But they soon threw off the mask of moderation; and, regardless of either of the approbation of the Senate or the people, resolved to continue themselves, against all order, in the decemviri. A conduct so notorious produced discontent; and these were as sure to produce fresh acts of tyranny. The city was become almost a despot, with respect to all who had any thing to lose; and the decemviri's capacity was then only discontinued, when they wanted fresh objects to exercise it upon. In this state of slavery, proscription, and mutual distrust, not one citizen was found to strike for his country's freedom; those tyrants continued to rule without control, being constantly guarded, not with their lictors alone, but a numerous crowd of dependents, clients, and even patricians, whom their vices had confederated round them.

In this gloomy situation of the state, the Equi and Valere, those constant enemies of the Romans, under the Equi took their incursions, resolved to profit by the intestine divisions of the people, and advanced within about 10 miles of Rome.

But the decemviri, being put in possession of all the military as well as of the civil power, divided their army
my into three parts; whereof one continued with Appius in the city, to keep it in awe; the other two were commanded by his colleagues, and were led one against the Equi, and the other against the Sabines. The Roman soldiers had now got into a method of punishing the generals whom they disliked, by suffering themselves to be vanquished in the field. They put it in practice upon this occasion, and shamefully abandoned their camp upon the approach of the enemy. Never was the news of a victory more joyfully received at Rome than the tidings of this defeat: the generals, as is always the case, were blamed for the treachery of their men: some demanded that they should be deposed; others cried out for a dictator to lead the troops to conquest: but among the rest, old Sicinius Dentatus the tribune spoke his sentiments with his usual openness; and treating the generals with contempt, showed all the faults of their discipline in the camp, and of their conduct in the field. Appius, in the mean time, was not remiss in obtaining the defection of the people. Dentatus, in particular, was marked out for vengeance, and, under pretence of doing him particular honour, he was appointed legate, and put at the head of the supplies which were sent from Rome to reinforce the army. The office of legate was held sacred among the Romans, as in it were united the authority of a general, with the reverence due to the priesthood. Dentatus, no way suspecting his design, went to the camp with alacrity, where he was received with all the external marks of respect. But the generals soon found means of inducing their desire of revenge. He was appointed at the head of 100 men to go and examine a more commodious place for encampment, as he had very candidly assured the commanders that their present situation was wrong. The soldiers, however, who were given as his attendants, were assassins; wretches who had long been ministers of the vengeance of the decemviri, and who now engaged to murder him, though with all those apprehensions which his reputation, as he was called the 'Roman deliberator,' might be supposed to inspire. With these designs, they led him from the way into the hollow bottom of a retired mountain, where they began to set upon him from behind. Dentatus, now too late, perceived the treachery of the decemviri, and was resolved to fell his life as dearly as he could; he therefore put his back to a rock, and defended himself against those who pressed most closely. Though now grown old, he had still the remains of his former valour, and killed no less than 15 of the assassins, and wounded 30. The assassins now therefore, terrified at his amazing bravery, flowered in their javelins upon him at a distance; all which he received in his shield with undaunted resolution. The combat, though so unequal in numbers, was managed for some time with doubtful success, till at length his assassins betook themselves of affending the rock against which he flung, and thus poured down stones upon him from above. This succeeded; the old soldier fell beneath their united efforts, after having shown by his death that he owed it to his fortitude, and not his fortune, that he had come off so many times victorious. The decemviri pretended to join in the general sorrow for so brave a man, and decreed him a funeral, with the first military honours: but the greatest of their apparent dilrefes, compared with their known hatred, only rendered them still more detestable to the people.

But a transaction still more atrocious than the former served to inspire the citizens with a resolution to break all measures of obedience, and at last to restore freedom. Appius, who still remained at Rome, sitting one day on his tribunal to dispose justice, saw a maiden of exquisite beauty, and aged about 15 passing to one of the public schools, attended by a matron her nurse. Conceiving a violent passion for her, he resolved to obtain the gratification of his desire, whatever should be the consequence, and found means to inform himself of her name and family. Her name was Virginius, the daughter of Virginius a centurion, then with the army in the field; and she had been contracted to Tullius, formerly a tribune of the people, who had agreed to marry her at the end of the present campaign. Appius, at first, resolved to break this match, and to elope her himself: but the laws of the Twelve Tables had forbidden the patricians to intermarry with the plebeians; and he could not infringe these, as he was the ender of them. Nothing therefore remained but a criminal enjoyment; which, as he was long used to the indulgence of his passions, he resolved to obtain. After having vainly tried to corrupt the fidelity of her nurse, he had recourse to another expedient, still more guilty. He pitched upon one Claudius, who had long been the minister of his pleasures, to affart the beautiful maid was his slave, and to refer the cause to his tribunal for decision. Claudius behaved exactly according to his instructions; for entering into the school, where Virginia was playing among her female companions, he seized upon her as his property, and was going to drag her away by force, but was prevented by the people drawn together by her cries. At length, after the first heat of opposition was over, he led the weeping virgin to the tribunal of Appius, and there plausibly expostulated his pretensions. He asserted, that she was born in the house of a female slave, who sold her to the wife of Virginia, who had been barren. That he had several credible evidences to prove the truth of what he said; but that, until they could come together, it was but reasonable the slave should be delivered into his custody, being her proper master. Appius seemed to be struck with the justice of his claims. He observed, that if the reputed father himself were present, he might indeed be willing to delay the delivery of the maiden for some time; but that it was not lawful for him, in the present case, to detain her from her master. He therefore adjudged her to Claudius, as his slave, to be kept by him till Virginia should be able to prove his paternity. This sentence was received with loud clamours and reproaches by the multitude: the women, in particular, came round Virginia, as if willing to protect her from the judge's fury; while Tullius, her lover, boldly opposed the decree, and obliged Claudius to take refuge under the tribunal of the decemviri. All things now threatened an open insurrection; when Appius, fearing the event, thought proper to suspend his judgment till the arrival of Virginia, who was then about 11 miles from Rome, with the army. The day following was fixed for the trial; and, in the mean time, Appius sent letters to the generals to confine Virginia, as his arrival in town might only serve to
kindled sedition among the people. These letters, however, were intercepted by the centurion’s friends, who sent him down a full relation of the design laid against the liberty and the honour of his only daughter. Virginius, upon this, pretending the death of a near relation, got permission to leave the camp, and flew to Rome, inspired with indignation and revenge. Accordingly, the next day he appeared before the tribunal, to the astonishment of Appius, leading his weeping daughter by the hand, both habited in the deepest mourning. Claudius, the accuser, was also there, and began by making his demand. Virginius next spoke in turn: he represented that his wife had many children; that the child had been seen pregnant by numbers; that, if he had intentions of adopting a suppositional child, he would have fixed upon a boy rather than a girl; that it was notorious to all, that his wife had herself flogged her own child; and that it was surprising such a claim should be now revived after a 15 years discontinuance. While the father spoke this with a stern air, Virginia fwooned by, and, with looks of perpetual innocence, added weight to all his remonstrances. The people seemed entirely shocked by the hardship of his case, till Appius, fearing what he said might have dangerous effects upon the multitude, interrupted him, under a pretence of being sufficiently instructed in the merits of the case, and finally adjudged her to Claudius, ordering the lidors to carry her off. The lidors, in obedience to his command, soon drove off the throng that pressed round the tribunal; and now they feized upon Virginia, and were delivering her up into the hands of Claudius, when Virginius, who found that all was over, seemed to acquiesce in the sentence. He therefore mildly intreated Appius to be permitted to take a last farewell of one whom he had long considered as his child; and so satisfied, he would return to his duty with fresh alacrity. With this the decemvir compiled, but upon condition that their endeavours should pass in his presence. Virginius, with the most poignant anguish, took his daughter in his arms, for a while supported her head upon his breast, and wiped away the tears that rolled down her lovely visage; and happening to be near the shops that surrounded the forum, he snatched up a knife that lay on the cumbles, and buried the weapon in her breast; then holding it up, reeking with the blood of his daughter, “Appius (he cried) by this blood of innocence, I devote thy head to the eternal gods.” Thus saying, with the bloody knife in his hand, and threatening destruction to whomsoever should oppose him, he ran through the city, wildly calling upon the people to strike for freedom, and from thence went to the camp, in order to spread a like flame through the army.

He no sooner arrived at the camp, followed by a number of his friends, but he informed the army of all that was done, still holding the bloody knife in his hand. He asked their pardon, and the pardon of the gods, for having committed so rash an act; but ascribed it all to the dreadful necessity of the times. The army, already predisposed, immediately with thongs echoed their approbation; and decamping, left their generals behind, to take their station once more upon mount Aventine, whether they had retired about 40 years before. The other army, which had been to oppose the Sabines, seemed to feel a like resentment, and came over in large parties to join them.

Appius, in the mean time, did all he could to quell the disturbances in the city; but finding the tumult incapable of control, and perceiving that his mortal enemies, Valerius and Horatius, were the most active in opposition, at first attempted to find safety by flight; nevertheless, being encouraged by Oppius, who was one of his colleagues, he ventured to appease the senate, and urged the punishment of all defectors. The senate, however, were far from giving him the relief he fought for; they foresaw the dangers and miseries that threatened the state, in case of opposing the incensed army; they therefore dispatched messengers to them, offering to refer their former mode of government. To this proposal all the people joyfully assented, and the army gladly obeyed. Appius and Oppius, one of his colleagues, both died by their own hands in prison. The other eight decemvirs went into voluntary exile; and Claudius, the pretended master of Virginia, was driven out after them.

The tribunes now grew more turbulent; they proposed two laws; one to permit plebeians to intermarry with patricians; and the other, to permit them to be admitted to the confulsiphip also. The senators received these proposals with indignation, and formed resolved to undergo the utmost extremities rather than submit to enact them. However, finding their resistance only increase the commotions of the state, they at last consented to pass the law concerning intermarriages, hoping that this concession would satisfy the people. But they were to be appeased but for a very short time: for, returning to their old custom of refusing to enlist upon the approach of an enemy, the confuls were forced to hold a private conference with the chief of the senate; where, after many debates, Claudius proposed an expedient as the most probable means of satisfying the people in the present conjuncture. This was, to create six or eight tribunes in the room of consuls, whereof one half at least should be patricians, and the other plebeians, the choice wholly fell upon the plebeians who offered themselves as candidates. These new magistrates were called military tribunes; they were at first but three, afterwards they were increased to four, and at length to six. They had the power and enfrings of confuls; yet that power being divided among a number, each singly was of little authority. The fault that were chosen only continued in office about three months, the augurs having found something amiss in the ceremonies of their election.

The military tribunes being deposed, the confuls once more came into office; and, in order to lighten the weight of business which they were obliged to fulfill, a new office was erected, namely, that of centurios. Their business was to take an estimate of the number and estates of the people, and to distribute them into their proper classes; to inspect into the lives and manners of their fellow-citizens; to degrade senators for misconduct; to disfranchise knights; and to turn down plebeians from their tribes into an inferior, in case of sedition. The two first centurios
The tribunes of the people were much enraged at the
death of Ma.lius; and, in order to punish the femate, at the next election, instead of confils, infilled upon reconfiding their military tribunes. With this the femate were obliged to comply. The next year, however, the government returned to its ancient channel, and confils were chosen.

The defttruction of Veii refoved.

Veii had long been the rivals of Rome; they had ever taken the opportunity of its internal diffrefs to ravage its territories, and had even threatened its ambaffadors, sent to complain of these injuries, with outrage. In war they had been extremely formidable, and had cut off almost all the Fabian family; who, to the number of 506 perfons, had voluntarily undertook to defend the frontier against their incursions. It feemed now therefore determined, that the city of Veii, whatever it fhould cost, was to fall; and the Romans accordingly fet regularly down before it, prepared for a long and painful refiftance. The strength of the place, or the unskilfulness of the besiegers, may be inferred from the continuance of the siege, which lasted for 10 years; during which time the army continued encamped round it, lying in winter under tents made of the skins of beasts, and in summer driving on the operations of the attack. Various was the fuccefs, and many were the commanders that directed the fiiege: sometimes all the besiegers' works were defroyed, and many of their men cut off by fallies from the town; sometimes they were annoyed by an army of Veians, who attempted to bring affiftance from without. A fiiege fo bloody feemed to threaten di-refta to Rome itself, by driving its forces con-stantly away; fo that a law was obliged to be made for all the bachelors to marry the widows of the foldiers who were slain. In order to carry it on with greater vigour, Furius Camillus was created dictator, and to him was intrusted the fole power of managing the long protracted war. Camillus, who, without intrigue or any folicitation had raised himfelf to the firit eminence in the state, had been made one of the cenfors fome time before, and was confidered as the head of that office; he was afterwards made a military tribune, and had in this post gained feveral advantages over the enemy. It was his great courage and abilities in the above offices that made him thought moft worthy to ferve his country on this prefailing occasion. Upon his appointment, numbers of the people flocked to his fandard, confident of fuccefs under fo experienced a commander. Confident, however, that he was unable to take the city by form, he secretly wrought a mine into it with vaft labour, which opened into the midft of the citadel. Certain thus of fuccefs, and finding the city incapable of relief, he fent to the fenate, defiring that all who chose to share in the plunder of Veii fhould immediately repair to the army. Then giving his men directions how to enter at the breach, the city was instantly filled with his legions, to the amazement and confutation of the befieged, who, but a moment before, had refted in perfect fecurity. Thus, like a fecond Troy, was the city of Veii taken, after a 10 years fiege, and with its fpoils enriched the conquerors; while Camillus himfelf, tran-ported with the honour of having subdued the rival of his native city, triumphed after the manner of the kings of Rome, having his chariot drawn by four milk-white horses; a diftinction which did not fail to difguft the majority of the fpedators, as they confidered thefe as sacred, and more proper for doing honour to their gods than their generals.

His ufual good fortune attended Camillus in another expedition against the Falis; he routed their army, flay the head befieged their capital city Faleri, which threatened Falerii, a long and vigorous refiftance. Here a schoolmafler, who had the care of the children belonging to the principal men of the city, having found means to defoy them into the Roman camp, offered to put them into the hands of Camillus, as the safest means of inducing the citizens to a footage furrender. The general was feci with the treachery of a wretch whose duty it was to protect innocence, and not to betray it; and immediately ordered him to be fpried, his hands tied behind him, and in that ignominious manner to be whipped into the town by his own scholars.

This
This generous behaviour in Camillus effected more than his arms could do: the magistrates of the town immediately submitted to the senate, leaving to Camillus the conditions of their surrender; who only fined them in a sum of money to satisfy his army, and received them under the protection and into the alliance of Rome.

Notwithstanding the veneration which the virtues of Camillus had excited abroad, they seemed but little adapted to bring over the respect of the turbulent tribunes at home, as they raised some fresh accusation against him every day. To their other charges they added that of his having concealed a part of the plunder of Veii, particularly two brazen gates, for his own use; and appointed him a day on which to appear before the people. Camillus, finding the multitude exasperated against him upon many accounts, deterred their ingratitude, resolved not to wait the ignominy of trial; but, embracing his wife and children, prepared to depart from Rome. He had already passed as far as one of the gates, unattended on his way, and unlaunted. There he could suppress his indignation no longer; but, turning his face to the Capitol, and lifting up his hands to heaven, intreated all the gods that his country might one day be sensible of their injustice and ingratitude; and so saying, he paffed forward to take refuge at Ardea, where he afterwards learned that he had been fined 1500 aces by the tribunes at Rome.

The Romans indeed soon had reason to repent their usage of Camillus; for now a more formidable enemy than ever they had met with threatened the republic: an inundation of Gauls, leaving their native woods, under the command of one Brennus, wasted every thing with fire and fword. It is said that one Cæcilius, a man of the lowest rank, pretended to have heard a miraculous voice, which pronounced distinctly these words: “Go to the magistrates, and tell them that the Gauls draw near.” The meannefs of the man made his warning despifed; though, when the event showed the truth of his prediction, Camillus erected a temple to the unknown Deity, and the Romans invented for him the name of Aius Locutius. Meffengers after meffengers arrived with the news of the progress and devastations of the Gauls; but the Romans behaved with as much ferocity as if it had been impossible for them to have felt the effects of their depredations. At last envoys arrived at Rome, imploiring the assistance of the republic against an army of Gauls, which had made an irruption into Italy, and now besieged their city. The occasion of the irruption and siege was this: Arunx, one of the chief men of Clusium in Hetruria, had been guardian to a young lucum, or lord of a lucumony, and had educated him in his house from his infancy. The lucum, as soon as he was of an age to feel the force of passion, fell in love with his guardian’s wife; and, upon the first discovery of their intrigue, conveyed her away. Arunx endeavoured to obtain reparation for the injury he had received; but the lucum, by his interest and money, gained over the magistrates: so that the injured guardian, finding no protectors in Hetruria, resolved to make his application to the Gauls. The people among all the Celtic nations, to whom he chose to address himself, were the Senones; and, in order to engage them in his quarrel, he acquainted them with the great plenty of Italy, and made them taste of some Italian wines. Upon this the Senones resolved to follow him; and a numerous army was immediately formed, which passing the Alps, under the conduct of their Het-

The Romans indeed soon had reason to repent their usage of Camillus; for now a more formidable enemy than ever they had met with threatened the republic: an inundation of Gauls, leaving their native woods, under the command of one Brennus, wasted every thing with fire and fword. It is said that one Cæcilius, a man of the lowest rank, pretended to have heard a miraculous voice, which pronounced distinctly these words: “Go to the magistrates, and tell them that the Gauls draw near.” The meannefs of the man made his warning despifed; though, when the event showed the truth of his prediction, Camillus erected a temple to the unknown Deity, and the Romans invented for him the name of Aius Locutius. Meffengers after meffengers arrived with the news of the progress and devastations of the Gauls; but the Romans behaved with as much ferocity as if it had been impossible for them to have felt the effects of their depredations. At last envoys arrived at Rome, imploiring the assistance of the republic against an army of Gauls, which had made an irruption into Italy, and now besieged their city. The occasion of the irruption and siege was this: Arunx, one of the chief men of Clusium in Hetruria, had been guardian to a young lucum, or lord of a lucumony, and had educated him in his house from his infancy. The lucum, as soon as he was of an age to feel the force of passion, fell in love with his guardian’s wife; and, upon the first discovery of their intrigue, conveyed her away. Arunx endeavoured to obtain reparation for the injury he had received; but the lucum, by his interest and money, gained over the magistrates: so that the injured guardian, finding no protectors in Hetruria, resolved to make his application to the Gauls. The people among all the Celtic nations, to whom he chose to address himself, were the Senones; and, in order to engage them in his quarrel, he acquainted them with the great plenty of Italy, and made them taste of some Italian wines. Upon this the Senones resolved to follow him; and a numerous army was immediately formed, which passing the Alps, under the conduct of their Hetrurian guide, and leaving the Celte in Italy unmolefted, fell upon Umbria, and poifefted themselves of all the country from Ravenna to Picenum. They were about six years in settling themselves in their new acquisitions, while the Romans were carrying on the siege of Veii. At length Arunx brought the Senones before Clusium, in order to besiege that place, his wife and her lover having flut themselves up there. The Senate, being unwilling to engage in an open war with a nation which had never offended them, sent an embassy of three young patricians, all the rote and an embassy of the Fabian family, to bring about an accommodation to them between the two nations. These ambassadors, being arrived at the camp of the Gauls, and conducted into the council, offered the mediation of Rome; and demanded of Brennus, the leader of the Gauls, what injury the Cluñini had done him; or what pretensions any people from a remote country could have upon Hetruria? Brennus answered proudly, that his right lay in the King of the Gauls, and that all things belonged to the brave; but, that, without having recourse to this primitive law of nature, he had a just complaint against the Cluñini, who, having more lands than they could cultivate, had refused to yield to him those they left untlit. And what other motives had you yourselves, Romans (said he), to conquer so many neighbouring nations? You have deprived the Sabines, the Albans, the Fidenates, the Eque, and the Volsci, of the belt part of their territories. Not that we accuse you of injustice; but it is evident, that you thought this to be the prime and most ancient of all laws, to make the weak give way to the strong. Forbear therefore to interef yourselves for the Cluñini, or to allo us to take the part of the people you have subdued.”

The Fabii were highly provoked at so haughty and impudent an answer; but, dissembling their resentment, desired leave of the Senate to go into the town, under pretence of conferring with the ambassadors. But they were not sooner there, than they began to stir up the inhabitants to a vigorous defence; nay, forgetting their regard for the law of nations: they put them at the head of the besieged in a fally, in which Q. Fabius, the chief of the ambassadors, flew with his own hand one of the principal officers of the Gauls. Hereupon Brennus, calling the gods to witnefs the perjury of the Romans, and their violating the law of nations, immediately broke up the siege of Clusium, and marched leisurely to Rome, having sent an herald before him, to demand that those ambassadors, who had so manifestly violated the law of nations, should be delivered up to him. The Roman Senate was greatly perplexed between their regard for the law of nations violated, and their affection for the Fabii. The wisest of the Senate thought the demand of the Gauls to be just and reasonable: however, as it concerned persons of great consequence and credit, the conscript fathers referred the affair to the people assembled by curiae. As the Fabian family was very popular, the curiae were far from condemning the three brothers, that, at the next election of military tribunes, they were chosen the firs.
Brennus, looking upon the promotion of the Roman arms as an high affront on his nation, halted his march to Rome.

As his army was very numerous, the inhabitants of the towns and villages through which he paused left their habitations at his approach; but he stopped nowhere, declaring that his design was only to be revenge on the Romans. The six military tribunes, to wit, Q. Fabius, Catil Fabius, Calus Fabius, Q. Sulpicius, Q. Servilius, and Sexius Cornelius, marched out of Rome at the head of 40,000 men, without either fixing in the gods or consulting the augurs; essential ceremonies among a people that drew their courage and confidence from the propitious signs which the augurs declared to them. As most of the military tribunes were young, and men of more value than experience, they advanced boldly against the Gauls, whose army was 70,000 strong. The two armies met near the river Allia, about 60 furlongs from Rome. The Romans, that they might not be surrounded by the enemy, extended their wings so far as to make their centre very thin. Their best troops, to the number of 24,000 men, they posted between the river and the adjoining hills; the rest they placed on the hills. The Gauls first attacked the latter, who being soon put into confusion, the forces in the plain were struck with such terror that they fled without drawing their swords. In this general disorder, most of the folders, instead of returning to Rome fled to Veii: some were drowned as they endeavoured to swim across the Tiber; many fell in the pursuit by the sword of the conquerors; and some got to Rome, which they filled with terror and consternation, it being believed there that all the rest were cut off. The day after the battle, Brennus marched his troops into the neighbourhood of Rome, and encamped on the banks of the Anio. Thither his scouts brought him word, that the gates of the city lay open, and that not one Roman was to be seen on the rumparts. This made him apprehensive of some ambuscade, it being unreasonable to suppose that the Romans would abandon their city to be plundered and sacked without making any resistance. On this consideration he advanced slowly, which gave the Romans an opportunity to throw into the Capitol all the men who were fit to bear arms. They carried into it all the provisions they could get; and, that they might last the longer, admitted none into the place but such as were capable of defending it.

As for the city, they had not sufficient forces to defend it; and therefore the old men, women, and children, seeing themselves abandoned, fled to the neighbouring towns. The Vestals, before they left Rome, took care to hide every thing appropriated to the gods which they could not carry off. The two palaestrae, and the sacred fire, they took with them. When they came to the Janiculum, one Abinius, a plebeian, who was conveying his wife and children in a carriage to a place of safety, seeing the sacred virgins bending under their load, and their feet bloody, made his family alight, put the priestesses and their gods into the carriage, and conducted them to Cæræ, a city of Etruria, where they met with a favourable reception. The Vestals remained at Cæræ, and there continued to perform the usual rites of religion; and hence those rites were called cremoneis. But while the rest of the citizens at Rome were providing for their safety, about 80 of the most illustrious and venerable old men, rather than fly from their native city, chose to devote themselves to death by a vow, which Fabius the high pontiff pronounced in their names. The Romans believed, that, by these voluntary devotions to the infernal gods, disorder and confusion was brought among the enemy. Of these brave old men some were pontifices, others had been consuls, and other generals of armies, who had been honoured with triumphs. To complete their sacrifice with a solemnity and pomp becoming the magnanimity and constancy of the Romans, they dressed themselves in their pontifical, consular, and triumphal robes; and repairing to the forum, seated themselves there in their curule chairs, expecting the enemy and death with the greatest constancy.

At length Brennus, having spent three days in useless precautions, entered the city the fourth day after the battle. He found the gates open, the walls without defence, and the houses without inhabitants. Rome appeared to him like a mere defart; and this solitude increased his anxiety. He could not believe, either that the Romans were lodged in the Capitol, or that so numerous a people should abandon the place of their nativity. On the other hand, he could nowhere see any armed men but on the walls of the citadel. However, having first secured all the avenues to the Capitol with strong bodies of guards, he gave the rest of his foldiers leave to disperse themselves all over the city and plunder it. Brennus himself advanced into the forum with the troops under his command, in good order; and there he was struck with admiration at the unexpected fight of the venerable old men who had devoted themselves to death. Their magnificent habits, the majesty of their countenances, the silence they kept, their modesty and constancy at the approach of his troops, made him take them for so many deities; for they continued as motionless as statues, and saw the enemy advance without showing the least concern. The Gauls kept a great while at an awful presence from them, being afraid to come near them. But at length one folder bolder than the rest, having out of curiosity touched the beard of M. Papirius, the venerable old man, not being used to such familiarity, gave him a blow on the head with his ivory staff. The folder in revenge immediately killed him; and the rest of the Gauls following his example, slaughtered all those venerable old men without mercy.

After this the enemy set no bounds to their rage and fury. They plundered all places, dragging fuch of the Romans as had hitherto been taken in their houses into the streets, and there putting them to the sword without distinction of age or sex. Brennus then invited the Capitol; but being repulsed with great loss, left the in order to be revenged of the Romans for their refilt. In consequence, he resolved to lay the city in ashes. Accordingly, by his command, the soldiers set fire to the houses, demolished the temples and public edifices, and razed the walls to the ground. Thus was the famous city of Rome entirely destroyed; nothing was to be seen in the place where it flourished but a few little hills covered with ruins, and a wide waste, in which the Gauls who invaded the Capitol were encamped. Brennus, finding he should never be able to take a place which nature had so well fortified otherwise than by famine, turned the siege into a blockade. But in the mean time, his army

ROM. [356]
army being distressed for want of provisions, he sent out parties to pillage the fields, and raise contributions in the neighbouring cities. One of these parties appeared before Ardea, where the great Camillus had now spent two years in a private life. Notwithstanding the affront he had received at Rome, the love he bore his country was not in the least diminished. The senate of Ardea being met to deliberate on the measures to be taken with relation to the Gauls, Camillus, more afflicted at the calamities of his country than at his own banishment, desired to be admitted into the council, and, with his eloquence, he prevailed upon the Ardeates to arm their youth in their own defence, and refuse the Gauls admission into their city.

Hereupon the Gauls encamped before the city; and as they defiled the Ardeates after they had made themselves masters of Rome, they preferred neither order nor discipline in the camp, but spent whole days in drinking. Hereupon Camillus, having easily persuaded the youth of the city to follow him, marched out of Ardea in a very dark night, surprized the Gauls drowned in wine, and made a dreadful slaughter of them. Those who made their escape under the shelter of the night fell next day into the hands of the seafants, by whom they were mazzacred without mercy. This defeat of the enemy revived the courage of the Romans scattered about the country, especially of those who had retired to Veii after the unfortunate battle of Allia. There was not one of them who did not condemn himself for the exile of Camillus, as if he had been the author of it; and looking upon that great man as their last resource, they resolved to choose him for their leader. Accordingly, they sent without delay ambassadors to him, beseeching him to take into his protection the fugitive Romans, and the wrecks of the defeat at Allia. But Camillus would not accept of the command of the troops till the people assembled by curia had legally conferred it upon him. He thought the public authority was lodged in the hands of those who were shut up in the citadel, and therefore would undertake nothing at the head of the Roman troops till a communion was brought him from thence.

To do this was very difficult, the place being invested on all sides by the enemy. However, one Pontius Cominius, a man of mean birth, but bold, and very ambitious of glory, undertook it. He put on a light habit, and providing himself with cork to keep the longer above water, threw himself into the Tiber above Rome in the beginning of the night, and suffered himself to be carried down with the stream. At length he came to the foot of the Capitol, and landed at a steep place where the Gauls had not thought it necessary to post any sentinels. There he mounted with great difficulty to the rampart of the citadel; and having made himself known to the guards, he was admitted into the place, and conducted to the magistrates. The senate being immediately assembled, Pontius gave them an account of Camillus's victory; and in the name of all the Romans at Veii demanded that great captain for their general. There was not much time spent in debates: the curia being called together, the act of condemnation which had been passed on Camillus was abrogated, and he named dictator with one voice. Pontius was immediately dispatched with the decree; and the same good fortune which had attended him to the Capitol accompanied him in his return. Thus was Camillus, from the state of banishment, raised to once to be sovereign magistrate of his country. His promotion to the command was no sooner known, but soldiers flocked from all parts to his camp; in so much that he soon found himself at the head of above 40,000 men, partly Romans and partly allies, who all thought themselves invincible under so great a general.

While he was taking proper measures to raise the blockade of the citadel, some Gauls rambling round the place, perceived on the side of the hill the print of Pontius's hands and feet. They searched the rocks on the rocks was in several places torn up. From these marks they concluded, that somebody had lately gone up to and returned from the capitol. The Gauls immediately made their report to Brennus of what they had observed; and that experienced commander laid a design, which he imparted to nobody, of surprizing the place by the same way that the Roman had ascended. With this view he chose out of the army such soldiers as had dwelt in mountainous countries, and been accustomed from their youth to climb precipices. These he ordered, after he had well examined the nature of the place, to ascend in the night the same way that was marked out for them; climbing two abreast, that one might support the other in getting up the steep parts of the precipice. By this means they advanced with much difficulty from rock to rock, till they arrived at the foot of the wall. They proceeded with such silence, that they were not discovered or heard, either by the centurions who were upon guard in the citadel, or even by the dogs, that are usually awaked and alarmed at the least noise. But though they eluded the sagacity of the dogs, they could not escape the vigilance of the geese. A flock of these birds was kept in a court of the Capitol in honour of Juno, and near her temple. Notwithstanding the want of provisions in the garrison, they had been spared out of religion; and as these creatures are naturally quick of hearing, they were alarmed at the first approach of the Gauls; so that running up and down, with their cackling and beating of their wings, they alarmed Manlius, a gallant soldier, who some years before had been confid. He founded an alarm, and was the first man who mounted the rampart, where he found two Gauls already upon the wall. One of these offered to discharge a blow at him with his battle-axe; but Manlius cut off his right hand at one blow, and gave the other such a push with his buckler, that he threw him headlong from the top of the rock to the bottom. He, in his fall, drew many others with him; and, in the mean time, the Romans crowding to the place, pressed upon the Gauls, and tumbled them one over another. As the nature of the ground would not suffer them to make a regular retreat, or even to fly, most of them, to avoid the swords of the enemy, threw themselves down the precipice, so that very few got safe back to their camp.

As it was the custom of the Romans at that time not to suffer any commendable action to go unrewarded, the tribune Sulpitius assembled his troops the next morning, in order to bestow the military rewards on those who, the night before, had deferred them. Among these Manlius was first named; and, in acknowledgment of the important service he had just rendered the state, every soldier gave him part of the corn which he received.
The Romans extended their punishments and rewards even to the animals. Geese were ever after had at the expense of the public. A golden image of a goose was erect'd in memory of them, and a goose every year carried in triumph upon a soft litter finely adorned: whilst dogs were held in abhorrence by the Romans, who every year impaled one of them on a branch of elder.

The blockade of the Capitol had already lasted seven months; so that the famine began to be very sensibly felt both by the besieged and besiegers. Camillus, since his nomination to the dictatorship, being master of the country, had poSted strong guards on all the roads; so that the Gauls dared not stir out for fear of being cut to pieces. Thus Brennus, who besieged the Capitol, was besieged himself, and suffered the same inconveniences which he made the Romans undergo. Besides, a plague raged in his camp, which was placed in the midst of the ruins of the demolished city, his men lying confusedly among the dead carcasses of the Romans, whom they had slain, and not buried. So great a number of them died in one quarter of the city, that it was afterwards called Buja Gallica, or the place where the dead bodies of the Gauls were burnt. But, in the mean time, the Romans in the Capitol were more pinched with want than the Gauls. They were reduced to the last extremity, and at the same time ignorant both of the lamentable condition to which the enemy's army was brought, and of the steps Camillus was taking to relieve them. That great general only waited for a favourable opportunity to fall upon the enemy; but, in the mean time, suffered them to pine away in their infected camp, not knowing the extreme want the Romans endured in the Capitol, where they were so destitute of all sorts of provisions, that they could no longer subsist. Matters being brought to this sad pass on both sides, the centurions of the Capitol, and those of the enemy's army, began to talk to one another of an accommodation. Their discourses came at length to the ears of their leaders, who were not averse to the design. The senate, not knowing what was become of Camillus, and finding themselves hard pinched by hunger, resolved to enter upon a negociation, and empowered Sulpius, one of the military tribunes, to treat with the Gauls; who made no great difficulty in coming to terms, they being no lefs defirous than the Romans to put an end to the war. In a conference, therefore, between Brennus and Sulpius, an agreement was made, and sworn to. The Romans were to pay to the Gauls 1000 pounds weight of gold, that is, 45,000l. Sterling; and the latter were to raise the siege of the Capitol, and quit all the Roman territories. On the day appointed, Sulpius, brought the sum agreed on, and Brennus the scales and weights; for there were no gold or silver coins at that time, metals falling only by weight. We are told, that the weights of the Gauls were false, and their scales untrue; which Sulpius complained of. Brennus, instead of redressing the injuries, threw his sword and belt into the scale where the weights were; and when the tribune asked him the meaning of so extraordinary a behaviour, the only answer he gave was, "Vo! vo!" "Wo! to the conquered!"

Sulpius was so flung with this haughty answer, that he was for carrying the gold back into the Capitol, and fouling the siege to the last extremity; but others thought it advisable to put up the affront, since they had submitted to a far greater one, which was to pay any thing at all.

During these disputes of the Roman deputies among themselves and with the Gauls, Camillus advanced with his army to the very gates of the city; and being there informed of what was doing, he commanded the main body to follow him slowly and in good order, while he, with the choicest of his men, hastened to the place of the parley. The Romans, overjoyed at his unexpected arrival, opened to make room for him as the supreme magistrate of the republic, gave him an account of the treaty they had made with the Gauls, and complained of the wrong Brennus did them in the execution of it. They had scarce done speaking, when Camillus cried out, "Carry back this gold into the Capitol; and you, Gauls, retire with your scales and weights. Rome drives away you fool not be redeemed with gold, but with steel," Brennus replied. That he contravened a treaty which was concluded and confirmed with mutual oaths. "Be it so (answered Camillus); yet it is of no force, having been made by an inferior magistrate, without the privy or consent of the dictator. I, who am invested with the supreme authority over the Romans, declare the contract void." At these words Brennus flew into a rage; and both sides drawing their swords, a confused scuffle ensued among the ruins of the houses, and in the narrow lanes. The Gauls, after an inconceivable loss, thought fit to retire within their camp; which they abandoned in the night, not caring to engage Camillus's whole army, and, having marched eight miles, encamped on the Gabinian way. Camillus pursu ed them as soon as it was day, and, coming up with them, gave them a total overthrow. The Gauls, according to Livy, made but a faint resistance, being disheartened at the loss they had sustained the day before. It was not so says that author, to much a battle as a slaughter. The Gauls were entirely cut to pieces; but the greater number were cut off, as they wandered up and down in the fields, by the inhabitants of the neighbouring villages. In short, there was not one single Gaul left to carry to his countrymen the news of this fatal catastrophe. The camp of the barbarians was plundered; and Camillus, loaded with spoils, returned in triumph to the city, the soldiers in their fongs sty ling him Romulus, Father of his country, and Second founder of Rome.

As the houses of Rome were all demolished, and the walls razed, the tribunes of the people renewed, with more warmth than ever, an old project which had occasioned great disputes. They had formerly proposed a law for dividing the senate and government between the cities of Veii and Rome. Now this law was revived: nay, most of the tribunes were for entirely aban doning their old ruined city, and making Veii the sole seat.
The people were inclined to favour the project, Veii offering them a place fortified by art and nature, good houses ready built, a wholesome air, and a fruitful territory. On the other hand, they had no materials for rebuilding a whole city, were quite exhausted by misfortunes, and even their strength was greatly diminished. This gave them a reluctance to enter upon the great undertaking, and emboldened the tribunes to utter seditious harangues being desirous to see Rome rebuilt, continued him, contrary to his views. As the Senate gave him authority against another patrician, who had crime being notorious, he was summoned before the (assembly of the people, to an answer for his conduct in his embassy. The criminal had reason to fear the severest punishment; but his relations gave out that he died suddenly, which generally happened when the accused person had determined to prevent his condemnation, and the shame of a public punishment. On the other hand, the republic gave an house situated on the Capitol to M. Manlius, as a monument of his valor, and of the gratitude of his fellow-citizens. Camillus closed this year by laying down his dictatorship; whereupon an interregnum ensued, during which he governed the state alternately with P. Cornelius Scipio; and it fell to his lot to preside at the election of new magistrates, when L. Valerius Poplicola, L. Virginius Tricortius, P. Cornelius Cossus, A. Manlius Capitolinus, L. Scilibeth Mamercus, and L. Potheumius Albinius, were chosen. The first care of these new magistrates was to collect all the ancient monuments of the religion and civil laws of Rome which could be found among the ruins of the demolished city. The laws of the twelve tables, and some of the laws of the kings, had been written on bracs, and fixed up in the forum; and the treaties made with several nations had been engraved on pillars erected in the temples. Pains were therefore taken to gather up the ruins of these precious monuments; and that could not be found was supplied by memory. The pontiffs, on their part, took care to re-establish the religious ceremonies, and made also a list of lucky and unlucky days.

And now the governors of the republic applied themselves wholly to rebuild the city. Plutarch tells us, that as the workmen were digging among the ruins of the temple of Mars, they found Romulus's augural staff untouched by the flames; and that this was looked upon as a prodigy, from whence the Romans inferred that their city would continue forever. The expense of building private houses was partly defrayed out of the public treasure. The cities had the direction of the works; but they had so little taste for order or beauty, that the city, when rebuilt, was even less regular than in the time of Romulus. And though in Augustus's time, when Rome became the capital of the known world, the temples, palaces, and private houses, were built in a more magnificent manner than before; yet even then these new decorations did not rectify the faults of the plan upon which the city had been built after its first demolition.

Rome was scarce restored, when her citizens were alarmed by the news that all her neighbours were combining to deprive her of her city. The Aequi, the Volsci, the Hetrurians, and even her old friends the Latins and the Hernici, entered into an alliance against her, in hopes of oppressing her before she had recovered her strength. The republic, under this terror, nominated Camillus dictator a third time. This great commander, having appointed Servilius to be his general of horse, summoned the citizens to take arms, without excepting even the old men. He divided the new levies into three bodies. The first, under the command of A. Manlius, he ordered to encamp under the walls of Rome; the second he sent into the neighbourhood of Veii, and marched himself at the head of the third, to relieve the tribunes, who were closely besieged in their camp by the united forces of the Volsci and Latins. Finding the enemy encamped near Lanuvium, on the declivity of the hill Marcus, he posted himself behind it, and, by lighting fires, gave the destroyed Romans notice of his arrival. The Volsci and Latins, when they understood that Camillus was at the head of an army newly arrived, were so terrified, that they flung themselves up in their camp, which they fortified with great trees cut down in haste. The dictator, observing that this barrier was of green wood, and that every morning there arose a great wind, which blew full upon the enemy's camp, formed the design of taking it by fire. With this view he ordered one part of his army to go by break of day with fire-brands to the windward side of the camp, and the other to make a brisk attack on the opposite side. By this means the enemy were entirely defeated, and their camp taken. Camillus then commanded his men to extinguish the flames, in order to save the booty, with which he rewarded his army. He then left his son in the camp to guard the prisoners; and, entering the country of the Aequi, made himself master of their capital city Bolsena. From thence he marched against the Volsci, whom
And the Hetrurias.

The unfortunate multitude no sooner saw the Romans, but they threw themselves at the dictator's feet, who, moved at this melancholy sight, defirèd them to take a little rest, and refresh themselves, adding, that he would soon dry up their tears, and transfer their forrows from them to their enemies. He imagined, that the Hetrurians would be wholly taken up in plundering the city, without being upon their guard, or observing any discipline. And herein he was not mistaken. The Hetrurians did not dream that the dictator could come so speedily from such a distance to surprize them; and therefore were wholly employed in plundering the houses and carrying off the booty, or fealing on the provisions they had found in them. Many of them were put to the sword, and an incredible number made prisoners; and the city was restored to its ancient inhabitants, who had not waited in vain for the performance of the dictator's promise. And now, after these glorious exploits, which were finifhed in so short a time, the great Camillus entered Rome in triumph a third time.

Camillus having resigned his dictatorship, the republic chose new military tribunes, Q. Quinctius, Q. Servius, L. Julius, L. Aequilius, L. Lucretius, and S. Sulpicius. During their administration the country of the Aequi was laid waste, in order to put it out of their power to revet anew; and the two cities of Cortona and Contenebra, in the lucumony of the Tarquiniienses, were taken from the Hetrurians, and entirely demolished. At this time it was thought proper to repair the Capitol, and add new works to that part of the hill where the Gauls had endeavoured to scale the citadel. These works were esteemed very beautiful, as Livy informs us, even in the time of Augustus, after the city was embellished with most magnificent decorations.

And now Rome being reinflated in her former flourishing condition, the tribunes of the people, who had been for some time quiet, began to renew their seditions harangues, and revive the old quarrel about the division of the conquered lands. The patricians had appropriated to themselves the Pontin territory lately taken from the Volfci, and the tribunes laid hold of this opportunity to raise new disturbances. But the citizens being so drained of their money that they had not enough left to cultivate new farms and stock them with cattle, the declamations of the tribunes made no impression upon their minds; so that the project vanished. As for the military tribunes, they owned that their election had been defective; and, left the irregularities of the former comites should be continued in the succeeding ones, they voluntarily laid down their office.

So that, after a short interregnum, during which M. Manlius, S. Sulpicius, and L. Valerius Pottius, governed the republic, six new military tribunes, L. Papirius, C. Sulpicius, L. Aemilius, L. Menenius, L. Valerius, and C. Cornelius, were chosen for the ensuing year, which was spent in works of peace. A temple, which had been vowed to Mars during the war with the Gauls, was built, and consecrated by T. Quintius, who presided over the affairs of religion. As there had hitherto been but few Roman tribes beyond the Tiber which had a right of suffrage in the comitia, four new ones were added, under the name of the Stetitina, Traunina, Sabatina, and Africeni; so that the tribes were now in all 25, which enjoyed the same rights and privileges.

The expectation of an approaching war induced the centuries to choose Camillus one of the military tribunes for the next year. His colleagues were S. Cornelius, Q. Servilius, L. Quinctius, L. Horatius, and P. Valerius. As all these were men of moderation, they agreed to invest Camillus with the sole management of affairs in time of war; and accordingly in full senate transferred all their power into his hands; so that he became in effect dictator. It had been already determined in the senate to turn the arms of the republic against the Hetrurians; but, upon advice that the Antiates had entered the Pontin territory, and obliged the Romans who had taken possession of it to retire, it was thought necessary to humble them before the republic engaged in any other enterprise. The Antiates had joined the Latins and Hernici near Satricum; so that the Romans, being terrified at their prodigious numbers, threw themselves very backward to engage which Camillus perceiving, he instantly mounted his horse, and riding through all the ranks of the army, encouraged them by a proper speech; after which he dismounted, took the next standard-bearer by the hand, led him towards the enemy, and cried out, Soldiers, advance. The foldiers were amazed, not to follow a general who expelled himself to the first attack; and therefore, having made a great shout, they fell upon the enemy with incredible fury. Camillus, in order to increase their eagerness still more, commanded a standard to be thrown into the middle of the enemy's battalions, which made the soldiers, who were fighting in the front ranks, exert all the resolution they could to recover it. The Antiates, not being able any longer to make head against the Romans, gave way, and were entirely defeated. The Latins and Hernici separated from the Volfci, and returned home. The Volfci, seeing themselves thus abandoned by their allies, took refuge in the neighbouring city of Satricum; which Camillus immediately invested, and took by assault. The Volfci threw down their arms, and surrendered at discretion. He then left his army under the command of Valerius; and returned to Rome to solicit the content of the senate, and to make the necessary preparations for undertaking the siege of Antium.

But, while he was proposing this affair to the senate, deputies arrived from Nepet and Sutrium, two cities, ties in alliance with Rome in the neighbourhood of Hetruria, demanding succours against the Hetrurians, who threatened to besiege these two cities, which were the keys of Hetruria. Hereupon the expedition against Antium
Antium was laid aside, and Camillus commanded to hasten to the relief of the allied cities, with the troops which Servilius had kept in readiness at Rome in case of an emergency. Camillus immediately set out for the new war; and, upon his arrival before Sutrium, found that important place not only besieged, but almost taken, the Hetrurians having made themselves masters of some of the gates, and gained possession of all the avenues leading to the city. However, the inhabitants no sooner heard that Camillus was come to their relief, but they recovered their courage, and, by barricades made in the streets, prevented the enemy from making themselves masters of the whole city. Camillus in the mean time having divided his army into two bodies, ordered Valerius to march round the walls, as if he designed to feale them, while he with the other undertook to charge the Hetrurians in the rear, force his way into the city, and shut up the enemy between the besieged and his troops. The Romans no sooner appeared but the Hetrurians betook themselves to a disorderly flight through a gate which was not inviolate. Camillus's troops made a dreadful slaughter of them within the city, while Valerius put great numbers of them to the sword without the walls. From reconquering Sutrium, Camillus hastened to the relief of Nepet. But that city being better affected to the Hetrurians than to the Romans, had voluntarily submitted to the former. Therefore Camillus, having invaded it with his whole army, took it by assault, put all the Hetrurian soldiers without distinction to the sword, and condemned the authors of the revolt to die by the axes of the lifters. Thus ended Camillus's military tribunanship, in which he acquired no less reputation than he had done in the most glorious of his dictatorships.

In the following magistracy of six military tribunes, a dangerous sedition is laid to have taken place through the ambition of Marcus Manlius, who had saved the Capitol from the Gauls in the manner already related. Though this man had pride enough to defile all the other great men in Rome, yet he envied Camillus, and took every opportunity of magnifying his own exploits beyond those of the dictator. But not finding such a favourable reception from the nobility as he desired, he concerted measures with the tribunes of the people, and strove to gain the affections of the multitude. Not content with renewing the proposal for the distribution of conquered lands, he also made himself an advocate for insolvent debtors, of whom there was now a great number, as most of the lower classes had been obliged to borrow money in order to rebuild their houses. The senate, alarmed at this opposition, created A. Cornelius Cossius dictator, for which the war with the Volsci afforded them a fair pretest. Manlius, however, still continued to inflame the people against the patricians. Besides the most unbounded personal generosity, he held assemblies at his own house (in the citadel), where he confidently gave out that the senators, not content with being the possessors of those lands which ought to have been equally divided among all the citizens, had concealed, with an intent to appropriate it to their own use, all the gold which was to have been paid to the Gauls, and which would alone be sufficient to discharge the debts of all the poor plebeians; and he moreover promised to throw in due time where this treasure was concealed. For this affiction he was brought before the dictator; who commanded him to discover where the pretended treasure was, or to confess openly before the whole assembly that he had flandered the senate. Manlius replied, that the dictator himself, and the principal persons in the senate, could only give the proper intelligence of this treasure, as they had been the most active in securing it. Upon this he was committed to prison; but the people made such disturbance, that the senate were soon after flain to release him. By this he to the anger of the gods on account of the pretense of his having delivered the Capitol from the Gauls, that they could not resolve to condemn him. But the military tribunes, who, it seems, were bent on his destruction, having appointed the assembly to be held without the city, there obtained their will. Manlius was thrown headlong from the Capitol itself: it was condemned thenceforth decreed that no patrician should dwell in the Capitol or citadel; and the Manlian family resolved that no member of it should ever afterwards bear the praenomen of Marcus. No sooner was Manlius dead, however, than the people lamented his fate; and because a plague broke out soon after, they imputed it to the anger of the gods on account of the destruction of the hero who had saved the state (A).

The Romans, having now triumphed over the Sabines, the Etrurians, the Latin, the Hernici, the Equi, and the Volsciains, began to look for greater conquests. They accordingly turned their arms against the Samnites, a people about 100 miles east from the city, defended from the Sabines, and inhabiting a large tract of southerm Italy, which at this day makes a considerable part of the kingdom of Naples. Valerius Corvus and Cornelius were the two consuls, to whose care it first fell to manage this dreadful contention between the rival states.

Valerius was one of the greatest commanders of his time; he was surnamed Corvus, from a strange circumstance of being affiled by a crow in a single combat, in which he fought and killed a Gaul of a gigantic stature. To his colleague's care it was configned to lead an army to Samnium, the enemy's capital; while Corvus was sent to relieve Capua, the capital of the...
The Romans were the bravest men the world had ever yet encountered, and the contest between the two nations was managed on both sides with the most determined resolution. But the fortune of Rome prevailed; the Sammites at length fled, averring that they were not able to withstand the fierce looks and the fire-darting eyes of the Romans. The other confid, however, was not at first so fortunate; for having unwarily led his army into a defile, he was in danger of being cut off, had not Decius, a tribune of the army, poiffled himself of an hill which commanded the enemy; so that the Sammites, being attacked on either side, were defeated with great slaughter, no less than 30,000 of them being left dead upon the field of battle.

Some time after this victory, the soldiery who were stationed at Capua muttering, forced Quintius, an old and eminent soldier, who was then residing in the country, to be their leader; and, conducted by their rage more than their general, came within eight miles of the city. So terrible an enemy, almost at the gates, not a little alarmed the senate; who immediately created Valerius Corvus dictator, and sent him forth with another army to oppose them. The two armies were now drawn up against each other, while fathers and sons beheld themselves prepared to engage in opposite causes: but Corvus, knowing his influence among the soldiery, instead of going forward to meet the mutineers in an hostile manner, went with the most cordial friendship to embrace and expiate with his old acquainances. His conduct had the desired effect. Quintius, as his speaker, only desired to have their defection from their duty forgiven; and as for him, as he was innocent of their conspiracy, he had no reason to solicit pardon for his offences.

A war between the Romans and the Latins followed soon after; but as their habits, arms, and language, were the same, the most exact discipline was necessary to prevent confusion in the engagement. Orders, therefore, were given by Manlius the consul, that no soldier should leave his ranks upon whatever provocation; and that he should be certainly put to death who should offer to do otherwise. With these injunctions, both armies were drawn out in array, and ready to begin; when Metius, the general of the enemy's cavalry, pulled forward from his lines, and challenged any knight in the Roman army to single combat. For some time there was a general pause, no soldier offering to dispute his orders, till Tius Manlius, the consul's own son, burning with shame to see the whole body of the Romans intimidated, boldly fell out against his adversary. The soldiery on both sides for a while suspend ed the general engagement to be spectators of this fierce encounter. Manlius killed his adversary; and then dispoiling him of his armour, returned in triumph to his father's tent, where he was preparing and giving orders relative to the engagement. Howsoever he might have been applauded by his fellow-soldiers, being as yet doubtful of the reception he should find from his father, he came, with hesitation, to lay the enemy's spoils at his feet, and with a modest air intimated, that what he did was entirely from a spirit of hereditary virtue. But he was soon dreadfully made liable of his error, when his father, turning away, ordered him to be led publicly before the army, and to have his head struck of account of his disobeying orders. The whole army was struck with horror at this unnatural mandate:因而 for a while kept them in suspense; but when they saw their young champion's head struck off, and his blood streaming upon the ground, they could no longer contain their excursions and their groans. His dead body was carried forth without the camp, and being adorned with the spoils of the vanquished enemy, was buried with all the pomp of military di@rents.

In the mean time, the battle joined with mutual fury; and as the two armies had often fought under the same leaders, they combated with all the animony of a civil war. The Latins chiefly depended on their bodily strength; the Romans, on their invincible courage and conduct. Forces so nearly matched seemed only to require the protection of the deities to turn the scale of victory; and, in fact, the augurs had foretold, that whatever part of the Roman army should be disconcert, the commander of that part should devote himself for his country, and die as a sacrifice to the immortal gods. Manlius commanded the right wing, and Decius led on the left. Both sides fought for some time with doubtful success, as their courage was equal; but, after a time, the left wing of the Roman army began to give ground. It was then that Decius, who commanded there, resolved to devote himself for his country, and to offer his own life as an atonement to his army. Thus determined, he called out to Manlius with a loud voice, and demanded his instructions, as he was the chief pontiff, how to devote himself, and the form of the words he should use. By his directions, therefore, being clothed in a long robe, his head covered, and his arms stretched forward, standing upon a javelin, he devoted himself to the celestial and infernal gods for the safety of Rome. Then arming himself, and mounting on horseback, he drove furiously into the midst of the enemy, carrying terror and consternation wherever he came, till he fell covered with wounds. In the mean time, the Roman army confedered his devoting himself in this manner as an assurance of success; nor was the superintendence of the Latins less powerfully influenced by his resolution; a total rout began to ensue: the Romans prefled them on every side; and so great was the carnage, that feare a fourth part of the enemy survived the defeat. This was the last battle of any consequence that the Latins had with the Romans; they were forced to beg a peace upon hard terms, and two years after, their strongest city, Pedum, being taken, they were brought under an entire subjection to the Roman power.

A signal disgrace which the Romans sustained about this time in their contest with the Sammites, made a pacte in their usual good fortune, and turned the scale for a while in the enemy's favour. The senate having denied the Sammites peace, Pontius their general was resolved to gain by stratagem what he had frequently lost by force. Accordingly, leading his army into a defile called Claudium, and taking possession of all its outposts, he sent 10 of his soldiers, habited like shepherds, with directions to throw themselves in the way the Romans were to march. The Roman consul met them, and taking them for what they appeared, demanded the route the Samnite army had taken; they, with seeming indifference, replied, that they were gone to Luceria, a town,
town in Apulia, and were then actually besieging it. The Roman general, not suspecting the stratagem that was laid against him, marched directly by the shortest road, which lay through the defiles, to relieve the city; and was not undeceived till he saw his army surrounded, and blocked up on every side. Pontius thus having the Romans entirely in his power, first obliged the army to pass under the yoke, having been previously stripped of all but their garments; he then stipulated that they should wholly quit the territories of the Samnites, and that they should continue to live upon terms of former confederacy. The Romans were contrained to submit to this ignominious treaty, and marched into Capua disarmed and half naked. When the army arrived at Rome, the whole city was most surprisingly affidavit at its shameful return; nothing but grief and resentment was to be seen, and the whole city was put into mourning.

But this was a transitory calamity; the war was carried on as usual for many years; the power of the Samnites declining every day, while that of the Romans continually increased. Under the conduct of Papirius Cursor, who was at different times consul and dictator, repeated triumphs were gained. Fabius Maximus also had his share in the glory of conquering them; and Decius, the son of that Decius whom we saw devoting himself for his country about 40 years before, followed the example of his father, and rushed into the midst of the enemy, imagining that he could save the lives of his countrymen with the loss of his own.

The success of the Romans against the Samnites alarmed all Italy. The Tarentines in particular, who had long plotted underhand against the republic, now openly declared themselves; and invited into Italy Pyrrhus king of Epirus, in hopes of being able by his means to subdue the Romans. The offer was readily accepted by that ambitious monarch, who had nothing less in view than the conquest of all Italy.—Their ambassadors carried magnificent presents for the king, with instructions to acquaint him, that they only wanted a general of fame and experience; and that, as for troops, they could themselves furnish a numerous army of 20,000 horse and 350,000 foot, made up of Lucanians, Messapians, Samnites, and Tarentines. As soon as the news of this deputation were brought to the Roman camp, Æmilius, who had hitherto made war on the Tarentines but gently, in hopes of adjusting matters by way of negotiation, took other measures, and began to commit all sorts of hostilities. He took cities, stormed castles, and laid the whole country waste, burning and destroying all before him. The Tarentines brought their army into the field; but Æmilius soon obliged them to take refuge within their walls. However, to induce them to lay aside the design of receiving Pyrrhus, he used the prisoners he had taken with great moderation, and even sent them back without ransom. These highly extolled the generosity of the consul, informing many of the inhabitants were brought over to the Roman party, and they all began to repent of their having rejected a peace and sent for Pyrrhus.

But, in the mean time, the Tarentine ambassadors arriving in Epirus, pursuant to the powers they had received, made an absolute treaty with the king; who immediately sent before him the famous Cyneas, with 3000 men, to take possession of the citadel of Tarrentum. This eloquent minister soon found means to depose Agis, whom the Tarentines had chosen to be their general and the governor of the city, though a sincere friend to the Romans. He likewise prevailed upon the Tarentines to deliver up the citadel into his hands; which he so sooner got possession of, than he dispatched messengers to Pyrrhus, soliciting him to hasten his departure for Italy. In the mean time, the consul Æmilius, finding that he could not attempt any thing with success against the Tarentines this campaign, resolved to put his troops into winter-quarters in Apulia, which was not far from the territory of Tarrentum, that was soon to become the seat of the war. As he was obliged to pass through certain defiles, with the sea on one side and high hills on the other, he was there attacked by the Tarentines and Epirots from great numbers of barks fraught with ballistas (that is, engines for throwing stones of a vast weight), and from the hills, on which were posted a great many archers and slingers. Hereupon Æmilius placed the Tarentine prisoners between him and the enemy, which the Tarentines perceiving, soon left off molesting the Romans, out of compulsion to their own countrymen; so that the Romans arrived safe in Apulia, and there took up their winter-quarters.

The next year Æmilius was continued in the command of his own troops, with the title of proconsul; and was ordered to make war upon the Salentines, who had declared for the Tarentines. The present exigence of affairs obliged the Romans to enlist the proletarii, who were the meanest of the people, and therefore by way of contempt called proletariorum, as being thought incapable of doing the state any other service than that of peopling the city, and flocking the republic with filji-hihs. Hitherto they had never been suffered to bear arms; but were now, to their great satisfaction, enrolled as well as others. In the mean time Pyrrhus arrived at Tarentum, having narrowly escaped shipwreck; and being conducted into the city by his faithful Cyneas, was received there with loud acclamations.

The Tarentines, who were entirely devoted to their pleasures, expected that he should take all the fatigues of the war on himself, and expose only his Epirots to danger. And indeed Pyrrhus for some days dissembled his design, and suffered the Tarentines to indulge without restraint in their usual diversions. But his ships, which had been dispersed all over the Ionian sea, arriving one after another, and with them the troops which he had put on board at Epirus, he began to reform the disorders that prevailed in the city. The theatre was the place to which the idle Tarentines repaired daily in great numbers, and where the incendiaries stirred up the people to faction with their harangues: he therefore caused it to be shut up, and instead thereof held like wise the public gardens, porticoes, and places of exercise, where the inhabitants used to entertain themselves with news, and speak with great freedom of their governors, cenfuring their conduct, and settling the government according to their different humours, which occasioned great divisions, and rent the city into various factions. As they were a very voluptuous and indolent people, they spent whole days and nights in feasts, masquerades, plays, &c. These therefore Pyrrhus ab-
Levinus being determined to draw the enemy to a
battle before Pyrrhus received the reinforcements he
expected, having harangued his troops, marched to the
first banks of the Siris; and there drawing up his infantry
battle in battalia, ordered the cavalry to file off, and march a
great way about, in order to find a passage at some
place not defended by the enemy. Accordingly, they
paid the river without being observed, and falling
upon the guards which Pyrrhus had posted on the
banks over-against the confederate army, gave the infantry
an opportunity of crossing the river on bridges which
Levinus had prepared for that purpose. But before they
got over, Pyrrhus, hastening from his camp, which
was at some distance from the river, hoped to cut the
Roman army in pieces while they were disordered with
the difficulties of passing the river, and climbing up the
steep banks; but the cavalry covering the infantry, and
standing between them and the Epirots, gave them time
to form themselves on the banks of the river. On the
other hand, Pyrrhus drew up his men as fast as they
came from the camp, and performed such deeds of va-
lour, that the Romans thought him worthy of the great
reputation he had acquired.

As the cavalry alone had hitherto engaged, Pyrrhus,
who confided much in his infantry, halted back to the
camp, in order to bring them to the charge; but took
two precautions before he began the attack: the first
was, to ride through the ranks, and show himself to the
whole army; for his horse having been killed under
him in the first onset, a report had been spread that he
was slain; the second was, to change his habit and hel-
met with Megacles; for having been known in the en-
gagement of the horse by the richness of his attire and
armour, many of the Romans had aimed at him in par-
tsicular, so that he was with the utmost difficulty taken
and saved, after his horse had been killed under him.
Thus disguised, he led his phalanx against the Roman
legions, and attacked them with incredible fury. Le-
vinus sustained the shock with great resolution, so that
the victory was for many hours warmly disputed. The
Romans gave several times way to the Epirots, and the
Epirots to the Romans; but both parties rallied again,
and were brought back to the charge by their com-
manders. Megacles, in the attire and helmet of Pyr-
rhus, was in all places, and well supported the charac-
ter he had assumed. But his disguise at last proved
detrimental to him: for a Roman knight, by name Dester,
taking him for the king, followed him wherever he
went; and having found an opportunity of discharging
a blow at him, struck him dead on the spot, stripped
him of his helmet and armour, and carried them in tri-
umph to the confederate army. But Pyrrhus, appearing
bare-headed in the left files of his phalanx, and riding through all
the lines, undetected and unsuspected by his men, and inspired them with
new courage.

The advantage seemed to be pretty equal on both
sides, when Levinus ordered his cavalry to advance;
which Pyrrhus observing drew up 20 elephants in the
front of his army, with towers on their backs full of
bowmen. The very sight of those dreadful animals
chilled the bravery of the Romans, who had never be-
fore seen any. However, they still advanced, till their
horses, not being able to bear the smell of them, and

---
The, the onsent was so furious, that they were forced to yield, and retire in disorder. The king of Epirus frightened, having caused a great disorder in his army, this accident favoured the Romans, and gave them time to repair the river, and take refuge in Apulia. The Epiret remained master of the field and had the pleasure to see the Romans fly before him; but the victory cost him dear, a great number of his best officers and soldiers having been slain in the battle; whence he was heard to say after the action, that he was both conqueror and conquered, and that if he gained such another victory, he should be obliged to return to Epirus alone.

His first care after the action was to bury the dead, with which the plain was covered; and herein he made no distinction between the Romans and his own Epirots. In viewing the bodies of the former, he observed, that none of them had received dishonourable wounds; that they had all fallen in the pots affixed to them, still holding their swords in their hands, and showed, even after death, a certain martial air and firmness in their faces; and on this occasion it served, that none of them had fallen in the strange showers of darts from the towers, wounded several of the Romans in that confusion, while others were trod to death by the elephants. The onset was so furious, that they were forced to yield, and retire in disorder. The king of Epirus frightened the army, which had been wounded by a Roman soldier, named Mimitius, having caused a great disorder in his army, this accident favoured the Romans, and gave them time to repair the river, and take refuge in Apulia. The Epirot remained master of the field and had the pleasure to see the Romans fly before him; but the victory cost him dear, a great number of his best officers and soldiers having been slain in the battle; whence he was heard to say after the action, that he was both conqueror and conquered, and that if he gained such another victory, he should be obliged to return to Epirus alone.

The king of Epirus understood the art of war too well not to reap what advantage he could from his victory. He broke into the countries in alliance with the Romans, plundered the lands of the republic, and made incursions even into the neighbourhood of Rome. Many cities opened their gates to him, and in a short time he made himself master of the greatest part of Campania. While he was in that fruitful province, fubmitting his troops there at the expanse of the Romans, he joined by the Samnites, Lucanians, and Meilipans, whom he had so long expected. After having repossessed them for their delay, he gave them a good share of the spoils he had taken from the enemy; and having by this means gained their affection, he marched without loss of time to lay siege to Capua: but Leinus, having already received a reinforcement of two legions, threw some troops into the city; which obliged Pyrrhus to drop his design, and, leaving Capua, to march straight to Naples. Leinus followed him, harrying his troops on their march; and at length, by keeping his army in the neighbourhood, forced him to give over all thoughts of making himself master of that important city. The king then, all on a sudden, took his route towards Rome by the Latin way, surprised Pregelle, and, marching through the country of the Hernici, cut down before Pyrrhus. There, from the top of an hill, he had the pleasure of seeing Rome; and was said to have advanced so near the walls, that he drove a cloud of dust into the city. But he was soon forced to retire by the other confuls T. Coruncanius, who, having reduced the city, was just then returned with his victorious army to Rome. The king of Epirus, therefore, having no hopes of bringing the Hetrurians into his interest, and seeing two confederate armies ready to fall upon him, raised the siege of Pyrrhus, and hastened back into Campania; where, to his great surprise, he found Leinus with a more numerous army than that which he had defeated on the banks of the Siris. The confuls went to meet him, with a design to try the fate of another battle; which Pyrrhus being unwilling to decline, drew up his army, and, to strike terror into the Roman legions, ordered his men to beat their bucklers with their lances, and the leaders of the elephants to force them to make a hideous noise. But the noise was returned with such an universal shout by the Romans, that Pyrrhus, thinking so much acclivity on the part of the vanquished too sure a prognostic of victory, altered his mind; and, pretending that the auguries were not favourable, retired to Tarentum, and put an end to the campaign.

While Pyrrhus continued quiet at Tarentum, he had time to reflect on the value and conduct of the Romans; which made him conclude, that the war in which he was engaged must end in his ruin and disgrace, if not terminated by an advantageous peace. He was therefore overjoyed when he heard that the senate had determined to send an honourable embassy to him, not doubting but their earnest desire would produce terms of peace. The ambassadors were three men of distinguished merit; to wit, Cornelius Dolabella, who had made Pyrrhus famous for the signal victory he had gained over the Hetrurians, Fabricius, and Sallustius Pappus, who had been his colleague in the confulate two years before. When they were admitted to an audience, the only question that was put to them was whether Pyrrhus was willing to receive the Romans back into the province, or at such a ransom as should be agreed on; for Pyrrhus, in the late battle, had made 8000 prisoners, most of them Roman knights and men of distinction in the republic. They had fought with great bravery, till their horses, frightened with the roaring of the king's elephants, had either thrown them, or obliged them to dismount; by which unforeseen accident they had fallen into the enemy's hands. The senate, therefore, pitting the condition of those brave men, had determined, contrary to their custom, to redeem them. Pyrrhus was greatly surprised and disappointed when he found that they had no other proposals to make; but concealing his thoughts, he only answered that he would consider of it, and let them know his resolution. Accordingly, he assembled his council; but his chief favourites were divided in their opinions. Milo, who commanded in the citadel of Tarentum, was for coming to no composition with the Romans; but Cyrene, who knew his master's inclination, proposed not only sending back the prisoners without ransom, but dispatching an embassy to Rome to treat with the senate of a lasting peace. His advice was approved, and he himself appointed to go on that embassy. After these resolutions, the king acquainted the ambassadors, that he intended to release the prisoners without ransom, since he had already riches enough, and de-
fired nothing of the republic but her friendship. Afterwards he had several conferences with Fabricius, whose virtue he had tried with mighty offers of riches and grandeur; but finding him proof against all temptations, he resolved to try whether his intrepidity and courage were equal to his virtue. With this view, he caused an elephant to be placed behind a curtain in the hall where he received the Roman ambassador. As Fabricius had never seen one of the beasts, the king, taking a turn or two in the hall with him, brought him within the elephant's reach, and then caused the curtain to be drawn all on a sudden, and that monstrous animal to make his usual noise, and even laid his trunk on Fabricius's head. But the intrepid Roman, without betraying the least fear or concern, "Does the great king (said he, with surprizing calmness), who could not stagger me with his offers, think to frighten me with the braying of a beast?" Pyrrhus, astonisht at his immovable constancy, invited him to dine with him; and on this occasion it was, that the conversation turning upon Epicurean philosophy, Fabricius made that celebrated exclamation, "O that Pyrrhus, both for Rome's sake and his own, had placed his happiness in the boasted indolence of Epicures."

Every thing Pyrrhus heard or saw of the Romans increased his earneisness for peace. He sent for the three ambassadors, released 200 of the prisoners without ransom, and suffered the rest, on their parole, to return to Rome to celebrate the Saturnalia, or feasts of Saturn, in their own families. Having by this obliging behaviour gained the good will of the Roman ambassadors, he sent Cynes to Rome, almost at the same time that they left Tarentum. The instructions he gave this faithful minister, were, to bring the Romans to grant these three articles: 1. That the Tarentines should be included in the treaty made with the king of Epirus. 2. That the Greek cities in Italy should be suffered to enjoy their laws and liberties. 3. That the republic should restore to the Samnites, Lucanians, and Bruttians, all the places they had taken from them. Upon these conditions, Pyrrhus declared himself ready to forbear all further hostilities, and conclude a lasting peace. With these instructions Cynes set out for Rome where, partly by his eloquence, partly by rich presents to the senators and their wives, he soon gained a good number of voices. When he was admitted into the senate, he made an harangue worthy of a disciple of the great Demosthenes; after which he read the conditions Pyrrhus proposed, and, with a great deal of eloquence, endeavouring to show the reasonableness and moderation of his master's demands, asked leave for Pyrrhus to come to Rome to conclude and sign the treaty. The senators were generally inclined to agree to Pyrrhus's terms; but nevertheless, as several senators were absent, the determination of the affair was postponed to the next day; when Appius Claudius, the greatest orator and most learned civilian in Rome, old and blind as he was, caused himself to be carried to the senate, where he had not appeared for many years; and there, partly by his eloquence, partly by his authority, so prepossessed the minds of the senators against the king of Epirus, and the conditions he offered, that, when he had done speaking, the orator fathers unanimously passed a decree, the substance of which was, That the war with Pyrrhus should be continued; that his ambassador should be sent back that very day; that the king of Epirus should not be permitted to come to Rome; and that they should acquaint his ambassador, that Rome would enter into no treaty of peace with his master till he had left Italy.

Cynes, surprized at the answer given him, left Rome the same day, and returned to Tarentum, to acquaint the king with the final resolution of the senate. Pyrrhus would have willingly concluded a peace with them upon honourable terms; but, as the conditions they offered were not by any means, conformable with the reputation of his arms, he began, without loss of time, to make all due preparations for the next campaign. On the other hand, the Romans having raised to the confulate P. Sulpicius Saverrio, and P. Decius Mus, dispatched them both into Apulia, where they found Pyrrhus encamped near a little town called Asculum. There the consuls, joining their armies, fortified themselves at the foot of the Appenines, having between them and the enemy a large deep stream which divided the plain. Both armies continued a great while on the opposite banks, before either ventured to pass over to attack the other. The Epirots allowed the Romans to cross the stream, and draw up on the plain. On the other hand, Pyrrhus placed his men likewise in order of battle in the same plain; and all the ancients do him the justice to say, that no commander ever understood better the art of drawing up an army and directing its motions. In the right wing he placed his Epirots and the Samnites; in his left the Lucanians, Bruttians and Salentines; and his phalanx in the centre. The centre of the Roman army consisted of four legions, which were to engage the enemy's phalanx; on their wings were posted the light-armed auxiliaries and the Roman horse. The consuls, in order to guard their troops against the fury of the elephants had prepared chariots, armed with long points of iron in the shape of forks, and filled with soldiers carrying firebrands, which they were directed to throw at the elephants, and by that means frighten them, and set their wooden towers on fire. These chariots were posted over against the king's elephants, and ordered not to fight till they entered upon action. To this precaution the Roman general added another, which was, to direct a body of Apulians to attack Pyrrhus's camp in the heat of the engagement, in order to force it, or at least to draw off part of the enemy's troops to defend it. At length the attack began, both parties being pretty equal in number; for each of them consisted of about 40,000 men. The phalanx sustained, for a long time, the furious onset of the legions with incredible bravery; but at length being forced to give way, Pyrrhus commanded his elephants to advance, but not on the side where the Romans had posted their chariots; they marched round, and falling upon the Roman horse, soon put them into confusion. Then the phalanx, returning with fresh courage to the charge, made the Roman legions in their turn give ground. On this occasion Decius was killed; so that one consul only was left to command the two Roman armies. But while all things seemed to favour Pyrrhus, the body of Apulians which we have mentioned above, falling unexpectedly on the camp of the Epirots, obliged the king to dispatch a strong detachment to defend his intrenchments.

Upon
Upon the departure of these troops, some of the Epirots, imagining that the camp was taken, began to lose courage, and retire; those who were next to them followed their example, and in a short time the whole army gave way. Pyrrhus having attempted several times in vain to rally his forces, returned to the charge with a small number of his friends and the most courageous of his officers. With these he fulfilled the fury of the victorious legions, and covered the retreat of his own men. But being, after a most gallant behaviour, dangerously wounded, he retired at last with his small band in good order, leaving the Romans masters of the field. As the sun was setting, the Romans, being extremely fatigued, and a great number of them wounded, the confid Sulpius, not thinking it advisable to pursue the enemy, founded a retreat, repassed the dream, and brought his troops back to the camp. Sulpius appeared in the field of battle the next day, with a design to bring the Epirots to a second engagement; but finding they had withdrawn in the night to Tarentum, he likewise retired, and put his troops into winter-quarters in Apulia.

Both armies continued quiet in their quarters during winter; but early in the spring took the field anew.—The Romans were commanded this year by two men of great fame, whom they had raised to the confulate the second time: these were the celebrated C. Fabri­cius and Q. Æmilius Pappus; who no sooner arrived in Apulia, than they led their troops into the territory of Tarentum. Pyrrhus, who had received considerable reinforcements from Epirus, met them near the frontier, and encamped at a small distance from the Roman army. While the confuls were waiting here for a favourable opportunity to give battle, a messenger from Nicias, the king's physician, delivered a letter to Fabri­cius; wherein the traitor offered to take off his mazer by poison, provided the confid would promulge him a reward proportionable to the greatness of the service. The virtuous Roman, being filled with horror at the bare proposal of such a crime, immediately communicated the affair to his colleague; who readily joined with him in writing a letter to Pyrrhus, wherein they warned him, without discovering the criminal, to take care of himself, and be upon his guard against the treacherous designs of those about him. Pyrrhus, out of a deep sense of gratitude for so great a benefit, released immediately, without ransom, all the prisoners he had taken. But the Romans, disdaining to accept either a favour from an enemy, or a compendium for not committing the blackest treachery, declared, that they would not receive their prisoners but by way of exchange; and accordingly sent to Pyrrhus an equal num­ber of Samnite and Tarentine prisoners.

As the king of Epirus grew every day more weary of a war which he feared would end in his disgrace, he sent Cynæas a second time to Rome, to try whether he could, with his artful harangues, prevail upon the con­script fathers to hearken to an accommodation, upon such terms as were consistent with his honour. But the ambassadour found the senators steady in their former resolution, and determined not to enter into a treaty with his master till he had left Italy, and withdrawn from thence all his forces. This gave the king great uneasiness; for he had already lost most of his veteran troops and belt officers, and was sensible that he should

...
He dons this way, this success, marched his army into the Taurian fields, and drew it up in a plain which was wide enough for his troops, but too narrow for the Epiphit phalanx, the phalanx being so crowded that they could not handle their arms without difficulty. But the king's eager sons to try his strength and skill with so renowned a commander, made him engage at that great disadvantage. Upon the first signal the action began; and one of the king's wings giving way, the victory seemed to incline to the Romans. But that wing where the king fought in person repulsed the enemy, and drove them back quite to their intrenchments. This advantage was in great part owing to the elephants; which Curius perceiving, commanded a corps de reserve, which he had posted near the camp, to advance and fall upon the elephants. These carrying burning torches in one hand, and their swords in the other, threw the former at the elephants, and with the latter defended themselves against their guides; by which means they were both forced to give way. The elephants being put to flight broke into the phalanx, close as it was, and there caused a general disorder; which was increased by a remarkable accident: for it is said, that a young elephant being wounded, and thereupon making a dreadful noise, the mother quitting her rank, and halting to the assistance of her young one, put those who still kept their ranks into the utmost confusion. But, however that be, it is certain that the Romans obtained at last a complete victory. Orothus and Eutropius tell us that Pyrrhus's army consisted of 80,000 foot and 6000 horse, including his Epiphot and allies; whereas the confiderable army was scarce 20,000 strong. Those who exaggerate the king's loss say, that the number of the slain on his side amounted to 30,000 men; but others reduce it to 20,000. All writers agree, that Curius took 1200 prisoners and eight elephants. This victory, which was the most decisive Rome had ever gained, brought all Italy under subjection, and paved the way for those vast conquests which afterwards made the Romans masters of the whole known world.

Pyrrhus being no way in a condition, after the great loss he had sustained, to keep the field, retired to Tar­rentum, attended only by a small body of horse, leaving the Romans in full possession of his camp; which they so much admired, that they made it ever after a model to form theirs by. And now the king of Epi­rus resolved to leave Italy as soon as possible; but concealed his design, and endeavoured to keep up the drooping spirits of his allies, by giving them hopes of speedy succours from Greece. Accordingly he dispatched ambassadors into Eotia, Illyricum, and Macedon, demanding supplies of men and money. But the answers from those courts not proving favourable, he forged such as might please those whom he was willing to deceive; and by this means supported the courage of his friends, and kept his enemy in play. When he could conceal his departure no longer, he pretended to be on a sudden in a great passion at the dilatoriness of his friends in sending him succours; and acquainted the Tarentines, that he must go and bring them over himself. However, he left behind him a strong garri­son in the citadel of Tarentum, under the command of the name Milo who had kept it for him during his stay in Sicily. In order to keep this governor in his duty, he is said to have made him a very strange present, viz. a chair covered with the skin of Nicias, the treacherous physician, who had offered Fabricius to poison his master. After all these disguises and precautions, Pyrrhus at last set sail for Epirus, and arrived safe at Acrocori­num with 8000 foot and 500 horse; after having spent to no purpose six years in Italy and Sicily.

Though, from the manner in which Pyrrhus took his leave, his Italian allies had little reason to expect any further assistance from him, yet they continued to amuse themselves with vain hopes, till certain accounts arrived of his being killed at the siege of Argos, as has been related under the article EPIRUS. This threw the Samnites into despair: so that they put all to the issue of a general battle; in which they were defeated with such dreadful slaughter, that the nation is said to have been almost exterminated. This overthrow was soon followed by the subjection of the Lucilians, Bruttian, Tarentines, Sarcinates, Picentes, and Salentines; so that Rome now became mistress of all the nations from the remotest parts of Etruria to the Ionian sea, and from the Tyrrhenian sea to the Adriatic. All these nations, however, did not enjoy the same privileges. Some were entirely subject to the republic, and had no laws but what they received from thence; others retained their old laws and customs, but in subjection to the republic: some were tributary; and others allies, who were obliged to furnish troops at their own expense when the Romans required. Some had the privilege of Roman citizenship, their soldiers being incorporated in the legions; while others had a right of suffrage in the elections made by the centuries. These different degrees of honour, privileges, and liberty, were founded on the different terms granted to the conquered nations when they surrended, and were afterwards increased according to their fidelity and the services they did the republic.

The Romans now became respected by foreign nations, and received ambassadors from Ptolemy Philadel­pheus king of Egypt, and from Apollonia a city of Ma­cedon. Sensitive of their own importance, they now made by the Romans. Sensible of their own importance, they now made by the Romans.
himself at the head of his victorious army, and marched to the temple of Jupiter Latialis, on the hill of Alba, with all the pomp that attended triumphant victors at Rome. He made no other alteration in the ceremony, but that of wearing a crown of myrtle instead of a crown of laurel, and this on account of his having defeated the Coriscans in a place where there was a grove of myrtles. The example of Paphius was afterwards followed by a great many generals to whom the senate refused triumphs.

The next year, when M. Æmilius Barbula and M. Junius Perus were consul, a new war sprang up in a kingdom out of Italy. Illyricum, properly so called, which bordered upon Macedon and Epirus, was at this time governed by a woman named Teuta, the widow of king Agron, and guardian to her son Phanor, who was under age. The presence of her late husband against the Ætolians had flustered her to such a degree, that, instead of settling the affairs of her ward in peace, she commanded her subjects to cruise along the coast, seize all the ships they met, take what places they could, and spare no nation. Her pirates had, pursuant to her orders, taken and plundered many ships belonging to the Roman merchants; and her troops were then besieging the island of Ifa in the Adriatic, though the inhabitants had put themselves under the protection of the republic. Upon the complaints therefore of the Italian merchants, and to protect the people of Ifa, the senate sent two ambassadors to the Illyrian queen, Lucius and Caius Coruncanas, to demand of her that she would refrain her subjects from inflicting the sea with pirates. She answered them haughtily, that she could only presume that her subjects should not for the future attack the Romans in her name, and by public authority: "but as for any thing more, it is not customary with us (said she) to lay restraints on our subjects, nor will we forbid them to reap those advantages from the sea which it offers them."

"Your customs then (replied the youngest of the ambassadors) are very different from ours. At Rome we make public examples of those subjects who injure others, whether at home or abroad. Teuta, we can, by our arms, force you to reform the abuses of your bad government. These unseemly threatenings provoked Teuta, who was naturally a proud and imperious woman, to such a degree, that, without regard to the right of nations, she caused the ambassadors to be murdered on their return home.

When so notorious an infradiction of the law of nations was known at Rome, the people demanded vengeance and the senate having first honoured the manes of the ambassadors, by erecting, as usual in such cases, statues three feet high to their memory, ordered a fleet to be equipped, and troops raised, with all possible expedition. But now Teuta, reflecting on the enormity of her proceedings, sent an embassy to Rome affuring the senate that she had no hand in the murder of the ambassadors, and offering to deliver up to the republic those who had committed that barbarous affiliaction. The Romans being at that time threatened with a war from the Gauls, were ready to accept this satisfaction; but in the mean time the Illyrian fleet having gained some advantage over that of the Achæans, and taken the island of Coreya, near Epirus, this success made Teuta believe herself invincible, and forget the promise she had made to the Romans: nay, the sent her fleet to feize on the island of Ifa, which the Romans had taken under their protection.

Hereupon the consuls for the new year, P. Pothimus Albinius and Cn. Fulvius Centumalas, embarked for Illyricum; Fulvius having the command of the fleet, which consisted of 100 galleys; and Pothimus of the land forces, which amounted to 20,000 foot, besides a small body of horse. Fulvius appeared with his fleet before Coreya in the Adriatic, and was put in possession both of the island and city by Demetrius of Pharos, governor of the place for Queen Teuta. Nor was this all; Demetrius found means to make the inhabitants of Apollonia drive out the Illyrian garrison, and admit into their city the Roman troops. As Apollonia was one of the keys of Illyricum on the side of Macedon, the consuls, who had hitherto acted jointly, no sooner saw themselves in possession of it than they separated, the fleet cruising along the coast, and the army penetrating into the heart of the queen's dominions. The Andycans, Porthia and Atinians, voluntarily submitted to Pothimus, being induced by the persuasions of Demetrius to shake off the Illyrian yoke. The confuls being now in possession of most of the inland towns, returned to the coast, where, with the assistance of the fleet, he took many strongholds, among which was Nutria, a place of great strength, and defended by a numerous garrison: so that it made a vigorous defence, the Romans having lost before it a great many private men, several legionary tribunes, and one quarter. However, this loss was repaired by the taking of 40 Illyrian vessels, which were returning home laden with booty. At length the Roman fleet appeared before Ifa, which, by Teuta's order, was still closely besieged, notwithstanding the losses she had sustained. However, upon the approach of the Roman fleet, the Illyrians dispersed; but the Pharians, who served among them, followed the example of their countryman Demetrius, and joined the Romans, to whom the Illyans readily submitted.

In the mean time Sp. Corvilius and Q. Fabius Maximus being raised to the consulate a second time, Pothimus was recalled from Illyricum, and refused a triumph for having been too prodigal of the Roman blood at the siege of Nutria. His colleague Fulvius was appointed to command the land forces in his room, in quality of proconsul. Hereupon Teuta, who had founded great hopes on the change of the consuls, retired to one of her strong-holds called Ribesam, and from thence early in the spring sent an embassy to Rome. The senate refused to treat with her; but granted the young king a peace upon the following conditions: 1. That he should pay an annual tribute to the republic. 2. That he should surrender part of his dominions to the Romans. 3. That he should never suffer above three of his ships of war at a time to sail beyond Lybis, a town on the confines of Macedon and Illyricum. The places he yielded to the Romans in virtue of this treaty, were the islands of Coreya, Ifa, and Pharos, the city of Dyrhrachium, and the country of the Atinians. Soon after Teuta, either out of shame, or compelled by a secret article of the treaty, abdicated the regency, and Demetrius succeeded her.

Before this war was ended, the Romans were alarmed of Catharinias, which they called the Gauls, of new motions of the Gauls, and the great progress and Ligu-
The Romans had been twice raised to the confuflate, was a great general, and had been honoured with two triumphs. But he was still more renowned for his domestic virtues and probity, than for his birth or valour. He married the daughter of the first Africanus, said to be the pattern of her sex, and the prodigy of her age; and had by her several children, of whom three only arrived to maturity of age, Tiberius Gracchus, Caius Gracchus, and a daughter named *Symphoria*, who was married to the second Africanus. Tiberius, the eldest, was deemed the most accomplished youth in Rome, with respect to the qualities both of body and mind. His extraordinary talents were heightened by a noble air, an engaging countenance, and all those winning graces of nature which recommend merit. He made his first campaigns under his brother-in-law, and distinguished himself on all occasions by his courage, and by the prudence of his conduct. When he returned to Rome, he applied himself to the study of eloquence; and at 30 years old was accounted the best orator of his age. He married the daughter of Appius Claudius, who had been formerly consul and censor, and was then prince of the senate. He continued for some time in the sentiments both of his own and his wife's family, and supported the interests of the patricians; but without openly attacking the popular faction. He was the chief author and negociator of that flamboyant necessary peace with the Numantines; which the Senate, with the utmost inartistry, difamnulled, and condemned the confil, the quaflor, and all the officers who had signed it, to be delivered up to the Numantines (see Numantia). The people indeed, out of esteem for Gracchus, would not suffer him to be sacrificed; but, however, he had just reason to complain, both of the Senate and people, for.passing so scandalous a decree against his general and himself, and breaking a treaty whereby the lives of so many citizens had been saved. But as the Senate had chiefly promoted such base and iniquitous proceedings, he resolved in due time to show his resentment against the party which had contributed most to his disgrace.

In order to this, he fled for the tribunship of the people; which he no sooner obtained, than he resolved to attack the nobility in the most tender part. They had usurped lands unjustly; cultivated them by slaves, to the great detriment of the public; and had lived for about 150 years in open defiance to the Licinian law, by which it was enacted that no citizen should possess more than 500 acres. This law Tit. Gracchus resolved to revive, and by that means revenge himself on the patricians. But it was not revenge alone which prompted him to embark in so dangerous an attempt. It is pretended, that his mother Cornelia animat*ed him to undertake something worthy both of his and her family. The reproaches of his mother, the authority of some great men, namely of his father-in-law Appius Claudius, of P. Cra fuss the pontifex maximus, and of Mutius Scaevola, the most learned civilian in Rome, and his natural thirst after glory, joined with an eager desire of revenge, conspired to draw him into this most unfortunate scheme.

The law, as he first drew it up, was very mild: for it only enacted, that those who possessed more than 500 acres of land should part with the overplus; and that by Gracchus.
the full value of the said lands should be paid them out of the public treasury. The lands thus purchased by the public were to be divided among the poor citizens; and cultivated either by themselves or by freemen, who were upon the spot. Tiberius allowed every child of a family to hold 250 acres in his own name, over and above what was allowed to the father. Nothing could be more mild than this new law; since by the Licinian law he might have absolutely deprived the rich of the lands they unjustly possessed, and made them accountable for the profits they had received from them during their long possession. But the rich patricians could not so much bear the name of the Licinian law, though thus qualified. Those chief of the senatoral and eque
f
rian order exclaimed against it, and were continually mounting the rostra one after another, in order to dissuade the people from accepting a law which, they said, would raise disturbances, that might prove more dangerous than the evils which Tiberius pretended to redress by the promulgation of it. Thus the zealous tribune was obliged day after day to enter the hills with fresh adversaries; but he ever got the better of them both in point of eloquence and argument.

The people were charmed to hear him maintain the cause of the unfortunate with so much success, and bestowed on him the highest commendations. The rich therefore had recourse to violence and calumny, in order to deloy, or at least to discredit, the tribune. It is said they hired assassins to dispatch him; but they could not put their wicked design in execution. Gracchus being always attended to and from the rostra by a guard of about 4000 men. His adversaries therefore endeavoured to ruin his reputation by the blackest calumnies. They gave out that he aimed at monarchy; and published pretended plots laid for crowning him king. But the people, without giving ear to such groundless reports, made it their whole business to encourage their tribune, who was hazarding both his life and reputation for their sakes.

When the day came on which this law was to be accepted or rejected by the people assembled in the comitium, Gracchus began with haranguing the mighty crowd which an affair of such importance had brought together both from the city and country. In his speech he showed the justice of the law with so much eloquence, made so moving a description of the miseries of the meaner sort of people, and at the same time set forth in such odious colours the usurpation of the public lands, and the immense riches which the avarice and rapaciousness of the great had raked together, that the people, transported with fury, demanded with loud cries the billets, that they might give their suffrages. Then Gracchus, finding the minds of the citizens in that warmth and emotion which was necessary for the success of his design, ordered the law to be read.

But unluckily one of the tribunes, by name Marcus Otavius Cecina, who had always professed a great friendship for Gracchus, having been gained over by the patricians, declared against the proceedings of his friend and colleague; and pronounced the word which had been always awful in the mouth of a tribune of the people, Veto, "I forbid it." As Otavius was a man of an unblamable character, and had hitherto been very zealous for the publication of the law, Gracchus was greatly surprized at this unexpected opposition from his friend. However, he kept his temper, and only desired the people to assemble again the next day to hear their two tribunes, one in defence of the other in opposition to the law proposed. The people met at the time appointed; when Gracchus addressing himself to his colleague, conjured him by the mutual duties of their function, and by the bonds of their ancient friendship, not to oppose the good of the people, whom they were bound in honour to protect against the usurpation of the great; and, taking his colleague aside, he addressed him thus, "Perhaps you are personally concerned to oppose this law; if so, I mean, if you have more than the five hundred acres, I myself, poor as I am, engage to pay you in money what you will lose in land." But Otavius, either out of shame, or from a principle of honour, continued inmoveable in the party he had embraced.

Gracchus therefore had recourse to another expedient; which was to suspense all the magistrates in Rome from the execution of their offices. It was lawful for any tribune to take this step, when the paling of the law which he proposed was prevented by mere chicanery. After this, he assembled the people anew, and made a second attempt to succeed in his design. When all things were got ready for collecting the suffrages, the rich privately conveyed away the urns in which the tablets were kept. This kindled the tribune's indignation, and the rage of the people. The comitium was like to become a field of battle, when two venerable senators, Manlius and Fulvius, very fea
fonably interposed; and throwing themselves at the tribune's feet, prevailed upon him to submit his law to the judgment of the conscript fathers. This was making the senators judges in their own cause; but Gracchus thought the law so undeniably just, that he could not persuade himself that they would reject it; and if they did, he knew that the incensed multitude would no longer keep any measures with them.

The senate, who wanted nothing but to gain time, affected delays, and came to no resolution. There were indeed some among them, who, out of a principle of equity, were for paying some regard to the complaints of the tribune, and for sacrificing their own interest to the relief of the disre<i,ed. But the far greater part would not hear of any composition whatsoever. Hereupon Gracchus brought the affair anew before the people, and earnestly intreated his colleague Otavius to drop his opposition, in compassion to the many unfortunate people for whom he interceded. He put him in mind of their ancient friendship, took him by the hand, and affectionately embraced him. But still Otavius was inflexible. Hereupon Gracchus resolved to deprive Otavius of his tribuneship, since he alone obdurately withstood the desires of the whole body of so great a people. Having therefore assembled the people, he told them, that since his colleague and he were divided in opinion, and the republic suffered by their division, it was the province of the tribes assembled in comitia to re-establish concord among their tribunes. "If the cause I maintain (said he) be, in your opinion, unjust, I am ready to give up my seat in the college. On the contrary, if you judge me worthy of being continued in your service in this station, deprive him of the tribuneship who alone obtrudes my wishes. As soon as you shall have
time nor merit would ever wipe

promised, and ever, continuing

law
departed, and never, continuing obdurate on this extraordinary occasion, Gracchus made fresh applications to Octavius, but to no purpose; he obstinately perished in his opposition. Then Gracchus turning to the people, "Judge you, (said he), which of us deserves to be deprived of his office." At these words the first tribune voted, and declared for the deposition of Octavius. Upon which Gracchus, suspending the ardour of the tribes, made another effort to bring over his opponent by gentle methods. But all his endeavours proving ineffectual, the other tribes went on to vote in their turns, and followed the example of the first. Of 35 tribes, 17 had already declared against Octavius, and the 18th was just going to determine the affair, when Gracchus, being willing to try once more whether he could reclaim his colleague, suspended the collecting of the suffrages; and addressing Octavius in the most flattering terms conjured him not to expose himself, by his obstinacy, to so great a misfortune, nor to give him the grief of having cast a blemish upon his colleague and friend, which neither time nor merit would ever expunge. Notwithstanding, however, continuing obstinate, was deposed, and the law passed as Gracchus had proposed it the last time. The deposed tribune was dragged from the rostra by the incensed multitude, who would have insulted him further, had not the senators and his friends facilitated his escape.

The Licinian law being thus revived with one contest: both by the city and country tribes, Gracchus caused the people to appoint triumvirs, or three commissioners, to halting their execution. In this commission the people gave Gracchus the first place; and he had interest enough to get his father-in-law Appius Claudius and his brother Caius Gracchus, appointed his colleagues. These three spent the whole summer in travelling through all the Italian provinces, to examine what lands were held by any person above 500 acres, in order to divide them among the poor citizens. When Gracchus returned from his progress, he found, by the death of his chief agent, that his absence had not abated either the hatred of the rich, or the love of the poor, toward him. As it plainly appeared that the deputies had been poisoned, the tribune took this occasion to apply himself again to his protectors, and implore their assistance against the violence and treachery of his enemies. The populace, more attached after this accident to their hero than ever, declared they would stand by him to the last drop of their blood; and this their zeal encouraged him to add a new clause to the law, viz. that the commissioners should likewise inquire what lands had been usurped from the republic. This was teaching the senators in a most tender print; for most of them had appropriated to themselves lands belonging to the republic. But after all, the tribune, upon a strict inquiry, found that the lands taken from the rich would not be enough to content all the poor citizens. But the following accident exalted him of this difficulty, and enabled him to stop the murmurs of the malcontents among the people.

Attalus Philometer, king of Pergamus, having been The trea- quenched his dominions and effects to the Romans, ter- ficers of Attalus, the Pergaman brought his trea- talus de- duced a new law at this time; and Gracchus immediately got a new law pased, enabling, that this money should be divided among the poor citizens who could not have lands, and that the disbursement of the revenues of Pergamus should not be in the Senate, but in the tribunes. By these steps Gracchus most effectually humbled the id; rate; who, in order to differ him among the people, gave out that Eudemus, who had brought the king's will to Rome, had left with Gracchus the royal diadem and mantle of Attalus, which the law-making tribune was to use when he should be proclaimed king of Rome. But these reports only served to make Gracchus more upon his guard, and to inspire the people with an implacable hatred against the rich who were the authors of them. Gracchus being now, by his power over the minds of the multitude, absolute master of their suffrages, formed a design of raising his father-in-law Appius Claudius to the consulate next year, of promoting his brother Caius to the tribuneship, and getting himself continued in the same office. The latter was what most nearly concerned him; his person, as long as he was in office, being sacred and inviolable. As the senate was very active in endeavouring to get such only elected into the college of tribunes as were enemies to Gracchus and his faction, the tribune felt the no flame unsettled to secure his election. He told the people, that the rich had resolved to affasinate him as soon as he was out of his office; he appeared in mourning, as was the custom in the greatest calamities; and bringing his children, yet young, into the forum, recommended them to the people in such terms, as showed that he despaired of his own preservation. At this sight the populace returned no answer, but by outcries and menaces against the rich.

When the day appointed for the election of new tribunes came, the people were ordered to assemble in the Capitol in the great court before the temple of Jupiter. The tribes being met, Gracchus produced his petition, intreating the people to continue him one year longer in the office of tribune, in consideration of the great danger to which he was exposed, the rich having vowed his destruction as soon as his peril should be no more feared. This was indeed an unusual request, having been long customary not to continue any tribune in his office above a year. However, the tribune began to vote, and the two first declared for Gracchus. Hereupon the rich made great clamours; which terrified Rubrius Varro, who presided in the college of tribunes that day, to such a degree, that he resigned his place to Q. Mummius, who offered to preclude in his room. But this raised a tumult among the tribunes themselves; so that Gracchus wisely dismissed the assembly, and ordered them to meet again the next day.

In the mean time the people, being sensible of what importance it was to them to preserve the life of so powerful
powerful a protector, not only conducted him home, but watched by turns all night at his door. Next morning by break of day, Gracchus having assembled his friends, led them from his house, and poled one half of them in the comitium, while he armed himself with the other to the Capitol. As soon as he appeared, the people saluted him with loud acclamations of joy. But fear was placed in his tribunal, when Fulvius Flaccus a senator, and friend to Gracchus, breaking through the crowd, came up to him, and gave him notice that the senators, who were assembled in the temple of Faith, which almost touched that of Jupiter Capitolinus, had confired against his life, and were resolved to attack him openly on his very tribunal. Hereupon Gracchus tucked up his robe, as it were, to prepare for a battle; and, after his example, some of his party, seizing the robes of the apparitors, prepared to defend themselves, and to repel force by force. These preparations terrified the other tribunes; who immediately abandoned their places in a cowardly manner, and mixed with the crowd; while the people, as it were, to prepare for a battle; let us immediately go and demolish with our own hands this idol of the people," Scipio Nasica, who had been all along for violent measures, inveighed bitterly against the confid for refusing to succour the republic in her greatest distress. Scipio Nasica was the great grandson of Caecus Scipio, the uncle of the first Africanus, and consequently cousin to the Gracchi by their mother Cornelia. But notwithstanding none of the senators betrayed a more irreconcilable hatred against the tribune than he. When the prudent confid refused to arm his legions, and put the adherents of Gracchus to death contrary to the usual forms of justice, he set no bounds to his fury, but, rising up from his place, cried out like a madman, "Since our confid betrays us, let those who love the republic follow me." Having uttered these words, he immediately walked out of the temple, attended by a great number of fanatics.

Nasica threw his robe over his shoulders, and having covered his head with it, advanced with his fellows into the crowd, where he was joined by a company of the clients and friends of the patricians, armed with staves and clubs. These, falling indifferently upon all who stood in their way, dispersed the crowd. Many of Gracchus's party took to their heels; and in that tumult all the seats being overturned and broken, Nasica, armed with the leg of a broken bench, knocked down all who opposed him, and at length reached Gracchus. One of his party seized the tribune by the lappet of his robe; but he, quitting his gown, fled in his tunic; and as he was in that hurry of spirits, which is inseparable from fear, leaping over the broken benches, he had the misfortune to slip and fall. As he was getting up again, he received a blow on the head, which stunned him; then his adversaries rushing in upon him, with repeated blows put an end to his life.

Rome was by his death delivered, according to Cicero, from a domestic enemy, who was more formidable to her than even that Numantia, which had first kindled her resentment. Perhaps no man was ever born with greater talents, or more capable of aggravating himself, and doing honour to his country. But his great mind, his manly courage, his lively, cast, and powerful eloquence, were, says Cicero, like a sword in the hands of a madman. Gracchus abused them, not in supporting an unjust cause, but in conducting a good one with too much violence. He went so far as to make some believe that he had really something in view besides the interest of the people whom he pretended to relieve; and therefore some historians have represented him as a tyrant. But the most judicious writers clear him from this imputation, and ascribe his first design of reviving the Licinian law to an eager desire of being revenged on the senators for the affront they had very unjustly put upon him, and the confid Mancinus, as we have hinted above. The law he attempted to revive had an air of justice, which gave a function to his revenge, without calling any blemish on his reputation.

The death of Gracchus did not put an end to the tumult. Above 500 of the tribune's friends lost their lives in the fray; and their bodies were thrown, with that of Gracchus, into the Tiber. Nay, the senate carried their revenge beyond the fatal day which had stained the Capitol with Roman blood. They sought for all the friends of the late tribune, and without any form of law afflicted some, and forced others into banishment. Caius Billius, one of the most zealous defenders of the people, was seized by his enemies, and shut up in a cell with snakes and vipers, where he miserably perished. Though the laws prohibited any citizen to take away the life of another before he had been legally condemned, Nasica and his followers were acquitted by the senate, who enacted a decree, justifying all the cruelties committed against Gracchus and his adherents.

The disturbances were for a short time interrupted by a revolt of the slaves in Sicily, occasioned by the haunts of their masters; but they being soon reduced, created commotions about the Senatus-consultum liber, as it was called, again took place. Both parties were determined not to yield; and therefore the most fatal effects ensued. The first thing of consequence was the death of Sci-
The haughty Romans were now made thoroughly sensible that they were not invincible: they were defeated in almost every engagement; and must soon have yielded had they not fallen upon a method of dividing their enemies. A law was passed, enacting, that all the nations in Italy, whose alliance with Rome was disputable, should enjoy the right of Roman citizens. This drew off several nations from the alliance; and at the same time, Sylla taking upon him the command of the Roman armies, fortune soon declared in favour of the latter.

The success of Rome against the allies served only to bring greater miseries upon herself. Marius and Sylla became rivals; the former adhering to the people, and the latter to the patricians. Marius associated with one of the tribunes named Sulpitius; in conjunction with whom he raised such disturbances, that Sylla was forced to retire from the city. Having thus driven off his rival, Marius got himself appointed general against Mithridates king of Pontus; but the soldiers refused to obey any other than Sylla. A civil war immediately ensued, in which Marius was driven out in his turn, and a price set upon his head and that of Sulpitius, with many of their adherents. Sulpitius was soon seized and killed; but Marius made his escape. In the mean time, however, the cruelties of Sylla rendered him obnoxious both to the senate and people; and Cinna, a furious partisan of the Marian faction, being chosen consul, cited him to give an account of his conduct. Upon this Sylla thought proper to set out for Africa; Marius was recalled from Africa, where he had fled; and immediately on his landing in Italy, was joined by a great number of shepherds, slaves, and men of desperate fortunes; so that he soon saw himself at the head of a considerable army.

Cinna, in the mean time, whom the senators had deposed and driven out of Rome, solicited and obtained a powerful army from the allies; and being joined by Sertorius, a most able and experienced general, the two, in conjunction with Marius, advanced, towards the capital; and as their forces daily increased, a fourth army was formed under the command of Papiarius Carbo. The senate raised some forces to defend the city; but the troops being vastly inferior in number, and likewise inclined to the contrary side, they were obliged to open their gates to the confederates. Marius entered at the head of a numerous guard composed of slaves, whom he called his Bardicnanus, and whom he designed to employ in revenging himself on his enemies. The first order he gave these auxiliaries was, to murder all who came to fail him, and were not favored with the like civility. As every one was forward to pay his compliments to the new tyrant, this order proved the destruction of vast numbers. At last these Bardicnanus abandoned themselves to such excesses in every kind of vice, that Cinna and Sertorius ordered their troops to fall upon them; which being instantly put in execution, they were all cut off to a man.

By the destruction of his guards, Marius was reduced to the necessity of taking a method of gratifying his revenge somewhat more tedious, though equally effectual. A conference was held between the four chiefs, in which Marius seemed quite frantic with rage. Sertorius endeavoured to moderate his fury; but being over-
This was immediately put in execution. A general slaughter commenced, which lasted five days, and during which the greatest part of the obnoxious senators were cut off, their heads stuck upon poles over against the rostra, and their bodies dragged with hooks into the forum, where they were left to be devoured by dogs. Sylla's house was demolished, his goods confiscated, and he himself declared an enemy to his country; however, his wife and children had the good fortune to make their escape.—This massacre was not confined to the city of Rome. The soldiers, like as many blood-hounds, were driven over the country in search of those who fled. The neighbouring towns, villages, and all the highways, swarmed with affaffins; and on this occasion Plutarch observes with great concern, that the most sacred ties of friendship and hospitality are not proof against treachery, in the day of adversity, for there were but very few who did not discover their friends who had fled to them for shelter.

This slaughter being over, Cinna named himself and Marius consuls for the ensuing year; and these tyrants deemed it right to begin the new year as they had ended the old one: but, while they were preparing to renew their cruelties, Sylla, having proved victorious in the east, sent a long letter to the senate, giving an account of his many victories, and his resolution of returning to Rome, not to restore peace to his country, but to revenge himself of his enemies, i.e. to destroy those whom Marius had spared. This letter occasioned an universal terror. Marius, dreading to enter the city, wrote a long letter to the senate, giving an account of such a cruel enemy. Soon after, the inhabitants of Norba, a city of Campania, finding themselves unable to resist the forces of the tyrant, sent fire to their houses, and all perished in the flames. The taking of these cities put an end to the civil war, not to the cruelness of Sylla. Having assembled the people in the comitium, he told them, that he was resolved not to spare a single person who had borne arms against him. This cruel resolution he put in execution with the most unrelenting vigour; and having at last cut off all those whom he thought capable of opposing him, Sylla caused himself to be declared perpetual dictator, or, in other words, king and absolute sovereign of Rome.

This revolution happened about 80 B.C. and from this time we may date the loss of the Roman liberty. Once submitted, were ever after more inclined to submit to a master. Though individuals retained the same enthusiastic notions of liberty as before, yet the minds of the generality seem from this time to have inclined towards monarchy. New masters were indeed already prepared for the public. Caesar and Pompey had eminently distinguished themselves by their martial exploits, and were already rivals. They were, however, for some time prevented from razing any disturbances by being kept at a distance from each other. Sertorius, one of the generals of the Marian faction, and the only one of them possessed of either honour or probity, had retired into
into Spain, where he erected a republic independent of Rome. Pompey and Metellus, two of the best reputed generals in Rome, were sent against him; but instead of conquering, they were on all occasions conquered by him, and obliged to abandon their enterprise with disgrace. At last Sextus was treacherously murdered; and the traitors, who after his death usurped the command, being totally destitute of his abilities, were easily defeated by Pompey: and thus that general reap­plied an undeserved honour from concluding the war with success.

The Spanish war was scarce ended, when a very dangerous one was excited by Spartacus, a Thracian gladiator. For some time this rebel proved very successful; but at last was totally defeated and killed by Crassus. The fugitives, however, rallied again, to the number of 5000; but, being totally defeated by Pompey, the latter took occasion from thence to claim the glory which was justly due to Crassus. Being thus become extremely popular, and setting no bounds to his ambition, he was chosen consul along with Crassus. Both generals were at the head of powerful armies; and a contest between them immediately began about who should first lay down their arms. With difficulty they were in appearance reconciled, and immediately began to oppose one another in a new way. Pompey courted the favour of the people, by reinstating the tribune in his ancient power, which had been greatly abridged by Sylla. Crassus, though naturally covetous, entertained the populace with surprising profusion at 10,000 tables, and at the same time distributed corn sufficient to maintain their families for three months — their prodigious expenses will seem less surprising, when we consider that Crassus was the richest man in Rome, and that his estate amounted to upwards of 7,000 talents, i.e. 1,356,250 l. sterling. Withstanding his utmost efforts, however, Pompey still had the superiority; and was therefore proposed as a proper person to be employed for clearing the seas of pirates. In this new station a most extensive power was to be granted to him. He was to have an absolute authority for three years over all the seas within the Straits or Pillars of Hercules, and over all the countries for the space of 400 furlongs from the seas. He was empowered to raise as many soldiers and mariners as he thought proper; to take what sums of money he pleased out of the public treasury without being accountable for them; and to choose out of the Senate fifteen senators to be his lieutenants, and to execute his orders when he himself could not be present. The sensible part of the people were against investing one man with so much power; but the unthinking multitude rendered all opposition fruitless. The tribune Roscius attempted to speak against it, but was prevented by the clamours of the people. He then held up two of his fingers, to show that he was for dividing that extensive commission between two persons: but on this the assembly burst out into such hideous outcries, that a crow flying accidentally over the comitium, was stunned with the noise, and fell down among the rabble. This law being agreed to, Pompey executed his commission to much to the public satisfaction, that on his return a new law was proposed in his favour. By this he was to be appointed general of all the forces in Asia; and as he was still to retain the sovereignty of the seas, he was now in fact made sovereign of all the Roman empire.—This law was supported by Cicero and Caesar, the former aspiring at the consulate, and the latter pleased to see the Romans so readily appointing themselves a master. Pompey, however, executed his commission with the utmost fidelity and success, completing the conquest of Pontus, Albania, Iberia, &c. which had been successfully begun by Sylla and Lucullus.

But while Pompey was thus aggrandizing himself, the republic was on the point of being overthrown by a conspiracy formed by Lucius Sergius Catiline. He was descended from an illustrious family; but having quite ruined his estate, and enraged himself infamous by a series of the most detestable crimes, he associated with a number of others in circumstances similar to his own, in order to repair their broken fortunes by ruining their country. Their scheme was to murder the consuls together with the greatest part of the senators, set fire to the city in different places, and then seize the government. This wicked design miscarried twice; but was not on that account dropped by the conspirators. Their party increased every day; and both Caesar and Crassus, who since the departure of Pompey had flirited to gain the affections of the people as far as possible, were thought to have been privy to the conspiracy. At last, however, the matter was discovered by means of a young knight, who had indirectly revealed the secret to his paramour. Catiline then openly took the field, and, soon raised a considerable army: but was utterly defeated and killed about 62 B.C.; and thus the republic was saved from the present danger.

In the mean time, Caesar continued to advance in popularity and in power. Soon after the defeat of Catiline, he was created pontifex maximus; and after that he went into Spain, where he subdued several nations that had never before been subjected to Rome. While he was thus employed, his rival Pompey returned from the east, and was received with the highest honours; but though still as ambitious as ever, he now affected extraordinary modesty, and declined accepting of the applause which was offered him. His aim was to assume a sovereign authority without seeming to desire it; but he was soon convinced, that, if he desired to reign over his fellow-citizens, it must be by force of arms. He therefore renewed his intrigues, and spared no pains, however mean and scandalous, to increase his popularity. Caesar, on his return from Spain, found the sovereignty divided between Crassus and Pompey, each of whom he ineffectually struggled to get the better of the other. Caesar, no less ambitious than the other two, proposed that they should put an end to their differences, and take him for a partner in their power. In short, he projected a triumvirate, or association of three persons, (Pompey, Crassus, and himself,) in which each of them should be lodged the whole power of the senate and people; and, in order to make their confederacy more lasting, they bound themselves by mutual oaths and promises to stand by each other, and suffer nothing to be undertaken or carried into execution without the unanimous consent of all the three.

Thus was the liberty of the Romans taken away a second time, nor did they ever afterwards recover it; though at present none perceived that this was the case, except...
The association of the triumvirs was for a long time kept secret; and nothing appeared to the people except the reconciliation of Pompey and Crassus, for which the state reckoned itself indebted to Cæsar. The first consequence of the triumvirate was the consulship of Julius Cæsar. But though this was obtained by the favour of Pompey and Crassus, he found himself disappointeed in the colleague he wanted to associate with him in that office. He had pitched upon one whom he knew he could manage, as he pleased, and disposed of to Pompey and himself, notwithstanding the vast riches he had acquired, was forced to yield. This defeat proved of small consequence. Cæsar set himself to engage the affections of the people; and this he did, by an agrarian law, so effectually, that he was in a manner idolized. The law was in itself very reasonable and just; nevertheless, the senate, perceiving the design with which it was proposed, thought themselves bound to oppose it. Their opposition, however, proved fruitless: the conful Bibulus, who shewed himself most active in his endeavours against it, was driven out of the assembly with the greatest indignity, and from that day became of no consideration; so that Cæsar was reckoned the sole conful.

The next step taken by Cæsar was to secure the knights, as he had already done the people; and for this purpose he abated a third of the rents which they annually paid into the treasury; after which he governed Rome with an absolute sway during the time of his confulate. The reign of this triumvir, however, was ended by his expedition into Gaul, where his military exploits acquired him the highest reputation. Pompey and Crassus in the mean time became confuls, and governed as deltropolically as Cæsar himself had done. On the expiration of their first confulate, the republic fell into a kind of anarchy, entirely owing to the disorders occasioned by the two late confuls. At last, however, this confusion was ended by raising Crassus and Pompey to the confulate a second time. This was no sooner done, than a new partition of the empire was proposed. Crassus was to have Syria and all the eastern provinces, Pompey to govern Africa and Spain, and Cæsar to be continued in Gaul, and all this for the space of five years. This law was passed by a great majority; upon which Crassus undertook an expedition against the Parthians, whom he imagined he should easily overcome, and then enrich himself with their spoils; Cæsar applied with great affiduity to the completing of the conquest of Gaul; and Pompey having nothing to do in his province, stood at Rome to govern the republic alone.

The affairs of the Romans were now hastening to a crisis. Crassus, having oppressed all the provinces of the east, was totally defeated and killed by the Parthians; after which the two great rivals Cæsar and Pompey were left alone, without any third person who could hold the balance between them, or prevent the deadly quarrels which were about to ensue. Matters, however, continued pretty quiet till Gaul was reduced to a Roman province. The question then was, whether Cæsar or Pompey should first resign the command of their armies, and return to the rank of private persons. As both parties saw, that whoever first laid down his arms must of course submit to the other, both refused to disarm themselves. As Cæsar, however, had amassed immense riches in Gaul, he was now in a condition not only to maintain an army capable of warring against Pompey, but even to buy over the leading men in Rome to his interest. One of the consuls, named Sempronius Paulus, cost him no less than 1500 talents, or 310,625 s., but the other, named Marcellus, could not be gained at any price. Pompey had put at the head of the tribunes one Scribonius Curio, a young patrician of great abilities, but so exceedingly debauched and extravagant, that he owed upwards of four millions and a half sterling. Cæsar, by enabling him to satisfy his creditors, and supplying him with money to pursue his debaucheries, secured him to his interest; and Curio, without seeming to be in Cæsar’s interest, found means to do him the most essential service. He proposed that both generals should be recalled; being well assured that Pompey would never consent to part with his army, or lay down the government of Spain with which he had been invested, so that Cæsar might draw from Pompey’s refusal a pretence for continuing himself in his province at the head of his troops. This proposal threw the opposite party into great embarrassments; and while both professed their pacific intentions, both continued in readiness for the most obstinate and bloody war. Cicero took upon himself the office of mediator; but Pompey would not hear any terms of accommodation. The orator, surprized to find him so obstinate at the same time that he neglected to strengthen his army, asked him with what forces he designed to make head against Cæsar? To which the other answered, that he needed but stamp with his foot, and an army would start up out of the ground. This confidence he assumed because he persuaded himself that Cæsar’s men would abandon him if matters came to extremities. Cæsar, however, though he affected great moderation, yet kept himself in readiness for the worst; and therefore, when the senate passed the fatal decree for a civil war, he was not in the least alarmed. This decree was issued in the year 49 B.C. and was expressed in the following words: To the consuls for the year, the proconsul Pompey, the pontiffs, and all those in or near Rome who have been consuls, provide for the public safety by the most proper means.” This decree was no sooner passed, than the consuls Marcellus went, with his colleague Lentulus, to a house at a small distance from the town, where Pompey then was; and presenting him with a sword, “We require you (said he) to take upon you with this the defence of the republic, and the command of her troops.” Pompey obeyed; and Cæsar was by the same decree divested of his office, and one Lucius Domitius appointed to succeed him, the new governor being empowered to raise 40,000 men in order to take possession of his province.

War being thus resolved on, the senate and Pompey began to make the necessary preparations for opposing Cæsar. The attempt of the latter to withdraw his authority they termed a tumult; from which contemptible epithet it appeared that they either did not know, or did not dread, the enemy whom they were bringing upon themselves. However, they ordered 30,000 Ro-
The first design of Caesar was to make himself master of Ariminum, a city bordering upon Cisalpine Gaul, and consequently a part of his province; but as this would be looked upon as a declaration of war, he resolved to keep his design as private as possible. At that time he himself was at Ravenna, from whence he sent upon his {how} to begin by a part of his province; but as this was to be looked upon as a declaration of war, he resolved to keep his design as private as possible. At that time he himself was at Ravenna, from whence he sent a detachment towards the Rubicon, defining the officer who commanded it to wait for him on the banks of that river. The next day he allited at a town of gladiators, and made a great entertainment. Towards the close of the day he rode from table, defining his guests to stay till he came back, which he said would be very soon; but, instead of returning to the company, he immediately set out for the Rubicon, having left orders to some of his most intimate friends to follow him through different roads, to avoid being observed. Having arrived at the Rubicon, which parted Cisalpine Gaul from Italy, the succeeding misfortunes of the empire occurred to his mind, and made him hesitate. Turning then to Afranius Pollio, "If I do not cross the river (said he), I am undone; and if I do cross it, how many calamities shall I by this means bring upon Rome!" Having thus spoken, he mused a few minutes; and then crying out, "The die is cast," he threw himself into the river, and crossing it, marched with all possible speed to Ariminum, which he reached and surprised before daybreak. From thence, as had but one legion with him, he dispatched orders to the formidable army he had left in Gaul to cross the mountains and join him.

The activity of Caesar struck the opposite party with the greatest terror; and indeed not without reason, for they had been extremely negligent in making preparations against such a formidable opponent. Pompey, himself, so little alarmed than the rest, left Rome with a design to retire to Capua, where he had two legions, whom he had formerly drafted out of Caesar's army. He communicated his intended flight to the Senate; but at the same time acquainted them, that if any magistrate or senator refused to follow him, he should be treated as a friend to Caesar and an enemy to his country. In the mean time Caesar, having raised new troops in Cisalpine Gaul, sent Marcus Antony with a detachment to seize Aregium, and some other officers to secure Piræum and Fanum, while he himself marched at the head of the thirteenth legion to Auximium, which opened its gates to him. From Auximium he advanced into Picenum, where he was joined by the twelfth legion from Transalpine Gaul. As Picenum readily submitted to him, he led his forces against Corfinium, the capital of the Pobigni, which Domitius Ahenobarbus defended with thirty cohorts. But Caesar no sooner invaded it, than the garrison betrayed their commander, and delivered him up with many senators, who had taken refuge in the place, to Caesar, who granted them their lives and liberty. Domitius, fearing the resentment of the conqueror, had ordered one of his slaves, whom he used as a physician, to give him a dose of poison. When he came to experience the humanity of the conqueror, he lamented his misfortune, and blamed the haughtiness of his own resolution. But his physician, who had only given him a sleeping draught, comforted him, and received his liberty as a reward for his affection.

Pompey, thinking himself no longer safe at Capua, after the reduction of Corfinium, retired to Brundium, with a design to carry the war into the enemy's country, where all the governors were his creatures. Caesar followed him close; and arriving with his army before Brundium, invested the place on the land-side, and undertook to shut up the port by a barricade of his own invention. But before the work was completed, the fleet which had convoyed the two consuls with thirty cohorts to Dyrrhachium being returned, Pompey resolved to make his escape, which he conducted with all the experience and dexterity of a great officer. He kept his departure very secret; but, at the same time, made all necessary preparations for the facilitating of it. In the first place, he walled up the gates, then dug deep and wide ditches criss-crossed by all the streets, except only those two that led to the port; in the ditches he planted sharp pointed stakes, covering them with hurdles and earth. After these precautions, he gave orders that all the citizens should keep within doors, lest they should betray his design to the enemy; and then, in the space of three days, disembarked all his troops, except the light-armed infantry, whom he had placed on the walls; and these likewise, on a signal given, abandoning their posts, repaired with great expedition to the ships. Caesar, perceiving the walls unguarded, ordered his men to scale them, and make what haste they could after the enemy. In the heat of the pursuit, they would have fallen into the ditches which Pompey had prepared for them, had not the Brundusians warned them of the danger; and, by many windings and turnings, led them to the haven, where they found all the fleet under sail, except two vessels, which had run aground in going out of the harbour. These Caesar took, made the soldiers on board prisoners, and brought them ashore.

Caesar, seeing himself, by the flight of his rival, master of all Italy from the Alps to the sea, was desirous to follow and attack him before he was joined by the supplies which he expected from Asia. But being definite of shipping, he resolved to go first to Rome, and settle some sort of government there; and then pass into Spain, to drive from thence Pompey's troops, who had taken possession of that great continent, under the command of Afranius and Petreius. Before he left Brundium, he sent Scribonius Curio with three legions into Sicily, and ordered Q. Valerius, one of his lieutenants, to get together what ships he could, and cross over with one legion into Sardinia. Cato, who commanded in Sicily, upon the first news of Curio's landing there, abandoned the island, and retired to the camp of the consuls at Dyrrhachium; and Q. Valerius no sooner appeared with his small fleet off Sardinia, than
In the mean time the general himself advanced towards Rome; and on his march wrote to all his generals in Italy, desiring them to repair to the capital, and assist him with their advice. Above all, he was desirous to see Cicero; but could not prevail upon him to return to Rome. As Caesar drew near the capital, he quartered his troops in the neighbouring municipalities; and then advancing to the city, out of a pretended respect to the ancient customs, he took up his quarters in the suburbs, whether the whole city crowded to see the famous conqueror of Gaul, who had been absent near ten years. And now such of the tribunes of the people as had fled to him for refuge reassumed their functions, mounted the rostra, and endeavoured by their speeches to reconcile the people to the head of their party. Marc Antony, particularly, and Cassius Longinus, two of Caesar's most zealous partisans, moved that the senate should meet in the suburbs, that the general might give them an account of his conduct. Accordingly, such of the senators as were at Rome, assembled; when Caesar made a speech in justification of all his proceedings, and concluded his harangue with proposing a deputation to Pompey, with orders of an accommodation in an amicable manner. He even defined the conscript fathers, to whom in appearance he paid great deference, to nominate some of their venerable body to carry proposals of peace to the consuls, and the general of the confular army; but none of the consuls would take upon him that commission. He then began to think of providing himself with the necessary sums for carrying on the war, and had recourse to the public treasury. But Metellus, one of the tribunes, opposed him; alleging a law forbidding any one to open the treasury, but in the presence and with the consent of the consuls. Caesar, however, without regarding the tribune, went directly to the temple of Saturn, where the public money was kept. But the keys of the treasury having been carried away by the conful Lentulus, he ordered the doors to be broken open. This Metellus opposed: but Caesar, in a passion, laying his hand on his sword, threatened to kill him if he gave him any farther disturbance; which so terrified Metellus, that he withdrew. Caesar took out of the treasury, which was ever after at his command, an immense sum; some say 300,000 pounds weight of gold. With this supply of money he raised troops all over Italy, and sent governors into all the provinces subject to the republic.

Caesar now made Marc Antony commander in chief of the armies in Italy, sent his brother C. Antonius to govern Illyricum, assigned Cilurne Gaul to Licinius Crassus, appointed M. Emilius Lepidus governor of the capital; and having got together some ships to cruise in the Adriatic and Mediterranean seas, he gave the command of one of his fleets to P. Cornelius Dolabella, and of the other to young Hortenius, the son of the famous orator. As Pompey had sent governors into the same provinces, by this means a general war was kindled in almost all the parts of the known world. However, Caesar would not trust any of his lieutenants with the conduct of the war in Spain, which was Pompey's favourite province, but took it upon himself; and having settled his affairs in great haste at Rome, returned to Ariminum, assembled his legions there, and, passing the Alps, entered Transalpine Gaul. There he was informed that the inhabitants of Marseille had resolved to refuse him entrance into their city; and that L. Domitius Ahenobarbus, whom he had generously pardoned and set at liberty after the reduction of Corinum, had set sail for Marseille with seven galleys, having on board a great number of his clients and slaves, with a design to raise the city in favour of Pompey. Caesar, thinking it dangerous to let the enemy take possession of such an important place, sent for the 15 chief magistrates of the city, and advised them not to begin a war with him, but rather follow the example of Italy, and submit. The magistrates returned to the city, and soon after informed him that they were to stand neutral; but in the mean time Domitius arriving with his small squadron, was received into the city, and declared general of all their forces. Hereupon Caesar immediately invested the town with three legions, and ordered twelve galleys to be built at Arles, now Arles, in order to block up the port. But as the siege was like to detain him too long, he left C. Trebonius to carry on the siege, and himself continued his march into Spain, where he began the war with all the valour, ability, and successes of a great general. Pompey had three generals in this continent, which was divided into two Roman provinces. Varro commanded in Farther Spain; and Petreius and Afranius, with equal power, and two considerable armies, in Histher Spain. Caesar, while he was yet at Marseille, sent Q. Fabius, one of his lieutenants, with three legions, to take possession of the passes of the Pyrenees, which Afranius had seized. Fabius executed his commission with great bravery, entered Spain, and left the way open for Caesar, who quickly followed him. As soon as he had crossed the mountains, he sent out scouts to observe the situation of the enemy; by whom he was informed, that Afranius and Petreius having joined their forces, consisting of five legions, 20 cohorts of the natives, and 5000 horse, were advantageously posted on an hill of an easy ascent in the neighbourhood of Ilerda, now Lerida, in Catalonia. Upon this advice Caesar advanced within sight of the enemy, and encamped on a point between the Sicos and Cinga, now the Segre and Cinga, two is greatly distressed in Spain.
Camp at 30 Roman denarii per bushel, that is, 1 l. 12 s. 1 d. sterling. He tried to rebuild his bridges, but in vain; the violence of the stream rendering all his endeavours fruitless.

Upon the news of Caesar's death, Pompey's party at Rome began to take courage. Several persons of distinction went to congratulate Afranius's wife on the success of her husband's arms in Spain. Many of the senators who had hitherto stood neutral, hastened to Pompey's camp, taking it for granted that Caesar was reduced to the last extremity, and all hopes of his party lost. Of this number was Cicero; who, without any regard to the remembrance of Atticus, or the letters Caesar himself wrote to him, defining him to join neither party, he left Italy, and landed at Dyrrhachium, where Pompey received him with great marks of joy and friendship. But the joy of Pompey's party was not long-lived. For Caesar, after having attempted several times in vain to rebuild the bridges, caused boats to be made with all possible expedition; and while the enemy were diverted by endeavouring to intercept the succours that were sent him from Gaul, he laid hold of that opportunity to convey his boats in the night on carriages 22 miles from his camp; where with wonderful quickness a great detachment passed the Sicoris, and encamping on the opposite bank unknown to the enemy, built a bridge in two days, opened a passage, and encamping on the other side of the river, received the supplies from Gaul, and relieved the wants of his soldiers. Caesar being thus delivered from danger, pursued the armies of Afranius and Petreius with such superior address and conduct, that he forced them to submit without coming to a battle, and by that means became master of all Upper Spain. The two generals disbanded their troops, sent them out of the province, and returned to Italy, after having solemnly promised never to assemble forces again, or make war upon Caesar.

Upon the news of the reduction of Upper Spain, the Spaniards in farther Spain, and one Roman legion, deferted from Varro, Pompey's governor in that province, which obliged him to surrender his other legions and all his money. Caesar having thus reduced all Spain in a few months, appointed Cassius Longinus to govern the two provinces with four legions, and then returned to Marselles; which city was just upon the point of surrendering after a most vigorous resistance. Though the inhabitants had by their late treachery deferred a severe punishment, yet he granted them their lives and liberty; but stripped their arsenals of arms, and obliged them to deliver up all their ships. From Marselles Caesar marched into Cisalpine Gaul; and from thence hastened to Rome, where he laid the foundation of his future grandeur. He found the city in a very different state from that in which he had left it. Most of the senators and magistrates were fled to Pompey at Dyrrhachium. However, there were still praetors there; and among them M. Aemilius Lepidus, who was afterwards one of the triumvirs with Octavian and Marc Antony. The praetors took it upon themselves to formally inform Caesar, nominated him dictator of his own authority, and against the inclination of the senate. Caesar accepted the new dignity; but neither abated his power, as Sylla had done, nor retained it so long. During the 11 days of his dictatorship, he governed with great moderation, and gained the affections both of the people, and the patricians. He recalled the exiles, granted the rights and privileges of Roman citizens to all the Gauls beyond the Po, and, as pontifex maximus, filled up the vacancies of the sacerdotal colleges with his own friends. Though it was expected that he would have absolutely cancelled all debts contracted since the beginning of the troubles, he only reduced the interest to one-fourth. But the chief use he made of his dictatorship was to proceed at the election of consuls for the next year, when he got himself, and Servilius Iulianus, one of his most zealous partisans, promoted to that dignity.

And now being resolved to follow Pompey, and carry the war into the east, he set out for Brundisium, where he had ordered 12 legions to repair with all possible expedition. But on his arrival he found only five there. The refit, being afraid of the dangers of the seas, and unwilling to engage in a new war, had marched leisurely, complaining of their general for allowing them no refpite, but hurrying them continually from one country to another. However, Caesar did not wait for them, but set sail with only five legions and 600 horse in the beginning of January. While the refit were waiting at Brundisium for ships to transport them over into Epirus, Caesar arrived safe with his five legions in Chonia, the northern part of Epirus, near the Ceraunian mountains. There he landed his troops, and sent the ships back to Brundisium to bring over the legions that were left behind. The war he was now entering upon was the most difficult he had yet undertaken. Pompey had for a whole year been assembling troops from all the eastern countries. When he left Italy, he had only five legions; but since his arrival at Dyrrhachium he had been reinforced with one from Sicily, another from Crete, and two from Syria. Three thousand archers, six cohorts of slingers, and seven thousand horse, had been sent him by princes in alliance with Rome. All the free cities of Asia had reinforced his army with their belt troops; nay, if we give credit to an historical poet, succours were brought him from the Indus and the Ganges to the east, and from Arabia and Ethiopia to the south; at least it is certain, that Greece, Asia Minor, Syria, Palestine, Egypt, and all the coasts of the Mediterranean to the Euphrates, took up arms in his favour. He had almost all the Roman knights, that is, the flower of the young nobility, in his squadrons, and his legions consisted mostly of veterans injured to dangers and the toils of war. Pompey himself was a general of great experience and address; and had under him some of the best commanders of the republic, who had formerly conducted armies themselves. As for his navy, he had above 500 ships of war, besides a far greater number of small vessels, which were continually cruising on the coasts, and intercepting such ships as carried arms or provisions to the enemy. He had likewise with him above 200 senators, who formed a more numerous senate than that at Rome. Cornelia Lentulus and Claudius Marcellus, the last year's consuls, prefided in it; but under the direction of Pompey their protector, who ordered them to assemble at Thessalonica, where he built a flately hall for that purpose. There, in one of their assemblies, at the motion of Ca­to, it was decreed, that no Roman citizens should be put to death but in battle, and that no city subject to the republic should be sacked. At the same time the
without opposition. The like success Rome. confcript fathers assembled at Thessalonica decreed, to sew that they alone represented the Roman senate, and that those who resided at Rome were encouragers of tyranny, and friends to the tyrant. And indeed, as the flower of the nobility was with Pompey, and the most virtuous men in the republic had taken refuge in his camp, he was generally looked upon as the only hope and support of the public liberty. Hence many persons of eminent probity, who had hitherto found neutrality, flocked to him from all parts. Among these were young Brutus, who afterwards confpired against Caesar, Titius Sextius, and Labienus. Brutus, whose father had been put to death in Galatia by Pompey's order, had never spoken to him, or so much as saluted him since that time; but as he now looked upon him as the defender of the public liberty, he joined him, sacrificing therein his private resentment to the interest of the public. Pompey received him with great joy, and was willing to confer upon him some command; but he declined the offer. Titius Sextius, though extremely old and lame, yet left Rome, and went as far as Macedonia to join Pompey there. Labienus likewise forsook his old benefactor, under whom he had served during the whole course of the Gaulish war, and went over to his rival, though Caesar had appointed him commander in chief of all the forces on the other side the Alps. In short, Pompey's party grew into such reputation, that his cause was generally called the good cause, while Caesar's adherents were looked upon as enemies to their country, and abettors of tyranny.

As soon as Caesar landed, he marched directly to Oricum, the nearest city in Epirus, which was taken without opposition. The like success attended him at Apollonia, which was in no condition to offer a siege; and these two conquests opened a way to Dyrhachium, where Pompey had his magazines of arms and provisions. This success, however, was interrupted by the news that the fleet which he had sent back to Brundusium to transport the rest of his troops had been attacked by Bibulus, one of Pompey's admirals, who had taken 30, and inhumanly burnt them with the seamen on board. This gave Caesar great uneasiness, especially as he heard that Bibulus, with 110 ships of war, had taken possession of all the harbours between Salonium and Oricum; so that the legions at Brundusium could not venture to cross the sea without great danger of falling into the enemy's hands. By this Caesar was so much embarrassed, that he made proposals of accommodation upon very moderate terms; being no other than that both Pompey and he should disband their armies within three days, renew their former friendship with solemn oaths, and return together to Italy. These proposals were sent by Bibulus to Rufus, an intimate friend of Pompey, whom Caesar had twice taken prisoner. Pompey, however, probably elated with his late good fortune, answered that he would not hearken to any terms, lest it should be said that he owed his life and return to Italy to Caesar's favour. However, the latter sent one Vatinius to confer with Pompey about a treaty of peace. Labienus was appointed to receive the proposals; but while they were conferring together, a party of Pompey's men coming up to them, disarmed their darts at Vatinius and those who attended him. Some of the guards were wounded, and Vatinius narrowly escaped with his life.

In the mean time Caesar advanced towards Dyrhachium, in hopes of surprising that important place; but Pompey unexpectedly appearing, he halted on the other side of the river Apulum, where he entrenched himself as having but a small number of troops in comparison of the formidable army which attended Pompey. The latter, however, notwithstanding his superiority, durst not cross the river in Caesar's sight; so that the two armies continued for some time quiet in their respective camps. Caesar wrote letter after letter to Marc Antony, who commanded the legions he had left in Italy, to come to his assistance; but receiving no answer, Caesar disengaged himself in the habit of a furer, and with all imaginable secrecy went on board a fisherman's bark, with a design to go over to Brundusium, though the enemy's fleet was encamping on the coast both of Greece and Italy. This design, however, miscarried, by reason of the boat being put back by contrary winds; and thus Caesar was relieved to his soldiers, who had been very uneasy at his absence. He was no sooner landed than he dispatched Pollithius, one of his lieutenants, with most pressing orders to Marc Antony, Gabinius, and Calenus, to bring the troops to him at all adventures. Gabinius, unwilling to expose all the hopes of his general to the hazards of the sea, thought it fperer to march a great way about by Illyricum, and therefore engaged all the legionaries he could to follow him by land. But the Illyrians, who had, unknown to him, declared for Pompey, fell unexpectedly upon him and killed him and his men, not one escaping. Marc Antony and Calenus, who went by sea, were in the greatest danger from one of Pompey's admirals; but had the good luck to bring their troops safe to shore at Nyphæum, in the neighbourhood of Apollonia. As soon as it was known that Antony was landed, Pompey marched to prevent his joining Caesar. On the other hand, Caesar instantly decamped and hastened to the relief of his lieutenant, joined him before Pompey came up. Then Pompey, not caring to engage them when united, retired to an advantageous post in the neighbourhood of Dyrhachium, known by the name of Alparagium, and there encamped. Caesar having thus at length got all his troops together, resolved to finish the war by one general action, and determine the fate of the world, either by his own death or by that of his rival. To this end he offered Pompey battle, and kept his army a great while drawn up in sight of the enemy. But Pompey declining an engagement, he decamped, and turned towards Dyrhachium, as if he designed to surprise it, hoping by this means to draw Pompey into the plain. But Pompey, looking upon the taking of Dyrhachium as a chimical project, followed Caesar at some distance, and letting him draw near to the city, encamped on a hill called Petra, which commanded the sea, whence he could be supplied with provisions from Greece and Asia, while Caesar was forced to bring corn by land from Epirus, at a vast expense, and through many dangers.

This inconvenience put Caesar upon a new design, which was to surround an army far more numerous than his own, and, by flutting them up within a narrow tract of ground, destitute them as much for want of forage as his troops were destitute for want of corn. Pursuant to this design, he drew a line of circumvallation from the sea quite round Pompey's camp, and kept him in his camp.
ROM

him so closely blocked up, that though his men were plentifully supplied with provisions by sea, yet the horses of his army began soon to die in great numbers for want of forage. Cæsar's men, though in the utmost distress for want of corn, yet bore all with incredible cheerfulness, protesting, that they would rather live upon the bark of trees than suffer Pompey to escape, now they had him in their power. Cæsar tells us, that in this extremity such of the army as had been in Sardinia found out the way of making bread of a certain root called *cleres*, which they steeped in milk; and that when the enemy infulced them on account of the starving condition which they were in, they threw several of these loaves among them, to put them out of all hopes of subduing them by famine. "So long as the earth produces such roots (said they), we will not let Pompey escape." At length Pompey, alarmed at the discontents which began to prevail in his army, made several attempts to break through the barriers that enclosed him, but was always repulsed with loss. At length being reduced to the utmost extremity for want of forage, he resolved at all events to force the enemy's lines and escape. With the assistance, therefore, and by the advice of two defectors, he embarked his archers, slingers, and light-armed infantry, and marching himself by land at the head of 60 cohorts, went to attack that part of Cæsar's lines which was next to the sea, and not yet quite finished. He set out from his camp in the dead of the night, and arriving at the post he designed to force by break of day, he began the attack by sea and land at the same time. The ninth legion, which defended that part of the lines, made for about a vigorous resistance; but being attacked in the rear by Pompey's men, who came by sea, and landed between Cæsar's two lines, they fled with such precipitation, that the succours Marcellinus sent them from a neighbouring post could not stop them. The enmity who carried the eagle at the head of the routed legion was mortally wounded; but nevertheless, before he died, had presence of mind enough to confign the eagle to the cavalry of the party, desiring them to deliver it to Cæsar. Pompey's men pursued the fugitives, and made such a slaughter of them, that all the centurions of the first cohort were cut off except one. And now Pompey's army broke in like a torrent upon the posts Cæsar had fortified, and were advancing to attack Marcellinus, who guarded a neighbouring fort; but Marc Antony coming very feanably to his relief with 12 cohorts, they thought it advisable to retire.

Soon after Cæsar himself arrived with a strong reinforcement, and posted himself on the shore, in order to prevent such attempts for the future. From this post he observed an old camp which he had made within the place where Pompey was enclofed, but afterwards abandoned. Upon his quitting it, Pompey had taken possession of it, and left a legion to guard it. This post Cæsar resolved to reduce, hoping to repair the loss he had sustained on this unfortunate day, by taking the legion which Pompey had posted there. Accordingly, he advanced secretly at the head of 33 cohorts in two lines; and upon arriving at the old camp before Pompey could have notice of his march, attacked it with great vigour, forced the first intrenchment, notwithstanding the brave resistance of Titus Pulcro, and penetrated to the second, whether the legion had retired. But here his fortune changed on a sudden. His right wing, in looking for an entrance into the camp, marched along the outside of a trench which Cæsar had formerly carried on from the left angle of his camp, about 400 paces, to a neighbouring river. This trench they made for the rampart of the camp; and being led away by that mistake from their left wing, they were soon after prevented from rejoining it by the arrival of Pompey, who came up at the head of a legion and a large body of horse. Then the legion which Cæsar had attacked taking courage, made a brisk rally and drove his men back to the first intrenchment which they had feized, and there put them in great disorder while they were attempting to pass the ditch. Pompey, in the mean time, falling upon them with his cavalry in flank, completed their defeat; and then flying to the enemy's right wing, which had paused the trench mentioned above, and was shut up between that and the ramparts of the old camp, made a most dreadful slaughter of them. The trench was filled with dead bodies, many falling into it in that disorder, and others puffing over them and pressing them to death.

This loss and disgrace greatly mortified Cæsar, but he did not discourage him. After he had by his lenity and eloquent speeches recovered the spirit of his troops, he decamped, and retired in good order to Apollonia, where he paid the army, and left his sick and wounded. From thence he marched into Macedon, where Scipio Metellus, Pompey's father-in-law, was encamped. He hoped either to draw his rival into some plain, or to overpower Scipio if not affailed. He met with great difficulties on his march, the countries through which he passed refusing to supply his army with provisions; to such a degree was his reputation sunk since his last defeat! On his entering Theffaly he was met by Domitius, one of his lieutenants, whom he had sent with three legions to reduce Epirus. Having now got all his forces together, he marched directly to Gomphi, the first town of Theffaly, which had been formerly in his interest but now declared against him. Whereupon he attacked it with much vigour, that though the garrison was very numerous, and the walls were of an uncommon height, he made himself master of it in a few hours. From hence he marched to Metropolis, another considerable town of Theffaly, which immediately surrendered; as did all the other cities of the country, except Larissa, of which Scipio had made himself master.

On the other hand, Pompey being continually importuned by the senators and officers of his army, left his camp at Dyrrhachium, and followed Cæsar, firmly resolved...
Pompey resolves to come to an engagement.

Thee, together with the complaints of his soldiers, made him at length resolve to venture a general action. With this design he marched into a large plain near the cities of Pharalia and Thebes; which latter was also called Philippi, from Philip king of Macedon, and the father of Pericles, who, having reduced the Thebans, placed a colony of Macedonians in their city. This plain was watered by the Empeus, and surrounded on all sides by high mountains; and Pompey, who was still averse from venturing an engagement, pitched his camp on the declivity of a steep mountain, in a place altogether inaccessible. There he was joined by Scipio his father-in-law, at the head of the legions which he had brought with him from Syria and Cilicia. But notwithstanding this reinforcement, he continued irresolution, and unwilling to put all to the issue of a single action; being still convinced of the wisdom of his maxim, that it was better to destroy the enemy by fatigues and want, than to engage an army of brave veterans, who were in a manner reduced to despair. As he put off from day to day, under various pretences, defending into the plain where Cæsar was encamped, his officers forced him to call a council of war, when all to a man were for venturing a general action the very next day. Thus was Pompey obliged to sacrifice his own judgment to the blind ardour of the multitude; and the necessary measures were taken for a general engagement.

The event of this battle was in the highest degree fortunate for Cæsar; for Pompey refused to pursue his advantage, and follow Pompey to whatever country he should retire. Hearing, therefore, of his being at Amphipolis, he sent off his troops before him, and then embarked on board a little frigate in order to crofs the Hellepont; but in the middle of the strait, he fell in with one of Pompey's commanders, at the head of ten ships of war. Cæsar, no way terrified at the superiority of his force, bore up to him, and commanded him to submit. The other instantly obeyed, awed by the terror of Cæsar's name, and surrendered himself and his fleet at discretion.

From thence he continued his voyage to Ephesus, then to Rhodes; and being informed that Pompey had been there before him, he made no doubt but that he was fled to Egypt; wherefore, losing no time, he set sail for that kingdom, and arrived at Alexandria with about 40,000 men; a very inconsiderable force to keep such a powerful kingdom under subjection. But he was now grown so secure in his good fortune, that he expected to find obedience everywhere. Upon his landing, the first accounts he received were of Pompey's miserable end, who had been affaftinated by orders of the treacherous king as soon as he went on shore; and soon after one of the murderers came with his head and ring as a most grateful present to the conqueror. But Cæsar turned away from it with horror, and shortly after ordered a magnificent tomb to be built to his memory on the spot where he was murdered; and a temple near the place, to Nemesis, who was the goddess that punished those that were cruel to men in adversity.

It should seem that the Egyptians by this time had some hopes of breaking off all alliance with the Romans; which they considered, as in fact it was, but a specious subjection. They first began to take offence at Cæsar's carrying the ensigns of Roman power before him as he entered the city. Photinus, the eunuch, also treated him with disrespect, and even attempted his life. Cæsar, however, concealed his resentment till he had a large force sufficient to punish his treachery; and sending privately for the legions which had been formerly enrolled for Pompey's service, as being the nearest to Egypt, he in the mean time pretended to repose an entire confidence in the king's minister. However, he soon changed his manner when he found himself in no danger from his attempts; and declared, that, as being a Roman consul, it was his duty to settle the succession to the Egyptian crown.

There were at that time two pretenders to the crown of Egypt: Ptolemy, the acknowledged king; and the celebrated Cleopatra his sister; who, by the custom of the country, was also his wife, and by their father's will, shared jointly in the succession. However, not being contented with a bare participation of power, the aimed at governing alone; but being opposed in her views by the Roman senate, who confirmed her brother's title to the crown, she was banished to Syria with Arsinoe her younger sister.

Cæsar, however, gave her new hopes of obtaining the kingdom, and sent both for her and her brother to plead their cause before him. Photinus, the young king's guardian, who had long borne the most inveterate hatred as well to Cæsar as to Cleopatra, disdained this proposal, and backed his refusal by sending an army of 20,000 men to besiege him in Alexandria. Cæsar bravely repulsed the enemy for some time; but finding the city of too great extent to be defended by so small an army as he then had with him, he retired to the palace, which commanded the harbour, where he purposed to make a stand. Achillas, who commanded the Egyptians, attacked him there with great vigour, and still aimed at making himself master of the fleet that lay before the palace. Cæsar, however, too well knew the importance of those ships in the hands of an enemy; and therefore burnt them all in spite of every effort to prevent it. He next pressed himself of the isle of Pharos, which was the key to the Alexandrian port, by which he was enabled to receive the fugitives sent him from all sides; and in this situation he determined to withstand the united force of all the Egyptians.

In the meantime, Cleopatra having heard of the present turn in her favour, resolved to depend rather on Cæsar's favour for gaining the government than her own forces. She had, in fact, assembled an army in Syria to support her claims; but now judged it the wiser way to rely entirely on the decision of her self-elected judge. But no arts, as she jully conceived, were so likely to influence Cæsar, as the charms of her person. The difficulty was how to get at Cæsar, as her enemies were in possession of all the avenues that led to the palace. For this purpose, she went on board a small vessel, and in the evening landed near the palace; where, being wrapped up in a coverlet, she was carried.
carried by one Apolodorus into the very chamber of Cæsar. Her address at first pleased him; but her caution, which were carried beyond the bounds of innocence, entirely brought him over to second her claims.

While Cleopatra was thus employed in forwarding her own views, her sister Arsinoë was also frequently engaged in the camp in pursuing a separate interest. She had found means, by the alacrity of one Ganymede her confidant, to make a large division in the Egyptian army in her favour; and soon after caused Archilas to be murdered, and Ganymede to take the command in his stead, and to carry on the siege with greater vigour than before. Ganymede's principal effort was by letting in the sea upon those canals which supplied the palace with fresh water; but this inconvenience Cæsar remedied by digging a great number of wells.

His next endeavour was to prevent the junction of Cæsar's 24th legion, which he twice attempted in vain. He soon after made himself master of a bridge which joined the isle of Pharos to the continent, from which point Cæsar was resolved to dislodge him. In the heat of action, some mariners came and joined the combattants; but being seized with a panic, instantly fled, and spread a general terror through the army. All Cæsar's endeavours to rally his forces were in vain, the confusion was past remedy, and numbers were drowned or put to the sword in attempting to escape; on which, seeing the irreparable disorder of his troops, he retired to a ship in order to get to the palace that was into Africa, where Pompey's party had found time to land with a small party in Africa, where Pompey's party had found time to land;

The Alexandrians, finding their efforts to take the palace ineffectual, endeavoured at least to get their king out of Cæsar's power, as he had seized upon his person in the beginning of their disputes. For this purpose they made use of their cunning arts of dissimulation, proferring the utmost desire for peace, and only wanting the presence of their lawful prince to give a sanction to the treaty. Cæsar, who was sensible of their perfidy, nevertheless concealed his suspicions, and gave them their king, as he was under no apprehensions from the abilities of a boy. Ptolemy, however, the infant he was left at liberty, instead of promoting peace, made every effort to give vigour to hostilities.

In this manner Cæsar was hemmed in for some time; but he was at last relieved from this mortifying situation by Mithridates, one of his most faithful partizans; who, collecting a numerous army in Syria, marched into Egypt, took the city of Pelusium, repulsed the Egyptian army with loss, and at last, joining with Cæsar, attacked their camp, and made a great slaughter of the Egyptians. Ptolemy himself, attempting to escape on board a vessel that was falling down the river, was drowned by the ship's sinking; and Cæsar thus became master of all Egypt without any further opposition. He therefore appointed, the new Cleopatra, with her younger brother, who was then but an infant, should jointly govern, according to the intent of their father's will; and drove out Arsinoë with Ganymede into banishment.

Cæsar now for a while seemed to relax from the usual activity of his conduct, captivated with the charms of Cleopatra. Instead of quitting Egypt to go and quell the remains of Pompey's party, he abandoned himself to his pleasures, passing whole nights in feasts with the young queen. He even resolved to attend her up the Nile to Ethiopia; but the brave veterans, who had long followed his fortune, boldly reprehended his conduct, and refused to be partners in so infamous an expedition. Thus, at length, roused from his lethargy, he left Cleopatra, by whom he had a son who was afterwards named Cæsarion, in order to oppose Pharœnas the king of Pontus, who had now made some inroads upon the dominions of Rome. Here he was attended with the greatest success, as we have related under the article POMPEY; and having settled affairs in this part of the empire, as well as time would permit, he embarked for Italy, where he arrived sooner than his enemies could expect, but not before his affairs there absolutely required his presence. He had been, during his absence, created consul for five years, dictator for one year, and tribune of the people for life. But Antony, who in the mean time governed in Rome for him, had filled the city with riot and debauchery, and many commotions ensued, which nothing but the arrival of Cæsar could appease. However, by his moderation and humanity, he soon restored tranquillity to the city, and having made a division between Phœnas and the opposite party. Thus having, by gentle means, restored his authority at home, he prepared to march into Africa, where Pompey's party had found time to rally under Scipio and Cato, assisted by Juba king of Mauritian. But the vigour of his proceedings had like to have been retarded by a mutiny in his whole army. These veteran legionaries, who had hitherto conquered all that came before them, began to murmur for not having received the rewards which they had expected for their past services, and now infilled upon their discharges. However, Cæsar found means to quell the mutiny; and then, according to his usual diligence, landed with a small force in Africa, the rest of the army following soon after. After many movements and skirmishes, he resolved at last to come to a decisive battle. For this purpose he invested the city of Tarsus, supposing that Scipio would attempt its relief, which turned out according to his expectation. Scipio, joining with the young king of Mauritania, advanced with his army, and encamping near Cæsar, they soon came to a general battle. Cæsar's success was as usual: the enemy received a complete and final overthrow, with little loss on his side. Juba, and Petreius his general, killed each other in despair; Scipio, attempting to escape by sea into Spain, fell in among the enemy, and was slain; so that, of all the generals of that undisciplined party, Cato was now alone remaining.

This extraordinary man, having retired into Africa after the battle of Pharsalus, had led the wretched remains of that defeat through burning defects and roads infested with serpents of various malignity, and was now in the city of Utica, which he had been long to defend. Still, however, in love with even the show of Roman government, he had formed the principal citizens into a senate, and conceived a resolution of holding out the town. He accordingly assembled his senators upon this occasion, and exhorted them to stand a siege; but finding his admonitions ineffectual, he flung himself with his sword. Upon his death, Cato kills himself. 
the war in Africa being completed, Cæsar returned in triumph to Rome; and, as if he had abridged all his former triumphs only to increase the splendor of this, the citizens were astonished at the magnificence of the procession, and the number of the countries he had subdued. It lasted four days: the first was for Gaul, the second for Egypt, the third for his victories in Asia, and the fourth for that over Juba in Africa. To every one of his fingers he gave a sum equivalent to about 150 l. Sterling, double the sum to the centurions, and four times as much to the superior officers. The citizens also shared his bounty; to every one of whom he distributed 10 bushels of corn, 10 pounds of oil, and a sum of money equal to about 2000 s. sterling, to the people at about 20,000 tables, treated them with the combat of gladiators, and filled Rome with a concourse of spectators from every part of Italy.

The people now seemed eager only to find out new modes of homage and unseemly methods of adulation for their great enslaver. He was created, by a new title Magifter Morum, or Morator of the Morals of the People; he received the title of Emperor, Father of his country; his person was declared sacred; and, in short, upon him alone were devolved for life all the great dignities of the state. It must be owned, however, that no sovereign could make a better use of his power. He immediately began his empire by repressing vice and encouraging virtue. He communicated the power of judicature to the senators and the knights alone, and by many sumpuous laws restrained the scandalous luxuries of the rich. He proposed rewards to all such as had many children; and took the most prudent methods of repeopling the city, that had been exhausted in the late commotions; and besides his other works, he greatly reformed the calendar.

Having thus restored prosperity once more to Rome, he again found himself under a necessity of going into Spain, to oppose an army which had been raised there under the two sons of Pompey, and Labienus his former general. He Proceeded in this expedition with the usual celebrity, and arrived in Spain before the enemy thought him yet departed from Rome. Cænus and Sextus, Pompey's sons, profiting by their unhappy father's example, resolved as much as possible to protract the war; so that the first operations of the two armies were spent in sieges and fruitless attempts to surprize each other. At length Cæsar, after taking many cities from the enemy, and pursuing young Pompey with unwearied perseverance, compelled him to come to a battle upon the plains of Munda.

After a most obstinate engagement, Cæsar gained a complete victory (see Munda) and having now subdued all his enemies, he returned to Rome for the last time to receive new dignities and honors, and to enjoy an accumulation of all the great offices of the state. Still, however, he pretended to a moderation in the enjoyment of his power; he left his consuls to be named by the people; but as he polled all the authority of the office, it from this time began to find its contempt. He enlarged the number of his triumphs also; but as he had previously destroyed their power, their new honors were but empty titles. He took care to pardon all who had been in arms against him, but not till he had deprived them of the power of resistance. He even set up once more the statues of Pompey; which, however, as Cicero observed, he only did to secure his own. The rest of this extraordinary man's life was employed for the advantage of the state. He adorned the city with magnificent buildings; he rebuilt Carthage, and Corinth sending colonies to both cities; he undertook to level several mountains in Italy, to drain the Pontine marches near Rome, and designed to cut through the Isthmus of Peloponnesus. Thus he formed mighty projects and designs beyond the limits of the longest life; but the greatest of all was his intended expedition against the Parthians, by which he designed to revenge the death of Crassus; then to pass through Hyrcania, and enter Scythia along the banks of the Caspian sea; from thence to open himself a way through the immeasurable forests of Germany into Gaul, and so return to Rome. These were the aims of ambition; but the jealousy of a few individuals put an end to them all.

The senate, with an adulation which marked the degeneracy of the times, continued to load Cæsar with fresh honors, and he continued with equal vanity to receive them. They called one of the months of the year after his name; they flamped money with his image; they ordered his statue to be set up in all the cities of the empire; they instituted public sacrifices on his birth-day; and talked, even in his life-time, of enrolling him in the number of their gods. Antony, at one of their public festivals, foolishly ventured to offer him a diadem; but he put it back again, refusing it several times, and receiving at every refusal loud acclamations from the people. One day, when the senate ordered him some particular honors, he neglected to rise from his seat; and from that moment was said to have been marked for destruction. It began to be rumoured that he intended to make himself king; for though in fact he already was so, the people, who had an utter avertness to the name, could not bear his assuming the title. Whether he really designed to assume that empty honour must now forever remain a secret; but certain it is, that the unfuturing generals and conduct marked something like a confidence in the innocence of his intentions. Warnings infombed by those of him of the jealousy of many persons who envied his power, he was heard to say, That he had rather die once by treachery, than to live continually in the apprehension of it: and to convince the world how little he had to apprehend from his enemies, he disband ed his company of Spanish guards, which facilitated the enterprise against his life.

A deep-laid conspiracy was formed against him, composed of 70 lfs than 60 senators. At the head of this was Brutus, whose life Cæsar had spared after the battle of Pharsalia, and Catiline, who had been pardoned soon after, both prators for the present year. Brutus made it his chief glory to have been defended from that Brutus who first gave liberty to Rome; and from a desire of following his example, broke all the ties of private friendship, and entered into a conspiracy which was to destroy his benefactor. Catiline, on the other hand, was importunate and pressing, and hired Cæsar's person still more than his estate. He had often sought an opportunity of gratifying his revenge by assassination, which took rise rather from private than public motives.

3 C
The conspirators, to give a colour of justice to their proceedings, remitted the execution of this design to the ides of March, the day on which it was reported that Caesar was to be offered the crown. The augurs had foretold that this day would be fatal to him; and the night preceding, he heard his wife Calpurnia lamenting in her sleep, and being awakened, she confided to him that she dreamt of his being affaffinated in her arms. These omens, in some measure, began to change his intentions of going to the senate, as he had resolved, that day; but one of the conspirators coming in, prevailed upon him to keep his resolution, telling him of the reproach which would attend his flaying at home till his wife had lucky dreams, and of the preparations that were made for his appearance. As he went along to the senate, a slave, who halfened to him with information of the conspiracy, attempted to come near him, but could not for the crowd.

As soon as he had taken his place in the senate, the conspirators came near him, under a pretence of flattering him; and Cimber, who was one of them, approached in a suppliant posture, pretending to sue for his brother’s pardon, which was banished by his order. All the conspirators seconded him with great tenderness; and Cimber, seeming to sue with still greater submission, took hold of the bottom of his robe, holding him so as to prevent his rifing. This was the signal agreed on. Caesar, who was behind, flabled him, though slight, in the shoulder. Caesar faintly turned round, and with the style of his tablet wounded him in the arm. However, all the conspirators were now alarmed; and inclosing him round, he received a second stab from an unknown hand in the breast, while Cassius wounded him in the face. He still defended himself with great vigour, rushing among them, and throwing down such as opposed him, till he drew Brutus among the conspirators, who, coming up, struck his dagger in his thigh. From that moment Caesar thought no more of defending himself, but looking upon this conspirator, cried out, “And you too, Brutus?” Then covering his head, funeral obsequies were performed to him in the face. He died of his information; but that this was to be deferred the crown.

It was in vain they alleged they only thought of benefiting them by a desire of plunder. In this affair their fears, ces. This was the signal agreed on. were the consuls, who, coming among the senators, by the prevailing decisions of the people, by the prevailing motives of private interest. He first read Caesar’s will, in which he had left Octavius, his sister’s grandson, his heir, permitting him to take the name of Caesar; and three parts of his private fortune Brutus was to inherit in equal shares between his father and every citizen, in particular, was to receive 500 sesterces. This last bequest not a little contributed to increase the people’s affections for their late dictator; they now began to consider Caesar as a father, who, not satisfied with doing them the greatest good while living, thought of benefiting them even after his death. As Antony continued reading, the multitude began to be moved, and sighs and lamentations were heard from every quarter. Antony, seeing the audience favourable.
vourable to his designs, now began to address the assembly in a more pathetic strain: he presented before them Cæsar’s bloody robe, and as he unfolded it, took care they should observe the number of flails in it: he then displayed an image, which to them appeared the body of Cæsar, all covered with wounds. The people could now no longer contain their indignation; they unanimously cried out for revenge; all the old soldiers who had fought under him, bemoaned, with his body, their coronets, and other marks of conquest with which he had honoured them. A great number of the first matrons in the city threw in their ornaments also; till at length, rage succeeding to sorrow, the multitude ran with flaming brands from the pile to set fire to the conspirators’ houses. In this rage of resentment, meeting with one Cinna, whom they made for another of the same name who was in the conspiracy, they tore him in pieces. The conspirators themselves, however, being well guarded, repulsed the multitude with no great trouble; but perceiving the rage of the people, they thought it safest to retire from the city. Divine honours were then granted him; and an altar was erected on the place where his body was burnt, where afterwards was erected a column inscribed, To the Father of his country.

In the mean time, Antony, who had excited this flame, resolved to make the best of the occasion. Having gained the people by his zeal in the cause, he next endeavoured to bring over the senate, by a seeming concern for the freedom of the state. He therefore proposed to recall Sextus, Pompey’s only remaining son, who had concealed himself in Spain since the death of his father; and to grant him the command of all the fleets of the empire. His next step to their confidence, was the quelling a sedition of the people, who rose to revenge the death of Cæsar, and putting their leader Amathus to death, who pretended to be the son of Marius. He after this pretended to dread the resentments of the multitude, and demanded a guard for the security of his person. The senate granted his request; and, under this pretext, he drew round him a body of 6000 retinues men, attached to his interest, and ready to execute his commands. Thus he continued every day making rapid strides to absolute power; all the authority of government was lodged in his hands and those of his two brothers alone, who shared among them the consular, tribunitian, and praetorian power. His views to revenge Cæsar’s death seemed either postponed, or totally forgotten; and his only aim seemed to be to confirm himself in that power which he had thus artfully acquired. But an obstacle to his ambition seemed to arise from a quarter in which he least expected it. This was from one Octavius, or Octavius Cæsar, afterwards called Augustus, who was the grand-nephew, and adopted son of Cæsar, and was at Apollonia when his kinman was slain. He was then about 18 years old, and had been sent to that city to improve himself in the study of Grecian literature. Upon the news of Cæsar’s death, notwithstanding the earnest dispositions of all his friends, he resolved to return to Rome, to claim the inheritance, and revenge the death of his uncle. From the former professions of Antony, he expected to find him a warm adherent to his aims; and he doubted not, by his concurrence, to take signal vengeance on all who had a hand in the conspiracy. However, he was greatly disappointed. Antony, whose projects were all to aggrandize himself, gave him but a very cold reception, and, instead of granting him the fortune left him by the will, delayed the payment of it upon various pretences, hoping to check his ambition by his limiting his circumstances. But Octavius, instead of abating his claims, even sold his own patrimonial estate, to pay such legacies as Cæsar had left, and particularly that to the people. By these means he gained a degree of popularity, which his enemies vainly laboured to diminish, and which in fact he had many other methods to procure. His conversation was elegant and instructing, his face comely and graceful, and his affection to the late dictator so sincere, that every person was charmed either with his piety or his address. But what added still more to his interest was the name of Cæsar, which he had assumed, and, in conformance of which, the former followers of his uncle now flocked in great numbers to him. All these he managed with such art, that Antony now began to conceive a violent jealousy for the talents of his young opponent, and secretly laboured to counteract all his designs. In fact, he did not want reason; for the army near Rome, that had long wished to see the conspirators punished, began to turn from him to his rival, whom they saw more sincerely bent on gratifying their desires. Antony having procured also the government of Histri Gaul from the people, two of his legions that he had brought home from his former government of Macedonia, went over to Octavius, notwithstanding all his remonstrances to detain them. This produced, as usual, interviews, complaints, recriminations; and pretended reconciliations, which only tended to widen the difference; so that, at length, both sides prepared for war. Thus the state was divided into three distinct factions; that of Octavius, who aimed at procuring Cæsar’s inheritance, and revenging his death; that of Antony, whose sole view was to obtain absolute power; and that of the conspirators, who endeavoured to restore the senate to its former authority.

Antony being raised by the people to his new government of Cisalpine Gaul, contrary to the inclinations of the senate, resolved to enter upon his province immediately, and oppose Brutus, who commanded a small body of troops there, while his army was yet entire. He accordingly left Rome, and marching thither, commanded Brutus to depart. Brutus, being unable to oppose him, retired with his forces; but being pursued by Antony, he was at last besieged in the city of Mutina, of which he sent word to the senate.

In the mean while, Octavius, who by this time had raised a body of 10,000 men, returned to Rome; and being resolved, before he attempted to take vengeance on the conspirators, if possible to diminish the power of Antony, began by bringing over the senate to second his designs. In this he succeeded by the credit of Cicero, who had long hated Antony because he thought him the enemy of the state. Accordingly, a war broke out, by means of his eloquence, a decree was passed, ordering Antony to raise the siege of Mutina, to evince Cisalpine Gaul, and to await the further orders of the senate upon the banks of the Rubicon. Antony treated the order with contempt; and instead of
obeying, began to show his displeasure at being hit
to fo submissive. Nothing now therefore remained
for the senate but to declare him an enemy to the state,
and to send Octavius, with the army he had raised, to
curb his insolence. The latter was very ready to offer
his army for this expedition, in order to revenge his
own private injuries, before he undertook those of the
public. The two consuls, Hortus and Panph, joined
all their forces, and thus combined, marched at the
head of a numerous army, against Antony, into
Cisalpine Gaul. After one or two ineffectual conflicts,
both armies came to a general engagement; in which
Antony was defeated, and compelled to fly to Lepi-
dus, who commanded a body of forces in Further
Gaul. This victory, however, which promised the se-
enate so much success, produced effects very different
from their expectations. The two consuls were morta-
ly wounded; but Panph, previous to his death, called
Octavius to his bedside, and advised him to join with
Antony, telling him, that the senate only desired to
depose both, by opposing them to each other. The
advice of the dying confess funk deep on his spirits; so
that from that time he only fought a pretext to break
with them. Their giving the command of a party of
his army to Decimus Brutus, and their denying him a
triumph soon after, served to alienate his mind en-
tirely from the senate, and made him resolve to join
Antony and Lepidus. He was willing, however, to
try the senate thoroughly, before he came to an open
rupture; wherefore he sent to demand the confalship,
which was refused him. He then thought himself ob-
ligated to keep no measures with that assembly, but pri-
vately sent to found the inclinations of Antony and
Lepidus, concerning a junction of forces, and found
them as eager to affift as the senate was to oppose
him. Antony was, in fact, the general of both armies,
and Lepidus was only nominally so, his soldiers refufing
to obey him upon the approach of the former. Where-
fore, upon being assured of the affection of Octavius
upon their arrival in Italy, they soon crossed the Alps
with an army of 17 legions, breathing revenge against
all who had opposed their designs.

The senate now began, too late, to perceive their
error in disbelieving Octavius; and therefore gave him
the confalship which they had so lately refused, and, to
prevent his joining with Antony, flattered him with new
honours, giving him a power superior to all law.
The first use Octavius made of his new authority was
to procure a law for the condemnation of Brutus and
Cassius; after which, he joined his forces with those of
Antony and Lepidus.

The meeting of these three usurpers of their coun-
try’s freedom was near Mutina, upon a little island of
the river Panars. Their mutual suspicions were the
cause of their meeting in this place. Lepidus first en-
tered, and, finding all things safe, made the signal for
the other two to approach. Octavius began the con-
ference, by thanking Antony for his zeal in putting
Decimus Brutus to death; who, being abandoned by
his army, was taken as he was designing to escape in-
to Macedonia, and beheaded by Antony’s command.
Their conference lasted for three days; and the refult
of it was, that the supreme authority should be lodged
in their hands, under the title of the triumvirate, for
the space of five years; that Antony should have
Gaul; Lepidus, Spain; and Octavius, Africa, and
the Mediterranean islands. As for Italy, and the e-
ternal provinces, they were to remain in common, until
their general enemy was entirely subdued. But the laft
article of their union was a dreadful one. It was
agreed that all their enemies should be destroyed; of
which each presented a list. In these were comprised
not only the enemies, but the friends of the triumvi-
rate, since the partisans of the one were often found
among the opponents of the others. Thus Lepidus gave
up his brother Paulus to the vengeance of his col-
league; Antony permitted the proscription of his uncle
Lucius; and Octavius delivered up the great Cicero.
The most favored rights of nature were violated; 300
senators, and above 2000 knights, were included in
this terrible proscription; their fortunes were confi-
crated, and their murderers enriched with the spoils.
Rome soon felt the effects of this infernal union, and
the horrid cruelties of Marius and Sylla were renewed.
As many as could escape the cruelty of the triumvirs,
flid thither into Macedonia to Brutus, or found refuge
with young Pompey, who was now in Sicily, and cov-
ered the Mediterranean with his numerous navy.
Their cruelties were not aimed at the men alone; but
the female sex were in danger of being marked as ob-
jects either of avarice or resentment. They made out
a lift of 1400 women of the best quality, and the
richest in the city, who were ordered to give in an ac-
count of their fortunes, to be taxed in proportion. But
this seemed so unpopular a measure, and was so firmly
opposed by Hortensia, who spoke against it, that, in-
stead of 1400 women, they were content to tax only
400. However, they made up the deficiency by ex-
tending the tax upon men; near 100,000, as well cit-
zens as strangers, were compelled to furnish supplies
to the subvention of their country’s freedom. At last,
both the avarice and vengeance of the triumvirs seem-
fully satisfied, and they went into the senate to de-
clare that the proscription was at an end; and thus ha-
ving deluged the city with blood, Octavius and An-
tony, leaving Lepidus to defend Rome in their ab-
defence, marched with their army to oppose the con-
spirators, who were now at the head of a formidable
army in Asia.

Brutus and Cassius, the principal of these, upon the
death of Caesar, being compelled to quit Rome, went oppo-
ited by into Greece where they persuaded the Roman citizens
and at Athens to declare in the cause of freedom; then
Leptus to declare in the cause of freedom; then
parting, the former raised a powerful army in Mace-
donia and the adjacent countries, while the latter went
into Syria, where he soon became master of 12 legions,
and reduced his opponent Dolabella to such straits
as to kill himself. Both armies, soon after joining at
Smyrna, the fight of such a formidable force began to
revive the declining spirits of the party, and to re-
call the two generals still more closely, between whom
there had been some time before a slight misunderstanding.
In short, having quitted Italy like disfue-
ed exiles, without having one single soldier or one
town that owned their command, they now found
themselves at the head of a flourishing army, furni-
ished with all the necessaries for carrying on the war, and in
a condition to support a contest where the empire
of the world depended on the event. This success in
raising levies was entirely owing to the justice, mo-
deration,
It was in this flourishing state of their affairs that the conspirators had formed a resolution of going against Cleopatra, who, on her side, had made great preparations to affright their opponents. However, they were diverted from this purpose by a proclamation that Octavius and Antony were now upon their march, with 40 legions to oppose them. Brutus now, therefore, moved to have their army pass over into Greece and Macedonia, and there meet the enemy; but Cassius fo far prevailed as to have the Rhodians and Lycians first reduced, who had refused their usual contribution. This expedition was immediately put in execution, and extraordinary contributions were raised by that means, the Rhodians having scarce anything left but their lives*. The Lycians suffered still more severely; for having that themselves up in the city of Xanthus, they defended the place against Brutus with such fury, that neither his art nor intreaties could prevail upon them to surrender. At length, the town being set on fire, by their attempting to burn the works of the Romans, Brutus, instead of laying hold on this opportunity to storm the place, made every effort to preserve it, intent on trying to give any means of extinguishing the fire; but the desperate phrenzy of the citizens was not to be mollified. Far from thinking themselves obliged to their generous enemy for the efforts which were made to save them, they resolved to perish in the flames. Wherefore, instead of extinguishing, they did all in their power to augment the fire, by throwing in wood, dry reeds, and all kinds of fuel. Nothing could exceed the dilletess of Brutus upon seeing the townsmen thus resolutely bent on deftroying themselves; he rode about the fortifications, stretching out his hand to the Xanthians, and conjuring them to have pity on themselves and their city; but, insensible to his entreatials, their resolution to save themselves was not to be mollified. At this horrid spectacle, Brutus offered a reward to every soldier who would bring him a Lycian alive. The number of those whom it was possible to save from their own fury amounted to no more than 150.

Brutus and Cassius met once more at Sardis, where, after the usual ceremonies were passed between them, they resolved to have a private conference together, when, after much altercation, they were at last perfectly reconciled. After which, night coming on, Cassius invited Brutus and his friends to an entertainment. Upon retiring home, it was that Brutus, as Plutarch tells the story, saw a spectre in his tent. It was in the dead of the night, when the whole camp was perfectly quiet, that Brutus was employed in reading by a lamp that was just expiring. On a sudden he thought he heard a noise as if somebody entered; and looking towards the door, he perceived it open. A gigantic figure, with a frightful aspect, stood before him, and continued to gaze upon him with silent severity. At last Brutus had courage to speak to it: "Art thou a demon or a mortal man? and why comest thou to me?" "Brutus," replied the phantom, "I am thy evil genius, thou shalt see me again at Philippi." "Well then," answered Brutus, without being discomposéd, we shall meet again." Upon which the phantom vanished; and Brutus calling to his servants, asked if they had seen any thing; to which replying in the negative, he again resumed his studies. But as he was struck with so strange an occurrence, he mentioned it the next day to Cassius, who, being an Epicurean, ascribed it to the effect of imagination too much exercised by vigilance and anxiety. Brutus appeared satisfied with this solution of his late terror; and, as Antony and Octavius were now advanced into Macedonia, they soon after passed over into Thrace, and advanced to the city of Philippi, near which the forces of the triumvirs were posted.

A battle soon ensued, in which the republicans were defeated, and Cassius killed, as is related in the article Philippi.

The first care of Brutus, when he became the sole general, was to assemble the disperced troops of Carullus, andanimate them with fresh hopes of victory. As they had lost all they possessed by the plundering of their camp, he promised them 2000 denarii each man to make up their losses. This once more inspired them with new ardour; they admired the liberality of their general, and with loud shouts proclaimed his former intrepidity. Still, however, he had not confidence sufficient to face the adversary, who offered him battle the ensuing day. His aim was to starve his enemies, who were in extreme want of provisions, their fleet having been lately defeated. But his single opinion was over-ruled by the rest of his army, who now grew every day more confident of their strength, and more arrogant to their new general. He was, therefore, at last, after a refpite of 20 days, obliged to comply with their solicitations to try the fate of the battle. Both armies being drawn out, they remained a long while opposite to each other without offering to engage. It is said that he himself had lost much of his natural ardour by having again seen the spectre the night preceding; however, he encouraged his men as much as possible, and gave the signal for battle within three hours of sun-set. Fortune again declared against him; and they were two triumvirs expressly ordered by no means to suffer defeated a general to escape, for fear he should renew the second time. Thus the whole body of the enemy seemed chiefly intent on Brutus alone, and his capture seemed inevitable. In this deplorable exigence, Lucullus his friend relieved, by his own death, to effect the general's delivery. Upon perceiving a body of Thracian horse closely pursuing Brutus, and just upon the point of taking him, he boldly threw himself in their way, telling them that he was Brutus. The Thracians, overjoyed with so great a prize, immediately dispatched some of their companions, with the news of their fel- ly, to the army. Upon which, the ardour of the pursuit now abating, Antony marched out to meet his prisoner; and, silently deploiring the fate of so virtuous a man, others reproaching that mean desire of life for which he contented to undergo captivity. Antony now seeing the Thracians approach, began to prepare himself for the interview; but the faithful Lucullus, advancing with a cheerful air, owned the deceit that he had put upon him; on which the triumvir, struck with so much fidelity, pardoned him upon the spot; and from that time forward loaded him with benefits, and honoured him with his friendship.
In the mean time Brutus, with a small number of friends, passed over a rivulet, and, night coming on, sat down under a rock which concealed him from the pursuit of the enemy. After taking breath for a little time, he sent out one Statilius to give him some information of those that remained; but he never returned, being killed by a party of the enemy's horse. Brutus judging very rightly of his fate, now resolved to die likewise, and spoke to those who would round him, to lend him their last sad affiance. None of them, however, would render him so melancholy a piece of service. At last one Strabo, averting his head, presented the sword to Brutus; who threw himself upon it, and immediately expired.

From the moment of Brutus's death the triumviri began to act as sovereigns, and to divide the Roman dominions between them, as theirs by right of conquest. However though there were apparently three who thus participated all the power, yet, in fact, only two were actually possessed of it; since Lepidus was at first admitted merely to curb the mutual jealousy of Antony and Octavianus, and was possessed neither of interest in the army nor authority among the people. Their first care was to punish those whom they had formerly marked for vengeance. The head of Brutus was sent to Rome to be thrown at the foot of Cæsar's statue. His ashes, however, were sent to his wife Porcia, Cato's daughter, who afterwards killed herself by swallowing burning coals. It is observed, that of all those who had a hand in the death of Cæsar, not one died a natural death.

The power of the triumviri being thus established upon the ruins of the commonwealth, Antony went into Greece, and spent some time at Athens, conversing among the philosophers, and afflicting them at their disputes in person. From thence he passed over to Asia, where all the monarchs of the east, who acknowledged the Roman power, came to pay him their obedience. In this manner he proceeded from kingdom to kingdom, attended by a crowd of sovereigns, exacting contributions, distributing favours, and giving away crowns and capricious insolence. He presented the kingdom of Cappadocia to Sytene, in prejudice of Ariarathes, only because he found pleasure in the beauty of Glypha, the mother of the former. He settled Herod in the kingdom of Judea, and supported him against every oppover. But among all the sovereigns of the east who shared his favours, none had so large a part as Cleopatra, the celebrated queen of Egypt.

It happened that Serapion, her governor in the island of Cyprus, had formerly furnished some favours to his conspirators; and it was thought proper that she should answer for his conduct on that occasion. Accordingly, having received orders from Antony to come and clear herself of this imputation of infidelity, she readily complied, equally conscious of the goodness of her caæle and the power of her beauty. She had already experienced the force of her charms upon Cæsar and Pompey's eldest son; and the addition of a few years since that time had not impaired their lustre. Antony was now in Tarsus, a city of Cilicia, when Cleopatra resolved to attend his court in person. She sailed down the river Cydnus, at the mouth of which the city floods, with the most sumptuous pageantry. Her galley was covered with gold; the sails were of purple, large, and floating in the wind. The ears of silver kept tune to the sound of flutes and cymbals. She herself lay reclined on a couch fringed with stars of gold, and with such ornaments as poets and painters had usually ascribed to Venus. On each side were boys like Cupids, who kindled her by turns; while the most beautiful nymphs, dressed like Nereids and Graces, were placed at proper distances around her. Upon the banks of the river were kept burning the most exquisite perfumes, while an infinite number of people gazed upon the sight. Antony was captivated with her beauty; and, leaving all his business to satisfy his passion, shortly after followed her into Egypt.

While he thus remained idle, Octavianus, who took upon him to lead back the veteran troops and settle them in Italy, was abundantly employed in providing for their subsistence. He had promised them lands at home, as a recompence for their past services; but they could not receive new grants, without turning out the former inhabitants. In consequence of this, multitudes of women, with children in their arms, whose tender years and innocence excited universal compassion, daily filled the temples and the streets with their dittresses. Numbers of husbandmen and shepherds came to deprecate the conqueror's intention, or to obtain an habitation in some other part of the world. Amongst this number was Virgil, the poet, in a humble manner begged permission to retain his patrimonial farm: Virgil obtained his request; but the rest of his countrymen, of Mantua and Cremona, were turned out without mercy.

Italy and Rome now felt the most extreme miseries; the insolent soldiers plundered at will; while Sextus furnished Pompey, being master of the sea, cut off all foreign communication, and prevented the people's receiving their usual supplies of corn. To these mischiefs were added the commencement of another civil war. Fulvia, the wife of Antony, who had been left behind him at Rome, had felt for some time all the rage of jealousy, and resolved to try every method of bringing back her husband from the arms of Cleopatra. She considered a breach with Octavianus as the only probable means of rousing him from his lethargy; and accordingly, with the assistance of Lucius her brother-in-law, who was then consul, and entirely devoted to her interest, she began to sow the seeds of dissension. The pretext was, that Antony should have a share in the distribution of lands as well as Octavianus. This produced some negotiations between them; Octavianus offered to make the veterans themselves umpires in the dispute. Lucius refused to acquiesce; and being at the head of more than six legions, mostly composed of such as had been dispossessed of their lands, he resolved to compel Octavianus to accept of whatever terms he should offer. Thus a new war was excited between Octavianus and Antony; or, at least, the generals of the latter affirmed the fact of his name. Octavianus, however proved victorious: Lucius was hemmed in between two armies, and conftrainted to retreat to Perusia, a city of Etruria, where he was closely besieged by the opposite party. He made many desperate sallies, and Fulvia did all in her power to relieve him, but without success. He was at last, therefore, reduced to such extremity by famine that he came out in person and delivered himself up to the mercy of the conqueror. Octavianus received him very honourably, and generously pardoned him and all his followers. Thus having concluded
The empire divided anew.

The death of this general removed one very powerful obstacle to the ambition of Octavius, and he resolved to take the earliest opportunity to get rid of the rest of his associates. An offence was soon furnished by Lepidus, that served as a sufficient pretext for his undoing. Pompey resolved to fly to Antony, from whom he expected refuge, as he had formerly obliged that triumvir by giving protection to his mother. However, he tried once more, at the head of a small body of men, to make himself independent, and even surprised Antony's officers who had been sent to accept of his submissions. Nevertheless, he was at last abandoned by his soldiers, and delivered up to Titus, Antony's lieutenant, who shortly after cauited him to be slain.

The next chapter...

Antony, who during this interval, was revelling in all the fuided luxuries procured him by his insidious mifsire, having heard of his brother's overthrow, and his wife's being compelled to leave Italy, was resolved to oppose Octavius without delay. He accordingly failed at the head of a considerable fleet from Alexandria to Tyre, from thence to Cyprus and Rhodes, and had an interview with Fulvia his wife at Athens. He much blamed her for occasioning the late disorders, and left the utmost contempt for her person, and, leaving her upon her death-bed at Sicyon, hastened into Italy to fight Octavius. They both met at Brundusium; and it was now thought that the flames of a civil war were going to blaze out once more. The forces of Antony were numerous, but mostly newly raised; however, he was affilled by Sextus Pompeius, who in these oppositions of interests was daily coming into power. Octavius was at the head of three veterans who had always been irresistible, but who seemed no way disposed to fight against Antony their former general. A negotiation was therefore proposed; and a reconciliation was effected. All offences and fronts were mutually forgiven; and to cement the union, a marriage was concluded between Antony and Octavia, the sister of Octavius. A division of the Roman empire was made between them; Octavius was to have the command of the west, Antony of the east, while Lepidus was obliged to content himself with the provinces in Africa. As for Sextus Pompeius, he was permitted to retain all the islands he had already possessed, together with Peloponnesus; he was also granted the privilege of demanding the confufulness in his absence, and of discharging that office by any of his friends. It was likewise stipulated to leave the sea open, and pay the people what corn was due out of Sicily. Thus a general peace was concluded, to the great satisfaction of the people, who now expected a cessation from all their calamities.

This calm seemed to continue for some time; Antony led his forces against the Parthians, over whom his lieutenant Verrinius had gained great advantages. Octavius drew the greatest part of his army into Gaul, where there were some disturbances; and Pompey went to secure his newly ceded province to his interest. It was on this quarter that fresh motives were given for renewing the war. Antony, who was obliged by treaty to quit Peloponnesus, refused to evacuate it till Pompey had satisfied him for such debts as were due to him from the inhabitants. This Pompey would not be satisfied with; but immediately fitted out a new fleet, and renewed his former enterprises, by cutting off such corn and provisions as were confined to Italy. Thus the grievances of the people were again renewed; and the people began to complain, that instead of three tyrants they were now oppressed by four.

In this exasperation, Octavius, who had long meditated the best means of diminishing the number, resolved to begin by getting rid of Pompey, who kept the state in continued alarms. He was master of two fleets; one of which he had caused to be built at Ravena; and another which Menodorus, who revolted from Pompey, brought to his aid. His first attempt was to invade Sicily; but being overpowered in his passage by

Pompey, and afterwards shattered in a storm, he was obliged to defer his designs to the ensuing year. During this interval he was reinforced by a fleet of 140 ships, given him by Antony, with which he resolved once more to invade Sicily, on three several quarters. The death of this general obviated the necessity of continuing the war, and the people of three tyrants they were now oppressed with.

A reconciliation was therefore proposed; and a reconciliation was effected. All offences and fronts were mutually forgiven; and to cement the union, a marriage was concluded between Antony and Octavia, the sister of Octavius. A division of the Roman empire was made between them; Octavius was to have the command of the west, Antony of the east, while Lepidus was obliged to content himself with the provinces in Africa. As for Sextus Pompeius, he was permitted to retain all the islands he had already possessed, together with Peloponnesus; he was also granted the privilege of demanding the confufulness in his absence, and of discharging that office by any of his friends. It was likewise stipulated to leave the sea open, and pay the people what corn was due out of Sicily. Thus a general peace was concluded, to the great satisfaction of the people, who now expected a cessation from all their calamities.

This calm seemed to continue for some time; Antony led his forces against the Parthians, over whom his lieutenant Verrinius had gained great advantages. Octavius drew the greatest part of his army into Gaul, where there were some disturbances; and Pompey went to secure his newly ceded province to his interest. It was on this quarter that fresh motives were given for renewing the war. Antony, who was obliged by treaty to quit Peloponnesus, refused to evacuate it till Pompey had satisfied him for such debts as were due to him from the inhabitants. This Pompey would not be satisfied with; but immediately fitted out a new fleet, and renewed his former enterprises, by cutting off such corn and provisions as were confined to Italy. Thus the grievances of the people were again renewed; and the people began to complain, that instead of three tyrants they were now oppressed by four.

In this exasperation, Octavius, who had long meditated the best means of diminishing the number, resolved to begin by getting rid of Pompey, who kept the state in continued alarms. He was master of two fleets; one of which he had caused to be built at Ravena; and another which Menodorus, who revolted from Pompey, brought to his aid. His first attempt was to invade Sicily; but being overpowered in his passage by

Pompey, and afterwards shattered in a storm, he was obliged to defer his designs to the ensuing year. During this interval he was reinforced by a fleet of 140 ships, given him by Antony, with which he resolved once more to invade Sicily, on three several quarters. The death of this general obviated the necessity of continuing the war, and the people of three tyrants they were now oppressed with.

A reconciliation was therefore proposed; and a reconciliation was effected. All offences and fronts were mutually forgiven; and to cement the union, a marriage was concluded between Antony and Octavia, the sister of Octavius. A division of the Roman empire was made between them; Octavius was to have the command of the west, Antony of the east, while Lepidus was obliged to content himself with the provinces in Africa. As for Sextus Pompeius, he was permitted to retain all the islands he had already possessed, together with Peloponnesus; he was also granted the privilege of demanding the confufulness in his absence, and of discharging that office by any of his friends. It was likewise stipulated to leave the sea open, and pay the people what corn was due out of Sicily. Thus a general peace was concluded, to the great satisfaction of the people, who now expected a cessation from all their calamities.

This calm seemed to continue for some time; Antony led his forces against the Parthians, over whom his lieutenant Verrinius had gained great advantages. Octavius drew the greatest part of his army into Gaul, where there were some disturbances; and Pompey went to secure his newly ceded province to his interest. It was on this quarter that fresh motives were given for renewing the war. Antony, who was obliged by treaty to quit Peloponnesus, refused to evacuate it till Pompey had satisfied him for such debts as were due to him from the inhabitants. This Pompey would not be satisfied with; but immediately fitted out a new fleet, and renewed his former enterprises, by cutting off such corn and provisions as were confined to Italy. Thus the grievances of the people were again renewed; and the people began to complain, that instead of three tyrants they were now oppressed by four.

In this exasperation, Octavius, who had long meditated the best means of diminishing the number, resolved to begin by getting rid of Pompey, who kept the state in continued alarms. He was master of two fleets; one of which he had caused to be built at Ravena; and another which Menodorus, who revolted from Pompey, brought to his aid. His first attempt was to invade Sicily; but being overpowered in his passage by
and conducted him to the Capitol: the people followed, crowned with garlands of flowers; and after having returned thanks to the gods, waited upon him to his palace. There remained now but one obstacle to his ambition, which was Antony, whom he resolved to remove, and for that purpose began to render his character as contemptible as he possibly could at Rome. In fact, Antony's conduct did not a little contribute to promote the endeavours of his ambitious partner in the state. He had marched against the Parthians with a prodigious army; but was forced to return with the loss of the fourth part of his forces, and all his baggage. This extremely diminished his reputation; but his making a triumphal entry into Alexandria soon after, entirely disquieted the citizens of Rome. However, Antony seemed quite regardless of their resentment: totally disregarding the buffoons of the state, he spent whole days and nights in the company of Cleopatra, who studied every art to increase his passion, and vary his entertainments. Not contented with sharing her company all the delights which Egypt could afford, Antony resolved to enlarge his sphere of luxury, by granting her many of those kingdoms which belonged to the Roman empire. He gave her all Phoenicia, Celo-Syria, and Cyprus; with a great part of Cilicia, Arabia, and Judea; gifts which he had no right to bestow, but which he pretended to grant in imitation of Hercules. This complication of vice and licentiousness, took care to suppress all the complaints of Octavia, whom he so much loved, and entirely to repudiate his first wife; but, in fact, to furnish a sufficient pretext of declaring war against him, as he knew she would be dismisst with contempt.

Antony was now in the city of Leucopolis, revelling with his injudicious paramour, when he heard that Octavia was at Athens, upon her journey to visit him. This was very unwelcome news to him as well as to Cleopatra, who, fearing the charms of her rival, endeavoured to convince Antony of the strength of her passion. He frequently caught her in tears, which she seemed as if willing to hide; and often intreated her to tell him the cause, which she ceased willing to suppress. These articles, together with the ceaseless flattery and importunity of her creatures, prevailed so much upon Antony's weakness, that he commanded Octavia to return home without seeing her, and attached himself still more closely to Cleopatra than before. His ridiculous passion now began to have no bounds. He resolved to own her for his wife, and entirely to repudiate Octavia. He accordingly assembled the people of Alexandria in the public theatre, where was raised an alcove of silver, under which were placed two thrones of gold, one for himself, and the other for Cleopatra. There he feated himself, dressed like Bacchus, while Cleopatra sat before him clothed in the ornaments and attributes of Isis, the principal deity of the Egyptians. On that occasion he declared her queen of all the countries which he had already belted upon her; while he associated Caesar, his son by Cleopatra, as his partner in the government. To the two children which he had by her herself he gave the title of "king of kings," with very extensive dominions; and, to crown his absurdities, he sent a minute account of his proceedings to the two confuls at Rome. It was now necessary to act up to his imaginary dignity; new luxuries and pageantries were now therefore studied, and new marks of profusion found out: not less than 60,000 l. Sterling were lavished upon one single entertainment; it is said, upon this occasion, that Cleopatra dissolved a pearl of great value in vinegar, and drank it off. But we are told of one circumstance that might well reprove their delights, and teach mankind to relish the beverage of virtue, however simple, above their greatest luxuries. He was sufficiently being poisoned in every meal; he feared Cleopatra, whom he so much loved, and would eat nothing without having it previously tasted by one of his attendants.

In the mean time Octavianus had now a sufficient resolves to pretext for declaring war; and informed the senate of his intentions. However, he deferred the execution of his design for a while, being then employed in quelling an insurrection of the Illyrians. The following year was chiefly taken up in preparations against Antony, who, perceiving his design, remonstrated to the senate, that he had many causes of complaint against Antony, who, having set upon Sicily without offering him a share; alleging that he had also dispossessed Lepidus, and kept to himself the province he had commanded; and that he had divided all Italy among his own followers, leaving nothing to recom pense those in Asia. To this complaint Octavianus was contented to make a sarcastic answer: implying, that it was absurd to complain of his distribution of a few trifling districts in Italy, when Antony having conquered Parthia, he might now reward his followers with cities and provinces. The farce upon Antony's misfortunes in Parthia so provoked him, that he ordered Candidus, who commanded his army, to march without intermission into Europe; while he and Cleopatra followed to Samos, in order to prepare for carrying on the war with vigour. When arrived there, it was ridiculous enough to behold the odd mixture of preparations for pleasure and for war. On one side all the kings and princes from Europe to the Euxine sea had orders to send him thither supplies both of men, provisions, and arms; on the other side, all the comedians, dancers, buffoons, and musicians of Greece, were ordered to attend him. Thus, frequently, when a ship was thought to arrive laden with soldiers, arms, and ammunition, it was found only filled with players and theatrical machinery. When news was expected of the approach of an army, messengers only arrived with tidings of a fresh quantity of venison. The kings who attended him endeavoured to gain his favour more by their entertainments than their warlike preparations; the provinces strove rather to please him by sacrificing to his divinity, than by their alacrity in his defence; so that some were heard to say, "What rejoicings would not this man make for a victory, when he thus triumphs at the eve of a dangerous war!"

In short, his best friends now began to forfake his interest.
to put himself in a condition for carrying on the war, and shortly after declared it against him in form. All Antony's followers were invited over to join him, with great promises of rewards; but they were not declared enemies, partly to prevent their growing desperate, and partly to give a show of moderation to his own party. At length both found themselves in readiness to begin the war, and their armies were answerable to the empire they contended for. The one was followed by all the forces of the east; the other drew all the strength of the west to support his pretensions. Antony's force composed a body of 100,000 foot and 12,000 horse; while his fleet amounted to 500 ships of war. The army of Octavius mustered but 60,000 foot, but equalled his adversary's in his number of cavalry; his fleet was but half as numerous as Antony's; however, his ships were better built, and manned with better soldiers.

The great decisive engagement, which was a naval one, was fought near Actium, a city of Epirus, at the entrance of the gulph of Ambracia. Antony ranged his ships before the mouth of the gulph; and Octavius drew up his fleet in opposition. Neither general affumed any fixed station to command in; but went about from ship to ship wherever his presence was necessary. In the mean time, the two land armies, on opposite sides of the gulph, were drawn up, only as spectators of the engagement; and encouraged the fleets by their thouts to engage. The battle began on both sides with great ardour, and after a manner not practised upon former occasions. The prows of their vessels were armed with brazen points; and with these they drove furiously against each other. In this conflict the ships of Antony came with greater force, but those of Octavius avoided the shock with greater dexterity. On Antony's side, the sterns of the ships were raised in form of a tower; from whence they threw arrows from machines, for that purpose. Those of Octavius made use of long poles hooked with iron, and fire-pots. They fought in this manner for some time with equal animosity; nor was there any advantage on either side, except a small appearance of disorder in the centre of Antony's fleet. But all of a sudden Cleopatra determined the fortune of the day. She was seen flying from the engagement attended by 60 slaves; frick, perhaps, with the terrors natural to her sex; but what increased the general amazement was, to behold Antony himself following soon after, and leaving his fleet at the mercy of the conquerors. The engagement, notwithstanding, continued with great obstinacy till five in the evening; when Antony's forces, partly constrained by the conduct of Agrippa, and partly persuaded by the promises of Octavius, submitted to the conqueror. The land-forces soon after followed the example of the navy; and all yielded to the conqueror without striking a blow the fourth day after the battle.

When Cleopatra fled, Antony pursued her in a five-cared galley; and coming along-side of her ship entered, without forcing or being seen by her. She was in the stern, and he went to the prow, where he remained for some time silent, holding his head between his hands. In this manner he continued three whole days; during which, either through indignation or shame, he neither saw nor spoke to Cleopatra. At last, when they were arrived at the promontory of Tenarus, the queen's female attendants reconciled them, and every thing went on as before. Still, however, he had the confusion to suppose his army continued faithful to him; and accordingly dispatched orders to his lieutenant Canidius to conduct it into Asia. However, he was soon undeceived when he arrived in Africa, where he was informed of their submission to his rival. This account he transported him with rage, that he was hardly prevented from killing himself; but at length, at the entreaty of his friends, he returned to Alexandria, in a very different situation from that in which he had left it some time before. Cleopatra, however, seemed to retain that fortitude in her misfortunes which had utterly abandoned her admirer. Having amased considerable riches by means of confiscation and other acts of violence, he formed a very singular and unheard of project; this was to convey her whole fleet over the isthmus of Suez into the Red Sea, and thereby save herself in another region beyond the reach of Rome, with all her treasures. Some of her vessels were actually transported thither, pursuant to her orders; but the Arabians having burst them, and Antony dilliliug her from the design, she abandoned it for the more improbable scheme of defending Egypt against the conqueror. She omitted nothing in her power to put his advice in practice, and made all kinds of preparations for war; at least hoping thereby to obtain better terms from Octavius. In fact, she had always loved Antony's fortunes rather than his person; and if she could have fallen upon any method of saving herself, though even at his expense, there is no doubt but she would have embraced it with gladness. She even still had some hopes from the power of her charms, though he was arrived almost at the age of 40; and was desirous of trying upon Octavius those arts which had been so successful with the greatest men of Rome. Thus in three embassies, which were sent one after another from Antony to his rival in Asia, the queen had always her secret agents, charged with particular proposals in her name. Antony defined no more than that his life might be spared, and to have the liberty of passing the remainder of his days in obscurity. To these proposals Octavius made no reply. Cleopatra sent him also public proposals in favour of her children; but at the same time privately resigned him her crown, with all the ensigns of royalty. To the queen's public proposal no answer was given; to her private offer he replied, by giving her assurances of his favour in case she went away Antony or put him to death. These negotiations were not so particular but they came to the knowledge of Antony, whose jealousy and rage were now heightened by every concurrence. He built a small military house upon a mole in the sea; and there he passed his time, flaving all commerce with mankind, and professing to imitate Timon the man-hater. However, his furious jealousy drove him even from this retreat into society; for hearing that Cleopatra had many secret conferences with one Thybium, an emissary from Octavius, he seized upon him, and having ordered him to be cruelly scourged, he sent him back to his patron. At the same time he sent letters by him, importing, that he had chastised Thybium for insulting a man in his misfortunes; but withal gave his rival permission to avenge himself, by scourging Hiparchus, Antony's freedman, in the same manner. The revenge, in this case, would have been
been highly pleasing to Antony, as Hyphasis had
left him to join the fortunes of his more successful rival.

Meanwhile, the operations of the war were carried
vigorously forward, and Egypt was once more the
theatre of the contending armies of Rome. Gallus,
the lieutenant of Octavianus, took Parionium, which
opened the whole country to his incursions. On the
other side, Antony, who had still considerable forces
by sea and land, wanted to take that important place
from the enemy. He therefore marched towards it,
flattering himself, that as soon as he should show him-
self to the legions which he had once commanded,
their affection for their ancient general would revive.
He approached, therefore, and exhorted them to
remember their former vows of fidelity. Gallus,
however, ordered all the trumpets to sound, in order to
hinder Antony from being heard, so that he was ob-
liged to retire.

Octavianus himself was in the mean time advancing
with another army before Pelium, which, by its
strong situation, might have retarded his progress for
some time. But the governor of the city, either want-
ing courage to defend it, or previously instructed by
Cleopatra to give it up, permitted him to take posses-
sion of the place; so that Octavianus had now no ob-
stacle in his way to Alexandria, whither he marched
with all expedition. Antony, upon his arrival, fell in
to oppose him, fighting with great desperation,
and putting the enemy's cavalry to flight. This flight
advantage once more revived his declining hopes; and,
being naturally vain, he re-entered Alexandria in tri-
umph. Then going, all armed as he was, to the pa-
lace, he embraced Cleopatra, and presented her a soldi-
er who had distinguished himself in the late engagement.
The queen rewarded him very magnificently; presenting
him with an head-piece and breast-plate of gold. With
these, however, the soldier went off the next night to
the other army. Antony could not bear this defection
without fresh indignation; he resolved, therefore, to
make a bold expiring effort by sea and land, but previ-
ously offered to fight his adversary in single combat.
Octavianus too well knew the inequality of their situa-
tions to comply with this forlorn offer; he only, there-
fore, coolly replied, that Antony had ways enough to
die besides single combat.

The evening before the day appointed for the laft
desperate attempt, he ordered a grand entertainment to
be prepared. At day-break he posted the few troops
he had remaining upon a rising ground near the city:
from whence he sent orders to his galleys to engage the
enemy. There he waited to be a spectator of the com-
batt; and, at first, he had the satisfaction to see them
advance in good order; but his apprehension was soon
turned into rage, when he saw his ships only following
those of Octavianus, and both fleets uniting together,
and falling back into the harbour. At the same time
Octavianus led his cavalry towards him. He tried, however,
to pass as swiftly as possible; but his prisoners were
lead on his right, which were easily vanquished; and he
himself compelled to return into the town. His
anger was now ungovernable; he could not help crying
out aloud as he passed, that he was betrayed by Cleo-
patra, and delivered by her to those who, for her sake
alone, were his enemies. In these fusions he was not
ceived; for it was by secret orders from the queen
that the fleet had passed over to the enemy.

Cleopatra had, for a long while, dreaded the effects
of Antony's jealousy; and, had some time before, pre-
pared a method of obviating any sudden futilities it
might produce. Near the temple of Isis she had erect-
ed a building, which was seemingly designed for a
fepulchre. Either she removed all her treasure and
most valuable effects, covering them over with torches,
faggots, and other combustible matter. This fepulchre
she designed to answer a double purpose; as well to
secure her from the sudden renomenents of Antony, as
to make Octavianus believe that he would burn all her
treasures in case he refused her proper terms of capitula-
tion. Here, therefore, the retired from Antony's
present fury; fluttering the gates, which were fortified
with bolts and bars of iron: but in the mean time gave
orders that a report should be spread of her death.
This news, which soon reached Antony, recalled all
his former love and tenderness. He now lamented her
death with the same violence he had but a few minutes
before seemed to desire it; and called one of his freed-
men, named Eros, whom he had engaged by oath to
kill him whenever fortune should drive him to this last
resource. Eros being now commanded to perform his
promise, this faithful follower drew the sword, as if
going to execute his orders; but turning his face,
plunged it into his own bosom, and died at his master's
feet. Antony for a while hung over his faithful ser-
vant, and, commending his fidelity, took up the sword,
with which flitting himself in the belly, he fell back-
ward upon a little couch. Though the wound was
mortal, yet the blood stopping he recovered his spirits,
and earnestly conjured those who were come into the
room to put an end to his life; but they all fled, being
seized with fright and horror. He therefore continued
in agonies for some time; till he was informed by one
of the queen's secretaries that his mistress was still alive.
He then earnestly desired to be carried to the place where
she was. They accordingly led him to the gate of
the sepulchre; but Cleopatra, who would not permit it
to be opened, appeared at the window, and threw down
cords in order to pull him up. In this manner, afflicted
by her two female attendants, she raised him all bloody
from the ground; and while yet suspended in the air,
continued stretching out his hands to encourage her.
Cleopatra and her maids had only just strength suffi-
cient to raise him; and at last, with much straining, they
effected their purpose, and carried him to a couch, on
which they gently laid him. Here the gave way to
her sorrow, tearing her clothes, beating her breast,
and kissing the wound of which he was dying. She
called upon him as her lord, her husband, her emperor,
and seemed to have forgot her own difficulties in the great-
ness of his sufferings. Antony intreated her to moderate
the transports of her grief, and asked for some wine.
After he had drank, he intreated Cleopatra to endeavour
to preserve her life, if she could do it with honour;
and recommended Proculus, a friend of Octavianus, as
one who might rely on her intercession. John, as the
was done speaking, he expired; and Proculus made his ap-
pearance by command of Octavianus, who had been
informed of Antony's desperate conduct. He was sent
to try all means of getting Cleopatra into his power;
his master having a double motive for his solicititude on
this occasion; one, to prevent her destroying the trea-
ures she had taken with her into the tomb; the other,
to preserve her person as an ornament to grace his triumph. Cleopatra, however, was upon her guard, and would not confer with Proculus, except through the gate, which was well secured. In the mean time, while he defignedly drew out the conference to some length, and had given Gallus, one of his fellow-soldiers, directions to carry on the conversation in his absence, he entered with two more by the window at which Antony had been drawn up. As soon as he was entered, he ran down to the gate; and one of the women crying out, that they were taken alive, Cleopatra, perceiving what had happened, drew a poniard, and attempted to stab herself; but Proculus prevented the blow, and gently remonstrated that she was cruel in refusing so good a prince as his master was, the pleasure of displaying his clemency. He then forced the poniard out of her hand, and examined her clothes to be certain she had no poison about her. Thus leaving every thing secured, he went to acquaint his master with his proceedings.

Octavianus was extremely pleased at finding her in his power; he sent Epaphroditus to bring her to his palace, and to watch her with the utmost circumspection. He was likewise ordered to use her, in every respect, with that deference and submision which were due to her rank, and to do everything in his power to render her captivity agreeable. She was permitted to have the honour of grating Antony the rights of burial, and furnished with every thing she desired, that was becoming his dignity to receive, or her love to offer. Yet still she languished under her new confinement. Her excessive sorrow, her many losses, the blows she had given her bosom, produced a fever which she feemed willing to increase. She resolved to abstain from taking any nourishment, under the pretence of a regimen necessary for her disorder; but Octavianus being made acquainted with the real motive by his physician, began to threaten her with regard to her children, in case she persisted. This was the only punishment that could now affect her; she allowed herself to be treated as they thought proper, and received whatever was preferred to her recovery.

In the mean time Octavianus made his entry into Alexandria; taking care to mitigate the fears of the inhabitants, by conversing familiarly as he went along with Areus, a philosoper, and a native of the place. The citizens, however, trembled at his approach; and when he placed himself upon the tribunal, they prostrated themselves, with their faces to the ground, before him, like criminals who waited the sentence of their execution. Octavianus presently ordered them to rise; telling them, that three motives induced him to pardon them: His respect for Alexander, who was the founder of their city; his admiration of its beauty; and his friendship for Areus, their fellow-citizen. Two only of particular note were put to death upon this occasion: Antony’s eldest son Antyllus, and Caesario, the son of Julius Caesar: both betrayed into his hands by their respective tutors, who themselves suffered for their perfidy shortly after. As for the rest of Cleopatra’s children, he treated them with great gentleness, leaving them to the care of those who were entrusted with their education, who had orders to provide them with every thing suitable to their birth. When she was recovered from her late indisposition, he came to visit her in person. Cleopatra had been preparing for this interview, and made use of every method she could think of to propitiate the conqueror, and to gain his affection; but in vain. However, at his departure, Octavianus imagined that he had reconciled her to life, and to the indignity of being shown in the intended triumph, which he was preparing for on his return to Rome: but in this he was deceived. Cleopatra, all this time, had kept a correspondence with Dolabella, a young Roman of high birth, in the camp of Octavianus; who, perhaps, from compasion, or stronger motives, was interrelated in the misfortunes of that princefs. From him she learnt the intentions of Octavianus, and that he was determined to send her off in three days, together with her children, to Rome. She now therefore determined upon dying; but previously intreated permission to pay her oblations at Antony’s tomb. This request being granted her, she was carried with her two female attendants to the stately monument where he was laid. There she threw herself upon his coffin, bewailed her captivity, and renewed her protestations not to survive him. She then crowned the tomb with garlands of flowers; and having kissed the coffin a thousand times, she returned home to execute her fatal resolution. Having bathed, and ordered a sumptuous banquet, she attired herself in the most splendid manner. She then feasted as usual; and soon after ordered all but her two attendants, Charmian and Iras, to leave the room. Then, having previously ordered an aps to be secretly conveyed to her in a basket of fruit, she sent a letter to Octavianus, informing him of her fatal purpofe, and desiring to be buried in the same tomb with Antony. Octavianus, upon receiving this letter, instantly dispatched messengers to prevent her, but they arrived too late. Upon entering the chamber, they beheld Cleopatra lying dead upon a gilded couch, arrayed in her royal robes. Near her, Iras, one of her faithful attendants, was stretched lifeless at the feet of her mistress: and Charmion herself, almost expiring, was settling the diadem upon Cleopatra’s head. She died at the age of thirty-nine, after having reigned twenty-two years. Her death put an end to the monarchy in Egypt, which had flourished there from time immemorial.

Octavianus seemed much troubled at Cleopatra’s death as it deprived him of a principal ornament in his intended triumph. However, the manner of it a good deal exalted her character among the Romans, with whom suicide was considered as a virtue. Her dying request was complied with, her body being laid by Antony’s, and a magnificent funeral prepared for her and her two female attendants.

After having settled the affairs of Egypt, he left Alexandria in the beginning of September, in the year of Rome 730, with a delign to return through Syria, Asia Minor, and Greece, to Italy. On his arrival at Antioch, he found there Tiridates, who had been raised to the throne of Parthia in opposition to Phrahatres, and likewise ambassadors from Phrahatres, who were all come on the same errand; to wit, to solicit the assistance of the Romans against each other. Octavianus gave a friendly answer both to Tiridates and the ambassadors of Phrahatres, without intending to help either; but rather with a design to animate the one against the other, and by that means to weaken both, so far as to render the Parthian name no longer formidable to Rome. After this, having appointed Meffala

Corvinus
That if, in taking upon him the sovereign power, he dreaded the name of king, a name so odious in a commonwealth, he might content himself with the title of Caesar or Imperator, and under that name, which was well known to the Romans, enjoy all the authority of a king.

This advice Oktavianus followed, and from that time laid aside all thoughts of abdicating the sovereign power; but, to deceive the people into a belief that they still enjoyed their ancient government, he continued the old magistrates, with the same name, pomp, and ornaments, but with just as much power as he thought fit to leave them. They were to have no military power, but only their old jurisdiction of deciding finally all causes, except such as were capital; and though some of these last were left to the governor of Rome, yet the chief was reserved for himself. He paid great court to the people; the very name that covered his usurpation was a compliment to them; for he affected to call it the power of the tribune ship, though he acted as absolutely by it as if he had called it the dictatorial power. He likewise won the hearts of the populace by cheapness of provis ions and plentiful markets; he frequently entertained them with shows and sports; and by these means kept them in good-humour, and made them forget usurpation, slavery, and every public evil; people in ease and plenty being under no temptation of inquiring into the title of their prince, or resenting acts of power which they do not immediately feel.

As for the senate, he filled it with his own creatures, raising the number of the conscript fathers to 1000. He supplied several poor senators with money out of the treasury to discharge the public offices, and on all occasions affected an high regard for that venerable body; but at the same time divested them of all power, and reduced them to mere ciphers. To prevent them from raising new disturbances in the distant provinces, he stilled an edict, forbidding any senator to travel out of Italy without leave, except such as had lands in Sicily, or Narbonne Gaul, which at that time comprehended Languedoc, Provence, and Dauphiny. To these provinces, which were near Italy, and in a perfect state of tranquillity, they had full liberty to retire when they pleased, and live there upon their estates. Before he ended his sixth consul ship, he took a census of the people, which was 41 years after the last; and in this the number of the men fit to bear arms amounted to 463,000, the greatest that had ever been found before. He likewise celebrated the games which had been decreed by the senate for his victory at Aetium; and it was ordered, that they should be celebrated every fifth year, four colleges of priests being appointed to take care of them; to wit, the pontifices, the augurs, the septemvirs, and quindecimvirs. The more to gain the affections of the people, he annulled, by one edict, the many severe and unjust laws, which had been enacted during the triumvirate. He raised many public buildings, repaired the old ones, and added many stately ornaments to the city, which at this time was, if we may give credit to some ancient writers, about 50 miles in compass, and contained near four millions of souls, reckoning men, women, children, and slaves. He attended business, reformed abuses, showed great regard for the Roman name, procured public abundance, pleasure, and jollity, often
Over the provinces of both forts were set men of distinction, to wit, such as had been consuls or praetors, with the titles of procuirus and propraetor; but the government of Egypt was committed to a private knight, Augustus fearing left a person of rank, depending upon the wealth and situation of that country, might raise new disturbances in the empire. All those governors held their employment only for a year, and were upon the arrival of their successors to depart their provinces immediately, and not fail to be at Rome within three months at the farthest. This division of the provinces was made, according to Ovid, on the ides of January; whereas he was velled by the senate and people with the sovereign power on the seventh of the ides of the same month, as is manifest from the Narbonne marbles: and from that time many writers date the years of his empire. Thus ended the greatest commonwealth, and at the same time began the greatest monarchy, that had ever been known; a monarchy which infinitely excelled in power, riches, extent and continuance, all the empires which had preceded it.

It comprehended the greatest and by far the best part of Europe, Asia, and Africa, being near 4000 miles in both length, and about half as much in breadth. As to the yearly revenues of the empire, they have by a moderate computation been reckoned to amount to forty millions sterling. But the Romans themselves now ran headlong into all manner of luxury and effeminacy. The people were become a mere mob; those who were wont to direct mighty wars, to raise and depose great kings, to bestow or take away potent empires, were so sunk and debauched, that, if they had but bread and shows, their ambition went no higher. The nobility were indeed more polite than in former ages; but at the same time idle, venal, vicious, infensible of private virtue, utter strangers to public glory or disgrace, void of zeal for the welfare of their country, and solely intent on gaining the favour of the emperor, as knowing that certain wealth and preferment were the rewards of ready submition, acquiescence, and flattery. No wonder, therefore, that they left their liberty, without ever being again able to retrieve it.

Augustus, now absolute master of the Roman empire, took all methods to ingratiate himself with his subjects, by whose means he had attained such a height of power. With this view, he dispersed them through different parts of Italy in 32 coloniae, that he might the more easily reassemble them on proper occasions. He kept 25 legions constantly on foot; 17 of which were in Europe; viz., eight on the Rhine, four on the Danube, three in Spain, and two in Dalmatia. The other eight were sent into Asia and Africa; four of them being quartered in the neighbourhood of the Euphrates, two in Egypt, and two in Africa Propria, that is, the ancient dominions of Carthage. All these forces, amounting to 170,000 men, were constantly kept on foot by the Roman emperors for several ages. In the neighbourhood of Rome were always quartered 12 cohorts, that is, about 15,000 men; nine of which were called praetorian cohorts; the other three city cohorts. These were established as a guard to the emperor, and to maintain peace and tranquility in the city, but had often a great share in the disturbances which took place throughout the empire. Besides these, Augustus constantly kept at sea two powerful navies; the one riding

The senate intrusted the title of Augustus to

Some of the confcript fathers proposed the name of Romulus, thereby to import that he was another founder of Rome; others offered other titles; but the venerable name of Augustus was procurred by Marcellus Plancus, esteemed preferable to all the rest, as it expressed more dignity and reverence than authority, the most prized things, such as temples, and places consecrated by augurs, being termed by the Romans Augustus. Othoians himself was inclined to assume the name of Romulus; but fearing he should be suspected of affording the kingdom, he declared it and took that of Augustus, by which we shall henceforth distinguish him.

Though the whole power of the senate and people was now vested in Augustus, yet, that he might seem to share it with the confcript fathers, he refused to govern all the provinces; assigning to the senate such as were quiet and peaceable; and keeping to himself those which, bordering upon barbarous nations, were most exposed to troubles and wars, laying. He defined the fathers might enjoy their power with ease and safety, while he underwent all the dangers and labours: but, by this politic conduct, he secured all the military power to himself; the troops lying in the provinces he had chosen; and the others, which were governed by the senate, being quite distinct of forces. The latter were called senatorial, and the former imperial, provinces.
at anchor near Ravenna in the Adriatic sea, to command Dalmatia, Greece, Cyprus, and the rest of the eastern provinces; the other at Ambracia in the Mediterranean, to keep in awe the western parts of the empire. They were likewise to keep the seas clear of pirates, to convey the vessels which brought to Rome the annual tributes from the provinces beyond sea, and to transport corn and other provisions necessary for the relief and subsistence of the city. As to the civil government, Augustus enacted several new laws, and reformed some of the old ones; however, he affected to do nothing without the advice of the senate; who were so well pleased with the complaisance shown them on all occasions, that to the rest of his titles they added that of "Father of his Country."

And now Augustus having settled all things with regard to the civil and military establishments of the empire, turned his arms against the Spanish nations called the Cantabrians and Autilrians, who had never been fully subdued. The war, however, terminated as usual, in favour of the Romans; and these brave nations were forced to receive the yoke, though not without the most violent resistance on their part, and the utmost difficulty on that of the Romans (See Asturia). By this and his other conquests the name of Augustus became so celebrated, that his friendship was courted by the most distant monarchs. Phraates king of Parthia conferred to a treaty with him upon his own terms, and gave him four of his own sons with their wives and children as hostages for the performance of the articles; and as a further instance of his respect, he delivered up the Roman eagles and other ensigns which had been taken from Cairus at the battle of Carrhae. He received also an embassy from the king of India, with a letter written in the Greek tongue, in which the Indian monarch informed him, that "though he reigned over 600 Kings, he had so great a value for the friendship of Augustus, that he had sent this embassy so long a journey on purpose to desire it of him; that he was ready to meet him at whatever place he pleased to appoint; and that, upon the first notice, he was ready to affil him in whatever was right." This letter he subscribed by the name of "Purus king of India." Of the ambassadors who set out from India, three only reached the presence of Augustus, who was at that time in the island of Samos, the others dying by the way. Of the three survivors one was named Zarmar, a gymnosophist, who followed the emperor to Athens, and there burnt himself in his presence; it being customary for the gymnosophists to put an end to their lives in this manner, when they thought they had lived long enough, or apprehended some misfortune. Soon after this the Roman dominions were extended southward over the Garamantes, a people whose country reached as far as the river Niger. All this time the emperor continued to make new regulations for the good of the state; and among other things caused the Sybiline oracles to be reviewed. Many of these he rejected; but such as were reckoned authentic, he caused to be copied by the pontifices themselves, and lodged them in golden cabinets, which he placed in the temple of Apollo, built by him in his palace. The Roman empire had now extended itself so far, that it seemed to have arrived at the limits prescribed to it by nature; and as soon as this was the case, it began to be attacked by those nations which in process of time were to overthrow it. The Germans, by which name the Romans confounded a great number of nations dwelling in the northern parts of Europe, began to make incursions into Gaul. Their first attempt happened in the year 17 B.C. when they at first gained an considerable advantage, but were soon driven back with great loss. Soon after this the Rheti, who seem to have inhabited the country bordering on the lake of Constance, invaded Italy, where they committed dreadful devastations, putting all the males to the sword without distinction of rank or age; nay, we are told, that, when women with child happened to fall into their hands, they consulted their augurs whether the child was male or female; and if they pronounced it a male, the mother was immediately massacred. Against these barbarians Augustus sent Drusus the second son of the empress Livia; who, though very young, found means to gain a complete victory with very little loss on his part. Those who escaped took the road to Gaul, being joined by the Vindelicis, another nation in the neighbourhood; but Tiberius, the elder brother of Drusus, marched against them, and overthrew them completely, that the Rheti, Vindelicis, and Norici, three of the most barbarous nations in those parts, were now fain to submit to the pleasure of the emperor. To keep their country in awe, Tiberius planted two colonies in Vindelicia, opening a road from thence into Noricum and Rhetia. One of the cities which he built for the defence of his colonies was called Drysonogus; the other, Augusti Vindelicorum; both of which are now known by the names of Nimmingen and Augsburg.

Augustus, who had long since obtained all the temporal honours which could well be conferred upon him, now began to assume those of the spiritual kind also; being in the year 13 B.C. created Pontifex Maximus: an office which he continued to hold till his death; as did also his successors till the time of Theodosius. By virtue of this office he corrected a very gross mistake in the Roman calendar; for the pontifices having, for the space of 36 years, that is, ever since the reformation of Julius Cæsar, made every third year a leap year, instead of every fourth, twelve days having been inserted instead of nine, so that the Roman year consisted of three days more than it ought to have done. These three superfluous days having been thrown out, the form of the year has ever since been regularly observed, and is still known by the name of the old style in us among us. On this occasion he gave his own name to the month of August, as Julius Cæsar hadformerly known to the month of July.

In the year 11 B.C. Agrippa died, and was succeeded in his high employment of governor of Rome by Tiberius; but, before investing him with this ample power, the emperor cauffed him to divorce his wife Agrippina (who had already brought him a son, and was then big with child), in order to marry Julia the widow of Agrippa and daughter of the emperor. Julia was a princess of an infamous character, as was known to almost every body excepting Augustus himself; however, Tiberius made no hesitation, through fear of displeasing the emperor.

The emperor now sent his two sons Tiberius and Drusus against the northern nations. Tiberius reduced
167 Tiberius, who had attempted to shake off the yoke after the death of Agrippa. Drusus performed great exploits in Germany; but while he was considering whether he should penetrate further into those northern countries, he was seized with a violent fever, which carried him off in a few days. He was succeeded in his command by Tiberius, who is reported to have done great things, but certainly made no permanent conquests in Germany. However, he was honoured with a triumph, and had the tribunitial power for five years conferred upon him; which was no sooner known, than the whole city, he desired leave to quit Rome and retire to Rhodes. Various reasons have been assigned for this extraordinary resolution; some are of opinion that it was in order to avoid being an eye-witness of the debaucheries of his wife Julia, who set no bounds to her lewdness; though others imagine that he was offended at the honours which Augustus had conferred on his grandchildren, especially at his flying them priests of the Roman youths; which left him no hopes of enjoying the sovereign power. However, Augustus positively refused to comply with his request, and his mother Livia used her utmost endeavours to dissuade him from his resolution: but Tiberius continued obstinate; and finding all other means ineffectual, at last shut himself up in his house, where he abstained four whole days from nourishment. Augustus, perceiving that he could not get the better of his obstinate and inflexible temper, at last complied with his request. Tiberius soon grew weary of his retirement, and, giving out that he had left Rome only to avoid giving umbrage to the emperor's two colleagues, declared his intention to return; but Augustus was so much displeased with his having obstinately inlisted on leaving Rome, that he obliged him to remain at Rhodes for seven years longer. His mother, with much ado got him declared by the senate and the people his successor to the throne, and to have the power of the province of Asia conferred on him. A profound peace now reigned throughout the whole empire; and in consequence of this the temple of Janus was shut, which had never before happened since the time of Numa Pompilius. During this pacific interval, the Saviour of mankind was born in Judea, as is recorded in the sacred history, 748 years after the foundation of Rome by Romulus. Three years after, Tiberius returned to the city, by permission of Augustus, who yet would not allow him to bear any public office; but in a short time, Lucius Caesar, one of the emperor's grandchildren, died, not without suspicions of his being poisoned by Livia. Tiberius showed such great concern for his death, that the affair of Augustus for him returned; and it is said that he would at that time have adopted Tiberius, had it not been for giving umbrage to his other grandson Caius Caesar. This obstacle, however, was soon after removed; Caius being taken off also, not without great suspicions of Livia, as well as in the former case. Augustus was exceedingly concerned at his death, and immediately adopted Tiberius as his son; but adopted also Agrippa Posthumius, the third son of the famous Agrippa; and obliged Tiberius to adopt Germanicus the son of his brother Drusus, though he had a son of his own name Drusus; which was a great mortification to him. As to Agrippa, however, who might have been an occasion of jealousy, Tiberius was found freed from him, by his disgrace and banishment, which very soon took place, but on what account is not known.

The northern nations now began to turn formidable; and though it is pretended that Tiberius was always successful against them, yet about this time they gave the Romans a most terrible overthrow; three legions and six cohorts, under Quintilius Varus, being almost entirely cut in pieces. Augustus set no bounds to his grief on this fatal occasion. For some months he let his hair and beard grow, frequently tearing his garments, knocking his head against the wall, and crying out like a distracted person, "Restore the legions, Varus!" Tiberius, however, was soon after sent into Germany; and for his exploits there he was honoured with a triumph. Augustus now took him for his colleague in the sovereignty; after which he sent Germanicus against the northern barbarians, and Tiberius into Illyricum. This was the last of his public acts; for having accompanied Tiberius for part of his journey, he died at Nock in Campania, in the 75th year of his age, and 56th of his reign. Livia was kept at Augustus' request, and though she was received with great friendship, and the city was interpreted to the senator, the people, and the soldiers, of Tiberius, who had betrayed him, was so provoked, that he banished him from his presence for ever; upon which the unfortunate Fabius, unable to survive his disgrace, laid violent hands on himself.

Tiberius, who succeeded to the empire, resolved to secure himself on the throne by the murder of Agrippa; whom accordingly he caused to be put to death by a military tribune. Though this might have been a sufficient evidence of what the Romans had to expect, and the death of Augustus was no sooner known, than the confuls, senators, and knights, to use the expression of Tacitus, ran headlong into slavery. The two consuls first took an oath of fidelity to the emperor, and then administered it to the senate, the people, and the soldiers. Tiberius behaved in a dark mysterious manner, taking care to rule with an absolute sway, but at the same time seeming to hesitate whether he should accept the sovereign power or not; inso much that one of the senators took the liberty to tell him, that other men were now in performing what they had promised, but he was now in promising what he had already performed. At last, however, his modesty was overcome, and he declared his acceptance of the sovereignty in the following words: "I accept the empire, and will hold it, till such time as you, confiripat fathers, in your great prudence, shall think proper to give repose to my old age." Tiberius had fear of possession of the throne, when news were brought him that the armies in Pannonia and Germany had mutinied. In Pannonia, three legions having been allowed some days of relaxation from their usual duties, either to mourn for the death of Augustus, or to rejoice for the accession of Tiberius, grew turbulent and seditions. The Pannonian mutineers
When Germanicus came to the camp, he found the greatest part of the legions destroyed. This greatly affected the humane Germanicus, who caufed the bodies of the slain to be burnt, and celebrated their obsequies with the usual solemnities; but the sedition was thus effectually quelled, after which he led his army into Germany. There he performed many great exploits; but all that he could perform was far from freeing the empire from so dangerous and troublesome an enemy. In the year 17, he died, of poison, as was supposed, given by Piso, his partner in the government of Syria, to which Germanicus had been promoted after his return from the north.

In the mean time, Tiberius, though he affected to court the favour of the people by various methods, yet showed himself in general such a cruel and blood-thirsty tyrant, that he became the object of universal abhorrence. Though he had hated Germanicus in his heart, he punished Piso with death; but in about a year after the death of Germanicus, having now no cruel tyrant, who had been his jealousy to keep him in awe, he began to relax his power, and appear more in his natural character than before. He took upon himself the interpretation of all political measures, and began daily to diminish the authority of the senate; which design was much facilitated, by their own apitude to slavery; so that he defpifed their meanenes, while he enjoyed its effects. A law at that time suffifed, which made it treason to form any injurious attempt against the majesty of the people. Tiberius suffifed to himself the interpretation and enforcement of this law; and extended it not only to the cases which really affected the safety of the state, but to every conjecture that could possibly be favourable to his hatred or suspicions. All freedom was now therefore banifhed from convivial meetings, and diffidence reigned among the dearest relations. The law of offended majesty being revived, many perfonns of diifinction fell a facrifice to it.

In the beginning of thefe cruelties, Tiberius took Rife of

But in the mean time, fame deputies

The revolt

The revolt of the German legions threatened much

danger, as they were more numerous than thofe

of Pannonia. They proceeded nearly in the fame way

as the Pannonian legions, falling: upon their officers,
especially the centurions, and beating them till they

almost expired, drove them out of the camp, and

some of them were even thrown into the Rhine. Germanicus, who was at that time in Gaul, hastened to

the camp on the first news of the disturbance; but being unable to prevail on them to return to their duty, he

was obliged to feign letters from Tiberius, granting all

their demands. These were, That all those who

had served 20 years shouId be discharged; that such as had

served 16 shouId be deemed veterans; and that lame

legacies which had been left them by Augustus should

not only be paid immediately, but doubled. This last

article he was obliged to discharge without delay out

of the money which he and his friends had brought to

defray the expences of their journey; and on receiving

it, the troops quiedy retired to their winter-quarters.

But in the mean time, some deputies sent either by

Tiberius or the senate, probably to quell the sedition,
oncaffioned fresh disturbances; for the legionaries, taking

it into their heads that these deputies were come to

revoke the concessions which Germanicus had made,

were with difficulty prevented from tearing them in

pieces; and, notwithstanding the utmost endeavours of

Germanicus, believed in fuch an outrageous manner,

that the general thought proper to fend off his wife

Agrippina, with her infant son Claudius, the herelf at

the fime time being big with child. As she was attended

by many women of distinction, wives of the chief officers

in the camp, their tears and lamentations on parting

with their husbands occasioned a great uproar, and

drew together the foldiers from all quarters. A new

scene enfued, which made an impression even upon the

moft obfinate. They could not behold, without fhame

and compassion, fo many women of rank travelling thus

forlorn, without a centurion to attend them, or a foil-

dier to guard them; and their general's wife among the

reft, carrying her infant child in her arms, and preparing
to fly for shelter against the treachery of the Roman

legions. This made fuch a deep impression on the minds of many of them, that fome ran to flop her,

while the reft recurred to Germanicus, earnestly in-
treating him to recall his wife, and to prevent her from

being obliged to fck a fnanuary among foreigners.

The general improved this favourite difposition, and in a short time they of their own accord feized and

massacred the ringleaders of the revolt. Still, however, two of the legions continued in their disobedience.

Against them therefore Germanicus determined to lead thofe who had returned to their duty. With

this view he prepared veffels; but before he embarked

his troops, he wrote a letter to Cecina who com-
mmanded them, acquainting him that he approached

with a powerful army, resolved to put them all to the

sword without diftinfection, if they did not prevent him

by taking vengeance on the guilty themselves. This

letter Cecina communicated only to the chief officers

and fuch of the foldiers as had all along difapproved of

the revolt, exhorting them at the fame time to enter

into an affociation againft the feditious, and put to the

sword fuch as had involved them in the present ignomi-

ny and guilt. This proposal was approved of, and a quelled by

cruel massacre immediately took place; infomuch that a dreadful

massacre.
It was from such humble beginnings that this minister even ventured to aspire to the throne, and was resolved to make the emperor's foolish confidence one of the first steps to his ruin. However, he considered that cutting off Tiberius alone would rather retard than promote his designs while his son Drusus and the children of Germanicus were yet remaining. He therefore began by corrupting Livia, the wife of Drusus; whom, after having debauched her, he prevailed upon to poison her husband. This was effected by means of a slow poison (as we are told), which gave his death the appearance of a casual dilettem. Tiberius, in the mean time, either naturally phlegmatic, or at least not much regarding his son, bore his death with great tranquillity. He was even heard to jest upon the occasion; for when the ambassadors from Troy came somewhat late with their compliments of condolence, he answered their pretended censure, by condoling with them also upon the loss of Hecuba.

Sejanus having succeeded in this, was resolved to make his next attempt upon the children of Germanicus, who were undoubted successors to the empire. However he was frustrated in his designs, both with regard to the fidelity of their governors, and the chastity of Agrippina their mother. Whereupon he resolved upon changing his aims, and removing Tiberius out of the city; by which means he expected more frequent opportunities of putting his designs into execution. He therefore used all his address to persuade Tiberius to retire to some agreeable retreat, remote from Rome. By this he expected many advantages, since there could be no access to the emperor but by him. Thus all letters being conveyed to the prince by soldiers at his own devotion, they would pass through his hands; by which means he might in time become the sole governor of the empire, and at last be in a capacity of removing all obstructions to his ambition. He now therefore began to intrigue with Tiberius the greater and numerous inconveniences of the city, the fatigues of attending the senate, and the tedious temper of the inferior citizens of Rome. Tiberius, either prevailed upon by his persuasions, or purifying the natural turn of his temper, which led to indulgence and debauchery, in the twelfth year of his reign left Rome, and went into Campania, under pretence of dedicating temples to Jupiter and Augustus. After this, though he removed to several places, he never returned to Rome; but spent the greatest part of his time in the island of Caprea, a place which was rendered as infamous by his pleasures as detestable by his cruelties, which were shocking to human nature. Buried in this retreat, he gave himself up to his pleasures, quite regardless of the miseries of his subjects. Thus an inundation of the Jews, upon placing his statue in Jerusalem, under the government of Pontius Pilate, gave him no sort of uneasiness. The falling of an amphitheatre at Sidene, in which 50,000 persons were either killed or wounded, no way affected his repose. He was only employed in studying how to vary his odious pleasures, and forcing his debased frame, shattered by age and former debaucheries, into the enjoyment of them. Nothing can present a more horrid picture than the retreat of this impure old man, attended by all the ministers of his perverted appetites. He was at this time 67 years old; his person was most displeasing; and some say the disagreeableness of it, in a great measure, drove him into retirement. He was quite bald before; his face was all broke out into ulcers, and covered over with plasters; his body was bowed forward, while its extreme height and leaness increased its deformity. With such a person, and a mind still more hideous, being gloomy, voluptuous, and cruel, he sat down with a view rather of forcing his appetites than satisfying them. He spent whole nights in debaucheries at the table; and he appointed Pomponius Flaccus and Lucius Pio to the first posts of the empire, for no other merit than that of having fat up with him two days and two nights without interruption. These he called his friends of all hours. He made one Novelius Torgnatus a praeator for being able to drink off five bottles of wine at a draught. His luxuries of another kind were still more detestable, and seemed to increase with his drunkenness and gluttony. He made the most eminent women of Rome fobolvent to his lusts; and all his inventions only seemed calculated how to make his vices more extravagant and abominable. The numberless obscene medals dug in that island at this day bear witness to once to his shame, and the veracity of the historians who have described his debaucheries. In short, in this retreat, which was surrounded with rocks on every side, he quite gave into the buffoon of the empire; or, if he was ever active, it was only to do mischief. But, from the time of his retreat, he became more cruel, and Sejanus always endeavoured to increase his difficulties. Secret spies and informers were placed in all parts of the city, who converted the most harmless actions into subjects of offence. If any person of merit testified any concern for the glory of the empire, it was immediately construed into a design to obtain it. If another spoke with regret of former liberty he was supposed to aim at re-establishing the commonwealth. Every action became liable to forced interpretations; joy expressed of the prince's death; melancholy, an envy of his prosperity. Sejanus found his time every day succeeding; the wretched emperor's torments were an instrument that he wrought upon at his pleasure, and by which he levelled every obstacle to his designs. But the chief objects of his jealousy were the children of Germanicus, whom he resolved to put out of the way. He therefore continued to render them obnoxious to the emperor, to alarm him with false reports of their ambition, and to terrify them with alarms of his intended cruelty. By these means, he so contrived to widen the breach, that he actually produced on both sides those dispositions which he pretended to obviate; till at length, the two princes Nero and Drusus were The child declared enemies to the state, and afterwards flaved down to death in prison; while Agrippina their mother was Germanicus put to death.

In this manner Sejanus proceeded, removing all who stood between him and the empire, and every day increasing in confidence with Tiberius, and power with the senate. The number of his slaves exceeded even

Vol. XVI.
the rock was to be seen, from which he ordered such as had displeased him to be thrown headlong. As he was one day examining some persons upon the rack, he was told that an old friend of his was come from Rhodes to see him. Tiberius supposing him brought for the purpose of information, immediately ordered him to the torture; and when he was convinced of his mistake, he ordered him to be put to death, to prevent further discovery.

In this manner did the tyrant continue to torment others, although he was himself still more tortured by his own suspicions; for that in one of his letters to the senate, he confessed that the gods and goddesses had so afflicted and confounded him, that he knew not what or how to write. In the mean time the frontier provinces were invaded with impunity by the barbarians. Mæsia was seized on by the Dacians and Sarmatians; Gaul was waited by the Germans, and Armenia conquered by the king of Parthia. Tiberius, however, was so much a slave to his brutal appetites, that he left his provinces wholly to the care of his lieutenants, and they were intent rather on the accumulation of private fortune than the safety of the state. Such a total disorder in the empire produced such a degree of anxiety in him who governed it, that he was heard to wish, that heaven and earth might perish when he died. At length, however, in the 22d year of his reign, he began to feel the approaches of his dissolution, and all his appetites totally to forsake his. He now, therefore, found it was time to think of a successor, and hesitated for a long while, whether he should choose Caligula, whose vices were too apparent to escape his observation. He had been often heard to say, that this youth had all the faults of Sylla, without his virtues; that he was a serpent that would sting the empire, and a Phæton that would set the world on fire. However, notwithstanding all his well-grounded apprehensions, he named him for his successor; willing, perhaps, by the enormity of Caligula's conduct to cover the memory of his own. But though he thought fit to choose a successor, he concealed his approaching decline with the utmost care, as if he was willing at once to hide it from the world and himself. He long had a contempt for physiognomy, and valued the advice of his attendants; he even seemed to take a pleasure in being present at the sports of the soldiers, and ventured himself to throw a javelin at a boar that was let loose before him. The effect which he made upon this occasion caused a pain in his side, which hastened the approaches of death; still, however, he seemed willing to avoid his end; and strove, by change of place, to put off the inquietude of his own reflections. He left his favourite island, and went upon the continent, where he at last fixed at the promontory of Misenum. It was here that Charicles, his physician, pretending to kiss his hand, felt the failure of his pulse, and apprised Macro, the emperor's present favourite, that he had not above two days to live. Tiberius, on the contrary, who had perceived the art of Charicles, did all in his power to impress his attendants with an opinion of his health; he continued at table till the evening; he saluted all his guests as they left the room, and read the acts of the senate, in which they had abolished some pernicious law he had written against, with great indignation. He resolved
No monarch ever came to the throne with more advantages than Caligula. He was the son of Germanicus, who had been the darling of the army and the people. He was bred among the soldiers, from whom he received the name of Caligula, from the short boot, called caliga, that was worn by the common centurions, and which was also usually worn by him. As he approached Rome, the principal men of the state went out in crowds to meet him. He received the congratulations of the people on every side, all equally pleased in being free from the cruelties of Tiberius, and in hoping new advantages from the virtues of his successor.

Caligula seemed to take every precaution to impress them with the opinion of an happy change. Amidst the rejoicings of the multitude, he advanced mourning, with the dead body of Tiberius, which the soldiers brought to be burnt at Rome, according to the custom of that time. Upon his entrance into the city, he was received with new titles of honour by the senate, whose chief employment seemed now to be, the art of increasing their emperor's vanity. He was left co-heir with Gemellus, grandson to Tiberius; but they set aside the nominations, and declared Caligula sole successor to the empire. The joy for this election was not confined to the narrow bounds of Italy; it spread through the whole empire, and victims without number were sacrificed upon the occasion. Some of the people, upon his going into the island of Campania, made vows for his return; and shortly after, when he fell sick, the multitudes crowded whole nights round his palace, and some even devoted themselves to death in case he recovered, setting up bills of their resolutions in the streets.

In this affection of the citizens, strangers themselves seemed ambitious of sharing. Artabanus, king of Parthia, sought the emperor's alliance with affiduity. He came to a personal conference with one of his legates; pulled the Euphrates, adored the Roman eagles, and kissed the emperor's images; so that the whole world seemed combined to praise him for virtues which they suspected him to possess.

The new emperor at first seemed extremely careful of the public favour; and having performed the festival solemnities of Tiberius, he hastened to the islands of reign well. Pandataria and Pontia, to remove the aties of his mother and brothers, exposing himself to the dangers of tempestuous weather, to give a luftre to his piety. Having brought them to Rome, he instituted annual solemnities in their honour, and ordered the month of September to be called Germanicus, in memory of his father. These ceremonies being over, he conferred the same honours upon his grandmother Antonia, which had before been given to Livia; and ordered all informations to be burnt, that any ways expedit the enemies of his family. He even refused a paper that was offered him, tending to the discovery of a conspiracy against him; alleging, That he was conscious of nothing to deserve any man's hatred, and therefore had no tears from their machinations. He caused the institutions of Augustus, which had been diffused in the reign of Tiberius, to be revived; undertook to reform many abuses which had lately prevailed among the governors. Among others, he banished Pontius Pilate into Gaul, where this unjust magistracy afterwards put an end to his life by suicide. He banished the Spirit...

or inventors of abominable recriminations from Rome; attempted to restore the ancient manner of electing magistrates by the suffrages of the people; and gave them a free jurisdiction, without any appeal to himself. Although the will of Tiberius was annulled by the senate, and that of Livia suppressed by Tiberius, yet he caused all their legacies to be punctually paid; and in order to make Cælius amend for marring the crown, he caused him to be elected Princeps Youth, or principal of the youth. He restored some kings to their dominions who had been unjustly dispossessed by Tiberius, and gave them the arrears of their revenues. And, that he might appear an encourager of every virtue, he ordered a female slave a large sum of money for enduring the most exquisite torments without discovering the secrets of her matter. So many concessions, and such apparent virtue, could not fail of receiving just applause. A shield of gold, bearing his image, was decreed to be carried annually to the Capitol, attended by the senate and the sons of the nobility singing in praise of the emperor's virtues. It was likewise ordained, that the day on which he was appointed to the empire should be called Publica; implying, that when he came to govern, the city received a new foundation.

In less than eight months all this show of moderation and clemency vanished; while furious passions, unexampled avarice, and capricious cruelty, began to take their turn in his mind. As most of the cruelties of Tiberius arose from suspicion, so most of those committed by Caligula took rise from prodigality. Some indeed assert, that a disorder which happened soon after his accession to the empire, entirely discomposed his understanding. However this may be, madness itself could scarce dictate cruelties more extravagant, or in inconveniences more ridiculous, than are imputed to him; some of them appear almost beyond belief, as they seem entirely without any motive to excite such barbarities.

The first object of his cruelty was a perfon named Politus, who had devoted himself to death, in cafe the emperor, who was then sick, should recover. When Caligula's health was re-established, he was informed of the zeal of Politus, and actually compelled him to complete his vow. This ridiculous devotee was therefore led round the city, by children, adorned with chaplets, and then put to death, being thrown headlong from the ramparts. Another, named Secundus, had vowed a battle in the amphitheatre upon the same occasion. To this he was also compelled, the emperor himself choosing to be a spectator of the combat. However, he was more fortunate than the former, being successful as to kill his adversary, by which he obtained a release from his vow. Gemellus was the next who suffered from the tyrant's inhumanity. The pretence against him was, that he had wished the emperor might not recover, and that he had taken a counter-poison to secure him from any secret attempts against his life. Caligula ordered him to kill himself; but as the unfortunate youth was ignorant of the manner of doing it, the emperor's messengers soon instructed him in the fatal lefion. Silenus, the emperor's father-in-law, was the next that was put to death upon flight suppositions; and Gercinus, a senator of noted integrity, refusing to witness falsely against him, shared his fate. After these followed a crowd of victims to the emperor's avarice or supposition. The pretext against them was their enmity to his family; and in proof of his accusations he produced those very memorials which but a while before he pretended to have burnt. Among the number of those who were sacrificed to his jealousy, was Macro, the late favourite of Tiberius, and the person to whom Caligula owed his empire. He was accused of many crimes, some of which were common to the emperor as well as to him, and his death brought on the ruin of his whole family.

These cruelties, however, only seemed the first fruits of a mind naturally timid and suppuricious: his vanity and profusion soon gave rise to others which were more atrocious, as they sprang from less powerful motives. His pride first began by assuming to himself the title of ruler, which was usually granted only to kings. He would also have taken the crown and diadem, had not he been advised that he was already superior to all the monarchs of the world. Not long after, he assumed divine honours, and gave himself the names of such divinities as he thought most agreeable to his nature. For this purpose he cauèd the heads of the statues of Jupiter and some other gods to be struck off, and his own to be put in their places. He frequently beat himself between Caflor and Pollux, and ordered all who came to their temple to worship, should pay their adorations only to him; nay, at last he altered their temple to the form of a portico, which he joined to his palace, that the very gods, as he said, might serve him in the quality of porters.

He was not less notorious for the depravation of his appetites than for his ridiculous preconceptions. Neither person, place, nor sex, were obstacles to the indulgence of his unnatural lusts. There was scarce a lady of any quality in Rome that escaped his lewdness; and, indeed, such was the degeneracy of the times, that there were few ladies who did not think this disgrace an honour. He committed incest with his three sisters, and at public feasts they lay with their heads upon his bosom by turns. Of these he profecuted Livia and Agrippina to his vile companions, and then banished them as adulteresses and conspirators against his person. As for Drusilla, he took her from her husband Longinus, and kept her as his wife. Her he loved so affectionately, that, being sick, he appointed her as heiress of his empire and fortune; and she happening to die before him, he made her a goddess. Nor did her example when living, appear more dangerous to the people than her divinity when dead. To mourn for her death was a crime, as she was become a goddess; and to rejoice for her divinity was capital, because she was dead. Nay, even silence itself was an unpardonable inofficiency, either of the emperor's foes or his friend's advancement. Thus he made his filter subdient to his profit, as before he had done to his pleasure; raising vast sums of money by granting pardons to some, and by confiscating the goods of others. As to his marriages, whether he contracted them with greater levity, or dissolved them with greater injustice, is not easy to determine. Being present at the nuptials of Livia Orellilla with Pilo, as soon as the solemnity was over, he commanded her to be brought to him as his own wife, and then dismissed her in a few days. He soon after banished her upon supposition of cohabiting with her husband after she was parted from him. He was enamoured of Lollio Paulina, upon a bare relation of her grand-
mother's beauty; and thereupon took her from her husband, who commanded in Macedonia; notwithstanding which, he repudiated her as he had done the former, and likewise forbade her future marrying with any other. The wife who caught most firmly upon his affections was Milonia Caetonia, whose chief merit lay in her perfect acquaintance with all the alluring arts of her sex, for the was otherwise possessed neither of youth nor beauty. She continued with him during his reign; and he loved her so ridiculously, that he sometimes showed her to his soldiers dressed in armour, and sometimes to his companions stark naked.

But of all his vices, his prodigality was the most remarkable, and that which in some measure gave rise to the revolt. The luxuries of former emperors were simplicity itself, when compared to those which he practised. He contrived new ways of building, where the richest oils and most precious perfumes were exhausted with the utmost profusion. He found out dishes of immense value; and had even jewels, as we are told, dissolved among his sauces. He sometimes had services of pure gold preferred before his guests instead of meat; observing, that a man should be an economist or an emperor.

For several days together he flung considerable sums of money among the people. He ordered ships of a prodigious bulk to be built of cedar, the stems of ivory inlaid with gold and jewels, the sails and tackling of various kinds, while the decks were planted with the choicest fruit trees, under the shade of which he often dined. Here, attended by all the ministers of his pleasures, the most exquisite fingers, and the most beautiful youths, he coasted along the shore of Campania with great splendor. All his buildings seemed rather calculated to raise astonishment, than to answer the purposes of utility. But the most notorious instance of his fruitless profusion was the vast bridge at Puteoli, adorned with gold and jewels, which he undertook in the third year of his reign. To satisfy his desire of being master as well of the ocean as the land, he caused an infinite number of ships to be fastened to each other, so as to make a floating bridge from Baiae to Puteoli, across an arm of the sea three miles and an half broad. The ships being placed in two rows, in form of a crescent, were secured to each other with anchors, chains, and cables. Over these were laid vast quantities of timber, and upon that earth, so as to make the whole resemble one of the streets of Rome. He next caused several houses to be built upon his new bridge, for the reception of himself and his attendants, into which fresh water was conveyed by pipes from land. He then repaired thither with all his court, attended by prodigious throngs of people, who came from all parts to be spectators of such an expensive pageant. It was there that Caligula, adorned with all the magnificence of eastern royalty, sitting on horseback, with a civic crown and Alexander's broad-plate, attended by the great officers of the army, and all the nobility of Rome, entered at one end of the bridge, and with ridiculous importance rode to the other. At night, the number of torches and other illuminations with which this expensive structure was adorned, cast such a gleam as illuminated the whole bay, and all the neighbouring mountains. This seemed to give the weak emperor new cause for exultation; boasting that he had turned night into day, as well as sea into land.

The next morning he again rode over in a triumphant chariot, followed by a numerous train of charioteers, and all his soldiers in glittering armour. He then ascended a rostrum erected for the occasion, where he made a solemn oration in praise of the greatness of his enterprise, and the affiduity of his workmen and his army. He then distributed rewards among his men, and a splendid feast succeeded. In the midst of the entertainment many of his attendants were thrown into the sea; several ships filled with spectators were attacked and sunk in an hollih manner; and although the majority escaped through the calmness of the weather, yet many were drowned; and some who endeavoured to save themselves by climbing to the bridge, were struck down again by the emperor's command. The calms of the sea during this pageant, which continued for two days, furnished Caligula with fresh opportunities for boating; he being heard to say, "that Neptune took care to keep the sea smooth and serene, merely out of reverence to him."

Expences like these, it may be naturally supposed, must have exhausted the most unbounded wealth; in fact, after reigning about a year, Caligula found his revenues totally exhausted; and a fortune of about 18,000,000 of our money, which Tiberius had amassed together, entirely spent in extravagance and folly. Now, therefore, his prodigality put him upon new methods of supplying the exchequer; and as before his profusion, so now his capacity became boundless. He put in practice all kinds of rapine and extortion; while his principal study seemed to be the inventing new imposts and illicit confiscations. Everything was taxed, to the very wages of the meanest tradesman. He caused freemen to purchase their freedom a second time; and poisoned many who had named him for their heir, to have the immediate possession of their fortunes. He set up a brothel in his own palace, by which he gained considerable sums by all the methods of profition. He also kept a gaming-house, in which he himself presided, frupling none of the meanest tricks in order to advance his game. On a certain occasion having had a run of ill luck, he saw two rich knights passing through his court; upon which he suddenly rose up, and causing both to be apprehended, confiscated their estates, and then joining his former companions, boasted that he never had a better throw in his life. Another time, wanting money for a stake, he went down and caused several noblemen to be put to death; and then returning, told the company that they fat playing for trifles while he had won 60,000 furtences at a cast.

Such intupitable and capricious cruelties produced many secret conspiracies against him; but these were for a while deferred, upon account of his intended expedition against the Germans and Britons, which he undertook in the third year of his reign. For this purpose, he caused numerous levies to be made in all parts of the empire; and talked with so much resolution, that it was universally believed he would conquer all before him. His march perfectly indicated the inequality of his temper; sometimes it was so rapid, that the cohorts were obliged to leave their standards behind them; at other times it was so slow, that it more resembled a pompous procession than a military expedition. In this disposition he would cause himself to be carried on eight men's shoulders, and order all the neighbouring
neighbouring cities to have their streets well swept and watered to defend him from the dust. However, all these mighty preparations ended in nothing. Instead of conquering Britain, he only gave refuge to one of its banished princes; and this he described in a letter to the senate, as taking possession of the whole island. Instead of conquering Germany, he only led his army to the sea-shore at Batavia. There disposing his engines and warlike machines with great solemnity, and drawing up his men in order of battle, he went on board his galley, with which coaling along, he commanded his trumpets to sound and the bands to be played, announcing the victory. However, their resolution, which, had decreed, he informed them that he would bring to the senate, as taking his share of the glory, and then laying his hands upon his sword, he ordered the galleys in which he had put to sea to be conveyed to Rome in a great measure by land.

After numberless instances of folly and cruelty in this expedition, among which he had intentions of destroying the whole army that had formerly mutinied under his father Germanicus, he began to think of a triumph. The senatus, who had long been the timid ministers of his pride and cruelty, immediately set about consulting how to satisfy his expectations. They considered that a triumph would, even to himself, appear as a burlesque upon his expedition: they therefore decreed him only an ovation. Having come to this resolution, they sent him a deputation, informing him of the honours granted him, and the decree, which was drawn up in terms of the most extravagant adulation. However, their flattery was far from satisfying his pride. He considered their conduct rather as a diminution of his power, than an addition to his glory. He therefore ordered them, on pain of death, not to concern themselves with his honours; and being met by their messengers on the way, who invited him to come and partake of the preparations which the senate had decreed, he informed them that he would come; and then laying his hand upon his sword, added, that he would bring that also with him. In this manner, either quite omitting his triumph, or deferring it to another time, he entered the city with only an ovation; while the senate paused the whole day in acclamations in his praise, and speeches filled with the most ex creducte, the emperor could have their arms set to defend him from the emperor's indignation; “Fear nothing (cried he to them), Caligula, by declaring against us, puts God on our side.”

The commencement of this horrid reign seemed to threaten universal calamity; however, it was but short. There had already been several conspiracies formed to destroy the tyrant, but without success. That which rece than palsy, hearing had previous orders, immediately fell to gathering the soldiers that lay upon the shore into their helmets, terming them the foils of the conquered ocean, worthy of the palace and the Capitol. After this doughty expedition, calling his army together as a triumphant resolution, consulting how to confirm his accusation. Whenever Cherea came to demand the watch-word from the emperor, according to custom, he always gave him either Venus, Adonis, or some such, implying effeminacy and softness. He therefore secretly imparted his designs to several senators and knights, whom he knew to have received personal injuries from Caligula, or to be apprehensive of his approach. Among these was Valerius Asiaticus, whose wife the emperor had debarced. Annius Vincianus, who was suspected of having been in a former conspiracy, was now defirous of really engaging in the first design that offered. Befides these, were Clemens the prefect; and Caligula, whose riches made him obnoxious to the tyrant’s resentment.

While these were deliberating upon the most certain and speedy method of destroying the tyrant, an unexpected incident gave new strength to the conspiracy. Pompeius, a senator of distinction, having been accused before the emperor, of having spoken of him with disrespect, the informer cited one Quintilia, an adfres, to confirm his accusation. Quintilia, however, was possessed of a degree of fortitude not easily found. She denied the fact with obstinacy; and being put to the torture at the informer’s request, she bore the severest torments of the rack with unshaken constancy. But what is most remarkable of her resolution is, that she was acquainted with all the particulars of the conspiracy; and although Cherea was appointed to preface the torture, she revealed nothing; on the contrary, when she was led to the rack, she trod upon the toe of one of the conspirators, intimating at once her knowledge of the confederacy, and her own resolution not to divulge it. In this manner she suffered until all her limbs were dislocated; and in that deplorable state was presented to the emperor, who ordered her a gratuity for what she had suffered. Cherea could now no longer
...other conspirators to attack him as he went to offer sacrifices in the Capitol, or while he was employed in the secret pleasures of the palace. The rest, however, were of opinion, that it was best to fall upon him when he should be unattended; by which means they would be more certain of success. After several deliberations, it was at last resolved to attack him during the continuance of the Palatine games, which lasted four days; and to strike the blow when his guards should have the least opportunity to defend him. In consequence of this, the three first days of the games passed without affording that opportunity which was so ardently desired. Cherea now, therefore, began to apprehend, that deferring the time of the conspiracy might be a mean to divulge it; he even began to dread, that the honour of killing the tyrant might fall to the lot of some other person more bold than himself. Wherefore, he last resolved to defer the execution of his plot only to the day following, when Caligula should pass through a private gallery, to some baths not far distant from the palace.

The last day of the games was more splendid than the rest; and Caligula seemed more sprightly and condolethful than usual. He took great amusement in seeing the people scramble for the fruits and other rarities thrown by his order among them; and seemed no way apprehensive of the plot formed for his destruction. In the mean time, the conspiracy began to transpire; and had he possessed any friends, it could not have failed of being discovered. The conspirators waited a great part of the day with the most extreme anxiety; and at one time Caligula seemed resolved to spend the whole day without any refreshment. This unexpected delay entirely exasperated Cherea; and had he not been restrained, he would have gone and perpetrated his design in the midst of all the people. Just at this instant, while he was yet hesitating what he should do, Alprenas, one of the conspirators, persuaded Caligula to go to the bath and take some light refreshment, in order to enjoy the rest of the entertainment with greater relish. The emperor therefore rising up, the conspirators used every precaution to keep off the throng, and to surround him, under pretence of greater safety. Upon entering into the little vaulted gallery that led to the bath, he was met by a band of Grecian children who had been instructed in singing, and were come to perform in his presence. He was once more therefore going to return into the theatre with them, had not the leader of the band exulted himself, as having a cold. This was the moment that Cherea seized to strike him to the ground; crying out, “Tyrant, think upon this.” Immediately after, the other conspirators rushed in; and while the emperor continued to resist, crying out, that he was not yet dead, they dispatched him with 30 wounds, in the 29th year of his age, after a short reign of three years ten months and eight days. With him, his wife and infant daughter also perished; the one being stabbed by a centurion, the other having its brains dashed out against the wall. His coin was also melted down by a decree of the senate; and such precautions were taken, that all seemed willing, that neither his features nor his name might be transmitted to posterity.

As soon as the death of Caligula was made public, it produced the greatest confusion in all parts of the city. The conspirators, who only aimed at destroy ing a tyrant without attending to a successor, had all sought safety by retiring to private places. Some thought that the report of the emperor’s death was only an artifice of his own, to see how his enemies would behave. Others averred that he was still alive, and actually in a fair way to recover. In this interval of suspense, the German guards finding it a convenient time to pillage, gave a loose to their licentiousness, under a pretence of revenging the emperor’s death. All the conspirators and senators that fell in their way received no mercy; Alprenas, Norbanus, and Anteus, were cut in pieces. However, they grew calm by degrees, and the senate was permitted to assemble, in order to deliberate upon what was necessary to be done in the present emergency.

In this deliberation, Saturninus, who was then consul, infilled much upon the benefits of liberty; and talked in raptures of Cherea’s fortune, alleging that it deferred the highest reward. This was a language highly pleasing to the senate. Liberty now became the favourite topic; and they even ventured to talk of extinguishing the very name of Caesar. Impressed with this resolution, they brought over some cohorts of the city to their side, and boldly seized upon the Capitol. But it was now too late for Rome to regain her primrose freedom; the populace and the army opposing their endeavours. The former were still mindful of their ancient hatred to the senate, and remembered the donations and public spectacles of the emperors with regret. The latter were sensible they could have no power but in a monarchy; and had some hopes that the election of the emperor would fall to their determination. In this opposition of interests, and variety of opinions, chance seemed at last to decide the fate of the empire. Some soldiers happening to run about the palace, discovered Claudius, Caligula’s uncle, lurking in a secret place, where he had hid himself through fear. Of this perfomome, who had hitherto been despised for his imbecility, they resolved to make an emperor; and accordingly carried him upon their shoulders to the camp, where they proclaimed him at a time he expected nothing but death.

The senate now, therefore, perceiving that force alone was likely to settle the succession, were resolved to submit, since they had no power to oppose. Claudius was the person most nearly allied to the late emperor, then living; being the nephew of Tiberius, and the uncle of Caligula. The senate therefore put a price, confirming him in the empire; and went soon after in a body, to render him their compulsive homage. Cherea was the first who fell a sacrifice to the jealousy of this new monarch. He met death with all the fortitude of an ancient Roman; desiring to die by the same sword with which he had killed Caligula. Lupus, his friend, was put to death with him; and Sabinius, one of the conspirators, laid violent hands on himself.

Claudius was 50 years old when he began to reign. The complicated diseases of his infancy had in some measure affected all the faculties both of his body and mind. He was continued in a state of pupillage much longer than was usual at that time; and seemed, in
Every part of his life incapable of conducting himself. Not that he was entirely delinute of understanding, since he had made a tolerable proficiency in the Greek and Latin languages, and even wrote an history of his own time; which, however delinute of other merits, was not contemptible in point of style. Nevertheless, with this share of erudition, he was unable to advance himself in the state, and seemed utterly neglected until he was placed all at once at the head of affairs. The commencement of his reign gave the most promising hopes of an happy continuance. He began by pulling an act of oblivion for all former words and actions, and diannulled all the cruel edicts of Caligula. He forbade all persons, upon severe penalties, to sacrifice to him as they had done to Caligula; was aliduous in hearing and examining complaints; and frequently administered justice in person; tempering by his meline the severity of the law. We are told of his bringing a woman to acknowledge her son, by adjudging her to marry him. The tribunes of the people coming one day to attend him when he was on his tribunal, he courteously excused himself for not having room for them to sit down. By this deportment he so much gained the affections of the people, that upon a vague report of his being slain by surprize, they ran about the streets in the utmost rage and conternation, with horrid imprecations against all such as were accessory to his death; nor could they be appeased, until they were assured, with certainty, of his safety. He took a more than ordinary care that Rome should be continually supplied with corn and provisions, securing the merchants against pirates. He was not less attentive in his buildings, in which he excelled almost all that went before him. He contructed a wonderful aqueduct, called after his own name, much surpassing any other in Rome, either for workmanship or plentiful supply. It brought water from 40 miles distance, through great mountains, and over deep valleys, being built on flately arches, and furnishing the highest parts of the city. He made also an haven at Ostia; a work of such immense expense, that his succedors were unable to maintain it. But his greatest work of all was the draining of the lake Fucius, which was the largest in Italy, and bringing its water into the Tiber, in order to strengthen the current of that river. For effecting this, among other vast difficulties, he mined through a mountain of iron three miles broad, and kept 30,000 men employed for 11 years together.

To this solicitude for the internal advantages of the state, he added that of a watchful guardianhip over the provinces. He retored Judea to Herod Agrippa, which Caligula had taken from Herod Antipas, his uncle, the man who had put John the Baptist to death, and who was banished by order of the present emperor. Claudius also restored such princes to their kingdoms as had been unjustly dispossessed by his predecessors; but deprived the Lycians and Rhodians of their liberty, for having promoted insurrections, and crucified some citizens of Rome.

His expedition against Britons, and his determination to gratify the people by foreign conquest, the Britons, who had been near 10 years, been left in sole possession of their own island, began to seek the mediation of Rome, to quell their intestine commotions. The principal man who defired to subject his native country to the Roman dominion, was one Bercus, who, by many arguments, perfuaded the emperor to make a descent upon the island, magnifying the advantages that would attend the conquest of it. In pursuance of his advice, therefore, Plautius the praetor was ordered to pass over into Gaul, and make preparations for this great expedition. At first, indeed, his soldiers seemed backward to embark; declaring, that they were unwilling to make war beyond the limits of the world, for so they judged Britain to be. However, they were at last persuaded to go; and the Britons, under the conduct of their king Cynogebelinus, were several times overthrown. And these successes soon after induced Claudius to go into Britain in person, upon pretence that the natives were still seditions, and had not delivered up some Roman fugitives who had taken shelter among them; but for a particular account of the exploits of the Romans in that island, see the article England.

But though Claudius gave in the beginning of his reign the highest hopes of an happy continuance, he soon began to lessen his care for the public, and to commit to his favourites all the concerns of the empire. This weak prince was unable to act but under the direction of others. The chief of his directors was his wife Messalina: whose name is almost become a common appellation to women of abandoned characters. However, she was not less remarkable for her cruelties than her lufts; as by her intrigues she destroyed many of the most illustrious families of Rome. Subordinate to her were the emperor's freedmen; Pallas, the treasurer; Narcissus, the secretary of state; and Calilitus, the master of the requisits. These entirely governed Claudius; so that he was only left the fatigues of ceremony, while they were professed of all the power of the state.

It would be tedious to enumerate the various cruelties which these infamous advisers obliged the feeble emperor to commit; those against his own family will suffice. Appius Silanus, a person of great merit, who had been married to the emperor's mother-in-law, was put to death upon the suggestions of Messalina. After him he flew both his sons-in-law, Silanus and Pompey, and his two nieces the Livias, one the daughter of Drusus, the other of Germanicus; and all without permitting them to plead in their defence, or even without assigning any cause for his displeasure. Great numbers of others fell a sacrifice to the jealousy of Messalina and her minions; who bore so great a sway in the state, that all offices, dignities, and governments, were entirely at their disposal. Every thing was put to sale: they took money for pardons and penalties; and accumulated, by these means, such vast sums, that the wealth of Cæsarius was considered as nothing in comparison. One day, the emperor complaining that his exchequer was exhausted, he was ludicrously told, that it might be sufficiently replenished if his two freedmen would take him into partnership. Still, however, during such corruption, he regarded his favourites with the highest esteem, and even solicited the senate to grant them peculiar marks of their approbation. These disorders in the ministers of government did not fail to produce conspiracies against the emperor. Statius Corvinus and Gallus Alfinus formed a conspiracy against him. Two knights, whose names are not told us, privately combined to assassinate him. But the revolts which
which gave him the greatest uneasiness, and which was punished with the most unrelenting severity, was that of Camillus, his lieutenant general in Dalmatia. This general, incited by many of the principal men of Rome, openly rebelled against him, and assumed the title of emperor. Nothing could exceed the terrors of Claudius, upon being informed of this revolt: his nature and his crimes had disposed him to be more cowardly than the rest of mankind; so that when Camillus commanded him by letters to relinquish the empire, and retire to a private station, he seemed inclined to obey. However, his fears upon this occasion were soon removed: for the legions which had declared for Camillus being terrified by some prodigies, shortly after abandoned him; so that the man whom but five days before they had acknowledged as emperor, they now thought it no infamy to destroy. The cruelty of Messalina and her minions upon this occasion seemed to have no bounds. They so worked upon the emperor's fears and suspicions, that numbers were executed without trial or proof; and scarce any, even of those who were but suspected, escaped, unless by ransoming their lives with their fortunes.

By such cruelties as thefe, the favourites of the emperor endeavoured to establish his and their own authority: but in order to increase the necessity of their affiduity, they laboured to augment the greatness of his terrors. He now became a prey to jealousy and difquietude. Being one day in the temple, and finding a sword that was left there by accident, he convened the senate in a fright, and informed them of his danger. After this he never ventured to go to any feast without being surrounded by his guards, nor would he suffer any man to approach him without a previous search. Thus wholly employed by his anxiety for self-preparation, he entirely left the care of the state to his favourites, who by degrees gave him a relish for quietude. Being one day in the temple, and finding a relation, supposed the enemy were ready at his gates; and frequently interrupted his repose. What this fellow spoke at random was actually at that time in preparation. It seems that some time before there had been a quarrel between Messalina and Narcissus, the emperor's first freedman. This sable minister therefore desired nothing more than an opportunity of ruining the emprefs, and he judged this to be a most favourable occasion. He first made the discovery by means of two concubines who attended the emperor, who were instructed to inform him of Messalina's marriage as the news of the day, while Narcissus himself stepped in to confirm their information. Finding it operated upon the emperor's fears as he could with, he resolved to alarm him still more by a discovery of all Messalina's projects and attempts. He aggravated the danger, and urged the expediency of speedily punishing the delinquents. Claudius, quite terrified at this unexpected relation, deemed the enemy were already at his gates; and frequently interrupted his repose, by asking if he was still master of the empire. Being assured that he yet had it in his power to continue so, he resolved to go and punish the affront offered to his dignity without delay. Nothing could exceed the consternation of Messalina and her thoughtless companions, upon being informed that the emperor was coming to disturb their felicity. Every one retired in the utmost confusion. Silius was taken. Messalina took shelter in some gardens which the had lately feized upon, having expelled Agrippina the true owner, and put him to death. From thence the sent Britannicus, her only son by the emperor, with Otho and her daughter, to intercede for her, and implore his mercy. She soon after followed them herself; but Narcissus had so fortified the emperor against her arts, and contrived such methods of diverting his attention from her defence, that she was obliged to return in despair. Narcissus being thus far successful, led Claudius

some years infatiable in her desires, she at length fixed her affections upon Calus Silius, the most beautiful youth in Rome. Her love for the young Roman seemed to amount even to madness. She obliged him to divorce his wife Junia Sylla, that she might entirely possess him herself. She obliged him to accept of immense treasures and valuable presents; engaging him with the most open manner, and treating him with the most shameless familiarity. The very imperial ornaments were transferred to his house; and the emperor's slaves and attendants had orders to wait upon the adulterer. Nothing was wanting to complete the insolence of their conduct; but their being married together; and this was soon after effected. They relied upon the emperor's imbecility for their security, and only waited till he retired to Oltia to put their ill-judged project in execution. In his absence, they celebrated their nuptials with all the ceremonies and splendor which attend the most confident security. Messalina gave a feast to her passion, and appeared as a Bacchanalian with a thyrsus in her hand; while Silius assumed the character of Bacchus, his body being adorned with robes imitating ivy, and his legs covered with bucklers. A troop of fingers and dancers attended, who heightened the revel with the most licentious fongs and the most indecent attitudes. In the midst of this riot, one Valens, a buffoon, is said to have climbed a tree; and being demanded what he saw, answered that he perceived a dreadful storm coming from Oltia.

What this fellow spoke at random was actually at that time in preparation. It seems that some time before there had been a quarrel between Messalina and Narcissus, the emperor's first freedman. This sable minister therefore desired nothing more than an opportunity of ruining the empresse, and he judged this to be a most favourable occasion. He first made the discovery by means of two concubines who attended the emperor, who were instructed to inform him of Messalina's marriage as the news of the day, while Narcissus himself stepped in to confirm their information. Finding it operated upon the emperor's fears as he could with, he resolved to alarm him still more by a discovery of all Messalina's projects and attempts. He aggravated the danger, and urged the expediency of speedily punishing the delinquents. Claudius, quite terrified at this unexpected relation, deemed the enemy were already at his gates; and frequently interrupted his repose, by asking if he was still master of the empire. Being assured that he yet had it in his power to continue so, he resolved to go and punish the affront offered to his dignity without delay. Nothing could exceed the consternation of Messalina and her thoughtless companions, upon being informed that the emperor was coming to disturb their felicity. Every one retired in the utmost confusion. Silius was taken. Messalina took shelter in some gardens which she had lately seized upon, having expelled Agrippina the true owner, and put him to death. From thence the sent Britannicus, her only son by the emperor, with Otho and her daughter, to intercede for her, and implore his mercy. She soon after followed them herself; but Narcissus had so fortified the emperor against her arts, and contrived such methods of diverting his attention from her defence, that she was obliged to return in despair. Narcissus being thus far successful, led Claudius
The unreasonable temper began to grow unsupportable to him; and he was heard to declare, when heated with wine, that it was his fate to suffer the disorders of his wives, and to be their executioner. This expression sunk deep on her mind, and engaged all her faculties to prevent the blow. Her first care was to remove Narcissus, whom she hated upon many accounts, but particularly for his attachment to Claudius. This minister, for some time, opposed her design; but at length thought fit to retire, by a voluntary exile, into Campania. The unhappy emperor, thus exposed to all the machinations of his officious comfort, seemed entirely regardless of the dangers that threatened his destruction. His affection for Britannicus was perceived every day to increase, which served also to increase the vigilance and jealousy of Agrippina. She now, therefore, resolved not to defer a crime which she had meditated a long while before; namely, that of poisoning her husband. She for some time, however, debated with herself in what manner she should administer the poison; as she feared too strong a dose would discover her treachery, and one too weak might fail of its effect.

Agrippina's chief aims were to gain the succession in favour of her son Nero, and to set aside the claims of young Britannicus, son to the emperor and Meffalina. For this purpose she married Nero to the emperor's daughter Octavia, a few days after her own marriage. Not long after this she urged the emperor to strengthen the succession, in imitation of his predecessors, by making a new adoption; and caused him to take it in some measure to divide the fatigues of government. Her urgent care was to increase her son's popularity, by giving him the name of a tutor. This excellent man, by birth a Spaniard, had been banished by Claudius, upon the false testimony of Meffalina, who had accused him of adultery with Julia the emperor's niece. The people loved and admired him for his genius, but still more for his strict morality; and a part of his reputation necessarily devolved to his pupil. This subtle woman was not less afeidious in pretending the utmost affection for Britannicus; whom, however, she resolved in a proper time to destroy; but her jealousy was not confined to this child only; she, shortly after her accension, procured the deaths of several ladies who had been her rivals in the emperor's affections. She displaced the captains of the guard, and appointed Burrhus to that command; a person of great military knowledge, and strongly attached to her interests. From that time thetook left steps to disguise her power, and frequently entered the Capitol in a chariot; a privilege which none before were allowed, except of the aedulterous order.

In the 12th year of this monarch's reign, she persuaded him to restore liberty to the Rhodians, of which he had deprived them some years before; and to remit the taxes of the city Ilium, as having been the progenitors of Rome. Her design in this was to increase the popularity of Nero, who pleaded the cause of both cities with great approbation. Thus did this ambitious woman take every step to aggrandize her son, and was even contented to become hateful herself to the public, merely to increase her popularity.

Such a very immoderate abuse of her power served at last to awaken the emperor's suspicions. Agrippina's imperious temper began to grow unsupportable to him; and he was heard to declare, when heated with wine, that it was his fate to suffer the disorders of his wives, and to be their executioner. This expression sunk deep on her mind, and engaged all her faculties to prevent the blow. Her first care was to remove Narcissus, whom she hated upon many accounts, but particularly for his attachment to Claudius. This minister, for some time, opposed her design; but at length thought fit to retire, by a voluntary exile, into Campania. The unhappy emperor, thus exposed to all the machinations of his officious comfort, seemed entirely regardless of the dangers that threatened his destruction. His affection for Britannicus was perceived every day to increase, which served also to increase the vigilance and jealousy of Agrippina. She now, therefore, resolved not to defer a crime which she had meditated a long while before; namely, that of poisoning her husband. She for some time, however, debated with herself in what manner she should administer the poison; as she feared too strong a dose would discover her treachery, and one too weak might fail of its effect.
At length he determined upon a poison of singular efficacy to destroy his intellects, and yet not suddenly to terminate his life. As he had been long conversant in this horrid practice, he applied to a woman called Leculla, notorious for afflicting on such occasions. The poison was given to the emperor among mushrooms, a dish he was particularly fond of. Shortly after having eaten, he dropped down insensible; but this caused no alarm, as it was usual with him to fit eating when he had flupidied all his faculties, and was obliged to be carried off to his bed from the table. However, his constitution seemed to overcome the effects of the poison, when Agrippina resolved to make sure of him: wherefore she directed a wretched physician, who was her creature, to thrust a poisoned feather down his throat, under pretence of making him vomit; and this dispatched him.

The reign of the emperor, feeble and impotent as he was, produced no great calamities in the state, since his cruelties were chiefly levied at those about his person. The lift of the inhabitants of Rome at this time amounted to six millions eight hundred and forty-four thousand souls; a number little inferior to all the people of England at this day. The general character of the times was that of corruption and luxury; but the military spirit of Rome, though much relaxed from its former severity, still continued to awe mankind; and though during this reign, the empire might be justly said to be without a head, yet the terror of the Roman name alone kept the nations in obedience.

Claudius being destroyed, Agrippina took every precaution to conceal his death from the public, until she had settled her measures for securing the succession. A strong guard was placed at all the avenues of the palace, while she amused the people with various reports; at one time giving out that he was still alive; at another, that he was recovering. In the meanwhile, the made sure of the person of young Britannicus, under a pretence of affection for him. Like one overcome with the extremity of her grief, she held the child in her arms, calling him the dearest image of his father, and thus preventing his escape. She used the same precautions with regard to his fitters, Oda­via and Antonia; and even ordered an entertainment in the palace, as if to amuse the emperor. At last, when all things were adjusted, the palace-gates were thrown open, and Nero, accompanied by Burrhus, prefect of the Praetorian guards, issued to receive the congratulations of the people and the army. The cohorts then attending, proclaimed him with the loudest acclamations, though not without making some inquiries after Britannicus. He was carried in a chariot to the reit of the army; wherein having made a speech proper to the occasion, and promising them a donation, in the manner of his predecessors, he was declared emperor by the army, the senate, and the people.

Nero's first care was, to show all possible respect to the deceased emperor, in order to cover the guilt of his death. His obsequies were performed with a pomp equal to that of Augustus: the young emperor pronounced his funeral oration, and he was ceremoniously among the gods. The funeral oration, though spoken by Nero, was drawn up by Seneca; and it was remark­ed, that this was the first time a Roman emperor needed the assistance of another eloquence.

Nero, though but 17 years of age, began his reign with the general approbation of mankind. As he owed the empire to Agrippina, so in the beginning he submitted to her directions with the most implicit obedience. On her part, she seemed resolved on governing with her natural ferocity, and considered every private animosity as the only rule to guide her in public justice. Immediately after the death of Claudius, she caused Silanus, the pro-consul of Asia, to be assassinated upon very flight suspicions, and without ever acquainting the emperor with her design. The next object of her resentment was Narcissus, the late emperor's favourite; a man equally notorious for the greatness of his wealth and the number of his crimes. He was obliged to put an end to his life by Agrippina's order, though Nero refused his consent.

This bloody onset would have been followed by His excel­lent administration for five years. His many severities of the same nature, had not Seneca and Burrhus, the emperor's tutor and general, opposed. These worthy men, although they owed their rise to the empress, were above being the instruments of her cruelty. They, therefore, combined together in an opposition; and gaining the young emperor on their side, formed a plan of power, at once the most merciful and wise. The beginning of this monarch's reign, while he continued to act by their counsels, has always been considered as a model for succeeding princes to govern by. The famous emperor Trajan used to say, "That for the first five years of this prince all other governments came short of his." In fact, the young monarch knew so well how to conceal his innate depravity, that his nearest friends could scarce perceive his virtues to be but assumed. He appeared just, liberal, and humane. When a warrant for the execution of a criminal was brought to him to be signed, he was heard to cry out, with seeming concern, "Would to Heaven that I had never learned to write!" The senate, upon a certain occasion, giving them their applause for the regularity and justice of his administration, he replied with singular modesty, "That they should defer their thanks till he had deserved them."

His condescension and affability were not less than his other virtues; so that the Romans began to think, that the excellency of this prince would compensate for the tyranny of his predecessors.

In the mean time, Agrippina, who was excluded from any share in government, attacked, by every possible method, to maintain her declining power. Perceiving that her son had fallen in love with a freedwoman, named polluted, and deciding the influence of a con­cubine, she tried every art to prevent his growing passion. However, in so corrupt a court, it was no difficult matter for the emperor to find other confidents ready to assist him in his wishes. The gratification of his passion, therefore, in this influence, only served to increase his hatred for the empress. Nor was mother; it long before he gave evident marks of his disobe­dience, by displacing Pallas her chief favourite. It was upon this occasion that the first perceived the total decline of her authority; which threw her into the most ungraspable fury. In order to give terror to her rage, she proclaimed that Britannicus, the real heir to the throne, was still living, and in a condition to receive his father's empire, which was now professed by an upstart. She threatened to go to the camp, and...
there expose his baseness and her own, invoking all the furies to her assistance. These menaces served to alarm the suppositions of Nero; who, though apparently guided by his governors, yet had begun to give way to his natural depravity. He, therefore, determined upon the death of Britannicus, and contrived to have him poisoned at a public banquet. Agrippina, however, still retained her natural ferocity: she took every opportunity of obbling and flattering the tribunes and consuls, in hopes of uniting them with a capacity beyond her natural avarice; all her actions were calculated to raise a faction, and make herself formidable to the emperor. Whereupon Nero commanded her German guard to take her from her, and obliged her to lodge out of the palace. He also forbade particular persons to visit her, and went himself but rarely and ceremoniously to pay her his respects. She now, therefore, began to find, that, with the emperor's favour, she had lost the affiduity of her friends. She was even accursed by Silana of conspiring against her son, and of designing to marry Plautius, a perfon defended from Augustus, and of making him emperor. A short time after, Pallas, her favourite, together with Burrhus, were arraigned for a similar offence, and intending to set up Cornelius Sylla. These informations being proved void of any foundation, the informers were banished; a punishment which was considered as very inadequate to the greatness of the offence.

As Nero increased in years, his crimes seemed to increase in equal proportion. He now began to find a pleasure in running about the city by night, disguised like a slave. In this vile habit he entered taverns and brothels, attended by the lewd and indolent; and that, had not his passion to satisfy his lusts, attended by the lewd and indolent, been gratified by the abolition of many of their taxes. The provinces also were no way affected; and frequently endangering his own. In imitation of the emperor's example, numbers of profligate young men infested the streets likewise; so that every night the city was filled with tumult and disorder. However, the people bore all these levities, which they ascribed to the emperor's youth, with patience, having occasion every day to experience his liberality, and having also been gratified by the abolition of many of their taxes. The provinces also were no way affected by these riots; for except disturbances on the side of the Parthians, which were soon suppressed, they enjoyed the most perfect tranquillity.

But those sensualities, which, for the first four years of his reign, produced but few disorders, in the fifth became alarming. He first began to transgress the bounds of decency, by publicly abandoning Octavia, his present wife, and then by taking Poppea, the wife of his favourite Otho, a woman more celebrated for her beauty than her virtues. This was another gratifying circumstance to Agrippina, who vainly used all her interest to disgrace Poppea, and reinstate herself in her son's lost favour. Historians assert, that she even offered to satisfy his passion herself, by an incestuous compliance; and that, had not Seneca interposed the son would have joined in the mother's crime. This however, does not seem probable, since we find Poppea victorious, soon after, in the contention of interests; and at last impelling Nero to parricide, to satisfy her revenge. She began her arts by urging him to divorce his present wife, and marry herself: she reproached him as a pupil, who wanted not only power over others, but liberty to direct himself. She inflamed the dangerous designs of Agrippina; and, by degrees accustomed his mind to reflect on parricide without horror. His cruelties against his mother began rather by various circumstances of petty malice than by any downright injury. He encouraged several persons to tease her with litigious suits; and employed some of the meannest of the people to ring satirical songs against her, under her windows; but, at last, finding these ineffectual in breaking her spirit, he resolved on putting her to death. His first attempt was by poisoning; but this, though repeated, proved ineffectual, as she had fortified her constitution against it by antidotes. This failing, a ship was contrived in so artificial a manner as to fall to pieces in the water; on board of which she was invited to sail to the coasts of Calabria. However, this plot was as ineffectual as the former: the mariners, not being apprized of the secrect, disturbed each other's operations; so that the ship not sinking as readily as was expected, Agrippina found means to continue swimming, till she was taken up by some trading vessels passing that way. Nero finding all his machinations were discovered, resolved to throw off the mask, and put her openly to death, without further delay. He therefore caused a report to be spread, that she had conspired against him, and that a poniard was dropped at her feet by one who pretended a command from Agrippina to affalmine him. In consequence of this, he applied to his governors Seneca and Burrhus, for their advice how to act, and their assistance in ridding him of his fears. Things were now come to such a crisis, that no middle way could be taken; and either Nero or Agrippina was to fall. Seneca, therefore, kept a profound silence; while Burrhus, with more resolution, refused to be perpetra­tor of so great a crime; alleging, that the army was entirely devoted to all the descendants of Caesar, and would never be brought to imbrue their hands in the blood of any of his family. In this embarrassement, Anictetus, the contriver of the ship abovementioned, offered his services; which Nero accepted with the greatest joy, crying out, "That then was the first moment he ever found himself an emperor." This freed­man, therefore, taking with him a body of soldiers, surrounded the house of Agrippina, and then forced open the doors. The executioners having dispatched her with several wounds, left her dead on the couch, and went to inform Nero of what they had done. Some historians say, that Nero came immediately to view the body; that he continued to gaze upon it with pleasure, and ended his horrid survey, by coolly observing, that he never thought his mother had been so hand­some.— However this be, he vindicated his conduct next day to the senate; who not only excused, but applauded his impiety.

All the bounds of virtue being thus broken down, Nero now gave a loose to his appetites, that were not only for­bid but inhuman. There seemed an odd con­trast in his disposition; for while he practiced cruelties which were sufficient to make the mind shudder with horror, he was fond of those amusing arts that soften and refine the heart. He was particularly addicted, even from childhood, to music, and not totally ignorant of poetry. But chariot-driving was his favourite pursuit. He never missed the circus when chari­ot-races were to be exhibited there; appearing at first privately, and then
soon after publicly; till at last, his passion increasing by indulgence, he was not content with being merely a spectator, but resolved to become one of the principal performers. His governors, however, did all in their power to restrain this perverted ambition; but finding him resolute, they included a space of ground in the valley of the Vatican, where he first exhibited only to some chosen spectators, but shortly after invited the whole town. The praises of his flattering subjects only stimulated him still more to these unbecoming pursuits; so that he now resolved to assume a new character, and to appear as a finger upon the stage.

His passion for music, as was observed, was no less natural to him than the former; but as it was less manly, so he endeavoured to defend it by the example of some of the most celebrated men, who practised it with the same fondness. He had been instructed in the principles of this art from his childhood; and upon his advancement to the empire, he had put himself under the most celebrated masters. He patiently submitted to their instructions, and used all those methods whichingers practise, either to mend the voice, or improve its volubility. Yet, notwithstanding all his affiduity, his voice was but a wretched one, being both feeble and unpleasant. However, he was resolved to produce it to the public, such as it was; for flattery, he knew, would supply every deficiency. His first public appearance was at games of his own institution, called juveniles; where he advanced upon the stage, tuning his instrument to his voice with great appearance of skill. A group of tribunes and centurions attended behind him; when his old governor Burrhus fled by his hopeful pupil, with indignation in his countenance, and praises on his lips.

He was devious also of becoming a poet: but he was unwilling to undergo the pain of study, which a proficiency in that art requires; he was devious of being a poet ready made. For this purpose, he got together several persons, who were considered as great wits at court, though but very little known as such to the public. These attended him with verses which they had composed at home, or which they blabbed out extemporaneously; and the whole of their compositions being tucked together, by his direction, was called a poem. Nor was he without his philosophers also; he took a pleasure in hearing their debates after dinner, but he heard them merely for his amusement.

Furnished with such talents as these for giving pleasure, he was resolved to make the tour of his empire, and give the most public display of his abilities wherever he came. The place of his first exhibition, upon leaving Rome, was Naples. The crowds there were so great, and the curiosity of the people so earnest in hearing him, that they did not perceive an earthquake that happened while he was singing. His desire of gaining the superiority over the other actors was truly ridiculous: he made interdict with his judges, reviled his competitors, formed private factions to support him, all in imitation of those who got their livelihood upon the stage. While he continued to perform, no man was permitted to depart from the theatre, upon any pretence whatsoever. Some were so fatigued with hearing him, that they leaped privately from the walls, or pretended to fall into fainting fits, in order to be carried out. Nay, it is said, that several women were delivered in the theatre. Soldiers were placed in several parts to observe the looks and gestures of the spectators, either to direct them where to point their applause, or to restrain their displeasure. An old senator, named Pacham, afterwards emperor, happening to fall asleep upon one of these occasions, very narrowly escaped with his life.

After being fatigued with the praises of his countrymen, Nero resolved upon going over into Greece, to receive new theatrical honours. The occasion was this. The cities of Greece had made a law to send him the crowns from all the games; and deputies were accordingly dispatched with this (to him) important embassy. As he one day entertained them at his table in the most sumptuous manner, and conversed with them with the utmost familiarity, they intended to hear him sing. Upon his complying, the artful Greeks fulfilled all the marks of ecstacy and rapture. Applauses so warm were peculiarly pleasing to Nero: he could not refrain from crying out, That the Greeks alone were worthy to hear him; and accordingly prepared without delay to go into Greece, where he spent the whole year ensuing. In this journey, his retinue resembled an army in number; but it was only composed of fingers, dancers, tailors, and other attendants upon the theatre. He passed over all Greece, and exhibited at all their games, which he ordered to be celebrated in one year. At the Olympic games he resolved to show the people something extraordinary; wherefore, he drove a chariot with horses; but being unable to sustain the violence of the motion, he was driven from his seat. The spectators, however, gave their unanimous applause, and he was crowned as conqueror. In this manner he obtained the prize at the Samian, Pythian, and Nemean games. The Greeks were not sparing of their crowns; he obtained 1800 of them. An unfortunate finger happened to oppose him on one of these occasions, and exerted all the powers of his art, which, it appears, were prodigious. But he seems to have been a better finger than a politician; for Nero ordered him to be killed on the spot. Upon his return from Greece, he entered Naples, through a breach in the walls of the city, as was customary with those who were conquerors in the Olympic games. But all the splendor of his return was reserved for his entry into Rome. There he appeared seating in the chariot of Augustus, drested in robes of purple, and crowned with wild olive, which was the Olympic garland. He bore in his hand the Pythian crown, and had 1000 more carried before him.—

Defide fat one Diodorus, a musician; and behind him followed a band of fingers, as numerous as a legion, who sung in honour of his victories. The senate, the knights, and the people, attended this puerile pageant, filling the air with their acclamations. The whole city was illuminated, every street frizzled with incense; wherever he passed, victims were slain; the pavement was strewed with saffron, while garlands of flowers, ribbons, fowls, and papples, (for so we are told), were flowered down upon him from the windows as he passed along. So many honours only inflamed his desire of acquiring new; he at last began to take lessons in wrestling; willing to imitate Hercules in strength, as he had rivalled Apollo in activity. He also caused a lion
ion of palæboard to be made with great art, against
which he unadulteratedly appeared in the theatre, and
flew it down with a blow of his club.

But his cruelties even outdid all his other extravagances; a complete list of which would exceed the limits of the present article. He was often heard to observe, that he had rather be hated than loved. When one happened to say in his presence, That the world would be burned when he was dead: "Nay," replied Nero, "let it be burnt while I am alive." In fact, a great part of the city of Rome was consumed by fire shortly after. This remarkable conflagration took place in the 11th year of Nero's reign. The fire began among certain shops, in which were kept such goods as were proper to feed it; and spread every way with such amazing rapidity, that its havoc was felt in distant streets, before any measures to stop it could be tried. Besides an infinite number of common houses, all the noble monuments of antiquity, all the flately palaces, temples, porticoes, with goods, riches, furniture, and merchandise, to an immense value, were devoured by the flames, which raged with such terrible violence, and spread with such rapidity, as to reduce all relief. The sufferings of the women, the various efforts of some endeavouring to save the young and tender, of others attempting to afflile the aged and infirm, and the hurry of such as strove only to provide for themselves, occasioned a mutual interruption and universal confusion. Many, while they chiefly regarded the danger that pursu'd them from behind, found themselves suddenly involved in the flames before and on every side. If they escaped into the quarters adjoining, or into the parts quite remote, there too they met with the devouring flames. At last, not knowing whither to fly, nor where to seek sanctuary, they abandoned the city, and repaired to the open fields. Some, out of despair for the loss of their whole substance, others, through tenderness for their children and relations, whom they had not been able to snatch from the flames, suffered themselves to perish in them, though they might easily have found means to escape. No man dared to stop the progress of the fire; there being many who had no other business but to prevent with repeated menaces all attempts of that nature; nay, some were, in the face of the public, seen to throw lighted fire-brands into the houses, loudly declaring that they were authorized so to do; but whether this was only a device to plunder more freely, or in reality they had such orders, was never certainly known.

Nero, who was then at Antium, did not offer to return to the city, till he heard that the flames were advancing to his palace, which, after his arrival, was, in spite of all opposition, burnt down to the ground, with all the houses adjoining to it. However, Nero, affecting compassion for the multitude, thus vagabond and benighted of their dwellings, laid open the field of Mars, and all the great edifices erected there by Agrippa, and even his own gardens. He likewise cau'de'1 banccles to be reared in hale for the reception of the foreign populace; from Olla, too, and the neighbouring cities, were brought, by his orders, all sorts of furniture and necessaries, and the price of corn was considerably lefled. But these bounties, however generous and popular, were bestowed in vain, because a report spread abroad, that, during the time of this general conflagration, he mounted his domed stage, and sung the destruction of Troy, comparing the present defolation to the celebrated calamities of antiquity. At length, on the fifth day, the fury of the flames was stilled at the foot of Mount Esquiline, by levelling with the ground an infinite number of buildings; so that the fire found nothing to encounter but the open fields and empty air.

But fearce had the late alarm ceased, when the fire broke out anew with fresh rage, but in places more wide and spacious; whence fewer persons were destroyed, but more temples and public porticoes were overthrown. As this second conflagration broke out in certain buildings belonging to Tigellinus, they were both generally ascribed to Nero; and it was conjectured, that, by destroying the old city, he aimed at the glory of building a new one, and calling it by his name. Of the fourteen quarters into which Rome was divided, four remained entire, three were laid in ashes, and, in the seven others, there remained here and there a few houses, miserably shattered, and half consumed. Among the many ancient and flately edifices, which the rage of the flames utterly consumed, Tacitus reckons the temple destroyed by Servius Tullius to the Moon; the temple and great altar consecrated by Evander to Hercules; the chapel vowed by Romulus to Jupiter Stator; the court of Numa, with the temple of Vesta, and in it the tutelar gods peculiar to the Romans. In the same fate were involved the inestimable treasures acquired by so many victories, the wonderful works of the best painters and sculptors of Greece, and, what is still more to be lamented, the ancient writings of celebrated authors, till then preferred perfectly entire. It was observed, that the fire began the same day on which the Gauls, having formerly taken the city, burnt it to the ground.

Upon the ruins of the demolished city, Nero found Nero's gold palace, which he called his golden house; though it was not so much admired on account of an immense profusion of gold, precious stones, and other inestimable ornaments, as for its vast extent, containing spacious fields, large wild meadows, artificial lakes, thick woods, orchards, vineyards, hills, groves, &c. The entrance of this flately edifice was wide enough to receive a colossal, representing Nero, 120 feet high: the galleries, which consisted of three rows of tall pillars, were each a full mile in length; the lakes were equipped with magnificent buildings, in the manner of cities, and the woods stocked with all manner of wild beasts. The house itself was tiled with gold: the walls were covered with the same metal, and richly adorned with precious stones and mother-of-pearl, which in those days was valued above gold: the timber-work and ceilings of the rooms were inlaid with gold and ivory: the roof of one of the banqueting rooms resembled the firmament both in its figure and motion, turning incessantly about night and day, and showering all sorts of sweet waters. When this magnificent structure was finished, Nero approved of it only so far as to say, that at length he began to lodge like a man. Pliny tells us that this palace extended quite round the city. Nero, it seems, did not finish it; for the first order Olib signed was, as we read in Suetonius, for fifty millions of letters to be employed in perfecting the golden palace which Nero had begun.
The projectors of the plan were Severus and Celer, two bold and enterprising men, who soon after put the emperor upon a still more expensive and arduous undertaking, namely, that of cutting a canal through hard rocks and steep mountains, from the lake Avernus to the mouth of the Tiber, 160 miles in length, and of such breadth that two galleys of five ranks of oars might easily pass abreast. His view in this was to open a communication between Rome and Campania, free from the troubles and dangers of the sea; for, this very year, a great number of vessels laden with corn were shipwrecked at Misenum, the pilots choosing rather to venture out in a violent storm, than not to arrive at the time they were expected by Nero. For the executing of this great undertaking, the emperor ordered the prisoners from all parts to be transported into Italy; and such as were convicted, whatever their crimes were, to be condemned only to his works. Nero, who undertook nothing with more ardour and readinesss than what was deemed impossible, expended incredible sums in this rash undertaking, and exerted all his might to cut through the mountains adjoining to the lake Avernus; but, not being able to remove by art the obstacles of nature, he was in the end obliged to drop the enterprise.

The ground that was not taken up by the foundations of Nero's own palace, he assigned for houses, which were not placed, as after the burning of the city by the Gauls, at random, and without order; but the streets were laid out regularly, spacious, and straight; the edifices restrained to a certain height, perhaps of 70 feet, according to the plan of Augustus; the courts were widened; and to all the great houses which stood by themselves, and were called ipsis, large porticoes were added, which Nero engaged to raise at his own expense, and to deliver to each proprietor the squares about them clear from all rubbish. He likewise promised rewards according to every man's rank and substance; and fixed a day for the performance of his promise, on condition that against that day their several houses and palaces were finished. He moreover made the following rules and regulations to obviate such a dreadful calamity for the future; to wit, That the new buildings should be raised to a certain height without timber; that they should be arched with stone from the quarries of Gabii and Alba, which were proof against fire; that over the common springs, which were diverted by private men for their own uses, over-seers should be placed to prevent that abuse; that every citizen should have ready in his house some machine proper to extinguish the fire; that no wall should be common to two houses, but every house be inclosed within its own peculiar walls, &c. Thus the city in a short time rose out of its ashes with new lustre, and more beautiful than ever. However, some believed, that the ancient form was more conducing to health, the rays of the sun being hardly felt on account of the narrowness of the streets, and the height of the buildings, whereas now there was no shelter against the searing heat. We are told, that Nero designed to extend the walls to Ostia, and to bring from thence by a canal the sea into the city.

The emperor used every art to throw the odium of this confagration upon the Christians, who were at that time gaining ground in Rome. Nothing could be more dreadful than the perfection raised against them upon this false accusation, of which an account is given under the article Ecclesiastical History. However, the citizens of Rome seemed comparatively exempted from his cruelties, which chiefly fell upon strangers, and his nearest connections; but a conspiracy formed against him by Piso, a man of great power and integrity, which was prematurely discovered, opened a new train of suspicions that destroyed many of the principal families in Rome. This conspiracy, in which several of the chief men of the city were concerned, was first discovered by the indiscreet zeal of a woman named Epicharis, who, by some means now unknown, had been let into the plot, which she revealed to Volusius, a tribune, in order to prevail upon him to be an accomplice. Volusius, instead of coming into her design, went and discovered what he had learned to Nero, who immediately put Epicharis in prison. Soon after, a freedman belonging to Scanius, one of the accomplices, made a farther discovery. The conspirators were examined apart; and as their testimonies differed, they were put to the torture. Natalis was the first who made a confession of his own guilt and that of many others. Scanius gave a lift of the conspirators full more ample. Lucan, the poet, was amongst the number; and he, like the rest, in order to save himself, fell farther enlarged the catalogue, naming, among others, Attilus, his own mother. Epicharis was now, therefore, again called upon and put to the torture; but her fortitude was proof against all the tyrant's cruelty; neither scourging nor burning, nor all the malicious methods used by the executioners, could extort the smallest confession. She was therefore remanded to prison, with orders to have her tortures renewed the day following. In the meantime, the found an opportunity of strangling herself, by hanging it against the back of her chair. On the discoveries already made, Piso, Lateranus, Fennius Rufus, Subrius Flavius, Sulpitius Afer, Valerius the conful, and numerous others, were all executed without mercy. But the two most remarkable personages who fell on this occasion were Seneca the philosopher, and Lucan the poet, who was his nephew. It is not certainly known whether Seneca was really concerned in this conspiracy or not.

This great man had for some time perceived the outrageous conduct of his pupil; and, finding himself incapable of controlling his savage disposition, had retired from court into solitude and privacy. However, his retreat did not now protect him; for Nero, either having real testimony against him, or else hating him for his virtues, sent a tribute to inform him that he was suspected as an accomplice, and soon after sent him an order to put himself to death, with which he complied.

In this manner was the whole city filled with slaughter, and frightful instances of treachery. No matter was secure from the vengeance of his slaves, nor even parents from the bader attempts of their children. Not only throughout Rome, but the whole country round, bodies of soldiers were seen in pursuit of the suspected and the guilty. Whole crowds of wretches loaded with chains were led every day to the gates of the palace, to wait their sentence from the tyrant's own lips. He always prefided at the torture in person, attended by Tigellinus,
pellinus, captain of the guard, who, from being the most abandoned man in Rome, was now become his principal minister and favourite.

Nor were the Roman provinces in a better situation than the capital city. The example of the tyrant seemed to influence his governors, who gave infinences, not only of their capacity, but of their cruelty, in every part of the empire. In the seventh year of his reign, the Britons revolted, under the conduct of their queen Boadicea; but were at last so completely defeated, that ever after, during the continuance of the Romans among them, that they left not only all hopes, but even all desire of freedom.

A war also was carried on against the Parthians for the greatest part of this reign, conducted by Corbulo; who, after many successes, had disappointed Tiridates, and settled Tigranes in Armenia in his room. Tiridates, however, was soon after restored by an invasion of the Parthians into that country; but being once more opposed by Corbulo, the Romans and Parthians came to an agreement, that Tiridates should continue to govern Armenia, upon condition that he should lay down his crown at the feet of the emperor's throne, and receive it as coming from him; all which he shortly after performed. A ceremony, however, which Nero desired to have repeated to his person; wherefore by letters and promises he invited Tiridates to Rome, granting him the most magnificent supplies for his journey. Nero attended his arrival with very sumptuous preparations. He received him seated on a throne, accompanied by the Senate standing round him, and the whole army drawn out with all imaginable splendor.—

Tiridates ascended the throne with great reverence; and in most absolute terms acknowledged himself his slave. Nero railed him up, telling him with equal arrogance, that he did well, and that by his submission he had gained a kingdom which his ancestors could never acquire by their arms. He then placed the crown on his head, and, after the most costly ceremonies and entertainments, he was sent back to Armenia, with incredible sums of money to defray the expenses of his return.

In the 12th year of this emperor's reign, the Jews also revolted, having been fiercely oppressed by the Roman governor. It is said that Florus, in particular, was arrived at that degree of tyranny, that by public proclamation he gave permission to plunder the country, provided he received half the spoil. These oppressions drew such a train of calamities after them, that the sufferings of all other nations were light in comparison to what this devoted people afterwards endured, as is related under the article Jews. In the mean time, Nero proceeded in his cruelties at Rome with unabated severity.

The valiant Corbulo, who had gained so many victories over the Parthians, could not escape his fury. Nor did the emperor Poppaea herself escape; whom, in a fit of anger, he kicked when she was pregnant, by which she was miscarried and died. At last the Romans began to grow weary of such a monster, and there appeared a general revolution in all the provinces.

The first appeared in Gaul, under Julius Vindex, who commanded the legions there, and publicly protested against the tyrannical government of Nero. He appeared to have no other motive for this revolt than that of freeing the world from an oppressor; for when it was told him that Nero had set a reward upon his head of 10,000,000 of sesterces, he made this gallant answer: "Whoever brings me Nero's head, shall, if he pleases, have mine." But still more to shew that he was not actuated by motives of private ambition, he proclaimed Sergius Galba emperor, and invited him to join in the revolt. Galba, who was at that time governor of Spain, was equally remarkable for his wisdom, in peace and his courage in war. But as all talents under corrupt princes are dangerous, he for some years, had seemed willing to court obscurity, giving himself up to an inactive life, and avoiding all opportunities of signifying his valor. He now therefore, either through the caution attending old age, or from a total want of ambition, appeared little inclined to join with Vindex, and continued for some time to deliberate with his friends on the part he should take.

In the mean time, Nero, who had been apprised of the proceedings against him in Gaul, appeared totally regardless of the danger, privately flattering himself that the supposition of this revolt would give him an opportunity of fresh confidences. But the actual revolt of Galba, the news of which arrived soon after, affected him in a very different manner. The reputation of that general was such, that from the moment he declared against him, Nero considered himself as undone. He received the account as he was at supper; and instantly, struck with terror, overturned the table with his foot, breaking two crystal vases of immense value. He then fell into a fwoon; from which when he recovered he tore his clothes, and struck his head, crying out, "that he was utterly undone." He then began to meditate slaughters more extensive than he yet had committed. He resolved to massacre all the governors of provinces, to destroy all exiles, and to murder all the Galls in Rome, as a punishment for the treachery of their countrymen. In short, in the wildness of his rage, he thought of poisoning the whole Senate, of burning the city, and turning the house kept for the purposes of the theatre over upon the people. These designs being impracticable, he resolved at last to face the danger in person. But his preparations served to mark the infatuation of his mind. His principal care was, to provide waggons for the convenient carriage of his musical instruments; and to dress out his concubines like Amazons, with whom he intended to face the enemy. He also made a resolution, that if he came off with safety and empire, he would appear again upon the theatre with the lute, and would equip himself as a pantomime.

While Nero was thus frivolously employed, the revolt became general. Not only the armies in Spain and Gaul, but also the legions in Germany, Africa, and Lusitania, declared against him. Virginius Rufus alone, who commanded an army on the Upper Rhine, for a while continued in Lusitania; during which his forces, without his permission, falling upon the Galls, routed them, with great slaughter, and Vindex slew himself. But this ill success no way advanced the interests of Nero; he was so deterred by the whole empire, that he could find none of the armies faithful to him, however they might disagree with each other. He therefore called for Locutius to furnish him with poison; and, thus prepared for the world, he retired to the Servilian gardens.

**Rom.** [416] **Rom.**
dens, with a resolution of flying into Egypt. He accordingly dispatched the freedmen, in which he had the most confidence, to prepare a fleet at Olbia; and in the meanwhile founded, in person, the tribunes and curators of the guard, to know if they were willing to share his fortunes. But they all excused themselves, under divers pretexts. One of them had the boldness to answer him by a part of a line from Virgil: Ulyce adeone miserum est mori? "Is death then such a misfortune?" Thus delitute of every resource, all the expedients that cowardice, revenge, or terror could produce, took place in his mind by turns. He at one time resolved to take refuge among the Parthians; at another, to deliver himself up to the mercy of the insurgents: one while, he determined to mount the rostrum, to ask pardon for what was paffed, and to conclude with promises of amendment for the future. With these gloomy deliberations he went to bed; but waking about midnight, he was surprised to find his guards had left him. The praetorian soldiers, in fact, having been corrupted by their commander, had retired to their camp, and proclaimed Galba emperor. Nero immediately sent for his friends to deliberate upon his present exigence; but his friends also forsook him. He went in person from house to house; but all the doors were shut against him, and none were found to answer his inquiries. While he was pursing this inquiry, his very domestics followed the general defection; and having plundered his apartment, escaped different ways. Being now reduced to desperation, he desired that one of his favourite gladiators might come and dispatch him; but even in this request there was none found to obey. "Alas! (cried he) have I neither friend nor enemy?" And then running desperately forth, he seemed resolved to plunge headlong into the Tiber. But just then his courage beginning to fail him, he made a sudden stop, as if willing to recollect his reason; and asked for some secret place, where he might re-assume his courage, and meet death with becoming fortitude. In this distress, Phaon, one of his freedmen, offered him his country-house, at about four miles distant, where he might for some time remain concealed. Nero accepted his offer; and, half-dressed as he was, with his head covered, and hiding his face under his cloak, he mounted on horsecback, attended by four of his domestics, of whom the servant, named Sporus, was one. His journey, though quite short, was crowded with adventures. Round him he heard nothing but confounded noises from the camp, and the cries of the soldiers, imprecating a thousand evils upon his head. A passenger, meeting him on the way, cried, "There go men in pursuit of Nero." Another asked him, if there was any news of Nero in the city? His horse taking fright at a dead body that lay near the road, he dropped his handkerchief; and a soldier that was near, addressed him by name. He now therefore quitted his horse, and forfaking the highway, entered a thicket that led towards the back part of Phaon's house, throufh which he crept, making the beft of his way among the reeds and brambles, with which the place was overgrown. When he was arrived at the back part of the house, while he was waiting till there should be a breach made in the wall, he took up some water in the hollow of his hands from a pool to drink; saying, "To this liquor is Nero reduced." When the hole was made large enough to admit him, he crept in upon all-fours, and took a short repose upon a wretched pallet, that had been prepared for his reception. Being pressed by hunger, he demanded somewhat to eat; they brought him a piece of brown bread, which he refused; but he drank a little water. During this interval, the senate finding the praetorian guards had taken part with Galba, declared him emperor, and condemned Nero to die more majorum; that is, "according to the rigour of the ancient laws." These dreadful tidings were quickly brought by one of Phaon's slaves from the city, while Nero yet continued lingering between his hopes and his fears. When he was told of the resolution of the senate against him, he asked the messenger what he meant by being punished "according to the rigour of the ancient laws?" To this he was answered, that the criminal was to be stripped naked, his head was to be fixed in a pillory, and in that posture he was to be scourged to death. Nero was so terrified at this, that he feized two poniards which he had brought with him, and examining their points, returned them to their sheaths, saying, that the fatal moment was not yet arrived. However, he had little time to spare; for the soldiers who had been sent in pursuit of him were just then approaching the house: wherefore hearing the sound of the horfe's feet, he fea a dagger to his throat, with which, by the affistance of Epaphroditus, his freedman and secretary, he gave himself a mortal wound. He was not quite dead when one of the censors entering the room, and pretending he came to his relief, attempted to stop the blood with his cloak But Nero, regarding him with a stern countenance, said, "It is now too late. Is this your fidelity?"— Upon which, with his eyes fixed, and frightfully staring, he expired, in the 32d year of his age, and the 14th of his reign. Galba was 72 years old when he was declared emperor, and was then in Spain with his legions. How ever, he soon found that his being raised to the throne was but an inlet to new disquietudes. His first embar rament arose from a disorder in his own army; for upon his approaching the camp, one of the wings of horfe repeating of their choice, prepared to revolt, and he found it no easy matter to reconcile them to their duty. He also narrowly escaped affassination from some slaves, who were preferred to him by one of Nero's freedmen with that intent. The death of Vindex also served to add not a little to his disquietudes; so that, upon his very entrance into the empire, he had some thoughts of putting an end to his own life. But hearing from Rome that Nero was dead, and the empire transferred to him, he immediately assumed the title and ensigns of command. In his journey towards Rome, he was met by Rufus Virginius, who, finding the senate had decreed him the government, came to yield him obedience. This general had more than once refused the empire himself, which was offered him by his soldiers; alleging, that the senate alone had the dispo- sal of it, and from them only he would accept the honour. Galba having been brought to the empire by means of his army, was at the same time willing to suppress his adversaries' power to commit any future disturbance. His first influxion of approach to Rome was attended with one of those rigorous strokes of justice which ought rather to be denominated cruelly than any thing else. A body of marines,
among the legions, went to meet Galba, three miles from the city, and with loud importunities demanded a confirmation of what his predecessor had done in their favour. Galba, who was rigidly attached to the ancient discipline, deferred their request to another time. But they, considering this delay as equivalent to an absolute denial, insisted in a very disrespectful manner; and some of them even had recourse to arms: whereupon Galba ordered a body of horse attending him to ride in among them, and thus killed 7000 of them; but not content with this punishment, he afterwards ordered them to be decimated. Their insolence demanded correction; but such excessive punishments deviated into cruelty. His next step to curb the insolence of the soldiers, was his discharging the German cohort, which had been established by the former emperors as a guard to their persons. Tho' he sent home to their own country unrewarded, pretending they were disaffected to his person. He seemed to have two other objects also in view; namely, to punish those vices which had come to an enormous height in the last reign, with the strictest severity; and to replenish the exchequer, which had been quite drained by the prodigality of his predecessors. But these attempts only brought on him the imputation of severity and avarice; for the state was too much corrupted to admit of such an immediate transition from vice to virtue. The people had long been maintained in sloth and luxury by the prodigality of the former emperors, and could not think of being obliged to seek for new means of subsistence, and to retrench their superfluities. They began, therefore, to satirize the old master, for his fidelity, a plate of beans: a famous player upon the flute, named *Ganus*, having greatly delighted him, it is reported, that he drew out his purse, and gave him five-pence, telling him, that it was for his merit, and not public money. By such ill-judged frugality, at such a time, Galba began to lose his popularity; and he, who before his accession was esteemed by all, being become emperor, was confidered with ridicule and contempt. But there are some circumstances alleged against him, less equivocal than those trifling ones already mentioned. Shortly after his coming to Rome, the people were presented with a most grateful spectacle, which was that of Lucullus, Elius, Ptolomeus, Petronius, and Petnius, all the bloody ministers of Nero's cruelty, drawn in fetters through the city, and publicly executed. But Tigellinus, who had been more active than all the rest, was not there. The crafty villain had taken care for his own safety, by the largeness of his bribes; and though the people cried out for vengeance against him at the theatre and at the circus, yet the emperor granted him his life and pardon. Helodus the eunuch, also, who had been the instrument of poisoning Claudio, escaped, and owed his safety to the proper application of his wealth. Thus, by the inequality of his conduct, he became detestable to his subjects. At one time shewing himself severe and frugal, at another remiss and prodigal; condemning some ill-fated persons without any hearing, and pardoning others though guilty: in short, nothing was done but by the mediation of his favourites; all offices were vacant, and all punishments redeemable by money.

Affairs were in this unsettled posture at Rome, when the provinces were yet in a worse condition. The succession in Spain, in choosing an emperor induced the legions in the other parts to wish for a similar opportunity. Accordingly, many seditions were kindled, and several factions promoted in different parts of the empire, but particularly in Germany. There were then in that province two Roman armies; the one which had lately attempted to make Rufus Virginius emperor, as has been already mentioned, and which was commanded by his lieutenant, the other commanded by Vitellius, who long had an ambition to obtain the empire for himself. The former of these armies desiring their present general, and considering themselves as insulted by the emperor for having been the last to acknowledge his title, resolved now to be foremost in denying it. Accordingly, when they were summoned to take the oaths of homage and fidelity, they refused to acknowledge any other commands but those of the senate. This refusal they backed by a message of the prætorian bands, importing, that they were resolved not to acquiesce in the election of an emperor created in Spain, and declaring that the senate should proceed to a new choice.

Galba being informed of this commotion, was sensible, that, besides his age, he was less respected for want of an heir. He resolved therefore to put what he had formerly designed in execution, and to adopt some person whose virtues might defend such advancement, and protect his declining age from danger. His favourites understanding his determination, instantly resolved to give him an heir of their own choosing; so that there arose a great contention among them upon this occasion. Otho made warm application for himself; alleging the great services he had done the emperor, as being the first man of note who came to his assistance when he had declared against Nero. However, Galba, being fully resolved to consult the public good alone, rejected his suit; and on a day appointed ordered Piso Lucianus to attend him. The character given by historians of Piso is, that he was every way worthy of the honour designed him. He was nowary related to Galba; and had no other interest but merit to recommend him to his favour. Taking this youth therefore by the hand, in the presence of his friends, he adopted him to succeed in the empire, giving him the most wholesome lessons for guiding his future conduct. Piso's conduct showed that he was highly deserving this distinction: in all his deportment there appeared such modesty, firmness, and equality of mind, as bespoke him rather capable of discharging his office than ambitious of obtaining it; his present dignity. But the army and the senate did not seem equally disinterested upon this occasion; they had been so long used to bribery and corruption, that they could now bear no emperor who was not in a capacity of satisfying their avarice. The adoption therefore of Piso was but coldly received; for his virtues were no recommendation in a nation of universal depravity.

Otho now finding his hopes of adoption wholly frustrated, and still further stimulated by the immense load of debt which he had contracted by his riotous way of living, resolved upon obtaining the empire by force, since
Galba, in the mean time, being informed of the revolt of the army, seemed utterly confounded, and in want of sufficient resolution to face an event which he should have long foreseen. In this manner the poor old man continued wavering and doubting; till at last, being seduced by a false report of Otho's being slain, he rode into the forum in complete armour, attended by many of his followers. Just at the same instant a body of horse fent from the camp to destroy him entered on the opposite side, and each party prepared for the encounter. For some time hostilities were suspended on each side; Galba, confused and irresolute, and his antagonists shrunk with horror at the baseness of their enterprise. At length, however, finding the emperor in some measure deterred by his adherents, they rushed in upon him, trampling under foot the crowds of people that then filled the forum. Galba seeing them approach, seemed to recollect all his former fortitude; and bending his head forward, bid the flames strike it off if it were for the good of the people. This was quickly performed; and his head remaining exposed in the streets till it was buried by one of his flaves. He died in the 73d year of his age, after a short reign of seven months.

No sooner was Galba thus murdered, than the senate and people ran in crowds to the camp, contending who should be foremost in extolling the virtues of the new emperor, and depreting the character of him they had so unjustly destroyed. Each laboured to excel the rest in his invective of homage; and the less his affections were for him, the more did he indulge all the vehemence of exaggerated praise. Otho finding himself surrounded by congratulating multitudes, immediately repaired to the senate, where he received the titles usually given to the emperors; and from thence returned to the palace, seemingly resolved to reform his life, and utmost manners becoming the greatness of his station.

He began his reign by a signal instance of clemency, in pardoning Marcus Cellus, who had been highly favoured by Galba; and not contented with barely forgiving, he advanced him to the highest honours; an act of clemency was followed by another of justice, equally agreeable to the people. Tigellinus, Nero's favourite, who had been the promoter of all his cruelties, was now put to death; and all those as had been foolishly banished, or stripped, at his indignation, during Nero's reign, were restored to their country and fortunes.

In the mean time, the legions in Lower Germany having been purchased by the large gifts and specious promises of Vitellius their general, were at length induced to proclaim him emperor; and regardless of the senate, declared that they had an equal right to appoint to that high station with the cohorts at Rome. The news of this conduct in the army soon spread confirmation throughout Rome; but Otho was particularly struck with the account, as being apprehensive that nothing but the blood of his countrymen could decide a contest of which his own ambition only was the cause. He now therefore sought to come to an agreement with Vitellius; but this not succeeding, both sides began their preparations for war. News being received that Vitellius was upon his march to Italy, Otho departed from Rome with a vast army to oppose him. But though he was very powerful with respect to numbers, his men, being little used to war, could not be relied on. He seemed by his behaviour sensible of the disproportion of his forces; and he is said to have been tortured with frightful dreams and the most uneasy apprehensions. It is also reported by some, that one night fetching many profound sighs in his sleep, his servants ran hastily to his bed-side, and found him stretched on the ground. He alleged he had seen the ghost of Galba, which had, in a threatening manner, beat and pushed him from the bed; and he afterwards used many expiations to appease it. However this be, he proceeded with a great show of courage till he arrived at the city of Brixellum, on the river Po, where he remained, sending his two generals Valens and Cecina, who had hitherto served under the conduct of his generals Suetonius and Calvis, who made what haste they could to give the enemy battle. The army of Vitellius, which consisted of 70,000 men, was commanded by his generals Valens and Cecina, he himself remaining in Gaul in order to bring up the rest of his forces. Thus both sides hastened to meet each other with so much animosity and precipitancy, that three considerable battles were fought in the space of three days. One near Placentia, another near Cremona, and a third at a place called Cajtor; in all which Otho had the advantage. But these successes were of but short-lived continuance; for Valens and Cecina, who had hitherto acted separately, joining their forces, and reinforcing their armies with fresh supplies, resolved to come to a general engagement. Otho, who by this time had joined his army at a little village called Bedriacum, finding the enemy notwithstanding their late losses, inclined to come to a battle, resolved to call a council of war to determine upon the proper measures to be taken. His generals were of opinion to protract the war; but others, whose inexperience had given them confidence, declared, that nothing but a battle could relieve the miseries of the state; protesting, that Fortune, and all the gods, with the divinity of the emperor himself, favoured the design, and would undoubtedly prosper the enterprise.
In this advice Otho acquiesced: he had been for some time so uneasy under the war, that he seemed willing to exchange sup彭ene for danger. However, he was so surrounded with flatterers, that he was prohibited from being personally present in the engagement, but prevailed upon to deliver himself for the fortune of the empire, and wait the event at Brixiactum. The affairs of both armies being thus adjused, they came to an engagement at Bedriacum; where, in the beginning, those on the side of Otho seemed to have the advantage.

At length, the superior discipline of the legions of Vitellius turned the scale of victory. Otho's army fled in great confusion towards Bedriacum, being pursued with a miserable slaughter all the way.

In the mean time, Otho waited for the news of the battle with great impatience, and seemed to tax his messengers with delay. The first account of his defeat was brought him by a common soldier, who had escaped from the field of battle. However, Otho, who was still surrounded by flatterers, was desirous to give no credit to a base fugitive, who was guilty of falsehood only to cover his own cowardice. The soldier, however, still persisted in the veracity of his report: and, finding none inclined to believe him, immediately fell upon his sword, and expired at the emperor's feet. Otho was so much struck with the death of this man, that he perceived his meditation with the generals of Vitellius in their favour. Upon his declining their requests, Ruburius Gallus, a person of considerable note, undertook their embassy to the generals of the conquering army; and soon after obtained a pardon for all the adherents of Otho.

Vitellius was immediately after declared emperor by the senate; and received the marks of distinction which were now accustomed to follow the appointment of the strongest side. At the same time, Italy was severely distressed by the soldiers, who committed such outrages as exceeded all the oppressions of the most calamitous war. Vitellius, who was yet in Gaul, resolved, before he set out for Rome, to punish the praetorian cohorts, who had been the instigators of all the late disturbances in the state. He therefore caused them to be discharged, and deprived of the name and honour of soldiers. He also ordered 150 of those who were most guilty to be put to death.

As he approached towards Rome, he passed through the towns with all imaginable splendor; his passage by water was in painted galleys, adorned with garlands of flowers, and profusely furnished with the greatest delicacies. In his journey there was neither order nor discipline among his soldiers; they plundered wherever they came with impunity; and he seemed no way displeased with the licentiousness of their behaviour.

Upon his arrival at Rome, he entered the city, not as a place he came to govern with justice, but as a town that became his own by the laws of conquest. He marched through the streets mounted on horseback, all in armour; the senate and people going before him, as if the captives of his late victory. He the next day made the senate a speech, in which he magnified his own actions, and promised them extraordinary advantages from his administration. He then harangued the people, who being now long accustomed to flatter all in authority, highly applauded and blessed their new emperor.

In the mean time, his soldiers being permitted to flatter themselves in the debaucheries of the city, grew ful of luxury, and other vices. In the meantime, Otho's soldiers repaired to Virginius, the commander of the German legions, earnestly intreating him to take upon him the command of the German legions, earnestly intreating him to take upon him the reins of government; or at least, intreating his mediation with the generals of Vitellius in their favour. Upon his declining their requests, Ruburius Gallus, a person of considerable note, undertook their embassy to the generals of the conquering army; and soon after obtained a pardon for all the adherents of Otho.

Vitellius was immediately after declared emperor by the senate; and received the marks of distinction which were now accustomed to follow the appointment of the strongest side. At the same time, Italy was severely distressed by the soldiers, who committed such outrages as exceeded all the oppressions of the most calamitous war. Vitellius, who was yet in Gaul, resolved, before he set out for Rome, to punish the praetorian cohorts, who had been the instigators of all the late disturbances in the state. He therefore caused them to be discharged, and deprived of the name and honour of soldiers. He also ordered 150 of those who were most guilty to be put to death.

As he approached towards Rome, he passed through the towns with all imaginable splendor; his passage by water was in painted galleys, adorned with garlands of flowers, and profusely furnished with the greatest delicacies. In his journey there was neither order nor discipline among his soldiers; they plundered wherever they came with impunity; and he seemed no way displeased with the licentiousness of their behaviour.

Upon his arrival at Rome, he entered the city, not as a place he came to govern with justice, but as a town that became his own by the laws of conquest.
Proclaimed emperor. Nero, however, had at first interrupted the progress of his arms, and the succession of Galba gave a temporary check to his conquests, as he was obliged to send his son Titus to Rome, to receive that emperor's commands. Titus, however, was so long detained by contrary winds, that he received news of Galba's death before he set sail. He then resolved to continue neutrality during the civil wars between Otho and Vitellius; and when the latter prevailed, he gave him his homage with reluctance. But being desirous of acquiring reputation, though he disliked the government, he determined to lay siege to Jerusalem, and actually made preparations for that great undertaking, when he was given to understand that Vitellius was defeated by all ranks in the empire. These murmurings increased every day, while Vitellian secretly endeavoured to advance the discontent of the army. By these means they began at length to fix their eyes upon him as the person most capable and willing to terminate the miseries of his country, and put an end to the injuries it suffered. Not only the legions under his command, but those in Mysia and Pannonia, came to the same resolution, so that they declared themselves for Vitellius. He was also without his own content proclaimed emperor at Alexandria, the army there confirming it with extraordinary applause, and paying their accustomed homage. Still, however, Vepilian feared to decline the honour done him; till at length his soldiers compelled him, with their threats of immediate death, to accept a title which, in all probability, he wished to enjoy. He now, therefore, called a council of war; where it was resolved, that his son Titus should carry on the war against the Jews; and that Munius, one of his generals, should, with the greatest part of his legions, enter Italy; while Vitellian himself should levy forces in all parts of the camp, in order to reinforce the legion in that quarter.

During these preparations, Vitellius, though burdened in sloth and luxury, was resolved to make an effrt to defend the empire; wherefore his chief commanders, Valens and Cecina, were ordered to make all possible preparations to reft the invaders. The first army that entered Italy with an hostile intention was under the command of Antonius Primus, who was met by Cecina near Cremona. A battle was expected to ensue; but a negotiation taking place, Cecina was prevailed upon to change sides, and declare for Vepilian. His army, however, quickly repented of what they had done; and imprisoning their general, attacked Antonius, though without a leader. The engagement continued during the whole night: in the mornmg, after a short repulf, both armies engaged a second time; when the soldiers of Antonius halting the rising sun, according to custom, the Vitellians supposing that they had received new reinforcements, betook themselves to flight, with the loss of 30,000 men. Shortly after, freeing their general Cecina from prison, they prevailed upon him to intercede with the conquerors for pardon; which they obtained, though not without the most horrid barbarities committed upon Cremona, the city to which they had retired for shelter.

When Vitellius was informed of the defeat of his army, his former insolence was converted into an extreme of timidity and irreolution. At length he commanded Julius Priscus and Alphenus Varus, with some forces that were in readiness, to guard the passes of the Apennines, to prevent the enemy's march to Rome; referring the principal body of his army to secure the city, under the command of his brother Lucius. But being persuaded to repair to his army in person, his presence only served to increase the contempt of his soldiers. He there appeared irresolute, and still luxurious, without counsel or conduct, ignorant of war, and demanding from others those instructions which it was his duty to give. After a short continuance in the camp, and understanding the revolt of his fleet, he returned once more to Rome: but every day only served to render his affairs still more desperate; till at last he made offers to Vepilian of resigning the empire, provided his life was granted, and a sufficient revenue for his support. In order to enforce his request, he issued from his palace in deep mourning, with all his domestics weeping round him. He then went to offer the sword of justice to Cecilianus, the confid; which he refusing, the abjed emperor prepared to lay down the ensigns of the empire in the temple of Concord. But being interrupted by some, who cried out, That he himself was Concord, he resolved, upon fo weak an encouragement, still to maintain his power, and immediately prepared for his defence.

During this fluctuation of counsels, one Sabinus, who had advised Vitellius to resign, perceiving his desperate situation, resolved, by a bold step, to oblige Vepilian, and accordingly seized upon the Capitol. But he was premature in his attempt; for the legions of Vitellius attacked him with great fury, and, prevailing by their numbers, soon laid that beautiful building in ashes. During this dreadful conflagration, Vitellius was feasting in the palace of Tibiscus, and beholding all the horrors of the assault with great satisfaction. Sabinus was the commander, and shortly after executed by the emperor's command. Young Domitian, his nephew, who was afterwards emperor, escaped by flight, in the habit of a priest; and all the rest who survived the fire were put to the sword.

But this success served little to improve the affairs of Vepilian. He vainly sent messengers after messengers to being Vepilian's general, Antonius, to a composition. This
This commander gave no answer to his requests, but still continued his march towards Rome. Being arrived before the walls of the city, the forces of Vespasian were resolved upon defending it to the utmost extremity. It was attacked on three sides with the utmost fury; while the army within, falling upon the besiegers, defended it with equal obstinacy. The battle lasted a whole day, till at last the besieged were driven into the city, and a dreadful slaughter made of them in all the streets, which they vainly attempted to defend. In the mean time, the citizens flew, looking on as both sides fought, and, as if they had been in a theatre, clapped their hands; at one time encouraging one party, and again the other. As either turned their backs, the citizens would then fall upon them in their places of refuge, and to kill and plunder them without mercy. But what was still more remarkable, during these dreadful slaughters both within and without the city, the people would not be prevented from celebrating one of their riotous feasts, called the Saturnalia; so that at one time might have been seen a strange mixture of mirth and misery, of cruelty and levities, in one place, buryings and slaughters; in another, drunkenness and feasting; in a word, all the horrors of a civil war, and all the licentiousness of the most abandoned secuity!

During this complicated scene of misery, Vespasian retired privately to his wife's house, upon mount Aventine, designating that night to fly to the army commanded by his brother at Tarracina. But, quite incapable, through fear, of forming any resolution, he changed his mind, and returned again to his palace, now void and desolate, all his slaves forfaking him in his diftresses, and purposely avoiding his presence. There, after wandering for some time quite disconsolate, and fearing the face of every creature he met, he hid himself in an obscure corner, from whence he was soon taken by a party of the conquering soldiers. Still, however, willing to add a few hours more to his miserable life, he begged to be ing an halter round his neck, led him along, half fed, others struck him with their hands; some ridiculed his defects with an hook, they threw it, with all possible ignomy into the river Tiber. Such was the miserable end of this emperor, in the 57th year of his age, after a short reign of eight months and five days.

Vespasian being dead, the conquering army purified their enemies throughout the city, while neither houses nor temples afforded refuge to the fugitives. The streets and public places were all strewed with dead, each man lying slain where it was his misfortune to be overtaken by his unmerciful pursuers. But not only the enemy suffered in this manner, but many of the citizens, who were obnoxious to the soldiers, were dragged from their houses, and killed without any form of trial. The heat of their resentment being somewhat abated, they next began to seek for plunder; and under pretence of searching for the enemy, left no place without marks of their rage or rapacity. Besides the soldiers, the lower rabble joined in these detestable outrages; some slaves came and discovered the riches of their masters; some were detected by their nearest friends; the whole city was filled with outcry and lamentation; insomuch, that the former ravages of Otho and Vespasian were now considered as flight evils in comparison.

At length, however, upon the arrival of Mutianus, general to Vespasian, these slaughters ceased, and the flate began to wear the appearance of former tranquility. Vespasian was declared emperor by the unanimous consent both of the senate and the army; and dignified with all those titles, which now followed rather the power than the merit of those who were appointed to govern. Messengers were dispatched to him into Egypt, defiring his return, and testifying the utmost desire for his government. However, the winter being dangerous for sailing, he deferred his voyage to a more convenient season. Perhaps, also, the diffentions in other parts of the empire retarded his return to Rome; for one Claudius Civilis, in Lower Germany, excited his countrymen to revolt, and destroyed the Roman garrisons, which were placed in different parts of that province. But, to give his rebellion an air of justice, he caused his army to swear allegiance to Vespasian, until he found himself in a condition to throw off the mark. When he thought himself sufficiently powerful, he disclaimed all submission to the Roman government; and having overcome one or two of the lieutenants of the empire, and being joined by such of the Romans as refused obedience to the new emperor, he boldly advanced to give Cerealis, Vespasian's general, battle. In the beginning of this engagement, he seemed successful, breaking the Roman legions, and putting their cavalry to flight. But at length Cerealis by his conduct turned the fate of the day, and not only routed the enemy, but took and destroyed their camp. This engagement, however, was not decisive; several others ensued with doubtful success. An accommodation at length took place. Civilis obtained peace for his countrymen, and pardon for himself; for the Roman empire was, at this time, torn by its own divisions, that the barbarous nations around made incursions with impunity, and were sure of obtaining peace whenever they thought proper to demand it.

During the time of these commotions in Germany, the Sarmatians, a barbarous nation in the north-east of the empire, suddenly passed the river Iler, and marched into the Roman dominions with such celerity and fury, as to destroy several garrisons, and an army under the command of Fonteius Agrippa. However, they were driven back by Rubrius Gallus, Vespasian's lieutenant, into their native forests; where several attempts were made to confine them by garrisons and forts, placed along the confines of their country. But these hardy nations, having once found the way into the empire, never
Valuable.}

Jerusalem. Rome, never after deposed from invading it upon every opportunity, till at length they over-ran and destroyed it entirely.

Vespasian continued some months at Alexandria in Egypt, where it is said he cured a blind and a lame man by touching them. Before he set out for Rome, he gave his son Titus the command of the army that was to lay seige to Jerusalem; while he himself went forward, and was met many miles from Rome by all the senators, and near half the inhabitants, who gave the sincerest testimonies of their joy, in having an emperor of such great and experienced virtues. Nor did he in the least disappoint their expectations; being equally affiduous in rewarding merits, and pardoning his adversaries; in reforming the manners of the citizens, and setting them the best example in his power.

In the mean time, Titus carried on the war against the Jews with vigour, which ended in the terrible destruction of the city, mentioned under the article Jews. After which his soldiers would have crowned Titus as conqueror; but he refused the honour, alleging that he was only an instrument in the hand of Heaven, that manifestly declared its wrath against the Jews. At Rome, however, all mouths were filled with the praises of the conqueror, who had not only showed himself an excellent general, but a courageou combatant: his return, therefore, in triumph, which he did with his father, was marked with all the magnificence and joy that was in the power of men to express. All things that were esteemed valuable or beautiful among men were brought to adorn this great occasion. Among the rich spoils were exposed vast quantities of gold taken out of the temple; but the book of their law was not the least remarkable among the magnificent profusion. A triumphal arch was erected upon this occasion, on which were described all the victories of Titus over the Jews, which remains almost entire to this very day. Vespasian likewise built a temple to Peace, wherein were deposited most of the Jewish spoils; and having now calmed all the commotions in every part of the empire, he took up the temple of Janus, which had been open about five or six years.

Vespasian having thus given security and peace to the empire, resolved to correct numerous abuses which had grown up under the tyranny of his predecessors. To effect this with greater ease, he joined Titus with him in the confulsip and triennial power, and in some measure admitted him a partner in all the highest offices of the state. He began with restraining the licentiousness of the army, and forcing them back to their primitive discipline. He abridged the process of that had been carried to an unreasonable length in the courts of justice. He took care to rebuild such parts of the city as had suffered in the late commotions; particularly the Capitol, which had been lately burnt; and which he now restored to more than former magnificence. He likewise built a famous amphitheatire, the ruins of which are to this day an evidence of its ancient grandeur. The other ruinous cities of the empire also shared his paternal care; he improved such as were declining, adorned others, and built many anew. In such acts as these he puffed a long reign of clemency and moderation; so that it is said, no man suffered by an unjust or a severe decree during his administration.

Julius Sabinus seems to be the only person who was treated with greater rigour than was usual with this emperor. Sabinus was entrusted with a small army in Gaul, and had declared himself emperor upon the death of Vitellius. However, his army was shortly after overcome by Vespasian's general, and he himself compelled to seek safety by flight. He for some time wandered through the Roman provinces, without being discovered; but finding the pursuit every day become closer, he was obliged to hide himself in a cave; in which he remained concealed for no less than nine years, attended all the time by his faithful wife Empona, who provided provisions for him by day, and repaired to him by night. However, he was at last discovered in the performance of this pious office, and Sabinus was taken prisoner and carried to Rome. Great intercession was made to the emperor in his behalf: Empona herself appearing with her two children, and imploring her husband's pardon. However, neither her tears nor entreaties could prevail; Sabinus had been too dangerous a rival for mercy; so that, though she and her children were spared, her husband suffered by the executioner. But this seems to be the only instance in which he restored him to life. He caused the daughter of Vittellius, his avowed enemy, to be married into a noble family, and he himself provided her a suitable fortune. One of Nero's servants coming to beg for pardon for having once rudely thrust him out of the palace, and insulted him when in office, Vespasian only took his revenge by serving him just in the same manner. When any plots or conspiracies were formed against him, he disdained to punish the guilty, saying, That they deserved rather his contempt for their ignorance, than his resentment; as they seemed to envy him a dignity of which he daily experienced the uneasiness. His liberality towards the encouragement of arts and learning, was not less than his clemency. He settled a conflat salary of 100,000 sesterces upon the teachers of rhetoric. He was particularly favourable to Josephus, the Jewish historian. Quintilian the orator, and Flinty the naturalist, flourished in his reign, and were highly esteemed. He was a great encourager of all other excellencies in art; and invited the greatest masters and artificers from all parts of the world, making them considerable presents, as he found occasion.

Yet all his numerous acts of generosity and magnificence could not preserve his character from the imputation of rapacity and avarice. He revived many oblique methods of taxation; and even bought and sold commodities himself, in order to increase his fortune. He is charged with advancing the most avaricious governors to the provinces, in order to share their plunder on their return to Rome. He defended some very unusual and dishonourable impost taxes upon urine. When his son Titus remonstrated against the exactions of such a tax, Vespasian took a piece of money, demanded if the smelt offended him; and then added, that this very money was produced by urine. But in excise for this, we must observe, that the exchequer, when Vespasian came to the throne, was so much exhausted, that he informed the senate that it would require a supply of three hundred millions (being) to re-establish the commonwealth. This necessity must naturally produce more numerous and heavy taxes than the empire had hitherto experienced; but while the provinces were thus obliged to contribute...
The love which all ranks of people bore to Titus, of him. The appellation of the prosperity, procured him the countenance of his companions of his former revolotions. The love which all ranks of people bore to Titus, of him. The love which all ranks of people bore to that ancient, barbarous people inhabiting along the river Tanais, abandoned their barren wilds, and invaded the kingdom of Media. From thence passing into Armenia, after great rages, they overthrew Tiridates, the king of that country, with prodigious slaughter. Titus was at length bent to chastise their insolence: but the barbarians retired at the approach of the Roman army, loaded with plunder; being compelled to wait a more favourable opportunity of renewing their irruptions. These incursions, however, were but a transient storm, the effects of which were soon repaired by the emperor’s moderation and clemency. We are told, that he now formed and established a thousand nations, which had scarcely before amounted to 200. No provinces in the empire lay out of his view and protection. He had, during his whole reign, a particular regard to Britain; his generals, Petullus Cerialis, and Julius Frontinus, brought the greatest part of the island into subjection; and Agricola, who succeeded soon after, completed what they had begun. See England.

In this manner, having reigned 10 years, loved by his subjects, and deferving their affection, he was surprised by an indisposition at Campania, which he at once declared would be fatal, crying out, in the spirit of Paganism, “Methinks I am going to be a god.” Removing from thence to the city, and afterwards to a country-seat near Reate, he was there taken with a flux, which brought him to the last extremity. However, perceiving his end approach, and just going to expire, he cried out, that an emperor ought to die standing: wherefore, raising himself upon his feet, he expired in the hands of them that sustained him.

Titus being joyfully received as emperor, notwithstanding a stiff opposition from his brother Domitian, who maintained that he himself was appointed, and that Titus had falsified the will, began his reign with every virtue that became an emperor and a man. During the life of his father there had been many imputations against him; but upon his exaltation to the throne he seemed entirely to take leave of his former vices, and succeed in Britain, Titus was saluted emperor the 15th. The emperor, however, did all that lay in his power to repair the damage sustained by the public; and, with respect to the city, declared that he would take the whole loss of it upon himself. These disasters were in some measure counter-balanced by the successes in Britain under Agricola.

This excellent general having been sent into that country towards the latter end of Vespasian’s reign, showed himself equally expert in quelling the refractory, and civilizing those who had formerly submitted to the Roman power. The Ordovices, or inhabitants of North Wales, were the first that were subdued. He then made a descent upon Mona, or the island of Anglesea; which surrendered at discretion. Having thus rendered himself master of the whole country, he took every method to restore discipline to his own army, and to introduce some share of politeness among those whom he had conquered. He extorted them, both by advice and example, to build temples, theatres, and stately houses. He caufed the sons of their nobility to be instructed in the liberal arts; he had them taught the Latin language, and induced them to imitate the Roman modes of dressing and living. Thus, by degrees, this barbarous people began to assume the luxurious manners of their conquerors, and in time even outdid them in all the refinements of sensual pleasure. For the successes in Britain, Titus was saluted emperor the 15th time; but he did not long survive his honours, being feized with a violent fever at a little distance from Rome. Perceiving his death to approach, Titus declared, that during the whole course of his life he knew but of one action which he repented of; but that action he did not think proper to express. Shortly after, he died (not without indignation of treachery from his brother Domitian, who had long wished to govern) in the 41st year of his age, having reigned two years, two months and twenty days.

The love which all ranks of people bore to Titus, succeeded facilitated the election of his brother Domitian, not by Domitian, but by the ill opinion many had already conceived of him. His ambition was already too well known,

took care that triumphant ornaments, statues, and other honours, should be decreed him; but at the same time he removed him from his command, under a pretence of appointing him to the government of Syria. By these means, Agricola surrendered his government to Sallustius Lucullus, but soon found that Syria was otherwise disposed of. Upon his return to Rome, which was privately and by night, he was coldly received by the emperor; and dying some time after retirement, it was supposed by some, that his end was hastened by Domitian's direction.

Domitian soon after found the want of a commander in the many interruptions of the barbarous nations that surrounded the empire. The Sarmatians in Europe, joined with those in Asia, made a formidable invasion; at once destroying a whole legion, and a general of the Romans. The Dacians, under the conduct of Decebalus their king, made an interruption, and overthrew the Romans in several engagements. Loffes were followed by lories, so that every season became memorable for some remarkable overthrow. At last, however, the state making a vigorous exertion of its internal power, the barbarians were repelled, partly by force and partly by the assistance which they gave to the state. Their cruelties, which they gave to the state, were followed by a new fort of lances of their own invention. Janus Rufillus died on publishing a book, in which he commended Thrasis and Priscus, two philosophers who opposed Vesuvian's coming to the throne.

Such cruelties as these, that seem almost without a motive, may naturally be supposed to have produced rebellion. Lucius Antonius, governor in Upper Germany, knowing how much the emperor was detested at home, assumed the ensigns of imperial dignity. As he was at the head of a formidable army, his success remained long doubtful; but a sudden overstepping of the Rhine dividing his army, he was set upon at that juncture by Normandus, the emperor's general, and totally routed. The news of this victory, we are told, was brought to Rome by supernatural means, on the same day that the battle was fought. Domitian's severity was greatly increased by this success, of short duration. In order to discover those who were accompanis with roth, the adverse party, he invented new tortures, sometimes cutting off the hands, at other times putting fire into the privities, of the people whom he suspected of being his enemies. During these cruelties, he aggravated...
their guilt by hypocrisy, never pronouncing sentence without a preamble full of gentleness and mercy. He was particularly terrible to the Senate and nobility, the whole body of whom he frequently threatened entirely to extirpate. At one time, he surrounded the Senate-house with his troops, to the great conflagration of the Senators. At another, he resolved to amuse himself with their terrors in a different manner. Having invited them to a public entertainment, he received them very formally at the entrance of his palace, and conducted them into a spacious hall, hung round with black, and illuminated by a few melancholy lamps, that diffused light only sufficient to show the horrors of the place. All around were to be seen nothing but coffins, with the names of each of the senators written upon them, together with other objects of terror, and instruments of execution. While the company beheld all the preparations with silent agony, several men, having their bodies blackened, each with a drawn sword in one hand and a flaming torch in the other, entered the hall, and danced round them. After some time, when the guests expected nothing less than instant death, well knowing Domitian’s capricious cruelty, the doors were set open, and one of the servants came to inform them, that the emperor gave all the company leave to withdraw.

These cruelties were rendered still more odious by his lucre and avarice. Frequently after prefiding at an execution, he would retire with the lowdlest prostitutes, and use the same baths which they did. His avarice, which was the consequence of his profunion, knew no bounds. He feized upon the estates of all against whom he could find the smallest pretensions; the most trifling action or word against the majesty of the prince was sufficient to ruin the possessor. He particularly exacted large sums from the rich Jews; who even then began to practise the art of peculation, for which they are so well known. Parthenius, the comptroller of the household, who came into the companion of the most important objects of terror, was placed in this position. Whereupon, this fulpicious tyrant, willing to evade the prediction, commanded all the Jews of the lineage of David to be diligently sought out, and put to death. Two Christians, grandsons of St Jude the apostle, of that line, were brought before him; but finding them poor, and no way ambitious of temporal power, he dismissed them, considering them as objects too mean for his jealousy. However, his persecution of the Christians was more severe than that of any of his predecessors. By his letters and edicts they were banished in several parts of the empire, and put to death with all the tortures of ingenuous cruelty. The predictions of Chaldeans and astrologers also, concerning his death, gave him most violent apprehensions, and kept him in the most tormenting disquietude. As he approached towards the end of his reign, he would permit no criminal, or prisoner, to be brought into his presence, until they were bound in such a manner as to be incapable of injuring him; and he generally secured their chains in his own hands. His jealousies increased to that degree, that he ordered the gallery in which he walked to be set round with a pellicid stone, which served as a mirror to reflect the perfons of all such as approached him from behind. Every omen and prodigy gave him fresh anxiety.

But a period was soon to be put to this monster’s cruelty. Among the number of those whom he at once #careasted and suspected, was his wife Domitia, whom he had taken from Alius Lampa, her former husband. This woman, however, was become obnoxious to him, for having placed her affections upon one Paris, a player; and he resolved to dispatch her, with several others that he either hated or suspected. It was the tyrant’s method to put down the names of all such as he was inclined to destroy in his tablets, which he kept about him with great circumspection. Domitia, fortunately happening to get a sight of them, was struck at finding her own name in the catalogue of those fated to destruction. She showed the fatal list to Norbanus and Petronius, prefects of the praetorian bands, who found themselves set down; as likewise to Stephanus, the comptroller of the household, who came into the conspiracy with alacrity. Parthenias also, the chief chamberlain, was of the number. These, after many confutations, determined on the first opportunity to put their design in execution; and at length fixed on the 18th day of September for the completion of their attempt. Domitian, whole death was every day foretold by the astrologers, who, of conference, must at last be right in their predictions, was in some measure apprehensive of that day; and at he had been ever timorous, so he was now more particularly upon his guard. He had some time before secluded himself in the most secret recesses of his palace; and at midnight he was so afflicted as to leap out of his bed, inquiring of his attendants what hour of the night it was. Upon their falsely affuring him that it was an hour later than that which he was taught to apprehend, quite transported, as if all danger was past, he prepared to go to the bath. Just then, Parthenius his chamberlain came to inform him that Stephanus the comptroller of his household defied to speak to him upon an affair of the utmost importance. The emperor having given orders that his attendants should retire, Stephanus entered with his hand in a scarf, which he had worn thus for some days, the better to conceal a dagger, as none were permitted to approach the emperor except unarmed. He began by giving information of a pretended conspiracy, and exhibited a paper in which the particulars were specified. While Domitian was reading the contents with an eager curiosity, Stephanus drew his dagger, and struck him in the groin. The wound not being mortal, Domitian caught hold of the assassin, and threw him upon the ground, calling out for assistance. He demanded also his sword, that was usually placed under his pillow; and a boy who attended in the apartment, running to fetch it, found only the scabbard, for Parthenius had previously removed the blade. The struggle with Stephanus still continued: Domitian still kept him under, and at one time attempted to wrest the dagger from his hand, at another to tear out his eyes with his fingers. But Parthenius, with his freedman, a gladiator, and two fabeliner officers, now coming in, ran all furious upon the emperor, and dispatched him with many wounds. In the mean time, some of the officers of the guard being alarmed, came to his assistance, but too late to save him; however, they flew Stephanus on the spot.

When it was publicly known that Domitian was slain, the joy of the Senate was so great, that being assembled with the utmost haste, they began to load his memory,
memory with every reproach. His statues were com-
mmanded to be taken down; and a decree was made,
that all his inscriptions should be erased, his name
struck out of the registers of fame, and his funeral
omitted. The people, who now took little part in the
affairs of government, looked on his death with indif-
fERENCE; the soldiery alone, whom he had loaded with
favourites, and enriched by largesses, sincerely regretted
their benefactor. The senate, therefore, resolved to
proffer a successor before the army could have an op-
portunity of taking the appointment upon themselves: and
Cocceius Nerva was chosen to the empire the very
day on which the tyrant was slain.

Rome was of an illustrious family, as molt say, by
birth a Spaniard, and above 65 years old when he was
called to the throne. He was, at that time, the
most remarkable man in Rome, for his virtues, mo-
deration and respect to the laws; and he owed his ex-
altation to the blameless conduct of his former life.
When the senate went to pay him their subjunctions,
he received them with his accustomed humility; while
Arius Antonius, in his mildest manner, having em-
braced him with greater familiarity, congratulated him
on his accession to the empire; and some, who had
ever sworn him more worthy of the throne than
Roma; his only fault being that he was too indulgent,
and often made a prey by his insidious courtiers.

However, an excess of indulgence and humanity
were faults that Rome could easily pardon, after the
cruelties of such an emperor as Domitian. Being long
accustomed to tyranny, they regarded Nerva's gentle
reign with rapture, and even gave his imbecility the
name of benevolence. Upon coming to the throne, he
solemnly swore than no senator of Rome should be
put to death by his command, during his reign, though
they gave ever so just a cause. He conferred great fa-
vours, and bestowed large gifts, upon his particular
friends. His liberality was so extensive, that, upon his
first promotion to the empire, he was constrained to fell
his gold and silver plate, with his other rich moveables,
to enable him to continue his liberalties. He relieved
the cities of the empire from many severe impositions,
which had been laid upon them by Vespasian; took off
a rigorous tribute, which had been laid upon carriages;
and restored those to their property who had been un-
justly dispossessed by Domitian.

During his short reign he made several good laws.
He particularly prohibited the caltration of male
children; which had been likewifc condemned by his pre-
decefeor, but not wholly removed. He put all those
slaves to death who had, during the last reign, inform-
ed against their masters. He permitted no statues to
be erected to honour him, and converted into money
such of Domitian's as had been spared by the senate.
He sold many rich robes, and much of the splendid
furniture of the palace, and retrenched several unre-
asonable expenses at court. At the same time, he had
so little regard for money, that when Hercules Aticcius,
one of his subjects, had found a large treasure, and
derceived to the emperor haw to dispose of it. He received
for answer, that he might use it; but the finder still in-
forming the emperor that it was a fortune too large for
a private person, Nerva, admiring his honesty, wrote
him word, that then he might abuse it.

A life of such generofity and mildness was not,
The great qualities of his mind were accompanied with all the advantages of person. His body was majestic and vigorous; he was at that middle time of life which is happily tempered with the warmth of youth and the caution of age, being 42 years old. To these qualities were added, a modesty that seemed peculiar to himself alone; so that mankind found a pleasure in praizing those accomplishments of which the poiser seemed no way conscious. Upon the whole, Trajan is distinguished as the greatest and the best emperor of Rome. Others might have equalled him in war, and might have been his rivals in clemency and goodness; but he seems the only prince who united these talents in the greatest perfection, and who appears equally to engage our admiration and our regard. Upon being informed of the death of Nerva, he prepared to return to Rome, whither he was invited by the united intreaties of the state. He therefore began his march with the discipline that was for a long time unknown in the armies of the empire. The countries through which he passed were neither ravaged nor taxed, and he entered the city not in a triumphant manner, though he was desired it often, but on foot, attended by the civil officers of the state, and followed by his soldiers, who marched silently forward with modesty and respect. It would be tedious and unnecessary to enter into a detail of this good monarch's labours for the state. His application to business, his moderation to his enemies, his modesty in exaltation, his liberality to the deserving, and his frugality in his own expences; these have all been the model of the pretorian band the sword, according to the use of which the death of Nerva, he prepared to return to Rome. While he was employed in these wars, there was a furious dreadful insurrection of the Jews in all parts of the empire. This wretched people, still infatuated, and ever expecting some signal deliverer, took the advantage of Trajan's absence in the east to massacre all the Greeks and Romans whom they got into their power, without reluctance or mercy. This rebellion first began in Cyrene, a Roman province in Africa; from thence the flame extended to Egypt, and next to the island of Cyprus. These places they in a manner defecrated with impious fury. These barbarities were such, that they eat the flesh of their enemies, wore their skins, fowed them affunder, cast them to wild beasts, made them kill each other, and fludied new torments by which to destroy them. However, these cruelties were of no long duration: the governors of the respective provinces making head against their tumultuous fury, soon treated them with a retaliation of cruelty, and put them to death, not as human beings, but as outrageous pests to society. As the Jews had practised their cruelties in Cyprus particularly, a law was publicly enacted, by which it was made capital for any Jew to set foot on the island.

During these bloody transactions, Trajan was pro-

look upon the Christians with a supicious eye. The extreme veneration which he professed for the religion of the empire, let him zealously to oppose every innovation, and the progress of Christianity, feared to alarm him. A law had for some time before been passed, in which all Heteroe, or societies differing from the established religion, were considered as illegal, being reputed nurseries of impolture and sedition. Under the sanction of this law, the Christians were persecuted in all parts of the empire. Great numbers of them were put to death, as well by popular tumults as by edicts and judicial proceedings. However, the persecution ceased after some time: for the emperor having advice from Pliny, the pro-conful in Bithynia, of the innocence and simplicity of the Christians, and of their inoffensive and moral way of living, he suspended their punishments. But a total stop was put to them under Tiberianus the governor of Palestine's tending him word, That he was wearied out with executing the laws against the Galileans, who crowded to execution in such multitudes, that he was at a loss how to proceed. Upon this intimation, the emperor gave orders, that the Christians should not be sought after; but if any were found, to themselves, that they should suffer. In this manner the rage of persecution ceased, and the emperor found leisure to turn the force of his arms against the Armenians and Parthians, who now began to throw off all submission to Rome.

While he was employed in these wars, there was a furious dreadful insurrection of the Jews in all parts of the empire. This wretched people, still infatuated, and ever expecting some signal deliverer, took the advantage of Trajan's absence in the east to massacre all the Greeks and Romans whom they got into their power, without reluctance or mercy. This rebellion first began in Cyrene, a Roman province in Africa; from thence the flame extended to Egypt, and next to the island of Cyprus. He persecuted the Christians.
king of Parthia. There entering the opulent kingdom of Mesopotamia, he reduced it into the form of a Roman province. From thence he went against the Parthians, marching on foot at the head of his army; in this manner crossing the rivers, and conforming to all the severities of discipline which were imposed on the meanest soldier. His successes against the Parthians were great and numerous. He conquered Syria and Chaldea, and took the famous city of Babylon. Here, attempting to cross the Euphrates, he was opposed by the enemy, who were resolved to stop his passage; but he secretly caused boats to be made upon the adjoining mountains, and bringing them to the water's edge, passed his army with great expedition, not, however, without great slaughter on both sides. From thence he traversed tracts of country which had never before been invaded by a Roman army, and seemed to take a pleasure in pursu-ing the fame march which Alexander the Great had formerly marked out for him. Having passed the rapid streams of the Tigris, he advanced to the city Ctesiphon, which he took, and opened himself a passage into Persepolis, where he made many conquests that were rather splendid than serviceable. After subduing all the country bordering on the Tigris, he marched southward to the Persian gulf, where he subdued a monarchy which posses-sed a considerable island made by the divided streams of that river. Here, winter coming on, he was in danger of losing the greatest part of his army by the inclemency of the climate and the inundations of the river. He therefore with indefatigable pains fitted out a fleet, and sailing down the Persian gulf, entered the Indian ocean, conquering, even to the Indies, and subduing a part of them to the Roman empire. He was prevented from pursuing further conquests in this distant country, both by the revolt of many of the provinces which he had already subdued, and by the scarcity of provisions, which seemed to con-tradict the reports of the fertility of the countries he was induced to invade. The inconveniences of increasing age also contributed to damp the ardour of this enterprise, which at one time he intended to push to the confines of the earth. Returning, therefore, along the Persian gulf, and sending the senate a particular account of all the nations he had conquered, the names of which alone composed a long catalogue, he prepared to punish those countries which had revolted from him. He began by laying the famous city of Edessa, in Mesopotamia, in ashes; and in a short space of time, not only retook all those places which had before acknowledged submission, but conquered many other provinces, so as to make himself master of the most fertile kingdoms of all Asia. In this train of successes he scarce met with a repulse, except before the city Arta, in the deserts of Arabia. Wherefore judging that this was a proper time for bounding his conquests, he resolved to give a master to the countries he had subdued. With this resolution he repaired to the city Ctesiphon, in Persia; and there, with great ceremony, crowned Par-thamaspates, king of Parthia, to the great joy of all his subjects. He established another king also over the kingdom of Albania, near the Caipian sea. Then placing governors and lieutenants in other provinces, he resolved to return to his capital in a more magnificent manner than any of his predecessors had done before him. He accordingly left Adrian general of all his forces in the east; and continued his journey towards Rome, where the most magnificent preparations were made for his arrival. However, he had not got farther than the province of Cilicia, when he found himself too weak to proceed in his usual manner. He therefore caused himself to be carried on ship-board to the city of Seleucia, where he died of the apoplexy, having been attacked by that disorder once before. During the time of his indisposition, his wife Plotina constantly attended near him; and, knowing the emperor's dislike to Adrian, it is thought forged the will, by which he was adopted to succeed. 

Trajan died in the 63d year of his age, after a reign of nineteen years six months and fifteen days. How and in such highly he was esteemed by his subjects appears by their manner of bequeathing his successors, always wishing them the fortune of Augustus, and the goodness of Trajan. His military virtues, however, upon which he chiefly valued himself, produced no real advantages to his country; and all his conquests disappeared, when the power was withdrawn that enforced them. 

Adrian was by descent a Spaniard, and his ancestors were of the same city where Trajan was born. He was nephew to Trajan, and married to Sabina his grand-niece. When Trajan was adopted to the empire, Adrian was a tribune of the army in Mysia, and was sent by the troops to congratulate the emperor on his advancement. However, his brother-in-law, who desired to have an opportunity of congratulating Trajan himself, supplied Adrian with a carriage that broke down on the way. But Adrian was resolved to lose no time, and performed the rest of the journey on foot. This affluency was very pleasing to the emperor; but he disliked Adrian from several more prevailing motives. His kindliness was expensive, and involved in debt. He was, besides, inconstant, capricious, and apt to envy another's reputation. These were faults, that, in Trajan's opinion, could not be compensated either by his learning or his talents. His great skill in the Greek and Latin languages, his intimate acquaintance with the laws of his country and the philosophy of the times, were no inducement to Trajan, who, being bred himself a soldier, desired to have a military man to succeed him. For this reason it was that the dying emperor would by no means appoint a successor; fearful, perhaps, of injuring his great reputation, by adopting a person that was unworthy. His death, therefore, was concealed for some time by Plotina his wife, till Adrian had found the inclinations of the army, and found them firm in his interests. They then produced a forged instrument, importing that Adrian was adopted to succeed in the empire. By this artifice he was elected by all orders of the state, though then absent from Rome, being left at Antioch as general of the forces in the east.

Upon Adrian's election, his first care was to write the senate, excusing himself for affuming the empire without their previous approbation; imputing it to the hasty zeal of the army, who rightly judged that the senate ought not long to remain without a head. He then began to pursue a course quite opposite to that of his predecessor, taking every method of declining war, and promoting the arts of peace. He was quite satisfied with preserving the ancient limits of the empire, and feared no way ambitious of extensive conquest.
Causes of the decline of the Roman empire.

For this reason he abandoned all the conquests which Trajan had made, judging them to be rather an inconvenience than an advantage to the empire; and made the river Euphrates the boundary of the empire, placing the legions along its banks to prevent the incur-

Having thus settled the affairs of the east, and leaving Severus governor of Syria, he took his journey by land to Rome, fending the ashes of Trajan thither by sea. Upon his approach to the city, he was informed of a magnificent triumph that was preparing for him; but this he modestly declined, desiring that those honours might be paid to Trajan’s memory which they had designed for him. In consequence of this command, a most superb triumph was decreed, in which Trajan’s statue was carried as a principal figure in the procession, it being remarked that he was the only man that ever triumphed after he was dead. Not content with paying him these extraordinary honours, his ashes were placed in a golden urn, upon the top of a column 140 feet high. On this were engraved the particulars of all his exploits in behalf relievo; a work of great labour, and which is still remaining. These testimonials of respect to the memory of his predecessor did great honour to the heart of Adrian. His virtues, however, were contrasted by a strange mixture of vices; or to say the truth, he wanted strength of mind to preserve his general rectitude of character without deviation. As an emperor, however, his conduct was most admirable, as all his public transactions appear dictated by the soundest policy and the most disinterested wisdom. But these being already enumerated under the article Adrian, it would be superfluous to repeat them in this place. He was succeeded by Marcus Antoninus, afterwards surnamed the Pious, whom he adopted some time before his death. See Antinous Pius.

From the beginning of the reign of Antinous Pius, we may date the decline of the Roman empire. From the time of Cæsar to that of Trajan, scarce any of the emperors had either abilities or inclination to extend the limits of the empire, or even to defend it against the barbarous nations who surrounded it. During all this space, only some inconsiderable provinces to the northward of Italy, and part of the island of Britain, had been subjugated. However, as yet, nothing was lost; but the degeneracy and corruption of the people had given those seeds of dissolution which the empire quickly began to feel. The disorders were grown to such an height that even Trajan himself could not cure them. Indeed his eastern conquests could scarce have been preferred though the republic, had been exiling in all its glory; and therefore they were quietly resigned by his successor Adrian, as too distant, disaffected, and ready to be over-run by the barbarous nations. The province of Dacia, being nearer to the centre of government, was more easily preferred; and of consequence remained for a long time subject to Rome. During the 23 years of the reign of Antoninus, few remarkable events happened. The histories of these times are exclusive in their praises of his justice, generosity, and other virtues, both public and private. He put a stop to the persecution of the Christians, which raged in the time of Trajan and Adrian, and reduced the Brigantes, a tribe of Britons, who had revolted. However, during his reign, several calamities befell the empire. The Tiber, overflowing its banks, laid the lower part of Rome under water. The inundation was followed by a fire, and this by a famine, which swept off great numbers, though the emperor took the utmost care to supply the city from the most distant provinces. At the same time the cities of Narbonne in Gaul, and Antioch in Syria, together with the great square in Carthage, were destroyed by fire; however, the emperor soon restored them to their former condition. He died in the year 160, universally lamented by his subjects, and was succeeded by Marcus Aurelius, surnamed the Philosopher, whom he had adopted towards the latter end of his reign.

The translations of this emperor the reader will find related under the article Antoninus Pius, (a)

(a) As, after the death of Marcus Aurelius, the Roman empire declined very fast, it may not be amiss here to give some account of the military and other establishments of the Roman emperors. Mr Gibbon observes that, in the times of the commonwealth, the use of arms was confined to those who had some property to defend, and an interest in maintaining the laws which were proposed to be engaged in the front of the legion, was almost an object of adoration with them; and it was esteemed impious, as well as ignominious, to abandon that sacred emblem in the time of danger. The centurions had a right to punish with blows, the generals with death; and it was an inexcusable maxim of the Roman discipline, that a good soldier should dread his officers much more than the enemy.

Notwithstanding all this, so sensible were the Romans of the insufficiency of mere valour without skill, that military
Military exercises were the unremitting object of their discipline. The recruits and young soldiers were constantly trained both in the morning and evening; and even the veterans were not excused from the daily repetition of their exercises. Large fields were erected in the winter-quarters of the troops, that these useful labours might not be interrupted by tempestuous weather, and the weapons used in these imitations of war were always twice as heavy as those made use of in real action. The soldiers were diligently instructed to march, to run, leap, swim, carry heavy burdens, and handle every species of weapon either for offence or defence; to form a variety of evolutions; and to move to the sound of flutes in the pyrrhic or martial dance. It was the policy of the ablest generals, and even of the emperors themselves, to encourage these military studies by their presence and example; and we are informed that Adrian, as well as Trajan, frequently condescended to instruct the unexperienced soldiers, to reward the diligent, and sometimes to dispute with them the prize of superior strength and dexterity. Under the reigns of these princes, the science of tactics was cultivated with success; and, as long as the empire retained any vigour, their military instructions were respected as the most perfect model of Roman discipline.

From the foundation of the city, as the Romans had in a manner been continually engaged in war, many alterations had taken place in the constitution of the legions. In the time of the emperors, the heavy-armed infantry, which composed its principal strength, was divided into ten cohorts and 55 companies, under the orders of a correspondent number of tribunes and centurions. The first cohort, which always claimed the post of honour and the custody of the eagle, was formed of 1125 soldiers, the most approved for valour and fidelity. The remaining nine cohorts consisted each of 555; and the whole body of legionary infantry consisted of 6100 men. Their arms were uniform, and excellently adapted to the nature of their service; an open helmet with a lofty crest; a breast-plate or coat of mail; greaves on their legs, and a large buckler of their left arm. Their buckler was of an oblong and concave figure, four feet in length, and two and a half in breadth; framed of a light wood, covered with a bull's hide, and strongly guarded with brass plates. Besides a lighter spear, the legionary carried the pilum, a ponderous javelin about six feet long, and terminated by a masy triangular point of steel 18 inches in length. This weapon could do execution at the distance of 10 or 12 paces; but its stroke was so powerful, that no cavalry durst venture within its reach, and scarce any armour could be formed proof against it. As soon as the Roman had darted his pilum, he drew his sword, and rushed forward to close with the enemy. It was a short well-tempered Spanish blade with a double edge, and equally calculated for the purposes of pushing and striking; but the soldier was always instructed to prefer the former use of his own weapon, as his body remained thereby the less exposed, while at the same time he inflicted a more dangerous wound on his adversary. The legion was usually drawn up eight deep; and the regular distance of three feet was left between the files and ranks. Thus the soldier possessed a free space for his arms and motions; and sufficient intervals were allowed, through which seasonable reinforcements might be introduced to the relief of the combatants. The cavalry, without which the force of the legion remained imperfect, was divided into ten troops or squadrons: the first, as the companion of the first cohort, consisted of 132 men; whilst each of the other nine amounted only to 66.

The entire establishment formed a body of 726 horse, naturally connected with its respective legion; but occasionally acting in the line, and composing a part of the wings of the army. The cavalry of the ancient republic was composed of the noblest youths of Rome and Italy, who, by performing their military service on horseback, prepared themselves for the offices of senator and consul; but after the alteration of manners and government which took place at the end of the commonwealth, the most wealthy of the equestrian order were engaged in the administration of justice and of the revenue; and, whenever they embraced the profession of arms, they were immediately entrusted with a troop of horse or a cohort of foot, and the cavalry, as well as the infantry, were recruited from the provincials. The horses were bred for the most part in Spain, or in Cappadocia. The Roman troopers deftiled the complete armour which encumbered the cavalry of the eait. Instead of this, their arms consisted only of an helmet, an oblong shield, light boots, and a coat of mail. A javelin and a long broadsword were their principal offensive weapons. They seem to have borrowed the use of lances and iron maces from the barbarians.

Besides the legionaries, the Romans, especially in the times of the emperors, began to take auxiliaries into their pay. Considerable levies were regularly made among those provincials who had not yet attained to the rank of Roman citizens. Many dependent princes and communities, dispersed round the frontiers, were permitted, for a while, to hold their freedom and security by the tenure of military service. Even fecked troops of barbarians were compelled to enter into the service; which was afterwards found to be a most destructive expedient, not only as it carried the Roman military skill among barbarians who were otherwise unacquainted with it, but it gave these auxiliaries themselves frequent opportunities of revolting, and at last of dethroning the emperors at pleasure, and even of overturning the empire itself. The number of auxiliaries was seldom inferior to that of the legionaries themselves. The bravest and most faithful bands among them were placed under the command of prefects and centurions, and fervently trained in the arts of Roman discipline; but the far greater part retained those arms which they had used in their native country. By this institution, each legion, to whom a certain number of auxiliaries was allotted, contained within itself every species of lighter troops, and of missile weapons; and
Tautinna was supposed to be intimate. According to Mr Gibbon, however, Commodus was not, as has been represented, a tiger born with an infatiate thirst of human blood, and capable from his infancy of the most inhuman actions. Nature had formed him of a weak, rather than a wicked disposition. His simplicity and timidity and was capable of encountering every nation with the advantages of its respective arms and discipline. Nor was the legion delitute of what, in modern language, would be styled a train of artillery. This consisted of 10 military engines of the largest size, and 56 smaller ones; but all of them, either in an oblique or horizontal manner, discharged stones and darts with irresistible violence.

The camp of a Roman legion presented the appearance of a fortified city. As soon as the space was marked out, the pioneers carefully levelled the ground, and removed every impediment that might interrupt its perfect regularity. Its form was an exact quadrangle; and it may be computed that a square of 700 yards was sufficient for the encampment of 20,000 Romans, though a similar number of modern troops would expose to the enemy a front of more than treble that extent. In the midst of the camp, the prætorium, or general's tent, arose above the others; and the cavalry, infantry, and auxiliaries, had each their respective stations apportioned them. The streets were broad, and perfectly straight; and a vacant space of 200 feet was left on all sides between the tents and rampart. The rampart itself was 12 feet high, armed with a line of strong and intricate palisades, and defended by a ditch 12 feet deep and as much broad. This labour was performed by the legions themselves, to whom the use of the spade and the pick-ax was no less familiar than that of the sword or pilum. Whenever the trumpet gave the signal of departure, the camp was almost instantly broke up, and the troops fell into their ranks without delay or confusion. Besides their arms, which the soldiers fearedly considered as an incumbrance, they were laden with their kitchen-furniture, the instruments of fortification, and provisions for many days. Under this weight, which would oppress a modern soldier, they were taught to advance by a regular step, near 20 miles in six hours. On the appearance of an enemy, they threw aside their baggage, and, by easy and rapid evolutions, converted the column of march into an order of battle. The flingers and archers skirmished in the front; the auxiliaries formed the first line, and were seconded or sustained by the legions. The cavalry covered the flanks, and the military engines were placed in the rear.

The numbers of the Roman armies are not easily calculated with any tolerable accuracy. We may compute, however, that the legion, which consisted of 6831 Romans, might, with its attendant auxiliaries, amount to 12,500 men. The peace establishment of Adiutan and his successors was composed of no fewer than 30 of these formidable brigades; and most probably formed an army of 370,000 men. Instead of being confined within the walls of fortified cities, which the Romans considered as the refuge of weakness or pusillanimity, the legions were encamped on the banks of the great rivers, and along the frontiers of the barbarians. Three legions were sufficient for Britain. The principal strength lay upon the Rhine and Danube, and consisted of 16 legions, disposed in the following proportions: two in the Lower, and three in the Upper Germany; one in Rhetia; one in Noricum; four in Pannonia; three in Media; and two in Dacia. The defence of the Euphrates was intrusted to eight legions, six of whom were placed in Syria, and the other two in Cappadocia. With regard to Egypt, Africa, and Spain, as they were far removed from any important scene of war, a single legion maintained the domestic tranquillity of each of those great provinces. Italy was defended by the city cohorts and prætorian guards formerly mentioned. These differed nothing from the legions in their arms and institutions, except in a more splendid appearance, and a less rigid discipline.

The Roman navy, though sufficient for every useful purpose of government, never seemed adequate to the greatness of the empire. The policy of the emperors was directed only to preserve the peaceful dominion of the Mediterranean sea, which was included within their dominions, and to protect the commerce of their subjects. Two permanent fleets were stationed by Augustus, one at Ravenna on the Adriatic, and the other at Misenum in the bay of Naples. A very considerable force was also stationed at Frejus in Provence; and the Euxine was guarded by 40 ships and 3000 soldiers. To all these we may add the fleet which preferred the communication between Gaul and Britain, and a great number of vessels constantly maintained on the Rhine and Danube to harass the enemy, or intercept the passage of the barbarians. The whole military establishment by sea and land amounted to about 450,000 men.

It was not, however, to this formidable power alone that the empire owed its greatness. The policy of the laws contributed as much to its support as the martial establishment itself. According to Mr Gibbon, though the provinces might occasionally suffer from the partial abuse of delegated authority, the general principle of government was wise, simple, and beneficent. Among these beneficent principles he reckons that of universal toleration; but to this there were several exceptions: for the British Druids were persecuted and destroyed by the Romans on account of their religion; the Egyptians and Jews were sometimes persecuted; and the Christians were frequently so, and that even under the very best emperors, Trajan and Marcus Aurelius. However, as a very general toleration of religious sentiments did take place under the heathen emperors of Rome, we must certainly look upon this as one of the causes of the prosperity of the empire.

Another thing which greatly contributed to the strength and prosperity of the empire, was extending of the freedom of Rome to so many people. "The narrow policy (says Mr Gibbon) of preferring, without any foreign mixture, the pure blood of the ancient citizens, had checked the fortune and hardened the ruin of Athens and Spars. During the most flourishing era of the Athenian commonwealth, the number of citizens decreased gradually from about 30,000 to 21,000. If, on the contrary, we study the growth of the Roman republic, we
timidity rendered him the slave of his attendants, who gradually corrupted his mind. His cruelty, which at first obeyed the dictates of others, degenerated into habit, and at length became the ruling passion of his soul."

But, however this may be, it is certain that the actions of this emperor were flagitious almost beyond parallel.

may discover, that notwithstanding the incessant demands of wars and colonies, the citizens, who, in the time of Servius Tullius, amounted to no more than 83,000, were multiplied, before the end of the social war, to the number of 465,000 men able to bear arms in the service of their country. When the allies of Rome claimed an equal share of honours and privileges, the Senate preferred the chance of war to a conciliation; however, at last, all the Italian states, except the Samnites and Lucanians, were admitted into the bosom of the republic, and freely contributed to the ruin of public freedom. When the popular assemblies had been suppressed by the administration of the emperor, the conquerors were distinguished from the vanquished nations only by the first and most honourable order of subjects; and their increase, however rapid, was no longer exposed to the same dangers. Yet the princes who adopted the maxims of Augustus, guarded with the strictest care the dignity of the Roman name, and diluted the freedom of the city with a prudent liberality.

"Till the privileges of the Romans had been progressively extended to all the inhabitants of the empire, an important distinction was preserved between Italy and the provinces. The citizens of the provinces were exempted from taxes, and their persons from the arbitrary jurisdiction of governors. From the foot of the Alps to the extremity of Calabria, all the natives of Italy were born citizens of Rome. The provinces of the empire were distin-...
a parallel. Many very strange instances of his cruelty are related by the ancients. He is said to have cut
attender a corpulent man whom he saw walking along the street; partly, to try his own strength, in which he
greatly excelled; and partly, as himself owned, out of curiosity, to see his entrails drop out at once. He
took pleasure in cutting off the feet, and putting out the eyes, of such as he met in his rambles through the city; telling the former, after he had thus maimed them, that now they belonged to the nation of Mom- 
pozibility, and the latter, that they now became La-
rimi, alluding to the word laue, “one-eyed.” Some
he murdered because they were negligently drest;
others, because they seemed to be trimmed with too
much nicety. He pretended to great skill in surgery,
especially at letting blood: but sometimes, instead of
cutting by that means those whom he visited, or who
were prevailed upon to recur to him, he cut off, by way
of diversion, their ears and noses. His lewdness
and debaucheries were equally remarkable, and equally in-
famous. However, it is said to have been exceedingly
well skilled in archery, and to have performed in-
credible feats in that way. He excelled all men in
strength; and is said to have run an elephant through
with his spear, and to have killed in the amphitheatre
100 lions, one after another, and each of them at one
blow. Forgetful of his dignity, he entered the lists
with the common gladiators, and came off conqueror
735 times; whence he often subscribed himself in his
letters, the conqueror of 1000 gladiators.

The public transactions of this reign were but very
few. Soon after his father’s death, Commodus conclud-
ed a peace with the Marcianoi, Quadri, &c. on
the following conditions. 1. That they should not
settle within five miles of the Danube. 2. That they
should deliver up their arms, and supply the Romans
with a certain number of troops when required. 3.
That they should amble on but once a month, in one
place only, and that in presence of a Roman centu-
ry. 4. That they should make war upon the Ja-
yges, Buri, or Vandals, without the consent of the
people of Rome. On the other hand, Commodus pro-
mised to abandon, which he accordingly did, all the
castles and fortresses held by the Romans in their coun-
try, excepting such as were within five miles of the
Danube. With the other German nations, whom his
father had almost entirely reduced, he concluded a very
dishonourable peace; nay, of some he purchased it with
large sums of money.

Soon after the return of the emperor to Rome, his
father Lucilla, perceiving that he was universally al-
armed on account of his cruelty, formed a conspiracy
against his life. Among the conspirators were many
senators of distinction. It was agreed among them that
they should fall upon the emperor while he was going
to the amphitheatre through a narrow and dark passage;
and that Claudius Pompeianus, to whom Lucilla had
betrothed her daughter, should give the first blow. But
he, instead of striking at once, threw him the naked
dagger, and cried out, “This present the senate sends
you!” so that the guards had time to rescue the em-
peror, and to seize the conspirators, who were soon
after put to death. The emperor banished his father to
the island of Capræa, where he soon after caused him to be
privately murdered.

The favourite minister of Commodus was one Pe-
rennis,

real strength of the monarchy. Their personal valour remained; but they no longer possessed that public
courage which is nourished by the love of independence, the sense of national honour, the presence of danger, and the
habit of command. They received laws and governors from the will of their sovereign, and trusted for
their defence to a mercenary army. The folly of their bold leaders were contented with the rank of
citizens, and subjects. The most aspiring spirits retired to the court or standard of the emperors; and the
deformed provinces, deprived of political strength or union, insensibly sunk into the languid indifference of pri-
vate life.

“The love of letters, almost inseparable from peace and refinement, was fashionable among the subjects of
Adrian and the Antonines; who were themselves men of learning and curiosity. It was diffused over the whole
extent of their empire; the most northern tribes of Britons had acquired a taste for rhetoric; Homer as well as
Virgil were transcribed and studied on the banks of the Rhine and Danube; and the most liberal rewards fought
out the faintest glimmerings of literary merit. The sciences of phyics and astronomy were cultivated with some
degree of reputation; but, if we except Lucian, an age of indolence passed away without producing a single writer
of genius who defsorted the attention of posterity. The authority of Plato, of Aristotle, of Zeno, and Epip-
curus, still reigned in the schools; and their systems, transmitted with blind deference from one generation of disci-
iples to another, precluded every generous attempt to correct the errors or enlarge the bounds of the human
mind. The beauties of the poets and orators, instead of kindling a fire like their own, produced only servile imita-
tions; or, if any ventured to deviate from these models, they deviated at the same time from good sense and
propriety. The provincials of Rome, trained by an uniform artificial education, were engaged in a very une-
qual competition with those bold ancients, who, by expressing their genuine feelings in their native tongue, had
already occupied every place of honour. The name of poet was almost forgotten; that of orator was usurped by
the sophists. A cloud of critics, of compilers, of commentators, darkened the face of learning, and the decline
of genius was soon followed by the corruption of taste.

Longinus observes and laments the degeneracy of his contemporaries, which debased their sentiments, enerva-
ted their courage, and deprived their talents; comparing them to pigmies, whose stature has been dimin-
ished by constant pressure on their limbs. This diminutive stature of mankind was constantly linking below the old stan-
ard, and the Roman world was indeed peopled by a race of pigmies; when the fierce giants of the north broke in and mended the pesty breed. They restored a manly freedom; and, after the revolution of ten centuries, freedom became the happy parent of taste and science."
Rom. 435

The revolt in the year 187 happened a remarkable revolt. In the year 187, in the reign of Commodus, a troop of children, having at their head a young woman of an extraordinary figure and fierce aspect, entering the circus, began to utter aloud many bitter invectives and dreadful curses against Cleander; which being for some time answered by the people with other invectives and curses, the whole multitude rose all of a sudden, and flew to the place where Cleander at that time resided with the emperor. There, renewing their invectives, they demanded the head of the minister who had been the occasion of so many calamities. Hereupon Cleander ordered the praetorian cavalry to charge the multitude; which they did accordingly, driving them with great slaughter into the city. But the populace discharging flowers of flowers, bricks, and tiles, from the tops of the houses and from the windows, and the city-guards at the same time taking part with the people, the praetorian horde were soon obliged to save themselves by flight; nor was the slaughter ended till the emperor, apprised of the tumult, cau ed the head of Commodus to be struck off and thrown out to the enraged populace. The emperor himself did not long survive Cleander; being cut off by a conspiracy of Marcia and her favourite concubine, Letus, captain of the guards, and Ecletus, his chamberlain.

No sooner was the death of Commodus known, than the senate assembled, and declared him a public enemy, loading him with cur ses, and ordering his statues to be broken to pieces, and his name to be erased out of all public inscriptions; and demanded his body, that it might be dragged through the streets, and thrown into the Tiber. But Helvius Pertinax, whom the conspirators had previously designed for the empire, who had raised himself to a throne, and who had assumed it, prevented such an outrage, by letting the senate assume the empire. But the senate proceeded to the utmost extremities; and the emperor being for some time answered by the people with other invectives and curses, the whole multitude rose all of a sudden, and flew to the place where Cleander at that time resided with the emperor. There, renewing their invectives, they demanded the head of the minister who had been the occasion of so many calamities. Hereupon Cleander ordered the praetorian cavalry to charge the multitude; which they did accordingly, driving them with great slaughter into the city. But the populace discharging flowers of flowers, bricks, and tiles, from the tops of the houses and from the windows, and the city-guards at the same time taking part with the people, the praetorian horde were soon obliged to save themselves by flight; nor was the slaughter ended till the emperor, apprised of the tumult, caused the head of Commodus to be struck off and thrown out to the enraged populace. The emperor himself did not long survive Cleander; being cut off by a conspiracy of Marcia and her favourite concubine, Letus, captain of the guards, and Ecletus, his chamberlain.

Rome [436]

Rome. 

willing to keep him still in view, made him prefect of the city; which employment he filled, when the conspirators fixed upon him as the properest person to succeed to the empire.

His being advanced by Commodus only served to increase his fears of falling as an object of his suspicions; when therefore the conspirators repaired to his house by night, he considered their arrival as a command from the emperor for his death. Upon Letus entering his apartment, Pertinax, without any shew of fear, cried out, 'That for many days he had expected to end his life in that manner, wondering that the emperor had delayed it so long. However, he was not a little surprised when informed of the real cause of their visit; and being strongly urged to accept of the empire, he at last complied with their offer.

Being carried to the camp, Pertinax was proclaimed emperor: soon after the citizens and senate confined; the joy for the election of a new sovereign being scarce equal to that for the death of the former. The provinces quickly followed the example of Rome; so that he began his reign with universal satisfaction to the whole empire, in the 68th year of his age.

Nothing could exceed the wisdom and justice of this monarch's reign the short time it continued. He punished all those who had served to corrupt the late emperor, and disposed of his ill-got possessions to public use. He attempted to restrain the licentiousness of the praetorian bands, and put a stop to the injuries and insolences they committed against the people. He filled most of the buffoons and jesters of Commodus as slaves; particularly such as had obscene names. He continually frequented the senate as often as it sat, and never refused an audience even to the meanest of the people. His success in foreign affairs was equal to his internal policy. When the barbarous nations abroad had certain intelligence that he was emperor, they immediately laid down their arms, well knowing the submission they were to expect from so experienced a commander. His great error was avarice; and that, in some kind, they became more insolent; and willing to make use of the power of which they found themselves possessed, made proclamation, that they would fell the empire to whoever would purchase it at the highest price. In consequence of this proclamation, so odious and unjust, only two bidders were found; but the Sulpiicians and Didius Julianus: The former, a confular person, prefect of the city, and fon-in-law to the late emperor Pertinax; the latter, a confular person likewise, a great lawyer, and the wealthiest man in the city. He was sitting with some friends at dinner when the proclamation was published; and being charmed with the prospect of unbounded power, immediately rose from table and hastened to the camp. Sulpiicus was got there before him; but as he had rather promised than treasured to bestow, the offers of Didius, who produced immense sums of ready money, prevailed. He was received into the camp by a ladder, and they instantly swore to obey him as emperor. From the camp he was attended by his new electors into the city; the whole body of his guards, which consisted of 10,000 men, ranged around him in such order as if they had prepared for battle, and not for a peaceful ceremony. The citizens, however, refused to confirm his election; but rather cursed him as he passed. Upon being conducted to the senate-house, he addressed the few senators that were present in a very laconic speech: "Fathers, you want an emperor; and I am the fittest person you can choose." But even this, florid as it seems, was unnecessary, since the senate had it not in their power to refuse their approbation. His speech being backed by the army, to whom he had given about a million of sterling, succeeded. The choice of the soldiers was confirmed by the senate, and Didius was acknowledged emperor, now in the 57th year of his age.

It should seem by this weak monarch's conduct when
feated on the throne, that he thought the government of an empire rather a pleasure than a toil. Instead of attempting to gain the hearts of his subjects, he gave himself up to ease and inactivity, utterly regardless of the duties of his station. He was mild and gentle in deed; neither daring any nor expecting to be injured. But that avarice, by which he became opulent, still followed him in his exaltation; so that the very soldiers who elected him, soon began to detest him for those qualities, so very opposite to a military character.

The people also, against whose consent he was chosen, were no less inimical. Whenever he issued from his palace, they openly poured forth their imprecations against him; crying out, that he was a thief, and had stolen the empire. Didius, however, in the true spirit of a trader, patiently bore it all; sometimes beckoning them with smiles to approach him, and testifying his regard by every kind of submission.

While Didius was thus contemptuously treated at home, two valiant generals, in different parts of the empire, disclaimed his authority, and boldly resolved to attempt the throne for themselves. These were, Pescennius Niger, governor of Syria; and Septimius Severus, commander of the German legions. Niger was beloved by the people for his clemency and valour; and in those courts where he had formerly pleaded with great fidelity of all the senators who had employments or influence.

He began by promising to revenge the death of Didius, who was now about 47 years of age, received them with all respect; and apprised of their approach, Severus marched towards Rome. As he came near the city, his first exertion of power was, to have all the praetorian soldiers who had lately sold the empire come forth unarmed to meet him. These, though sensible of their danger, had no other resource left but compliance; and accordingly came forward with branches of laurel, as if to welcome his approach. Severus, however, soon showed how little capable their present submission was to atone for their past offences; after upbraiding them, in a short speech, with all their crimes, he commanded them to be instantly stripped of their military habits, deprived of the name and honour of soldiers, and banished 100 miles from Rome. He then entered the city in a military manner, took possession of the palace, and promised the senate to conduct himself with clemency and justice. However, though he united great vigour with the most refined policy, yet his African cunning was considered as a particular defect in him. He is celebrated for his wit, learning, and prudence; but equally blamed for infidelity and cruelty. In short, he seemed alike disposed to the performance of the greatest acts of virtue and the most bloody severities. He began his command, by killing all the children of such as had employments or authority in the city, and detained them as pledges for their fathers' loyalty. He next supplied the city with corn; and then with all possible expedition marched against Niger, who was still considered and honoured as emperor of the east.

One of the chief obstacles to his march was, the Niger de
defeating the subject, who had deserted him Clodius Albinus, commander of the forces and legions in Britain, whom he by all means wished to be killed, to secure in his interests. For this end, he endeavoured to prevail
prevail upon him, by giving him hopes of succeeding to the empire; insinuating, that he himself was declining, and his children were as yet but infants. To deceive him still farther, he wrote in the same style to the senate, gave him the title of Caesar, and ordered money to be coined with his image. These arts served to lull Albinus into false security, Severus marched against Niger with all his forces. After some undecided conflicts, the last great battle that was fought between these extraordinary men was upon the plains of Ilius, on the very spot where Alexander had formerly conquered Darius. Beside the two great armies drawn up on the plain, the neighbouring mountains were covered with infinite numbers of people, who were merely led by curiosity to become spectators of an engagement that was to determine the empire of the world. Severus was conqueror; and Niger’s head being struck off by some soldiers of the conquering army, was intrudingly carried through the camp on the point of a lance.

This victory insured Severus the power of the throne. However, the Parthians, Persians, and some other neighbouring nations, took up arms, under a pretence of vindicating Niger’s cause. The emperor marched against them in person, had many engagements with them, and obtained such signal victories over them, as enlarged the empire, and established peace in the east.

Niger being no more, Severus now turned his views against Albinus, whom he resolved by every means to destroy. For this purpose he sent auxiliaries into Britain, under a pretence of bringing him letters, but in reality to dispatch him. Albinus being apprised of their designs, prevented their attempt by recurring to open force and proclaiming himself emperor. Nor was he without a powerful army to support his pretensions; of which Severus being sensible, bent his whole force to oppose him. From the east he continued his course across the straits of Byzantium, into the most western parts of Europe, without intermission. Albinus being informed of his approach, withdrew with most of his forces into Gaul; so that the campaign on both sides was carried on with great vigour. Fortune seemed for a while variable; but at last a decisive engagement came on, which was one of the most desperate recorded in the Roman history. It lasted from morning till night, without any seeming advantage on either side; at length the troops of Severus began to fly, and he himself happening to fall from his horse, the army of Albinus cried out, Victory. But the engagement was soon renewed with vigour by Latus, one of Severus’s commanders, who came up with a body of reserve, designing to destroy both parties and make himself emperor. This attempt, though designed against both, turned out entirely to the advantage of Severus. He therefore again charged with such fury and exactness, that he soon plucked the victory from those who but a short time before seemed conquerors; and pursuing them into the city of Lyons, took Albinus prisoner, and cut off his head; treating his dead body with insult that could only flow from a mean and revengeful temper. All the senators who were slain in battle ordered to be quartered, and such as were taken alive were immediately executed.

Having thus secured himself in possession of the empire, upon his return to Rome he loaded his soldiers with rewards and honours; giving them such privileges as strengthened his own powers while they destroyed that of the state. For the soldiers, who had hitherto showed the strongest inclination to an abuse of power, were now made arbiters of the fate of emperors; and we shall henceforward behold them setting them up, and dethroning them, at pleasure.

Being thus secure of his army, he resolved to give way to his natural turn for conquest, and to oppose his arms against the Parthians, who were then invading the frontiers of the empire. Having therefore previously given the government of domestic policy to one Plautianus, a particular favourite of his, to whose daughter he married his son Caracalla, he set out for the east, and prosecuted the war with his usual expedition and success. He forced submission from the king of Armenia, destroyed several cities in Arabia Felix, landed on the Parthian coasts, took and plundered the famous city Ctesiphon, marched back through Palestine and Egypt, and at length returned to Rome in triumph.

During this interval, Plautianus, who was now left to direct the affairs of Rome, began to think of aspiring to the empire himself. Upon the emperor’s return, he employed a tribune of the pretorian cohorts, with which he was the commander, to affaiinate him, as likewise his son Caracalla. The tribune seemed cheerfully to undertake this dangerous office; but instead of going through with it, informed Severus of his favourite’s treachery. He at first received it as an improbable story, and as the artifice of some one who envied his favourite’s fortune. However, he was at last persuaded to permit the tribune to conduct Plautianus to the emperor’s apartments. With this intent, the tribune went and amused him with a pretended account of his killing the emperor and his son, defiring him, if he thought it fit to see them dead, to come with him to the palace. As Plautianus ardently desired their deaths, he readily gave credit to this relation; and following the tribune, he was conducted at midnight into the innermost recedes of the palace. But what must have been his disappointment, instead of finding the emperor lying dead, as he expected, he beheld the room lighted up with torches, and Severus, surrounded by his friends, prepared in array to receive him. Being asked by the emperor, with a stern countenance, what had brought him there at that unseasonable time? he was at first utterly confounded; wherefore, not knowing what excuse to make, he ingenuously confessed the whole, intreating forgivenesses for what he had intended. The emperor seemed in the beginning inclined to pardon; but Caracalla his son, who from the earliest age showed a disposition to cruelty, spurned him away in the midst of his supplications, and with his sword ran him through the body.

Severus having escaped this danger, spent a considerable time in visiting some cities in Italy, permitting none of his officers to fall places of trust or dignity, and distributing justice with the strictest impartiality. He took such an exact order in managing his exchequer, that notwithstanding his great expences, he left more money behind him than any of his predecessors. His armies also were kept upon the most respectable footing; so that he feared no invasion. Being equally attentive to the preservation of all parts of the empire, he resolved to make his last expedition into Britain.

But this opposition was of no long continuance; for Caracalla being resolved to govern alone, furiously entered Geta’s apartment, and, followed by ruffians, flew him in his mother’s arms. Having committed this detestable murder, he fled with great haste from the palace, crying out, ’That his brother would have slain him; and that he was obliged, in self-defence, to retaliate the intended injury. He then took refuge among the praetorian cohorts, and in a pathetic tone began to implore their assistance, still making the same excuse for his conduct. To this he added a much more prevailing argument, promising to bestow upon them the largesses usually given upon the election of new emperors, and distributing among them a molt of the treasures which had been amassed by his father. By such perjuivatives the soldiery did not hesitate to proclaim him sole emperor, and to signify the memory of his brother Geta as a traitor and an enemy to the commonwealth. The senators were soon after induced, either through favour or fear, to approve what had been done by the army: Caracalla wept for the death of his brother whom he had slain; and, to carry his hypocrisy to the utmost extreme, ordered him to be adored as a god.

Being now emperor, he went on to mark his course with bloody tyrant. Whatever was done by Domitian or Nero fell short of this monster’s barbarities. Lucius, who first advised him to murder his brother, was the first who fell a sacrifice to his jealousy. His own wife Plautina followed. Papinian, the renowned civilian, was beheaded for refusing to write in vindication of his cruelty; anfwering the emperor’s request, by observing, That it was much easier to commit a parricide than to defend it. He commanded all governors to be slain that his brother had appointed; and slewforty not less than 2000 persons who had adhered to his party. Whole nights were spent in the execution of his bloody decrees; and the dead bodies of people of all ranks were carried out of the city in carts, where they were burnt in heaps, without any of the ceremonies of a funeral. Upon a certain occasion, he ordered his soldiers to set upon a crowded audience in the theatre, only for the purpose of slaying a character whom he happened to favour. Perceiving himself hated by the people, he publicly said, that he could injure his own safety though not their love; so that he neither valued their reproaches nor feared their hatred.

His extraordinary procuring a vast sum from the treasury, drained the provinces, and committed a thousand acts of rapacity, merely to keep them fed and happy in his interests; and being disposed to trull himself with them particularly, he resolved to lead them upon a visit through all the provinces of the empire. He first went into Germany; where, to oblige the natives, he defiled himself in the habit of their country. From thence he travelled into Macedonia, where he pretended to be a great admirer of Alexander the Great; and among other extravagancies caused a statue of that monarch to be made with two faces; one of which resembled Alexander and the other himself. He was so corrupted by flattery, that he called himself Alexander; walked as he was told that monarch had walked; and, like him, bent his head to one shoulder. Shortly after, arriving at Letter Asia and the ruins of Troy, as he was
to be slain. Him therefore Macrinus exhorted to revenge his brother's death, by killing the tyrant, which he might easily effect, as being always near his person. Martialis readily undertook the dangerous task, willing to meet death himself, so he might obtain his desire of seeing the tyrant expire before him. Accordingly, as the emperor was riding out one day, he is reported near a little city called Carre, he happened to withdraw himself privately, upon a natural occasion, with only one page to hold his horse. This was the opportunity Martialis had so long and ardently desired: wherefore running to him as if he had been called, he stabbed the emperor in the back, so that he died immediately. Martialis unconcernedly returned to his troop; but retiring by insensible degrees, he endeavoured to secure himself by flight. But his companions soon muffling him, and the page giving information of what had been done, he was pursued by the German horse and cut in pieces.

During the reign of this execrable tyrant, which continued six years, the empire was every day declining; the soldiery were entirely masters of every election; and as there were various armies in different parts, so there were as many interests all opposite to each other. Caracalla, by satisfying their most unreasonable appetites, destroyed all discipline among them, and all subordination in the state.

The soldiery, now without an emperor, after a sufficient pence of two days, fixed upon Macrinus, who took all possible methods to conceal his being privy to Caracalla's murder. The senate confirmed their choice shortly after; and likewise that of his son Diadumenus, whom he took as a partner in the empire. Macrinus was 53 years old when he entered upon the government of the empire. He was of obscure parentage; some say by birth a Moor, who by the mere rotation of office, being first made prefect of the praetorian bands, was now, by treason and accident, called to fill the throne. We are told but little of this emperor, except his engaging in a bloody though undecided battle with Artabanus king of Parthia, who came to take vengeance for the injury he had sustained in the late reign; however, this monarch finding his real enemy dead, was content to make peace, and returned into Parthia. Something is also said of the severity of this emperor's discipline; so that a pitch of licentiousness was the Roman army now arrived, that the most severe punishments were unable to restrain the soldiery; and yet the most gentle inducements were looked upon as severity. It was this rigorous discipline, together with the artifices of Mafa, grandmother to Heliogabalus the natural son of Caracalla, that caused the emperor's ruin. Heliogabalus was priest of a temple dedicated to the Sun, in Emesa, a city of Phcenicia; and though but 14 years old was greatly loved by the army for the beauty of his person, and the memory of his father, whom they still considered as their greatest benefactor. This was soon perceived by the grandmother; who being very rich in gold and jewels, gave liberal presents among them, while they frequently repaired to the temple, both from the garrison in the city and the camp of Macrinus. This intercourse growing every day more frequent, the soldiery, being disgusted with the severities of their present emperor, began to think of placing Heliogabalus in his stead. Accordingly, sending for him
Macrinus, who at this time was pursing his pleasures at Antioch, gave but little attention to the first report; only sending his lieutenant Julian, with some legions, to quell the insurrection. However, they, like the rest, soon declared for Heliogabalus, and flew their general. It was then that Macrinus found he had treated the rebellion too lightly; he therefore resolved, with his son, to march directly against the feditious legions, and force them to their duty. Both parties met on the confines of Syria: the battle was for some time furious and obstinate, but at last Macrinus was overthrown, and obliged to seek safety by flight. His principal aim was to get to Rome, where he knew his friends, and expected protection. There those who were sent in pursuit, overtook him in less than two months.

The senate and citizens of Rome being obliged to submit to the appointment of the army as usual, Heliogabalus ascended the throne at the age of 14. One at a very early age, invested with unlimited power, and surrounded with flatterers, could be expected to act only as they thought proper to direct. This young emperor was entirely led by them; and being fensible that it was in his power to indulge all his appetites, he flung only their gratification. As he is described by historians, he appears a monster of sensuality. His short life therefore is but a tiffue of effeminacy, lust, and extravagance. He married, in the small space of four years, six wives, and divorced them all. He built a temple to the sun; and willing that his god should have a wife as well as himself, he married him to Pallas, and shortly after to the moon. His palace was a place of rendezvous for all the prostitutes of Rome, whom he frequently met naked, calling them his fellow soldiers, and companions in the field. He was so fond of the fops, that he carried his mother with him to the senate-house, and demanded that she should always be present when matters of importance were debated. He even went so far as to build a senate-house for women, with suitable orders, habits, and distinctions, of which his mother was made president. They met several times; all their debates turning upon the fashions of the day, and the different formalities to be used in giving and receiving visits. To these follies, he added great cruelty and boundless prodigality; so that he was heard to say, that such dishes as were cheaply obtained were scarce worth eating. His fuppers therefore generally cost 6000 crowns, and often 60,000. He was always drest in cloth of gold and purple, enriched with precious stones, and yet never wore the same habit twice. His palace, his chambers, and his beds, were all furnished of the richest stuffs, covered with gold and jewels. Whenever he took horse, all the way between his apartment and the place of mounting was covered with gold and silver dust thrown at his approach.

These excesses were soon perceived by his grandmother Maria, whose intrigues had first raised him to the throne: so that the thought to lessen his power by diluting it. For this purpose, under a pretence of freeing him from the cares of public business, she persuaded him to adopt his cousin, German, as his successor; and likewise to make him his partner in the confalship. Heliogabalus, having thus raised his cousin, and taken him for his bosom friend, had scarce given him his power, when he wished again to take it away; but the virtues of this young prince had so greatly endeared the people and the army to him, that the attempt had like to have been fatal to the tyrant himself. The praetorian soldiers mutinying, attempted to kill him as he was walking in his gardens; but he escaped, by hiding himself from their fury. However, upon returning to their camp, they continued the sedition; requiring that the emperor should remove such perons from about him as opposed the subject, and contributed to contaminate him. They required also the being permitted to guard the young prince themselves, and that none of the emperor's favourites or familiars should ever be permitted to converse with him. Heliogabalus was reluctantly obliged to comply; and conscious of the danger he was in, made preparations for death, when it should arrive, in a manner truly whimsical and peculiar. He built a lofty tower with steps of gold and pearl, from whence to throw himself headlong in case of necessity. He also prepared cords of purple silk and gold to strangle himself with; he provided golden swords and daggers to stab himself with; and poisons to be kept in boxes of emerald, in order to obtain what death he chose. Thus fearing all things but particularly fulidious of the deligns of the senate, he banished them all out of the city: he next attempted to poison Alexander, and spread a report of his death; but perceiving the soldiers begin to mutiny, he immediately took him in his chariot to the camp, where he experienced a fresh mortification, by finding all the acclamations of the army directed only to his successor. This not a little raised his indignation, and excited his desire of revenge. He returned towards the city, threatening the most severe punishments against those who had displeased him, and meditating fresh cruelties. However, the soldiers were unwilling to give him time to put his designs in execution by the foliers: they followed him directly to his palace, purfued him from apartment to apartment, and at last found him concealed in a privy; a situation very different from that in which he expected to die. Having dragged him from thence through the streets, with the most bitter invectives, and having dispatched him, they attempted once more to squeeze his pampered body into a privy; but not easily effecting this, they threw it into the Tiber, with heavy weights, that none might afterwards find or give it burial. This was the miserable and ignominious death of Heliogabalus, in the 18th year of his age, after a detestable reign of four years. His mother also was slain at the same time by the soldiers; as were also many of the opprobrious associates of his criminal pleasures.

Alexander being, without opposition, declared emperor, the senate, in their usual method of adulation, were for conferring new titles upon him; but he modestly declined them all, alleging that titles were only honourable when given to virtues, not to flations. This outcry was an happy omen of his future pleasures; and few princes in history have been more commended by his contemporaries, or indeed more deferred commendation.
Mammæa; this was remarkable for his great strength, and was now becoming little more than a splendid ruin.

About the 13th year of his reign, the Upper Germans, and other northern nations, began to pour down immense swarms of people upon the more southern parts of the empire. They passed the Rhine and the Danube with such fury, that all Italy was thrown into the most extreme confusion. The emperor, ever ready to expose himself for the safety of his people, made what levies he could, and went in person to stem the torrent; which he speedily effected. It was in the course of his successes against the enemy, that he was cut off by a mutiny among his soldiers. The legions encamped about Moguntia, having been abominably corrupted during the reign of Heliogabalus, and trained up in all kinds of rapine and disobedience, required the most strict command. Alexander could neither endure their tumultuary obedience, nor their regular discipline. His own faults, and those of his mother Mammæa, were objected against him. They openly exclaimed, That they were governed by an avaricious woman, and a mean-spirited boy; and resolved, in derision, that this general revolt: Maximinus, an old and experienced commander, held frequent conferences with the soldiers, and enflamed the sedition. At length, being determined to dismiss their present emperor, they sent an executioner into his tent; who immediately struck off his head, and, shortly after, that of his mother. He died in the 29th year of his age, after a prosperous reign of thirteen years and nine days.

The tumults occasioned by the death of Alexander being appealed, Maximinus, who had been the chief promoter of the sedition, was chosen emperor. This extraordinary man, whose character deserves particular attention, was born of very obscure parentage, being the son of a poor herdman of Thrace. In the beginning he followed his father's profession, and only exercised his personal courage against the robbers who infested the part of the country in which he lived. Soon after his ambition increasing, he left his poor employment, and enlisted in the Roman army; where he soon became remarkable for his great strength, discipline, and courage. This gigantic man was no less than eight feet and a half high; he had a body and strength corresponding to his size, being not less remarkable for the magnitude than the symmetry of his person. His wife's bracelet usually served him for a thumb-ring; and his strength was so great, that he was able to draw a carriage which two oxen could not move. He could strike out an horse's teeth with a blow of his fist, and break its thigh with a kick. His diet was as extraordinary as the rest of his endowments; he generally ate 40 pounds weight of flesh every day, and drank six gallons of wine, without committing any debauch in either. With a frame so athletic, he was possessed of a mind undaunted in danger, and neither fearing nor regarding any man. The first time he was made known to the emperor Severus, was upon his celebrating games on the birth-day of his son Geta. Maximinus was then a rude countryman, and requested the emperor to be permitted to contend for the prizes which were distributed to the best runners, wrestlers, and boxers, of the army. Severus, unwilling to infringe the military discipline, would
becomes a cruel tyrant.

He began his reign, by endeavouring to force obedience from every rank of people, and by vindicating his authority by violence. The senate and people of Rome were the first that incurred his resentment. They utterly refusing to confirm the election of the army, he was the first emperor who reigned without their concurrence or approbation. However he seemed regardless of their opposition, proceeding to ficide his election by putting all such to death as had been raised by his predecessor. The Christians also, having found favour in the former reign, felt the weight of his resentment; and were perfected in several parts of the empire, particularly in those where he himself resided. His cruelty likewise extended to the rich, whose lives and estates became a frequent sacrifice to avarice and superstition. But what appears still a more extraordinary instance of his cruelty, being ashamed of the meanness of his extradition, he commanded all such as were best acquainted with him and his parentage to be slain, although there were some among the number that had relieved him in his low condition.

However, his cruelties did not retard his military successes, which were carried on with a spirit befitting a coming a better monarch. He overthrew the Germans in several battles, waited all their country with fire and sword for 400 miles together, and set a resolution of subduing all the northern nations as far as the ocean. In these expeditions, in order to attach the soldiers more firmly to him, he increased their pay; and in every duty of the camp, he himself took as much pains as the meanest centenel in his army, showing incredible courage and affiduity. In every engagement, where the conflict was hottest, Maximinus was always seen fighting there in person, and destroying all before him: for, being bred a barbarian, he considered it as his duty to combat as a common soldier, while he commanded as a general.

In the mean time, his cruelties had so alienated the minds of his subjects, that several conspiracies were formed secretly aimed against him. Magnus, a confular, against him, and some others, had plotted to break down a wooden bridge, as soon as the emperor had passed it, and thus to abandon him to the enemy. But this being discovered, gave Maximinus an opportunity of indulging his natural severity, upon this pretext alone causing above 4000 to be slain. Shortly after, some of Alexander's old soldiers withdrawing themselves from the camp, proclaimed one Glycerius, who had been lately disgraced at Maximinus for being dismissed from employment. The soldiers, in fact, constrained him to accept of the dangerous superiority to which he was exalted; and shortly after, in the spirit of the times, the person who had been the promoter of his advancement, murdered him in his bed, and carried his head to Maximinus; who received him kindly at first, but soon put him to a cruel death, for his complicated guilt of treason and treachery.

These partial insurrections were soon after followed by a spirit of general discontent throughout all the empire. The provinces of Africa were the first that showed their detestation of the tyrant, whose extortion and cruelties among them were become insupportable. They first flew his procurator; and afterwards considering how dangerous a crime they had committed, they resolved to throw off all expectations of pardon, and create a new emperor. Gordian was then proconful of Africa, a person of great fame for his virtues, and highly revered as a blameless life of near 80 years. Him, therefore, they determined to elect; and accordingly the soldiers and natives assembling together, tumultuously entered his house, resolved to put their design in execution. Gordian, who at first supposed they...
they were come to kill him, being made sensible of their intentions, utterly refusing their offer, alleging his extreme age, and Maximinus's power. But all his opposition was vain: for they constrained him to accept of the proffered dignity; and he, with his son Gordian, who was 46 years of age, were declared emperors. Being thus raised contrary to his inclination, the old man immediately wrote to the senate, declaring that he had unwillingly accepted the empire, and would only keep his authority till he had freed it from the tyranny of its present oppressor. The senate very joyfully confirmed his election, adjudging Maximinus as an enemy and traitor to the state. The citizens also showed an equal zeal in the cause: they flew upon such as were the reputed friends of Maximinus, and tore them in pieces; even some who were innocent falling a sacrifice to the multitude's blind rage. So great an alteration being made in the city against the interests of Maximinus, the senate were resolved to drive the opposition to the extreme; and accordingly made all necessary preparations for their security, ordering Maximinus's governors to be displaced, and commanding all the provinces to acknowledge Gordian for emperor. This order was differently received in different parts, as people were affected to one or the other party; in some provinces the governors were slain; in others, the messengers of the senate; so that all parts of the empire felt the consequence of the civil war.

In the mean time, when Maximinus was informed of these charges against him, his rage appeared uncom-

Theodore of Mopso7on hearing it was brought to the emperor, who now increased his diligence, and flattered himself with a speedy opportunity of revenge. He led on his large army by hasty journeys into Italy, threatening destruction to all his opposers, and ardently willing for fresh opportunities of slaughter.

Nothing could exceed the confirmation of the senate upon the news of this defeat. They now saw themselves not only deprived of the assistance of Gordian and his son, on whom they greatly relied; but also opposed by two formidable tyrants, each commanding a victorious army, directly marching towards Rome, and meditating nothing but vengeance. In this afflicting exigence, they, with great solemnity, met at the temple of Jupiter, and after the most mature deliberations, chose Pupienus and Balbinus emperors conjointly. These were men who had acquired the esteem of the public both in war and peace, having commanded armies and provinces, with great reputation; and being now appointed to oppose Maximinus, they made what levies they could, both in Rome and the country. With these, Pupienus marched to stop the progress of the invaders, leaving the city to a fresh and unlooked for calamity. This was occasioned by two of Maximinus's soldiers, who, entering the palace, were slain by two senators. This quickly gave offence to the body of the pretorian soldiers, who instantly resolved to take revenge, but were opposed by the citizens; so that nothing was seen throughout Rome, but tumult, slaughter, and cruelty. In this universal confusion, the calamity was increased by the soldiers setting the city on fire, while the wretched inhabitants were combating each other in the midst of the flames.

Nevertheless, Maximinus himself, in whose favour these seditions were promoted, did not seem to be more fortunate. Upon being informed of the new election of emperors, his fury was again renewed, and he passed the Alps, expecting upon entering Italy, to refresh his fatigued and famished army in that fertile part of the country. But in this he was entirely disappoointed; the senate had taken such care to remove all kinds of fortification to fortified places, that he still found himself reduced to his former necessities, while his army began to murmur for want. To this another disappointment was added shortly after: for, approaching the city of Aquileia, which he expected to enter without any difficulty, he was astonished to find it prepared for the most obstinate resistance, and resolve to hold out a regular siege. This city was well fortified and populous, and the inhabitants greatly averse to Maximinus's government but what added still more to its strength, it was commanded by two excellent generals, Crispinus and Menophilius, who had so well furnished it with men and ammunition, that Maximinus found no small resistance, even in invading the place. His first attempt was, to take the city by storm; but the besieged threw down such quantities of scalding pitch and sulphur upon his soldiers, that they were unable to continue the assault. He then determined upon a blockade; but the inhabitants were so resolute, that even the old men and children were seen combating upon the walls, while the women cut off their hair to furnish the soldiers with bowstrings. Maximinus's rage at this unexpected opposition was now
The first four years of this emperor's reign were attended with the utmost prosperity; but in the fifth he was alarmed with accounts from the east, that Sapor, king of Persia, had furiously invaded the confines of the Roman empire, and having taken Antioch, had pillaged Syria and all the adjacent provinces. Besides the Persians, the Goths also invaded the empire on their side, pouring down like an inundation from the north, and attempting to fix their residence in the kingdom of Thrace. To oppose both these invasions, Gordian prepared an army; and having gained some victories over the Goths, whom he obliged to retire, he turned his arms against the Persians, whom he defeated upon several occasions, and forced to return home with disgrace. In gaining these advantages, Mithraeus, whom he had made praetorian prefect, had the principal share; but he dying soon after (as it is supposed being poisoned by Philip an Arabian, who was appointed his successor), the fortunes of Gordian seemed to die with him. The army began to be no longer supplied with provisions as usual; murmurs were heard to prevail, and these were artfully somented by Philip. Things thus proceeding from bad to worse, Philip was at first made his equal in the command of the empire; shortly after, invested with the sole power, and, at length, finding himself capable of perpetrating his long meditated cruelty, Gordian was, by his order, slain, in the 22d year of his age, after a successful reign of near six years.

Philip having thus murdered his benefactor, was so fortunate as to be immediately acknowledged emperor by the army. The senate also, though they seemed at first to oppose his power, confirmed his election, and gave him, as usual, the title of Auguus. Philip was about 40 years old when he came to the throne; being the son of an obscure Arabian, who had been captain of a band of robbers. Upon his exaltation, he associated his son, a boy of six years of age, as his partner in the empire; and, in order to secure his power at home, made peace with the Persians, and marched his army towards Rome. On his way, having conceived a desire to visit his native country of Arabia, he built there a city called Philippopolis; and from thence returning to Rome, he was received as emperor, and treated with all the marks of suffragement, though not with joy. To put the people in good humour, he caused the regular games to be celebrated, with a magnificence superior to any of his predecessors, it being just 1000 years after the building of the city. Upon occasion of these games, we are told that both Philip and his son were converted to Christianity. However this, a murderer and an ungrateful usurper does no great honour to whatever opinion he may happen to have. We have little account of the latter part of his reign in the wretched and mutilated histories of the times; we only learn, that the Goths having invaded the empire, Marinus, Philip's lieutenant, who was sent against them, revolted, and caused himself to be declared emperor. This revolt, however, was but of short duration; for the army which had raised him repented of their rashness, deposed him with equal levity, and put him to death. Decius was the person whom Philip appointed to command in the room of the revolving general. The chief merit of Decius with the emperor...
that when Marcius had rebelled, he averted in
that senate. That the traitor's pretension would be
very shortly his ruin; which, when it happened ac-
cordingly, Philip appointed him to succeed in the
command of the rebellious army. Decius, who was a
man of great subtlety, being thus entrusted with so
much power, upon arriving at the army found that
the soldiers were resolved on inveigling him with the
supreme authority. He therefore seemed to suffer
their importunities, as if through constraint; and, in
the mean time, sent Philip word, that he had unwill-
ingly assumed the title of emperor, the better to se-
cure it for the rightful possessor; adding, that he only
looked for a convenient opportunity of giving up his
pretensions and title together. Philip knew mankind
too well, to rely upon such professions; he therefore
got together what forces he could from the several
provinces, and led them forward towards the confines
of Italy.

However, the army had scarce arrived at Ve-
rona, when it revolted in favour of Decius, and put
their legions violently upon Philip, a centinel, with one blow,
cut off his head, or rather cleaved it asunder, separating
the under jaw from the upper. Such was the deferred
death of Philip, in the 45th year of his age, after a reign
of about five years; Decius being universally acknow-
ledged as his successor, A. D. 428.

The activity and wisdom of Decius in some mea-
sure ftopped the hastening decline of the Roman em-
pire. The senate seemed to think so highly of his
merits, that they voted him not inferior to Trajan; and
indeed he seemed in every instance to consult their
dignity in particular, and the welfare of all inferior ranks
of people. He permitted them to choose a cenator, as
was the custom in the flourishing times of Rome; and
Valerian, his general, a man of such strict morals, that
his life was said to be a continual censorship, was
chosen to that dignity.—But no virtues could now prevent
the approaching downfall of the state; the obstinate dis-
putes between the Pagans and the Christian, within
the empire, and the unceasing irritations of barbarous
nations from without, enfeebled it beyond the power of
a remedy. To flop these, a persecution of the Chris-
tians, who were now grown the most numerous body
of the people, was impolitically, not to say unjustly,
begun; in which thousands were put to death, and all
the arts of cruelty tried in vain to lessen their growing
number. This persecution was succeeded by dreadful
devastations from the Goths, particularly in Thrace
and Moesia, where they had been most successful.
These irruptions Decius went to oppose in person; and
coming to an engagement with them, flew 30,000 of
the barbarians in one battle. However, being resolved
to pursue his victory, he was, by the treachery of Gal-
lus his own general, led into a defile, where the king of
the Goths had secret information to attack him. In
this disadvantageous situation, Decius first slew his
son, killed with an arrow, and soon after his whole army
put to the rout. Wherefore, resolving not to survive
his loss, he put spurs to his horse, and instantly plung-
ging into a quagmire, was swallowed up, and his
body could never be found after. He died in the
poor year of his age, after a short reign of two
years and six months, leaving the character of an
excellent prince, and one capable of averting the de-
struction of the empire, if human means could have
effected it.

Gallus, who had thus betrayed the Roman army,
had address enough to get himself declared emperor
by that part of it which survived the defeat; he was 45
years old when he began to reign, and was descended
from an honourable family in Rome. He bought a dif-
honourable peace from the enemies of the state, agree-
ing to pay a considerable annual tribute to the Goths,
whom it was his duty to repress. Having thus pur-
hased a short remission from war, by the disgrace
of his country, he returned to Rome, to give a loose
to his pleasures, regardless of the wretched situa-
tion of the empire.

Nothing can be more deplorable than the state of
the Roman provinces at this time. The Goths and
other barbarous nations, not satisfied with their late
bribes to continue in peace, broke in upon the eastern
parts of Europe. On the other side, the Persians and
Scythians committed unheard of ravages in Mesopo-
tamia and Syria. The emperor, regardless of every
national calamity, was lost in debauch and sensuality
at home; and the Pagans were allowed a power of
persecuting the Christians through all parts of the
state; these calamities were succeeded by a pellience,
that seemed to have in general spread over every part
of the earth, and which continued raging for several
years in an unheard of manner; and all these by a
civil war, which followed shortly after, between Gal-
lus and his general Æmilianus, who had gained a
victory over the Goths, was proclaimed emperor by his
conquering army. Gallus hearing this, was soon rou-
ted from the intoxications of pleasure, and prepared
to oppose his dangerous rival. Both armies met in Mo-
sia, and a battle ensued, in which Æmilianus was
victorious, and Gallus, with his son, were slain. His
death was merited, and his vices were such as to de-
serve the detestation of posterity. He died in the 49th
year of his age, after an unhappy reign of two years
and four months, in which the empire suffered in-
expressible calamities. Æmilianus, after his victory over
Gallus, expected to be acknowledged emperor; but
he soon found himself miserably disappointed. The
senate refused to acknowledge his claim; and an army
that was flativated, near the Alps chose Valerian, their
own commander, to succeed to the throne. In con-
sequence of this, Æmilianus's followers began to confi-
der their general as an obstacle to the universal tranqui-
lity, and flew him in order to avoid the mischiefs of a
civil war.

Valerian being thus universally acknowledged as
emperor, although arrived at the age of 70, set about
reforming the state with a spirit that seemed to mark
a good mind and unabated vigour. But reformation
was then grown almost impracticable. The disputes
between the Pagans and Christians divided the empire
as before; and a dreadful persecution of the latter en-
sued. The northern nations over-ran the Roman do-
minions in a more formidable manner than ever; and
the empire began to be usurped by a multitude of petty
leaders, each of whom, neglecting the general state,
set up for himself. To add to these calamities, the Persians,
under their king Sapor, invaded Syria; and coming
into Mesopotamia, took the unfortunate Valerian Pri-
soner, the Per-
sians.
The empire invoked on all sides by the barbarians.

In Rome.

The emperor, as he was making preparations to oppose them. Nothing can exceed the indignities, as well as the cruelties, which were practised upon this unhappy monarch, thus fallen into the hands of his enemies. Sapor, we are told, usual led him as a footstool for mounting his horse; he added the bitterness of ridicule to his insults, and usually observed, 'That an attitude like that to which Valerian was reduced, was the best statue that could be erected in honour of his victory.' This horrid life of insult and suffrance continued for seven years, and was at length terminated by the cruel Persian's commanding his prisoner's eyes to be plucked out, and afterwards causing him to be fed alive.

The news of the defeat of the Roman army by the Persians, and the captivity of Valerian, no sooner the empire reached the barbarous nations at war with Rome, than they poured on all sides into the Roman territories in incredible multitudes, threatening the empire, and humus, Lollianus, Scythians ravaged Pontus and Alia, committing every savageries, which, thus nefling, as was said, from the celebrated king Decembal whom Trajan had conquered, and had, by several gallant actions, gained reputation in the Roman armies. After he was proclaimed emperor, he gained great advantages over the Sarmatians; but was soon after murdered by his own soldiers. These revolts were quickly followed by many others. Indeed it is not surprising, at a time when the rens of government were held with so loose an hand, that a crowd of usurpers should start up in every province of the empire. The great number of usurpers who pretended to the empire about this time have been distinguished by the name of the tyrants. However, there were only 19 viz. The thirty Cyriades, Macriamis, Balila, Udenatus, and Zenobia tyrants in the east: in Gaul, and the western provinces, Poithinus, Lollianus, Victorinus and his mother Victoria, Marius, and Tiricinus; in Illyricum, and on the confines of the Danube, Isengus, Regillianus, and Aurelius; in Pontus, Saturninus; in Iberia, Trebellius; in Thrasy, Piso; in Achaia, Valens; in Egypt, Aemilianus; and in Africa, Celus. Several of these pretenders to the empire, however, though branded with the opprobrious appellation of tyrants, were eminent examples of virtue, and almost all of them were possessed of a considerable share of vigour and ability. The principal reason assigned for their revolt was, the infamous character of Gallienus, whom neither officers nor soldiers could bear to serve. Many of them, however, were forced by the soldiery to assume the imperial dignity much against their will. "You have lost," said Saturninus to his soldiers when they inveigled him with the purple, "a very useful commander, and have made a very wretched emperor." The apprehensions of Saturninus were justified by the event. Of the 19 usurpers already mentioned, not one died a natural death; and in Italy and Rome Gallienus alone continued to be acknowledged emperor. That prince indeed honoured Odencatus prince of Palmyra with the title of Augustus, who continued to possess an independent sovereignty in the east all his lifetime, and at his death transmitted it to his wife Zenobia. See PALMYRA.

The consequences of these numerous usurpations, fatal to the states, were the most fatal that can be conceived. The elecions of these precarious emperors, their life and death, were equally destructive to their subjects and adherents. The price of their elevation was instantly paid to the troops by an immense donative drawn from the exhausted people. However virtuous their character, and however pure their intentions might be, they found themselves reduced to the necessity of supporting their usurpation by frequent acts of rapine and cruelty. When they fell, they involved armies and provinces in their fall, as appears from the letter of Gallienus already quoted. Whilft the forces of the late were dispersed in private quarrels, the defenseless provinces lay exposed to every invader. The bravest usurpers were compelled, by the perplexity of their situation, to conclude dishonourable treaties with the barbarians, and even to submit to shameful tributes, and introduce such numbers of barbarians into the Roman service as seemed sufficient at once to overthrow the empire.
But when the empire seemed thus ready to sink at once, it suddenly revived on the death of Gallienus, who was murdered by Marcellus, one of his generals, while he besieged Aureolus, one of the tyrants, in Milan. His death gave general satisfaction to all, except his followers, who hoped to reap the reward of their treachery by the plunder of Milan. But being frustrated in these expectations, and in some measure kept within bounds by the large effusion of Marcellus, Claudius was nominated to succeed, and joyfully accepted by all orders of the state, and his title confirmed by the senate and the people.

We are not sufficiently assured of this emperor's lineage and country. Some affirm that he was born in Dalmatia, and defended from an ancient family there; others affirm that he was a Trojan; and others, that he was son to the emperor Gordian. But, whatever might have been his descent, his merits were by no means doubtful. He was a man of great valour and conduct, having performed the most eminent services against the Goths, who had long continued to make incursions into the empire. He was now about 55 years old, equally remarkable for the strength of his body and the vigour of his mind: he was chaste and temperate, a rewarder of the good, and a severe punisher of such as transgressed the laws. Thus endowed, therefore, he, in some measure put a stop to the precipitate decline of the empire, and once more succeeded in restoring the glory of Rome.

His first success, upon being made emperor, was against Aureolus, whom he defeated near Milan. His next expedition was to oppose the Goths, against whom he led a very numerous army. These barbarians had made their principal and most successful incursions into Thrace and Macedonia, swarmed over all Greece, and pillaged the famous city of Athens, which had long been the school of all the polite arts to the Romans. The Goths, however, had no veneration for those embellishments that tend to soften and humanize the mind, but destroyed all monuments of taste and learning with the most savage alacrity. It was upon one of these occasions, that, having heaped together a large pile of books in order to burn them, he ordered that a fire was put to the precipitate decline of the empire, and once more succeeded in restoring the glory of Rome.

Immediately after the death of Claudius, the army made unanimous choice of Aurelian, who was at that time master of the horde, and esteemed the most valiant commander of his time. However, his promotion was not without opposition on the part of the senate, as Quintillus, the brother of the deceased emperor, put in his claim, and was for a while acknowledged at Rome. But his authority was of very short duration; for finding himself abandoned by those who at first inveigled him to declare for the throne, he chose to prevent the severity of his rival by a voluntary death, and confining his veins to be opened, expired, after having reigned but 17 days.

Aurelian being thus universally acknowledged by all the states of the empire, assumed the command, with a greater show of power than his predecessors had enjoyed for some time before. This active monarch was born of mean and obscure parentage in Dacia, and was about 55 years old at the time of his coming to the throne. He had spent the early part of his life in the army, and had risen through all the gradations of military duty. He was of unhonored courage and amazing strength; and, in one engagement killed 40 of the enemy with his own hand, and above 900 at several different times. In short, his valour and expedition were such, that he was compared to Julius Caesar; and, in fact, only wanted mildness and clemency to be every way equal.

The whole of this monarch's reign was spent in suppressing the incursions of the northern nations, in scouring the barbarians, and retrieving the affairs of the empire. His great army marched against the Goths, for a considerable time after, made but a feeble opposition. He some time after marched against the revolted Germans, and overthrew them with considerable slaughter. His last expedition was to oppose Tetricus and Zenobia, his two puissant rivals in the empire. But on his march, as he approached near Sirmium, in Pannonia, he was seized with a pestilential fever, of which he died in a few days, to the great regret of his subjects, and the irreplaceable loss of the Roman empire. His reign, which was not quite of two years' continuance, was active and successful; and such is the character given of him by historians, that he is said to have united in himself the moderation of Augustus, the valour of Trajan, and the piety of Antoninus.

criminal in two. This was a severity that might take the name of cruelty; but the vice of the age, in some measure, required it. In those punishments inflicted on the guilty, the Christians, who had all along been growing more numerous, were sharers. Against these he drew up several letters and edicts, which showed that he intended a very severe persecution; but if we may believe the credulous historians of the times, he was diverted just as he was going to sign them by a thunderbolt, which fell so near his person, that all the people judged him to be destroyed.

But however Heaven might have interposed on this occasion, it is certain that his severities at last were the canes of his destruction. Menethus, his principal secretary, having been threatened by him for some fault which he had committed, began to consider how he might prevent the meditated blow. For this purpose, he forged a roll of the names of several persons, whom he pretended the emperor had marked out for death, adding his own to strengthen him in the confidence of the party. The ferocit thus contrived was shown with an air of the utmost ferocity to some of the persons concerned; and they, to procure their safety, immediately agreed with him to deliver the emperor. This resolution was soon put in execution; for, as the emperor failed with a small guard from Urales, in Thrace, towards Byzantium, the conspirators fet upon him at once, and flew him with very small resistance. He was slain in the 60th, or, as some say, in the 63d year of his age, after a very active reign of almost five years.

The number of pretenders to the throne, which had formerly infested the empire, were, by the last monarch's activity, so entirely removed, that there now seemed to be none that would venture to declare himself a candidate. The army referred the choice to the senate; and, on the other side, the senate declined it; so that a space of near eight months elapsed in these negociations. At length, however, the senate made choice of Tacitus, a man of great merit, and noway ambitious of the honours that were offered him. Upon being solicited to accept the empire, he at first refused, and retired to his country-house in Campania, to avoid their importunities; but being at length prevailed upon, he accepted the reins of government, being at that time 75 years old.

One of the first acts of his government was the punishment of those who had conspired against the late emperor. Menethus was impaled alive, his body being thrown to be devoured by wild beasts; his estate also was confiscated to the exchequer; and his ready money, which was very considerable, applied towards paying the army. During this short reign, the senate seemed to have a large share of authority, and the historians of the times are liberal of their praises to such emperors as were thus willing to divide their power. Upon endeavouring to obtain the confidulhip for his brother Probus, he was refused it by the senate; at which he seemed no way moved, but calmly remarked that the senate but knew whom to choose. This moderation prevailed in all the rest of his conduct; he was extremely temperate; his table was plain, and furnished with nothing expensive; he even prohibited his emprefs from wearing jewels, and forbad the use of gold and embroideries. He was fond of reading, and the memory of six men as had deferred well of their country. He particularly esteemed the works of his namesake Tacitus the historian; commanding that they should be placed in every public library throughout the empire, and that many copies of them should be transcribed at the public charge. A reign begun with such moderation and justice, only wanted continuance to have made the empire happy; but after enjoying the empire about six months, he died of a fever in his march to oppose the Persians and Scythians, who had invaded the eastern parts of the empire.

Upon the death of Tacitus the army seemed divided in the choice of an emperor; one part of it chose Florianus, brother to the deceased; but the majority were for some time undetermined. They alleged amongst each other the necessity of choosing one eminent for valour, honour, piety, clemency, and probity; but the last virtue being that chiefly infifted upon, the whole army, as if by common consent, cried out that Probus should be emperor. He was accordingly confirmed in this dignity with the usual solemnities: and Florianus finding himself defeated, even by those legions who had promised to stand up in his support, opened his arteries and bled himself to death.

Probus was 44 years old when he ascended the Probusian throne, being born of noble parentage at Sirmium in Pannonia, and bred up a soldier from his youth. He began early to Distinguish himself for his discipline and valour; being frequently the first man who in bellying towns scaled the walls, or that burst into the enemy's camp. He was no limbs remarkable for single combats, and saving the lives of many eminent citizens. Nor was his activity and courage, when elected to the empire, less apparent, than in his private station. He first reproved the Germans in Gaul, of whom he flew 400,000. He then marched into Dalmatia, to oppose and subdue the Sarmatians. From thence he led his forces into Thrace, and forced the Goths to sue for peace. He after that turned his arms towards Asia; His confinced the province of Lycia; and marching on towards, conquered a people called the Bitymens; who, leaving their native forests of Ethiopia, had pillaged themselves of Arabia and Judea, and had continued in a state of rebellion since the reign of Gallienus. Probus alio, the king of Persia, submitted at his approach; and upon his return into Europe, he divided the depopulated parts of Thrace among his barbarous invaders: a circumstance that afterwards produced great calamities to the empire.

His diligence was not less conspicuous in supressing intelli commotions. Saturninus being compelled by the Egyptians to declare himself emperor, was defeated and slain. Proculus alio (a person remarkable only for his great attachment to women, and who boasted in a letter, that, having taken 100 Sarmatian virgins prisoners, he deprived ten of that name in one night, and all the rest within a fortnight) set up against the emperor; but was compelled to fly, and at length delivered up by the Germans. At the same time Conoitis (who was a remarkable votary to Bacchus, being able to drink as much wine as ten old do, without being disorder'd) rebelled, and being overcome hanged himself in despair. Probus, when he saw him immediately after his death, could not avoid pointing to him, and saying, "There hangs not a man but a calf." Still, however, notwithstanding every effort to give quiet to the empire,
the barbarians who surrounded it kept it in continual alarms. They were frequently repulsed into their native woods, but as they certainly returned with fresh rage and increased ferocity. The Goths and Vandals, finding the emperor engaged in quelling domestic disputes, renewed their accustomed threats, and once more sent the commencement of their pretensions. They were overcome in several engagements; and Probus returned in triumph to Rome. His active temper, however, would not suffer him to continue at rest whilst a single enemy was left to conquer. In his last expedition he led his soldiers against the Persians; and, going through Thrace, the place of his nativity, he there employed several thousands of his soldiers in draining a fen that was incommodious to the inhabitants. The fatigues of this undertaking, and the great restraint that was laid upon the soldiers' licentious manners, produced a conspiracy, which ended in his ruin: for taking the opportunity as he was marching into Greece, they set upon and slew him after he had reigned six years and four months, with general approbation.

Carus, who was praetor in succession to the deceased emperor, was chosen by the army to succeed him; and he, to strengthen his authority, named his two sons Carinus and Numerianus with him in command; the former of whom was as much fullied by his vices, as the youngest was virtuous, modest, and courageous. The new emperor had scarce time to punish the murderers of the late monarch, when he was alarmed by a fresh irruption of the Sarmatians; over whom he gained a signal victory. The Perian monarch also made some attempts upon the empire; but Carus assured his ambassadors, that if their matter perftilled in his obduracy, all his fields should shortly be as bare as his own had been, which he showed them. In consequence of this threat, he marched to the very walls of Ctesiphon, and a dreadful battle ensuing, he once more gained a signal victory. What was incommodious to the empire, however, was not without bloody engagements that he was overcome, and condemned by Diocletian to be devoured by lions. In Africa, the Romans, in like manner, joined with many of the natives, seized upon the public revenues, and plundered those who continued in their duty. These were also subdued by Maximian, and, after a long and dubious war, constrained to sue for peace. About the same time, a principal commander in Britain, named Carausius, proclaimed himself emperor; and it must be observed, that there was a period in which there were more numerous formidable enemies to oppose.

The peasants and labourers in Gaul made a dangerous insurrection, under the conduct of Amandus and Helianus, but were subdued by Maximian. Achilleus, who commanded in Egypt, proclaimed himself emperor; and it was not without bloody engagements that he was overcome, and condemned by Diocletian to be devoured by lions. In Africa, the Roman legions, in like manner, joined with many of the natives, seized upon the public revenues, and plundered those who continued in their duty. These were also subdued by Maximian; and, after a long and dubious war, constrained to sue for peace. About the same time, a principal commander in Britain, named Carausius, proclaimed himself emperor, and possessed himself of the island. To oppose this general's claims, Maximian made choice of Constantius Chlorus, whom he created Caesar, and married to Theodora his daughter-in-law. He, upon his arrival in Britain, finding Carausius very strong, and continually reinforced from Germany, though proper to come to an accommodation; so that this usurper continued for seven years in quiet possession of the whole island, till he was slain by Alcibus, his friend and intimate. About this time also, Narces, king of Persia, began a dangerous war. The Persians in the east were invaded by the Parthians. To stop the progress of the enemy upon this quarter, Diocletian made choice of Galerius (furnamed Armentarius, from the report of his being born of a cow-herd in Dacia); and he likewise was created Caesar. His successes, though very doubtful in the beginning, was in the end terminated according to his wishes. The Persians were overcome in a decisive engagement, their camp plundered and taken, and their king's wives and children made prisoners of war. There only remained, of all the enemies of the Roman empire, those who lay to the northward unsubdued. These were utterly unconquerable, as well upon account of their savage fierceness, as the inhospitable severity of the climate and cold from whence they issued. Ever at war with the Romans, they issued forth, when the armies that were to repel their invasions were called away; and upon their return, they as suddenly withdrew into cold, barren, and inaccessible places,
The Christians cruelly persecuted.

Diocletian and Maximian reigns.

Rome, | 451 |

The Romans, which only themselves could endure. In this manner the Goths, Sarmatians, Alani, Quadi, &c. poured down in incredible numbers; while every defeat seemed but to increase their strength and perseverance. Of these, multitudes were taken prisoners, and sent to people the more southern parts of the empire; still greater numbers were destroyed; and though the rest were driven back to their native forests, yet they continued ever mindful of their inverteate enmity, and, like a savage beast, only continued inactive, till they had licked their wounds for a new encounter.

During this interval, as if the external miseries of the empire were not sufficient, the tenth and last great persecution was renewed against the Christians. This is said to have exceeded all the former in severity: and this was the zeal with which it was pursued, that, in an ancient inscription, we are informed that they had effaced the name and superstition of the Christians, and had restored and propagated the worship of the gods. Their attempts, however, were but the malicious efforts of an expiring party; for Christianity shortly after was established by law, and triumphed over the malice of all its enemies. In the midst of the troubles raised by this persecution, and of the content that struck at the internal parts of the state, Diocletian and Maximian purified the world by reigning their dignities on the same day, and both retiring into private stations. Historians are much divided concerning the motives that thus induced them to give up those honours which they had purchased with so much danger. Some ascribe it to the philosophical turn of Diocletian; and others, to his being disgusted with the obstinacy of his Christian subjects; but Laodicius affirms, that he was compelled to it, together with his partner, by Galerius, who coming to Nicomedia, upon the emperor’s recovery from a great sickness, threatened him with a civil war in case he refused to reign. However, of this we are well assured, that he still preferred a dignity of sentiment in his retirement, that might induce us to believe he had no other motive for resignation than the love of quiet, and the consciousness of his inability to discharge on a sick-bed the duties of a sovereign. Having retired to his birth-place, he spent his time in cultivating his garden, affording his visitors that then only began to enjoy the world, when he was thought by the rest of mankind to forsake it. When also some attempted to persuade him to resume the empire, he replied, That if they knew his present happiness, they would rather endeavour to imitate than disturb it. In this contented manner he lived some time, and at last died either by poison or madness; it is uncertain which. His reign, which continued 20 years, was active and useful; and his authority, tinctured with severity, was well adapted to the depraved state of morals at that time.

Maximian, his partner in the empire and in regnination, was by no means so contented with his situation. He longed once more for power, and disturbed the two succeeding reigns with various efforts to resume it; attempting to engage Diocletian in the same design. Being obliged to leave Rome, where he had bred great confidence, he went over into Gaul, where he was kindly received by Constantine, the then acknowledged emperor of the west. But here also continuing his intrigues, and endeavouring to force his own daughter and destroy her husband, he was detected, and condemned to die by whatever death he should think proper; and Laodicius tells us that he chose hanging.

Upon the resignation of the two emperors, the two Conflantius Cæsars whom they had formerly chosen were universally acknowledged as their successors. Conflantius and Galerius, who was so called from the plainness of his complexion, was virtuous, valiant, and merciful. Galerius, on the other hand, was brave, but brutal, incontinent, and cruel. As there was such a disparity in their tempers, they readily agreed, upon coming into full power, to divide the empire: Conflantius being appointed to govern the western parts; namely, Italy, Sicily, the greatest part of Africa, together with Spain, Gaul, Britain, and Germany: Galerius had the eastern parts allotted to his share; to wit, Illyricum, Pannonia, Thrace, Macedonia, all the provinces of Greece, and the Lesser Asia, together with Egypt, Syria, Judea, and all the countries easterward. The greatness of the division, however soon induced the emperors to take in two partners more, Severus and Maximin, who were made Cæsars, and allotted in the conducting of affairs: so that the empire now was under the guidance of four persons, all invested with supreme authority.

We are informed but of few particulars of the reign of Conflantius, except a detail of his character, which appears in every light most amiable. He was frugal, chaste, and temperate. His mercy and justice were equally conspicuous in his treatment of the Christians, whom he would not suffer to be injured; and when at length persuaded to displace all the Christian officers of his household that would not change religion, when some of them compiled he sent them away in disgrace; alleging, that those who were not true to their God, would never be faithful to their prince.

In the second year of his reign he went over into Britain; and leaving his son Conflantine as a kind of hostage in the court of his partner in the empire, took up his residence at York. He there continued in the practice of his usual virtues; till falling sick, he began to think of appointing his son for his successor. He accordingly sent for him with all speed; but he was not able to recover before his arrival: notwithstanding, he received him with marks of royalty; and raising himself in his bed, gave him several useful instructions, particularly recommending the Christians to his protection. He then bequeathed the empire to his care; and crying out, that none but the pious Conflantine should succeed him, he expired in his arms.

In the mean time, Galerius, his partner in the empire, being informed of Conflantine’s advancement, testified the most ungovernable rage, and was even going to condemn the messenger who brought him the account; but being dissuaded, he seemed to acquiesce in what he could not prevent, and sent him the marks of royalty; but at the same time declared Severus emperor, in opposition to his interests. Just about this time: also another pretender to the empire started up. This was Maxentius.
Rome.

Salving to ruin the inhabitants, and to destroy the whole senate. His soldiers, however, upon approaching the capital began to waver in their resolutions: wherefore he was obliged to have recourse to intrigues, imploring them not to abandon him; and, retiring by the same route by which he had advanced, made Licinius, who was originally the son of a poor labourer in Dacia, Caesar, in the room of Severus who was slain. This seemed to be the last hint of his power; for shortly after he was seized with a very extraordinary disorder in his privates, which baffled all the skill of his physicians, and carried him off, after he had languished in torments for near the space of a year. His cruelty to the Christians was one of the many crimes alleged against him; and their historians have not failed to aggravate the circumstances of his death as a judgment from Heaven for his former impiety. However this be, he abated much of his severities against them on his deathbed; and revoked those edicts which he had formerly published, tending to their persecution, a little before his death.

Constantine being thus delivered from his greatest opponent, might now be considered as possessing more power than any of his rivals who were yet remaining. The empire was at that time divided between him and three others: Maxentius, who governed in Rome, a person of a cruel disposition, and a redoubted supporter of paganism; Licinius, who was adopted by Galerius, and commanded in the east; and likewise Maximin, who had formerly been declared Caesar with Severus, and who also governed some of the eastern provinces.

For some time all things seemed to wear a peaceful appearance; till at length, either ambition, or the tyrannical conduct of Maxentius, induced Constantine to engage in an expedition to expel that commander from Rome, and to make the proper preparations for marching into Italy. It was upon this occasion that he formed a resolution which produced a mighty change in the politics as well as the morals of mankind, and gave a new turn to the councils of the wife, and the pursuits of ambition. One evening, as we are told by Eusebius, the army being upon its march toward Rome, Constantine was taken up with various considerations upon the fate of sublunary things, and the dangers of his approaching expedition: sensible of his own incapacity to succeed without divine assistance, he employed his meditations upon the opinions that then were chiefly agitated among mankind, and sent up his ejaculations to Heaven to inspire him with wisdom to choose the path he ought to pursue. It was then, as the sun was declining, that there suddenly appeared a pillar of light in the heavens, in the fashion of a cross, with this inscription, "To thy name "In this overcome." So extraordinary an appearance did not fail to create astonishment both in the emperor and his whole army, who considered it as their dispositions led them to believe. Those who were attached to paganism, promoted by their aurochs, pronounced it a most inauspicious omen, portending the most unfortunate events. But it made a different impression on the emperor's mind; who, as the account goes, was further encouraged by visions the same night. He therefore, the day following, caused a royal standard to be made, like that which he had seen in the heavens; and commanded it to be carried before him in his wars, as an ensign of victory and celestial protection. After this, he consulted with several of the principal teachers of Christianity, and made a public avowal of that sacred persuasion.

Constantine having thus attached his soldiers to his interest, who were mostly of the Christian persuasion, lost no time in entering Italy with 90,000 foot and 8000 horse; and soon advanced to the very gates of Rome. The unfortunate Maxentius, who had long given himself up to cafe and debauchery, now began to make preparations when it was too late. He first put in practice all the superfluous rites which paganism taught to be necessary; and then consulted the sibyl-line books; from whence he was informed, that on that great day the enemy of Rome should perish. This prediction, which was equivocal, he applied to Constantine, whereupon, leaving all things in the best posture, he advanced from the city with an army of 100,000 foot and 18,000 horse. The engagement was for some time fierce and bloody, till his cavalry being routed, victory declared upon the side of his opponent, and he himself was drowned in his flight by the breaking down of a bridge as he attempted to cross the river Tiber.

Constantine, in consequence of this victory, entered the city, declaimed all praises which the senate and people were ready to offer; attributing his success to a superior power. He even caused the cross, which he was said to have seen in the heavens, to be placed at the right of all his statues, with this inscription: "That under the influence of that victorious cross, Constantine had delivered the city from the yoke of tyrannical power, and had restored the senate and people of Rome to their ancient authority." He afterwards ordained, that no criminal should for the future suffer death by the cross; which had formerly been the most usual way of punishing slaves convicted of capital offences. Edicts were soon after issued, declaring that the Christians should be eased from all their grievances, and received into places of trust and authority. Thus the new religion was seen at once to prevail over the whole Roman empire; and as that enormous fabric had been built, and guided upon pagan principles, it lost a great deal of its strength and coherence when those principles were thus at once subverted.

Things continued in this state for some time, Constantine all the while contributing what was in his power to the interest of religion, and the revival of learning, which had been long upon the decline, and was almost wholly extinct in the empire. But in the midst of these affinities, the peace of the empire was again disturbed by the preparations of Maximin, who governed in the east, and who, desirous of a full participation of power, marched against Licinius with a very numerous army.

In consequence of this step, after many conflicts, a general engagement ensued, in which Maximin suffered a total defeat; many of his troops were cut to pieces, death, and those that survived submitted to the conqueror. Maximin, however, having escaped the general carnage, once more put himself at the head of another army, resuming to try the fortune of the field; but death prevented his design. As he died by a very extraordinary kind of madness, the Christians, of whom he was the declared enemy, did not fail to ascribe his end to a judgment from Heaven; but this was the age in which false judgments and false miracles made up the bulk of their unprofitive history.
Constantine and Licinius thus remaining undivided possessors and partners in the empire, all things promised a peaceable continuance of friendship and power. However, it was soon found, that the same ambition that aimed after a part, would be content with nothing less than the whole. Pagan writers ascribe the rupture between these two potentates to Constantine; while the Christians, on the other hand, impute it wholly to Licinius. Both, perhaps, might have concurred: for Licinius is considered of having perfected Christianity, which was so highly favoured by his rival; and Constantine is known to have been the first to begin the preparations for an open rupture. Both sides exerted all their power to make opposition; and at the head of very formidable armies, came to an engagement near Cybalis, in Pannonia. Constantine, previous to the battle, in the middle of his Christian bishops, begged the alliance of Heaven; while Licinius, with equal zeal, called upon the pagan priests to intercede with the gods in his favour. Constantine, after an ob­flinate resistance from the enemy, became victorious; took their camp; and, after some time, compelled Licinius to flee for a truce, which was agreed upon. But this was of no long continuance; for, soon after, the war breaking out afresh, and the rivals coming once more to a general engagement, it proved decisive. Licinius was entirely defeated, and pursued by Constantine into Nicomedia, where he surrendered himself up to the victor; having first obtained an oath that his life should be spared, and that he should be permitted to pass the remainder of his days in retirement. This, however, Constantine shortly after broke; for either fearing his designs, or finding him actually engaged in fresh conspiracies, he commanded him to be put to death, together with Martian his general, who some time before had been created Caesar.

Constantine being now sole monarch of the empire, without a rival to divide his power, or any person from whose claims he could have the least apprehensions, resolved to establish Christianity, on so sure a basis, that no new regulations should shake it. He commanded that in all the provinces of the empire the orders of the bishops should be exactly obeyed; a privilege of which, in succeeding times, these fathers made but a very indifferent use. He called also a general council of presbyters to meet at Nicea, in order to repeal the heresies that had already crept into the church, particularly that of Arius. To this place repaired about 318 bishops, besides a multitude of presbyters and deacons, together with the emperor himself; who, all, to about 17, concurred in condemning the tenets of Arius; who, with his associates, was banished into a remote part of the empire.

Having thus restored universal tranquillity to the empire, he was not able to ward off the calamities of a more domestic nature. As the histories of that period are entirely at variance with each other, it is not easy to tell the motives which induced him to put his wife Fausta and his son Crispus to death. The most plausible account is that: Fausta the empress, who was a woman of great beauty, but of extravagant desires, had long, though secretly, loved Crispus, Constantine’s son by a former wife. She had tried every art to inspire this youth with a mutual passion; but, finding her more distant efforts ineffectual, had even the confidence to make him an open confession of her desires. This produced an explanation, which was fatal to both. Crispus received her address with detestation; and she, to be revenged, accused him to the emperor. Constantine, fired at once with jealousy and rage, ordered him to die without a hearing; nor did his innocence appear till it was too late for redress. The only reparation therefore that remained, was the putting Fausta, the wicked instrument of his former cruelty, to death; which was accordingly executed upon her, together with some others who had been accomplices in her falsehood and treachery.

But the private misfortunes of a few were not to be weighted against evils of a more general nature, which the Roman empire shortly after experienced. These arose from a measure which this emperor conceived and executed, of transferring the seat of the empire from Rome to Byzantium, or Constantinople, as it was afterwards called. Whatever might have been the reasons which induced him to this undertaking; whether it was because he was offended at some affronts he received at Rome, or that he supposed Constantinople more in the centre of the empire, or that he thought the eastern parts more required his presence, experience has shown that they were weak and groundless. The empire had long before been in the most declining state; but this in a great measure gave precipitation to its downfall. After this it never returned its former splendor, but languished.

His first design was to build a city which he might make the capital of the world; and for this purpose, he made choice of a situation at Chalcedon in Asia Minor; but we are told, that in laying out the ground-plan, an eagle caught up the line, and flew with it over to Byzantium, a city which lay upon the opposite side of the Bosporus. Here, therefore, it was thought expedient to fix the seat of the empire; and indeed nature seems to have formed it with all the conveniences and all the beauties which might induce power to make it the seat of residence. It was situated on a plain that was gently from the water; it commanded a strait which unites the Mediterranean with the Euxine sea, and was furnished with all the advantages which the most indulgent climate could bestow. This city, therefore, he beautified with the most magnificent edifices; he divided it into 14 regions; built a capital, an amphitheatre, many churches, and other public works; and having thus rendered it equal to the magnificence of his idea, he dedicated it in a very solemn manner to the God of martyrs; in about two years after, repairing thither with his whole court.

This removal produced no immediate alteration in the government of the empire; the inhabitants of Rome, tho’ with reluctance, submitted to the change; nor was there for two or three years any disturbance in the state, until at length the Goths, finding that the Romans had withdrawn all their garrisons along the Danube, renewed their inroads, and ravaged the country with unheard-of cruelty. Constantine, however, soon repelled their incursions, and so情況ed them, that near 100,000 of their number perished by cold and hunger. These and some other insurrections being happily suppressed, the government of the empire was divided as follows. Constantine, the emperor’s eldest son, commanded in Gaul and the western provinces; Constantine governed Africa and Illyricum; and
Romans ruled in Italy. Dalmatius, the emperor's brother, was sent to defend those parts that bordered upon the Goths; and Amphilobius, his nephew, had the charge of Cappadocia and Armenia Minor. This division of the empire still farther contributed to its downfall: for the united strength of the state being no longer brought to reprefs invasions, the barbarians fought with superior numbers; and conquered at last, though often defeated. Constanstine, however, did not live to feel these calamities. The latter part of his reign was peaceful and splendid; ambassadors from the remotest Indies came to acknowledge his authority; the Persians, who were ready for fresh inroads, upon finding him prepared to oppose, sent humbly to desire his protection, who with peaceable and splendid presents, who, after a memorable and active reign of 32 years, whose character is represented to us in very different lights: the Christian writers of that time adoring it with every strain of panegyric; the heathen, on the contrary, loading it with all the virulence of invective. He established a religion that continues the bleeding of many kings; but pursued a scheme of politics that destroyed the empire. From the time of Constanstine to the division of the empire between Valentinian and his brother Valens, the history of Rome is related under the article Constantiople, where also that of the eastern part is carried down to the final destruction of that city by the Turks.

To the beginning of the reign of Valentinian, the province of Libya Tripolitana was grievously oppressed by the barbarians of the desert, and almost equally so by Romanus its own governor. His conduct was so exceedingly oppressive, that the inhabitants sent a deputation to Valentinian, complaining of their unhappy situation, and defining redress. Palladius was accordingly sent to inquire into the state of the province; but being gained over by Romanus, he made a false report to the emperor; and thus the unhappy province was left a prey to the merciless invaders and rapacious governor. During the reign of this emperor the barbarians continued their inroads into the empire; and among others, we find the Saxons now putting in for a share of the spoils of the ruined empire: however, their army was at this time entirely cut off. At last Valentinian himself took the field against these northern barbarians; and entering the country of the Quadi, destroyed all with fire and sword. The barbarians on this were lain to sue for peace in a very humble manner; but Valentinian, falling into a great passion while speaking to them, threatened to stir up the whole nation at once. His fury on this occasion produced an apoplectic fit; or some other mortal disorder; for he suddenly fell down, and being conveyed by his attendants into his chamber, he was found with violent convulsive fits and convulsions of all his limbs, in the agonies of which he expired, in the year 375, the 55th of his age, and 12th of his reign.

After the death of Valentinian, his son Gratian took upon him the imperial dignity; soon after becoming master of the whole empire by the death of Valens. The traditions of his reign, and those of his partner Theodosius, are related under the article Constantiople, n° 77—89. The death of Theodosius gave the first stroke to the Roman affairs; his son Honorius, to whom he left the western empire, being possessed of no abilities whatever, and indeed seeming to have been but very little removed from an idiot. The barbarians appear to have been abundantly sensible of the advantages offered them by the death of Theodosius. He expired in the month of January; and before the accession of spring, the Goths were in arms. The barbarian auxiliaries also now declared their independency; and along with their countrymen, furiously affailed the declining empire. The Goths were now headed by an experienced commander, their celebrated king Alaric, who would have proved formidable even in better times of the empire. He first overran Greece, which he accomplished without opposition, through the treachery of the governor, who commanded the troops that defended the pass at Thermopolis to retire at the approach of the enemy. Athens, Corinth, Argos, Spart-a, yielded without resistance; and the whole country was ravaged and destroyed by the blood-thirsty barbarians. At last, in the year 397, he was opposed by Stilicho, the general of Honorius, a man of great valor and experience in war. The Goths were defeated with great loss, and afterwards besieged in their camp; but through mistake or negligence in the Roman commander, they were suffered to escape, and make themselves masters of the province of Epirus. Alaric then, having found means to conclude a treaty with the minions of Conстанtіnople, Stilicho was obliged to retire.

Not long after this, Alaric invaded Italy itself. The emperor, struck with terror, would have abandoned the country and fled into Gaul; but this disgraceful and pernicious measure was opposed by Stilicho, who promptly went to the court of Honorius, at that time at Milan, that if they would maintain their ground during his absence, he would soon return with an army capable of opposing the barbarians. This being agreed to, Stilicho immediately set out for Raetia, where the most considerable body of the Roman forces at that time was, and collected his troops with the utmost diligence. But in the mean time Honorius was in the greatest danger; having been obliged to take refuge in the town of Alba in Piedmont. To this place the Goths instantly laid siege, and a capitulation had been proposed, when the drooping spirits of Honorius were at once revived by the arrival of Stilicho, whom he had so long expected. The Goths were now besieged in their turn, and obliged to come to a decisive battle feared at Pollentia. The engagement lasted the whole day, but at last the Goths were compelled to retreat. Their camp was instantly invested; their entrenchments forced with great slaughter; the wife of Alaric was taken, with all the wealth which had been amassed in plundering Greece; while many thousands of Roman prisoners were released from the most deplorable slavery. The victory, however, was not so decisive but that
Alaric continued still extremely formidable; and Stilicho chose rather to conclude a treaty with him, and allow him an annual pension, than to continue the war with vigour. Alaric, who was not very scrupulous in his observance of this treaty, in his retreat attempted to make himself master of the city of Verona, but Stilicho coming up with him near that place, gave him a terrible defeat, in which the loss was little less than it had been at Pollentia; after which he effected a retreat out of Italy, but not without the greatest difficulty and danger.

Italy being thus happily delivered, Honorius entered Rome in triumph, having Stilicho along with him in the triumphal chariot. On his entry into the city, he abolished the shows of gladiators, which, though forbidden by Constantine, had been tolerated by his successors, and even by Theodosius himself, out of compliance to the people, who were beyond measure fond of that inhuman diversion. However, soon after, the emperor was obliged to leave the metropolis and retire to Ravenna, in order to secure himself from the barbarians, who now broke in upon the empire on all sides. Such multitudes now made their appearance, that it is not a little difficult to account for their sudden emigration. Mr Gibbon accounts for it from a supposed resolution in the north-eastern parts of China. "The Chinese annals (says he), as they have been interpreted by the learned industry of the present age, may be usefully applied to reveal the secret and remote causes of the fall of the Roman empire. The extensive territory to the north of the great wall was peopled, after the flight of the Huns, by the victorious Sienni, who were sometimes broken into independent tribes, and sometimes re-united under a supreme chief; till at length styling themselves Topa, or "masters of the earth," they acquired a more solid confidence, and a more formidable power. The Topa soon compelled the pastoral nations of the eastern desert to acknowledge the superiority of their arms, invaded China in a period of weakness and infirmity, and carried the leaders of the vanquished people, founded an imperial dynasty, which reigned near the last of the northern provinces of the monarchy. Some generations before they ascended the throne of China, one of the Topa princes had enlisted in his cavalry a slave of the name of Moko, renowned for his valour; but who was tempted, by the fear of punishment, to desert his standard, and to range the desert at the head of 100 followers. This gang of robbers and outlaws swelled into a camp, a tribe, a numerous people, distinguished by the appellation of Geogen; and their hereditary chieftain, the potterty of Moko the slave, aspired their rank among the Scythian monarchs. The youth Toulun, the greatest of his descendants, was exercised by those uniformities which are the school of heroes. He bravely struggled with adversity, broke the imperious yoke of the Topa, and became the legislator of his nation, and the conqueror of Tartary. His troops were distributed into regular bands of 100 and of 1000 men; cowards were flung to death; the most splendid honours were proposed as the reward of valour; and Toulun, who had knowledge enough to despise the learning of China, adopted only such arts and institutions as were favourable to the military spirit of his government. His
imperfect and precarious, that the revolutions of the north might escape the knowledge of the court of Ravenna; till the dark cloud which was collected along the coast of the Baltic burst in thunder upon the banks of the Upper Danube. The emperor of the west, if his ministers disturbed his amusements by the news of the impending danger, was satisfied with being the occasion and the spectator of the war. The safety of Rome was intrusted to the counsels and the sword of Stilicho; but such was the feeble and exhausted state of the empire, that it was impossible to restore the fortifications of the Danube, or to prevent, by a vigorous effort, the invasion of the Germans. The hopes of the vigilant minister of Honorius were confined to the defence of Italy. He once more abandoned the provinces; recalled the troops; prepaid the new levies, which were rigorously exacted, and pusillanimously eluded; employed the most efficacious means to arrest or allure the defeaters; and offered the gift of freedom, and of two pieces of gold, to all the slaves who would enlist. By these efforts he painfully collected from the subjects of a great empire an army of 30,000 or 40,000 men; which, in the days of Scipio or Camillus, would have been instantly furnished by the free citizens of the territory of Rome. The 30 legions of Stilicho were reinforced by a large body of barbarian auxiliaries; the faithful Alani were personally attached to his service; and the troops of Hunus and of Goths, who marched under the banners of their native princes Holden and Sarus, were animated by interest and resentment to oppose the ambition of Radagaisus. The king of the confederate Germans passed, without resistance, the Alps, the Po, and the Appenine; leaving on one hand the inaccessible palace of Honorius, securely buried among the marshes of Ravenna; and on the other, the camp of Stilicho, who had fixed his head-quarters at Ticinium, or Pavia, but who seems to have avoided a decisive battle till he had assembled his distant forces. Many cities of Italy were pillaged, or destroyed; and the siege of Florence by Radagaisus is one of the earliest events in the history of that celebrated republic, whose firmness checked and delayed the unskilful fury of the barbarians. The senate and people trembled at their approach within 180 miles of Rome; and anxiously compared the danger which they had escaped with the new perils to which they were exposed. Alaric was a Christian and a soldier, the leader of a disciplined army; who understood the laws of war, who respected the sanctity of treaties, and who had familiarly conversed with the subjefts of the empire in the same camps and the same churches. The savage Radagaisus was a stranger to the manners, the religion, even the language, of the civilized nations of the south. The feriennes of his temper was exasperated by cruel superstition; and it was universally believed, that he had bound himself by a solemn vow to reduce the city into a heap of stones and ashes, and to sacrifice the most illustrious of the Roman senators on the altars of those gods who were appealed by human blood. The public danger, which should have recalled all domestic animosities, displayed the incurable madness of religious faction. The oppressed votaries of Jupiter and Mercury respected, in the imposable enemies of Rome, the character of a devout pagan; loudly declared, that they were more apprehensive of the sacrileges than of the arms of Radagai-

"Florence was reduced to the last extremity; and the defeated fainting courage of the citizens was supported only by the authority of St Ambrose, who had communicated in a dream the promise of a speedy deliverance. On a sudden they beheld from their walls the banners of Stilicho, who advanced with his united force to the relief of the faithful city; and who soon marked that fatal spot for the grave of the barbarian host. The apparent contradictions of those writers who variously relate the defeat of Radagaisus, may be reconciled without offering much violence to their respective testimonies. Orfius and Augullin, who were intimately connected by friendship and religion, ascribe this miraculous victory to the providence of God rather than to the valour of man. They sharply exclude every idea of chance, or even of bloodshed; and positively affirm, that the Romans, whose camp was the scene of plenty and idleness, enjoyed the diftrefs of the barbarians, flowly expiring on the sharp and barren ridge of the hills of Fæfule, which rise above the city of Florence. Their extraordinary act, that not a single soldier of the Christian army was killed, or even wounded, may be dismissed with silent contempt; but the rest of the narrative of Augullin and Orfius is consistent with the state of the war and the character of Stilicho. Conscious that he commanded the last army of the republic, his prudence would not expose it in the open field to the headlong fury of the Germans. The method of surrounding the enemy with strong lines of circumvallation, which he had twice employed against the Gothic king, was repeated on a larger scale, and with more considerable effect. The examples of Caesar must have been familiar to the most illiterate of the Roman soldiers; and the fortifications of Dyrrhachium, which connected 24 castles by a perpetual ditch and rampart of 15 miles, afforded the model of an entrenchment which might confine and starve the most numerous host of barbarians. The Roman troops had left degenerated from the industry than from the value of their ancestors; and if the servile and laborious work offended the pride of the soldiers, Tuscany could supply many thousand peafants, who would labour, though perhaps they would not fight, for the salvation of their native country.—The imprisoned multitude of horfes and men was gradually destroyed by famine, rather than by the sword; but the Romans were exposed, during the progress of such an extensive work, to the frequent attacks of an impotent enemy. The despair of the hungry barbarians would precipitate them against the fortifications of Stilicho; the general might sometimes indulge the ardour of his brave auxiliaries, who eagerly praised to assault the camp of the Germans; and these various incidents might produce the sharp and bloody conflicts which dignify the narrative of Zosimus, and the Chronicles of Prosper and Marcellinus. A seasonable supply of men and provisions had been introduced into the walls of Florence; and the famished host of Radagaisus was in its turn besieged. The proud monarch of so many warlike nations, after the loss of his bravest warriors, was reduced to confide either in the faith of a capitulation, or in the elerency of Stilicho. But the death of the royal captive, who was ignominiously beheaded, disgraced the triumph of Rome and of Christianty; and
the short delay of his execution was sufficient to brand the conqueror with the guilt of cruelty. The famed Germans who escaped the fury of the auxiliaries were sold as slaves, at the contemptible price of as many single pieces of gold; but the difference of food and climate swept away great numbers of those unhappy strangers; and it was observed, that the humble purchase, instead of reaping the fruit of their labors, were soon obliged to add to it the expense of interring them. Stilicho informed the emperor and the senate of his success; and deferred a second time the glorious title of Deliverer of Italy.

"The fame of the victory, and more especially of the miracle, has encouraged a vain persuasion, that the whole army, or rather nation, of Germans, who migrated from the shores of the Baltic, miserably perished under the walls of Florence. Such indeed was the fate of Radagaisus himself, of his brave and faithful companions, and of more than one-third of the various multitude of Suevi and Vandals, of Alani and Burgundians, who adhered to the standard of their general. The union of such an army might have made our surprize, because the causes of separation are obvious and foreseen; they were the pride of birth, the inoffensive valor, the jealousy of command, the impatience of subordination, and the obstinate conflict of opinions, of interests, and of passions, among so many kings and warriors, who were untaught to yield or to obey. After the defeat of Radagaisus, two parts of the German host, which must have exceeded the number of 100,000 men, still remained in arms between the Apennine and the Alps, or between the Alps and the Danube. It is uncertain whether they attempted to revenge the death of their general; but their irregular fury was soon diverted by the prudence and firmness of Stilicho, who opposed their march, and facilitated their retreat; who considered the safety of Rome and Italy as the great object of his care, and who sacrificed with too much indifference the wealth and tranquillity of the distant provinces. The barbarians acquired, from the junction of some Pannonian defectors, the knowledge of the country and of the roads; and the invasion of Gaul, which Alaric had designed, was executed by the remains of the great army of Radagaisus.

"Yet if they expected to derive any assistance from the tribes of Germany who inhabited the banks of the Rhine, their hopes were disappointed. The Alamanni preferred a state of inactivity and neutrality; and the Franks distinguished their zeal and courage in the defence of the empire. In the rapid progress down the Rhine, which was the first act of the administration of Stilicho, he had applied himself with peculiar attention to secure the alliance of the warlike Franks, and to remove the irreconcilable enemies of peace and of the republic. Marcomann, one of their kings, was publicly convicted before the tribunal of the Roman magistrate of violating the faith of treaties. He was sentenced to a mild, but difflent exile, in the province of Tuscany; and this degradation of the royal dignity was so far from exciting the resentment of his subjects, that they punished with death the turbulent Sammo, who attempted to revenge his brother, and maintained a dastardly allegiance to the princes who were established on the throne by the choice of Stilicho. When the limits of Gaul and Germany were shaken by the northern emigration, the Franks bravely encountered the single force of the Vandals; who, regardless of the lessons of adversity, had again separated their troops from the standard of their barbarian allies. They paid the penalty of their rashness; and 20,000 Vandals, with their king Godigis, were slain in the field of battle. The whole people must have been terrified, if the squadrons of the Alan, advancing to their relief, had not trampled down the invidious march of the Franks; who, after an honourable refiinance, were compelled to relinquish the unequal contest. The victorious confederates pursued their march; and on the last day of the year, in a season when the waters of the Rhine were most probably frozen, they entered without opposition the defended provinces of Gaul. This memorable passage of the Suevi, the Vandals, the Alani, and the Burgundians, who never afterwards retreated, may be considered as the fall of the Roman empire in the countries beyond the Alps; and the barri­ers, which had so long separated the savage and the civilized nations of the earth, were from that fatal moment levelled with the ground. "While the peace of Germany was secured by the attachment of the Franks and the neutrality of the Alamanni, the subjects of Rome, unconscious of their approaching calamities, enjoyed a state of quiet and prosperity, which had seldom blest the frontiers of Gaul. Their flocks and herds were permitted to graze in the pastures of the barbarians; their huntsmen penetrated, without fear or danger, into the darkest recesses of the Hercynian forest. The banks of the Rhine were crowned, like those of the Tiber, with elegant houses and well cultivated farms; and if a poet described the river, he might express his doubt on which side was situated the territory of the Romans. This scene of peace and plenty was suddenly changed into a desolation, and the prospect of the smouldering ruins could alone dis­tinguish the solitude of nature from the desolation of man. The flourishing city of Ments was surprised and destroyed; and many thousand Christians were inhumanly massacred in the church. Worms perished after a long and obstinate siege: Strauburg, Spires, Rheims, Tours, Bay, Amiens, experienced the cruel oppression of the German yoke; and the consuming flames of war spread from the banks of the Rhine over the greatest part of the 17 provinces of Gaul. That rich and extensive country, as far as the Ocean, the Alps, and the Pyrenees, was delivered to the barbarians, who drove before them, in a promiscuous crowd, the bishop, the senatus, and the virgin, laden with the spoils of their houses and altars."

In the midst of these calamities a revolt happened in Revolt of Britain, where one Constantine, a common soldier, raised to the imperial throne, merely for the sake of his name. However, he seems to have been a man of considerable abilities, and by no means unfit for the great dignity to which he was raised. He governed Britain with great prosperity; passed over into Gaul and Spain, and the inhabitants of which submitted without opposition, being glad of any protector whatever from the barbarians. Honorius, incapable of defending the empire, or repressing the revolt, was obliged to acknowledge him as his partner in the empire. In the mean time, Alaric, with his Goths, threatened a new invasion; he was paid a certain sum of money. Stilicho is said to have occasioned this demand, and to have inflat-
After the taking of Rome by Alaric, the city suffered very little at this time, not so much as when it was taken by Charles V.

Alaric did not long survive the taking of Rome, being cut off by a violent fit of sickness in the neighbourhood of Rhegium. After his death the affairs of Honorius seemed a little to revive by the defeat and death of Constantine and some other usurpers; but the provinces of Gaul, Britain, and Spain, were now almost entirely occupied by barbarians; in which state they continued till the death of Honorius, which happened in the year 423, after an unhappy reign of 28 years.

After some usurpations which took place on the death of Honorius, his nephew Valentinian III. was declared emperor of the west, and his mother Placidia regent during his minority. He was fiercely feated on the throne, when the empire was attacked by the Huns under the celebrated Attila. The Romans, however, wretched and degenerate as they were, had they been unanimous, would even yet have been superior to their enemies. The emperors then had two celebrated generals, Boniface and Aetius; who by their union might have saved the empire; but unhappily, through the treachery of Aetius, Boniface was obliged to retire; and a civil war ensued, in which he lost his life. Aetius, however, notwithstanding his treachery, was pardoned, and put at the head of the forces of the empire. He defended it against Attila with great spirit and success, notwithstanding the deplorable situations of affairs, till he was murdered by Valentinian with his own hand, on the suspicion that he aspired to the empire. But in the mean time the provinces, except Italy itself, were totally overrun by the barbarians. Generice king of the Vandals ravaged Africa and Sicily; the Goths, Suevi, Burgundians, &c. had taken possession of Gaul and Spain; and the Britons were oppressed by the Scots and Picts, so that they were obliged to call in the Saxons to their assistance, as is related under the article England. In the year 455, Valentinian was murdered by one Maximus, whose wife he had ravished. Maximus immediately assumed the empire; but felt such violent anxieties, that he designed to resign it and fly out of Italy, in order to enjoy the quiet of a private life. However, being diffused from this by his friends, and his own wife dying soon after, he forced the Empress Eudoxia to marry him. Eudoxia, who had tenderly loved Valentinian, provoked beyond measure at being married to his murderer, invited Generice king of the Vandals into Italy. This proved a most fatal scheme: for Generice immediately appeared before Rome; a violent tumult ensued, in which Maximus was slain, and the city taken and plundered by Generice, who carried off what had been left by the plundered Goths. A vessel was loaded with costly statues; half by Generice, but the covering of the Capitol, which was of brass plated over with gold; sacred vessels enriched with precious stones; and those which had been taken by Titus out of the temple of Jerusalem, all of which were looted with the vessel in its passage to Africa.

Nothing could now be more deplorable than the state of the Roman affairs: nevertheless, the empire continued to exist for some years longer; and even seemed to revive for a little under Marcellinus, who was declared emperor in 458. He was a man of great courage, and possessed of many other excellent qualities. He defeated...
...defeated the Vandals, and drove them out of Italy. With great labour he fitted out a fleet, of which the Romans had been long destitute. With this he design'd to pass over into Africa; but, it being surpriz'd and burnt by the enemy, he himself was slain soon after murdered by one Ricimer a Goth, who had long governed everything with an absolute sway. After the death of Marjorianus, one Anthemius was rais'd to the empire: but beginning to counteract Ricimer, the latter openly revolted, beleaguered and took Rome; where he committed innumerable cruelties, among the Britons putting to death the unhappy emperor Anthemius, and raising one Olybius to the empire. The transactions of his reign were very few, as he died soon after his accession. On his death one Glycerius usurped the empire. He was deposed in 474, and one Julius Nepos had the name of emperor. He was driven out the next year by his general Orelles, who caus'd his son Augustus or Augustulus to be proclaimed emperor. But the following year, 476, the barbarians who served in the Roman armies, and were distinguished with the title of allies, demanded, as a reward for their services, the third part of the lands in Italy; pretending, that the whole country, which they had so often defended, belonged of right to them. As Orelles refused to comply with this insolent demand, they resolved to do themselves justice, as they called it; and openly revolting, chose one Odoacer for their leader. Odoacer was, according to Ennodius, nearly born, and only a private man in the guards of the emperor Augustulus, when the barbarians revolting, chose him for their leader. However, his claim to have been a man of uncommon parts, equally capable of commanding an army and governing a state. Having left his own country when he was yet very young, to serve in Italy, as he was of a stature remarkably tall, he was admitted among the emperor's guards, and continued in that station till the present year; when, putting himself at the head of the barbarians in the Roman pay, who, though of different nations, had, with one consent chosen him for their leader, he marched against Orelles and his son Augustulus, who still refused to give them any share of the lands in Italy.

As the Roman troops were inferior, both in number and valour, to the barbarians, Orelles took refuge in Pavia, at that time one of the best fortified cities in Italy; but Odoacer, invincibly the place without loss of time, took it soon after by assault, gave it up to be plundered by the soldiery, and then set fire to it; which reduced most of the houses, and two churches, to ashes. Orelles was taken prisoner, and brought to Odoacer, who carried him to Placentia, and there caused him to be put to death, on the 28th of August, the day on which he had driven Nepos out of Ravenna, and obliged him to abandon the empire. From Placentia, Odoacer marched straight to Ravenna, where he found Paul, the brother of Orelles, and the young emperor Augustulus. The former he immediately put to death; but sparing Augustulus, in consideration of his youth, he stripp'd him of the ensigns of the imperial dignity, and confin'd him to Lucullanum, a castle in Campania; where he was, by Odoacer's orders, treated with great humanity, and allowed an handsome maintenance to support himself and his relations. Rome readily submitted to the conqueror, who immediately caus'd himself to be proclaimed king of Italy, but would not assume the purple, or any other mark of the imperial dignity. Thus fell the very name of an empire in the West. Britain had been long since abandoned by the Romans; Spain was held by the Goths and Suevi; Africa, by the Vandals; the Burgundians, Goths, Franks, and Alani, had erected several tranches in Gaul; at length Italy itself, with its proud metropolis, which for so many ages had given law to the rest of the world, was enslaved by a contemptible barbarian, whose family, country, and nation, are not well known to this day.

From this time, Rome has ceased to be the capital of an empire; the territories of the pope, to whom the city is now subject, being inconsiderable. The origin of the pope's temporal power, and the revolutions of Italy, are related under the article Italy; and a sketch of the spiritual usurpations of the popes may be seen under the articles History, fed. ii. and Reformation; and likewise under the various historical articles as they occur in the course of this work.

It is thought that the walls of modern Rome take their present shape in the same extent of ground as the ancient; but the difference between the number of buildings on this spot is very great, one half of modern Rome lying waste, or occupied with gardens, fields, meadows, and vineyards. One may walk quite round the city in three or four hours at most, the circumference being reckoned about 13 Italian miles. With regard to the number of the inhabitants, modern Rome is also greatly inferior to the ancient: for, in 1709, the whole of these amounted only to 138,688; among which were 40 bishops, 2686 priests, 3559 monks, 1814 nuns, 3924 curates, about 8000 or 9000 Jews, and 14 Moors. In 1714, the number was increased to 143,000. In external splendor, and the beauty of its temples and palaces, modern Rome is thought by the most judicious travellers to excel the ancient. There was nothing in ancient Rome to be compared with St Peter's church in the modern. That Rome was able to recover itself after so many calamities and devastations, will not be matter of surprize, if we consider the prodigious sums that it has long annually drawn from all countries of the Popish perfusion. These sums, though still considerable, have been continually decreasing since the Reformation. The surface of the ground on which Rome was originally founded is surprizingly altered. At present, it is difficult to distinguish the seven hills on which it was first built, the low grounds being almost filled up with the ruins of the ancient streets and houses, and the great quantities of earth washed down from the hills by the violence of the rains. Anciently the suburbs extended a vast way on all sides, and made the city appear almost boundless; but it is quite otherwise now, the country about Rome being almost a desert. To this and other causes it is owing, that the air is none of the most wholesome, especially during the summer heats, when few go abroad in the day-time. No city at present in the world surpasses, or indeed equals, Rome, for the multiplicity of fine fountains, noble edifices, antiquities, curiosities, paintings, statues, and sculptures. The city stands on the Tiber, 10 miles from the Tuscan sea, 380 from Vienna, 560 from Paris, 740 from Amsterdam, 810 from London, and 900 from Madrid. The Tiber is subject to frequent...
Rome, a city in Italy, is the seat of the Roman Catholic Church and the capital of the Roman Catholic Church. It is one of the seven hills of Rome, which are: the Capitoline, the Quirinal, the Esquiline, the Caelian, the Aventine, the Palatine, and the Subura. The city is divided into six regions, each with its own special character and history. The city is famous for its ancient monuments, including the Colosseum, the Pantheon, and the Forum Romanum. It is also known for its art, fashion, and cultural scene. The city has been the capital of the Roman Empire, the Papal States, and the Kingdom of Italy, and is now the capital of Italy. The city is home to many important institutions, including the Vatican City, the Pontifical Academy of Sciences, and the Pontifical Academy of Letters. The city is also home to many museums, including the Vatican Museums, the National Roman Museum, and the Museum of the Bible.
RON

RONSA RD (Peter de) was born at the castle of Poitoumore in Vendomais in 1524. He was descended from a noble family, and was educated at Paris in the college of Navarre. Academical pursuits not fitting his genius, he left college, and became page to the duke of Orleans, who resigned him to James Stuart, king of Scots, married to Magdalene of France. Ronfard continued in Scotland with King James upwards of two years, and afterwards went to France, where he was employed by the duke of Orleans in several negotiations. He accompanied Lazarus de Bai to the diet of Spires. Having from the conversation of this learned man imbibed a passion for the belles-lettres, he studied the classics, Pindar, Virgil, and Homer. Having reported of Ronfard, he was loaded with favours. Having gained the first prize of the Jesu: Floraus, they thought the reward promised below the merit of the work, and the reputation of the poet. The city of Touloue caufed a Minerva of marly silver of considerable value to be made and sent to him. This present was accompanied with a decree declaring him The French Poet, by way of distinction. Ronfard afterwards made a present of his Minerva to Henry II. and this monarch appeared as much elated with this mark of the poet's esteem for him, as the poet himself could have been had he received the present from his sovereign. Mary, the beautiful and unfortunate queen of Scots, who was equally sensible of his merit with the Toulouese, gave him a very rich set of table-plate, among which was a vessel in the form of a rose-bush, representing Mount Parmasus, on the top of which was a Pegasus with this inscription:

A Ronfard, l'Apollon de la fourche des muses.

From the above two anecdotes of him may easily be inferred the reputation in which he was held, and which he continued to keep till Malherbe appeared. His works possess both invention and genius; but his affectation of everywhere thrilling in his learning, and of forming words from the Greek, the Latin, and the different provincialisms of France, has rendered his verification disagreeable and often unintelligible.

Ronfard, dit Despréaux, par une autre méthode, Reçut tout, bronilla tout, fit un art à la mode ; Et tout ce long temps eut un heureux déflin ; Mais si vôtes, en Françoys parlant Grec et Latin, Vi dins l'âge suivant, par un retour grotesque, Temblar de tora grands mots le ffeul pédalesque.

He wrote hymns, odes, a poem called the Franciad, elegi'cques, epigrams, sonnets, &c. In his odes he takes himself for a poetical rapture. He wishes to imitate Pindar; and labouring too much for lofty expressions, he loses himself in a cloud of words. He is obscure and barb to the last degree; faults which he might easily have avoided by studying the works of Marot, who had before he wrote brought French poesy very near to perfection. “Marot’s turn and style of composition are such (says Brucere), that he seems to have written after Ronfard; there is hardly any difference, except in a few words, between Marot and us. Ronfard, and the authors his contemporaries, did more difference than good to fyle: they checked its course in the advances it was making towards perfection, and had like to have prevented its ever attaining it. It is surprizing that Marot, whose works are so natural and easy, did not make Ronfard, who was fired with the strong enthusiasm of poetry, a greater poet than either Ronfard or Marot.” But what could be expected from a man who had so little taste, that he called Marot’s works “a dunghill, from which rich grains of gold by industrious working might be drawn”? As a specimen of our author’s intolerable and ridiculous affection of learning, which we have already censured, Boileau cites the following verse of Ronfard to his mistress: Eteus-vois pas ma feule entelechie? “Are not you my only entelechie?” Now entelechie is a word peculiar to the peripatetic philosophy, the sense of which has never been fixed. Hermelanus Barbarus is said to have had recourse to the devil, in order to know the meaning of this new term used by Aristotle; but he did not gain the information he wanted, the devil, probably to conceal his ignorance, speaking in a faint and whispering sort of voice. What could Ronfard’s mistress therefore, or even Ronfard himself, know of it; and, what can excuse in a man of real genius, the low affectation of using a learned term, because in truth nobody could understand it. He has, however, some pieces not deftitute of real merit; and there are perhaps few effusions of the French muse more truly poetical than his Four Scebons of the Tragedy, where a most fertile imagination displays all its riches.

Ronfard, though it is doubtful whether he ever was in orders, held several benefices in commendam; and he died at Saint-Cosmes-Tours, one of these, December 27, 1585, being then 61 years of age. He appeared more ridiculous as a man than as a poet; he was particularly vain. He talked of nothing but his family and his alliances with crowned heads. In his panegyrics, which he addresses to himself without any ceremony, he has the vanity to pretend, that from Francis I. before Pavia: “Juft as heaven (said he) wished to indemnify France for the losses it had sustained at that place.” He blushed not to tell of his intrigues. All the ladies fought after him; but he never said that any of them gave him a denial of their favours. His immoderate indulgence in pleasure, joined to his literary labours, served to hasten his old age. In his 50th year he was weak and valetudinary, and subject to attacks of the gout. He retained his wit, his vivacity, and his readiness at poetic composition, to his last moments. Like all those who aspire after public esteem, he had a great number of admirers and some enemies. Though Melin de Saint-Gelais railed at him continually, Rabelais was the perfon whom he most dreaded. He took always care to inform himself where that jovial rector of Meudon went, that he might not be found in the same place with him. It is reported, that Voltaire used a familiar par with regard to Feron, that Voltaire said of whose contemporaries nothing but that he was much more
ROO

1. Definition.
ROOF, expresses the covering of a house or building, by which its inhabitants or contents are protected from the injuries of the weather. It is perhaps the essential part of a house, and is frequently used to express the whole. To come under a person's roof, is to enjoy his protection and society, to dwell with him. Tellum was used in the same sense by the Romans. To be within our walls rather expresses the being in our polis; a roof therefore is not only an essential part of a house, but it even seems to be its characteristic feature. The Greeks, who have perhaps excelled all nations in taste, and who have given the most perfect model of architeconic ornamentation within a certain limit, never erected a building which did not exhibit this part in the differentil manner; and though they borrowed much of their model from the orientals, as will be evident to any who compares their architecture with the ruins of Periopolis, and of the tombs in the mountains of Sciras, they added that form of roof which their own climate taught them was necessary for protecting them from the rains. The roofs in Persia and Arabia are flat, but those of Greece are without exception sloping. It seems therefore a gross violation of the true principles of taste in architecture (at least in the regions of Europe), to take away or to hide the roof of a house; and it must be ascribed to that rage for novelty which is so powerful in the minds of the rich. Our ancestors seemed to be of a very different opinion, and turned their attention to the ornamenting of their roofs as much as any other part of a building. They showed them in the most copious manner, running them up to a great height, broke them into a thousand fanciful shapes, and stuck them full of highly dressed windows. We laugh at this, and call it Gothic and clumsy; and our great architects, not to offend any more in this way, conceal the roof altogether by parapets, balustrades, and other contrivances. Our forefathers certainly did offend against the maxims of true taste, when they enriched a part of a house with marks of elegant habitation, which every spectator must know to be a cumbrous garret: but their successors no less offend, who take off the cover of the house altogether, and make it impossible to know whether it is not a mere screen or colonnade we are looking at.

We cannot help thinking that Sir Christopher Wren erred when he so industriously concealed the roof of St Paul's church in London. The whole of the upper order is a mere screen. Such a quantity of wall would have been intolerably offensive, had he not given it some appearance of habitation by the mock windows or niches. Even in this flat it is gloomy, and it is odd, and is a puzzle to every spectator—There should be no puzzle in the design of a building any more than in a discourse. It has been said that the double roof of the great churches which have aisles is an incongruity, looking like a house standing on the top of another house. But there is not the least occasion for such a thought. We know that the aisle is a shed, a cloister. Suppose only that the lower roof or shed is hidden by a balustrade, it then becomes a portico, against which the connoisseur has no objection: yet there is no difference; for the portico must have a cover, otherwise it is neither a shed, cloister, nor portico, any more than a building without a roof is a house. A house without a visible roof is like a man abroad without his hat; and we may add, that the whim of concealing the chimneys, now so fashionable, changes a house to a barn or store-house. A house should not be a copy of any thing. It has a title to be original; and a screen-like house and a pillar-like candlestick are similar foliacims in taste.

The architect is anxious to present a fine object, and little attention is paid by Architects to this part of a house; and it is a very simple outline difficult all his concerns with the roof. He leaves it to the carpenter, whom he frequently puzzles (by his arrangements) with coverings almost impossible to execute. Indeed it is seldom that the idea of a roof is admitted by him into his great compositions; or if he does introduce it, it is from mere affectation, and we may say pedantry. A pediment is frequently stuck up in the middle of a grand front, in a situation where a roof cannot perform its office; for the rain that is supposed to flow down its sides, must be received on the top of the level buildings which flank it. This is a manifest incongruity. The tops of dreefed windows, trifling porches, and sometimes a projecting portico, are the only situations in which we see the figure of a roof correspond with its office. Having thus loft sight of the principle, it is not surprising that the draughtsmen (for he should not be called architect) runs into every whim: and we see pediment within pediment, a round pediment, a hollow pediment, and the greatest of all absurdities, a broken pediment. Nothing could ever reconcile us to the sight of a man with a hat without its crown, because we cannot overlook the use of a hat.

But when one builds a house, ornament alone will not do. We must have a cover; and the enormous expense and other great inconveniences which attend the concealment of this cover by parapets, balustrades, and screens, have obliged architects to consider the pent roof as admissible, and to regulate its form. Any man of sense, not under the influence of prejudice, would be determined in this by its fitness for answering its purpose. A high pitched roof will undoubtedly shoo off the rains and shows better than one of a lower pitch. The wind will not so easily blow the dropping rain in between the flats, nor will it have so much power to stir them off. A high pitched roof will exert a smaller thrust on the walls, both because its slant is less horizontal, and because it will admit of lighter covering. But it is more expensive, because there is more of it. It requires a greater size of timbers to make it equally strong, and it exposes a greater surface to the wind.

There have been great changes in the pitch of roofs; our forefathers made them very high, and we make them very low. It does not, however, appear, that this change in change has been altogether the effect of principle. In the pitch the simple unadorned habitations of private persons of the sixteenth century comes to be adjusted by an experience of inconveniences which have resulted from too low pitched roofs; and their pitch will always be nearly such as suits the climate and covering. Our architects, however, go to work on different principles. Their professed aim is to make a beautiful object. The sources of the pleasures arising from what we call taste are so various, so complicated, and even so whimsical, that it
And of the Greek architecture of them.

...is almost in vain to look for principle in the rules adopted by our professed architects. We cannot help thinking, that much of their practice results from a pedantic veneration for the beautiful productions of Grecian architecture. Such architects as have written on the principles of the art in respect of proportions, or what they call the ordnances, are very much pleased to make a chain of reasoning; and the more that they have made of the Greek architecture, is, that it exhibits a nice adjustment of strength and strain. But when we consider the extent of this adjustment, we find that it is wonderfully limited. The whole of it consists of a basement, a column, and an entablature; and the entablature, it is true, exhibits something of a connection with the framework and roof of a wooden building; and we believe that it really originated from this in the hands of the orientals, from whom the Greeks certainly and borrowed their forms and their combinations. The tombs in the mountains (which were long prior to the unquestionable principle. The only addition made by the Greeks was the pent roof; and the changes made by them in the subordinate forms of things we should deviate by them in the subordinate forms of things such as we should expect from their exquisite judgment of beauty.

But the whole of this is very limited; and the Greeks, after making the roof a chief feature of a house, went no farther, and contented themselves with giving it a slope suited to their climate. This we have followed, because in the milder climates we have no cogent reason for deviating from it; and if any architect should devise greatly in a building where the outline is exhibited as beautiful, we should be disgustsd; but the disgust, though felt by almost every spectator, has its origin in nothing but habit. In the professed architect or man of education, the disgust arises from pedantry; for there is not such a close connection between the form and uses of a roof as shall give beauty to the structure; and the mere form is a matter of indifference. We should not therefore reproach the high-pitched roofs of our ancestors, particularly on the continent of Europe. It is there where we see them in all the extremity of the fashion, and the taste is by no means exploded as it is in England. A baronial castle in Germany and France is seldom rebuilt in the pure Greek style, or even like the modern houses in Britain; the high pitched roofs are retained. We should not call them Gothic, and ugly because Gothic, till we show their principle to be false or tasteless. Now we apprehended that it will be found quite the reverse; and that though we cannot bring ourselves to think them beautiful, we ought to think them so. The construction of the Gothic architecture is a transference of the practices that are necessary in a wooden building to a building of stone. To this the Greeks had adlered, in spite of innumerable difficulties. Their marble quarries, however, put it in their power to retain the proportions which habit had rendered agreeable. But it is next to impossible to adhere to these proportions with freestone or brick, when the order is of magnificent dimensions. Sir Christopher Wren saw this; for his mechanical knowledge was equal to his taste. He composed the front of St Paul's church in London of two orders, and he coupled his columns; and still the lintels which form the architrave are of such length that they could carry no additional weight, and he was obliged to truss them behind. Had he made but one order, the architrave could not have carried its own weight. It is impossible to execute a Doric entablature of this size in brick. It is attempted in a very noble front, the Academy of Arts in St. Petersburg. But the architect was obliged to make the mutules and other projecting members of the cornice of granite, and many of them broke down by their own weight.

Here is surely an error in principle. Since stone is the chief material of our buildings, ought not the members of ornamented architecture to be refinements on the essential and unaffected parts of a simple stone building. There is almost as much propriety in the architecture of India, where a dome is made in imitation of a lily or other flower inverted, as in the Greek imitation of a wooden building. The principles of masonry, and not of carpentry, should be seen in our architecture, if we would have it according to the rules of jult taste. Now we affirm that this is the characteristic feature of what is called the Gothic architecture. In this no dependence is had on the transverse strength of the building. No lintels are to be seen; no extravagant projections. Every stone is pressed to its neighbours, and none is exposed to a transverse strain. The Greeks were enabled to execute their colossal buildings only by using immense blocks of the hardest materials. The Norman mason could raise a building to the skies without using a stone which a labourer could not carry to the top on his back. Their architects studied the principles of equilibrium; and having attained a wonderful knowledge of it, they indulged themselves in exhibiting remarkable inances. We call this false taste, and say that the appearance of insecurity is the greatest fault. But this is owing to our habits: our thoughts may be said to run into a wooden train, and certain simple maxims of carpentry are familiar to our imagination; and in the careful adherence to these consists the beauty and symmetry of the Greek architecture. Had we been as much accustomed to the equilibrium of prehistory, this apparent insecurity would not have met our eye: we would have perceived the strength, and we should have relished the ingenuity.

The Gothic architecture is perhaps entitled to the name of rational architecture, and its beauty is founded on the characteristic distinction of our species. It derives cultivation: not the pithful, servile, and unskilled copying of the monuments; this will produce incongruities and absurdities equal to any that have crept into the Greek architecture: but let us examine with attention the nice disposition of the grubs and spandrels; let us study the tracery and knots, not as ornaments, but as useful members; let us observe how they have made their walls like honeycombs, and admire their ingenuity as we pretend to admire the instinct infused by the great architect into the bee. All this cannot be understood without mechanical knowledge; a thing which few of our professional architects have any share of. Thus would architectonic taste be a mark of skill; and the person who pretends the design of a building would know how to execute it, without committing it entirely to the mason and carpenter.

These observations are not a depreciation of our fath-
The same principles of mutual pressure and equilibrium have a place in roofs and many wooden edifices; and if they had been as much studied as the Normans and Saracens seem to have studied such of them as were applicable to their purposes, we might have produced wooden buildings as far superior to what we are familiarly acquainted with, as the bold and wonderful churches still remaining in Europe are superior to the timid productions of our flone architecture. The centres used in building the bridge of Orleans and the corn-market of Paris, are late instances of what may be done in this way. The last mentioned is a dome of 200 feet diameter, built of fir planks; and there is not a piece of timber in it more than nine feet long, a foot broad, and three inches thick.

The Norman architects frequently roofed with flone. Their wooden roofs were in general very simple, and their professed aim was to dispense with them altogether. Fond of their own science, they copied nothing from a wooden building, and ran into a similar fault with the ancient Greeks. The parts of their buildings which were necessarily of timber were made to imitate flone-buildings; and Gothic ornament confilts in cramming every thing full of arches and spandrels. Nothing else is to be seen in their timber-works, may even in their sculpture. Look at any of the maces or sceptres full to be found about the old cathedrals; they are silver fleeces.

But there appears to have been a rivalry in old times between the masons and the carpenters. Many of the baronial halls are of prodigious width, and are roofed with timber; and the carpenters appeared to have borrowed much knowledge from the masons of those times, and their wide roofs are frequently constructed with great ingenuity. Their aim, like the masons, was to throw a roof over a very wide building without employing great logs of timber. We have seen roofs 60 feet wide, without having a piece of timber in it above 10 feet long and 4 inches square. The Parliament House and Tron-Church of Edinburgh, the great hall of Tarnaway castle near Elgin, are specimens of those roofs. They are very numerous on the continent. Indeed Britain retains few monuments of private magnificence. Aristocratical state never was so great there; and the want of the civil wars gave most of the performances of the carpenter to the flames. Westminster-hall exhibits a specimen of the false taste of the Norman roofs. It contains the essential parts indeed, very properly disposed; but they are hidden, or intentionally covered, with what is conceived to be ornamental; and this is an imitation of flone arches, crammed in between flender pillars which hang down from the principal frames, trifles, or rafters. In a pure Norman roof, such as Tarnaway hall, the essential parts are exhibited as things understood, and therefore relished. They are refined and ornamented; and it is here that the inferior kind of taste or the want of it may appear. And here we do not mean to defend all the whims of our ancestors; but we assert that it is no more necessary to consider the members of a roof as things to be concealed like a garret or privy, than the members of a walling, which form the most beautiful part of the Greek architecture. Should it be said that a roof is only a thing to keep off the rain, it may be answered, that a ceiling is only to keep off the dust, or the floor to be trodden under foot; and that we should have neither compartments in the onerous inlaid work or carpets on the other. The structure of a roof may therefore be exhibited with propriety, and made an ornamental feature. This has been done even in Italy. The church of St Maria Maggiore in Rome and several others are of stone; but it must be acknowledged, that the forms of the principal frames of these roofs, which resemble those of our modern buildings, are very unfit for agreeable ornament. As we have already observed, new imaginations have not been made sufficiently familiar with the principles, and we are rather alarmed than pleased with the appearance of the immense logs of timber which form the couples of these roofs, and hang over our heads with every appearance of weight and danger. It is quite otherwise with the ingenious roofs of the German and Norman architects. Slender timbers, interlaced with great symmetry, and thrown by necessity into figures which are naturally pretty, form altogether an object which no carpenter can view without pleasure. And why should the gentleman refuse himself the same pleasure of beholding scientific ingenuity?

The roof is in fact the part of the building which requires the greatest degree of skill, and where science will be of more service than in any other part. The architect seldom knows much of the matter, and leaves the talk to the carpenter. The carpenter considers the framing of a great roof as the touchstone of his art; and nothing indeed tends so much to his advantage and his fertility of resource.

It must therefore be very acceptable to the artist to have a clear view of the principles by which this difficult problem may be solved in the best manner, so that the roof may have all the strength and security that can be wished for, without an extravagant expence of timber and iron. We have said that mechanical science can give great assistance in this matter. We may add that the framing of carpentry, whether for roofs, floors, or any other purpose, affords one of the most elegant and most satisfactory applications which can be made of mechanical science to the arts of common life. Unfortunately the practical artist is seldom possessed even of the small portion of science which would almost insure his practice from all risk of failure; and even our most experienced carpenters have seldom any more knowledge than what arises from their experience and natural ingenuity. The most approved author in our language is Price in his British Carpenter. Mathurin Jourfe is in like manner the author most in repute in France; and the publications of both these authors are void of every appearance of principle. It is not uncommon to see the works of carpenters of the greatest reputation tumble down, in consequence of mistakes from which the most elementary knowledge would have saved them.

We shall attempt, in this article, to give an account of the leading principles of this art in a manner so familiar and palpable, that any person who knows the common properties of the lever, and the composition of motion, shall so far understand them as to be able, on every occasion, to dispose his materials, with respect to the strains to which they are to be exposed, that he shall always know the effective strain on every piece, and
shall, in most cases, be able to make the disposition such as to derive the greatest possible advantage from the materials which he employs.

It is evident that the whole must depend on the principles which regulate the strength of the materials, relative to the manner in which this strength is exercised, and the manner in which the strain is laid on the pieces or structure. With respect to the first, this is not the proper place for considering it, and we must refer the reader to the article *Strength of Materials in Mechanics*.

We shall just borrow from that two or three propositions suited to our purpose.

The force with which the materials of our edifices, roofs, floors, machines, and framings of every kind, resist being broken or crushed, or pulled asunder, is, immediately or ultimately, the cohesion of their particles. This will happen to a parcel of them from among the materials he employs, and the load tends either to force them asunder laterally, or to make them slide on each other: either of these things happening, the whole is crushed to pieces.

The resistance of fibrous materials to such a strain is a little more intricate, but may be explained in a way very similar.

A piece of matter of any kind may also be destroyed by wrenching or twirling it. We can easily form a notion of its resistance to this kind of strain by considering what would happen to the cylinder of small shot if treated in this way.

And lastly, a beam, or a bar of metal, or a piece of from other matter, may be broken transversely. This will happen to a rafer or joint supported at the ends when overloaded, or to a beam having one end fixed and its load placed on its projection part. This is the strain to which materials are most commonly exposed in roofs; and, unfortunately, it is the strain which they are least able to bear; or rather, it is the manner of application which causes an external force to excite the greatest possible immediate strain on the particles. It is against this that the carpenter must chiefly guard, avoiding it when it is possible, and, in every case, diminishing it as much as possible.

It is necessary to give the reader a clear notion of the great weakness of materials in relation to this transverse strain. But we shall do nothing more, referring him to the articles *Strain, Stress*, and *Strength*.

Let ACBD (fig. 1) represent the side of a beam projecting horizontally from a wall in which it is firmly fixed, and let it be loaded with a weight W appended to its extremity. This tends to break it; and the least reflection will convince any person that if the beam is equally strong throughout, it will break in the line CD, even with the surface of the wall. It will open at D, while C will serve as a joint of mere, round which it will turn. The cross section through the line CD is, for this reason, called the section of the beam, and the horizontal line, drawn through D on its under surface, is called the edge of fracture. The fracture is made by tearing asunder the fibres, such as DE or FG. Let us suppose a real joint at C, and that the beam is really sawed through along CD, and that in place of its natural fibres threads are substituted all over the section of fracture. The weight now tends to break these threads; and it is our business to find the force necessary for this purpose.

It is evident that DCA may be considered as a divided lever, of which C is the fulcrum. If f be the force which will just balance the coherence of a thread when hung on it so that the smallest addition will break it, we may find the weight which will be sufficient for this purpose when hung on at A, by saying, AC : CD = f : φ, and W will be the weight which will just break the thread, by hanging φ by the point A. This gives us

\[ \frac{f}{\phi} = \frac{CA}{f}. \]

If the weight be hung on at A, the force just sufficient for breaking the same thread will be

\[ \frac{CD}{f} = \frac{CA}{f} \cdot \phi. \]

In like manner the force φ, which must be hung on at A in order to break an equally strong or an equally...
equally resisting fibre at $F$, must be $\frac{CF}{GA}$. And

so on of all the rest.

If we suppose all the fibres to exert equal resistances at the instant of fracture, we know, from the simplest elements of mechanics, that the resistance of all the particles in the line CD, each acting equally in its own place, is the same as if all the individual resistances were united in the middle point $g$. Now this total resistance is the resistance or strength $f$ of each particle, multiplied by the number of particles. This number may be expressed by the line CD, because we have no reason to suppose that they are at unequal distances. Therefore, in comparing different sections together, the number of particles in each are as the sections themselves. Therefore DC may represent the number of particles in the line DC. Let us call this line the depth of the beam, and express it by the symbol $d$. And since we are at present treating of roofs whose rafters and other parts are commonly of uniform breadth, let us call $AH$ or $BI$ the breadth of the beam, and express it by $b$, and let $C \perp$ be called its length, $l$. We may now express the strength of the whole line CD by $f \times d$, and we may suppose it all concentrated in the middle point $g$. Its mechanical energy, therefore, by which it resists the energy of the weight $w$, applied at the distance $l$, is $f \cdot CD \cdot Gg$, while the momentum of $w$ is $w \cdot CA$. We must therefore have $f \cdot CD = w \cdot CA$, or $fd = \frac{w}{d} = w \cdot \frac{l}{d} = w \cdot l$; and $fd = w = \frac{1}{3}l \cdot d$.

That is twice the length of the beam is to its depth as the absolute strength of one of its vertical planes to its relative strength, or its power of resisting this transverse fracture.

It is evident, that what has been now demonstrated of the resistance exerted in the line CD, is equally true of every line parallel to CD, in the thickness or breadth of the beam. The absolute strength of the whole section of fracture is properly represented by $f \cdot d \cdot b$, and we shall have $2l : d = fd = w$; or twice the length of the beam is to its depth as the absolute strength to the relative strength. Suppose the beam 12 feet long and one foot deep; then whatever is its absolute strength, the 24th part of this will break it if hung at its extremity.

But even this is too favourable a statement; all the fibres are supposed to act alike in the instant of fracture. But this is not true. At the instant that the fibre at D breaks, it is stretched to the utmost, and is exerting its whole force. But at this instant the fibre at $g$ is not so much stretched, and it is not then exerting its utmost force. If we suppose the extension of the fibres to be as their distance from $C$, and the actual exertion of each to be as their extensions, it may easily be shown (see Strength and Strain), that the whole resistance is the same as if the full force of all the fibres were united at a point $r$ distant from $C$ by one third of CD. In this case we must say, that the absolute strength is to the relative strength as three times the length to the depth; so that the beam is weaker than by the former statement in the proportion of two to three.

Even this is more strength than experiment justifies; and we can see an evident reason for it. When the beam is strained, not only are the upper fibres stretched, but the lower fibres are compressed. This is very distinctly seen, if we attempt to break a piece of cork cut into the shape of a beam: this being the case, C is not the centre of fracture. There is some point $c$ which lies between the fibres which are stretched and those that are compressed. This fibre is neither stretched nor squeezed; and this point is the real centre of fracture; and the lever by which a fibre $D$ resists, is not DC, but a shorter one $Dc$; and the energy of the whole resistances must be less than by the second statement. Till we know the proportion between the dilatability and compressibility of the parts, and the relation between the dilatations of the fibres and the resistances which they exert in this state of dilatation, we cannot positively say where the point $c$ is situated, nor what is the sum of the actual resistances, or the point where their action may be supposed concentrated. The former woods, such as oak and chestnut, may be supposed to be but slightly compressible; we know that willow and other soft woods are compressible. These last must therefore be weaker: for it is evident, that the fibres which are in a state of compression do not resist the fracture. It is well known, that a beam of willow may be cut through from C to $g$ without weakening it in the least, if the cut be filled up by a wedge of hard wood lath in.

We can only say, that very sound oak and red fir have the centre of effort so situated, that the absolute strength is to the relative strength in a proportion not less than that of three and a half times the length of the beam to its depth. A square inch of sound oak will carry about 8000 pounds. If this bar be firmly fixed in a wall, and project 12 inches, and be loaded at the extremity with 200 pounds, it will be broken. It will just bear 190, its relative strength being $\frac{1}{3}$ of its absolute strength; and this is the case only with the finest pieces, so placed that their annual plates or layers, are in a vertical position. A larger log is not so strong transversely, because its plates lie in various directions round the heart.

These observations are enough to give us a distinct notion of the vast diminution of the strength of timber when the strain is across it, and we feel the justice of the maxim which we inculcated, that the carpenter, in framing roofs, should avoid as much as possible the exposing his timbers to transverse strain. But this cannot be avoided in all cases. Nay the ultimate strain, arising from the very nature of a roof, is transverse. The rafters must carry their own weight, and this tends to break them across; an oak beam a foot deep will not carry its own weight if it project more than 60 feet. Besides this, the rafters must carry the lead, tyling, or flates. We must therefore consider this transverse strain a little more particularly, so as to know what strain will be laid on any part by an unavoidable load, laid on either at that part or at any other.

We have hitherto supposed, that the beam had one effect of its ends fixed in a wall, and that it was loaded at the other end. This is not an usual arrangement, and such beams are treated merely as affording a simple application of some of the mechanical principles. It is much more usual to have the beam supported at the ends, and loaded in the middle. Let the beam FEGH (fig. 2.) rest on the props E and G, and be loaded at its middle point $C$ with a weight $W$. It is required to determine the strain at the section CD? It is plain that the beam will receive
receive the same support, and suffer the same strain; if, instead of the blocks E and G, we substitute the ropes \( F, G, H \), going over the pulleys \( f, g, h \), and loaded with proper weights \( e \) and \( g \). The weight \( e \) is equal to the support given by the block \( E \); and \( g \) is equal to the support given by \( G \). The sum of \( e \) and \( g \) is equal to \( W \); and, on whatever point \( W \) is hung, the weights \( e \) and \( g \) are to \( W \) in the proportion of \( DG \) and \( DE \).

Now, in this state of things, it appears that the strain on the section CD arises immediately from the upward action of the ropes \( F, G, H \); or the upward prehensions of the blocks \( E \) and \( G \); and that the office of the weight \( W \) is to oblige the beam to oppose this strain. Things are in the same state in respect of strain as if a beam were substituted at \( D \) for the weight \( W \), and the weights \( e \) and \( g \) were hung on at \( E \) and \( G \); only the directions will be opposite. The beam tends to break in the section CD, because the ropes pull it upwards at \( E \) and \( G \), while a weight \( W \) holds it down at \( C \). It tends to open at \( D \), and \( C \) becomes the centre of fracture. The strain therefore is the same as if the half \( ED \) were fixed in the wall, and a weight equal to \( g \), that is, to the half of \( W \), were hung on at \( G \).

Hence we conclude, that a beam supported at both ends, but not fixed there, and loaded in the middle, will carry twice as much weight as it can carry at its extremity, when the other extremity is fast in a wall.

The strain occasioned at any point \( L \) by a weight \( W \), hung on at any other point \( D \), is \( W \times \frac{DE}{EG} \times \frac{1}{LG} \). For \( EG \) is to \( ED \) as \( L \) to \( G \), and \( DE \) is to \( DG \) as \( GL \) to \( D \). Hence we fee, that the strain on the beam arising from one weight, is proportional to the rectangle of the parts of the beam, (for \( \frac{DE}{EG} \) is as \( DE \)) and is greatest when the load is laid on the middle of the beam.

We also fee, that the strain at \( L \), by a load at \( D \), is equal to the strain at \( D \) by the same load at \( L \). And the strain at \( L \), from a load at \( D \), is to the strain by the same load at \( L \) as \( DE \) to \( LE \). These are all very obvious corollaries; and they sufficiently inform us concerning the strains which are produced on any part of the timber by a load laid on any other part.

If we now suppose the beam to be fixed at the two ends, that is, firmly framed, or held down by blocks at \( I \) and \( K \), placed beyond \( E \) and \( G \), or framed into pollts, it will carry twice as much as when its ends were free. For suppose it fawn through at \( CD \); the weight \( W \) hung on there will be jup sufficient to break it at \( E \) and \( G \). Now restore the connection of the section \( CD \), it will require another weight \( W \) to break it there at the same time.

Therefore, when a raftcr, or any piece of timber, is firmly connected with three fixed points \( G, E, I \), it will bear a greater load between any two of them than if its connection with the remote point were removed; and if it be fastened in four points, \( G, E, I, K \), it will be twice as strong in the middle part as without the two remote connections.

One is apt to expect from this that the joint of a floor will be much strengthened; by being firmly built in the wall. It is a little strengthened; but the hold which can thus be given it is much too short to be of any feasible service; and it tends greatly to fatter the wall, because, when it is bent down by a load, it forces up the wall with the momentum of a long lever. Judicious builders therefore take care not to bind the joints right in the wall. But when the joints of adjoining rooms lie in the same direction, it is a great advantage to make them of one piece. They are then twice as strong as when made in two lengths.

It is easy to deduce from these premises the strain on any point which arises from the weight of the beam itself, or from any load which is uniformly diffused over the whole or any part. We may always consider the whole of the weight which is thus uniformly diffused over any part as united in the middle point of that part; and if the load is not uniformly diffused, we may still suppose it united at its centre of gravity. Thus, to know the strain at \( L \) arising from the weight of the whole beam, we may suppose the whole weight accumulated in the middle point \( D \) of the beam, and therefore the strain at \( L \) is \( W \times \frac{DE}{EG} \times \frac{1}{LG} \), or \( \frac{DE}{EC} \times \frac{1}{LG} \).

Therefore the strain in the middle of a beam, arising from its own weight, or from any uniform load, is the weight of the beam or its load \( \frac{DE}{EG} \times \frac{1}{DG} \); that is, half the weight of the beam or load multiplied or acting by the lever \( LG \). Now call the weight of the part \( DE \); this upward pressure will be \( \frac{DE}{EC} \times \frac{1}{LG} \) or \( \frac{DE}{EC} \).

Also the strain at \( L \), arising from the weight of the beam, or the uniform load, is \( \frac{DE}{EC} \times \frac{1}{DG} \), that is, half the weight of the beam or load multiplied or acting by the lever \( LG \); hence \( \frac{DE}{EC} \) is \( \frac{1}{2} \).

It is of importance to know the relation between the strains arising from the weights of the beams, or from any uniformly diffused load, and the relative strength. We have already seen, that the relative strength is \( \frac{f}{m} \); where \( m \) is a number to be discovered by experiment for every different species of materials. Leaving out every circumstance but what depends on the dimensions of the beam, viz. \( d, b, \) and \( h \), we see that the relative strength is in the proportion of \( \frac{1}{b} \).
that is, as the breadth and the square of the depth
directly and the length inversely.

Now, to consider first the strain arising from the
weight of the beam itself, it is evident that this weight
increases in the same proportion with the depth, the
breadth, and the length of the beam. Therefore its
power of resisting this strain must be as its depth direc-
tly, and the square of its length inversely. To consider
this in a more popular manner, it is plain that the in-
crease of breadth makes no change in the power of
resisting the actual strain, because the load and the abso-
late strength increase in the same proportion with the
breadth. But by increasing the depth, we increase the
resisting section in the same proportion, and therefore
the number of resisting fibres and the absolute strength:
but we also increase the weight in the same propor-
tion. This makes a compensation, and the relative
strength is yet the same. But by increasing the depth,
we have not only increased the absolute strength, but
also its mechanical energy: For the resistence to fra-
ture is the same as if the full strength of each fibre was
exerted at the point which we called the centre of ef-
fert; and we showed that the distance of this from the
underside of the beam was a certain portion (a half, a
third, a fourth, &c.) of the whole depth of the beam.
This distance is the arm of the lever by which the cohe-
sion of the wood may be supposed to act. Therefore
this arm of the lever, and consequently the energy of
the resistence, increases in the proportion of the depth
of the beam, and this remains unaccompanied by any
increase of the strain. On the whole, therefore, the
power of the beam to sustain its own weight increas-
es in the proportion of its depth. But, on the other
hand, the power of withstanding a given strain applied
at its extremity, or to any aliquot part of its length,
is diminished as the length increases, or is inversely as
the length; and the strain arising from the weight
of the beam also increases as the length. Therefore
the power of resisting the strain actually exerted on it
by the weight of the beam is inversely as the square of
the length. On the whole, therefore, the power of a
beam to carry its own weight, varies in the proportion
of its depth directly and the square of its length in-
versonly.

As this strain is frequently a considerable part of the
whole, it is proper to consider it apart, and then to re-
ckon only on what remains for the support of any ex-
traeous load.

In the next place the power of a beam to carry any
load which is uniformly diffused over its length, must
be inversely as the square of the length; for the
power of withstanding any strain applied to an aliquot
part of the length (which is the case here, because the
load may be conceived as accumulated at its centre of
gravity, the middle point of the beam) is inversely as
the length; and the actual strain is as the length, and
therefore its momentum is as the square of the length.
Therefore the power of a beam to carry a weight uni-
formly diffused over it, is inversely as the square of the
length.

N. B. It is here understood, that the uniform
load is of some determined quantity for every foot of
the length, so that a beam of double length carries a
double load.

We have hitherto supposed that the forces which
tend to break a beam transversely, are acting in a direc-
tion perpendicular to the beam. This is always the
case in level floors loaded in any manner; but in roofs,
the action of the load tending to break the rafters is ob-
lige, because gravity always acts in vertical lines. It
may also frequently happen, that a beam is strained by
a force acting obliquely. This modification of the
strain is easily diffusible. Suppose that the external
force, which is measured by the weight W in fig. t.
acts in the direction A W instead of A W. Draw C A
perpendicular to A W. Then the momentum of this
external force is not to be measured by W X A C, but
by W X A C. The strain therefore by which the fibres
in the fraction of fracture D C are torn asunder, is di-
minished in the proportion of C A to C A, that is, in
the proportion of radius to the sine of the angle C A C,
which the beam makes with the direction of the exter-
nal force.

To apply this to our purpose in the most familiar
manner, let A B (fig. 3.) be an oblique rafter of a build-
ing, loaded with a weight W suspended to any point
C, and thereby occasioning a strain in some part D.
We have already seen, that the immediate cause of
the strain on D is the reaction of the support which is gi-
gen to the point B. The rafter may at present be con-
sidered as a lever, supported at A, and pulled down by
the line C W. This occasion a pressure on B, and the
support acts in the opposite direction to the action of
the lever, that is, in the direction B A, perpendicular to
BA. This tends to break the beam in every part.

The pressure exerted at B is \( \frac{W \times A E}{A B} \), AE being a
horizontal line. Therefore the strain at D will be
\( \frac{W \times A E}{A B} \times BD \). Had the beam been lying hori-
zontally, the strain at D, from the weight W suspended
at A C, would have been \( \frac{W \times A C}{A B} \times BD \). It is therefore di-
minished in the proportion of AC to AE, that is, in
the proportion of radius to the cosine of the elevation,
or in the proportion of the secant of elevation to the
radius.

It is evident, that this law of diminution of the strain
is the same whether the strain arises from a load on any
part of the rafter, or from the weight of the rafter it-
self, or from any load uniformly diffused over its
length, provided only that these loads act in vertical
lines.

We can now compare the strength of roofs which
have different elevations. Supposing the width of the
building to be given, and that the weight of a square
yard of covering is also given. Then, because the load
on the rafter will increase in the same proportion with
its length, the load on the flant-side B A of the roof
will be to the load of a similar covering on the half A F
of the flat roof, of the same width, as A B to A F. But
the transverse action of any load on A B, by which it
tends to break it, is to that of the same load on A F
as A F to A B. The transverse strain therefore is the
same on both, the increase of real load on A B being
compensated by the obliquity of its action. But the
strengths of beams to resist equal strains, applied to si-
milar points, or uniformly diffused over them, are in-
versonly as their lengths, because the momentum or en-
ergy of the strain is proportional to the length. The re-

23 When the action of the load is oblique.
known in mechanics that the supports given by plates are exerted in a direction perpendicular to those planes in the points of contact; and we know that the weight of the beam acts in the same manner as if it were all accumulated in its centre of gravity G, and that it acts in the direction GN perpendicular to the horizon. Moreover, when a body is in equilibrio between three forces, they are acting in one plane, and their directions are either parallel or they pass through one point.

The support given to the beam is therefore the same as if it were suspended by two lines which are attached to the single point P. We may also infer, that the points of supension C, D, the points of support E, F, the points of contact A, B, and the centre of gravity G, are all in one vertical plane.

When this position of the beam is disturbed by any external force, there must either be a motion of the points A and B round the centres of supension C and D, or of the props round these points of support E and F, or a sliding of the beam along the polished planes GH and IK; and in consequence of these motions the centre of gravity G will go out of its place, and the vertical line GN will no longer pass through the point where the directions of the supports intersect each other. If the centre of gravity rises by this motion, the body will have a tendency to recover its former position, and it will require force to keep it away from it. In this case the equilibrium may be said to be flable, or the body to have stability. But if the centre of gravity descends when the body is moved from the position of equilibrium, it will tend to move still farther; and so far will it be from recovering its former position, that it will now fall. This equilibrium may be called a tottering equilibrium. These accidents depend on the situations of the points A, B, C, D, E, F; and they may be determined by considering the subject geometrically. It does not much interest us at present; it is rarely that the equilibrium of suspension is tottering, or that of props is flable. It is evident, that if the beam were suspended by lines from the point P, it would have stability, for it would swing like a pendulum round P, and therefore would always tend towards the position of equilibrium. The intersection of the lines of support would still be at P, and the vertical line drawn through the centre of gravity, when in any other situation, would be on that side of P towards which the centre has been moved. Therefore, by the rules of pendulous bodies, it tends to come back. This would be more remarkably the case if the points of supension C and D be on the same side of the point P with the points of attachment A and B; for in this case the new point of intersection of the lines of support would shift to the opposite side, and be fixed farther from the vertical line through the new position of the centre of gravity.

It is plain that, with respect to the mere momentary equilibrium, there is no difference in the support by threads,

...
threads, or props, or planes, and we may substitute the one for the other. We shall find this substitution extremely useful, because we easily conceive distinct notions of the support of a body by strings.

Observe further, that if the whole figure be inverted, and strings be substituted for props, and props for strings, the equilibrium will still obtain: for by comparing fig. 5. with fig. 6. we see that the vertical line through the centre of gravity will pass through the intersection of the two strings or props; and this is all that is necessary for the equilibrium: only it must be observed in the substitution of props for threads, and of threads for props, that if it be done without inverting the whole figure, a stable equilibrium becomes a tottering one, and vice versa.

This is a most useful proposition, especially to the unlettered artisan, and enables him to make a practical use of problems which the greatest mechanical geniuses have found no easy task to solve. An instance will show the extent and utility of it. Suppose it were required to make a manfair of kirb roof whose width is AB (fig. 7.), and consisting of the four equal rafters AC, CD, DE, EB. There can be no doubt but that its best form is that which will put all the parts in equilibrio, so that no ties or stays may be necessary for opposing the unbalanced thrust of any part of it. Make a chain acbed (fig. 8.) of four equal pieces, loosely connected by pin-joints, round which the parts are perfectly moveable. Suspend this from two pins a, b, fixed in a horizontal line. This chain or feejon will arrange itself in such a form that its parts are in equilibrio.

Then we know that if the figure be inverted, it will compose the frame or truss of a kirb-roof, and is also in equilibrio, the thrusts of the pieces balancing each other in the same manner that the mutual pulls of the hanging feejon acbed did. If the proportion of the height df to the width ab is not such as pleases, let the pins a, b be placed nearer or more distant, till a proportion between the width and height is obtained which pleases, and then make the figure ACDEB (fig. 7) similar to it. It is evident that this proposition will apply in the same manner to the determination of the form of an arch of a bridge; but this is not a proper place for a farther discussion.

We are now able to compute all the thrusts and other presffures which are exerted by the parts of a roof on each other and on the walls. Let AB (fig. 9.) be a beam flanding anyhow obliquely, and G its centre of gravity. Let us suppose that the ends of it are supported in any directions AC, BD, by strings, props, or planes. Let these directions meet in the point P of the vertical line PG passing through its centre of gravity. Through G draw lines Ga, Gb parallel to PB, PA. Then

The weight of the beam

*The pressure or thrust at A *are proportional to

\[ \frac{PG}{Pa} \]

The pressure at B

For when a body is in equilibrio between three forces, these forces are proportional to the sines of a triangle which have their directions.

In like manner, if Ag be drawn parallel to Pb, we shall have

Weight of the beam

*Thrust on A *are proportional to

\[ \frac{Pg}{Pa} \]

*Thrust on B *are proportional to

\[ \frac{Bg}{Bb} \]

Or, drawing Bv parallel to Pa

Weight of beam

*Thrust at A *are proportional to

\[ \frac{Py}{By} \]

*Thrust at B *are proportional to

\[ \frac{Pb}{PB} \]

It cannot be disputed that, if strength alone be considered, the proper form of a roof is that which puts the whole in equilibrio, so that it would remain in that shape although all the joints were perfectly loose or flexible. If it has any other shape, additional ties or braces are necessary for preserving it, and the parts are uneconomically strained. When this equilibrium is obtained, the rafters which compose the roof are all acting on each other in the direction of their lengths; and by this action, combined with their weights, they sustain no strain but that of compression, the strain of all others that they are the most able to resist. We may consider them as so many inflexible lines having their weights accumulated in their centres of gravity. But it will allow an easier investigation of the subject, if we suppose the weights of the forces to be at the joints, equal to the real vertical pressures which are exerted on these points. These are very easily computed: for it is plain, that the weight of the beam AB (fig. 9.) is to the part of the weight that is supported at B as AB to AG. Therefore, if W represent the weight of the beam, the vertical pressure at B will be \( W \times \frac{AG}{AB} \), and the vertical pressure at A will be \( W \times \frac{BG}{AB} \). In like manner, the prop AB being considered as another beam, and f as its centre of gravity and \( w \) as its weight, a part of this weight, equal to \( w \times \frac{F}{BF} \), is supported at B, and the whole vertical pressure at B is \( W \times \frac{AG}{AB} + w \times \frac{F}{BF} \). And thus we greatly simplify the consideration of the mutual thrusts of roof frames. We need hardly observe, that although these presffures by which the parts of a frame support each other in opposition to the vertical action of gravity, are always exerted in the direction of the pieces, they may be resolved into presffures acting in any other direction which may engage our attention.

All that we propose to deliver on this subject at present may be included in the following proposition.

Let ABCDE (fig. 10.) be an assemblage of rafters in a vertical plane, resting on two fixed points A and E in a horizontal line, and perfectly moveable round all the joints A, B, C, D, E; and let it be supposed to be in equilibrio, and let us investigate what adjustment of the different circumstances of weight and inclination of its different parts is necessary for producing this equilibrio.

Let F, G, H, I, be the centres of gravity of the different rafters, and let these letters express the weights of each. Then (by what has been said above) the weight which presses B directly downwards is \( F \times \frac{AF}{AB} + G \times \frac{BG}{AB} + C \times \frac{CG}{AB} \), and the weight on C is in like manner \( G \times \frac{BG}{AB} + C \times \frac{CG}{AB} \). The weight on D is \( H \times \frac{DH}{CD} + I \times \frac{EI}{DE} \).

Let AbcdE be the figure ABCDE inverted, in the manner already described. It may be conceived as a thread fastened at A and E, and loaded at b, c, and...
We may discover this form by means of this single consideration, that any part of the thread is equally stretched throughout in the direction of its length. Let us therefore investigate the proportion between the weight \( g \), which we suppose to be pulling the point \( b \) in the vertical direction \( bh \) to the weight \( a \), which is pulling down the point \( d \) in a similar manner. It is evident, that since \( AE \) is a horizontal line, and the figures \( Abcde \) and \( ABCDE \) equal and similar, the lines \( bB, cC, dD \) are vertical. Take \( bf \) to represent the weight hanging at \( b \). By stretching the threads \( BA \) and \( BC \), it is let in opposition to the contractile powers of the threads, acting in the directions \( AB \) and \( BC \), and it is in immediate equilibriam with the equivalent of these two contractile forces. Therefore make \( bg \) equal to \( bf \), and make it the diagonal of a parallelogram \( bb \times bg \). It is evident that \( bb, bi \), are the forces exerted by the threads \( BA, BC \). Then, seeing that the thread \( bc \) is equally stretched in both directions, make \( cB \) equal to \( bi \); \( cB \) is the contractile force which is excited at \( c \) by the weight which is hanging there. Draw \( kI \) parallel to \( cD \), and \( LM \) parallel to \( bc \). The force \( Ie \) is the equivalent of the contractile forces \( cB, cm \), and is therefore equal and opposite to the force of gravity acting at \( C \). In like manner, make \( dn, dp \) are the contractile forces excited at \( c \) and \( d \), and the weight hanging there must be equal to \( do \).

Therefore, the load at \( b \) is to the load at \( d \) as \( bg \) to \( do \). But we have seen that the compressive forces at \( B, C \), \( D \) may be substituted for the extending forces at \( b, c, d \). Therefore the weights at \( B, C, D \) which produce the compressions, are equal to the weights at \( b, c, d \), which produce the extensions. Therefore \( bg:do = \frac{AF}{AB} + \frac{CG}{BC} + \frac{CH}{CD} + 1 + \frac{EI}{DE} \).

Let us enquire what relation there is between this proportion of the loads upon the joints at \( B \) and \( D \), and the angles which the rafters make at these joints with each other, and with the horizon or the plumb lines. Produce \( AB \) till it cut the vertical \( Cr \) in \( Q \); draw \( BR \) parallel to \( CD \), and \( BS \) parallel to \( DE \). The similarity of the figures \( ABCD \) and \( ABCDE \), and the similarity of their position with respect to the horizontal and plumb lines, show, without any further demonstration, that the triangles \( QCB \) and \( gbf \) are similar, and that

\[
\frac{QB}{BC} = \frac{gB}{bB} = \frac{iB}{ib} = \frac{bB}{ib}.
\]

Therefore \( QB \) is to \( BC \) as the contractile force exerted by the thread \( Ab \) to that exerted by \( cD \); and therefore \( QB \) is to \( BC \) as the compression of \( BA \) to the compression on \( BC \).

Then, because \( bi \) is equal to \( eB \), and the triangles \( CB \) and \( kkl \) are similar, \( CB : BR = eB : kI = ce \); and \( CB \) is to \( BR \) as the compression on \( CB \) to the compression on \( CD \). And, in like manner, because \( em = d \), we have \( BR \) to \( BS \) as the compression on \( DC \) to the compression on \( DE \). Also \( BR : RS = nd : do \), that is, as the compression on \( DC \) to the load on \( D \). Finally combining all these ratios.

\[
\begin{align*}
QC:CB & = \frac{gb}{bi} = \frac{gb}{ke} \\
BR:BS & = \frac{ke}{kl} = \frac{ke}{dn} \\
BS:RS & = \frac{ns}{ds} = \frac{ns}{dp}, \text{ we have finally} \\
QC:RS & = \frac{gb}{do} = \text{ Load at } B \text{ : Load at } D.
\end{align*}
\]

Now

\[
\begin{align*}
QC:BC & = \frac{fQ}{ABC} = \frac{fQ}{ABC} = \frac{fQ}{ABC} = \frac{fQ}{ABC} = \frac{fQ}{ABC} = \frac{fQ}{ABC} = \frac{fQ}{ABC} \\
BR:BC & = \frac{fB}{ABC} = \frac{fB}{ABC} = \frac{fB}{ABC} = \frac{fB}{ABC} = \frac{fB}{ABC} = \frac{fB}{ABC} = \frac{fB}{ABC} \\
BR:BS & = \frac{fS}{BSR} = \frac{fBS}{SBR} = \frac{fS}{SBR} = \frac{fS}{SBR} = \frac{fS}{SBR} = \frac{fS}{SBR} = \frac{fS}{SBR} \\
QC:RS & = \frac{fS}{CDE} = \frac{fS}{CDE} = \frac{fS}{CDE} = \frac{fS}{CDE} = \frac{fS}{CDE} = \frac{fS}{CDE} = \frac{fS}{CDE}.
\end{align*}
\]

Therefore

\[
\begin{align*}
QC:RS & = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC} \\
& = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC}.
\end{align*}
\]

Or

\[
\begin{align*}
QC:RS & = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC}.
\end{align*}
\]

That is, the loads on the different joints are as the sines of the angles at these joints directly, and as the products of the sines of the angles which the rafters make with the plumb lines inversely.

Or, the loads are as the sines of the angles of the joints directly, and as the products of the cofeants of the elevations of the rafters jointly.

Or, the loads at the joints are as the sines of the angles at the joints, and as the products of the cofeants of elevation of the rafters jointly: for the cofeants of angles are inversely as the sines.

Draw the horizontal line \( BT \). It is evident, that if this be considered as the radius of a circle, the lines \( BO, BC, BR, BS \) are the cofeants of the angles which these lines make with the horizon. And they are also as the thrusts of the rafters to which they are parallel. Therefore, the thrust which any rafter makes in its own direction is as the cofeant of its elevation.

The horizontal thrust is the same at all the angles. For \( iB = mB, mB = mB = pB \). Therefore both walls are equally pressed out by the weight of the roof.

We can find its quantity by comparing it with the load on one of the joints:

\[
\text{Thus, } QC:CB = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC} = \frac{fS}{ABC}.
\]

It deserves remark, that the lengths of the beams do not affect either the proportion of the load at the different joints, nor the position of the rafters inversely as the cofeants. This depends merely on the weights at the angles. If a change of length affects the weight, this indeed affects the form also; and this is generally the case. For it seldom happens, indeed it never should happen, that the weight on rafters of longer bearing are not greater. The covering: alone increases nearly in the proportion of the length of the rafter.

If the proportion of the weights at \( B, C \), and \( D \) are

\[
(\text{A}) \text{ This proportion might have been shown directly without any use of the inverted figure or consideration of contractile forces; but this substitution gives different notions of the mode of acting even to persons not much conversant in such disquisitions: and we wish to make it familiar to the mind, because it gives an easy solution of the most complicated problems, and furnishes the practical carpenter, who has little leisure, with solutions of the most difficult cases by experiment. A foolom, as we called it, may easily be made; and we are certain, that the forms into which it will arrange itself are models of perfect frames.}
\]
To determine the position of any two of the lines, the position of all the rest is determined.

If the horizontal distances between the angles are all equal, the forces on the different angles are proportional to the verticals drawn on the lines through these angles from the adjoining angle, and the thrul's from the adjoining angles are as the lines which connect them.

If the rafters themselves are of equal length, the weights at the different angles are as the verticals and as the tangents of the elevation of the rafters jointly.

This proposition is very fruitful in its practical consequences. It is easy to perceive that it contains the whole theory of the construction of arches; for each stone of an arch may be considered as one of the rafters of this piece of carpentry, since all is kept up by its mere equilibrium. We may have an opportunity in some future article of exhibiting some very elegant and simple solutions of the most difficult cases of this important problem; and we now proceed to make use of the knowledge we have acquired for the construction of roofs.

We mentioned by the bye a problem which is not unfrequent in practice, to determine the belt form of a kirb-roof. Mr Couplet of the Royal Academy of Paris has given a solution of it in an elaborate memoir in 1746, occupying several lemmas and theorems.

Let $AE$ (Fig. 11.) be the width, and $CF$ the height; it is required to construct a roof $ABCD$ whose rafters $AB$, $BC$, $CD$, $DE$, are all equal, and which shall be in equilibrio.

Draw $CE$, and bisect it perpendicularly in $I$ by the line $DHG$, cutting the horizontal line $AE$ in $G$. About the centre $G$, with the distance $GE$, describe the circle $EDC$. It must pass through $C$, because $CH$ is equal to $HE$ and the angles at $H$ are equal. Draw $HK$ parallel to $FE$, cutting the circumference in $K$. Draw $CK$, cutting $GH$ in $D$. Join $CD$, $DE$; these lines are the rafters of half of the roof required.

We prove this by showing, that the loads in the angles $C$ and $D$ are equal. For this is the proportion which results from the equality of the rafters, and the extent of surface of the uniform roofs which they are suppos'd to support. Therefore produce $ED$ till it meet the vertical $FC$ in $N$; and having made the side $CBA$ similar to $CDE$, complete the parallelogram $BCDP$, and draw $DB$, which will bisect $CP$ in $R$, as the horizontal line $KH$ biseets $CF$ in $Q$. Draw $KF$, which is evidently parallel to $DP$. Make $CS$ perpendicular to $CF$, and equal to $FG$; and about $S$, with the radius $SF$, describe the circle $FKW$. It must pass through $K$, because $SF$ is equal to $CG$, and $CQ = QF$. Draw $WK$, $WS$, and produce $BC$, cutting $ND$ in $O$.

The angle $WKF$ at the circumference is one-half of the angle $WSF$ at the centre, and is therefore equal to $WSC$, or $CGF$. It is therefore double of the angle $CEF$ or $ECS$. But $ECS$ is equal to $ECD$ and $DCS$, and $ECD$ is one-half of $NDC$, and $DCS$ is one-half of $DCO$, or $CDP$. Therefore the angle $WKF$ is equal to $NPD$, and $WK$ is parallel to $ND$, and $CF$ is to $CW$ as $CP$ to $CN$; and $CN$ is equal to $CF$. But it has been shown above, that $CN$ and $CP$ are as the loads upon $D$ and $C$. Thefe are therefore equal, and the frame $ABCD$ is in equilibrio.

A commenion of this solution with that of Mr Couplet will show its great advantage in respect of simplicity and perplicity. And the intelligent reader can easily adapt the construction to any proportion between the rafters $AB$ and $BC$, which other circumstances, such as garret-room, &c. may render convenient. The construction must be such that $NC$ may be to $CP$ as $CD$ to $DE$.

Whatever proportion of $AB$ to $BC$ is assumed, the point $D'$ will be found in the circumference of a semicircle $H'D'B'$, whose centre is in the line $CE$, and having $AB : BC = CH' : HE' = c'b' : b'n E$.—The roof of the construction is simple.

In buildings which are roofed with slate, tyle, or shingles, the circumference which is most likely to limit the construction is the slope of the upper rafters $CB$, $CD$. This must be sufficient to prevent the penetration of rain, and the stripping of the winds. The only circumstance left in our choice in this cafe is the proportion of the rafters $AB$ and $BC$. Nothing is easier than making $NC$ to $CP$ in any defird proportion when the angle $BCD$ is given.

We need not repeat that it is always a desirable thing to form a truss for a roof in such a manner that it shall be in equilibrio. When this is done, the whole force of the rafters and braces which are added to it is employed in preserving this form, and no part is expended in unnecessary strains. For we must now observe, that the equilibrium of which we have been treating is always of that kind which we called the tottering, and the roof requires stays, braces, or hanging timbers, to give it firmness, or keep it in shape. We have also said enough to enable any reader, acquainted with the most elementary geometry and mechanics, to compute the transverse strains and the thrusts to which the component parts of all roofs are exposed.

It only remains now to show the general maxims by which all roofs must be constructed, and the circumstances which determine their excellence. In doing this we shall be exceedingly brief, and almost content ourselves with exhibiting the principal forms, of which the endless variety of roofs are only slight modifications.—We shall not trouble the reader with any account of such roofs as receive part of their support from the interior walls, but confine ourselves to the more difficult problem of throwing a roof over a wide building, without any intermediate support; because when such roofs are constructed in the best manner, that is, deriving the greatest possible strength from the materials employed, the whole construction of the others is necessarily included. For all such roofs as rest on the middle walls are of roofs of smaller bearing. The only exception deserving notice is the roofs of churches which have aisles separated from the nave by columns. The roof must rise from these. But if it is of an arched form internally, the horizontal thrul's must be nicely balanced, that they may not pull the columns aside.

The simplest notion of a roof-frame, is that it consists of two rafters $AB$ and $BC$ (fig. 12.), meeting in notion of the ridge $B$.

Even this simple form is susceptible of better and worle
Reasons of economy have made carpenters prefer a low pitch; and although this does diminish the support given by the opposite leg faster than it increases the relative strength of the other, it is not of material consequence, because the strength remaining in the opposite leg is still very great; for the supporting leg is acting against compression, in which case it is vastly stronger than the supported leg acting against a transverse strain.

But a roof of this simplicity will not do in most cases. Thrift on there is no notice taken in its construction of the thrust on the walls, which it exerts on the walls. Now this is the strain which is the most hazardous of all. Our ordinary walls, instead of being able to resist any considerable strain thrusting them outwards, require, in general, some ties to keep them on foot. When a person thinks of the thinness and height of the walls of even a strong house, he will be surprised that they are not blown down by any strong puff of wind. A wall of three feet thick, and 60 feet high, could not withstand a wind blowing at the rate of 30 feet per second (in which case it acts with a force considerably exceeding two pounds on every square foot), if it were not stiffened by cross-walls, joists, and roof, which all help to tie the different parts of the building together.

A carpenter is therefore exceedingly careful to avoid how every horizontal thrust, or to oppose them by other avoided. forces. And this introduces another essential part into the construction of a roof, namely the tie or beam AC, (fig. 14-), laid from wall to wall, binding the feet A and C of the rafters together. This is the load office of the beam; and it should be considered in no other light than as a firing to prevent the roof from pulling out the walls. It is indeed used for carrying the ceiling of the apartments under it; and it is even made to support a flooring. But, considered as making part of a roof, it is merely a firing; and the strain which it withstands tends to tear its parts asunder. It therefore acts with its whole absolute force, and a very small cantilever would suffice if we could contrive to fasten it firmly enough to the foot of the rafter. If it is of oak, we may safely fasten it to a strain of three tons for every square inch of its section. And for will safely bear a strain of two tons for every square inch. But we are obliged to give the tie-beam much larger dimensions, that we may be able to connect it with the foot of the rafter by a mortise and tenon. Iron straps are also frequently added. By attending to this office of the tie-beam, the judicious carpenter is directed to the proper form of the mortise and tenon and of the flarp. We shall consider both of these in a proper place, after we become acquainted with the various strains at the joints of a roof.

These large dimensions of the tie-beam allow us to load it with the ceilings without any risk, and even to lay floors on it with moderation and caution. But when it has a great bearing or span, it is very apt to bend downwards in the middle, or, as the workmen term it, to sway or sag; and it requires a support. The question is, where to find this support? What fixed points can we find with which to connect the middle of the tie-beam? Some ingenious carpenter thought of suspending it from the ridge by a piece of timber BD (fig. 15.), called by some carpenters the king-post. It must be acknowledged that there was great ingenuity in this thought. It was also perfectly just. For the weight of the rafters DA, EC tends to make them fly out.
out at the foot. This is prevented by the tie-beam, and this excites a pretence, by which they tend to compress each other. Suppose them without weight, and that a great weight is laid on the ridge B. This can be supported only by the butting of the rafters in their own directions A and C, and the weight tends to compress them in the opposite directions, and, through their intervention, to stretch the tie-beam. If neither the rafters can be compressed, nor the tie-beam fretched it is plain that the triangle A B C must retain its shape, and that B becomes a fixed point, very proper to be used as a point of suspension. To this point, therefore, is the tie-beam suspended by means of the king-post. A common spectator, unacquainted with carpentry, views it very differently, and the tie-beam appears to him to carry the roof. The king-post appears a pillar reeling on the beam, whereas it is really a string; and an iron-rod of one-sixteenth of the fize would have done just as well. The king-post is sometimes mortised into the tie-beam, and pins put through the joint, which gives it more the look of a pillar with the roof reeling on it. This does well enough in many cases. But the best method is to connect them by an iron strap, like a stirrup, which is bolted at its upper ends into the king-post, and passes round the tie-beam. In this way a space is commonly left between the end of the king-post and the upper side of the tie-beam. Here the beam plainly appears hanging in the stirrup; and this method allows us to restore the beam to an exact level, when it has sunk by the unavoidable compression or other yielding of the parts. The holes in the sides of the iron strap are made oblong instead of round; and the bolt which is drawn through all is made to taper on the under side; so that driving it farther draws the tie-beam upwards. A notion of this may be formed by looking at fig. 16. which is a section of the poet and beam.

It requires considerable attention, however, to make this suspension of the tie-beam sufficiently firm. The top of the king-post and tie-beam cut into the form of the arch of a bridge, and the heads of the rafters are firmly mortised into this projecting part. These projections are called joggles, and are formed by working the king-post out of a much larger piece of timber, and cutting off the unnecessary wood from the two sides; and, left all this should not be sufficient, it is usual in great works to add an iron-plate or strap of three branches, which are bolted into the heads of the king-post and rafters.

The rafters, though not so long as the beam, seem to stand as much in need of something to prevent their bending, for they carry the weight of the covering. — This cannot be done by suspension, for we have no fixed points above them: But we have now got a very firm point of support at the foot of the king-post. —"Braces or struts, ED, FD, (fig. 17.), are put under the middle of the rafters, where they are slightly mortised, and their lower ends are firmly mortised into joggles formed on the foot of the king-post. As these braces are very powerful in their resistance to compression, and the king-post equally so to resist extension, the points E and F may be considered as fixed; and the rafters being thus reduced to half their former length, have now four times their former relative strength.

Roofs do not always consist of two sloping sides meeting in a ridge. They have sometimes a flat on the top, with two sloping sides. They are sometimes formed with a double slope, and are called kirk or manlyard roofs. They sometimes have a valley in the middle, and are then called M roofs. Such roofs require another piece which may be called the truss beam because all such frames are called trusses, probably from the French word trufls, because such roofs are like portions of plain roofs trusses or shortened.

A flat-topped roof is thus constructed. Suppose the three rafters A B, B C, D (fig. 18.) of which A B and C D are equal, and B C horizontal. It is plain that they will be in equilibrium, and the roof have no tendency to go to either side. The tie-beam A D withstands the horizontal thrusts of the whole frame, and the two rafters A B and C D are each pressed in their own directions in consequence of their butting with the middle rafter or truss beam B C. It lies between them like the keystone of an arch. They lean towards it, and it relies on them. The pressure which the truss-beam and its load excites on the two rafters is the same as if the rafters were produced till they met in G, and a weight were laid on these equal to that of B C and its load. If therefore the truss-beam is of a scantling sufficient for carrying its own load, and withstands the compression from the two rafters, the roof will be equally strong; whereas if it keeps its shape as the plain roof A G D furnished with king-post and braces. We may conceive this another way. Suppose a plain roof A G D, without braces to support the middle B and C of the rafters. Then let a beam B C be put in between the rafters, butting upon little notches cut in the rafter. It is evident that this must prevent the rafters from bending downwards, because the points B and C cannot deflect, moving round the centres A and D, without shortening the distance B C between them. This cannot be without compressing the beam B C. It is plain that B C may be wedged in, or wedges driven in between its ends B and C and the notches in which it is put. The wedges may be driven in till they even force out the rafters G A and G D. Whenever this happens, all the mutual pressure of the heads of the rafters at G is taken away, and the parts G B and G C may be cut away, and the roof A B C D will be as strong as the roof A G D furnished with the king-post and braces, because the truss-beam gives a support of the same kind at B and C as the brace would have done. But this roof A B C D would have no firmness of shape. Any addition of weight on one side would destroy the equilibrium at the angle, would depress that angle, and cause the opposite one to rise. To give it firmness, it must either have ties or braces, or something partaking of the nature of both. The usual method of framing is to make the heads of the rafters butt on the joggles of two side-rafters B E and C F, while the truss-beam, or strut as it is generally termed by the carpenters, is mortised square into the inside of the heads. The lower ends E and F of the side-rafters are connected with the tie-beam either by mortises or struts.

This construction gives firmness to the frame; for the angle B cannot deflect in consequence of any inequality of pressure, without forcing the other angle C to rise. This it cannot do, being held down by the post C F. And the same construction fortifies the tie-beam, which is now suspended at the points E and F from
from the points B and C, whose firmness we have just now shown.

But although this roof may be made abundantly strong, it is not quite so strong as the plain roof AGD of the same scantling. The compression which BC must sustain in order to give the same support to the rafters at B and C that was given by braces properly placed, is considerably greater than the compression of the brace. And this strain is an addition to the transfer strain which BC gets from its own load. Also this form necessarily exposes the tie-beam to crofs strains. If BE is mortised into the tie-beam, then the strain which tends to depress the angle ABC preffes on the tie-beam at E transversely, while a contrary strain acts on F, pulling it upwards. These strains however are small; and this construction is frequently used, being susceptible of sufficient strength, without much increase of the dimensions of the timbers; and it has the great advantage of giving free room in the garrets. Were it not for this, there is a much more perfect form represented in fig. 19. Here the two polts BE, CF are united below. All transverse action on the tie-beam is now entirely removed. We are almost disposed to say that this is the strongest roof of the same width and slope: for if the iron strap which connects the pieces BE, CF with the tie-beam have a large bolt G through it, confining it to one point of the beam, there are five points A, B, C, D, G, which cannot change their places, and there is no transverse strain in any of the connections.

When the dimensions of the building are very great, so that the pieces AB, BC, CD, would be thought too weak for withstanding the crofs strains, braces may be added as is expressed in fig. 18, by the dotted lines. The reader will observe that it is not meant to leave the top flat externally: it must be raised a little in the middle to shoot off the rain. But this must not be done by incavating the beam BC. This would soon be cruflod, and spring upwards. The slopes must be given by pieces of timber added above the flut ting beam.

And thus we have completed a frame of a roof. It consists of these principal members: The rafters, which are immediately loaded with the covering; the tie-beam which withstands the horizontal thruf which by which the roof tends to fly out below and push out the walls; the king-post, which haunt from fixed points and serve to uphold the tie-beam, and also to afford other fixed points on which we may rest the braces which support the middle of the rafters; and lastly the truf and flutting-beam, which serves to give mutual abatement to the different parts which are at a distance from each other. The rafters, braces, and trusses are exposed to compression, and muft therefore have not only cohesion but fufficiency. For if they bend, the prodigious compression to which they are subjected would quickly crush them in this bendėd flate. The tie-beams and king-posts, if performing no other office but supporting the roof, do not require fufficiency, and their places might be supplied by ropes, or by rods of iron of one-tenth part of the section that even the smallest oak firefleacher requires. These members require no greater dimensions than what is necessary for giving fufficient joints, and any more is a needless ex pense and load. All roofs, however complicated, confist of these effential parts, and if pieces of timber are to be seen which perform none of these offices, they muft be pronounced useless, and they are frequently hurtful, by producing crofs strains in some other piece. In a roof properly constructed there should be no such strains. All the timbers, except those which immediately carry the covering, should be either pulled or drawn in the direction of their length. And this is the rule by which a roof should always be examined.

These effential parts are susceptible of numberless combinations and varieties. But it is a prudent maxim to make the construction as simple, and confifting of as few parts, as possible. We are left exposed to the imperfec tions of workmanship, such as loft joints, &c. Another effential harm arises from many pieces, by the crofs perforation and the shrinkage of the timber in the crofs direction of the fibres. The effect of this is equivalent to the thinning of the piece which butts on the joint. This alters the proportions of the sides of the triangle on which the shape of the whole depends. Now in a roof such as fig. 18 there is twice as much of this as in the plain pent roof, because there are two polts. And when the direction of the butting pieces is very oblique to the action of the load, a small shrink ing permits a great change of shape. Thus in a roof of what is called pediment pitch, where the rafters make an angle of 30 degrees with the horizon, half an inch compression of the king-post will produce a fagg ing of an inch, and occasion a great strain on the tie-beam if the polts are mortised into it. In fig. 2, of the roofs in the article Acute cross, half an inch shrink ing of each of the two polts will allow the middle to fagg above five inches. Fig. 1, of the fame plate is faulty in this repect, by cutting the flutting-beam in the middle. The flutting-beam is thus shortened by three shrinkings, while there is but one to shorten the rafters. The confeqence is, that the trus which is included within the rafters will fagg away from them, and then they must bend in the middle till they again rest on this included truf. This roof is, however constructed on the whole on good principles, and we adduce it only to show the advantages of fimplicity. This cutting of the flutting-beam is unavoidable, if we would prefer the king-post. But we are in doubt whether the service performed by it in this cafe will balance the in inconvenient. It is employed only to support the middle of the upper half of each rafter, which it does but imperfectly, because the braces and truss must work the crofs half through at their crofsing; if these joints are made tight, as a workman would wish to do, the futting of the roof will cause them to work on each other crofswise with inufferable force, and will undoubtedly ftrain them exceedingly.

This method of including a truss within the rafters of a pent roof is a very consider able addition to the art of carpentry. But to infure its full effect, it should always be executed in the manner represented in fig. 1. Plate XLVIII with buttting rafters under the principal ones, buttting on joggles in the heads of the polts. Without this the fnt-beam is hardly of any service. We would therefore recommend fig. 20, as a proper conftuction of a trussed roof, and the king-post which is placed in it may be employed to support the upper part of the rafters, and also for preventing the fnt-beam from bending in either direction in conformance of its great compression. It will also give a fulfion for the great burdens which are sometimes necelary in a theatre.
Roo.

The machinery has no other firm points to which it can be attached; and the portion of the single rafters which carry this king-post are but short, and therefore may be considerably loaded with safety.

We observe in the drawings which we sometimes have of Chinese buildings, that the trussing of roofs is underfloored by them. Indeed they must be very experienced carpenters. We see wooden buildings run up to a great height, which can be supported only by such trussing. One of these is sketched in fig. 21. There are some very excellent specimens to be seen in the buildings at Deptford, belonging to the victualling-office, usually called the Red House, which were erected about the year 1785, and we believe are the performances of Mr James Arrow of the Board of Works, one of the most intelligent artists in Britain.

Thus have we given an elementary, but a rational or scientific account of this important part of the art of carpentry. It is such, that any practitioner, with the use of a little reflection, may always proceed with confidence, and without retrying any part of his practice on the vague notions which habit may have given him of the strength and supports of timbers, and of their manner of acting. That these frequently mislead, is proved by the mutual criticisms which are frequently published by the rivals in the profession. They have frequently, for it can seldom be called science, to look into glaring blunders; and any person who will look at some of the performances of Mr Price, Mr Wyatt, Mr Arrow, and others of acknowledged reputation, will readily see them distinguishable from the works of inferior artists by simplicity alone. A man without principles is apt to consider an intricate construction as ingenious and effectual; and such roofs sometimes fail merely by being ingeniously loaded with timber, but more frequently still by the wrong action of some useless piece, which produces strains that are transferable to other pieces, or which, by rendering some points too firm, cause them to be defeated by the rest in the general subsiding of the whole. Instances of this kind are pointed out by Price in his British Carpenter. Nothing throws the skill of a carpenter more than the dissimilitude with which he can foresee the changes of shape which must take place in a short time in every roof. A knowledge of this will often correct a construction which the mere mathematician thinks unexceptionable, because he does not reckon on the actual compresion which must obtain, and imagines that his triangles, which sustain no crofs strains, invariably retain their shape till the pieces break. The sagacity of the experienced carpenter is not, however, enough without science for perfecting the art. But when he knows how much a particular piece will yield to compresion in one case, science will tell him, and nothing but science can do it, what will be the compresion of the same piece in another very different case. Thus he learns how far it will now yield, and then he proportions the parts to each other, that when all have yielded according to their strains, the whole is of the shape he wished to produce, and every joint is in a state of firmness. It is here that we observe the greatest number of improprieties. The iron straps are frequently in positions not suited to the actual strain on them, and they are in a state of violent twist, which both tends strongly to break the strap, and to cripple the pieces which they surround.

In like manner, we frequently see joints or mortises in a state of violent strain or the tenons, or on the heels and shoulders. The joints were perhaps properly shaped to the primitive form of the truss; but by its settling, the bearing or the push is changed: the brace, for example, in a very low pitched roof, comes to press with the upper part of the shoulder, and acting as a powerful lever on the tenon, breaks it. In like manner, the lower end of the brace, which at first butted firmly and squarely on the joggle of the king-post, now presses with one corner with prodigious force, and seldom fails to splinter off on that side. We cannot help recommending a maxim of Mr Perronet the celebrated hydraulic architect of France, as a golden rule, viz. to make all the shoulders of butting pieces in the form of an arch of a circle, having the opposite end of the piece for its centre. Thus, in fig. 18, if the joggle-joint B be of this form, having A for its centre, the sagging of the roof will make no partial bearing at the joint; for in the sagging of the roof, the piece AB turns or bends round the centre A, and the counter-pressure of the joggle is still directed to A, as it ought to be. We have just now said bends round A. This is too frequently the case, and it is always very difficult to give the tenon and mortise in this place a true and invariable bearing. The rafter pushes in the direction BA, and the beam resists in the direction AD. The abutment should be perpendicular to neither of these but in an intermediate direction, and it ought also to be of a curved shape. But the carpenters perhaps think that this would weaken the beam too much to give it this shape in the shoulder; they do not even aim at it in the heel of the tenon. The shoulder is commonly even with the surface of the beam. When the bearing therefore is on this shoulder, it causes the foot of the rafter to slide along the beam till the heel of the tenon bears against the outer end of the mortise (See Price's British Carpenter, Plate C. fig. I K). This abutment is perpendicular to the beam in Price's book, but it is more generally pointed a little outwards below, to make it more secure against slanting. The consequence of this construction is, that when the roof fettles, the shoulder comes to bear at the inner end of the mortise, and it rises at the outer, and the tenon taking hold of the wood beyond it, either tears it out or is itself broken. This joint therefore is seldom trusted to the strength of the mortise and tenon, and is usually fastened by an iron strap, which lies obliquely to the beam, to which it is bolted by a large bolt quite through, and then embraces the outside of the rafter foot. Very frequently this strap is not made sufficiently oblique, and we have seen some made almost square with the beam. When this is the case, it not only keeps the foot of the rafter from flying out, but it binds it down. In this case, the rafter acts as a powerful lever, whose fulcrum is the inner angle of the shoulder, and then the strap never fails to cripple the rafter at the point. All this can be prevented only by making the strap very long and very oblique, and by making its outer end (the risup part) square with its length, and making a notch in the rafter foot to receive it. It cannot now cripple the rafter, for it will slide along with it, turning round the
the bolt at its inner end. We have been thus particu-
lar on this joint, because it is here that the ultimate
strain of the whole roof is exerted, and its situation will
not allow the excavation necessary for making it a good
mortise and tenon.

Similar attention must be paid to some otheriraps,
such as thole which embrace the middle of the rafter,
and connect it with the poll or trusses below it. We
must attend to the change of shape produced by the
fagging of the roof, and place the irap in such a man-
ner as to yield to it by turning round its bolt, but so
as not to become loose, and far less to make a fulcrum
for any thing acting as a lever. The iraps arising from
diff actions, in framings of carpentry which change
their shape by fagging, are enormous, and nothing can
refit them.

We shall close this part of the subject with a simple
method, by which any carpenter, without mathematical
science, may calculate with sufficient precision the
strains or thruts which are produced on any point of
his work, whatever be the obliquity of the pieces.

Let it be required to find the horizontal thrust act-
ing on the tie-beam AD of fig. 18. This will be the
same as if the weight of the whole roof were laid at G
on the two rafters GA and GD. Draw the vertical
line GH. Then, having calculated the weight of the
whole roof that is supported by this single frame
ABCD, including the weight of the pieces AB, BC,
CD, BE, CF themselves, take the number of pounds,
tons, &c. which expresses it from any fcale of equal
parts, and set it from G to H. Draw HK, HL pa-
rallel to GD, GA, and draw the line KL, which will
be horizontal when the two fides of the roof have the
same flope. Then ML measured on the fame fcale
will give the horizontal thrust, by which the ftrength
of the tie-beam is to be regulated. GL will give the
thrust which tends to cruff the rafters, and LM will
go the force which tends to cruff the frut-beam BC.

In like manner, to find the strain on the king-poll
BD of fig. 17. confider that each brace is profied by
half the weight of the roofing laid on BA or BC, and
this prefure, or at leat its hurtful effect, is diminished
in the proportion of BA to DA, because the action of
gravity is vertical, and the effect which we want to coun-
teraét by the braces is in a direction Ee perpendicular to
BA or BC. But as this is to be refit by the brace
AE feding in the direction fE, we must draw fE perpen-
dicular to Ee, and fuppofe the strain augmented in
the proportion of E to fE.

Having thus obtained in tons, pounds, or other mea-
sures, the strains which must be balanced at E by the co-
lation of the king-poll, take this measure from the fcale
of equal parts, and set it off in the directions of the
braces to G and H, and complete the parallelogram
GfHK; and fK measured on the fame fcale will be the
ftrum on the king-poll.

The arift will then examine the strength of his triais
upon this principle, that every square inch of oak
will bear at an average 7000 pounds compression or
fretching it, and may be fately loaded with 1500 for
any length of time; and that a square inch of fir will
in like manner fecurly bear 2500. And, because
iraps are used to refit some of thefes strains, a square
inch of wrought tough iron may be fately strained
by 50,000 pounds. But the arift will always recal-
led, that we cannot have the fame confidence in iron
as in timber. The faults of this laft are much more
eafily perceived; and when timber is too weak, it
gives us warning of its failure, by yielding fenibly
before it breaks. This is not the cafe with iron; and
much of its service depends on the honesty of the black-
smith.

In this way may any defign of a roof be examined. We shall here give the reader a sketch of two or three
fruted roofs, which have been executed in the chief
varieties of circumstances which occur in common prac-
tice.

Fig. 22. is the roof of St Paul's Church, Covent Gar-
den, London, the work of Inigo Jones. Its conftruction
is fingular. The roof extends to a confiderable distant
beyond the building, and the ends of the tie-beams
support the Tuscan corniche, appearing like the mu-
tules of the Doric order. Such a roof could not rest
on the tie-beam. Inigo Jones has therefore supported
it by a trufs below it; and the height has allowed him
to make this extremely strong with very little timber.
It is accounted the highest roof of its width in Lon-
don. But this was not difficult, by reafon of the great
height which its extreme width allowed him to employ
without hurting the beauty of it by too high a pitch.
The supports, however, are disposed with judgment.

Fig. 23. is a kirb or mantiai roof by Price, and fup-
pofed to be of large dimensions, having braces to carry
the middle of the rafters.

It will serve exceedingly well for a church having
pillars. The middle part of the tie-beam being taken
away, the strains are very well balanced, fo that there
is no risk of its pulling aside the pillars on which it
rests.

Fig. 24. is the celebrated roof of the theatre of the
university of Oxford, by Sir Christopher Wren. The span
between the walls is 75 feet. This is accounted a very
ingenious, and a fingular performance. The middle part
of it is almost unchangeable in its form; but from this
circumstance it does not diftribute the horizontal thrust
with the fame regularity as the ufual confusion.
The horizontal thrust on the tie-beam is about twice
the weight of the roof, and is carried on by an iron
truf below the beam, which stretches the whole width
of the building in the form of a rope, making part of
the ornament of the ceiling.

In all the roofs which we have confidered hitherto
in the thrust is difcharged entirely from the walls by
the tie-beam. But this cannot always be done. We
fre- tum it may be very convenient to keep the walls far
of all prefure owards, and arched ceil-
ins such cafes, it is a much more diftinguished matter

Yet this is the greateft fault of a roof. We fhall juft
point out the methods which may be moat successfully
aadopted.

We have faid that a tie-beam juft performs the of-
cine of a fir. We have faid the fame of the king-
poll. Now fuppofe two rafters AB, BC (fig. 25.)
connected about the joint B, and refting on the top of
the walls. If the line BD be refjended from B, and
the two lines DA, DC be faftened to the feet of the
rafters, and if these lines be incapable of extenfon, it
is plain that all thrust is removed from the walls as ef-
fectually.
frequently as by a common tie-beam. And by shortening BD to B d, we gain a greater inside height, and more room for an arched ceiling. Now if we substitute a king-post BD (fig. 26) and two stratches or hammer-beams DA, DC for the other struts, and connect them firmly by means of iron straps, we obtain our purpose.

Let us compare this roof with a tie-beam roof in point of strain and strength. Recur to fig. 25, and complete the parallelogram ABCF, and draw the diagonal AC, BF crossing in E. Draw BG perpendicular to CD. We have seen that the weight of the roof (which we may call W) is due to the horizontal thrust at C as BF to EC; and if we express this thrust by T, we have $T = \frac{W \times EC}{BF}$.

We may at present consider BC as a lever moveable round the joint B, and pulled at C in the direction EC by the horizontal thrust, and held back by the firing pulling in the direction CD. Suppose that the forces in the directions EC and CD are in equilibrium, and let us find the force S by which the firing CD is strained. These forces must (by the property of the lever) be inversely as the perpendiculars drawn from the centre of motion on the lines of their direction. Therefore $BG = BE = T \times S$, where $BE = BE\cdot EC$, and $S = T \times \frac{EC}{BF \cdot BG}$.

Therefore the strain upon each of the ties DA and DC is always greater than the horizontal thrust or the strain on a simple tie-beam. This would be no great inconvenience, because the smallest dimensions that we could give to the ties, so as to procure sufficient fixtures to the adjoining pieces, are always sufficient to withstand this strain. But although the same may be said of the iron straps which make the ultimate connections, there is always some hazard of imperfect work, cracks or flaws, which are not perceived. We can judge with tolerable certainty of the soundness of a piece of timber, but cannot say so much of a piece of iron. Moreover, there is a prodigious strain excited on the king-post, when BG is very short in comparison of BE, namely, the force compounded of the two struts S and S on the ties DA and DC.

But there is another defect from which the straight tie-beam is entirely free. All roofs settle a little. When this roof settles, and the points B and D descend, the legs BA, BC must spread further out, and thus a pressure outwards is excited on the walls. It is seldom therefore that this kind of roof can be executed in this simple form, and other contrivances are necessary for counteracting this supervening action on the walls.

Fig. 27, is one of the best which we have seen, and is executed with great success in the circus or equestrian theatre in Edinburgh, the width being 60 feet. The pieces EF and ED help to take off some of the weight, and by their greater uprightness they exert a smaller thrust on the walls. The beam D d is also a sort of truss-beam, having something of the same effect. Mr Price has given another very judicious one of this kind, British Carpenter, Plate 1K, fig. C, from which the tie-beam may be taken away, and there will remain very little thrust on the walls. Tho' which he has given in the following Plate K are, in our opinion, very faulty. The whole strain in the last roofs tends to break the rafters and ties transfervely, and the fixtures of the ties are also not well calculated to resist the strain to which the pieces are expos'd. We hardly think that these roofs could be executed.

It is scarcely necessary to remind the reader, that in General observations on the subject, we have attended only to the construction of the principal rafters or trusses. In small buildings all the rafters are of one kind; but in great buildings the whole weight of the covering is made to rest on a few principal rafters, which are connected by beams placed horizontally, and either mortised into them or scarfed on them. These are called purlins. Small rafters are laid from purlin to purlin; and on these the laths for tiles, or the flanking boards for slates, are nailed. Thus the covering does not immediately rest on the principal frames. This allows some more liberty in their construction, because the garrets can be so divided that the principal rafters shall be in the partitions and the roof left unincumbered. This contrivance is so far analogous to that of floors which are constructed with girders, binding, and bridging joists.

It may appear presuming in us to question the propriety of this practice. There are situations in which it is unavoidable, as in the roofs of churches, which can be allowed to rest on some pillars. In other situations, where partition-walls intervene at a distance not too great for a flat purlin, no principal rafters are necessary, and the whole may be roofed with short rafters of very slender scantling. But in a great uniform roof, which has no intermediate supports, it requires at least some reasons for preferring this method of carcase-roofing to the simpler method of making all the rafters alike. The method of carcase-roofing requires the selection of the greatest logs of timber, which are seldom of equal strength and soundness with thinner rafters. In thee the outside planks can be taken off, and the belt part alone worked up. It also exposes to all the defects of workmanship in the mortising of purlins, and the weakening of the rafters by this very mortising; and it brings an additional load of purlins and short rafters. A roof thus contructed may therefore be compared with a floor of similar construction. Here there is not a shadow of doubt, that if the girders were sawed into planks, and these planks laid as joists sufficiently near for carrying the flooring boards, they will have the same strength as before, except so much as is taken out of the timber by the saw. This will not amount to one-tenth part of the timber in the binding, bridging, and ceiling joists which are an additional load; and all the mortises and other joinings are so many diminutions of the strength of the girders; and as no part of a carpenter's work requires more skill and accuracy of execution, we are exposed to many chances of imperfection. But, not to rest on these considerations, however reasonable they may appear, we shall repeat an experiment made by one on whose judgment and exactness we can depend.

Two models of floors were made 18 inches square of Confirmed the finest uniform deal, which had been long seasoned, by experiment. The one consisted of simple joists, and the other was framed with girders, binding, bridging, and ceiling joists. The plain joists of the one contained the same quantity of timber with the girders alone of the other, and both were made by a most accurate workman. They were placed in wooden trunks 18 inches square within,
The only argument of weight which we can recollect in favour of the compound construction of roofs is, that the plain method would prodigiously increase the quantity of work; would admit nothing but long timber, which would greatly add to the expense; and would make the girders a mere thicket of planks. We admit this in its full force; but we continue to be of the opinion that plain roofs are greatly superior in point of strength, and therefore should be adopted in cases where the great difficulty is to infuse this necessary circumstamce.

It would appear very negligent to omit an account of the roofs put to round buildings, such as domes, cupolas and the like. They appear to be the most difficult tasks in the carpenter art. But the difficulty lies entirely in the mode of framing, or what the French call the trait de charpenterie. The view which we are taking of the subject, as a part of mechanical science, has little connection with this. It is plain, that whatever form of a truss is excellent in a square building, has little to do with the subject, but is merely an application of principles, and therefore should be adopted in cases where the great difficulty is to infuse this necessary circumstance.

The trial had been made before, and the loads were 341 and 482. But the models having been made by a left accurate hand, it was not thought a fair specimen of the strength which might be given to a carcase floor.

Rook [480] Rook

49 Farther remarks on Norman roofs.

We cannot take leave of the subject without taking some notice of what we have already spoken of with commendation by the name of Norman roofs. We called them Norman, because they were frequently executed by that people soon after their establishment in Italy and other parts of the south of Europe, and became the prevailing taste in all the great baronial castles. Their architects were rivals to the Saracens and Moors, who, about that time built many Christian churches; and the architecture which we now call Gothic seems to have arisen from their joint labours.

The principle of a Norman roof is extremely simple. The rafters all butted on joggles king-posts AF, BG, CH, &c. (fig. 29.), and braces or ties were then disposed in the intervals. In the middle of the roof HB and HD are evidently ties in a flat roof or to a floor. A floor such as this is supported at E by a cheek put between it and the under rafter. The middle point of each square of the roof is supported and stiffened by four braces, one of which springs from e., and its opposite from the middle part only of the adjoining trusses. The other two braces spring from the middle points of the lower purlins, which go horizontally from a and b to the next trusses, and are supported by planks in the same manner as the rafters. By this contrivance the whole becomes very stiff and firm.

We hope that the reader will not be displeased with our having taken some notice of what was the pride of our ancestors, and constituted a great part of the finery of the grand hall, where the feudal lord assembl'd his vassals and displayed his magnificence. The intelligent mechanic will see much to commend; and all who look at these roofs admire their apparent firmness and strength.

Much of what has been said on this subject may be applied to the construction of wooden bridges and the arches for turning the arches of stone bridges. But the farther discussion of this must be the employment of another article.

ROOFING, the materials of which the roof of a house is composed. See the foregoing article.

ROOK, in ornithology. See Corvus.

Rooks are very destructive of corn, especially of wheat. They search out the lands where it is fown, and watching them more carefully than the owners, they perceive when the corn first begins to shoot up its blade; this is the time of their feeding on it. They will not be at the pains of searching for it at random in the open field, for that is of no use; for the living rooks will tear the seeds to pieces, and to that bird, and it will no longer give itself the trouble to destroy them.

Wheat that is fown so early as to shoot up its green blades before the harvest is all carried in, is in no danger from these birds; because while it is in a state worth their searching for, the scattered corn in the harvest fields is easier come at, and they feed wholly on this, neglecting the fown grain. But as this cannot always be done, the farmers, to drive away these ravenous and mischievous birds, dig holes in the ground and fling up the feathers of rooks in them, and hang up dead rooks on sticks in several parts of the fields; but all this is of very little use; for the living rooks will tear up the ground about the feathers, and under the dead ones, to steal the seeds. A much better way than either is to tear several rooks to pieces, and to scatter the pieces over the fields; but this leaves but a little while, for the kites and other birds of prey soon carry off the pieces and feed upon them. A gun is a good remedy while
while the person who has it is present; but as soon as
he is gone, they will return with redoubled vigour to
the field and tear up every thing before them.

The best remedy the farmer has is to watch well the
time of the corn's being in the condition in which they
feed upon it; and as this lasts only a few days, he
should keep a boy in constant pay to watch the field
from day-break till the dusk of the evening. Every
time they settle upon the ground to fly over it, the boy
is to holloa, and throw up a dead rook into the air:
this will always make them rise; and by degrees they
will be so tired of this constant disturbance, that they
will seek out other places of preying, and will leave
the ground even before the time of the corn's being unfit
for them. The reason of their rising at the toffing up
of their dead fellow-creature is, that they are a bird
extremely apprehensive of danger, and they are always
alarmed when one of their comrades rife. They take
this for the rising of an out-bird, and all fly off at the
signal.

ROOKE (Sir George), a gallant naval commander,
born of an ancient and honourable family in Kent, in
England, in 1652. His merit raised him by regular
steps to be vice-admiral of the blue: in which station he
ferved in the battle of La Hogue, on the 22d of May
1692; when it was owing to his vigorous behaviour,
that the left stroke was given on that important day,
which threw the French entirely into confusion. But
the next day he obtained still more glory; for he had
orders to go into La Hogue, and burn the enemy's
ships as they lay there. There were 13 large men of
war, which had crowded as far up as possible; and the
transports, tenders, and ammunition ships, were dis-
pofed in such a manner that it was thought impossible
to burn them. Besides, the French camp was in flight,
with all the French and Irish troops that were to have
been employed in the invasion of England; and several
batteries were raised on the coast, well provided with
heavy artillery. The vice-admiral made the necessary
preparations for obeying his orders, but found it im-
possible to carry in the ships of his squadron: he there-
fore ordered his light frigates to ply in close to the
shore; and having manned all his boats, went him-
telf to give directions for the attack, burnt that very
night five three-deck-ships, and the next day six more,
from 76 to 60 guns, together with most of the trans-
ports and ammunition vessels; and this under the fire
of all the batteries just mentioned, and in sight of all
the French and Irish troops: yet this bold action cost
the lives of no more than ten men. The vice-admiral's
behaviour on this occasion appeared so great to King
William, that having no opportunity at that time of
promoting him, he settled a pension of 1000l. per an-
um on him for life; and afterwards going to Port-
smouth to view the fleet, went on board Mr. Rooke's
ship, dined with him, and then conferred on him the
honour of knighthood, having a little before made
him vice-admiral of the red.

In consequence of other services he was in 1694 raised
to the rank of admiral of the blue; towards the close
of the next year, he was admiral of the white; and was also appointed admiral and com-
mander in chief in the Mediterranean.

During King William's reign, Sir George was twice
elected member for Portsmouth; and upon the acces-
sion of Queen Anne in 1702, he was constituted vice-
admiral and lieutenant of the admiralty of England, as
also lieutenant of the fleets and seamen of the kingdom.

Upon the declaration of war against France he was
ordered to command a fleet sent against Cadiz, the
duke of Ormond having the command of the land
forces. On his passage home, receiving an account that
the gallions, under the escort of a strong French fluo-
dron, were got into the harbour of Vigo, he resolved
to attack them; and on the 11th of October came before
the harbour of Rondondello, where the French
commander had neglected nothing necessary for putting
the place into the best posture of defence. But not-
withstanding this, a detachment of 15 English and 10
Dutch men of war, of the line of battle, with all the
fire ships, were ordered in; the frigates and bomb-ve-

fels followed; the great ships moved after them, and
the army landed near Rondondello. The whole service
was performed under Sir George's directions, with ad-
mirable conduct and bravery; for, in short, all the ships
were destroyed or taken, prodigious damage done to
the enemy, and vast wealth acquired by the allies.

For this action Sir George received the thanks of
the House of Commons, a day of thanksgiving was ap-
pointed both by the queen and the states-general, and
Sir George was promoted to a seat in the privy-coun-
cil; yet, notwithstanding this, the House of Lords
resolved to inquire into his conduct at Cadiz. But
he so fully justified himself, that a vote was passed,
approving his behaviour.

In the spring of the year 1704, Sir George com-
manded the ships of war which conveyed King Cha.
III. of Spain to Lisbon. In July, he attacked Gib-
ralter; when, by the bravery of the English seamen,
the place was taken on the 24th, though the town was extremely
strong, well furnished with ammunition, and had 160
guns mounted, all facing the sea and the narrow palls
to the land: An action which was conceived and ex-
cuted in less than a week; though it has since endured
fieges of many months continuance, and more than once
baffled the united forces of France and Spain. This
brave officer being at last obliged, by the prevalence of
party-spirit, to quit the service of his country, retired
to his seat in Kent; where he spent the remainder of
his days as a private gentleman.

He was thrice married; and by his second lady Mrs
Luttrel left one son. He died January 24. 1708-9,
in his 58th year, and was buried in Canterbury cath-
dral, where a monument is erected to his memory. In
his private life he was a good husband and a kind mat-
ter, lived hospitably towards his neighbours, and left
behind him a moderate fortune; so moderate, that when
he came to make his will, it surprized those who were
present: but Sir George assigned the reason in a few
words, "I do not leave much (said he), but what I
leave was honestly gotten; it never cost a sailer a tear,
or the nation a farthing."

ROOM, a chamber, parlour, or other apartment in
a house. See Architecture and Ventilation.

ROOT, among botanists, denotes that part of a
plant which imbibes the nutritious juices of the earth,
and transmits them to the other parts. See Plant and
Radix.

Colours extracted from Roots. See Colour-Making,
Root, in algebra and arithmetic, denotes any number which, multiplied by itself once or oftener, produces any other number; and is called the square, cube, biquadrate, &c. root, according to the number of multiplications. Thus, 2 is the square-root of 4; the cube-root of 8; the biquadrate-root of 16, &c.

ROPE, is a word too familiar to need a definition. We need say no more than that it is a chord applied to a considerable collection of twisted fibres. Smaller bands are called lines, strings, cords; and it is no applied with great propriety even to those, unless they are composed of smaller things of the same kind twisted together. Two hay bands twisted together would be called a rope. All the different kinds of this manufacture, from a fishing-line or whip-cord to the cable of a first rate ship of war, go by the general name of Cordage.

Ropes are made of every substance that is sufficiently fibrous, flexible, and tenacious, but chiefly of the barks of plants. The Chinese and other orientals even make them of the ligneous parts of several plants, such as certain bamboos and reeds, the stems of the aloe, the fibrous covering of the cocoa nut, the filaments of the cotton-pod, and the leaves of some gramineous, such as the pàparate (Lygeum, Linn.) The aloe (Aloe, Linn.) and the pàparate exceed all others in strength. But the barks of plants are the most productive of fibrous matter fitted for this manufacture. Those of the Linden tree (Tilia), of the willow, the bramble, the nettle, are frequently used: but hemp and flax are of all others employed in all cordage exceeding the size of a line, and even in many of this denomination.

Hemp is very various in its useful qualities. These are great strength, and the length and fineness of the fibre. Being a plant of very greedy growth, it sucke up much of the unaltered juices of the soil, and therefore differs greatly according to its soil, climate, and culture. The best in Europe comes to us through Riga, to which port it is brought from very distant places to the southward. It is known by the name of Riga rizin (that is, clean) hemp. Its fibre is not the longest (at least in the dressed flat, in which we get it) of all others, but it is the finest, most flexible, and strongest. The next to this is supposed to be the Peterburgh brake hemp. Other hampers are esteemed nearly in the following order:—Riga out-of-town, Petterburgh out-of-town, hemp from Koningburgh, Archangel, Sweden, Memel. Chucking is a name given to a hemp that comes from various places, long in the fibre, but coarse and harsh, and its fineness is inferior to hampers which one would think weaker. Its texture is such, that it does not admit splitting with the hatchel so as to be more completely dreid. It is therefore kept in its coarse form, and used for inferior cordage. It is however a good and strong hemp, but will not make fine work. There are doubtless many good hampers in the southern parts of Europe, but little of them is brought to our market. Codilée, half clean, &c. are portions of the abovementioned hampers, separated by the dreidding, and may be considered as broken fibres of those hampers.

Only the first qualities are manufactured for the rigging of the British navy and for the ships of their East India company.

ROPE-MAKING is an art of very great importance; and there are few that better deserve the attention of the intelligent observer. Hardly any art can be carried on without the assistance of the rope-maker. Cordage makes the very fines and muscles of a ship; and every improvement which can be made in its preparation, either in respect to strength or pliability, must be of immense service to the mariner, and to the commerce and the defence of nations.

We shall give a very short account of the manufacture, which will not indeed fully instruct the artificers, but will give such a view of the process as shall enable the reader to judge, from principle, of the propriety of the different parts of the manipulation, and perceive its defects, and the means for removing them.

The aim of the rope-maker is to unite the strength of a great number of fibres. This would be done in the completest manner by laying the fibres parallel to each other, and fastening the bundle at the two ends; but this would be of very limited use, because the fibres are short, not exceeding three feet and an half on an average. They must therefore be entangled together, in such a manner that the strength of a fibre shall not be able to draw it out from among the rest of the bundle. This is done by twining or twining them together, which causes them mutually to compress each other. When the fibres are so disposed in a long skain, that their ends succeed each other along its length, without many of them meeting in one place, and this skain is twilled round and round, we may cause them to compress each other to any degree we please, and the friction on a fibre which we attempt to pull out may be more than its cohesion can overcome. It will therefore break. Consequently, if we pull at this twilled skain, we will not separate it by drawing one parcel out from among the rest, but the whole fibres will break; and if the distribution of the fibres has been very equable, the skain will be nearly of the same strength in every part. If there is any part where many ends of fibres meet, the skain will break in that part.

We know very well that we can twitk a skain of fibres so very hard, that it will break with any attempt to twitk it harder. In this state all the fibres are already strained to the utmost of their strength. Such a skain of fibres can have no strength. It cannot carry a weight, because each fibre is already strained in the same manner as if loaded with as much weight as it is able to bear. What we have said of this extreme case is true in a certain extent of every degree of twist that we give the fibres. Whatever force is actually exerted by a twitted fibre, in order that it may sufficiently compress the rest to hinder them from being drawn out, must be considered as a weight hanging on that fibre, and must be deduced from its absolute strength of cohesion, before we can estimate the strength of the skain. The strength of the skain is the remainder of the absolute strength of the fibres, after we have deduced the force employed in twitkling them together.

From this observation may be deduced a fundamental principle in rope-making; that all twitting, beyond what is necessary for preventing the fibres from being drawn out without breaking, diminishes the strength of the cordage, and should be avoided when in our power. It is of importance to keep this in mind.
It is necessary then to twist the fibres of hemp together, in order to make a rope; but we should make a very bad rope if we contended ourselves with twisting together a bunch of hemp sufficiently large to withstand the strains to which the rope is to be exposed. As soon as we let it go out of our hands, it would untwist itself, and be again a loose bundle of hemp; for the fibres are strained, and they are in a considerable degree elastic; they contract again, and thus untwist the rope or skain. It is necessary to continue the twist in such a manner, that the tendency to untwist in one part may act against the same tendency in another and balance it. The process, therefore, of rope-making is more complicated.

The first part of this process is spinning of rope-yarns. This is done in various ways, and with different machinery, according to the nature of the intended cordonage. We shall confine our description to the manufacture of the larger kinds, such as are used for the standing and running rigging of ships. It is sometimes covered above. At the upper end of this rope-walk is set up the spinner, of a form resembling that in fig. 5. A rope-walk, or ROPE-WALK, is a sort of loose hemp. He waits, therefore, till he sees the reeler begin to turn the reel, and he goes flowly up the walk, keeping the yarn of an equal tightness all the way, till he arrives at the wheel, where he waits with his yarn in hand till another spinner has finished his yarn. The first spinner takes it off the wheel hook, joins it to his own, that it may follow it on the reel, and begins a new yarn.

Rope-yarns, for the greatest part of the large rigging, are from a quarter of an inch to somewhat more kinds of than a third of an inch in circumference, or of such a rope-yarns. These sizes range from 3½ to 4 pounds when white. The different sizes of yarns are named from the number of them contained in a strand of a rope of three inches in circumference. Few are so coarse that 16 will make a strand of British cordage; 18 is not unfrequent for cable yarns, or yarns spun from harth and coarse hemp; 25 is, we believe, the finest size which is worked up for the rigging of a ship. Much finer are indeed spun for the rigging of lines, fishing lines, and many other marine uses and for the other demands of society. Ten good spinners will work up above 600 weight of hemp in a day; but this depends on the weather. In very dry weather the hemp is very elastic, and requires great attention to make smooth work. In the warmer climates, the spinner is permitted to moisten the rag with which he grasps the yarn in his right hand for each yarn. No work can be done in an open spinning walk in rainy weather, because the yarns would not take on the tar, if immediately tared, and would rot if kept on the reel for a long time.

The second part of the process is the conversion of the skain into rope.
the yarns into what may with propriety be called a rope, cord, or line. That we may have a clear conception of the principle which regulates this part of the process, we shall begin with the simplest possible case, the union of two yarns into one line. This is not a very usual fabric for rigging, but we select it for its simplicity.

When hemp has been split into very fine fibres by the hatchet, it becomes exceedingly soft and pliant, and after it has lain for some time in the form of fine yarn, it may be unreeled and thrown loose, without losing much of its twist. Two such yarns may be put on the whirl of a spinning wheel, and thrown, like flaxen yarn, so as to make sewing thread. It is in this way, indeed, that the tailor's sewing thread is manufactured, and when it has been kept on the reel, or on balls or bobbins, for some time, it retains its twist as well as its uses require. But this is by no means the case with yarn spun for great cordage. The hemp is so elastic, the number of fibres twilled together is so great, and the diameter of the yarn (which is a sort of lever on which the elasticity of the fibre exerts itself) is so considerable, that no keeping will make the fibres retain this constrained position. The end of a rope-yarn being thrown loose, it will immediately untwist, and this with considerable force and speed. It would, therefore, be a fruitless attempt to twill two such yarns together; yet the ingenuity of man has contrived to make use of this very tendency to untwist not only to counteract itself, but even to produce another and a permanent twist, which requires force to undo it, and which will recover itself when this force is removed. Every person must recollect that, when he was twilled a packthread very hard with his fingers between his two hands, if he slackens the thread by bringing his hands nearer together, the packthread will immediately curl up, running into loops or kinks, and will even twist itself into a neat and firm cord. Familiar as this fact is, it would puzzle any person not accustomed to these subjects to explain it with difleinfulness. We shall consider it with some care, not as piece of mechanical curiosity, but as a fundamental principle in this manufacture, which will give us clear instructions to direct us in the most delicate part of the whole process. And we beg the attention of the artificers themselves to a thing which they seem to have overlooked.

Let \( m, n \) (fig. 4.) be two yarns fixed to one point \( d \), and let both of them be twilled, each round its own axis, in the direction \( a b c \), which will cause the fibres to lie in a screw form, as represented in the figure. If the end \( d \) of the yarn \( m \) were at liberty to turn round the point \( d \), it would turn accordingly, as often as the end \( m \) is turned round, and the yarn would acquire no twist; but being attached to some solid body, it cannot turn without turning this body. It has, however, this tendency, and the body must be forcibly prevented from turning. If it be held fast for a time, and then let go, it will be turned round, and it will not stop till it has turned as often as the end \( m \) has been twisted, and now all the twist will be undone. Thus it is the tendency of the yarn \( m \) to untwist at the end \( d \) (because it is kept fast at \( m \)), which produces this motion of the body attached to it at \( d \). What we have said of the yarn \( m \) is equally true of the yarn \( n \). Both tend to turn, and will turn, the body attached at \( d \) round the common axis, in the same direction in which they are twilled. Let fig. 5. be supposed a crofs section of the two yarns touching each other at \( d \), and there glued to a board. The fibres of each pull obliquely, that is, they both pull away from the board, and pull laterally. The direction of this lateral pull of the fibres in the circumference of each yarn is represented by the little darts drawn round the circumferences. These actions directly oppose and balance each other at \( d \); but in the semicircles \( o e t, t f o \), they evidently confpire to turn the board round in the same direction. The same may be said of the outer halves of any circles described within these. In the inner halves of these inner circles the actions of some fibres oppose each other; but in every circle there are many more compelling actions than opposing ones, and the confpiring actions exert themselves by longer levers, so that their joint momentum greatly exceeds that of the opposing forces. It may be demonstrated, that if all the fibres exert equal forces, the force which tends to turn the board round the common axis is \( \frac{1}{2} \) of the force employed to twill both the yarns.

Suppose then that the solid body to which the yarns are attached is at liberty to turn round the common axis; it cannot do this without carrying the yarns round with it. They must, therefore, turn round each other, and thus compose a rope or cord \( k l \), having its component yarns (now called strands) lying in a direction opposite to that of the fibres in each strand. The rope will take this twist, while each of the strands is really untwisting, and the motion will not stop till all is again in equilibrium. If the yarn had no diameter and no rigidity, their elastic contractions would not be balanced till the cord had made half the number of turns which had been given to that part of the yarn which is thus doubled up. But, as the yarns have a diameter, the same ultimate contraction of the fibres will be expended by the twirling of the cord in fewer turns, even if the yarns had no rigidity. The turns necessary for this purpose will be far much fewer, in proportion to the twist of the yarns, as the fibres of the yarn lie more obliquely, that is, as the yarns are more twilled.

But further, this contrivable force has to overcome the rigidity or stiffness of the yarns. This requires force merely to bend it into the screw form; and therefore, when all is again at rest, the fibres are in a state of strain, and the rope is not so much clozed by doubling as it would have been had the yarns been closer. If any thing can be done to it in this state which will loosen the yarns, it will twist itself more up. It has therefore a tendency to twist more up; and if this be aided by an external force which will bend the strands, this will happen. Beating it with a foremallet will have this effect; or, if it be forcibly twilled till the fibres are allowed to contract as much as they would have done had the yarn been perfectly soft, the cord will keep this twist without any effort; and this must be considered as its most perfect state, in relation to the degree of twist originally given to the yarn. It will have no tendency to run into kinks, which is both troublesome and dangerous, and the fibres will not be exerting any useless effort.

To attain this state should therefore be the aim of every part of this second process; and this principle should be kept in view through the whole of it.
ROP [ 485 ] ROP

Rope-making.

10 Description of the machinery, and mode of using it.

has been already observed; and the operation of uniting them with a permanent twist is called laying or cloising, the latter term being chiefly appropriated to cables and other very large cordage.

Lines and cordeges less than 1½ inches circumference are laid at the spinning-wheel. The workman faltens the ends of each of two or three yarns to separate whirl-hooks. The remote ends are united in a knot. This is put on one of the hooks of a fiwheel called the loper, represented in fig. 6. and care is taken that the yarns are of equal lengths and twist. A piece of soft cord is put on the other hook of the loper; and, being put over a pulley several feet from the ground, a weight is hung on it, which stretches the yarn. When the workman finds that they are equally fretched, he orders the wheel to be turned in the same direction as when twining the yarns. This would twine them harder; but the fiwheel of the loper gives way to the brain, and the yarns immediately twist around each other, and form a line or cord. In doing this the yarns lose their twist. This is relieved by the wheel. But this simple operation would make a very bad line, which would be slack, and would not hold its twist; for, by the turning of the loper, the strands twist immediately together, to a great distance from the loper. By this turning of the loper the yarns are untwisted. The wheel restores their twist only to that part of the yarns that remains separate from the others, but cannot do it in that part where they are already twined round each other, because their mutual preflure prevents the twist from advancing. It is, therefore, necessary to retard this tendency to twine, by keeping the yarns apart. This is done by a little tool called the top, represented in fig. 7. It is a truncated cone, having three or more notches along its fides, and a handle called the staff. This is put between the strands, the small end next the loper, and it is pressed gently into the angle formed by the yarns which lie in the notches. The wheel being now turned, the yarns are more twisted, or hardened up, and their preflure on the top gives it a strong tendency to come out of the angle, and also to turn round. The workman does not allow this till he thinks the yarns sufficiently hardened. Then he yields to the preflure, and the top comes away from the fiwheel, which immediately turns round, and the line begins to lay. — Gradually yielding to this preflure, the workman slowly comes up towards the wheel, and the laying goes on, till the top is at last close to the wheel, and the work is done. In the mean time, the yarns are shortened, both by the twining of each and the laying of the cord. The weight, therefore, gradually rises. The use of this weight is evidently to oblige the yarn to take a proper degree of twist, and not run into kinks. A cord or line made in this way has always some tendency to twist a little more. However little friction there may be in the loper, there is some, so that the turns which the cord has made in the laying are not enough to balance completely the elasticity of the yarns; and the weight being appended caufes the strands to be more nearly in the direction of the axis, in the same manner as it would stretch and untwist a little any rope to which it is hung. On the whole, however, the twist of a laid line is permanent, and not like that upon thread doubled or thrown in a mill, which remains only in confequence of the great softness and flexibility of the yarn.

The process for laying or cloising large cordege is considerably different from this. The strands of which the rope is composed confist of many yarns, and require a considerable degree of hardening. This cannot be done by a whirl driven by a wheel-hand; it requires the power of a crane turned by the hand. The strands, when properly hardened, become very stift, and when bent round the top are not able to transmit force enough for laying the heavy and unplant rope which forms beyond it. The elastic twist of the hardened strands must, therefore, be affifted by an external force. All this requires a different machinery and a different procif.

At the upper end of the walk is fixed up the tackleboard, fig. 8. This consists of a strong oaken plank called a breach-board, having three or more holes in it, in this cafe, such as A, B, C, fitted with fraps or iron plates. Into these are put iron cranks, called heavers, which have hooks, or forlocks, and kept on the ends of their spindles. They are placed at such a distance from each other, that the workmen do not interfere with each other while turning them round. This breach-board is fixed to the top of strong posts well flured by fraps or braces facing the lower end of the walk. At the lower end is another breach-board fixed to the upright poles of a fledge, which may be loaded with flones or other weights. Similar cranks are placed in the holes of this breach-board. The whole goes by the name of the fledge; (see fig. 9.) The top necessary for cloising large cordege is too heavy to be held in the hand. It therefore has a long staff, which has a truck on the end. This rests on the ground; but even this is not enough in laying great cables. The top must be supported on a carriage, as shown in fig. 10. where it must lie very fleady, and need no attendance, because the master workman has sufficient employment in attending to the manner in which the strads close behind the top, and in helping them by various methods. The top is, therefore, fixed to the carriage by lathing its staff to the two upright poles. A piece of soft rope, or strap, is attached to the handle of the top by the middle, and its two ends are brought back and wrapped several times tight round the rope, in the direction of its twist, and bound down. This is shown at W, and it greatly affifts the laying of the rope by its friction. This both keeps the top from flying too far from the point of union of the strands, and brings the strads more regularly into their places.

The fiift operation is winding the yarns. At each end of the walk are frames called winding frames, which carry a great number of reels or winches filled with rope-yarn. The foreman of the walk takes off a yarn end from each, till he has made up the number necessary for his rope or frand, and bringing the ends together, he paifes the whole through an iron ring fixed to the top of a flake driven into the ground, and draws them through: then a knot is tied on the end of the bundle, and a workman pulls it through this ring till the intended length is drawn off the reels. The end is made fast at the bottom of the walk, or at the fledge, and the foreman comes back along the train of yarns, to see that none are hanging slackier than the rest. He
takes up in his hand such as are slack, and draws them tight, keeping them so till he reaches the upper end, where he cuts the yarns to a length, again adjuts their tightness, and joins them all together in a knot, to which he fixes the hook of a tackle, the other block of which is fixed to a firm post, called the swaring-post. The skain is well stretched by this tackle, and then separated into its different strands. Each of these is knotted apart at both ends. The knots at their upper ends are made to those at their lower ends are fastened to the cranks in their places, and every thing adjusted, so that the ledge to the cranks are turned the twist y. is dragged up the walk. When the foreman thinks the motion of the ledge, he orders the heavers at the cranks to cut off from the crank. This crank is brought back to an edge turn at both ends. Those at the tackle-board stand square on the walk, and then the strands, in which case it will be too slack, and draws them closer. The heaving at the upper end of the rope advances, the whole is increased by the motion of closing, they see no reason to move the cranks at the tackle-board, and the mark of the rope accelerates, while the ledge remains in the same place, because the strands are losing their twist, and are lengthening, while the closed rope is shortening. When, on the other hand, he thinks the top too far advanced, and fears that it will be at the head of the walk before the ledge has got to its proper place, he makes the men heave briskly on the strands, and the heavers at the ledge crank to work slowly. This quickens the motion of the ledge by shortening the strands; and by thus compensating what has been overdone, the ledge and top come to their places at once, and the work appears to answer the intention.

But this is a bad manner of proceeding. It is evident, that if the strands be kept to one degree of hardness throughout, and the heaving at the ledge be uniformly continued, the rope will be uniform. It may be a little longer or shorter than was intended, and the laying may be too hard in proportion to the twist of the strands, in which case it will not keep it; or it may be too slack, and the rope will tend to twit more. Either of these faults are discoverable by slackening the rope before it come off the hooks, and it may then be corrected. But if the error in one place be compensated by that in another, this will not be easily seen before taking off the hooks; and if it is a large and stiff rope, it will hardly ever come to an equable state in its different parts, but will be apt to run into loops during service.

It is, therefore, of importance to preserve the uniformity throughout the whole. Mr Du Hamel, in his great work on rope-making, proposes a method which is very exact, but requires an apparatus which is cumbersome, and which would be much in the way of the workmen. We think that the following method would be extremely easy, embarrass no one, and is perfectly exact. Having determined the proportion between the proposed, velocity of the top and ledge, let the diameter of the truck
ROP [ 487 ]

**Rope-making.**

The truck of the top carriage be to that of another truck fixed to the fledge, in the proportion of the velocity of the top to that of the fledge. Let a mark be made on the rim of each; let the man at the fledge make a figural every time that the mark on the fledge truck is uppermost. The mark on the carriage truck should be uppermost at the same instant; and in this way the foreman knows the state of the rope at all times without quitting his station. Thus, in making a cable of 120 fathoms, it is usual to warp the yams 180 fathoms, and to harden them up to 140 before closing. Therefore, in the closing, the top must move 140 fathoms, and the fledge only 20. The diameter of the carriage truck should therefore be seven times the diameter of the fledge truck.

We have hitherto proceeded on the supposition, that the twist produced by the cranks is propagated freely along the strands and along the closing rope. But this is not the case. It is almost unavoidable that the twist is greater in the neighbourhood of the crank which produces it. The strands are frequently of very considerable weight, and lie heavy on the stakes. Force is therefore necessary to overcome their friction, and it is only the overplus that is propagated beyond the point where the twist is first made. It is proper to lift them up from time to time, and let them fall down again, as the fawyer does with his marking line. This helps the twist to run along the fledge. But this is not enough for the closed rope, which is of much greater weight, and much thicker.—

When the top approaches the tackle-board, the heaving at the fledge could not cause the strands immediately behind the top to close well, without having previously produced an extravagant degree of twist in the intermediate rope. The effort of the crank must therefore be assisted by men stationed along the rope, each furnished with a tool called a wodder. This is a stout oak flick about three feet long, having a strap of soft rope-yarn or cordage fastened on its middle or end. The strap is wrapped round the laid rope, and the workman works with the flick as a lever, twisting the rope round in the direction of the crank's motion. The workmen should keep their eye on the men at the crank, and make their motion correspond with his. Thus they send forward the twist produced by the crank, without either increasing or diminishing it, in that part of the rope which lies between them and the fledge.

It is usual before taking the rope from the hooks to heave a while at the fledge end, in order to harden the rope a little. They do this so as to take it up about \( \frac{1}{4} \). The propriety or impropriety of this practice depends entirely on the proportion which has been previously observed between the hardening of the strands and the twisting of the closing rope. It is, in all cases, better to adjust these precisely, and then nothing remains to be done when the top has arrived at the upper end of the walk. The making of two strands and three strand line pointed out the principle which should be attended to in this case; namely, that the twist given to the rope in laying should be precisely what a perfectly soft rope would give to itself. We do not see any reason for thinking that the proportion between the number of turns given to the strands and the number of turns given to the laid line by its own elasticity, will vary by any difference of diameter. We would therefore recommend to the artificers to settle this proportion by experiment. The line should be made of the finest, smallest, and softest threads or yarn. These should be made into strands, and the strands should be hardened up in the direction contrary to the spinning twist. The rope should then be laid, hanging perpendicularly, with a small weight on the top to keep it down, and a very small weight at the end of the rope. The number of turns given to the strands should be carefully noticed, and the number of turns which the rope takes of itself in closing. The weight should then be taken off, and the rope will make a few turns more. This whole number will never exceed what is necessary for the equilibrium; and we imagine it will not fall much short of it. We are clearly of opinion an exact adjustment of this particular will tend greatly to improve the art of rope-making, and that experiments on good principles for ascertaining this proportion would be highly valuable, because there is no point about which the artificers themselves differ more in their opinions and practice.

The cordage, of which we have been describing the mode of manufacture, is said to be hauser-laid. It is not making thread-laid cordage uncommon to make ropes of four strands. These are used for hawking, and this cordage is therefore made on anyone part of a strand amounts only to \( \frac{1}{4} \) of the section of a strand. This is to be filled up by compressing the strands by twisting them. Each must fill up \( \frac{1}{4} \) of it by changing its shape; and \( \frac{1}{4} \) of this change is made on each side of the strand. The greatest change of shape therefore made on any one part of a strand amounts only to \( \frac{1}{16} \) of the section of the strand. The vacancy between four cylinders is \( \frac{1}{16} \) of one of them. This being divided into eight parts, is \( \frac{1}{16} \) of a strand, and is the greatest compression which any part of it has to undergo. This is nearly five times greater than the former, and must be more difficult to produce. Indeed, it may be seen by looking at the figures 11, and 12, that it will be easier to compress a strand into the obtuse angle of 120 degrees than into the right angle of 90; and without reasoning more about the matter, it appears that the difficulty will increase with the number of strands. Six strands must touch each other, and form an arch leaving a hollow in the middle, into which one of the strands will slip, and then the rest will not completely surround it. Such a rope would be uneven on the surface. It would be weak; because the central strand would be slack in comparison of the rest, and would not be exercising its whole force when they are just ready to break. We see then that a four strand rope must be more difficult to lay well than a hauser-laid rope. With care, however, they may be laid well and close, and are much used in the British navy.

Ropes are made of four strands, with a heart or And with shroud-laid cordage of four strands. This gives no additional strength, for the reason just now given. Its only use is to make the work better and more easy, and to support all the strands at the same distance from the axis of the rope. This is of great consequence; because when they are at unequal distances from the axis, some must be more sloping than others, and they will not rest alike. This
The heart is of reasoning and translation. This happens as follows: When the rope is violently strained, it stretches greatly because the strands surround the axis obliquely, and the strands draw them into a position more parallel to the axis. But the heart has not the obliquity of parts, and cannot stretch so much; at the same time, its yarns are firmly grasped by the hard strands which surround them; they must therefore be torn into short pieces.

The process from laying a rope with a heart is not very different from that already described. The top has a hole pierced through it, in the direction of the axis. The flax or flax intended for the heart passes through this hole, and is stretched along the walk. A boy attends it, holding it tight as it is taken into the closing rope. But a little attention to what has been said will show this method to be defective. The wick will have no more turns than the laid rope; and as it lies in the very axis, its yarns will be much straighter than the strands. Therefore when the rope is strained and stretched, the wick cannot stretch as much as the laid strands; and being firmly grasped by them, it must break into short pieces, and the strands, having left their support in those places, will sink in, and the cordage grow loose. We should endeavour to enable all to stretch alike. The wick therefore should be twiddled in the same manner as the strands, perhaps even a little more. It will thus communicate part of its strength to the rope. Indeed it will not be so uniformly solid, and may chance to have three spiral vacuities. But that this does no harm, is quite evident from the superior strength of cable-laid cordage, to be described presently, which have the same vacuities. In this way are the main and fore hawsers made for ships of the line. They are thought stronger than hawser-laid ropes, but unfit for running rigging; because their strands are apt to get out of their places when the rope is drawn into loops. It is also thought that the heart retains water, rots, and communicates its putrefaction to the surrounding strands.

Such is the general and essential process of rope-making. The fibres of hemp are twisted into yarns, that they may make a line of any length, and flick among each other with a force equal to their own cohesion. The yarns are made into cords of permanent twist by laying them; and, that we may have a rope of any degree of strength, many yarns are united in one strand, for the same reason that many fibres were united in one yarn; and in the course of this process it is in our power to give the rope a solidity and hardness which makes it less penetrable by water, which would rot it in a short while. Some of these purposes are inconsequent with others: and the skill of a rope-maker lies in making the belt compaction; so that the rope may on the whole be the belt in point of strength, planity, and duration, that the quantity of hemp in it can produce.

There is another species of cordage in very general use. A rope of two or more strands may be used as a strand, in order to compoit a still larger rope; and in this manner are cables and other ground tackle commonly made; for this reason such cordage is called cable-laid cordage.

The process of cable-laying hardly differs from that of hawser-laying. Three ropes, in their state of permanent twist, may be twisted together; but they will not hold it, like fine thread, because they are fliff and elastic. They must therefore be treated like strands for a hawser. We must give them an additional twist, which will dispose them to lay or close themselves; and this disposition must be aided by the workmen at the fledge. We say the twist should be an addition to their twist as a rope. A twist in the opposite direction will indeed give them a disposition to close behind the top; but this will be very small, and the ropes (now strands) will be exceedingly open, and will become more open in laying. The twist is therefore given in the direction of their twist as a rope, or opposite to that of the primary strands, of which the ropes are composed. These primary strands are therefore partly untwiddled in cable-laying a rope, in the same manner as the yarns are untwiddled in the usual process of rope-making.

We need not insist farther on this part of the manufacture. The reader must be sensible that the hawser intendeas for strands of a cable must not be so much twisted as those intended to remain hawser; for the twist given to a finished hawser is presumed to be that which renders it most perfect, and it must be injured by any addition. The precise proportion, and the distribution of the working up between the hardening of the strands and closing the cable, is a subject about which the artificers are not better agreed than in the case of hawser-laid cordage. We did not enter on this subject while describing the process, because the introduction of reasonings and principles would have hurt the simplicity of the description. The reader being now acquainted with the different parts of the manipulation, and knowing what can be done on any occasion, will now be able to judge of the propriety of the whole, when he learns the principle on which the strength of a rope depends.

We have already said, that a rope-yarn should be made of twisted till a fibre will break rather than be pulled out from among the rest, and that all twisting beyond this is injurious to the strength of the yarn: And we advanced this maxim upon this plain consideration, that it is needful to bind them closer together, for they will already break rather than come out; and because this closer binding is produced only by forcibly wrapping the outer fibres round the inner, and drawing the outer ones tight. Thus these fibres are on the stretch, and are strained as if a weight were hung on each of them. The process of laying lines, of a permanent twist, shows that we must do a little more. We must give the yarn a degree of elastic contrariety, which will make it lay itself and form a line or cord which will retain its twist. This must leave the fibres of the yarns in a state of greater comprension than is necessary for just keeping them together. But more than this seems to be needful and hurtful. The same maxim must direct us in forming a rope consisting of strands, containing more than one yarn. A needful excess of twist leaves them strained, and left able to perform their office in the rope.

It is not unfrequently happens, that the workman, in order to make his rope solid and firm, hardens up the
the strands till they really break: and we believe that, in the general practice of making large hawser, many of the outer yarns in the strands, especially those which chance to be outermost in the laid rope, and are therefore most strained, are broken during the operation.

But there is another consideration which should also make us give no greater twist in any part of the operation than is absolutely necessary for the firm cohesion of the parts, and this independent of the strain to which the fibres or yarns are subjected. Twisting causes all the fibres to lie obliquely with respect to the axis or general direction of the rope. It may just happen that one fibre or one yarn shall keep in the axis, and remain straight; all the rest must be oblique, and the more oblique as they are farther from the axis, and as they are more twisted. Now it is to be demonstrated, that when any strain is given to the rope in the direction of its length, a strain greater than this is actually excited on the oblique fibres, and so much the greater as they are more oblique; and thus the fibres which are already the weakest are exposed to the greatest strains.

Let CE (fig. 13.) represent a fibre hanging from a hook, and loaded with a weight F, which it is just able to bear, but not more. This weight may represent the absolute force of the fibre. Let such another fibre be laid over the two pulleys A, B (fig. 14.), which are in a horizontal line AB, and let weights W and F equal to the former, be hung on the ends of this fibre, while another weight R, less than the sum of F and f, is hung on the middle point C by a hook or thread. This weight will draw down the fibre into such a position ACB, that the three weights F, R, and f, are in equilibrium by the intervention of the fibre. We affirm that this weight R is the measure of the relative strength of the fibre in relation to the form ACB; for the fibre is equally stretched in all its parts, and therefore in every part it is strained by the force F. If therefore the weights F and f are held fast, and any addition is made to the weight R, the fibre must break, being already strained to its full strength; therefore R measures the strength in relation to its situation. Complete the parallelogram ACBD, and draw the diagonal CD; because AB is horizontal, and AC = BC, DC is vertical, and coincides with the direction CR, by which the weight R acts. The point C is drawn by three forces, which are in equilibrium. They are therefore proportional to the sides of a triangle, which have the same directions; or, the force acting in the direction CA is to that acting in the direction CR as CA to CD. The point R is supported by the two forces CA, CB, which are equivalent to CD; and therefore the weight F is to the weight R as CA is to CD. Therefore the absolute strengths of the two fibres AC, BC, taken separately, are greater than their united strengths in relation to their position with respect to CR: and since this proportion remains the same, whatever equal weights are hung on at F and f it follows, that when any strain DC is made to act on this fibre in the direction DC, it excites a greater strain on the fibre, because CA and CB taken together are greater than CD. Each fibre sustains a strain greater than the half of CD.

Now let the weight R be turned round the axis CR. This will cause the two parts of the fibre ACD to lap round each other, and compose a twisted line or cord CR, as in fig. 15. and the parallelogram ACBD will remain of the same form, by the yielding of the weights F and f, as it is evident from the equilibrium of forces.

The fibre will always assume that form which makes the sides and diagonal in the proportion of the weights.

While the fibres lap round each other, they are strained to the same degree, that is, to the full extent of their strength, and they remain in this degree of strain in every part of the line or cord CR. If therefore each of the fibres has the strength AB, the cord has the strength DC; and if F and f be held fast, the smallest addition to R will break the cord. The sum of the absolute strength of the two fibres of which this thread is composed is to the sum of their relative strengths, or to the strength of the thread, as AC + CB is to CD, or as AC is to EC.

If the weights F and f are not held fast, but allowed to yield, a heavier weight R may be hung on at C without breaking the fibre; for it will draw it into another position A B, such that R shall be in equilibrium with F and f. Since F and f remain the same, the fibre is as much strained as before. Therefore make e, b, equal to CA and CB, and complete the parallelogram edbc. e will now be a measure of the weight R, because it is the equivalent of e and fb. It is evident that e, d is greater than CD, and therefore the thread formed by the lapping of the fibre in the position abe is stronger than the former, in the proportion of ed to CD, or ec to CE. The cord is therefore so much stronger as the fibres are more parallel to the axis, and it must be strongest of all when they are quite parallel. Bring the pulleys A, B close to each other. It is plain that if we hang on a weight R less than the sum of F and f, it cannot take down the bight of the fibre; but if equal to them, although it cannot pull it down, it will keep it down. In this case, when the fibres are parallel to each other, the strength of the cord (improperly so called) is equal to the united absolute strengths of the fibres.

It is easy to see that the length of each of the fibres which compose any part CR of this cord is to the length of the part of the cord as AC to CE; and this is the case even although they should lap round a cylinder of any diameter. This will appear very clearly to any person who considers the thing with attention. Let a (fig. 16.) be an indefinitely small portion of the fibre which is lapped obliquely round the cylinder, and let HKG be a section perpendicular to the axis. Draw ae parallel to the axis, and draw e c to the centre of the circle HKG, and a e parallel to ec. It is plain that ec is the length of the axis corresponding to the small portion ae, and that ec is equal to ae.

Hence we derive another manner of expressing the ratio of the absolute and relative strength; and we may say that the absolute strength of a fibre, which has the same obliquity throughout, is to its relative strength as the length of the fibre to the length of the cord of which it makes a part. And we may say, that the strength of a rope is to the united absolute strength of its yarns as the length of the cord to the length of the yarns; for although the yarns are in various states of obliquity, they contribute to the strength of the cord in as much as they contribute immediately to the strength of the strands. The strength of the yarns is to that of the strands as the length of the yarns to that of the strands.
fronds, and the strength of the fronds is to that of the rope as the length of the first to that of the last.

And thus we see that twining the fibres diminishes the strength of the assemblage; because their obliquity, which is its necessary conformation, enables any external force to excite a greater strain on the fibres than it could have excited had they remained parallel; and since a greater degree of twinning necessarily produces a greater obliquity of the fibres, it must more remarkably diminish the strength of the cord. Moreover, since the greater obliquity cannot be produced without a greater strain in the operation of twining, it follows, that immoderate twining is doubly prejudicial to the strength of cordage.

These theoretical deductions are abundantly confirmed by experiment; and as many persons give their adherence more readily to a general proposition when presented as an induction from unexceptionable particulars, than when offered as the consequence of uncontroverted principles, we shall mention some of the experiments which have been made on this subject. Mr. Reaumur, one of the most zealous, and at the same time judicious, observers of nature made the following experiments. (Mémoires de l'Acad. de Paris, 1741.)

1. A thread, consisting of 832 fibres of silk, each of which carried a medium 1 dram and 18 grains, would hardly support 5½ pounds, and sometimes broke with 5 pounds. The sum of the absolute strengths of the fibres is 1040 drams, or upwards of 8 pounds 2 ounces.

2. A skein of white thread was examined in many places. Every part of it bore 92 pounds, but none of it would bear 10. When twined flack into a cord of 2 yarns it broke with 16 pounds.

3. Three threads were twined together. Their mean strength was very nearly 8 pounds. It broke with 17½, whereas it should have carried 24.

4. Four threads were twined. Their mean strength was 7½. It broke with 21¼ instead of 30. Four threads, whose strength was nearly 9 pounds, broke with 22 instead of 36.

5. A small and very well made hemp cord broke in different places with 58, 63, 67, 72 pounds. Another part of it was untwisted into its three fronds. One of them bore 29½, another 33½, and the third 3½; therefore the sum of their absolute strengths was 98. In another part which broke with 72, the fronds which had already borne this flain were separated. They bore 26, 28, and 30; the sum of which is 84.

The late admiral Sir Charles Knowles made many of his experiments on cordage of flax. A piece of rope 2½ inches in circumference was cut into many portions. Each of these had a fathom cut off, and it was carefully opened out. It was white, or un-tarred, and contained 72 yarns. They were each tried separately, and their mean strength was 90 pounds. Each corresponding piece of rope was tried apart, and the mean strength of the nine pieces was 4552 pounds. But 90 times 72 is 6480.

Nothing is more familiarly known to a seaman than the superior strength of rope-yarns made up into a flain without twisting. They call such a piece of rope a salvage. It is used on board the king's ships for rolling tackles, slinging the great guns, butt-lings, nippers for holding the violin on the cable, and in every service where the utmost strength and great pliancy are wanted.

It is therefore sufficiently established, both by theory and observation, that the twining of cordage diminishes its strength. Experiments cannot be made with sufficient precision for determining whether this diminution is in the very proportion, relative to the obliquity of the fibres, which theory points out. In a lawer the yarns lie in a great variety of angles with the axis. The very stemmost yarn of a fland is not much inclined to the axis of the rope; for the inclination of this yarn to the axis of its own ftrand nearly compensates for the inclination of the fland. But then the opposite yarn of the same ftrand, the yarn that is next the axis of the rope lies with an obliquity, which is the sum of the obliquities of the ftrand and of the yarn. So that all the yarns which are really in the axis of the rope are exceedingly oblique, and, in general, the inside of the rope has its yarns more oblique than the outside. But in a laid rope we should not consider the strength as made up of the strengths of the yarns; it is made up of the strengths of the fronds: For when the rope is violently stretched, it untwists as a rope, and the fronds are a little more twisted; for that, they are very twist yarns, and not as yarns. Indeed, when we consider the processes of laying the rope, we see that it must be so. We know, from what has been already said, that the three fronds would carry more when parallel than when twisted into a rope, although the yarns would then be much more oblique to the axis. The chief attention therefore should be turned to the making the most perfect fronds.

We are fully authorized to say that the twist given to cordage should be as moderate as possible. We are certain that it diminishes the strength, and that the appearance of strength which its superior smoothness and hardiness gives is fallacious. But a certain degree of this is necessary for its duration. If the rope is laid too flack, its parts are apt to open when it happens to be caught in short loops at its going into a pulley, &c. in which case some of the fronds or yarns are apt to kink and break. It also becomes too pervious to water, which foaks and rots it. To prevent these and other such inconveniences, a considerable degree of firmness or hardiness is necessary; and in order to give the cordage this appearance of superior strength, the manufacturer is dispensed to exceed.

Mr. Du Hamel made many experiments in the royal dock-yards in France, with a view to ascertaining what is the most of the belte degree of twist. It is usual to work up the yarns to of their length. Mr. Du Hamel thought this too much, and procured some to be worked up only to of their length of the yarns. The strength of the flain, by a mean of three experiments, was 4350, and that of the last was 5187.

He cauht three ropes to be made from the same hemp, spun with all possible equality, and in such proportion of yarn that a fathom of each was of the same weight. The rope which was worked up to bore 4090 pounds; that which was worked up to bore 4850; and the one worked up to bore 6200. In another trial the strengths were 4350, 6755, and 7397. These ropes were of different fizes.

He had influence enough, in consequence of these experiments, to get a considerable quantity of rigging made.
made of yarns worked up only to $\frac{1}{2}$ of their length, and had them used during a whole campaign. The officers of the ships reported that this cordage was about $\frac{1}{3}$ lighter than the ordinary kind; nearly $\frac{1}{4}$ binder, so as to give lees hold to the wind, was therefore more supple and pliant, and run easier through the blocks, and did not run into kinks; that it required fewer hands to work it, in the proportion of two to three; and that it was at least $\frac{1}{3}$ stronger. And they said that it did not appear to have suffered more by using than the ordinary cordage, and was fit for another campaign.

Mr Du Hamel also made experiments on other fabrics of cordage, which made all twirling unnecessary such as simply laying the yarn in flaxens, and then covering it with a worming of small line. This he found of much advantage to the workmen, and that it was much stronger. The ordinary processes of rope-making therefore must be adhered to; and we must endeavour to improve it by diminishing the twist as far as is compatible with the necessary solidity.

In pursuance of this principle, it is surely advisable to lay slack all such cordage as is used for standing rigging, and is never exposed to short bendings. Shrouds, stays, backstays, pendants, are in this situation, and can easily be defended from the water by tarring, furring, &c.

The same principle also directs us to make such cordage of four strands. When the strands are equally hardened, and when the degree of twist given in the laying is precisely that which is correspondent to the twist of the strands, it is demonstrable that the strands are lying less obliquely to the axis in the four-strand cordage, and should therefore exert greater force. And experience fully confirms this. Mr Du Hamel caused two very fine hawser to be made, in which the strands were equally hardened. One of them had three strands, and the other fix with a heart. They were worked up to the same degree. The first broke with 865 pounds, and the other with 1325. Several comparisons were made, with the same precautions, between cordage of two and four of strands, and in them all the four-strand cordage was found greatly superior; and it appeared that a heart judiciously put in not only made the work easier and more perfect to the eye, but also increased the strength of the cordage.

It is surely unreasonable to refuse credit to such a uniform course of experiment, in which there is no motive for imposition, and which is agreeable to every clear notion that we can form on this complicated subject; and it argues a considerable preeminence in the professional artists to oppose the vague notions which they have of the matter to the calm reflections, and minute examination of every particular, by a man of good understanding, who had no interest in misleading them.

The same principles will explain the superiority of cable-laid cordage. The general aim in rope-making is to make every yarn bear an equal share of the general strain, and to put every yarn in a condition to bear it. But if this cannot be done, the next thing aimed at is to put the yarns in such situations that the strains to which they are exposed in the use of the rope may be proportioned to their ability to bear it. Even this point cannot be attained, and we must content ourselves with an approach towards it.

The greatest difficulty is to place the yarns of a large Strand agreeably to the idea maxim. Supposing them placed with perfect regularity round the yarn which is in the middle: they will lie in the circumferences of concentric circles. When this whole mass is turned equally round this yarn as an axis, it is plain that they will all keep their places, and that the middle yarn is simply twisted round its axis, while those of the surrounding circles are lapped round it in spirals, and that these spirals are so much more oblique as the yarns are farther from the axis. Suppose the thread kept fast, so that the strand is not allowed to shorten. The yarns must all be fretted, and therefore strained; and those must be the most extended, and the most strained, and have the smallest remainder of their absolute forces. Unfortunately they are put into the most unfavourable situations, and those which are already most strained are left the most oblique, and have the greatest strain laid on them by any external forces. But this is unavoidable: Their greatest hurt is the strains they furnish in the manufacture. When the strand is very large, as in a nine-inch hawser, it is almost impossible to bring the whole to a proper firmness for laying without straining the outer yarns to the utmost, and many of them are broken in the operation.

The reader will remember that a two-strand line was laid or closed merely by allowing it to twist itself up at the twist of the upper; and that it was the elasticity of the yarn which produced this effect, and be would probably be increased when we find, that, in laying a larger rope, the strands are twisted in a direction opposite to that of the spinning. Since the tendency to close into a rope is nothing but the tending of the friction's to untwist, it would seem natural to twist the strands as the yarns were twisted before. This would be true, if the elasticity of the fibres in a yarn produced the same tendency to untwist in the strand that it does in the yarn. But this is not the case. The contraction of one of the outer yarns of a strand tends to pull the strand backward round the axis of the thread; but the contraction of a fibre of this yarn tends to turn the yarn round its own axis, and not round the axis of the strand. It tends to untwist the yarn, but not to untwist the strand. It tends to untwist the strand only so far as it tends to contract the yarn. Let us suppose the yarn to be spun up to one-half the length of the fibres. The contracting power of this yarn will be only one-half of the force exerted by the fibres: therefore, whatever is the force necessary for closing the rope properly, the fibres of the
the yarns must be exerting twice this force. Now let
the same yarn, spun up to one-half, be made up in a
strand, and let the strand be twilled in the opposite di-
rection to the spinning till it has acquired the same
elasticity fit for laying. The yarns are untwilled. Sup-
pose to three-fourths of the length of the fibres. They
are now exerting only four-thirds of the force nece-
ssary for laying, that is, two-thirds of what they were obliged
to exert in the other case; and thus we have stronger
yarns when the strands are equally strained. But they
require to be more strained than the other; which, be-
ing made of more twisted yarn, sooner acquire the elas-
 ticity fit for laying. But since the elasticity which
fits the strand for laying does not increase so fast as
the strain on the fibres of the yarn which produces
it, it is plain, that when each has acquired that elas-
ticity which is proper for laying, the strands made
of the slack-twilled yarn are the strongest; and the
yarns are also the strongest; and being softer, the
rope will close better.

Experience confirms all this; and cordage, whose
strands are twilled in the opposite direction to the twist
of spinning, are found to be stronger than the others
in a proportion not less than that of 7 to 6.

Such being the difficulty of making a large strand,
and its defects when made, we have fallen on a method
of making great cordage by laying it twice. A haw-
fer-laid rope, slack spun, little hardened in the strands,
and slack laid, is made a strand of a large rope called
a cable or cablet. The advantages of this fabric are
evident. The strands are reduced to one-third or one-
fourth of the diameter which they would have in a
hawser of the same size. Such strands cannot have
their yarns lying very obliquely, and the outer yarns
cannot be much more strained than the inner ones.
There must therefore be a much greater equality in
the whole substance of cable-laid cordage, and from
this we should expect superior strength.

Accordingly, their superiority is great, not less than
in the proportion of 13 to 9, which is not far from
the proportion of 4 to 3. A cable is more than a
fourth part, but is not a third part, stronger than a
hawser of the same size or weight.

They are seldom made of more than three hawfers
of three strands each, though they are sometimes made
de of three four-stranded hawfers, or of four three-strand-
ed. The first of these two is preferred, because four
small strands can be laid very close; whereas it is diffi-
cult to lay well four hawfers, already become very
hard.

The superiority of a cable-laid cordage being at-
tributed entirely to the greater perfection of the strands,
and this seeming to arise entirely from their smallness,
it was natural to expect still better cordage by lay-
ing cables as the strands of still larger pieces. It has
been tried, and with every requisite attention. But
although they have always equalled, they have not de-
cidedly excelled, common cables of the same weight;
and they require a great deal more work. We shall
not therefore enter upon the manipulations of this fa-
bic.

There is only one point of the mechanical pro cess of
rope-making which we have not considered minutely;
and it is an important one, viz. the distribution of the
total shortening of the yarns between the hardening of
the strands and the laying the rope. This is a point
about which the artists are by no means agreed. There
is certainly a position of the strands of a laid rope which
puts every part in equilibrio; and this is what an elas-
tic, but perfectly soft rope (were such a thing possible)
would assume. But this cannot be discovered by any
experiments made on large or even on firm cordage; and
it may not be thought sufficiently clear that the pro-
portion which would be discovered by the careful fabri-
cation of a very small and soft line is the same that
will suit a cordage of any diameter. We must proceed
much on conjecture; and we cannot say that the argu-
ments used by the partizans of different proportions are
very convincing.

The general practice, we believe, is to divide
the whole of the intended shortening of the yarns, or
the working up into three parts, and to employ two of
these in hardening the strands, and the remaining third
in closing the hawser.

Mr Du Hamel thinks, that this repartition is inju-
dicious, and that the yarns are too much strained, and
the strands rendered weak. He recommends to inver-
se this proportion, and to shorten one-third in the harden-
ing of the strands, and two-thirds in laying the hawser.
But if the strain of the strands only is considered, one
should think that the outside yarn of a strand will be
more strained in laying, in proportion to the yarn of
the same strand, that is, in the very axis of the rope.
We can only say, that if a very soft line is formed in
this way, it will not keep its twist. This shows that
the turns in laying were more than what the elasticity
or hardening of the strands required. The experiments
made on soft lines always showed a tendency to take a
greater twist when the lines were made in the first man-
er, and a tendency to lose their twist when made in
Mr Du Hamel's manner. We imagine that the true
proportion is between these two extremes, and that we
shall not err greatly if we halve the total shortening be-
tween the two parts of the process. If working up
to two-thirds be inflicted upon, and if it be really too
much, Mr Du Hamel's repartition may be better, becaus
part of this working will quickly go off when the cor-
dage is used. But it is surely better to be right in
the main point, the total working up, and then to adju-
t this distribution of it so that the finished cordage shall
precisely keep the form we have given to it.

There must be the same uncertainty in the quadruple
distribution of the working up a cable. When a cable
has its yarns shortened to one-third, we believe the or-
dinary practice has been, 1d, To warp 180 fathoms ;
2d, To harden up the strands 50 fathoms; 3d, To lay
or close up 13 fathoms; 4th, To work up the hawser
nine fathoms; 5th, To close up eight fathoms. This
leaves a cable of 120. Since Mr Du Hamel's experi-
ments have had an influence at Rochefort, the prac-
tice has been to warp 150, to harden up 38, to lay up
12, to work up the hawser 10, and then to close up fix;
and when the cable is finished, to shorten two fathoms
more, which our workmen call throwing the turn well
up. This leaves a cable of 122 fathoms.

As there is a little doubt of the superiority of cor-
dage shortened one-fourth over cordage shortened one-
third, the following distribution may be adopted: warp
190
ROP [ 493 ]

ROP

Rope-making.

Of the strands made use of during the operation,

190 fathoms, harden up 12, lay up 11, work up the hawers 12, and close up 12 more, which will leave a cable of 143.

There is another question about which the artists are divided in their opinions, viz. the strain made use of during the operation. This is produced by the weight laid on the fledge. If this be too small, the strands will not be sufficiently tightened, and will run into kinks. The fledge will keep up by flarts; and a small inequality of twist in the strands will throw it askew. The top will not run well without a considerable preface to throw it from the closing point, and therefore the cordage will neither close fairly nor firmly; on the other hand, it is evident, that the strain on the strands is a complete expenditure of so much of their force, and it may be fair as to break them. These are the extreme opinions. And we think that it may be fairly deduced from our principles, that as great a strain should be laid on the strands as will make good work, that is, as will enable the rope to close nearly and completely, but no more. But can any general rule be given for this purpose?

The practice at Rochefort was to load the fledge till its weight and load were double the weight of the yarns when it was warped at 180 fathoms. A fix-inch hawser will require about a ton. If we suppose the friction of one-third of the weight; the strain on each strand will be about two hundred and a quarter weight. Mr Du Hamel thinks this too great a load, and proposes to put only five-fourths or three-seCONDS of the weight of the cordage; and still less if a shorter piece was warped, because it does not require so much force to throw the twist from the two cranks to the middle of the fledge. We shall only say, that stronger ropes are made by heavy loading the carriage, and working up moderately, than by greater shortening, and a lighter load; but all this is very vague.

The reader will naturally ask, after this account of the manufacture, what is the general rule for computing the strength of cordage? It cannot be expected to be very precise. But if ropes are made in a manner perfectly similar, those should expect the strength to be in proportion to the area of their section; that is, to the square of their diameters or circumferences, or to the number of equal threads contained in them.

Nor does it deviate far from this rule; yet Mr Du Hamel shows, from a range of experiments made on all cordage of 3½ inch circumference and under, that the strength increases a little faster than the number of equal threads. Thus he found that ropes of

</table>

We cannot pretend to account for this. We must also observe, that the strength of cordage is greatly improved by making them of yarn spun fine. This requires finely dried hemp; and being more supple, the fibres lie close, and do not form such oblique spirals. But all hemp will not spin equally fine. Every fackle seems to consist of a number of principal fibres, which split more easily into a second, and these more difficultly into a third, and so on. The ultimate fineness, therefore, with a reasonable degree of drying, can give to hemp, bears some proportion, not in
Mr Du Hamel says, that it is decided by experience, 1. That white cordage in continual service is one-third more durable than tanned. 2. That it retains its force much longer while kept in store. 3. That it resists the ordinary injuries of the weather one-fourth longer.

We know this one remarkable fact. In 1738 the thows and stays of the Sheer shulk at Portsmouth dockyard were overhauled, and when the worming and service were taken off, they were found to be of white cordage. On examining the storeskeeper’s books, they were found to have been formerly the thows and rigging of the Royal William, of 110 guns, built in 1715, and rigged in 1716. She was thought top-heavy and unfit for sea, and unrigged and her thores laid up. Some few years afterwards, her thows and stays were fitted on the Sheer shulk, where they remained in constant and very hard service for about 30 years, while every tarred cope about her had been repeatedly renewed. This information we received from Mr Brown, boat-swain of the Royal William during the war 1758, &c.

Why then do we tar cordage? We thus render it more unpliant, weaker, and less durable. It is chiefly serviceable for cables and ground tackle, which must be continually wetted and even soaked. The result of careful observation is, 1. That white cordage, exposed to be alternately very wet and dry, is weaker than tanned cordage. 2. That cordage which is superficially tanned is constantly stronger than what is tanned throughout, and it refits better the alternatives of wet and dry. N. B. The thows of the Sheer shulk were well tanned and blacked, so that it was not known that they were of white cordage.

Tars is a curious substance, miscible completely with water. Attempts were made to anoint cordage with oils and fats which do not mix with water. This was expected to defend them from its pernicious effects. But it was distinctly found that these matters made the fibres of hemp glide so easily on each other, that it was hardly possible to twist them permanently. Before they grasped each other so hard that they could not be drawn, they were strained almost to breaking.

Attempts have been made to increase the strength of cordage by tanning. But although the practice as a constant practice in the manufacture of nets, it does not appear that much addition, either of strength or durability, can be given to cordage by this means. The trial has been made with great care, and by persons fully able to conduct the process with propriety. But it is found that the yarns take so long time in drying, and are so much hurt by drying slowly, that the room required for a considerable rope-work would be immense; and the improvement of the cordage is but trifling, and even equivocal. Indeed tanning is a chemical process, and its effect depends entirely on the nature of the materials to which the tan is applied. It unquestionably condenses, and even strengthens, the fibre of leather; but for any thing that we know a priori, it may destroy the cohesion of hemp and flax; and experiment alone could decide the question. The result has been unfavourable; but it does not follow from this that a tan cannot be found which shall produce on the texture of vegetables effects similar to what oak-bark and other astringents produce on the animal fibre or membrane. It is well known that some dyes increase the strength of flax and cotton, notwithstanding the corrosion which we know to be produced by some of the ingredients. This is a subject highly worth the attention of the chemist and the patriot.

**Rope-Dancer.** See Rope-Dancer.

**Rope-Tars.** Among sailors, is the yarn of any rope untwill’d but commonly made up of junk; its use is to make finnet, mats, &c. See ROCKET.

**RORIDULA.** In botany: A genus of the monogyia order, belonging to the pendantiæas of plants. The corolla is pentapetalous; the calyx pentaphyllous; the capsule trivalved; the antheræ f erotiform at the base.

**ROSA,** the **Ross:** A genus of the polygymia order belonging to the icofandria clafs of plants; and in the natural method ranking under the 35th order, Seniicofa. There are five petals; the calyx is urceolate, quinqued, corneous, and straightened at the neck. The seeds are numerous, hifpid, and affixed to the inside of the calyx.

The sorts of roses are very numerous; and the botanists find it very difficult to determine with accuracy which are species and which are varieties, as well as which are varieties of the respective species. On this account Linnaeus, and some other eminent authors, are inclined to think that there is only one real species of rose, which is the *roga canina*, or “dog-rose of the hedges,” &c. and that all the other sorts are accidental varieties of it. However, according to the present Linnaean arrangement, they stand divided into 14 supposed species, each comprehending varieties, which in some sorts are but few, in others numerous.

The supposed species and their varieties, according to the arrangement of modern botanists, are as follow: 1. The canina, canine rose, wild dog-rose of the hedges, or hepb-tree, grows five or fix feet high, having prickly-flanks and branches, pinnated, five or seven-lobed leaves, with aculeate foot-flanks, smooth pedunculi, oval smooth germina, and small fingle flowers. There are two varieties, red-flowered and white-flowered. They grow wild in hedges abundantly all over Britain; and are sometimes admitted into gardens, a few to increase the variety of the shrubbery collection. 2. The alba, or common white-rose, grows five or six feet high, having a green stem and branches, armed with prickles, hifpid pedunculi, oval smooth germina, and large white flowers. The varieties are,—large double white rose—dwarf fingle white rose—maiden’s-blush white rose, being large, produced in clusters, and of a white and bluish-red colour.

3. The Gallica, or Gallican rose, &c. grows from about three or four to eight or ten feet high, in different varieties; with pinnated, three, five, or seven-lobed leaves, and large red and other coloured flowers in different sorts. This species is very extensive in supposed varieties, bearing the above specific distinction, several of which have been formerly confidered as distinct species, but are now ranged among the varieties of the Gallican rose, confuring the following noted varieties.

Common red officinal rose, grows ered, about three or four feet high, having small branches, with but few prickles, and large spreading half double deep red flowers.
ROPE MAKING.

Plate CCCC XLI.
Blush hundred-leaved rose, grows like the other, with large very double pale-red flowers. 

Providence rose, grows five or six feet, with greenish-brown prickly branches, and very large double globular red flowers, with large petals folding over one another, more or less in the varieties. The varieties are, common red Providence rose, and pale Providence rose; both of which have larger and somewhat looser petals than the following sort. Cabbage Providence rose; having the petals closely folded over one another like cabbages—Dutch cabbage rose, very large, and cabbages tolerably. 

Chiding Providence rose—Great royal rose, grows fix or eight feet high, producing remarkably large, somewhat loose, but very elegant flowers. All these are large double red flowers, somewhat globular at first blooming, becoming gradually a little spreading at top, and are all very ornamental fragrant roses. 

Mofs Providence rose, supposed a variety of the common rose; grows creply four or five feet high, having brownish flanks and branches, very closely armed with short prickles, and double crimson-red flowers; having the calyx and upper part of the peduncle surrounded with a rough mossy-like substance, effecting a curious singularity. This is a fine delicate rose, of a high fragrance, which, together with its mossy calyx, renders it of great estimation as a curiosity. 

5. The cinnamomea, or cinnamon rose, grows five or six feet high, or more, with purplish branches thinly aculeated; pinnated five or seven lobed leaves, having almost inermous petals, smooth pedunculi, and smooth globular germina; with small purplish-red cinnamomeated flowers early in May. There are varieties with double flowers. 

6. The Alpina, or Alpine inermous rose, grows five or six feet high, having smooth or unarmed reddish branches, pinnated seven-lobed smooth leaves, somewhat hispid pedunculi, oval germina, and deep-red single flowers; appearing in May. This species, as being free from all kind of armature common to the other sorts of roses, is esteemed as a singularity; and from this property is often called the virgin rose. 

7. The Carolina, or Carolina and Virginia rose, &c. grows fix or eight feet high, or more, having smooth reddish branches, very thinly aculeated; pinnated seven-lobed smooth leaves, with prickly foot-flanks, hispid pedunculi, globose hispid germina, and single red flowers in clusters, appearing mostly in August and September. The varieties are, dwarf Pennsylvanica rose, with single and double red flowers—American pale-red rose. This species and varieties grow naturally in different parts of North America; they effect a fine variety in our gardens, and are in estimation for their late-flowering property, as they often continue to blow from August until October; and the flowers are succeeded by numerous red berry-like heps in autumn, causing a variety all winter. 

8. The villosi, or villosi apple-bearing rose, grows fix or eight feet high, having strong erect brownish smooth branches; aculeated sparingly pinnated seven-lobed villosi or hairy leaves, downy underneath, with prickly foot-flanks, hispid pedunculi, a globular prickly germina; and large single red flowers, succeeded by large round prickly heps, as big as little apples. This species merits admittance into every collection as a curiosity for the singularity of its fruit, both for variety.
and use; for it having a thick pulp of an agreeable acid relish, is often made into a tolerable good sweetmeat.

9. The pinnatifolium, or burnet-leaved rose, grows about a yard high, aculeated sparingly; small neatly pinnate seven-lobed leaves, having obtuse foliolo and rough petioles, smooth peduncules, a globular smooth germen, and small single flowers. There are varieties with red flowers—and with white flowers. They grow wild in England, &c. and are cultivated in shrubberies for variety.

10. The spinaclima, or moss spiny, dwarf burnet-leaved rose, commonly called Scotch rose, grows but two or three feet high, very closely armed with spines; small neatly pinnate seven-lobed leaves, with prickly foot-flanks, prickly peduncle, oval smooth germen, and numerous small single flowers, succeeded by round dark-purple hips. The varieties are, common white-flowered—red-flowered—striped-flowered—marble-flowered. They grow naturally in England, Scotland, &c. The first variety rises near a yard high, the others but one or two feet, all of which are single-flowered; but the flowers being numerous all over the branches, make a pretty appearance in the collection.

11. The eleganteria, egalline rose, or sweet briar, grows five or six feet high, having green branches, armed with strong spines sparingly; pinnate seven-lobed odoriferous leaves, with acute foliolo and rough foot-flanks, smooth peduncle, globular smooth germen, and small pale-red flowers. The varieties are, common single-flowered—semi-double flowered—double-flowered—blue double-flowered—yellow-flowered. This species grows naturally in some parts of England, and in Switzerland. It claims culture in every garden for the odoriferous property of its leaves; and should be planted in the borders, and other compartments contiguous to walks, or near the habitation, where the plants will impart their refreshing fragrance very profusely all around; and the young branches are excellent for improving the odour of rose-gays and bow-pots.

13. The sempervirens, or ever-green musk-rose, hath smooth green stalks and branches, rising by support from six to eight or ten feet high or more, thinly armed with strong spines; pinnate seven-lobed smooth leaves, with prickly foot-flanks; hispid peduncles; oval hispid germen; and all the branches terminated by large umbellate clusters of pure-white musk-scented flowers in August, &c.

13. The sempervirens, or ever-green musk-rose, hath a somewhat trailing stalk and branches, rising by support five or six feet high or more, having a smooth bark armed with prickles; pinnate five-lobed smooth shining evergreen leaves, with prickly petioles, hispid peduncle, oval hispid germen; and all the branches terminated by clusters of pure-white flowers of a musky fragrance; appearing the end of July, and in August. The sempervirens property of this elegant species renders it a curiosity among the rose tribe; it also makes a fine appearance as a flowering shrub. There is one variety, the deciduous musk-rose abovementioned. This species and variety flower in August, and is remarkable for producing them numerously in clusters, continuing in succession till October or November.

The above 13 species of roses, and their respective varieties, are of the shrub kind; all deciduous, except the last sort, and of hardy growth, succeeding in any common soil and situation, and flowering annually in great abundance from May till October, in different sorts; though the general flowering season for the principal sorts of them is June and July. And in a full collection of the different species, the flower is continued in constant succession several months, even sometimes from May till near Christmas; producing their flowers universally on the same year's shoots, rising from those the year before, generally on long pedunculi, each terminated by one or more roses, which in their characteristic state consist of each of five large petals and many stamina; but in the doubles, the petals are very numerous; and in some sorts, the flowers are succeeded by fruit ripening to a red colour in autumn and winter, from the seed of which the plants may be raised: but the most certain and eligible mode of propagating most of the sorts is by suckers and layers; and by which methods they may be increased very expeditiously in great abundance.

The white and red roses are used in medicine. The former distilled with water yields a small portion of a butyrous oil, whose flavour exactly resembles that of the rose itself. This oil, and the distilled water, are very useful and agreeable cordials. These roses also, besides the cordial and aromatic virtues which reside in their volatile parts, have a mild purgative one, which remains entire in the decoction left after distillation. The red rose, on the contrary, has an astringent and gratefully corroborating virtue.

ROSÁ (Salvator), an admirable painter, born at Naples in 1614. He was first instructed by Francesco Francanazo, a kinsman: but the death of his father reduced him to fall drawings sketched upon paper for any thing he could get; one of which happening to fall into the hands of Lanfranc, he took him under his protection, and enabled him to enter the school of Spagnolotto, and to be taught moreover by Daniel Falcone, a distinguished painter of battles at Naples. Salvator had a fertile imagination. He studied nature with attention and judgment; and always represented her to the greatest advantage: for every tree, rock, cloud, or situation, that enters into his composition, shows an elevation of thought that extorts admiration. He was equally eminent for painting battles, animals, sea or land storms; and he executed these different subjects in such taste as renders his works readily distinguishable from all others. His pieces are exceedingly scarce and valuable; one of the most capital is that representing Saul and the witch of Enord, which was preferred at Versailles. He died in 1673; and as his paintings are in few hands, he is more generally known by his prints; of which he etched a great number. He painted landscapes more than history; but his prints are chiefly historical. The capital landscape of this matter at Chiswick is a noble picture. However, he is said to have been ignorant of the management of light, and to have sometimes shaded faces in a disagreeable manner. He was however a man of undoubted genius; of which he has given frequent specimens in his works. A raving disposition, to which he is said to have given full scope, seems to have added a wildness to all his thoughts. We are told that he spent the early part of his life in a troop of banditti; and that the rocky desolate scenes
Rosacea

in which he was accustomed to take refuge, furnished
him with those romantic ideas in landscape, of which he
is so exceedingly fond, and in the description of which
he so greatly excels. His roflere, as his detached fig-
ures are commonly called, are supposed also to have
been taken from the life.

Salvator Ros is sufficiently known as a painter; but
until now we never heard of him as a musician.

Among the musical manuscripts purchased at Rome
by Dr Burney, was a music book of Salvator, in
which are many airs and cantatas of different ma-
ters, and eight entire cantatas, written, set, and tran-
scribed by this celebrated painter himself. The
specimen of his talents for music here given, we make
no scruple of declaring, that he had a truer genius
for this science, in point of melody, than any of his
predecessors or contemporaries: there is also a strength
of expression in his verses, which sets him far above
the middle rank as a poet. Like most other arts of
real original merit, he complains of the ill usage of the
world, and the difficulty he finds in procuring a bare
subsistence.

Rosamond, daughter of Walter Lord Clifford,
was a young lady of exquisite beauty, fine accomplis-
ments, and blessed with a most engaging wit and sweet-
ness of temper. She had been educated, according to
the custom of the times, in the nunnery of Godstow; and
the popular story of her is as follows: Henry II. saw
her, loved her, declared his passion, and triumphed over
her honour. To avoid the jealousy of his queen Ei-
nor, he kept her in a wonderful labyrinth at Wood-
tock, and by his connection with her had William
Longsword earl of Salisbury, and Geoffrey bishop of
Lincoln. On Henry's absence in France, however,
on account of a rebellion in that country, the queen
found means to discover her, and though struck with
her beauty, she revealed sufficient resentment to poison
her. The queen, it is said, discovered her apartment
by a thread of silk; but how she came by it is differ-
ently related. This popular story is not however support-
ed by history; several writers mention no more of her,
than that the queen so vented her spleen on Rosamond
as that the lady lived not long after. Other writers
assert that she died a natural death; and the story of her
being poisoned is thought to have arisen from the figure
of a cup on her tomb. She was buried in the church of
Godstow, opposite to the high altar, where her body
remained till it was ordered to be removed with every
mark of disgrace by Hugh bishop of Lincoln, in 1191.
She was, however, by many considered as a saint after
her death, as appears from an inscription on a crosf
which Leland says stood near Godstow:

Qui morte hoc oris, signum salutis adorat,
Unique flet deur veniam. Rosamunda precatur.

And also by the following story: Rosamond, during
her residence at her bower, made several visits to God-
stow; where being frequently reproved for the life she
led, and threatened with the consequences in a future
state, she always answered, that she knew she should be
fared; and as a token to them, showed a tree which she
said would be turned into a stone when she was with
the saints in heaven. Soon after her death this won-
derful metamorphosis happened, and the stone was
given to strangers at Godstow till the time of the dif-
solution.

Rosary, among the Roman catholics. See Char-
let.

Rosbach, a town of Germany, in Saxony, fa-
amous for a victory obtained here by the king of Prussia
over the French, on November 5, 1757, in which
10,000 of the French were killed or taken prisoners,
with the loss of no more than 500 Prussians. See Paus-
ia, No. 30.

Roschild, a town of Denmark, in the isle of
Zeeland, with a bishop's see and a small university. It
is famous for a treaty concluded here in 1658; and in
the great church there are several tombs of the kings
of Denmark. It is seated at the bottom of a small bay,

Roscommon, a county of Ireland, in the pro-
vince of Connaught, bounded on the west by the river
Sue, on the east by the Shannon, on the north by the
Curlew mountains, on the south and south-east by the
King's county and part of Galway. Its length is 35
miles, its breadth 28. The air of the country, both
on the plains and mountains, is healthy; the soil yields
plenty of grass, with some corn, and feeds numerous
herds of cattle. The Curlew mountains on the north
are very high and steep; and, till a road with great
labour and difficulty was cut through them, were im-
passable.

Roscommon, which gives the title of earl to the
family of Dillon, and name to the county, though not
large, is both a parliamentary borough and the county
town.

Roscomon (Wentworth Dillon, earl of), a
celebrated poet of the 17th century, was the son
of James Dillon earl of Roscommon; and was born
in Ireland, under the administration of the first earl
of Strafford, who was his uncle, and from whom he
received the name of Wentworth at his baptism.
He passed his infancy in Ireland; after which the earl
of Strafford sent him into England, and placed him
at his own seat in Yorkshire, under the tuition of Dr Hail,
afterwards bishop of Norwich, who instructed him in
Latin, without teaching him the common rules of gram-
mar, which he could never retain in his memory, and
yet he learnt to write in that language with classical
elegance and propriety. On the earl of Strafford's being
impeached, he went to complete his education at Caen
in Normandy; and after some years travelled to Rome,
where he became acquainted with the most valuable re-
ains of antiquity, and in particular was well skilled in
medals, and learned to speak Italian with such grace and
fluency, that he was frequently taken for a native.
He returned to England soon after the Restoration, and
was made captain of the band of pensioners; but a dif-
pute with the lord privy seal, about a part of his estates,
obliged him to resign his post, and revisit his native
country, where the duke of Ormond appointed him captain
of the guards. He was unapply very fond of ga-
ing; and as he was returning to his lodgings from a
gaming-table in Dublin, he was attacked in the dark by
three ruffians, who were employed to affliminate him.

3 R

The
The earl defended himself with such resolution, that he had dispatched one of the aggressors, when a gentleman falling that way took his part, and disarmed another, on which the third fought his safety in flight. This generous assailant was a disbanded officer of good family and fair reputation, but reduced to poverty; and his lordship rewarded his bravery by resigning to him his part of captain of the guards. He at length returned to London; where he was made master of the horse to the duchess of York, and married the lady Frances, eldest daughter of Richard earl of Burlington, who had been the wife of Colonel Courtney. He here distinguished himself by his writings; and in imitation of those learned and polite assemblies with which he had been acquainted abroad, began to form a society for refining and fixing the standard of the English language, in which his great friend Mr Dryden was a principal assailant. This scheme was entirely defeated by the religious commotions which ensued on the king's accession to the throne. In 1683 he was permitted a respite from the gout; and being too impatient of pain, lengthened it has a number of crove cowardly comforts. Jericho; but they are of a species much inferior to those flowers, which the value, and elegant order. His imagination might probably be more fruitful and sprightly, if his judgment had been less severe; but that severity (delivered in a masculine, clear, succinct style) contributed to make him too eminent in the didactical manner, that no man, with justice, can affirm he was ever equalled by take a journey, to form an alliance, to conclude any purposes, as in those of some contemporaries, there are as Pope, in his ‘Essay on Criticism,’ hath testified in the following lines:rose common not more learned than good, with manners generous as his noble blood; to him the wit of Greece and Rome was known, and every author’s merit but his own.

We must allow of Roscommon, what Fenton has at his disposal, as well as a good poet: as Pope, in his ‘Essay on Criticism,’ hath testified in the following lines:

_—_ Roscommon not more learned than good, with manners generous as his noble blood; to him the wit of Greece and Rome was known, and every author’s merit but his own._

We must allow of Roscommon, what Fenton has not mentioned so divinely as he ought, and, what is yet very much to his honour, that he is perhaps the only correct writer in verse before Addison; and that, if there are not so many or so great beauties in his compositions as in those of some contemporaries, there are at least fewer faults. Nor is this his highest praise; for Pope has celebrated him as the only moral writer of King Charles’s reign:

Unhappy Dryden! in all Charles’s days, Roscommon only boasts unspotted lays.

Of Roscommon’s works, the judgment of the public seems to be right. He is elegant, but not great; he never labours after exquisite beauties, and he seldom falls into gross faults. His verification is smooth, but rarely vigorous, and his rhymes are remarkably exact. He improved taste, if he did not enlarge knowledge, and may be numbered among the benefactors to English literature.

ROSE, in botany. See _Rosa_.

_Essence of Roses_. See _Roses Oiler_.

_Rosse of Jericho_, so called because it grows in the plain of that city, though it did not originally grow there. It has perhaps been fo named by travellers who did not know that it was brought from Arabia Petraea. Rose bulbes are frequently found in the fields about Jericho; but they are of a species much inferior to those so much extolled in Scripture, the flowers of which some naturalists pretend to have in their cabinets.

_The rose shrub of Jericho_ (says Mariti) is a small Travels plant, with a bulbous root, about an inch and a half in length. It has a number of items which diverge from the earth: they are covered with few leaves; but it is loaded with flowers, which appear red when in bud, turn paler as they expand, and at length become white entirely. These flowers appear to me to have a great resemblance to those of the elder-tree; with this difference, that they are entirely deficient of smell. The items never rise more than four or five inches from the ground. This shrub sheds its leaves and its flowers as it withers. Its branches then bend in the middle, and becoming entwined with each other to the top, form a kind of globe. This happens during the great heats; but during moist and rainy weather they again open and expand.

_In this country of ignorance and superstition, people do not judge with a philosophical eye of the alternate flaming and opening of this plant_: it appears to them to be a periodical miracle, which heaven operates in order to make known the events of this world. The inhabitants of the neighbouring cantons come and examine these shrubs when they are about to undertake a journey, to form an alliance, to conclude any affair of importance; or on the birth of a son. If the items of the plants are open, they do not doubt of success; but they account it a bad omen to see them _closely_ at a distance: and therefore renounce their project if it be not too late.

_This plant is neither subject to rot nor to wither. It will bear to be transplanted; and thrives without degenerating in any kind of soil whatever._

_Roses Oiler_ (or essential oil of roses), is obtained from roses by simple distillation, and may be made in the following manner: A quantity of fresh roses, for example 40 pounds, are put in a fill with 60 pounds of water, the roses being left as they are with their calices, but with the items cut close. The mass is then well mixed together with the hands, and a gentle fire is made under the fill; when the water begins to grow hot, and fumes to rise, the cap of the fill is put on, and the pipe fixed; the chimneys are then well luted with paste, and cold water put on the refrigeratory at top; the receiver is also adopted at the end of the pipe; and the fire is continued under the fill, neither too violent nor too weak. When the impregnated water begins to come over, and the fill is very hot, the fire is feigned!
R o f e - w a t e r is to... and not be difficult to do, as the essence congeals with a flight cold, and the water may then be made to run off. If, after that, the essence is kept fluid by heat, thesecs will sublime, and may be separated; but if the operation has been neatly performed, the essence will be little or none. The fecs are highly perfumed as the essence, and must be kept, after as much of the essence has been skimmed from the rose-water as could be. The remaining water should be used for fresh distillations, instead of common water, at least as far as it will go.

The above is the whole process, as given in the Asiatic Re-searches by lieutenant-colonel Poier*, of making genuine otter of roses. But attempts (he says) are often made to augment the quantity, though at the expense of the quality. Thus the rapsings of fandal-wood, which contain a deal of essential oil, are used, but the imposition is easily discovered, both by the smell, and because the essential oil of fandal-wood will not congeal in common cold. In other places they adulterate the otter by distilling with the roses a sweet-scented grase, which colours it of a high clear green. This does not congeal in a flight cold. There are numerous other modes, far more palpable, of adulteration. The quantity of essential oil to be obtained from roses is very precarious, depending on the skill of the distiller, on the quality of the roses, and the favourableness of the season. The colour of the otter is no criterion of its goodness, quality, or country. The calxes by no means diminish the quality of otter, nor do they impart any green colour to it. They indeed augment the quantity, but the trouble necessary to distil them is such as to prevent their being often used.

Rose-Noble, an ancient English gold coin, first struck in the reign of Edward III. It was formerly current at 6s. 8d. and so called because flamped with a rose. See Money.

Rose-Wood. See Aspalathus.

ROSETTO, a town of Africa, in Egypt, is pleasantly situated on the west side of that branch of the Nile called by the ancients Bubdunum, affirmed by Herodotus to have been formed by art; the town and castle being on the right hand as you enter that river. Any one that sees the hills about Rosetto would judge that they had been the ancient barriers of the sea, and conclude that the sea has not left more ground than the space between the hills and the water.

R o t t o f e - w a t e r is esteemed one of the pleasantest places in Egypt: it is about two miles long, and consists only of two or three streets. The country about it is most delightful and fertile, as is all the whole Delta on the other side of the Nile, exhibiting the most pleasant prospect of gardens, orchards, and corn-fields, excellently well cultivated. The cattle stands about two miles north of the town, on the west side of the river. It is a square building, with round towers at the four corners, mounted with pieces of brass cannon. The walls are of brick, cated with stone, supposed to have been built in the time of the holy war, though since repaired by Cheyk Begh. At a little distance lower, on the other side of the river, is a platform, mounted with some guns, and to the exit of it are the salt lakes, out of which they gather great quantities of that commodity. At some farther distance, falling up the river, we see a high mountain, on which stands an old building that serves for a watch-tower. From this eminence is discovered a large and deep gulf, in form of a crescent, which appears to have been the work of art, though it be now filled up, and discovers nothing but its ancient bed. Rosetto is grown a considerable place for commerce, and hath some good manufactures in the linen and cotton way; but its chief business is the carriage of goods to Cairo, all the European merchandise being brought thither from Alexandria by sea, and carried in other boats to that capital; as those that are brought down from it on the Nile are there shipped off for Alexandria; on which account the Europeans have here their vice-consuls and factors to transact their business; and the government maintains a beigh, a custom-house, and a garrison, to keep all life and quiet.

In the country to the north of Rosetto are delightful gardens, full of orange, lemon, and citron trees, and almost all sorts of fruits, with a variety of groves of palm-trees; and when the fields are green with rice, it adds greatly to the beauty of the country. It is about 25 miles north-east of Alexandria, and 100 north-west of Cairo. E. Long. 30° 45'. N. Lat. 31° 30'.

ROSICRUCIANS, a name assumed by a sect or cabal of hermetical philosophers; who, as it is said, have been known by several names, all which they pretended to have received by tradition from the ancient Egyptians, Chaldeans, the Magi, and Gymnosophists. They have been distinguished by several names, accommodated to the several branches of their doctrine. Because they pretend to protract the period of human life, by means of certain nostrums, and even to restore youth, they were called Immortales; as they pretended to know all things, they have been called Illuminati; and because they have made no appearance for several years, unless the sect of Illuminati which lately started up on the continent derives its origin from them, they have been called the invisible brothers. Their society is very frequently...
frequently signed by the letters F. R. C. which some among them interpret frateris rosis colli; it being pretended, that the matter of the philosopher's stone is dew concocted, excalated, &c. Some, who are no friends to freemasonry, make the present flourishing society of free-masons a branch of Rosicrucians; or rather the Rosicrucians themselves, under a new name or relation, viz. as retainers to building. And it is certain, there are some freemasons who have all the characters of Rosicrucians; but how the era and original of masonry (see MASONRY), and that of Rosicrucianism, here fixed from Naundor, who has written expressly on the subject, confuse we leave others to judge.

Notwithstanding the pretended antiquity of the Rosicrucians, it is probable that the alchemists, Paracelsists, or fire-philosophers, who spread themselves through almost all Europe about the close of the sixteenth century, assumed about this period the obscure and ambiguous title of Rosicrucian brethren, which commanded at first some degree of respect, as it seemed to be borrowed from the arms of Luther, which were a cross placed upon a rose. But the denomination evidently appears to be derived from the science of chemistry. It is not compounded, says Mothes, as many imagine, of the two words rosa and crux, which signify rose and cross, but of the latter of these words, and the Latin ros, which signifies dew. Of all natural bodies, dew was deemed the most powerful diluent of gold; and the cross, in the chemical language, is equivalent to light, because the figure of a cross is exhibited, at the same time, the three letters of which the word luz, or light, is compounded. Now luz is called, by this sect, the middle finger, or middle beam of the red dragon; or, in other words, that groes and coros light which, when properly digested and modified, produces gold. Hence it follows, if this etymology be admitted, that a Rosicrucian philosopher is one who, by the intervention and assistance of the dew, seeks for light, or, in other words, the substance called the philosopher's stone. The true meaning and energy of this denomination did not escape the penetration and sagacity of Gafendi, as appears by his Examen Philosophiae Flandrianae, sect. 15: tom. iii. p. 261. And it was more fully explained by Renaudot, in his Confessae Publices, tom. iv. p. 87.

At the head of these fanatics were Robert Fludd, an English physician, Jacob Behmen, and Michael Mayer; but if rumour may be credited, the present Illuminated have a head of higher rank. The common principles, which serve as a kind of centre of union to the Rosicrucian society, are the following: They all maintain, that the distribution of bodies, by the power of fire, is the only way by which men can arrive at true wisdom, and come to differ the first principles of things. They all acknowledge a certain analogy and harmony between the powers of nature and the doctrines of religion; and believe that the Deity governs the kingdom of grace by the same laws with which he rules the kingdom of nature; and hence they are led to use chemical denominations to express the truths of religion. They all hold, that there is a sort of divine energy, or soul, diffused through the frame of the universe, which some call the argus, others the universal spirit, and which others mention under different appellations. They all talk in the most superstitious manner of what they call the signatures of things, of the power of the stars over all corporeal beings, and their particular influence upon the human race, of the efficacy of magic, and the various ranks and orders of demons. These demons they divide into two orders, sphers and gnomes; which supplied the beautiful machinery of Pope's Rape of the Lock. In fine, the Rosicrucians and all their fanatical descendants agree in throwing out the most crude incomprehensible notions and ideas, in the most obscure, quaint, and unusual expressions.—Moth. Eccl. Hist. vol. iv. p. 266, &c. English edition, 8vo.

ROSIER. See PILATRE.

ROSIERS-AUX-SALINES, a town of France, in Lorraine, and in the bailiwick of Nancy, famous for its salt-works. The works that king Stanislaus made here are much admired. It is seated on the river Murtz, in E. Long. 6. 27. N. Lat. 48. 32.

ROSKILD, formerly the royal residence and metropolis of Denmark, stands at a small distance from the Bay of Isefjord, not far from Copenhagen. In its flourishing state it was of great extent, and comprised within its walls 27 churches, and as many convents. Its present circumference is scarcely half an English mile, and it contains only about 1620 souls. The houses are of brick, and of a neat appearance. The only remains of its original magnificence are the ruins of a palace and of the cathedral, a brick building with two spires, in which the kings of Denmark are interred. Little of the original building now remains. According to Holberg, it was constructed of wood, and afterwards built with stone, in the reign of Canute.—From an inscription in the choir, it appears to have been founded by Harold VI. who was styled king of Denmark, England, and Norway. Some verbes, in barbarous Latin, obscurely allude to the principal incidents of his life; adding, that he built this church, and died in 980.—See Coxe's Travels into Poland, Russia, Sweden, and Denmark, vol. ii. p. 325.

ROSLEY-HILL, a village in Cumberland (England), with a fair on Whit-Monday, and every fortnight after till September 29. for horses, horned cattle, and linen cloth.

ROSLIN, or ROSSLYN, a place in the county of Mid Louthian in Scotland, remarkable for an ancient chapel and caitle. The chapel was founded in 1446, by St Clare, prince of Orkney, for a provost, six prebendaries, and two singing boys. The outside is ornamented with a multitude of pinnacles, and variety of ludicrous sculpture. The inside is 69 feet long, the breadth 34, supported by two rows of clustered pillars, between seven and eight feet high, with an aisle on each side. The arches are obtusely Gothic. These arches are continued across the side-aisles, but the centre of the church is one continuous arch, elegantly divided into compartments, and finely sculptured. The capitals of the pillars are enriched with foliage, and a variety of figures; and amidst a heavenly concert appears a cherubim blowing the ancient Flighland bagpipe. The castle is seated on a peninsulated rock, in a deep glen far beneath, and accessible by a bridge of great height. This had been the seat of the great family of Sinlaire. Of this house was Oliver, favourite of James V. and the innocent cause of the loss of the battle of Solway Moss, by reason of the envy of the nobility on account of his being preferred to the command.
Near this place the English received three defeats in one day under John de Segrave the English regent of Scotland in 1302. They are to be fmelt at a great distance from the land.

However, they are hardly enough to bear the cold of our ordinary winters, provided they be planted upon a poor, dry, gravelly soil, on which they will endure the cold much better than in a richer ground, where, growing more vigorously in summer, they are more apt to be injured by frost in winter; nor will they have such a strong aromatic scent as those on a dry and barren soil. They are propagated either by slips or cuttings.

Rosemary has a fragrant smell, and a warm pungent bitterish taste, approaching to that of lavender; the leaves and tender tops are strongest; next to those, the cup of the flower; the flowers themselves are considerably the weakest, but most pleasant. Aquose liquors extract great share of the virtues of rosemary leaves by infusion, and elevate them in distillation; along with the water arises a considerable quantity of essentil oil, of an agreeable strong penetrating smell. Pure spirit extracts in great perfection the whole aromatic flavour of the rosemary, and elevates very little of it in distillation; hence the refinues made, left upon extrading the spirit, proves an elegant aromatic, very rich in the peculiar qualities of the plant. The flowers of rosemary give over great part of their flavour in distillation with pure spirit; by watery liquors, their fragrance is much injured; by beating, destroyed.

ROSS, in Herefordshire, in England, 119 miles from London, is a fine old town, with a good trade, on the river Wye. It was made a free borough by Henry III. It is a populous place, famous for cider, and was noted in Camden's time for a manufacture of iron-wares. There are in it two charity-schools, which lately have been enriched by a legacy of 200l. per annum, from Mr Scott, in Dec. 1786, a second Man of Ross. And its market and fairs are well flored with cattle and other provisions. At the west end of it there is a fine broad caufeway, constructed by Mr. John Kyrle, the celebrated Man of Ross, who also raised the flire upward of 100 feet, and inclosed a piece of ground with a flone wall, and flunk a refervoir in its centre, for the use of the inhabitants of the town. He died in 1714, aged 90, with the bleffing of all who knew him, both rich and poor. There cannot be a pleafanter country than the banks of the Wye, between this town and Monmouth. W. Long. 2. 25. N. Lat. 51. 56.

Ross, a county of Scotland, including Tayne and Cromarty, stretching 80 miles in length, and 78 in breadth, is bounded on the west by the western sea, and part of the isle of Skye by Inverness, on the south; Strathnavern and Sutherland, on the north and northeast; and by Cromarty and the Murray-Frith on the east. Tayne includes the greater part of Ross, with the isles of Skye, Lewis, and Harris. Cromarty lies on the other side of the Murray-Frith, to the northward of Inverness, extending but 12 miles in length, bounded on the south and east by part of Ross and the Frith of Murray, and by the Frith of Cromarty on the north. The frith of Ross takes up the whole breadth of the island; and being much indented with bays and inlets from both seas, appears of a very irregular form. These bays afford safe harbours for shipping, especialy that of Cromarty, which is capacious enough to contain all the fleets of Europe, being land-locked on every side, and in all respects one of the belt harbours in the known world. The Frith of Tayne, on the eall fide of the frith, runs up 25 miles from the sea, as far as the Cape Tarbat, dividing Ross from Sutherland: it is about seven miles broad at the mouth, but, on account of quick sands, unsafe for navigation. The country of Ross is encumbered with huge mountains, on which the snow lies for the greatest part of the year; there, however, yield good pasture; but on the eastern side, next the German ocean, the country admits of agriculture, and produces good crops of corn. The valleys are fertilized by several rivers, among which we reckon the Okel, the Charron, and the Braan; besides a number of fresh-water lakes, which indeed are found.
found in every part of the country. The valleys, or
braths, are generally covered with wood; and near Al-
frag there are forests of fir 15 or 20 miles in length,
well stocked with deer and game of all sorts. Great
numbers of black cattle, horses, sheep, and goats, are
fed upon the mountains; and the sea, rivers, and lakes,
toom with fish and fowl. The lochs on the western
coast abound with herrings in the season, particularly
Loch Eu, about nine miles long, and three in breadth;
one part of this is formed by a bay, or inlet of the sea;
and the other is a lake of fresh water. The sides of it
are covered with wood, where formerly abundance
iron was smelted. Though the middle part of Ross,
called Ardroy, is mountainous and scarce inhabited,
the north eait parts on the rivers Okel, Charron,
and Frith of Tayne, are fruitful, and abound with villages.
Coygach and Asgut, two northerly districts, are bare
and hilly; yet they abound with deer and black cattle;
and we fee several good houses towards the
coast, where there are also promontories, and huge rocks of marble.
Ardmeanach, part of the peninsula betwixt the bays
of Cromarty and Murray, is a barony, which of old
bellowed a title on the king of Scotland's second son.
The district of Glen-echig, on the south-west, was the
paternal estate of the earl of Seaforth, chief of the clan
of Mackenzie; but the last earl of that name, having
rifen in rebellion, was in the year 1719 defeated at Glen-
fiel, in this very quarter, together with a small body of
Spaniards by whom he had been joined. His auxi-
laries were taken; and though he himself, with some
of his friends, escaped to the continent, his estate
and honours were forfeited. At the same time, the king's
soldiers, under the command of Colonel Urquhart,
made great inroads into the country of Ross, and
made whole districts, or droseras, of it. The
so-called Ross, or Rosso, is a town of Italy, in the kingdom
of Naples, and in the Hither Calabria, with an archbi-
pope's see, and the title of a principality. It is pretty
large, well peopled, and famed on an eminence sur-
rounded with rocks. There is nothing in this archiepisco-
pal city that claims much notice; the buildings are
mean, the streets vilely paved and contrived. The
number of inhabitants does not exceed 6000, who subsist
by the sale of their oil, the principal object of their
attention, though the territory produces a great deal
of good wine and corn.
Rossano, a strong town of Italy, in the kingdom
of Naples, and in the Hither Calabria, with an archbi-
pope's see, and the title of a principality. It is pretty
large, well peopled, and famed on an eminence sur-
rounded with rocks. There is nothing in this archiepisco-
pal city that claims much notice; the buildings are
mean, the streets vilely paved and contrived. The
number of inhabitants does not exceed 6000, who subsist
by the sale of their oil, the principal object of their
attention, though the territory produces a great deal
of good wine and corn.
Rossano probably owes its origin to the Roman
emperors, who considered it as a polt equally valuable for
strength and convenience of traffic. The Marfians,
a family of French extraction, possessed this territory,
with the title of prince, from the time of Charles II.
to that of Alphonso II. when the last male heir was,
by that prince's order, put to death in Iclisia, where he
was confined for treason. It afterwards belonged to
Bona, queen of Poland, in right of her mother Isabella,
daughter to Alphonso II. and her decease returned to
the crown. It was next in the possession of the Al-
dobrandini, from whom the Borghesi inherited it. So
late as the 16th century, the inhabitants of this city
spoke the Greek language, and followed the rites of the
eastern church. Here was formerly the most celebrated
rendezvous of the Baalish monks in Magna Grecia.
E. Long. 16. 52. N. Lat. 39. 45.
ROSSANO, Sun-dew, an agreeable spirituous liquor,
composed of burnt brandy, sugar, cinnamon, and milk-
water; and sometimes perfumed with a little milk. It
has its name from being at first prepared wholly of the
juice of the plant ros solis, or drosera. See DROSERA.
ROSTOCK, a town of Germany, in the circle of
Upper Saxony, and duchy of Mecklenburg, with an
university and a very good harbour. It is the seat
of this country; and has go dot fortifications, with
an arsenal. The duke has a strong castle, which may
be looked upon as a citadel. It is divided into three
parts, the Old, the New, and the Middle Towns. It
was formerly one of the Hanseatic towns, and is still
Imperial, under the protection of the duke of Meck-
lenburg. It is seated on a lake where the river Varne
falls into it, and carries large boats. The government
is in the hands of 24 aldermen, elected out of the no-
bility, university, and principal merchants; four
of whom are burgomasters, two chamberlains, two stew-
ards for the river, and two judges of civil and criminal
matters. These 24 are called the Upper House, and
have in a manner the whole executive power lodged in
them, with the power of coinmg money, and electing
officers. There is also a common council of 100 infer-
ior citizens, who are summoned to give their advice
upon extraordinary emergencies relating to the whole
commonwealth. The principal things worth seeing are the
fortifications, the prince's palace, the palace of the
bishops, and the public library. The town is famous for
good beer, which they export in great quantities. Some
years ago they had no less than 250 privileged brewers,
who, it is said, brewed fo many thousand tuns a year,
besides what particular persons brew for their own use.
E. Long. 12. 55. N. Lat. 54. 8.
ROSTOFF, or Rostow, a large town of the Ruffian
empire, and capital of a territory of the same name,
with an archbishop's see, seated on the lake Coteri, in
E. Long. 40. 25. N. Lat. 57. 5. The duchy of Rof-
toff is bounded on the north by Jaroflow, on the eait
by Sudal, on the south by the duchy of Moscow, and
on the west by that of Tuire.
ROSTRA, in antiquity, a part of the Roman fo-
rum, wherein orations, pleadings, funeral harangues,
&c. were delivered.
ROSTRUM, literally denotes the beak or bill of a
bird; and hence it has been figuratively applied to the
beak or head of a ship.
ROSYCRUCIANS. See ROSICRUCIANS.
ROTH, a very fatal disordered incident to sheep, aris-
ing from wet feasons, and too moist pasture. It is very
difficult of cure, and is attended with the singular cir-
cumstance of a kind of animals being found in the
blood-veins. See OVIS and SHEEP.
ROTA, the name of an ecclesiastical court of Rome,
composed of 12 prelates, of whom one must be a Ger-
aman, another a Frenchman, and two Spaniards; the
other eight are Italians, three of whom must be Ro-
mans, and the other five a Bolognese, a Ferrara, a
Milanese, a Venetian, and a Tuscan.—This is one of

the most august tribunals in Rome, which takes cogna-

tization of all suits in the territory of the church, by ap-

peal; as also of all matters, beneficiary and patrimonial.

**Rotation.** (from *rota*, "a wheel"), the name of

the 20th order in Linnaeus's Fragments of a Natural

Method: consisting of plants with one flat, wheel-sha-

**Rotala**, in botany; a genus of the monogynia

order, belonging to the triaclis clafs of plants.

The calyx is tridentate; there is no corolla; the capsule

is trilocular and polypermous.

**Rotation**. See **Calamus**.

**Rotation**, is a term which expresses the motion

of the different parts of a solid body round an axis, and
different from the progressive motion which it may

have in its revolution round a distant point. The earth

has a rotation round its axis, which produces the vicis-
situdes of day and night; while its revolution round the

sun, combined with the obliquity of the equator, pro-
duces the variety of summer and winter.

The mechanism of this kind of motion, or the rela-
tion which subsists between the intensity of the moving

forces, modified as it may be by the manner of applica-
tion, and the velocity of rotation, is highly interesting,
both to the speculative philosopher and to the practi-
cal engineer. The precepts of the equinoxes, and many

other astronomical problems of great importance and
difficulty, receive their solutions from this quarter:

and the actual performance of our most valuable machines

cannot be ascertained by the mere principles of equili-

brium, but require a previous acquaintance with cer-
tain general propositions of rotatory motion.

It is chiefly with the view of affording the engineer

that we propose to deliver in this place a few funda-

mental propositions; and we shall do it in as familiar

and popular a manner as possible, although this may

cause the application of them to the abstruse problems

of astronomy to be greatly deficient in the elegance of

which they are susceptible.

When a solid body receives an impulfe on anyone

plane, the particles adjoining, and change, or tend to

move, because the external moving force is propagated

directly to the particle immediately affected, and it is

converted into the force really impelling it is a force

arising from the cohesion of the body. The particle immedi-
ately impelled by the external force is pressed towards its

neighbouring particles, or is drawn away from them; and,

by this change of place, the connecting forces are

brought into action, or are excited; they act on the

particles adjoining, and change, or tend to change,

distances from the particles immediately beyond them;

and thus the forces which connect these next series

of particles are also excited, and another series of

particles are made to exert their forces; and this goes

on through the body till we come to the remote par-

ticle, whose motion we are considering. The forces

which connect it with the adjoining series of particles

are excited, and the particles moved. We frequently

say that the external moving force is propagated thro

the body to the distant particle; but this is not accur-
ate. The particle is really and immediately moved by

the forces which connect it with those adjoining. It

will
will greatly add to our conception of the manner in which
motion is thus produced in a dilant particle, if we con-
cider the particles as so many little balls, connected with
each other by slender spiral springs like cork-screws.
This would comp of a maze which would be con-}
trivable, or which could be stretched, &c. And if we give
an impulse to one of these balls, we shall set the whole
affumblage in motion round any axis which we may
suppose to support it. Now any one of these balls is
really and immediately moved by the elacticity of the
spiral wires which join it to its neighbours.

We are but little acquainted with the nature of these
connecting forces. It can be learned only by the phe-
nomena which are their effect. These are various, al-
much beyond description; but the mechanical philo-
osopher has little to do with this variety. The differenti-
ations which are the immediate causes of fluidity, of hardne-
s, softness, elacticity, ductility, are not of very difficult
conception. There is one general fact which is suffi-
cient for our present purpose—the forces by which the
particles of bodies act on each other are equal. This is
a matter of unexpccted experience; and no other foun-
dation can be given to it as a law of mechanical na-
ture.

An immediate consequence of this law is, that when
two external forces A and B are in equilibriun by the
intervention of a solid body (or rather when a solid body
is in equilibrium between two external forces), these
forces are equal and opposite; for the force A is in
fact in immediate equilibriun with the opposite forces
exerted by the particles to which it is applied, and is
therefore equal and opposite to the force refuting from
the combination of all the forces which connect that
particle with the series of particles immediately adjoin-
ing. This refuting force may with propriety be called
the equivalent of the forces from the combination of
which it results. The use of this term will greatly ab-
 Strange structure

Mechan

ical

science

has

been

ab-
suffice by our very attempts to simplify it. Many el-
aborate treatises have been written on the fundamental
property of the lever, and in them all it has been
thought next to an insuperable difficulty to demonstrate
the equilibrium of a straight lever when the parallel
forces are inerely as their distances from the ful-
crum.

We think the demonstrations of Archimedes, Fon-
fex, D’Alembert, and Hamilton, extremely ingenious;
but they only bring the mind into such a state of con-
ception that it cannot refute the truth of the propo-
sition; and, except Mr Hamilton’s, they labour under
the disadvantage of being applicable only to commen-
surable distances and forces. Mr Vince’s, in the Phi-
losophical Transactions for 1794, is the most ingeni-
ous of them all; and it is wonderful that it has not oc-
curred long ago. The difficulty in them all has arisen
from the attempt to simplify the matter by considering a
lever as an inflexible straight line. Had it been taken
out of this abstract form, and considered as what it
really is, a natural body, of some form, having its par-
ticles connected by equal and opposite forces, all diffi-
culty would have vanished.

That
That we may apply these propositions to explain the motion of rotation, we must recollect an unquestionable proposition in dynamics, that the force which produces any motion is equal and opposite to the force which would prevent it, when applied in the same place and in the same line, or which would extinguish it in the same time in which we suppose it to be produced. Therefore the force which is excited and made to act on any particle of a body, by the action of an external force on another particle, so as to cause it to move round an axis, is equal and opposite to the force which, when applied to that particle in the opposite direction, would be in equilibrium with the external force.

The only distinct notion we can form of the magnitude of any moving force is the quantity of motion which it can produce by acting uniformly during some given time. This will be had by knowing the velocity which it will produce in a body of known bulk. Thus we know that the weight of ten pounds of matter acting on it for a second will cause it to fall 16 feet with an uniformly accelerated motion, and will leave it in a state such that it would move on for ever at the rate of 32 feet in a second; which we call communicating the velocity of 32 feet per second. In the same manner, the best way of acquiring a distinct conception of the rotatory effort of a moving force, is to determine the quantity of rotatory motion which it can produce by acting uniformly during some known time.

Let a solid body turn round an axis passing through the point C (fig. 3.) perpendicular to the plane of this figure. Let this rotation be supposed to be produced by an external force acting in the direction FP. Let this force be such, that if the body were free, that is, unconnected with any axis supported by fixed points, it would, by acting uniformly during a small moment of time, cause its centre of gravity G (A) to describe a line of a certain length parallel to FP. We know this to be the effect of a moving force acting on any solid body in free space. The centre of gravity will always describe a straight line. Other particles may chance to move differently, if the body, besides its progressive motion, has also a motion of rotation, as is generally the case. Draw GI parallel to FP, and make GI to GC as the velocity which the external force would communicate to the centre of the body (if moving freely, unconnected with a supported axis), to the velocity which it communicates to it in the same time round the axis.

We expressed the external moving force by m.GI, which urges the particle A. In order to discover what part of the external force is necessary for this purpose, draw CP perpendicular to FP. The preceding observations show us, that the force wanted at A is equal to the force which, when applied at P in the direction FP, would balance the force A-CA applied to A in the direction LA. Therefore (by the property of the lever ACP, which is impelled at right angles at A and P) we must have CP to CA as the force A-CA to the balancing pressure, which must be exerted at P, or at any point in the line FP. This pressure is therefore CP/CP, or A-CA.

As we took m.GI for the measure of the whole external force, GI being the velocity which it would communicate to the whole body moving in free space, we may take GI for the velocity which would be communicated to the whole body by the pressure A-CA, and then this pressure will be properly expressed by m.GI. In like manner m.\v, may express the portion of the external force employed in communicating to another particle B the motion which it acquires; and so on with respect to all the particles of the body.

It must be desirable to see the manner in which the forces
forces are really concerned in giving motion to the different particles.

Suppose the external force to act immediately on the external particle F. The line FC connecting this particle with the axis in C is either stretched or compressed by the effort of giving motion to a remote particle A. It is plain that, in the circumstances represented in the figure, the line FC is compressed, and the axis is pulled by it against its supports in the direction Cx; and the body mut, on this account, resist in the opposite direction F: the particle A is dragged out of its position, and made to begin its motion in the direction AL perpendicular to AC. This cannot be, unless by the connection of the two lines AC, AF. A resists by its inertia, and therefore both AC and AF are stretched by dragging it in to motion. By this resistance the line AC tends to contract itself again, and it pulls C in the direction Cx, and A in the direction Aa; and if we take Ce to represent the action on C, A must be taken equal to it. In like manner AF is stretched and tends to contract, pulling F in the direction Fg and A in the direction Aa with equal forces. Thus the particle A is pulled in the directions Aa and Aa; the particle F is pulled in the direction Fg, and pulled in the direction Fb; and C is pulled in the direction Cx, and pulled in the direction Cx. A and Aa have produced their equivalent AL, by which A is dragged into motion; Ff and Fg produce their equivalent FG by which the external force is resisted, and FG is equal and opposite to FG. If FG is equal and opposite to FG, the forces Ce and Cx produce their equivalent CD by which the axis is pressed on its supports, and this is resisted by an equal and opposite reaction of the supports in the direction dC. The forces therefore which excite in the body the motion A.AL are both external, viz. the impelling force gF, and the supporting force dC. All therefore is not only the immediate equivalent of Aa and Aa, but also the remote equivalent of gF and dC. We may therefore ascertain the proportion of gF (that is, of m.GI) to AL (that is, of A.AC), independent of the property of the lever. gF is to AL in the ratio compounded of the ratios of gF to FG or Aa, and of AL to Aa. But we shall obtain it more easily by considering gF as the equivalent of AL and dC. By what has been demonstrated above, the directions of the three forces gF, AL, and dC must meet in one point E, and gF must be equal to the diagonal tE of the parallelogram EEtE', of which the sides EEt, EEt are respectively equal to AL and dC. Now if E is E as the line of the angle tE to the line of the angle EEt, that is, as the line of CEA to the line of CEP, that is, as CA to CP, as we have already demonstrated by the property of the lever. We preferred that demonstration as the shorted, and as abundantly familiar, and as congenial with the general mechanism of rotary motions. And the intelligent reader will observe, that this other demonstration is nothing but the demonstration by the lever expanded into its own elements. Having once made all our readers sensible of the internal process of the excitement and operation of the forces which connect the particles, we shall not again have recourse to it.

It is evident that the sum of all the forces gF, or m.GI, must be equal to the whole moving force m.GI. That is, we must have m.GI = \frac{\mathbf{AC}^2}{\mathbf{CP}}. or, because CP is given when the position of the line FP is given, we must have m.GI = \frac{\mathbf{AC}^2}{\mathbf{CP}}. where both A and CA are variable quantities.

This equation gives us m.GI.CP = \int \mathbf{AC}^2. Now we learn in mechanics that the energy of any force applied to a lever, or its power of producing a motion around the fulcrum, in opposition to any resistance whatever, is expressed by the product of the force by the perpendicular drawn from the fulcrum on the line of its direction. Therefore we may call m.GI.CP the momentum (a), energy, or rotary effort, of the force m.GI. And in like manner \int \mathbf{AC}^2 is the sum of the momenta of all the particles of the body in actual rotation; and as this rotation required the moment of inertia, and the equilibrium between the momentum of the external force m.GI, acting in the direction FP, and the combined momenta of the inertia of all the particles of the whirling body, is expressed by the equation m.GI.CP = \int \mathbf{AC}^2 = \int \mathbf{PR}. The usual way of studying elementary mechanics gives us the habit of associating the word equilibrium with a state of rest; and this has made our knowledge of it imperfect. But there is the same equilibrium of the actual immediate presurces when motion ensues from the action. When a weight A depending raises a smaller weight B by means of a thread passing over a pulley, the thread is equally stretched between the acting and resiling weights. The strain on this thread is undoubtedly the immediate moving force acting on B, and the immediate resiling force acting on A.

The fame equation gives us GI = \int \mathbf{PR}. Now GI: CG = \frac{\mathbf{PR}}{m.CP} = \frac{\mathbf{PR}}{m.CP} = m.CP

(a) The word "momentum" is very carelessly used by our mechanical writers. It is frequently employed to express the product of the quantity of matter and velocity, that is, the quantity of motion; and it is also used (with little propriety of language) to express the power, energy, or efficacy of a force to produce motion in the circumstances in which it acts. We wish to confine it to this use alone. Sir Isaac Newton adhered rigidly to this employment of the term (indeed no man exceeds him in precision of expression), even when he used it to express the quantity of motion; for in these instances the energy of this quantity of motion, as modified by the circumstances of its action, was always in the ratio of the quantity of motion.
ROT

Rotation. \[ m \cdot CP \cdot CG = GI \cdot CG \] or, that \( f \cdot p \cdot r^2 \) is to \( m \cdot CP \cdot CG \), as the velocity of the body moving freely to the velocity of the centre of gravity round the axis of rotation.

Therefore the velocity of the centre is \( \frac{m \cdot GI \cdot CP \cdot CG}{f \cdot p \cdot r^2} \).

The velocity of any point B is \( \frac{m \cdot GI \cdot CP \cdot CB}{f \cdot p \cdot r^2} \).

This fraction represents the length of the arch described by the point B in the same time that the body unconnected with any fixed points would have described GI.

Therefore the angular velocity (the arch divided by the radius) common to the whole body is \( \frac{m \cdot GI \cdot CP}{f \cdot p \cdot r^2} \).

It may be here asked, how this fraction can express an angle? It evidently expresses a number; for both the numerator and denominator are of the same dimensions, namely, surfaces. It therefore expresses the portion of the radius which is equal to the arc measuring the angle, such as \( \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \&c. \) And to have this angle in degrees, we have only to recollect that the radius is \( 57\frac{29}{60} \) or \( 57\frac{16}{29} \) degrees.

This angular velocity will be a maximum when the axis of rotation passes through the centre of gravity G. For draw from any particle A the line \( A \cdot a \) perpendicular to CG, and join AG. Then \( CA = GA^2 + CG^2 - 2 \cdot CG \cdot X \cdot a \). Therefore \( \frac{f \cdot CA^2}{f \cdot CG^2 + f \cdot GA^2 + m \cdot GI \cdot CP \cdot CG} = \frac{f \cdot CG^2 + f \cdot GA^2 + m \cdot GI \cdot CP \cdot CG}{f \cdot CA^2} \).

Therefore \( f \cdot CA^2 \) or \( f \cdot p \cdot r^2 \) is smallest, and \( \frac{f \cdot p \cdot r^2}{m \cdot GI \cdot CP} \) is greatest when \( m \cdot CG \) is nothing, or when \( CG \) is nothing; that is, when \( C \) and \( G \) coincide.

The absolute quantity of motion in the whirling body, or the sum of the motions of all its particles, is \( m \cdot GI \cdot CP \cdot p \cdot r \).

For the motion of each particle is \( m \cdot GI \cdot CP \cdot p \cdot r \).

The resistence which a given quantity of matter makes to a motion of rotation is proportional to \( f \cdot p \cdot r^2 \). For this must be measured by the forces which must be similarly applied in order to give it the same angular motion or angular velocity. Thus let one external force be \( m \cdot GI \), and the other \( m \cdot \gamma \). Let both be applied at the distance CP. Let \( r \) be the radius vector in the one body, and \( s \) in the other; now the angular velocities \( \frac{f \cdot p \cdot r^2}{m \cdot GI \cdot CP} \) and \( \frac{m \cdot \gamma \cdot s \cdot CP}{f \cdot p \cdot r^2} \) are equal by supposition. Therefore \( m \cdot GI \cdot s \cdot CP = m \cdot \gamma \cdot s \cdot CP \).

As in the communication of motion to bodies in free space a given force always produces the same quantity of motion; so in the communication of motion to bodies obliged to turn round axes, a given force, applied at a given distance from the axes, always produces the same quantity of momentum. Whence it may easily be deduced (and we shall do it afterwards), that as in the communication of motion among free bodies the same quantity of motion is preferred, so in the communication of motion among whirling bodies the same quantity of whirling motion is preferred.

This is a proposition of the utmost importance in practical mechanics, and may indeed be considered as the fundamental proposition with respect to all machines of the rotatory kind when performing work; that is, of all machines which derive their efficacy from levers or wheels. There is a valuable set of experiments by Mr Smeeon in the Philosophical Transactions, Volume LXVI. which fully confirm it. We shall give an example by and by of the utility of the proposition, showing how exceedingly imperfect the usual theories of mechanics are which do not proceed on this principle.

With respect to the general proposition from which all these deductions have been made, we must observe, that the demonstration is not referred to the time necessary for causing each particle to describe an arch equal to the radius vector. We assumed the radius vector as the measure of the velocity merely to simplify the notation. Both the progressive motion of the free body and the rotation of the whirling body are uniformly accelerated when we suppose the external force to act uniformly during any time whatever; and the spaces described by each motion in the same time are in a constant ratio. The formulœ may therefore with equal propriety represent the momentary accelerations in the different cases.

It must also be observed, that it is not necessary to suppose that all the particles of the body are in one plane, and that the moving force acts in a line FP lying also in this plane. This was tacitly allowed, merely to make the present investigation (which is addressed chiefly to the practical mechanic) more familiar and easy. The equilibrium between the force \( A \times CA \), which is immediately urging the particle A, and the force \( m \cdot GI \) employed at \( P \) or \( F \), in order to excite that force at \( A \) would have been precisely the same although the lines \( AC \) and \( FP \) had been in different planes, provided only that these planes were parallel. This is known to every person in the least acquainted with the wheel and axle. But if the external moving force does not act in a plane parallel to the circles of rotation of the different particles, it must be separated into two forces, one of which is perpendicular to these planes, or parallel to the axis of rotation, and the other lying in a plane of rotation. And it is this last only that we consider as the moving force; the other tends merely to pull the body in the direction of its axis, but has no tendency to turn it round that axis. When we come to consider the rotation of a body perfectly free, it will be necessary to attend particularly to this circumstance.

But there are several important mechanical propositions which do not require this.

The motion of any body is estimated by that of its centre of gravity, as is well known. The difference of a body estimated by that of the centre of a free body and that of the centre of a body turning round an axis, is evidently owing to the connection which the parts of the body have with this axis, and to the action of the points of support on this axis. This action must be considered as another external force, combined with that which acts on the particle \( P \), and therefore must be such as, if combined with it, would produce the very motion which we observe. That is, if
Suppose a line laid over a pulley, and a pound weight at one end of it, and ten pounds at the other; the pressure of the axis on its support is eleven pounds, according to the usual rule; whereas we shall find it only 3\(\sqrt{r}\). For, if we call the radius of the pulley 1, the moment of the moving force is 10 \times 1 - 1 \times 1, = 9; and the moment of inertia is 10 \times 1^2 + 1 \times 1^2 (n \approx 18) = 11. Therefore the angular velocity is \(\sqrt{8}\). But the distance CG of the centre of gravity from the axis of motion is also \(\sqrt{8}\), because we may suppose the two weights in contact with the circumference of the pulley. Therefore the velocity of the centre of gravity is \(\sqrt{8} \times \sqrt{8} \times \sqrt{8} = 3\sqrt{8}\) of its natural velocity. It is therefore diminished \(\frac{3\sqrt{8}}{2}\) by the figure of the axis of the pulley, and the 11 pounds press it with \(\frac{3\sqrt{8}}{2}\) of their weight that is, with 3\(\sqrt{8}\) pounds.

Since all our machines consist of inert matter, which requires force to put it in motion, or to stop it, or to change its motion, it is plain that some of our natural power is expended in producing this effect; and since the principles of equilibrium only state the proportion between the power and resistance which will preserve the machine at rest, our knowledge of the actual performance of a machine is imperfect, unless we know how much of our power is thus employed. It is only the remainder which can be fracted in opposition to the resistance opposed by the work. This renders it proper to give some general propositions, which enable us to compute this with ease.

It would be very convenient, for instance, to know the moment of a force at a point in which we might suppose the whole rotary part of the machine concentrated; because then we could at once tell what the moment of its inertia is; and what force we must apply to the impelled point of the machine, in order to move it with the desired velocity.

Let S, fig. 3, be this point of a body turning round the supported axis passing through C; that is, let S be such a point, that if all the matter of the body were collected there, a force applied at P will produce the same angular velocity as it would if applied at the same point of the body having its natural form. The whole matter being collected at S, the expression \(m \cdot GI \cdot CP = \frac{fP^2}{m \cdot CG}\) of the angular velocity becomes \(m \cdot GI \cdot CP = \frac{fP^2}{m \cdot CG}\), and these are equal by supposition. Therefore \(fP^2 = m \cdot CS^4\), and \(CS = \sqrt{\frac{fP^2}{m}}\).

This point S has been called the Centre of Gyration.

In a line or slender rod, such as a working beam, or the spoke of a wheel in a machine, \(CS = \sqrt{\frac{L}{2}}\) of its length.

In a circle or cylinder, such as the solid drum of a capstan, \(CS = \sqrt{\frac{L}{2}}\) its radius, or nearly \(\frac{V_0}{2}\). But if it turns round one of its diameters, \(CS = \frac{L}{4}\) radius. In the periphery of a circle, or rim of a wheel, \(CS = \frac{L}{2}\) radius nearly.

If it turn round a diameter, \(CS = \sqrt{\frac{L}{2}}\) radius. The surface of a sphere, or a thin spheroidal shell, turning round a diameter, has \(CS = \sqrt{\frac{L}{2}}\) radius, or nearly \(\frac{V_0}{2}\) or \(\sqrt{\frac{5}{8}}\).

A solid sphere turning round a diameter has \(CS = \sqrt{\frac{L}{2}}\) radius, or nearly \(\frac{V_0}{2}\). This is useful in the problem of...
A simpler mode of allowing for the inertia of machines.

There is another way of making this correction of the motion of a machine, or allowing for the inertia of the machine itself, which is rather simpler than the one now given. We can suppose a quantity of matter collected at the point to which the moving force is applied, such that its inertia will oppose the machine reluctance to rotation that the machine does in its natural form. Suppose the moving force applied at $P$, as before, and that instead of the natural form of the body a quantity of matter $\frac{dp}{\mathbf{r}^2}$ collected at $P$; the moving force will produce the same angular velocity as on the body, in its natural form. For the angular velocity in this case must be $\int \frac{dp}{\mathbf{r}^2}$,

\[
\frac{\mathbf{G} \mathbf{L} \mathbf{C} \mathbf{P}}{m \mathbf{G} \mathbf{I} \mathbf{C} \mathbf{P}},
\]

i.e., $\frac{\mathbf{G} \mathbf{I} \mathbf{C} \mathbf{P}}{m \mathbf{G} \mathbf{I} \mathbf{C} \mathbf{P} (n^2 a)}$, which is equal to $\frac{\mathbf{G} \mathbf{I} \mathbf{C} \mathbf{P}}{m \mathbf{G} \mathbf{I} \mathbf{C} \mathbf{P}}$.

The angular velocity in this case must be $\frac{\mathbf{G} \mathbf{I} \mathbf{C} \mathbf{P}}{m \mathbf{G} \mathbf{I} \mathbf{C} \mathbf{P}}$.

Therefore we have $\frac{\mathbf{G} \mathbf{I} \mathbf{C} \mathbf{P}}{m \mathbf{G} \mathbf{I} \mathbf{C} \mathbf{P}}$, and $\frac{\mathbf{G} \mathbf{I} \mathbf{C} \mathbf{P}}{m \mathbf{G} \mathbf{I} \mathbf{C} \mathbf{P}} = \frac{\mathbf{G} \mathbf{I} \mathbf{C} \mathbf{P}}{m \mathbf{G} \mathbf{I} \mathbf{C} \mathbf{P}}$. Also, as in $n^2 31$.

This point $O$ has several remarkable properties. In the first place, it is the point of a common heavy body swinging round $C$ by its gravity, where, if all its weight be supposed to be concentrated, it will perform its oscillations in the same time. For while the body has its natural form, the whole force of gravity may be supposed to be exerted on its centre of gravity. When the matter of the body is collected at $O$, the force of gravity is concentrated there also; and if $C$ have the same inclination to the horizon in the first case that $O$ has, the action of gravity will be applied in the same angle of inclination, and the two bodies will acquire the same angular velocity; that is, they will descend from this situation to the vertical situation (that is, through an equal angle) in the same time. These two bodies will therefore oscillate in equal times. For this reason, the point $O$ is taken in the line $CG$, which is the radius vector of the centre of inertia, that $CO$ is equal to $\frac{\mathbf{A} \cdot \mathbf{C} \mathbf{A}^2}{m \cdot \mathbf{C} \mathbf{G}}$, or $\mathbf{GO} = \frac{\mathbf{A} \cdot \mathbf{G} \mathbf{A}^2}{m \cdot \mathbf{C} \mathbf{G}}$.

If the body is a heavy sphere, of whose height many times exceeds its base, swinging round its vertex in any direction.

If a sphere, of which $r$ is the radius, be suspended by a thread whose weight may be neglected, and whose length is $l$, the distance between its centre of suspension and centre of oscillation is $\frac{r}{1 + e} + \frac{r}{1 + e} - \frac{r}{1 + e} + \frac{r}{1 + e}$; and the distance between its centers of bulk and oscillation is $\frac{r}{1 + e}$. Thus, in a common second's pendulum, whose length at London is about 39$\frac{3}{8}$ inches, the centre of oscillation will be found about $\frac{r}{1 + e}$ of an inch below the centre of the ball, if it be two inches in diameter.

If the weight of the thread is to be taken into the account, we have the following distance between the centre of the ball and that of oscillation, where $B$ is the weight of the ball, $a$ the distance of the point.
Rotation. of suspension and its centre, d the diameter of
the ball, and \( w \) the weight of the thread or rod,
\[
GO = \left( \frac{1}{2}w + \frac{3}{2}B \right) d^2 - \frac{1}{2}w (a d + a^2);
\]
or, if we consider the weight of the thread as an unit, and the
weight of the ball as its multiple (or as expressed by the
number of times it contains the weight of the thread),
\[
GO = \frac{1}{2}a \left( B + \frac{a}{d} \right).
\]
As the point O, determined as above, by making
\[
CO = \frac{1}{2} \frac{r^2}{mCG},
\]
it is the centre of oscillation of the body
turning round C, so C is the centre of oscillation of the
fame body turning round O; for, referring A. CA in
place of \( pr \), we have \( fA.CA^2 = m.CO.CG \). Now
\( fA.CA^2 = fA.OA^2 + fA.OC^2 = fA.OC \cdot 2a \),
(Euclid, II. 12. 13.), or \( m.CO.CG = fA.OA^2 + fA.OC^2 = 2a \).
But \( fA.OC = m.OC_1 = m.OC.CG \); and (by the nature of the centre of gravity)
fA.OC = \( m \cdot OC \cdot 2a \). Therefore we have
\( m.CO.CG = m.CO.CG + m.CO.CG + m.CO.CG = m.CO.CG \).
But C = \( m \cdot CG \) and \( CG + \frac{1}{2} \) =\( CG + 2 \cdot OG = CO \).
Therefore \( fA.OA_1 = m.CO.CG \), and
\[
CO = \frac{1}{2} \frac{r^2}{m.OG},
\]
which is all that is wanted (according to
n° 39.), to make C the centre of oscillation when O
is the centre of suspension.

If the point of suspension, or axis of rotation, be
anywhere in the circumference of a circle of which G
is the centre, the point O will be in the circumference
of another circle of which G is the centre: for, by n° 38.
\[
GO = \frac{1}{2} \frac{r^2}{m.CG},
\]
and therefore while CG is constant, OG will also be
constant.

We may also observe that the distance of the axis
from the centre \( S \) of gyration is a mean proportional
between its distance from the centre \( G \) of gravity and the
centre O of oscillation: for we had (n° 59.).
\[
CS = \frac{1}{2} \frac{r^2}{m.CG} \quad \text{and} \quad \frac{CO}{m.CG} = \frac{1}{2} \frac{r^2}{m.CG},
\]
and therefore
\[
CO : CG = CO : CS = CG : CG.
\]

We see also that the distance CO is that at which an
external force must be applied; so that there may
not be any prejure excited in the axis upon its points
of support, and the axis may be a spontaneous axis of
conversion. This we learn, by comparing the value of
CO with that of \( CP \) in art. 30. This being the case,
it follows, that if an external force is applied in a
direction passing thro' O, perpendicular to CO, it will
produce the same initial velocity of the centre as if the
body were free; for as it exerts no prejure on the
points of support, the initial motion must be the same
as if they were not there.

If the external force be applied at a greater distance
in the line CG, the velocity of the centre will be greater
than if the body were free. In this case the prejure
excited in the axis will be backward, and consequently
the points of support will react forward, and this
reaction will be equivalent to another external
force conspiring with the one applied at O. Some
curious consequences may be deduced from this.

If the external force be applied to a point in the
line CG, lying beyond C, the motion of the centre will
be in the opposite direction to what it would have tak-
en had the body been free, and so will be the pre-
}
and equal to the quantity of motion of the board, all motion will be stopped: for when the point G is stopped, no reason can be assigned why one part of the board shall advance more than another. The same thing must happen if the board be stopped by a straight edge put in its way, and passing through G: for example, in the line LGM, or \( g \cdot G \). But if this edge be so placed that the board shall meet it with the line IPK, then, because this line does not divide it equally, and because there is a greater quantity of motion in the part CIKC' than in the part ID'D'K, though the progresive motion may be stopped, the upper part will advance, and a motion of rotation will commence, of which IK will be the axis. Now suppose that the board, instead of having been moved along in the direction GH, every part with the same velocity had been swaying round the axis CC' like a pendulum, from the position Cdd' to C', and that it was stopped by a straight edge meeting it in the line LGM parallel to CO', in the moment that it has attained the vertical position CDD'C'; all its motion will not be stopped: for, although LGM divides the board equally, there is more motion in the lower part Dd'M than in the upper part CLMC' because every particle of the lower part is describing larger circles and moving swifter. Therefore when the line LGM is stopped, there will be a tendency of the lower part to advance, and the pivots DD' and CG parallel. Let \( A \) be the centre of oscillation, which is the vertical projection of the lower part. This motion \( AL \) may be considered as compounded of the motion \( A \), perpendicular to the plane DCG, and the motion \( AM \) in this plane. It is evident that it is \( A \) only which is opposed by the external force moving the body at \( P \), because \( A \) alone makes any part of the progresive motion of the centre of gravity in the direction GH.

But any point of this line will not do. It is evident that if the board should meet the fixed edge in the line \( g \cdot GO \), all motion will be stopped, for the motions on each side are equal, and neither can prevail. But if it be stopped in the line \( p \cdot PQ \), there is more motion in the part \( p \cdot D' \) than in the part \( p \cdot C' \); and if the supports at \( C \) and \( C' \) were that instant taken away, a rotation would commence, of which \( LM \) is the axis. The board must therefore be stopped in some line IPK below LGM, and so situated, that the sum of all the momenta on each side of it shall be equal. This alone can hinder a rotation round the axis IPK. From what has been already demonstrated, it appears, that this will be prevented if the edge meets the board in a line IPK passing through \( O \) the centre of oscillation, which is situated in the line \( g \cdot GH \) passing through the centre of gravity perpendicular to the axis CC'. This line \( KO \) may therefore be called the line or axis of percussion.

We have hitherto taken the \textit{radii vectores} for the measures of the velocities or motions of the particles. Therefore the quantity of motion or the moving force of \( A \) is \( A.Aa \), and this is exerted in the direction \( AL \), and may be conceived as exerted on any point in this line, and therefore on the point \( L \). That is, the point \( L \) might be considered as urged in this direction with the force \( A.Aa \), or with the two forces of which the force \( A.Aa \) is compounded. The force in the direction \( AL \) is to the force in the direction \( AL \) as \( AL \) to \( aL \), or as \( Aa \) to \( aL \), because the triangles \( A/L \) and \( aL \) are similar. Therefore, instead of supposing the point \( L \) urged by the force \( A.Aa \), acting in the direction \( AL \), we may suppose it impelled by the force \( A.aL \), acting perpendicularly to the line \( AL \), or to the plane DCG, and by the force \( A.AL \) acting in this plane, viz. in the direction \( Ln \). This last force has nothing to do with the percussion at \( P \). Therefore we need consider the point \( L \) as only impelled by the force \( A.AL \). The momentum of this force, or its power to urge the plane DCG forward in the direction \( GH \), by turning it round \( Dd \), must be \( A.aL.aL \). (N. B. This is equal to \( A.Aa \), because \( aL.aL = A.aL \), and \( A.Aa \) has been shown long ago to be the general one.)
Draw \( Lm \) perpendicular to \( PP \). If we consider \( PP \) as an axis about which a motion of rotation may be produced, it is plain that the momentum of the point \( L \) to produce such a rotation will be \( A.al.Lm \). In like manner, its momentum for producing a rotation round \( nP \) would be \( A.al.Ln \). In general, its momentum for producing rotation round any axis is equal to the product of the perpendicular force at \( L \) (that is, \( A.al \)) and the distance of \( L \) from this axis.

In order therefore that \( P \) may be the centre of percussion, the sum of all the forces \( A.al.Lm \) must be equal to nothing; that is, the sum of the forces \( A.al.Ln \) on one side of this axis \( PP \) must be balanced by the sum of forces \( A'al'Lm' \) on the other side. To express this in the usual manner, we must have \( \int A.al.nP = 0 \). Next \( OP \) is the axis wherever the particle \( A \) is situated; and because \( G \) is the centre of gravity, the sum of all the quantities \( A.al \) is \( m.GC \), \( m \) being the quantity of matter of the body; that is, \( \int A.al = m.GC \), and \( \int A.al.nO = \int A.al.OP = m.GC.OP = \int A.al.nO \). Hence we derive the final equation

\[
OP = \frac{\int A.al.nO}{m.GC}.
\]

Therefore the centre of percussion \( P \) of a body turning round the axis \( DD \) is determined by these conditions: 1st, It is in the plane \( DCG \), passing through the axis and the centre of gravity; 2d, It is in a line \( nO \) passing through the centre of percussion, and parallel to the axis, and therefore its distance \( OP \) from the axis of rotation is \( \frac{\int A.al.nO}{m.GC} \); and, 3d, Its distance \( OP \) from the centre of percussion is \( \frac{\int A.al.nO}{m.GC} \).

In order therefore that the centres of oscillation and percussion may coincide, or be one and the same, \( OP \) must vanish, or \( SA.al.nO \) must be equal to nothing, that is, the sum of all the quantities \( A.al.nO \) on one side of the line \( CO \) must be equal to the sum of all the quantities \( A'al.nO \) on the other side.

Let \( DD'a \) be a plane passing through the axis \( DD \) perpendicular to that other plane \( DCG \) through it, in which the centre of gravity is situated, and let \( C, F, G \) \&c. be a third plane passing through the centre of gravity perpendicular to both the planes \( D'aD \) and \( DCG \). Draw \( lr \) and \( a \alpha \) perpendicular to \( aL \), and \( r \alpha \) perpendicular to \( cr \), and then draw \( A \alpha \), \( A \alpha \) perpendicular to \( a \alpha \) and \( r \alpha \). It is evident that \( A \alpha \) and \( A \alpha \) are respectively equal to \( aL \) and \( lr \), or to \( aL+nr \); so that the two factors or constituents of the momentum of a particle \( A \) round the centre of percussion are the distances of the points of the planes \( D'da \) and \( xeG \), both of which are perpendicular to that plane passing through the axis in which the centre of gravity is placed.

We may see, from these observations, that the centres of oscillation and percussion do not necessarily coincide; and the circumstance which is necessary for their coincidence, viz. that \( \int A.al.\alpha = \int 0 \), is of importance to keep this in mind.

There occurs here another observation of great importance. Since every force is balanced by an equal force acting in the opposite direction, and since all motion progressive and rotary is opposed by an external force applied at \( P \) in the direction \( qP \), it follows that, if the body were at rest, and the same force be applied there, it will set the body in rotation round the axis \( DD \) in the opposite direction, with the same angular velocity, and without any preface on the pivots \( P \) and \( D \). For whatever motion of the particle \( A \), in the direction \( AL \), was stopped by a part of the external force applied at \( P \), the same motion will be produced by it in the slightest particle \( A \) in the opposite direction \( LA \). And as the pivots \( P \) and \( D \) had no motion in the case of the body turning round them, they will acquire no motion, or will have no tendency to motion, or no preface will be exerted on them, in the last case. Therefore when an external force is applied at \( P \) in a direction perpendicular to the line \( PP \), the line \( DD \) will become a momentary spontaneous axis of conversion, and the incipient motion of the body will perfectly resemble the rotation of the same body round a fixed axis \( DD \).

There is another set of forces of which we have as yet no notice, viz. that part of each force \( AL \) which is directed along the plane \( DCG \), and is represented by \( AL \), or by \( AL \) when the whole force is represented by \( A \alpha \). These forces being all in the plane \( DCG \), and in the direction \( CG \) or \( GC \), can have no effect on the rotation round any axis in that plane. But they tend, separately, to produce rotation round any axis passing through this plane perpendicularly. And the momentum of \( A \) to produce a rotation round an axis perpendicular to this plane, \( O \) for instance, must evidently be \( A.al.nO \), and round \( P \) it must be \( A.al.nP \). We shall have occasion to consider these afterwards.

It is usual in courses of experimental philosophy to illustrate the motions of bodies on inclined planes and cylinders by experiments with balls rolling down inclined planes and cylinders. But the motions of such rolling balls along curved surfaces are by no means jut representations of the motions they represent. The ball not only goes down the inclined plane by the action of gravity, but it also turns round an axis. Force is necessary for producing this rotation; and as there is no other force but the weight of the ball, part of this weight is expended on the rotation, and the remainder only accelerates it down the plane. The point of the ball which rests on the plane is hindered from sliding down by friction; and therefore the ball tumbles, as it were, over this point of contact, and is instantly caught by another point of contact, over which it tumbles in the same manner. A cylinder rolls down in the very same way; and its motion is nearly the same as if a fine thread had been lopped round it, and one end of it made fast at the head of the inclined plane. The cylinder rolls down by unwinding this thread.

The mechanism of all such motions (and some of them are important) may be understood by considering the following as follows: Let a body of any shape be connected with a cylinder \( FCB \) (fig. 6) whole axis passes through \( G \) the centre of gravity of the body. Suppose that body suspended from a fixed point \( A \) by a thread wound round the cylinder. This body will descend by the action of gravity, and it will also turn round, unwinding the thread. Draw the horizontal line...
Rotation. [513]

The weight of the descending body will be to the tension of the thread as CO to CG: for the tension of the thread is the difference between the momentum of the rolling body and that of the body falling freely.

Observe, that this proportion between the weight of the body and the tension of the thread will be always the same; for it has been demonstrated already, \( n^2 \leq 42 \), that if C be in the circumference of a circle whose centre is G, O will be in the circumference of another circle round the same centre, and therefore the ratio of CG to CO is constant.

Cor. 1. The weight of the descending body will be to the tension of the thread as CO to GO: for the tension of the thread is the difference between the momentum of the rolling body and that of the body falling freely.

Cor. 2. If a circular body FCB roll down an inclined plane by unfolding a thread, or by friction which prevents all sliding, the space described will be to that by which the body would describe freely as CG to CO: for the tendency down the inclined plane is a determined proportion of the weight of the body. The motion of rotation in these cases, both progressive and whirling, is uniformly accelerated.

Something of the same kind obtains in common pendulous bodies. A ball hung by a thread not only oscillates, but also makes part of a rotation; and for this reason its oscillations differ from those of a heavy point hanging by the same thread, and the centre of oscillation is a little below the centre of the ball. A ball hung by a thread, and oscillating between cycloidal checks, does not oscillate like a body in a cylinder, because its centre of oscillation is continually shifting its place. Huyghens avoided this by suspending his pendulous body from two points, so that it did not change its attitude during its oscillation. If our spring-carrigages were hung in this manner, having the four lower flaps to which the straps are fixed as far afunder as the four upper flaps at the ends of the springs, the body of the carriage would perform its oscillations without kicking up and down in the disagreeable manner they now do, by which we are frequently in danger of finding the glands with our heads. The springs would indeed be greater, but incomparably easier; and we could hold things almost as steadily in our hand as if the carriage were not swaying at all.

This will suffice for an account of the rotation round fixed axes, as the foundation for a theory of machines actually performing work. The limits of our understanding will not allow us to do any more than just point out the method of applying it.

Let there be any machine of the rotatory kind, i.e., a method of applying this theory of rotation to practice, composed of levers or wheels, and let its construction be such, that the velocity of the point to which the power is applied (which we shall call the impressed point) is to the velocity of the working point in the ratio \( \frac{m}{n} \). It is well known that the energy of this machine will be the same with that of an axis in peritrochic, of which the radii are \( mw \) and \( n \).

Let \( p \) express the actual pressure exerted on the impressed point by the moving power, and let \( r \) be the actual pressure or resistance exerted on the working point by the work to be performed. Let \( x \) be the inertia of the power, or the quantity of dead matter which must move with the velocity of the impressed point in order that the moving power may act. Thus the moving power may be the weight of a bucket of water in a water-wheel; then \( x \) is the quantity of matter in this bucket of water. Let \( y \) in like manner be the inertia of the work, or matter which must be moved with the velocity of the working-point, in order that the work may be performed. Thus \( y \) may be a quantity of water which must be continually pulled along a pipe. This is quite different from the weight of the water, though it is proportional to it, and may be measured by it.

Let \( f \) be a preasure giving the same resistance when applied at the working-point with the friction of the machine, and let \( ax \) be the momentum of the machine's inertia, viz. the force as if a proper quantity of matter \( a \) were attached to the working-point, or to any point at the same distance from the axis.

This state of things may be represented by the wheel and axle PQS (fig. 7), where \( x \) and \( y \) and \( a \) are represented by weights acting by lines. \( P \) is the impressed point, and \( R \) the working-point; \( CP \) is \( m \) and \( CR \) is \( n \). The moving force is represented by \( PA \), the resistance by \( RB \), and the friction by \( BF \).

It is evident that the momentum of the inertia of \( mx \), \( y \), and \( a \) are the same as if they were for a moment attached to the points \( P \) and \( R \).

Hence we derive the following expressions,

1. The angular velocity \( = \frac{pm-r+fa}{xm^2+y+an^2} \).

2. The velocity of the working-point \( = \frac{pm-nr+r+fa}{xm^2+y+an^2} \).

3. Work performed \( = \frac{pmn-r+fa}{xm^2+y+an^2} \).

For the work is proportional to the product of the resistance and the velocity with which it is overcome.

We shall give a very simple example of the utility of these formulae. Let us suppose that water is to be raised in a bucket by the descent of a weight, and that the machine is a simple pulley. Such a machine is described by Defaguliers \(^*\), who says he found it preferable to all other machines. The bucket dipped itself into the cistern. A chain from it went over a pulley, and at its extremity was a flange on which a man could step from the head of a stair. His preponderance brought down the flange and raised the bucket, which discharged its water into another cistern. The man quitted the flange, and walked up stairs, and there he found it.
it ready to receive him, because the empty bucket is made heavier than the empty stage.

Now, if there be no water in the buckets, it is evident, that although the motion of the machine will be the quickest possible, there will be no work performed. On the other hand, if the loaded stage and the full bucket are of equal weight, which is the usual statement of such a machine in elementary treatises of mechanics, the machine will stand still, and no work will be performed. In every intermediate state of things the machine will move, and work will be performed. Therefore the different values of the work performed must be a series of quantities which increase from nothing to a certain magnitude, and then diminish to nothing again.

The maxim which is usually received as a fundamental proposition in mechanics, viz. that what is gained in force by the intervention of a machine is lost in time, is therefore false. There must be a particular proportion of the velocities of the impelled and working-points, which will give the greatest performance when the power and resistance are given; and there is a certain proportion of the power and resistance which will have the same effect when the structure of the machine has previously fixed the velocities of the impelled and working-points.

This proportion will be found by treating the formula which expresses the work as a fluxionary quantity, and finding its maximum. Thus, when the impelled point of the machine. Now the universal fact and the equality of action and reaction in the collision of bodies affirms us, that their mutual pressure in their collision is measured by the change of motion which each sustains: for this change of motion is the only indication and measure of the pressure which we suppose to be its cause. A way therefore of ascertaining what is the real moving force on a machine actuated by the impulsion of a moving body, is to discover what quantity of motion is lost by the body or gained by the machine; for these are equal. Having discovered this, we may proceed according to the propositions of rotatory motion.

Therefore let AEF (fig. 8.) represent a body movable round an axis passing through C, perpendicular to the plane of the figure. Let this body be struck in the point A by a body moving in the direction FA, and let BAD be a tangent to the two bodies in the point of collision. It is well known that the mutual actions of two solid bodies are always exerted in a direction perpendicular to the touching surfaces. Therefore the mutual pressure of the two bodies is in the direction AP perpendicular to AD. Therefore let the motion of the impelling body be resolved into the directions AP and AD. The force AD has no share in the pressure. Therefore let V be the velocity of the impelling body actuated in the direction AP, and let n be its quantity of matter. Its quantity of motion in the direction AP will be nV.

Did AP pass through C, it is evident that the only effect
...effect would be to press the axis on its supports. But if the direction of the preijure, being inclined to AC, the point A is forced aside, and in some small moment of time describes the little arch Aa round the centre C. The point P will therefore describe a small arch Pp, subtending an angle PCp = AC a. Draw a a perpendicular to AP, and a d perpendicular to AD. The triangles AaA, ACP are similar, and A a : A A = AC : CP. But the angles AC a, PCp being equal, the arches are as their radii, and A a : P p = AC : CP, = A a : A o; therefore p p = A o.

Now, since, in consequence of the impulse, A describes A a in the moment of time, it is plain that A o is the space through which the impelling body continues to advance in the direction of the preijure; and if V be taken equal to the space which it described in an equal moment before the stroke, v will express the remaining velocity, and V—v is the velocity lost, and n(V—v) is the quantity of motion lost by the impelling body, and is the true measure of the preijure exerted. This gives us the whole circumstances of the rotatory motion. The angular velocity will be \( \frac{n(V-v)CP}{\sqrt{fp^2}} \), and the velocity of the point A will be \( \frac{n(V-v)CP-CA}{\sqrt{fp^2}} \). Call this velocity \( u \). The similarity of triangles gives us CA : CP = A a : A o (or u) : A o (or v) and \( u = \frac{v CP}{\sqrt{fp^2}} \). Therefore

\[
\frac{VCP}{\sqrt{fp^2}} = \frac{n(V-v)CP}{\sqrt{fp^2}}.
\]

From this we deduce

\[
v = \frac{nCP}{\sqrt{fp^2}} + \frac{\sqrt{fp^2}}{n} V.
\]

And thus we have obtained the value of \( v \) in known quantities; for \( n \) was g, or supposed known; so also was \( V \); and since the direction \( FA \) was given, its distance \( CP \) from the axis is given; and the form of the body being known, we can find the value of \( fp \). Now we have seen that \( v \) is also the velocity of the point \( P \); therefore we know the absolute velocity \( v \) of a given point of the body or machine, and consequently the whole rotatory motion.

We have the angular velocity \( = \frac{nVCP}{\sqrt{fp^2} + nCP^2} \); we shall find this a maximum when \( fp = nCP \); and in this case \( CP = \sqrt{fp^2} = n \), and \( v = \frac{1}{2} V \). So that the greatest velocity of rotation will be produced when the drinking body loses \( \frac{1}{2} \) of its velocity.

What we have now delivered is sufficient for explaining all the motions of bodies turning round fixed axes; and we presume it to be agreeable to our readers, that we have given the investigation of the centres of gyration, oscillation, and percussion. The curious reader will find the application of these theorems to the theory of machines in two very valuable dissertations by Mr Euler in the Memoirs of the Academy of Berlin, vols viii. and x. and occasionally by other authors who have treated their mechanics in a scientific and useful manner, going beyond the school-boy elements of equilibrium.

There remains a very important case of the rotation of bodies, without which the knowledge of the motion of solid bodies, is incomplete; namely, the rotation of free bodies, that is, of bodies unconnected with any fixed points. We hardly see an instance of motion of a free body without some rotation. A stone thrown from the hand, a ball from a cannon, the planets themselves, are observed not only to advance, but also to whirl round. The famous problem of the precession of the equinoxes depends for its solution on this doctrine; and the theory of the working of ships has the same foundation. We can only touch on the leading propositions.

We need not begin by demonstrating, that when the direction of the external force passes through the centre of the body, the body will advance without any rotation. This we consider as familiarly known to every person verant in mechanics; nor is it necessary to demonstrate, that when the direction of the moving force does not pass through the centre of gravity, this will lead in advance in a direction parallel to that of the moving force, and with the same velocity as if the direction of the moving force had passed through it. This is the immediate consequence of the equality of action and reaction observed in all the mechanical phenomena of the universe.

But it is incumbent on us to demonstrate, that when the direction of the moving force does not pass thro' the centre of gravity, the body will not only advance in the direction of the moving force, but will also turn round an axis, and we must determine the position of this axis, and the relation subsisting between the progressive and rotatory motions.

The celebrated John Bernoulli was the first who considered this subject; and, in his Disquisitiones Mechanicae, he has demonstrated several propositions concerning the spontaneous axis of conversion, and the motions arising from eccentric external forces: and although he assumed for the leading principle a proposition which is true only in a great number of cases, he has determined the rotation of spherical bodies with great accuracy.

This combination of motions will be palpable in some simple cases, such as the following: Let two equal bodies A and B (fig. 9) be connected by an inflexible rod (of which we may neglect the inertia for the present). Let G be the middle point, and therefore the centre of gravity. Let an external force act on the point P in the direction FP perpendicular to AB, and let AP be double of PB. Also let the force be such, that it would have caused the sytem to have moved from the situation AB to the situation a b, in an indefinitely small moment of time, had it acted immediately on the centre G. G would in this case have described Gg, A would have described Aa, and B would have described Bb, and a b would have been parallel to AB: for the force impreseed on A would have been equal to the force impressed on B; but because the force acts on P, the force impressed on A is but one half of that impressed on B by the property of the lever: therefore the initial motion or acceleration of A will be only half of the initial motion of B; yet the centre G must still be at g. We shall therefore ascertain the initial motion of the system, by drawing through g a line \( ag \), so that A shall be \( \frac{1}{2} \) of B \( \beta \). This we shall do by making AC = AB, and drawing C \( ag \). Then \( a \beta \) will be the position of the sytem at the end of the moment of time. Thus we see that the body must have a motion of rotation combined with its progressive motion.
And we deduce immediately from the premises that this rotation is performed round an axis passing through the centre of gravity \( G \); for since the centre describes a straight line, it is never either above or below the axis of rotation, and is therefore always in it. This is a fundamental theorem, and our subsequent investigation is by this means greatly simplified, being thus reduced to two problems: 1. To determine in what direction the axis passes through the centre of gravity.

2. To determine the angular velocity of the rotation, or how far the centre must advance while the body makes one turn round the axis. This establishes the relation between the progressive and rotatory motions. It will contribute to our better conception of both these problems to see the result in the present simple case.

In the next place, in \( b a \) produced take \( b c = BC \). Then supposing \( AC \) to be a rigid line connected with the system, it is evident that if there had been no rotation, the line \( BC \) would have kept parallel to its first position, and that at the end of the moment of time \( C \) would have been at \( e \). The point \( C \) therefore has had, by the rotation, a backward motion \( \epsilon C \), relative to the centre \( G \) or \( g \), and this motion is equal to the progressive motion \( Gg \) of the centre; therefore if we make \( Gg = \epsilon C \) equal to the circumference of a circle whose radius is \( CG \), the body will make one rotation round the centre of gravity, while this centre moves along \( Gg \); and thus the relation is established between the two motions.

But farther, the point \( C \) has, in fact, not moved out of its place. The incipient motion has therefore been such, that \( C \) has become a spontaneous centre of conversion; it is easy to see that this must always be the case, whatever may be the form of the rigid body or system of particles connected by inflexible and inextensible lines. Since the system both advances and turns round an axis passing through its centre of gravity, there must be some point in the system, or which may be conceived as connected with it by an inflexible line, which moves backward, by the rotation, as fast as the centre advances forward. A line drawn through this point parallel to the axis must in this instant be at rest, and therefore must be a spontaneous axis of conversion. And, in this instant, the combined motions of rotation round an axis passing through the centre of gravity and the motion of progression, are equivalent to, and actually constitute, an incipient simple motion of rotation round another axis parallel to the former, whose position may be ascertained. But it is necessary to establish this proposition and its converse on clearer evidence.

Therefore let \( G \) (fig. 10) be the centre of gravity of a rigid system of particles of matter, such as we suppose a solid body to be. Let this system be supposed to turn round the axis \( GG \), while the axis itself is moving forward in the direction and with the velocity \( GI \). Let the rotation be such, that a particle \( A \) has the direction and velocity \( A \delta \). Let us first suppose the progressive motion \( GI \) to be perpendicular to the axis \( GG \). It will therefore be parallel to the planes of the circles described round the axis by the different particles. Let \( CG \) be a plane perpendicular to \( GI \). It will cut the plane of the circle described by \( A \) in a straight line \( eg \), and \( g \) will be the centre round which \( A \) is turning. Therefore \( AG \) will be the radius vector of \( A \), and \( AB \) is perpendicular to \( AG \). Let \( AD \) be perpendicular to \( eg \), and in \( AD \) take \( AE \) equal to \( GI \) or \( gi \). It is evident, that the absolute motion of \( A \) is compounded of the motions \( AE \) and \( AB \), and is the diagonal of the parallelogram \( AEfB \). In the line \( gi \), which is perpendicular to \( GG \), take \( gF \) to \( gA \), as \( A \delta \) to \( A \), and draw \( CF \) parallel to \( gG \), and produce \( bA \) till it cut \( eg \) in \( n \). We say that \( C \) is in this moment a spontaneous axis of conversion; for, because \( \Delta n \) is perpendicular to \( AG \) and \( AD \) to \( CG \), the angle \( \Delta e \) is equal to \( dAN \) or \( jfb \). Therefore, since \( \Delta e = abc \), the triangles \( \Delta eA \) and \( \Delta fB \) are similar, and the angle \( \Delta e \) is equal to \( bA \). Take away the common angle \( \Delta f \), and the remaining angle \( \Delta A \) is equal to the remaining angle \( \Delta b \), and \( \Delta f \) is perpendicular to \( \Delta \), and the incipient motion of \( A \) is the same in respect of direction as if it were turning round the axis \( C \). Moreover, \( A \) is to \( fb \) or \( gi \) as \( \Delta \) to \( eg \). Therefore, both the direction and velocity of the absolute motion of \( A \) is the same as if the body were turning round the fixed axis \( AC \); and the combined motion \( \Delta \) of progression, and the motion \( A \) of rotation round \( Gc \), are equivalent to, and really constitute, a momentary simple motion of rotation round the axis \( Cc \) given in position, that is, determinable by the ratio of \( A \delta \) to \( A \).

On the other hand, the converse proposition is, that a simple motion of rotation round a fixed axis \( C \), such that the centre \( G \) has the velocity and direction \( GI \) perpendicular to \( CG \), is equivalent to, and produces a motion of rotation round an axis \( GG \), along with the progressive motion \( GI \) of this axis. This proposition is demonstrated in the very same way, from the consideration that, by the rotation round \( C \), we have \( \Delta \) : \( eg = A \) : \( f \) : \( gi \). From this we deduce, that \( AB \) is perpendicular to \( AG \), and that \( fB : A \) : \( eg : gA \); and thus we resolve the motion \( A \) into a motion \( AB \) of rotation round \( Gg \), and a motion \( A \) of progression common to the whole body.

But let us not confine the progressive motion to the direction perpendicular to the axis \( GG \). Let us suppose that the whole body, while turning round \( GG \), is carried forward in the direction and with the velocity \( GK \). We can always conceive a plane \( LGC \), which is perpendicular to the plane in which the axis \( GG \) and the direction \( GK \) of the progressive motion are situated.

And the motion \( GK \) may be conceived as compounded of a motion \( GI \) perpendicular to this plane and to the axis; and a motion of translation \( GL \), by which the axis slides along in its own direction. It is evident, that in the consequence of the first motion \( GI \), there arises a motion of rotation round \( C \). It is also evident, that if, while the body is turning for a moment round \( C \), this line be slid along itself in the direction of \( C \), a motion equal to \( GL \) will be induced on every particle \( A \), and compounded with its motion of rotation \( AF \), and that if \( F \) be drawn equal and parallel to \( GL \), it will be the situation of the particle \( A \) when \( G \) is in \( K \).

And thus it appears, that when the progressive motion is...
tion is perpendicular to the axis of rotation passing through the centre of gravity, the two motions progressive and rotatory are equivalent to a momentary simple motion of rotation round a spontaneous axis of conversion, which is at rest: but when the progressive motion is inclined to the axis passing through the centre, the spontaneous axis of conversion is sliding in its own direction.

We may conceive the whole of this very distinctly and accurately by attending to the motion of a garden roller. We may suppose it fixed feet in circumference, and that it is dragged along at the rate of three feet in a second from east to west, the axis of the roller lying north and south. Suppose a chalk line drawn on the surface of the roller parallel to its axis. The roller will turn once round in two seconds, and this line will be in contact with the ground at the intervals of every six feet. In that instant the line on the roller now spoken of is at rest, and the motion is the same as if it were fixed, and the roller really turning round it. In short, i. is then a spontaneous axis of conversion.

Now, suppose the roller dragged in the same manner and in the same direction along a sheet of ice, while the ice is floating to the south at the rate of four feet in a second. It is now plain that the roller is turning round an axis through its centre of gravity, while the centre is carried in the direction 36° 52' W. at the rate of five feet per second. It is also plain, that when the line drawn on the surface of the ice is applied to the ice, its only motion is that which the ice itself has to the southward. The motion is now a motion of rotation round this spontaneous axis of conversion, compounded with the motion of four feet per second in the direction of this axis. And thus we see that any complication of motion of rotation round an axis passing through the centre of gravity, and a motion of progression of that centre, may always be reduced to a momentary or incipient motion of rotation round another axis parallel to the former, compounded with a motion of that axis in its own direction.

The demonstration which we have given of these two propositions points out the method of finding the axis $C_1$, the incipient rotation round which is equivalent to the combined progressive motion of the body, and the rotation round the axis $G$. We have only to note the rotatory velocity $A_b$ of some particle $A$, and its distance $A_g$ from the axis, and the progressive velocity $G_1$ of the whole body, and then to make $G_C$ a fourth proportional to $A_b$, $G_1$, and $g A$, and to place $G_C$ in a plane perpendicular to $G_1$, which is perpendicular to $G_2$, and to place $C$ on that side of $G_g$ which is moving in the opposite direction to the axis.

In the simple case of this problem, which we exhibited in order to give us easy and familiar motions of the subject, it appeared that the retrograde velocity of rotation of the point $C$ was equal to the progressive velocity of the centre. This must be the case in every point of the circumference of the circle of which $C_g$, fig. 9, is the radius. Therefore, as the body advances, and turns round $G$, this circle will apply itself in succession to the line $C K$ parallel to $G_2$; and any individual point of it, such as $C$, will describe a cycloid of which this circle is the generating circle, $C K$ the base, and $C G$ half the altitude. The other points of the body will describe trochoids, elongated or contracted according as the deferring points are nearer to or more remote from $G$ than the point $C$ is.

It is now evident that all this must obtain in every case, as well as in this simple one. And when we have ascertained the distance $G_C$ between the axis of rotation passing through the centre, and the momentary spontaneous axis of conversion passing through $C$, we can then ascertain the relation between the motions of rotation and progression. We then know that the body will make one rotation round its central axis, while its centre moves over a space equal to the circumference of a circle of a known diameter.

We must therefore proceed to the methods for determining the position of the point $C$. This must depend on the proportion between the velocity of the general progressive motion, that is, the velocity of the centre, and the velocity of some point of the body.—This must be ascertained by observation. In most cafes which are interesting, we learn the position of the axis, the place of its poles, the comparative progressive velocity of the centre, and the velocity of rotation of the different points, in a variety of ways; and it would not much increase our knowledge to detail the rules which may be followed for this purpose. The circumstances which chiefly interest us at present is to know how these motions may be produced; what force is necessary, and how it must be applied, in order to produce a given motion of rotation and progression; or what will be the motion which a given force, applied in a given manner, will produce.

We have already given the principles on which we may proceed in this investigation. We have shown the circumstances which determine the place of the centre of percussion of a body turning round a given fixed axis. This centre of percussion is the point of the body where all the inherent forces of the whirling body precisely balance each other, or rather where they unite and compose one accumulated progressive force, which may then be opposed by an equal and opposite external force. If, therefore, the body is not whirling, but at rest on this fixed axis, and if this external force be applied at the centre of percussion, it will become a point of impulsion, and a rotation will commence round the fixed axis precisely equal to what had been stopped by this external force, but in the opposite direction; or, if the external force be applied in the direction in which the axis of percussion was moving at the instant of stoppage, the rotation produced by this impulse will be the same in every respect. And we found that in the instant of application of this external force, either to stop or to begin the motion, no prejudice whatever was excited on the supports of the axis, and that the axis was, in this instant, a spontaneous axis of conversion.

Moreover, we have shown, art. 84, that a rotation round any axis, whether fixed or spontaneous, is equivalent to, or compounded of, a rotation round another axis parallel to it, and passing through the centre of gravity, and a progressive motion in the direction of the centre's motion at the instant of impulse.

Now, as the position of the fixed axis, and the known disposition of all the particles of the body with respect to this axis, determines the place of the centre of percussion, and furnishes all the mathematical conditions which must be implemented in its determination, and the direction and magnitude of the force which is produced and exerted at the centre of percussion; so, on the other hand, the knowledge of the magnitude and direction
direction of an external force which is exerted on the point of impulsion of a body not connected with any fixed axis, and of the disposition of all the parts of this body with respect to this point of impulsion, will furnish us with the mathematical circumstances which determine the position of the spontaneous axis of conversion, and therefore determine the point of action of the axis through the centre whereof the spontaneous axis of conversion passes, round which the body will whirl, while its centre proceeds in the direction of the external force.

The process, therefore, for determining the axis of progressive rotation is just the converse of the process for determining the centre of percussion.

John Bernoulli was the first who considered the motion of free bodies impelled by forces whose whole line of direction did not pass through their centre of gravity; and he takes it for granted, that forces which the body both advances and turns round an axis passing through the centre of gravity, this axis is perpendicular to the plane passing through the direction of the force, and through the point of impulsion and the centre of gravity. Other authors of the first name, such as Huyghens, Leibnitz, Roberval, &c. have thought themselves obliged to demonstrate this. Their demonstration is as follows:

Let a body whose centre of gravity is G (fig. 11.) be impelled at the point P by a force acting in the direction PQ not passing through the centre. The motion of the whole body will result in the same manner as if the whole matter were collected in G, and therefore the resistence will be propagated to the point P in the direction GP. The particle P, therefore, is impelled in the direction PQ, and resists in the direction PA, and must therefore begin to move in some direction PB, which makes the diagonal of a parallelogram of which the sides have the directions PQ and PA. The diagonal and sides of a parallelogram are in one plane. P is therefore moving in the plane APQB or GPQ, and it is turning round an axis which passes through G. Therefore this axis must be perpendicular to the plane GPQ.

It would require a series of difficult propositions to shew the fallacy of this reasoning in general terms, and to determine the position of the axis through G. We shall content ourselves with a very simple case, where there can be no hesitation. Let A and B (fig. 12.) be two equal balls connected with the axis ab by inflexible lines Aa, Bb, perpendicular to ab. Let Aa be h and Bb 2. The centre of gravity G will evidently be in the line of ab, parallel to Aa and Bb, and in the middle of ab, and G is 1j. Let O be the centre of oscillation. The axis of oscillation is G = \( \frac{Aa}{Aa} + \frac{Bb}{Bb} \).

Draw A m, B n perpendicular to ab, and suppose the balls transferred to m and n. Their centre of oscillation will be still at O; and we see that if the system in this form were stopped at O, all would be in equilibrium. For the force with which the ball A arrives (by swinging round the axis) at m, is as its quantity of matter and velocity jointly, that is, \( \frac{Aa}{Aa} \). That of B arriving at n is \( \frac{Bb}{Bb} \). The arm m O of the lever turning round O is \( \frac{m}{m} \), and the arm n O is \( \frac{n}{n} \). The forces, therefore, are reciprocally as the arms of the lever on which they act, and their moments, or powers to turn the line m n round O, are equal and opposite, and therefore balance each other; and therefore, at the instant of stopping, no prejudice is exerted at n. Therefore, if any impulse is made at O, the balls at m and n will be put in motion with velocities 1 and 2, and e will be a spontaneous centre of conversion. Let us see whether this will be the case when the balls are in their natural places A and B, or whether there will be any tendency to a rotation round the axis ab. The momentum of A, by which it tends to produce a rotation round \( \epsilon O \) is \( Aa \times 1 \). That of B is \( Bb \times 2 \). Am and Bn are equal, and therefore the momentum of B is double that of A, and there is a tendency of the system to turn round \( \epsilon O \); and if, at the instant of stoppage, the supports of the axis ab were removed, this rotation round \( \epsilon O \) would take place, and the point \( \epsilon \) would advance, and \( b \) would recede, only remaining at rest. Therefore, if an impulse be made at O, ab would not become a spontaneous momentary axis of conversion, and O is not the centre of conversion. This centre must be somewhere in the line OP parallel to ab, as at P, and so situated that the momenta \( Aa \times 1 \) and \( Bb \times 2 \) may be equal, or that \( Aa \) may be double of \( Bb \), or \( ab \) double of \( \epsilon b \). If an impulse be now made at P, the balls AB will be urged by forces as 1 and 2, and therefore must continue to round the axis ab, and there will be no prejusces produced at a and \( \epsilon \), and \( ab \) will really become a momentary spontaneous axis of conversion.

Now join G and P. Here then it is evident, that a body or system A, B, receiving an impulse at \( P \) perpendicular to the plane \( acG \), acquires to itself a spontaneous axis of conversion which is not perpendicular to the line joining the point of impulsion and the centre of gravity. And we have shown, in art. 84, that this motion round \( ab \) is compounded of a progressive motion of the whole body in the direction of the centre, and a rotation round an axis passing through the centre of gravity. Therefore, in this system of free bodies, the axis of rotation is not perpendicular to the plane passing through the centre of gravity in the direction of the impelling force. As we have already observed, it would be a laborious task to ascertain in general terms the position of the progressive axis of rotation. Although the process is the inverse of that for determining the centre of percussion when the axis of rotation is given, it is a most intricate business to convert the steps of this process.

The general method is this: The momenta of a particle \( A \) (fig. 5.) by which it tends to change the position of the axis \( DD \), has for its factors \( Aa \times Aa \), which are its distances from three planes.

Draw three other planes (of which only one is in some measure determined in position, being perpendicular to \( DCO \)), so situated that the sums of similar products of the distances of the particles from them may in like manner be equal to nothing. This is a very intricate problem; so intricate, that mathematicians have long doubted and disputed about the certainty of the solutions. Euler, d'Alambert, Fréj, Landen, and others, have at last proved, that every body, however irregular its shape, has at least three axes passing through its centre of gravity, round which it will continue to rotate.
volve while proceeding forward, and that these are at right angles to each other; and they have given the conditions which must be implemented in the determination of these axes. But they fill leave us exceedingly at a loss for means to discover the positions of the axes of a given body which have these conditions.

To solve this problem therefore in general terms, would lead to a disquisition altogether disproportioned to our work. We must restrict ourselves to those forms of body and situations of the point of impulsion which admit of the coincidence of the centres of oscillation and percussion; and we must leave out the cases where the axis has a motion in the direction of its length; that is, we shall always suppose the spontaneous axis of conversion to have no motion. Thus we shall comprehend the phenomena of the planetary motions, similar to the precession of our equinoctial points, and all the interesting cases of practical mechanics. The speculative mathematical reader will fill up the blanks of this investigation by consulting the writings of Euler and D’Alembert in the Berlin Memoirs, Frilli’s Cosmography, and the papers of Mr. Landen, Mr. Milner, and Mr. Vince, in the Philosophical Transactions. But we hope, by means of a beautiful proposition on the composition of rotatory motions, to enable every reader to discover the position of the axis of progressive rotation in every case which may interest him, without the previous solution of the intricate problem mentioned above.

Let $ABPC \rho \beta \lambda$ (fig. 13) be a section of a body through its centre of gravity $G$, so formed, that the part $ABPC$ is similar, and similarly placed with the part $A \beta \lambda C$, so that the plane $AC$ would divide it equally. Let this body be impelled at $P$ in the direction $HP$, perpendicular to the plane $AC$. The axis round which it will turn will be perpendicular to $G \pi$. Suppose it at $A$. Then drawing $AB$ and $A \beta \lambda$ to similar points, it is plain that $B \beta, \beta \lambda$ are equal and opposite; these represent the forces which would raise or lower one end of the axis, as has been already observed. The axis therefore will remain perpendicular to $G \pi$.

93

Let the body be so shaped, that if the parts of the right and left of the point of impulsion $\pi$ (the impulse is here supposed not perpendicular to the plane $AC$, but in this plane) are equal and similarly placed; then the momenta round $AC$ must balance each other, and the axis $EF$ will have no tendency to go out of the plane $A B C \lambda A$ perpendicular to the impulse.

Any body whose shape has these two properties will turn round an axis perpendicular to the plane which passes through the centre of gravity in the direction of the impelling force. This condition is always found in the planets when disturbed by the gravitation to a distant planet: for they are all figures of revolution. The direction of the disturbing or impelling force is always in a plane paffing through the axis and the disturbing body.

With such limitations therefore we propose the following problem:

Let $G$ (fig. 14) be the centre of gravity of a body in free space, which is impelled by an external force $f$, acting in the line $FP$, which does not pass through the centre. Let $m$ be the number of equal particles in the body, or its quantity of matter. Let the force $f$ be such, that it would communicate to the body the velocity $v$; that is, would cause the centre to move with the velocity $v$. It may be expressed by the quantity of motion which it produces, that is, by $m v$, and it would produce the velocity $m v$ on one particle. It is required to determine the whole motion, progressive and rotatory, which it will produce, and the space which it will describe during one turn round its axis.

Draw $GI$ parallel and PG perpendicular to $FP$, and let $GI$ be taken for the measure of the progressive velocity $v$.

It has been demonstrated that the centre $G$ will proceed in the direction $GI$ with the velocity $v$, and that the body will at the same time turn round an axis passing through $G$, perpendicular to the plane of the figure, every particle describing circles in parallel planes round the axis, and with velocities of rotation proportional to their distances from it. There is therefore a certain distance $GB$, such that the velocity with which a particle describes its circumference is equal to the progressive velocity $v$. Let $BCD$ be this circumference.

When the particle describing this circumference is in the line $CGP$, and in that part of it which lies beyond $P$ from $G$, its absolute velocity must be double that of the centre $G$; but when it is in the opposite point $C$, its retrograde velocity being equal to the progressive velocity of the centre, it must be at rest. In every position of the body, therefore, that point of the accompanying circumference which is at this extremity of the perpendicular drawn through the centre on the line of direction of the impelling force is at rest. It is at that instant a spontaneous centre of conversion, and the straight line drawn through it perpendicular to the plane of the figure is then a spontaneous axis of conversion, and every particle is in a momentary state of rotation round this axis, in directions perpendicular to the lines drawn to the axis at right angles, and with velocities proportional to those distances; lastly, the body advances in the direction $GI$ through a space equal to the circumference $BCD$, while it makes one turn round $G$.

Let $A$ be one of the particles in the plane of the figure. Join $AC, AG, AP$. Draw $Ab, Ac, Ad$ perpendicular to $CP, CA, GA$. The absolute motion $Ac$ of $A$ is compounded of the progressive motion $Ab$ common to the whole body and equal to $GI$, and the motion $Ad$ of rotation round the centre of gravity $G$. Therefore since $Ab$ is equal to $v$, and $Ac$ is the diagonal of a parallelogram—given both in species and magnitude, it is also given, and (as appears also from the reasoning in art. 87.) it is to $GI$ as $CA$ to $CG$.

By the application of the force $m v$ in the direction $FP$, every particle of the body is dragged out of its place, and exerts a resistance equal to the motion which it acquires. A part of this force, which we may call $m v$, is employed in communicating the motion $Ac$ to $A$; and, from what has been lately shown, $CG: CA = GI: A \pi = v: Ac$, and therefore $A \pi = \frac{v CA}{CG}$. But farther (agreeably to what was demonstrated in art. 16.) we have $CP: CA = A \pi = m v = \frac{v CA}{CG}$, and therefore $m v = v CA^2$. 
Therefore the whole force employed in communicating to each particle the motion it really acquires or \( m \cdot v_1 \) is equal to the fluent of the quantity \( \frac{v \cdot CA^2}{CP \cdot CG} \)
or \( m \cdot v_1 = \frac{v \cdot CA^2}{CP \cdot CG} \), and \( m \cdot CP \cdot CG = \int GA^2 \), which by art. 23. is equal to \( \int GA^2 + m \cdot CG^2 \). Therefore we have \( m \cdot CP \cdot CG - m \cdot CG^2 \cdot \int GA^2 \), or \( m \cdot GP \cdot CG = \int GA^2 \), and finally, \( CG = \frac{\int GA^2}{m \cdot GP} \).

Now the form of the body gives us \( \int GA^2 \), and the position of the impelling force gives us \( m \cdot GP \). Therefore we can compute the value of \( CG \); and if \( \pi \) be the periphery of a sphere whose radius is unity, we have \( \pi \cdot CG \) equal to the space which the body must describe in the direction \( GI \), while it makes one rotation round its axis.

**Cor. 1.** The angular velocity, that is, the number of turns or the number of degrees which one of the radii will make in a given time, is proportional to the impelling force: for the length of \( CG \) depends only on the form of the body and the situation of the point of impulsion; while the time of describing \( \pi \) times this length is inversely as the force.

2. The angular velocity with any given force is as \( \frac{\int GA^2}{m \cdot GP} \); for \( CG \), and consequently the circumference \( \pi \cdot CG \) described during one turn, is inversely as \( GP \).

3. \( PC \) is equal to \( \frac{\int GA^2}{m \cdot GP} \); for we have \( \frac{\int GA^2}{m \cdot GP} = \int GA^2 + m \cdot GP^2 \). Therefore \( \frac{\int GA^2}{m \cdot GP} = \int GA^2 + \frac{m \cdot GP^2}{m \cdot GP} = CG + GP = CP \).

4. If the point \( C \) is the centre of impulsion of the same body, \( P \) will be a spontaneous centre of conversion (see art. 41).

5. A force equal and opposite to \( m \cdot \dot{v}_1 \), or to \( f \), applied at \( G \), will stop the progressive motion, but will make no change in the rotation; but if it be applied at \( P \), it will stop all motion both progressive and rotary. If applied between \( P \) and \( G \), it will stop the progressive motion, but will leave some motion of rotation. If applied beyond \( P \) it will leave a rotation in the opposite direction. If applied beyond \( G \), or between \( G \) and \( C \), it will increase the rotation. All this will be easily conceived by reflecting on its effect on the body at rest.

6. A whirling body which has no progressive motion cannot have been brought into this state by the action of a single force. It may have been put into this condition by the simulaneous operations of two equal and opposite forces. The equality and opposition of the forces is necessary for stopping all progressive motion. If one of them has acted at the centre, the rotary motion has been the effect of the other only. If they have acted on opposite sides, they conspired with each other in producing the rotation; but have opposed each other if they acted on opposite sides.

In like manner, it is plain that a motion of rotation, together with a progressive motion of the centre in the direction of the axis, could not have been produced by the action of a single force.

7. When the space \( S \) which a body describes during one rotation has been observed, we can discover the point of impulsion by which a single force may have acted in producing both the motions of progressive rotation and rotation: for \( CG = \frac{S}{\pi} \), and \( GP = \frac{\int GA^2}{m \cdot CG} = \frac{\pi \cdot GA^2}{m \cdot S} \).

In this manner we can tell the distances from the centre at which the sun and planets may have received the single impulses which gave them both their motions of revolution in their orbits and rotation round their axes.

It was found (art. 40.) that the distance \( OG \) of the centre of oscillation or periphery of a sphere swaying round the fixed point \( C \) from its centre \( G \), is \( \frac{2}{3} \) of the third proportional to \( CG \), and the radius of the sphere, or that \( OG = \frac{2}{3} \frac{\pi \cdot R G^2}{CG} \).

Supposing the planets to be homogeneous and spherical, and calling the radius of the planet \( r \), and the radius of its orbit \( R \), the time of a rotation round its axis \( t \), and the time of a revolution in its orbit \( T \), and making \( \frac{r}{T} \) the ratio of radius to the periphery of a circle, we shall have \( \pi R \) for the circumference of the orbit, and \( \pi \frac{r}{T} \) for the arch of this circumference described during one rotation round the axis. This is \( S \) in the abovementioned formula. Then, diminishing this in the ratio of the circumference to radius, we obtain \( CG = R \frac{r}{T} \), and \( OG = \frac{2}{3} \frac{r^2}{CG} = \frac{2}{3} \frac{T \cdot r}{R} \). This is equivalent to \( \pi \cdot GA^2 = m \cdot S \), and easier obtained.

This gives us \( G \cdot \pi \).

For the Earth = \[ \frac{r}{157} \]
Moon = \[ \frac{r}{555} \]
Mars = \[ \frac{r}{195} \]
Jupiter = \[ \frac{r}{2,8125} \]
Saturn = \[ \frac{r}{2,588} \]

We have not data for determining this for the sun. But the very circumstance of his having a rotation in 27° 8' 47 makes it very probable that he, with all his attending planets, is also moving forward in the celestial spaces, perhaps round some centre of still more general and extensive gravitation: for the perfect opposition and equality of two forces, necessary for giving a rotation without a progressive motion, has the odds against it of infinity to unity. This corroborates the conjectures of philosophers, and the observations of Herschel and other astronomers, who think that the solar system is approaching to that quarter of the heavens in which the constellation Aquila is situated.

...mentum is therefore that of the whole fibreoid is equal to the momentum of the whirling figure at the surface, or whose semiaxis is $b$, and let $v$ be the velocity on the equator of the inscribed sphere. Then since the momentum of the whirling circle $DD'$ is $\frac{v \cdot v \cdot b}{a}$, the momenta of the sphere and fibreoid are in the quadruplicate ratio of their equatorial radii; and therefore that of the whole fibreoid is $\frac{b^4}{a^4} \cdot v$. And if $w$ be the velocity at $E$ corresponding to the velocity $v$ at $A$, so that $w = \frac{b}{a} v$, we have the momentum of the fibreoid, expressed in terms of the equalitarian velocity at the surface, $\frac{b^4}{a^4} \cdot w$.

If the same force $mu$ be made to act in the same manner at $E$, its momentum $mu w$ is $\frac{15}{4} \cdot b^3 \cdot a \cdot w$, and $w = \frac{15}{4} \cdot b \cdot a \cdot w$. Therefore the angular velocities $\frac{v \cdot w}{a \cdot b}$, which the same force $mu$ acting at $A$ or $E$ will produce in the sphere and fibreoid, are $\frac{15}{4} \cdot b^3 \cdot a \cdot u$, and $\frac{15}{4} \cdot b \cdot a \cdot u$, that is, in the triplicate ratio of the equatorial diameter $b$ to the polar axis $a$.

Lastly, if the oblate fibreoid is made to turn round an equatorial diameter passing through $C$ perpendicular to the plane of the figure, it is plain that every section parallel to the meridian $EPQ$ is an ellipse similar to this meridian. If this ellipse differs very little from the inscribed circle, as is the case of the earth in the problem of the precession of the equinoxes, the momentum of each ellipse may be considered equal to that of a circle of the same area, or whose diameter is a mean proportional between the equatorial and polar diameters of the fibreoid. This radius is to the radius of the circumference circle as $\sqrt{b^2 - a^2}$ to $b$. Therefore the momenta of the section of the fibreoid and of the circumference sphere are in the confluent ratio of $b^2$ to $b$, or of $a^2$ to $b^2$. And if the velocity in the equator of this circumference sphere be called $v$, the momentum of the sphere is $\frac{15}{4} \cdot b^3 \cdot a \cdot v$; and therefore that of the fibreoid is $\frac{b^4}{a^4} \cdot v$, agrees to what was assumed in the article Precession, nro. 33.

This value of the momentum of a fibreoid round an equatorial diameter is only a very easy approximation; an exact value may be obtained by an infinite series. The whole matter of the fibreoid may be considered as uniformly distributed on the surface of a similar fibreoid whose diameter is $\sqrt{b^2 - a^2}$ of the diameter of the fibreoid. It will have the same moment, because a triangle in one of the ellipses, having an elementary arch of the circumference for its base, and the centre of the ellipse for its vertex, has its centre of gyration distant from the vertex $\sqrt{b^2 - a^2}$ the length of the radius of the ellipse, and the problem is reduced to the finding of these lines. But even when the series for this sum involves the 3d power of the eccentricity, it is not more exact than the above approximation.

A similar proposition may be obtained for a prolate fibreoid vibrating round an equatorial diameter, and applied to the conical shape of the moon, for explaining her oscillations.

The reader must have observed that the preceding disquisitions refer to those motions only which result from the action of external forces and to the state of incipient motion. All circular motions, such as those of rotation, are accompanied by centrifugal forces. A central force is necessary for retaining every particle in its circular path; such forces must therefore be excited in the body, and can arise only from the forces of cohesion by which its particles are held together. These forces are mutual, equal, and opposite; and as much as a particle $A$ (fig. 5.) is retained by a force in the direction $A a$ of the line which connects it with the fixed axis $D d$ or in the direction $A G$ (fig. 10.), which connects it with the progressive axis; so much must the point $a$ of the axis $D d$ be urged in the opposite direction $A a$, or so much must the whole body be urged in the direction $A G$. Every point therefore of the axis $D d$, or of the axis through $G$ in fig. 10. is carried in a variety of directions perpendicular to itself. These forces may or may not balance each other. If this balance obtains with respect to the fixed axis, its supports will maintain no prejudice but what arises from the external force; if not, one support will be more prepossessed than the other; and if both were removed, the axis would change its position. The same must be affirmed of the axis through $G$ in fig. 10. This, having no support, must change its position.

And thus it may happen, that the axis of rotation passing through $G$ which has been determined by the preceding disquisitions is not permanent either in respect of the body, or in respect of absolute space. These two rotations are essentially different. The way to conceive both is this. Suppose a spherical surface described round the body, having its centre in the centre of gravity; and suppose this surface to revolve and to proceed forward along with the body: in short, let it be conceived as an immaterial surface attached to the body. The axis of rotation will pass through this surface in two points which we shall call its poles. Now, we say that the axis is permanent with respect to the body when it has always the same poles in this spherical surface. Suppose another spherical surface described round the same centre, and that this surface also accompanies the body in all its progressive motion, but does not turn with it. The axis is permanent with respect to absolute space when it has always the same poles in this surface: it is evident that these two facts are not inseparable. A boy's top spins on the same point and the same corporeal axis, while, towards the end of its motion, we observe it directing this round and round to different quarters of the room. And when we make an egg or a lemon spin with great rapidity on its side on a level table, we see it gradually rise up, till it stands quite on end, spinning all the while round an axis pointing to the zenith.

This change in the position of the axis is produced by the unbalanced actions of the centrifugal forces exerted by the particles. Suppose two equal balls $A$ and $B$ (fig. 16.) connected by an inelastic rod whose middle point is $G$, the centre of gravity of the balls. This system may be made to turn round the material axis $D d$, $A$ describing the circle $A E F A$, and $B$ describing the circle $B H K B$. The rod $A B$ may also be conceived as...
Robtion. as moveable round the point G by means of a pin at right angles to the axis. Suppose the balls passing through the situations A and B; their centrifugal forces urge them at the same time in the directions CA and OB, which impulsion compels to make the connecting rod recede from both ends of the axis Dd. And thus the balls, instead of describing parallel circles round this axis, will describe parallel spirals, gradually opening, and then contracting, till the balls acquire the position \( a \beta \) at right angles to the axis. They will not stop there, for each came into that position with an oblique motion. They will pass it; and were it not for the resistence of the air and the friction of the joint at G, they would go on till the ball exhausted the circle AEF. The centrifugal forces will now have the power of resistence, and the balls arrive at their original position AB, when the circle of rotation again begins to move. Thus they will continue a kind of oscillating rotation.

The axis is continually changing with respect to the system of balls; but it is fixed in respect to absolute space, because the axis Dd is supported. It does not yet appear that it has any tendency to change its position, because the centrifugal tendency of the balls is completely yielded to by the joint at G. The material axis has indeed attained no change; but the real axis, or mathematical line round which the rotation takes place, has been continually shifting its place. This is not so obvious, and requires a more attentive consideration. To know accurately the gradual change of position of the real axis of rotation would require a long discussion. We shall content ourselves with exhibiting a case where the position of the horizontal axis is unquestionably different from that of the vertical axis, which we may suppose horizontal.

Take the balls in the position \( a \beta \). They came into this position with a spiral motion, and therefore each of them was moving obliquely to the tangent \( a \alpha, \beta \gamma \) to the sphere \( a \beta \), and into the directions \( a \beta, \beta \). They are therefore moving round the centre G in a plane \( a \beta, \beta \gamma \) inclosed by the plane \( a \beta \gamma \) of the circle \( a \beta \). The momentary axis of rotation is therefore perpendicular to this oblique plane, and therefore does not coincide with Dd.

We cannot enter upon the investigation of this evagination of the axis, although the subject is both curious and important to the speculative mathematician. A knowledge of it is absolutely necessary to a complete solution of the great problem of the precession. But when treating that article, we contented ourselves with saying that the evagination which obtains in this natural phenomenon is so exceedingly minute, that although multiplied many thousands of times, it would escape the nicest observations of modern astronomers; and that it is a thing which does not accumulate, beyond a certain limit, much too small for observation, and then diminishes again, and is periodical. Euler, D'Alembert, Frisi, and De la Grange, have thrown the momentary position of the real variable axis corresponding to any given time; and Landen has with great ingenuity and elegance connected these momentary positions, and given the whole paths of evagination. Mr. Segner was, we believe, the first who showed (in a Dissertation De Motu Turbinum, Halle, 1755), that in every body there were at least three lines passing through the centre of gravity at right angles to each other, forming the fourfold angle of a cube, round which the centrifugal forces were absolutely balanced, and therefore a rotation begun round either of these three lines would be continued, and they are permanent axes of rotation. Albert Euler gave the first demonstration in 1750, and since that time the investigation of these axes has been extended and improved by the different authors already named. It is an exceedingly difficult subject; and we recommend the synthetic investigation by Frisi in his Geometria as the right for instructing a curious reader to whom the subject is new. We shall conclude this dissertation with a beautiful theorem, the enunciation of which we owe to P. Frisi, which has amazingly improved the whole theory, and gives easy and elegant solutions of the most difficult problems. It is analogous to the great theorem of the composition of motions and forces.

If a body turns round an axis AGA (fig. 17.) perpendicularly through its centre of gravity G with the angular velocity \( a \), while this axis is carried round another axis BGB with the angular velocity \( b \), and if GD be taken to GK as \( a \) to \( b \) (the points B and E being taken on the side of the centre where they are moving towards the same side of the plane of the figure), and the line DE be drawn, then the whole and every particle of the body will be in a state of rotation round a third axis CGC, lying in the plane of the other two, and parallel to DE, and the angular velocity \( c \) round this axis will be to \( a \) and to \( b \) as DE is to GD and to GE.

For, let P be any particle of the body, and suppose a spherical surface to be described round G passing through P. Draw PR perpendicular to the plane of the figure. It is evident that PR is the common section of the circle of rotation IP of round the axis Aa, and the circle KP of round the axis BB. Let IR, RK be the diameters of these circles of rotation, F and G their centres. Draw the radius PF and PO, and the tangents PM and PN. These tangents are in a plane MPN which touches the sphere in P, and cuts the plane of the axis in a line MN, to which a line drawn from the centre G of the sphere through the point R is perpendicular. Let PN represent the velocity of rotation of the point P round the axis BB, and PF its velocity of rotation round AA. Complete the parallelogram PNI. Then PI is the direction and velocity of motion resulting from the composition of PN and PF. PI is in the plane MPN, because the diagonal of a parallelogram is in the plane of its sides PN and PF.

Let perpendiculars PF, IT, be drawn to the plane of the axis, and the parallelogram PNI will be orthographically projected on that plane, its projection being a parallelogram RNTF. (Here falls on the centre by accident). Draw the diagonal RT. It is evident that the plane PRT is perpendicular to the plane of the two axes, because PR is so. Therefore the compounded motion PR is in the plane of a circle of revolution round some axis situated in the plane of the other two. Therefore produce TR, and draw GC cutting it at right angles.
angles in H, and let LP be the circle, and PH a radius. PR is therefore a tangent, and perpendicular to PH, and will meet RT in some point Q of the line MN. The particle P is in a state of rotation round the axis CG, and its velocity is to the velocities round AA or BB as Pt to PF or PN. The triangles PRN and OPN are similar. For PN the tangent is perpendicular to the radius OP, and PR is perpendicular to ON. Therefore OP : PN = PR : RN, and RN = PR : PN. But the velocity of P round the axis BB is OP.b. Therefore RN = PR.OP.b = PR.a. In like manner RF = PR.a. Therefore RF : RN = a : b = GD : GE. But NT : RN = fine NRT : fine NTR, and GD : GE = fine GED : fine GDE. Therefore fine NRT = fine GED : fine GDE. But NRT = EGDF, for NF is perpendicular to EG and NT (being parallel to IF) is perpendicular to DG. Therefore TR is perpendicular to ED, and Cc is parallel to ED, and the rotation of the particle P is round an axis parallel to ED.

And since RN, RF, RT, are as the velocities b, a, e, round these different axes, and are proportional to EG, DG, DE, we have c to a or to b as ED to GD or GE; and the proposition is demonstrated.

This theorem may be thus expressed in general terms.

If a body revolves round an axis passing through its centre of gravity with the angular velocity a, while this axis is carried round another axis, also passing through its centre of gravity, with the angular velocity b, these two motions compose a motion of every particle of the body round a third axis, lying in the plane of the other two, and inclined to each of the former axes in angles whose sines are inversely as the angular velocities round them; and the angular velocity round this new axis is to that round one of the primitive axes as the sine of inclination of the two primitive axes is to the sine of the inclination of the new axis to the other primitive axis.

When we say that we owe the enunciation of this theorem to P. Frii, we grant at the same time that something like it has been supposed or assumed by other authors. Newton seems to have considered it as true, and even evident, in homogeneous spheres; and this has been tacitly acquiesced in by the authors who followed him in the problem of the precession. Inferior writers have carelessly assumed it as a truth. Thus Nollet, Gravefande, and others, in their contrivances for exhibiting experiments for illustrating the composition of vortices, proceeded on this assumption. Even authors of more scrupulous research have satisfied themselves with a very imperfect proof. Thus Mr. Landen, in his excellent dissertation on rotatory motion, Philosophical Transactions, Vol. LXVII., contents himself with showing, that, by the equality and opposite directions of the motions round the axes AA and BB, the point C will be at rest, and from thence concludes that CGe will be the new axis of rotation. But this is exceedingly halting (note also that this dissertation was many years posterior to that of P. Frii). For although the separate motions of the point C may be equal and opposite, it is by no means either a mathematical or a mechanical consequence that the body will turn round the axis Cc.

In order that the point C may remain at rest, it is necessary that all tendencies to motion be annihilated; this is not even thought of in making the assumption. Frii has shown, that in the motion of every particle round the axis Cc, there is involved a motion round the two axes AA and BB, with the velocities a and b; and it is a consequence of this, and of this only, that the impulses which would separately produce the rotations of every particle round AA and BB will, either in succession or in conjunction, produce a rotation round Cc. Moreover, Mr. Landen, not having attended to this, has led him, as we imagine, into a mistake respecting the velocity with which the axis changes its position; and though his process exhibits the path of evaporation with accuracy, we apprehend that it does not allign the true times of the axes arriving at particular points of this path.

It follows from this proposition, that if every particle of a body, whether solid or fluid, receives in one instant a separate impulse, competent to the production of a motion of the particle round an axis with a certain angular velocity, and another impulse competent to the production of a motion round another axis with a certain velocity, the combined effect of all these impulses will be a motion of the whole system round a third axis given in position, with an angular velocity which is also given; and this motion will obtain without any separation or diffusion of parts; for we see that a motion round two axes constitute a motion round a third axis in every particle, and no separation would take place although the system were incoherent like a mass of sand, except by the action of the centrifugal forces arising from rotation. Mr. Simpson therefore erred in his solution of the problem of the precession, by supposing another force necessary for enabling the particles of the fluid spheroid to accompany the equator when displaced from its former situation. The very force which makes the displacement produces the accomplishment, as far as it obtains, which we shall fee presently is not to the extent that Mr. Simpson and other authors who treat this problem have supposed.

For the same reason, if a body be turning round any axis, and every particle in one instant get an impulse precisely such as is competent to produce a given angular velocity round another axis, the body will turn round a third axis given in position, with a given angular velocity; for it is indifferent (as it is in the ordinary composition of motion) whether the forces act on a particle at once or in succession. The final motion is the fame both in respect of direction and velocity.

Lastly, when a rigid body acquires a rotation round an axis by the action of an impulse on one part of it, and at the same time, or afterwards, gets an impulse on any part which, alone, would have produced a certain rotation round another axis, the effect of the combined actions will be a rotation round a third axis, in terms of this proposition; for when a rigid body acquires a motion round an axis, not by the simultaneous impulse of the precisely competent force on each particle, but by an impulse on one part, there has been propagated to every particle (by means of the connecting forces) an impulse precisely competent to produce the motion which the particle really acquires; and when a rigid body, already
This must be considered as one of the most important propositions in dynamics, and gives a great extension to the doctrine of the composition of motion. We see that rotations are compounded in the same manner as other motions, and it is extremely easy to discover the composition. We have only to suppose a sphere described round the centre of the body, and the equator of this sphere corresponding to any primitive position of the axis of rotation gives us the direction and velocity of the particles situated in it. Let another great circle cut this equator in any point; it will be the equator of another rotation. Set off an arch of each from the point of intersection, proportional to the angular velocity of each rotation, and complete the spherical parallelogram. The great circle, which is the diagonal of this parallelogram, will be the equator of the rotation, which is actually compounded of the other two.

And thus may any two rotations be compounded. We have given an instance of this in the solution of the problem of the Precession of the Equinoxes, Vol. XV. p. 455.

It appears plainly in the demonstration of this theorem that the axis C is a new line in the body. The change of rotation is not accomplished by a transference of the poles and equator of the former rotation to a new situation, in which they are again the poles and equator of the rotation; for we see that in the rotation round the axis C, the particle of the body which was formerly the pole A is describing a circle round the axis C. Not knowing this composition of rotations, Newton, Walmesly, Simpson, and other celebrated mathematicians, supposed that the axis of the earth's rotation remained the same, but changed its position. In this they were confirmed by the constancy of the observed latitudes of places on the surface of the earth. But the axis of the earth's rotation really changes its place, and the pole of the earth's rotation is at the same time moving round the earth in the equator of the fixed stars. This would seem to result from these observations, that it is impossible that the axis of rotation can change its position in absolute space without changing its position in the body, contrary to what we experience in a thousand familiar instances; and indeed this is impossible by any one change. We cannot by the impulse of any one force make a body which is turning round the axis a change its position and turn round the fixed material axis brought into the position C. In the same way that a body must pass through a series of intermediate points, in going from one end of a line to the other, so it must acquire an infinite series of intermediate rotations (each of them momentary) before the fixed material axis passes into another position, so as to become an axis of rotation. A momentary impulse may make a great change of the position of the axis of rotation, as it may make in the velocity of a rectilineal motion. Thus although the rotation round a body is be indefinitely small, if another equally small rotation be impressed round an axis B perpendicular to A, the axis will at once shift to C half way between them; but a succession of rotations is necessary for carrying the primitive material axis into a new position, where it is again an axis. This transference, however, is possible, but gradual, and must be accomplished by a continual rotation of impulses totally different from what we would at first suppose. In order that A may pass from A to C, it is not enough that it gets an impulse in the direction AC. Such an impulse would carry it either, if the body had not been whirling round A by the mere perseverance of matter in its state of motion; but when the body is already whirling round A, the particles in the circle IP are moving in the circumference of that circle; and since that circle also partsake of the motion given to A, every particle in it must be insensibly deflected from the path in which it is moving. The continual agency of a force is therefore necessary for this purpose; and if this force be discontinued, the point A will immediately quit the plane of the arch AC, along which we are endeavouring to move it, and will start up.

This is the theorem which we formerly said would enable us to overcome the difficulties in the investigation of the axis of rotation.

Thus we can discover what Mr Landen calls the evaginations of the poles of rotation by the action of centrifugal forces: For in fig. 16, the known velocity of the ball A and the radius AC of its circle of rotation will give us the centrifugal force by which the ball is acted upon in its movement. Thus we can discover what Mr Landen calls the evaginations of the poles of rotation by the action of centrifugal forces.

The distance of the new poles from D and d is an arch of a circle which measures the angle made by the spiral with the circle of rotation round the primitive axis. This will gradually increase, and the mathematical axis of rotation will be a spiral round D and d, gradually separating from these points, and again approaching them, and in the time that the balls themselves are most of all removed from their primitive situation, namely, when A is in the place of D.

The same theorem also enables us to find the incipient axis of rotation in the complicated cases which are almost inaccesible by means of the elementary principles of rotation.

Thus, when the centres of oscillation and percussion do not coincide, as we supposed in fig. 5. and 12. Suppose, first, that they do coincide, and find the position of the axis b, and the angular velocity of the rotation. Then find the centre of percussion, the axis P, and the momentum round it, and the angular velocity which this momentum would produce. Thus we have obtained two rotations round given axes, and with given angular velocities. Compound these rotations by this theorem, and we obtain the required position of the true
true incipient axis of rotation, and the angular velocity, without the intricate process which would otherwise have been necessary.

If the body is of such a shape, that the forces in the plane $DCG$ do not balance each other, we shall then discover a momentum round an axis perpendicular to this plane. Compound this rotation in the same manner with the rotations around $D$ and $D'$.

And from this simple view of the matter we learn (what would be difficult to discover in the other way), that when the centre of percussion does not coincide with that of rotation, the axis is in the plane $DCG$, though not perpendicular to $PG$. But when there is a momentum round an axis perpendicular to this plane, the incipient axis of rotation is neither perpendicular to $PC$, nor in a plane perpendicular to that passing through the centre in the direction of the impelling force.

We must content ourselves with merely pointing out these tracks of investigation to the curious reader, and recommending the cultivation of this most fruitful theorem of Father Fripi.

There are no means speculations of mere curiosity, interesting to none but mathematicians; the noblest art which is practised by man must receive great improvement from a complete knowledge of this subject. We mean the art of seamanship. A ship, the most admirable of machines, must be considered as a body in free space, impelled by the winds and waters, and continually moved round spontaneous axes of conversion, and incessantly checked in these movements. The trimming of the tails, the action of the rudder, the very disposition of the loading, all affect her vitality. An experienced seaman knows by habit how to produce and facilitate these motions, and to check or stop such as are inconvenient. Experience, without any reflection or knowledge how and why, informs him what position of the rudder produces a deviation from the course. A fort of common sense tells him, that, in order to make the ship turn her head away from the wind, he must increase the surface or the obliquity of the head, and diminish the power of the tails near the stern. A few other operations are dictated to him by this kind of common sense; but few even of old seamen can tell why a ship has such a tendency to bring her head up in the wind, and why it is so necessary to crowd the fore part of the ship with tails; fewer still know that a certain shifting of the loading will facilitate some motions in different cases; that the crew of a great ship running suddenly to a particular place shall enable the ship to accomplish a movement in a stormy sea which could not be done otherwise; and perhaps not one in ten thousand can tell why this procedure will be successful. But the mathematical inquirer will see all this; and it would be a most valuable acquisition to the public, to have a manual of such propositions, deduced from a careful and judicious consideration of the circumstances, and freed from that great complication and intricacy which only the learned can unravel, and expressed in a familiar manner, clothed with such reasoning as will be intelligible to the unlearned; and though not accurate, yet perspicuous. Mr. Bouguer, in his Traité du Nauire, and in his Monuwm de Faïfseau, has delivered a great deal of useful information on this subject; and Mr. Desentre has made a very useful abstract of these works in his Cours de Mathematique. But the subject

is left by them in a form far too abstruse to be of any general use: and it is unfortunately so combined with or founded on a false theory of the action and refiiance of fluids; that many of the propositions are totally inconsistent with experience, and many maxims of seamanship are false. This has occasioned these doctrines to be neglected altogether. Few of our professional seamen have the preparatory knowledge necessary for improving the science; but it would be a work of immense utility, and would acquire great reputation to the person who successfully prosecutes it.

We shall mention under the article Seamanship the chief problems, and point out the mechanical principles by which they may be solved.

ROTHERHAM, a town in the West Riding of Yorkshire, feated on the river Don, near which there is a handsome stone-bridge. It is a well-built place, and the market is large for provisions. W. Long. 1. 10. N. Lat. 53. 25.

ROTHSAY, a town in the isle of Bute, of which it is the capital. It is a well-built town of small houses, and about 200 families; and is within these few years much improved. It has a good pier, and is seated at the bottom of a fine bay, whose mouth lies exactly opposite to Loch Steven in Cowal. Here is a fine depth of water, a secure retreat, and a ready navigation down to the Frith for an export trade. Magazines of goods for foreign parts might be most advantageously erected here. The women of this town spin yarn, the men support themselves by fishing. W. Long. 5. o. N. Lat. 55. 50.

Rothsay gives the title of Duke to the prince of Scotland, a title which was formerly accompanied with suitable revenues, powers, and privileges. Of the origin of this title we have the following account from the pen of the learned Dr. McLeod of Glasgow. Some time between the 16th of March and the 26th of October 1398, John of Gaunt, who is styled John duke of Aquitaine and Lancaster, uncle to the king of England, and David, who is styled earl of Carrick, eldest son of the king of Scotland, met for the purpose of settling the borders, and terminating all matters in dispute. At a subsequent interview between the same parties, David is styled Duke of Rothsay. "This innovation probably proceeded on an idea, to which the interview of the two princes might naturally give rise, that it was unsuitable, and unworthy of the Scottish national dignity, that the princes of England should enjoy a title of nobility, which was esteemed to be of higher rank than that possessed by the hereditary prince of Scotland." And this, in the opinion of our author, was the occasion of introducing the title of Duke into Scotland.

ROTTBBELLIA, in botany; a genus of the digyna order, belonging to the triandria class of plants. The racis is jointed, roundish, and in many cases filiform; the calyx is ovate, lanceolated, flat, simple, or bipartite; the florets are alternate on the winding racis.

ROTONDO, or Rotundo, in architecture, an appellation given to any building that is round both within and without; whether it be a church, a palace, or the like. The most celebrated rotundo of the ancients is the pantheon at Rome. See Pantheon.

Rotten-stone, a mineral found in Derbyshire and
ROT [ 527 ]

Rottenness and used by mechanics for all sorts of finer grinding and polishing, and sometimes for cutting of flones. According to Ferber, it is a tripoli mixed with calcareous earth.

ROTTENNESS. See Putrefaction.

ROTTERDAM, is a city in the province of Holland, in E. Long. 4° 20. N. Lat. 52° situated on the north bank of the river Maas, about 37 miles south of Amsterdam, nine south-east of the Hague, and 15 to the east of Breda. It is a large and populous city, of a triangular figure, handsomely built of brick, the streets wide and well paved. There are ten gates to the town, six of which are at the land side and four at the side of the Maas. It is supposed to take its name from the Rot, or River, a little river that falls into the canals of this city, and from Dam, a dike. It is uncertain when it was first built; and though it is supposed to be very ancient, yet we find no mention made of it before the 13th century. In the year 1270 it was surrounded with ramparts, and honoured with several privileges; but 27 years after it was taken by the Flemings. In the year 1418, Brederode chief of the Maeks made himself master of it; since which time it has continued yearly to increase by means of the convenience of its harbour. Its arms are vert, a pale argent, quarterly in a chief on a field of the second, or a lion spotted gules, on the second and fourth a lion spotted gules.

Rotterdam is not reckoned one of the principal cities of the province, because it has not been in its present flourishing condition. The Dutch call it The frift of the second rank, whereas it ought to be esteemed the second of the first, being, next to Amsterdam, the most trading town in the United Provinces. Its port is very commodious; for the canals, which run through most parts of the town, bring the ships, some of 200 or 300 ton, up to the merchant's door; a convenience for loading and unloading which is not to be found in other places. The great ships go up into the middle of the town by the canal into which the Maas enters by the old head, as it comes out by the new. A stranger, upon his first entering this place, is astonished at the beautiful confusion of chimneys intermixed with tops of trees with which the canals are planted, and streamers of vessels; insomuch that he can hardly tell whether it be fleet, city, or forest. The Haring Vilet is a very fine street; most of the houses are new, and built of hewn stone; but the grandest as well as most agreeable street in Rotterdam is the Bomb Quay, which lies parallel with the Maas; on one side it is open to the river, and the other is ornamented with a grand facade of the belt houses in the city, inhabited chiefly by the English; they are five or six stories high, mally and very clumpy; wherever there is any attempt at ornament, it is the worst that can be conceived. One sees no Grecian architecture, except Doric entablatures, stuck upon the top of the upper story, without pilasters; Ionic volutes, turned often the wrong way, and an attempt at Corinthian capitals, without any other part of the order. The doors are large, and stuck with great knobs and clumsily carving; you ascend to them, not in front, but by three or four steps going up on each side, and you are assisted by iron rails of a most immense thickness. These houses are all almost all window; and the window shutters and frames being painted green, the glass has all a green cast, which is helped by the reflection from the trees that overshadow their houses, which, were it not for this circumstance, would be intolerably hot, from their vicinity to the canals. Most of the houses have looking glasses placed on the outsides of the windows, on both sides, in order that they may see everything which passes up and down the street. The flat-sails are narrow, steep, and come down almost to the door. In general, the houses rise with enormous steep roofs, turning the gable end upon the street, and leaning considerable forward, so that the top often projects near two feet beyond the perpendicular. The Bomb Quay is so broad, that there are distinct walks for carriages and foot-passengers, lined and shaded with a double row of trees. You look over the river on some beautiful meadows, and a fine avenue of trees, which leads to the pest-house: it seems to be an elegant building, and the trees round it are so disposed as to appear a thick wood. This street is at least half a mile in length, and extends from the old to the new head, the two places where the water enters to fill the canals of this extensive city. When water runs through a street, it then assumes the name of a canal, of which kind the Heeren-fleet has the pre-eminence; the houses are of free-stone, and, very lofty; the canal is spacious, and covered with ships: at one end stands the English church, a neat pretty building, of which the bishop of London is ordinary.

This port is much more frequented by the British merchants than Amsterdam, insomuch that, after a frost, when the sea is open, sometimes 300 full of British vessels sail out of the harbour at once. There is always a large number of British subjects who reside in this town, and live much in the same manner as in Great Britain. The reason of the great traffic between this place and England, is because the ships can generally load and unload, and return to England from Rotterdam, before a ship can get clear from Amsterdam and the Texel. Hence the English merchants find it cheaper and more commodious, after their goods are arrived at Rotterdam, to send them in boats over the canals to Amsterdam. Another great advantage they have here for commerce is, that the Maas is open, and the passage free from ice, much sooner in the spring than in the Y and Zuyder-see, which lead to Amsterdam.

The glass-house here is one of the best in the seven provinces; it makes abundance of glass-toys and enamelled bowls, which are sent to India, and exchanged for chima-ware, and other oriental commodities.

The college of admiralty here is called the college of the Maas, the chief of all Holland and the United Provinces. The lieutenant-general, admiral of Holland, is obliged to go on board of a Rotterdam ship in the Maas when he goes to sea, and then he commands the squadron of the Maas.

On the east side of the city there is a large bafen and dock, where ship-carpenters are continually employed for the use of the admiralty, or of the East India company. But the largest ships belonging to the admiralty of Rotterdam are kept at Helvoetluys, as the most commodious station, that place being situated on the ocean; for it requires both time and trouble to work a large ship from the dock of Rotterdam to the sea.

Rotterdam has four Dutch churches for the Established religion. There is one thing very remarkable in
Rotterdam in respect to the great church, that the tower which
leamed on one side was set up freight in the year 1655,
as appears by the inscription engraved on brass at the
bottom of the tower within side. In the choir of this
church are celebrated, with no small solemnity, the pro-
motions made in the Latin schools. Besides, there are
two English churches, one for those of the church of
England and the other for the Presbyterians; and one
Scotch church; as likewise one Lutheran, two Arme-
nian, two Anabaptists, four Roman Catholic chapels,
and one Jewish synagogue.

Though the public buildings here are not so lofty
as those of Amsterdam and some other cities, yet there
are several of them well worth seeing. The great
church of St Laurence is a good old building, where
we find the Latin school of the erudite man Crelius.

Besides, there are the tide rises 270 feet, that vessels of
200 tons may come up to the quay; but one of the greatest curiosities
is the bridge, of 270 paces in length, supported by
boats, and consequently is higher or lower according
to the tide. It is paved and there are ways for foot-
paflengers on each side, with benches to sit upon; and
coaches may pass over it at any hour of the day or
night. It is often called Roger by English historians;
and is 50 miles south-west of Amiens, and 70 north-
west of Paris.

Though large, and enriched by commerce, Rouen is
not an elegant place. The streets are almost all nar-
row, crooked, and dirty; the buildings old and irregu-
lar. It was fortified by St Louis in 1253, but the
walls are now demolished. The environs, more pecu-
larily the hills which overlook the Seine, are wonder-
fully agreeable, and covered with magnificent villages. E.

Rouergue, a province of France, in the go-

vernment of Guienne; bounded on the east by the
Cevennes and Gaujdan, on the west by Quercy, on
the north by the name and Auvergne, and on the
south by Languedoc. It is 75 miles in length, and
50 in breadth; not very fertile, but feeds a number of
families, and has mines of copper, iron, alum, vitriol,
and sulphur. It is divided into a county, and the up-
per and lower marche. Rhodes is the capital town.

Rovigo, a town of Italy, in the territory of
Venice, and capital of the Polemi di Rovigo, in E.

Round.
ROUNDLEY, or Roundo, a sort of ancient poem, derived its name, according to Menage, from its form, and because it still turns back again to the first verse, and thus goes round. The common roundelay consists of 13 verses, eight of which are in one rhyme and five in another. It is divided into couplets; at the end of the second and third of which the beginning of the roundelay is repeated; and that, if possible, in an equivocal or punning sense. The roundelay is a popular poem in France, but is little known among us. Marot and Voiture have succeeded the best in it. Rapin remarks, that if the roundelay be not very exquisite, it is intolerably bad. In all the ancient ones, Menage observes, that the verse preceding has a less complete sense, which should be united with the sense of the following verse, and yet joins agreeably with that of the close, without depending necessarily thereon. This rule, well observed, makes the roundelay more ingenious, and is one of the fiestives of the poem. Some of the ancient writers speak of the roundelay or roundel as a kind of air appropriated to dancing; and in this sense the term seems to indicate little more than dancing in a circle with the hands joined.

ROUND-House, a kind of prison for the nightly watch in London to secure disorderly persons till they can be carried before a magistrate.

Round-House, in a ship, the uppermost room or cabin on the stern of a ship, where the master lies.

Round, in military matters, a detachment from the main-guard, of an officer or a non-commissioned officer and six men, who go round the rampart of a garrison, to listen if any thing be firing without the place, and to see that the centinels be diligent upon their duty, and all in order. In strict garrisons the rounds go every half-hour. The centinels are to challenge at a distance, and to set their arms as the round pages. All guards turn out, challenge, exchange the parole, and set their arms, &c.

Round are ordinary and extraordinary. The ordinary rounds are three: the town-major's round, the grand-round, and the visiting-round.

Manner of going the rounds. When the town-major goes his round, he comes to the main guard, and demands a sergeant and four or six men to escort him to the next guard; and when it is dark, one of the men is to carry a light.

As soon at the sentry at the guard perceives the round coming, he shall give notice to the guard, that they may be ready to turn out when ordered; and when the round is advanced within about 20 or 30 paces of the guard, he is to challenge briskly; and when he is answered by the sentry who attends the round, Town major's round, he is to say, Stand round! and set his arms; after which he is to call out immediately, Sergeants, turn out the guard, town-major's round. Upon the sentry calling, the sergeant is to turn out the guard immediately, drawing up the men in good order with shouldered arms, the officer placing himself at the head of it, with his arms in his hand. He then orders the sergeant and four or six men to advance toward the round, and challenge: the sergeant of the round is to answer, Town major's round; upon which the sergeant of the guard replies, Advance, sergeant, with the parole! at the same time ordering his men to set their arms. The sergeant of the round advances alone, and gives the sergeant of the guard the parole in his ear, that none else may hear it; during which period the sergeant of the guard holds the spear of his halbert at the other's breast. The sergeant of the round then returns to his post, whilst the sergeant of the guard leaving his men to keep the round from advancing, gives the parole to his officer. This being found right, the officer orders his sergeant to return to his men; says, Advance, town-major's round! and orders the guard to set their arms; upon which the sergeant of the guard orders his men to wheel back from the centre, and form a lane, through which the town-major is to pass (the escort remaining where they were), and go up to the officer and give him the parole, laying his mouth to his ear. The officer holds the spear of his epaulet at the town major's breast while he gives him the parole.

The design of rounds is not only to visit the guards, and keep the centinels alert; but likewise to discover what pages in the outworks, and beyond them.

ROUSSILLON, a province of France, in the Pyrenees, bounded on the east by the Mediterranean sea, on the west by Cardagne, on the north by Lower Languedoc, and on the south by Catalonia, from which it is separated by the Pyrenees. It is a fertile country. About 50 miles in length, and 25 in breadth, and remarkable for its great number of olive-trees. Perpignan is the capital town.

ROUSSEAU (James), an eminent painter, was born at Paris in the year 1630, and studied first under Swevvelt, who had married one of his relations; after which he improved himself by travelling into Italy, painting solely in perspective, architecture, and landscape. On his return home, he was employed at Marly. He distinguished himself very much in painting buildings, and by his knowledge of, and attention to, the principles of perspective. Louis XIV. employed him to decorate his hall of devices at St Germain-en-Laye, where he represented the operas of Lulli. But being a Protestant, he quitted France on the persecution of his brethren, and retired to Switzerland. Louis invited him back; he refused, but sent his designs, and recommended a proper perfon to execute them. After a short stay in Switzerland, he went to Holland; whence he was invited over to England by Ralph duke of Montague, to adorn his new house in Bloomsbury, where he painted much. Some of his pictures, both in landscape and architecture, are over doors at Hampton-court; and he etched some of his own designs. His perpectives having been most commonly applied to decorate courts or gardens, have suffered much from the weather. Such of them as remain are monuments of an excellent genius. The colours are durable and bright, and the choice of them most judicious. He died in Soho-square, about the year 1693, aged 65.

ROUSSEAU (John Baptista), a celebrated French poet, was born at Paris in April 1671. His father, who was a shoemaker in good circumstances made him study in the bell college of Paris, where he distinguished himself by his abilities. He at length applied himself entirely to poetry, and soon made himself known by several short pieces, that were filled with lively and agreeable images, which made him sought for by persons of the first rank, and men of the brightest genius. He was admitted in quality of eloque, or pupil, into the academy of Inscriptions and Belles Lettres, in 1701,
and almost all the rest of his life attached himself to some of the great lords. He attended marshall Tallard into England, in quality of secretary, and here contracted a friendship with St Evremond. At his return to Paris, he was admitted into the polite society, lived among the courtiers, and seemed perfectly satisfied with his situation; when, in 1708, he was prosecuted for being the author of some couplets, in which the characters of several persons of wit and merit were blackened by the most atrocious calumnies. This prosecution made much noise; and Roufeau was banished in 1712 out of the kingdom, to which he was never more to return, by a decree of the parliament of Paris. However, he always steadily denied, and even on his deathbed, his being the author of these couplets.—From the date of this sentence he lived in foreign countries, where he found illusive protectors. The count de Luc, ambassador of France, in Switzerland, took him into his family, and studied to render his life agreeable. He took him to the treaty of Baden in 1714, where he was one of the plenipotentiaries, and presented him to prince Eugene, who entertaining a particular esteem for him, took him to Vienna, and intruded him to the emperor's court. Roufeau lived about three years with prince Eugene; but having lost his favour by satirizing one of his mistresses, retired to Brussel, where he afterwards usually resided, and where he met with much attention and much generosity, as we shall soon mention.—It was here that his disputes with Voltaire commenced, with whom he had become acquainted at the college of Louis the Great, who then much admired his turn for poetry. At that time Voltaire adroitly cultivated the acquaintance of Roufeau, and made him a present of all his works; and Roufeau, flattered by his respect, announced himself as a man who would one day be a glory to the age. The author of the Henriade continued to confide about his productions, and to lavish on him the highest encomiums, while their friendship daily increased. When they again met at Brussels, however, the historian harboured the blackest malice against another. The cause of this enmity, as Roufeau and his friends tell the story, was a lecture which he had composed from his Epistle to Julia, now Urania. This piece frightened Voltaire, as it plainly discovered his rage against him. The young man, vexed at these calumnies, understood the whole as thrown out against him. This is what Roufeau afferts. But his adversaries, and the friends of the poet whom he cried down, suspected him, perhaps rather rashly, of having employed farceums, because he thought that his own reputation was in danger of being eclipsed by that of his rival. What is very singular, these two celebrated characters endeavoured each of them to prepossess the public with a bad opinion of the other, which they themselves never entertained in reality, and to injure in their broad that esteem for each other which, in defiance of all their exertions, still held its place. Roufeau, from the period of this dispute, always represented Voltaire as a hurly-burly, as a writer polishing neither taste nor judgment, who owed all his success to a particular mode which he pursued. As a poet he considered him as inferior to Lucian, and little superior to Praden. Voltaire treated him still worse. Roufeau, according to him, was nothing better than a plagiarist, who could make shift to rhime, but could not make any reflections; that he had nothing but the talent of arranging words, and that he had even loft that in foreign countries. He thus addresses him, in a piece little known:

Auffaits le Dieu qui se inspire
T'arrache le lait et le lyre
Qu'avoient defbanores tes mains;
Tu n'es plus qu'un reptile indomme,
Rebut du Paradis et du monde
Enfveli dans tes venins.

In consequence of the little enmity in which Roufeau was held at Brussel, he could never forget Paris. The grand-prior of Vendome, and the baron de Breteuil, solicited the regent duke of Orleans to allow him to return; which favour was obtained. But our poet, before he would make use of the lettres de nobles, in his favour, demanded a review of his poems, which he wished to be repealed, not as a matter of favour, but by a solemn judgment of court; but his petition was refused. He then came over, in 1721, to England, where he printed A Collection of his Works, in 2 vols 12mo, at London. This edition, published in 1723, brought him near 10,000 crowns, the whole of which he placed in the hands of the Oifend company. The affairs of this company, however soon getting into confusion, all those who had any money in their hands lost the whole of it, by which unfortunate event Roufeau, when arrived at that age when he stood in need of the comforts of fortune, had nothing to depend upon but the generosity of some friends. Boutet, public notary in Paris, was peculiarly generous and attentive to him. He found a full greater asylum in the Duke of Aremberg, whose table was open to him at all times; who being obliged in 1733 to go into the army in Germany, settled him a pension of 1500 livres. But unfortunately he soon lost his good opinion, having been imprudent enough to publish in a Journal (of which Voltaire accused him), that the duke d'Aremberg was the author of those verses for which he himself had been banished France. He was therefore dismissed from his table, and his pride would not allow him to accept of the pension after this rupture. Brussel now became insupportable to him; and the count de Luc, and M. de Senezan, receiver-general of the church revenue, being informed of his disappointments, invited him to come privately to Paris, in the hopes of procuring a diminution of the period of his banishment. Some time previous to this Roufeau had published two new letters; one to P. Brumoi, on tragedy; the other to Rollin, on history. It is said, he expected from his letter to Brumoi to get the favour of all the Jesuits; and from the one to Rollin, the patronage of the Jen.-enists. He had likewise written an Ode, in praise of Cardinal de Fleury, on Peace, which met with a favourable reception, although it was not equal to some of his former pieces. He imagined his return to Paris would be found on no difficult matter. He attempted it, and found he could not obtain a pass for a single year. Some say, that Roufeau had incurred some perfecution in power, by an allegory, called Le jugement de Pluto; in which piece he describes one of the principal judges, whose
ROU

Roufeau, whose skin Pluto had caused to be taken off, and stretched out on the seat in the bench. This satire, joined to the secret machinations of enemies, rendered all the attempts of his friends to procure his return abortive. After having lived three months at Paris, he returned to Brussels in February 1740, at which place he died March 17, 1741, strongly impressed with religious sentiments. Immediately before he received the viaticum, he protested he was not the author of those horrid verses which had so much embittered his life; and this declaration, in the opinion of the virtuous part of mankind, will be considered as a sufficient proof of his innocence. Some have said that Roufeau was profane, troublesome, capricious, froward, vindictive, envious, a flatterer, and a fatirist. Others again represent him as a man full of candour and openness, a faithful and grateful friend, and as a Christian affected with a sense of religion.—Amidst such widely varied accounts it is difficult to form an opinion of his character. Such of our readers as wish to know more of this great poet may consult the Dictionary of M. Chaupepin, written with as much precision as impartiality, who endeavours to give a just idea of his character. From what he says, it does not appear that Roufeau can be cleared from the accusation brought against him of having attacked his benefactors. We believe he may be much more easily freed from the imputation brought against him by some of having disowned his father: for what occasion had Roufeau to conceal the obscurity of his birth? It exalted his own merit.

M. Segny, in concert with M. the prince of la Tour Tallys, has given a very beautiful edition of his works, agreeable to the poet's last corrections. It was published in 1743; at Paris, in 3 vols. 4to, and in 4 vols. 12mo, containing nothing but what was acknowledged by the author as his own. It contains, 1. Four Books of Odes, of which the first are sacred odes, taken from the Psalms. "Roufeau (says Freron) unites in himself Pindar, Horace, Anacreon, and Malherbe. What fire, what genius, what flights of imagination, what rapidity of description, what variety of affecting strokes, what a crowd of brilliant comparisons, what richness of rhyme, what happy verification; but especially what inimitable expression! His verses are finisht in the highest style of perfection that French verse is capable of assuming." The lyric compositions of Roufeau are, in general, above mediocrity. All his odes are not, however, of equal merit. The most beautiful are those which he has addressed to count du Luc, to Malherbe, to prince Eugene, to Vendôme, to the Christian princes; his Odes on the death of the prince de Conti, on the battle of Peterwaradin; and the Ode to Fortune, altho' there are certainly some few weak stanzas to be met with in it. There is considerable neatness in the composition of the Ode to a Widow, in his stanzas to the Abbé de Chaulieu, in his addresses to Roligniel, in his Odes to count de Boneval, to M. Duche, and to count de Sinzdorf; and it is to be lamented that he wrote so few pieces of this kind, from which his genius seemed to lead him with difficulty. 2. Two books of Epistles, in verse. Although these do not want their beauties, yet there prevails too much of a misanthropic spirit in them, which takes away greatly from their excellence. He makes too frequent mention of his enemies and his misfortunes; he displays those principles which are supported less on the basis of truth than on those various passions which ruled his mind at the time. He puts forth his anger in paradoxes. If he be reckoned equal to Horace in his odes, he is far inferior in his epistles. There is much more philosophy in the Roman poet than in him. 3. Cantatas. He is the father of this species of poetry, in which he stands unrivalled. His pieces of this sort breathe that poetical exaltation, that picturesque style, those happy turns, and those easy graces, which constitute the true character of this kind of writing. He is as lively and impetuous as he is mild and affecting, adapting himself to the passions of those persons whom he makes to speak. "I confefs (says M. de la Harpe) that I find the cantatas of Roufeau more purely lyric than his odes, although he rises to greater heights in those. I see nothing in his cantatas but bold and agreeable images. He always addresses himself to the imagination, and he never becomes either too verbose or too prolix. On the contrary, in some of the best of his odes, we find some languishing stanzas, ideas too long delayed, and verses of inexcusable meandra." 4. Allegories, the moft of which are happy, but some of them appear forced. 5. Epigrams, after the manner of Martial and Marot. He has taken care to leave out of this edition those pieces which linctuousness and debauchery inspired. They bear, indeed, as well as his other pieces, the marks of genius; but such productions are calculated only to dishonour their authors, and corrupt the heart of those who read them. 5. A book of Poems on Various Subjects, which sometimes want both ease and delicacy. The most distinguished are two eclogues, imitated from Virgil. 6. Four comedies in verse: the Flatterer, whose character is well supported; the Imaginary Fathers, a piece which had much less success, although it affords sufficiently good sentiment; the Capricious Man, and the Duke of Herfelf, pieces of very incon siderable merit. 7. Three comedies in prose: the Coffee-houses, the Magic Circle, and the Madragore, which are little better than his other theatrical pieces. The theatre was by no means his forte; he had a genius more suited for satire than comedy, more akin to Boileau's than Molière's. 8. A Collection of Letters, in prose. In this edition he has selected the moft interesting. There is a larger collection in 5 volumes. This lat has done at the same time both injury and honour to his memory. Roufeau in it speaks both in favour of and against the very fame persons. He appears too hasty in tearing to pieces the characters of those who displeased him. We behold in them a man of a steady character and an elevated mind, who wishes to return to his native country only that he might be enabled completely to justify his reputation. We fee him again corresponding with persons of great merit and uncommon integrity, with the Abbé d'Olivet, Racine the fon, the poets La Fosse and Duche, the celebrated Rollin, M. le Franc de Pompignan, &c, &c. We meet also with some anecdotes and exact judgments of several writers. A bookseller in Holland has published his post-follio, which does him no honour. There are, indeed, some pieces in this wretched collection which did come from the pen of Roufeau; but he is left to be blamed for them than they are who have drawn these works from that oblivion to which our great poet had been restored.
confidential. A pretty good edition of his Selected Pieces appeared at Paris in 1741, in a small 12mo volume. His portrait, engraved by the celebrated Aved, his old friend, made its appearance in 1778, with the following motto from Martial:

Certior in sufrro carmine volutis err.

ROUSSEAU (John-James), was born at Geneva June 28, 1716. His father was by profession a clock and watch-maker. At his birth, which, he says, was the first of his misfortunes, he endangered the life of his mother, and he himself was for a long time after in a very weak and languishing state of health; but as his bodily strength increased, his mental powers gradually opened, and afforded the happiest prelages of future greatness. His father, who was a citizen of Geneva, was a well-informed tradesman; and in the place where he wrought he kept a Plutarch and a Tacitus, and these authors of course soon became familiar to his son. A rash juvenile rep occasioned his leaving his father's house. "Finding himself a fugitive, in a strange country, and without money or friends, he changed (says he himself) his religion, in order to procure a subsistence." Bornex, bishop of Annecy, from whom he sought an asylum, committed the care of his education to Madame de Warenns, an ingenious and amiable lady, who had in 1726 left part of her wealth, and the Protestant religion, in order to throw herself into the bosom of the church. This generous lady famed in the triple capacity of a mother, a friend, and a lover, to the new profelyte, whom she regarded as her son. The necessity of procuring for himself some settlement, however, or perhaps his unfettered disposition, obliged Rousseau often to leave this tender mother.

He possessed more than ordinary talents for music; and the Abbé Blanchard flattered his hopes with a place in the royal chapel, which he, however, failed in obtaining for him; he was therefore under the necessity of teaching music at Chamberi. He remained in this place till 1741, in which year he went to Paris, where he was long in very different circumstances. Writing to a friend in 1743, he thus expresses himself:

"Every thing is dear here, but especially bread."

What an expression! and to what may not genius be reduced! Meanwhile he now began to emerge from that obscurity in which he had hitherto been buried. His friends placed him with M. de Montaigu, ambassadour from France to Venice. According to his own confession, a proud misanthrope and a peculiar contempt of the riches and pleasures of this world, constituted the chief traits in his character, and a misunderstanding soon took place between him and the ambassador. The place of depute, under M. Dupin, farmer-general, a man of considerable parts, gave him some temporary relief; and enabled him to be of some benefit to Madame de Warenns his former benefactress. The year 1750 was the commencement of his literary career. The academy of Dijon had proposed the following question: "Whether the renewal of the arts and sciences has contributed to the refinement of manners?" Rousseau at first inclined to support the affirmative.

"This is the faux abnomum (says a philosopher, at that time a friend of his), take the negative side of the question, and I'll promise you the greatest success."

His discourse against the sciences, accordingly, having been found to be the best written, and replete with the deepest reasoning, was publicly crowned with the approbation of that learned body. Never was a paradox supported with more eloquence; it was not however a new one; but he enriched it with all the advantages which either knowledge or genius could confer on it. Immediately after its appearance, he met with several opponents of his tenets, which he defended; and from one dispute to another, he found himself involved in a formidable train of correspondence, without having ever almost dreamed of such opposition. From that period he decreased in happiness as he increased in celebrity. His "Dissertation on the Causes of Inequality Among Mankind, and on the Origin of Social Compacts," a work full of almost unintelligible maxims and wild ideas, was written with a view to prove that mankind are equal; that they were born to live apart from each other; and that they have perverted the order of nature in forming societies. He beflows the highest praise on the state of nature, and depreciates the idea of every social compact. This discourse, and especially the dedication to the public of Geneva, are the chef-d'oeuvres of that kind of eloquence of which the ancients alone had given us any idea. By presenting this performance to the magistrates, he was received again into his native country, and reinstated in all the privileges and rights of a citizen, after having with much difficulty prevailed on himself to abjure the Catholic religion. He soon, however, returned to France, and lived for some time in Paris. He afterwards gave himself up to retirement, to escape the shafts of criticism, and follow after the regimen which the strangury, with which he was tormented, demanded of him. This is an important epoch in the history of his life, as it is owing to this circumstance, perhaps, that we have the most elegant works that have come from his pen. His "Letter to M. d'Alembert" on the design of erecting a theatre at Geneva, written in his retirement, and published in 1752, contains, along with some paradoxes, some very important and well-handled truths. Thus he first drew upon him the envy of Voltaire, and was the cause of those indignities with which that author never ceased to load him. What is singular in him, is, that although so great an enemy to theatrical representations himself, he caused a comedy to be printed, and in 1752 gave to the theatre a pastoral (The Village Conjuror), of which he composed both the poetry and music, both of them abounding with sentiment and elegance, and full of innocent and rural simplicity. What renders the Village Conjuror highly delightful to persons of taste, is that perfect harmony of words and music which everywhere pervades it; that proper connection among the parties who compose it; and its being perfectly correct from beginning to end. The musician, hath spoken, hath thought, and felt like a poet. Every thing in it is agreeable, interesting, and far superior to those common affected and insipid productions of our modern poet-dramatists. His Dictionary of Music affords several excellent articles; some of them, however, are very inaccurate. "This work (says M. la Borde), in his Essay on Music, has need to be written over again, to save much trouble to those who wish to study it, and prevent them from falling into errors, which
Roufeau, it is difficult to avoid, from the engaging manner in which Roufeau drag along his readers. These passages in which he has any reference to literature may be easily distinguished, as they are treated with the agreeableness of a man of wit and the exactness of a man of taste. Roufeau, soon after the rapid success of his Village Conjurer, published a Letter on French Mafie, or rather against French music, written with as much freedom as liveliness. The exaggerated passion of French comedy treated him with as much fury as if he had confined against the rate. A crowd of insignificant enthuflails spent their strength in outcries against him. He was insulted, menaced, and lampooned. Harmonic fanaticism went even to hang him up in effigy.

That interesting and tender style, which is so conspicuous throughout the Village Conjurer, animates several letters in the New Heliôf. In four parts, published 1761, in 12mo. This epistolary romance, of which the plot is ill-managed, and the arrangement bad, like all other works of genius, has its beauties as well as its faults. More truth in his characters and more precision in his details were to have been wished. The characters, as well as their style, have too much famefulness, and their language is too affected and exaggerated. Some of the letters are indeed admirable, from the force and warmth of expression, from an effervescence of sentiments, from the irregularity of ideas which always characterize a passion carried to its height. But why is so affecting a letter often accompanied with an unimportant digression, an insipid criticism; or a felt-contradicting paradox? Why, after having thrown in all the energy of sentiment, does he on a sudden turn unmeaning? It is because none of the passions are truly interesting. That of St. Preux is weak, and after forced. Julia is an assemblage of tenderness and pity, of elevation of soul and of coquetry, of natural parts and pedantry. Wolmar is a violent man, and almost beyond the limits of nature. In fine, when he wishes to change his style, and adopt that of the speaker, it may easily be observed that he does not long support it, and every attempt embarrasses the author and cools the reader. In the New Heliôf, Roufeau's unlucky talent of rendering every thing problematical, appears very conspicuous; as in his arguments in favour of and against duelling, which afford an apology for suicide, and a just condemnation of it; in his faculty in palliating the crime of adultery, and his very strong reasons to make it abhorred: on the one hand, in declamations against social happiness; on the other, in transports in favour of humanity; here, in violent rhapsodies against philosophers; there, by a rage for adopting their opinions; the excellence of God attacked by sophistry, and Atheists confuted by the most irreconcilable arguments; the Christian religion combated by the most sanguine objections, and celebrated with the most sublime eulogies.

His Emilia afterwards made more noise than the New Heliôf. This moral romance, which was published in 1762, in four vols. 12mo, treats chiefly of education. Roufeau wished to follow nature in every thing, and though his system in several places differs from received ideas, it deferves in many respects to be put in practice, and with some necessary modifications it has been so. His precepts are expressed with the force and dignity of a mind full of the leading truths of morality. If he has not always been virtuous, no body at least has felt it more, or made it appear to more advantage. Everything which he says against luxury shows the vices and conceited opinions of his age, and is worthy at once of Plato or of Tacitus. His style is peculiar to himself. He sometimes, however, appears, by a kind of affected rudeness and affectation, to ape at the mode of Montaigne, of whom he is a great admirer, and whose sentiments and expressions he often clothes in a new dress. What is most to be lamented is, that in wishing to educate a young man as a Christian, he has filled his third volume with objections against Christianity. He has, it must be confessed, given a very sublime eulogium on the Gospel, and an affecting portrait of its divine Author: but the miracles, and the prophecies which serve to establish his mission, he attacks without the least reserve. Admitting only natural religion, he weighs every thing in the balance of reason; and this reason being false, leads him into dilemmas very unavourable to his own reputation and happiness.

He dwelt from 1754 in a small house in the country near Montmorenci; a retreat which he owed to the generosity of a farmer-general. The cause of his love for this retirement was, according to himself, "that invincible spirit of liberty which nothing could conquer, and in competition with which honours, fortune, and reputation, could not stand. It is true, this desire of liberty has occasioned less pride than laziness; but this indolence is inconceivable. Every thing flutters it; the most inconsiderable reciprocities of social life are to it insupportable. A word to speak, a letter to write, a visit to pay, things necessary to be done, are to me punishments. Hear my reasons. Although the ordinary intercourse between mankind be odious to me, intimate friendship appears to me very dear; because there are no mere ceremonies due to it; it agrees with the heart, and all is accomplished. Hear, again, why I have always shunned kindnefs as much; because every act of kindness requires a grateful mind, and I find my heart ungrateful, from this alone, that gratitude is a duty. Lastly, that kind of felicity which is necessary for me, is so much to do that which I wish, as not to do what I wish, not to do." Roufeau enjoyed this felicity which he so much wished in his retirement. Without altogether adopting that too rigorous mode of life pursued by the ancient Cynics, he deprived himself of every thing that could in any measure add fuel to this withied-for luxury, which is ever the companion of riches, and which inverts even culture itself. He might have been happy in this retreat, if he could have forgot this public which he affected to despise; but his desire after a great name got the better of his selfish love, and it was this thirst after reputation which made him introduce so many dangerous paragraphs in his Emilia.

The French parliament condemned this book in 1762, and entered into a criminal prosecution against the author, which forced him to make a precipitate retreat. He directed his steps towards his native country, which shut its gates upon him. Proscribed in the place where he first drew breath, he sought an asylum in Switzerland, and found one in the principality of Neuchâtel. His first care was to defend his Emilia against the mandate of the archbishop of Paris, by whom it had been anathematized. In 1763 he published a letter, in which he re-exhibits all his errors, set off with the
ROU

The most animated display of eloquence, and in the most insidious manner. In this letter he describes himself as "more vehement than celebrated in his researches, but sincere on the whole, even against himself; simple and good, but sensible and weak; often doing evil, and always loving good; united by friendship, never by circumstances, and keeping more to his opinions than to his interests; requiring nothing of men, and not willing to be under any obligation to them; yielding no more to their prejudices than to their will, and preferring his own as free as his reason; disputing about religion without licentiousness; loving neither impertinence nor fanaticism, but differing people more than bold spirits." &c. &c. From this specimen, the limitations he would appoint to this portrait may easily be discovered.

The letters of La Montaigne appeared soon after; but this work, far less eloquent, and full of envious discussions on the magistrates and clergy of Geneva, irritated the Protestant ministers without effecting a reconciliation with the clergy of the Romish church. Rousseau had solemnly abjured the latter religion in 1753, and, what is somewhat strange, had then resolved to live in France, a Catholic country. The protestant clergy were not fully reconciled by this change; and the protection of the king of Prussia, to whom the principality of Neuchatel belonged, was not sufficient to rescue him from that obloquy which the minister of Montiers-Travers, the village to which he had retired, had excited against him. He preached against Rousseau, and his sermons produced an uproar among the people. On the night between the 6th and 7th September 1765, some fanatics, drove on by wine and the declamations of his minister, threw some stones at the windows of the Genevan philosopher, who, fearing new insults, in vain sought an asylum in the canton of Berne. As this Canton was connected with the republic of Geneva, they did not think proper to allow him to remain in their city, being proscribed by that republic. Neither his broken flat: of health, nor the approach of winter, could soften the hearts of these ebullient Spartans. In vain, to prevent them from the fear they had of the speaking of his opinions, did he beseech them to flout him up in prison till the spring; for even this favour was denied him. Obliged to set out on a journey, in the beginning of a very inclement season, he reached Strasbourg in a very destitute situation. He received from Marshal de Contades, who then commanded in that place, every accommodation which could be expected from generosity, humanity, and compassion. He waited there till the weather was milder, when he went to Paris, where Mr Hume then was, who determined on taking him with him to England. After having made some stay in Paris, Rousseau actually set out for London in 1766.

Hume, much affected with his situation and his misfortunes, procured for him a very agreeable settlement in the country. Our Genevan philosopher was not, however, long satisfied with this new place. He did not make such an impression on the minds of the English as he had done on the French. His free disposition, his obdurate and melancholy temper, was deemed no singularity in England. He was there looked upon as an ordinary man, and the periodical prints were filled with satires against him. In particular, they published a forged letter from the king of Prussia, holding up to ridicule the principles and conduct of this new Diogenes. Rousseau imagined there was a plot between Hume and some philosophers in France to destroy his glory and repose. He sent a letter to him, filled with the most abusive expressions, and reproaching him for his conduct towards him. From this time he looked upon Hume as a wicked and pernicious person, who had brought him to England with no other view than to expose him to public ridicule; which foolish and chimerical idea was nourished by self-love and a reflex disposition. He imagined that the English philosopher, amidst all his kindneless, had something disagreeable in the manner of expressing them. The bad health of Rousseau, a strong and melancholy imagination, a too sensibility, a jealous disposition, joined with philosophic vanity, cherished by the false informations of his governors, who possessed an uncommon power over him; all these taken together, might tend to prepossess him with unfavourable sentiments of some innocent freedoms his benefactor might have taken with him, and might render him ungrateful, which he thought himself incapable of becoming. Meanwhile, these false conjectures and probabilities ought never to have had the weight with an honest mind to withdraw itself from its friend and benefactor. Proofs are always necessary in cases of this kind; and that which Rousseau had was by no means a certain demonstration. The Genevan philosopher, however, certainly returned to France. In passing through Amiens, he met with M. Greffet, who interrogated him about his misfortunes and the controversies he had been engaged in. He only answered, "You have got the art of making a parrot speak; but you are not yet possessed of the secret of making a bear speak." In the mean time, the magistrates of this city wished to confer on him some mark of their esteem, which he absolutely refused. His disordered imagination viewed these flattering civilities as nothing else than insults, such as were lavished on Sancho in the island of Barataria. He thought one part of the people looked upon him as like Lazarille of the Torrnes, who, being fixed to the bottom of a tub, with only his head out of the water, was carried from one town to another to amuse the vulgar. But these wrong and whimsical ideas did not prevent him from aspiring after a residence in Paris, where, without doubt, he was more looked on as a spectacle than in any other place whatever. On the 18th July 1770, Rousseau appeared, for the first time, at the regency coffee-house, drest in ordinary clothing, having for some time previous to this wore an Armenian habit. He was loaded with praises by the surrounding multitude. "It is somewhat singular (says M. Sennebier) to see a man so haughty as he returning to the very place from whence he had been banished so often. Nor is it one of the smallest inconsistencies of this extraordinary character, that he preferred a retreat in that place of which he had spoken so much ill." It is as singular that a person under sentence of imprisonment should wish to live in public a manner in the very place where his sentence was in force against him. His friends procured for him, however, liberty of staying, on condition that he should neither write on religion nor politics; he kept his word; for he wrote none at all. He was contented with living in a calm philosophical manner, giving himself to the society of a few tried friends, spinning the company
Rousseau, company of the great, appearing to have given up all his whimsies, and affecting neither the character of a philosopher nor a bel esprit. He died of an apoplexy at Ermenonville, belonging to the marquis de Girardin, about ten leagues from Paris, July 2, 1778, aged 66 years. This nobleman has erected to his memory a very plain monument, in a grove of poplars, which constitutes part of his beautiful gardens. On the tomb are inscribed the following epitaphs:

Ici repose
L'Homme de la Nature
Es de la Vérité!
Vitam impenitère Vero *
His jacent Offa J. J. Rousseau.

The curious who go to see this tomb likewise see the cloak which the Genius philosopher wore. Above the door is inscribed the following sentence, which might afford matter for a whole book: "He is truly free, who, to accomplish his pleasure, has no need of the affliction of a second person." Rousseau, during his stay in the environs of Lyons, married Mademoiselle de Vaffue, his governness, a woman who, without either beauty or talents, had gained over him a great ascendancy. She waited on him in health and sickness. But as if she had been jealous of poising him alone, she drove from his mind, by the most pernicious intimations, all those who came to entertain him; and when Rousseau did not dismiss them, he prevented their return by invariably refusing them admittance. By these means the more early led her husband into inconveniences of conduct, which the originality of his character as well as of his opinions so much contributed to afflict. Nature had perhaps but given him the embryo of his character, and art had probably united to make it more singular. He did not incline to affect with any person; and as this method of thinking and living was uncommon, it procured him a name, and he displayed a kind of fantasticalness in his behaviour and his writings. Like Diogenes of old, he united simplicity of manners with all the pride of genius; and a large stock of indolence, with an extreme sensibility, served to render his character still more uncommon. "An indolent mind (says he), terrified at every application, a warm, bilious, and irritable temperament, sensitive also in a high degree to every thing that can affect it, appear not possible to be united in the same person: and yet these two contrarieties compose the chief of mine. An active life has no charms for me. I would an hundred times rather consent to be idle than to do any thing against my will; and I have an hundred times thought that I would have not sat in the Bafille, provided I had nothing to do but just continue there. In my younger days I made several attempts to get in there; but as they were only with the view of procuring a refuge and rest in my old age, and, like the exertions of an indolent person, only by fits and starts, they were never attended with the smallest success. When misfortunes came, they afforded me a pretext of giving myself up to my ruling passion." He often exaggerated his misfortunes to himself as well as to others. He endeavoured particularly to render interesting by his description his misfortunes and his poverty, although the former were far less than he imagined, and notwithstanding he had certain resources against the latter. In other respects he was charitable, generous, sober, just, containing himself with what was purely necessary, and refusing the means which might have procured him wealth and offices. He cannot, like many other sophists, be accused of having often repeated with a studied emphasis the word Virtue, without inspiring the sentiment. When he is speaking of the duties of mankind, of the principles necessary to our happiness, of the duty we owe to ourselves and to our equals, it is with a copiousness, a charm, and an impiety, that could only proceed from the heart. He said one day to M. de Buffon, "You have afflicted and proved before J. J. Rousseau that mothers ought to suckle their children." "Yes (says this great naturalist), we have all said so; but M. Rousseau alone forbids it, and causes himself to be obeyed." Another academican said, "that the virtues of Voltaire were without heart, and those of Rousseau without head." He was acquainted at an early age with the works of the Greek and Roman authors; and the republican virtues there held forth to view, the rigorous austerity of Cato, Brutus, &c. carried him beyond the limits of a simple effusion of them. Influenced by his imagination, he admired everything in the ancients, and saw nothing in his contemporaries but enraptured minds and degenerated bodies.

His ideas about politics were almost as eccentric as his paradoxes about religion. Some reckon his Social Compact, which Voltaire calls the Unsocial Compact, the greatest effort his genius produced. Others find it full of contradictions, errors, and cynical palpiations, obtuse, ill-arranged, and by no means worthy of his thinking pen. There are several other small pieces wrote by him, to be found in a collection of his works published in 25 vols 8vo. and 1amo, in which there is appended a very insignificant supplement in 6 vols.

The most useful and most important truths in this collection are picked out in his Thoughts; in which the eminent sophist and the impious author disappar, and nothing is offered to the reader but the eloquent writer and the contemplative moralist. There were found in his port-folio his Confessions, in twelve books; the first six of which were published. "In the preface to these memoirs, which abound with characters well drawn, and written with warmth, with energy, and sometimes with elegance, he declares (says M. Paliffot), like a pestilential misanthrope, who boldly introduces himself alone in the ruins of the world, to declare to mankind, whom he supposed assembled upon these ruins, that in that immeasurable multitude, none could dare to say, I am better than that man. This affection of seeing himself alone in the universe, and of continually directing every thing to himself, may appear to some more or less minds a fanaticism of pride, of which we have no examples, at least from the time of Cardan." But this is not the only blunder which may be attached to the author of the Confessions. With uneasiness we see him, under the pretext of sincerity, dimmitting the character of his benefactor's Lady Warren. There are innumerable no less offensive against obscure and celebrated characters, which ought entirely or nearly to have been suppressed. A bay of wit said, that Rousseau would have been held in higher estimation for virtue, if he had died without his collection. The like opinion is entertained by M. Sennabier,
Rousseau, bier, author of the Literary History of Geneva: "His confessions (says he) appear to me to be a very dangerous book, and paint Rousseau in such colours as we would never have ventured to apply to him. The excellent analysis which we meet with of some sentiments, and the delicate anatomy which he makes of some actions, are not sufficient to counterbalance the detestable matter which is found in them, and the unceasing obloquies everywhere to be met with." It is certain, that if Rousseau has given a faithful delineation of some persons, he has viewed others through a cloud, which formed in his mind perpetual suspicions. He imagined but his vices. They ought not perhaps to be separated from the fixed books of his memoirs, where nothing appears of the vices he disclosed, and by the manner in which he has viewed them, he might become poison. Rousseau, in what he says of himself, makes such acknowledgments as certainly prove that there were better men than he, at least if we may judge him from the first six books of his memoirs, where nothing appears but his vices. They ought not perhaps to be separated from the six last books, where he speaks of the virtues which make reparation for them; or rather the work ought not to have been published at all, if it be true (which there can be little doubt of) that in his confessions he injured the public manners, both by the bafefulness of the vices he delineated, and by the manner in which he united them with the virtues. The other pieces which we find in this new edition of his works are, 1. The Reveries of a Solitary Walker, being a journal of the latter part of his life. In this he confides, that he liked better to send his children into hospitals defined for orphans, than to take upon himself the charge of their maintenance and education; and endeavours to palliate this error, which nothing can exculpate. 2. Considerations upon the Government of Poland. 3. The Adventures of Lord Edward, a novel, being a kind of supplement to the new Heloise. 4. Various Memoirs and Fugitive Pieces, with a great number of letters, some of which are very long, and written with too much study, but containing some eloquent passages and some deep thought. 5. Emilia and Soph'ia. 6. The Levite of Ephraim, a poem in prose, in 4 canons; written in a truly ancient style of simplicity. 7. Letters to Sara. 8. An Opera and a Comedy. 9. Translations of the first book of J. v. o. s's History of the Epistle of Oinonda and Sophronia, taken from Tasso, &c. &c. Like all the other writings of Rousseau, we find in these phalhumous pieces many admirable and some useful things; but they are all abound with contradictions, paradoxes, and ideas very unavailing to religion. In his letters especially we see a man charigned at misfortunes, which he never attributes to himself, suspicious of every body about him,ailing and believing himself a lamb in the midst of wolves; in one word, as like Paul in the strength of his genius, as in his fancy of always seeing a precipice about him. This is the reflection of M. Servant, who knew him, afflicted him, and cared for him during his retreat at Grenoble in 1768. This magistrate having been very attentive in observing his character, ought the rather to be believed, as he inspected it without either malice, envy, or relentment, and only from the concern he had for this philosopher, who he loved and admired.

ROU, in law, is applied to an assembly of persons going forcibly to commit some unlawful act, whether they execute it or not. See RIOT.

ROUTE, a public road, highway, or course, especially that which military forces take. This word is also used for the defeat and flight of an army.

ROWE (Nicholas), descended of an ancient family in Devonshire, was born in 1673. He acquired a complete taste of the classic authors under the famous Dr Bully in Westminster school; but poetry was his early and daring study. His father, who was a lawyer, and designed him for his own profession, entered him a student in the Middle Temple. He made remarkable advances in the study of the law; but the love of the belles lettres, and of poetry in particular, loft him in his career. His first tragedy, the Ambitious Stepmother, meeting with universal applause, he laid aside all thoughts of rising by the law. He afterwards composed several tragedies; but that which he valued himself most upon, was his Tamerlane. The others are, the Fair Penitent, Ulysses, the Royal Convent, Jane Shore, and Lady Jane Grey. He also wrote a poem called the Biter, and several poems upon different subjects, which have been published under the title of Miscellaneous Works, in one volume, as his dramatic works have been in two. Rowe is chiefly to be considered (Dr Johnfon observes) in the light of a tragic writer and a translator. In his attempts at comedy, he failed so ignominiously, that his Biter is not inferred in his works; and his occasional poems and short compositions are rarely worthy of either praise or cenoure, for they seem the casual sports of a mind seeking rather to amuse its leisure than to exercise its powers. In the construction of his dramas there is not much art; he is not a nice observer of the unities. He extends time, and varies place, as his convenience requires. To vary the place is not (in the opinion of the learned critic from whom these observations are borrowed) any violation of nature, if the change be made between the acts; for it is no less easy for the spectator to suppose himself at Athens in the second act, than at Thebes in the first; but to change the scene, as is done by Rowe in the middle of an act, is to add more acts to the play, since an act is to much of the business as is translated without interruption. Rowe, by this licence, easily extricates himself from difficulties; as in Lady Jane Gray, when we have been terrified with all the dreadful pomp of public execution, and are wondering how the heroine or the poet will proceed, no sooner has Jane pronounced some prophetic rhimes, than—paft and be gone—the scene closes, and Pembroke and Gardner are turned out upon the stage. I know not (says Dr Johnson) that there can be found in his plays any deep search into nature, any accurate discriminations of kindred qualities, or nice display of passion in its progress; all is general and undefined. Nor does he much interest or affect the auditor, except in Jane Shore, who is always seen and heard with pity. Alicia is a character of empty noise, with no resemblance to real sorrow or to natural madness. Where then has Rowe his reputation? From the reasonableness and propriety of some of his scenes, from the elegance of his diction, and the fluency of his verse. He seldom moves either pity or terror, but he often elevates the sentiment; he seldom pieces the breach, but he always delights the ear, and often improves the
ROW [ 537 ] ROW

Rowe—understanding. Being a great admirer of Shakespeare, he gave the public an edition of his plays; to which he prefixed an account of that great man's life. But the most considerate of Mr Rowe's performances was a translation of Lucan's Pharsalia, which he just lived to finish, but not to publish; for it did not appear in print till 1728, ten years after his death.

Meanwhile, the love of poetry and books did not make him unfit for business; for nobody applied closer to it when occasion required. The Duke of Queenberry, when secretary of state, made him secretary for public affairs. After the Duke's death, all avenues were flopped to his preferment; and during the rest of Queen Anne's reign he passed his time with the Muses and his books. A story, indeed, is told of him, which shows that he had some acquaintance with her minions. It is said, that he went one day to pay his court to the lord treasurer Oxford, who asked him, "If he understood Spanish well?" He answered, "No!" but thinking that his Lordship might intend to send him into Spain on some honourable commission, he presently added, "that he did not doubt but he could shortly be able both to understand and to speak it." The earl approving what he said, Rowe took his leave; and, retiring a few weeks to learn the language, waited again on the Earl to acquaint him with it. His Lordship asking him, "If he were sure he understood it thoroughly?" and Rowe affirming that he did, "How happy are you, Mr Rowe," said the Earl; "that you can have the pleasure of reading and understanding the History of Don Quixote in the original!" On the accession of George I he was made poet laureate, and one of the land surveyors of the customs in the port of London. The prince of Wales conferred on him the clerkship of his council; and the Lord Chancellor Parker made him his secretary for the presentations. He did not enjoy these promotions long; for he died Dec. 6, 1718, in his 54th year.

Mr Rowe was twice married, had a son by his first wife, and a daughter by his second. He was a handsome, gentle man; and his mind was as amiable as his person. He lived beloved; and at his death had the honour to be lamented by Mr Pope, in an epitaph which is prefixed in Pope's works, although it was not prefixed on Mr Rowe's monument in Westminster-abbey, where he was interred in the poet's corner, opposite to Chaucer.

Rowe (Elisabeth), an English lady, eminent for her excellent writings both in prose and verse, born at Ilchester in Somersetshire in 1647, was the daughter of worthy parents, Mr Walter Sanger and Mrs Elisabeth Portnel. She received the first serious impressions of religion as soon as she was capable of it. There being a great affinity between painting and poetry, this lady, who had a vein for the one, naturally had a taste for the other. She was also very fond of music; chief of the grave and solemn kind, as best suited to the grandeur of her sentiments and the soberity of her devotion. But poetry was her favourite employment, her distinguishing excellence. So prevalent was her genius this way, that her prose is all poetical. In 1695, a collection of her poems was published at the desire of two friends. Her paraphrase on the xxviith chapter of Job was written at the request of Bishop Ken. She had no other tutor for the French and Italian languages than the honourable Mr Thynne, who willingly took the task upon himself. Her shining merit, with the charms of her person and conversation, had procured her a great many admirers. Among others, it is said, the famous Mr Prior made his addresses to her. But Mr Thomas Rowe was to be the happy man. This gentleman was honourably defended: and his superior genius, and invariable thirst after knowledge, were conspicuous in his earliest years. He had formed a design to compile the lives of all the illustrious persons in antiquity omitted by Plutarch; which, indeed, he partly executed. Eight lives were published since his decease. They were translated into French by the abbe Bolland in 1734. He spoke with ease and fluency: had a frank and benevolent temper, an inexhaustible fund of wit, and a communicative disposition. Such was the man who, charmed with the person, character, and writings, of our authoress, married her in 1710, and made it his study to repay the felicity with which she crowned his life. Too intense an application to study, beyond what the delicacy of his frame would bear, broke his health, and threw him into a consumption, which put a period to his valuable life in May 1715, when he was but just past the 28th year of his age. Mrs Rowe wrote a beautiful elegy on his death; and continued to the last moments of her life to express the highest veneration and affection for his memory. As soon after his decease as her affairs would permit, she indulged her inclination for solitude, by retiring to Frome, in Somersetshire, in the neighbourhood of which place the greatest part of her estate lay. In this retreat it was that she composed the most celebrated of her works, Friendship in Death, and the Letters Moral and Entertaining. In 1736, she published, the History of Joseph; a poem which she had written in her younger years. She did not long survive this publication; for she died of an apoplexy, as was supposed, Feb. 20, 1736-7. In her cabinet were found letters to several of her friends, which she had ordered to be delivered immediately after her decease. The Rev. Dr Isaac Watts, agreeable to her request, revised and published her devotions in 1737, under the title of Devout Exercises of the Heart in Meditation and Solitude, Prayers and Devotions; and, in 1739, her Miscellanea of Works, in prose and verse, were published in 2 vols. 8vo, with an account of her life and writings prefixed.

As to her person, she was not a regular beauty, yet possessed a large share of the charms of her sex. She was of a moderate stature, her hair of a fine colour, her eyes of a darkish grey inclining to blue, and full of fire. Her complexion was very fair, and a natural blush bloomed in her cheeks. She spoke gracefully; her voice was exceedingly sweet and harmonious; and she had a softness in her aspect which inspired love, yet not without the mixture of that awe and veneration which distinguished sense and virtue, apparent in the countenance, are wont to create.

ROWEL, among farriers, a kind of issue answering to what in surgery is called a fiston. See FARRIERES, par. v.

ROWLEY, a monk who is said to have flourished at Bristol in the 17th century, and to have been an author voluminous and elegant. Of the poems attributed to him, and published some time ago, various opinions.
opinions have been entertained, which we have noticed elsewhere. They seem now to be almost forgotten. See Chatterton.

Rowley (William), who stands in the third class of dramatic writers, lived, in the reign of King Charles I. and received his education at the university of Cambridge; but whether he took any degree there, is not evident; there being but few particulars preferred in regard to him more than his close intimacy and connection with all the principal wits and poetical geniuses of that age, by whom he was well beloved, and with some of whom he joined in their writings. Wood styles him "the ornament, for wit and ingenuity, of Pembroke-hall in Cambridge." In a word, he was a very great benefactor to the English stage, having, exclusive of his aid lent to Middleton, Day, Heywood, Webster, &c., left us five plays of his own composing, and one in which the immortal aid left us five plays of his own composing, and one in which

ROXBURGH-shire, or TEVIOTDALE, a county of Scotland, deriving its name from the town of Roxburgh, which is now destroyed, and the river Teviot, that runs through the shire into the Tweed, is divided into the three districts of Teviotdale, Liddifdale, and Elibdale, or Enfield, so called from their respective rivers, Teviot, Liddel, and Esk. It is bounded on the east and south-east by Northumberland and Cumberland, on the south and south-west by Annandale, on the west by Tweeddale, on the north by the Merse and Lauderdale; extending about 30 miles from east to west, and about 15 in breadth from the border of England to the Blue Cairn in Lauderdale. The shire exhibits a rough irregular appearance of hills, moors, and mountains intermixed, however, with narrow valleys, and watered with delightful streams. Though the face of the country is bare of woods, the valleys yield plenty of corn, and the hills abound with pasture for sheep and black cattle. The principal mountains of this country are known by the name of Cockburns; from whence a range of very hige hills runs westward, dividing Scotland from England. On the confines of this shire are the debatable lands; the property of which was formerly disputed by the Scots and English borderers, but adjudged to the Scots at the union of the crowns. Roxburghshire yields plenty of lime and freestone, which in former times was freely used by the inhabitants in building castles to defend them from the invasions of their English neighbours. The most distinguished families in this country are the Scots and Kers, who raised themselves to wealth and honours by their bravery and success in a sort of predatory war with their enemies of South Britain. The shire is very populous; and the people are stout and valiant. They were formerly instructed to military discipline and all the dangers of war, by living on dry marches contiguous to those of England; being so numerous and alert, that this and the neighbouring shire of Berwick could in 24 hours produce 10,000 men on horseback, well armed and accoutered. In the shire of Roxburgh we still meet with a great number of old castles and seats belonging to private gentlemen, whose ancestors signified themselves in this manner; and we find the remains of old encampments, and a Roman military way, vulgarly called the causeway, running from Hawick to the Tweed. The principal town, called Roxburg, giving the title of duch to the chief of the Kers, was anciently a royal borough, containing divers parishes, large and flourishing, defended by a strong citadel, which was often alternately reduced by the English and Scotch invaders. It was in besieging this castle that James II. of Scotland lost his life by the bursting of a cannon. In consequence of the almost continual wars between the two nations, this fortress was razed, the town ruined, and its royalty translated to Jedburgh, which is now a royal borough, situated between the Tevi and Jed.

ROYAL, something belonging to a king: thus we say, royal family, royal affent, royal exchange, &c.

ROYAL Family. The first and most considerable branch of the king's royal family, regarded by the laws of England, is the queen.

1. The queen of England is either queen regent, queen consort, or queen dowager. The queen regent, regnant, or foreign, is she who holds the crown in her own right; as the first (and perhaps the second) queen Mary, queen Elizabeth, and queen Anne; and such a one has the same powers, prerogatives, rights, dignities, and duties, as if she had been a king. This is expressly declared by statute 1 Mar. I. c. 3. 1. But the queen consort is the wife of the reigning king; and she by virtue of her marriage is participator of divers prerogatives above other women.

And, first, she is a public person exempt and distinct from the king; and, not, like other married women, so closely connected as to have lost all legal or separate existence so long as the marriage continues. For the queen is of ability to purchase lands and to convey them, to make leaves, to grant copyholds, and do other acts of ownership, without the concurrence of her lord; which no other married woman can do: a privilege as old as the Saxon era. She is also capable of taking a grant from the king, which no other wife is from her husband; and in this particular the agrees with the augea or piuma regina concus dies imperatoris of the Roman laws; who, according to Justinian, was equally capable of making a grant to, and receiving one from, the emperor. The queen of England hath separate courts and officers distinct from the king's, not only in matters of ceremony, but even of laws; and her attorney and solicitor general are entitled to a place within the bar of his majesty's courts, together with the king's counsel. She may likewise sue and be sued alone, without joining her husband. She may also have a separate property in goods as well as lands, and has a right to dispose of them by will. In short, she is in all legal proceedings looked upon as a feme sole, and not as a feme covert; as a single, not as a married woman. For which the reason given by Sir Edward Coke is this: because the wisdom of the common law would not have the king (whose continual care and study is for the public, and circa avitus regni) to be troubled and disquieted on account of his wife's domestic affairs; and therefore it avails in the queen a power of transacting her own concerns, without the intervention of the king, as if she were an unmarried woman. The queen hath also many exceptions, and minute prerogatives. For instance: she pays no toll; nor is
the liable to any amercement in any court. But in general, unless where the law has expressly declared her exempted, she is upon the same footing with other subjects; being to all intents and purposes the king's subject, and not his equal; in like manner as in the imperial law, Augultus legibus solutus non est.

The queen hath also some pecuniary advantages, which form her a distinct revenue: as, in the first place, she is intituted to an ancient perquisite called queen-gold or aurum regina; which is a royal revenue belonging to every queen-consort during her marriage with the king, and due from every person who hath made a voluntary offering or fine to the king, amounting to 10 marks or upwards, for and in consideration of any privileges, grants, licences, pardons, or other matter of royal favour conferred upon him by the king; and it is due in the proportion to one-tenth part more, over and above the entire offering or fine made to the king, and becomes an actual debt of record to the queen's majesty by the mere recording of the fine. As, if 100 marks of silver be given to the king for liberty to take in mortmain, or to have a fair, market, park, chase, or free-warren; there the queen is entitled to 10 marks in silver, or (what was formerly an equivalent denomination) to one mark in gold, by the name of queen-gold, or aurum regina. But no such payment is due for any aids or subsidies granted to the king in parliament or convocation; or for fines imposed by courts on offenders against their will; nor for voluntary presents to the king, without any consideration moving from him to the subject; nor for any sale or contravention by the present revenues or poisefeions of the crown are granted away or diminished.

The original revenue of the ancient queens, before and soon after the conquest, seems to have consisted in certain reservations or rents out of the demesne lands of the crown, which were expressly appropriated to her majesty, distinct from the king. It is frequent in domeday book, after specifying the rent due to the crown, to add likewise the quantity of gold or other renders reserved to the queen. These were frequently appropriated to particular purposes: to buy wood for the majesty's use, to furnish oil for lamps, and to furnish her attire from head to foot, which was frequently very costly, as one single robe in the fifth year of Henry II. the city of London in upwards of 80 pounds: A practice somewhat similar to that of the eastern countries, where whole cities and provinces were specifically assigned to purchase particular parts of the queen's apparel. And for a farther addition to her income, this duty of queen-gold is supposed to have been originally granted; those matters of grace and favour, out of which it arose, being frequently obtained from the crown by the powerful intercession of the queen. There are traces of its payment, though obscure ones, in the book of domeday, and in the great pipe-roll of Henry I. In the reign of Henry II. the manner of collecting it appears to have been well understood; and it forms a distinct head in the ancient dialogue of the exchequer written in the time of that prince, and usually attributed to Gervase of Tilbury. From that time downwards, it was regularly claimed and enjoyed by all the queen-consorts of England till the death of Henry VIII.; though after the accession of the Tudor family, the collecting of it seems to have been much neglected; and there being no queen consort afterwards till the accession of James I. a period of near 60 years, its very nature and quantity then became a matter of doubt; and being referred by the king to the chief justices and chief baron, their report of it was so very unfavourable, that his consort queen Anne, though she claimed it, yet never thought proper to exact it. In 1635, 11 Car. I. a time teemile of expedients for raising money upon dormant precedents in our old records (of which ship-money was a fatal instance), the king, at the petition of his queen Henrietta Maria, flued out his writ for levying it; but afterwards purchased it of his consort at the price of 10,000 pounds; finding it, perhaps, too trifling and troublesome to levy. And when afterwards, at the Restoration, by the abolition of military tenures, and the fines that were consequent upon them, the little that legally remained of this revenue was reduced to almost nothing at all; in vain did Mr. Prynne, by a treatise that does honour to his abilities as a painful and judicious antiquarian, endeavoured to excite queen Catherine to revive this antiquated claim.

Another ancient perquisite belonging to the queen consort, mentioned by all our old writers, and therefore only worthy notes, is this: that on the taking a whale on the coasts, which is a royal gift, it shall be divided between the king and queen; the head only being the king's property, and the tail of it the queen's. De flargime atherum, quod rex illum batavit integrum: de balena vero sussitt, et rex habet caput, et regina canoram. The reason of this whimsical division, as attested by our ancient records, was, to furnish the queen's wardrobe with whale bone.

But farther: though the queen is in all respects a subject, yet, in point of the security of her life and person, she is put upon the same footing with the king. It is equally treason (by the statute 25 Edward III.) to imagine or compass the death of our lady the queen. As, for instance, her death, or to violate her chastity. But it is not high treason to conspire against her: but, in the infinse of conjugal fidelity, he is not subject to the same penal restrictions. For which the reason seems to be, that if a queen consort is unfaithful to the royal bed, this may deserve or bastardize the heirs to the crown; but no such danger can be consequent on the infidelity of the husband to a queen regent.

2. A queen dowager is the widow of the king, and as such enjoys most of the privileges belonging to her as queen consort. But it is not high treason to conspire her death, or to violate her chastity; for the same reason as was before alleged, because the succession to the crown is not thereby endangered.
no man can marry a queen-dowager without special licence from the king, on pain of forfeiting his lands and goods. This Sir Edward Coke tells us, was enacted in parliament in 6 Henry VI., though the statute be not in print. But she, though an alien born, shall still be entitled to dower after the king's demise, which no other alien is. A queen-dowager when married again to a subject, doth not lose her regal dignity, as peeresses-dowager do when they marry commoners. For Katharine, queen-dowager of Henry V., though the married a private gentleman, Owen ap Meredith ap Theodore, commonly called Owen Tudor; yet, by the name of Katharine queen of England, maintained an action against the bishop of Carlisle. And so the dowager of Navarre marrying with Edmund the brother of King Edward I., maintained an action of dower by the name of queen of Navarre.

The prince of Wales, or heir apparent to the crown, and also his royal confoft, and the princes royal, or elder daughter of the king, are Likewise peculiarly regarded by the laws. For, by statute 25 Edw. III. to compas or confpire the death of the former, or to violate the chastity of either of the latter, are as much high treason as to confpire the death of the king, or violate the chastity of the queen. And this upon the same reason as was before given; because the prince of Wales is next in succession to the crown, and to violate his wife might taint the blood-royal with balfardy; and the elder daughter of the king is also alone inheritable to the crown on failure of issue male, and therefore more respected by the laws than any of her younger sisters; insomuch that upon this, united with other (feodal) principles, while the military tenures were in force, the king might levy an aid for marrying his elder daughter, and her only. The heir apparent to the crown is usually made prince of Wales and earl of Chester, by special creation and investment; but being the king's eldest son, he is by inheritance duke of Cornwall, without any new creation.

The rest of the royal family may be considered in two different lights, according to the different senses in which the term royal family is used. The larger sense includes all those who are by any possibility inheritable to the crown. Such, before the revolution, were all the descendants of William the Conqueror; who had branched into an amazing extent by intermarriages with the ancient nobility. Since the revolution and act of settlement, it means the Protestant issue of the princes Sophia; now comparatively few in number, but which in process of time may possibly be as largely diffused. The more confined sense includes only those who are in a certain degree of propinquity to the reigning prince, and to whom therefore the law pays an extraordinary regard and respect, but after that degree is past, they fall into the rank of ordinary subjects, and are seldom considered any farther, unless called to the succession upon failure of the nearer lines. For though collateral consanguinity is regarded infinitely with respect to inheritance or succession, yet it is and can only be regarded within some certain limits in any other respect, by the natural constitution of things and the dictates of positive law.

The younger sons and daughters of the king, and other branches of the royal family, who are not in the immediate line of succession, were therefore little farther regarded by the ancient law, than to give them a certain degree of precedence before all peers and public officers as well ecclesiastical as temporal. This is done by the statute 31 Henry VIII. c. 10, which enacts that no person except the king's children shall presume to fix or have place at the side of the cloth of estate in the parliament chamber; and that certain great officers therein named shall have precedence above all dukes, except only such as shall happen to be the king's son, brother, uncle, nephew (which Sir Edward Coke explains to signify grandson or nepos), or brother's or sister's son. But under the description of the king's children, his grandsons are held to be included, without having recourse to Sir Edward Coke's interpretation of nephew; and therefore when his late majesty King George II. created his grandson Edward, the second son of Frederick prince of Wales deceased, duke of York, and referred it to the house of lords to settle his place and precedence, they certified that he ought to have precedence next to the late duke of Cumberland, the then king's youngest son; and that he might have a seat on the left hand of the cloth of estate. But when, on the accession of his present majesty, these royal personages ceased to take place as the children, and ranked only as the brother and uncle of the king, they also left their seats on the side of the cloth of estate; so that when the duke of Gloucester, his majesty's second brother, took his seat in the house of peers, he was placed on the upper end of the earl's bench (on which the dukes usually sit) next to his royal highness the duke of York. And in 1717, upon a question referred to all the judges by King George I., it was resolved, by the opinion of ten against the other two, that the education and care of all the king's grandchildren, while minors, did belong of right to his majesty as king of this realm, even during their father's life. But they all agreed, that the care and approbation of their marriages, when grown up, belonged to the king their grandfather. And the judges have more recently concurred in opinion, that this care and approbation extend also to the presumptive heir of the crown; though to what other branches of the royal family the same did extend, they did not find precisely determined. The most frequent instances of the crown's interposition go no farther than nephews and nieces; but examples are not wanting of its reaching to more distant collateral. And the statute 6 Henry VI. before-mentioned, which prohibits the marriage of a queen-dowager without the consent of the king, affirms this reason for it: "because the disparagement of the queen shall give greater comfort and example to other ladies of estate, who are of the blood-royal, more lightly to disparage themselves." Therefore by the statute 28 Hen. VII. c. 18 (repealed, among other statutes of treasons, by 1 Edw. VI. c. 12) it was made high treason for any man to contract marriage with the king's children or reputed children, his sisters or brothers, or the children of his brethren or sisters; being exactly the same degrees to which precedence is allowed by the statute 31 Hen. VIII. before-mentioned. And now, by statute 12 Geo. III. c. 11, no descendant of the body of King George II. (other than the issue of princes married into foreign families) is capable of contracting...
trading matrimony, without the previous consent of the king, signifies under the great seal; and any marriage contracted without such a consent is void. Provided, that such of the said descendants as are not above 25 years of age, may after a twelvemonth's notice given to the king's privy council, contract and enter into marriage without the consent of the crown; unless both houses of parliament shall, before the expiration of the said year, expressly declare their disapprobation of such intended marriage. And all persons solemnizing, affiling, or being present at any such prohibited marriage, shall incur the penalties of the act of praemunire.

Royal Oak, a fair spreading tree at Boscobel, in the parish of Donnington in Staffordshire, the boughs whereof were once covered with ivy in the thick of which King Charles II. sat in the day-time with colonel Careless, and in the night lodged in Boscobel house; so that they are mistaken who speak of it as an old hollow oak; it being then a gay flourishing tree, surrounded with many more. The poor remain thereof are now fenced in with a handsome wall, with this inscription in gold letters: Felicissimam arbolem quam aphisiam potentiissimi regis Caroli II. Deo op. max. per quem regis regnans, hic creare veluit, &c.

Royal Society. See Society.

ROYALTIES, the rights of the king, otherwise called the king's prerogative, and the regalia. See PRE-ROGATIVE and REGALIA.

ROYENIA, in botany: A genus of the digynia order, belonging to the decandria class of plants; and in the natural method ranking under the 18th order, Bisexuales. The calyx is urceolate; the corolla monopetalous, with the limb revolted; the capsule is unilocular and quadrivalved.

ROYSTON, a town of Hertfordshire in England, seated in E. Long. 0. 1. N. Lat. 52° 3'. It is a large place, seated in a fertile vale full of inns, and the market is very considerable for corn. There was lately discovered, almoat under the market-place, a subterraneous chapel of one Roja, a Saxon Lady; it has several alters and images cut out of the chalky sides, and is in form of a sugar-loaf, having no entrance but at the top.

RUBBER. See COUTCHOUC.

RUBENS (Sir Peter Paul), the most eminent of the Flemish painters, was born in 1577; but whether at Antwerp or Cologne it is not easy to determine. His father, who was a counsellor in the senate of Antwerp, had been forced by the civil wars to seek refuge in Cologne, and during his residence there Rubens is commonly said to have been born.

The genius of Rubens, which began to unfold itself in his earliest years, was cultivated with peculiar care, and embellished with every branch of classical and polite literature. He soon discovered a strong inclination for designing; and used to amuse himself with that employment in his leisure hours, while the rest of his time was devoted to other studies. His mother, perceiving the bias of her son, permitted him to attend the instructions of Tobias Verhaecht, a painter of architecture and landscape. He next became the pupil of Adam Van Oort, but he soon found that the abilities of this master were insufficient to answer his elevated ideas. His fiery temper too was difficult to Rubens, whose natural disposition was modest and amiable.

Anxious to find an artist whose genius and dispositions were congenial with his own, he became the disciple of Ondio Van Veen, generally known by the name of Ottone Venius, a painter of singular merit, and who was not only skilled in the principles of the art, but also distinguished for learning and other accomplishments. Between the master and scholar a remarkable similarity appeared in temper and inclination; indeed, in the whole turn of their minds. It was this congeniality of sentiments which animated Rubens with that ardent passion for the art of painting which at length determined him to pursue it as a profession. From this time he gave up his whole mind to it; and so successful were his exertions, that he soon equalled his master.

In order to arrive at that perfection which he already beheld in idea, it became requisite to study the productions of the most eminent artists. For this purpose he travelled through Italy, visiting the most valuable collections of paintings and antique statues with which that country abounds.

Sandrart, who was intimately acquainted with Rubens, informs us, that he was recommended in the most honourable manner to the duke of Mantua by the archduke Albert, who had witnessed his talents in the finishing of some fine paintings designed for his own palace. At Mantua he was received by the duke with the most flattering marks of distinction, and had opportunities of improving himself which he did not neglect. Here he carefully studied the works of Julio Romano. He next visited Rome, where he had an opportunity of examining the productions of Raphael. The paintings of Titian and Paolo Veronese called him to Venice, where he accomplished himself in the art of colouring.

He continued in Italy seven years. At length receiving intelligence that his mother was taken ill, he hastened to Antwerp; but his filial affection was not gratified with a sight of her; she died before his arrival. He married soon after; but his wife dying at the end of four years, he retired from Antwerp for some time, and endeavoured to soothe his melancholy by a journey to Holland. At Utrecht he visited Herturt, for whom he had a great value.

The fame of Rubens was now spread over Europe. He was invited by Mary of Medicis queen of Henry IV. of France to Paris, where he painted the galleries in the palace of Luxemburg. These form a series of paintings which delineate the history of Mary; and afford a convincing proof how well qualified he was to excel in allegorical and emblematical compositions. While at Paris he became acquainted with the duke of Buckingham, who was so taken with his great talents and accomplishments, that he judged him well qualified to explain to Isabella, the wife of Albert the archduke, the causes of the misunderstanding which had taken place between the courts of England and Spain. In this employment Rubens acquitted himself with such propriety, that Isabella appointed him envoy to the king of Spain, with a commission to propose terms of peace, and to bring back the instructions of that monarch. Philip was no less captivated with Rubens; he conferred on him the honour of knighthood, and made him secretary to his privy council. Rubens returned
Rubens returned to Brussels, and thence passed over into England in 1630 with a commissione from the Catholic King to negotiate a piece between the two crowns. He was successful in his negotiation, and a treaty was concluded. Charles I., who then had the British throne, could not receive Rubens in a public character on account of his profession; nevertheless, he treated him with every mark of respect. Having engaged him to paint some of the apartments of Whitehall, he not only gave him a handsome sum of money, but, as an acknowledgment of his merit created him a knight; and the public character and fame of the apartments of Whitehall, he not only painted but returned to Antwerp, where he married a lady called Helena Forment, who, being an eminent beauty, helped him much in the figures of his women. He died on 30th May 1640, in the 63d year of his age; leaving an immense fortune to his children. Albert his eldest son succeeded him in the office ofsecretary of state at Flanders.

As Rubens possessed all the ornaments and advantages that render a man worthy to be esteemed or courted, he was always treated as a person of consequence. His figure was noble, his manners engaging, and his conversation lively; his learning was universal. Though his favourite study must have occupied him much, yet he found time to read the works of the most celebrated authors, and especially the poets. He spoke several languages perfectly, and was an excellent statesman.

His house at Antwerp was enriched with every thing that is rare and valuable. It contained one spacious apartment, in imitation of the rotunda at Rome, adorned with a choice collection of pictures which he had purchased in Italy; part of which he sold to the duke of Buckingham.

His genius qualified him to excel equally in every thing that can enter into the composition of a picture. His invention was so fertile, that, if he had occasion to paint the same subject several times, his imagination always supplied him with something striking and new. The attitudes of his figures are natural and varied, the carriage of the head is peculiarly graceful, and his expression noble and animated.

He is by all allowed to have carried the art of colouring to its highest pitch; he understood it thoroughly the true principles of the chiaro-scuro, that he gave to his figures the utmost harmony, and a prominence resembling real life. His pencil is mellowed, its strokes bold and easy, his carnation glows with life, and his drapery is simple, but grand, broad, and hung with much skill.

The great excellence of Rubens appears in his grand compositions; for as they are to be viewed at a distance, he laid on a proper body of colours with uncommon boldness, and fixed all his tints in their proper places; so that he never impaired their lustre by breaking or torturing them; but touched them in such a manner as to give them a lasting force, beauty, and harmony.

It is generally allowed, that Rubens wanted correctness in drawing and designing; some of his figures being heavy and too short, and the limbs in some parts not being justly sketched in the outline. Though he had spent seven years in Italy in studying those antiques by which other celebrated artists had modelled their tale; though he had examined them with such minute attention as not only to perceive their beauties, but to be qualified to describe them in a Dissertations which he wrote on that subject; yet he seems never to have divested himself of that heavy style of painting, which, being peculiar to his native country, he had ineflicibly acquired. The artificial rapidity too with which he painted, made him fall into inaccuracies, from which those works that he finished with care are entirely exempted.

Among his finished pieces may be mentioned the Crucifixion of Jesus Christ between the two Thieves, which was very lately to be seen at Antwerp; but of all his works the paintings in the palace of Luxembourg display his genius and his style.

It is the observation of Algarotti, that he was more moderate in his movements than Tintoretto, and more soft in his chiaro-scuro than Caravaggio; but not so rich in his compositions, nor so light in his touches, as Veronese; in his caracters less true than Titian, and less delicate than Van Dyck. Yet he contrived to give his colours the utmost transparence and harmony, notwithstanding the extraordinary deepness of them; and he had a strength and grandeur of style entirely his own.

RUBIA, Madder: A genus of the monogyynia order, belonging to the tetranidia class of plants; and in the natural method ranking under the 47th order, Silenatae. The corolla is monopetalous and campanulated; and there are two monoporous stamens. There are three species, of which the most remarkable is the tinctorum, or dye's madder, so much used by the dye's and calico-printers. This hath a perennial root and annual flalk: the root is composed of many long, thick, succulent fibres, almost as large as a man's little finger; these are jointed at the top in a head like a parapagus, and run very deep into the ground. From the upper part, or head of the root, come out many side-roots, which extend just under the surface of the ground to a great distance, whereby it propagates very fast; for these send up a great number of shoots, which, if carefully taken off in the spring soon after they are above ground become so many plants. These roots are of a reddish colour, somewhat transparent; and have a yellowish pith in the middle, which is tough and of a bitter taste. From this root arise many large four-cornered jointed flalks, which, in good land, will grow five or six feet long, and if supported, sometimes seven or eight: they are armed with short herbaceous prickles; and at each joint are placed five or six spear-shaped leaves; their upper surfaces are smooth: but their midrib on the under side is armed with rough herbaceous spines, and the leaves fit close to the branches in whorls.

From the joints of the flalk come out the branches, which sultain the flowers: they are placed by pairs opposite; each pair croosing the other; these have a few small leaves toward the bottom, which are by threes, and upwards by pairs opposite: the branches are terminated by loose branching spikes of yellow flowers, which are cut into four parts resembling frrms. These appear in June, and are sometimes succeeded by seeds, which
which seldom ripen in England. For the manner
of its cultivation and preparation for the use of dyers, see
the article Madder.

Madder-root is used in medicine. The virtues at-
tributed to it are those of a detergent and aperient;
whence it has been usually ranked among the opening
roots, and recommended in obstructions of the vasa-
crea, particularly of the kidneys, in coagulations of the blood
from falls or bruises, in the jaundice, and beginning
dropsy. It is an ingredient in the lafier decoction
of the Edinburgh pharmaepoeia.

It is observable, that this root, taken internally,
tinges the urine of a deep red colour; and in the Phi-
losophical Transactions we have an account of its pro-
ducing a like effect upon the bones of animals who
had it mixed with their food: all the bones, parti-
cularly the more solid ones, were said to be changed,
both externally and internally, to a deep red; but nei-
ther the fishy nor the cartilaginous parts suffered any al-
terations: some of these bones macerated in water for
many weeks together, and afterwards steeped and boil-
ed in spirit of wine, lost none of their colour, nor com-
municated any tinge to the liquors. This root, there-
fore, was concluded to be possessed of great utility of
parts, and its medical virtues hence to deserve inquiry.
The same trials, however, made by others, have not
been found to produce the same effects as those above
mentioned.—Of late the root has come into great re-
putation as an emmenagogue.

RUBINISKA, one of the northern provinces of
Russia, bounded by the province of Dwina on the
north, by Syrians on the east, by Belouza on the
south, and by the lake Ongas on the west.

RUBRIC, in the canon law, signifies a title or ar-
ticle in certain ancient law-books; thus called becau-
se, as the titles of the chapters in our ancient
bibles are, in red letters.

RUBUS, the Bramble, or Raspberry buff: A ge-
nus of the polygamy order, belonging to the icofan-
dia class of plants; and in the natural order ranking
under the 35th order, Senticafa. The calyx is quin-
quefoliate, the petals five; the berry consisting of mono-
fermous acoi or pulpy grains. The principal species
is the common raspberry, which, with its varieties, de-
mands culture in every garden for their fruit; particu-
larly the common red kind, white fort, and twice-
bearing raspberry; all of which are great bearers: but
for the general plantations, we choose principally the
common red, and the white kind, as being generally
the greatest bearers of all; planting also a share of the
twice-bearing fort, both as a curiosity and for the
lace of its autumnal crops of fruit, which in favour-
able seasons ripen in tolerable perfection; observing
to allow all the fruits some open exposure in the kitchen
garden, though they will prosper in almost any situa-
tion.

The other species are considered as plants of variety,
for hardy plantations in the shrubbery. Some of them
are also very ornamental flowering plants; particularly
the Virginian flowering raspberry, and the double-
blossomed bramble, which have great merit as furniture
for ornamental compartments; and the white-berried
bramble, which is a great curiosity. All the other spe-
cies and varieties serve to diversify large collections.

RUBY, a genus of precious stones of various col-
ours: As 1. Of a deep red colour inclining a little to
purple; the carbuncle of Pliny. 2. The spinel, of the
colour of a bright corn poppy flower. 3. The balafs
or pale red inclining to violet; suppos'd to be the
mother of rubies. 4. The rubicell, of a reddish yellow.
According to Crowlited, the ruby chrysalisfics into an oc-
toedral form, as well as the diamond, from which it
differs very little in hardness and weight, whence he
concludes that they are both of the same nature; but
some late experiments have shown that the diamond dif-
sers exceptively from all other gems, in being dissolvable
by a strong fire, which the others resist. Tavernier
and Duets inform us, that in the East Indies all coloured
gems are named rubies, without regard to what their
colours may be; and that the particular colour is
added to the name of each in order to distinguish
them from one another. There are, however, some
soft stones of this kind which they call bacan; and
it is certain, that the hard and brilliant rubies named
oriental, as well as the sapphires and topazes, are all the
same, excepting only the circumference of colour. Some
are partly red and partly blue, yellow, and some quite
colourless. The spinel rubies are about half the va-

cue of diamonds of the same weight; the balafs is val-

eued at 30 shillings per carat. Tavernier mentions 108
rubies in the throne of the great Mogul, from 100
to 200 carats, and of a round one almost 2½ ounces:
there is also mention made by other travellers of rubies
exceeding 200 carats in weight. According to Du-
tens a perfect ruby, if it weighs more than 3½ ca-
rats, is of greater value than a diamond of the fame
weight. If it weighs one carat, it is worth 10 gu-
neas; if two carats, 40 guineas; three carats, 150 gu-
neas; if six carats, upwards of 1000 guineas.

According to the experiments of Bergman and A-
chard, the texture of the ruby is foliated like that of
diamonds; it is fusible with borax in a strong and long-
continued heat, running into a transparent glass of a
pale green colour; the same effect is produced by mi-
icroscopic salt; but with sedative salt, or mineral or
vegetable alkali, the glass is opaque and differently co-
loured. From the experiments of M. d'Arcet, it appears
that the ruby does not lose its colour in the greatest
heat; but Henckel says, that, by means of a burning
flame, he softened it in such a manner as to receive the
impression of a seal of jasper. It becomes electric by
being rubbed. Its specific gravity, according to Berg-
man, is from 3,180 to 4,240; but Bristows tells us that
it is 4,283. The specific gravity of the spinel is 3,750,
of the Brazilian ruby 3,535.

Rubies are met with in the Cáplean mountains of
Pegu in the East Indies; and at Caos, Ava, Bintargar,
Calicut, Cananor, Ceylan, and Brasil. They are found
in the sands of rivers of a red colour, in an argillaceous
earth of an hard texture and greenish colour: some-
times they adhere to red rocks. The spinell rubies
are met with in Hungary, Silisia, Bohemia, and Bra-
asil. The balafs comes principally from Brasil, though
some are also brought from the East Indies. The rub-
icell comes also from Brasil, but are said to lose their
colour in the fire. A variety of this gem, but of a soft
quality, is found in great plenty on the sea-shore
near Ely in Fifeshire, Scotland. There is also a stone

Thus it was apparent, that ample room was left for the discovery of some more certain resource than any of the former; and the scheme which has suggested itself to me, will, I trust, be found fully to answer the proper intended. The materials are such as scarcely any ship can venture to see without; and the construction of a vessel, if easy, and simple, that the capacity of the meanest able will at once conceive it. I need not, from mathematical principles, show the certainty of its effect, as it is formed and managed in the same manner as a ship's common rudder: and as the common rudder is certainly of all inventions the best calculated for guiding a vessel through the water, it will of course follow, that whatever substitute the nearest resembles that, must be best adapted to supply its place.

RUDIMAN (Thomas), one of the most eminent grammarians which Scotland had produced, was born in October 1672 at Ragel, in the parish of Boyndie and county of Banff. His father James Ruddiman was a farmer, and strongly attached to the house of Stuart.

Mr Ruddiman was instructed in the principles of Latin grammar at the parish-school of Boyndie, where his application was so vigorous, and his progress so rapid, that he quickly surpassed all his class-fellows. His master, George Morison, who was a skilful and attentive teacher, being unwilling to check his ardour for learning, permitted him to follow the impulse of his genius, and to advance without waiting the slow progress of the other boys.

The pleasure which the youthful mind receives from vivid description, though wild and romantic, approaches to ecstasy, and often makes an impression which remains indelible. While at school, the first book which charmed the opening mind of Ruddiman was Ovid's Metamorphoses; nor did he cease to relish the beauties of this author when his judgment was mature, for during the rest of his life Ovid was his favourite poet.

At the age of sixteen he became anxious to pursue his studies at the university; but his father thinking him too young, opposed his inclination. Hearing of the competition trial, which was annually held at King's college, Aberdeen, for a certain number of bursaries on the foundation of that university, Ruddiman's ambition was kindled. Without the knowledge of his father, and with only a single guinea in his pocket, which his sister had privately given him, he set out for that place.

On the road he was met by a company of gypsies, who robbed him of his coat, his shoes, his stockings, and his guinea. This misfortune did not damp his enterprising spirit: He continued his journey to Aberdeen, presented himself before the professors as a candidate; and though he had neither clothes to give him a decent appearance nor friends to recommend him, he gained the first prize.

After attending the university four years, he obtained the degree of master of arts; an honour of which he was always proud. The theses being, the disputation on this occasion lifted _ab aurora usque ad vesperum, i.e._

Vol. XVI.

"From morning till night." Tho' Ruddiman was only twenty years of age when he left the university, it appears from a book intitled _Rhetoriorum Libri tres_, composed before this period, but never published, that he had then read the Roman classics with uncommon attention and advantage.

He was soon after engaged as a tutor to the son of Robert Young, Esq; of Auldbar, the great-grandson of Sir Peter Young, who under the direction of Buchanan had been preceptor of James VI. His income here must have been very small, or his situation unpleasant; for within a year he accepted the office of schoolmaster in the parish of Laurence-kirk. The profession of schoolmaster in a country-parish at that period could open no field for ambition, nor prospects of great emolument; for by an act of parliament passed in 1653, the salary appropriated to this office could not be increased above 200 marks Scots, or L. 11: 2: 2½ Sterling. In discharging the duties of this humble but important station, it is probable that he used Simson's _Rudimenta Grammatica_, which was then originally taught in the northern schools, and by which he himself had been instructed in the principles of Latin grammar.

When Ruddiman had spent three years and a half in this employment, the celebrated Dr Pitcairne happening to pass through Laurence-kirk, was detained in that village by a violent storm. Pitcairne wanting amusement, required at the hostels if he could procure any agreeable companion to bear him company at dinner. She replied, that the schoolmaster, though young, was said to be learned, and, though modest, she was sure he could talk. Pitcairne was delighted with the conversation and learning of his new companion, invited him to Edinburgh, and promised him his patronage.

When Ruddiman arrived in Edinburgh, the advocates library which had been founded eighteen years before by Sir George Makenzie, attracted his curiosity and attention, and he was soon after appointed assistant-keeper under Mr Spottiswoode the principal librarian. His salary for executing this laborious office was L. 3: 6: 8. He had besides a small honorary present from those to whom he was admitted advocates for correcting their theses: he was also paid for copying manuscripts for the use of the library. And the faculty, before he had held the office two years, were so highly pleased with his conduct, that they made him a present of 50 pounds Scots, or L. 4: 5: 4 Sterling.

During the sitting of the court of session he attended the library from ten till three. But this confinement did not prevent him from engaging in other laborious duties: A part of his time was occupied in teaching young gentlemen the Latin language. Some he attended at their lodgings, some waited upon him, and some refided in his own house. An exact list of the names of those who attended him, expressing the date of their entry, and the sums which he was to receive from each, has been found in his pocket-book; a curious relic, which is still preserved.

When Ruddiman's merit as a scholar became better known, his assistance was anxiously solicited by those who were engaged in literary publications. Freebairn, a respectable bookseller of that period, prevailed upon him to correct and prepare for the press Sir Robert Sibbald's _Introduétio ad hifloriam rerum a Romanis gera- rum in ea Boreallis Britanniae parte que ultra marum_, etc.
In 1707 he commenced auctioneer, an employment not very suitable to the dignified character of a man of letters: but to this occupation he was probably impelled by necessity; for upon balancing his accounts at the end of the preceding year, the whole surplus was £28 25. with prospects of £236:7:6 Scots. Ruddiman had a family; and seems to have been a stranger to that foolish pride which has seduced some literary men into the opinion, that it is more honourable to starve than have recourse to an occupation which men of rank and opulence are accustomed to despise. The same year he published an edition of Volucent de Anima Tranquilitate Dialogus, to which he prefixed the life of Volucentus. Volucentus or Wilson was a learned Buchanan, and had the honour to be patronized by Cardinal Wolley (see Wilson). In 1709 he published Johnfoni Centeci Solomonis Paraphrasis Poetica, and Johnfoni Cortica with notes, which he dedicated in verse to his friend and patron Dr Pitcairne. The edition consisted of 200 copies. The expense of printing amounted to £5 10s. Sterling, and he sold them at ailling each copy.

The philological talents of Ruddiman were next directed to a still more important object, in which they became more conspicuous and useful. Freebairne the bookfeller proposed to publish a new edition of the Scotch translation of Virgil’s Aeneid by Gawin Douglas bishop of Dunkeld. Of the contributions which some eminent characters of the age presented, the most valuable were supplied by Ruddiman. Freebairne acknowledged in general terms this obligation, but has not done him the justice to inform the reader what these valuable contributions were, and Ruddiman’s modesty restrained him from publicly asserting his claim. From the pocket-book which has been already mentioned, it appears that Ruddiman corrected the work and wrote the glossary; and there is strong reason to believe that he was the author of the 42 general rules for assisting the reader to understand the language of Douglas. To those who wish to be acquainted with the ancient language of this island, the glossary, will be a treasure, as it forms a comprehensive dictionary of the Anglo-Saxon. For this elaborate work Ruddiman was allowed £8:6:8 Sterling.

The reputation of Ruddiman had now extended to a distance. He was invited by the magistrates of Dundee to be rector of the grammar-school of that town; but the faculty of advocates, anxious to retain him, augmented his salary to £30:6:8 Sterling, and he declined the offer.

In 1711 he affisted Bishop Sage in publishing Drummond of Hawthorned’s works; and performed the same favour to Dr Abercrombie, who was then preparing for the press his Martial Achievements.

In 1713 he was deprived of his friend Dr Pitcairne. On this occasion he testified all the respect which friendship could inspire to the memory of his deceased patron and surviving family. He composed Pitcairne’s epitaph, and conducted the sale of his library, which was disposed of to Peter the Great.

In 1714 the Rudiments of the Latin tongue were published. Eighteen or nineteen Latin grammars, composed by Scotchmen, had appeared before this period; yet June is the intrinsic value of this little treatise, that it soon superseded all other books on the subject, and is now taught in all the grammar-schools in Scotland. It has also been translated into other languages.

He was next called upon to publish the works of Buchanan. The value of these he enhanced much by an elaborate preface, his Tabula Regum Scotiae Chronologica, and Propriorum Nominum Interpretatio. The interpretation of proper names was highly requisite; for Buchanan has so dignified them in the Roman drefs, that the original name is scarcely discernible; and the preface puts the reader on his guard against the chronological errors and factitious spirit of the history. Ruddiman also added a learned dissertation, intitled De Miseris Buchananatis Libellus, and subjoined annotations critical and political on the History of Scotland. As he escaped the curse of Queen Mary, he raised against himself an hoist of enemies, and gave occasion to that celebrated controversy which has been carried on with much keenness and animosity, and with little interruption, even to the present times. For this work Ruddiman was promised £40 Sterling.

He had now been so long accustomed to superintend the press, that he was led to form the plan of erecting a printing-office himself (A). Accordingly, in the year 1715, he commenced printer in partnership with his brother Walter, who had been regularly bred to the business. Some years after he was appointed printer to the university, along with James Davidson bookfeller.

The first literary society formed in Scotland was instituted in the year 1718. It probably derived its origin from the factious and turbulent spirit of the times. The learned, anxious perhaps to find some reprieve from the political dimensions of the day, endeavoured to procure it in elegant amusement; for one of the fundamental articles of the new association was, that the “affairs of church and state should not be introduced.” Ruddiman and the masters of the high-school had the honour to found this society. They were afterwards joined by Lord Kames.

In 1725 the first part of his Grammatica Latina Institutiones, which treated of etymology, was published. The second part, which explained the nature and principles of syntax, appeared in 1731. He also wrote a third part on prosody, which is said to be more copious and correct than any other publication on this subject. When urged to give it to the public, he said dryly, “The age has too little taste, the sale would not pay the expense.” Of this work he published an abridgment,

(A) It has long been an object of curiosity to ascertain the time at which the art of printing was introduced into Scotland. Mr Robertson, the keeper of the records, has lately discovered a patent of King James IV., which renders it certain that a printing-press was first established at Edinburgh during the year 1507, 30 years after Caxton had brought it into England. See Painting, p. 522.
Ruddiman next engaged in the management of a newspaper, an employment for which his genius and industry seemed to render him well qualified. But those who should expect either much information or amusement from this publication, would perhaps be greatly disappointed. The newspaper which he conducted was the Caledonian Mercury, and was established in 1720 by William Rolland a lawyer. Ruddiman acted only in the capacity of printer for five years; but upon the death of Mr Rolland in 1729, the property was transferred to him, or to his brother Walter and him jointly. This paper continued in the family of Ruddiman till the year 1772, when it was sold by the trustees of his grandchild to Mr John Robertson.

The Caledonian Mercury was at first printed three times a week, on Monday, Tuesday, and Thursday, in a small 4to of four pages, with two columns in each page and 50 lines in each column; so that the whole paper contained only 400 lines. It now contains in itsfolio size 2480 lines.

Mr Ruddiman, after the death of Mr Spottefoode librarian, remained for some time in his former station; but was at length appointed keeper of the library, tho' without any increase of salary; and some years after Mr Goodal, the defender of Queen Mary, succeeded him in the office of sub-librarian.

The avowed application of Ruddiman, supported by such learning, was intituled to wealth, which now indeed flowed upon him in what was at that period deemed great abundance. On the 11th of October 1735, it appeared from an exact statement of his affairs, that he was worth £1882; 5s; 2d Sterling; and on the 20th of May, the ensuing year, his wealth had increased to £1985; 6s; 3d Sterling. In 1740 he valued his effects at £24; 14s; 9d Sterling.

In 1737 the schoolmasters and teachers in Edinburgh formed themselves into a society, in order to establish a fund for the support of their wives and children. Of this scheme Ruddiman was an active promoter, and was chosen treasurer. Perhaps it was this association which in 1742 gave the idea to the Scots clergy of forming their widows fund.

In 1739 he published Selectus Diplomatum et Numismatum Scotia Theolaurae. This work was projected and begun by Anderson (hence called Anderson's Diplomata), but was finished by Ruddiman. The preface, which is an excellent commentary on Anderson's performance, was written by Ruddiman, and displays a greater extent of knowledge than any of his other productions.

As Ruddiman had imbibed from his father those political principles which attached him to the family of Stuarts, he probably did not remain an unconcerned spectator of the civil commotions which in 1745 agitated Scotland. He did not, however, take any active part in the rebellion. His principles he has been heard to say, induced him to be a quiet subject and a good citizen. He retired to the country during the summer of 1745: and while his fellow-citizens were spilling each other's blood, he was more happily engaged in writing Critical Observations on Burman's Commentaries on Lucan's Pharsalia. The Caledonian Mercury was in the mean time marked with a jealous eye. His son, who had for some time been the principal manager of that newspaper, having copied a paragraph which was reckoned seditious from an English paper, was imprisioned. The solicitation of his father procured his release: but it was too late; for the unhappy young man had contracted a distemper in the tolbooth of Edinburgh which brought him to his grave.

During the last fifteen years of his life Ruddiman was almost incessantly engaged in controversy. To this he was in some measure compelled by the violent attacks which some critics of the times had successively made upon his works. He was first called upon by Benfon, auditor in the exchequer, to determine the comparative merit of Buchanan and Johnfon as poets. He gave a decided preference to Buchanan in purity, purity, and variety of style; but, like a candid critic, allowed Johnfon to be superior in the harmony of his numbers. His next antagonist was Logan, one of the ministers of Edinburgh, a weak illiterate man, but an obstinate polemic. The subject of contest was, whether the crown of Scotland was strictly hereditary, and whether the birth of Robert III. was legitimate? Ruddiman maintained the affirmative in both points, and certainly far surpassed his antagonist in the powers of reasoning. He proved the legitimacy of Robert by the public records of the kingdom with a force of argument which admits of no reply; but in discussing the first question (by which he was led to consider the contest between Bruce and Balliol) he was not so successful: for there are many instances in the history of Scotland in which the brother succeeded to the crown in preference to the son. He showed, however, that the Scotch crown was at no period properly elective; and that, according to the old licentious constitution of the kingdom, the right of Bruce, who was the nearest in blood to the royal stock, was preferable to the claim of Balliol though descended from the eldest daughter.

But the labours of Ruddiman did not end when the pen dropped from the feeble hand of Logan. He was soon called upon to repel the attacks of Love, schoolmaster of Dalkeith, who maintained, in opposition to him, that Buchanan had neither repented of his treatise, nor had been guilty of ingratitude to that prince. That Buchanan ever repented there is reason to doubt. Whether he was guilty of ingratitude let the unbiased determine, when they are assured by authentic records that Mary conferred on him a pension for life of 500 pound Scots.

When Ruddiman had arrived at his eightieth year, and was almost blind, he was assailed by James Man, master of an hospital at Aberdeen, with a degree of rancour and virulence, united with some learning and ability, which must have touched him in a sensible manner, but was alarmed his fears for his reputation after his decease. He was called a finned pedant, a furious calumniator, and a corrupter of Buchanan's works. The venerable old man again put on his armour, entered the lists, and gained a complete victory. Man, with all his scuteneus, could only point out twenty errors in two folio volumes. Some of these were typographical, some trifling, and some doubtful. Ruddiman, with much pleasantrv, drew up against Man an account of 469 errors, consisting of 14 articles, of which two or three may be produced as a specimen. 1. Falsehoods and prevarications, 20. 2. Aburdities, 69. 3. Passages from clas
Rudesheim, a rich village of the Rhinegau, situated about five miles from the city of Mentz, contains about 2500 inhabitants. The wine of this place is looked upon as without comparison the best of the Rhinegau, and consequently of all Germany. Baron Riebeck says, he found it much more fiery than that of Hochheim; but that for pleasantness of taste there is no comparison between them. The best Rudesheimer, like the best Hochheimer, sells upon the spot for three guilders the bottle. "You can (says our author) have no tolerable wine here for one guilder, nor any very good for two; at least I should prefer the worst Burgundy I ever tasted to any Rudesheimer I met with either here or at Mentz for these prices. Indeed the wine of our beet (a rich ecclesiastic) was far better than any we could get at the inn. It stands to reason, that the same vintage furnishes grapes of very different degrees of goodness; but besides this, it is in the Rhinegau as everywhere else. The best wines are generally sent abroad by the poor and middling inhabitants, and the worst kept for internal consumption; for the expense of the carriage being the same in both cases, strangers had much rather pay a double price for the good than have the bad. It is only rich people, such as our host was, who can afford to keep the produce of their land for their own drinking. Upon this principle, I have eaten much better Swiss cheeses out of Switzerland than in it, and have drank much better Rhenish in the inns of the northern parts of Germany than in the country where the wine grows. The portion of the country also contributes to render the wine dearer that it would otherwise be. As the best wine grows in its more northern parts, the easy transport by the Rhine to Holland, and all parts of the world, raises its price above its real value. The place where the flower of the Rudesheim wine grows is precisely the neck of the land, formed by the winding of the Rhine to the north after it has run to the westward from Mentz hither. This neck, which is a rock almost perpendicular, enjoys the first rays of the rising and the last of the setting sun. It is divided into small low terraces, which are carried up to the utmost top of the hill like steep stairs; these are guarded by small walls and earthen mounds, which are often washed away by the rain. The first vine was brought hither from France, and they still call the best grape the Orleans. They plant the vine flocks very low, scarce ever more than four or five feet high. This way of planting the vine is favourable to the production of a great deal of wine, but not to its goodness, as the phlegmatic and harsh parts of it would certainly evaporate more, if the sap was refined through higher and more numerous canals. This is undoubtedly the reason why every kind of Rhenish has something in it that is harsh, four, and watery. The harvest of the best vineyards, which are the lower ones, in the abovementioned neck of land, is often bought before-hand, at the advanced price of some ducats, by Dutch and other merchants. It must be a very rich flock to yield above four measures of wine.—

You may easily imagine, that the cultivation of vineyards must be very expensive in this country, as the dung, which is extremely dear, must be carried up to the top of the mountains on the peasants' shoulders."

Rudiments, the first principles or grounds of any art or science, called also the elements thereof.

Rue, in botany. Se Ruta.

Rue (Charles de la), a French orator and poet, was born at Paris in 1643. He was educated at the college of the Jesuits, where he afterwards became a professor of humanity and rhetoric. At an early age his talent for poetry disclosed itself. In 1667, when he was only 24 years old, he composed a Latin poem on the conquests of Louis XIV. which was so much esteemed by the

(a) The following character of Love was published in the Caledonian Mercury of the 24th of September 1750. "On Thursday morning died at Dalkeith, after a lingering illness, in the 57th year of his age, Mr. John Love, rector of the grammar-school there; who, for his uncommon knowledge in classical learning, his indefatigable diligence, and strictness of discipline without severity, was justly accounted one of the most sufficient masters in this country." This character is doubtless just; though Love is now known to have been the schoolmaster patronized by Smollett in the beginning of his Roderick Random.
ruella, in botany: A genus of the angiosperm order, belonging to the didynamia class of plants; and in the natural method ranking under the 40th order, Perforata. The calyx is quinquenervate; the corolla subcampanulate; the stamina approaching together in pairs; the ovule springing slender by means of its elastic segments.

Ruellia. French, presented regularly referred original, that the author was received into the favour of that monarch, and ever after treated

De la Rue, anxious to preach the gospel to the Canadians, requested leave of absence from his superiors; but having defined him for the pulpit, they refused to comply with his request. Accordingly he commenced preacher, and became one of the most eminent orators of his age. In his discourses he would probably have been too lavish of his wit, if he had not been cautioned against it by a judicious courtier. "Continue (said he) to preach as you do. We will hear you with pleasure as long as you reason with us; but avoid wit. We value the wit contained in two verses of a song more than all that is contained in most of the sermons in Lent."

Respecting the delivery of sermons, he entertained an opinion quite opposite to the established practice of his countrymen. In France it was customary not to read sermons from the pulpit, but to recite them from memory. This he considered as a laborious task not compensated by any advantages. On the contrary, he was of opinion that reading sermons was preferable. The preacher, with his discourse before him, could read it with ease, free from that timidity and embarrassment which frequently attends the act of recollection; and he would save a considerable time which is usually spent in committing it to memory. In these sentiments many will not be disposed to acquiesce; but, without pretending to determine the question, it may be asserted, that a sermon, whether read or recited, if spoken in a serious manner, and with proper inflections and tones of voice, will produce all the effects for which a sermon is calculated.

De la Rue died at Paris on the 27th of May 1725, at the age of 82.

He was as amiable in society as he was venerable in the pulpit. His conversation was pleasant and instructive. His taste and knowledge enabled him to converse with ease, and to express himself with propriety on every subject. He charmed his superiors by his wit, and his inferiors by his affability. Though living amidst the hustle of the world, he was always prepared for the solicitude of the cloister and the retreat of the cloister. In the pulpit he poured forth the finest effusions of eloquence in the most animated and impressive manner. He published Panegyrics, Funeral Orations, and Sermons. His best sermon is that entitled Des Causes Publiques, and his most admired funeral oration was composed on the Prince of Luxemburg. There are also tragedies of his writing, both in Latin and French, which were approved by Corneille. He was one of those whose published editions of the classics for the use of the Dauphin Virgil, which fell to his share, was published with notes, and a Life of the Poet, in 1675, 4to, and is a valuable and useful edition.

Ruffhead (Dr. Owen), was the son of his Majesty's baker, in Piccadilly; who buying a lottery ticket for him in his infancy, which happened to be drawn a prize of 500l. this sum was applied to educate him for the law. He accordingly entered in the Middle Temple; and seconded so well the views of his father, that he became a good scholar and an acute barrister. While he was waiting for opportunities to distinguish himself in his profession, he wrote a variety of pamphlets on temporary politics; and was afterwards distinguished by his accurate edition of The Statutes at Large, in 4to. He now obtained good business, though more as a chamber-counsellor in framing bills for parliament than as a pleader; but his close application to study, with the variety of works he engaged in as an author, so impaired his constitution, that after the last exertion of his abilities to defend the conduct of administration toward Mr. Wilkes, by a pamphlet intitled, "The Cause of the late election for the county of Middlesex confidered," he was prevented from receiving the reward of a place in the Treasury, by dying in 1769, at about 46 years of age. Some time before his death, his noble patron Warburton engaged him to write his long promised Life of Alexander Pope; which, however, when executed, was very far from giving general satisfaction. The author attributed his ill success to the deficiency of his materials; while the public seemed rather to be of opinion that, as a lawyer, he ventured beyond his proper line, when he assumed the task of a critic in poetry.

Ruffling, or ruffling, a beat on the drum. Lieutenant-generals have three ruffles, major-generals two, brigadiers one, and governors one, as they pass by the regiment, guard, &c.

Rufinus was born about the middle of the fourth century at Concordia, an inconsiderable town in Italy. At first he applied himself to the belles lettres, and particularly to the study of eloquence. To accomplish himself in this elegant art, he removed to Aquileia, a town at that time so celebrated that it was called a second Rome. Having made himself acquainted with the polite literature of the age, he withdrew into a monastery, where he devoted himself to the study of theology. While thus occupied, St. Jerome happened to pass through Aquileia. Rufinus formed an intimate friendship with him; but to his inexpressible grief was soon deprived of the company of his new friend, who continued his travels through France and Germany, and then set out for the east. Rufinus, unable to bear his absence, resolved to follow him. Accordingly he embarked for Egypt; and having visited the hermits who inhabit the deserts of that country, he repaired to Alexandria to hear the renowned Didymus. Here he was gratified with a visit of St. Melania, of whose virtue and charity he had heard much. The sanctity of his manners soon obtained the confidence of St. Melania, which continued without interruption during their residence in the east, a period of 30 years. The Arians, who swayed the ecclesiastical see in the reign of Valens, persecuted Rufinus with great cruelty. They threw him into a dungeon, loaded him with chains, and after almost flattering him to death, banished him to the deserts of Palestine. From this exile he was relieved by the pietuious aid of St. Melania, who employed her wealth in ransomng the
confessors who had been condemned to prison or banishment.

St Jerome, supposing that Rufinus would immediately proceed to Jerusalem, wrote to one of his friends there, congratulating him on the prospect of his illustrious visitor. To Jerusalem he went, and having built a monastery on the Mount of Olives, he there assembled a great number of hermits, whom he animated to virtue by his exhortations. He converted many to the Christian faith, and persuaded more than 400 hermits who had taken part in the schism of Antioch to return to the church. He prevailed on many Macedonians and Arians to renounce their errors.

His attachment to the opinions of Origen got him at variance with St Jerome, who, being of a temper peculiarly irritable, not only retracted all the praises which he had lavished upon him, but loaded him with severe reproaches. Their disputes, which were carried to a very indecent height, tended to injure Christianity in the eyes of the weak. Theophylus, their mutual friend, settled their differences; but the reconciliation was of short continuance. Rufinus having published a translation of the principles of Origen at Rome, was summoned to appear before Pope Anastasius. But he made no apology for not appearing, and sent a vindication of his work, in which he attempted to prove that certain errors, of which Origen had been accused, were perfectly consistent with the opinions of the orthodox. St Jerome attacked Rufinus's translation. Rufinus composèd an eloquent reply, in which he declared that he was only the translator of Origen, and did not consider himself bound to sanction all his errors. Most ecclesiastical historians say that Rufinus was excommunicated by Pope Anastasius; but for this no good evidence has been brought. In 407, he returned to Rome; but the year after, that city being threatened by Alaric, he retired to Sicily, where he died in 410.

His works are,

1. A Translation of Josephus;
2. A Translation of several works of Origen;
3. A Latin Version of Ten Discourses of Gregory Nazianzen, and Eight of Basil's;
4. Chromatius of Aquileia prevailed on him to undertake a Translation of the Ecclesiastical History of Eusebius, which engaged him almost ten years. He made many additions to the body of the work, and continued the history from the 20th year of Constantine to the death of Theodosius the Great. Many parts of this work are negligently written, many things are recorded as facts without any authority but common report, and many things of great importance are entirely omitted.
5. A Vindication of Origen.
6. Two Apologies addressed to St Jerome.
7. Commentaries on the prophets Hosea, Joel, and Amos.

RUGEN, an island in the Baltic Sea, on the coast of Pomerania, over against Stralsund, about 25 miles in length and 15 in breadth, with the title of a principality. It is strong both by art and nature, abounds in corn and cattle, and belongs to Sweden. The chief town is Bergen. E. Long. 14. 30. N. Lat. 54. 32.

RUINS, a term particularly used for magnificent buildings fallen into decay by length of time, and whereof there only remains a confused heap of materials. Such are the ruins of the tower of Babel, of the tower of Belus, two days journey from Bagdad, in Syria, on the banks of the Euphrates; which are now no more than a heap of bricks, cemented with Bitumen, and whereof we only perceive the plan to have been square. Such also are the ruins of a famous temple, or palace, near Schiras, in Persia, which the antiquaries will have to have been built by Ahuferus, and which the Persians now call Tehelminar, or Chelemimar; q. d. the 40 columns; because there are so many columns remaining pretty entire, with the traces of others; a great quantity of baso-relievo, and unknown characters, sufficient to shew the magnificence of the antique architecture. The most remarkable ruins now existing of whole cities are those of Palmyra and Persepolis of the grandeur of which some idea may be formed from the views given in the plates referred to from these articles, to which may be added those of Herculanum and Pompeii. The magnificent ruins still remaining in Rome, Athens, &c. of particular edifices, as temples, palaces, amphitheatres, aqueducts, baths, &c. it were endless to enumerate, and beyond the plan of this work to represent.

RUIZA, in Botany: A genus of the polyandria order, belonging to the monodelphias class of plants; and in the natural method ranking under the 37th order, Columnfera. The calyx is double; the external are triphyllous; the internal are parted into five. The corolla consists of five petals, inclining to the right hand side, and adhering to the flamine, which are from 30 to 40. It has ten filyi, and as many capsule. There are compressed and membranous. In each capsule are two seeds. There are four species, viz. 1. Cordalia; 2. Lobata; 3. Palmata; 4. Laxifima, all natives of Asia and the Cape of Good Hope.

RULE, in matters of Literature, a maxim, canon, or precept, to be observed in any art or science.

RULE, in a monastic sense, a system of laws or regulations, whereby religious houses are governed, and which the religious make a vow, at their entrance, to observe. Such are the rules of the Augustins, Benedictins, Carthusians, Francisca, &c. See Augustins, &c.

RULES of Court, in law, are certain orders made from time to time in the courts of law, which attorneys are bound to observe, in order to avoid confusion; and both the plaintiff and defendant are at their peril also bound to pay obedience to rules made in court relating to the cause depending between them.

It is to be observed, that no court will make a rule for any thing that may be done in the ordinary course; and that if a rule be made, grounded upon an affidavit, the other side may move the court against it, in order to vacate the same, and thereupon shall bring into court a copy of the affidavit and rule. On the breach and contempt of a rule of court an attachment lies; but it is not granted for disobedience to a rule, when the party has not been personally served; nor for disobeying a rule made by a judge in his chamber, which is not of force to ground a motion upon, unless the same be entered.

A rule of court is granted every day the courts at Westminster sit, to prisoners of the King's-bench or Fleet prions, to go at large about their private affairs.

RULES of Three. See Arithmetic and Proportion.

Rule, or Ruler, an instrument of wood or metal, with several lines delineated on it; of great use in prac-
The aquaticus, or water-dock, grows on the banks of rivers and streams. It is a species of Rumex, a genus of plants characterized by their triangular or lance-shaped leaves, and is also known as Dock.

Rum, according to Dr Shaw, differs from simple sugar-spirit in that it contains more of the natural flavour or essentioil of the sugar-cane; a great deal of raw juice and parts of the cane itself being often fermented in the liquor or solution of which the rum is prepared. The untinted or oily flavour of rum is often supposed to proceed from the large quantity of fat and its inflammable part, examining the phlegm both by fire and athinmmable part, examining the phlegm both by fire and by setting fire to a little of it; and, when it has burnt away all the inflammable part, the patientia, commonly called patience rhubarb.

The method of making rum is this: When a sufficient flock of the materials are got together, they add water to them, and ferment them in the common method, though the fermentation is always carried on very slowly at first, because at the beginning of the season for making rum in the islands, they want yeast or some other ferment to make it work; but by degrees, after this, they procure a sufficient quantity of the ferment, which rises up as a head to the liquor in the operation; and thus they are able afterwards to ferment and make their rum with a great deal of expedition, and in large quantities.

When the wash is fully fermented, or to a due degree of acidity, the distillation is carried on in the common way, and the spirit is made up proof; though sometimes it is reduced to a much greater strength, nearly approaching to that of alcohol of spirit of wine; and it is then called double-distilled rum. It might be easy to rectify the spirit, and bring it to much greater purity than we usually find it to be of: for it brings over in the distillation a very large quantity of the oil; and this is often so disagreeable, that the rum must be suffered to lie by a long time to mellow before it can be used; whereas, if well rectified, it would grow mellow much sooner, and would have a much less potent flavour.

The best spirit to keep rum in, both for exportation and other uses, is double distillation of alcohol or rectified spirit. This manner it would be transported in one half the bulk it usually is, and might be let down to the common proof-strength with water when necessary; for the common use of making punch, it would likewise serve much better in the state of alcohol: as the taint would be cleaner, and the strength might always be regulated to a much greater exactness than in the ordinary way.

The only use to which it would not so well serve in this state, would be the common practice of adulteration among our distillers; for when they want to mix a large portion of cheaper spirit with the rum, their busines is to have it of the proof-strength, and as full of the flavouring oil as they can, that it may drowp the flavour of the spirits they mix with it, and extend its own. If the business of rectifying rum was more nicely managed, it seems a very practicable scheme to throw out so much of the oil, as to have it in the fine distillation of a clear spirit, but lightly impregnated with it: in this case it would very nearly resemble aranc, as is proved by the mixing a very small quantity of it with a tattefles spirit, in which case the whole bears a very near resemblance to arace in flavour.

Rum is usually very much adulterated in Britain; some are so bare-faced as to do it with malt-spirit; but when it is done with molasses spirit, the tases of both are so nearly allied, that it is not easily discovered. The best method of judging of it is by setting fire to a little of it; and, when it has burnt away all the inflammable part, examining the phlegm both by the taint and smell.

Rum is a considerable island, one of the Hebrides, or rather one continued rock, of nearly 50 miles in circumference. It is the property of Mr Maclean of Coll; contains 300 inhabitants; grazes cattle and sheep; pays 200L rent annually: but has neither kelp, freestone, nor lime.

RUMELIA, in geography, the same with ancient Greece; now a part of Turkey in Europe.

RUMEN, the paunch, or first stomach of such animals as chew the cud; thence called Ruminant Animals. See Comparative Anatomy, Part 2.

RUMEX, dock, in botany; A genus of the trigynia order, belonging to the hortus clas of plants; and in the natural method ranking under the 12th order Holarctae. The calyx is triphyllous; there are three connivent petals, and one triquetrous seed. There are several species, of which the most remarkable are:

1. The patientia, commonly called patience rhubarb. This was formerly much more cultivated in the British gardens than at present; the roots of this have been generally used for the monk's rhubarb, and has even been thought to be the true kind; but others suppose the second sort should be used as such. The root is large, and divides into many thick fibres; their outer cover is brown, but they are yellow within, with some reddish veins; the leaves are broad, long, and acute-pointed; their footstalks are of a reddish colour; the flalsk rise fix or seven feet high, and divided towards the top into several erect branches garnished with a few narrow leaves terminating with loose spikes of large flaminous flowers. These appear in June, and are succeeded by pretty large three-cornered seeds, whose coverings are entire, which ripen in autumn.

2. The alpinus, or monk's rhubarb, grows naturally on the Alps, but has long been cultivated in the British gardens. This hath large roots which spread and multiply by their offsets: they are shorter and thicker than the former, are of a very dark brown on the outside, and yellow within. The leaves are of the round heart-shape, standing upon long footstalks. The flalsk rise from two to three feet high; they are thick, and have a few small roundish leaves on the lower part; but the upper part is closely garnished with spikes of white flowers standing erect close to the flalsks. These appear in the latter end of May and are succeeded by large triangular seeds which ripen in August.

3. The aquaticus, or water-dock, grows naturally in ponds, ditches, and standing waters, in many parts of Britain. It is supposed to be the herb Britannica of the ancients. It hath large roots which strike deep into the loofe mud, sending out leaves which are above two feet long. The flalsk rise five or six feet high, when the plants grow in water, but in dry land seldom more than three: these are garnished with narrow leaves,
leaves among the spikes of flowers to the top. The flowers fland upon slender footstalks, which are reflexed; they are of an herbaceous colour, appear in June, and the seeds ripen in autumn.

4. The acorus, or sharp-pointed dock, (the oxypathum of the shops); but the markets are supplied with roots of the common docks which are indifferently gathered by those who collect them in the fields, where the kind commonly called butter-dock (from its leaves being used to wrap up butter) is much more common than this. The roots of this are flender, and run downright, sending out a few small fibres; the stalks rise about two feet high, garnished at bottom with leaves four inches long, and one and a half broad in the middle. They are rounded at their base, where they are slightly indent, but end in acute points. From the joints of the stalks come out alternately long footstalks, which sustain the spikes of flowers, which grow in small whorls round the stalks, at about an inch distant.

These plants are but seldom cultivated; and so easily multiply by their numerous seeds, that they soon become troublesome weeds where they once get an entrance.

RUMINANT, in natural history, is applied to an animal which chews over again what it has eat before; which is popularly called chewing the cud. Peyer, in a treatise De Ruminantium et Ruminatione, shows that there are some animals which really ruminant; as oxen, sheep, deer, goats, camels, hares, and squirrels: and that there are others which only appear to do so, as moles, crickets, bees, beetles, crabs, mullets, &c. The latter class, he observs, have their stomachs compos'd of mucular fibres, by which the food is ground up and down as in those which really ruminant. Mr Ray observs, that ruminants are all four-footed, hairy, and viviparous; some with hollow and perpetual horns, others with deciduous ones.

RUMP OF THE SACRIFICES, Moses had ordained, that the rump and fat of the fheep that were offered for peace-offering should be put upon the fire of the altar (Lev. vii. 1. viii. 3. vii. 25. 15. 19.). The rump was esteemed the most delicate part of the animal.

RUMPHIA, in botany: A genus of the monogy-nia order, belonging to the triandra class of plants; and in the natural method ranking with those of which the order is doubtful. The calyx is trid; the petals three; the fruit a trilocular plum.

RUNDEL, or RUNLET, a small vessel, containing an uncertain quantity of any liquor, from 3 to 20 gallons.

RUNGS, in a ship, the same with the floor or ground timbers; being the timbers which constitute her floor; and are bolted to the keel, whose ends are rung-heads.

RUN-HEADS, in a ship, are made a little bending to direct the sweep or mold of the futtocks and navel-timbers; for here the lines begin which make the compass and bearing of the ship.

RUNIC, a term applied to the language and letters of the ancient Goths, Danes, and other northern nations. See Alphabet.

RUNNER, in the sea-language, a rope belonging to the gaffes, and the two bolt-tackles. It is reeved in a single block joined to the end of a pendant; it has at one end a hook to hitch into anything; and, at the other, a double block, into which is reeved the fall of the tackle, or the garnet, by which means it purchases more than the tackle would without it.

RUNNET, or RENNET, is the coagulated milk found in the stomachs of sucking quadrupeds, which as yet have received no other nourishment than their mother’s milk. In ruminating animals, which have several stomachs, it is generally found in the last, though sometimes in the next to it. If the runnet is dried in the sun, and then kept close, it may be preserved in perfection for years. Not only the runnet itself, but also the stomach in which it is found, curdles milk without any previous preparation. But the common method is, to take the inner membrane of a calf’s stomach, to clean it well, to salt and hang it up in brown paper; when this is used the salt is washed off, then it is macerated in a little water during the night, and in the morning the infusion is poured into the milk to curdle it. But see more particularly the article CHEESE for a proper receipt to make runnet, upon which the quality of the cheese greatly depends. The medicinal qualities of runnet are its acrimony, its refolvent power, and its usefulness in fevers from food of difficult digestion.

RUPEE, a silver coin current in the East Indies, worth about 2s. 6d. sterl.ing.

RUPERT, or ROBERT. See Robert.

RUPERT, prince palatine of the Rhine, &c. son of Frederic prince elector palatine of the Rhine and Elizabeth daughter to king James I. of England, was born in 1619. He gave proofs of his bravery at the age of 13; and in 1642 came over into England, and offered his service to king Charles I. his uncle, who gave him a command in his army. At Edgehill he charged with incredible bravery, and made a great slaughter of the parliamentarians. In 1644 he seized the town of Cirencester; obliged the governor of Litchfield to surrender; and having joined his brother prince Maurice, reduced Bristol in three days, and passed to the relief of Newark. In 1644 he marched to relieve York, where he gave the parliamentarians battle, and entirely defeated their right wing, but Cromwell charged the marquis of Newcastle with such an irresistible force, that prince Rupert was entirely defeated. After this the prince put himself into Bristol, which surrendered to Fairfax after a gallant resistance. The king was so enraged at the loss of this city, to contrary to his expectation, that he recalled all prince Rupert’s commissions, and sent him a pass to go out of the kingdom. In 1648 he went to France, was highly complimented by that court, and kindly received by king Charles II. who sojourned there for the time. Afterward he was constituted admiral of the king’s navy; infused the Dutch ships, many of which he took; and having engaged with De Ruyter, obliged him to fly. He died in 1682, and was interred in king Henry VII’s chapel, Westminster, with great magnificence. Mr Granger observes, that he possessed in a high degree that kind of courage which is better in an attack than a defence; and is less adapted to the land service than that of the sea, where precipitate valour is in its element.

He seldom engaged but he gained the advantage, which
he generally left by pursuing it too far. He was better qualified to form a citadel, or even to mount a breach, than patiently to sustain a siege; and would have furnished an excellent hand to a general of a cooler head. This prince is celebrated for the invention of prints in mezzotinto, of which he is said to have taken the hint from a tailor's scraping his rusty needles. The first print of this kind ever published was done by his highness, and may be seen in the first edition of Evelyn's Sculptura. The secret is said to have been soon after discovered by Sherwin an engraver, who made use of a loaded file for laying the ground. The prince, upon seeing one of his prints, suspected that his servant who had lent him his tool, which was a channelled roller; but upon receiving full satisfaction to the contrary, he made him a present of it. The roller was afterwards named after Linlithgow's scarping his metal, and was used instead of it. He also invented a metal called by his name, in which guns were cast; and contrived an excellent method of boring them, for which purpose a water-mill was erected at Hackney-marsh, to the great detriment of the undertaker, as the secret died with the inventor.

Rupin or Rupin, a town of Germany, in the marquisate of Brandenburg, and capital of a duchy of the same name. It is divided into the Old and the New. The Old was nothing but an ancient castle, very well furnished, the late king of Prussia, before his father's death, residing there. New Rupin is seated on a lake, and become a considerable place of trade, with a manufacture of cloth. It is also noted for brewers. E. Long. 13° 25'. N. Lat. 53° 3'.

Ruppiua, in botany: A genus of the tetragnia order, belonging to the tetrandra class of plants; and in the natural method ranking under the 11th order, Tetranda. There is neither calyx nor corolla; but four pedicellate seeds.

Ruscus,刺- Holly, or Butcher's Broom: A genus of the syngenia order, belonging to the dicoty class of plants; and in the natural method ranking under the 11th order, Syngenia. The male calyx is hexaphyllous; there is no corolla; the stamens are central, ovate, and perforated at the top. The female calyx, corolla, and stamens, are the same as in the male; there is one style, with a trilocular two-seeded berry.

The most remarkable species is the aculeatus, or common butcher's broom, common in the woods in many parts of England. It has roots composed of many thick fibres which twine about each other; from which arise several stiff green flanks about three feet high, fending out from their sides several short branches, garnished with fluff, oval, heart-shaped leaves, placed alternately on every part of the flock, ending with sharp prickly points. The flowers are produced in the middle, on the upper side of the leaves; they are small, and cut into six parts; of a purple colour, fitting close to the midrib. They appear in June; and the male flowers are succeeded by berries as large as cherries, of a sweetish taint, which ripen in winter; when they are of a beautiful red colour. As this plant grows wild in most parts of England, it is rarely admitted into gardens; but if some of the roots are planted under tall trees in large plantations, they will spread into large clumps; and as they retain their leaves in winter, at that season they will have a good effect. The seeds of this plant generally lie a year in the ground before they germinate; and the plants so raised are long before they arrive at a size big enough to make any figure, and therefore it is much better to transplant the roots.—The root of this plant is accounted aperient, and in this intention is sometimes made an ingredient in apomys and diet-drinks, for opening flight obstructions of the v Afterwards Sculptrum, or the caterpillar, or even to mount a for a time, he used the univercity of Oxford for some time, he removed to Lincoln's Inn; but the study of law not fitting his genius, he soon deserted it, in order to seek a situation where he might more easily gratify his love for political information. He frequented the meetings of parliament, and wrote down the speeches both of the king and members. During the space of 11 years, from 1630 to 1640, when no parliament was held, he was an attentive observer of the great transactings of state in the flar-chamber, the court of honour, and exchequer chamber, when all the judges of England assembled there on cales of great emergency. Nor did he neglect to observe with a watchful eye those events which happened at a distance from the capital. He visited the camp at Berwick, was present at the battle of Newborn, at the treaty of Rippon, and at the great council of York.

In 1640 he was appointed asfistant to Henry Ellyngton, clerk to the house of commons, and thus had the best opportunities of being acquainted with their debates and proceedings. The commons considered him as a person worthy of confidence. In particular, they trusted him with carrying their messages to the king while he remained at York. And when the parliament created Sir Thomas Fairfax their general, Ruthworth was appointed his secretary, and discharged the office much to the advantage of his master. When Fairfax resigned his commission, his secretary returned to Lincoln's Inn, and was soon after (in 1651-2) chosen one of the committee that was appointed to deliberate concerning the propriety and means of altering or new-modelling the common law. He was elected one of the representatives for Berwick upon Tweed to the parliament which Richard Cromwell assembled in 1658, and was re-elected by the same town to the parliament which restored Charles II. to the crown.

After the Restoration, he delivered to the king several
RUSSIA, a very large and powerful kingdom, partly in Europe and partly in Asia, is bounded on the north by the Northern Ocean, or Frozen Sea; on the east it is washed by the Eastern Ocean, and is divided from America by Behring's (formerly Anian) Straits, which are about 75 versts (a) wide. From thence, towards the south, it extends along the chain of the Aleoutkie islands, which approach the north-west coast of America; and from Kamtchatka, towards the south-west, it extends, by a chain of other islands, called Kourilskie islands, as far as Japan; on the south it borders on the Black Sea, on the nations which dwell at the foot of the Caucasian mountains, on a part of Persia, the Caspian sea, the hordes of Kirghiasacki, on Zungoria, Chinefes Mungalia and Daouria (b); and on the west, on the Danish and Swedish Lapland, the Baltic Sea, Courland, Livonia, Lithuania, Poland, and Turkey in Europe.

Russia occupies more than a seventh part of the known continent, and nearly the 26th part of the whole globe. Its greatest extent from west to east, viz. from the 39° to 207° degree of longitude, is 168 degrees; and if the islands of the Eastern Ocean be included, it will then be 185; so that the continental length of Russia, viz. from Riga to Tchoukotskiy Nofs, which is the patternmost promontory, will constitute about 8500 versts. The greatest extent of this empire from north to south, that is, from the 78th to 50° degree of latitude, is 577 degrees. Hence the breadth of Russia, that is, from the Cape Taymour, which is the north-eastern promontory, to Kakhta, will constitute about 3200 versts.

The greater part of this empire lies in the temperate zone, and a part of it, viz. that which is beyond the 66° degree of latitude, lies in the frigid zone; and the whole surface contains above 2,150,000 square versts. There therefore is not at present, and never has been in any period, an empire, the extent of which could be compared to that of Russia. The length and breadth of this immense empire, taken in a straight line, may be thus discovered. Its furthermost point or spot on the north is the Taymour Cape, which is the most north-eastern promontory in the government of Tobolsk, lying in the 78th degree of latitude; its furthermost point on the south is the mouth of the river Soula, falling into the Caspian Sea in the government of Caucasus, lying in the 43d degree of latitude; its westernmost point is the island of Oezel in the government of Rigas, in the 39° degree of longitude; and the furthermost point of it on the east is the Tchoukotskiy Nofs, which is the most eastern cape in the government of Irkoutsk, lying in the 207° degree of longitude.

In ancient times Russia was inhabited by various nations; such as Huns, Scythians, Sarmatians, Massa inhabites, Scelovians, Cimbri, &c. of whom an account is given under the various detached articles in this work. The origin of the Russians themselves, though not prior to the ninth century, is still covered with almost impenetrable obscurity; partly owing to the ignorance and barbarity of the people, and partly to the

---

(a) Versts is the usual measure of roads in Russia, 1166 yards and two feet.
(b) Daouria is that extent of land which is traversed by the river Amour. It is so called on account of the Daouris, its ancient inhabitants, who were a race of the Toungooi or Manjouiri.
According to several authors of credit, the Russians derived their origin from the Slav or Slavonian, corruptly called the Scævontians, who settled first along the banks of the Volga, and afterwards near the Danube, in the countries named Bulgaria and Hungary; but being driven from thence by the Romans (whom the Russians call Wolochers, or Wolstaners), they first removed to the river Boryfthenes, or Dnieper, then over ran Poland, and, as is reported, built the city of Kiev. Afterwards they extended their colonies farther north, to the rivers which run into the Imen lake, and laid the foundation of the city of Novgorod. The towns of Smol’nik and Tjernikow appear also to have been built by them, though the dates of these events cannot be ascertained. The most ancient inhabitants, not only of Russia, but all over Siberia, quite to the borders of China, are called Tjuddi; for professor Muller, on inquiring in those parts by whom the ancient buildings and sepulchral monuments he saw there, were erected, was everywhere answered, that they were the works of the Tjuddi, who in ancient times had lived in that country.

In the ninth century, the Scandinavians, that is, the Danes, Norwegians, and Swedes, emigrated from the north, and, crossing the Baltic, went to seek habitations in Russia. They first subdued the Courlanders, Livonians, and Ethelians; and, extending their conquests farther, they exacted tribute from the Novgorodians, settled kings over them, and traded as far as Kiow, and even to Greece. These new invaders were called Waregers; which, according to professor Muller, signifies "sea-faring people" or, if derived from the old northern word war, it signifies "warlike men." To these Waregers the name of Ruffia, or Rusians, is thought by the most eminent authors to owe its origin; but the etymology of the word itself is entirely uncertain.

In the dark ages of which we are speaking, it is pretty certain that Russia was divided among a great number of petty princes, who made war upon each other with the ferocity and cruelty of wild beasts; so that the whole country was reduced to the utmost misery; when Goltomiel, a chief of the Novgorodians, pitying the unhappy fate of his countrymen, and seeing no other method of remedying their calamities, advised them to offer the government of their country to the Waregers. The proposal was readily accepted, and three princes of great abilities and valour were sent to govern them; namely, Ruric, Sicinus, and Truwor, generally supposed to have been brothers. The first took up his residence at Ladoga, in the principality of Great Novgorod; the second at Bielo Oiero, or the White Lake; and the third kept his court at Ibforsk, or, according to others, at a small town, then called Tver, in the principality of Pleskow. The three brothers reigned amicably, and made considerable additions to their dominions; all of which at length devolved to Rurik by the death of Sicinus and Truwor; but what the conquests of the two brothers were, we have no records to inform us of.

Rurik, to his hon--ur, became zealous for the strict Ruric the administration of justice; and instituted a command to all his fenate the body those princes who possessed territories under him, to exercise the same in an exact and uniform manner. To this end, it was necessary there should be general laws. And this necessarily leads us to conjecture, that letters were not entirely unknown in his dominions.

The Russian empire continued to flourish till the end of the reign of Wolodomir, who ascended the throne in the year 976. Having settled the affairs of his empire in peace, he demanded in marriage the princess Anne, daughter to the Greek emperor Basilus Porphyrogenitus. His suit was granted, on condition that he should embrace Christianity. With this the Russian Christian-monarch complied; and that vast empire was henceforward considered as belonging to the patriarchate of Constantinople. Wolodomir received the name of Basilus on the day on which he was baptized; and, according to the Russian annals, 20,000 of his subjects, were baptized the same day. Michael Syra, or Cyril, a Greek, sent by Photius the patriarch of Constantinople, was accepted as metropolit of the whole country. At the same time, Wolodomir put away all his former wives and concubines, of whom he had upwards of 800, and by whom he had 12 sons, who were baptized on the same day with himself. The idols of paganism were now thrown down; churches and monasteries were erected, towns built, and the arts began to flourish. The Scævonian letters were now first introduced into Russia; and Wolodomir sent missionaries to convert the Bulgarians; but only three or four of their princes came to church and were baptized. These events happened in the year 987.

Wolodomir called the arts from Greece, cultivated them in the peaceable periods of his reign, and rewarded their professors with generosity, that he might dispel the clouds of ignorance which enveloped his country, call forth the genius of his countrymen, and render them happy. He also founded public schools, and enacted a law concerning the methods of instructing youth, and directing the conduct of the matters appointed to instruct them. He died in 1008, and, contrary to all rules of sound policy and prudence, divided his empire among his 12 sons. The consequence was, that they fell to making war and destroying one another as soon as their father was dead. Stanepolok, one of the brothers, having destroyed and feized upon the dominions of two others, was himself driven out by Jaritlaus, and obliged to fly to Boleslaus king of Poland. This brought on a dreadful war between the Poles and Russians, in which the former were victorious, and the latter lost a great part of their dominions, as has been related under the article Poland.

Jaritlaus finding himself unable to oppose the king of Poland, now turned his arms against the rest of his brothers, all of whom he dispossessed of their dominions, and feized them for himself. He next attacked the Coflocks, over whom he gained several advantages. After which he ventured once more to try his fortune with Boleslaus; but in this second expedition he was attended with worse success than before; being now reduced to the condition of a vassal and tributary to the

Rusi. [555] Rusi.

Rusi. at first divided into a number of petty kingdoms.
John, likewise surmamed Kalita, was then made czar. This John left three sons, John, Simon, and Andrew; and the eldest of these, commonly called Ivan Ivanovitz, was made czar, with the approbation of the Tartars, on whom he was dependent.

During these several reigns, which fill a space of upwards of 100 years, and which all historians have passed over for want of records concerning them, the miseries of a foreign yoke were aggravated by all the calamities of intestine discord and war; whilst the knights of Livonia, or brothers of the short-sword, as they are sometimes called, a kind of military order of religious, on one side, and the Poles on the other, catching at the opportunity, attacked Ruffia, and took several of its towns, and even some considerable countries. The Tartars and Ruffians, whose interests were in this case the same, often united to oppose their common enemies; but were generally crossed. The Livonians took Pletkow; and the Poles made themselves masters of Black Russia, the Ucraine, Podolia, and the city of Kiev. Calimir the Great, one of their kings, carried his conquests still farther. He affected his pretensions to a part of Russia, in right of his relation to Boleslaus duke of Halitz, who died without issue, and forcibly possessed himself of the duchies of Perzemylia, Halitz, and Luckow, and of the districts of Samock, Lubaczow, and Trebowla; all which countries he made a province of Poland.

The newly-conquered Ruffians were ill-disposed to break the government of the Poles; whose laws and customs were more contrary to their own than those of the Tartars had been. They joined the Jatter to rid themselves of the yoke; and assembled an army numerous enough to overwhelm all Poland, but dift糊涂 of valour and discipline. Calimir, un daunted by this deluge of barbarians, prefented himself at the head of a few troops on the borders of the Vifula, and obliged his enemies to retire.

Demetrius Ivanovitz, fon of Ivan Ivanovitz, who commanded in Moscow, made frequent efforts to rid himself of the gallung yoke. He defeated in several battles Maymay khan of the Tartars; and, when conqueror, refused to pay them any tribute, and assumed the title of great duke of Muscovy. But the oppressors of the north returned in greater numbers than before; my cur in and Demetrius, at length overpowered, after a struggle of three years, perished with his whole army, which, if we may credit historians, amounted to upwards of 240,000 men.

Bailius Demetriovitz revenged his father's death. He attacked his enemies, drove them out of his dominions, and conquered Bulgaria. He made an alliance with the Poles, whom he could not subdue; and eued to them a part of his country, on condition that they should help him to defend the reft against any new incursions of the Tartars. But this treaty was a weak barrier against ambition. The Ruffians found new enemies in their allies; and the Tartars soon returned.—Bailius Demetriovitz had a son who was called after his name, and to whom the crown ought naturally to have descended. But the father, suspecting his legitimacy, left it to his own brother Gregory, a mance of a severe and tyrannical disposition, and therefore hated by the people, who averted the son's right, and proclaimed him their sovereign. The Tartars took cognizance of
His cut of the neighbouring of the Poles, voluntarily rendered submitted to; what they had to say; Ruffia. John Bafilowitz I. retrieves the affairs of Russia. Marries a Greek prince, who excites him to make off the Tartar yoke.

14

In the midst of this general confusion, John Bafilowitz I., by his invincible spirit and refined policy, became both the conqueror and deliverer of his country, and laid the first foundation of its future grandeur. Oberving with indignation the narrow limits of his power at his accession to the throne, after the death of his father Bafilus the Blind, he began immediately to revolve within himself the means of enlarging his dominions. Marriage, though he had in reality no regard or inclination for women, seemed to him one of the best expedients he could begin with; and accordingly he demanded and obtained Maria, sister of Michael duke of Twir; whom he soon after deposed, under pretence of revenging the injuries done to his father, and added this duchy to his own territories of Moscow. Maria, by whom he had a son named John, who died before him, did not live long; and upon his death he married Sophia, daughter of Thomas Paleologus, who had been driven from Constantinople, and forced to take shelter at Rome, where the pope portioned this princess, in hopes of procuring thereby great advantages to the Romish religion; but his expectations were frustrated, Sophia being obliged to conform to the Greek church after her arrival in Ruffia. What could induce Bafilowitz to seek a consort at such a distance, is nowhere accounted for; unless it be, that he hoped by this means to establish a pretension to the empire of the east, to which her father was the next heir: but however that may be, the Ruffians certainly owed to this alliance their deliverance from the Tartar yoke. Shocked at the servile homage exacted by these proud victors, her husband going to meet their ambassadours at some distance from the city, and endeavoring to hear what they had to say; whilst they were at dinner, Sophia told him, that she was surprised to find that she had married a servant to the Tartars. Nestled at this reproach, Bafilowitz feigned himself ill when the next deputation from the Tartars arrived, and under that pretence avoided a repetition of the slipulated humiliating ceremonial. Another circumstance equally dis pleasing to this princess was, that the Tartars had, by agreement, within the walls of the palace of Moscov, houses in which their ministers resided; to show their power, and at the same time watch the actions of the great duke. To get rid of these, a formal embassy was sent to the Tartar khan, to tell him, that Sophia having been favoured with a visit from above, ordering her to build a temple in the place where those houses stood, her mind could not be at ease till she had fulfilled the divine command; and therefore his leave was desired to pull them down, and give his people others. The khan conformed; the houses within the Kremlin were demolished; and no new ones being provided, the Tartar residents were obliged to leave Moscow; their prince not being able to revenge this breach of promise, by reason of a war he was then engaged in with the Poles. Bafilowitz taking advantage of this circumstance, and having in the mean time considerably increased his forces, openly disclaimed all sub jection to the Tartars, attacked their dominions, and made himself master of Caffan, where he was solemnly crowned with the diadem of that kingdom, which is said to be the fame that is now used for the coronation of the Russian sovereigns. The province of Permia, with great part of Lapland and Atlantic Bulgaria, soon submitted to him; and Great Novgorod, a city then so famous that the Ruffians used to express its vast importance by the proverbial expression of, Who can resist God and the Great Novgorod? was reduced by his generals after a few years siege, and yielded him an immense treasure; more than 500 cart loads of gold and silver, and old wares. Alexander Witold, waiwode of Lithuania, was in possession of this rich place, from which he had exacted for some years an annual tribute of 100,000 roubles, a prodigious sum for those days and for that country. When it was taken by John Bafilowitz, he, the better to secure his conquest, put it under the protection of the Poles, voluntarily rendered himself their tributary for it, and accepted a governor from the hand of their king Casimir, a weak and indolent prince, from whom he well knew he had nothing to fear. The Novgorodians continued to enjoy all their privileges till about two years after; when John, ambitious of reigning without control, entered their city with a numerous retinue, under pretence of keeping to the Greek faith, he being accused of an intention to embrace the Romish religion; and with the assistance of the archbishop Theophilus, stripped them all of their remaining riches. He then deposed the treacherous prelate, and established over Novgorod new magistrates, creatures of his own; destroying at once, by this means, a whole city, which, had its liberties been protected, and its trade encouraged, might have proved to him an inexhaustible fund of wealth. All the north held with terror and abhorrence the rapid increase of the victor's power; foreign nations courted his alliance; and the several petty princes of Ruffia submitted to him without resistance, acknowledging themselves his vassals.

15

16

17

The Poles, however, complained loudly of his late breach of faith in regard to Novgorod, and threatened revenge; upon which Bafilowitz, elated with his successes, with the riches he had amased, and with the weak condition of most of his neighbours, sent a body of troops into Lithuania, and soon became master of several of its towns. Casimir applied for alliance to Matthias king of Hungary: but was answered by this letter, that his own soldiers were quite undisciplined; that his auxiliaries had lately mutinied for want of pay; and that it was impossible for him to raise a new army out of the neighbouring countries. The Polish monarch in this distress was obliged to purchase of John a cession of arms for two years, during which the Muscovite made new accessions to his dominions. The dukes of Servia, whose territories were about
His success against the Lithuanians, they invaded Livonia in the year 1552, with 130,000 men; but Walter Von Plettenberg, grand-master of the knights of the cross, was defeated with only 12,000 men, gave them a total overthrow; in Livonia killing 10,000 of his enemies, with scarce any loss on his own side. Basiłowitz dispirited by this defeat, and being then engaged in a war with the Tartars, the Poles, and the city of Plettenberg, immediately dispatched his ambassador to Plettenberg, and concluded a truce with him for 50 years. At the same time he begged of that general to send to Moscow, that he might fee, one of the iron-dragoons, as he called them, who had performed wonders in the late engagement. Von Plettenberg readily complied; and the czar, struck with admiration, rewarded the courier's accomplishments with considerable honours and presents.

Alexander had been elected king of Poland on the death of his brother John Albert, which happened in the beginning of this year; but the Poles refused to crown his consort Helena, because she adhered to the Greek religion. Provoked at this affront, and probably still more stimulated by ambition, Basiłowitz resolved again to try his fortune with them; and accordingly ordered his son Demetrius, now the eldest, to march against Smolenfsk, and reduce that city. The young prince did all that could be done: but the vigorous resistance of the besieged, and the arrival of the king of Poland with a numerous army, obliged the Russians to raise the siege and return home; and the czar was glad to make a fresh truce with the Poles for six years, upon the easy terms of only returning the prisoners he had taken. Some writers say, that flying into a violent passion with his son the moment he saw him, and imputing the miscarriage of this expedition to his want of courage or conduct, he gave him a blow which laid him dead at his feet; to which is added, that remorse for this rash action carried his father to his grave: but this account is not confirmed by authors whose authority can be relied on. Certain it is, however, that neither of them long survived this event; and that Demetrius died first; for Sophia, who had gained an absolute ascendancy over her husband, and wanted to give the sovereignty to her own children, persuaded him by various artful insinuations to set aside and imprison his grandson Demetrius, the only child of the late John, whom he had by his first wife Maria, and declare her then eldest son, Gabriel, his successor. Age and infirmities had rendered the czar fo weak, that he blindly followed the iniquitous advice; but shortly after finding his end approach, he sent for young Demetrius, expressed great repentence for his barbarity towards him, and on his death-bed declared him his lawful successor. He died in November 1505, after a reign of 55 years; leaving behind him an immense territory, chiefly of his own acquiring.

The czar was no sooner dead, than his son Gabriel Ivanovitz, at the instigation of his mother Sophia, put an end to the life of the young Demetrius, by confining him in prison, where he perished with hunger and cold; after which Gabriel was crowned by the name of Basiowitz, and took the title of czar, as well as all the other titles belonging to the sovereignty. On his accession to the throne he expected that the Poles would be in confusion about the election of a new sovereign; but his expectations being defeated by their unanimous election.
RUS

He takes Pskov and Smolensko.

24

But is utterly defeated by the Poles.

25

Ruffia. election of Sigismund I. a prince of a mild and peaceable disposition, he sent an army into Lithuania, and laid siege to Smolensko. The place made a brave resistance, till news arrived that the crown-troops of Poland were coming to their assistance, with the additional aid of 80,000 Crime Tartars; on which the Russians returned home with the utmost precipitation. They were, however, quickly followed by the Poles, who reduced the czar to submit to such terms as they pleased to impose. Bajillus remained quiet till he thought himself capable of revenging the injuries he had sustained; after which, pretending to set out upon some other expedition, he marched with a numerous army, and encircled in the neighbourhood of Pskow, where the Poles, presuming on the late treaty, received him as a friend and ally. But in the mean time the Mucovitche priests of the Greek church preached to their hearers concerning the expediency of having a sovereign of their own religion; and brought them to such a height of enthusiasm, that they murdered their magistrates, and opened their gates to the czar, who made them all slaves, and sent them away to different parts, replacing them with Mucovitche, the better to secure his conquest. Soon after he took also the city of Smolensko; and the Swedes, alarmed at his rapid progress, defied a prolongation of the truce, at that time subsisting between the two states, for 60 years longer. The duchy of Lithuania was the great object of the design of Bajillus; and to accomplish his design, he ordered Ivan Czeladin, a man of great resolution, and enterprising even to rashness, to march thither with 80,000 men. The army of the Poles did not exceed 35,000 men, but was commanded by a most experienced general. The two armies met on the opposite banks of the Dnieper, near Orsouva, and the Poles paddled that river in fight of their enemies. Czeladin's officers advised him to fall upon the enemy when about half of them had crossed the river; but that general, too confident of success, replied, that the other half would then run away, and he was determined to gain a complete victory. The Lithuanians began the attack, but were repulsed by the Russians, who imprudently followed them, lost an advantageous situation, and found themselves at once exposed to the full fire of the enemy's artillery. The Polish cavalry then rushed in among them sword in hand, and made dreadful havoc; the trembling Russians scarce even attempting to defend themselves. Those who endeavoured to fly, fell into the Dnieper and were drowned; and all the rest, including Czeladin himself, were made slaves.

Bajillus was at Smolensko when he received the news of this dreadful defeat; on which he immediately fled to Mogow, where his danger increased daily. The Crime Tartars ravaged his dominions, and the emperor Maximilian, with whom he had been in alliance, deserted him; his troops were utterly defeated in Livonia, where he was obliged to submit to a peace on dishonourable terms; but what these terms were historians do not inform us. In the mean time, the king of Poland stirred up the Tartars to invade Russia, while the Russian monarch in his turn endeavoured to excite them to an invasion of Poland. These barbarians, equally treacherous to both parties, first invaded and ravaged Podolia, a province of Poland; and then having invaded Russia and defeated the armies of the czar in the year 1521, they poured in thither in such incredible multitudes, that they quickly made themselves masters of Mogow. An army, which had been sent to oppose their progress, was defeated near the river Ocka; and the czar's brother Andrew, who commanded it, was the very first who fled. Bajillus, with great difficulty made his way to Novgorod; but determined, that he hid himself by the way under a haystack, to avoid a dragging party of the enemy. The Tartars, however, soon obliged him to sign a writing, by which he acknowledged himself their vassal, and promised to pay them a tribute of so much a head for every one of his subjects. Besides this, Machmetgerei, the commander of the Tartars, caused his own statue to be set up at Moscow, as a mark of his sovereignty; compelled Bajillus to return to his capital, to bring thither in person the first payment of this tribute, and, as a token of his submission, to proclaim himself before his statue. Machmetgerei then left Moscow, and returned home with an immense booty, and upwards of 80,000 prisoners, who were made slaves, and sold like cattle to the Turks and other enemies of the Christian name. In his way back he attempted to take the city of Rezan; but was repulsed with considerable loss by Iwan Kowen, who commanded in that place for the Russians. Here the Tartar general narrowly escaped with his life, his coat being shot through with a musket-ball; and the Mucovitche pulled down his statue, and broke it to pieces as soon as the conquerors had left them.

The Tartars were no sooner gone, than Bajillus began to talk in a high strain of the revenge he intended to take of them; but was never able to execute his threats. He died in 1533, and was succeeded by his son Ivan or John Bajilovitz, an infant of five years of age.

During the minority of the young prince, his two uncles Andrew and George endeavoured to deprive him of the crown; but their attempts were defeated by the care and activity of his guardians; and the Poles also immediately commenced hostilities, but could make but little progress. The new czar, as soon as he entered the 19th year of his age, showed an inclination for religion. Charles V. who was then at Augsburg, to defray the renewal of the treaty of friendship which had been concluded with his father Maximilian; and offering to enter into a league with him against the Turks, as enemies to the Christian religion; for his farther information in which, particularly in regard to the doctrine and ceremonies of the Latin church, he requested that his ambassador might be allowed to send from Germany to Russia proper priests to instruct him and his subjects. With these he likewise desired to have some wife and experienced statesmen, able to civilize the wild people under his government; and also, the better to help to polish them, he requested that he would send mechanics and artists of every kind; in return for all which he offered to furnish two tons of gold yearly, for 20 years together, to be employed in the war against the Turks. The emperor readily agreed to the desire of the czar; and the Russian ambassador accordingly engaged.
The besieged still made an obstinate defence, and the of Caffan Russians again began to be dispirited; upon which the czar ordered his pioneers to undermine the walls of the citadel, a practice that was unknown to the Tartars. This work being completed, he directed his priests to read a solemn mass to the whole army, at the head of which he afterwards spent some time in private prayer, and then ordered fire to be set to the powder, which acted so effectively, that great part of the foundation was immediately blown up, and the Muscovites rushing into the city, slaughtered all before them, while the assailed Tartars, crowding out at the opposite gate, crossed the river Caffanka, and fled into the forests. Among the prisoners taken on this occasion were Simeon king of Caffan, with his queen, both of whom were sent to Moscow, where they were treated with the utmost civility and respect.

Encouraged by this success, Basilovitz invaded the Atraiccan country of Atraiccan, the capital of which he soon reduced; after which he prepared to revenge himself on the Livonians for their behaviour in stopping the German artists. John Basilovitz I. had concluded a truce with this people for 50 years; which being now expired, Iodocus, archbishop of Dorpt and canon of Munster in Welfphalia, sensible of the danger to which he was exposed by the vicinity of the Russians, requested the czar to let him give a prolongation of the truce. Basilovitz desired him to choose whether he would have a truce for five years longer, on condition that all the inhabitants of his archbishopric should pay to him the annual tribute of a fifth part of a ducat for each person, which the people of Dorpt had formerly agreed to pay to the grand-dukes of Peterkow; or, for 20 years, on this farther condition that he and the Livonians should rebuild all the Russian churches which had been demolished in their territories at the time of the reformation, and allow his subjects the free exercise of their religion. Iodocus evaded an answer as long as he could; but finding at last that the affair grew serious, he levied a considerable sum from his subjects, and fled with it to Munster, where he resigned his prebend and married a wife. His successor, whose name was Herman, and the deputies from Livonia, accepted of the conditions, and swore to observe them; with this additional clause, that the priests of the Romish communion should be exempted from paying tribute.

But though the Livonians swore to the observance of these terms, they were at that very time in treaty treachery, with Gustavus Vasa, king of Sweden, to join them in attacking Russia. The king of Sweden very readily complied with their desires; upon which Basilovitz invaded Finland. Gustavus advanced against him with a powerful army; but as neither the Poles nor Livonians gave him any assistance, he was obliged to conclude a treaty with the czar, and soon after to evacuate the country. Finland was at this time governed by William of Furstenberg grand-master of the Livonian knights, and the archbishop of Riga, with some other prelates; between whom a quarrel happened about this time, which soon facilitated the designs of Basilovitz on the country. The archbishop, after attempting

Immediately after this punishment on the rebels, Basilovitz marched with a fresh army to re-invest Caffan before the Tartars had time to recover themselves. The capital of Caffan had to be inhabited by a powerful army; and after which the czar ordered his pioneers to undermine the walls of the citadel, a practice that was unknown to the Tartars. This work being completed, he directed his priests to read a solemn mass to the whole army, at the head of which he afterwards spent some time in private prayer, and then ordered fire to be set to the powder, which acted so effectively, that great part of the foundation was immediately blown up, and the Muscovites rushing into the city, slaughtered all before them, while the assailed Tartars, crowding out at the opposite gate, crossed the river Caffanka, and fled into the forests. But though the Livonians swore to the observance of these terms, they were at that very time in treaty treachery, with Gustavus Vasa, king of Sweden, to join them in attacking Russia. The king of Sweden very readily complied with their desires; upon which Basilovitz invaded Finland. Gustavus advanced against him with a powerful army; but as neither the Poles nor Livonians gave him any assistance, he was obliged to conclude a treaty with the czar, and soon after to evacuate the country. Finland was at this time governed by William of Furstenberg grand-master of the Livonian knights, and the archbishop of Riga, with some other prelates; between whom a quarrel happened about this time, which soon facilitated the designs of Basilovitz on the country. The archbishop, after attempting
attempting to set himself above the grand-maister even in civil affairs, and to persecute those who adhered to the confession of Augsburg, chose for his coadjutor in the archbishopric of Riga Christopher duke of Mecklenburg. From the abilities and haughty temper of this lord, the Livonian knights apprehended that they had reason to fear the same fate which had befallen the Teutonic order in Prussia; and the step itself was, besides, unprecedented, and contrary to the established laws of the country. These discontents were heightened by letters paid to be intercepted from the archbishop to his brother Albert duke of Prussia, inviting this last totally to supplant the order of Livonian knights, and to secularize their possessions, especially in Finland; so that an open war broke out among the contending parties, and the archbishop was seized and made prisoner. He was, however, soon released through the mediation of the emperor of Germany and other potentates, backed by the powerful preparations of the Frussians to avenge his cause; but in the mean time, the strength of their country being totally exhausted, the Livonians were obliged, instead of preparing for war, to sue for the Czar for peace. Baisiovitz replied, that he did not believe their intentions to be sincere while they kept 6000 Germans in pay; and therefore, if they meant to treat of peace, they must begin with disarming these troops. The Livonians, having no longer any power to resist, did as they were ordered; but it availed them nothing. In 1558 an army of 100,000 Russians entered the district of Dorpi, and laid waste before them with the most shocking cruelty. After this they entered the territories of Riga, where they behaved with equal inhumanity; and having at last fatiated themselves with blood and treasure, they retired with an immense booty and a great number of prisoners.

The Livonians, now thoroughly convinced of their own folly in exposing themselves to the resentment of the exasperated Russians, sent ambassadors to sue for peace in good earnest. These offered the Czar a present of 30,000 ducats, and prevailed upon him to grant their nation a truce for four months, during which they returned home to get the money. But in this interval the Livonian governor of the city of Nerva, out of an idle frolic, fired some cannon against Ivanogorod or the Russian Nerva, situated on the opposite side of the river, and killed several of the Czar's subjects who were assembled in an open place quite unarmed. The Russians, out of regard to the truce, did not even attempt to make reprisals; but immediately acquainted Baisiovitz with what had happened: which so incensed the Czar, that when the Livonian ambassadors arrived, he told them, he looked upon their nation to be a set of perfidious wretches, who had renounced all honesty; that they might go back with their money and propositions, and let their countrymen know that his vengeance would soon overtake them.

The ambassadors were fiercely received in Livonia, when an army of 300,000 Russians entered the district of Nerva, under the command of Peter Stieig-derdib, who had been a famous pirate in the Exmine sea. He took the city of Nerva in nine days, and very speciously made himself master of Dorpi, where he found immense treasuries. Several other garrisons, terrified by the approach of such numbers, quitted their posts; so that the Russians became masters of a great part of Livonia almost without opposition. At last, Gothard Kettler, grand-maister of the knights of Livonia, intreated Christian III. king of Denmark to take Riga, Revel, and the countries of Garnland, Wirland, and Eftomia, under his protection; but the advanced age of that monarch, the distance of the places, and the want of sufficient power to withstand so potent an adversary, made him decline the offer. However, he affiled them with some money and powder, of which they found greatly in need. Having then applied, without success, first to the emperor of Germany, and then to the court of Sweden, Kettler put himself under the protection of the Poles, who had hitherto been such formidable enemies to the Russians. In the mean time the latter punished their conquests: they took the city of Marienburg, laid waste the district of Riga, destroyed Garnland, and penetrated to the very gates of Revel. Felin, in which was the best artillery of the whole country, became theirs by the treachery of its garrison, and the whole grand-maister was taken, and ended his days in a prison at Moscow. The disfitted situation of the Livonian affairs now induced the bishop of Oefel to fall his bishopric to Ferdinand king of Denmark, who exchanged it with his brother Magnus for a part of Holstein. The districts of Revel and Eftomia put themselves under the protection of Sweden; and then the grand-maister, finding himself deserted on all sides, superseded the order of which he was the chief, and accepted of the duchy of Courland, which he held as a fief of the crown of Poland.

The Czar saw with pleasure the division of Livonia between the Swedes and Poles, which, he rightly judged, would produce quarrels between the two nations, and thus give him the fairer opportunity of seizing the whole to himself. Accordingly, in 1561, the Swedes offered him their assistance against the Poles; but he, judging himself to be sufficiently strong without them, attacked the Poles with his own forces, and was twice defeated, which checked his further operations in Livonia. In 1569 he entered into a treaty of commerce with England, captain Richard Chancellor having a short time before discovered a passage to Archangel in Russia through the White Sea, by which that empire was likely to be supplied with foreign goods, without the assistance either of Poland or Livonia. To the discoverers of this new passage Baisiovitz granted many exclusive privileges; and after the death of queen Mary renewed the alliance with queen Elizabeth, and which has been continued without interruption ever since.

In the mean time, however, a prodigious army of Turks and Tartars entered Muscovy, with a design to subdue the whole country. But Zerebrinov, the Czar's general, having attacked them in a defile, put them to flight with considerable slaughter. Then they retired towards the mouth of the Volga, where they expected a considerable reinforcement; but being closely pursued by the Russians and Tartars in alliance with them, they were again defeated and forced towards Azan on the Black Sea. But when they came there, they found the city almost entirely ruined by the blowing up of a powder magazine. The Russians then attacked their thimble there, took form, and sunk the rest; by which means almost the whole army perished with hunger or the fievor of the enemy.

From this time the empire of Russia became so formidable
midable, that none of the neighbouring nations could hope to make a total conquest of it. The Poles and Swedes indeed continued to be very formidable enemies; and, by the infligation of the former, the Crimean Tartars, in 1571, again invaded the country with an army of 70,000 men. The Russians, who might have prevented their paling the Volga, retired before them till they came within 18 miles of the city of Moscow, where they were totally defeated. The Czar no sooner heard this news than he retired with his most valuable effects to a well-fortified cloyster; upon which the Tartars entered the city, plundered it, and set fire to several churches. A violent storm which happened at the same time soon spread the flames all over the city; which was entirely reduced to ashes in six hours, though its circumference was upwards of 40 miles. The fire likewise communicated itself to a powder-magazine at some distance from the city; by which accident upwards of 50 rods of the city wall, with all the buildings upon it, were destroyed; and, according to the best historians, upwards of 120,000 citizens were burnt or buried in the ruins, besides women, children, and foreigners. The cattle, however, which was strongly fortified, could not be taken; and the Tartars hearing that a formidable army was coming against them under the command of Magnus duke of Holstein, whom Bafliovitz had made king of Livonia, thought proper to retire. The war, nevertheless, continued with the Poles and Swedes; and the Czar being defeated by the latter after some trifling successes, was reduced to the necessity of suing for peace.

But the negotiations being somehow or other broken off, the war was renewed with the greatest vigour. The Livonians, Poles, and Swedes, having united in a league together against the Russians, gained great advantages over them; and, in 1579, Stephen Battori, who was then raised to the throne of Poland, levied an army expressly with a design of invading Russia, and of regaining that nation, he artfully pretended to be unwilling to accept the crown, till compelled to it by the importunities of the people; and then he put the acceptance of it on the issue of an expedition which he was about to undertake against the Tartars. The truth of the matter, however, was, that no Tartar army was in the field, nor had Boris any intention of invading that country; but by this pretence he assembled an army of 500,000 men, which he thought the most effectual method of securing himself in his new dignity. In 1580 he concluded a peace with the Poles, but resolved to continue the war against the Swedes; however, being disappointed in some of his attempts against that nation, he entered into an alliance with the Swedifh monarch, and even proposed a match between the king's brother and his daughter. But while these things were in agitation, the city of Moscow was decimated by one of the most dreadful famines recorded in history. Thousands of the people lay dead in the streets and highways, with their mouths full of hay, straw, or even the most filthy things which they had been attempting to eat. In many houses the fattest persons were killed in order to serve for food to the rest. Parents were said to have eaten their children, and children their parents, or to have folded them to buy bread. One author (Pietrus) says, that he himself saw a woman bit several pieces of a child's arm as she was carrying it along; and captain Margaret relates, that four women having ordered a peasant to come to one of their houses, under pretence of paying him for some wood, killed and ate up both him and his horse. This dreadful calamity lasted three years, notwithstanding all the means which Boris could use to alleviate it; and in this time upwards of 500,000 people perished in the city.

In 1604 a young man appeared, who pretended to be Demetrius, whom Boris had caufed to be murdered, as we have already seen. Being supported by the Poles, he proved very troublesome to Boris all his lifetime; and after his death deprived Theodore Borisslovitz, the new Czar, of the empire; after which he ascended the throne himself, and married a Polish princess. However, he held the empire but a short time, being killed in an insurrection of his subjects; and the unhappy Czarina was sent prisoner to Jaroflaw.

After the death of Demetrius, Zuiki, who had confpired against him, was chosen Czar; but rebellions continually taking place, and the empire being perpetually harassed by the Poles and Swedes, in 1610 Zuiki was deposed, and Uladislaus son of Sigismund king of Poland was elected. However, the Poles representing to the king Sigismund, that it would be more glorious for him to be the conqueror of Russia, than only the father of its sovereign, he carried on the war with such fury, that the Russians in despair fell upon the Poles, who refided in great numbers at Moscow. The Poles being well armed
army, and mostly soldiers, had greatly the advantage; however, they were on the point of being oppressed by numbers, when they fell upon the most cruel method of ensuring their success that could be devised. This was by setting fire to the city in several places; and while the dismembered Ruffians ran to save their families, the Poles fell upon them sword in hand. In this confusion upwards of 100,000 people perished; but the event was, that the Poles were finally driven out, and left all footing in Russia.

The expulsion of the Poles was succeeded by the election of Theodorovitz Romanov, a young nobleman of 17 years of age, who possessed, till the accession of the present Emperors, continued to enjoy the sovereignty. He died in 1646, and was succeeded by his son Alexis; whose reign was a continued scene of tumult and confusion, being harassed on all sides by external enemies, and having his empire perpetually disturbed by internal commotions.

The sources of these commotions were found in the multiplicity and inconsistency of the laws on the borders. An emnany ukefe, or peroral order, which is an edict of the sovereign, signed with his own hand, is the only law of Russia. These edicts are as various as the opinions, prejudices, passions, or whims of men; and in the days of Alexis, they produced endless contentions. To remedy this evil, he made a seceding, from all the edicts of his predecessors, of such as had been familiarly current for a hundred years; presuming that those either were founded in natural justice, or during so long a currency had formed the minds of the people to consider them as just. This digest, which he declared to be the common law of Russia, and which is prefixed by a fort of inquisite, is the standard law-book at this day known by the title of the Ulogenie or Selection; and all edicts prior to it were declared to be obsolete. He soon made his novelle, however more bulky than the Ulogenie; and the additions by his successors are beyond enumeration. This was undoubtedly a great and useful work; but Alexis performed another still greater.

Though there are many courts of judicature in this widely extended empire, the emperor has always been lord paramount, and could take a cause from any court immediately before himself. But as several of the old nobles had the remains of principalities in their families, and held their own courts, the sovereign or his ministers, at a distance up the country, frequently found it difficult to bring a culprit out of one of these hereditary feudal jurisdictions, and try him by the laws of the empire. This was a very disagreeable limitation of imperial power; and the more to, that some families claimed even a right to repledge. A lucky opportunity offered of settling this dispute; and Alexis embraced it with great ability.

Some families on the old frontiers were taxed with their defence, for which they were obliged to keep regiments on foot; and as they were but feantly indemnified by the state, it sometimes required the exertion of authority to make them keep up their levies. When the frontier, by the conquest of Cäfar, were far extended, these gentlemen found the regiments no longer burdensome, because by the help of false mutters, the former scanty allowance much more than reimbursed them for the expense of the establishment. The consequence was, that disputes arose from them about the right of guarding certain districts, and law-suits were necessary to settle their respective claims. These were tedious and intricate. One claimant showed the order of the court, issued a century or two back, to his ancestor for the marching of his men, as a proof that the right was then in his family. His opponent proved, that his ancestors had been the real lords of the marches; but that, on account of their negligence, the court had signed an emnany ukefe to the other, only at that particular period. The emperor ordered all the family archives to be brought to Moscow, and all documents on both sides to be collected. A time was set for the examination; a fine wooden court-house was built; every paper was lodged under a good guard; the day was appointed when the court should be opened and the claims heard; but that morning the house, with all its contents, was in two hours burned by fire. The emperor then said, "Gentlemen, henceforward your ranks, your privileges, and your courts, are the nation's, and the nation will guard itself. Your archives are unfortunately lost, but those of the nation remain. I am the keeper, and it is my duty to administer justice for all and to all. Your ranks are not private, but national; attached to the services you are actually performing. Henceforward Colonel Buturin (a private gentleman) ranks before Captain Viazemsky (an old prince)."

This constitution, which established the different Alexis's ranks of Russia as they remain to this day, is by Voltaire ascribed to Peter: but it was the work of respect to Alexis; who, when the situation of himself and his country is considered, must be allowed to have been a great and a good man. He died in 1676, and was succeeded by his son Theodore Alexiovitz; who after an excellent reign, during the whole of which he exerted himself to the utmost for the good of his subjects, died in 1682, having appointed his brother Peter I. his successor. See of Peter Peter I.

Theodore had another brother named John; but as he was subject to the falling-sickness, the Czar had preferred Peter, though very young, to the succession. But through the intrigues, of the princess Sophia, sister to Theodore, a strong party was formed in favour of John; and soon after both John and Peter were proclaimed sovereigns of Russia under the administration of Sophia herself; who was declared regent. However, this administration did not continue long; for the princes regent having conspired against Peter, and having the misfortune to be discovered, was confined for life in a convent. From this time also John continued to be only a nominal sovereign till his death, which happened in 1696, Peter continuing to engrave all the powers.

It is to this emperor that Russia is universally allowed to owe the whole of her present greatness. The private character of Peter himself seems to have been very indifferent. Though he had been married in his eighteenth year to a young and beautiful princess, he was not sufficiently restrained by the solemn ties of wedlock; and he was besides so much addicted to feasting and drunkenness, the prevailing vice of his country, that nobody could have imagined him capable of effecting the reformation upon his subjects which he actually accomplished. In spite of all disadvantages, however, he
he applied himself to the military art and to civil government. He had also a very singular natural defect, which, had it not been conquered, would have rendered him for ever incapable of accomplishing what he afterwards did. This was a vehement dread of water; which is thus accounted for. When he was about five years of age, his mother went with him in a coach, in the spring-leaon; and pausing over a dam where there was a considerable water-fall, whilst he lay asleep in her lap, he was so suddenly awakened and frightened by the rushing of the water, that it brought a fever upon him; and after his recovery he retained such a dread of that element, that he could not bear to see any standing water, much less to bear a running stream. This aversion, however, he conquered by jumping into water; and afterwards became very fond of that element.

Being ashamed of the ignorance in which he had been brought up, he learned almost of himself, and without a master, enough of the High and Low Dutch languages to speak and write intelligibly in both. He looked upon the Germans and Hollanders as the most civilized nations; because the former had already erected some of those arts and manufactures in Moscow, which he was desirous of spreading throughout his empire; and the latter excelled in the art of navigation, which he considered as more necessary than any other. During the administration of the princes Sophia, he had formed a design of establishing a maritime power in Russia; which he accomplished by the means which we have recorded in his life.

Having reformed his army, and introduced new discipline among them, he led his troops against the Turks; from whom, in 1696, he took the fortresses of Azov, and had the satisfaction to see his fleet defeat that of the enemy. On his return to Moscow were struck the first medals which had ever appeared in Russia. The legend was "Peter the First, theaugust emperor of Russia." On the reverse was Azov, with these words, "Victorious by fire and water." Notwithstanding this success, however, Peter was very much chagrined at having his ships all built by foreigners; having besides a great inclination to have a harbour on the Baltic as on the Euxine Sea. These considerations determined him to send some of the young nobility of his empire into foreign countries, where they might improve. In 1697 he sent 60 young Russians to Italy; most of them to Venice, and the rest at Leghorn, in order to learn the method of constructing their galleys. Forty more were sent out by his direction for Holland, with an intent to instruct themselves in the art of building and working large ships; others were appointed for Germany, to serve in the land-forces, and to learn the military discipline of that nation. At last he resolved to travel through different countries in person, that he might have the opportunity of profiting by his own observation and experience. Of this journey we have given a short account elsewhere; and shall here only add, that in executing his great design, he lived and worked like a common carpenter. He laboured hard at the forges, rope-yards, and at the several mills for the sawing of timber, manufacturing of paper, wire-drawing, &c. In acquiring the art of a carpenter, he began with purchasing a boat, to which he made a mast himself, and by degrees he executed every part of the construction of a ship.

Besides this, Peter frequently went from Sweden to Amsterdam, where he attended the lectures of the celebrated Ruyff on anatomy. He also attended the lectures of burgomaster Witfen on natural philosophy. From this place he went for a few days to Utrecht, in order to pay a visit to King William III. of England, and on his return sent to Archangel a 60 gun ship, in the building of which he had assisted with his own hands. In 1698 he went over to England, where he employed himself in the same manner as he had done in Holland. Here he perfected himself in the art of ship-building; and having engaged a great number of artificers, he returned with them to Holland; from whence he set out for Vienna, where he paid a visit to the emperor; and was on the point of setting out for Venice to finish his improvements, when he was informed of a rebellion having broken out in his dominions. This was occasioned by the superfluous and obstinacy of the Russians, who, having an almost invincible attachment to their old ignorance and barbarism, had resolved to dethrone the Czar on account of his innovations. But Peter arriving unexpectedly at Moscow, quickly put an end to their machinations, and took a more severe revenge on those who had been guilty. Having then made great reformations in every part of his empire, in 1700 he entered into a league with the kings of Denmark and Poland against Charles XII. of Sweden. The particulars of this famous war are related under the article Sweden. Here we shall only observe, that, from the conclusion of this war, Sweden ceased not only to be a formidable enemy to Russia, but even lost its political consequence in a great measure altogether.

Peter applied himself to the cultivation of commerce. He established arts and sciences, with equal affluence as to the pursuits of his own spirit of war; and he made such acquisitions of dominion that he had been the most powerful prince of his age. He was unfortunate in the Czarnovitz his eldest son, whom he contrived to get rid of by the forms of justice (see Peter I. note 8), and then ordered his wife Catharine to be crowned with the same magnificent ceremonies as if she had been a Greek empress, and to be recognised as his successor; which he accordingly was, and mounted the Russian throne upon the decease of her husband. She died, after a glorious reign, in 1727, and was succeeded by Peter II. a minor, son to the Czarnovitz. Many domestic revolutions happened in Russia during the short reign of this prince; but none was more remarkable than the disgrace and exile of Prince Menzilloff, the favourite general in the last two reigns, and esteemed the richest subject in Europe. Peter died of the small-pox in 1740. No matter of Peter the Great Anne dethroned him, the Russian senate and nobility, upon the death of Peter II. ventured to sit aside the order of succession which they had established. The male issue of Peter was now extinguished; and the Duke of Holstein, son to his eldest daughter, was by the definition of the late empress intituled to the crown: but the Russians, for political reasons, filled their throne with Anne duchess of Courland, second daughter to John, Peter's eldest brother; though her eldest sister the duchess of Mecklenburgh was alive. Her reign was extremely prosperous; and though she accepted of the crown under
der limitations that some thought derogatory to her dignity, yet the broke them all, affared the prerogative of her ancestors, and punished the aspiring Dolgoruk family, who had imposed upon her limitations, with a view, as it is said, that they themselves might govern. She raised her favourite Biron to the duchy of Courland, and was obliged to give way to many severe executions on his account. Upon her death in 1740, John, the son of her niece the princesse of Mecklenburg, by Antony Ulric of Brunswick-Wolfebuttel, was, by her will, intituled to the succession; but being no more than two years old, Biron was appointed to be administrator of the empire during his minority. This election was disagreeable to the princesse of Mecklenburg and her husband, and unpopular among the Russians. Count Munich was employed by the princes of Mecklenburg to arrest Biron; who was tried, and condemned to die, but was sent in exile to Siberia.

The administration of the princesse Anne of Mecklenburg and her husband was, upon many accounts, but particularly that of her German connections, disagreeable not only to the Russians, but to other powers of Europe; and notwithstanding a prosperous war they carried on with the Swedes, the princesse Elizabeth, daughter by Catharine to Peter the Great, formed such a party, that in one night's time she was declared and proclaimed empress of the Russias; and the princes of Mecklenburg, her husband, and son, were made prisoners.

Elizabeth's reign may be said to have been more glorious than that of any of her predecessors, her father excepted. She abolished capital punishments, and introduced into all civil and military proceedings a moderation till her time unknown in Russia; but at the same time she punished the counts Munich and Osterman, who had the chief management of affairs during the late administration, with exile. She made peace with Sweden; and settled the succession to that crown, as well as to her own dominions, upon the most equitable foundation. Having gloriously finished a war, which had been stirred up against her with Sweden, she replaced the natural order of succession in her own family, by declaring the duke of Holstein-Gottorp, who was detested from her elder sister, to be her heir. She gave him the title of grand duke of Russia; and soon after her accession to the throne, he called her to her court; where he renewed the succession to the crown of Sweden, which undoubtedly belonged to him, embraced the Greek religion, and married a princess of Amhurst Zeibit, by whom he had a son, who is now heir to the Russian empire.

Few princes have had a more uninterrupted career of glory than Elizabeth. She was completely victorious over the Swedes. Her alliance was courted by Great Britain at the expense of a large subsidy; but many political, and some private reasons, it is said, determined her to take part with the house of Austria against the king of Prussia in 1756. Her arms alone gave a turn to the succession of the war, which was in favor of Prussia, notwithstanding that monarch's amazing abilities both in the field and cabinet. Her conquests were such as portended the entire destruction of the Prussian power, which was perhaps saved only by her critical death on January 5, 1762.

Elizabeth was succeeded by Peter III, grand prince of Russia and duke of Holstein; a prince whose conduct has been variously represented. He mounted the throne possessed of an enthusiastic admiration of his Prussian majesty's virtues; to whom he gave peace, and of her success. Peter III.
He publicly ridiculed the exercise and evolutions of the Russian troops; and hastily adopting the Prussian discipline, without digesting and fitting it for the constitution of his own forces, he completely ruined himself by disgracing the army.

They are easily gained over to the party of Catharine.

What he first found and easily gained by the eminencies of Catharine. Four regiments of guards, amounting to 8000 men, were instantly brought over by the three brothers Orloff, who had contrived to ingratiate themselves with their officers. The people at large were in a state of indifference, out of which they were routed by the following means. A little manuscript was handed about, containing principles of legislation for Russia, founded on natural rights, and on the claims of the different classes of people which had infensibly been formed, and become so familiar as to appear natural.

In that performance was proposed a convention of deputies from all the classes, and from every part of the empire to convene, but without authority, on the subjects of which it treated, and to inform the Senate of the result of their deliberations. It passed for the work of her majesty, and was much admired.

While Catharine was thus high in the public esteem and affection, the emperor took the alarm at her popularity, and in a few days came to the resolution of confining her for life, and then of marrying his favourite. The servants of that favourite betrayed her to her sister, who imparted the intelligence to the empress. Munich received him again at Oranienbaum, and the empress was completely happy. The convention of deputies was even resolved on; and as they were not to be elected by the people, except here and there for the show, Prince Galitzin and Count Panin, whom she had completely gained over, and who had the greatest abilities of any Russians about court, were at immense pains in appointing a proper set. In the mean time, a great number of showy patriotic projects were begun. A she infliguate English clergyman was invited over to superintend the institution of schools for civil and moral education; and the empress was most liberal in her appointments. This institution failed, however, to produce the effects expected from it. The clergyman appointed, though a most excellent character and real philanthropist, had views too contracted for the sphere in which he was placed; and Mr Betsky, the Russian Mezenoff, to whom the empress referred him for instructions, preferred declamation, and stage-playing, and ballads, to all other accomplishments.

In the mean time, elegance of all kinds was introduced before the people were taught the principles of traveling. The nobles were sent a travelling; and as the Russians more easily acquire foreign languages than the people of most other nations, have great vivacity without flippancy, and in general understand play, these travellers were everywhere well received, especially at Paris, where reaons of state contributed not a little to procure to them that attention with which they were treated. They were ravished with the manners of foreign courts, and imported fashions and fineries without bounds. The sovereign turned all this to her own account, by encouraging a dilapidation which rendered court favours necessary, and made the people about her forget their Utopian dreams.

The convention of deputies was at last assembled in the capital. The empress's book of instructions came forth; and by some great things were doubled, and expected. The most consequent of the deputies were privately instructed to be very cautious, and informed that carriages and guards were ready for Siberia. There was a grand procession at their presentation. Each had the honour of kissing her majesty's hand and receiving a gold medal. They met in form to recognize one another.

(c) This lady, during the progress of the revolution, certainly acted either from the most disinterested patriotism or the most generous friendship. She might have taken part with the emperor, and directed the counsels of the empire; for her father, on whom she doted, acknowledged her superiority, and wanted nothing but pleasure. Between them they could easily have governed such a man as Peter III. But Catharine Romanoiva was a theoretical enthusiast, who loved the empress because she thought her a philosopher and philanthropist; and perhaps the might entertain hopes of directing the conduct of Catharine II. as she had formerly affiled her in her patriotic studies.

(n) It is intitled, Instructions for the Deputies to consult about a New Code of Laws, &c. and is a very respectable work, which does honour to the empress, by whom it was undoubtedly composed.
RUS

The plain has a great variety of different climates, soils, and products. The northern part of it is very woody, marshy, and but little fit for cultivation, and has a fensible declivity towards the White and the Frozen Seas. The other part of this vast plain includes the whole extent along the river Volga as far as the deserts, extending by the Caspian and the Azov Seas, and constitutes the finest part of Russia, which in general is very rich and fruitful, having more arable and meadow land than wood, marshes, or barren deserts.

The part lying on the other side of the Oural mountains, known by the name of Siberia, is a flat tract of land of considerable extent, declining imperceptibly towards the Glaicial Sea, and equally by imperceptible degrees rising towards the south, where at last it forms a great range of mountains, constituting the borders of Russia on the side of China. Between the rivers Irith Obé, and the Altay mountains, there is a very extensive plain, known by the name of Barabinskaya Stepe, viz. the deserts of Baraba, the northern part of which is excellent for agriculture; but the southern part, on the contrary, is a desert full of sands and marshes, and very unfit for cultivation. Between the rivers Obé and Enissey there is more woodland than open ground; and the other side of the Enissey is entirely covered with impervious woods, as far as the lake Baical; but the soil is fruitful everywhere; and wherever the trouble has been taken of clearing it of the wood, and of draining it from unnecessary water, it proves to be very rich, and fit for cultivation; and the country beyond the Baical is surrounded by ridges of high lofty mountains. Proceeding on farther towards the east, the climate of Siberia becomes by degrees more and more severe, the summer grows shorter, the winter longer, and the frosts prove more intense.

With respect to the variety of climates, as well as the produce of the earth, Russia naturally may be divided into three regions or divisions, viz. into the northern, middle, and southern divisions.

There were about 20 years ago subdivided into different governments, for the better administration of justice.

The northern division, beginning from the 57th degree of latitude, extends to the end of the Russian dominions on the north, and includes the governments of St. Petersburg, Riga, Revel, Vyborg, Pétov, Novgorod, Tver, Obol'ts, Archangel, Vologda, Yaroslav I, Kol'tsno, Viatka, Permo, and Tobolik. The middle division is reckoned from the 57th to the 50th degree of latitude, and includes the governments of Moskow, Smolensk, Polotik, Mogiliev, Chernigov, Novgorod-Sievskoy, Kharkov, Voronez, Kurki, Oreil, Kalouga, Tula, Riazane, Vladimir, Nenets, Nenegorod, Tambov, Saratov, Penza, Sinib'fat, Kazane, Onza, Kolivzane and Irkoutik. The southern division begins at the 50th degree of latitude, and extends to the end of Russia on the south, including the governments of Kiev, Ekaterinoflav, Caucasus, and the province of Taurida. To this may be added the habitations of the Caafcates of the Don.

The northern division, though deficient in grain and garden vegetables, has the preference before the other two in the abundance of animals, rare and them, mid-valuable for their skins; in fihes of particular sorts, very useful for different purposes of life; in cattle, and metals of inferior kind, &c. The middle division of Russia abounds in different kinds of grain, hemp, flax, cattle,
cattle, fish, bees, timber proper for every use, different kinds of wild beals, metals, both of superior as well as of inferior kind, different precious stones, &c. This division is likewise most convenient for the habitation of mankind, or account of the temperature and pleasantness of the air. The fourth division has not that abundance of grain, but has the preference in different delicate kinds of fruit, quantity of fish, cattle, and wild animals, amongst which there are several species different from those which are found in the middle division. It exceeds greatly both the other divisions in plants and the products of different forts, agates, cornelian, beryl, chalcedony, onyx, porphry, antimony, pyrites, aquamarines, chrysolites, opalites, and lapis lazuli, are found in them, besides marble, granite, trapp, maria or Mucowy, chifs, of remarkable size and clearness, bafaltes, and coal, &c.; and in every part of Siberia, but particularly in the plains of it, are found bones of animals uncommonly large, mammoth's teeth (See Mammam), and other fossils.

In the Russian empire are many lakes of very large extent. 1. The Ladoga, anciently called Nova, is the largest lake in Europe, extending in length 175, and in breadth 105 versts; or it is 116 English miles long and near 70 broad. It lies between the governments of St Peterburgh, Olonetz, and Vyborg; and communicates with the Baltic sea by the river Neva, with the Onega lake by the river Swir, and with the Ilmen lake by the river Volkov. Several considerable rivers fall into it, as the Pafha, Sias, Otay, and others. The Ladoga canal is made near this lake. 2. The Onega lake is situated in the government of Olonetz. It is above 200 versts long, and the greatest width of it does not exceed 80 versts. 3. The Tchude lake, or Pepis, lies between the governments of St Peterburgh, Pico, Revel, and Riga. It is near 80 versts long and 60 broad. It joins to the lake of Novogorod by a large neck of water. The length of this lake is 50 and the width about 40 versts. "The River Volkova flows into it. The river Narova comes out of the lake Pepis, which by the river Embahka communicates with the lake Wittz-Erve, and from this latter flows the river Felin, and runs into the bay of Riga. 4. The Ilmen lake, anciently called Majk, lies in the government of Novogorod. Its length is 40 and width 30 versts. The rivers Pico, Lovate, Shelone, and others, fall into it; and only one river Volkov, runs out of it, by which it is joined with the Ladoga lake. 5. The Biolo-Ozero, that is, the White Lake, lies in the government of Novogorod. It extends 50 versts in length, and about 30 in width. There are many small rivers which run into it; but only one river, Shekina, comes out of it, and falls into the river Volga. 6. The Altin, or Altay lake, otherwise called the Tchude Lake, is situated in the government of Khikinwan. It extends in length 120 and in width about 84 versts. The river Biya comes out of it, which being joined to the river Katonuya, constitutute the river Ob. 7. The Bissakale, otherwise called the Bissal Sea, and the Holy Sea, lies in the government of Irkouth. Its extent in length is 600, and in width from
RUS [569]

Rustia. 50 to 50 verfs, and in the widest places as far as 70 verfs. 8. The Tchehi Lake lies in the deferts of Byrabs, between the rivers Obè and Irith. It joins with a great many smaller lakes, occupies a vast tract of land, and abounds very much in fhrubs. 9. Between the Gulf of Finland and the White Sea there are several lakes, which extend from 50 to 70 verfs in length; and besides these are many other falt lakes in different parts of Rustia, fuch as the Ozeron, that is, the lake Eltonkoye, Bogdo, Inderkoye, Ebele, Koryakovkoye, Yamilhewkoye, Boroyye, and others; and the falt which is got from them ferves for the ufe of the empire. To these may be added the Cafpian, which, though called a sea, is more properly a lake, as in its extent of country, stretching from the State of temperate fo far into the frigid zone, the climate the warmest vary confiderably in different places. In the southern parts of the Russian empire, the longitude day does not exceed fifteen hours and a half; whereas in the moft northern, the fun in summer is seen two months above the horizon. The country in general, though lying under different climates, is excessively cold in the winter. Towards the north, the country is covered near three quarters of the year with snow and ice; and by the severity of the cold many unfortunate perfoncs are maimed, or perifh. This fort of weather commonly fets in about the latter end of Auguft, and continues till the month of May; in which interval the rivers are frozen to the depth of four or five feet. Water thrown up into the air will fall down in icicles; birds are frozen in their flight, and travellers in their fleges. In fome provinces the heats of summer are as fcorching as the winter colds are rigorous.

The soil of Russia varies more than the climate, according to the influence of the fun and the fife of the country. In the warmer provinces, the proceeds of vegetation are fo rapid, that corn is commonly reaped in two months after it begins to appear above the surface of the ground. Hence the great variety of funrooms produced spontaneously in Rustia, which may be confidered as a comfortable relief to the poor, while they appear as delicacies at the tables of the rich. Above 1000 waggon-loads of them ufed to be fold annually in Moscow. Perhaps it is on account of the scarcity of provisions that fuch a number of falls are infifted in the Moscovite Rehigion.

Besides the productions already mentioned as peculiar to each of the three great natural divisions of the em- fable, Rustia yields rhubarb, flax, hemp, pafture for cattle, wax, and honey. Among other vegetables, we find in Russia a particular kind of rice called pplyth, plenty of excellent meUons, and in the neighbourhood of Astrakan the famous zoophytus, or animal plant, which the Muscovites call lauvnet, o lambkin, from its re- femblance to a lamb. See the article "Stillian Laos."

Agriculture in general is but little understood, and Stati-STATE, agriculture left prosecuted in this country. The most considerable articles in the economy of a Russian farm are wax and wa-
honey, by which the peasant is often enriched. He cuts down a great number of trees in the forest, and sawing the trunks into a number of parts, bores each of them, and drills up the hollows at both ends, leaving only a little hole for the admittance of the bees; thus the honey is secured from all the attempts of the bear, who is extremely fond of it, and tries many different experiments for making himself master of the ludicrous treasure.—

Of this honey the Russians make a great quantity of strong mead, or for their ordinary drink. They likewise extract from rye a spirit, which they prefer to brandy.

The wild beasts in the Northern parts of Russia are the same with those we have mentioned in the articles of Norway and Lapland; such as rein-deer, bears, foxes, ermines, martens, fables, hares, and squirrels. In the more southern provinces the Multcovites breed black cattle, small but hardy horses, sheep, goats, and camels. The breed of cattle and horses has been enlarged by the care and under the protection of Peter and succeeding sovereigns. The whole empire abounds with wild-fowl and game of all sorts, and a variety of birds of prey; besides the different kinds of poultry, which are raised in this as well as in other countries. The external parts and provinces of Muscovy are well supplied with sea-fish from the Northern ocean, the Baltic, or gulf of Finland, the White sea, the Black sea, and the Caspian; but the whole empire is plentifully provided with fresh-water fish from the numerous lakes and rivers, yielding immense quantities of salmon, trout, pike, surgenor, and beluga: the last being a large fish, of whose roe the best caviar is made. Innumerable in- sects, like those of Lapland, are hatched by the summer’s heat in the sand, morasses, and forests, with which this empire abounds; and are so troublesome as to render great part of the country altogether uninhabitable.

The Russian empire is inhabited by no less than 16 different nations, of which our limits will hardly permit us to give the names. The first are the Scævonian nations, comprehending the Russians, who are the predominant inhabitants of the whole empire, and the Poles, who besides occupying the countries lately wrested from the republic, live in the governments of Podlask and Moghilew, as well as in the district of Salenghink and along the river Iril. 2. The Germanic nations, comprehending the Germans properly so called, who inhabit Estonia and Livonia; the Swedes inhabiting the Russian Finland, as well as some of the islands on the Baltic sea; and the Danes, who inhabit the islands of the Baltic sea, the Worms, and Grofs or Great Roge. 3. The Lettonian or Livonian nations, under which are classed the original or real Lettonians or Letis, inhabiting Livonia; and the Lithuanians, who live in the government of Podlask and Moghilew. 4. The Finns, or Tchudi, nations who inhabit the governments of Viberg and St Peterburgh, with many other districts of the empire, being branched out into no fewer than 12 different tribes. 5. The Tartarian nations, who are all either Mahometans or idolators. The Mahometan Tartars, commonly called by the Russians Tartars, dwell in Kazane, and the places adjacent; at Kefimov; at Oute, in the government of Parma; at Tomisk and its neighbourhood, and are in general a sober, industrious, cleanly, and generous people. The other Tartars inhabit different parts of Siberia, and are intermixed with still different races, called after the towns, rivers, and other places to which their habitations are nearest.—

They are, as we have said, idolators, and governed by shamans. (See Shamen.) Besides these, there are in the Russian dominions the Nagay Tartars; the Crimean Tartars, inhabiting the Crimea, who, together with the land belonging to them, came under the subjection of Russia in 1783; the Mecherekats; the Balkhirs; the Kirghiz or Kirghis-Kalifaks; the Yakouti; and the white Kalmuks. 6. The Caucasian nations, which are six in number, and are each subdivided into many different tribes, of which it is probable that few of our readers have ever heard the names, except of the Circassians, who live in different settlements bordering on the river Kubané. 7. The Samoyeds or Samaed, comprehending the Olfiacks. These inhabit the northernmost part of Russia, along the coast of the Icy sea. 8. The Mungian nations, comprehending the original Mungals, who are chiefly dispersed in the deserts of Goby: the Bourati, who live on the banks of the Bial- kal, and other places in the government of Irkoutsk; and the Kalmuks, confiding of four different tribes.—

All these hordes speak the Mungian language, observe the religion of Lama and the Kalmuks live in large tents. 9. The Tongoufi, a very populous tribe, dispersed from the river Enilfey as far as the sea of Okh-hoks, and from the Penjikayka Gooba beyond the Chinde frontier. They are all idolators, and live by hunting and fishing. 10. The Kamchadells. 11. The Koriaksi. 12. The Korilacks. Of these three nations we have given some account under the article Kamt- schatska. 13. The Aleouti, who dwell in the islands between Siberia and America, and very much resemble the Esquimaux and the inhabitants of Greenland. They live in large huts, and seem to be idolators. 14. The Arintzi, a very numerous people scattered in the government of Kolhivane. 15. The Yukaghiri, who are dispersed on the coasts of the Glacial sea, about the rivers Yana, Kolhima, and Lena, and as far as the source of the Anadir. 16. The Tchoukchi, who occupy the north-eastern part of Siberia, between the rivers Kolhima and Anadir. Besides these sixteen different nations, there are scattered through the Russian empire vast numbers of Buchharian Tartars, Perians, Georgians, Indians, Greeks, Servians, Albanians, Bulgarians, Moldavians, Valezians, Armenians, and Jews.

The empire of Russia is so widely extended, that notwithstanding the number of nations which it comprehends, it must be considered as by no means populous. At the last revision it was found to contain 26 millions of souls; but it is to be observed, that the nobility, clergy, land as well as sea forces, different officers, servants belonging to the court, persons employed under government in civil and other offices; the students of different universities, academies, seminaries, and other schools; hospitals of different denominations; likewise all the irregular troops, the roving hordes of different tribes, foreigners and colonists, or settlers of different nations—are not included in the abovementioned number; but with the addition of all these, the population of Russia, of both sexes, may be supposed to come near to 28 millions.
To such a vast variety of people, nations, and languages, it is needless to observe, that no general character can with truth be applied. The native Russians are distinguished by their neighbours as ignorant and brutal, totally resigned to loth, and addicted to drunkenness, even in the most healthily excess; nay, they are accused of being arbitrary, pernicious, inhuman, and dilatory of every social virtue. There is not a phrase in their language analogous to ours, "the manners or the sentiments of a gentleman," nor does gentleman with them express any thing moral. Indeed they have no such distinction. Cunning is professed and glorified in all; and the nobleman whom you detect telling a lie is vexed, but not in the least ashamed. In the whole reglement of the marine by Peter the Great, there is not one word addressed to the honour, or even to the propriety, of his officers. Hopes of reward, and the constant fear of detection and punishment, are the only motives touched on. In every ship of war, and in every regiment, there is a fiscal or authorized spy, a man of respectable rank, whose letters must not be opened but at the risk of the great knout (see KNOUT); and he is required by express statute to give monthly reports of the behaviour of the officers and privates.

Such regulations we cannot think well adapted to improve the morals of the people; yet we believe they have been improved by the care, affluence, and example of some of their late sovereigns. Certain it is, the vice of drunkenness was so universally prevalent among them, that Peter I. was obliged to restrain it by very severe edicts, which, however, have not produced much effect. They numbered in the city of Moscow fewer than 4000 brandy-shops, in which the inhabitants used to let away their time in drinking strong liquors and smoking tobacco. This last practice became so dangerous, among persons in the most healthily state of intoxication, that a very severe law was found necessary to prevent the pernicious consequences, otherwise the whole city might have been consumed by conflagrations. The nobility were heretofore very powerful, each commanding a great number of vassals, whom they ruled with the most despotic and barbarous authority; but their possessions have been gradually circumscribed, and their power transferred in a great measure to the czar, on whom they are now wholly dependent. At present there is no other degree of the nobility but that of the boyars: these are admitted to the council, and from among them the wazhodes, governors, and other great officers, are nominated, and their ranks with respect to each other are regulated by the importance of their respective offices.

Alexis, who introduced this order of precedence, abhorred the personal abatement of the inferior clades to their superiors, which he would not accept of when exhibited to himself; and it may appear surprising that Peter, who deftined mere ceremonial, should have encouraged every extravagance of this kind. In a few years of his reign, the beautiful simplicity of designation and address which his father had encouraged was forgotten, and the cumbrous and almost inexpressible titles which disgrace the little courts of Germany were crowded into the language of Russia. He enjoined the lowest order of gentlemen to be addressed by the phrase, "your respectable birth"; the next rank, by "your high good birth"; the third, "your excellence"; the fourth, "your high excellence"; and that some of them were ordered to be called "Highnesses and majesties," were reserved for the great duke and czar.

These titles and modes of address were ordered with all the regularity of the manual exercise; and the man who should omit any of them when speaking to his superior might be lawfully beaten by the offended boyar. Before this period, it was polite and courtly to speak to every man, even the heir apparent, by adding his father's name to his own; and to the great duke, Paul Petrovitz was perfectly respectful, or a single word, signifying dear father, when he was not named. Those pompous titles were unknown among them before the era of Peter, the subordination of ranks was more complete than in any other European nation; but with this simplicity peculiar to them and the Poles, that they had but three ranks, the sovereign, the nobleman or gentility, and the serfs. It was not till very lately that the mercantile rank formed any distinction; and that distinction is no more than the freedom of the person, which was formerly a transferable commodity belonging to the boyar. Notwithstanding this simplicity, which put all gentlemen on a level, the subscription of a person holding an inferior office was not servantes, but races; and the legal word for a petition in form was toshelbilibi, which signifies, "a beating with the forehead," i.e. striking the ground with the forehead; which was actually done. The father of Alexis abolished the practice; but at this day, when a Russian petitions you, he touches his forehead with his finger; and if he be veryearnest, he then puts his finger to the ground.

The Russian nobles formerly wore long beards, and long robes with straight sleeves dangling down to their ankles: their collars and shirts were generally wrought with flilk of different colours: in lieu of hats, they covered their heads with furred caps; and, instead of shoes, wore red or yellow leathern buckskins. The dress of the women nearly resembled that of the other sex; with this difference, that their garments were more loose, their caps fantastical, and their shift-sleeves three or four ells in length, gathered up in folds from the shoulder to the forearm. By this time, however, the French fashions prevail among the better sort throughout all Muscovy.

The common people are generally tall, healthy, and Manners robust, patient of cold and hunger, inured to hardships, and remarkably capable of bearing the most sudden transition from the extremes of hot or cold weather. Nothing is more customary than to see a Russian, who is over-heated and sweating at every pore, slip himself naked, and plunge into a river: nay, when their pores are all opened in the hot-bath, to which they have daily recourse, they either practice this immersion, or subject themselves to a discharge of some pailulls of cold water. This is the custom of both men and women, who enter the baths promiscuously, and appear naked to each other, without scruple or hesitation.

A Russian will subsist for many days upon a little oatmeal and water, and even raw roots: an onion is a regale; but the food they generally use in their journeys is a kind of rye-bread, cut into small square pieces, and dried again in the oven: these, when they are hungry, they soak in water, and eat as a very com-
The Russian women are remarkably fair, comely, strong, and well-shaped, obedient to their lordly husbands, and patient under discipline; they are even said to be fond of correction, which they consider as an infallible mark of their husband's conjugal affection; and they pour and pine if it be withheld, as if they thought themselves treated with contempt and disregard. Of this neglect, however, they have very little cause to complain; the Russian husband being very well disposed, by nature and inebriation, to exert his arbitrary power. Some writers observe, that, on the wedding-day, the bride presents the bridegroom with a whip of her own making, in token of submission; and this he fails not to employ as the instrument of his authority. Very little ceremony is here used in match-making, which is the work of the parents. Perhaps the bridegroom never sees the woman till he is joined to her for life. The marriage being proposed and agreed to, the lady is examined, "mark-made," by a certain number of her female relations; and if they find any bodily defect, they endeavour to cure it by their own skill and experience. The bride, on her wedding-day, is crowned with a garland of wormwood, implying the bitterness that often attends the married state. When the priest has tied the nuptial knot at the altar, his clerk or sexton having been exhorted to cease with the minority of children; it continues while he enters, and visits her father and mother, of whom the demands the marriage portion. It is always profibly obeisance. This ceremony being performed, the bride and bridegroom are conducted to their own chamber by an old woman, who exhorts the wife to obey her husband, and returns. Then the bridegroom defiles the lady by pulling off one of his buckles, giving her to understand, that in one of them is contained a whip, and in the other a jewel or a purse of money. She takes her choice; and if she finds the purse interprets it into a good omen; whereas should the light on the whip, she considers it into an unhappy presage, and instantly receives a lath as a specimen of what she has to expect. After they have remained two hours together, they are interrupted by a deputation of old women, who come to search for the signs of her virginity: if these are apparent, the young lady ties up her hair, which before consummation hung loose over her shoulders, and visits her mother, of whom she demands the marriage portion. It is generally agreed, that the Muscovite husbands are barbarous even to a proverb; they not only administer frequent and severe correction to their wives, but sometimes even torture them to death, without being subject to any punishment for the murder.

The canon law of Muscovy forbids the conjugal commerce on Mondays, Wednesdays, and Fridays; and whoever transgresses this law, must bathe himself before he enters the church-porch. He that marries a second wife, the first being alive, is not admitted farther than the church-door: and if any man espouses a third, he is excommunicated: so that though bigamy is tolerated, they nevertheless count it infamous. If a woman is barren, the husband generally persuades her to retire into a convent; if fair means will not succeed, he is at liberty to whip her into confection. When the czar, or emperor, has injunction for a wire, the most beautiful maidens of the empire are presented to him for his choice.

The education of the czarivitz, or prince royal, is instructed to the care of a few persons, by whom he is strictly kept from the eyes of the vulgar, until he hath attained the 15th year of his age: then he is publicly exhibited in the market-place, that the people, by viewing him attentively, may remember his person, in order to ascertain his identity; for they have more than once been deceived by impostors.

Such is the slavery in which the Muscovites of both sexes are kept by their parents, their patrons, and the emperor, that they are not allowed to dispute any match that may be provided for them by these directors, however disagreeable or odious it may be. Officers of the greatest rank in the army, both native and foreigners, have been faddled with wives by the sovereign in this arbitrary manner. A great general some time ago deceased, who was a native of Britain, having been pressed by the late czarina to wed one of her ladies, saved himself from a very disagreeable marriage, by pretending his constitution was too unwell, that the lady would be irreparably injured by his compliance.

In Russia, the authority of parents over their children is almost as great as it was among the ancient Romans, and is often exercised with equal severity. Should a father, in punishing his son for a fault, be the immediate cause of his death, he could not be called to account for his conduct; he would have done nothing but what the law authorised him to do. Nor does this legal tyranny cease with the minority of children; it continues while they remain in their father's family, and is often exerted in the most indifferent manner. It is not uncommon, even in St Peterburgh, to see a lady of the highest rank, and in all the pomp and pride of youthful beauty, flanding in the courtyard with her back bare, exposed to the whip of her father's servants. And so little disgrace is attached to this punishment, that the same lady will sit down at table with her father and his guests immediately after she has suffered her flogging, provided its severity has not confined her to bed.

The Muscovites are fond of the bagpipe, and have a kind of violin, with a large belly like that of a lute; dancing, but their music is very barbarous and defective. Nevertheless, there are public schools, in which the children are regularly taught to sing. The very beggars ask ams in a whining cadence, and ridiculous form of recitative. A Russian ambassador at the Hague, having been regaled with the best concert of vocal and instrumental music that could be procured, was asked how he liked the entertainment? he replied, "Perfectly well; the beggars in my country sing just in the same manner." The warlike music of the Russians consists in kettle-drums and trumpets: they likewise use hunting horns; but they are not at all expert in the performance
The Ruffians were converted to the Christian religion towards the latter end of the tenth century, as has been already related. Since that period they have confessed the articles of the Greek church, mingled with certain superstitious ceremonies of their own. They do not believe in the pope's infallibility or supremacy, or even hold communion with the see of Rome: they use auricular confession, communicate in both kinds, adopt the Athenian creed, and adhere to the eucharistic liturgy of St. Basil. They worship the Virgin Mary, and other saints; and pay their adorations to crosses and relics. They observe four great days in the year, during which they neither taste fish, flesh, nor any animal production: they will not drink after a man who has eaten flesh, nor use a knife that has cut meat in less than 24 hours after it has been used; nor will they, even though their health is at stake, touch any thing in which hart-horn or any animal substance has been used. As a mark of respect, when the czar engages in any religious service, at which the czar is attended by his whole court. He is immediately preceded by the officers of his household, one of whom carries his handkerchief on his arm, lying upon another of the richest embroidery. He halts at a few of the platform of free-flown, where, turning to the east, and bending his body almost double, he pronounces a short prayer; then he proceeds to the church of Jerusalem, where he renews his devotion. This exercise being performed, he returns to his palace, the bride of the patriarch's horse reposing upon his arm. The horse's head being covered with white linen, is held by some nobleman; while the patriarch, sitting sideways, and holding a crosier in his hand, distributes benedictions as he moves along; on his head he wears a cap edged with ermin, adorned with loops and buttons of gold and precious stones: before him are displayed banners of consecrated stuff, in a variety of colours. Above are priests walk in the procession, those who are near the patriarch bearing pictures of the Virgin Mary, richly ornamented with gold, jewels, and pearls, together with crosses, relics, and religious books, including a copy of the Gospel, which they reckon to be of inestimable value.
of worship; though it was not without great difficulty, and by dint of extraordinary solicitation from different powers, that the Romish religion was allowed. Peter knowing the dangerous tenets of a religion that might fet the spiritual power of the pope at variance with the temporal power of the emperor, and being well acquainted with the meddling genius of its professors, held out for some time against the introduction of Germany, France, and Poland; and though at length he yielded to their joint interposition, he would by no means suffer any Jesuit to enter his dominions.

The government of Russia is mere despotism. The whole empire is ruled by the arbitrary will and pleasure of the sovereign, who is styled the czar or tsar, a title which is probably a corruption of Cæsar. Herefore he was styled grand duke of Muscovy; but since the reign of Peter, he is dignified with the appellation of emperor of Russia; and the present sovereign is styled emperor of all the Russias. The emperor is absolute lord, not only of all the estates in the empire, but also of the lives of his subjects; the greatest noblemen call themselves his fave, and execute his commands with the most implicit obedience. The common people revere him as something supernatural; they never mention his name, or any thing immediately belonging to him, without marks of the most profound respect and awful veneration. A man asking a carpenter at work upon one of the czar's warehouses, what the place was intended for? answered, "None but God and the czar knows."

The nobility of Russia were formerly rich and powerful, and ruled despotically over their inferiors: but we have seen how the father of Peter the Great contrived to clip them of their privileges, and they are now vassal dependants on the court. They still retain the titles of their ancestors, though many of them are in the most abject poverty and contempt.

All the peasants in the empire are considered as immediate slaves belonging to the czar, to the boyars, or to the monasteries. The value of estates is computed, not by the extent or quality of the land, but from the number of those peasants, who may be sold, alienated, or given away, at the pleasure of their masters. The number of those hubdman, whether living in villages or in the open country, being known, the czar, by requiring a certain proportion of each lord or proprietor, can raise 300,000 men in less than 40 days.

The administration is managed by a grand council, called dumny boyaren, or "council of the boyars," who are the grandees of the empire, and act as privy counsellors. To this are subject inferior chambers and courts of judicature, provided each with a president. The first regulates every thing relating to ambassadors and foreign negociations; the second takes cognizance of military affairs; the third manages the public revenues of the empire; the business of the fourth is to encourage, protect, and improve trade and commerce. The two last hear and determine in all causes, whether civil or criminal.

Peter divided the empire into the eight governments of Moscovy, Archangel, Afpip, Caftan, Astracan, Chioff and the Ukraine, Siberia, Livonia, comprehending Ingria, Plescow, and Novgorod, Smolenko, and Venizy. The governors or waivodes were vested with power to dispense of all employments civil and military, and receive the revenues. They were directed to defray
Russia.

They defray all expenses in their respective governments, and send a certain yearly sum to the great treasury. In a word, they enjoyed absolute power in every thing but what related to the regular troops, which, though quartered in their jurisdiction, were neither paid nor directed by them, but received their orders immediately from the czar or his generals.

In 1775 the present empress made a complete new-modelling of the internal government in a form of great simplicity and uniformity. By this regulation she divided the whole empire into 43 governments, as we have already mentioned, placing over each, or where they are of less extent, over two contiguous governments, a governor-general with very considerable powers. She subdivided each government into provinces and districts; and for the better administration of justice erected in them various courts of law, civil, criminal, and commercial, analogous to those which are found in other countries. She established likewise in every government, if not in every province, a tribunal of conciencé, and in every district a chamber for the protection of orphans. Amidst so many wife institutions a chamber for the administration of her imperial majesty’s revenues was not forgotten to be established in each government, nor a tribunal of police in each district. The duty of the governor-general, who is not properly a judge, but the guardian of the laws, is to take care that the various tribunals in his government discharge their respective duties, to protect the oppressed, to enforce the administration of the laws; and when any tribunal shall appear to have pronounced an irregular sentence, to stop the execution till he make a report to the senate and receive her majesty’s orders: It is his business likewise to see that the taxes be regularly paid; and, on the frontiers of the empire, that the proper number of troops be kept up, and that they be attentive to their duty.

This reglement contains other institutions, as well as many directions for the conducting of law-suits in the different courts, and the administration of justice, which do her majesty the highest honour; but the general want of morals, and what we call a fenne of honour, in every order of men through this vast empire, must make the wilful regulations of little avail. Russia is perhaps the only nation in Europe where the law is not an incorporated profession. There are no feminaries where a practitioner must be educated. Any man who will pay the fees of office may become an attorney, and any man who can find a client may plead at the bar. The judges are not more learned than the pleaders. They are not fitted for their offices by any kind of education; nor are they necessarily chosen from those who have frequented courts and been in the practice of pleading. A general, from a successful or an equivocal campaign, may be instantly set at the head of a court of justice; and in the absence of the imperial court from St Peterburgh, the commanding officer in that city, whoever he may be, presides ex officio in the high court of justice. The other courts generally change their prefdents every year. Many inconveniences must arise from this singular constitution; but fewer, perhaps, than we are apt to imagine. The appointment to so many inferior governments makes the Russian nobility acquainted with the grofs of the ordinary business of law-courts; and a statute or imperial edict is law in every place. The great obstacles to the administration of justice are the contrariety of the laws and the venality of the judges. From inferior to superior courts there are two appeals; and in a great proportion of the causes the reversal of the sentence of the inferior courts subjects its judges to a heavy fine, unless they can produce an edict in full point in support of their decision. This indeed they seldom find any difficulty to do; for there is hardly a case so simple but that edicts may be found clear and precise for both parties; and therefore the judges, sensible of their safety, are very seldom incorruptible. To the principle of honour, which often guides the conduct of judges in other nations, they are such absolute strangers, that an officer has been seen sitting in state and distributing justice from a bench to which he was chained by an iron collar round his neck, for having the day before been detected in conniving at smuggling. This man seemed not to be ashamed of the crime, nor did any one avoid his company in the evening.

Few crimes are capital in Russia: murder may be stoned by paying a sum of money; nay, the civil magistrate takes no cognizance of murder, without having previously received information at the suit of some individuals. Criminals were punished with torture and the most cruel deaths till the reign of the illustrious Catharine I. when a more merciful system took place, and which the present empress has since confirmed by law. See the articles Catharine I. of Russia, and Elisabêth Petrovna.

We have already mentioned the traffic of the Russians with the different nations both of Asia and Europe, and specified iron as one of the articles which they export. We may here add, that in 1792 there were in the government of Parma alone, which lies in the northern division of the empire, 88 copper and iron works belonging to the government and private persons, and three gold works. The metals extracted in these works are chiefly conveyed to St Peterburgh by water-carriage on the river Tschufovaya, which falls into the Kama. With respect to the revenue of Russia, it continually fluctuates, according to the increase of commerce or the pleasure of the czar, who has all the wealth of the empire at his disposal. He monopolizes all the salt, furs, mines, minerals, and the trade by land to the East Indies; he farms out all the tobacco, wine, brandy, beer, mead, and other liquors; the inns, taverns, public houses, baths, and sweating-houses. The customs upon merchandise, the imposts upon corn, and toll exacted from cities, towns, and villages, are very considerable. He pollutes demeines to a very great value; inherits the effects of all those that die intestate, or under accusation of capital crimes; derives a duty from all law-suits; and to sum up the whole, can command the fortunes of all his subjects. All these articles produce a large revenue, which was three years ago estimated at upwards of 40,000,000 rubles, or L. 6,333,333; 6:8 Sterling; but then the intrinsic value of money is at least three times greater in Russia than in Britain. The expenses in time of peace never exceed 38,000,000 rubles: the remainder is not treasured up, but is employed by her imperial majesty in constructing public edifices, making harbours, canals, roads, and other useful works, for the glory of the empire and benefit of her subjects.

The standing army of Russia is computed at 270,000 men; besides these, the Russians can assemble a body of
RUT, in architecture, implies a manner of building in imitation of nature, rather than according to the rules of art. See Architecture.

Rustic Gods, or rustic spirits, in antiquity, were the gods of the country or those who preferred over agriculture, &c. Varro invokes the 12 dii confluentes, as the principal among the rustic gods; viz., Jupiter, Tellus, the Sun, Moon, Ceres, Bacchus, Rubigus, Flora, Minerva, Venus, Lympba, and Good Luck. Besides these 12 arch-rustic gods, there were an infinite number of rustic others; as Pales, Vertumnus, Turnus, Vulcanus, Sylvanus, and Priapus. Struvius adds the Satyrs, Fauns, Sileni, Nymphs, and even Tritons; and gives the empire over all the rustic gods to the god Pan.

Rustic Order, that decorated with rustic quoin, rustic work, &c.

Rustic Work, is where the stones in the face, &c. of a building, instead of being smooth, are hatched, or picked with the point of a hammer.

Rustre, in heraldry, a bearing of a diamond shape, pierced through in the middle with a round hole. See Heraldry.

Ruta, in hunting, the venery or copulation of deer.

Ruta, rute: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 26th order, Multifolium. The calyx is quinquepartite; the petals concave; the receptacle surrounded with 10 melliferous pores; the capsule lobed. In some flowers, a fifth part of the number is excluded. There are several species; of which the most remarkable is the hortenis, or common broad-leaved garden rute, which has been long cultivated for medicinal use. This rute with a shrubby thall to the height of five or six feet, sending out branches on every side, garnished with decomposed leaves, whose small lobes are wedge-shaped, of a grey colour, and have a strong odour. The flowers are produced at the end of the branches in branches almost in the form of umbels: they are composed of four yellow concave petals which are cut on their edges, and eight yellow stamens which are longer than the petals, terminated by roundish stamens. The hermen becomes a roundish capsule, with four lobes punctured full of holes containing tough black seeds.

Rue has a strong ungrateful smell, and a bitterish penetrating taste: the leaves, when full of vigour, are extremely acid, insomuch as to inflame and blister the skin if much handled. With regard to their medicinal virtues, they are powerfully stimulating, attenuating, and digestive; and hence, in cold phlegmatic habitus, they quicken the circulation, dissolve tenacious juices, open obstructions of the excretory glands, and promote the fluid secretions. The writers on the materia medica in general have entertained a very high opinion of the virtues of this plant. Boerhaave is full of its praises; particularly of the effulent oil, and the diffilfed water cohabated or rediluted several times from fresh parcels of the herb. After extravagant commendations other waters prepared in this manner, he adds, with regard to that of rue, that the greatest commendations he can bestow upon it fall short of its merit: "What medicine (says he) can be more efficacious for promoting sweat and peripilation, for the cure of the hysteric palpitation and of epilepsies, and for expelling poison?" Whatever service rue may be of in the two last cafes, it undoubtedly has its use in the others: the cohabated water, however, is not the most efficacious preparation of it. An extract made by rectified spirit contains in a small compass the whole virtues of the rue; this menstruum taking up by infusion all the pungency and flavour of the plant, and elevating nothing in distillation. With water, its peculiar flavour and warmth arife; the bitterness, and a confiderable share of the pungency, remaining behind.

Ruta Baga, or Swedish turnip. See Husbandry, p. 761.

Book of RUTH, a canonical book of the Old Testament; being a kind of appendix to the book of Judges, and an introduction to those of Samuel; and having its title from the person whose story is here principally related. In this story are observable the ancient rights of kindred and redemption; and the manner of buying the inheritance of the deceased, with other particulars of great note and antiquity. The canonicalness of this book was never disputed; but the learned are not agreed about the epocha of the history it relates. Ruth the Moabitess is found in the genealogy of our Saviour. Math. i. 5.

Rutillus. See Cyprinus, n° 6.

Rutherglen, or by contraction Ruthlen, the head borough of the netherward of Lanarkshire in Scotland, is situated in N. Lat. 55° 51', and W. Long. 4° 13'; about two miles south-east of Glasgow, and nine miles west of Hamilton. Few towns in Scotland can lay greater claim to antiquity than Rutherglen. Maitland, in his History of the Antiquities of Scotland, vol. i. p. 92. tells us, that it was founded by a king Reuther, from whom it derived its name; and a tradition of the same import prevails among the inhabitants. But without laying any stress on the authority of tradition, which is often fallacious and always doubtful, we find, from several original charters still preserved, that it was erected into a royal borough by king David I. about the year 1126.

The territory under the jurisdicion of the borough was extensive, and the inhabitants enjoyed many distinguished privileges, which were however gradually wrested from them, by political influence, in favour of Glasgow, which in latter times rose into consequence by trade and manufactures. The ancient dimensions of the place are now unknown; but in the fields and gardens towards the east the foundations of houses are occasionally discovered. It is now of a very reduced size, consisting but of one principal street and a few lanes, and containing about 1651 inhabitants.

About 150 yards to the south of the main street
RUTLANDSHIRE, is the least county in England, it being but 40 miles in circumference; in which are two towns, 48 parishes, and 3,603 houses. However, for quality it may be compared with any other county; the air being good, and the soil fertile both for tillage and pastures; and it not only affords plenty of corn, but feeds a great number of horned cattle and sheep. It is well watered with brooks and rivulets; and the principal rivers are the Weland and the Wash. It is bounded on the east by Lincolnshire; on the south by the river Weland, which parts it from Northamptonshire; and on the west and north by Leicesthire. It has only two market-towns; namely, Oakham, where the alizes and feffions are held, and Uppingham.

RUYSCH (Frederic), one of the most eminent anatomists of which Holland can boast, was born at the Hague in 1638. After making great progress at home, he repaired to Leyden, and there prosecuted the study of anatomy and botany. He studied next at Francker, where he obtained the degree of doctor of physic. He then returned to the Hague; and marrying in 1661, dedicated his whole time to the study of his profession. In 1665 he published a treatise, entitled Dilucidatio volcularum de varii lymphaticis et latice; which raised his reputation so high, that he was chosen professor of anatomy at Amsterdam. This honour he accepted with the more pleasure, because his situation at Amsterdam would give him easy access to every requisite help for cultivating anatomy and natural history. After he settled in Amsterdam, he was perpetually engaged in dissecting and in examining with the most inquisitive eye the various parts of the human body. He improved the science of anatomy by new discoveries; in particular, he found out a way to preserve dead bodies many years from putrefaction. His anatomical collection was curious and valuable. He had a series of fetuses of all sizes, from the length of the little finger to that of a new born infant. He had also bodies of full grown persons of all ages, and a vast number of animals almost of every species on the globe, besides a great many other natural curiosities. Peter the Great of Russia, in his tour through Holland in the year 1698, visited Ruyfch, and was so charmed with his conversation, that he
RUY [ 578 ]

Ruyter, Ruyter.

passed whole days with him; and when the hour of departure came, he left him with regret. He felt for a high value on Ruyter's cabinet of curiosities, that when he returned to Holland in 1717, he purchased it for 30,000 florins, and sent it to Petersburg.

In 1685 he was made professor of medicine, an office which he discharged with great ability. In 1728 he got his thigh-bone broken by a fall in his chamber. The year before this misfortune happened he had been deprived of his sight. He was also a member of the Royal Society of London.

RUYTER (Michael Adrian), a distinguished naval officer, was born at Fliessingue, a town of Zealand, in 1607. He entered on a sea-faring life when he was only 11 years old, and was first a cabin-boat. While he advanced successively to the rank of mate, master, and captain, he acquitted himself with ability and honour in all these employments. He repulsed the Irish, who attempted to take Dublin out of the hands of the English. He made eight voyages to the West Indies and to Brazil. He was then promoted to the rank of rear admiral, and went to assist the Portuguese against the Spaniards. When the enemy came in sight, he advanced boldly to meet them, and gave such unquestionable proofs of valour as drew from the Portuguese monarch the warmest applause. His gallantry was still more conspicuous before Bazelee, a town of Barbary. With one single vessel he failed through the roads of that place in defiance of five Algerine Corsairs who came to attack him.

In 1633 a squadron of seventy vessels was dispatched against the English under the command of Van Tromp. Ruyter, who accompanied the admiral in this expedition, seconded him with great skill and bravery in the three battles which the English so gloriously won. He was afterwards stationed in the Mediterranean, where he captured several Turkish vessels. In 1659 he received a commissio to join the king of Denmark in his war with the Swedes; and he not only maintained his former reputation, but raised it higher. As the reward of his services, the king of Denmark nobly him and gave him a pension. In 1661 he ran a vessel belonging to Tunis, released 40 Christian slaves, made a treaty with the Tuniitians, and reduced the Algerine corsairs to fame. His country as a testimony of her gratitude for such illustrious services, raised him to the rank of vice-admiral and commander in chief. To the latter dignity, the highest that could be conferred upon him, he was well intituled by the signal victory which he obtained over the combined fleets of France and Spain. This battle was fought in 1672 about the time of the conquest of Holland. The fight was maintained between the English and Dutch with obstinate bravery of nations which were accustomed to dispute the empire of the main. Ruyter having thus made himself master of the sea, conducted a fleet of Englishmen safely into the Texel; thus defending and enriching his country, while it was become the prey of hostile invaders. The next year he had three engagements with the fleets of France and England, in which, if possible his bravery was still more distinguished than ever. D'Estrées the French vice-admiral wrote to Colbert in these words: "I would purchase with my life the glory of De Ruyter." But he did not long enjoy the triumphs which he had so honourably won. In an engagement with the French fleet off the coast of Sicily, he lost the day, and received a mortal wound, which put an end to his life in a few days. His corpse was carried to Amsterdam, and a magnificent monument was there erected by the command of the states-general. The Spanish council bestowed on him the title of duke, and transmitted a patent investing him with that dignity; but he died before it arrived.

When some person was congratulating Louis XIV. upon De Ruyter's death, telling him he had now got rid of the dangerous enemy; he replied, "Every one must be sorry at the death of so great a man."

RYE, in botany. See Scales.

Rye, a town in Sufex, with two markets on Wednesdays and Saturdays, but no fair. It is one of the five-ports; is a handsome well-built place, governed by a mayor and jurats, and sends two members to parliament. It has a church built with stone, and a townhall, and consists of three streets, paved with stone. One side of the town has been walled in, and the other is guarded by the sea. It has two gates, and is a place of considerable trade in the shipping way. From thence large quantities of corn are exported, and many of the inhabitants are fishermen. It is 34 miles south-east by south of Tunbridge, and 64 on the same point from London. The mouth of the harbour is of late choked up with sand; but if well opened, it would be a good station for privateers that cruise against the French. E. Long. 0° 58. N. Lat. 51. 0."
RYO

View of the Tragedies of the 17th Age, and afterwards published a tragedy named Edgar. For a critic he was certainly not well qualified, for he wanted candour; nor is his judgment much to be relied on, who could condemn Shakespeare with such rigid severity. His tragedy will show, that his talents for poetry were by no means equal to those whose poems he has publicly cen turied. But though he has no title to the appellation of poet or critic, as an antiquarian and historian his memory will long be preferred. His Faderon, which is a collection of all the public transacts, treaties, &c. of the kings of England with foreign princes, is esteemed one of the most authentic and valuable records, and is often referred to by the best English historians than perhaps any other book in the language. It was published at London in the beginning of the present century in 17 volumes folio. Three volumes more were added by Sanderon after Rymer's death. The whole were reprinted at the Hague in 10 vols in 1739. They were abridged by Rapin in French, and inserted in Le Clerc's Bibliothèque, a translation of which was made by Stephen Whatley, and printed in 4 vols 8vo, 1731.

Rymer died 14th December 1713, and was buried in the parish church of St Clement's Danes. Some specimens of his poetry are preferred in the first volume of Mr Nichol's Select Collection of Miscellaneous Poems, 1780.

RYNCHOPS, in ornithology, a genus belonging to the order of anuses. The bill is straight; and the superior mandible much shorter than the inferior, which is truncated at the point. The species are two, viz. the nigra and fulva, both natives of America.

RYOTS, in the policy of Hindoostan, the modern name by which the renters of land are distinguished. They hold their possessions by a lease, which may be considered as perpetual, and at a rate fixed by ancient surveys and valuations. This arrangement has been so long established, and accords so well with the ideas of the natives, concerning the diftribution of lands, and the functions allotted to each, that it has been invariably maintained in all the provinces subject either to Mahometans or Europeans; and to both it serves as the basis on which their whole system of finance is founded.

Respecting the precise mode, however, in which the ryots of Hindoostan held their possessions, there is much diversity of opinion; the chief of which are very partially delineated in note iv. to the Appendix of Robertson's Historical Disquisition, &c. concerning India, p. 345. to which we refer such of our readers as are interested in this subject of finance.

RYSCHIA, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking with those which are doubtful. The calyx is pentaphyllous; the corolla is pentapetalous; and the apices turned back, about three times the length of the calyx; the filaments are five, awl-shaped, and shorter than the petals. The seed-veil is quadrilocular, and contains many seeds. Of this there are two species, viz. the Clausfölia and Sarracena.

RYSWICK, a large village in Holland, seated between the Hague and Delft, where the prince of Orange has a palace, which stands about a quarter of a mile farther. It is a very noble structure, all of hewn stone, of great extent in front, but perhaps not proportionally high. It is adorned with a marble flar-cafe, marble floors, and a magnificent terrace. There is a good prospect of it from the canal between Delft and the Hague. This place is remarkable for a treaty concluded here in 1697 between England, Germany, Holland, France, and Spain. E. Long. 4. 20. N. Lat.

52. 8.

S.

S, or s, the 18th letter and 14th consonant of our alphabet; the sound of which is formed by driving the breath through a narrow passage between the palate and the tongue elevated near it, together with a motion of the lower jaw and teeth towards the upper, the lips being a little way open; with such a configuration of every part of the mouth and larynx, as renders the voice somewhat fibulous and hissing. Its sound, however, varies; being strong in some words, as this, thus, &c. and soft in words which have a final e, as wife, wife, &c. It is generally doubled at the end of words, whereby they become hard and harsh, as in kifs, lofs, &c. In some words it is silent, as isle, island, off­court, &c. In writing or printing, the long character / is generally used at the beginning and middle of words, but the short s at the end.

In abbreviations, S stands for societas or focius; as,

R. S. S. for regi societatis, focius, i. e. fellow of the royal society. In medicinal prescriptions, S. A. signifies secundum artem, i.e. according to the rules of art;

And in the notes of the ancients, S stands for Sextus; S. P. for Spurius; S. C. for senatus consultum; S. P. Q. R. for senatus populaire Romanus; S. S. for frater; S. P. for fratum, i.e. one layer above another alternately.

S. V. B. E. E. Q. V. for si vale Frida, ego quique valo, a form used in Cicero's time, in the beginning of letters. Used as a numeral S anciently denoted seven;

in the Italian music, S signifies solo; And in books of navigation, S. stands for souther; S. E. for south-eaft; S. W. for south-west; S. E. for south-east; S. W. for south-west.

SAAVEDRA (Michael de Cervantes), a celebrated Spanish writer, and the inimitable author of Don Quixote, was born at Madrid in the year 1549. From
hia infancy he was fond of books; but he applied himself wholly to books of entertainment, such as novels and poetry of all kinds, especially Spanish and Italian authors. From Spain he went to Italy, either to serve Cardinal Aquisaviva, to whom he was chamberlain at Rome; or else to follow the profession of a soldier, as he did some years under the victorious banners of Marcus Antonio Colonna. He was present at the battle of Lepanto, fought in the year 1571; in which he either lost his left hand by the shot of an harquebus, or had it so maimed that he lost the use of it. After this he was taken by the Moors, and carried to Algiers, where he continued a captive five years and a half. Then he returned to Spain, and applied himself to the writing of comedies and tragedies; and he composed several, all of which were well received by the public, and acted with great applause. In the year 1584 he published his Galatea, a novel in six books; which he presented to Acanio Colonna, a man of high rank in the church, as the first fruits of his wit. But the work which has done him the greatest honour, and will immortalize his name, is the history of Don Quixote; the first part of which was printed at Madrid in the year 1605. This is a tale upon books of knight-errantry; and the principal, if not the sole, end of it was to destroy the reputation of these books, which had so infatuated the greater part of mankind, especially those of the Spanish nation. This work was universally read; and the most eminent painters, tapestry-workers, engravers, and sculptors, have been employed in representing the history of Don Quixote. Cervantes, even in his lifetime, obtained the glory of having his work receive a royal approbation. As King Philip III. was standing in a balcony of his palace at Madrid, and viewing the country, he observed a student on the banks of the river Manzanares reading in a book, and from time to time breaking off and beating his forehead with extraordinary tokens of pleasure and delight: upon which the king said to those about him, "That scholar is either mad, or reading Don Quixote?" the latter of which proved to be the case. But virtus laudatur et agit: notwithstanding the vaft applause his book everywhere met with, he had not interred enough to procure a small pension, but had much ado to keep himself from starving. In the year 1615, he published a second part; to which he was partly moved by the presumption of some scribler, who had published a continuation of this work the year before. He wrote also several novels; and among the rest, "The Troubles of Perilis and Sigifmuta." He had employed many years in writing this novel, and finished it but just before his death; for he did not live to see it published. His sickness was of such a nature, that he himself was able to be, and actually was, his own historian. At the end of the preface to the Troubles of Perilis and Sigifmuta, he represents himself on horseback upon the road, and a student, who had overtaken him, engaged in conversation with him: "And happening to talk of my ills (says he), the student soon let me know my doom, by saying it was a drop of I had got; the thirst attending which all the water of the ocean, though it were not salt, would not suffice to quench. Therefore Senor Cervantes, says he, you must drink nothing at all, but do not forget to eat; for this alone will recover you without any other phylic. I have been told the fame by others, answered I; but I can no more forbear tipping, than if I were born to do nothing else. My life is drawing to an end; and from the daily journal of my pulse, I shall have finished my course by next Sunday at the farthest.—But adieu, my merry friends all, for I am going to die; and I hope to see you ere long in the other world, as happy as heart can with." His dropy increased, and at last proved fatal to him; yet he continued to say and to write bon mots. He received the last sacrament on the 18th of April 1616; and the day after wrote a dedication of the Troubles of Perilis and Sigifmuta to the Conde de Lemos. The particular day of his death is not known.

SABA, a Dutch island near St Eulatia in the West Indies. It is a steep rock, on the summit of which is a little ground, very proper for gardening. Frequent rains, which do not lie any time on the soil, give growth to plants of an exquisite flavour, and cabbages of an extraordinary size. Fifty European families, with about one hundred and fifty slaves, here raise cotton, spin it, make stockings of it, and sell them to other colonies for as much as ten crowns a pair. Throughout America there is no blood so pure as that of Saba; the women there prefer a freemens of complexion, which is not to be found in any other of the Caribee islands. Happy colony! elevated on the top of a rock between the sky and sea, it enjoys the benefit of both elements without dreading their storms; it breathes a pure air, lives upon vegetables, cultivates a simple commodity, from which it derives ease without the temptation of riches: is employed in labours less troublesome than useful, and posses in peace all the blessings of moderation, health, beauty, and liberty. This is the temple of peace from whence the philosopher may contemplate at leisure the errors and paffions of men, who come, like the waves of the sea, to strike and dath themselves on the rich coasts of America, the spoils and possession of which they are perpetually contending for, and wrestling from each other; hence may he view at a distance the nations of Europe bearing thunder in the midst of the ocean, and burning with the flames of ambition and avarice under the heats of the tropics; devoring gold without ever being satisfied; wading through seas of blood to amass those metals, those pearls, those diamonds, which are used to adorn the oppressors of mankind; loading innumerable ships with those precious casks, which furnish luxury with purple, and from which flow pleasures, effeminacy, cruelty, and debauchery. The tranquil inhabitant of Saba views this mass of follies, and spins his cotton in peace.

SABAZIA. See SABIANS.

SABAZIA, in Greek antiquity, were nocturnal mysteries in honour of Jupiter Sabazius. All the initiates had a golden serpent put in at their breasts, and taken out at the lower part of their garments, in memory of Jupiter's ravishing Proserpina in the form of a serpent. There were also other feasts and sacrifices distinguished by this appellation, in honour of Mithras, the deity of the Persians, and at Bacchus, who was thus denominated by the Sabians, a people of Thrace.

SABBATARIANS, OF SEVENTH DAY BAPTISTS, a sect of anabaptists; thus called, because they observed the Jewish or Saturday-Sabbath, from a persuation that it was never abrogated in the New Testament by the institutions of any other.

SABBATH,
SABBATH, in the Hebrew language, signifies **rest**.

The seventh day was denominated the Sabbath, or **day of rest**, because that in it God had rested from all his works which he created and made. From that time the seventh day seems to have been set apart for religious services; and, in consequence of a particular injunction, was afterwards observed by the Hebrews as a holyday. They were commanded to set it apart for sacred purposes in honour of the creation, and likewise in memorial of their own redemption from Egyptian bondage.

The importance of the institution may be gathered from the different laws respecting it. When the ten commandments were published from Mount Sinai in tremendous pomp, the law of the Sabbath held a place so peculiar to religious service, and a form by Moses, which the rules of criticism have entered upon their week; and subsequently, when the principal and regular returns of hallowed days, man would quickly forget the duty which he owes to God, and in a short time no vestige of religion would be found in the world.

Among the ordinances which God vouchsafed to the patriarchal age, we find that the pious observation of the holydays was particularly instituted; and the Sabbath was enjoined to be kept holy, in the most solemn manner, and under the severest penalties. Can it then be supposed that He would suffer mankind, from the creation of the world to the Mosaic era, to remain without an institution so expedient in itself, and as well fitted to answer the end proposed by it, under the one dispensation, as ever it could be under the other? No; we have every imaginable reason to conclude, that when religious services were enjoined, religious times were appointed also; for the one necessarily implies the other.

It is no objection to the early institution of the Sabbath, that there is no mention of it in the history of the patriarchal age. It would have swelled the Bible to a most enormous size, had the sacred historian given a particular account of all the transfigurations of those times; besides, it would have answered no end. When Moses wrote the book of Genesis, it was unnecessary to relate minutely transfigurations and institutions already well known by tradition; accordingly we see, that his narrative is everywhere very concise, and calculated only to preserve the memory of the most important facts.

Concerning the time at which the Sabbath was first instituted, different opinions have been held. Some have maintained, that the sanctification of the seventh day was observed by the patriarchs, and that it was to be observed by the Hebrews afterwards, from the children of Israel at the commencement of the Mosaic dispensation. But without entering into a particular examination of all the arguments adduced to support this opinion, a few observations will be sufficient to show that it rests on no solid foundation.

It cannot easily be supposed that the inspired penman would have mentioned the sanctification of the seventh day amongst the primeval transfigurations, if such sanctification had taken place until 2500 years afterwards. Writers, ambitious of that artificial elegance which the rules of criticism have established, often bring together in their narratives events which were themselves far distant, for the fake of giving form to their discourse; but Moses appears to have despised all such trifling refinements, and to have constructed his narrative in great conformity to the series of events.

From the accounts which we have of the religious service practised in the patriarchal age, it appears that, immediately after the fall, when Adam was restored to favour through a Mediator, a sacred form of public worship was instituted, which man was required to observe in testimony, not only of his dependence on the Creator, but also of his faith and hope in the promise made to our first parents, and from far off. Of an institution so grand and important, no circumstance would be omitted that is necessary to preserve it, or that contributes to render the observance of it regular and solemn.

That determined times are necessary for the due celebration of divine service, cannot be denied. Such is the constitution of man, that he must have particular times set apart for particular services. He is doomed to toil and labour; to earn his bread in the sweat of his face; and is capable of performing religious duties only in such a manner as is consistent with his situation in the world. If flatted times for religious solemnities had not been enjoined, the consequence would have been, that such solemnities would have been altogether neglected; for experience shows, that if mankind were left at liberty when and how often they would perform religious offices, these offices would not be performed at all. It is the observance of holy times that preserves the practice of holy services; and without the frequent and regular returns of hallowed days, man would quickly forget the duty which he owes to God, and in a short time no vestige of religion would be found in the world.

Among the ordinances which God vouchsafed to the early institution of the Sabbath, that there is no mention of it in the history of the patriarchal age. It would have swelled the Bible to a most enormous size, had the sacred historian given a particular account of all the transfigurations of those times; besides, it would have answered no end. When Moses wrote the book of Genesis, it was unnecessary to relate minutely transfigurations and institutions already well known by tradition; accordingly we see, that his narrative is everywhere very concise, and calculated only to preserve the memory of the most important facts.

However, if we take a view of the religious service of the patriarchal age, we shall find that what is called the legal dispensation, at least the liturgic part of it, was no new system, but a collection of institutions observed from the beginning, and republished in form by Moses. The Scriptures inform us that Cain and Abel offered sacrifices; and the account which is given of the acceptance of the one, and the rejection of the other, evidently shows that flatted laws respecting the service had then taken place. “In process of time,” “at the end of the days,” “Abel brought an offering.” Here was priest, altar, matter of sacrifice, appointed time, motive to sacrifice, atonement made, and accepted. The slitting of animals into clean and unclean before the flood, and Noah’s sacrifice immediately after his deliverance, without any new direction, is an unanswerable proof of the same truth. It is testified of Abraham, by God himself, that he kept his charge, his commands, his statutes, and his laws. These expressions comprehend the various branches, into which the law given at Sinai was divided. They contain the moral precepts, affirmative and negative, the matter of religious service, a body of laws.
from his conduct in every part of duty. Agreeably to this, we find that sacrifices were offered, altars and places of wor(lip consecrated, and the Sabbath also mentioned as a well-known solemnity, before the promulgation of the law. It is expressly taken notice of at the fall of manna; and the incidental manner in which it is then mentioned, is a convincing proof that the Israelites were no strangers to the institution; for had it been a new one, it must have been enjoined in a positive and particular manner, and the nature of it must have been laid open and explained, otherwise the term would have conveyed no meaning.

The division of time into weeks, or periods of seven days, which obtained to early and almost universally, is a strong indication that one day in seven was always distinguished in a particular manner. Week*, and seven days, are in scripture language synonymous terms. God commanded Noah, seven days before he entered the ark, to introduce into it all sorts of living creatures. When the waters of the flood began to abate, Noah sent forth a dove, which, finding no reft for the sole of her foot, returned to him. After seven days he sent forth the dove a second time, and again the returned to the ark.

At the expiration of other seven days he let go the dove a third time; and a week is spoken of (Gen. xxi) as a well known space of time.

This septenary division of time has been, from the earliest ages, uniformly observed over all the ancient world. The Israelites, Assyrians, Egyptians, Indians, Arabians, and Persians, have always made the division of a week, consisting of seven days. Many vain attempts have been made to account for this uniformity; but a practice so general and prevalent could never have taken place, had not the septenary distribution of time been intimated from the beginning, and handed down by tradition.

From the same source also must the ancient heathens have derived their notions of the sacredness of the seventh day. That they had such notions of it is evident from several passages of the Greek poets quoted by Aristobulus, a learned Jew, by Clement of Alexandria, and Eusebius.

Hesiod.

The seventh, the sacred day.

Homer.

Afterwards came the seventh, the sacred day.

Again:

On the seventh day all things were completed.

Linus.

All things were made perfect on the seventh day.

The Pythagoreans call it the venerable number, a sign of worthy of veneration, and held it to be perfect and most proper to religion. They denominated it fortunate, and also styled it voices, sound, mufs, because no doubt, seven distinct notes comprehend the whole scale of music, beyond which neither voice nor instrument can go, but must return from the seventh, and begin again anew. They likewise designated it leading to the end.

Seven, in the Hebrew language, is expressed by a word that primarily signifies fulness, completion, sufficiency, and is applied to a week, or seven days, because that was the full time employed in the work of creation; to the Sabbath, because on it all things were completed; and to an oath, because it is sufficient to put an end to all strife. This opening of the Hebrew root will enable us to come at the meaning of these expressions of the heathens, and also let us see whence they derived their ideas and modes of speaking, and that the knowledge of the transactions at the creation, though much perverted, was never entirely lost by them.

It has been supposed by some, that the heathens borrowed the notion of the sacredness of the seventh day from the Jews. But this opinion will not readily be admitted, when it is considered that the Jews were held in the greatest contempt by the surrounding nations, who derided them no less for their sabbaths than for their circumcision. All forts of writers ridiculed them on this account. Seneca charged them with spending the seventh part of their time in sloth. Tacitus said, that not only the seventh day, but also the seventh year, was unprofitably wasted. Juvenal brings forward the same charge; and Perius upbraided them with their return of sabbata. Plutarch said that they kept it in honour of Bacchus. Tacitus affirmed, that it was in honour of Saturn; but the most abominable affront of all is that of Apion, who said that they observed the Sabbath in memory of their being cured on that day of a shameful disease, called by the Egyptians fabbo.

Some perceiving the force of this objection have contended, that time was divided into weeks of seven days, that each of the planetary gods, the Sun, Moon, Mercury, Venus, Mars, Jupiter, and Saturn, who were the Divi majorum gentium, might have a day appropriated to his service. But if such was the origin of weeks, how came the great and ancient goddess Tellus to be omitted? She was worshipped by the early idolaters as well as the other planets, and must surely have been deemed by them as worthy of a particular day set apart to her honour as the planet Saturn, who was long unfrequented, afterwards seen but occasionally, and all times considered as of malignant aspect. (See Rem.

Others have supposed, that as the year was divided into lunar months of something more than 28 days, it was natural to divide the month into quarters from the different phases of the moon, which would produce as many weeks of seven days. But this supposition is less tenable than the former. The phases of the moon are not so precisely marked at the quarters as to attract to them any particular notice, nor are the quarterly appearances of one month commonly like those of another. We cannot, therefore, conceive what should have induced the earliest observers of the phases of the moon to divide the month into four parts rather than into three, or five, or seven. Had the ancient week consified of 14 days, it might have been inferred, with some degree of plausibility, that its length was regulated by the phases of the moon, because the shape of that luminary, at the end of the second quarter, is very precisely marked; but there is nothing which, in the present hypothesis, could have everywhere led mankind to make their weeks consist of seven days. This division of time, therefore, can be accounted for only by admitting the primeval institution.
Sabbath.

Fritution of the Sabbath, as related by Mofes in the book of Genesis. That institution was absolutely necessary to preserve among men a sense of religion; and it was renewed to the Jews at the giving of the law, and its observance enforced by the severest penalties. It was accordingly observed by them with more or less strictness in every period of their commonwealth, and there is none of the institutions of their divine lawgiver which, in their present state of dispersion, they more highly reverence. They regard it, indeed, with a superstitious reverence, and speak of it in the most magnificent terms. They have often varied in their opinions of the manner in which it ought to be kept. In the time of the Maccabees, they carried their respect for the sabbath so very high, that they would not on that day defend themselves from the attacks of their enemies. But afterwards, they did not scruple to stand on their necessary defence, although they would do nothing to prevent the enemy from carrying on their operations. When our favour was on earth, it was no sin to loose a beast from the stall, and lead him to water; and if he had chanced to fall into a ditch, they pulled him out: but now it is absolutely unlawful to give a creature in that situation any other affittance than that of food; and if they lead an animal to water, they must take care not to let the bridle or halter hang loose, otherwise they are transgressors.

As the law enjoins rest on that day from all servile employments, in order to comply with the injunction, they undertake no kind of work on Friday but such as can easily be accomplished before evening. In the afternoon they put into proper places the meat that they have prepared to eat the day following. They afterwards set out a table covered with a clean cloth, and place bread upon it, which they also cover with another cloth; and during the sabbath the table is never moved out of its place. About an hour before sunset, the women light the sabbath lamps, which hang in the places where they eat. They then stretch forth their hands to the light, and pronounce the following benediction, “Blessed be thou, O God, king of the world, who hast enjoined us, that are sanctified by thy commandments, to light the sabbath lamp.” These lamps are two or more in number, according to the size of the chamber in which they are suspended, and continue to burn during the greatest part of the night. In order to begin the sabbath well, they wash their hands and faces, trim their hair, and pare their nails, beginning at the fourth finger, then going to the second, then the fifth, then the third, and ending with the thumb. If a Jew calls the pairings of his nails to the ground, he is rajmah, that is, a wicked man; if he burns them in the fire, he is cheduf, that is worthy of honour, an holy man. When they have performed these preparatory ceremonies, they repair to the synagogue, and enter upon their devotions. As soon as prayers begin, the departed souls rising out of the purgatorial flames, and have given them to cool themselves in water while the sabbath lasts; for which reason the Jews prolong the continuance of it as much as they can; and the Rabbins have strictly commanded them not to exhaust all the water on the sabbath day, lest those miserable souls should by that means be deprived of the refreshing element. When they have ended their prayers, they return home, and salute another, by wishing a good sabbath. They then sit down to table. The matter of the family takes a cup full of wine, and lifting up his hand, says, “Blessed be thou, O God, our Lord, king of the world, who hast created the fruit of the vine.—Blessed be thou, O God our Lord, king of the world, who hast sanctified us by thy commandments, and given us thy holy sabbath; and of thy good will and pleasure hast left it to us as an inheritance, the memorial of thy works of creation. For it is the beginning of the congregation of saints, and the memorial of the coming out of Egypt. And thou hast also chosen us from all other people, and sanctified us, and with love and pleasure hast left thy holy sabbath an inheritance. Blessed be thou, O God, who sanctified the sabbath.” After this benediction is ended, he drinks, and gives the cup to all that are present. He then removes the cloth, and taking bread, says, “Blessed be thou, O God our Lord, king of the world, who bringest bread out of the earth.” Then he breaks off a bit, and eats, and also gives a piece of it to every one of the company.

On the morning of the sabbath, the Jews do not rise so early as they do at other times. Thinking, the greater pleasure they take on that day, the more devoutly they keep it. When they come into the synagogue, they pray as usual, only the devotions are somewhat longer, being intermingled with psalmody, in honour of the sabbath. The pentateuch is then produced, and several sections of it are read in order by seven persons who are chosen for the purpose. Several lessons are likewise read out of the prophets, which have some relation to what was read out of the law. After morning prayers they return to their houses, and eat the second sabbath meal, flattering every token of joy, in honour of the festivity. But if one has seen any thing ominous in his sleep; if he has dreamed that he burnt the book of the law; that a beam has come out of the walls of his house; that his teeth have fallen out,—then he fasts until very late at night, for all such dreams are bad ones. In the afternoon they go again to the synagogue, and perform the evening service, adding to the ordinary prayers some lessons that respect the sabbath. When the devotional duties are ended, they return home, and light a candle resembling a touch, and again sit down to eat. They remain eating until near six, and then the master of the family takes a cup, and pouring wine into it rehearsses some benedictions; after which he pours a little of the wine upon the ground, and says, “Blessed be thou, O Lord God, king of the world, who hast created the fruit of the vine.” Then holding the cup in his left hand, with the right he takes a box of sweet spices, and says, “Blessed be thou, O Lord God, who hast created various kinds of sweet spices.” He flinches the spices, and holds them out to the left, that they may do the fame. He then takes the cup in his right hand, and going to the candle views the left very narrowly, and pronounces a blessing. With the cup in the left hand, he examines the right in the same manner. Again, holding the cup in his right hand, he rehearses another benediction, and at the same time pours some of the wine on the ground. After this he drinks a little of it, and then hands it about to the rest of the family, who finish what

Sabbath.

what remains. In this manner the sabbath is ended by
the Jews, and they may return to their ordinary employments.
Those who meet their compliments, by wishing one another a happy week.

The Rabbins have reckoned up nine and thirty pri-
mary prohibitions, which ought to be observed on the
sabbatical festival; but their circumstances and dependents,
which are also obligatory, are almost innumerable. The
39 articles are, Not to till the ground; to sow; to reap;
to hay; to make band up sheaves of corn; to thresh;
to winnow; to grind; to sift meal; to knead the
dough; to bake; to shear; to whiten; to comb or card
wool; to spin; to twine or warp; to dye; to tie; to untie;
to few; to tear or pull in pieces; to build; to pull down;
to beat with a hammer; to hunt or fish; to kill a beast;
to fly it; to scrape the skin; to tan it; to cut leather;
to write; to scratch out; to rule paper for writing;
to kindle a fire; to extinguish it; to carry a thing from
place to place; to expose any thing to sale. These are
the primary prohibitions, and each of these has its pro-
cerbe and the Jews themselves say, that if they could
keep but two sabbaths as they ought, they would soon
be delivered out of all their troubles.

If a Jew on a journey is overtaken by the sabbath
in a wood, or on the highway, no matter where, nor
under what circumstances, he sits down; he will not fir
out of the spot. If he falls down in the dirt, he lies
there; he will not rise up. If he should tumble into a
privy, he would rest there: he would not be taken out
(a). If he fees a flea skipping upon his clothes, he
must not catch it. If it bites him, he may only re-
move it with his hand; he must not kill it; but a loufe
meets with no such indulgence, for it may be destroy-
ed. He must not wipe his hands with a towel or cloth,
but he may do it very lawfully with the highway, no matter where, nor
sances, but the blind
may indeed be very reasonably
of that devoted race, he may
be rescued from the dominion of him who has the power of
death.

This day was denominated by the primitive Chris-
tians the Lord's day. It was also sometimes called
Sunday; which was the name given to it by the heav-
thens, who dedicated it to the sun. And indeed, al-
thought it was originally called Sunday by the heathens,
yet it may very properly retain that name among Chris-
tians, because it is dedicated to the honour of: "The
true light," which lighteth every man that cometh into
the world, of Him who is styled by the prophet "The
Sun of righteousness," and who on this day arose
from the dead. But although it was, in the primitive
times, indifferently called the Lord's day or Sunday,
yet it was never denominated the sabbath; a name con-
stantly appropriated to Saturday, or the seventh day, both
by sacred and ecclesiastical writers.

Of the change from the seventh to the first day of
the week, or even of the institution of the Lord's day
festival, there is no account in the New Testament.
However, it may be fairly inferred from it, that the first
day of the week was, in the apostolic age, a stated
time for public worship. On this day the apostles were
assembled, when the Holy Ghost came down so visi-
ably upon them to qualify them for the conversion of
the world. On this day we find St Paul preaching at
Troas, when the disciples came to break bread; and
the directions which the same apostle gives to the Cor-
inthians concerning their contributions for the relief
of their suffering brethren, plainly allude to their reli-
gious assemblies on the first day of the week.

Thus it would appear from several passages in the
New Testament, that the religious observation of the
first day of the week is of apostolical appointment; and
may indeed be very reasonably supposed to be among
those directions and instructions which our blessed Lord
himself gave to his disciples, during the 40 days be-
 tween his resurrection and ascension, wherein he con-
verted with them, and spoke of the things pertaining
to the kingdom of God. Still, however, it must be
owned that those passages, although the plainest
that occur, are not sufficient to prove the apostolical institu-
tion of the Lord's day, or even the actual observation
of it. In order, therefore, to place the matter beyond
all controversy, recourse must be had to ecclesiastical
testimony.

From the consistent evidence and uniform practice
of the primitive church, and also from the attestation of
Pliny, an heathen of no mean figure both in learning and
power, we find that the first day of the week was
observed in the earliest ages as a holyday or festival,
in honour of the resurrection of Christ. Now there are
but two sources whence the custom could possibly have
arisen. It must have been instituted either by human
or divine authority: by human authority it was not
instituted; for there was no general council in those
early times, and without the decree of a general coun-
cil it was impossible that any ecclesiastical institution
could have been universally established at once. It re-
mains, therefore, that it must have been instituted by

(a) This seems, was once really the case. A Jew of Magdeburg fell into a privy on a Saturday. He might
have been taken out; but he told those who offered him their assistance to give themselves no trouble, for there
he was determined to keep holy the sabbath day. The bishop, when he heard of it, resolved that he should
sanctify the next day also in the same place; and so, betwixt them, the poor Jew lost his life.
divine authority: and that it really was so, will farther appear from the following considerations. It is certain that the apostles travelled over the greatest part of the world, and planted churches in the remotest parts of it. It is certain also that they were all led by the same spirit; and their desire was, that unity and uniformity should be observed in all the churches which they had founded. It is not therefore surprising that, in the primitive times, the same doctrine, the same worship, the same rites and customs, should prevail all over the Christian world; nay, it would have been unaccountable had the cause been otherwise. For this reason we may conclude that every custom, universally observed in the early ages of the Christian church, and not instituted by a general council, was of original appointment.

As the Lord's day is sanctified, that is, set apart to Christians for the worship and service of God, their Creator, Redeemer, and Sanctifier, a little consideration will easily discover how it ought to be observed. Although a day separated from worldly business, yet it is in no sense a day of idleness, but a season appropriated to the works of salvation and labours of charity.

In the primitive times this holy day was observed in the most solemn manner. From the monuments of those early ages we learn, that it was spent in a due and constant attendance on all the offices of divine worship. On it they held their religious assemblies, in which the writings of the apostles and prophets were read to the people, and the doctrines of Christianity further pressed upon them by the exhortations of the clergy. Solemn prayers and praises were offered up to God, and hymns sung in honour of Christ; the Lord's supper was constantly celebrated; and collections were made for the maintenance of the clergy and the relief of the poor. On this day they abstained, as much as they could, from bodily labour. They looked upon it as a day of joy and gladness; and therefore all fufpicion on it was prohibited, even during the season of lent, their great annual fast. — Such was the zeal of those times, that nothing, no not the severest persecutions, hindered them from celebrating holy offices on this day. They were often baited and betrayed, and as often flattered in consequence of cruel edicts from emperors, those very emperors for whose happiness and prosperity they always offered up their fervent prayers. For this cause, when they could not meet in the daytime, they assembled in the morning before it was light; and when sick, in exile, or in prison, nothing troubled them more than that they could not attend the service of the church. No trivial pretences were then admitted for any one's absence from public worship; for severe confinements were passed upon all who were absent without some urgent necessity. When the empire became Christian, Constantine and his successors made laws for the more solemn observation of the Lord's day. They prohibited all procriptions and pleadings and other juridical matters to be transacted on it, and also all unnecessary labour; not that it was looked upon as a Jewish sabbath, but because these things were considered as inconsistent with the duties of the festival.

But although the primitive Christians did not indulge themselves in the practice of unnecessary labour or idleness on this day, yet they did not wholly abstain from working, if great necessity required it. The council of Laodicea enjoined that men should abstain from work on the Lord's day if possible; but if any were found to judjce, they were to be curst as great transgressors. So circumstanced were the primitive Christians about their conduct on this festival, that on the one hand they avoided all things which tended to profane it, while on the other they curst all those who instilled it should be observed with Pharisaical rigour.

The primary duty of the Lord's day is public worship. The nature and design of the Christian religion sufficiently shows the necessity and importance of assembling for the duties of devotion. The whole scope of Christianity is to bring us to an union with God, it is the end which cannot be obtained or preferred without frequent communications with him; and the reasons which show religious intercourse to be the indispensable duty of Christians in a private capacity, will bind it with equal or more force on them considered as a community.

The advantages of public worship, when duly performed, are many and great. There are two, however, which deserve to be considered in a particular manner. It gives Christians an opportunity of openly professing their faith, and testifying their obedience to their Redeemer in the world and before men; and in an age when atheism has arisen to an alarming height, when the Son of God is crucified afresh, and put to open shame, every man, who has any regard for religion, will cheerfully embrace all opportunities of declaring his abhorrence of the vicious courses pursued by those degenerate apostates. He will with pleasure lay hold on every occasion to testify that he is neither afraid nor ashamed to confess the truth; and will think it his indispensable duty openly to disfavour the sins of others, that he may not incur the guilt of partaking of them. Public worship preserves in the minds of men a sense of religion, without which society could not exist. Nothing can keep a body of men together and unite them in promoting the public good, but such principles of adhesion may reach and govern the heart. But these can be derived only from a sense of religious duties, which can never be so strongly impressed upon the mind as by a constant attendance upon public worship. Nothing can be more weak than to neglect the public worship of God, under the presence that we can employ ourselves as acceptably to our Maker at home in our closets. Both kinds of worship are indeed necessary; but one debt cannot be paid by the discharge of another. By public worship every man professes his belief in that God whom he adores, and appeals to Him for his sincerity, of which his neighbour cannot judge. By this appeal he endears himself more or less to others. It creates confidence; it roots it in the heart, and all other Christian virtues, which produce, in common life, the fruits of mutual love and general peace.

People in general are of opinion that the duties of the Lord's day are over when public worship is ended. But they seem to forget for what purposes the day was set apart. It is not only appropriated to the duties of public worship, but also sanctified to our improvement in the knowledge of the doctrines of Christianity. It is an institution calculated to alleviate the condition of the laborious classes of mankind, and, in
consequence of that, to afford rest to beast alike. It is proper, it is necessary, that man should reflect on his condition in the world, that he should examine the state of his soul, and inquire what progress he has made in that work which was given him to do. Those that have children or servants are obliged to look after their instruction as well as their own. These are the ends which the institution of Sunday was designed to answer. Every man must allow that these things must be done at some time or other; but unless there be fit times for doing them, the generality of mankind would wholly neglected them.

Visiting and travelling (though very common) are enormous profanations of this holy day. Families are thereby robbed of their time; a loss for which no amends can ever be made; Servants, instead of having leisure to improve themselves in spiritual knowledge, are burdened with additional labour: And in a man of any humanity, it must excite many painful sensations, when he reflects how often the useful hortense on that day experiences all the anguish of hunger, torn sides, and battered knees. Every kind of amulence, every kind of common labour, is an encroachment on the particular duties of the Lord's day; and consequently men profane the day by spending it in any amusements, or undertaking upon it any ordinary employment unless it be a work of absolute necessity.

Sabbatarian Breaking, or profanation of the Lord's day, is punished by the municipal laws of England. For, besides the notorious indecency and scandal of permitting any secular busines to be publicly transacted on that day in a country professing Christianity, and the corruption of morals which usually follows its profanation, the keeping one day in seven holy, as a time of relaxation and refreshment, as well as for public worship, is of admirable service to a state, considered merely as a civil institution. It humanizes, by the help of conversation and society, the manners of the lower classes; which would otherwise degenerate into a savage ferocity fordid and selfishness of spirit; it enables the industrious workman to pursue his occupation in the ensuing week with health and cheerfulness; it imprints on the minds of the people that sense of their duty to God so necessary to make them good citizens; but which yet would be worn out and defaced by an unremitting continuance of labour, without any fated times of recalling them to the worship of their Maker. And therefore the laws of king Athelian forbade all merchandizing on the Lord's day, under very severe penalties. And by the statute 27 Hen. VI. c. 5. no fair or market shall be held on the principal festivities, Good-Friday, or any Sunday (except the four Sundays in harvest), on pain of forfeiting the goods expose to sale. And, since by the statute 1 Car. I. c. 1. no persons shall assemble, out of their own parishes, for any sport whatsoever, upon this day; nor, in their parishes, shall use any bull or bear beating, interludes, plays, or other unlawful exercises or pastimes; on pain that every offender shall pay 3s. 4d. to the poor. This statute does not prohibit, but rather impeded allows, any innocent recreation or amusement, within their respective parishes, even on the Lord's day, after divine service is over. But by statute 20 Car. II. c. 7. no person is allowed to work on the Lord's day, or use any boat or barge, or expose any goods to sale, except meat in public houses, milk at certain hours, and works of necessity or charity, on forfeiture of 5s. Nor shall any drover, carrier, or the like, travel upon that day, under pain of 20s.

SABELLIANS, a sect of Christians of the 3rd century, that embraced the opinions of Sabellius, a philosopher of Egypt, who openly taught that there is but one person in the Godhead.

The Sabellians maintained, that the Word and the Holy Spirit are only virtues, emanations, or functions of the Deity; and held, that he who is in heaven is the Father of all things, that he descended into the virgin, became a child, and was born of her as a son; and that having accomplished the mystery of our salvation, he diffused himself on the apostles in tongues of fire, and was then denominated the Holy Ghost. This they explained by resembling God to the sun, the illuminative virtue or quality of which was the Word, and its warming virtue the Holy Spirit. The word, they taught, was darted, like a divine ray, to accomplish the work of redemption; and that being re-descended to heaven, the influences of the Father were communicated after a like manner to the apostles.

SABIONS, an early sect of idolaters, which continues to this day, and worships the sun, moon, and stars. See Polytheism, n° 10, 11, 12.

SABINA, a province of Italy, in the territories of the church; bounded on the north by Umbria, on the east by Farther Abruzzo, on the south by the Campagna of Rome, and on the west by the patri­mony of St Peter. It is 22 miles in length, and almost as much in breadth; watered by several small rivers, and abounding in oil and wine. There is no walled town in it, and Magliano is the principal place.

SABINUS (George), a celebrated Latin poet, born in the electorate of Brandenburg in 1508. His poem Res gesta Cesarum Germanorum, spread his reputation all over Germany, and procured him the patronage of all the princes who had any regard for polite literature; he was made professor of the belles lettres at Frankfort on the Oder, rector of the new academy of Koningburg, and counsellor to the elector of Brandenburg. He married two wives, the first of which was the eldest daughter of the famous reformer Melanchthon; and died in 1560. His poems are well known, and have been often printed.

SABLE, or Sable Animal, in zoology, a creature of the weasel-kind, called by authors mystis zelitha. See Mustela, n° 6.

The chase of these animals, in the more barbarous times of the Russian empire, was the employ, or rather talk, of the unhappy exiles in Siberia. As that country is now become more populous, the fables have in a great measure quitted it; and retired farther north and east, to live in desert forests and mountains: they live near the banks of rivers, or in the little islands in them; on this account they have, by some, been supposed to be the Zacaphyes of Aristotle (Hyl. Anim. lib. viii. c. 5.), which clasps with the animals conversant among waters.

At present the hunters of fables form themselves into troops, from five to 40 each: the last subdivides into letter parties, and each chooses a leader; but there is one that directs the whole: a small covered boat is provided for each party, loaded with provisions, a dog, and
and net for every two men, and a vessel to bake their bread in; each party has also an interpreter for the country they penetrate into. Every party then sets out according to the course their chief points out: they go against the stream of the rivers, drawing their boats up, till they arrive in the hunting country; there they stop, build huts, and wait till the waters are frozen, and the feason commences; before they begin the chase, their leader assembles them, they unite in a prayer to the Almighty for success, and then separate: the first fable they take is called God's fable, and is dedicated to the church. When the sojourners have been reduced to take two thin boards, one of the furriers are frozen, and the season commences: before they be-

Then they penetrate into the woods; mark the trees as they advance, that they may know their way back; and in their hunting-quarters form huts of trees, and bank up the snow round them; near these they lay their traps; then advance farther, and lay more traps, till building new huts in every quarter, and return successively to every old one to visit the traps and take out the game to skin it, which none but the chief of the party must do; during this time they are supplied with provisions by persons who are employed to bring it on sledges, from the places on the road, where they are obliged to form magazines, by reason of the impracticability of bringing quantities through the rough country they must pass. The traps are a fort of pitfall, with a loose board placed over it, baited with fish or flesh: when fables grow scarce, the hunters trace them in the new-fallen snow to their holes; place their nets at the entrance; and sometimes wait, watching two or three days for the coming in of the animal; it has happened that these poor people have, by the failure of their provisions, been so pinched with hunger, that, to prevent the cravings of appetite, they have been reduced to take two thin boards, one of which they applied to the pit of the stomack, the other to the back, drawing them tight together by cords placed at the ends: such are the hardships our fellow-creatures undergo to supply the wantonness of luxury.

The feason of chase being fulfilled, the hunters reassemble, make a report to their leader of the number of fables each has taken; make complaints of offenders against their regulations; punish delinquents; share the booty; then continue at the head-quarters till the rivers are clear of ice; return home, and give to every church the dedicated furs.

**Sable Cape**, the most southerly province of Nova Scotia, in North America, near which is a fine cod-fifhery. W. Long. 65. 34. N. Lat. 43. 24.

Sable Isle is adjoined to this cape, and the coasts of both are most commodiously fitted for fisheries.

**Sable Trade**, the trade carried on in the skins or furs of fables; of which the following commercial history was translated by Mr. J. R. Ford in a Russian performance on that subject by Mr. Muller.

"**Sable, fable** in Russian; *wolke* in German. Their price varies from 1 l. to 10 l. Sterling, and above: fine and middling fable-skins are without bellies, and the coarse ones are with them. Forty skins make a collection called *zimmer*. The finest fables are sold in pairs perfectly similar, and are dearer than single ones of the same goodness; for the Russians want those in pairs for facing caps, cloaks, tippets, &c. the blackest are reputed the best. Sables are in seafon from November to February; for those caught at any other time or the year are short-haired, and then called *mehofobi*. The hair of fables differs in length and quality: the long hairs, which reach far beyond the inferior ones, are called *or*; the more a skin has of such long hairs, the blacker it is, and the more valuable is the fur; the very best have no other but those long and black hairs. *Motchka* is a technical term used in the Russian fur-trade, expressive of the lower part of the long hairs; and sometimes it comprehends likewise the lower and shorter hairs: the abovementioned belt fable furs are said to have a black motchka. Below the long hairs is called the greater part of the fable-furs, some shorter hairs, called *podofia*, i.e. under-os; the more podofia a fur has, it is the less valuable: in the better kind of fables the podofia has black tips, and a grey or rusy motchka. The first kind of motchka makes the middling kind of fable furs; the red one the worst, especially if it has but few os. Between the os and podofia is a low woolly kind of hair, called *podofa*. The more podofa a fur has, the less valuable: for the long hair will, in such case, take no other direction than the natural one; for the characters of fable is, that notwithstanding the hair naturally lies from the head towards the tail, yet it will lie equally in any direction as you strike your hand over it. The various combinations of these characters, in regard to os, motchka, podofia, and podofa, make many special divisions in the goodness of furs: besides this, the furriers attend to the size, preferring always, *catrus paribus*, the bigger, and those that have the greatest glos. The size depends upon the animal being male or a female, the latter being always smaller. The glos vanishes in old furs: the fresh ones have a kind of bloominess appearance, as they express it; the old ones are said to have done blooming: the dyed fables always lose their gloes; become less uniform, whether the lower hairs have taken the dye or not; and commonly the hairs are somewhat twighted or crilped, and not so straight as in the natural ones. Some fumigate the skins, to make them look blacker; but the smell, and the crilped condition of the long hair, betrays the cheat; and both ways are detected by rubbing the fur with a moist linen cloth, which grows black in such cases.

"The Chinese have a way of dyeing the fables, so that the colour not only lasts (which the Russian cheats cannot do), but the fur keeps its glos, and the crilped hairs only discover it. This is the reason that all the fables, which are of the belt kind, either in pairs or separate, are carried to Russia; the rest go to China. The very best fables come from the environs of Nertchik and Yakutik; and in this latter district, the country about the river Ud affords sometimrs fables of whom one single fur is often sold at the rate of 60 or 70 rubles, 12 l. or 14 l. The bellies of fables, which are sold in pairs, are about two fingers breadth, and are tied together by 40 pieces, which are sold from 1 l. to 2 l. Sterling, Tails are sold by the hundred. The very best fable-furs must have their tails; but ordinary fables are often cropped, and 100 fold from 4 l. to 8 l. Sterling. The legs or feet of fables are seldom sold separately; white fables are rare, and no common merchandise, but bought only as curiosities: some are yellowish, and are bleached in the spring on the snow."
SABLE, in heraldry, signifies "black;" and is borrowed from the French, as are most terms in this science: in engraving it is expressed by both horizontal and perpendicular lines crossing each other. Sable of itself signifies confidency, learning, and grief; and ancient heralds will have it, that when it is compounded with

Or [Honour]

Az. [Application]
Ver. [Comfort]
Pur. [Authority]

The occasion that introduced this colour into heraldry is thus related by Alexander Nesbit, p. 8. The duke of Anjou, king of Sicily, after the loss of that kingdom, appeared at a tournament in Germany all in black, with his shield of that tincture, fené de larmes, i.e. bespotted with drops of water, to represent tears, indicating that both his grief and loss.

SABLESTAN, or Sabestan, a province of Asia, in Persia, on the frontiers of Indolban; bounded on the north by Khorasan; on the east, by the mountains of Balk and Candahar; on the south, by Sagelian or Segfelan; and on the west, by Heri. It is a mountainous country, very little known to Europeans; nor is it certain which is the capital town.

SABRE, a kind of sword or scimitar, with a very broad and heavy blade, thick at the back, and a little of sugar spoils the colour of, and partially weapon worn by the Turks, who are said to be very expert in the use of it. Dr. Blackill and Candahar; on the Segfelan; broad and heavy blade, thick at the back, and a little sugar spoils the colour of, and partially weapon worn by the Turks, who are said to be very expert in the use of it. Dr. Blackill and Candahar; on the Segfelan; broad and heavy blade, thick at the back, and a little sugar spoils the colour of, and partially weapon worn by the Turks, who are said to be very expert in the use of it. Dr. Blackill and Candahar; on the Segfelan; broad and heavy blade, thick at the back, and a little sugar spoils the colour of, and partially weapon worn by the Turks, who are said to be very expert in the use of it. Dr. Blackill and Candahar; on the Segfelan; broad and heavy blade, thick at the back, and a little sugar spoils the colour of, and partially weapon worn by the Turks, who are said to be very expert in the use of it. Dr. Blackill and Candahar; on the Segfelan; broad and heavy blade, thick at the back, and a little sugar spoils the colour of, and partially weapon worn by the Turks, who are said to be very expert in the use of it. Dr. Blackill and Candahar; on the Segfelan; broad and heavy blade, thick at the back, and a little sugar spoils the colour of, and partially weapon worn by the Turks, who are said to be very expert in the use of it. Dr. Blackill and Candahar; on the Segfelan; broad and heavy blade, thick at the back, and a little sugar spoils the colour of, and partially weapon carried by the horsemanship to the horse, in pulling or twitching the reins of the bridle all on a sudden and with one pull, and that when a horse lies heavy Sacerdotal upon the hand, or obstinately arms himself.

This is a correction used to make a horse carry well; but it ought to be used discreetly, and but seldom.

SACREDOTAL, something belonging to priests. See PRIEST.

SACCUS, in anatomy, a diminutive of sacrum, signifies a little bag, and is applied to many parts of the body.

SACCHARUM, Sugar, or the Sugar-Cane, in botany: A genus of the digynia order, belonging to the triandra class of plants; and in the natural method ranking under the 4th order, Gramina. There is no calyx, but a long down; the corolla is bivalved. There is but one species of this genus, viz. the officina. It is a native of Africa, the East Indies, and of Brazil; from whence it was introduced into the West India islands soon after they were settled. The sugar-cane is the glory and the pride of those islands. It amply rewards the industrious planter, enriches the British merchant, gives bread to thousands of manufacturers and seamen, and brings immense revenue to the crown. For the produce of making sugar, see Sugar.

Sugar, formerly a luxury, is now become one of the necessaries of life. In crop-time every negro on the plantations, and every animal, even the dogs, grow fat. This sufficiently points out the nourishing and healthy qualities of sugar. It has been alleged, that the eating of sugar spoils the colour of, and corrupts the teeth: this, however, proves to be a mistake, for no people on the earth have finer teeth than the negroes in Jamaica. Dr. Alliton, formerly professor of botany and materia medica at Edinburgh, endeavored to obviate this vulgar opinion: he had a fine set of teeth, which he ascribed solely to his eating great quantities of sugar. Externally too it is often useful: mixed with the pulp of roasted oranges, and applied to putrid or ill-disposed ulcers, it proves a powerful corrector.

SACCHI (Andrea), a celebrated painter, born at Rome in 1594. He was the disciple of Francisco Alano, whom he afterwards surpassed in taste and correctness. He distinguished himself in a very eminent degree by his paintings in fresco; and a strong emulation of the works of Raphael and of Pietro da Cortona, they each arrived at a degree of perfection that neither of them might have known without such a competition. The works of Sacchi have much intrinsic merit, and are finished with such uncommon care and skill, as will always secure the applause of the judicious, and preserve their true value. He died in 1668.

SACHEVEREL (Dr. Henry), a famous clergyman of the Tory faction in the reign of Queen Anne; who distinguished himself by indecent and scurrilous sermons and writings against the dissenters and revolution principles. He owed his consequence, however, to being indirectly prosecuted by the house of lords for his libellous sermons at Derby, and his 5th of November sermon at St. Paul's in 1709; in which he ascertained the doctrine of non-resistance to government in its utmost extent; and reflected severely on the act of toleration. The high and low church parties were very violent at that time; and the trial of Sacheverel inflamed the high-church party to dangerous riots and excesses; he was, however, suspended for three years, and his sermons burned by the common hangman. The Tories being
in administration when Sackvill's suspension expired, he was freed with every circumstance of honour and public rejoicing; was ordered to preach before the commons on the 29th of May, had the thanks of the house for his discourse, and obtained the valuable reversion of St Andrew's, Holborn.

SACK, a wine used by our ancestors, which some have taken to be Rhenish and some Canary wine. Venner, in his Via Retta ad Vitam Longam, printed in 1628, says that fack is "completely not in the third degree, and that some affect to drink fack with sugar and fome without, and upon no other ground, as I think, but as it is best pleasing to their palate." He goes on to say, "that fack, taken by itself, is very hot and very penetrative; being taken with sugar, the heat is both somewhat allayed, and the penetrative quality thereof also retarded." He adds further, that Rhenish, &c. decline after a twelvemonth, but fack and the other stronger wines are best when they are two or three years old. It appears to be highly probable that fack was not a sweet wine, from its being taken with sugar, and that it did not receive its name from having a fuchacrine flavour, but from its being originally flaked in facks or borchios. It does not appear to have been a French wine, but a strong wine the production of a hot climate. Probably it was what is called dry mountain, or some Spanish wine of that kind. This conjecture is the more plausible, as Howell, in his French and English Dictionary, printed in the year 1659, translates fack by the words vin d'Espagne, vin sec.

Sack of Wool, a quantity of wool containing just 22 stone, and every stone 14 pounds. In Scotland, a sack is 24 stone, each stone containing 16 pounds.

Sack of Cotton Wool, a quantity from one hundred and a half to four hundred weight.

Sacks of Earth, in fortification, are canvas bags filled with earth. They are used in making reinforceiments in haits, to place on parapets, or the head of the breaches, &c. to repair them, when beaten down.

SACKBUT, a musical instrument of the wind kind, being a sort of trumpet, though different from the common trumpet both in form and use; it is fit to play a bass, and is contrived to be drawn out or shortened, according to the time required, whether grave or acute. The Italians call it trombone, and the Latins tuba dulcis.

SACKVILLE (Thomas, Lord Buckhurst, and earl of Dorset), a statesman and poet, the son of Richard Sackville, Eng. of Buckhurst, in the parish of Whitham in Suffex, was born in the year 1556. He was sent to Harrow in Oxford, in the latter end of the reign of Edward VI, whence he removed to Cambridge, where he took a master of arts degree, and thence to the Inner Temple. He now applied himself to the study of the law, and was called to the bar. We are told that he commenced poet whilst at the universities, and that these his juvenile productions were much admired, none of which, however, have been preserved.

In the fourth and fifth year of queen Mary, we find him a member of the house of commons; about which time, in 1557, he wrote a poetical piece, intituled The Induction, or The Mirror of Magistrates. This laft was meant to comprehend all the unfortunate Great from the beginning of English history; but the design being dropped, it was inserted in the body of the work. The Mirror of Magistrates is formed on a dramatic plan; Sackville in which the persons are introduced speaking. The Induction is written much in the style of Spencer, who, with some probability, is supposed to have imitated this author.

In 1561, his tragedy of Coriolanus was acted before queen Elizabeth by the gentlemen of the Inner Temple. This was the first tolerable tragedy in our language. The Companion to the Play-house tells us, that the three first acts were written by Mr Tho. Norton. Sir Philip Sidney, in his Apology for Poetry, says, "it is full of flately speeches, and well-founding phrases, climbing to the height of Seneca in his style, &c. Rymer speaks highly in its commendation. Mr Spence, at the induction of Mr Pope, republished it in 1736, with a pompous preface. It is said to be our first dramatic piece written in verse.

In the first parliament of this reign, Mr Sackville was member for Suffolk, and for Bucks in the second. In the mean time he made the tour of France, Italy, and in 1566 was imprisoned at Rome, when he was informed of his father's death, by which he became possessed of a very considerable fortune.

Having now obtained his liberty, he returned to England; and being first knighted was created Lord Buckhurst. In 1570 he was sent ambassador to France. In 1586 he was one of the commissioners appointed to try the unfortunate Mary queen of Scots; and was the meffenger employed to report the confirmation of her sentence, and to see it executed. The year following he went ambassador to the States General, in consequence of their complaint against the earl of Leiceter; who, disliking his impartiality, prevailed on the queen to recall him, and confine him to his house. In this state of confinement he continued about ten months, when Leiceter dying, he was restored to favour, and in 1580 was invested knight of the garter: but the most incontrovertible proof of the queen's partiality for Lord Buckhurst appeared in the year 1591, when she caused him to be elected chancellor in the university of Oxford, in opposition to her favourite Essex. In 1598, on the death of the treasurer Burleigh, Lord Buckhurst succeeded him, and by virtue of his office became in effect prime minister; and when, in 1601, the earls of Essex and Southampton were brought to trial, he sat as lord high toudar on that awful occasion.

On the accesion of James I, he was graciously received, had the office of lord high treasurer confirmed to him for life, and was created earl of Dorset. He continued in high favour with the king till the day of his death; which happened suddenly, on the 19th of April 1608, in the council chamber at Whitehall. He was interred with great solemnity in Westminster abbey. He was a good poet, an able minister, and an honest man. From him is descended the present noble family of the Dorsets. "It were needless (says Mr Walpole) to add, that he was the patriarch of a race of genius and wit."

SACKVILLE (Charles, earl of Dorset), a celebrated wit and poet, descended from the foregoing, was born in 1637. He was, like Villiers, Rochester, Sedley, &c. one of the libertines of Charles's court, and sometimes indulged himself in inexculcable excesses. He openly discontenanced the violent measures of James II. and engaged early for the prince of Orange.
SACRAMENT

Orange, by whom he was made lord chamberlain of the household, and taken into the privy-council. He died in 1706, and left several poetical pieces, which, though not considerable enough to make a volume by themselves, may be found among the works of the minor poets, published in 1749.

SACRAMENT is derived from the Latin word sacramentum, which signifies an oath, particularly the oath taken by soldiers to be true to their country and general. The words of this oath, according to Polybius, were: omittaturus sum et facturus quicquid mandavit ab imperatoribus justa vires. The word was adopted by the writers of the Latin church, and employed, perhaps with no great propriety, to denote those ordinances of religion by which Christians came under an obligation, equally facred with that of an oath, to observe their part of the covenant of grace, and in which they have the assurances of Christ that he will fulfill his part of the same covenant.

Of sacraments, in this sense of the word, Protestant churches admit of but two; and it is not easy to conceive how a greater number can be made out from Scripture, if the definition of a sacrament be just in its nature, as given by the church of England. By that church, the meaning of the word sacrament is declared to be an outward and visible sign of an inward and spiritual grace given unto us, ordained by Christ himself, as a means whereby we receive the same, and a pledge to assure us thereof.” According to this definition, baptism and the Lord’s Supper are certainly sacraments; for each consists of an outward and visible sign of what is believed to be an inward and spiritual grace; both were ordained by Christ himself, and by the reception of each does the Christian come under a solemn obligation to be true to his divine master, according to the terms of the covenant of grace. (See BAPTISM and SUPPER of the Lord.)

The Romanists, however, add to this number confirmation, penance, extreme unction, ordination, and marriage, holding in all seven sacraments; but two of those rites not being peculiar to the Christian church cannot possibly be Christian sacraments, in contradistinction to the sacraments or obligations into which men enter by the Christian church. Marriage was instituted from the beginning, when God made man male and female, and commanded them to be fruitful, and multiply and replenish the earth; and penance, as far as it is of the same import with repentance, has a place in all religions which teach that God is merciful, and men fallible.

The external severities imposed upon penitents by the church of Rome (i.e. PENCE) may indeed be in some respects peculiar to the discipline of that church, though the penances of the Hindoos are certainly as rigid; but none of these severities were ordained by Christ himself as the pledge of an inward and spiritual grace; nor do they, like baptism and the Lord’s Supper, bring men under obligations which are supposed to be analogous to the meaning of the word sacramentum. Confirmation has a better title to the appellation of a sacrament than any of the other five papal rites of that name, though it certainly was not considered as such by the earliest writers of the Christian church, nor does it appear to have been ordained by Christ himself, (see CONFIRMATION). Ordination is by many churches considered as a very important rite; but as it is not administered to all men, nor has any particular form ap-propriated to it in the New Testament, it cannot be considered as a Christian sacrament conferring grace generally necessary to salvation. It is rather a form of authorizing certain persons to perform certain offices, which respect not themselves but the whole church; and extreme unction is a rite which took its rise from the miraculous powers of the primitive church vainly claimed by the succeeding clergy. (See ORDINATION and EXTREME UNCTION.) These confiderations seem to have some weight with the Roman clergy themselves; for they call the eucharist, by way of eminence, the holy sacrament. Thus to expose the holy sacrament, is to lay the consecrated host on the altar to be adored.—The procession of the holy sacrament is that in which this host is carried about the church, or about a town.

Numerous as we think the sacraments of the Roman church, a sect of Christians sprung up in England early in the current century who increased their number. The founder of this sect was a Dr. Deacon, whom we think, of Manchester, where the remains of it were lately, and probably do so at present. According to the men, every rite and every phrase in the book called the Apostolical Constitutions were certainly in use among the apostles themselves. Still, however, they make a distinction between the greater and the lesser sacraments. The greater sacraments are only two, baptism and the Lord’s supper. The lesser are no fewer than ten, viz. five belonging to baptism, exorcism, anointing with oil, the white garment, a taste of milk and honey, and anointing with chrism or ointment. The other five are, the sign of the cross, imposition of hands, union of the sick, holy orders, and marriage. Of the nature of these lesser sacraments, or the grace which they are supposed to confer, our limits will permit us to give no account.—Nor is it necessary that we should. The sect which taught them, if not extinguished, is certainly in its last wane. It has produced, however, one or two learned men; and its founder’s Full, True, and Comprehensive View of Christianity, in two Catechisms, is a work which the Christian antiquary will read with pleasure for information, and the philosopher for the materials which it contains for meditation on the workings of the human mind. It was published in 8vo, in the year 1748.

Congregation of the Holy Sacrament, a religious establishment formed in France, whose founder was Augustin, bishop of Bethlehem, and which, in 1644, received an order from Urban VIII. to have always a number of ecclesiastics ready to exercise their ministry among pagan nations, wherever the pope, or congregation de propaganda, should appoint.

SACRAMENTARIANS, a general name given to all such as have published or held erroneous doctrines of the sacrament of the Lord’s Supper. The term is chiefly applied among Roman Catholics, by way of reproach, to the Lutherans, Calvinists, and other Protestants.

SACRAMENTARY, an ancient Roman church-book, which contains all the prayers and ceremonies practiced in the celebration of the sacraments.

It was wrote by pope Gelasius, and afterwards reviv’d, corrected, and abridged, by St. Gregory.

SACRE, or Saker, in ornithology, the name of a species of falcon, called by authors falco fasciatus, and differ-
Sacred, Sacrifice. 

Sacred, sacrifice; are fons; abbots are only blessed.—The deaconship, sub-deaconship, and subprio- 
fes, are all sacred orders, and are said to impart a sacred indelible character. The 
custom of consecrating kings with holy oil is derived (says Guttingius) from the Hebrews; among whom, 
he agrees with Grotius, it was never used but to kings who had not an evident right by 
succession. He adds, that the Christian emperors never used it before Justin 
the younger; from whom he takes it to have passed to the Goths, &c.

Sacred is applied to things belonging to God and the church. Churchlands, ornaments, &c. are 
held sacred.—The sacred college is that of the cardinals.

Sacred Majesty, is applied to the emperor and to the king of England; yet Loyseau says it is blasphemy. 
See Majesty. The ancients held a place stuck with thunder as sacred. In the civil law, sacred place chiefly 
denotes that a person deceased has been interred.

Sacred Elixir. See Elixir.

Sacrifice, an offering made to God on an altar, by means of a regular minister, as an acknowledgment 
of his power, and a payment of homage. Sacrifices (though the term is sometimes used to comprehend 
all the offerings made to God, or in any way devoted to his service and honour) differ from 
mere oblations in this, that in a sacrifice there is a real destruction or change of the thing offered, 
whereas an oblation is only a simple offering or gift, without any such change at all: thus, all sorts of tythes, 
and first fruits, and whatever of men's worldly substance is consecrated to God, for the support of his 
worship and the maintenance of his ministers, are offer- 

ings or oblations; and these, under the Jewish law, 
were either of living creatures or other things: but 
sacrifices, in the more peculiar sense of the term, were 
either wholly or in a part consumed by fire. They 
have by divines been divided into bloody and unbloody. 
Bloody sacrifices were made of living creatures; un- 
bloody of the fruits of the earth. They have also been 
divided into expiatory, imperatory, and cabalistical. The 
first kind were offered to obtain of God forgiveness of 
sins; the second, to procure some favour; and the 
third, to express thankfulness for favours already re- 
ceived. Under one or other of these heads may all 
sacrifices be arranged; though we are told, that the 
Egyptians had 666 different kinds, a number surpassing 
all credibility.

Concerning the origin of sacrifices, various opinions have been held. By many, the Phenicians are 
supposed to have been the authors of them; though 
Porphyry attributes their invention to the Egyptians; 
and Ovid imagines, from the import of the name victlm 
and kyphia, that no bloody sacrifices were offered till wars 
prevailed in the world, and nations obtained victories 
over their enemies. These are mere hypotheses, 
contradicted by the most authentic records of antiquity, 
and entitled to no regard.

By modern deists, sacrifices are said to have had their origin in superstitition, which operates much in the same 
way in every country. It is therefore weak, according to 
those men, to derive this practice from any particular 
persons of great name, who admit the authenticity of 
the Hebrew and Christian sacrificial ceremonies, and 
firmly rely on the atonement made by Christ, are yet unwilling (it is 
difficult to conceive for what reason) to allow that 
sacrifices were originally instituted by God. Of this 
way of thinking were St. Chrysostom, Spencer, Grotius, 
and Warburton, as were likewise the Jews Maimonides, R. 
Levi,
Levi, Men Gerson, and Abarnabel. The greater part of these writers maintain, that sacrifices were at first a human institution; and that God, in order to prevent their being offered to idols, introduced them into his service, though he did not approve of them as good in themselves, or as proper rites of worship. That the infinitely wise and good God should introduce into his service improper rites of worship, appears to us for them, extremely improbable, that we cannot but wonder how such an opinion should ever have found its way into the minds of such men as those who held it. Warburton's theory of sacrifice is much more plausibly, and being more lately published, is worthy of particular examination.

According to this ingenious prelate, sacrifices had their origin in the sentiments of the human heart, and in the ancient mode of conveying by action in aid of words. Gratitude to God for benefits received is natural to the mind of man, as well as his bounden duty. "This duty (says the bishop *) was in the most early times discharged in expressive actions, the least equivocal of which was the offerer's bringing the first fruits of agriculture and cultivate to that lieuferedly place where the Deity used to be more solemnly invoked, at the hallowed times of public worship; and there presenting them in homage, with a demand which spoke to this purpose. "I do hereby acknowledge thee, O my God! to be the author and giver of all good: and do now, with humble gratitude, return my warmest thanks for these thy blesings particularly bestowed upon me."—Things thus devoted became consecrated: and to prevent their deformation, the readiest way was to send them to the table of the priest, or to consume them in the fire of the altar. Such, in the opinion of our author, was the origin of eucharistical sacrifices. Imperatorial or precative sacrifices had, he thinks, the same origin, and were contrived to express by action an invocation for the continuance of God's favour. "Expiatory sacrifices (says the learned prelate) were in their own nature as intelligible, and in practice as rational, as either of the other two. Here, instead of presenting the first fruits of agriculture and palturage, in corn, wine, oil, and wool, as in the eucharistical, or a portion of what was to be sown or otherwise propagated, as in the imperatorial; some chosen animal precious to the repenting criminal, who deprecates or is supposed to be obnoxious to the Deity who is to be appeased, was offered up and slain at the altar, in an action which, in all languages, when translated into words, speaks to this purpose:—"I confess my transgressions at thy footstool, O my God! and with the deepest contrition implore thy pardon: confessing that I deserve death for these my offences."—The latter part of the confession was more forcibly expressed by the action of striking the devoted animal, and depriving it of life; which, when put into words, concluded in this manner.—And I own that I myself deserve the death which I now inflict on this animal." This system of sacrifice, which his lordship thinks so well supported by the most early movements of simple nature, we admit to be ingenious, but by no means satisfactory. That mankind in the earlier ages of the world were accustomed to imply the deficiencies of their language by expressive gestures we are not inclined to controvert: the part prevails among savage nations, or nations half civilized, at the present day. His lordship, however, is of opinion, and we heartily agree with him, that our first parents were instructed by God to make articulate sounds significant of ideas, notions, and things (see Language, p. 6), and not left to fabricate a language for themselves. That this heaven-taught language could be at first copious, no man will suppose who thinks of the puerility of ideas which those who spoke it had to express: but when we consider its origin, we cannot entertain a doubt but that it was precise and peripatetic, and admirably adapted to all the real purposes of life. Among these purposes must surely be included the worship of God as the most important of all. Every sentiment therefore which enters into worship, gratitude, invocation, confession, and prayer, the progenitors of mankind were undoubtedly taught to clothe in words the most significant and unequivocal; but we know from Moses, whose divine legation the bishop fully admitted, that Cain and Abel, the eldest children of our first parents, worshipped God by the rites of sacrifice: and can we suppose that practice occurred to them from their having so far forgotten the language taught them by their father, as to be under the necessity of denoting by action what they could not express by words? If this supposition be admitted, it will force another upon us full more extravagant. Even Adam himself must, in that case, have become dumb in consequence of his fall: for it is not conceivable, that as long as he was able to utter articulate sounds, and affix a meaning to them, he would cease, in the presence of his family, to confess his sins, implore forgiveness, and express his gratitude to God for all his mercies.

The right reverend writer, as if aware of some such objection as this to his theory, contends, that if sacrifices had arisen from any other source than the light of reason, the Scripture would not have been silent concerning that source; especially since we find Moses carefully recording what God immediately, and not nature, taught to Adam and his family. Had the original of sacrifice, says he, been prescribed, and directly commanded by the Deity, the sacred historian could never have omitted the express mention of that circumstance. The two capital observances in the Jewish ritual were the Sabbath and Sacrifices. To impress the highest reverence and veneration on the Sabbath, it is careful to record its divine original: and can we suppose that, had sacrifices had the same original, he would have neglected to establish this truth at the time that he recorded the other, since it is of equal use and of equal importance? I should have said, indeed, of much greater; for the multifarious sacrifices of the law had not only a reference to the forfeiture of Adam, but likewise prefigured our redemption by Jesus Christ."

But all this reasoning was foreseen, and completely answered before his lordship gave it to the public. It is probable, that though the distinction of weeks was well known over all the eastern world, the Hebrews, during their residence in Egypt, were very negligent in their observance of the Sabbath. To enforce a religious observance of that sacred day, it became necessary to inform them of the time and occasion of its first institution; that they might keep it holy in memory of the creation; but, in a country like Egypt, the people were in danger of holding sacrifices rather too high, and too low veneration, so that there was not the same necessity.
Sacrifice.

Sacrifice. by mentioning explicitly the early institution of them. It was sufficient that they knew the divine institution of their own sacrifices, and the purposes for which they were offered. Besides this, there is reason to believe, that, in order to guard the Hebrews from the infected of the heathen, the rite of sacrificing was loaded with many additional ceremonies at its second institution under Moses. It might, therefore, be improper to relate its original simplicity to a rebellious people, who would think themselves ill-used by any additional burdens of trouble or expense, however really necessary to their happiness. Bishop Warburton sees clearly the necessity of concealing from the Jews the spiritual and refined nature of the Christian dispensation, lest such a backsliding people should, from the contemplation of it, have held in contempt their own economy. This, he thinks, is the reason why the prophets, speaking of the reign of the Messiah, borrow their images from the Mosaic dispensation, that the people living under that dispensation might not despise it from perceiving its end; and we think the reason will hold equally good for their lawgiver concealing from them the simplicity of the first sacrifices, lest they should be tempted to murmur at their own multifarious ritual.

But his lordship thinks that sacrifices had their origin from the light of natural reason. We should be glad to know what light natural reason can throw upon such a subject. That ignorant pagans, adoring as gods departed heroes, who still retained their sensual appetites, might naturally think of appeasing such beings with the fat of fed beasts, and the perfumes of the sacrifices were soon introduced; for it naturally occurred to those who offered them, that what they most valued themselves would be most acceptable to their offended gods, (see the next article.) By the Jewish law, these abominable offerings were strictly forbidden, and the whole ritual of sacrifice restored to its original purity, though not simplicity.

All Christian churches, the Socinian societies or churches, not excepted, have till very lately agreed in believing that the Jewish sacrifices served, amongst other uses, for types of the death of Christ and the Christian worship, (see Typ.) In this belief all sober Christians agree still, whilst many are of opinion that they were likewise federal rites, as they certainly were considered by the ancient Romans.

Of the various kinds of Jewish sacrifices, and the subordinate ends for which they were offered a full account is given in the books of Moses. When an Israelite offered a loaf or a cake, the priest broke it in two parts; and setting aside that half which he reserved for himself, broke the other into crumbs, poured oil, wine, incense, and salt upon it, and spread the whole upon the fire of the altar. If these offerings were accompanied with the sacrifice of an animal, they were thrown upon the victim to be consumed along with it. If the offerings were of the ears of new corn, they were parched at the fire, rubbed in the hand, and then offered to the priest in a vessel, over which he poured oil, incense, wine, and salt, and then burnt it upon the altar, having first taken as much of it as of right belonged to himself.

The principal sacrifices among the Hebrews consisted of bullocks, sheep, and goats; but doves and turtles were accepted from those who were not able to bring the other; these beasts were to be perfect, and without blemish. The rites of sacrificing were various; all of which are very minutely described in the books of Moses.

The manner of sacrificing among the Greeks and Romans was as follows. In the choice of the victim, they took care that it was without blemish or imperfection; its tail was not to be too small at the end; the tongue not black, nor the ears ecart; and that the bull was one that had never been yoked. The victim being pitched upon, they girt his forehead and horns, especially if a bull, heifer, or cow. The head they also adorned with a garland of flowers, a woollen infula or holy fillet, whence hung two rows of chaplets with twisted ribands; and on the middle of the body a kind of stole, pretty large, hung down on each side; the lesser victims were only adorned with garlands and bundles of flowers, together with white tufts or wreaths.

The victims thus prepared were brought before the altar; the lesser being driven to the place, and the greater led by an herder; when, if they made any struggle, or refused to go, the resistance was taken for an ill omen, and the sacrifice frequently set aside. The victim thus brought was carefully examined, to see that there was no defect in it; then the priest, clad in his sacred habit, and accompanied with the sacrificers and other attendants, and being washed and purified ac-
SAC CIRCUIT. cording to the ceremonies prescribed, turned to the right
cut, and went round the altar, sprinkling it with meal and
and holy water, and also be sprinkling those who were
present. Then the priest proclaimed with a loud voice,
Who is here? To which the people replied, Many and
good. The priest then having exhorted the people to
join with him by saying, Let us pray, confessed his
own unworthiness, acknowledging that he had been
guilty of divers sins; for which he begged pardon of
the gods, hoping that they would be pleased to grant
his requests, accept the oblations offered them, and fend
them all health and happiness; and to this general form
added petitions for such particular favours as were then
defined. Prayers being ended, the priest took a cup of
wine; and having tafted it himself, caused his affiliats
do the like; and then poured forth the remainder be-
tween the horns of the victim. Then the priest or the
crier, or sometimes the most honourable person in the
company, killed the beast, by knocking it down or
cutting its throat. If the sacrifice was in honour of the
celestial gods, the throat was turned up towards heav-
but if they sacrificed to the heroes or infernal gods,
the victim was killed with its throat towards the ground.
If by accident the beast escaped the froke, leaped up
after it, or expired with pain and difficulty, it was
thought to be unacceptable to the gods. The beast be-
ing killed, the priest inspected its entrails, and made
predictions from them. They then poured wine, toge-
ether with frankincencie, into the fire, to increase the
flame, and then laid the sacrifice on the altar; which in
the primitive times was burnt whole to the gods, and
thence called an holocaust; but in after times, only part
of the victim was consumed in the fire, and the remain-
der reserved for the sacrificers; the thighs, and some-
times the entrails, being burnt to their honour, the
company feated upon the reft. During the sacrifice,
the priest, and the perfon who gave the sacrifice,
jointly prayed, laying their hand upon the altar.
Sometimes they played upon musical instruments
in the time of the sacrifice, and on fome occasions they
danced round the altar, finging sacred hymns in honour
of the god.

Human SACRIFICES, an abominable practice, about the
origin of which different opinions have been formed.—
The true account seems to be that which we have given
in the preceding article. When men had gone fo far
as to indulge the fancy of bribing their gods by sacri-
ifice, it was natural for them to think of enhancing the
value of fo cheap an aTowment by the coll and rarity of
the offering; and, oppofed with their malady, they
never reliffed till they had got to that which they concei-
ved to be the most precious of all, a human sacrifice.

"It was customary (fays Sanchoniathon,) in ancient
times, in great and public calamities, before things be-
came inexcusable, for princes and magiftrates to offer up
in sacrifice to the avenging demons the deareft of their
offspring," Sanchoniathon wrote of Phoenicia, but the
practice prevailed in every nation under heaven of which
we have received any ancient account. The Egyptians
had it in the early part of their monarchy. The Cretans
likewise had it, and retained it for a longer time.—
The nations of Arabia did the fame. The people of
Dumah, in particular, sacrificed every year a child, and
buried it underneath an altar, which they made use of
instead of an idol; for they did not admit of images.
The Persians buried people alive. AemELIS, the wife
of Xerxes, entombed 12 persons quick under ground
for the good of her soul. It would be endless to enu-
merate every city, or every province, where thefe dire
practices obtained. The Cyprians, the Rhodians, the
Phocceans, the Ionians, thefe of Chios, Lebros, Te-
nedos, all had human sacrifices. The natives of the
Tauric Cheremons offered up to Diana every stranger
whom chance threw upon their coaft. Hence arose
that just expoultation in Euripides upon the inconfi-
tency of the proceeding; wherein much good Reasoning
is implied. Iphigenia wonders, as the goddess delight-
ed in the blood of men, that every villain and murderer
should be privileged to escape, may be driven from the
threshold of the temple; whereas, if an honest and vir-
tuous man chance to fray thither, he only was seized
upon, and put to death. The Pelaqys, in a time of
fearcity, vowed the tenth of all that should be born to
them for a sacrifice, in order to procure plenty. Arii-
tomes, the Meffenian flew 300 noble Lacedemonians,
among whom was Theopompus the king of Sparta, at
the altar of Jupiter at Ithome. Without doubt the
Lacedemonians did not fail to make ample returns; for
they were a fevere and revengeful people, and offered
the like victims to Mars. Their festival of the Diama-
figolis is well known; when the Spartan boys were
whipped in the face of their parents with fuch fverity
before the altar of Diana Orthia, that they often ex-
pired under the torture. Phylarchus affirms, as he is
quoted by Porphyry, that of old every Grecian
nation under which heard of {uch
very common, or he

SAC CIRCUIT. SAC

Aemilius Paulus and Terentius Vario, two Gauls,
a man and a woman, and two in like manner of Greece,
were buried alive at Rome in the Ox-market, where
was a place under ground, walled round, to receive
them; which had before been made ufe of for fuch
cruel purposes. He fays it was a sacrifice not properly
Roman, that is, not originally of Roman institution;
yet it was frequently practiced there, and that too by
public authority. Phylarch makes mention of a like
infatnce a few years before, in the confulhip of Flami-
nuus and Furius. There is reafon to think, that all
the principal captives who graced the triumphs of the
Romans, were at the clofe of that cruel pageantry put
to death at the altar of Jupiter Capitolinus. Caius Ma-
rius offered up his own daughter for a victim to the
Dii Averuncii, to procure success in a battle againf
the Cimбри; as we are informed by Dorotheus, quoted
by Clemens. It is likewife attested by Plutarch, who
fays that her name was Calpurnia. Marius was a man
of a four and bloody disposition; and had probably
heard of fuch sacrifices being offered in the enemy's
camp, among whom they were very common, or he
might have beheld them exhibited at a distance; and
therefore murdered what was nearest, and fhould have
been deareft to him, to counterfeit their fearful fpells,
and outdo them in their wicked machinery. Cicero,
making mention of this custom being common in Gaul,
adds, that it prevailed among that people even at the
time
time he was speaking: from whence we may be led to infer, that it was then discontinued among the Romans. And we are told by Pliny, that it had then, and not very long, been discouraged. For there was a law enacted, when Lentulus and Crassus were consuls, so late as the 657th year of Rome, that there should be no more human sacrifices: for till that time those horrid rites had been celebrated in broad day without any mask or controul; which, had we not the evidence for the fact, would appear far incredible. And however they may have been discontinued for a time, we find that they were again renewed: tho' they became so public, nor so general. For not very long after this, it is reported of Augustus Cesar, when Perufia surrendered in the time of the second triumvirate, that besides multitudes executed in a military manner, he offered up, upon the Ides of March, 300 chosen persons, both of the equesrian and senatorial order, at an altar dedicated to the manes of his uncle Julius. Even at Rome itself this custom was revived: and Porphyry assures us, that in his time a man was every year sacrificed at the shrine of Jupiter Lataisius. Heligabalus offered the like victims to the Syrian deity which he introduced among the Romans. The same is said of Aurelian.

The Gauls and the Germans were so devoted to this shocking custom, that no business of any moment was transacted among them without being preceded with the blood of men. They were offered up to various gods; but particularly to Hebus, Taranis, and Thaumates. Those deities are mentioned by Lucan, where he enumerates the various nations who followed the fortunes of Cesar.

The altars of these gods were far removed from the common resort of men; being generally situated in the depth of woods, that the gloom might add to the horror of the operation, and give a reverence to the place and proceeding. The persons devoted were led thither by the Druids, who presided at the solemnity, and performed the crucial offices of the sacrifice. Tacitus takes notice of the cruelty of the Hermunduri, in a war with the Catti, wherein they had greatly the advantage; at the close of which they made one general sacrifice of all that was taken in battle. The poor remains of the legioners under Varus suffered in some degree the same fate. There were many places defined for this purpose all over Gaul and Germany; but especially in the mighty woods of Arduenia, and the great Hercynian forest: a wild that extended above 30 days journey in length. The places set apart for this solemnity were held in the utmost reverence, and only approached at particular feasons. Lucan mentions a grove of this sort near Maffilia, which even the Roman soldiers were afraid to violate, though commanded by Cesar. It was one of those set apart for the sacrifices of the country.

Claudian compliments Sisilicho, that, among other advantages accruing to the Roman armies through his conduct, they could now venture into the awful forest of Hercynia, and follow the chase in those so much dreaded woods, and otherwise make use of them. These practices prevailed among all the people of the north, of whatever denomination. The Maffagetae, the Scythians, the Getae, the Sarmatians, all the various nations upon the Baltic, particularly the Suevi and Scandinavians, held it as a fixed principle, that their happiness and security could not be obtained but at the expense of the lives of others. Their chief gods were Thor and Woden, whom they thought they could never sufficiently glut with blood. They had many very celebrated places of worship; especially in the island Rugen, near the mouth of the Oder; and in Zealand: some, too, very famous among the Semones and Naharvall. But the most revered of all, and the most frequented, was at Upfal, where there was every year a grand celebrity, which continued for nine days. During this term they sacrificed animals of all sorts: but the most acceptable victims, and the most numerous, were men. Of these sacrifices none were esteemed so auspicious and salutary as a sacrifice of the prince of the country. When the lot fell for the king to die, it was received with universal acclamations and every expression of joy; and it once happened in the time of a famine, when they cast lots, and it fell to king Domalder to be the people's victim: and he was accordingly put to death. Olaus Tretelger, another prince, was burnt alive to Woden. They did not spare their own children. Harald the son of Gunild, the first of that name, flew two of his children to obtain a storm of wind. "He did not let (says Verstegan) to sacrifice two of his sons unto his idols, to the end he might obtain of them such a temptation at sea, as should break and deliver the shipping of Harald king of Denmark." Saxo Grammaticus mentions a like fact. He calls the king Haquin; and speaks of the persons put to death as two very hopeful young princes. Another king flew nine sons to prolong his own life; in hopes, perhaps, that what they were abridged of would in great measure be added to himself. Such instances, however, occur not often, but the common victims were without end. Adam Brenmenf, speaking of the awful grove at Upfal, where these horrid rites were celebrated, says, that there was not a single tree but what was revered, as if it were gifted with some portion of divinity: and all this because they were stained with gore and foul with human putrefaction. The same is observed by Scheiffer in his account of this place.

The manner in which the victims were slaughtered, was diverse in different places. Some of the Gaulish nations chined them with a stroke of an ax. The Celtae placed the man who was to be offered for a sacrifice upon a block, or an altar, with his breast upwards, and with a sword struck him forcibly across the sternum; then tumbling him to the ground, from his agonies and convulsions, as well as from the effusion of blood, they formed a judgment of future events. The Cimbri ripped open the bowels; and from them they pretended to divine. In Norway they beat men's brains out with an ox-yoke. The same operation was performed in Iceland, by dashling them against an altar of stone. In many places they transfixed them with arrows. After they were dead, they suspended them upon the trees, and left them to putrefy. One of the writers above quoted mentions, that in his time 70 carcases of this sort were found in a wood of the Suevi. Dithmar of Merburgh, an author of nearly the same age, speaks of a place called Ledur in Zealand, where there were every year 99 persons sacrificed to the god Swanotwite. During these bloody festivals a general
joy prevailed, and banquets were most royally served. They fed, caromed, and gave a loose to indulgence, which at other times was not permitted. They imagined that there was something mysterious in the number nine; for which reason these feasts were in some places celebrated every ninth year, in others every ninth month; and continued for nine days. When all was ended, they washed the image of the deity in a pool; and then dismissed the assembly. Their servants were numerous, who attended during the term of their feasting, and partook of the banquet. At the close of all, they were immersed in the same pool, or otherwise made away with. On which Tacitus remarks, how great an awe this circumstance must necessarily infuse into those who were not admitted to these mysteries.

These accounts are handed down from a variety of authors in different ages; many of whom were natives of the countries which they describe, and to which they seem strongly attached. They would not therefore have brought so foul an imputation on the fore have brought so foul an imputation on the

fealting, were numerous, who attended during the term of their

ly infufe into thofe who were not admitted to thefe

The like custom prevailed to a great degree at Mexico, and even under the mild government of the Peruvians; and in most parts of America. In Africa it is still kept up; where, in the inland parts, they sacrifice some of the captives taken in war to their fetishes, in order to secure their favour. Snelgrave was in the origin which we have assigned to it.

mer was killed, without any hesitation laid hold of a boy, and

offered him on the spot to Kronus; and at the same time drowned a number of priests, to appease the deity of the sea. The Carthaginians another time, upon a great defeat of their army by Agathocles, imputed their miscarriages to the anger of this god, whose services had been neglected. Touched with this, and seeing the

enemy at their gates, they feized at once 300 children of the prime nobility, and offered them in public for a sacrifice. Three hundred more, being persons who were somehow obnoxious, yielded themselves voluntarily, and were put to death with the others. The neglect of which they accused themselves, confilting in sacrificing children purchased of parents among the poorer sort, who feared them for that purpose, and not fealing the most promising, and the most honourable, as had been the custom of old. In short, there were particular children brought up for the altar, as sheep are fattened for the lambs; and they were brought and butchered in the same manner. But this indiscriminate way of proceeding was thought to have given offence. It is remarkable, that the Egyptians looked out for the most specious and handsome persons to be sacrificed. The Albanians pitched upon the best man of the community, and made him pay for the wickedness of the rest. The Carthaginians chose what they thought the most excellent, and at the same time the most dear to them; which made the lot fall heavy upon their children. This is taken notice of by Silius Italicus in his fourth book.

Kronus, to whom these sacrifices were exhibited, was an oriental deity, the god of light and fire; and therefore always worshipped with some reverence to that element. See Phoenicia.

The Greeks, we find, called the deity to whom their offerings were made Agraulos; and reigned that he was a woman, and the daughter of Cecrops. But how came Cecrops to have any connection with Cyprus? Agraulos is a corruption and transposition of the original name, which should have been rendered Ek El Aera, or Ek El Aerus; but has, like many other oriental titles and names, been strangely sophisticd, and is here changed to Agraulos. It was in reality the god of light, who was always worshipped with fire. This deity was the Moloch of the Tyrians and Canaanites, and the Meled of the East; that is the great and principal god, the god of light, of whom fire was esteemed a symbol; and at whose shrine, instead of viler victims, they offered the blood of men.

Such was the Kronus of the Greeks, and the Moloch of the Phoenicians: and nothing can appear more shocking than the sacrifices of the Tyrians and Carthaginians, which they performed to this idol. In all emergencies of state, and times of general calamity they devoted what was most necessary and valuable to them for an offering to the gods, and particularly to Moloch. But besides these undetermined times of bloodshed, they had particular and preferred feasons every year, when children were chosen out of the most noble and reputable families, as before mentioned. If a person had an only child, it was the more liable to be put to death, as being esteemed more acceptable to the deity, and more efficacious for the general good. Those who were sacrificed to Kronus were thrown into the arms of a molten idol, which stood in the midst of a large fire, and was red with heat. The arms of it were stretched out, with the hands turned upwards, as it were to receive them; yet flowing downwards, so that they dropped from thence into a glowing furnace below. To other gods they were otherwise slaughtered, and, as it is implied, by the very hands of their parents. What can be more
SACRILEGE, SACRILEGIO, the crime of profaning sacred things, or things devoted to God; or of alienating from laymen, or common purposes, what was given to religious persons and pious uses.

SACRISTAN, a church-officer, otherwise called SEXTON.

SACRISTY, in church-history, an apartment in a church where the sacred utensils were kept, being the same with our VISITARS, are Saddles, is a seat upon a horse's back, contrived for the convenience of the rider.

A hunting-faddle is composed of two bows, two bands, fore-bolsters, pannels, and saddle-strips; and the great saddle has, besides these parts, corks, hind-bolsters, and a troublequin.

The pillow is common to both.

SADDUCEES, were a famous sect among the ancient Jews, and conflituted of persons of great quality and opulence. Refpecting their origin there are various accounts and various opinions. Epiphanius, and after him many other writers, contend, that they took their rise from Dositheus a sectary of Samaria; and their name from the Hebrew word הים just or juftice, from the great justice and equity which they showed in all their actions; a derivation which neither suits the word SADDUCE nor the general character of the sect. They are thought by some too to have been Samaritans; but this is by no means probable, as they always attended the worship and sacrifices at Jerusalem and never at Geriziz.

In the Jewish Talmud we are told that the Sadducees derived their name from Saddoc, and that the sect arose about 260 years before Christ in the time of Antigonus of Socho, president of the Sanhedrim at Jerusalem, and teacher of the law in the principal divinity school of that city. He had often in his lectures, it seems, taught his scholars, that they ought not to serve God as slaves do their masters, from the hopes of a reward, but merely out of filial love for his own sake; from which Saddoc and Baithns inferred that there were no rewards at all after this life. They therefore separated from their master, and taught that there was no resurrection nor future state. This new doctrine quickly spread, and gave rise to the sect of Sadducees, which in many respects resembled the Epicureans.

Dr. Prideaux thinks, that the Sadducees were at first no more than what the Caraites are now; that is, they would not receive the traditions of the elders, but stick to the written word only; and the Pharisees being great promoters of those traditions, hence these two sects became directly opposite to each other. See Prideaux's Cont. parts ii. b. 2. and 3. and see also PHARISEES and CARAITES.

Afterwards the Sadducees imbibed other doctrines, which
which rendered them a fact truly impious; for they denied the resurrection of the dead, and the existence of angels, and of the spirits or souls of men departed (Mat. xxii. 23. Acts xviii. 8.) They held, that there is no spiritual being but God only; that as to man, this world is his all. They did not deny but that we had reasonable souls: but they maintained this soul was mortal; and, by a necessary consequence, they denied the rewards and punishments of another life. They pretended also, that what is said of the existence of angels, and of a future resurrection, are nothing but illusions. St. Ephraem, and after him St. Austin, have advanced, that the Sadducees denied the Holy Ghost. But neither Josephus nor the evangelists accuse them of any error like this. It has been also imputed to them, that they thought God corporeal, and that they received none of the prophecies.

It is pretty difficult to apprehend how they could deny the being of angels, and yet receive the books of Moses, where such frequent mention is made of angels and of their appearances. Grotius and M. Le Clerc observe, that it is very likely they looked upon angels, as particular beings, not as particular beings, but as emanations, or qualities, inseparable from the Deity, as the fun-beams are inseparable from the sun. Or perhaps they held angels not to be spiritual but mortal; just as they thought that substance to be which animates us and thinks in us. The ancients do not tell us how they solved this difficulty, that might be urged against them from so many passages of the Pentateuch, where mention is made of angels.

As the Sadducees acknowledged neither punishments nor recompenses in another life, fo they were inexorable in their chastising of the wicked. They observed the law themselves, and caused it to be observed by others, with the utmost rigour. They admitted of none of the traditions, explications, or modifications, of the Pharisees; they kept only to the text of the law; and maintained, that only what was written was to be observed.

The Sadducees are accused of rejecting all the books of Scripture except those of Moses; and to support this opinion, it is observed, that our Saviour makes use of no Scripture against them, but passages taken out of the Pentateuch. But Scaliger produces good proofs to vindicate them from this reproach. He observes, that they did not appear in Israel till after the number of the holy books were fixed; and that if they had been to choose out of the canonical Scriptures, the Pentateuch was least favourable to them than any other book, since it often makes mention of angels and their apparition. Besides, the Sadducees were present in the temple and at other religious assemblies, where the books of the prophets were read indifferently as well as those of Moses. They were in the chief employ of the nation, many of them were even priests. Would the Jews have suffered in these employments persons that rejected the greatest part of their Scriptures? Menasseh-ben-Israel says expressly, that indeed they did not reject the prophets, but that they explained them in a sense very different from that of the other Jews.

Josephus affirms us, that they denied destiny or fate; alleging, that there were only deaths void of fate, and that all the good or evil that happens to us is in conformance of the good or evil we have taken, by the Sadducees. They said also, that God was far removed from doing or knowing evil, and that man was the absolute master of his own actions. This was roundly to deny a providence; and upon this footing I know not, says F. Calmet, what could be the religion of the Sadducees, or what influence they could ascribe to God in things here below. However, it is certain they were not only tolerated among the Jews, but that they were admitted to the high-priesthood itself. John Hircanus, high-priest of that nation, separated himself in a signal manner from the sect of the Pharisees, and went over to that of Sadoc. It is said also, he gave strict command to all the Jews, on pain of death, to receive the maxims of this sect. Arilobulus and Alexander Jannaeus, son of Hircanus, continued to favour the Sadducees; and Maimonides affirms us, that under the reign of Alexander Jannaeus, they had in possession all the offices of the Sanhedrin, and that there only remained of the party of the Pharisees, Simon the son of Secra. Caiaphas, who condemned Jesus Christ to death, was a Sadducee (Acts, v. 17, iv. 1); as also Ananus the younger, who put to death St. James the brother of our Lord. At this day, the Jews hold as heretics that small number of Sadducees that are to be found among them. See upon this matter Servar. Tiberis. Menahe ben-Israel, De Resurrectione mortuorum; Bajnague’s History of the Jews, &c.; and Calmet’s Diftertation upon the Sects of the Jews before the Commentary of St. Mark.

The sect of the Sadducees was much reduced by the destruction of Jerusalem, and by the dispersion of the Jews; but it revived afterwards. At the beginning of the third century it was so formidable in Egypt, that Ammonin, Origens’s matter, when he faw them propagate their opinions in that country, thought himself obliged to write against them, or rather against the Jews, who tolerated the Sadducees, though they denied the fundamental points of their religion. The emperor Julianus mentions the Sadducees in one of his novels, banishes them out of all the places of his dominions, and condemns them to the severest punishments, as people that maintained atheistical and impious tenets; denying the resurrection and the last judgment. Ananus, or Ananus, a disciple of Juda, son of Nachman, a famous rabbin of the 8th century, declared himself, as it is said, in favour of the Sadducees, and strenuously protected them against their adversaries. They had also a celebrated defender in the 12th century, in the person of Alpharag a Spanish rabbin. This doctor wrote against the Pharisees, the declared enemies of the Sadducees; and maintained by his public writings, that the purity of Judaism was only to be found among the Sadducees; that the traditions avowed by the Pharisees were useless; and that the ceremonies, which they had multiplied without end, were an unsupportable yoke. The rabbi Abraheam-ben-David Italleri replied to Alpharag, and supported the sect of the Pharisees by two great arguments, that of their universality and that of their antiquity. He proved their antiquity by a continued succession from Adam down to the year 1167; and their universality, because the Pharisees are spread all the world over, and are found in all the synagogues. There are still Sadducees in Africa and in several other places. They deny the immortality of the soul, and
the resurrection of the body: but they are rarely found, at least there are but few who declare themselves for those opinions.

SADLER (John), was descended from an ancient family in Shropshire; born in 1615; and educated at Cambridge, where he became eminent for his great knowledge in the oriental languages. He removed to London soon after his departure from Cambridge, where he became eminent for his great knowledge in the oriental language. He removed to London and the same year published his Rights of the kingdom. He was greatly esteemed by Oliver Cromwell, by whose special warrant he was continued a master in Chancery, when the number was reduced to six. In 1649 he was chosen town-clerk of London and the same year published his Rights of the kingdom. He was greatly esteemed by Oliver Cromwell, by whose special warrant he was continued a master in Chancery, as also one of the two masters of requets. In 1649 he was chosen town-clerk of London and the same year published his Rights of the kingdom. SAFE-GUARD, a protection formerly granted to a stranger who feared violence from some of the king's subjects for seeking his right by course of law.

SAFE-Conduct, is a security given by a prince under the great seal, to a stranger for his safe-coming into and passing out of the realm; the form whereof is in Reg. Orig. 25. There are letters of safe conduct which must be enrolled in chancery; and the persons to whom granted must have them ready to show; and touching which there are several statutes. See Proviso.

SAFFRON, in the materia medica, is formed of the stigma of the crocus officialis *, dried on a kiln, and preserved together into cakes. Of this there are two kinds, the English and Spanish; of which the latter is by far the most esteemed. Saffron is principally cultivated in Cambridgeshire, in a circle of about ten miles diameter. The greatest part of this tract is an open level country, with few inclosures; the custom there is, as in most other places, to crop two years, and let the land be fallow the third. Saffron is generally planted upon fallow-ground, and, all others things being alike, they prefer that which has borne barley the year before.

The saffron ground is seldom above three acres, or less than one; and in choosing, the principal thing they have regard to is, that they be well exposed, the soil not poor, nor a very stiff clay, but a temperate dry mould, such as commonly lies upon chalk, and is of an hazel colour; though, if every thing else answers, the colour of the mould is pretty much neglected.

The ground being made choice of, about Lady-day or the beginning of April, it must be carefully ploughed, the furrows being drawn much closer together, and deeper if the soil will allow it, than is done for any kind of corn; and accordingly the charge is greater.

About five weeks after, during any time in the month of May, they lay between 20 and 30 loads of dung upon each acre, and having spread it with great care, they plough it in as before. The shortlfeft rotten dung is the belt; and the farmers, who have the convenience of making it, spare no pains to make it good, being sure of a proportionable price for it. About midsummer they plough a third time, and between every 16 feet and an half they leave a broad furrow or trench, which shall be both as a bound for the furrows of the next year, and for throwing the weeds into at the proper season. The time of planting is commonly in the month of July. The only instrument used at this time is a small narrow spade, commonly called a flat-hoe. The method is this: One man with his shovel raises about three or four inches of earth, and throws it before him about six or more inches. Two persons, generally women, follow with roots, which they place in the farthest edge of the trench made by the digger, at about three inches from each other. As soon as the digger has gone once the breadth of the ridge, he begins again at the other side; and, digging as before, covers the roots half set, which makes room for another row of roots at the same distance from the first that they are from one another. The only dexterity necessary in digging is, to leave some part of the soil to the earth untouched, to lie under the roots; and, in setting, to place the roots directly upon their bottom. The quantity of roots planted upon an acre is generally about 15 bushels. From the time of planting till the beginning of September, or sometimes later, there is no more labour required; but at that time they begin to vegetate, and are ready to show themselves above ground, which may be known by digging up a few of the roots.

The ground is then to be pared with a sharp hoe, and the weeds raked into the furrows, otherwise they would hinder the growth of the saffron. In some time after, the flowers appear. They are gathered before they are full blown, as well as after, and the proper time for it is early in the morning. The owners of the saffron-fields get together a sufficient number of hands, who pull off the whole flowers, and throw them by handfuls into a balek, and so continue till about 11 o'clock. Having then carried home the flowers, they immediately fall to picking out the figmata of chives, and together with them a pretty large proportion of the stylus itself, or bring to which they are attached: the rest of the flower they throw away as refuse. Next morning they return to the field, without regarding whether the weather be wet or dry; and so on daily, even on Sundays, till the whole crop is gathered.—The next labour is to dry the chives on the kiln. The kiln is built upon a thick plank
Saffron plank, that it may be moved from place to place. It is supported by four thin legs; the outside consists of eight pieces of wood of three inches thick, in form of a quadrangular frame, about 12 inches square at the bottom on the inside, and 22 on the upper part; which last is likewise the perpendicular height of it. On the foreside is left a hole of about eight inches square, and four inches above the plank, through which the fire is put in; over all the reft laths are laid pretty thick, close to one another, and nailed to the frame already mentioned. They are then plastered over on both sides, as are also the planks at bottom, very thick, to serve for an hearth. Over the mouth is laid a hair-cloth, fixed to the edges of the kiln, and likewise to two rollers or moveable pieces of wood, which are turned by wedges or screws, in order to stretch the cloth. Instead of the hair-cloth, some people use a net-work of iron-wire, by which the saffron is sooner dried, and with less fuel; but the difficulty of preferring it from burning makes the hair-cloth preferred by the bel judges. The kiln is placed in a light part of the house; and they begin with putting five or fix sheets of white paper on the hair-cloth, and upon these they lay out the wet saffron two or three inches thick. It is then covered with some other sheets of paper, and over these they lay a coarse blanket five or six times doubled, or instead of this, a canvas pillow filled with straw; and after the fire has been lighted for some time, the whole is covered with a board having a considerable weight upon it. At first they apply a pretty strong heat, to make the chives sweat as they call it; and at this time a great deal of care is necessary to prevent burning. When it has been thus dried about an hour, they turn the cakes of saffron upside down, putting on the coverings and weight as before. If no finifter accident happens during these first two hours, the danger is thought to be over; and nothing more is requisite than to keep up a very gentle fire for 24 hours, turning the cake every half hour. That fuel is best which yields the least smoke; and for this reason charcoal is preferable to all others.

The quantity of saffron produced at a crop is uncertain. Sometimes five or fix pounds of wet chives are got from one rood, sometimes not above one or two; and sometimes not so much as is sufficient to defray the expense of gathering and drying. But it is always observed, that about five pounds of wet saffron go to make one pound of dry for the first three weeks of the crop, and fix pounds during the last week. When the heads are planted very thick, two pounds of dry saffron may at a medium be allowed to an acre for the first crop, and 24 pounds for the two remaining ones, the third being considerably larger than the second.

To obtain the second and third crops, the labour of hoeing, gathering, picking, &c. already mentioned, must be repeated; and about midsummer, after the third crop is gathered, the roots must all be taken up and transplanted. For taking up the roots, sometimes the plough is made use of, and sometimes a forked hoe; and then the ground is harrowed once or twice over. During all the time of ploughing, harrowing, &c. 15 or more people will find work enough to follow and gather the heads as they are turned up. The roots are next to be carried to the house in facks, where they are cleaned and raked. This labour consists in cleaning the roots thoroughly from earth, decayed old pieces, involucra, or excrescences; after which they become fit to be planted in new ground immediately, or they may be kept for some time, without danger of spoiling. The quantity of roots taken up in proportion to those planted is uncertain; but, at a medium, 24 quarters of clean roots, fit to be planted, may be had from each acre. There sometimes happens a remarkable change in the roots of saffron and some other plants. As soon as they begin to shoot upwards, there are commonly two or three large tap-roots sent forth from the fide of the old one, which will run two or three inches deep into the ground. At the place where these bulbs first come out from, the old one will be formed sometimes, though not always, and the tap-root then decays. The bulb increases in bigness, and at last falls quite off; which commonly happens in April. But many times these tap-roots never produce any bulbs, and remain barren for ever after. All such roots therefore should be thrown away in the making a new plantation. This degeneracy of the roots is a difeafe for which no cure is as yet known.

When saffron is offered to sale, that kind ought to be chosen which has the broadest blades; this being the mark by which English saffron is distinguished from the foreign. It ought to be of an orange or fiery-red colour, and to yield a dark yellow tincture. It should be chosen fresh, not above a year old, in close cakes, neither dry nor yet very moist, tough and firm in tearing, of the same colour within as without, and of a strong, acrid, diffusive smell.

This drug has been reckoned a very elegant and useful aromatic. Besides the virtues it has in common with other substances of that class, it has been accounted one of the highest cordials, and is said to exhilarate the spirits to such a degree as, when taken in large doses, to occasion immoderate mirth, involuntary laughter, and the ill effects which follow from the abuse of spirituful liquors. This medicine is particularly serviceable in hysterical depressions proceeding from a cold caufe or obftruction of the uterine secretions, where other aromatics, even tho'f of the more generous kind, have little effect. Saffron imparts the whole of its virtue and colour to rectified spirit, proof-spirit, wine, vinegar and water. A tincture drawn with vinegar loses greatly of its colour in keeping; the watery and vinous tinctures are apt to grow four, and then lose their colour also; that made in pure spirit keeps in perfection for many years.

Meadow-Saffron. See Colchicum.

Sagan, in scripture-history, the suffragan or deputy of the Jewish high priest. According to some writers, he was only to officiate for him when he was rendered incapable of attending the service through sickness or legal uneasiness on the day of expiation; or, according to others, he was to assist the high-priest in the care of the affairs of the temple and the service of the priests.

Sagapenum, in pharmacy, &c. a gum-refin brought to us in two forms; the finer and purer is in loose granules or single drops; the coarser kind is in masses composed of these drops of various sizes, cemented together by a matter of the same kind. In either case, it is of a firm compact substance, considerably heavy, and of a reddish colour on the outside, brownish within,
SAGE

SAGE (Alain Rene), an ingenious French romance-writer, was born at Ruyis in Brittany, in the year 1667. He had a fine flow of imagination, was a complete master of the French and Spanish languages, and wrote several admired romances in imitation of the Spanish authors. There were, The Bachelor of Salamanca, 2 vols 12mo; New Adventures of Don Quixote, 2 vols 12mo; The Devil on Two Sticks, 2 vols 12mo; and Gil Blas, 4 vols 12mo. He produced also some comedies, and other pieces of piety; and died in 1747, in a little house near Paris, where he supported himself by writing.

SAGE (the reverend John), so justly admired by all who knew him for his clafsical learning and reasoning powers, was born, in 1652, in the parish of Creich and county of Fifeshire, North Britain, where his ancestors had lived for seven generations with great respect though with little property. His father was a captain in Lord Duff's regiment, and fought for his king and country when Monk formed Dundee on the 30th of August 1651.

The issue of the civil wars, and the loyalty of captain Sage, left him nothing to bestow upon his son but a liberal education and his own principles of piety and virtue. In those days the Latin language was taught in the parochial schools of Scotland with great ability and at a trifling expense; and after young Sage had acquired a competent knowledge of that language at one of those useful seminaries, his father, without receiving from an ungrateful court any recompense for what he had lost in the cause of royalty, was still able to send him to the university of St Andrew's, where having remained in college the usual number of terms or sessions, and performed the exercises required by the statutes, he was admitted to the degree of master of arts, the highest honour which it appears he ever received from any university.

During his residence in St Andrew's he studied the Greek and Roman authors with great diligence, and was likewise instructed in logic, metaphysics, and such other branches of philosophy as then obtained in the schools, which, though we affect to smile at them in this enlightened age, he always spoke of as highly useful to him who would understand the poets, historians, and orators of ancient Greece, and even of the Christian church. In this opinion every man will agree with him who is at all acquainted with the ancient metaphysics, and has read the writings of Clemens Alexandrinus, Origen, Tertullian, Chrysostome, and other fathers of great name; for each of those writers adopted the principles of some one or other of the philosophical sects, reasoned from their notions, and often made use of their terms and phrasing.

When Mr Sage had taken his master's degree, the narrowness of his fortune compelled him to accept of the first literary employment which was offered to him; and that happened to be nothing better than the office of schoolmaster in the parish of Birrigy in Fifeshire, whence he was soon removed to Tippermuir in the county of Perth. In these humble stations, though he wanted many of the necessaries and almost all the comforts of life, he prosecuted his studies with great success; but in doing so, unhappily imbibed the seeds of several difeases which afflicted him through life, and notwithstanding the native vigour of his constitution impaired his health and shortened his days. From the miserable drudgery of a parth-schoolmiller, he was relieved by Mr Drummond of Cultmalund, who invited him to superintend the education of his sons, whom he accompanied first to the public school at Perth, and afterwards to the university of St Andrew's. This was still an employment by no means adequate to his merit, but it was not wholly without advantages. At Perth he gained the friendship and esteem of Dr Rolfe, afterwards lord bishop of Edinburgh, and at St Andrew's of every man capable of properly estimating genius and learning.

The education of his pupils was completed in 1684, when he was left with no determinate object of pursuit. In this moment of indecision, his friend Dr Rolfe, who had been promoted from the parsonage of Perth to the professorship of divinity in the university which he was leaving, recommended him to effectually to his uncle then archbishop of Glasgow, that he was by that prelate admitted into orders and presented to one of the churches in the city. He was then about 34 years of age, had studied the Scriptures with great affinity, was no stranger to ecclesiastical history, or the apologues and other writings of the ancient fathers, was thorough master of school-divinity, had examined with great accuracy the modern controversies, especially those between the Romish and reformed churches, and between the Calvinites and Remonstrants; and it was perhaps to his honour that he did not fully approve of all the articles of faith subscribed by any one of those contending sects of Christians.

A man so far advanced in life, and so thoroughly accomplished as a scholar, would naturally be looked up to by the greater part of the clergy as soon as he became one of their body. This was in fact the case: Mr Sage was, immediately on his admission into orders, appointed clerk to the fynod or prebendary of Glasgow; an office of great trust and responsibility, to which we know nothing similar in the church of England.

During the establishment of episcopacy in Scotland, from the restoration of Charles II. till the year 1690, the authority of the bishops, though they prescribed the
sole power of ordination, was very limited in the government of the church. They did every thing with the consent of the presbyters over whom they presided. Diocesan synods were held at stated times for purposes of the same kind with those which employ the meetings of presbyters at present (see Presbyterians), and the only prerogative which the bishop seems to have enjoyed was to be permanent president, with a negative voice over the deliberations of the assembly. The acts of each synod, and sometimes the charge delivered by the bishop at the opening of it, were registered in a book kept by the clerk, who was always one of the most eminent of the diocesan clergy.

Mr Sage continued in this office, discharging in Glasgow all the duties of a clergyman, in such a manner as endeared him to his flock, and gained him the esteem even of those who were dissenters from the establishment. Many of his brethren were trimmers in ecclesiastical as well as in civil politics. They had been republicans and presbyterians in the days of the last five of those who were dissenters from the established church, with greater lenity than at any other time, and feared by his adversaries for his talents. He was an episcopal and a presbyterian, in such a manner as to himself appeared to have their foundation in truth. To persecution he was at all times an enemy, whilst he never tamely betrayed through fear what he thought it his duty to maintain. The consequence was, that in the end of the year 1688 he was treated by the rabble, which in the western counties of Scotland rose against the established church, with greater lenity than his more complying brethren. Whilst they, without the smallest apprehension of their danger, were torn from their families by a lawless force, and many of them persecuted in the cruelest manner, he was privately warned to withdraw from Glasgow, and never more to return to that city. So much was constancy of conduct and a steady adherence to principle respected by those who deemed it nothing else.

Mr Sage retired to the metropolis, and carried with him the synodical book, which was afterwards demanded by the presbytery of Glasgow, but not recovered till about three or four years ago, that, on the death of a nephew of Dr Roff the late established bishop of Edinburgh, it was found in his possession, and restored to the presbytery to which it belonged. Mr Sage had detained it and given it to his diocesan and friend, from the fond hope that episcopacy would soon be re-established in Scotland; and it was doubtful from a view to contribute what he could to the realizing of that hope, that, immediately on his being obliged to leave Glasgow, he commenced a keen polemical writer. At Edinburgh he preached a while, till refusing to take the oaths of allegiance when required by the government, he was obliged to retire. In this extremity, he found protection in the house of Sir William Bruce, the sheriff of Kinross, who approved his principles and admired his Virtue. Returning to Edinburgh, in 1695, he was observed, and obliged to abfcond. Yet he returned in 1696, when his friend Sir William Bruce was imprisoned as a suspected perfon. He was soon forced to look for refuge in the hills of Angus, under the name of the Jacksons.

After a while Mr Sage found a safe retreat with the countess of Calender, who employed him to instruct her family as chaplains, and her sons as tutors. These occupations did not wholly engage his active mind: for he employed his pen in defending his order, or in exposing his oppressors. When the countess of Calender had no longer sons to instruct, Sage accepted the invitation of Sir John Stuart of Garnutli, who wanted the help of a chaplain, and the conversation of a scholar. With Sir John he continued till the decency of his manners, and the extensiveness of his learning, recommended him to a higher station. And, on the 25th of January 1705, he was consecrated a bishop by Pater son the Archbishops of Glasgow, Rofe the bishop of Edinburgh, and Douglas the bishop of Dumblain. But this promotion did not prevent sickness from falling on him in November 1706. After lingering for many months in Scotland, he tried the effect of the waters of Bath in 1709, without success. At Bath and at London he remained a twelvemonth, recovering by the gentle and carefilies of the learned. Yet, though he was invited to stay, he returned in 1710 to his native country, which he desired to see, and where he wished to die. And though his body was debilitated, he engaged, with undiminished vigour of mind in the publication of the works of Drummond of Hawthornden, to which the celebrated Ruddiman lent his aid. Bishop Sage died at Edinburgh on the 7th of June 1711, lamented by his friends for his virtues, and feared by his adversaries for his talents.

His works are, 1stly, Two letters concerning the Persecution of the Episcopalian Clergy in Scotland, which with other two by different authors were printed in one volume at London in 1689. 2dly, An Account of the late Establishment of Presbyterian Government by the Parliament of Scotland, in 1695, London, 1693. 3dly, The Fundamental Charter of Presbyters, London, 1693. 4thly, The Principles of the Cyprianick Age with regard to Episcopalian Power and Jurisdiction, London, 1705, 4thly, A Vindicition of the Principles of the Cyprianick Age, London, 1707. 5thly, Some Remarks on the Letter from a Gentleman in the City, to a Minifter in the Country, on Mr David Williamson's Sermon before the General Assembly, Edinburgh, 1703. 6thly, A Brief Examination of some Things in Mr Meldrum's Sermon, preached on the 16th of May 1703, against a Toleration to those of the Episcopal Church, Edinburgh, 1703. 7thly, The Reasonableness of a Toleration to those of the Episcopal Church required in purely on Church Principles, Edinburgh, 1704, 8thly, The Life of Gawin Douglas, in 1710. 9thly, An Introduction to Drummond's History of the Five Jameses, Edinburgh, 1711. Of the principles maintained in these publications, different readers will think very differently; and it is probable that the acrimony displayed in some of them will be
be generally condemned in the present day; whilst the learning and acuteness of their author will be universally acknowledged and admired by all who can distinguish merit in a friend or an adversary.

SAGENE, a Russian measure, 500 of which make a verst; the fage is equal to seven English feet.

SAGINA, in botany: A genus of the tetragnia or four-leaved rush. The female flowers are in the natural method ranking under the 22d order, Caryophyllaceae. The calyx is tetrphyllous; the petals four; the capsule is unilocular, quadrivalved, and polypermous.

SAGITTARIA, Arrow-head: A genus of the polyantha order, belonging to the monocotyledons; and in the natural method ranking under the fifth order, Tripletaloidae. The male calyx is triphyllous; the corolla tripetalous; the filaments generally about 14; the female calyx is triphyllous; the corolla tripetalous; many pistils; and many naked seeds. There are four species of which the most remarkable is the sagittifolia, growing naturally in many parts of England. The root is composed of many strong fibres, which strike into the mud; the footstalks of the leaves are in length proportional to the depth of the water in which they grow; so they are sometimes almost a yard long: they are thick and finous; the leaves, which float upon the water, are shaped like the point of an arrow, the two ears at their base spreading wide and slender, and are very sharp-pointed. The flowers are produced upon long stalks which rise above the leaves, standing in whorls round them at the joints. They consist of three broad white petals, with a cluster of stigmas in the middle, which have purple stamens. There is always a bulb at the lower part of the root, growing in the solid earth beneath the mud. This bulb constitutes a considerable part of the food of the Chineese; and upon that account they cultivate it. Horses, goats, and swine eat it; cows are not fond of it.

SAGITTARIUS, in astronomy, the name of one, of the 12 signs of the zodiac.

SAGO, a simple brought from the East Indies, of considerable use in diet as a relish. It is produced from a species of palm-tree (Cocos circinatus, L.) growing spontaneously in the East Indies without any culture. The progress of its vegetation in the early stages is very slow. At first it is a mere thorny, thick white thorn with thorns, which makes it difficult to come near it; but as soon as its stem is once formed, it rises in a short time to the height of 30 feet, is about six feet in circumference, and imperceptibly loses its thorns. Its ligneous bark is about an inch in thickness, and covers a multitude of long fibres; which, being interwoven one with another, envelop a mass of a gummy kind of meal. As soon as this tree is ripe, a whitish dust, which transpires through the pores of the leaves, and adheres to their extremities, proclaims its maturity. The Malais then cut them down near the root, divide them into several sections, which they split into quarters: they then scoop out the mass of fibrous substance, which is enveloped by and adheres to the fibres; they dilute it in pure water, and then pass it through a straining bag of fine cloth, in order to separate it from the fibres. When this paste has lost part of its moisture by evaporation, the Malais throw it into a kind of earthen vessels, of different shapes, where they allow it to dry and harden. This paste is wholesome nourishing food, and preserves for many years. The Indians eat it diluted with water, and sometimes baked or boiled. Through a principle of humanity, they revere the finest part of this meal for the aged and infirm. A jelly is sometimes made of it, which is white and of a delicious flavour.

SAGUM, in Roman antiquity, a military habit, open from top to bottom, and usually fastened on the right shoulder with a buckle or clasp. It was not different in shape from the oblong of the Greeks and the paludamentum of the generals. The only difference between them was, that the paludamentum was made of a richer stuff, was generally of a purple colour, and both longer and fuller than the fagum.

SAGUMTUN, an ancient town of Spain, now called Morvedra, where there are still the ruins of a Roman amphitheatre to be seen. The new town is situated on a river called Morvedra, 15 miles to the north of Valencia, in E. Long. 10°. N. Lat. 39° 38'. It was taken by Lord Peterborough in 1706.

SAICK, or Sagicus, a Turkia sail, very common in the Levant for carrying merchandize.

SAIDE, the modern name of Sidon. See SIDON.

SAIL, in navigation, an assemblage of several breadths of canvas sewed together by the laths, and edged round with cord, fastened to the yards of a ship, to make it drive before the wind. See SHIP.

The edges of the cloths, or pieces, of which a sail is composed are generally sewed together with a double seam; and the whole is skitted round at the edges with a cord, called the bolt-robe.

Although the form of sails is extremely different, they are all nevertheless triangular or quadrilateral figures; or, in other words, their surfaces are contained either between three or four sides.

The former of these are sometimes spread by a yard, as lateen-sails; and otherwise by a stay, as stay-sails; or by a mast, as shoulder-of-mutton sails; in which the foresail is attached to the yard, mast, or stay, throughout its whole length. The latter, or those which are four-sided, are either extended by yards, as the principal sails of a ship; or by yards and booms, as the standing-sails, drivers, ring-sails, and all those sails which are set occasionally; or by gaffs and booms, as the main-sails of a ship.

The principal sails of a ship (Plate CCCCXLIV. fig. 2.) are the courses or lower sails a; the top-sails b, which are next in order above the courses; and the top-gallant sails c, which are expanded above the top-sails.

The courses are the main-sail, fore-sail and mizen, main stay-sail, fore stay-sail, and mizen stay-sail; but more particularly the three first. The main-stay-sail is rarely used except in small vessels.

In all quadrangular sails the upper edge is called the head; the sides or skirts are called leeches; and the bottom or lower edge is termed the foot. If the head is parallel to the foot, the two lower corners are denominated clews, and the upper corners corners.

In all triangular sails, and in those four-sided sails wherein the head is not parallel to the foot, the foremost corner at the foot is called the tack, and the after corner the clew; the foremost perpendicular or slanting edge is called the fore-leech, and the hinder the after-leech.
The heads of all four-sided falls, and the fore-leeches of lateen-fails, are attached to their respective yard or gaff by a number of small cords called ro-hands; and the extremities are tied to the yard-arms, or to the peak of the gaff, by earings.

The flay-fails are extended upon flays between the masts, whereon they are drawn up or down occasionally, as a curtain slides upon its rod, and the lower parts are stretched out by a tack and sheet. The leeches of a top-fail are drawn out to the extremities of the lower yard, by two large ropes called the top-fall fleets; and the leeches of the top-gallant fails are in like manner extended upon the top-fall yard-arms, as exhibited by fig. 2.

The fludding-fails are set beyond the leeches or skirts of the main-fail and fore-fail, or of the top-fails or top-gallant fails of a ship. Their upper and lower edges are accordingly extended by poles run out beyond the extremities of the yards for this purpose. These falls, however, are only let in favourable winds and moderate weather.

All falls derive their name from the falls, yard, or flay, upon which they are extended. Thus the principal fall extended upon the main-mast is called the main-fall, d; the next above, which stands upon the main-top-mast, is termed the main-top-fall, e; and the highest, which is spread across the main-top-gallant mast, is named the main-top-gallant fall, f.

In the same manner there is the fore-fall, g; the fore top-fall, h; and the fore-top-gallant-fall, i; the mizen, k; the mizen top-fall, l; and mizen top-gallant fall, m. Thus also there is the main-flay-fall, o; the main-top-mast flay-fall, p; and main-top-gallant flay-fail, q; with a middle flay-fail which stands between the two fails.

N.B. All these flay-fails are between the main and fore-masts.

The flay-fails between the main-mast and mizen-mast are the mizen flay-fail, r; and the mizen top-mast flay-fail, s; and sometimes a mizen top-gallant flay-fail above the latter.

The flay-fails between the foremast and the bowsprit are the fore flay-fail, t; the fore top-mast flay-fail, u; and the jib, v. There is besides two square falls extended by yards under the bowsprit, one of which is called the sprit-fall, y; and the other the sprit-fail top-fall, z.

The fludding-fails being extended upon the different yards of the main-mast and fore-mast, are likewise named according to their stations, the lower, top-mast, or top-gallant fludding fails.

The ropes by which the lower yards of a ship are hove up to their proper height on the masts, are called the jears. In all other falls the ropes employed for this purpose are called halliards.

The principal fails are then extended by halliards, fleets, and bowlines, except the courses, which are always stretched out below by a tack and sheet. They are drawn up together, or trussed up, by brunt-lines, clue-lines, d; leech-lines, ee; reef-tackles, ff; flab-lines, g; and spilling lines. As the brunt-lines and leech-lines pass on the other side of the main-yard, they are expressed by the dotted lines in the figure.

The courses, top-falls, and top-gallant falls, are wheeled about the masts, so as to suit the various directions of the wind by braces. The higher fludding falls, and in general all the flay-fails, are drawn down, so as to be furled, or taken in, by down-hauls.

Some experienced fail-makers contend, that it would be of much advantage if many of the falls of ships were made of equal magnitude; in which case, when necessity required it, they could be interchangeably used. For example, as the mizen top-fall is now made nearly as large as the main top-gallant fall, it would be easy to make the yards, masts, and falls, so as mutually to suit each other. The main and fore-top-falls differ about two feet at head and foot, and from one to three feet in depth. These likewise could be easily made alike, and in some cases they are so. The name may be said of the main and fore-top-gallant falls, and of the mizen top-gallant fall, and main fore-royal. The main-fall and fore-fall might also, with respect to their head, be made alike; but as the former has a gore at the leech, and a larger gore at the foot for clearing it of the gallow, boats, &c. which the latter has not, there might be more difficulty in arranging them. The difficulty, however, appears not to be insurmountable. These alterations, it is thought, would be extremely useful in the event of losing falls by fires of weather. Fewer falls would be thus necessary, less room would be required to flow them, and there would be less danger of confusion in taking them out. But perhaps the utility of these alterations will be more felt in the merchant-service than in the navy, which latter has always a large store of spare falls, and sufficient room to flow them in order. Thus, too, spare yards and masts might be considerably reduced in number, and yet any casual damages more easily repaired at sea. Top-mast fludding falls are occasionally substituted for awnings, and might, by a very little attention in planning the rigging of a ship, be contrived as to answer both purposes. See Ship-building.

Sail is also a name applied to any vessel before at a distance under sail.

To set Sail, is to unfurl and expand the sails upon their respective yards and flays, in order to begin the action of sailing.

To Make Sail, is to spread an additional quantity of sail, so as to increase the ship's velocity.

To shorten Sail, is to reduce or take in part of the sails, with an intention to diminish the ship's velocity.

To Strike Sail, is to lower suddenly. This is particularly used in saluting or doing homage to a superior force, or to one whom the law of nations acknowledges as superior in certain regions. Thus all foreign vessels strike to a British man of war in the British seas.

Sailing, the movement by which a vessel is wafted along the surface of the water, by the action of the wind upon her falls.

When a ship changes her state of rest into that of motion, as in advancing out a harbour, or from her station at anchor, she acquires her motion very gradually, as a body which arrives not at a certain velocity till after an infinite repetition of the action of its weight.

The first impression of the wind greatly affects the velocity, because the resistance of the water might destroy it; since the velocity being but small at first, the
resistance of the water which depends on it will be
very feeble; but as the ship increases her motion, the
force of the wind on the sails will be diminished;
whereas, on the contrary, the resistance of the wa-
ter on the bow will accumulate in proportion to the
velocity with which the vessel advances. Thus the
repetition of the degrees of force, which the action of
the sails adds to the motion of the ship, is perpetually
decreasing; whilst on the contrary, the new degrees
added to the effort of resistance on the bow are always
augmenting. The velocity is then accelerated in pro-
portion as the quantity added is greater than that which
is subtracted; but when the two powers become equal;
when the impulsion of the wind on the sails has lost so
much of its force, as only to act in proportion to the
opposite impulsion of resistance on the bow, the ship will
then acquire no additional velocity, but continue to fail
with a constant uniform motion. The great weight of
the ship may indeed prevent her from acquiring her
greatest velocity; but when she has attained it, the will
advance by her own intrinsic motion, without gaining
any new degree of velocity, or lessening what she has
acquired. She moves then by her own proper force
in vacuo, without being afterwards subject either to the
effort of the wind on the sails, or to the resistance of
the water on the bow. If at any time the impulsion of
the water on the bow should destroy any part of the
velocity, the effort of the wind on the sails will revive it,
so that the motion will continue the same. It must,
however, be observed, that this state will only subsist
when these two powers act upon each other in direct
opposition; otherwise they will mutually destroy one
another. The whole theory of working ships depends
on this counter-action, and the perfect equality which
should subsist between the effort of the wind and the
impulsion of the water.

The effect of failing is produced by a judicious ar-
angement of the sails to the direction of the wind.
Accordingly the various modes of failing are derived
from the different degrees and situations of the wind
with regard to the course of the vessel. See Seam-
ship.

To illustrate this observation by examples, the plan
of a number of ships proceeding on various courses are
represented by fig. 3, which exhibits the 32 points
of the compact, of which C is the centre; the direction
of the wind, which is northerly, being expressed by the
arrow.

It has been observed in the article Cross-Hauled,
that a ship in that situation will fail nearly within six
points of the wind. Thus the ships B and j are close-
hauled; the former being on the larboard-tack, steer-
ing E. N. E. and the latter on the starboard tack, fail-
ing W. N. W. with their yards a b braced obliquely, as
suitable to that manner of sailing. The line of battle
on the larboard tack would accordingly be expressed by
CB, and on the starboard by CG.

When a ship is neither close-hauled, nor steering
afbre the wind, she is in general said to be failing large.
The relation of the wind to her course is precisely
determined by the number of points between the latter
and the course close-hauled. Thus the ships e and x
have the wind one point large, the former steering
E. & N. and the latter W. & N. The yards remain al-
most in the same position as in B and j; the bowlines
and sheets of the sails being only a little slackened.

The ships d and a have the wind two points large,
the one steering east and the other west. In this man-
ner of failing, however, the wind is more particularly
said to be upon the beam, as being at right angles
with the keel, and coinciding with the position of the
ship's beams. The yards are now more across the ship,
the bowlines are cast off, and the sheets more relaxed;
so that the effort of the wind being applied nearer to
the line of the ship's course, her velocity is greatly
augmented.

In e and f the ships have the wind three points
large, or one point abeam. The course of the former
being E. & S. and that of the latter W. & S. The sheets
are still more flowing, the angle which the yards make
with the keel further diminished, and the course acce-
lerated in proportion.

The ships f and g, the first of which steers E. & S.
and the second W. & S. W. have the wind four points
large, or two points abeam. In g and r the wind is five points large, or three points abeam, the former failing S. E. & E. and the latter S. & W. In both these situations the sheets are still farther slackened, and the yards laid yet more athwart the ship's length, in proportion as the wind approaches the quarter.

The ships h and s, steering S. E. and S. W. have
the wind six points large, or more properly on the quar-
ter; which is considered as the most favourable manner
of failing, because all the sails co-operate to increase
the ship's velocity; whereas, when the wind is right
aft, as in the ship m, it is evident that the wind in its
passage to the foremost sails will be intercepted by
those which are farther aft. When the wind is on the
quarter, the fore-tack is brought to the cat-head; and
the main-tack being cast off, the weather-clue of the
main-sail is hoisted up to the yard, in order to let the
wind pass freely to the fore-sail; and the yards are dis-
posed so as to make an angle of about two points, or
nearly 22°, with the keel.

The ships i and p, of which the former fails S. E. & S.
and the latter S. & W. are said to have the wind
three points on the larboard or starboard quarter: and
those expressed by k and o, two points; as steering S. E.
and S. W. in both which positions the yards make
nearly an angle of 16°, or about a point and a half,
with the ship's length.

When the wind is one point on the quarter, as in the
ships i and n, whose courses are S. & E. and S. & W.
the situation of the yards and sails is very little dif-
te from the last mentioned; the angle which they
make with the keel being somewhat less than a point,
and the stay-sails being rendered of very little service.
The ship m fails right aforesail the wind, or with the wind
right aft. In this position the yards are laid at right
angles with the ship's length: the stay-sails being en-
tirely useless, are hauled down; and the main-sail is
drawn up in the braces, that the fore-sail may operate;
a measure which considerably facilitates the steerage,
or effort of the helm. As the wind is then intercepted
by the main-top-sail and main-top-gallant-sail, in its
passage to the fore-top-sail and fore-top-gallant-sail,
these latter are by consequence entirely becalmed; and
might
might therefore be furled, to prevent their being fretted by flapping against the mast, but that their effort contributes greatly to prevent the ship from broaching-to, when she deviates from her course to the right or left thereof.

Thus all the different methods of sailing may be divided into four, viz. close-hauled, large, quartering, and afore the wind; all which relate to the direction of the wind with regard to the ship's course, and the arrangement of the sails.

Sailing also implies a particular mode of navigation, formed on the principles, and regulated by the laws, of trigonometry. Hence we say, Plain Sailing, Mercator's, Middle-latitude, Parallel, and Great-circle Sailing. See the article Navigation.

Sail-making, the art of making sails. See Sail and Ship-building.

Sailor, the same with Mariner and Seaman.

Saint, means a person eminent for piety and virtue, and is generally applied to us by the apostles and other holy persons mentioned in Scripture. But the Romanists make its application much more extensive. Under the word Canonization we have already said something on their practice of creating saints. Our readers, however, will not, we trust, be displeased with the following more enlarged account, which they themselves give of the matter. The canonization of saints, then, they tell us, is the enrolment of any person in the canon or catalogue of those who are called saints; or, it is a judgment and sentence of the church, by which it is declared, that a deceased person was eminent for sanctity during his lifetime, and especially towards the end of it; and that consequently he must now be in glory with God, and deserves to be honoured by the church on earth with that veneration which he is wont to pay to the blessed in heaven.

The discipline with regard to this matter has varied. It would seem that in the first ages every bishop in his own diocese was wont to declare what persons were to be honoured as saints by his people. Hence St Cyprian, about the middle of the third century, B. 3. ep. 6. requires that he be informed of those who should die in prison for the faith, that so he might make mention of them in the holy sacrifice with the martyrs, and might honour them afterwards on the anniversary day of their happy death. This veneration continued sometimes to be confined to one country; but sometimes it extended to distant provinces, and even became universal all over the church. It was thus that St Lawrence, St Ambrose, St Augustine, St Basil, and many others, appear to have been canonized by custom and universal per function. In those ages none were reckoned saints but the apostles, the martyrs, and very eminent confessors, whose sanctity was notorious everywhere.

Afterwards it appears that canonizations were wont to be performed in provincial synods under the direction of the metropolitan. It was thus that St Ifodore of Seville was canonized in the 7th century, by the 8th council of Toledo, 14 years after his death. This manner of canonization continued occasionally down to the 12th century. The last instance of a saint canonized in that way, is that of St Walter abbot of Pontrofe, who was declared a saint by the archbishop of Rouen in the year 1153.

In the 12th century, in order to prevent mistakes in so delicate a matter, Pope Alexander III. judged it proper to refer this declaration to the holy see of Rome exclusively; and decreed that no one should for the future be honoured by the church as a saint without the express approbation of the pope.

Since that time, the canonization of saints has been carried on in the form of a process; and there is at Rome a congregation of cardinals, called the congregation of holy priests, who are assisted by several divines under the name of consultors, who examine such matters, and prepare them for the decision of the holiness. When therefore any potentate, province, city, or religious body, think fit, they apply to the pope for the canonization of any person.

The first juridical step in this business must be taken by the bishop in whose diocese the person for whom the application is made had lived and died, who by his own authority calls witnesses to attest the opinion of the holiness, the virtues, and miracles, of the person in question. When the deceased has refused in different dioceses, it may be necessary that different bishops take such depositions; the originals of which are preserved in the archives of their respective churches, and authentic copies sealed up are sent to Rome by a special messenger, where they are deposited with the congregation of rites, and where they must remain for the space of ten years without being opened. They are then opened, and maturely examined by the congregation, and with their advice the pope allows the cause to go on or not as he thinks proper. The solicitors for the canonization are then referred by his holiness to the said congregation, which, with his authority, gives a commission to one or more bishops, or other respectable persons, to examine, on the spot and in the places where the person in question has lived and died, into his character and whole behaviour. These commissioners summon witnesses, take depositions, and collect letters and other writings of the venerable man, and get all the intelligence they can concerning him, and the opinion generally entertained of him. The report of these commissioners is considered attentively and at length by the congregation, and every part of it discussed by the consultors, when the congregation determines whether or not they can permit the process to go on. If it be allowed to proceed, a cardinal, who is called promotor, undertakes to be the principal agent in that affair. The first question then that comes to be examined is, whether or not the person proposed for canonization can be proved to have been in an eminent degree endued with the moral virtues of prudence, justice, fortitude, and temperance; and with the theological virtues of faith, hope, and charity? All this is canvassed with great deliberation; and there is a distinguished ecclesiastic called the promoter of the holy faithful, who is sworn to make all reasonable objections to the proofs that are adduced in favour of the canonization. If the decision be favourable, then the proofs of miracles done to show the sanctity of the person in question are permitted to be brought forward; when two miracles must be verified to the satisfaction of the congregation, both as to the reality of the facts, and as their having been truly above the power of nature. If the decision on this comes out likewise favourable, then the whole is laid before
before the pope and what divines he chooses (a). Public prayer and fasting are likewise preferred, in order to obtain light and direction from heaven. After all this long procedure, when the pope is resolved to give his approbation, he issues a bull, first of beatification, by which the person is declared blessed, and afterwards another of canonization, by which the name of saint is given him. These bulls are published in St Peter’s church with very great solemnity.

A person remarkable for holiness of life, even before he is canonized, may be venerated as such by those who are persuaded of his eminent virtue, and his prayers may be implored: but all this must rest on private opinion. After his canonization, his name is inserted in the Martyrology, or catalogue of saints, of which the respective portion is read every day in the choir at the divine office. A day is also appointed for a yearly commemoration of him. His name may be mentioned in the public church service, and his intercession with God be sought. His relics may be enshrined: he may be painted with rays of glory, and altars and churches may be dedicated to God in honour of him, and in thanksgiving to the divine goodness for the blessings bestowed on him in life, and for the glory to which he is exalted in heaven.

The affair of a canonization is necessarily very expensive, because so many persons must be employed about it; so many journeys must be made; so many writings for and against it must be drawn out. The expense altogether amounts to about 25,000 Roman crowns, or £6000 Sterling. But it is generally contrived to canonize two or three at a time, by which means the particular expense of each is very much lessened, the solemnity being common.

It often happens that the solicitors for a canonization are unsuccessful. Thus the Jéfuits, even when their interest at Rome was greatest, could not obtain the canonization of Bellarmine; and it is remarkable, that the objection is said to have been, his having defended the indirect power of the pope over Christian princes even in temporals.

Several authors have written on canonization, and particularly Prosper Lambertini, afterwards pope under the name of Benedict XIV. who had held the office of promoter of the faith for many years. He published on it a large work in several volumes, in folio, of which there is an abridgment in French. In this learned performance there is a full history of the canonization of saints in general, and of all the particular proceedings of that kind that are on record; an account is given of the manner of proceeding in these extraordinary trials; and it is shown that, besides the affiance of Providence, which is implored and expected in what is so much connected with religion, all prudent human means are made use of, in order to avoid mistakes, and to obtain all the evidence of which the matter is susceptible, and which must appear more than sufficient to every impartial judge. See Pope, Popery, &c.

SAINT-PAIN, in botany, a species of the hedyssarum. See Hedysarum; and Agriculture, n° 160.

SAINT Januarus’s Blood. See Chemistry, n° 800. SAINTE, an ancient and considerable town of France. It is the capital of Saintonge, and before the revolution was a bishop’s see. It contained likewise several convents, a Jéfuits college, and an abbey remarkable for its steeple, built with small stones, which admits the light. It is seated on a rock, and is reckoned impregnable.

This city was a Roman colony; and those conquerors of the earth, who polished the nations they subdued, have left behind them the traces of their magnificence. In a hollow valley between two mountains, and almost adjoining to one of the suburbs, are the ruins of the amphitheatre. Though now in the last stage of decay, its appearance is august and venerable. In some parts, scarce any of the arches are to be seen; but the east end is still in a great degree of preservation. From its situation in a valley, and from the ruins of an aqueduct which conveyed water to the town from near three leagues distance, it has been supposed that Naumachie were represented in it; but this amounts only to conjecture. A triumphal arch, on which is an inscription in Roman letters, merits likewise attention. It was erected to Germanicus, on the news of his death, so universally lamented throughout the empire. The river Charente surrounds this city, as the Severn does that of Shrewsbury, describing the form of a horseshoe.

Except the remains of Roman grandeur yet visible at Saintes, the place contains very little to detain or amuse a traveller. It is built with great irregularity; the streets are narrow and winding, the houses mean, and almost all of them are some centuries old. The cathedral has been repeatedly defaced and destroyed by Normans and Huguenots, who made war alike on every monument of art or piety. One tower only escaped their rage, which is said to have been built as early as the year 800 by Charlemagne. It is of an enormous magnitude, both as to height and circumference. These circumstances have probably conduced more to its preservation during the fury of war, than any veneration for the memory of its founder, or for the sanctity of its institution.

SAINTONGE, a province of France, bounded on the east by Angoumois and Perigord, on the north by Poitou and the territory of Annes, on the west by the ocean, and on the south by Bourdeleux, and Giron, about 62 miles in length and 30 in breadth. The river Charente runs through the middle of it, and renders it one of the finest and most fertile provinces in France, abounding in all sorts of corn and fruits; and they make the belt salt here in Europe.

The SAINTS; three leagues distant from Guadaloupe, are two very small islands, which, with another yet smaller, form a triangle, and have a tolerable harbour. Thirty Frenchmen were sent thither in 1648, but were soon driven away by an excessive drought, which dried up their only spring before they had time to make any refouvoirs. A second attempt was made in 1652, and

(a) His holinesses generally appoints three consultories; in the first of which the cardinals only assist, and give their opinion; in the second, a preacher pronounces a speech in praise of the candidate before a numerous audience; to the third, not only the cardinal, but all the bishops who are at Rome, are invited, and all of them give their vote by word of mouth.
and lasting plantations were established, which now yield 50,000 weight of coffee, and 100,000 of cotton.

Sakradawendra is the name of one of the Ceylonese deities, who commands and governs all the reis, and formerly answered the prayers of its worshippers; but according to the fabulous account which is given of him, the golden chair, on which he sat, and the foot of which was made of wax, that was sotted by their prayers and tears, and sunk downward, so that he could take notice of their requests and relieve them, being disposed of among the poor, they no longer derive any benefit from him, or pay him any reverence.

SAL. See Salt.

SAL Ammoniac. See Chemistry, n. 1047.

Native SAL Ammoniac. This salt, according to Mon- goul, is met with in the form of an effervescence on the surface of the earth, or adhering in powder to rocks. Sometimes, as in Persia and the country of the Kalmucks, it is found as hard as stone. It is meet with of different colours, as grey, black, green, and red, in the neighbourhood of volcanoes, in the caverns or grottoes of Puzzol, and in the mineral lakes of Tufcany, as well as in some mountains of Tartary and Thibet. At Sol-faterra, near Naples, it is found in the crevices, of a yellowish colour, like common sal-ammoniac more than once fiblimed. For common sal-ammoniac, see Chemistry-Index at Ammoniac and Ammoniacal Salt.

SAL. Glauber’s secret. See Chemistry-Index at Glauber.

SAL Vegetable. See Chemistry-Index at Salt, &c.

SAL. Volatile. See Chemistry-Index at Volatile.

SAL Primula. See Chemistry, n. 744.

SAL Sedative. See Chemistry-Index at Boras.

SAL Volatile Oleum. See Chemistry, n. 1036.

SALADIN, a famous sultan of Egypt, equally re- named as a warrior and legislator. He supported himself by his valour, and the influence of his amiable charac- ter, against the united efforts of the chief Christian potentates of Europe, who carried on the most unjust wars against him, under the false appellation of Holy Wars. See under the articles Egypt and Crusade.

SALAMANCA, an ancient, large, rich, and popu- lous city of Spain, in the kingdom of Leon, situated on the river Tormes, about 75 miles west from Madrid. It is said to have been founded by Teucer the son of Telamon, who called it Salamis or Salmantica, in memory of the ancient Salamis. Here is an university, the greatest in Spain, and perhaps inferior to none in the whole world, in respect at least to its revenues, build- ings, number of scholars, and masters. Here are also many grand and magnificent palaces, figure, convents, churches, colleges, chapels, and hospitals. The bishop of this country is suffragan to the archbishop of Com- poltella, and has a yearly revenue of 1000 ducats. A Roman way leads from hence to Merida and Seville, and there is an old Roman bridge over the river. Of the colleges in the university, four are appropriated to young men of quality; and near it is an infirmary for poor fick scholars. W. Long. 6. 10. N. Lat. 41. 0.

SALAMANDER, in zoology. See Lacerta.

SALAMIS, an island of the Archipelago, situated in E. Long. 34. 0. N. Lat. 37. 32. - It was famous in antiquity for a battle between the Greek and Persian fleets. In the council of war held among the Persians on this occasion, all the commanders were for engaging, because they knew this advice to be most agreeable to the king’s inclination. Queen Artemisia was the only peron who opposed this resolution. She was queen of Halicarnassus; and followed Xerxes in this war with five ships, the best equipped of any in the fleet, except those of the Sidonians. This princess distinguished herself on all occasions by her niggardly courage, and still more by her prudence and conduct. She represented, in the council of war we are speaking of, the dangerous consequences of engaging a people that were far more expert in maritime affairs than the Persians; alleging, that the loss of a battle at sea would be attended with the ruin of their army; whereas, by steering out of the war, and advancing into the heart of Greece, they would create jealousies and divisions among their ene- mies, who would separate from one another, in order to defend each of them their own country; and that the king might, almost without firing a blow, make himself master of Greece. This advice, though very prudent, was not followed, but an engagement unanimously resolved upon. Xerxes, in order to encourage his men by his presence, caused a throne to be erected on the top of an eminence, whence he might safely behold what ever happened; having several scribes about him, to write down the names of such as should signalize themselves against the enemy. The approach of the Persian fleet, with the news that a strong detachment from the army was marching against Cleombrous, who defended the isthms, struck such a terror into the Pe- loponnesians, that they could not by any intrigues be prevailed upon to stay any longer at Salamis. Being therefore determined to put to sea, and fail to the isthms, Themistocles privately dispatched a trusted friend to the Persian commanders, informing them of the in- tended flight; and exhorting them to fend part of their fleet round the island; in order to prevent their escape. The same messenger assured Xerxes, that Themistocles, who had sent him that advice, designed to join the Per- sians, as soon as the battle began, with all the Athenian ships. The king giving credit to all he said, immediately called a strong squadron to round the island in the night in order to cut off the enemy’s flight. Early next morning, as the Peloponnesians were preparing to set sail, they found themselves encompassed on all sides by the Persian fleet; and were against their will obliged to remain in the straits of Salamis and expose themselves to the same dangers with their allies. The Grecian fleet consisted of 380 sail, that of the Per- sians of 2000 and upwards. Themistocles avoided the engagement till a certain wind, which rose regularly every day at the same time, and which was entirely contrary to the ene- my, began to blow. As soon as he found himself fav-oured by this wind, he gave the signal for battle. The Persians, knowing that they fought under their king’s eye, advanced with great resolution; but the wind blowing directly in their faces, and the largeness of num-
number of their ships embarking them in a place so
strait and narrow, the courage from abated; where the
Greeks observing, used such efforts, that in a short time
breaking into the Perilian fleet, they entirely disordered
them; some flying towards Phalana, where their army
lay encamped; others fancying themselves in the harbours
of the neighbouring islands. The Ionians were the first
that betook themselves to flight. But Queen Artemisia
distinguished herself above all the rest, her ships being
the last that fled; which Xerxes observing, cried out
that the men behaved like women, and the women with
the courage and intrepidity of men. The Athenians
were so incensed against her, that they offered a reward
of 10,000 drachmas to any one that should take her alive:
but she, in spite of all their efforts, got clear of
the ships that purfued her, and arrived safe on the coast
of Asia. In this engagement, which was one of the
most memorable actions we find recorded in history, the
Grecians lost 40 ships; and the Perilians 200, besides a
great many more that were taken, with all the men and
ammunition they carried.

The island of Salamis is of a very irregular shape; it
was reckoned 70 or 80 itdias; i.e. 8 or 10 miles long,
reaching westward as far as the mountains called Kerata
or The Horns. Pausanias informs us, that on one side
of this island stood in his time a temple of Diana, and
on the other a trophy for a victory obtained by Themistocles,
together with the temple of Cychreus, the site of which is
now thought to be occupied by the church of
St. Nicholas.

The city of Salamis was demolished by the Athenians,
because in the war with Cassander it surrendered
to the Macedonians, from disaffection. In the second
century, when it was visited by Pausanias, some ruins of
the Agora or market-place remained, with a temple and
image of Ajax; and not far from the port was shown a
monument, on which, they related, Telamon sat to view
the Salaminian ships on their departure to join the Gre­
cian fleet at Aulis. The walls may still be traced, and
it has been conjectured were about four miles in cir­
cumference. The level space within them was now cov­
ered with green corn. The port is choked with mud,
and was partly dry. Among the scattered marbles are
some with inscriptions. One is of great antiquity, be­
fore the introduction of the Ionic alphabet. On an­
other, near the port, the name of Solon occurs. This
renowned lawgiver was a native of Salamis, and a sta­
tue of him was erected in the market-place, with one
hand covered by his vulture, the symbol of wisdom in which he
was accustomed to address the people of Athens. An inscription on black marble was also copied in 1676
near the ruin of a temple, probably that of Ajax. The
island of Salamis is now inhabited by a few Albanians,
who till the ground. Their village is called Ampelaki,
"the Vineyard," and is at a distance from the port,
standing more inland. In the church are marble frag­
ments and some inscriptions.

SALARY, a recompense or consideration made to
a person for his pains and industry in another man's
business. The word is used in the statute 23 Edw. III.
cap. 1. Salaries at first signified the rents or profits of
a farm, hall, or house (and in Galloigne they now call
the feates of the gentry falis, as we do halls); but af­
afterwards it was taken for any wage, stipend, or annual
allowance.

Vol. XVI.
Several methods of preparing salep have been proposed and practiced. Geoffroy has delivered a very judicious paper on this subject in the Histoire de l'Académie Royale des Sciences, 1740, and Rammus, in the Swedish Transactions, 1754, has improved Geoffroy's method. But Mr Mount of Rochdale has lately favoured the public with a new manner of curing the orchis root; by which salep is prepared, at least equal, if not superior, to any brought from the Levant. The root is to be washed in water, and the fine brown skin which covers it is to be separated by means of a small brush, or by dipping the root in hot water, and rubbing it with a coarse linen cloth. When a sufficient number of roots have been thus cleaned, they are to be spread on a tin-plate, and placed in an oven heated to the usual degree, where they are to remain six or ten minutes, in which time they will have lost their milky whiteness, and acquired a transparency like horn, without any diminution of bulk. Being arrived at this state, they are to be removed, in order to dry and harden in the air, which will require several days to effect; or by using a very gentle heat, they may be finished in a few hours.

Salep thus prepared, may be afforded in those parts of England where labour bears a high value, at about eight-pence or ten-pence per pound: And it might be sold still cheaper, if the orchis were to be cured, without separating from it the brown skin which covers it; a troublesome part of the process, and which does not contribute to render the root either more palatable or savoury. Whereas the foreign salep is now sold at five and sixpence or ten-pence per pound; and when mixed with vinegar, seemed only to dilute like an equal proportion of water, and not to cover its sharpness. Salep, however, appears by my experiments to retard the acetic fermentation of milk; and consequently would be a good lithing for milk-pottage, especially in large towns, where the cattle being fed upon four draught must yield acetic milk.

Salep in a certain proportion, which I have not yet been able to ascertain, would be a very useful and profitable addition to bread. I directed one ounce of the powder to be dissolved in a quart of water, and the mucilage to be mixed with a sufficient quantity of flour, salt, and yeat. The flour amounted to two pounds, the yeast to two ounces, and the salt to 80 grains. The loaf when baked was remarkably well. It weighed two pounds and 12 ounces; from which it appears that the salep, though used in so small a proportion, increased the gravity of the loaf six ounces; by absorbing and retaining more water than the flour alone was capable of. Half a pound of flour and an ounce of salep were mixed together, and the water added according to the usual method of preparing bread. The loaf when baked weighed 13 ounces and an half; and would probably have been heavier if the salep had been previously dissolved in about a pint of water. But it should be remarked, that the quantity of flour used in this trial was not sufficient to conceal the peculiar taste of the salep.

The restorative, mucilaginous, and demulcent qualities of the orchis root, render it of considerable use in various diseases. In the fea-scurvy it powerfully obtains the acrimony of the fluids, and at the same time repairs the uterine coat of the intestines, by abating irritation, and gently correcting putrefaction. In the schematic fever, which arises from the absorption of pus from ulcers in the lungs, from wounds, or from putrefaction, salep used plentifully is an admirable demulcent.
cent, and well adapted to refit the dissolution of the 
crals of the blood, which is so evident in their cases.
And by the fame mucilaginous quality, it is equally 
efficacious in the strangury and dysuria; especially in
the latter, when arising from a venereal caufe, because
the discharge of urine is then attended with the most 
exquisite pain, from the ulceration about the neck of the
bladder and through the course of the urethra. I have
found it also an useful aliment for patients who labour
under the stone or gravel." The ancient chemists ap-
pear to have entertained a very high opinion of the or-
chis root, as appears from the secretum secretorum of Ray-
mond Lully, a work dated 1565.

SALERNO, an ancient and considerable town of
Italy, in the kingdom of Naples, and capital of the
Hither Principat, with an archbishop's see, a castle,
harbour, and an university chiefly for medicine. It is
feated at the bottom of a bay of the fame name. E.
Long. 14. 43. N. Lat. 40. 45.

SALER, in war, a light covering or armour for the
head, anciently worn by the light-horse, onl different
from the caufe in that it had no crest and was little
more than a bare cap.

SALIANT, in fortification, denotes projecting. There
are two kinds of angles, the one salitant, which have their
point outwards; the other re-entering, which have their
points inwards.

SALITANT, SALIANT, or SALIANT, in heraldry, is
applied to a lion, or other beast, when its fore-legs are
raised in a leaping posture.

SALIC, or SALICA, LAW, (Les Salica), an ancient
and fundamental law of the kingdom of France, usually
supposed to have been made by Pharamond, or at least by
Clovis; in virtue whereof males only are to inherit.

Some, as Poilletius, would have it to have been called
Sali, q. d. Gallic, because peculiar to the Gauls. For
Montanus infifts, it was because Pharamond was at first
called Salicis. Others will have it to be so named, as
having been made for the falcic lands. These were noble
fiefs which their first kings used to fello on the fal-
lians, that is, the great lords of their falle or court,
without any other tenure than military service; and for
this reafon, fuch fiefs were not to descend to women,
as being by nature unfit for fuch a tenure. Some,
again, derive the origin of this word from the Salians,
a tribe of Franks that settled in Gaul in the reign of
Julian, who is faid to have given them lands on condition
of their personal fervice in war. He even paffed the
conditions into a law, which the new conquerors ac-
quiefced in, and called it falli, from the name of their
former countrymen.

SALICORNIA, JOINTED GLASS-WORT, or Salt-
wort: A genus of the monogynia order, belonging to
the monandria clas of plants; and in the natural
method ranking under the 11th order, Holocarices. The
calyx is ventricose, or a little swelling out and entire;
there are no petals, and but one feed. There are four
species, of which the moft remarkable are, 1. The fru-
te condors, with obtufe points, grows plentifully in moft
of the salt marshes which are overflowed by the tides in
many parts of England. It is an annual plant, with
thick, fuculent, jointed falks, which trail upon the
ground. The flowers are produced at the ends of the
joints toward the extremity of the branches, which are
small, and fare difcernible by the naked eye. 2. The
perennis, with a shrubby branching flalk, grows natur-
ally in Sheppey island. This hath a shrubby branch-
ing flalk about six inches long; the points of the articu-
lations are acute; the flalks branch from the bottom,
and form a kind of pyramid. They are perenni, and
produce their flowers in the fame manner as the
former.

The inhabitants near the feacoasts where these plants
grow, cut them up toward the latter end of fummer,
when they are fully grown; and, after having dried
them in the sun, they burn them for their ashes, which
are used in making of glafs and soap. These herbs
are by the country people called helpe, and promifcuouly
gathered for ufe. See the article SALICORNIA also Dying
of LEATHER, p. 759. note a.

SALISII, in Roman antiquity, priatts of Mars, whereof
there were 12, inftituted by Numa, wearing painted
particloured garments, and high bonnets; with a fleet
curiaffe on the breach. They were called falii, from fallare
"to dance;" because, after affliting at facrifices, they
went dancing about the streets, with bucklers in their left-
hand, and a rod in their right, striking musically with
their rods on one another's bucklers, and finging hymns
in honour of the gods.

SALINO, one of the Lipari iflands, fuated bet-
ween Sicily and Italy, consists of two mountains both
in an high flat of cultivation. The one lying more
towards the north than the other is rather the height
of the two, and is called del Capo, "the head." The
other is called deUa Fuda felice, or "the happy valley."
One-third of the extent of these hills from the bottom
to the summit is one continued orchard, confifting of
vines, olive, fig, plum, apricot, and a vall diverty of
other trees. The white roofs of the houfes, which are
every where interperfmed amid this diverty of verdure
and foliage, contribute to variegate the fcape in a
very agreeable manner. The back part of almost all
the houfes is shaded by an arbour of vines, supported by
pillars of brick, with crofs poles to flant the branches
and foliage of the vines. Thofe arbours felter the
houfes from the rays of the sun, the heat of which is
quite scorching in these fouthern regions. The vines
are extremely fruitful; the poles bending under the
weight of the grapes.

Theifenes in this island are more interefling to the
lover of natural history than to the antiquarian. See
RETICULUM.

On the south fide of the ifland, however, there are
still to be fon some five ruins of an ancient bath, a
Roman work. They confift of a wall of 10 or 11 fa-
thoms in extent, and terminating in an arch of no
great height, of which only a small part now remains.
The building feems to have been reduced to its prefent
flate rather by the ravages of men than the injuries of
time. Almost all the houfes in the ifland are built of
materials which have belonged to ancient monu-
ments. The ancients had, in all probability, bathes of
freath as well as of falt water in this ifland; for when-
ever the prefent inhabitants have occafion for a fpring
of freath water, they have only to dig a pit on the thore,
and pure fweet water flows in great abundance.

There were formerly mines of alun here, from which
the inhabitants drew a very confiderable yearly revenue.
But whether they are exhausted, or whatever circum-
fance may have ceafed them to be given up, they are
Salisbury, now no longer known. The island abounds in a variety of fruits.

On the east side it is very populous. There are two places which are both called Lingua “the tongue,” and which contain a good number of inhabitants; the one is near Salino, the other is distinguished by the name of St. Marina; there are besides these two other villages. All these places together may contain about 4,000 inhabitants; the circumference of the island may be about 14 miles.

Salisbury, the capital of the county of Wiltshire in England, situated in W. Long. 1. 55. N. Lat. 51. 3. This city owed its first site to its cathedral, which was begun in 1219, and finished in 1258. According to an estimate delivered in to Henry III. it cost forty thousand marks. It is a Gothic building, and is certainly the most elegant and regular in the kingdom. The doors and chapels are equal in number, the one to the hours in a year. It is built in the form of a lantern, with a spire in the middle, and nothing but buttresses and glaze windows on the outside. The spire is the highest in the kingdom, being 410 feet, which is twice the height of the monument in London. The pillars and pilaestres in the church are of fine marble; the art of making which is now either entirely lost or little known. This magnificent church has lately undergone most beautiful alterations; with an addition of two fine windows, and an organ prefixed by the king. The roof of the chapter-house, which is 50 feet in diameter, and 150 in circumference, bears all upon one slender pillar, which is such a curiosity as can hardly be matched in Europe. The turning of the western road through the city in the reign or Edward III. was a great advantage to it. The chancellorship of the most noble order of the garter, which is annexed to this fee, was first conferred on bishop Richard Beauchamp. The hospital of St. Michael’s, near this city, was founded by one of its bishops. Dr. Seth Ward, bishop of this fee in the reign of Charles II. contributed greatly to the making the river Avon navigable to Christ church in Hampshire. The same prelate in 1683, built an hospital for the entertainment of the widows of poor clergymen. There are three other churches beside the cathedral, which is without the liberty of the city, and a greater number of boarding schools, especially for young ladies, than in any other town in England. Here is a manufacture of druggets, flannels, bonnets, and those clothes called Salisbury whites; in consideration of which, and its fairs, markets, affizes, boarding-schools, and clergy, the city may be justly said to be in a flourishing condition. It was incorporated by Henry III. and is governed by a mayor, high-beward, recorder, deputy-recorder, 24 aldermen, and 30 alfiants or common council men. The number of souls is about 10,000. A new council chamber is just begun (June 1794) building here with proper courts of justice, by the earl of Radnor; to which Mr. Hussey is also a great benefactor. That quarter called the close, where the canons and prebendaries live, is like a fine city of itself. Here is an assembly for the ladies every Tuesday, and coaches set out from hence to London every day. In this town are several charity-schools; the expence of one of them is entirely defrayed by the bishop. The city gives the title of earl to the noble family of Cecil.

Salisbury Plain, the extensive downs in Wiltshire, which are thus denominated, form in summer one of the most delightful parts of Great Britain for extent and beauty. It extends 28 miles west of Weymouth, and 25 east to Winchester; and in some places is near 40 miles in breadth. That part about Salisbury is a chalky down, and is famous for feeding numerous flocks of sheep. Considerable portions of this tract are now enclosed, the advantages of which are so great, that we hope the whole will undergo so beneficial an alteration.

Saliva, is that fluid by which the mouth and tongue are continually moistened in their natural state; and is supplied by glands which form it, that are called salivary glands. This humor is thin and pellucid, incapable of being concreted by the fire, almost without taste and smell. By chewing, it is expressed from the glands which separate it from the blood, and is intimately mixed with our food, the digestion of which it greatly promotes. In hungry persons it is acrid, and copiously discharged; and in those who have fasted long it is highly acrid, penetrating, and resolvent. A copious evacuation of it, produces thirst, loss of appetite, bad digestion, and an atrophy.

Salivation, in medicine, a promoting of the flux of saliva, by means of medicines, mostly by mercury. The chief use of salivation is in diseases belonging to the glands and membrana adiopis, and principally in the cure of the venereal disease; though it is sometimes also used in epidemic diseases, cutaneous diseases, &c. who've cures tend that way.

Salix, the willow, in botany: A genus of the diandria order, belonging to the dicecia class of plants; and in the natural method ranking under the 50th order, according to the glands and prebendaries live, is like a fine city of itself. Here is an assembly for the ladies every Tuesday, and coaches set out from hence to London every day. In this town are several charity-schools; the expence of one of them is entirely defrayed by the bishop. The city gives the title of earl to the noble family of Cecil.

In this town are several charity-schools; the expence of one of them is entirely defrayed by the bishop. The city gives the title of earl to the noble family of Cecil.
SALIX, (L., Salic.) grows but to a moderate height; having yellow, very
pliant shoots; oval, acute, serrated, very smooth leaves, with the
ferratures cartilaginous, and with callous punctures on the
footstalks. 4. The purpurea, purple, or red willow, grows to a
height, having slender rod-like branches; very long, planty,
greenish shoots; and very long, narrow, spear-shaped, acute,
almost entire leaves, hoary, and silky underneath. 6. The pentandra, pentandrous, broad-
leaved, sweet-scented willow, grows to some considerable
figure, having brownish-green branches; oblong, broad, serrated, smooth, sweet-scented leaves, thinning
above, and pentandrous flowers. 7. The triandra, or triandrous willow, grows to a large figure, having
numerous, erect, greyish-green branches, and plant
shoots; oblong, acute-pointed, ferrated smooth, thinning-
green leaves, cared at the base; and triandrous flowers.
8. The fragilis, fragile, or crack-willow, rises to a modi-
dling figure, with brownish, very fragile, or brittle branches,
long, oval-lanceolate, fawed, smooth leaves of a thinning-green on both sides, having dentated glandular foot-stalks. This sort in particular being exceedingly fragile, so that it easily cracks and breaks, is unfit for culture in other-grounds. 6. The Baby-
lonica, Babylonian pendulous willow, commonly called
weeping willow, grows to a large height, having numer-
ous, long, slender, pendulous branches, hanging down;
loosely all round in a curious manner, and long, narrow,
spear-shaped, ferrated, smooth leaves. This curious will-
low is a native of the east, and is retained in our hardy
plantations for ornament, and exhibits a most agreeable
variety; particularly when diffused singly by the verges
of any piece of water, or in spacious openings of gras-
ground.

All the species of salix are of the tree kind, very
hardy, remarkable fast growers, and several of them
attaining a considerable stature when permitted to run
up to standards. They are mostly of the aquatic tribe,
being generally the most abundant and of most prosper-
ous growth in watery situations; they however will
grow freely almost any where, in any common soil and
exposure: but grow considerably the fairest and strong-
cut in low moist land, particularly in marshy situations,
by the verges of rivers, brooks, and other waters;
likewise along the sides of watery ditches, etc., which
places often lying waste, may be employed to good
advantage, in plantations of willows, for different
purposes.

SALLE, an ancient and considerable town of
Africa in the kingdom of Fez, with a harbour and se-
veral ports. The harbour of Salle is one of the best
in the country; and yet, on account of a bar that lies
across it, ships of the smallest draught are forced to un-
load and take out their guns before they can get into it.
There are docks to build ships; but they are hardly
ever used, for want of skill and materials. It is a large
place, divided into the Old and New Towns, by the ri-
er Guero. It has long been famous for its rovers or
pirates, who make prizes of all the christian ships that
come in their way, except there is a treaty to the con-
trary. The town of Salle in its present state, though
large, presents nothing worthy the observation of the
traveller except a battery of 24 pieces of cannon front-
ing the sea, and a redoubt at the entrance of the river,
which is about a quarter of a mile broad, and penetrates
several miles into the interior country. W. Long. 6.
39, N. Lat. 34. 6.

SALLET, or SALLAD, a dill of eatable herbs, or-
dinarily accompanying roast meat; composed chiefly of
crude, fresh herbages, seasoned with salt, oil, and vin-
gar.

Menage derives the word from the Latin falata; of
fal,“salt,” others from faledos Du-Canpe from folgana,
which is used in Ascentis and Collumella in the same
sense.

Some add mustard, hard eggs, and sugar; others,
pepper, and other spices, with orange-peel, saffron, &c.

The principal fallet-herbs, and those which ordinarily
make the bals of our English fallets, are lettuce, celer-
y, endive, crefle, radish, and rape; along with which,
by way of furniture, or additional, are used put:lane, spinach, fennel, tarragon, burnet, cori-fallet,
and chervil.

The gardeners call some plants small herbs in fallets;
these should always be cut while in the seed-leat: as
creffes, mustard, radish, turnip, spinach, and lettuce;
all which are raised from seeds down in drills, or lines,
from the middle of February to the end of March, un-
der glass or frames; and thence to the middle of May,
upon natural beds, warmly exposed; and during the
summer heats in more shady places; and afterwards in
September, as in March, &c., and lastly, in the rigour
of the winter, in hot-beds. If they chance to be frozen
in very frosty weather, putting them in spring-water
for two hours before they be used, recovers them.

SALLO (Denis de), a French writer, famous for
being the projector of literary journals, was born at
Paris in 1626. He studied the law, and was admitted
a counsellor in the parliament of Paris in 1652. It
was in 1664 he schemed the plan of the Journal des
Sciences; and the year following began to publish it
under the name of Sieur de Heronville, which was that
of his valet de chambre. But he played the critic so
severely, that authors, surprized at the novelty of such
attack, retorted so powerfully, that M. de Sallo, un-
able to weather the storm, after he had published his
third Journal, declined the undertaking, and turned it
over to the abbe Gallois, who, without professing to
criticize, continued himself with merely giving titles,
and making extracts. Such was the origin of literary
journals, which afterwards sprung up in other countries
under different titles; and the issue of them, under
judicious management, is a clear proof of their utility.

M. de Sallo died in 1669.

SALLUSTIUS (Cnitus Crispus), a celebrated Ro-
man historian, was born at Amnerum, a city of Italy,
in the year of Rome 669, and before Christ 85. His
education was liberal, and he made the best use of it.
His Roman History in six books, from the death of
Sylla to the conspiracy of Catiline, the great work
from which he chiefly derived his glory among the ancients,
is unfortunately lost excepting a few fragments; but
his two detached pieces of History which happily re-
main entire, are sufficient to justify the great encom-
iums he has received as a writer.—He has had the
singular honour to be twice translated by a royal
hand: first by Queen Elizabeth, according to Camden,
and secondly, by the present Infant of Spain, whose version of this elegant historian, lately printed in folio, is one of the most beautiful books that any country has produced since the invention of printing. No man has inveighed more sharply against the vices of his age than this historian; yet no man had left pretensions to virtue than he. His youth was spent in a most lewd and profligate manner; and his patrimony almost squandered away when he had scarcely taken possession of it. Marcus Varro, a writer of undoubted credit, relates, in a fragment preferred by Aulus Gelius, that Sallust was actually caught in bed with Faustina, the daughter of Sylla, by Milo her husband; who scourged him very severely, and did not suffer him to depart till he had redeemed his liberty with a considerable sum. A. C. 694, he was made quæstor, and in 702 tribune of the people; neither of which places is he allowed to have acquitted himself at all to his honour. By virtue of his quæstorship, he obtained an admission into the senate; but was expelled thence by the censors in 704, on account of his immoral and debauched way of life. In the year 705, Cæsar restored him to the dignity of a senator; and to introduce him into the house with a better grace, made him quæstor a second time. In the administration of this office he behaved himself very scandalously; exposed every thing to sale that he could find a purchaser for; and if we may believe the author of the invective, thought nothing wrong which he had a mind to do: non nihil non emoveret, nihil non aquis et seminibus, quod ipse facere collibusset.

In the year 707, when the African war was at an end, he was made praetor for his services to Cæsar, and sent to Numidia. Here he acted the same part as Verres had done in Sicily; outrageously plundered the province; and returned with such immense riches to Rome, that he purchased a most magnificent building upon mount Quirinal, with those gardens which to this day retain the name of Sallustian gardens, besides his country house at Tivoli. How he spent the remaining part of his life, we have no account from ancient writers. Eusebius tells us, that he married Terentia, the divorced wife of Cicero; and that he died at the age of 50, in the year 710, which was about four years before the battle of Actium. Of the many things which he wrote, beside his History of the Catilinarian and Jugurthine wars, we have some orations or speeches, printed with his fragments.

SALLY-PORTS, in fortification, or Pollen-Gates, as they are sometimes called, are those under-ground passages which lead from the inner works to the outward ones; such as from the higher flank to the lower, or to the tenailles, or the communication from the middle of the curtain to the ravelin. When they are made for men to go through only, they are made with steps at the entrance and going out. They are about 6 feet wide and 8½ feet high. There is also a gutter or channel made under the sally-ports, which are in the middle of the curtains, for the water which runs down the streets to pass into the ditch; but this can only be done when they are wet ditches. When sally-ports serve to carry guns through them for the out-works, instead of making them with steps, they must have a gradual slope, and be 8 feet wide.

SALMASIUS (Claudius), a French writer of uncommon abilities and immeasurable erudition, descended from an ancient and noble family, and born at or near Semur in 1596. His mother, who was a protestant, infused her notions of religion into him, and he at length converted his father; he settled at Leyden; and in 1670 paid a visit to Christina, queen of Sweden, who is reported to have frown upon him extraordinary marks of regard. Upon the violent death of Charles I, of England, he was prevailed on by the royal family, then in exile, to write a defence of that king; which was answered by the famous Milton in 1671, in a work entitled Defensio pro Populo Anglicano contra Claudii Salmofti Deiitioem Regiam. This book was read over all Europe; and conveyed such a proof of the writer's abilities, that he was respected even by those who hated his principles. Salmasius died in 1673; and some did not scruple to say, that Milton killed him by the acuteness of his reply. His works are numerous, and of various kinds; but the greatest monuments of his learning are, his Opera Posthuma, and his Exercitationes Plantanea in Solinum.

SALMO, the SALMON; a genus of the order of abdaminales. The head is smooth, and furnished with teeth and a tongue; the rays of the gills are from four to ten; the back-fin is fat behind; and the belly-fins have many rays. There are 29 species; of which the most remarkable are:

1. The Galar, or common salmon, is a northern fish, being unknown in the Mediterranean sea and other warm climates; it is found in France in some of the rivers that empty themselves into the ocean, and north as far as Greenland; they are also very common in Newfoundland, and the northern parts of North America. Salmons are taken in the rivers of Kamtschatka; but whether they are of the same species with the European kind, is not very certain. They are in several countries a great article of commerce, being cured in different ways, by salting, pickling, and drying: there are stationary fisheries in Iceland, Norway, and the Baltic; but we believe no where greater than those at Colquhine in Ireland; and in Great Britain at Berwick, and in some of the rivers in Scotland. In the History of Cumberland, we are told that "they deposit their spawn even on the upper side of Pooley-bridge, but always in the stream of Eamont. At those times it is not an easy matter to drive them away by throwing stones at them. They will take a bait of ore, or small fish, while upon the rod, or laying their spawn. We have never heard of a salmon or salmon fillet being fished in the lake. They go up the river Derwent in September, through the lake of Baffenthwaite, up the river which runs through Keswick into the vale of St John, where they deposit their spawn in the small streams and feeders of the lake. The young salmon are called salmon fillets, and go down to the sea with the first floods in May."

The salmon was known to the Romans, but not to the Greeks. Pliny speaks of it as a fish found in the rivers of Aquitaine; Antonius enumerates it among those of the Moifel. The salmon is a fish that lives both in the salt and fresh waters; quitting the sea at certain seasons for the sake of depositing its spawn, in seculi, in the gravelly beds of rivers remote from their mouths. There are scarce any difficulties but what they will overcome, in order to arrive at places fit for their
their purpose: they will ascend rivers hundreds of miles, force themselves against the most rapid streams, and spring with amazing agility over cataracts of several feet in height. Salmon are frequently taken in the Rhine as high up as Basel; they gain the sources of the Lapland rivers in spite of their torrent-like currents, and surmount the perpendicular falls of Leixlip, Kenderth, and Pont Aberglaflyn. It may here be proper to contradict the vulgar error, of their taking their tail in their mouth when they attempt to leap; such as Mr Pennant saw, sprung up quite straight, and with a strong tremulous motion.

The salmon is a fish so generally known, that a very brief description will serve. The largest we ever heard of weighed 74 pounds. The colour of the back and sides are grey, sometimes spotted with black, sometimes plain; the covers of the gills are subject to the same variety; the belly silvery; the nose sharp-pointed; the end of the under jaw in the males often turns up in the form of a hook; sometimes this curvature is very considerable; it is said that they lose this hook when they return to the sea. The teeth are lodged in the jaws and on the tongue, and are slender, but very sharp; the tail is a little forked.

2. The trutta, or sea-trout, migrates like the true salmon up several of our rivers; spawns, and returns to the sea. That described by Mr Pennant was taken in the Tweed below Berwick, June 1769. The shape was more thick than the common trout; the weight three pounds two ounces. The irides silver; the head thick, smooth, and dusky, with a pleas of blue and green; the back of the same colour, which grows fainter towards the side-line. The back is plain, but the sides, as far as the lateral line, are marked with large distinct irregular shaped spots of black; the lateral line straight; the sides beneath the line and the belly, are white. Tail broad, and even at the end. The dorsal fin had 12 rays; the peduncle 14; the ventral 9; the anal 10. The flesh when boiled is of a pale red, but not of a very pleasant taste.

3. The fario, or trout; the colours of which vary greatly in different waters, and in different seasons. Trouts differ also in size. One taken in Llynneith, Denbighshire, which is famous for its excellent trout, measured 17 inches, its depth three and three-quarters, its weight one pound ten ounces; the head thick; the nose rather sharp; the upper jaw a little longer than the lower; both jaws, as well as the head, were of a pale brown, blotched with black; the teeth sharp and strong, diploped in the jaws, roof of the mouth, and tongue. The back was dusky; the sides tinged with a purplish bloom, marked with deep purple spots, mixed with black above and below the side-line, which was strait; the belly white. The first dorsal fin was spotted; the spurious fin brown, tipped with red; the peduncle, ventral, and anal fins, of a pale brown; the edges of the anal fin white; the tail very little forked when extended. The stomachs of the common trout are uncommonly thick and mucilaginous. They feed on the fish of lakes and rivers, as well as on small fish. They likewise take into their stomachs gravel or small stones, to assist in comminuting the tefeaceous parts of their food. The trouts of certain lakes in Ireland, such as those of the province of Galway and some others, are remarkable for the great thickness of their stomachs, which, from some flight resemblance to the organs of digestion in birds, have been called gizzard; the Irish name the species that has them gillaroo trouts. These stomachs are sometimes served up to table under the former appellation. Trouts are most voracious fish, and afford excellent diversion to the angler. The passion for the sport of angling is so great in the neighbourhood of London, that the liberty of fishing in some of the streams in the adjacent counties is purchased at the rate of 10s. per annum. These fish shut their quarters to spawn; and, like salmon, make up towards the heads of rivers to deposit their roes. The under jaw of the trout is subject, at certain times, to the same curvature as that of the salmon.

"It is caught (say the editors of the History of Cumberland) in very great plenty at all lakes of the year; one weighing a pound and a half is a usual size, though some are caught of 4 lb. weight. Five or six ounces is a common weight; the largest are commonly the best for the table, when they cut of a deep salmon colour. In the winter months great quantities are caught along with the char and sea trout, and sent to London. So that the angler, on a favourable day, here enjoys his diversion in higher perfection than in most places. A trout occasionally flays out of the Eamont into the lake, and vice versa, out of the lake into the river. They are easily distinguished by their spots; and it is observed, that a fish taken from its usual place is not in so good a condition as one of equal length taken on its own ground; hence it is probable, that they do not emigrate, except when diseased or spawning. Gilt fish (those without spawn) are the finest and best. They have been taken out of a fold piece of ice, in which they were frozen, as it were in a cage, perfectly uninjured, after an imprisonment of several hours.

4. The species, called from its colour the noble, migrates out of the sea into the river Elkh in Cumberland, from July to September. When dressed, their flesh is red, and most delicious eating. They have, on their first appearance from the salt-water, the Irena falmonae, or salmon leue adhering to them. They have both milt and spawn; but no fry has as yet been observed. This is the fish called by the Scots philine. They never exceed a foot in length. The upper jaw is a little longer than the lower; in the first there are two rows of teeth, in the last one; on the tongue are fixed teeth. The back is straight: the whole body of an elegant form; the lateral line is straight; colour, between that and the top of the back, dusky and silvery intermixed; beneath the line, of an exquisite whiteness; the first dorsal fin spotted with black; tail black, and much forked.

5. The farlact is the leaf of the trout kind; is frequent in the Wye, in the upper part of the Severn, and the rivers that run into it; in the north of England, and in Wales. It is by several imagined to be the fry of the salmon; but Mr Pennant differs from that opinion. See his Brit. Zool. vol. 3, p. 303.

This species has a general resemblance to the trout, therefore must be described comparatively. yd. The head is proportionably narrower, and the mouth less than that of the trout. yd. Their body is deeper, yd. They seldom exceed six or seven inches in length: at most, eight and a half. yd. The pectoral fins have generally
SAL [616] SAL

SALmo. generally but one large black spot, though sometimes a single small one attends it; whereas the pectoral fins of the trout are more numerously marked. In some, the spurious or fat fin on the back is never tipped with red; nor is the edge of the anal fin white. In others, the spots on the body are fewer, and not so bright. It is also marked from the back to the sides with six or seven large bluish bars; but this is not a certain character, as the same is sometimes found in young trout. In some, the tail of the salmon is much more forked than that of the trout. These fins are very frequent in the rivers of Scotland, where they are called *parr*. They are also common in the Wye, where they are known by the name of *furlings*, or *lorsprings*.

6. The alpinus, or red char (umbra minor, or cafe char of Pennant), is an inhabitant of the lakes of the north, and of those of the mountainous parts of Europe. It affects clear and pure waters, and is very rarely found in running streams, except into such wholly bottom is similar to the neighbouring lake. It is found in watery abundance in the cold lakes on the summits of the Lapland Alps, and is almost the only fish that is met with in any plenty in those regions; where it would be wonderful how they subsisted, had not Providence supplied them with innumerable larvae of the great kind: these are food to the fish, who in their turn are a support to the migratory *Laplangoers*, in their summer-voyages to the distant lake. In such excursions those vacant people find a luxurious and easy repast in these fish, which they despise and eat without the addition of sauces; for exercise and temperance render useless the inventions of epicureism. There are but few lakes in Great Britain that produce this fish; and even those not in any abundance. It is found in Ullswater and Windermere in Westmorland; in Llyn Quelwyn, near the foot of Snowdon; and, before the discovery of the copper mines, in those of Llynvyriss; but the mineral springs have entirely destroyed the fish in the last lakes. In Scotland it is found in Loch Inch, and other neighbouring lakes, and is said to go into the Spey to spawn.

"The largest and most beautiful we ever received (says Mr Pennant) were taken in Windermere, and were communicated by the Rev Mr Farish of Carlisle, with an account of their natural history. He sent five specimens; two under the name of the *cach char*, male and female; another he called the *gold char*, i.e. a char which had not spawned the preceding season, and on that account is reckoned to be in the greatest perfection. The two others were inferior, the *red char*, the *fiver char*, or the *gold char*, the *carpa lacus natans*, *Rall Syn. Pisc. 66*, which last are in Westmorland distinguished by the *spur red*, by reason of the flesh assuming a higher colour than the other when dressed.

"The umbra minor, or cafe char, spawn about Michaelmas, and chiefly in the river Braithy, which unites with another called the *Rowthay*, about a quarter of a mile above the lake, they both fall into it together. The Braithy has a black rocky bottom; the bottom of the Rowthay is a bright sand, and into this the char are never observed to enter. Some of them, however, spawn in the lake; but always in such parts of it which are stony, and resemble the channel of the Braithy. They are supposed to be in the highest perfection about May, and continue so all the summer; yet are rarely caught after April. When they are spawning in the river they take a bait, but at no other time; being commonly taken, as well as the other species, in what they call *breach-nets*, which are in length about 24 fathoms, and about five or six wide. The reason which the other species spawn in is from the beginning of January to the end of March. They are never known to ascend the rivers, but always in those parts of the lake which are springy, where the bottom is smooth and sandy, and at the water warmest. The fishermen judge of this warmth, by observing that the water seldom freezes in the places where they spawn except in intense frosts, and then the ice is thinner than in other parts of the lake. They are taken in greatest plenty from the end of September till the end of November; at other times they are hardly to be met with. This species is much more esteemed for the table than the other, and is very delicate when cold." The length of the red char to the division in its tail was 12 inches; its biggest circumference about 7. The fish dorsal fin was five inches and three-quarters from the tip of its nose, and consists of 12 branched rays, the first of which was short, the fifth the longest; the fat fin was very small. Each of the five fins had double nodri, and small teeth in the jaws, roof of the mouth, and on the tongue. The jaws of the cafe char are perfectly even; on the contrary, those of the red char were unequal, the upper jaw being the broadest, and the teeth hung over the lower, as might be perceived on passing the finger over them. The gold or barren char was rather more slender than the others, as being without spawn. The back was of a glossy dusty blue; the sides silver, mixed with blue, spotted with pale red; the sides of the belly were of a pale red, the bottom white. The tails of each bifurcated."

7. The thymalus, or graying, haunts clear and rapid streams, and particularly those that flow through mountainous countries. It is found in the rivers of Derbyshire; in some of those of the north; in the Tame near Ludlow; in the Lug, and other streams near Leominster; and in the river near Christchurch, Hampshire. It is also very common in Lapland; the inhabitants make use of the guts of this fish instead of venison, to make the cheese which they get from the milk of the reindeer. It is a voracious fish, rises freely to the fly, and will very eagerly take a bait. It is a very swift swimmer, and disappears like the transient passage of a shadow, from whence we believe it derived the name of *umbra*.

*Effingenfue occlus celeri levis umbra natata.* Aufl. The umbrella swift escapes the quickest eye.

*Thymalus* and *thymus* are names bestowed on it on account of the imaginary scent, compared by some to that of thyme; but we never could perceive any particular smell. It is a fish of an elegant form; lies deep than that of a trout: the largest we ever heard of was taken near Ludlow, which was about half a yard long, and weighed four pounds six ounces; but this was a very rare instance. The irides are silvery, tinged with yellow; the teeth very minute, seated in the jaws and the roof of the mouth, but none on the tongue: the head is dusky; the covers of the gills of a glossy green: the back and sides of a fine silvery grey; but when the fish is just taken,
SAL. [ 617 ]

SALMON. See SALMO, no. 1.

SALMON-FISHERY. See Salmon-Fishery.

SALON, or SALON, in architecture, a lofty, spacious fort of hill, vaulted at top, and usually comprehending two stories, with two ranges of windows.

The salon is a grand room in the middle of a building, or at the head of a gallery, &c. Its faces, or sides, are all to have a symmetry with each other; and as it usually takes up the height of two stories, its ceiling, Daviler observes, should be with a moderate sweep.

The salon is a plate-room much used in the palaces in Italy; and from thence the mode came to us. Ambassadors, and other great visitors, are usually received in the salon.

It is sometimes built square, sometimes round or oval, sometimes octagonal, as at Marly, and sometimes in other forms.

SALONA, a sea-port town of Dalmatia, seated on a bay of the gulph of Venice. It was formerly a very considerable place, and its ruins show that it was 10 miles in circumference. It is 18 miles north of Spalato, and subject to Venice. It is now a wretched village, preferring few diluqishable remains of its ancient splendor. Doubtless the two last ages have decimated all that has escaped the barbarity of the northern nations that demolished it. In a valuable MS. relation of Dalmatia, written by the senator Giambattista Guittiani, about the middle of the 16th century, there is a hint of what existed at that time. The nobility, grandeur, and magnificence of the city of Salona, may be imagined from the vaulks and arches of the wonderful theatre, which are seen at this day; from the vall vales of the finest marble, which lies scattered on, and buried in the fields; from the beautiful column of three pieces of marble, which is still standing in the place where they saw the arsenal was, towards the sea shore; and from the many arches of surprising beauty.
excavations of Salo Dichi’s I by a narrow pass fordable at low water, the earth, which is increased, has buried the most ancient stones, and the most valuable things.” E. Long. 17. 29. N. Lat. 44. 10.

SALONIACI, formerly called Thessalonica, a seaport town of Turkey in Europe, and capital of Macedonia, with an archbishop’s see. It is ancient, large, populous, and rich, being about 10 miles in circumference. It is a place of great trade, carried on principally by the Greek Christians and Jews, the former of which have 30 churches, and the latter as many synagogues; the Turks also have a few mosques. It is surrounded with walls, fenced with towers, and defended on the land side by a citadel, and near the harbour with three forts. It was taken from the Venetians by the Turks in 1431. The principal merchandise is silk. It is seated at the bottom of a gulph of the same name, partly on the top, and partly on the side of a hill, near the river Vardar.

SALSOULI, a very strong castle of France, in Roussillon, on the confines of Languedoc. It was taken from the Spaniards by the French in 1642; and is seated on a lake of the same name, among mountains, 10 miles north of Perignan. E. Long. 3° 35’. N. Lat. 40. 41.

SALSES, a very strong castle of France, in Roussillon, on the confines of Languedoc. It was taken from the Spaniards by the French in 1642; and is seated on a lake of the same name, among mountains, 10 miles north of Perignan. E. Long. 3° 35’. N. Lat. 40. 41.

SALSETTE, an island of the East Indies, adjacent to Bombay, from which it is in one place divided only by a narrow pass fordable at low water. It is about 26 miles long, and eight or nine broad. The soil is rich, and by proper cultivation capable of producing anything that will grow in tropical climates. It is everywhere well watered, and when in the possession of the Portuguese furnishes such quantities of rice, that it was called the Granary of Goa. It abounds also in all kinds of provisions, and has great plenty of game, both of the four-footed and feathered kind. It has pretty high mountains; and there is a tradition that the whole island was found, some years ago, a stone anchor, such as was anciently used by the inhabitants of that country. Here meet with the ruins of a place called Cinara, where there are excavations of rocks, supposed to be contemporary with those of Elephanta. They are much more numerous, but not comparable to the former either in bigness or workmanship.

The island of Salsette lately formed part of the Portuguese dominions in India. It ought to have been ceded to the English along with Bombay, as part of the dower of Catharine of Lisbon, espoused to Charles II. The fulfilment of this article, however, being evaded, the island remained in possession of the Portuguese; and notwithstanding the little care they took of it, the revenue of it was valued at 60,000 l. Such was the negligence of the Portuguese government that they took no care to fortify it against the attacks of the Marattas, from whose dominions Salsette was only separated by a very narrow pass fordable at low water. Here they had only a miserable redoubt of no consequence, till, on the appearance of an approaching war with the Marattas, they began to build another, which indeed would have answered the purpose of protecting the island, provided the Marattas had allowed them to finish it. This, however, was not their intention. They allowed them indeed to go quietly on with their works, till they saw them almost completed, when they came and took possession of them. The Marattas thus became dangerous neighbours to the English at Bombay, until it was ceded to the latter by the treaty concluded with those people in 1780. E. Long. 72. 15. N. Lat. 19. 0. SALSOLA, Glass-wort: A genus of the digynia order, belonging to the pentandra class of plants; and in the natural method ranking under the 12th order, Holobaeae. The calyx is pentaphyllous; there is no corolla; the capsule is monoepiperal, with a fewed seed.

The species are, 1. The kali, which grows naturally in the salt marshes in divers parts of England. It is an annual plant, which rises above five or six inches high, sending out many side branches, which spread on every side, garnished with short awl-shaped leaves; which are feebly, and terminate in acute spines. The flowers are produced from the side of the branches, to which they fit close, and are encompassed by short prickly leaves; they are small, and of an herbaceous colour. The seeds are wrapped up in the emaplement of the flower, and ripen in autumn; soon after which the plant decays. 2. The tragus grows naturally on the sandy shores of the south of France, Spain, and Italy. This is also an annual plant, which sends out many diffused stalks, garnished with linear leaves an inch long, ending with sharp spines. The flowers are produced from the side of the stalks in the same manner as those of the former; their emaplements are blunt, and not so closely encompassed with leaves as those of the other. 3. The fodia, rises with herbaceous stalks near three feet high, spreading wide. The leaves on the principal stalk, and those on the lower part of the branches, are long, slender, and have no spines; those on the upper part of the stalks and branches are slender, short, and crooked. At the base of the leaves are produced the flowers, which are small, and hardly perceptible; the emaplement of the flower afterwards encompasses the capsule, which contains one coehleated seed. 4. The vermiculata grows naturally in Spain. This hath thrushly perennial stalks, which rise three or four feet high, sending out many side branches, garnished with feebly, oval, acute-pointed leaves, coming out in clusters from the side of the branches; they are hoary, and have stiff prickles. The flowers are produced from between the leaves toward the ends of the branches; they are so small as scarce to be discerned, unless they are closely viewed. The seeds are like those of the other kinds. 5. The rosea grows naturally in Tartary. This is an annual plant, whose stalks are herbaceous, and seldom rise more than five or six inches high. The leaves are awl-shaped, ending in acute points; the emaplements of the flowers spread open; the flowers are small, and of a rose colour, but soon fade: the seeds are like those of the other forts.

All the forts of glass-wort are sometimes promiscuously used for making the tall kali, but it is the third fort which is esteemed best for this purpose. The manner of making it is as follows: Having dug a trench
near the sea, they place laths across it, on which they lay
the herb in heaps, and, having made a fire below, the
liquor, which runs out of the herbes, drops to the bot-
tom, which at length thickening, becomes fafl kalsi,
which is partly of a black, and partly of an ash-colour,
very sharp and corrosive, and of a faltish taffe. This,
when thoroughly hardened, becomes like a flone; and
in that flate is transported to different countries for
making of glafs.

SALT, one of the great divilions of natural bodies,
but which has never yet been accurately defined. The
characterilic marks of falt have usually been reckoned
its power of affecting the organs of taffe, and being fo-
luble in water. But this will not diftinguish falt from
quilkime, which alfo affects the fens of tiffe, and
diffolves in water; yet quilkime has been universally
reckoned an earth, and not a falt. The only dif tin-
guilishing property of falts, therefore, is their crys-
allization in water: however, this does not belong to all
fals; for the nitrous and marine acids, though allowed
on all hands to be falts, are yet incapable of crys-
allization, at lealf by any method hitherto known. Several
of the imperfect neutral metals alfo, such as combina-
tions of the nitrous, muriatic, and vegetable acids
with fome kinds of earths, crystallize with very great
difficulty. However, by the addition of spirit of wine,
or fome other fubfances which absorb part of the water,
keeping the liquor in a warm place, &c. all of them
may be reduced to crysals of one kind or other. Salt,
therefore, may be defined a fubfaflce affecting the or-
gans of faffe, fofible in water, and capable of crys-
allization, either by itself or in conjunction with fome
other body; and, universally, every falt capable of be-
ing reduced into a folid form, is alfo capable of crys-
allization per felf. Thus the ealps of faltine bodies will
be fufficiently diftinguifhed from all others: for quilkime,
though fofible in water, cannot be crysallized without
addition either of fixed air or fome other acid; yet it
is moft commonly found in a folid flate. The precious
flones, baffeled, &c. though fuppos'd to be formerly
crysallized, are nevertheless diftinguifhed from falts
by their infipidity and infolubility in water.

But acids and alkalils, and combinations of both, when
in a concrete form, are falts, and of the pureft fort. Hen-
ce we conclude, that the bodies, to which the name of falts
more properly belongs, are the combinations of thofe
fubfaflces; which are accordingly called acid falts, alkalline
fals, and neutral fals. Thofe lart are combinations of acid
and alkaline fals, in fuch proportion as to render the
compounds neither four nor alkaline to the taffe. This
crysallization combination is called faturafion: thus the
common kitchen-falt is a neutral falt, compofed of marine
acid and mineral alkalii combined together to the point
of fafluration. The appellation of neutral fals is alfo
extended to denote all thofe combinations of acids, and
any other fubfaflce with which they can unite, fo as to
lofe, wholly or in great meafure, their acid properties.

But although this general definition of fals is com-
monly recelved, yet there are many writers, efpecially
mineralogifts, who confine the denomination of fals in
the manner we firit mentioned, viz. to fuch fubfaflces
only which, besides the general properties of fals, have
the power of crysallizing, that is, of arranging their
particles fo as to form regularly-shaped bodies, called
crySals, when the water superfluous to their concrete ex-
sistence has been evaporated.

The ancient chemilfs allerted that falt was one of
the component principles of metals, and indeed of
every thing elfe: a doctrine which was attempted to
be revived by the late Dr Price of Guilford, who
thought it probable that the fubs of all imperfect me-

tals is faline, becaufe Mr Scheele had lately extrac ted
a real acid from arsenic, which, by the addition of a pro-
per quantity of phlogifon, becomes a fennetal. But
here the argument will hold only with regard to the fe-
melals, all of which are volatile in the fire, and
therefore may poifibly have a volatile fubs, fuch as all
acids are in fome degree: but fome of the imperfect
metals, as tin and copper, may be reduced to a cafl
reduced equally refractory with quilkime ifelf; and even zinc,
though volatile in clofe vefhls, is yet capable of being
reduced to an exceedingly refractory cafl called flowefers
of zinc; and it is to be obferved, that the regulas
of arsenic, even in its moft perfect metaline form, cannot
be caified like other metals. The common opinion
that metals have an earthly, rather than a faltine baflis,
seems to be well founded.
The origin of fals is very much, or rather totolly,
unknown. Some eminent chemifts, particularly Stahl,
have fuppos'd that the number of fubsfaflces truly and
efentially faline is very small; nay, that there is but
one faline principle in nature. This principle they
fuppos'd to be the vitriolic acid, as being the molt
fimpie and indeftruitible of them all. Stahl delivers his
opinion on this fubjet in the following words: "That
he confiders the vitriolic acid as the only fubsfaflce ef-
entially faline; as the only faine principle which, by
uniting more or lefs intimately with other fubsfaflces
that are not faline, is capable of forming an innumera-
ble multitude of other faline matter, which nature
and art fhew us; and, focondly, that this faline principle
is a fecondary principle, compofed only by the inti-
mate union of two primary principles, water and
earth.

In support of this theory Mr Macquer argues in
the following manner: "Every true chemift will eafily
discover that this grand idée is capable of comprehendid
by its generality, and of connecting together, all
the phenomena exhibited by faltine fubsfaflces. But we
must at the fame time acknowledge, that when we exa-
mine the proofs upon which it is founded, although it
has a great appearance of truth by its confifiency with
the principles of chcmiary, and with many phenomena,
yet it is not supported by a fufficient number of facts
and experiments to affertain its truth. We might here
examine what degree of probability ought to be grant-
ed to this theory of fals; but this could not be pro-
perly accomplished, without entering into long details,
and penetrating into the depths of chcmiary. We are
therefore obliged to relate only what is most effential to
be known concerning this grand hypothesis. We may
perceive at once, that the former of thofe propopitions,
upon which is founded the theory which we mentioned,
cannot be demonstrated, unless it be previously proved
that every faline matter, excepting pure vitriolic acid, is
nothing but this fame acid differently modified, the pri-
mary properties of which are more or lefs altered or dif-
guged by the union contracted with other fubsfaflces.
But we confefs, that chemifts are not capable of proving
decisively this opinion; which, however, will appear
very probable from the following refleflions.

First, of all faline matters known, none is fo strong,
The vitriolic acid, when combined with other substances, forms vitriolic salts, which vary both in specific names and properties according to the various substances with which the acid is combined. Thus the vitriolic acid, combined with mineral alkalis, forms the salt called *Glauca's salt*, or *sal mirabilis*. When it is combined with calcareous earths, it forms vitriolic salts with bases of calcareous earth, which are commonly called *salpetraria*. When combined with argillaceous earths, it forms *alum*. When combined with metals, it forms vitriolic salts with metallic bases, to which the general name *vitriol* is given; and in commerce are commonly called *copperas*. The vitriols principally used are: 1. The *marial vitriol*; 2. The *copper vitriol*, called also *English vitriol*, *green vitriol*, or *green copperas*, which is a combination of vitriolic acid with iron. 3. The vitriol of copper, called also *blue vitriol*, *Cyprian vitriol*, or *blue copperas*; which is a combination of vitriolic acid and copper. 4. The vitriol of zinc, called also *white copperas*, and *Goffar vitriol*, which is a combination of the same acid with a femineral called *zinc*. It is a property peculiar to the vitriolic acid, that all the combinations of it, with those substances with which it can form neutral salts, are susceptible of crystallization.

Secondly, Amongst the other saline substances, those which appear most active and most simple, as nitrous and marine acids, are at the same time those whose properties most resemble the properties of vitriolic acid.

The nitrous acid, combined with all the substances with which it can mix, forms saline substances, in general called *nitrous salts*; specifying each particular salt by the name of the substance united to the acid. Thus nitrous acid, with fixed vegetable alkali, forms a saline substance called *nitre*, or *jat petre*. With mineral alkali, forms cubic or quadrangular nitre. When mixed with metallic substances, forms metallic nitres, which are specified nitre of gold, nitre of silver, or *nitre de mercury*. When mixed with vegetable alkali, and calcined, forms nitrous crystals of mercury, nitre of copper, &c.

Thirdly, We may give to vitriolic acid many of the characteristic properties of nitrous acid, by combining it in a certain manner with the inflammable principle, as we see in the volatile sulphurous acid; and even, according to an experiment of Mr. Pfeil, in a memoir concerning the origin of nitre, which gained the prize of the academy of Berlin, vitriolic acid, mixed with vegetable and animal matters susceptible of fermentation, is really transformed into a nitrous acid by the putrefaction of these matters. See Chemistry, n° 720.

Fourthly, The marine acid, although its principles are less known than those of the nitrous acid, may be approximated to the character of vitriolic and nitrous acids by certain methods. This acid, after it has been treated with tin and other metallic matters, is capable of forming ether with the spirit of wine, as vitriolic acid does, which it cannot do in its natural state; and when iron is dissolved in it, it seems to be approximated to the nature of nitrous acid. Reciprocally the approximation of vitriolic acid to the character of marine acid seems not impossible. Having once diluted very pure vitriolic acid upon a considerable quantity of white arsenic, I was struck with a strong smell like that of marine acid, which was not either that of arsenic or of vitriolic acid; for this has no smell when it is pure.

The marine acid, combined with various matters, forms marine salts, or simply salts, specified by the names of their particular bases. The sea-salt or kitchen salt, and salt gem, are combinations of marine acid and mineral alkali. When this acid is combined with volatile alkali, it forms sal ammoniac (*A*.) With metals, it forms metallic salts, called *salt of gold*, *salt of copper*, &c., according to the various metals combined with the acid. The salt of silver is also called *luna cornua*; the salt of lead is often called *plumbum cornuvm*; and the salts of antimony, and of arsenic, are known by the name of *butter of antimony, and butter of arsenic*.

Fifthly, Oily vegetable acids become so much stronger, and more similar to vitriolic acid, as they are more perfectly deprived of their oily principle, by combining them with alkalis, earths, or metals; and afterwards by separating them from these substances by distillation, and especially by frequently repeating these operations. They might perhaps be reduced to a pure vitriolic acid, by continuing sufficiently this method: and reciprocally, vitriolic and nitrous acids, weakened by water, and treated with much oily matters, or still better with spirit of wine, acquire the characters of vegetable acids. We may see a remarkable instance of this in Mr. Pott's dissertation De acido nitri vinigo. [The most remarkable experiment in which is related under the article Chemistry, n° 781.]

Sixthly, The properties of fixed alkalis seem to be very different from those of acids in general, and consequently of vitriolic acid. Yet if we consider that a large quantity of earth enters their composition; that much of it may be separated by repeated solutions and calcinations; and also, that by depriving these saline substances of their earthy principles, they become less fixed, more deliquescent, and, in a word, more similar to vitriolic acid in this respect; we shall not think it improbable, that fixed alkalis owe their saline properties to a saline principle, of the nature of vitriolic acid, but much disguised by the quantity of earth, and probably of inflammable principle, to which it is united in these combinations. The properties of volatile alkalis, and the transformation of fixed alkali, or of its materials, into volatile alkali in putrefaction, and in several distillations, seem to show sufficiently that they are matters essentially saline, as fixed alkalis are, and that their volatility which distinguishes them proceeds from their containing a less quantity of earth, but more attenuated, and a portion of very subtle and volatile oil, which enters their composition. [For some other particulars relating to the transmutation of salts, see Chemistry, n° 784.]

Besides these principal facts, there are many others, too numerous to be even slightly mentioned here; they may be found scattered in the works of chemists, particularly of Stahl. But persons who would collect and compare all the experiments relating to this subject,
subject, ought to know, that many of them are not sufficiently ascertained; and that perhaps a greater number of them have not been sufficiently professed, and are, properly speaking, only begun. We must acknowledge, that many of those experiments which we have mentioned, have not been sufficiently professed.

"The second fundamental proposition of the theory of salts, namely, 'That the vitriolic acid is compounded of only the aqueous and earthly principles,' is, like the first, supported by many facts which give it a degree of probability, but which do not amount to a complete demonstration. This proposition may be supported by the following considerations.

"First, Experience constantly shows, that the properties of compound bodies are always the result of those of the component parts of those bodies, or rather they are the properties of those component bodies modified by one another.

"Thus, if a body be composed of two principles, one of which is fixed, and the other volatile, it will have a less degree of stability than the former, and a less volatility than the latter. If it be composed of two principles, one of which is specifically heavier than the other, its specific gravity will be greater than that of one of these and less than that of the other. The same observation is applicable to all the other essential properties, excepting those which destroy each other; as, for instance the tendency to combination, or the dissolving power; for these latter properties are weakened so much more in the compounds as their principles are more strongly united, and in more just proportion.

"We observe, nevertheless, that the properties of compound bodies are not always exactly intermediate between the properties of the component bodies; for, to produce this mean, the quantities of each of the component parts must be equal, which is the case in few or no compounds.

"Besides, some particular circumstances in the manner in which the principles unite with one another, contribute more or less to alter the result of the combined properties: for instance, experience shows, that when several bodies, particularly metals, are united together, the specific gravities of which are well known, the alloy formed by such union has not the specific specific gravity which ought to result from the proportion of the alloyed substances; but that in some alloys it is greater and in others less. But we are certain, on the other hand, that these differences are too inconsiderable to prevent our distinguishing the properties of the principles in the compounds which they form, especially when they have very different properties.

"These things being premised, when we examine well the properties of vitriolic acid, we shall easily find that they partake of the properties of the aqueous and of the earthly principles.

"First, When the acid is as pure as we can have it, it is like the purest water and the purest vitriifiable earth, free from colour or fineness, and perfectly transparent.

"Secondly, Although we cannot deprive the vitriolic acid of all the water superabundant to its saline essence, and therefore its specific specific gravity has not been determined, we know that when it is well concentrated, it is more than twice as heavy as pure water, and much less heavy than any earthly substance.

"Thirdly, This acid is much less fixed than any pure earth, since, however well it may be concentrated, it may always be entirely dissolved; for which purpose a much stronger degree of heat is requisite than for the distillation of pure water.

"Fourthly, We do not know the degree of solidity of vitriolic acid, or the adhesion of aggregation, which its integrant parts have one to another, because for this purpose the vitriolic acid ought to be deprived of all superabundant water; but if we judge of it by the solid consistence of this acid, when highly concentrated, as we see from the vitriolic acid called glacial, the integrant parts of this acid seem susceptible of a much stronger adhesion than those of pure water; but much less than those of earth, as we see from the instance of hard stones.

"Fifthly, The union which this acid contracts with water and with earths, shows that these substances enter into its composition; for we know, that in general compounds are disposed to unite superabundantly with the principles which compose them. All these properties of vitriolic acid, which so strongly partake, and much more than any other acid, of the properties of earth and of water, are sufficient to induce us to believe that it is composed of these two principles; but it has one very eminent property, which is common with it to neither water nor pure earth, which is, its violent and corrosive taste. This property is sufficient to raise doubts, if we could not explain it from principles, which seem certain and general, relating to the combination of bodies.

"We observe, then, concerning the property now in question, that is, or taste in general, that it can only be considered as an irritation made upon the organs of taste by rapid bodies; and if we reflect attentively upon it, we shall be convinced, that no substance that is not impressed by some impulse can irritate or agitate our sensible organs, but by a peculiar force of its integrant parts, or by their tendency to combination; that is, by their dissolving power. According to this notion, the taste of bodies, or the impression made upon our sensible organs by their tendency to combination, or by their dissolving power, are the same property; and we see accordingly, that every solvent has a taste, which is so much more strong as its dissolving power is greater; that these whole taste is so violent that it amounts to acrimony, corrosion, and causticity, when applied to any other of the sensible parts of our body besides the organs of taste, exerts in them itching and pain.

"This being premised, the question is, How earth, in which we perceive no taste nor dissolving power, and water, which has but a very weak dissolving power, and little or no taste, should form by their combination a substance, such as the vitriolic acid is, powerfully corrosive and solvent?

"To conceive this, let us consider, first, that every part of matter has a power by which it combines, or tends to combine, with other parts of matter. Secondly, that this force, the effects of which are perceptible, in chemical operations, only among the very small molecules, or the integrant and constituent parts of bodies, seems proportionable to the density or specific gravity of these parts. Thirdly, that this same force is limited
in every integrant molecule of matter: that if we consider this force as not satisfied, and consequently as a simple tendency to combination, it is the greatest possible in an integrant molecule of matter perfectly insulated, or attached to nothing; and is the smallest possible, or none, when it is satisfied by its intimate combination with other parts capable of exhausting all its action; its tendency being then changed into adhesion.

"Hence we may infer, that the integrant parts of the earthy principle have essentially, and like all the other parts of matter, a force of tendency to union, or of cohesion in union, according to their condition; that as this earthy principle has a much more considerable density or specific gravity than all other simple bodies that we know, we may probably presume that its primary integrant molecules have a more considerable force of tendency to union, in the same proportion, than the integrant parts of other principles; that consequently when they cohere together, and form an aggregate, their aggregation must also be stronger and firmer than that of any other body. But that the primary integrant parts of the earthy principle are not all solvents.

"Firstly, we consider the combustion of body, comprehending many, from many proofs, that all saline substances, comprehending those that contain vitriolic acid, as vitriolated tartar, Glauber's salt, and other vitriolated salts which are sufficiently fixed to support a perfect drying, or rather calcination, being alternately distilled, dried, and calcined a number of times, are more and more diminished in quantity, and that earth and water are separated from them each operation. But alkaline salts appear to be still more susceptible than any other saline matter of this kind of decomposition.

"Secondly, When nitre is burnt in close vessels, so that we may retain not only all that remains fixed after this burning, but also what exhales in vapours, as in the experiment of the clyffus of nitre, we have a proof which seems decisive, that the mineral acid of this salt, which is not very far from the simplicity of vitriolic acid, is totally decomposed and reduced into earth and water. For if we examine the fixed residuum in the retorts, we find that it is only the alkali that was contained in the nitre, charged with a superabundant earth, which is separable from it by solution and filtration. And if the liquor in the receiver, formed by the vapours condensed there, be examined, which ought to be nitrous acid; if this acid had not been destroyed, we find, that, so far from being acid, it is only pure water, sometimes even charged with a little fixed alkali, which had been raised by the force of the detonation. Thus nitrous acid is made to disappear in this experiment, and in its place we find only earth and water.

"Thirdly, The phenomena of lime:stone, which by calculation and extintion in water acquires saline properties that it had not before its attenuation by fire and its combination with water; and also the experiment of Becher, who afferts, that if a vitriifiable stone be alternately made red-hot, and extinguished in water a number of times, it may be so attenuated that it shall be like a saline gelatious matter; these, I say, shew that saline matters are actually formed by intimate combination of the very attenuated parts of earth with those of water. We find in the writings of Becher and Stahl, and particularly in the Specimen Becchianum of the latter author, many other observations and experiments tending to prove the same proposition; but we must confess, that none of the experiments we have mentioned, excepting that of the decomposition of
Salt of nitrous acid by burning, are absolutely decisive; principally because they have not been sufficiently repeated or prosecuted, nor carefully enough examined in all their circumstances.

On this theory it is obvious to remark, that our author has omitted to mention the most active part of the composition of salts, namely elementary fire. Of this both acids and alkalis undoubtedly contain a great quantity in a very active state; as is evident from their performing the effects of fire when applied to certain substances; may, from their actually bursting into flame when mixed with some kinds of oil. For an explanation of the reason of which, see Heat, and the various detached articles relative to that subject. Whatever doubts we may have of the power of mere water combined with mere earth to affect the organs of taste, we can have none that the element of fire is capable of so doing; and from the very tainting of these substances, we may be assured, that whatever gives that peculiar sensation to the tongue which we call acid or alkaline, gives also the other properties of the salt, whatever they may be. In alkalis, no doubt the greatest part of the composition is earth; but from what has been said on Quicklime, it appears, that mere earth, by the artificial addition of fire alone, acquires all the properties of salt, that of crystallizing p r e e x p e c t e d : it seems probable therefore, that, in the more perfect operations of nature, the same materials are used; only the proportions are such, that the substance is more soluble, and its capacity greater, than even quicklime itself. With regard to acids, the earthy parts seem to be fewer; and in all probability the most considerable ingredient in their composition is water: but in what manner this element is united to that of fire so as to produce the peculiar phenomena of acids, cannot be explained.

The acid of tartar (the purest part of which, or that saline substance which first crystallizes by evaporation in the vessels in which it is purified, is called cream of tartar), and also all other concrete vegetable acids analogous to it, when mixed with various other substances, form compounds, generally called tartarous salts, or soluble tartars, because they are dissolved by water more easily than the acid of tartar itself. Acetous salts, that is, all salts containing the acid of vinegar, are also combined with various bases, and form saline substances of different names; the principal of which are, the acetic salt of copper, called crystals of Venus, or of verdigris by the chemists, and diffused or crystallized verdigris in commerce; the acetic salt of lead, commonly called salt or sugar of lead; and the acetic mercurial salts. Sugar is an essential vegetable salt, of a pleasant sweet taste, containing a vegetable acid combined with earth and oil.

Potash is a fixed vegetable alkali, extracted from the ashes of wood. Concrete volatile alkalis are generally called volatile salts; although this name is sometimes also given to the volatile salt of amber, which is not an alkali but an acid salt. Borax is a neutral saline matter, whose origin, whether animal or vegetable, is as yet unknown, its components being not sufficiently examined. It is soluble in water, and very nearly as crystallizable as alum. When borax is exposed to the fire, it first bubbles and foams very much, but afterwards it melts into a clear glass. When acids are combined with the alkaline part of borax, a substance of a singular nature is separated from it, commonly called sedative salt. Although this substance acts as an acid in borax, by fuming its alkali, yet it has no acid taste, nor doth it turn the tincture of heliotropium to a red, as other acids do. It is the property of borax to facilitate considerably the fusion of metals, of earths, and other minerals. Some species of stones and earths cannot be vitrified at all, except they are mixed with borax. For this property borax is commonly used as a flux (that is, a substance which facilitates the fusion of other bodies) in various manufactories; but especially in pounding metals, and in affaying ores. Phosphoric salts are combinations of alkaline, earthy, and metallic substances with the acid obtained from the phosphorus of urine. Besides the abovementioned salts, there are several others to be met with in the writings of the chemical and medical authors: but, as they are of little consequence, we shall omit any account of them.

Some new neutral salts have been formed by the dephtoglificated marine, or, according to the new theory, the oxygenated muriatic acid.—This was first taken notice of by M. Berthollet, and the discovery is thus illustrated by Dr Dollfus, in Crel!. Annals for the year 1788, vol. i. p. 319.

"In the month of November 1786 (says he), whilst I was preparing to translate Higgin's experiments respecting the acetic acid, I found the following amongst the numerous observations which that work contains, p. 180. 'The acid elastic fluid which inflates, when two pounds of manganese are mixed and distilled with two or three of ordinary spirit of sea-fault, may all, except a small portion of phosphoric air, be condensed in a solution of fixed vegetable alkali; and the solution thus impregnated yields a considerable quantity of nitre, which crystallizes in the ordinary form, and detonates on red-hot coals. The solution at the same time yields regenerated sea-fault.' The part of this proposition which relates to the form of the crystals and to their detonation is sufficiently plain; but that I might have a still more complete conviction on the subject, I repeated the experiment upon a small scale.

"For this purpose I put into a vial an ounce of pulverized oxyz (seals) of manganese with an ounce and a half of muriatic acid, and by means of a bent tube I directed the vapour into another vial, which contained a solution of vegetable alkali. I then distilled by the gentle heat of a small lamp. From the vial containing the alkali went a second tube, for the purpose of carrying off the air which I hoped to obtain by this process.

"As soon as the oxygenated muriatic acid appeared, some air escaped through the tube, which showed all the properties of common atmospheric air; and as soon as all the air which the vials contained previous to the distillation had been expelled, no more such air appeared. The vapours of the oxygenated muriatic acid were absorbed by the solution of vegetable alkali, without the extraction of the smallest portion of carbonic acid (fixed air) from the alkali. As salt as the alkali, which adhered to the fides of the glafs, absorbed the acid vapour, prismatic crystals appeared; and many more, which I obtained a few hours afterwards, were formed in the liquor. Although these crystals detonated in the fire, they had a taste very different from that of nitre. It was extremely pungent, and was rendered still more..."
more intolerable by the suffocating odour of the nitro-
muriatic acid (aqua regia). In order to complete the
crystallization, I evaporated in the fame vial the remain-
ing liquor. As soon as the vapour appeared, a quanti-
ty of carbonic acid was difengaged, and afterwards
some atmospheric air. The falt which I obtained by
crystallization after the evaporation was a true muriat
of potash, which did not detonate in the fire. Pro-
bably Mr Higgins performed the operation in the way
I have decribed; but he was too hasty in concluding
this falt to be nitre merely because it detonated. I
gave an account of this experiment to Mr Kirwan at
the time, and soon after communicated it to Professor
Gadolun, who offered to affift me in repeating the ex-
periment.

"We agreed to employ crystallized carbonat of soda
(mild mineral alkali); and the following was the result
of our experiment. We difolved some of this carbonat
in a large quantity of water, and we employed two
or three hours a day, for several fuccedent days, in
introducing into the solution as much oxygenated muri-
ad acid as was sufficient entirely to saturate it; we then
poured the faHne liquor into a glass basin, and left it
covered over to evaporate spontaneously. After some
time a number of prismatic crystals were formed, which
detonated in the fire like nitre. They occasioned a
brown precipitate from a folution of iron in sulphuric
or vitriolic acid; and mixed with faH ammoniac, they
gave out a strong ammoniacal odour, accompanied with
some effervescence, which was to be attributed to the
evaporation of fixed air during the mixture. The re-
maning part of the liquor evaporated again, produced
fresh crystals, which, though they certainly had a faint
fmal of oxygenated muriad acid, in reality confifted
partly of muriat of soda (common falt), and partly of
uncombined faH; for they did not detonate, and they
precipitated iron of a light green colour. The liquor
which appeared above these crystals, however, had not
yet entirely loft the fmal of the oxygenated muriatic
acid. Since this, M. Gadolun has made the following
experiment, which he communicated to me. He put
two drams of magnesia, faturated with carbonic acid,
into an ounce and a halfe of water, into which he intro-
duced during feveral hours a quantity of oxygenated
muriatic gas. The water evidently acquired the odour
of the oxygenated muriatic acid. He filtered the liquor,
and washed and dried that part of the magnesia which
had not been difolved, and which weighed one dram
4.5ths, fo that the water was found to have difolved
1.5th of a dram. As soon as the liquor began to boil,
a strong effervescence was occasioned, fome oxygenated
muriatic gas was difengaged, and a small quantity of
carbonat of magnesia was precipitated. When the li-
quor had become cool, it was filtered, that it might be
separated from the precipitated powder. It had fill
the fame odour; and on being again heated, an efferv-
escence similar to the first took place, and a fresh quantity
of carbonat of magnesia was feparated. This phenome-
on appeared every time M. Gadolun boiled the liquor
after its cooling, till at laft he had evaporated it to dry-
ness, when there ftil remained a small quantity of mag-
nesia. Hence M. Gadolun concludes, that water, oxy-
genated muriatic acid, and carbonat of magnesia, form
a combination which heat does not decompose till the
vapour of the water carries off the oxygenated muriatic
acid, at which time the carbonat of magnesia is precipi-
tated. In confequence of what we have now related,
we ought to reckon, in addition to the two falks difco-
dered by M. Berthollet, another falt, to which, acord-
ing to the new French nom-encature, might be given
the name muriad oxenrrenus magnesia liquideis, becaufe we
cannot obtain it in a concrete form. The oxygenated
muriatic acid appears to enter into a very different,
or at leaft into a much more intimate, combination with
the metals; a fubject which greatly merits the attention of
the chemist.

The probability of this propofition is strengthened
by the theory of M. Berthollet; according to which the
mercury in correlative muriat of mercury (corroive sub-
flate) is combined with the oxygenated muriatic acid,
lo as not to be defparated from it without great
difficulty.

Common Salk, or Sea-Salt, the name of that falt ex-
tracted from the waters of the ocean, which is used
in great quantities for preferving provifions, &c.

It is a perfect neutral falt, composed of marine or
muriatic acid, faturated with mineral alkali. It has a
faine but agreeable fmalor. It requires about four
times its weight of cold water to be difolved, and
nearly the fame quantity of boiling water, according
to Macquer. But according to Kirwan, it only requires
2.5 its weight of water to be difolved in the tempera-
ture of fifty degrees of Farenheit. This falt always
contains some part formed with a calcareous falt; and,
in order to have it pure, it must be difolved in diftilled
water; then a folution of mineral alkali is to be poured
in it until no white precipitation appears; then by
filtrating and evaporating the folution, a pure common
falt is produced. Its figure is perfectly cubic, and
those hollow pyramids, or tremies as the French call
them, as well as the paralleloipipeds formed sometimes
in its crystallization, confift all of a quantity of small
cubes disposed in those forms. Its defcription on the
fire, which has been reckoned by some as a characteritic
of this falt, although the vitriolated tartar, nitrous lead,
and other falks, have the fame property, is owing chiefly
to the water, and perhaps also to the air of its crys-
tallization.

Its specific gravity is 2.120 according to Kirwan.
The acid of tartar precipitates nothing from it. One
hundred parts of common falt contain thirty-three
of real acid, fifty of mineral alkali, and seventeen of water.
It is commonly found in falt water and falt springs,
in the proportion of even thirty-six per cent. It is found
also in coals, and in beds of gypsum. This falt is un-
teritable by fire, though it fufes, and becomes more
opaque: nevertheless a violent fire, with the free access
of air, causes it to evaporate in white flowers, which
flick to the neighbouring bodies. It is only decom-
poled, as Macquer affirms, by the vitriolic and nitrous
acid; and also by the boracic or feditive falt. But
although nitre is decomposed very easily by arsenic, this
neutral marine falt is nowise decomposed by the fame.

According to Menges, the fixed vegetable alkali, when
erucuted, decomposes also this marine falt. It prefrerves
from corruption almost all farts of animal food much
better for use than any other falt; as it prefrers them
without destroying their taste and qualities; but when
applied in too fmall a quantity, it then forwards their
corruption.

Of this moft useful commodity there are ample flores
on land as well as in the ocean. There are few countries
which
which do not afford vast quantities of rock or fossil salt. Mines (4) of it have long been discovered and wrought in England, Spain, Italy, Germany, Hungary, Poland, and other countries of Europe. In several parts of the world there are huge mountains which wholly consist of fossil salt. Of this kind are two mountains in Russia, nigh Astracan; several in the kingdoms of Tunis and Algiers, in Africa; and several also in Asia; and the whole island of Ormus in the Persian gulf almost entirely consists of fossil salt. The new world is likewise stored with treasures of this useful mineral, as well as with all other kinds of subterranean productions. Moreover, the sea affords such vast plenty of common salt, that all mankind might thence be supplied with quantities sufficient for their occasions. There are also innumerable springs, ponds, lakes, and rivers, impregnated with common salt, from which the inhabitants of many countries are plentifully supplied therewith. In some countries which are remote from the sea, and have little commerce, and which are not blessed with mines of salt or salt-waters, the necessities of the inhabitants have forced them to invent a method of extracting their common salt from the ashes of vegetables. The muriatic salt of vegetables was described by Dr. Grew under the title of lixiviated marine salt. Leucadenhoek obtained cubic crystals of this salt from a lixivium of soda or kelp, and also from a solution of the lixivial salt of cardus benedictus; of which he hath given figures in a letter to the Royal Society, published in No. 173. of their Transactons. Dr. Dagner, in Act. Acad. N. C. vol. v. ob. 15o. takes notice of the great quantities of it which he found mixed in pot ashes. And the ingenious Dr. Fothergill extracted plenty of it from the ashes of fern: See Medical Essays, vol. v. article 13.

The muriatic salt which the excellent Mr. Boyle extracted from sandviver, and supposed to be produced from the materials used in making glass, was doublets separated from the kelp made use of in that process. Kunckel also informs us, that he took an alkaline salt; and after calcining it with a moderate fire, dissolved it in pure water, and placing the solution in a cool cellar, obtained from it many crystals of a neutral salt. He supposes, that the alkaline salt was by the process converted into this neutral salt. But it is more reasonable to believe, that the alkaline salt which he applied was not pure, but mixed with the muriatic salt of vegetables, which by this process was only separated from it.

It is doublets chiefly this muriatic salt which, in some of the inland parts of Asia, they extract from the ashes of duck-weed and of Adam's fig-tree, and use for their common salt. That they are able in those countries to make common salt to profit from vegetables, ought not to be wondered at, since in Dehli and Agra, capitals of India, salt is so scarce as usually to be sold for half-a-crown a pound. We may therefore give some credit to Marco Polo, when he informs us, that in the inner parts of the same quarter of the world, in the province

---

(4) Amongst the salt mines of chief note are those of Northwich in Cheshire, Altamonte in Calabria, Hall in Tyrol, Cardona in Catalonia: also those stupendous mines at Wilczka of Poland, and Soowar in Upper Hungary: of which see accounts in Phil. Trans. No. 61. and 413.
A men in (he boiling-houfe are placed the furnace, Brownrigg, and in various colours, of which the yellow and brown are the most plentiful, as I have observed on the spot, which I visited in June 1782, in company with my worthy and learned friend Mr Volta, professor of Natural Philosophy in the University of Pavia, and well known by his great abilities, and many discoveries in that branch of knowledge. The mine into which we descended was excavated in the form of a vast dome or vault underground, supported by various columns of the fall, that were purposely left to support the incumbent weight. And the workmen having lighted a number of candles all round its circumference, it furnished us with the most agreeable and surprizing sight, whilst we were descend ing in the tub, which serves to bring up the lumps that are broken from the mine, &c. See the description of the famous fall-mines of Willeczka in Poland, by Mr Bernard, in the Journal de Physique, vol. 16. for 1780, pag. 459, in which the miraculous tales concerning those subterraneous habitations, villages, and towns, are reduced to their proper magnitude and estimate. But the English toffall fall is unfit for the uses of the kitchen, until by solution of earth, is unfit for the uses of the kitchen, until by solution by the violent boiling of the sea-water with an exceedingly gentle heat; and evaporate the sea-water with an exceedingly gentle heat; and which are clofiy applied to the bottom of the pan, from which they are dif­fused about eight inches. From these beams hang down strong iron hooks, which are linked to other hooks or clamps of iron firmly nailed to the bottom of the pan; and thus the bottom of the pan is supported, and prevented from bending down or changing its figure. The plates most commonly used are of malleable iron, about four feet and a half long, a foot broad, and the third of an inch in thickness. The Scots prefer smaller plates, 14 or 15 inches square. Several make the sides of the pan, where they are not exposed to the fire, of lead; those parts, when made of iron, being found to confume fall in rust from the steam of the pan. Some have used plates of cast iron, five or six feet square, and an inch in thickness; but they are very subject to break when unequally heated, and faken (as they frequently are) by the violent boiling of the liquor. The cement most commonly used to fill the joints is plaster made of lime. The pan, thus formed, is placed over the furnace, being supported at the four corners by brick work; but along the middle, and at the sides and ends, by round pillars of cast iron called tampins, which are placed at three feet distance from each other, being about eight inches high, and at the top, where smallest, four inches in diameter. By means of these pillars the heat of the fire penetrates equally to all parts of the bottom of the pan, its four corners only excepted. Care is also taken to prevent the smoke of the furnace from passing into the boiling house, by bricks and strong cement, which are closely applied to every side of the fall pan. In some places, as at Blyth in Northumberland, besides the common fall pans here described, they have a preparing-pan placed between two fall pans, in the middle part of the building, which in other works is the fore-house. The sea-water being received into this preparing-pan, is there heated and in part evaporated by the flame and heat conveyed under it through flues from the two furnaces of the fall pans. And the hot water, as occasion requires, is conveyed through troughs from
S A L

from the preparing pan into the falt pans. Various
other contrivances have been invented to lessen the ex-
 pense of fuel, and several patents have been obtained
for that purpose; but the falt-boilers have found their
old methods the most convenient.

Between the sides of the pan and walls of the boi-
ling-house, there runs a walk five or fix feet broad,
where the workmen stand when they draw the falt, or
have any other business in the boiling-house. The
same walk is continued at the end of the pan, next to
the chimney; but the pan is placed close to the wall
at the end adjoining to the fore-house.

The roof of the boiling-house is covered with boards
fastened on with nails of wood, iron nails quickly
mouldering into ruit. In the roof are several open-
ings, to convey off the watery vapours: and on each
side of it a window or two, which the workmen open
when they look into the pan whilst it is boiling.

Not far distant from the falt-pan, on the foalshore,
between full fea and low-water marks, they also make
a little pond in the rocks, or with stones on the found,
which they call their fump. From this pond they lay
a pipe, through which, when the tide is in, the fea-
water runs into a well adjoining to the falt-pan; and
from this well they pump it into troughs, by which it
is conveyed into their flip or ciftern, where it is stored
up until they have occasion to ufe it.

The ciftern is built clofe to the falt-pan, and may be
placed most conveniently between the two boiling-
houses, on the back fide of the fore-house; it is made
either of wood, or brick and clay; it fometimes wants
a cover, but ought to be covered with a fhed, that
the falt-water contained therein may not be weakened
by rains, nor mixed with foot and other impurities.
It fhould be placed fo high, that the water may con-
veniently run out of it, through a trough, into the falt-
pan.

Besides the buildings already mentioned, feveral
others are required; as flore-houses for the falt, cifterns
for the britten, an office for his majefty's falt-officers,
and a dwelling-house for the falt-boilers.

All things being thus prepared, and the fea-water
having ftood in the ciftern till the mud and sand are
settled to the bottom, it is drawn off into the falt-pan:
And at the four corners of the falt-pan, where the
flame does not touch its bottom, are placed four fmall
lead pans called fcratch pans, which, for a falt-pan of
the fize above-mentioned, are ufually about a foot and
an half long, a foot broad, and three inches deep; and
have a bow or circular handle of iron, by which they
may be drawn out with a hook, when the liquor in the
pan is boiling.

The falt-pan being filled with fea-water, a strong
fire of pit-coal is lighted in the furnace; and then
for a pan which contains abont 1400 gallons, the falt-
boiler takes the whites of three eggs, and incorporates
them well with two or three gallons of fea-water,
which he pours into the falt-pan while the water con-
tained therein is only lukewarm; and immediately flirs
it about with a rake, that the whites of eggs may every
where be equally mixed with the falt-water.

Instead of whites of eggs, at many falters, as at moft
of thofe nigh Newcastle, they ufe blood from the butch-
eries, either of sheep or black cattle, to clarify the fea-
water: And at many of the Scots falters they do not
give themselves the trouble of clarifying it.

As the water grows hot, the whites of eggs separate
from it a black frothy fcream, which rises to the surface
of the water, and covers it all over. As foon as the pan
begins to boil, this fcream is all risen, and it is then time
to skim it off.

The moft convenient instruments for this purpose are
skimmer of thin alth boards, fix or eight inches broad,
and fo long that they may reach above half way over
the falt-pan. These skimmers have handles fitted to
them; and the falt-boiler and his affiliate, each holding
one of them on the opposite fides of the pan, apply
them fo to each other that they overlap in the middle,
and beginning at one end of the pan, carry them gently
forward together, along the surface of the boiling li-
quor, to the other end; and thus, without breaking
the fcream, collect it all to one end of the pan, from
where they easily take it out.

After the water is skimmed, it appears perfectly clear
and transparent; and they continue boiling it briskly,
till fo much of the frefh or aqueous part is evaporated,
that what remains in the pan is a ftrong brine almost
fully faturated with falt, fo that small faltine cryftals
begin to form on its surface; which operation, in a pan
filled 15 inches deep with water, is ufually performed
in five hours.

The pan is then filled up a fectond time with clear
sea-water drawn from the ciftern; and about the time
when it is half filled, the fcratch-pans are taken out,
and being emptied of the fcratch found in them, are
again placed in the corners of the falt-pan. The fcratch
taken out of thefe pans is a fine white calcareous earth
found in the form of powder, which separates from the
sea-water during its folution, before the falt begins
to form into grains. This fubtle powder is violently agi-
tated by the boiling liquor, until it is driven to the cor-
ners of the pan, where the motion of the liquor being
more gentle, it fubfides into the fcratch pans placed
there to receive it, and in them it remains undisturbed,
and thus the greateft part of it is feparated from the
brine.

After the pan hath again been filled up with fea-wa-
ter, three whites of eggs are mixed with the liquor, by
which it is clarified a fected time, in the manner before
defcribed; and it is afterwards boiled down to a ftrong
brine as at firft; which second boiling, may take up
about four hours.

The pan is then filled up a third time with clear fea-
water; and after that, a fourth time; the liquor being
each time clarified and boiled down to a ftrong brine,
as before related; and the fcratch-pans being taken out
and emptied every time that the pan is filled up.

Then, at the fourth boiling, as soon as the cryftals
begin to form on the surface of the brine, they flacken
the fire, and only fuffer the brine to simmer, or boil
very gently. In this heat they confantly endeavour
to keep it all the time that the falt corns or granulates,
which may be nine or ten hours. The falt is laid to
granulate, when its minute cryftals cohere together into
little mafles or grains, which sink down in the brine and
lie at the bottom of the falt-pan.

When moft of the liquor is evaporated, and the falt
thus lies in the pan almost dry on its surface, it is then

4 K 2
time to draw it out. This part of the process is performed by taking the salt to one side of the pan into a long heap, where it drains a while from the brine, and is then filled out into barrows or other proper vessels, and carried into the store-house, and delivered into the custody of the warehouse keeper. And in this manner the whole process is performed in 24 hours; the salt being usually drawn every morning.

In the store-house the salt is put into hot drabs, which are partitions like flats for horSES, lined on three sides and at the bottom with boards, and having a sliding-board on the fore-side to put in or draw out as occasion requires. The bottoms are made shelving, being high at the back-side, and gradually inclining forwards; by which means the saline liquor, which remains mixed with the salt, easily drains from it; and the salt, in three or four days, becomes sufficiently dry; and is then taken out of the drabs, and laid up in large heaps, where it is ready for sale.

The saline liquor which drains from the salt is not a pure brine of common salt, but hath a sharp and bitter taste, and is therefore called bitters; this liquor, at some work, they save for particular uses, at others throw away. A considerable quantity of this bittern is left at the bottom of the pan after the process is finished; which, as it contains much salt, they suffer to remain in the pan, when it is filled up with sea-water. But at each process this liquor becomes more sharp and bitter, and also increaseth in quantity: so that, after the third or fourth process is finished, they are obliged to take it out of the pan; otherwise it mixes in such quantities with the salt, as to give it a bitter taste, and dippeth it to grow soft and run in the open air, and renders it unfit for domestic uses.

After each process there also adheres to the bottom and sides of the pan a white dirty crust, of the fame calcareous substance with that before collected from the boiling liquor. This the operators call stone-scratch, distinguishing the other found in the lead-pans by the name of powder-scratch. Once in eight or ten days they separate the stone-scratch from their pans with iron picks, and in several places find it a quarter of an inch in thicknes. If this dirty crust is suffered to adhere to the pan much longer, it grows so thick that the pan is burnt by the fire, and quickly wears away.

In M. de Pagés's Travels round the World, we find the following important fact. "I had been anxious (says that author) to ascertain by comparison, whether sea-water contains salt in greater quantity under the tertial than under the other zones; and my experiments on this subject served to shew, contrary to what I expected, that sea-water is impregnated with salt in less quantity within than without the tropics." These experiments were made on a hundred pounds of sea-water, taken at the depth of ten fathoms, and weighed in water-cells. M. de Pagés has given a table of these experiments, from which it appears that 100 lb. of sea-water in 56° 12' 8 lat. gave 4 4/3 lb. of salt, and in 1° 16' only 4 lb., and that in 74 N. lat. it gave 4 2/3 lb. and in 4° 22' only 3 lb., these being the highest and lowest latitudes in which the experiments were made, and also the greatest and least quantities of salt.

SALT, a distinct branch of the king of England's extraordinary revenue, and confits in an excise of 4d. per bushel imposed upon all salt, by several statutes of King William and other subsequent reigns. This is not generally called an excise, because under the management of different commissioners: but the commissioners of the salt-duties have, by statute 1 Ann. c. 21. the same powers, and must observe the same regulations, as those of other excises. This tax has usually been only temporary: but by statute 26 Geo. II. c. 3. was made perpetual.

Triple SALT, a kind of salt formed by the union of three ingredients: the common neutrals being composed only of two. They are but lately discovered; and it is chiefly to the industry of Mr Bergman that we owe the knowledge we have of them. Sometimes we meet with salt of four ingredients; in which case we call the resulting compounds quadruple salts. The most remarkable of these complicated substances are the following.

1. Aphronitrum, or mineral alkali, combined with a small quantity of calcareous earth. The three ingredients here are fixed air, pure alkali, and calcareous earth. "This salt (says Cronstadt) is so strongly united with the calcareous earth, that the latter enters into it with the very crystals of the salt; though, by repeated solutions, the earth is by degrees separated from it, and falls to the bottom after every solution." Cartheuer afferts, that, on throwing into its solution in water a fixed mineral alkali, the calcareous earth was precipitated; and on the contrary, by adding oil of vitriol, nitrous acid was expelled, and a Glauber's salt produced; "from which (says M. Magellan) it is evident, that the aphronitrum is a triple salt arising from the combination of the nitrous acid with calcareous earth and mineral fixed alkali." Wallerus mentions three species of this salt; one which contains only a mixture of calcareous earth with fixed mineral alkali. This, he says, is the aphronitrum of the ancients; but he thinks that it ought to be rather called aphronitron, as they belowe the name of natron upon the mineral alkali. The second species is that described by Cronstadt under the title of calcareous nitre. The third is that described by Hoffman under the title of aphronitrum jaenae, into whose composition the vitriolic acid enters. It is a kind of Glauber's salt, and is frequently confounded with it.

The aphronitrum of Cronstadt is described by him as appearing on old walls and below vaults, or in places where it cannot be washed away by the rain. When it contains any considerable quantity of calcareous earth, it shoots into rhomboidal crystals, a figure frequently affected by the calcareous earth when it shoots into crystals: but when the aphronitrum is purer, it forms prismatic crystals. From these circumstances, M. Magellan thinks, that the aphronitrum is not only a triple but a multiple salt; as these pieces of old mortar, covered with this white froth, on ancient walls, are the very same from which the salt-makers extract the mother water of nitre; after mixing with it the vegetable ahes to fix the alkali.

Common salt with magnesia, or mineral alkali, contaminated by mutric magnesia. This is a compound of common salt with magnesia, and is very deliquecent, owing to the compound of magnesia and spi-
3. Vitriolated magnesia with vitriol of iron, or Epsom salt contaminated with copperas. This, according to M. Monet, is found in some mineral waters.

4. Native alum contaminated with copperas. This is sometimes found in the aluminous schists, and effloresces in a feathery form, and is perhaps the plumose alum of the ancients.

5. Native alum contaminated with sulphur. Dr Withering informs us, that this salt is met with about Wednesbury and Belfont, two places in Staffordshire, where the coal-pits are on fire. It subdues to the surface, whence it may be collected in considerable quantity during dry or frosty weather. Our author, however, does not certainly affirm that this is a true chemical union, but the parts, he says, cannot be distinguished by the eye. It is kept in a deliquescent flake by an access of vitriolic acid.

6. Native alum contaminated by vitriolated cobalt. This is found in some of the mines of Herregrund and Idria, where it flows into long and slender filaments. M. Magellan supposes that this may be the triebites of the Greeks. On dissolving it in water, the presence of the vitriolic acid is discovered by adding a solution of terra ponderosa in muriatic acid; the phlogisticated alkali throws down a precipitate of cobalt, which forms a blue glass with cobalt or micromorphic salt.

7. Vitriol of copper with iron, the vitriolum ferreo-cuprum cyanum of Linnaeus. It is also called Vitriol of Hungary, because found in plenty in that country. Its colour is that of blue mixed with green; but sometimes the one shade prevails, and sometimes the other.

8. Vitriol of copper, iron, and zinc, is prepared in Sweden from the water pumped out of the copper mines at Dalame. The copper does not precipitate from a solution of this salt by rubbing it on iron, as is the case with the common blue vitriol. Large crystals of this salt are often found in the water of the copper mines from whence it is prepared.

9. Vitriol of copper and zinc. This is a quadruple salt, styled by Linnaeus Vitriolum ferreo-zincico cuprum cyanum. Its colour is blue inclining to green; and it does not precipitate the copper by rubbing on iron, as the common blue vitriol does. It is called the blue vitriol or Goifar. Monge makes a separate article of a compound salt mentioned by Wallerius, consisting also of a vitriolated copper with zinc, but whose crystalls are of a fine red colour, found lately in the mines of Falun in Sweden. He adds, that the pale blue colour of the former salt shows the predominancy of the copper, by which it is necessarily distinguished from the latter, where the vitriol is over-saturated. M. Magellan, however, is of opinion, that the red colour is owing to a proper quantity of iron in a dephlogisticated flake, which has been overlooked in that compound. To this kind also Wallerius refers the yellownish vitriol found in Hungary.

10. Vitriol of iron and zinc; the green vitriol from Goifar in the Hartz; vitriolum zinciferreum vitride of Linnaeus. It is of a pale-green colour.
SALPETRE, 124 lb. for 100 lb. of beef, is L. 0 12 6
Bay-fall, 12 ½ lb. for do. is 0 1 6
Brown-fugar, 250 oz. for do. is 10 5
Beef, 100 lb. for 6 d. per pound, is 2 10 0
Three walks for it at 1s. 6d. each, 4 6
Labour, and heating the oven twice, 4 0
Common falt, 533 oz. for do. is 6 0

These articles are taken high; and if beef costs 6 d. per pound, meat cured thus will cost less than 1s. per pound; and therefore comes much cheaper than live-flock in long sea-voyages.

SALTPETRE. See Chemistry, n° 740.

SALTSBURG, an archbishopric of Germany, in the circle of Bavaria, bounded on the east by Styria and the Upper Austria, on the west by the county of Tyrol, on the north by the duchy of Bavaria, and on the south by the duchy of Carinthia and the bishopric of Brixen. It is said to be about 100 miles from east to west, and upwards of 60 from north to south. With respect to the soil, it is very mountainous, yielding, however, excellent pasturage, and, in consequence of that, abounding in cattle, and horeses remarkable for their mettle and hardiness. This country is particularly noted for the great quantities of salt it produces, and its strong paffes and cafles. Here are also considerable mines of gold, silver, copper, lead, iron, and lapis calaminaris, with quarries of marble, and a natural hot-bath. The principal rivers are the Salza, the Inn, the Ens, and the Muer; which, as well as the lakes and other streams, are well-stored with fish. The peasants here are all allowed the use of arms, and trained to military duty. There are no nobles in the country, and most of the lands belong to the clergy. The states consist of the prelates, the cities, and towns. Notwithstanding this country is under the power of a popiol ecclesiastic, and the violent, arbitrary, and oppressive manner in which the Protestants have always been treated, great numbers of them still remained in it till the year 1732, when no less than 33,000 of them withdrew from it, dispersing themselves in the several Protestant states of Europe, and some of them were even sent from Great Britain to the American colonies. Besides brass and felt wares, and all sorts of arms and artillery, there are manufactures of coarse cloth and linen here. The archbishopric has many and great prerogatives: he is a prince of the empire, and perpetual legate of the holy see in Germany, of which he is also primate. He has the first voice in the diet of this circle, and next to the electors in that of the empire, in the college of princes, in which he, and the archduke of Austria, preside by turns. No appeal lies from him either in civil or ecclesiastical causes, but to the pope alone; and he is entitled to wear the habit of a cardinal. He has also the nomination to several bishoprics; and the canonates that fall vacant in the months in which the popes, by virtue of the concordat, are allowed to nominate, are all in his gift. His suffragans are the bishops of Freyingen, Ratibon, Brixen, Gurk, Chiemsee, Seekau, and Lavant; and of these, the four laft are nominated, and even confirmed by him, and not by the pope. At the diet of the empire, his envoy takes place of all the princes that are present, under the degree of an elector. His revenue is said to amount to near 200,000 l. a year, and to consist partly of rents and revenues, partly of arrears of rents, and partly of money arising from the salt-works. He is able to raise 25,000 men; but keeps in constant pay, besides his guards, only one regiment, consisting of 1000 men. He is in every respect a very magnificent prince; and he has his hereditary great officers, and his colleges. The chapter consists of 34 canons, who must be all nobles; and are obliged only to four months residence. At his accession to the see, the archbishop must pay 100,000 crowns to Rome for the pall. There is an order of knighthood here, instituted in 1711, in honour of St Rupert, who was the first bishop of Salzburg about the beginning of the 8th century.

SALTSBURG, the capital of a German archbishopric of the same name, and which takes its own from the river Salza, on which it stands, and over which it has a bridge. It is a very handsome place, well fortified, and the residence of the archbishop. The houses are high, and all built of stone; the roofs are in the Italian taste, and you may walk upon them. The castle here is very strong, and is strongly garrisoned, and well provided with provisions and warlike stores. The archbishop’s palace is magnificent; and in the area before it is a fountain, esteemed the largest and grandest in Germany. The fables are very lofty; and the number of the horses usually kept by the archbishop is said to be upwards of 200. The city, of which one part stands on a steep rock, is well built, but the streets are narrow and badly paved. Besides the abovementioned, there are two other lately palaces belonging to the archbishop; one of which is called the Nußbaun, and the other Mirobellu. The latter of these has a very beautiful garden; and the number of trees in the orangery is so great, that Mr Keyller tells us, 20,000 oranges have been gathered from them in one year. The river Salza runs close by the walls of this garden. There are a great many other fine structures in the city, public and private, such as palaces, monasteries, hospitals, and churches. In the cathedral dedicated to St Rupert (the apothecary of Bavaria, and a Scotchman by birth), all the altars are of marble of different kinds, and one of the organs has above 3200 pipes. The whole structure is extremely handsonable. It is built of freestone in imitation of St Peter’s at Rome. The portico is of marble, and the whole is covered with copper. Before the portico there is a large quadrangular place, with arches and galleries, in which is the prince’s residence and there is a statue of Peter. In the middle of this place is an image of the Virgin in bronze; it is fine, but of an unnatural face. There are large areas encompaied with handsome buildings on both sides of the church. In the middle of that which is to the left, there is a most magnificent fountain of marble, and some valuable figures of gigantic size. There is likewise a fountain in that to the right, but it is not to be compared with the former one, and the Neptune of it makes a very pitiful figure. This town contains many more excellent buildings and statues, which remind one that the borders of Italy are not far distant. The winter and summer riding schools here are noble structures. The university was founded in 1620, and committed to the care of the Benedictines. Besides it, there are two colleges, in which the young noblemen are educated. E. Long. 53° 0. N. Lat. 47° 45’.

SALVADOR, in botany: A genus of the monoegynia order, belonging to the tetrandria class of plants;
Salvage, a reward allowed by the civil and statute law for the saving of ships or goods from the danger of the sea, pirates, or enemies. Where any ship is in danger of being stranded, or driven on shore, judges of the peace are to command the constables to assemble as many persons as are necessary to preserve it; and, on its being preferred by their means, the persons affiling therein shall, in 30 days after, be paid a reasonable reward for their salvage; otherwise the ship or goods shall remain in the custody of the officers of the customs as a security for the same.

Salvation, means the safety or preservation of any thing which is or has been in danger, and is generally used in a religious sense, when it means preservation from eternal death, or reception to the happiness of heaven, which is now offered to all men by the Christian religion, upon certain conditions. The Hebrews but rarely make use of concrete terms as they are called, but often of abstractions. Thus, instead of saying that God saves them and protects them, they say that God is their salvation. Thus the word of salvation, the joy of salvation, the shield of salvation, the horn of salvation, &c. is as much as to say, the word that declares deliverance, the joy that takes refuge, and where he takes refuge, and where he may be in safety from his enemy; a buckler, that secures him from the arm of the enemy; a horn or ray of light, of happiness and salvation, &c. See Theology, &c.

Salvator Rosa. See Rosa.

Salve Regina, among the Romans, the name of a Latin prayer, addressed to the Virgin, and sung after complines, as also upon the point of executing a criminal. Durandus says, it was composed by Pope bishop of Compostella. The custom of singing the Salve Regina at the clofe of the office was begun by order of St. Dominic, and first in the congregation of Dominicans at Bologna, about 1257. Gregory IX. first appointed it to be general. St. Bernard added the conclusion, O dulcis! O pia, &c.

Salvia, sage: A genus of the monogynia order, belonging to the digynia class of plants; and in the natural method ranking under the 42d order, Verticillata. The corolla is unequal; and the filaments placed cross-wise on a pedicle. The most remarkable species are: 1. The officinalis, or common large fage, which is cultivated in gardens, of which there are the following varieties: a. The common green fage. b. The wormwood fage. c. The green fage, with a variegated leaf. 4. The red fage. 5. The red fage with a variegated leaf. There are accidental variations, and therefore are not enumerated as species. The common fage grows naturally in the southern parts of Europe, but is in Britain cultivated in gardens for use; but that variety with red or blackish leaves is the most common in the British gardens; and the wormwood fage is in greater plenty there than the common green-leaved fage, which is but in few gardens.

2. The tomentosa, generally titled balsamis fage by the gardeners. The stalks of this do not grow so upright as those of the common fage; they are very hairy, and divided into several branches, which are garnished with broad heart-shaped woolly leaves standing upon long foot-ralls; they are sawed on their edges, and their upper surfaces are rough; the leaves, which are upon the flower-ralls, are oblong and oval, standing upon shorter foot ralls, and are very slightly sawed on their edges; they grow in whorled spikes toward the top of the branches; the whorls are pretty far distant, but few flowers in each; they are of a pale blue, about the size of those of the common fage. This fage is preferred to all the others for making teas.

4. The auriculata, common fage of virtue, which is also well known in the gardens and markets. The leaves of this is narrower than those of the common fage; they are hoary, and some of them are indented on their edges towards the bafe, which indentures have the appearance of ears. The spikes of flowers are longer than those of the two former sorts, and the whorls are generally naked, having no leaves between them. The flowers are smaller, and of a deeper blue than those of common red fage.

4. The pomifera, with spear-shaped oval entire leaves, grows naturally in Crete. This hath a thorny stalk, which rifes four or five feet high, dividing into several branches. The flowers grow in spikes at the end of the branches; they are of a pale blue colour, and have obtuse emplacements. The branches of this fage have often punctures made in them by infléct, at which places grow large protuberances as big as apples, in the same manner as the galls upon an oak, and the rough balls on the briar.

All the sorts of fage may be propagated by seeds, if they can be procured; but, as some of them do not perfect their seeds in cold countries and most of the sorts, but especially the common sorts for use, are easily propagated by slips, it is not worth while to raise them from seeds.

Salvianus, an ancient father of the Christian church, who flourished in the 5th century, and was well skilled in the sciences. It is said he lived in continence with his wife Palladia, as if she had been his sister; and that he was so afflicted at the wickedness of that age, that he was called the Jeremiah of the fifth century. He acquired such reputation for his piety and learning, that he was named the master of the bishops. He wrote a Treatise on Providence; another on Avarice; and some epistles, of which Baluze has given an excellent edition; that of Conrad Ritterflusius, in 2 vols octavo, is also esteemed.

Salutation, the act of saluting, greeting, or paying respect and reverence to any one.

When men (writes the compiler of L'Esprit des Caricatures) salute each other in an amicable manner, it signifies little whether they move a particular part of the body, or practice a particular ceremony. In these actions there must be different customs. Every nation imagines it employs the most reasonable; but all are equally simple, and none are to be treated as ridiculous. This infinite number of ceremonies may be reduced to two kinds: to reverence or salutations; and to the touch of some part of the human body. To bend and prostrate one's self to express sentiments of respect, appears to be a natural motion; for terrified persons throw themselves on the earth when they adore invisible beings. The affectionate touch of the...
Salutation. The person they salute, is an expression of tenderness.

As nations decline from their ancient simplicity, much farce and grimace are introduced. Superstition, the manners of a people, and their situation, influence the modes of salutation; as may be observed from the instances we collect.

Modes of salutation have sometimes very different characters, and it is no uninteresting speculation to examine their shades. Many display a refinement of delicacy, while others are remarkable for their simplicity, or for their felicity. In general, however, they are frequently the same in the infancy of nations, and in more polished societies. Respect, humility, fear, and esteem, are expressed much in a similar manner; for these are the natural consequences of the organization of the body. These demonstrations become, in time, only empty civilities, which signify nothing; we shall notice what they were originally, without reflecting on what they are.

The first nations have no peculiar modes of salutation; they know no reverences, or other compliments, or they despise and disdain them. The Greenlanders laugh when they see an European uncover his head and bend his body before him whom he calls his superior. The islanders, near the Philippines, take the hand or foot of him they salute, and with it they gently rub their face. The Laplanders apply their noise strongly against that of the person they salute. Dampier says, that at New Guinea they are satisfied in placing on their heads the leaves of trees, which have ever paused for symbols of friendship and peace. This is as least a picturesque salute.

Other salutations are very inconvenient and painful; it requires great practice to enable a man to be polite in an island situated in the Straits of the Sound. Houtman tells us, they saluted him in this odd way: "They raised his left foot, which they passed gently over the right leg, and from thence over his face." The inhabitants of the Philippines bend their body very low, in placing their hands on their cheeks, and raising at the same time one foot in the air, with their knee bent. An Ethiopian takes the robe of another, and ties it about his own waist, so that he leaves his friend half naked. This custom of undressing on these occasions takes other forms; sometimes men place themselves naked before the person whom they salute; it is to show their humility, and that they are unworthy of appearing in his presence. This was practised before Sir Joseph Banks, when he received the visit of two female Oceaniaans. Their innocent simplicity, no doubt, did not affect away in the eyes of the virtues. Sometimes they only undress partially. The Japanese only take off a lower; the people of Arracon, their sandal in the street, and their stockings in the house.

In the progress of time, it appears servile to uncover one's self. The grandees of Spain claim the right of appearing covered before the king to show that they are not so much subject to him as the rest of the nation; and (this writer observes) we may remark, that the English do not uncover their heads so much as the other nations of Europe. In a word, there is not a nation (observes the humourous Montaigne), even to the people who, when they salute, turn their backs on their friends, but that can be justified in their customs. It must be observed of the negroes, that they are lovers of ludicrous actions, and thus make all their ceremonies farcical. The greater part pull the fingers till they crack. Snellgrave gives an odd representation of the emblems which the king of Dahomy sent to him. The ceremonies of salutation confuted in the most ridiculous contortions. When two negro monarchs visit, they embrace in snapping three times the middle finger.

Barbarous nations frequently imprint on their salutations the dispositions of their character. When the inhabitants of Caratums (says Athenes) would show a peculiar mark of esteem, they breathed a vein, and presented for the beverage of their friend the blood as it issued. The Franks tore hair from their heads, and presented it to the person they saluted. The face cut his hair, and offered it to his master. The Chinese are singularly affected in their personal civilities: they even calculate the number of their reverences: these are their most remarkable politeness. The men move their hands in an affectionate manner, while they are joined together on the breast, and bow their head a little. If they respect a person, they raise their hands joined, and then lower them to the earth in bending the body. If two persons meet after a long separation, they both fall on their knees, and bend the face to the earth, and this ceremony they repeat two or three times. Surely we may differ here with the sentiment of Montaigne, and confess this ceremony to be ridiculous. It arises from their national affection. They substitute artificial ceremonies for natural actions. Their expressions mean as little as their ceremonies. If a Chinese is asked how he finds himself in health? he answers, "Very well; thanks to your abundant felicity." If they would tell a man that he looks well? they say, "Prospertz painted on your face." If you render your visit, they say, "My thanks should be immortal." If you praise them, they answer, "How shall I dare to profane myself of what you say of me?" If you dine with them, they tell you at parting, "We have not treated you with sufficient distinction." The various titles they invent for each other it would be impossible to translate.

It is to be observed, that all these answers are prescribed by the Chinese ritual, or academy of compliments. There are determined the number of bows; the expressions to be employed; the genuflections; and the inclinations which are to be made to the right or left hand: the salutations of the master before the chair where the stranger is to be seated, for he salutes it with the utmost profoundity, and wipes the dust away with the skirts of his robe; all these and other things are noticed, even to the silent gestures, by which you are entreated to enter the house. The lower classes of people are equally nice in these punctilios; and ambassadors pass 40 days in practicing them before they are enabled to appear at court. A tribunal of ceremonies has been erected, and every day very odd decrees are issued, to which the Chinese most religiously submit.

The marks of honour are frequently arbitrary; to be seated, with us, is a mark of repefe and familiarity; to stand up, that of respect. There are countries, however, in which princes will only be addressed by persons who are seated, and it is considered as a favour to be permitted to stand in their presence. This custom prevails in despotic countries: a despot cannot suffer without dignity the elevated figure of his subjects; he is pleased.
pleased to bend their bodies with their genius: his presence must lay those who behold him prostrate on the earth: he defies no eagerness, no attention; he would only inspire terror.

The pope makes no reverence to any mortal except the emperor, to whom he bows a very little when he permits him to kiss his lips.

**SALUTE,** in military matters, a discharge of artillery, or small arms, or both, in honour of some person of extraordinary quality. The colours likewise salute royal persons, and generals commanding in chief; which is done by lowering the point to the ground. In the field, when a regiment is to be reviewed by the king or his general, the drums beat a march as he passes along the line, and the officers salute one after another, bowing their half-pikes or swords to the ground; then recover and take off their hats. The ensigns salute altogether, by lowering their colours.

**SALUTE,** in the navy, a testimony of deference or homage rendered by the ships of one nation to another, or by ships of the same nation to a superior or equal.

This ceremony is variously performed, according to the circumstances, rank or situation, of the parties. It consists in firing a certain number of cannon, or volleys of small arms; in striking the colours or top-falls; or in one or more general thouts of the whole ship's crew, mounted on the masts or rigging for that purpose.

The principal regulations with regard to salutes in the royal navy are as follow:

- When a flag-officer salutes the admiral and commander in chief of the fleet, he is to give him fifteen guns; but when captains salute him, they are to give him seventeen guns. The admiral and commander in chief of the fleet is to return two guns less to flag-officers and four less to captains. Flag-officers, saluting their superior or senior officer, are to give him thirteen guns. Flag-officers are to return an equal number of guns to flag-officers bearing their flags on the same mast, and two guns less to the ref, as also to captains.

- When a captain salutes an admiral of the white or blue, he is to give him fifteen guns; but vice and rear admirals, thirteen guns. When a flag-officer is saluted by two or more of his majesty's ships, he is not to return the salute till all have finished, and then to do it with such a reasonable number of guns as he shall judge proper.

- In case of the meeting of two squadrons, the two chiefs only are to exchange salutes. And if single ships meet a squadron confining of more than one flag, the principal flag only is to be saluted. No salutes shall be repeated by the same ships, unless there has been a separation of six months at least.

- None of his majesty's ships of war, commanded only by captains, shall give or receive salutes from one another, in whatsoever part of the world they meet.

- A flag officer commanding in chief shall be saluted, upon his first hoisting his flag, by all the ships present with such a number of guns as is allowed by the first, third, or fifth articles.

- When any of his majesty's ships shall meet with any ship or ships belonging to any foreign prince or state, within his majesty's seas (which extend to Cape Finisterre), it is expected, that the said foreign ships do salute their top-sails, and take in their flag, in acknowledgment of his majesty's sovereignty in these seas: and if any shall refuse or offer to return, it is enjoined to all flag-officers and commanders to use their utmost endeavours to compel them thereto, and not suffer any dishonour to be done to his majesty. And if any of his majesty's subjects shall so much forget their duty, as to omit striking their top-fall in passing by his majesty's ships, the name of the ship and master, and from whence, and whither bound, together with affidavits of the fact, are to be sent up to the secretary of the admiralty, in order to their being proceeded against in the admiralty court. And it is to be observed, that in his majesty's seas, his majesty's ships are in nowise to strike to any; and that in other parts, no ship of his majesty's is to strike her flag or top-fall to any foreigner, unless such foreign ship shall have first struck, or at the same time strike, her flag or top-fall to his majesty's ship.

- The flag-officers and commanders of his majesty's ships are to be careful to maintain his majesty's honour upon all occasions, giving protection to his subjects, and endeavouring, what in them lies, to secure and encourage them in their lawful commerce; and they are not to injure, in any manner, the subjects of his majesty's friends and allies.

- If a foreign admiral meets with any of his majesty's ships, and salutes them, he shall receive gun for gun. If he be a vice-admiral, the admiral shall answer with two guns less. If a rear-admiral, the admiral and vice-admiral shall return two less. But if the ship be commanded by a captain only, the flag-officer shall give two guns less, and captains an equal number.

- When any of his majesty's ships come to an anchor in a foreign port or road, within cannon-shot of its forts, the captain may salute the place with such a number of guns as have been customary, upon good assurance of having the same number returned, but not otherwise. But if the ship bears a flag, the flag-officer shall first carefully inform himself how flags of like rank, belonging to other crowned heads, have given or returned salutes, and to inflict upon the same terms of respect.

- It is allowed to the commanders of his majesty's ships in foreign parts, to salute the persons of any admirals, commanders in chief, or captains of ships of war of foreign nations, and foreign noblemen, or strangers of quality, as also the factories of the king's subjects, coming on board to visit the ship; and the number of guns is left to the commander, as shall be suitable to the occasion and the quality of the persons visiting; but he is nevertheless to remain accountable for any excess in the abuse of this liberty. If the ship visited be in company with other ships of war, the captain is not to make use of the civilities allowed in the preceding articles but with leave and consent of the commander in chief or the senior captain.

- Merchant-ships, whether foreigners or belonging to his majesty's subjects, saluting the admiral of the fleet, shall be answered by six guns less; when they salute any other flag-ships, they shall be answered by four guns less; and if they salute men of war commanded by captains, they shall be answered by two guns less. If several merchant-ships salute in company, no return is to be made till all have finished, and then by such a number of guns as is allowed by the first, third, or fifth articles.
such a number of guns as shall be thought proper; but though the merchant-ships should answer, there shall be no second return.

"None of his majesty's ships of war shall salute any of his majesty's forts or castles in Great Britain or Ireland, on any pretence whatsoever."

SALUZZO, called by the French Saluzzo a town and capital of Italy, in Piedmont, and capital of a marquisate of the same name, with a bishop's see. It is situated on an eminence at the foot of the Alps near the river Po, in E. Long. 18. 27. N. Lat. 44. 35. It is subject to the king of Sardinia.

SALUZZO, the marquisate of, a province of Piedmont in Italy, bounded on the north by Dauphiny and the province of the Four Valleys, on the east by those of Savignon and Fossano, on the south by that of Cona and the county of Nice, and on the west by Barcelonetta. It was ceded to the duke of Savoy in 1601.

SAMA, a town and fort in the hands of the Dutch on the Gold Coast of Africa, stands on an eminence, the fort being watered by the pleasant river of St George, that discharges itself into the sea. The town contains above 200 houses, which seem to form three distinct villages, one of which is immediately under the cannon of the Dutch fort St Sebastian. Des Marchais deems this town to be one of the largest on the whole coast, Barbot likewise agreeing with him in its situation, extent, and number of inhabitants. The sole employment of the natives is fishing; a circumstance which easily accounts for their poverty. The government of this place is republican, the magistrates having the supreme power, being subject to periodical changes, and under the authority of the king of Gavi, who seldom interferes in the affairs of the state. This prince resides some leagues distant from the sea, is rich, and much respected by his neighbours.

SAMANEANS, in antiquity, a kind of magi or philosophers, have been confounded by some with the Brahmins. They proceeded from Ariana, a province of Persia, and the neighbouring countries, spread themselves in India, and taught new doctrines.

The Brahmins, before their arrival, it is said, were in the highest period of their glory, were the only oracles of India, and their principal residence was on the banks of the Ganges, and in the adjacent mountains; while the Samaneans were settled towards the Indus. Others say, that the Brahmins acquired all their knowledge from the Samaneans, before whose arrival it would be difficult to prove that the Brahmins were the religious teachers of the Indians. The most celebrated and ancient of the Samanean doctors was Boutry, or Buddha, who was born 683 years before Christ. His scholars paid him divine honours; and his doctrine, which consisted chiefly in the transmigration of souls, and in the worship of cows, was adopted not only in India, but also in Japan, China, Siam, and Tartary. It was propagated, according to M. de Sainte Croix, in Thibet, in the 8th century, and succeeded there the ancient religion of Zoroakist. The Samaneans, or Buddhists, were entirely destroyed in India by the jealous rage of the Brahmins, whose absurd practices and fables they affected to treat with contempt; but several of their books are still preserved and respected on the coasts of Malabar.

We are told, too, that several of the Bramin orders have adopted their manner of living, and openly profess the greatest part of their doctrines. L'Escur Vedam, ou Ancien Comment du Vedam, published by M. de S. Croix, Paris 1779. See Brahmins.

SAMA, a Spanish island not far from Manila in the East Indies, is called Sarmar on the side which looks towards the other islands, and Isabue on that next the southern coast. It is like the trunk of a man's body, without a head or legs. Its greatest length, from Cape Baliquatan, which, with the point of Manila, makes the strait of St Bernardino, in 13 degrees 30 minutes north latitude, extends towards that of Guignan in 11 degrees towards the south. The other two points, making the greatest breadth of the island, are Cabo de Espirito Santo, or Cape of the Holy Ghost, the high mountains of which are the first discovered by ships from New Spain; and that which lying opposite to Leyte westward, makes another strait, far to the north over. The whole compass of the island is about 150 leagues. Between Guignan and Cape Espirito Santo is the port of Borogon, and far from the village of Palapa and Cattibug, and the little island of Bin, and the coast of Catamaran. Vessels from countries not yet discovered are very frequently cast away on the before-mentioned coast of Palapa. Within the straits of St Bernardino, and beyond Baliquatan, is the coast of Sama, on which are the villages of Iba, Bangahon, Caltobig, Paranos, and Calviga. Then follow the straits of St Juanillo, without which, standing eastward, appears the point and little island of Guignan, where the compass of the island ends. It is mountainous and craggy, but fruitful in the few plains there are. The fruits there are much the same as those of Leyte; but there is one particular fort called by the Spaniards eldo, and by the Chinese, which put a great value on it, jesu, without kernels.

SAMARA, in botany; a genus of the monogynia order, belonging to the tetrands clafs of plants. The calyx is quadripartite, the corolla tetrapetalous; the stamina immersed in the base of the petal; the stigma funnel-shaped.

SAMARCAND, or Sarmacand, an ancient and famous town of Asia, capital of the kingdom of the same name in the country of the Ulbeck Tartars, with a castle and a famous university. The houses are built with stones, and it carries on a trade in excellent fruits. It is pleasantly seated near the river Sogde, a branch of the Amu, E. Long. 69. 0. N. Lat. 39. 50. This town was the capital of the kingdom of Bogdha in the time of Alexander the Great, when it was called Marasanda. It was afterwards the capital of the empire of Tamerlane the Great. In the time of Jenghiz Khan, it was forced to yield to the arms of that cruel conqueror; by whom the garrisons amounting to 30,000 men, were butchered; 30,000 of the inhabitants with their wives and children, were presented to his generals; the rest were permitted to live in the city, on paying a tribute of 320,000 dinars or crowns of gold.

SAMARIA (anc. geog.) one of the three larger Cisjordan districts, situated in the middle between Galilee to the north and Judea to the south, beginning at the village Ginza, in the Campus Magnus, and ending at the toparchy called Aethaetana (Josephus). Its fall
SAMARIA, full differing in nothing from that of Judea; both equally hilly and champaign, both equally fertile in corn and fruit (id.) Called the kingdom of Samaria in Ephraim (Bible); comprising the ten tribes, and consequently all the country to the north of Judea and east and west of Jordan.

Samaria, the capital city of the kingdom of Samaria, or of the ten tribes. It was built by Omri, king of Israel, who began to reign in the year of the world 3079, and died 3086 (1 Kings xvi. 24.) He bought the hill Samaria of Shemer for two talents of silver, or for the sum of 6,833. It took the name of Samaria from Shemer the owner of the hill; though some think there were already some beginnings of a city, because, before the reign of Omri, there is mention made of Samaria (1 Kings xiii. 32.) in the year of the world 3029. But others take this for a prophec-y or an anticipation, in the discourse of the man of God, who speaks of Samaria under the reign of Jeroboam.

However this be, it is certain that Samaria was no considerable place, and did not become the capital city of the kingdom of Israel till after the reign of Omri. Before him, the kings of Israel dwelt at Shechem, or at Tirzah. Samaria was situated upon an agreeable and fruitful hill, and an advantageous situation, and was 12 miles from Dothaim, 12 from Merrom, and four from Athsaroth. Josephus says, it was a day's journey from Jerusalem. Besides, though it was built upon an eminence, yet it must have water in abundance; since we find medals struck in this city, wherein is represented the goddess Athara treading a river under foot; which proves it to have been well watered. And Josephus observes, that when it was taken by John Hircanus the prince of the Jews, he entirely demolished it, and caused even the brook to flow over its ruins, to obliterate all the footprints of it.

The kings of Samaria omitted nothing to make this city the strongest, the finest, and the richest, that was possible. Ahab built there a palace of ivory (1 Kings xxii. 39), that is, in which there were many ornaments of ivory. Amos describes Samaria under Jeroboam II. as a city sunk into all excresses of luxury and effeminacy (Amos iii. 15, and iv. 1, 2).

Ben-hadad king of Syria built public places or streets in Samaria (1 Kings xx. 34.) probably for traffic, where his people dwelt to promote trade. His son Ben-hadad belegied this place under the reign of Ahab (1 Kings xx. 1, 2, 3, 5c.) in the year of the world 3103.

The following year, Ben-hadad brought an army into the field, probably with a design to march against Samaria: but his army was again cut in pieces. Some years after this, Ben-hadad came a third time, lay down before Samaria, and reduced it to such necessities by famine, that a mother was there forced to eat her own child; but the city was relieved by a fortunate effect of the protection of God.

Lately, it was besieged by Shalmaneser king of Assyria, in the ninth year of Hosea king of Israel (2 Kings xviii. 6, 7, &c.), which was the fourth of Hezekiah king of Judah. It was taken three years after, in the year of the world 3283. The prophet Hosea speaks of the cruelties exercised by Shalmaneser against this besieged (Hosea x. 4, 8, 9, xiv. 1) and Mohiah says, that this city was reduced to a heap of flames (Mic. i. 6.). The Cuthites that were sent by Eftar-haddon to inhabit the country of Samaria, did not think it worth while to repair the ruins of this city; they dwelt at Shechem, which they made the capital city of their state.

They were fill upon this footing when Alexander the Great came into Phœnicia and Judea. However, the Cuthites had rebuilt some of the houfes of Samaria even from the time of the return from the captivity, since Ezra then speaks of the inhabitants of Samaria (Ezra iv. 17. Nehem. iv. 2.) and that the Samaritans, being jealous of the favours that Alexander the Great had conferred on the Jews, revolted from him while this prince was in Egypt, and burnt Andromachus alive, whom Alexander had left governor of Syria. Alexander marched against them, took Samaria, and put in Macedonians to inhabit it; giving the country round it to the Jews; and to encourage them to cultivate it, he granted them an exemption from tribute. The king of Egypt and Syria, who succeeded Alexander, deprived them of the property of this country.

But Alexander Balas king of Syria referred to Jonathan Maccabæus the cities of Lydda, Ephrem, and Ramatha, which he cut off from the country of Samaria (1 Mac. x. 30, 38, and xi. 28, 34.) Lastly, the Jews re-entered into the full possession of this whole country under John Hircanus the Aimonæan, who took Samaria, and ruined it in such a manner, according to Josephus, that he made the river run through its ruins. It continued in this condition to the year of the world 3947, when Aulus Gabinius, the proconsul of Syria, rebuilt it, and gave it the name of Gabinianam. But it was yet but very inconsiderable, till Herod the Great restored it to its ancient lustre, and gave it the Greek name of Seballe, which in Latin is Augulia, in honour of the emperor Augustus, who had given him the property of this place.

The sacred authors of the New Testament speak but little of Samaria; and when they do mention it, it is rather in respect of the country about it, than of the city itself. (See Luke xviii. 11. John iv. 5.) It was there our Lord had the conversation with the woman of Samaria, that is, with a Samaritan woman of the city of Sychar. After the death of St Stephen, (Acts viii. 1, 2, 3.) when the disciples were dispersed through the cities of Judea and Samaria, St Philip the deacon withdrew into this city of Samaria, where he made several converts. When the apostles heard that this city had received the word of God, they sent Peter and John thither, to communicate the Holy Ghost to such as had been baptized. It was there they found Simon Magus, who offered money to the apostles, being in hopes to buy this power of communicating the Holy Ghost. Samaria is never called Seballe in the books of the New Testament, though strangers hardly knew it by this name. St Jerome says, that it was thought Obadiah was buried at Samaria. They also shewed there the tombs of Eliah and of St John the Baptist. There are found many ancient medals that were struck at Seballe, or Samaria, and some bishops of this city have subscribed to the ancient councils.

SAMARITANS. We have already spoken of the Samaritans under the article Cuth. The Samaritans...
Samanians are the people of the city of Samaria, and the inhabitants of the province of which Samaria was the capital city. In this sense, it should seem that we might give the name of Samarians to the Israelites of the ten tribes who lived in this country and territory of Samaria. However, the ancient authors commonly give the name of Samarians to the strange people whom the kings of Assyria sent from beyond the Euphrates to inhabit the kingdom of Samaria, when they took away captive the Israelites that were there before. Thus we may fix the epoch of the Samarians at the taking of Samaria by Salmanasar, in the year of the world 3283. This prince carried away captive the Israelites that he found in the country, and assigned them dwellings beyond the Euphrates, and in Assyria, (2 Kings xvii. 24.) He sent other inhabitants in their stead, of which the most considerable were the Cuthites, a people descended from Cush, and who are probably of the number of those whom the ancients knew by the name of Scythians.

After Salmanasar, his successor Esar-haddon was informed, that the people which had been sent to Samaria were infeled by lions that devoured them, (2 Kings xvii. 25;) this he imputed to the ignorance of the people in the manner of worshipping the god of the country. Wherefore Esar-haddon sent a priest of the God of Israel that he might teach them the religion of the Hebrews. But they thought they might blend this religion with that which they professed before; so they continued to worship their idols as before, in conjunction with the God of Israel, not perceiving how absurd and incompatible these two religions were.

It is not known how long they continued in this state; but at the return from the captivity of Babylon, it appears they had entirely quitted the worship of their idols; and when they asked permission of the Israelites that they might labour with them at the rebuilding of the temple of Jerusalem, they affirmed, that from the time that Esar-haddon had brought them into this country they had always worshipped the Lord, (Esrah iv. 1, 2, 3;) and indeed, after the return from the captivity, the scripture does not say where they worshipped them with idolatrous worship, though it does not declare either their jealousy against the Jews, nor the ill offices they had done them at the court of Persia, by their flanders and calumnies, or the first steps they contrived to hinder the repairing of the walls of Jerusalem.—(Nehem. ii. 10, 19. iv. 2, &c. vi. 1, 2, &c.)

It does not appear that there was any temple in Samaria, in common to all those people who came thither from beyond the Euphrates, before the coming of Alexander the Great into Judea. Before that time, every one was left to his own discretion, and worshipped the Lord where he thought fit. But they presently comprehended, from the books of Moses which they had in their hands, and from the example of the Jews their neighbours, that God was to be worshipped in that place only which he had chosen. So that since they could not go to the temple of Jerusalem, which the Jews would not allow of, they bethought themselves of building a temple of their own upon Mount Gerizim, near the city of Shechem, which was then their capital. Therefore Sanballat, the governor of the Samaritans, applied himself to Alexander, and told him he had a son-in-law, called Manasseh, son to Jaddus the high-priest of the Jews, who had retired to Samaria with a great number of other people of his own nation; that he desired to build a temple in this province, where he might exercise the high-priesthood; that this undertaking would be to the advantage of the king's affairs, because in building a temple in the province of Samaria, the nation of the Jews would be divided, who are a turbulent and seditionous people, and by such a division would be made weaker, and less in a condition to undertake new enterprises.

Alexander readily consented to what Sanballat desired, and the Samaritans presently began their building of the temple of Gerizim, which from that time they have always frequented, and still frequent to this day, as the place where the Lord intended to receive the adoration of his people. It is of this mountain, and of this temple that the Samaritan woman of Sychar spake to our Saviour, (John iv. 20.) See Gerizim.

The Samaritans did not long continue under the obedience of Alexander. They revolted from him the very next year, and Alexander drove them out of Samaria, put Macedonians in their room, and gave the province of Samaria to the Jews. This preference that Alexander gave to the Israelites contributed not a little to increase that hatred and animosity that had already obtained between these two people. When any Israelite had deserved punishment for the violation of some important point of the law, he presently took refuge in Samaria or Shechem, and embraced the way of worship according to the temple of Gerizim. When the Jews were in a prosperous condition, and affairs were favourable to them, the Samaritans did not fail to call themselves Hebrews, and pretended to be of the race of Abraham. But no sooner were the Jews fallen into discredit or perdition, but the Samaritans immediately distrusted them, would have nothing in common with them, acknowledged themselves to be Phoenicians originally, or that they were descendants from Joseph and Manasseh his son. This used to be their practice in the time of Antiochus Epiphanes.

The Samaritans, having received the Pentateuch, or the five books of Moses, from the priest that was sent by Esar-haddon, preferred it to this day, in the same language and character it was then, that is, in the old Hebrew or Phoenician character, which we now call the Samaritan, to distinguish it from the modern Hebrew character, which at present we find in the books of the Jews. These last, after their captivity, changed their old characters, and took up those of the Chaldee, which they had been used to at Babylon, and which they continue still to use. It is wrong, says F. Calmet, to give this the name of the Hebrew character, for that can be said properly only of the Samaritan text. The critics have taken notice of some variations between the Pentateuch of the Jews and that of the Samaritans; but these varieties of reading chiefly regard the word Gerizim, which the Samaritans seem to have purposely introduced to favour their pretensions, that Mount Gerizim was the place in which the Lord was to be adored. The other various readings are of small importance.

The religion of this people was at first the Pagan. Every one worshipped the deity he had been used to in his own country (2 Kings xvii. 25, 30, 31.)
The Babylonians worshipped Succoth-benoth; the Cuthites, Nergal; the Hamathites, Ahabia; the Avites, Nebhab and Tartak; the Sepharvites, Adrammelech and Anammelech. If we would enumerate all the names of false gods to whom the Samaritans have paid a sacrilegious worship, we should have enough to do. This matter is sufficiently perplexed, by reason of the different names by which they were adored by different nations, insomuch that it would be almost impossible to clear up this affair. See Succoth-benoth, &c. Afterwards, to this profane worship the Samaritans added that of the Lord, the God of Israel, (2 Kings xvii. 29, 30, 31, 32.) They gave a proof of their little regard to this worship of the true God, when under Antiochus Epiphanes they consecrated their temple at Gerizim to Jupiter Argivus. In the time of Alexander the Great, they celebrated the fabbatical year, and consequently the year of jubilee also. We do not know whether they did it exactly at the same time with the Jews, or whether they observed any other epoch; and it is to little purpose that some critics have attempted to aearcertain the first beginning of it. Under the kings of Syria they followed the epoch of the Greeks, or that of the Seleucids, as other people did that were under the government of the Seleucids. After that Herod had re-established Samaritans, and had given it the name of Sebaste, the inhabitants of this city, in their medals, and all public acts, took the date of this new establishment. But the inhabitants of Samaria, of which the greater part were Pagans or Jews, were no rule to the other Samaritans, who probably reckoned their years according to the reigns of the emperors they were subject to, till the time they fell under the jurisdiction of the Mahometans, under which they live at this day; and they reckon their year by the Hegira, or, as they speak, according to the reign of Ithmael, or the Ishmaelites. Such of our readers as desire to be further acquainted with the history of the ancient Samaritans, we refer to the works of Josephus, where they will find that subject largely treated of.

Their belief, it is objected to them, that they receive only the Pentateuch, and reject all the other books of scripture, chiefly the prophets, who have more expressly declared the coming of the Messiah. They have also been accused of believing God to be corporeal, of denying the Holy Ghost, and the resurrection of the dead. Jesus Christ reproaches them (John iv. 22.) with worshipping they know not what; and in the place already referred to he seems to exclude them from salvation, when he says, that “Salvation is of the Jews.” True it is, that these words might only signify, that the Messiah was to proceed from the Jews; but the crime of schism alone, and a separation from the true church, was sufficient to exclude them from salvation. The Samaritan woman is a sufficient testimon y that the Samaritans expected a Messiah, who they hoped would clear up all their doubts (John iv. 25.) Several of the inhabitants of Shechem believed at the preaching of Jesus Christ, and several of Samaria believed at that of St Philip; but it is said, they soon fell back to their former errors, being perverted by Simon Magus.

The Samaritans at present are very few in number. Joseph Scaliger, being curious to know their usages, wrote to the Samaritans of Egypt, and to the high-priest of the whole feet who resided at Neapolis in Syria. They returned two answers to Scaliger, dated in the year of the Hegira 998. These were preserved in the French king’s library, and were translated into Latin by father Morin, and printed in England in the collection of that father’s letters, in 1682, under the title of Antiquitates Ecleiæ Orientalis. By these letters it appears, that they believe in God, in his servant Moses, the holy law, the mountain Gerizim, the house of God, the day of vengeance and of peace; that they value themselves upon observing the law of Moses in many points more rigidly than the Jews themselves.—They keep the sabbath with the utmost strictness required by the law, without stinting from the place they are in, but only to the synagogue. They go not out of the city, and abstrain from their wives on that day. They never delay circumcision beyond the eighth day. They fill sacrifice to this day in the temple on mount Gerizim, and give to the priest what is enjoined by the law. They do not marry their own nieces, as the Jews do, nor do they allow themselves a plurality of wives. Their hatred for the Jews may be seen through all the history of Josephus, and in several places of the New Testament. The Jewish historian informs us that under the government of Cononius, one passover night, when they opened the gates of the temple, some Samaritans had scattered the bones of dead men there, to insult the Jews, and to interrupt the devotion of the festival. The evangelists show us, that the Jews and Samaritans held no correspondence together (John iv. 9.) “The Jews have no dealings with the Samaritans.” And the Samaritan woman of Sychar was much surprized that Jesus talked with her, and asked drink of her, being a Samaritan. When our Saviour sent his apostles to preach in Judea, he forbade them to enter into the Samaritan cities, (Matt. x. 5.) because he looked upon them as schismatics, and as strangers to the covenant of Israel. One day when he sent his disciples to provide him a lodging in one of the cities of the Samaritans, they would not entertain him, because they perceived he was going to Jerusalem (Luke ix. 52. 53.) “Because his face was as though he would go to Jerusalem.” And when the Jews were provoked at the reproaches of Jesus Christ, they told him he was a Samaritan (John viii. 48.) thinking they could say nothing more severe against him. Josephus relates, that some Samaritans having killed several Jews as they were going to the feast at Jerusalem, this occasioned a kind of a war between them. The Samaritans continued their fealty to the Romans, when the Jews revolted from them; yet they did not escape from being involved in some of the calamities of their neighbours.

There are still at this day some Samaritans at Shechem, otherwise called Naplous. They have a priestess, who says they are of the family of Aaron. They have a high-priest, who resides at Shechem, or at Gerizim, who offers sacrifices there, and who declares the feast of the passover, and all the other feasts, to all the defacred Samaritans. Some of them are to be found at Gaza, some at Damascus, and some at Grand Cairo.

SAMBUCUS, ELDER, in botany: A genus of the trigynia order, belonging to the pentandria class of plants; and in the natural method ranking under the
Sambucus

434 order, *Dumoe***. The calyx is quinquepartite; the corolla quinquefidd; the berry trispernum.

The most remarkable species are, 1. The nigra, or common black-berried elder-tree, rises with a tree-form, branching numerously into a large spreading head, twenty or thirty feet high; pinnated leaves, of two or three pair of oval lobes and an odd one; and large five parted umbels of white flowers towards the ends of the branches, succeeded by bunches of black and other different colored berries, in the varieties; which are—Common black-berried elder-tree—White-berried elder—Green-berried elder—Laciniated, or parley-leaved elder, having the foliodes much laciniated, so as to resemble parley-leaves—Gold-striped-leaved elder—Silver-striped elder—Silver-dusted elder. 2. The racemoi, racemose red-berried elder, rises with a tree-like form, branching ten or twelve feet high, having reddish-brown branches and buds; pinnated leaves of six or seven oval deeply-fawed lobes; and compound, oval, racemose, clusters of whitish-green flowers, succeeded by oval clusters of red berries. This is a reedy of the numerous parts of the fourth of Europe, and is retained in our gardens as a low growing shrub, having a peculiar singularity in its oval-clustered flowers and berries. 3. The Canadensis, or Canada shrubby elder, rises with a shrubby form, branching eight or ten feet high, having reddish shoots; somewhat bipinnated leaves, often ternate below, the other composed of five, seven, or nine oval lobes; and towards the ends of the branches, cymose quinquepartite umbels of flowers, succeeded by blackish red berries. All the sorts of elder are of the deciduous tribe, very hardy, and grow freely anywhere; are generally free shooters, but particularly the common elder, and varieties, which make remarkably strong, jointed shoots, of several feet in length, in one season; and they flower mostly in summer, except the racemose elder, which generally begins flowering in April; and the branches being large, spreading, and very abundant, are exceedingly conspicuous; but they emit a most disagreeable odour. The flowers are succeeded in the most of the sorts by large bunches of ripe berries in autumn, which, although very unpalatable to eat, are in high estimation for making that well known cordial liquor called elder wine, particularly the common black-berried elder. The merit of the elder in gardening may be both for use and ornament, especially in large grounds.

SAMIAN EARTH, in the materia medica, the name of two species of marl used in medicine, viz. 1. The white kind, called by the ancients *collyrium fami-ium*, being astringent, and therefore good in diarrhoea, dysenteries, and hemorrhages; they also used it externally in inflammations of all kinds. 2. The brownish white kind, called *offur familis* by Dioscorides; this also stands recommended as an astringent.

SAMIEL, the Arabian name of a hot wind peculiar to the desert of Arabia. It blows over the desert in the months of July and August from the north-west quarter, and sometimes it continues with all its violence to the very gates of Bagdad, but never affects any body within the walls. Some years it does not blow at all, and in others it appears six, eight, or ten times, but seldom continues more than a few minutes at a time. It often comes with the apparent quickness of lightning. The Arabians and Persians, who are acquainted with the appearance of the sky at or near the time this wind arises, have warning of its approach by a thick haze, which appears like a cloud of dust arising out of the horizon; and they immediately upon this appearance throw themselves with their faces to the ground, and continue in that position till the wind is passed, which frequently happens almost instantaneously; but if, on the contrary they are not careful or brisk enough to take this precaution, which is sometimes the case, and they get the full force of the wind, it is instant death.

The above method is the only one which they take to avoid the effects of this fatal blast; and when it is over, they get up and look round them for their companions; and if they see any one lying motionless, they take hold of an arm or leg, and pull and jerk it with some force; and if the limb thus agitated separates from the body, it is a certain sign that the wind has had its full effect; but if, on the contrary, the arm or leg does not come away, it is a sure sign there is life remaining, although to every outward appearance the person is dead; and in that case they immediately cover him or them with clothes, and administer some warm dilution to induce perspiration, which is certainly but slowly brought about.

The Arabs themselves can say little or nothing about the nature of this wind, only that it always leaves behind it a very strong sulphurous smell, and that the air at these times is quite clear, except about the horizon, in the north-west quarter, before observed, which gives warning of its approach. We have not been able to learn whether the dead bodies are scorched, or dissolved into a kind of gelatinous substance; but from the stories current about them, there has been frequent reason to believe the latter; and in that case such fatal effects may be attributed rather to a noxious vapour than to an absolute and excessive heat. The story of its going to the gates of Bagdad and no farther may be reasonably enough accounted for, if the effects are attributed to a poisonous vapour, and not an excessive heat. The above-mentioned wind, Samiel, is so well known in the neighbourhood of Bagdad and Bassora, that the very children speak of it with dread.

SAMOGITIA, a province of Poland, bounded on the north by Courland, on the east by Lithuania, on the west by the Baltic Sea, and on the south by Regal Prussia, being about 175 miles in length and 125 in breadth. It is full of forests and very high mountains, which feed a great number of cattle, and produce a large quantity of honey. There are also very active horsies, in high esteem. The inhabitants are clownish, but honest; and they will not allow a young woman to go out in the night without a candle in her hand and two bells at her girdle. Roffena and Wormia are the principal places.

SAMOILEDA, a country of the Russian empire, between Asiatic Tartary and Archangel, lying along the sea-coast as far as Siberia. The inhabitants are rude people that they can hardly pretend to humanity, except in their face and figure: they have little understanding, and in many things resemble brutes; for they will eat carrion of every kind. They travel on the snow on flegdes, drawn with an animal like a reindeer, but with the horns of a stag. Those who have seen them affirm, that no people on the earth make such flocking figures: their stature is short; their shoulders...
S A M O L U S, in botany: A genus of the monogynia order, belonging to the pentandra clafs of plants; and in the natural method ranking under the 21st order, Precis. The corolla is sliper-shaped, the flamina surrounded by small scales at its throat. The capfule is uninocular inferior.

S A M O S (anc. geogr.), an island at no great distance from the promontory Mycale, on the continent of the Hithor Asia, and opposite to Ephesus; the distance only seven fladia (Strabo); a free island, in compass 87 miles (Pliny); or 100 (Hieronymus); with a cognominal town (Ptolomy, Horace); famous for the worship and a temple of Juno, with a noted asylum (Virgil, Strabo, Tacitus); and hence their coin exhibited a peacock (Athanaeus). The country of Pythagoras, who, to avoid the oppression of tyrants, retired to Italy, the land of freedom. Samos, though not so happy in producing wine, which Strabo wonders at, all the adjoining islands yielding a generous fort, yet abounds in all the neccesaries of life. The Vafa Samaria, among earthen ware, were held in high repute. Samit, the people (Ovid).—The island is now in the hands of the Turks. It is about 32 miles in length, and 22 in breadth, and extremely fertile. The inhabitants live at their ease, their taxation by the Turks being moderate. The women are very natty and ugly, and they never shift above once a month. They wear the costume in the Turkish manner, the head red coif, and their hair hanging down their backs, with plates of fliver or block-tin fastened to the ends. They have abundance of melons, lentils, kidney-beans, and excellent muskadine grapes. They have white figs four times as big as the common sort, but not so well talled. Theirilk is very fine, and their honey and wax admirable; besides which, their poultry are excellent: they have iron mines, and most of the soil is of a ruly colour: they have also emery stone, and all the mountains are of white marble. The inhabitants are about 12,000 who are almost all Greeks; and the monks and priests occupy most part of the island. They have a bishop who resides at Cora. See Poly-crates.

S A M P A N, a Chinefe boat without a keel, looking almost like a trough; they are made of different dimensions, but are mostly covered. These boats are as long as floors, but broader, almost like a baking trough; and have at the end one or more decks of bamboo ficks: the cover or roof is made of bamboo ficks, arched over the shape of a grater; and may be raised or lowered at pleasure: the fides are made of boards, with little holes, with futters instead of wincows: the boards are fastened on both fides to polls; which have notches like steps on the sides, that the roof may be let down, and rest on them: on both ends of the deck are commonly two little doors, at left there is one at the hindmost end. A fine white smooth carpet spread up as far as the boards makes the floor, which in the middle of the holds; but this carpet is only made use of to keep on. As these boats greatly differ from ours in shape, they are likewise rowed in a different manner: for two rowers, pulling themselves at the back end of the sampan, work it forwards very readily by the motion of two oars; and can almost turn the vessel just as they please: the oars, which are covered with a little hollow quadrangular iron, are laid on iron fivvels, which are fastened in the sides of the sampan: at the iron the oars are pieced, which makes them look a little bent: in common, a rower sits before with a short oar; but this he is forced to lay aside when he comes near the city, on account of the great throng of sampans; and this inconvenience has confirmed the Chinefe in their old way of rowing. Instead of pitch, they make use of a cement like our putty, which we call thinau, but the Chinefe call it klang. Some authors lay that this cement is made of lime and a reinf exuding from the tree long gut, and bamboo ockam.

Beside a couple of chairs, they have the following furniture: two oblong tables or boards on which some Chinefe characters are drawn; a lantern for the night-time, and a pot to boil rice in. They have also a little cover for their household god, decorated with gilt paper and other ornaments: before him stands a pot filled with ashes, into which the tapers are put before the idol. The candles are nothing else than bamboo chips, to the upper end of which sawdust of sandal-wood is stuck on with gum. These tapers are everywhere where lighted before the idols in the pagodas, and before the doors in the streets; and, in large cities, occasion a fmore very pernicious to the eyes. Before this idol stands some jampen, or Chinefe brandy, water, etc. We ought to try whether the Chinefe would not like to use jumpan-water instead of sandal-wood, which latter comes from Suratte, and has almost the fame small with jumpan.

S A M S O N, one of the judges of Israel, memorable for his supernatural strength, his victories over the Philistines, and his tragical end, as related in the book of Judges.

S a m s o n's P o f f, a fort of pillar erected in a ship's hold, between the lower deck and the kelson, under the edge of a hatchway, and furnished with several notches that serve as steps to mount or descend, as occasion requires. This poff being firmly driven into its place, not only serves to support the beam and fortify the vessel in that place, but also to prevent the cargo or materials contained in the hold, from shifting to the opposite side, by the rolling of the ship in a turbulent and heavy sea.

Books of S A M U E L, two canonical books of the Old Testament, as being usually ascribed to the prophet Samuel.

The books of Samuel and the books of Kings are a continued history of the reigns of the kings of Israel and Judah; for which reason the books of Samuel are likewise styled the first and second books of Kings. Since
At Sana, and in the other cities of the East, are great timfers or caravanseras for merchants and travelers. Each different commodity isfold in a separate market. In the market for bread, none but women are to be seen; and their little shops are portable. The several classes of mechanics work, in the same manner, in particular quarters in the open street. Writers go about with their desks, and make out briefs, copybooks, and instruct scholars in the art of writing, all at the same time. There is one market where old clothes are taken in exchange for new.

Wood for the carpenter’s purpose is extremely dear through Yemen; and wood for the fire at Sana is no less so. All the hills near the city are bleak and bare, and wood is therefore to be brought hither from the distance of three days journey; and a camel’s burden commonly costs two crowns. This scarcity of wood is partly supplied by the use of a little pitch-coal. Peats are burnt here; but they are so bad, that straw must be intermingled to make them burn.

Fruits are, however, very plentiful at Sana. Here are more than 20 different species of grapes, which, as they do not all ripen at the same time, continue to afford a delicious refreshment for several months. The Arabs likewise prefer grapes, by hanging them up in their cellars, and eat them almost through the whole year. The Jews make a little wine, and might make more if the Arabs were not such enemies to strong liquors. A Jew convicted of conveying wine into an Arab’s house is severely punished; nay, the Jews might even use great caution in buying and selling it among themselves. Great quantities of grapes are dried here; and the transportation of raisins from Sana is considerable. One fourth of these grapes are without stones, and contains only a soft grain, the presence of which is not perceptible in eating the raisin.

In the castle, which stands on a hill, are two palaces. "I saw" (says Niebuhr) "six or seven ruins of old buildings, but, notwithstanding the antiquity of the place, no remarkable inscriptions. There is the mint, and a range of prisons for persons of different ranks. The reign of Imam Metwokel resides in the city; but several princes of the blood-royal lie in the castle. The battery is the most elevated place about these buildings; and there I met with what I had no expectation of, a German mortar, with this inscription, Jorg Selau Gom- mick, 1513. I saw also upon the same battery seven iron cannons, partly buried in the sand, and partly set upon broken carriages. These seven small cannons, with six others near the gates, which are fired to announce the return of the different festivals, are all the artillery of the capital of Yemen."

SANADON (Noel Etienne), a Jesuit, was born at Rouen in 1676, and was a distinguished professor of humanity at Caen. He there became acquainted with Huet bishop of Avranche, whose taste for literature and poetry was similar to his own. Sanadon afterwards taught rhetoric at the university of Paris, and was entrusted with the education of the prince of Conti, after the death of Du Morceau. In 1728 he was made librarian to Louis XIV, an office which he retained to his death. He died on the 21st September 1733, in the 58th year of his age.

His works are: 1. Latin Poems, in 12mo, 1715, and reprinted by Barbou, in 8vo, 1754. His style poises the graces of the Augustan age. His language is pure and nervous; his verbes are harmonious, and his thoughts are delicate and well chosen; but sometimes his imagination flags. His Latin poems confit of Iodes, Eleges, Epigrams, and others, on various subjects. 2. A translation of Horace, with Remarks, in 2 vols 4to, printed at Paris in 1727; but the best edition of this work was printed at Amsterdam in 1735, in 8 vols 12mo, in which are also inserted the versets

SAN,
We must be careful to distinguish him from another Sancho

Sanchez, called in Latin Sanclattho, a Phenician philosopher and historian, who is said to have flourished before the Trojan war about the time of Semiramis. Of this most ancient writer, the only remains extant are sundry fragments of cosmogony, and of the history of the gods and first mortals, preserved by Eubeius and Theodore; both of whom speak of Sanchoniatho as an accurate and faithful historian; and the former adds, that his work, which was translated by Philo-Biblius from the Phenician into the Greek language, contains many things relating to the history of the Jews which deserve great credit, both because they agree with the Jewish writers, and because the author received these particulars from the annals of Hieromulus, a priest of the god Jao.

Several modern writers, however, of great learning, have called in question the very existence of Sanchoniatho, and have contended with much plausibility, that the fragments which Eubeius adopted as genuine upon the authority of Porphyry, were forged by that author, or the pretended translator Philo, from eminence to the Christians, and that the Pagans might have something to show of equal antiquity with the books of Moses. These opposite opinions have produced a controversy that has filled volumes, and of which our limits would hardly admit of an abstract. We shall therefore in few words state what to us appears to be the truth, and refer to the historians for a full account.

The controversy respecting Sanchoniatho resolves itself into two questions: 1. Was there in reality such a writer? 2. Was he of the very remote antiquity which his translator claims for him?

That there was really such a writer, and that the fragments preferred by Eubeius are indeed parts of his history interpolated perhaps by the translator (b), we are compelled to believe by the following reasons. Eubeius, who admitted them into his work as authentic, was one of the most learned men of his age, and a diligent searcher into antiquity. His conduct at the Nicene council shows, that on every subject he thought for himself, neither baffled by authority to the one side, nor carried over by the rage of innovation to the other. He had better means than any modern writer can, of satisfying himself with regard to the authenticity of a very extraordinary work, which had then but lately been translated into Latin, as the Fables of Ovid, the Metamorphoses of Apuleius, and the works of the Later Platonists, which he had read and understood before this work passed into general use.

(A) Bochart, Scaliger, Volius, Cumberland, Dodwell, Stillingfleet, M. Shein's Cudworth, and Warburton.

(b) Of this there are indeed several proofs. Philo makes Sanchoniatho speak of Byblus as the most ancient city of Phoenicia, which, in all probability, it was not. We read in the book of Judges of Bethel or Byrillus, the city where Sanchoniatho himself lived; but not of Byblus, which was the native city of Philo, and to which he is therefore partial. He makes him likewise talk of the Greeks at a period long before any of the Grecian states were known or probablypeople.
been translated into the Greek language, and made generally known; and there is nothing in the work itself, or at least in those parts of it which he has preferred, that could induce a wife and good man to obliterate it upon the public as genuine, had he himself suspected it to be spurious. Too many of the Christian fathers were indeed very credulous, and ready to admit the authenticity of writings without duly weighing the merits of their claim; but then such writings were always believed to be favourable to the Christian cause, and inimical to the cause of Paganism. That no man of common sense could suppose the cosmogony of Sanchoniatho favourable to the cause of revealed religion, a farther proof cannot be requisite than what is furnished by the following extract.

"He supposeth, or affirms, that the principles of the universe was a dark and windy air, or a wind made of dark air, and a turbulent evening chaos; and that these things were boundless, and for a long time had no bound or figure. But when this wind fell in love with its own principles, and a mixture was made, that mixture was called (πατέρας)."

"This mixture completed, was the beginning of the (σώματος) making of all things. But that wind did not know its own production; and of this, with that wind, was begotten (Mort, which some call (Mort, others the purification of a watery mixture. And of this came all the seed of this building, and the generation of the universe."

"But there were certain animals, which had no sense, out of which were begotten intelligent animals, and were called (Zophelenin, that is, the spies or overseers of Heaven; and were formed alike in the shape of an egg. Thus shone out (Mort, the sun and the moon, the lefts and the greater fars."

"And the air shining thoroughly with light, by its fiery influence on the sea and earth, winds were begotten, and clouds and great defluxions of the heavenly waters. And when all these things first were parted, and were separated from their proper place by the heat of the sun, and then all met again in the air, and dashed against one another, and were so broken to pieces; whence thunders and lightnings were made: and at the stroke of these thunders the above mentioned intelligent animals were awakened, and frightened with the found; and male and female flirred in the earth and in the sea: This is their generation of animals."

"After these things our author (Sanchoniatho) goes on laying: Those things are written in the Cosmogony of Theogony, and in his memoirs; and out of the conjectures, and furer natural signs which his mind saw, and found out, and wherewith he hath enlightened us."

"Afterwards declaring the names of the winds, north and south and the rest, he makes this epilogue. ' But these first men confecrated the plants floating out of the earth, and judged them gods, and worshipped them; upon whom they themselves lived, and all their posterity and all before them: to thefe they made their meat and drink offerings.' Then he concludes: ' These were the devices of worship agreeing with the weakness and want of boldness in their minds.'"

Let us suppose Eusebius to have been as weak and credulous as the darkest monk in the darkest age of Europe, a supposition which no man will make who knows any thing of the writings of that eminent hist-
Oursan had much ifus, wherefore Ge being grieved at it and jealous, reproached Oursan, so as they parted from each other. But Oursan, though he parted from her, yet by force invading her, and lying with her when he lifted, went away again; and he also attempted to kill the children he had by her. Ge also often defended or avenged herself, gathering auxiliary powers unto her. But when Cronus came to man's age, using Hermes Trimegistas as his counsellor and aitiffant (for he was his secretary), he opposed his father Oursan, and reigned by himself. But Cronus had children, Persephone and Athena, the former being a virgin, but the latter married to a man, and Cronus made of iron a scymetar and a spear. Then Hermes, speaking to the aitiffants of Cronus with enchanting words, wrought in them a keen desire to fight against Oursan in the behalf of Ge; and thus Cronus warring against Oursan, drove him out of his kingdom, and succeeded in the imperial power or office. In the fight was taken a well-beloved concubine of Oursan big with child. Cronus gave her in marriage to Dagon, and the brought forth at his house what he had in her womb by Oursan, and called him Demaros. After these things Cronus builds a wall round about his house, and founds Byblus the first city in Phenicia. Afterwards Cronus, suspiciong his own brother Atlas, with the advice of Hermes, threw him into a deep hole of the earth, buried him there, and having a son called Sadis, he dispatched him with his own sword, having a suspicion of him, and depriving his own son of life with his own hand. He also cut off the head of his own daughter, so that all the gods were amazed at the mind of Cronus. But in process of time, Oursan being in flight, or banishment, sends his daughter Artar, with two other daughters Rhea and Dione, to cut off Cronus by deceit, whom Cronus taking, made wives of these daughters. Oursan, understanding this, sent Eiramene and Hore, Fate and Beauty, with other auxiliaries, to war against him: but Cronus, having gained the aitiffions of these also, kept them with himself. Moreover, the god Oursan devised Batulla, confirving stones that moved as having life. But Cronus begat on Artar seven daughters called Titanides or Artemides; and he begat on Rhea seven sons, the youngest of whom, as soon as he was born, was confecrated a god. Also by Dione he had daughters, and by Atlas moreover two sons, Phobos and Eros, i. e. Cupid and Love. But Dagon, after he had found out bread, corn, and the plough, was called Zeus Aratrius. To Sylit, or the jufet, one of the Titanides bare Aeolemus. Cronus had also in Perse three sons, 1. Geus his father's namesake.

Is it conceivable, that a writer so acute as Porphyry, or indeed that any man of common sense, either in his age or in that of Philo, would forge a book filled with such stories as these, in order to remove the Christian objections to the immortal characters of the Pagan deities? The very supposition is impossible to be made. Nor let any one imagine that Sanchoniatho is here writing allegorically, and by his tales of Oursan, and Ge, and Cronus, is only perverting the heaven, the earth, and time. On the contrary, he affures us, that Oursan, or Euphras, or Autokton (for he gives him all these names), was the son of one Eluan or Hippsios, who dwelt about Byblus, and that from him the element which is over us was called heaven, on account of its excellent beauty, as the earth was named Ge after his father and wife. And his translator is very angry with the Neotolic Greeks, as he calls them, because that, „by a great deal of force and strainings, they laboured to turn all the stories of the gods into allegories and physical discourses.” This proves unanswerably, that the author of this book, whoever he was, did not mean to veil the great truths of religion under the cloak of mythologic allegories; and therefore, if it was forged by Porphyry in order to Paphnitis, the former so far mistaken the state of the question between him and his adversaries, that he contrived a book, which, if admitted to be ancient, totally overthrew his own cause.

The next thing to be enquired into with respect to Sanchoniatho is his antiquity. Did he really live and write at so early a period as Porphyry and Philo pretend? We think we did not; and what contributes not a little to confirm us in our opinion, is that mark of national vanity and partiality, common to after-times, in making the sacred mysteries of his own country original, and conveyed from Phenicia into Egypt. This, however, furnishes an additional proof of the roman, was not the forger of the work; for he well knew that the mysteries had their origin in Egypt (see Mysteries), and would not have fallen into such a blunder. He is guilty, indeed, of a very great anachronism, when he makes Sanchoniatho contemporary with Semiramis, and yet pretends that what he writes of the Jews is compiled from the records of Hierombalus the priest of the god Jao; for he has made it appear in the highest degree probable, that Hierombalus or Jerubbaal is the Jerub-baal or Gideon of scripture.

Between the reign of Semiramis and the Trojan war, a period elapsed of near 800 years, whereas Gideon flourished not above seventy years before the destruction of Troy. But supposing Sanchoniatho to have really consulted the records of Gideon, it by no means follows that he flourished at the fame period with that judge of Israel. He speaks of the building of Tyre as an ancient thing, while our best chronologers place it in the time of Gideon. Indeed, were we certain that any writings had been left by that holy man, we should be obliged to conclude, that a large tract of time had intervened between the death of their author and their falling into the hands of Sanchoniatho; for, surely, they could not, in a short period, have been so completely corrupted as to give any countenance to his impious absurdities. His atheistic cohnmony he does not intend to have got from the annals of the priest Jao, but from records which were deposited in his own town of Berytus by Thoth a Phenician philosopher, who was afterwards made king of Egypt. But surely the annals of Gideon, if written by himself, and preferred pure to the days of Sanchoniatho, must have contained so many truths of the Mosaic religion, as must have prevented any man of sense from adopting so impossible a theory as Thoth’s, though fashioned by the greatest name of profane antiquity. Stillingfleet indeed thinks it most probable that Sanchoniatho became acquainted with the most remarkable passages of the life of Jerub-baal from annals written by a Phenician pen. He observes, that immediately after the death of Gideon, the Israelites with their usual pronouns to idolatry, worshipped Baal berith, or the idol of Berytus,
He published a volume in 1720, intitled Modern Sandification, taken from Machiavel, Borgia, and other choice authors; Familiar Letters to Mr North, an 8vo pamphlet; and three of his sermons were printed together after his death.

SANCTIFICATION, the act of sanctifying, or rendering a thing holy. The reformed divines define sanctification to be an act of God's grace, by which a person's desires and affections are alienated from the world; and by which he is made to die to sin, and to live to righteousness; or, in other words, to feel an adherence of all vice, and a love of religion and virtue.

SANCTION, the authority given to a judicial act, by which it becomes legal and authentic.

SANCTORIUS, a most ingenious and learned physician, was a professor in the university of Padua, in the beginning of the 17th century. He contrived a kind of vacuum flask, by means of which, after eliminating the animals received, and theensible discharges, he was enabled to determine with great exactness the quantity of insensible perpiration, as well as what kind of vituals and drink increased or diminished it.

These experiments he erected a curious system, which he published under the title of De medicina flatica; of which we have an English translation by Dr Quincy. Sandtorius published several other treatises, which shewed great abilities and learning.

SANCTUARY, among the Jews, also called Sanctum sanctorum, or Holy of holies, was the holiest and most retired part of the temple of Jerusalem, in which the ark of the covenant was preferred, and into which none but the high-priest was allowed to enter, and that only once a-year, to intercede for the people.

Some distinguished the sanctuary from the fanctum sanctorum, and maintain that the whole temple was called the sanctuary.

To try and examine any thing by the weight of the sanctum, is to examine it by a just and equal scale; because, among the Jews, it was the custom of the priests to keep four weights, to serve as standards for regulating all weights by, though these were not at all different from the royal or profane weights.

SANCTUARY, in the Romish church, is also used for that part of the church in which the altar is placed, encompassed with a rail or balustrade.

SANCTUARY, in ancient customs, the same with asylum.

SAND, in natural history, a genus of fossils, the characters of which are, that they are found in minute concretions; forming together a kind of powder, the genuine particles of which are all of a tendency to one determinate shape, and appear regular though more or less complete concretions; not to be dissolved or disintegrated by water, or formed into a coherent mass by means of it, but retaining their figure in it; transparent, vitrifiable by extreme heat, and not disintensible in nor effervescing with acid. Sands are subject to be variously blended, both with homogene and heterogeneous substances, as that of talks, &c. and hence, as well as from their various colours, are subdivided into, 1. White sands, whether pure or mixed with other arenaceous or heterogeneous particles; of all which there are several species, differing no less in the fineness of their particles than in the different degrees of colour, from a bright and shining white,
the is of great use in the glass-manufacture; a white kind of sand being employed for making of the white glasses, and a coarse greenish-looking sand for the green glasses.

In agriculture, it seems to be the office of sand to make unwholesome earths fertile, and fit to support vegetables, &c. For earth alone, we find, is liable to coalesce, and gather into a hard coherent mass, as appears in clay; and being thus embodied, and as it were glued together, is no way disposed to nourish vegetables. But if stich earth be mixed with sand, its pores are thereby kept open, and the earth itself loose, so as thus to give room for the juices to ascend, and for plants to be nourished thereby. A vegetable planted only in sand, or in a fat glebe, or in earth, receives little growth or increase; but a mixture of both renders the mass fertile. In effect, earth is in some measure made organic by means of sand; pores and spaces, something analogous to vessels, being thereby maintained, by which the juices may be conveyed, prepared, digested, circulated, and at length discharged. Common sand is, therefore, a very good addition, by way of manure, to all sorts of claylands; it warms them, and makes them more open and loose.

Sand-Bags, in the art of war. See Sacks of Earth. Sand-Ed, in ichthyology. See Ammodites. Sand-Floods, a name given to the flowing of sand so common in the deserts of Arabia. Mr Bruce gives the following accurate description of some that he saw in travelling through that long and dreary desert. "At one o'clock (says he) we alighted among some acacia-trees at Waadi el Halboub, having gone twenty-one miles. We were here at once surprised and terrified by a whole of putting a sand-bag on the earth of a large cannon shot. About noon they began to advance with considerable swiftness upon us, the wind being very strong at north. Eleven of them ranged along side of us about the distance of three miles. The greatest diameter of the largest appeared to me at that distance as if it would measure ten feet. They retired from us with a wind at south-east, leaving an impression upon my mind to which I can give no name, though surely one ingredient in it was fear, with a considerable deal of wonder and astonishment. It was in vain to think of flying, the swiftest horse or swiftest falling ship could be of no use to carry us out of this danger; and the full persuasion of this rivetted me as if to the spot where I stood, and let the camels gain on me so much in my state of lameness, that it was with some difficulty I could overtake them.

"The same appearance of moving pillars of sand presented themselves to us this day in form and disposition like those we had seen at Waadi Halboub, only they seemed to be more in number and less in size. They came several times in a direction close upon us, that is, I believe, within less than two miles. They began immediately after sun-rise, like a thick wood, and almost darkened the fun: his rays shining through them for near an hour, gave them an appearance of pillars of fire. Our people now became desperate: the Greeks shrieked out, and said it was the day of judgment. "The state of Furvie, in the county of Forres, is another melancholy instance. This tract was once worth L. 500 a-year lot to the Errol family, as appears by the oath of the factor in 1600, made before the court of seftion to ascertain the minister's salary. Not a vestige is to be seen of any buildings, unless a fragment of the church.

"The state of Cousin, near Forres, is another melancholy instance. This tract was once worth L. 500 a-year, at this time overwhelmed with sand. This strange inundation was still in motion in 1769, chiefly when a strong wind prevailed. Its motion is so rapid, that I have been assured, that an apple tree has been covered with it in one fseason, that only the very summits appeared. This disaster was brought on about ninety years ago, and was occasioned by the cutting down some trees, and pulling up the bent or litar which grew on the sand-hills; which at last gave rise to the act of 15 George II. c. 33, to prohibit the destruction of this useful plant.

"I beg leave to suggest to the public a possible means of putting a stop to these destructive ravages, Providence hath kindly formed this plant to grow only in pure sand. Mankind was left to make, in after-times, an application of it suitable to their wants. The sand-hills, on a portion of the Flintshire shores, in the parish of Llanasa, are covered with it naturally, and kept firm in their place. The Dutch perhaps owe the existence of part at least of their country to the flowing of it on the mobile solum, their sand-banks.

"My humane and amiable friend, the late Benjamin Stillingfleet.
SANDARACH, as quoted, recommended the fowing of this plant on the sandy wilds of Norfolk, that its matted roots might prevent the deluges of fand which that country experiences. It has been already remarked, that wherever this plant grows the fallutary effects are often observed to follow. A single plant will fix the fand, and gather it into a hillock; these hillocks, by the increafe of vegetation, are formed into larger, till by degrees a barrier is made often against the encroachments of the sea; and might as often prove preventative of the calamity in question. I cannot, therefore, but recommend the trial to the inhabitants of many parts of North Britain. The plant grows in moit places near the fea, and is known to the Highlanders by preserving themfelves from a consumption which might as often prove preventa- tive. Riff five or six inches long, not unlike rye; the feeds are orange, but having the particles too fine to be visible. The SANDARACH, in natural history, is a very beautiful native fofil, though too often confounded with the common factitious red arfenic, and with the red matter formed by melting the common yellow orpiment.

It is a pure fubstance, of a very even and regular structure, is throughout of that colour which dyers term an orange fcarlet, and is confiderably transparent even in the thickest pieces. But though, with repect to colour, it has the advantage of cinnabar while in the mass, it is vally inferior to it when both are reduced to powder. It is moderately hard, and remarkably heavy; and, when exposed to a moderate heat, melts and flows like oil: if fit on fire, it burns very briskly.

It is found in Saxony and Bohemia, in the copper and filver mines; and is fold to the painters, who find it a very fine and valuable red; but its virtues or qualities in medicine are no more conferted at this time than thofe of the yellow orpiment.

SANDARACH, is a dry and hard refin, ufually met with in loose granules, of the bignefs of a pea, a horfe-bean, or larger; of a pale whitish yellow colour, transparent, and of a reifinous fmal, brittle, very inflammable, of an acrid and aromatic taffe, and diffufing a very pleafant fmal when burning. It is produced from a fpecies;
SANDEMANIANS, in ecclesiastical history, a modern sect that originated in Scotland about the year 1728; where it is at this time distinguished by the name of Glafites, after its founder Mr John Glaf, who was a minister of the established church in that kingdom; but being charged with a design of subverting the national covenant, and fapping the foundation of all national establishments by the kirk judicatory, was expelled by the synod from the church of Scotland. His sentiments are fully explained in a tract published at that time, intituled, "The Testimony of the King of Martyrs," and prefixed in the first volume of his works. The sequence of Mr Glaf's expulsion, his adherents formed themselves into churches, conformable in their institution and discipline to what they apprehended to be the plan of the first churches recorded in the New Testament. Soon after the year 1755, Mr Robert Sandeman, an elder in one of these churches in Scotland, published a series of letters addressed to Mr Hervey, occasioned by his Theron and Apfafi; in which he endeavours to show, that his notion of faith is contradictory to the scripture account of it, and could only ferve to lead men, professedly holding the doctrines commonly called Calvinistic, to establish their own rightoufness upon their frames, inward feelings, and various acts of faith. In these letters Mr Sandeman attempts to prove, that faith is neither more nor lefs than a simple affent to the divine testimony concerning Jesus Christ, recorded in the New Testament; and he maintains, that the word faith, or belief, is constantly used by the apostles to signify what is denoted by it in common discourse, viz. the verification of the truth of any proposition, and that there is no difference between believing any common testimony, and believing the apostolic testimony, except that which results from the nature of the testimony itself. This led the way to a controversy, among those who were called Calvinistic, concerning the nature of justifying faith; and those who adopted Mr Sandeman's notion of it, and who took the denomination of Sandemanian, formed themselves into church order, in strict fellowship with the churches in Scotland, but holding no kind of communion with other churches. The chief opinions and practices in which this sect differs from other Christians, are, their weekly administration of the Lord's Supper, their love-feasts, of which every member is not only allowed but required to partake, and which consist of their dinner together at each other's houses in the interval between the morning and afternoon service; their kiss of charity used on this occasion, at the admission of a new member, and at other times when they deem it to be necessary or proper; their weekly collection before the Lord's Supper, for the support of the poor, and defraying other expenses; mutual exhortation; abstinence from blood and things trianglel; washing each other's feet, the precept concerning which, as well as other precepts, they understand literally; community of goods, so far as that every one is to consider all that he has in his possession and power as liable to the calls of the poor and church; and the unlawfulness of laying up treasures on earth, by setting them apart for any distant, future, and uncertain use. They allow of public and private divisions, so far as they are not connected with circumstances really sinful; but apprehending a lot to be facred, disapprove of playing at cards, dice, &c. They maintain a plurality of elders, pastors, or bishops, in each church; and the necessity of the presence of two elders in every act of discipline, and at the administration of the Lord's Supper. In the choice of these elders, want of learning, and engagements in trade, &c. are no sufficient objection; but second marriages disqualify for the office; and they are ordained by prayer and fasting, imposition of hands, and giving the right hand of fellowship. In their discipline they are strict and severe; and think themselves obliged to separate from the communion and worship of all such religious bodies as appear to them not to profess the simple truth for their only ground of hope, and who do not walk in obedience to it. We shall only add, that in every church transunion, they esteem unanimity to be absolutely necessary. From this abstract of the account which they have published of their tenets and practices, it does not seem to be probable that their number should be very considerable.

SANDERS. See SAUNDERS.

SANDIVER, a whitish salt, continually cast up from the metal, as it is called, whereof glafs is made; and swimming on its surface, is skimmed off.

Sandiver is also plentifully thrown out in the eruptions of volcanoes; some is of a fine white, and others tinged bluish or yellowish.

Sandiver is said to be detergent, and good for freyellow of the skin. It is also used by guilders of iron.

SANDIX, a kind of mineral, or red-lead, made of ceruse, but much inferior to the true mineral.

SANDOMIR, a city, the capital of a palatinate of the same name, in Little Poland, on the Vistula. The Swedes blew up the castle in 1656, and here in 1659, was a dreadful battle between the Tartars and Russians. It is 84 miles south-east of Cracow. Lat. 49. 26. Long. 20. 10.

SANDORICUM, in botany: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 23d order, Tribullata. The calyx is quinquedentate; the petals five, and linear-shaped; the nectarium has ten dents, on which the antherae grow; the fruit is a drupa, and five in number, each of which has one seed. There is only one species, viz. the indicum, a native of Africa and the East Indies.

SANDPU, or SANGE, the vulgar name of one of the most mighty rivers in the world. The name it generally goes by, and by which it is best known, is that of Zorropiper. Of this most majestic body of waters we have the following very animated account in Moretus Indian Antiquities. "An object equally novel and grand now claims our attention; so novel, as not to have been known to Europeans in the real extent of its magnificence before the year 1765, and so admirably grand, that the accomplished geographer, thinking the language of prose inadequate to convey his conception, has
has had recourse to the more expressive and energetic
language of poetry: but

Dares stretch her wing o'er this enormous mass
Of rushing waters; to whose dread expanse,
Continuous depth, and wondrous length of course,
Our floods are rills.

"This stupendous object is the Burampooter, a
word which in Shanfsrit signifies the son of Brahma;
for no meane origin could be assigned to so wonderful
a progeny. This supreme monarch of Indian rivers
derives its source from the opposite side of the
mountain from which the Ganges springs, and taking a
bold sweep towards the east, in a line directly opposite
to the course of that river, washes the vait country of
Tibet, where, by way of diversion, it is denominated
Sanpoor, or the river. Winding with a rapid current
through Tibet, and, for many a league, amidst dreary
deserts and regions remote from the habitations of men,
it waters the borders of the territory of Lafa, the re-
idence of the grand Lama; and then, by a circuitous
route, glides majestically through Tibet, and, for many a
league, around the accumulation of two such
bodies of water, that the mighty wanderer approaches
within two hundred miles of the western frontiers of the
enormous empire of China. From
this point its more direct path to the ocean lay through
the gulph of Siam; but with a defultory course peculiar
to itself, it suddenly turns to the west through
Afar, and enters Bengal on the north-east quarter.
Circling round the western point of the Garrow
moun-
tains, the Burampooter now takes a southerly direction;
and for 60 miles before it meets the Ganges, its
wetness, in point of origin, but not its vital point in
magni
tude, glides majestically along in a stream which is
regularly from four to five miles wide, and but for its
freshet, Mr Rennel says, might pass for an arm of the
sea. About 40 miles from the ocean these mighty rivers
unite their streams, but that gentleman is of opinion
that their junction was formerly higher up, and that
the accumulation of two such vast bodies of water,
swept out the amazing bed of the Megna lake. Their
present conflux is below Luckncpore; and by that conflu-
ence a body of fresh running water is produced, hardly
equalled, and not exceeded, either in the old or the new
hemisphere. So stupendous is that body of water, that
it has formed a gulph of such extent as to contain islands
that rival the Isle of Wight in size and fertility; and with
such reftlesse violence does it rush into the ocean, that
in the rainy season the sea itself, or at least its surface,
is perfectly fresh for many leagues out."

SANDBICH, a town of Kent, one of the five
ports, and which has the title of an earldom. It con-
sists of about 1500 houses, most of them old, and built
with wood, though there are a few new ones built with
brick and flints. It has three long narrow streets,
paved, and thirty cross-streets or alleys, with about
6000 inhabitants, but no particular manufactories. The
town is walled round, and also fortified with ditches
and ramparts; but the walls are much decayed, on ac-
count of the harbour being so choked up with sand that
a ship of 100 tons burthen cannot get in. E. Long.
1. 30. N. Lat. 51. 25.

SANDBICH, a group of islands in the South
Sea, lying near New Ireland, were among the last dis-
covers of captain Cook, who so named them in ho-
nour of the Earl of Sandwich, under whose administra-
tion these discoveries were made. They consist of
eleven islands, extending in latitude from 18. 54. to 22.
15. N. and in longitude from 150. 54. to 160. 24. W.
They are called by the natives, Owhyeek, Moweek,
Rana, Morote, Tahobrowa, Woahoo, Atotk, Nee-
beekoua, Oreahoua, Moratimna, and Tahoora, all in-
hbited except the two last. An account of the most
remarkable of which will be found in their alphabetical
order, in their proper places in this work. The climate
of these islands differs very little from that of the West
Indies in the same latitude, though perhaps more tem-
perate; and there are no traces of those violent winds
and hurricanes, which render the horrid months in the
West Indies so dreadful. There is also more rain at
the Sandwich Isles, where the mountainous parts being
generally enveloped in a cloud, successive showers fall
in the inland parts, with fine weather and a clear sky, on
the sea shore. Hence it is, that few of those incon-
veniences, to which many tropical countries are subjected,
whether from heat or moisture, are experienced here.
There is rarely, in the winter months, a wind from
east-south-east to north-east. The vegetable productions
are nearly the same as those of the other islands in this
ocean, but the taro root is here of a superior quality.
The bread-fruit trees thrive not in such abundance as in
the rich plains of Otaheite, but produce double the
quantity of fruit. The sugar-canes are of a very unusual size,
some of them measuring eleven inches and a quarter in
circumference, and having fourteen feet eatable. There
is also a root of a brown colour, shaped like a yam,
and from this to ten pounds in weight, the juice of which
is very sweet, of a pleasant taste, and is an excellent
substitute for sugar. The quadrupeds are confined to
the three usual farts, hogs, dogs, and rats. The fowels
are also of the common fart; and the birds are beauti-
ful and numerous, though not various. Goats, pigs,
and European fuids, were left by captain Cook; but
the possession of the goats soon gave rise to a content
between two districts, in which the breed was entirely
destroyed. The inhabitants are undoubtedly of the
caste that possesses the islands fourth of the equa-
tor; and in their persons, language, customs, and man-
ers, approach nearer to the New Zealanders than to
their left distant neighbours, either of the Society or
Friendly Islands. They are in general about the mid-
dle size, and well made; they walk very gracefully,
rue nimbly, and are capable of bearing very great fa-
tigue. Many of both sexes have fine open countenances,
and the women in particular have good eyes and teeth,
with a sweetness and sensibility of look, that render
them very engaging. There is one peculiarity, char-
acteristic of every part of these islands, that even in
the handsomest faces there is a fulness of the nofe, withou-
without any flatness or spreading of the nofe. They
fufler their beards to grow, and wear their hair after
various fashions. The drefs of both men and women
nearly resemb! the ftole of New Zealand, and both fexes
wear necklaces of small variegated shells. Tattooing
the body is practiced by every colony of this nation.
The hands and arms of the women are also very neatly
marked, and they have the singular custom of tattooing
the tip of the tongue. Like the New Zealanders,
they have adopted the method of living together in vil-
lages, containing from an hundred to two hundred
house...
Sandwich. Houses, built pretty closely together, without any order, and having a winding path between them. They are generally flanked, towards the sea, with detached walls, which are meant both for shelter and defence. These walls consist of loose stones, and the inhabitants are very dexterous in shifting them suddenly to such places as the direction of the attack may require. In the sides of the hills, or surrounding eminences, they have also little holes, or caves, the entrance to which is also secured by a fence of the same kind. They serve for places of retreat in cases of extremity, and may be defended by a single person against several assailants. Their houses are of different sizes, some of them being large and commodious, from forty to fifty feet long, and from twenty to thirty broad; while others are mere hovels. The food of the lower class consists principally of fish and vegetables, to which the people of higher rank add the flesh of dogs and hogs. The manner of spending their time admits of little variety. They rise with the sun, and, after enjoying the cool of the evening, retire to rest, a few hours after sun-set. The making of canoes, mats, &c. forms the occupations of the men; the women are employed in manufacturing cloth, and the servants principally engaged in the plantations and fishing. Their idle hours are filled up with various amusements, such as dancing, boxing, wrestling, &c. Their agriculture and navigation bear a great resemblance to those of the South-sea islands. Their plantations, which are spread over the whole sea-coast, consist of the taro, or eddy-root, and sweet potatoes, with plants of the cloth-trees set in rows. The bottoms of their canoes are a single piece of wood, hollowed out to the thickness of an inch, and brought to a point at each end. The sides consist of three boards, each about an inch thick, neatly fitted and lashed to the bottom part. Some of their double canoes measure 70 feet in length, three and a half in depth, and twelve in breadth. Their cordage, fish-hooks, and fishing tackle, differ but little from those of the other islands. Among their arts must not be forgotten that of making felts, which they have in great abundance, and of a good quality. Their instruments of war are spears, daggers, clubs, and flings; and for defensive armour they wear strong mats, which are not easily penetrated by such weapons as theirs. As the islands are not united under one sovereign, wars are frequent among them, which no doubt, contribute greatly to reduce the number of inhabitants, which, according to the proportion assigned to each island, does not exceed 400,000. The fame system of subordination prevails here as at the other islands, the same absolute authority on the part of the chiefs, and the same methods of punishment on the part of the people. The government is likewise monarchical and hereditary. At Owhyhee there is a regular society of priests living by themselves, and distinct in all respects from the rest of the people. Human sacrifices are here frequent; not only at the commencement of a war, or any signal enterprise, but the death of every considerable chief calls for a repetition of these horrid rites. Notwithstanding the irreparable loss in the death of Captain Cook, who was here murdered through sudden resentment and violence, they are acknowledged to be of the most mild and affectionate disposition. They live in the utmost harmony and friendship with each other; and in hospitality to strangers they are not exceeded even by the inhabitants of the Friendly Islands. Their natural capacity seems, in no respect, below the common standard of mankind; and their improvements in agriculture, and the perfection of their manufactures, are certainly adequate to the circumstances of their situation, and the natural advantages which they enjoy.

SANDYS (Sir Edwin), second son of Dr Edwin Sands, archbishop of York, was born about 1568, and educated at Oxford under Mr Richard Hooker, author of the Ecclesiastical Polity. In 1581 he was collated to a prebend in the cathedral of York. He travelled into foreign countries; and, upon his return, grew famous for learning, prudence, and virtue. While he was at Paris, he drew up a tract, published under the title of Europe Speculum. In 1602, he resigned his prebend; and, the year following, was knighted by king James I, who employed him in several important affairs. He was dexterous in any great employment, and a good patriot. However, opposing the court with vigour in the parliament held in 1621, he, with Mr Seldon, was committed to custody for a month. He died in 1629, having bequeathed 1500 l. to the university of Oxford, for the endowment of a metaphysical lecture.

SANDS (George), brother of the foregoing Sir Edwin, and youngest son of archbishop Sands, was born in 1577. He was a most accomplished gentleman; travelled over several parts of Europe and the East; and published a relation of his journey in folio, in 1615. He made an elegant translation of Ovid's Metamorphoses; and composed some poetical pieces of his own, that were greatly admired in the times of their being written. He also paraphrased the Psalms; and has left behind him a Translation, with Notes, of one Sacred Drama written originally by Grotius, under the title of Chryslus Patiens; on which, and Adamus Exul, and Mofenius, is founded Lauder's impudent charge of plagiarism against the immortal Milton. Our author became one of the privy chamber to Charles I. and died in 1643.

SAN FERNANDO, near the entrance of the Golfo Dolce, in 15 degrees 18 minutes north latitude, has lately been fortified by the Spaniards, with an intent to curb the Mufquito-men, logwood-cutters, and bay-men. It is a very good harbour, with safe anchorage from the north and east winds, in eight fathoms water.

SANGUIFICATION, in the animal economy, the conversion of the chyle into true blood. See Blood.

SANGUINARIA, blood-wort, in botany: A genus of the monogynia order, belonging to the polyantris class of plants; and in the natural method ranking under the 27th order, Rosae. The corolla is obovate, the calyx diphylous; the filica ovate and unilocular. There is only one species, viz. the camadenfis, a native of the northern parts of America, where it grows plentifully in the woods; and in the spring, before the leaves of the trees come out, the surface of the ground is in many places covered with the flowers, which have some resemblance to the wood anemone; but they have shorter naked pedicles, each supporting one flower at top. Some of these flowers will have 10 or 12 petals, so that they appear to have a double range of leaves, which has occasioned their being termed double flowers; but this is only accidental, the same root...
roots in different years producing different flowers.—The plant can bear the open air in this country, but should be placed in a loose soil and sheltered situation, not too much exposed to the sun. It is propagated by the roots; which may be taken up and parted, in September, every other year. The Indians paint themselves yellow with the juice of these plants.

SANGUISORBA, greater wild burnet, in botany: A genus of the monogynia order, belonging to the tetrameria class of plants; and in the natural method ranking under the 54th order Misellanæa. The calyx is diphylous; the germin situated between the calyx and corolla. The most remarkable species is the officinalis, with oval spikes. This grows naturally in moist meadows in many parts of Britain. The stalks rise from two to three feet high, branching towards the top; and are terminated by thick oval spikes of flowers of a greyish brown colour, which are divided into four segments almost to the bottom. These are succeeded by four oblong cornered seeds. The leaves of this fort are composed of five or six pair of lobes placed along a midrib, terminated by an odd one. These are heart-shaped, deeply fawed on their edges, and a little downy on their under sides. The cultivation of this plant has been greatly recommended as food to cattle. See Agriculture, n° 48, &c.

SANHEDRIM, or Sanhedrin, from the Greek word Σανεδρινον, which signifies a council or assembly of persons fitting together, was the name whereby the Jews called the great council of the nation, assembled in an apartment of the temple of Jerusalem to determine the most important affairs both of their church and state. This council consisted of seventy senators. The room they met in was a rotunda, half of which was built without the temple, and half within; that is, one semicircle was within the compas of the temple; the other semicircle, they tell us, was built without, for the senators to sit in; it being unlawful for any one to sit down in the temple. The Nasi, or prince of the sanhedrin, sat upon a throne at the end of the hall, having his deputy at his right hand, and his sub-deputy on his left. The other senators were ranged in order on each side.

The rabbits pretend, that the sanhedrin has always subsisted in their nation from the time of Moses down to the destruction of the temple by the Romans. They date the establishment of it from what happened in the wilderness; some time after the people departed from Sinai (Num. xi. 16.), in the year of the world 2514. Moses, being discouraged by the continual murmuring of the Israelites, addressed himself to God, and desired to be relieved, at least, from some part of the burden of the government. Then the Lord said to him, “Gather unto me 70 men of the elders of Israel, whom thou knowest to be the elders of the people, and officers over them; and bring them unto the tabernacle of the congregation, that they may stand there with thee: And I will come down and talk with thee there; and I will take of the spirit which is upon thee, and will put it upon them; and they shall bear the burden of the people with thee, that thou bear it not thyself alone.” The Lord, therefore, poured out his spirit upon these men, who began at that time to prophesy, and have not ceased from that time. The sanhedrin was composed of 70 counsellors, or rather 72, six out of each tribe; and Moses, as president, made up the sanhedrin, number 73. To prove the uninterrupted succession of the judges of the sanhedrin, there is nothing unattempted by the partisans of this opinion. They find a proof where others cannot so much as perceive any appearance or shadow of it. Groton may be consulted in many places of his Commentaries, and in his first book De jure belli & pacis, c. 3. art. 20. and Siden de Synodis veterum Hebræorum. Also, Calmet’s Diction concerning the polity of the ancient Hebrews, printed before his Comment upon the Book of Numbers.

As to the personal qualifications of the judges of this bench, their birth was to be untainted. They were often taken from the race of the priests or Levites, or out of the number of the inferior judges, or from the lesser sanhedrin, which consisted only of 23 judges.—They were to be skilful in the law, as well traditional as written. They were obliged to study magic, divination, fortune-telling, physic, astrology, arithmetic, and languages. The Jews say, they were to know to the number of 70 tongues; that is, they were to know all the tongues, for the Hebrews acknowledged but 70 in all, and perhaps this is too great a number. Eunuchs were excluded from the sanhedrin, because of their cruelty, usurers, decrepit persons, players at games of chance, such as had any bodily deformities, those that had brought up pigeons to decoy others to their pigeon-houses, and those that made a gain of their fruits in the sabbatical year. Some also exclude the high-priest and the king, because of their too great power; but others will have it, that the kings always presided in the sanhedrin, while there were any kings in Israel.

Lastly, it was required, that the members of the sanhedrin should be of a mature age, a handsome person, and of considerable fortune. We speak now according to the notions of the rabbins, without pretending to warrant their opinions.

The authority of the great sanhedrin was vastly extensive. This council decided such causes as were brought before it by way of appeal from the inferior courts. The king, the high-priest, the prophets, were under its jurisdiction. If the king offended against the law, for example, if he married above 18 wives, if he kept too many horses, if he hoarded up too much gold and silver, the sanhedrin had him stripped and whipped in their presence. But whipping, they say, among the Hebrews was not at all ignominious; and the king bore this correction by way of penance, and himself made choice of the perfon that was to exercise this discipline over him. Also, the general affairs of the nation were brought before the sanhedrin. The right of judging in capital cases belonged to this court, and this sentence could not be pronounced in any other place, but in the hall called Laïquat-baggesith, or the hall paved with stones, supported by four to be the Abbeypore, or pavement, mentioned in John xix. 13. From whence it came to pass, that the Jews were forced to quit this hall when the power of life and death was taken out of their hands, 40 years before the destruction of their temple, and three years before the death of Jesus Christ. In the time of Moses this council was held at the door of the tabernacle of the testimony. As soon as the people were in possession of the land of promise, the sanhedrin followed the tabernacle. It was kept successively
SAN

Sanhedrin. firely at Gilgal, at Shiloh, at Kiriath jearim, at Nob, at Gibeah in the house of Obed-edom; and lastly, it was settled at Jerusalem, till the Babylonish captivity. During the captivity it was kept up at Babylon. After the return from Babylon, it continued at Jerusalem to the time of the Sicarii, or Assassins. Then finding that these profligate wretches, whose number increased every day, sometimes escaped punishment by the favour of the president or judges, it was removed to Hanoth, which were certain abodes situated, as the rabbins tell us, upon the mountain of the temple. From thence they came down into the city of Jerusalem, withdrawing themselves by degrees from the temple. Afterwards they removed to Jamnia, thence to Jericho, to Uzzah, to Sephavaim, to Bethaniam, to Sephoris, half of all to Tiberias, where they continued to the time of their utter extinction. And this is the account the Jews themselves give us of the Sanhedrin.

But the learned do not agree with them in all this. Father Petæu fixes the beginning of the sanhedrin not till Gabinus was governor of Judea, who, according to Josephus, erected tribunals in the five principal cities of Judea; at Jerusalem, at Gadara, at Amathus, at Jericho, and at Sepphoris, a city of Galilee. Grotius places the origin of the sanhedrin under Moses, as the rabbins do; but he makes it determine at the beginning of Herod's reign. Mr Bainage at first thought that the sanhedrin began under Gabinus; but afterwards he places it under Judas Maccabæus, or under his brother Jonathan. We see indeed, under Josephus, a town called by its mercif-slave conquerors. Raynal says, that its whole inhabitants amount at present only to 1500 Spaniards, Melteses, and Mulattoes, and about 3000 negroes. Thus one of the finest islands in the West Indies has been depopulated by the cruelty, and left uncultivated by the indifference, of its poiffleurs. But it is the appointment of Providence, who seldom permits aggravat crimes to pass unpunished, that poverty and wretchedness should be uniform consequences of oppression.

SANJACKS, a people inhabiting the Carpathian, or Perisan mountains, subsisting chiefly by plunder, and the scanty pittance afforded by their own mountainous country. "They were much reduced (says Mr Ives) by the late baihaw Achmet of Begdat, who purified them in person to their suberranean retreats, and destroyed many by the sword, and carried off great numbers of prisoners, who were sold for slaves." Notwithstanding this check, in the year 1758, they were again become so daring that they would attack caravans of 700 men, and sometimes carry all off. They are said to be worshippers of the evil principle.

SAN JUAN DE PUERTO RICO, usually called Porto Rico, one of the West India islands belonging to Spain, is situated in about 18° N. Lat. and between 65° 36' and 69° 54' W. Long, and is about 40 leagues long and 20 broad. The island is beautifully diversified with woods, valleys, and plains, and is extremely fertile. It is well watered with springs and rivers, abounds with meadows, is divided by a ridge of mountains running from east to west, and has a harbour so spacious that the largest ships may lie in it with safety. Before the arrival of the Spaniards it was inhabited by 4 or 5000 people, who, in a few years, were exterminated by their merciless conquerors. Raynal says, that its whole inhabitants amount at present only to 1500 Spaniards, Meliteses, and Mulattoes, and about 3000 negroes. Thus one of the finest islands in the West Indies has been depopulated by the cruelty, and left uncultivated by the indifference, of its poiffleurs. But it is the appointment of Providence, who seldom permits aggravat crimes to pass unpunished, that poverty and wretchedness should be uniform consequences of oppression.

SANICULA, Sanicile, or Self-heal, in botany: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 45th order, Umbellate. The umbels are close together, almost in a round head; the fruit is scarious; the flowers of the disk abortive. There are three species, viz. the canadensis, marilandica, and europa, found in many parts both of Scotland and England. This plant was long celebrated for its healing virtues; but it is now totally disregarded.

SANIDIUM, in natural history, the name of a genus of fowils of the class of the Felinæa, but neither of the rhomboidal nor columnar kinds, nor any other way distinguishable by its external figure; being made up of several plain flat plates.

SANIES, in medicine, a ferox putrid matter, issuing from wounds. It differs from pus, which is thicker and whiter.

SANNAZARIUS (James), in Latin Aulus Cæcinius Sannazarius, a celebrated Latin and Italian poet, born at Naples in 1458. He by his wit ingratiated himself into the favour of king Frederic; and, when that prince was dethroned, attended him into France, where he died with him till his death, which happened in 1504. Sannazarius then returned into Italy, where he applied himself to polite literature, and particularly
to Latin and Italian poetry. His gay and facetious humour made him sought for by all companies; but he was so afflicted at the news that Phillibert prince of Orange, general of the emperor's army, had demolished his country-house, that it threw him into an illness, of which he died in 1530. It is said, that being informed a few days before his death, that the prince of Orange was killed in battle, he called out, "I shall die contented, since Mars has punished this barbarous enemy of the Muses." He wrote a great number of Italian and Latin poems: among those in Latin, his De Partu Virginis and Eclogues are chiefly esteemed; and the most celebrated of his Italian pieces is his Arcadia.

SANTA CRUZ, a large island in the South Sea, and one of the most considerable of those of Solomon, being about 250 miles in circumference. W. Long. 130° 0'. S. Lat. 16° 16'.

Santa Cruz, or St Croix, a small and unhealthy island, situated in about 64 degrees west longitude and 18 north latitude. It is about eighteen leagues in length, and from three to four in breadth. In 1643 it was inhabited by Dutch and English, who soon became enemies to each other; and in 1650 were both driven out by 1200 Spaniards, who arrived there in five ships. The triumph of these lasted but a few months. The remains of that numerous body, which were left for the defence of the island, surrendered without resistance to 160 French, who had embarked in 1651, from St Christophe's, to make themselves masters of the island.

These new inhabitants lost no time in making themselves acquainted with a country so much disputed. On a soil, in other respects excellent, they found only one river of a moderate size, which, gilding gently on a level with the sea through a flat country, furnished only a brackish water. There in two or three springs, which were found in the innermost part of the island, made but feeble amends for this defect. The wells were for the most part dry. The construction of reservoirs required time. Nor was the climate more inviting to the new inhabitants. The island being flat, and covered with old trees, scarce afforded an opportunity for the winds to carry off the poisonous vapours with which its morasses clogged the atmosphere. There was but one remedy for this inconvenience; which was to burn the woods. The French set fire to them without delay; and, getting on board their ships, became spectators from the sea, for several months, of the conflagration they had raised in the island. As soon as the flames were extinguished, they went on shore again.

They found the soil fertile beyond belief. Tobacco, cotton, arnatto, indigo, and sugar, flourished equally in it. So rapid was the progress of this colony, that in 11 years from its commencement there was upon it 422 white persons, with a proportionable number of slaves. It was rapidly advancing to prosperity, when such obstacles were thrown in the way of its activity as made it decline again. This decay was as sudden as its rise. In 1656 there were no more than 147 men, with their wives and children, and 623 blacks remaining; and these were transported to St Domingo.

Some obscure individuals, some writers unacquainted with the views of government, with their secret negotiations, with the character of their ministers, with the interests of the protectors and the protected, who flatter themselves that they can discern the reason of events amongst a multitude of important or frivolous causes, which may have equally occasioned them; who do not conceive, that among all these causes the most natural may possibly be the farthest from the truth; who after having read the news, or journal of the day, with profound attention, decide as peremptorily as if they had been placed all their lifetime at the helm of the state, and had afliated at the council of kings; who are never more deceived than in those circumstances in which they display some share of penetration; writers as absurd in the praiies as in the blame which they shall upon nations, in the favourable or unfavourable opinion they form of ministerial operations: these idle dreamers, in a word, who think they are perfons of importance, because their attention is always engaged on matters of consequence, being convinced that courts are always governed in their decisions by the most comprehensive views of profound policy, have supposed that the court of Verailles had neglected Santa Cruz, merely because they wished to abandon the small islands, in order to unite all their strength, industry, and population, in the large ones; but this is a mistaken notion. This determination arose from the farmers of the revenue, who found that the contraband trade of Santa Cruz with St Thomas was detrimental to their interests. The spirit of finance hath in all times been injurious to commerce; it hath destroyed the four from whence it sprung. Santa Cruz continued without inhabitants, and without cultivation, till 1733, when it was sold by France to Denmark for 30750L. Soon after the Danes built there the fortress of Christianstadt. Then it was that this northern power seemed likely to take deep root in America. Unfortunately, she laid her plantations under the yoke of exclusive privileges. Industrious people of all sorts, particularly Moravians, strove in vain to overcome this great difficulty. Many attempts were made to reconcile the interests of the colonists and their oppressors, but without success. The two parties kept up a continual struggle of animosity, not of industry. At length the government, with a moderation not to be expected from its constitution, purchased, in 1754, the privileges and effects of the company. The price was fixed at L. 412,500, part of which was paid in ready money, and the remainder in bills upon the treasury, bearing interest. From this time the navigation to the islands was opened to all the subjects of the Danish dominions. Of 345 plantations, which were seen at Santa Cruz, 150 were covered with sugar canes, and every habitation is big enough to be a large town. 52,244 slaves, and by 155 freedmen.

Santa Cruz, in Teneriff. See TENERIFF.

Santa Cruz, a town of Africa, on the coast of Barbary, and in the province of Suez and kingdom of Morocco, with a harbour and a fort. The Moors took it from the Portuguese in 1536. It is seated at the extremity of Mount Atlas, on the Cape Aguer. W. Long. 10° 7'. N. Lat. 3o° 38'.
SANTAREM, a handsome town of Portugal in Estremadura, seated on a mountain near the river Tajo, in a country very fertile in wheat, wine, and oil. They get in their harvest here two months after they have torn their corn. It was taken from the Moors in 1447. W. Long. 7. 45. N. Lat. 36. 12.

SANTAUGUSTINE. See Augustine.

SANTEN, a town of Germany, in the circle of Weilphalia, and in the duchy of Kleve. It has a handsome church belonging to the Roman Catholics, wherein is an image of the Virgin Mary, which they pretend performs a great many miracles. Here the fine walks begin that run as far as Weil, from which it is five miles distant to the north-west. E. Long. 6. 33. N. Lat. 51. 38.

SANTERRE, a small territory of France, in Picardy; bounded on the north by Cambresis, on the east by Vermandois, on the west by Amienois, and on the south by the river Somme. It is very fertile, and the capital town is Peronne.

SANTEUIL, or rather Santeuil (John Baptist de), in Latin Santinus Victorinus, an excellent Latin poet, was born at Paris in 1630. Having finished his studies in Louis the Great's College, he applied himself entirely to poetry, and celebrated in his verse the praises of several great men; by which he acquired universal applause. He enriched Paris with a great number of inscriptions, which are to be seen on the public fountains, and the monuments consecrated to politeness. At length, some new hymns being to be composed for the Breviary of Paris, Claude Santeuil his brother, and M. Boffuet, persuaded him to undertake that work; and he succeeded in it with the greatest applause. On which the order of Cluny defiring him to compose some for their Breviary, he complied with their request; and that order, out of gratitude, granted him letters of filiation, with an annual pension. Santeuil was cared for by all the learned men of his time; and had for his admirers the two princes of Condé, the father and son, from whom he frequently received favours. Louis XIV. also gave him a proof of his esteem, by bestowing a pension upon him. He attended the duke of Bourbon to Dijon, when that prince went thither in order to hold the fleets of Burgundy; and died there in 1697, as he was preparing to return to Paris. Besides his Latin hymns, he wrote a great number of Latin poems, which have all the fire and marks of genius discoverable in the works of great poets.

To Santeuil we are indebted for many fine church-hymns, as abovementioned. Santeuil read the verses he made for the inhabitants of heaven with all the agitation of a demoniac. Despreaux said he was the devil.
devil whom God compelled to praise fants. He was among the number of poets whose genius was as impetuous as his mufe was decnet.

La Bruyère has painted the character of this singular and truly original poet in the most lively colours. "Image a man of great facility of temper, complaisant and docile, in an infant violent, choleric, passionable, and capricious. A man simple, credulous, playful, volatile, puerile; in a word, a child in gray hairs: what latinity! Do you speak of one and the fame per­

Theodas; for he is a good man,

SAP

Santorini, an island of the Archipelago, to the north of Candia, and to the south-west of Naxos. It is eight miles in length, and near as much in breadth, and almost covered with pumice-stone, whence the soil in general must be dry and barren; it is, however, greatly improved by the labour and industry of the inhabitants, who have turned it into a garden. It affords a great deal of barley, plenty of cotton, and large quantities of wine. Fruit is scarce except figs; and they have neither oil nor wood. The inhabitants are all Greeks, and are about 10,000 in number. Pyrgos is the capital town, and there are several villages and small towns and villages. They have but one spring in the island, for which reason they preserve the rain-water in cisterns. Though subject to the Turks, they choose their own magistrates.

SANZIO (Raphael). See Raphael.

SAP, the juice found in vegetables.

We observed, when treating of Plants, that it has been long disputed whether the sap of plants be analogous to the blood of animals, and circulates in the same manner. We also mentioned the conclusions that Dr Hales drew from his numerous experiments, which were all in opposition to the doctrine that the sap circulates. As the subject is curious and interesting, and as additional light has been thrown upon it by late years, we wish to communicate it to our readers as fully as our limits will permit.

As the vegetable economy is still but imperfectly understood, and experiments made for tracing the motion of the sap may lead to important discoveries, we are happy to find, that of late years this subject has been again revived. Dr Walker, professor of Natural History in the university of Edinburgh, has published in the 1st volume of the Philosophical Transactions of Edinburgh an account of a course of very accurate and ingenious experiments, accompanied with observations and conclusions made with a caution which inspires confidence, and is indeed worthy of a disciple of Bacon. He is the first person, as far as we know, who thought of comparing the thermometer with the motion of the sap.

It is well known that in the spring vegetables contain a great quantity of sap; and there are some trees, as, the birch and plane, which, if wounded, will discharge a great portion of it. Whence is this moisture derived? Whether it is imbibed from the atmosphere, or does it flow from the soil through the roots? These are the questions which require first to be answered; and Dr Walker’s experiments enable us to answer them with confidence.

He selected a vigorous young birch, 30 feet high and 26 inches in circumference at the ground. He bored a hole just above the ground on the 1st of February, and cut one of its branches at the extremity. He repeated this every second day; but no moisture appeared at either of the places till the 5th of May, when a small quantity flowed on making an incision near the ground. He then cut 21 incisions in the trunk of the tree, on the north side, at the distance of a foot from one another, and reaching from the ground to the height of 20 feet. The incisions were solid triangles, each side being an inch long and an inch deep, and penetrating through the bark and wood. Dr Walker visited the tree almost every day for two months, and marked exactly from which of the incisions the sap flowed. He observed that it flowed from the lowest incision first, and gradually ascended to the highest. The following table will shew the progress of the sap upwards, and its correspondence with the thermometer.

The frill column is the day of the month on which the observation was made; the second expresses the number of incisions from which the sap flowed on the day of the month opposite; and the third column the degree of the thermometer at noon. Some days are omitted in March, as the incisions, though made on the 5th, did not bleed till the 11th. Some days are also passed over in April, because no observation was made on account of rain.

Dr Walker found that the sap ascends through the wood, and still more copiously between the wood and the bark; but none could be perceived ascending through the pith or the bark. He found also, that when the thermometer at noon is about 49, or between 46 and 50, the sap rises about one foot in 24 hours; that when the thermometer it about 45 at noon, it ascends about.

one foot in two days; and that it does not ascend at all unless the mid-day heat be above 40. He observed that it moves with more velocity through young than through old branches. In one young branch it moved through seven feet in one day, the thermometer being at 49, while it moved in the trunk of the tree only seven feet in seven days. Dr. Walker has thus explained the reason why the buds on the extremities of branches unfold first, because they are placed on the youngest wood, to which the sap flows most abundantly.

The effects produced by the motion of the sap deserve to be attended to. In those parts to which it has mounted, the bark easily separates from the wood, and the ligneous circles may, without difficulty, be detached from one another. The buds begin to swell and their scales to separate, while those branches when the sap has reached the extremities of the tree, and has thus pervaded the whole plant, it is evident that there is an intimate connection between here and the ascent of the sap. It did not begin to flow till the thermometer stood at a certain point; when it fell below 40, it was arrested in its progress. The south side of the tree, when the sun was bright, bledd more profusely than the north side; and at sun-set the incisions at the top ceased to bleed, where it was exposed most to the cold air, while it still continued to flow from the incisions next to the ground; the ground retaining its heat longer than the air.

Sap, in sieges, is a trench, or an approach made under cover of 10 or 12 feet broad, when the besiegers come near the place, and the fire from the garrison grows so dangerous that they are not able to approach uncovered. There are several forts of saps; the single, which has only a single parapet; the double, having one on each side; and the flying, made with gabions, &c. In all saps traverse are left to cover the men.

Sapindus, the Soap-berry tree, in botany: A genus of the digynia order, belonging to the deciduous class of plants; and in the natural method ranking under the 22d order, Cynophyllaea. The calyx is monophyllous and naked; there are five unngulate petals; the capsule is oblong and unilocular.

There are eight species, the officinalis, vaccaria, cretica porrigena, illyrica, oxymoide, orientalis, and lutea. The officinalis, which is a British plant, has a creeping root, so that in a short time it would fill a great space of ground. The stalks are about two feet high, and of a purplish colour. The footstalks of the flowers arise from the wings of the leaves opposite; they sustain four, five, or more purple flowers each; which have generally two small leaves placed under them. The stalk is also terminated by a loose bunch of flowers growing in form of an umbel; they have each a large swelling cylindrical emplacement, and five broad obtuse petals, which spread open, of a purple colour. These are succeeded by oval capsules, with one cell filled with small seeds.—The decoduction of this plant is used to cleanse and scour woollen cloths: the poor people in some countries use it instead of soap for washing; from which use it had its name.

Sapor, taste. See Taste, and Anatomy, p. 130.

Sapota, plum, in botany. See Acharas.

SAPPERS, are soldiers belonging to the royal artillery, whose business it is to work at the saps, for which they have an extraordinary pay. A brigade of sappers generally consists of eight men, divided equally into two parties; and whilst one of these parties is advancing the sap, the other is furnishing the gabions, fascines, and other necessary implements. They relieve each other alternately.

Sapphira, was the wife of a rich merchant in Guedres, and equally distinguished for her beauty and her virtue. Rhinfauld, a German officer, and governor of the town of Guedres, fell in love with her; and not being able to seduce her either by promises or presents, he imprisoned her husband, pretending that he kept up a traitorous correspondence with the enemies of the state. Sapphira yielded to the passion of the governor.
SAP [ 657 ] SAP

SPPHIRE. a gem of precious stones, of a blue colour, and the hardnest of all except the ruby and diamond. They are found in the same countries with the ruby; also in Bohemia, Africa, Siberia, and Auvergne. M. Rome de l'ille mentions one found at Auvergne, which appeared quite green or blue according to the position in which it was viewed. Crongdell, however, informs us, that the blue fluor spars are frequently met with in collections under the name of sapphires; and it is certain from Pliny, B. 37. chap. 9. that the sapphire of the ancients was our lapis lazuli. They are seldom found near a marriage over, Charles commanded him to be put to death. Thus the children of a wife whom he had induced, and of a husband whom he had murdered, became lawful heirs to all his wealth.

SARABAND, a musical composition in the triple time, the motions of which are slow and serious. Saraband is also a dance to the same measure, which usually terminates when the hand that beats the time falls; and is otherwise much the same as the minuet. The saraband is said to be originally derived from the Saracens, and is usually danced to the sound of the guitar or citternettes.

SARACA, in botany: a genus of the hexandria order, belonging to the diadelphia class of plants. — There is no calyx: the corolla is funnel-shaped and quadripartite; the filaments are on each side the throat of the corolla; the legumen is pedicellate.

SARACENS, the inhabitants of Arabia; so called from the word sara, which signifies a desert, as the greatest part of Arabia is; and this being the country of Mahomet, his disciples were called Saracens.

SARAGOSSA, a city of Spain, in the kingdom of Aragon, with an archbishop’s see, an university, and a court of inquisition. It is said to have been built by the Phcenicians; and the Romans sent a colony here in the reign of the emperor Augustus, whom it is said was of the name of Caesar Augustus, by which corruption has been changed into Saragotha. It is a large, handsome, and well-built town. The streets are long, broad, well-paved, and very clean, and the houses from three to five stories high. It is adorned with many magnificent buildings; and they reckon 17 large churches, and 14 handsome monasteries, not to mention others left considerate. The river Ebro runs across the place, dividing it into two; and on its banks is a handsome quay, which serves for a public walk. The Holy-tree is the largest, and so broad that it may be taken for a square; and here they have their bull-fights; in this street there are several nobleman’s families, particularly that of the viceroy. The convents are handsome and richly adorned, as well as the churches. The cathedral church is a spacious building, after the Gothic taste; but the finest church is that of Nuestra Signora del Pilar, seated on the side of the Ebro, and is a place of the greatest devotion in Spain. They tell us the Virgin appeared to St James, who was preaching the gospel, and left him her image, with a handsome pillar of Jasper: it is still in this church which they pretend is the first in the world built to her honour. This image stands on a marble pillar, with a little Jesus in her arms; but the place is so dark, that it cannot be seen without the assistance of lamps, which are 50 in number, and all of silver. There are also chandeliers and balustrades of mazy silver. The ornaments of this image are the richest that can be imagined, her crown being full of precious stones of an insuperable price; in short, there is scarce anything to be seen but gold and jewels, and a vast number of people come in pilgrimage hither. The town-house is a spacious edifice, adorned with fine columns: in the hall are the pictures of all the kings of Aragon; and in a corner of it is George on horseback, with a dragon of white marble under him. It is seated in a very large plain, where the Ebro receives two other rivers; and over it are two bridges, one of stone and the other of wood, which last has been thought the most beautiful in Europe. A victory was obtained here over the French and Spaniards in 1710, but it was abandoned by the allies soon after. It is 97 miles west by north of Tarragona, 137 west of Barcelona, and 150 north-east of Madrid. W. Long. c. 48. N. Lat. 41° 47'.

SARANNE. See LILIUM.

SARCASM, in rhetoric, a keen bitter expression which has the true point of satire, by which the orator scoffs and inflicts his enemy: such as that of the Jews to our Saviour: “He saved others, himself he cannot save.”

SARCOCOELE, in surgery, a spurious rupture of the hernia, wherein the testicle is considerably turned or indurated, like a firrour, or much enlaged by a flabby excrescence, which is frequently attended with acute pains, so as to degenerate at last into a cancerous dispoition. See SURGERY.

SARCOCOLLA, a concrete juice brought from Perfo and Arabia, in small whitish-yellow grains, with a few of a reddish and sometimes of a deep red coloured with them; the whitest tears are preferred, as a dull kind of sweetness. This drug diffolves in watery liquors, and appears chiefly to be of the gummy kind, with a small admixture of resinous matter. It is principally celebrated for conglutinating wounds and ulcers (whence its name sarcoolla felbo-glue), a quality which neither this nor any other drug has any jult title to.

SARCOLOGY, is that part of anatomy which treats of the soft parts, viz. the muscles, intestines, arteries, veins, nerves, and fat.

SARCOCOMA, in surgery, denotes any flabby excrescence.

SARCOPIAGUS, in antiquity, a fort of stone coffin or grave, wherein the ancients laid those they had not a mind to burn.

The word, as derived from the Greek, literally signifies flesh-eater; because at first they used a fort of stone for the making of tombs, which quickly consumed the bodies. See the following article.

SARCOPIAGUS, or Lapith Afflu, in the natural history of the ancients, a stone much used among the Greeks in their sculptures, is recorded to have always perfectly consumed the flesh of human bodies buried in it in forty days. This property it was much famed for, and all the ancient naturalists mention it. There was another very singular quality also in it, but whether in all, or only in some peculiar pieces of it, is not known: that is, its turning into stone any thing that was put into vessels made of it. This is recorded only.
only by Mutianus and Theophrastus, except that Pliny had copied it from these authors, and some of the later writers on these subjects from him. The account Mutianus gives of it, that it converted into stone the bones of persons buried in it, as also the utensils which it was in some places customary to bury with the dead, particularly those which the person while living most delighted in. The utensils this author mentions, are as much have been made of very different materials; and hence it appears that this stone had a power of consuming not only flesh but that its petrifying quality extended to substances of very different kinds. Whether ever it really possessed this last quality has been much doubted; and many, from the seeming improbability of it, have been afraid to record it. What has much encouraged the general belief of it is, Mutianus's account of its taking place on substances of very different kinds and textures; but this is no real objection, and the whole account has probably truth in it. Petrifications in those early days might not be distinguished from incrustations of sparry and stony matter on the surfaces of bodies only, as we find they are not with the generality of the word even to this day; the incrustations of spar on mofles and other substances in some of our springs, being at this time called by many petrified webs, &c. and incrustations like these might easily be formed on substances enclosed in vegetable mass of this form; by water passing through its pores, dilodging from the common mass of the stone, and carrying with it particles of such spar as it contained; and afterwards falling in repeated drops on whatever lay in its way, it might again deposit them on such substances in form of incrustations. By this means, things made of ever so different matter, which happened to be included, and in the way of the passage of the water, would be equally incrusted with and in appearance turned into stone, without regard to the different configuration of their pores and parts.

The place from whence the ancients tell us they had this stone Ailos, a city of Lycia, in the neighborhood of which it was dug; and De Boot informs us, that in that country, and in some parts of the East, there are also stones of this kind, which, if tied to the bodies of living persons, would in the same manner confine their flesh. Hill's Notes on Theophrastus, p. 14.

SARCOTICS, in surgery, medicines which are supposed to generate flesh in wounds.

SARDANAPALUS, the last king of Assyria, whose character is one of the most infamous in history. He is said to have funk so far in depravity, that, as far as he could, he changed his very sex and nature. He clothed himself as a woman, and fpun amidst companies of his concubines. He painted his face, and behaved in a more lewd manner than the most lascivious harlot. In short, he buried himself in the most unbounded senility, quite regardless of sex and the dictates of nature. Having grown odious to all his subjects, a rebellion was formed against him by Arbaces the Mede and Belbasis the Babylonian. They were attended, however, with very bad success at first, being defeated with great slaughter in three pitched battles. With great difficulty Belbasis prevailed upon his men to keep the field only five days longer; when they were joined by the Bedrissans, who had come to the assistance of Sardanapalus, but had been prevailed upon to renounce their allegiance to him. With this reinforcement they twice defeated the troops of Sardanapalus, who, that himself up in Nineveh the capital of his empire. The city held out for three years; at the end of which, Sardanapalus finding himself unable to hold out any longer, and-dreading to fall into the hands of an enraged enemy, retired into his palace, in a court of which he caused a vast pile of wood to be raised; and hesping upon it all his gold and silver, and royal apparel, and at the same time inclining his eunuchs and concubines in an apartment within the pile, he set fire to it, and so destroyed himself and all together.

SARDINIA, an island of the Mediterranean, bound by the strait which divides it from Corsica on the north; by the Tuscan sea, which flows between this island and Italy, on the east; and by other parts of the Mediterranean sea on the south and west. It is about 140 miles in length and 70 in breadth, and contains 420,000 inhabitants. The revenue arises chiefly from a duty upon salt, and is barely sufficient to defray the expenses of government; but it certainly might be considerably augmented, as the soil produces wine, corn, and oil, in abundance. Most of the salt that is exported is taken by the Danes and Swedes; the English formerly took great quantities for Newfoundland, but having found it more convenient to procure it from Spain and Portugal, they now take little or none. A profitable turtle fishery is carried on at the south-west part of the island, but it is monopolized by the Duke of St. Pierre, and a few more people, who happen to be proprietors of the adjoining land. Wild bears abound in the hilly parts of the island, and here are some few deer, not so large as those in Britain, but in colour and make exactly the same. Bees and sheep are also common, as well as horses.

The feudal system still subsists in a limited degree, and titles go with their estates, so that the purchaser of the latter inherits the former. The regular troops seldom exceed 2000 men; but the militia amount to near 26,000, of whom 11,000 are cavalry. Their horses are small, but uncommonly active. It would be more easy to beat them in a charge than to overtake them in a march. The country people are generally armed; but notwithstanding their having been so long under the Spanish and Italian government, affinities are by no means frequent; and yet by the laws of the country, if a man flabs another without premeditated malice, within four hours after quarrelling with him, he is not liable to be hanged. On the other hand, the church affords no protection to the guilty. The Sardinians are not at all bigoted; and, next to the Spaniards, the English are their favourites. The whole island is subject to the Duke of Savoy, who enjoys the title of king of Sardinia. See CAGLIARI.

There is in this island a pleasing variety of hills and valleys, and the soil is generally fruitful; but the inhabitants are a very lethargic generation, and cultivate but a little part of it. On the coast there is a fishery of anchovies and coral, of which they send large quantities to Genoa and Leghorn. This island is divided into two parts; the one, called Antiochia, lies to the south; and the other Coptdi-Lugary, which is seated to the north. The principal towns are Cagliari the capital, Oristano, and Saffiari.
SARDIS, or Sardes, now called Sard or Satt, is an ancient town of Asia, about 30 miles east of Smyrna. It was much celebrated in early antiquity, was enriched by the fertility of the soil, and had been the capital of the Lydian kings. It was seated on the side of Mount Tmolus; and the citadel, placed on a lofty hill, was remarkable for its great strength. It was the seat of King Croesus, and was in his time taken by Cyrus; after which the Persian satraps, or commandant resided at Sardis as the emperor did at Susa. The city was also taken, burnt, and then evacuated by the Macedonians in the time of Darius, and the city and strongholds surrendered on the approach of Alexander after the battle of Granicus. Under the Romans Sardis was a very considerable place till the time of Tiberius Caesar, when it suffered prodigiously by an earthquake.

The munificence of the emperor, however, was nobly exerted to repair the various damages it then sustained. Julian attempted to restore the heathen worship in the place. He erected temporary altars where none had been left, and repaired the temples if any vestiges remained. In the year 400 it was plundered by the Goths, and it suffered considerably in the subsequent troubles of Asia. On the incession of the Tartars in 1304, the Turks were permitted to occupy a portion of the citadel, separated by a strong wall with a gate, and were afterwards murdered in their sleep. The site of this once noble city is now green and flowery, the whole being reduced to a poor village, containing nothing but wretched huts. There are, however, some curious remains of antiquity about it, and some ruins which display its ancient grandeur. See Chandler's Travels in Asia Minor, p. 251, &c.

There is in the place a large caravansary, where travellers may commodiously lodge. The inhabitants are generally shepherds, who lead their flocks into the fine pastures of the neighbouring plain. The Turks have a mosque here, which was a Christian church, at the gate of which there are several columns of polished marble. There are a few Christians, who are employed in gardening. E. Long, 28. 5. N. Lat. 37. 51.

SARDONIUS, or Sardonia, a species of ranunculus, and is said to produce such convulsive motions in the muscles as resemble those motions which are observed in the face during a fit of laughter. This complaint is sometimes speciously fatal. If the ranunculus happens to be the cause, the cure must be attempted by means of a vomit, and frequent draughts of hydromel with milk.

SARDONYX, a precious stone consisting of a mixture of the chalcedony and carnelian, is often seen in iatrists, but at other times blended together. It is found, 1. Striped with white and red, which may be cut in cameo as well as the onyx. 2. White with red dentritic figures, greatly resembling the mucha-stone; but with this difference, that the figures in the sardonyx are of a red colour, in the other black. There is no real difference, excepting in the circumstance of hardness, between the onyx, carnelian, chalcedony, and agate, notwithstanding the different names bestowed upon them. Mongez informs us, that the yellow, or orange-coloured agates, with a wavy or undulating surface, are now commonly called sardonyx. See CARNEIAN and ONIX.

SARGUS, in ichthyology. See SIRUS.

SARIPATAM, a country of Indostan, lying at the back of the dominions of the Samorin of Malabar, and which, as far as we know, was never subdued by any foreign power. Mr Groce relates, that "it has been constantly in arms with its inhabitants of this country never to make any but a defensive war; and even then, not to kill any of their adversaries in battle, but to cut off their noses. To this service the military were peculiarly trained up, and the dread of the deformity proved sufficiently strong to keep their neighbours, not much more martial than themselves, from effectively attacking them."

SARMENOSAE (from sarmentum, a long shoo like that of a vine); the name of the 11th class in Linneus's Fragments of a Natural Method, consisting of plants which have climbing stems and branches, that, like the vine, attach themselves to the bodies in their neighbourhood for the purpose of support. See Botany, p. 453.

SAROTHRA, in botany: A genus of the trigynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 20th order, Rosaceae. The corolla is pentapetalous; the capsule unilocular, trivalved, and coloured.

SARPARI, of wool, a quantity of wool, otherwise called a pocket or half sack; a sack containing 80 tods; a tod two flones; and a stone 14 pounds. In Scotland it is called serplath, and contains 80 flones.

SARRACONIA, in botany: A genus of the monogynia order, belonging to the polyandria class of plants; and in the natural method ranking under the 54th order, Misellaceae. The corolla is pentapetalous; the calyx is double, and triphyllous below; pentaphyllous above; the capsule quinquelocular; the style has a stigma of the form of a shield.

SARSAPARILLA, in botany. See SMILAX.

SARTORIUS, in Anatomy. See there, Table of the Muscles.

SARUM, in Wilts, about one mile north of New Sarum or Salisbury, has the ruins of a fort, which belonged to the ancient Britons; and is said also to have been one of the Roman stations. It has a double intrenchment, with a deep ditch. It is of an orbeliform form, and has a very august look, being erected on one of the most elegant plans for a fortress that can be imagined. In the north-west angle stood the palace of the bishop, whose fee was removed hither from Wilton and Sherborne; but the bishop quarrelling with King Stephen, he seized the castle and put a garrison into it, which was the principal cause of its destruction, as the fee was soon after removed from hence to Salisbury in 1218. The area of this ancient city is situated on an artificial hill, whose walls were three yards thick, the ruins of which in many places in the circumference are still to be seen, and the tracks of the minsters and cathedral church may be traced out by the different colour of the corn growing where once the city stood. Here synods and parliaments have formerly been held, and itinerants, the flates of the kingdom summoned to swear fidelity to William the Conqueror. Here also was a palace of the Britth and Saxon kings, and of the Roman emperors; which was defenled in the reign of Henry III. for want of water, so that one farm house is all that is left of this ancient city; yet it is called the Bo-rough.
rough of Old Sarum, and sends two members to parliament, who are chosen by the proprietors of certain adjacent lands.

In February 1795 a subterranean passage was discovered at this place, of which we have the following account in the Gentleman's Magazine for March, in a letter dated Salisbury, Feb. 10. "Some persons of Salisbury on Saturday last went to the upper verge of the fortification (the citadel), and on the right-hand, after the road had reached the summit, discovered a large hole. They got a candle and lantern, and went down a flight of steps for more than 30 yards. It was an arched way seven feet wide, neatly chiselled out of the solid rock or chalk. It is probable the crown of the arch gave way from the sudden thaw, and fell in. There is a great deal of rubbish at the entrance. It appears to be between six and seven feet high, and a circular arch overhead all the way. Thrice particulars I learned from the person who himself explored it, but was afraid to go farther lest it might fall in again and bury him. He thinks it turns a little to the right towards Old Sarum house, and continues under the fosse till it reached the outer verge. The marks of a chisel, he says, are visible on the side. There are two large pillars of square-stone at the entrance, which appear to have had a door at foot. They are 18 inches by 27, of good freestone, and the mason-work is extremely neat. The highest part of the archway is two feet below the surface of the ground."

It is all now again filled up by order of farmer Whitechurch, who rents the ground of Lord Camelford, and thinks curiosity would bring so many people there as to tread down his grass whenever grazes shall be there. I went into it 30 yards, which was as far as I could get for the rubbish. I measured it with a line, and found it extend full 120 feet inwards from the two pillars supposed to be the entrance; then onwards it appeared to be filled to the roof with rubbish. By measuring with the same line on the surface of the earth, I found it must go under the bottom of the outer bank of the outer trench; where I think the opening may be found by digging a very little way. Whether it was a Roman or a Norman work it is difficult to say; but it certainly was intended as a private way to go into or out of the castle; and probably a fort or strong castle was built over the outer entrance. I looked for inscriptions or coins, but have not heard of any being found."

SATIRE. See SATYR.

SATRAPA, or SATRAPES, in Persian antiquity, denotes an admiral; but more commonly the governor of a province.

SATURNA, a glossy kind of silk fluff, the warp of which is very fine, and stands so as to cover the coarser wool.

SATURING, a slight thin kind of fattin, commonly striped, and ordinarily used by the ladies for summer night-gowns.

SATURANTS, in anatomy, the same with ASERBENTS.

SATURATION, in chemistry, is the impregnating an acid with an alkali, or vice versa, till either will receive no more, and the mixture will then become neutral.

SATUREIA, SAVORY, in botany: A genus of the gymnoptera order, belonging to the didynama class of plants; and in the natural method ranking under the 42d order, Verticillata. The segments of the corolla are nearly equal; the flamina fanding anfuer.

Species. 1. The hortensis, or summer savory, is an annual plant, which grows naturally in the south of France and Italy, but is cultivated in many places both for the kitchen and medicinal use. 2. The montana, or winter savory, is a perennial plant growing naturally in the south of France and Italy, but is cultivated in gardens both for culinary and medicinal purposes.

Culture. Both kinds are propagated by seeds. Those of the first kind should be sown in the beginning of April upon a bed of light earth, either where they are to remain, or for transplanting. If the plants are to stand unremoved, they should be sown thinly; but if they are to be transplantated, they may be sown closer. The second species may be sown upon a poor dry soil, where the plants will endure the severest winters, though they are often killed by the frost when planted in good ground. The plants will continue several years; but when they are old, the shoots will be short and not so well furnished with leaves; it will therefore be proper to raise a supply of young plants every year.

Uses. Summer savory is a very warm pungent aromatic; and affords in distillation with water a volatile effient oil, of a penetrating smell, and very hot acrid taste. It yields little of its virtues by infusion to aqueous liquors; reduced spirit extracts the whole of its taste and smell, and elevates nothing in distillation.

SATURN, in astrology, one of the planets of our solar system, revolving at the distance of more than 900 millions of miles from the sun. See ASTRONOMY, n° 31, 109, 191, and 296.

Dr Harkegh, who has so much signalized hisb'f by his discoveries in the celestial region, has not omitted to make his observations on this planet, which he considers as one of the most engaging objects that astronomy offers to our view. His attention was first drawn to it in the year 1774, when he saw its ring extending in appearance a narrow line, extending on both sides not much less than the diameter of the planet's disk. The observation was taken with a five and a half feet reflector.
The ring seems to be endowed with a greater reflective power than the body of the planet; and the Doctor gives instances of its seeing part of the ring brighter than Saturn himself, as well as of his seeing it plainly through a telescope which could scarcely afford light enough for the planet. The most remarkable property of this wonderful ring, however, is its extreme thinness. "When we were nearly in the plane of the ring (says our author), I have repeatedly seen the first, second, and third satellites, even the fifth and seventh, pass before and behind the ring in such a manner that they served as excellent micrometers to estimate its thickness. It may be proper to mention a few instances, especially as they will serve to solve some phenomena that have been remarked by other astronomers, though they have not been accounted for in a manner sufficiently with other known facts. July 18th 1789, at 19h 41° 9", sidereal time, the first satellite seemed to hang upon the following arm, declining a little towards the north, and I saw it gradually advance upon it towards the body of Saturn; but the ring was not so thick as the lucid point. July 23d, at 19h 41° 8'; the second satellite was a very little preceding the ring; but the ring appeared to be less than half the thickness of the satellite. July 27th, at 20h 15' 12", the second satellite was about the middle, upon the following arm of the ring, and towards the south; and the fifth satellite on the farther end towards the north; but the arm was thinner than either of them. Aug. 29th, at 22h 12' 55", the third satellite was upon the ring, near the end of the preceding arm, when the latter seemed not to be the fourth, or at most the third part of the diameter of the satellite; which, in the situation it was, I took to be less than one single second in diameter. At the same time, I also saw the seventh satellite following the third, at a little distance, in the shape of a bead upon a thread, projecting on both sides of the same arm. Hence also we are sure that the arm appeared thinner than the seventh satellite, which is considerably smaller than the fifth, which again is less than the first. Aug. 31st, at 20h 48' 26", the preceding arm was loaded about the middle with the third satellite. October 15th, at 0h 43' 44", I saw the sixth satellite, without obstruction, about the middle of the preceding arm, though the ring was but barely visible with my 40 feet reflector, even while the planet was in the meridian. However, we were then a little inclined to the plane of the ring, and the third satellite, when it came near its conjunction with the first, was so situated, that it must have partly covered it a few minutes after I left it behind my house. In all these observations, the ring did not in its least interfere with my view of the satellites. October 16th, I followed the fifth and seventh satellites up to the very disk of the planet; and the ring, which was extremely faint, did not in the least obstruct my seeing them gradually approach the disk, where the seventh vanished at 21h 49' 44", and the fifth at 22h 36' 44". There is, however, some suspicion, that by a refraction through some very rare atmosphere on the two planes of the ring, the satellites might be lifted up and depressed so as to become visible on both sides of the ring, even though the latter should be equal in thickness to the diameter of the smallest satellite, which may amount to 1000 miles.—As for the arguments of its incredible thinness, which
The planet Saturn is now observed to have belts or falce upon its disk as dimly as Jupiter. Dr Herchel, on the 9th of April 1775, observed a northern belt on his body, inclined a little to the line of the ring. On the 1st of May 1776, there was another belt observed, inclined about 15° to the same line, but more to the fourth; and on the falling side came up to the place where the ring crosses the body of the planet. On the 8th of April two belts were observed, and these continued with variations, and sometimes the appearance of a third belt, till the 8th of September, when the account of the observations was discontinued. The Doctor remarks, that he generally observed these belts in equatorial situations, though sometimes it was otherwise. Two conclusions, he says, may be drawn from the observations he made this year. "The first, which relates to the changes in the appearance of the belts, is, that Saturn has probably a very considerable atmosphere, in which these changes take place, just as the alterations in the belts of Jupiter have been shown with great probability to be in his atmosphere. This has also been confirmed by other observations. Thus, in occultations of Saturn's satellites, I have found them to hang to the disk for a long while before they would vanish. And though we ought to make some allowance for the encroachment of light, whereby a satellite is seen to reach up to the disk sooner than it actually does, yet without a considerable refraction it could hardly be kept so long in view after the apparent contact. The time of hanging upon the disk in the seventh satellite has usually amounted to 20 minutes. Now, as its quick motion during that interval carries it through an arch of near 5 degrees, we find that this would denote a fraction of about two seconds, provided the encroaching of light had no share in producing the effect. By an observation of the fifth satellite, the refraction of Saturn's atmosphere amounts to nearly the same quantity; for this satellite remained about 14 or 15 minutes longer in view than it should have done; and as it moves about 2½ degrees in that time, and its orbit is larger than that of the seventh, the difference is inconsiderable. The next inference we may draw from the appearance of the belts on Saturn is, that this planet turns upon an axis which is perpendicular to its ring. The arrangement of the belts, during the course of 15 years that I have observed them, has always followed the direction of the ring, which is what I have called being equatorial. Thus, as the ring opened, the belts began to advance towards the foot, and to show an incurrence answering to the projection of an equatorial line, or to a parallel of the fame. When the ring closed up, they returned towards the north, and are now, while the ring passes over the centre, exactly ranging with the shadow of it, on the body, generally one on each side, with a white belt close to it. When I say that the belts have always been equatorial, I pass over trifling exceptions, which certainly were owing to local causes. The step from equatorial belts to a rotation on an axis is so easy, and, in the case of Jupiter, so well ascertained, that I shall not hesitate to take the same consequence for granted here. But if there could remain a doubt, the observations of June 19th, 20th, and 21st, 1780, where the same spot upon one of the belts was seen in three different situations, would remove it completely."
Another evidence that Saturn, as well as the other planets, revolves upon its axis, is drawn from its flattened shape, like that of Mars, Jupiter, and Saturn. On the 31st of May 1781, the disk seemed to deviate as much from a true circle as that of Jupiter, though by the interference of the ring this could not be so well determined as after an interval of eight years. On the 18th of August 1787, the difference between the equatorial and polar diameters was measured, the mean of three observations of the former being 22°.81, of the latter 20°.61. From these observations, it appears that the polar diameter of Saturn is to its equatorial diameter nearly as 10 to 11; and that his axis is perpendicular to the plane of the ring.

In a subsequent paper, the Doctor gives up his reasoning against fixed lucid points in the ring, in consequence of having frequently observed them in such situations as could not by any means be accounted for by the satellites. He even attempts to invalidate his own arguments abovementioned concerning the vast magnitude of the mountains necessary to make them visible at this distance. "As observations (says he) carefully made should always take the lead of theories, I shall not be concerned if such lucid spots as I am now going to admit, should seem to contradict what has been said in my last paper concerning the idea of inequalities or protuberant points. We may, however, remark, that a lucid and apparently protuberant point may exist without any great inequality in the ring. A vivid light, for instance, will seem to project greatly beyond the limits of the body on which it is placed, if, therefore, the luminous places on the ring should be fixed as proceed from very bright reflecting regions, or, which is more probable, owe their existence to the more fluctuating causes of inherent fire acting with great violence, we need not imagine the ring of Saturn to be very uneven or distorted, in order to present us with such appearances. In this sense of the word, then, we may still oppose the idea of protuberant points, such as would denote immense mountains of elevated surface.

"On comparing together several observations, a few trials shewed that the bright and well observed spot agrees to a revolution of 32° 25'.4; and calculating its distance from the centre of Saturn, on a supposition of its being a satellite, we find it 174.227, which brings it upon the ring. It is therefore certain, that unless we should imagine the ring to be sufficiently fluid to allow a satellite to revolve in it, or supposing a notch, groove, or division in the ring, to suffer the satellite to pass along, we ought to admit a revolution of the ring itself. The density of the ring, indeed, may be supposed to be very inconsiderable by those who imagine its light to be rather the effect of some thinning fluid, like an aurora borealis, than a reflection from some permanent substance; but its dissipation, in general, and in my telescopes its faintness, when turned edgeways, are in no manner favourable to this idea. When we add also, that this ring casts a deep shadow upon the planet, is very sharply defined both in its outer and inner edge, and in brightness exceeds the planet itself, it seems to be almost proved that its confluence cannot be less than the body of Saturn, and that consequently no degree of fluidity can be admitted sufficient to permit a revolving body to keep in motion for any length of time. A groove might afford a passage, especially as on a former occasion we have already considered the idea of a divided ring. A circumstance also which seems rather to favour this idea, is, that in some observations a bright spot has been seen to project equally on both sides, as the satellites have been observed to do when they padded the ring. But, on the other hand, we ought to consider, that the spot has often been observed very near the end of the arm of Saturn's rings, and that the calculated distance is consequently a little too small for such appearances, and ought to be 19 or 20 seconds at least. We should also attend to the size of the spot, which seems to be variable: for it is hardly to be imagined that a satellite, brighter than the sixth, and which could be seen with the moon nearly at full, should so often escape our notice in its frequent revolutions, unless it varied much in its apparent brightness. To this we must add another argument drawn from the number of lucid spots, which will not agree with the motion of one satellite only; whereas, by admitting a revolution of the ring itself in 32° 25'.4, and supposing all the spots to adhere to the ring, and to share in the same periods, provided they last long enough to be seen many times, we shall be able to give an easy solution of all the remaining phenomena. See Phil. Trans. 1799, p. 427.

Saturn, in chemistry, an appellation given to lead.

Saturn, in heraldry, denotes the black colour in blazing the arms of sovereign princes.

Saturn, one of the principal of the Pagan deities, was the son of Caelus and Terra, and the father of Jupiter. He depôsed and castrated his father; and obliged his brother Titan to resign his crown to him, on condition of his bringing up none of his male issue, that the succession might at length devolve on him. For this purpose he devoured all the sons he had by his wife Rhea or Cybele; but the bringing forth at one time Jupiter and Juno, he presented the latter to her husband, and sent the boy to be nursed on mount Ida; when Saturn being informed of her having a son, demanded the child; but in his stead his wife gave him a stone swaddled up like an infant, which he instantaneously swallowed. Titan finding that Saturn had violated the contract he had made with him, put himself at the head of his children, and made war on his brother, and having made him and Cybele prisoners, confined them in Tartarus; but Jupiter being in the mean time grown up, raised an army in Crete, went to his father's assistance, defeated Titan, and restored Saturn to the throne. Some time after, Saturn being told that Jupiter intended to dethrone him, endeavoured to prevent it; but the latter being informed of his intentions, deposed his father, and threw him into Tartarus. But Saturn escaping from thence fled into Italy, where he was kindly received by Janus king of the country, who associated him to the government: whence Italy obtained the name of Saturnia Tellus; as also that of Latium, from latos, "to lie hid." There Saturn by the wisdom and mildness of his government, is said to have produced the golden age.

Saturn is represented as an old man with four wings, armed with a scythe; sometimes he is delineated under the figure of a serpent with its tail in its mouth. This is emblematic of the feaons, which roll perpetually in the same circle. Sometimes also Saturn is painted with
SATURNIA, in Roman antiquity, a festival observed about the middle of December, in honour of the god Saturn, whom Lucan introduces giving an account of the ceremonies observed on this occasion, thus. “During my whole reign, which lasted for one week, no public business is done; there is nothing but drinking, feasting, playing, creating imaginary kings, placing servants with their masters at table, &c. There shall be no disputes, reproaches, &c. but the rich and poor, masters and servants, all shall be equal, &c.”

SATURNINE, an appellation given to persons of a melancholy disposition, as being suppos'd under the influence of the planet Saturn.

SATURNITE, a name given by Mr. Kirwan to a new metallic substance, supposed to be discovered by M. Monnet. It was met with in some lead foundaries at a place named Poulla oven in Brittany; being separated from the lead ore during its torrefaction. It resembles lead in colour, weight, solubility in acids and other properties, but differs from it in being more fusible, brittle, easily corroded and volatilized, and likewise not being fusible with lead in fusion. Meissners Haffenrattz and Girond contended, that this saturnite was nothing but a compound of different fusiblances, and accordingly gave an analysis of it as consisting of lead, copper, iron, silver, and sulphur; the proportions of which naturally vary according to the quality of the ore put into the furnace. M. Monnet, however, inferred that the substance analyzed by them was not that which he had discovered; but when he again visited the mines above-mentioned, he could meet with none of the substance there which he had found before.

SATYAVRATA, or Menu, in Indian mythology, is believed by the Hindoos to have reigned over the whole world in the earliest age of their chronology, and to have reigned in the country of Dravira on the coast of the eastern Indian peninsula. His patronymic name was Vaiavatavata, or child of the sun. In the Bhagavatas, we are informed, that the Lord of the Universe, intending to preserve him from the flood of destruction, caused by the depravity of the age, thus told him how he was to act. “In seven days from the present time, O thou tamer of enemies, the three worlds will be plunged in an ocean of death; but in the midst of the destroying waves, a large vessel, sent by me for thy use, shall stand before thee. Then shalt thou take all medicinal herbs, all the variety of seeds, and, accompanied by seven fairs, encircled by pairs of all brute animals, thou shalt enter the spacious ark and continue in it, secure from the flood on one immense ocean without light, except the radiance of thy holy companions. When the flood shall be agitated by an impetuous wind, thou shalt fill it with a large sea-serpent on my horn; for I will be near thee; drawing the vessel, with thee and thy attendants, I will remain on the ocean, O chief of men, until a night of Brahma shall be completely ended. Thou shalt then know my true greatness, rightly named the supreme Godhead; by my favour, all thy questions shall be answered, and thy mind abundantly instructed.”

All this is said to have been accomplished; and the story is evidently that of Noah disguised by Asiatic fiction and astronomy. It proves, as Sir William Jones has rightly observed, an ancient Indian tradition of the universal deluge described by Moses; and enables us to trace the connection between the eastern and western traditions relating to that event. The same learned author has shown it to be in the highest degree probable, that the Satyavrata of India is the Cronus of Greece and the Saturn of Italy. See Saturn; and Asiatic Researches, Vol. I. p. 236, &c.

SATYR, or SATIRE, in matters of literature, a discourse or poem, exposing the vices and follies of mankind. See Poetry, Part II. Sect. x.

The chief satirists among the ancients are, Horace, Juvenal, and Persius: those among the moderns, are Regnier and Boileau, in French; Butler, Dryden, Rochester, Buckingham, Swift, Pope, Young, &c. among the English; and Cervantes among the Spaniards.

SATYRIASIS. See Medicine, nö. 372.

SATYRIM, in botany: A genus of the diandria order, belonging to the gynandria class of plants; and in the natural method ranking under the 42d order, Pericarps. The nectarium is scrotiform, or inflated double behind the flower.

SATYRS (in ancient mythology) a species of demigods who dwelt in the woods. They are represented as monsters, half-men, and half-goats; having horns on their heads, a hairy body, with the feet and tail of a goat. They are generally in the train that follows Bacchus. As the poets supposed that they were remarkable for piercing eyes and keen railing, they have placed them in the same pictures with the Graces, Lutes, and even with Venus herself.

SAVAGE (Richard) one of the most remarkable characters that is to be met with perhaps in all the records of biography, was the son of Anne countess of Macclesfield by the earl of Rivers, according to her own confession; and was born in 1698. This confession of adultery was made in order to procure a separation from her husband the earl of Macclesfield: yet, having obtained this desired end, no sooner was her spurious offspring brought into the world, than, without the dread of shame or poverty to excite her, she discovered the resolution of disowning him; and, as long as he lived, treated him with the most unnatural cruelty. She delivered him over to a poor woman to educate as her own; prevented the earl of Rivers from leaving him a legacy of £6,000, by declaring him dead; and in effect deprived him of another legacy which his godmother Mrs Lloyd had left him, by concealing from him his birth, and thereby rendering it impossible for him to prosecute his claim. She endeavour'd to send him secretly to the plantations; but this plan being either laid aside or frustrated, the place him apprentice with a shoemaker. In this situation, however, he did not long continue: for his nurse dying, he went to take care of the effects of his supposed mother; and found in

Vol. XVI.
her boxes some letters which discovered to young Savage his birth, and the cause of its concealment.

From the moment of this discovery it was natural for him to become dissatisfied with his situation as a shoemaker. He now conceived that he had a right to share in the affluence of his real mother; and therefore he desperately and perhaps indiscriminately applied to her, and made use of every art to awaken her tenderness and attract her regard. But in vain did he solicit this unnatural parent; she avoided him with the utmost precaution, and took measures to prevent his ever entering her house on any pretence whatever.

Savage was at this time so touched with the discovery of his birth, that he frequently made it his practice to walk before his mother's door in hopes of seeing her by accident; and often did he warmly solicit her to admit him to see her; but all to no purpose: he could neither soften her heart nor open her hand.

Mean time, while he was assiduously endeavouring to mould the affections of a mother in whom all natural affection was extinct, he was destitute of the means of support, and reduced to the miseries of want. We are not told by what means he got rid of his obligation to the shoemaker, or whether he ever was actually bound to him; but we now find him very differently employed in order to procure a subsistence. In short, the youth had parts, and a strong inclination towards literary pursuits, especially poetry. He wrote a poem; and afterwards two plays, Woman's a Riddle and Love in a Veil: but the author was not allowed any part of the profits from the first; and from the second he received no other advantage than the acquaintance of Sir Richard Steel and Mr. Wilks, by whom he was pitied, cared for, and relieved. However the kindnes of his friends not affording him a constant supply, he wrote the tragedy of Sir Thomas Overbury; which not only procured him the esteem of many persons of genius, but brought him in 1701. The celebrated Aaron Hill, Esq. was of great service to him in correcting and fitting this piece for the stage and the press; and extended his patronage still farther. But Savage was, like many other wits, a bad manager, and was ever in difficulties. As fast as his friends raised him out of one difficulty, he sunk into another; and, when he found himself greatly involved, he would ramble about like a vagabond, with force a shilling on his back. He was in one of these situations all the time wherein he wrote his tragedy above mentioned; without a lodging, and often without a dinner: so that he used to scribble on scraps of paper picked up by accident, or begged in the streets, which he occasionally stepped into, as thoughts occurred to him, craving the favour of pen and ink, as it were just to take a memorandum.

Mr. Hill also earnestly promoted a subscription to a volume of Miscellanies, by Savage; and likewise furnished part of the poems of which the volume was composed. To this miscellany Savage wrote a preface, in which he gave an account of his mother's cruelty, in a very uncommon strain of humour.

The profits of his Tragedy and his Miscellanies together, had now, for a time, somewhat raised poor Savage both in circumstances and credit; so that the world at last began to behold him with a more favourable eye than formerly, when both his fame and life were endangered by a most unhappy event. A drunken frolic in which he one night engaged, ended in a fray, and Savage unfortunately killed a man, for which he was condemned to be hanged; his friends earnestly solicited the mercy of the crown, while his mother as earnestly exerted herself to prevent his receiving it. The counts of Hertford at length laid his whole case before Queen Caroline, and Savage obtained a pardon.

Savage had now lost that tenderness for his mother, which the whole series of her cruelty had not been able wholly to repress; and considering her as an implacable enemy, whom nothing but his blood could satisfy, threatened to harass her with lampoons, and to publish a copious narrative of her conduct, unless she consented to allow him a pension. This expedient proved successful; and the lord Tyrconnel, upon his promise of laying aside his design of exposing his mother's cruelty, took him into his family, treated him as an equal, and engaged to allow him a pension of 200l. a year. This was the golden part of Savage's life. He was courted by all who endeavoured to be thought men of genius, and cared for by all who valued themselves upon a refined taste. In this gay period of his life he published the Temple of Health and Mirth, on the recovery of lady Tyrconnel from a languishing illness; and The Wanderer, a moral poem, which he dedicated to lord Tyrconnel, in strains of the highest panegyric; but these praises he in a short time found himself inclined to retract, being discredited by the man on whom they were bestowed. Of this quarrel lord Tyrconnel and Mr. Savage assigned very different reasons. Our author's known character pleads too strongly against him; for his conduct was ever such as made all his friends, sooner or later, grow weary of him, and even forced most of them to become his enemies.

Being thus once more turned adrift upon the world, Savage, whose passions were very strong, and whose gratitude was very small, became extremely diligent in expounding the faults of lord Tyrconnel. He, moreover, now thought himself at liberty to take revenge upon his mother. Accordingly he wrote The Ballad, a poem, remarkable for the vivacity of its beginning, (where he finely enumerates the imaginary advantages of a base birth), and for the pathetic conclusion, wherein he recounts the real calamities which he suffered by the crime of his parents. The reader will not be displeased with a transcript of some of the lines in the opening of the poem, as a specimen of this writer's spirit and manner of verification.

Fleat be the ballad's birth! thro' wondrous ways,
He shines eccentric like a comet's blaze.
No lickly fruit of faint compliance he;
He lamp'd in nature's mint with eclatcy!
He lives to build, not boast, a generous race;
No tenth transfmitter of a foolish face.
He, kindling from within, requires no flame,
He glories in a ballad's glowing name.
—Nature's unbounded son, he stands alone,
His heart unbius'd, and his mind his own.
—O mother! yet no mother!—'tis to you
My thanks for such distinguiish'd claims are due.

This poem had an extraordinary sale; and its appearance happening at the time when his mother was at Bath, many persons there took frequent opportunities of repeating passages from the Ballad in her hearing.
This was perhaps the first time that ever he discovered a sense of shame, and on this occasion the power of wit was very conspicuous: the wretch who had, without scruple, proclaimed herself an adulteress, and who had first endeavoured to flave her son, then to transport him, and afterwards to hang him, was not able to bear the representation of her own conduct; but fled from reproach, though she felt no pain from guilt; and left Bath with the utmost haste, to shelter herself among the crowds of London.

Some time after this, Savage formed the resolution of applying to the queen; who having once given him life, he hoped the might farther extend her goodness to him by enabling him to support it.—With this view, he published a poem on her birth-day, which entitled The Volunteer-Laureat; for which she was pleased to send him 50l. with an intimation that he might annually expect the same bounty. But this annual allowance was nothing to a man of his strange and singular extravagance. His usual custom was, as soon as he had received his pension, to disappear with it, and extricate himself from his most intimate friends, till every shilling of the 50l. was spent; which done, he again appeared, penniless as before: but he would never inform any person where he had been, nor in what manner his money had been dissipat'd.—From the reports, however, of those who found means to penetrate his haunts, it would seem that he expanded both his time and his cash in the most forlorn and desppicable senility; particularly in eating and drinking, in obscure house of entertainment, over his bottle and trencher, immersed in filth and filth, with scarce decent apparel; generally wrapped up in a horseman's great coat; and, on the whole, with his very homely countenance, and altogether, exhibiting an object the most disgusting to the sight, if not to some other of the senses.

His wit and parts, however, still raised him new friends as fast as his misbehaviour lost him his old ones. Yet such was his conduct, that occasional relief only confirmed the means of occasional excess; and he defeated all attempts made by his friends to fix him in a decent way. He was even reduced so low as to be delirious of lodging; infomuch that he often passed his nights in those mean houses that are fet open for casual wanderers; sometimes in cellars amidst the riot and filth of the most profligate of the rabble; and not seldom would he walk the streets till he was weary, and then lie down in summer on a bulk, or in winter with his associates among the alleys of a glas-house.

Yet, amidst all his penury and wretchedness, had this man so much pride, and so high an opinion of his own merit, that he ever kept up his spirits, and was always ready to reprove, with scorn and contempt, the least appearance of any flight or indignity towards himself, in the behaviour of his acquaintance; among whom he looked upon none as his superior. He would be treated as an equal, even by persons of the highest rank. We have an instance of this preposterous and inconsistent pride, in his refusing to wait upon a gentleman who was deficient of relieving him when at the lowest ebb of distress, only because the message signified the gentleman's desire to see him at nine in the morning. Savage could not bear that any one should presume to prescribe the hour of his attendance, and therefore he absolutely rejected the proffered kindness. This life, unhappy as it may be already imagined, was yet rendered more unhappy, by the death of the queen, in 1738; which broke deprived him of all hopes from the court. His pension was discontinued, and the insolent manner in which he demanded of Sir Robert Walpole...

---

(A) Mr. Boswell, in his life of Dr. Johnson, has called in question the story of Savage's birth, and grounded his fulpicion on two mistakes, or, as he calls them, falsehoods, which he thinks he has discovered in his friend's memoirs of that extraordinary man. Johnson has said, that the earl of Rivers was Savage's godfather, and gave him his own name; which, by his direction, was inserted in the register of the parish of St. Andrew's, Holborn. Part of this, it seems, is not true; for Mr. Boswell carefully inspected that register, but no such entry is to be found. But does this omission amount to a proof, that the person who called himself Richard Savage was an impostor, and not the son of the earl of Rivers and the countess of Macclesfield? Mr. Boswell thinks it does; and, in behalf of his opinion, appeals to the maxim falsum in uno, falsum in omnibus. The falsity of this maxim may be allowed by others; but it was not without surmise that, on such an occasion, we found it adopted by the biographer of Johnson. To all who have compared his view of a celebrated cause, with Stuart's letters on the same subject addressed to Lord Mansfield, it must be apparent, that, at one period of his life, he would not have deemed a thousand such mistakes sufficient to invalidate a narrative otherwise so well authenticated as that which relates to the birth of Savage. The truth is, that the omission of the name in the register of St. Andrew's may be easily accounted for, without bringing against the wretched Savage an accusation of imposture, which neither his mother nor his friends dared to urge when provoked to it by every possible motive that can influence human conduct. The earl of Rivers would undoubtedly give the direction about registering the child's name to the same person whom he entrusted with the care of his education; but that person, it is well known, was the countess of Macclesfield, who, as she had resolved from his birth to defamation, would take care that the direction should not be obeyed.

That which, in Johnson's life of Savage, Mr. Boswell calls a second falsehood, seems not to amount even to a mistake. It is there stated, that "Lady Macclesfield having lived for some time upon very uneasy terms with her husband, thought a public confession of adultery the most obvious and expeditious method of obtaining her liberty." This Mr. Boswell thinks cannot be true; because, having perused the journals of both houses of parliament at the period of her divorce, he there found it authentically ascertained, that so far from voluntarily submitting to the ignominious charge of adultery, she made a strenuous defence by her counsel. But what is this to the purpose? Johnson has no where said, that she confessed her adultery at the
Savage to have it restored, for ever cut off this considerable supply; which possibly had been only delayed, and might have been recovered by proper application.

His distress now became so great, and so notorious, that a scheme was at length concerted for procuring him a permanent relief. It was proposed that he should retire into Wales, with an allowance of 50l. per annum, on which he was to live privately, in a cheap place, for ever quitting his town-haunts, and resigning all further pretensions to fame. This offer he seemed gladly to accept: but his intentions were changed the moment he received letters from his friends and patron Mr Pope, who proposed that Savage should write another tragedy, and then to return with it to London: which was strenuously opposed by his great and constant friend Mr Pope; who proposed that Savage should put this play into the hands of Mr Thomson and Mr Mallet, in order that they might fit it for the stage, that his friends should receive the profits it might bring in, and that the author should receive the produce by way of annuity. This kind and prudent scheme was rejected by Savage with the utmost contempt. He declared he would not submit his works to any one's correction; and that he would no longer be kept in leading-strings. Accordingly he soon returned to Bristol, in his way to London; but at Bristol, meeting with a repetition of the fame kind treat he had before found there, he was tempted to make a second play in that opulent city for some time. Here he was again not only careless and treated, but the sum of 50l. was raised for him, with which it had been happy if he had immediately departed for London: But he never considered that a frequent repetition of such kind}
acquainted. He flaid, in the midft of poverty, hunger, and contempt, till the middles of a coffee-house, to whom he owed about eight pounds, arrested him for the debt.

He remained for some time, at a great expense, in the house of the sheriff's officer, in hopes of procuring bail; which expense he was enabled to defray, by a present of five guineas from Mr Nafi at Bath. No bail, however, was to be found; fo that poor Savage was at last lodged in Newgate, a prifon fo named in Bristol.

But it was the fortune of this extraordinary mortal always to find more friends than he deferved. The keeper of the prifon took compaflion on him, and greatly softened the rigours of his confinement by every kind of indulgence; he supported him at his own table, gave him a commodious room to himself, allowed him a liberal education, and had his natural talents been known to his merit, and that he was little obliged to any one for those favours which he thought it their duty to confer on him: it is therefore the lefs to be wondered at, that he never rightly estimated the kindness of his many friends and benefactors, or preferred a grateful and due fervice of their generosity towards him.

The works of this original writer, after having long lain dispersed in magazines and fugitive publications, have been lately collected and published in an elegant edition, in 2 vols 8vo; to which are prefixed, the admirable Memoirs of Savage, written by Dr Samuel Johnson.

Savage is a word so well understood as scarcely to require explanation. When applied to inferior animals, it denotes that they are wild, untamed, and cruel; when applied to man, it is of much the fame import with barbarian, and means a person who is untaught and uncivilized, or who is in the rude state of uncultivated nature. That such men exist at preient, and have existed in most ages of the world, is undeniable: but a question naturally occurs respecting the origin of this savage state, the determination of which is of considerable importance in developing the nature of man, and a£tertaining the qualities and powers of the human mind. Upon this subject, as upon most others, opinions are very various, and the systems built upon them are consequently very contradictory. A large fect of ancient philosophers maintained that man sprang at first from the earth like his brother vegetables; that he was without ideas and without speech; and that many ages elapsed before the race acquired the use of language, or attained to greater knowledge than the beafts of the foreif. Other fects again, with the vulgar, and almost all the poets, maintained that the first mortals were wiser and happier, and more powerful, than any of their offpring; that mankind, instead of being originally savages, and rifing to the state of civilization by their own gradual and progressive exertions, were created in a high degree of perfection; that, however, they degenerated from that state, and that all nature degenerated with them. Hence the various ages of the world have almost everywhere been compared to gold, silver, brass, and iron, the golden having been always suppofed to be the firft age.

Since the revival of letters in Europe, and especially during the preient century, the fame question has been much agitated both in France and England, and by far the greater part of the most fashionable names in modern fciencé have declared for the original savagism of men. Such of the ancients as held that opinion were countenanced by the atheiflic cofmogony of the Phe-nicians, and by the early history of their own nations; the moderns build their fysten upon what they fuppofe to be the constitution of the human mind, and upon the late improvements in arts and fciences. As the question muft finall, be decided by historical evidence, before we make our appeal to facts, we shall confider the force of the modern reafonings from the fuppofed innate powers of the human mind; for that reafoning is totally dif- ferent from the other, and to blend them together would only prevent the reader from having an adequate conception of either.

Upon the fuppofition that all mankind were originally savages, deftitute of the use of speech, and, in the firft defte of the words, mutum et turpe pœus, the
great difficulty is to conceive how they could emerge from that state, and become as enlightened and civilized. The modern advocates for the universality of the savage state remove this difficulty by a number of inferences or internal senses, with which they suppose the human mind endowed, and by which the savage is, without reflection, not only enabled to distinguish right and wrong, and prompted to do every thing necessary to the preservation of his existence, and the continuance of the species, but also led to the discovery of what will contribute, in the first instance, to the ease and accommodation of life. These instincts, they think, brought mankind together when the reasoning faculty, which had hitherto been dormant, being now roused by the collisions of society, made its observations upon the consequences of their different actions, taught them to avoid such as experience showed to be pernicious, and to improve upon those which they found beneficial; and thus was the progress of civilization begun. But this theory is opposed by objections which we know not how to obviate. The bundle of instincts with which modern idlenesses, under the denomination of philosophy, has so amply furnished the human mind, is a mere chimera. (See Instinct.) But granting its reality, it is by no means sufficient to produce the consequences which are derived from it. That it is not the parent of language, we have shown at large in another place (see Language, no. 1—7.); and we have the confession of some of the ablest advocates for the original vagabondy of man, that large societies must have been formed before language could have been invented. How societies, at least large societies, could be formed and kept together without language, we have not indeed been told; but we are assured by every historian and every traveller of credit, that in such societies only have mankind been found civilized. Among known savages the focal image is very much confined; and therefore, it had been in the first race of men of as enlarged a nature, and as facile a guide, as the instinctive philosophers contend that it was, it is plain that those men could not have been savages. Such an appetite for society, and such a director of conduct, instead of enabling mankind to have emerged from vagabondy, would have effectively prevented them from ever becoming savages. It would have knit them together from the very first, and furnished opportunities for the progenitors of the human race to have begun the process of civilization from the moment that they dropped from the hands of their Creator. Indeed, were the modern theories of internal senses and focal affections well founded, and were these senses and affections sufficient to have impelled the first men into society, it is not easy to be conceived how there could be at this day a savage tribe on the face of the earth. Natural caustics, operating in the same direction and with the same force, must in every age produce the same effects; and if the focal affections of the first mortals impelled them to society, and their reasoning faculties immediately commenced the process of civilization, surely the same affections and the same faculties would in a greater or less degree have had the same effect in every age and on every tribe of their numerous offspring; and we should wherever observe mankind advancing in civilization, instead of standing still as they often do, and sometimes retreating by a retrograde motion. This, however, is far from being the case. Hordes of savages still in all parts of the globe; and the Chinese, who have undoubtedly been in a state of civilization for at least 2000 years, have during the whole of that long period been absolutely stationary, if they have not lost some of their ancient arts. (See Porcelain.) The origin of civilization, therefore, is not to be looked for in human instincts or human propensities, carrying men forward by a natural progress; for the supposition of such propensities is contrary to fact; and by fact and historical evidence, in conjunction with what we know of the nature of man, must this great question be at last decided.

In the article Religion, no. 7. it has been shown that the first men, if left to themselves without any influence, instead of living the life of savages, and in pursuits of time advancing towards civilization, must have perished before they acquired even the use of some of their senses. In the same article it has been shown (no. 14—17.), that Moses, as he is undoubtedly the oldest historian extant, wrote likewise by immediate inspiration; and that therefore, as he represents our first parents and their immediate descendants as in a state far removed from that of savages, it is vain to attempt to deduce the originality of such a state from hypothetical theories of human nature. We have, indeed, heard it observed by some of the advocates for the antiquity and universality of the savage state, that to the appeal to revelation they have no objection, provided we take the Mosaic account as it stands, and draw not from it conclusions which it will not support.

They contend, at the same time, that there is no argument fairly deducible from the book of Genesis which militates against their position. Now we beg leave to remark, that besides the reasoning which we have already used in the article just referred to, we have as much positive evidence against their position as the nature of the Mosaic history could be supposed to afford. We are there told that God created man after his own image; that he gave him dominion over every thing in the sea, in the air, and over all the earth; that he appointed for his food various kinds of vegetables; that he ordained the Sabbath to be observed by him, in commemoration of his works of creation; that he prepared for him a garden to till and to dress; and that, as a test of his religion and submission to his Creator, he forbade him, under severe penalties, to eat of a certain tree in that garden. We are then told that God brought to him every animal which had been created; and we find that Adam was so well acquainted with their several natures as to give them names. When too an helpmate was provided for him, he immediately acknowledged her as bone of his bone, flesh of his flesh, and called her woman, because she was taken out of man.

How these facts can be reconciled to a state of ignorant vagabondy is to us absolutely inconceivable; and it is indeed strange, that men who profess Christianity should appeal to reason, and tick by its decision on a question which revelation has thus plainly decided against them. But it is agreeable to their theory to believe that man rose by slow steps to the full use of his reasoning powers. To us, on the other hand, it appears equally plausible to suppose that our first parents were created, not in full maturity, but mere infants, and that they went through the tedious process of childhood and youth.
Savage. youth, &c. as to suppose that their minds were created weak, uninforme, and uncivilized, as are those of savages.

But if it be granted that Adam had a tolerable share of knowledge, and some civilization, nothing can be more natural than to suppose that he would teach his descendants what he knew himself: and if the Scriptures are to be believed, we are certain that some of them possessed more than savage knowledge, and better than savage manners. But instead of going on to farther perfection, as the theory of modern philosophers would lead us to suppose, we find that mankind degenerated in a most astonishing degree; the causes of which we have already in part developed in the article Polytheism, no. 4, &c.

This early degeneracy of the human race, or their sudden progress towards ignorance and savagery, appears to lead to an important consequence. If men so very soon after their creation, possessing, as we have seen they did, a considerable share of knowledge and of civilization, instead of improving in either, degenerated in both respects, it would not appear that human nature has that strong propensity to refinement which many philosophers imagine; or that had all men been originally savage, they would have civilized themselves by their own exertions.

Of the ages before the flood we have no certain account anywhere but in Scripture; where, though we find mankind represented as very wicked, we have no reason to suppose them to have been absolute savages.

On the contrary, we have much reason, from the short account of Moses, to conclude that they were far advanced in the arts of civil life. Cain, we are told, built a city; and two of his early descendants invented the harp and organ, and were artificers in brass and iron. Cities are not built, nor musical instruments invented, by savages, but by men highly cultivated; and surely we have no reason to suppose that the righteous posterity of Seth were behind the apostate descendants of Cain in any branch of knowledge that was really useful. That Noah and his family were far removed from savagery, no one will controvert who believes that with them was made a new covenant of religion; and it was unquestionably their duty, as it must otherwise have been their wish, to communicate what knowledge they possessed to their posterity. Thus far then every consistent Christian, we think, must determine against original and universal savagery.

In the preface to a discourse on Sketches of the History of Man, Lord Kames would inter, from some facts which he states, that many pairs of the human race were at first created, of very different forms and natures, but all depending entirely on their own natural talents. But to this statement he rightly observes, that the Mosaic account of the Creation opposes insuperable objections. "Whence then (says his Lordship) the degeneracy of all men into the savage state? To account for that dismal catastrophe, mankind must have suffered some dreadful convulsion." Now, if we mistake not, this is taking for granted the very thing to be proved. We deny that at any period since the creation of the world, all men were sunk into the state of savages; and that they were, no proof has yet been brought, nor do we know of any that can be brought, unless our fashionable philosophers choose to prop their theories by the buttresses of Sanchoniatho's Phenician cosmogony. (See Sanchoniatho.) His Lordship, however, goes on to say, or rather to suppose, that the confusion at Babel, &c. was this dreadful convulsion: For, says he, "by confounding the language of men, and scrambling them abroad upon the face of all the earth, they were rendered savages." Here again we have a positive assertion, without the least shadow of evidence; for it does not at all appear that the confusion of language, and the scrambling abroad of the people, was a circumstance such as could induce universal savagery. There is no reason to think that all the men then alive were engaged in building the tower of Babel; nor does it appear from the Hebrew original that the language of those who were engaged in it was so much changed as the reader is apt to infer from our English version. (See Philology, no. 8—16.) That the builders were scattered, is indeed certain; and if any of them were driven, in very small tribes, to a great distance from their brethren, they would, in course of time inevitably become savages. (See Polytheism, no. 4—6, and Language, no. 7.) But it is evident, from the Scriptural account of the peopling of the earth, that the descendents of Shem and Japheth were not scattered over the face of the earth: and that therefore they could not be rendered savage by the catastrophe at Babel. In the chapter which relates that wonderful event, the generations of Shem are given in order down to Abram; but there is no indication that they had suffered with the builders of the tower, or that any of them had degenerated into the state of savages. On the contrary, they appear to have possessed a considerable degree of knowledge; and if any credit be due to the tradition which represents the father of Abraham as a satyr, and himself as skilled in the science of astronomy, they must have been far advanced in the arts of refinement. Even such of the posterity of Ham as either emigrated or were driven from the plain of Shinar in large bodies, so far from sinking into savagery, retained all the accomplishments of their antediluvian ancestors, and became afterwards the instructors of the Greeks and Romans. This is evident from the history of the Egyptians and other eastern nations, who, in the days of Abraham, were powerful and highly civilized. And that for many ages they did not degenerate into barbarism, is apparent from its having been thought to exalt the character of Moses, that he was learned in all the wisdom of the Egyptians, and from the wisdom of Solomon having been said to excel all the wisdom of the Gentiles and of Egypt.

Thus decided are the Scriptures of the Old Testament against the universal prevalence of savagery in that period of the world; nor are the most authentic Pagan writers of antiquity of a different opinion. Moehus the Phenician*, Democritus, and Epicurus, appear to be the first champions of the savage state, and they are followed by a numerous body of poets and philosophers, among the Greeks and Romans, who were unquestionably devoted to fable and fiction. The account which they have given of the origin of man, the reader will find in another place (see Theology, Part i. sect. 1.)

But we hardly think that he will employ it in support of the fashionable doctrine of original savagery. Against the wild reveries of this school are polled all the leaders of the other sects, Greeks and barbarians; the philosophers
savage. sophers of both Academies, the fuges of the Italian and Alexandrian Schools; the magi of Persia; the Brahmins of India, and the Druids of Gaul, &c. The testimony of the early historians among all the ancient nations, indeed, who are avowedly fabulous, is very little to be depended on, and has been called in question by the most judicious writers of Pagan antiquity. (See Plutarch Pia Thes. sub init. Thucyd. L. 1. cap. 1. Strabo, l. 11. p. 507. Livy Prof. and Varro ap. Auguf de Civ. Dei.) The more populous and extensive kingdoms and societies were civilized at a period prior to the records of profane history; the presumption, therefore, without taking revelation into the account, certainly is, that they were civilized from the beginning. This is rendered further probable from other circumstances. To account for their system, the advocates of savagism are obliged, as we have seen, to have recourse to numerous suppositions. They imagine, that since the creation dreadful convulsions have happened, which have spread ruin and devastation over the earth, which have destroyed learning and the arts, and brought on savagism by some sudden blow. But this is reasonaing at random, and without a vestige of probability: for the only conviction that can be mentioned is that at Babel, which we have already shown to be inadequate.

Further, it does not appear that any people who were once civilized, and in process of time had degenerated into the savage or barbarous state, have ever recovered their primitive condition without foreign aid. From whence we conclude, that man, once a savage, would never have raised himself from that hopeless state. This appears evident from the history of the world; for that it requires strong incitements to keep man in a very high state of knowledge and civilization, is evident from what we know of barbarous nations which were famed in antiquity, but which a short degeneration in an astonishing degree. That man cannot, or, which is the same thing, has not risen from barbarism to civilization and science by his own efforts and natural talents, appears further from the following facts. The rudiments of all the learning, religion, laws, arts, and sciences, and other improvements that have enlightened Europe, a great part of Asia, and the northern coast of Africa, were many rays diverging from two points, on the banks of the Euphrates and the Nile. In proportion as nations receded from these two sources of humanity and civilization, in the same proportion were they more and more immersed in ignorance and barbarism. The Greeks had made no progress towards civilization when the Titans first, and afterwards colonies from Egypt and Phenicia, taught them the very elements of science and urbanity. The aborigines of Italy were in the same state prior to the arrival of the Pelasgi, and the colonies from Aegyptus and other parts of Greece. Spain was indebted for the first fruits of improvement to the commercial spirit of the Phenicians. The Gauls, the Britons, and the Germans, derived from the Romans all that in the early periods of their history they knew of science, or the arts of civil life, and so on of other nations in antiquity. The same appears to be the case in modern times. The countries which have been discovered by the restless and inquisitive spirit of Europeans have been generally found in the lowest state of savagism; from which, if they have emerged at all, it has been exactly in proportion to their connection with the inhabitants of Europe. Even western Europe itself, when sunk in ignorance during the reign of monarchy, did not recover by the efforts of its own inhabitants. Had not the Greeks, who in the 15th century took refuge in Italy from the cruelty of the Turks, brought with them their ancient books, and taught the Italians to read them, we who are disputing about the origin of the savage state, and the innate powers of the human mind, had at this day been gross and ignorant savages ourselves, incapable of reasoning—"with accuracy upon any subject. That we have now advanced far before our masters is readily admitted; for the human mind, when put on the right track, and spurred on by emulation and other incitements, is capable of making great improvements in between improving science, and emerging from savagism, every one perceives there is an immense difference.

Lord Kames observes, that the people who inhabit a grateful soil, where the necessaries of life are easily procured, are the first who invent useful and ingenious arts, and the first who figure in the exercises of the mind. But the Egyptians and Chaldeans, who are thought to support this remark, appear from what we have seen to have derived their knowledge from their antediluvian progenitors, and not from any advantages of situation or strength of genius. Besides, the inhabitants of a great part of Africa, of North and South America, and of many of the islands lately discovered, live in regions equally fertile, and equally productive of the necessaries of life, with the regions of Chaldee and Egypt; yet these people have been savages from time immemorial, and continue so in the same state. The Athenians, on the other hand, inhabited the most barren and ungrateful region of Greece, while their perfection in the arts and sciences has never been equalled. The Norwegian colony which settled in Iceland about the beginning of the 9th century, inhabited a most bleak and barren soil, and yet the fine arts were eagerly cultivated in that dreary region when the rest of Europe were sunk in ignorance and barbarism. Again, there are many parts of Africa, and of North and South America, where the soil is neither so luxuriant as to beget indolence, nor so barren and ungrateful as to deprive the spirits by labour and poverty; where, notwithstanding, the inhabitants still continue in an uncultivated state. From all which, and from numerous other instances which our limits permit us not to bring forward, we infer that some external influence is necessary to impel towards the civilization of savages; and that in the history of the world, or the nature of the thing, we find no instance of any people emerging from barbarism by the progressive efforts of their own genius. On the contrary, as we find in societies highly cultivated and luxurious a strong tendency to degenerate; so in savages we not only find no mark of tendency to improvement, but rather a rooted aversion to it. Among them, indeed, the selfish appetite never reaches beyond their own horde. It is, therefore, too weak and too confined to dispoje them to unite in large communities; and of course, had all mankind been once in the savage state, they never could have arrived at any considerable degree of civilization.

Instead of trusting to any such natural progress, as is contended for, the Providence of Heaven, in pity to the human race, appears at different times, and in different
different countries, to have raised up some persons endowed with superior talents, or, in the language of poetry, some heroes, demi-gods, or god-like men, who, having themselves acquired some knowledge in nations already civilized, by useful inventions, legislation, religious institutions, and moral arrangements, sowed the first seeds of civilization among the hordes of wandering destined barbarians. Thus we find the Chinese look up to their Fohe, the Indians to Brahma, the Persians to Zoroaster, the Chaldeans to Oanes, the Egyptians to Thoth, the Phenicians to Melicerta, the Scandinavians to Odin, the Italians to Janus, Saturn, and Pius, and the Peruvians to Manco. In latter times, and almost within our own view, we find the barbarous nations of Russia reduced to some order and civilization by the alighting powers and exertions of Peter the Great. The endeavours of succeeding monarchs, and especially of the present empress, have powerfully contributed to the improvement of this mighty empire. In many parts of it, however, we find the inhabitants in a state very little superior to savagism; and through the most of it, the lower, and perhaps the middling orders, appear to want an almost invincible averter to all further progress*. A fact which was added to numerous others of a similar nature which occur in the history of the world, seems to prove indisputably that there is no such natural propensity to improvement in the human mind as we are taught by some authors to believe. The origin of savagism, if we allow mankind to have been at first civilized, is easily accounted for by natural means: The origin of civilization, if at any period the whole race were savages, cannot, we think, be accounted for otherwise than by a miracle, or repeated miracles.

To many persons, in the present day especially, the doctrine we have now attempted to establish, will appear very humiliating; and perhaps it is this alone that has prevented many from giving the subject its proper hearing as its importance seems to require. It is a fashionable kind of philosophy to attribute to the human mind very pre-eminent powers; which so flatter our pride, as in a great measure, perhaps, to pervert our reason, and blind our judgment. The history of the world, and of the dispensations of God to man, are certainly at variance with the popular doctrine respecting the origin of civilization; for if the human mind be possessed of that innate vigour which that doctrine attributes to it, it will be extremely difficult to account for those numerous facts which seem with irresistible evidence to proclaim the contrary; for that unceasing care with which the Deity appears to have watched over us; and for those various and important revelations He has vouchsafed to us. Let us rejoice and be thankful that we are men, and that we are Christians; but let not a vain philosophy tempt us to imagine that we are angels or gods.

SAVAGE-Island, one of the small islands in the South Sea, lying in S. Lat. 19° 1' W. Long. 169° 37'. It is about seven leagues in circuit, of a good height, and has deep water close to its shores. Its interior parts are supposed to be barren, as there was no soil to be seen upon the coast; the rocks alone supplying the trees with humidity. The inhabitants are exceedingly warlike and fierce, so that Captain Cook could not have any intercourse with them.

SAVANNA-la-MAR, a town of Jamaica, situated in the county of Cornwall in that island. It is the county-town, where the assize-courts are held, the last Thursday in March, June, September, and December. It has lately been ornamented by an elegant court-house, and contains about 100 other houses. It belongs to the Westmoreland parish, in which are 89 parishes, 106 other estates, and 18,000 slaves.

SAVANNAH, a port of entry and post-town in Georgia, formerly the metropolis of that State. It is situated in Chatham county, on the south side of Savannah river upon a high sandy bluff, elevated about 50 feet above the river, and 17 miles above its confluence with the ocean. The town is regularly laid out, in the form of a parallelogram, and contains 2,500 inhabitants; about 80 or 90 of these are Jews. The public buildings are a Presbyterian, an Episcopalian, a German Lutheran church, a Jewish synagogue, and a courthouse. It is 120 miles from Augusta, and 873 S. W. by S. of Philadelphia. W. Long. 101° 20'. N. Lat. 32° 0'.

SAVANNAH, a large navigable river of Georgia, which is formed by the union of the Tugeloo and Keowee rivers, that rise in the Appalachian mountains; these confluent rivers assume the name of Savannah, which pursues a S. E. course, and receives from the N. W. Broad river, a considerable stream, thence continuing a S. E. course, enters the Atlantic, in Lat. 32°, after passing by Augusta, Ebenezer, and Savannah: to the latter it is navigable in large vessels, having generally 16 feet water at half-tides, and in boats of 100 feet keel, carrying 80 or 90 hogheads of tobacco, to Augusta, where it is about 250 yards wide, and from 10 to 15 feet deep. The navigation is obstructed about 3 miles above Augusta, by falls, but after passing these it is navigable to the mouth of Tugeloo river. In high floods the falls are frequently passed by loaded boats. The great number of logs and stumps which are concealed under water, have often overflowed boats; and render the navigation of this river somewhat dangerous. In the year 1790 nearly 200 hogheads of tobacco were left in paling down the river.

Savary (James), an eminent French writer on the subject of trade, was born at Dom, in Anjou, in 1622. Being bred to merchandise, he continued in trade until 1658; when he left off the practice, to cultivate the theory. He had married in 1650; and in 1660, when the king declared a purpose of allowing privileges and petitions to such of his subjects as had twelve children alive, Mr Savary was not too rich to put in his claim to the royal bounty. He was afterwards admitted of the council for the reformation of commerce; and the orders which passed in 1670 were drawn up by his instructions and advice. He wrote Le Parfait Négociant, 4to; and, Avis et conseils pour les plus importantes matières du Commerce, 4to. He died in 1695; and out of 17 children whom he had by one wife, left 11. Two of his sons, James and Philemon Lewis, laboured jointly on a great work, Dictionnaire Universel du Commerce, 2 vols folio. This work was begun by James, who was inspector-general of the manufactures at the cuffe-mhances, Paris; who called in the assistance of his brother Philemon Lewis, although a canon of the royal church of St Maur; and by his death left him to finish it. This work appeared in 1723, and Philemon afterwards added a third supplemental volume to the former. Postlethwayte's English Dictionary of Trade.
SAVARY, an eminent French traveller and writer, was born at Vitre, in Brittany, about the year 1748. He studied with applause at Rennes, and in 1776 travelled into Egypt, where he remained almost three years. During this period he was wholly engaged in the study of the Arabian language, in searching out ancient monuments, and in examining the national manners. After making himself acquainted with the knowledge and philosophy of Egypt, he visited the islands in the Archipelago, where he spent 18 months. On his return to France, in 1780, he published, 1. A Translation of the Koran, with a short Life of Mahomet, in 1783, 2 vols 8vo. 2. The Morality of the Koran, or a collection of the most excellent Maxims in the Koran; a work extracted from his translation, which is esteemed both elegant and faithful. 3. Letters on Egypt, in 3 vols 8vo. In these the author makes his observations with accuracy, paints with vivacity, and renders interesting every thing he relates. His descriptions are in general faithful, but are perhaps in some instances too much ornamented. He has been justly cenfured for painting modern Egypt and its inhabitants too dark colours. These letters, however, were bought up by the curious public, and read with pleasure.

On his return into the country adjacent to Paris, his health was at first doubtful; for it is well known that when the organization of one of the viscera has been much deranged, deep traces of it will ever remain. His active mind, however, made him regardless of his health, and he conceived it his duty to profit by those appearances of recovery which he experienced at the close of the summer and the beginning of autumn, to put into order his travels into the islands of the Archipelago, intended as a continuation of his letters on Egypt. His warmth of temper was exasperated by some lively criticisms which had been made on his former productions, and he gave himself up to study with a degree of activity of which the consequences were sufficiently obvious. An obstruction in the liver again took place, and made a new progress; his digestion became extremely languid; sleep quite forsook him, both by night and day; a dry and troublesome cough came on; his face appeared bloated, and his legs more and more inflamed. The use of barley-water and cream of tartar (still however promoted, in some degree, the urinary secretions, and afforded some little glimmering of hope. In this situation he returned to Paris in the beginning of the year 1788, to attend to the publication of his new work concerning the islands of the Archipelago, particularly the isle of Candia. He had then all the symptoms of a dangerous dropsey, which became still more alarming from the very exhausted state of the visera. The right lobe of the liver was extremely hard and fénile. The patient had shivering; without any regular returns, and his strength was undermined by a hectic fever. At the same time still more uneasy symptoms took place, those of a dropsey in the chest; but the circumstances which destroyed all hope, and announced his approaching dissolution, were a severe pain in the left side, with a very troublesome cough, and a copious and bloody expectoration (in hepaticus, says Hippocrates, punctum cruentum mortiferum); his respiration became more and more difficult; his strength was exhausted, and his death took place on the 4th of February 1788, attended with every indication of the most copious overflowing in the chest, and of an abscess in the liver. Thus he was destroyed, in the vigour of his age, an author whose character and talents rendered him worthy of the happiest lot.

Mr SAVARY's genius was lively and well cultivated; his heart warm and benevolent; his imagination vigorous; his memory Retentive. He was cheerful and open; and had so great a talent for telling a story, that his company was not less agreeable than instructive. He did not mingle much with the world, but was satisfied with performing well the duties of a son, of a brother, and of a friend.

SAUCISSE, or SAUcissON, in mining, is a long pipe or bag made of cloth well pitched, or sometimes of leather, of about an inch and a half diameter, filled with powder, going from the chamber of the mine to the entrance of the gallery. It is generally placed in a wooden pipe called an auget, to prevent its growing damp. It serves to give fire to mines, caufins, bomb-cheafs, &c.

SAUcissOn, is likewise a kind of sausage, longer than the common ones; they serve to raise batteries and to repair breaches. They are also used in making epaulets, in topping passages, and in making travois or a wet ditch, &c.

SAVE, a river of Germany, which has its source in Upper Carniola, on the frontiers of Carinthia. It runs through Carniola from west to east, afterwards separates Scelonia from Croatia, Bofinia, and part of Servia, and then falls into the Danube at Belgrade.

SAVER-KROUT. See CROUTE.

SAVERNAKE-FOREST is situated near Marlborough in Wiltshire, and is 12 miles in circumference, well fenced with deer, and delightful from the many villas cut through the woods and coppices with which it abounds. Eight of these villas meet, like the rays of a star, in a point near the middle of the forest; where an octagon tower is erected to correspond with the villas; through one of which is a view of Tottenham Park, Lord Ailesbury's seat, a lately edifice erected after the model, and under the direction, of the modern Vitruvius, the earl of Burlington, who to the strength and convenience of the English architecture has added the elegance of the Italian.

SAVILE (Sir George), afterwards marquis of Halifax, and one of the greatest statesmen of his time, was born about the year 1630; and some time after his return from his travels was created a peer, in consideration of his own and his father's merits. He was a strenuous opposer of the bill of exclusion; but proposed such limitations of the duke of York's authority, as fould disable him from doing any harm either in church or state, as the taking out of his hands all power in ecclesiastical matters, the dispensal of the public money, and the power of making peace and war; and lodging these in the two houses of parliament. After that bill was rejected in the house of lords, he prefixed them, though without success, to proceed to the limitation of the
SAV

SAU

the duke’s power; and began with moving, that during the king's life he might be obliged to live five hundred miles out of England. In Aug. 1682 he was created a marquis, and soon after made privy-seal. Upon King James’s accession, he was made president of the council; but on his refusal to consent to the repeal of the test, he was dismissed from all public employments. In that assembly of the lords which met after King James’s withdrawing himself the first time from Whitehall, the marquis was chosen their president; and upon the king’s return from Fermorham, he was sent, together with the earl of Shrewsbury and lord Delamere, from the prince of Orange, to order his majesty to quit the palace at Whitehall. In the convention of parliament he was chosen speaker of the house of lords, and strenuously supported the motion for the vacancy of the throne, and the conjunctive sovereignty of the prince and princess; upon whose accession he was again made privy-seal. Yet, in 1689, he quit the court, and became a zealous opponent of the measures of government till his death, which happened in April 1697. The rev. Mr Grainger observes, that † he was a person of untutored principles, and of a lively imagination, which sometimes got the better of his judgment. He would never lose his jest, though it spoiled his argument, or brought his sincerity or even his religion in question. He was deservedly celebrated for his parliamentary talents; and in the famous contest relating to the bill of exclusion was thought to be a match for his uncle Shaftesbury. The pieces he has left us show him to have been an ingenious, if not a matterly writer; and his Advice to a Daughter contains more good sense in fewer words than is, perhaps, to be found in any of his contemporary authors.† His lordship also wrote, The Anatomy of an Equivalent; a Letter to a Differenter; A Rough Draught of a New Model at Sea; and Maxims of State; all which were printed together in one volume 8vo.—Since these were also published under his name the character of king Charles II. 8vo; the Character of Bishop Burnet, and Historical Observations upon the reigns of Edward II., III., and Richard II., with Remarks upon their faithful Counsellors and false Favourites.

SAVIN, in botany. See Juniperus.

SAVOUR, an appellation peculiarly given to Jesus Christ, as being the Messiah and Saviour of the world. See Jesus.

Order of St Saviour, a religious order of the Romish Church, founded by St Bridget, about the year 1345, and so called from its being pretended that our Saviour himself declared its constitution and rules to the founders. According to the constitutions, this is principally founded for religious women who pay a particular honour to the holy virgin; but there are some monks of the order, to administer the sacrament and spiritual assistance to the nuns.

SAUL the son of Kish, of the tribe of Benjamin, was the first king of the Israelites. On account of his disobedient conduct, the kingdom was taken from his family, and given to David. See the First Book of Samuel. Saul, a hero of called Paul. See Paul.

SAUMUR, a considerable town of France, in Anjou, and capital of the Saumarois, with an ancient castle. The town is small, but pleasantly situated on the Loire, a river which is a long bridge, continued through a number of wells. Saumur was anciently a most important place over the river, and of consequence was frequently and fiercely disputed by either party, during the civil wars of France in the sixteenth century. The fortifications are of great strength, and Henry the Fourth, on the reconciliation which took place between him and Henry the Third, near Tours, in 1589, demanded that Saumur should be delivered to him, as one of the cities of safety. The castle overlooks the town and river. It is built on a lofty eminence, and has a venerable and magnificent appearance, and was lately used as a prison of state, where persons of rank were frequently confined. The kings of Sicily, and dukes of Anjou of the house of Valois, who descended from John king of France, often resided in the castle of Saumur, as it constituted a part of their Angevin dominions. E. Long. o. 2. N. Lat. 47. 15.

SAUNDERS, a kind of wood brought from the East Indies, of which there are three kinds; white, yellow, and red. See Pterocarpus and Santalum.

SAUNDERSON (Dr Robert), an eminent caufuist, was born at Rotherham, in Yorks, on the 19th September 1587, and was descended of an ancient family. He attended the grammar-school at Rotherham, where he made such wonderful proficiency in the languages, that at 13 it was judged proper to send him to Lincoln college, Oxford. In 1608 he was appointed logic reader in the same college. He took orders in 1611, and was promoted successively to several benefices. Archbishop Laud recommended him to king Charles I. as a profound caufuist; and that monarch, who seems to have been a great admirer of casuistical learning, appointed him one of his chaplains in 1631.

Charles proposed several cases of conscience to him, and received so great satisfaction from his answers, that at the end of his month’s attendance he told him, that he would wait with impatience during the intervening 11 months, as he was resolved to be more intimately acquainted with him, when it would again be his turn to officiate. The king regularly continued his sermons, and was wont to say, that “he carried his ears to hear other preachers, but his conscience to hear Mr Saunders.”

In 1642 Charles created him regius professor of divinity at Oxford, with the canony of Christ church annexed: but the civil wars prevented him till 1646 from entering on the office; and in 1648 he was ejected by the visitors which the parliament had commissioned. He must have stood high in the public opinion; for in the same year in which he was appointed professor of divinity, both houses of parliament recommended him to the king as one of their trustees for settling the affairs of the church. The king, too, repeated great confidence in his judgment, and frequently consulted him about the state of his affairs. When the parliament proposed the abolition of the episcopal form or church-government as incompatible with monarchy, Charles desired him to take the subject under his consideration and declare his opinion. He accordingly wrote a treatise entitled, Episcopacy as established by law in England not prejudicial to regal power.

Dr Saunders was taken prisoner by the parliament’s troops and conveyed to Lincoln, in order to procure in exchange a Puritan divine named Clark, whom the king’s army had taken. The exchange was agreed to, on condition that Dr Saunders’s living should
should be restored, and his person and property remain un molested. The first of these demands was readily complied with: and a stipulation was made, that the second should be observed; but it was impossible to restrain the licentiousness of the soldiers. They entered his church when he was absent, and in the same manner interrupted him when reading prayers, and even had the audacity to take the common prayer book from him, and to tear it to pieces.

The Honourable Mr Boyle, having read a work of Dr Saunderson's entitled De jurament. obligationes, was so much pleased, that he inquired at Bishop Barlow, whether he thought it was possible to prevail on the author to write Cases of Conscience, if an honorary pension was assigned him to enable him to purchase books, and pay an amanuensis. Saunderson told Barlow, "that if any future tract of his could be of any use to mankind, he would cheerfully set about it without a pension." Boyle, however, sent him a present of 50l. feasible, no doubt, that, like the other royalties, his finances could not be great. Upon this Saunderson published his book De Conscientia.

When Charles II. was reinstated in the throne, he recovered his professorship and canonry, and soon after was promoted to the bishopric of Lincoln. During the two years and a half in which he possessed this new office, he spent a considerable sum in augmenting poor vicarages, in repairing the palace at Bugden, &c. He died January 29, 1662-3, in his 76th year.

He was a man of great acuteness and solid judgment. "That fluid and well-weighted man Dr Saunderson (says Dr Hammond) conceives all things deliberately, dwells upon them discreetly, discerns things that differ exactly, paseth his judgment rationally, and expresseth it aptly, clearly, and honestly." Being asked, what books he had read most? he replied, that "he did not read many books, but those which he did read were well chosen and frequently perused." These, he said, were chiefly three, Aristotle's Rhetoric, Aquinas's Secunda Secunda Saundera, and Tully's Works; especially his Offices, which he had not read over less than 20 times, and could even, in his old age, recite without book.

He added, that "the learned civilian Dr Zouch had written Elementa juris prudential, which he thought he could also say without book, and that no wise man could read it too often."

It will now be proper to give a short account of his works. 1. In 1615 he published Logica Aris Compendium, which was the system of lectures he had delivered in the University when he was logic-reader. 2. Sermons, amounting in number to 36, printed in 1681, folio, with the author's life by Walton. 3. Nine Cases of Conscience resolved; first collected in one volume, in 1696, 8vo. 4. De jurament. obligationes. This book was translated into English by Charles I., while a prisoner in the Isle of Wight, and printed at London in 1665, 8vo. 5. De Obligatione conscient. 6. Centuries of Mr Anthony Ascham his book of the confusions and revolutions of government. 7. Pau Eclesiae concerning Predestination, or the five points. 8. Episcopacy, as established by Law in England, not prejudicial to the regal power, in 1661. Befides these, he wrote two Discourses in defence of Usher's writings.

Saunderson (Dr. Nicolas), was born at Thuxton in Yorkshire in 1682, and may be considered as a prodigy for his application and success in mathematical literature in circumstances apparently the most unfavourable. He left his school by the small-pox before he was a year old. But this difficulty did not prevent him from searching after that knowledge for which nature had been so bountifully provided. He was initiated into the Greek and Roman authors at a free school at Penrith. After spending some years in the study of the languages, his father (who had a place in the excise) began to teach him the common rules of arithmetic. He soon surpassed his father; and could make long and difficult calculations, without having any sensible marks to affright his memory. At 18 he was taught the principles of algebra and geometry by Richard Welte of Un- derbank, Esq.; who, though a gentleman of fortune, yet, being strongly attached to mathematical learning, readily undertook the education of so uncommon a genius. Saunderson was also allured in his mathematical studies by Dr Nettleton. These two gentlemen read books to him and explained them. He was next sent to a private academy at Attercliffe near Sheffield, where logic and metaphysics were chiefly taught. But these sciences not putting his turn of mind, he soon left the academy. He lived for some time in the country without any instructor; but such was the vigour of his own mind, that few instructions were necessary: he only required books and a reader.

His father, besides the place he had in the excise, possessed also a small estate; but having a numerous family to support, he was unable to give him a liberal education at one of the universities. Some of his friends, who had remarked his perceptive and interesting manner of communicating his ideas, proposed that he should attend the university of Cambridge as a teacher of mathematics. This proposal was immediately put in execution; and he was accordingly conducted to Cambridge in his 25th year by Mr Joshua Dunn, a fellow-commoner of Christ's college. Though he was not received as a member of the college, he was treated with great attention and respect. He was allowed a chamber, and had free access to the library. Mr Whiston was at that time professor of mathematics; and as he read lectures in the way that Saunderson intended, it was naturally to be supposed he would view his project as an invasion of his office. But, instead of meditating any opposition, the plan was no sooner mentioned to him than he gave his consent. Saunderson's reputation was fast spread through the university. When his lectures were announced a general curiosity was excited to hear such intimate mathematical subjects explained by a man who had been blind from his infancy. The subject of his lectures was the Principia Mathematica, the Optics, and Anagogica Universali of Sir Isaac Newton. He was accordingly attended by a very numerous audience. It will appear at first incredible to many that a blind man should be capable of explaining optics, which requires an accurate knowledge of the nature of light and colours; but we must recollect, that the theory of vision is taught entirely by lines, and is subject to the rules of geometry. While thus employed in explaining the principles of the Newtonian philosophy, he became known to its illustrious author. He was also intimately acquainted with Halley, Claus, De Moivre, and other eminent mathematicians. When Wharton was removed from his professor-
Saunderfon was universally allowed to be the man best qualified for the situation. But to enjoy this office, it was necessary, as the statutes directed, that he should be promoted to a degree. To obtain this privilege the heads of the university applied to their chancellor the duke of Somerset, who procured the royal mandate to confer upon him the degree of master of arts. He was then elected Lucian professor of mathematics in November 1711. His inaugural speech was composed in classical Latin, and in the style of Cicero, with whose works he had been much conversant. He now devoted his whole time to his lectures, and the instruction of his pupils. When George II. in 1728, visited the University of Cambridge, he expressed a desire to see Professor Saunderfon. In compliance with this desire, he waited upon his majesty in the senate-house, and was there, by the king's command, created doctor of laws. He was admitted a member of the Royal Society in 1736.

Saunderfon was naturally of a vigorous constitution; but having confined himself to a sedentary life, he at length became feeble and infirm. For several years he felt a numbness in his limbs, which, in the spring of 1739, brought on a mortification in his foot; and, unfortunately, his blood was so vitiated by the fever, that attendance from medicine was not to be expected. When he was informed that his death was near, he remained for a little space calm and silent; but he soon recovered his former vivacity, and continued with his usual ease. He died on the 19th of April 1739, in the 57th year of his age, and was buried at his own request in the chancel of Boxworth.

He married the daughter of the reverend Mr Dickens, rector of Boxworth, in Cambridgeshire, and by her had a son and daughter.

Dr Saunderfon was rather to be admired as a man of wonderful genius and affiduity, than to be loved for amiable qualities. He spoke his sentiments freely of characters, and praised or condemned his friends as well as his enemies without reserve. This has been ascribed to fame to a love of defamation; but perhaps with more propriety it has been attributed by others to an inelastic love of truth, which urged him upon all occasions to speak the sentiments of his mind with直Je, without considering whether this conducit would please or give offence. His sentiments were supposed unfavourable to revelation; religion. It is said, that he asked could not know God, because he was blind, and could not see his works; and that, upon this, Dr. Holmes replied, “Lay your hand upon yourself, and the organization which you will feel in your own body will dilipitate so gross an error.” On the other hand, we are informed, that he had defined the sacrament to be given him on the evening before his death. He was, however, seized with a delirium, which rendered this impossible.

He wrote a system of algebra, which was published in 2 volumes 4to, at London, after his death in the year 1740, at the expense of the University of Cambridge.

Dr Saunderfon invented for his own use a Palpable Arithmetic. that is, a method of performing operations in arithmetic solely by the sense of touch. It consisted of a table ruled upon a small frame, so that he could apply his hands with equal ease above and below. On this table were drawn a great number of parallel lines which were crossed by others at right angles; the edges of the table were divided by notches half an inch distant from one another, and between each notch there were five parallels; so that every square inch was divided into a hundred little squares. At each angle of these squares, where the parallels intersected one another, a hole was made quite through the table. In each hole he placed two pins, a big and a small one. It was by the various arrangements of the pins that Saunderfon performed his operations. A description of this method of making calculations by his table is given under the article Blind, nO. 38, though it is there by mistake said that it was not of his own invention.

His sense of touch was so perfect, that he could discover with the greatest exactness the slightest inequality of surface, and could distinguish in the most finished works the smallest oversight in the polishing. In the cabinet of medals at Cambridge he could single out the Roman medals with the utmost correctness; he could also perceive the slightest variation in the atmosphere. One day, while some gentlemen were making observations on the sun, he took notice of every little cloud that passed over the sun which could interrupt their labours. When any object passed before his face, even though at some distance, he discovered it, and could guess its size with considerable accuracy. When he walked, he knew when he passed by a tree, a wall, or a house. He made these distinctions from the different ways his face was affected by the motion of the air.

His musical ear was remarkably acute; he could distinguish accurately to the fifth of a note. In his youth he had been a performer on the flute; and he had made such proficiency, that if he had cultivated his talents in this way, he would probably have been as eminent in music as he was in mathematics. He recognized not only his friends, but even those with whom he was slightly acquainted, by the tone of their voices; and he could judge with wonderful exactness of the size of any apartment into which he was conducted.

SAVONA, a large, handome, populous, and strong town of Italy, in the territory of Genoa, with two cathedrals and a bishop's see. It contains several handsome churches and well-built buildings. It was taken by this king of Sardinia in 1746, at which time it had a capacious harbour; but the people of Genoa, being afraid that it would hurt their own trade, choked it up. It is seated on the Mediterranean sea, in a well-cultivated country, abounding in silk and all kinds of good fruit.

SAVONAROLA (Jerome), a famous Italian monk, was born at Ferrara in 1452, and descended of a noble family. At the age of 22 he assumed the habit of a Dominican friar, without the knowledge of his parents, and distinguished himself in that order by his piety and ability as a preacher. Florence was the theatre where he chose to appear; there he preached, confessed, and wrote. He had address enough to place himself at the head of the faction which opposed the family of the Medici. He explained the Apocalypse, and there found a prophecy which foretold the destruction of his opponents. He predicted a renovation of the church, and declaimed with much severity against the clergy and the court of Rome. Alexander VI. excommunicated him, and prohibited him from preaching. He devised his own anathemas of the Pope: yet he forbore preaching for
Savonarola, the author of his life, has described him as an eminently sainted. He gravely informs us, that his heart was found in a river; and that he had a piece of it in his possession, which had been very useful in curing diseases, and ejecting demons. He remarks, that many of his persecutors came to a miserable end. Savonarola has also been defended by Father Queit, Bovioz, Baron, and other religious Dominican.

He wrote a prodigious number of books in favour of religion. He has left, 1. Sermons in Italian; 2. A Treatise entitled, Triumphant Cruces, etc. Eruditorum Confessius, and several others. His works have been published at Leyden in 6 volumes 12mo.

Savor. See TASTE.

Savoy. See TASTE.

Savoy, a duchy lying between France and Italy, and which takes its name from the Latin Sabaudia, altered afterwards to Saboia, and Saboia.

This country was anciently inhabited by the Celts, whose descendants therein were subdivided into the Allobroges, Nantuates, Verargri, Seduni, Salasiti, Centrones, Gacelvari, and some others of inferior note.—Of all these the Allobroges were the most considerable. The reduction of these tribes, in which Julius Caesar had made a great progress, was completed under Augustus. Afterwards this country shared the fate of the western empire, and was over-run by the northern barbarians. The Burgundians held it a considerable time; but when or how it first became a dukedom under the present family, is what historians are not agreed about: thus much, however, is certain, that Amadeus, who lived in the 12th century, was count of it. In 1416, Amadeus VIII. was created by the emperor Sigismund duke of Savoy; and Victor Amadeus first took the title of king of Sicily, and afterwards of Sardinia. See SARDINIA. Savoy was lately conquered by the French, and added to the republic as the eightieth department. As this arrangement, though decreed by the convention to last for ever, may probably be of short duration, we shall write of the duchy as of an independent state. Savoy, then, is bounded to the south by France and Piedmont; to the north by the lake of Geneva, which separates it from Switzerland to the west by France; and to the east by Piedmont, the Milanese, and Switzerland; its greatest length being about eighty-eight miles, and breadth about seventy-six.

As it lies among the Alps, it is full of lofty mountains, which in general are very barren: many of the highest of them are perpetually covered with ice and snow. The summit of one called Montagnes Maudites, "the cursed mountains," are said to be more than two English miles in perpendicular height above the level of the lake of Geneva, and the level itself is much higher than the Mediterranean. In some few of the valleys there is corn, land and pasture, and a good breed of cattle and mules; and along the lake of Geneva, and in two or three other places, a tolerable wine is produced. Mount Senis or Cenis, between Savoy and Piedmont, over which the highway from Geneva to Turin lies, is as high, if not higher, than the Montagnes Maudites; but of all the mountains of the Alps, the highest is mount Rochmelon, in Piedmont, between Furtiere and Novalete. The roads over these mountains are very tedious, disagreeable, and dangerous, especially as large masses of snow, called by the Italians avalanche,
avalanches, and fragments of rocks, frequently roll down into them from the impending precipices. The way of travelling is either in ladders, chairs, or on the backs of mules: in some places the path on the brink of the precipices is so narrow, that there is but just room for a single person to pass. It begins to snow on these mountains commonly about the beginning of October. In summer, in the months of July, August, and September, many of them yield very fine grapes, with a great variety of flowers and herbs; and others box-wood, walnuts, chestnuts, and pines. The height and different combinations of these mountains, their towering fummits rising above another, and covered with snow the many cataracts or falls of water, the noise and rapidity of the river Arc, the froth and green tinture of its water, the echoes of its numerous streams tumbling from cliff to cliff, form altogether a very romantic scene. These mountainous traits, notwithstanding their height, are not altogether free from thunder in summer, and are also much exposed to thick clouds, which sometimes settle unexpectedly on them, and continue several days. There are some wolves among the thicket; and they abound with hares, ru-picapras or chamois, and marmottes. In the lower parts of Savoy, there are also bears, wild boars, deer, and rabbits; and among the defolate mountains are found great quantities of rock-crystal. In the glaciers or ice-valleys, between the high mountains, the air is extremely cold, even in the months of July and August. The surface of these ice-valleys looks like a sea or lake, which, after being agitated by fierce and contrary winds, has been frozen all at once, interspersed with hideous cracks and chafms. The noise of these cracks, when first made by the heat of the noon day sun, and reverberated by the surrounding rocks and mountains, is alienifying. The height of the impending mountains is such, that the sun’s rays seldom reach the ice-valleys, except a few hours in the middle of summer. The avalanches or snow-balls, which the leafy concurrence of the air will occasion, tumble down the mountains with amazing rapidity, continually increasing, and carrying all before them. People have been taken out alive, after being buried several days under them. The mountainous nature of this duchy renders the plough an useless instrument of agriculture. The peafants break up the hungry soil with the pickaxe and spade, and to improve it carry up mould and dung in baskets. For the purpose of preserving it from drought in the spring and summer, they cut small reservoirs above it, the water of which may be let out at will; and to prevent the earth from giving way, break the declivity of the mountains by building walls on the sife for its support, which frequently assume the appearance of ancient fortification, and are a very pleasing deception to travellers. The Savoyards carry their better sort of cheese into Piedmont, as the flavour is much esteemed there; but they gain more by their skins of bears, chamois, and bouquetins (a species of the wild goat), or by the sale of growth and peafants, which they carry in great numbers to Turin.

The chief rivers are the Rhone, which, on the sife of Geneva, separates Savoy from France; the Arve, which has some particles of gold in its sands; the Ilere, the Seran, the Siers and the Arc. There are also a great many lakes in this country, which yield plenty of fish, but none of them are very large, together with medicinal and reciprocating springs and hot baths.

The language of the common people is a corrupt French; but the better sort, and those who live in the great cities, speak such good French as they do in Paris itself.

In their temper, however, and disposition, the Savoyards resemble the Germans more than the French, retaining still much of the old German honesty and simplicity of manners, which no doubt is partly owing to the poverty and barbarities of the country. To this also, joined to their longevity and the fruitfulness of their women, which are the effects of their cheerful disposition, healthy air, activity, temperance, and sobriety, it is owing that great numbers of them are able to go abroad in quest of a livelihood, which they earn, those at least who have no trades, by flowing marmottes, cleaning shoes, sweeping chimneys, and the like. It is said, that there are generally about 18,000 of them, young and old, about Paris. In summer they lie in the trees, and in winter, forty, fifty, or sixty of them lodge together in a room: they are so honest that they may be trusted to any amount. The children are often carried abroad in barkeis before they are able to walk. In many villages of Savoy there is hardly a man to be seen throughout the year, excepting a month or two. Those that have families generally set out and return about the same season, when their wives commonly lie in, and they never fail to bring home some part of their small earnings. Some of them are such consummate masters of economy, that they set up shops and make fortunes, and others return home with a competency for the rest of their days. An old man is often dispatched with letters, little presents, and some money, from the younger sort, to their parents and relations, and brings back with him fresh colonies, letters, messages, and news. The cultivation of their grounds, and the reaping and gathering in of the harvest and vintage, are generally left to the women and children; but all this is to be understood of the mountainous parts of Savoy. Great numbers of the mountaineers of both sexes are said to be lame and deformed; and they are much subject to a kind of warts, which grow about their throats, and very much disfigure them, especially the women; but that is the only inconvenience they feel from them.

The nobility of Savoy, and the other dominions of the king of Sardinia, labour under great hardships and retributions, unheard of in other countries, which we have not room here to particularize. A minute account of them will be found in Mr Kekiller’s Travels. In short, the king has left neither liberty, power nor much property, to any but himself and the clergy, whose overgrown wealth he has also greatly curtailed.

No other religion is professed or tolerated in Savoy but that of the church of Rome. The decrees, however, of the council of Trent are not admitted; nor are the churches afylums for malefactors.

This duchy is divided into those of Chablais, Gene­vois, and Savoy Proper, the counties of Tarantail and Maurienne, and the barony of Faucigny.

SAURIN (James), a celebrated preacher, was born at Ni­mes in 1677, and was the son of a protestant lawyer of considerable eminence. He applied to his studies with
with great success; but at length being captivated with a military life, he relinquished them for the profession of arms. In 1694 he made a campaign as a cadet in Lord Galloway's company, and soon afterwards obtained a pair of colours in the regiment of Colonel Renault which served in Piedmont. But the duke of Savoy having made peace with France, he returned to Geneva, and resumed the study of philosophy and theology under Turretin and other professors. In 1700 he visited Holland, then went to England, where he remained for several years, and married. In 1709 he returned to the Hague, where he fixed his residence, and preached with the most unbounded applause. To an exterior appearance highly prepossessing, he added a strong harmonious voice. The sublime prayer which he recited before his sermon was uttered in a manner highly affecting. Nor was the attention excited by the prayer dissipated by the sermon; all who heard it were charmed; and those who came with an intention to criticise, were carried along with the preacher and forgot their design. Saurin had, however, one fault in his delivery; he did not manage his voice with sufficient skill. He exhausted himself so much in his prayer and the beginning of his sermon, that his voice grew feeble towards the end of the service. His sermons, especially those published during his life, are distinguished for justness of thought, force of reasoning, and an eloquent unaffected style.

The first time that the celebrated Abaddie heard him preach, he exclaimed, “Is it an angel or a man who speaks?” Saurin died on the 30th of December, 1750, aged 53 years.

He wrote, 1. Sermons, which were published in 12 vols 8vo and 12mo; some of which display great genius and eloquence, and others are composed with negligence. One may observe in them the imprecations and the averton which the Calvinists of that age were wont to utter against the Roman Catholics. Saurin was, notwithstanding, a lover of toleration; and his sentiments on this subject gave great offence to some of his fanatical brethren, who attempted to obscure his merit, and embitter his life. They found fault with him because he did not call the pope Antichrist, and the Roman church the whore of Babylon. But these prophetic metaphors, however applicable they may be, were certainly not intended by the benevolent religion of Jesus to be bandied about as terms of reproach; which would teach those torail who use them, and irritate, without convincing, those to whom they were applied.

Saurin, therefore, while he perhaps interpreted these metaphors in the same way with his opponents, discovered more of the moderation of the Christian spirit. Five volumes of his sermons were published in his life, the rest have been added since his decease.

2. Discours Historical, Critical, and Moral, on the most memorable Events of the Old and New Testament. This is his greatest and most valuable work. It was printed first in two volumesfolio. As it was left unfinished, Beaufobre and Roques undertook a continuation of it, and increased it to four volumes. It is full of learning; it is indeed it to four volumes. It is full of learning; it is indeed a collection of the opinions of the best authors, both Christian and Heathen; of the philosophers, historians, and critics, in every subject which the author examines. 3. The State of Christianity in France, 1755, 8vo. In this book he discusses many important points of controversy, and calls in question the truth of the miracle said to be performed on La Fole in Paris. 4. An Abridgment of Christian Theology and Morality, in the form of a Catechism, 1722, 8vo. He afterwards published an abridgment of this work.

A Dissertation which he published on the Expediency of sometimes disguising the Truth, raised a multitude of enemies against him. In this discourse his plan was, to state the arguments of those who affirm that, in certain cases it is lawful to disguise truth, and the answers of those who maintain the contrary. He does not determine the question, but forms, however, to introduce the first opinion. He was immediately attacked by several adversaries, and a long controversy ensued; but his doctrines and opinions were at length publicly approved of by the synods of Campen and of the Hague.

The subject of this controversy has long been agitated, and many equal good principles have supported opposite sides. It would certainly be a dangerous maxim that falsehood can ever be lawful. There may, indeed, be particular cases, where the motives to it are of such a nature as to diminish its criminality in a high degree; but to lessen its guilt is a very different thing from justifying it by the laws of morality.

Saurin (Joseph), a geometrical of the academy of sciences at Paris, was born at Courtonfins in the principality of Orange, in 1659. His father, who was a minister at Grenoble, was his first preacher. He made rapid progress in his studies, and was admitted minister of Eure in Dauphiny when very young; but having made use of some violent expressions in one of his sermons, he was obliged to quit France in 1683. He retired to Geneva, and thence to Berne, where he obtained a considerable living. He was scarcely settled in his new habitation, when some theologians raised a persecution against him. Saurin, hating controversy, and disguising with Switzerland, where his talents were entirely concealed, repaired to Holland. He returned from after to France, and surrendered himself into the hands of Bishop bishop of Meaux, who obliged him to make a recantation of his errors. This event took place in 1690. His enemies, however, suspected his sincerity in the abjuration which he had made. It was a general opinion, that the desire of cultivating science in the capital of France had a greater effect in producing this change than religion. Saurin, however, speaks of the reformers with great asperity, and condemns them for going too far. “Deceived in my opinions concerning the rigid system of Calvin, I no longer regarded that reformer in any other light but as one of those extravagant geniuses who are carried beyond the bounds of truth. Such appeared to me in general the founders of the reformation; and that just idea which I have now obtained of their character has enabled me to shake off a load of prejudices. I saw in most of the articles which have separated them from us, such as the invocation of saints, the worship of images, the distinction of meats, &c. that they had much exaggerated the inevitable abuses of the people, and imposed these to the Roman church, as if sanctioned by its doctrines. Besides, that they have misrepresented those doctrines which were not connected with any abuse. One thing which surprised me much when my eyes began to open, was the false idea, though in appearance...
full of respect, for the word of God, which the reformers entertained of the perfection and perspicuity of the Holy Scriptures, and the manifest misinterpretation of passages which they bring to support that idea (for that misinterpretation is a point which can be proved). Two or three of their articles raised some objections in my mind against the Romish church; to wit, Transubstantiation, the adoration of the sacrament, and the infallibility of the church. The adoration of the sacrament I considered as idolatry, and, on that account, removed from her communion. But soon after, the Exposition of the Parias entertained of the person of our Saviour, was treated by the Academy of Sciences with the most flattering respect. At that time (1717), geometry formed his principal occupation. He adorned the Journal des Savants with many excellent treatises; and he added to the memoirs of the Academy many interesting papers. These are the only works which he has left behind him. He died at Paris on the 29th December 1737, in his 78th year, of a fever. He married his brother's wife, and of the countess of Konigsmarck, a Swedish lady, celebrated both for her wit and beauty. He was educated along with Frederic Augustus the electoral prince, afterwards king of Poland. His infamy announced the future warrior. Nothing could prevail on him to apply to his studies but the promise of being allowed, after he had finished his task, to mount on horse-back or exercise himself with arms.

He served his first campaign in the army commanded by prince Eugene and the duke of Marlborough, when only twelve years old. He signalized himself at the siege of Tournay and Mons, and particularly at the battle of Malplaquet. In the evening of that memorable day, he was heard to say, "I'm content with my day's work." During the campaign of 1710, prince Eugene and the duke of Marlborough made many public encomiums on his merit. Next year the young count accompanied the king of Poland to the siege of Stralsund, the strongest place in Pomerania, and displayed the greatest intrepidity. He swam across the river in sight of the enemy, with a pike in his hand. His valour alone made him conspicuous on the bloody day of Gaedetalbuck, where he commanded a regiment of cavalry. He had a horse killed under him, after he had three times rallied his regiment, and led them on to the charge.

Soon after that campaign, his mother prevailed on him to marry the countess of Lubin, a lady both rich and beautiful. This union lasted but a short time. In 1771, the count procured a dissolution of the marriage.
Count Saxe, thus firm in his territories, devoted himself for some time to the study of mathematics. He composed also, in 13 nights, and during the intervals of an ague, his *Réveries*, which he corrected afterwards. This book is written in an incorrect but forcible style; it is full of remarks both new and profound, and is extremely useful to the soldier and the general.

The death of the king of Poland his father, in 1733, kindled a new war in Europe. His brother, the elector of Saxony, offered him the command of all his forces, but he preferred the French service, and repaired to the marshal of Berwick's army, which was encamped on the Rhine. "Count," said that general, who was preparing to attack the enemy's entrenchments at Elbinghen, "I was going to send for 3000 men, but your arrival is of more value than theirs." When the attack began, the count, at the head of a regiment of grenadiers, forced the enemy's lines, and by his bravery decided the victory. He behaved at the siege of Philipburg with no little intrepidity. For these services he was, in 1734, rewarded with the rank of lieutenant-general. Peace was concluded in 1736; but the death of Charles VI. emperor of Germany kindled a new war almost immediately.

Prague was besieged by the count of Saxe in 1741, near the end of November, and taken the same month by assault. The conquest of Egra followed that of Prague. It was taken a few days after the trenches were opened. This success gave so much joy to the Emperor Charles VII. that he wrote a congratulatory letter to the conqueror with his own hands.

In 1744 he was made marshal of France, and commanded a part of the French army in Flanders. During that campaign he displayed the greatest military conduct. Though the enemy was superior in number, he observed their motions so skilfully that they could do nothing.

In January 1745, an alliance was concluded at Warsaw between the queen of Hungary, the king of England, and the States of Holland. The ambassador of the States General, meeting marshal Saxe one day at Vervailles, asked his opinion of that treaty. "I think," says he, "that if the king my master would give me an unlimited commission, I would read the original at the Hague before the end of the year." This answer was not a bravado; the marshal was capable of performing it.

He went soon after, though exceedingly ill, to take the command of the French army in the Low Countries. A gentleman, seeing the feeble condition in which he left Paris, asked him how he could in that situation undertake so great an enterprise? "The question (replied he) is not about living, but getting out."—

Soon after the opening of the campaign, the battle of Fontenoy was fought. Marshal Saxe was at the point of death, yet he cauffed himself to be put into a litter, and carried round all the pofts. During the action he mounted on horseback, though he was so very weak that his attendants dreaded every moment to see him expire. The victory of Fontenoy, owing entirely to his vigilance and capacity, was followed by the reduction of Tournay, Bruges, Ghent, Oudenarde, Ostend, Ath, and Bruxelles: this last city was taken on the 28th February 1746; and very soon after the king sent to the marshal a letter of naturalization conceived in the most flattering
Holland now began to tremble for her safety, Maeftricht and Bergen-op-Zoom had already fallen, and nothing but misfortunes seemed to attend the further prosecution of the war. The States General, therefore, offered terms of peace, which were accepted, and a treaty concluded on the 18th October 1748.

Marechal Saxe retired to Chambord, a country seat which the king of France had given him. Some time after he went to Berlin, where the king of Prussia received him as Alexander would have received Caesar.—On his return to France, he spent his time among men of learning, artists, and philosophers. He died of a fever, on the 30th November 1750, at the age of 54. Some days before his death, talking to M. Senac his physician about his life, "It has been (says he) an excellent dream." He was remarkably careful of the lives of his men. One day a general officer was pointing out to him a post which would have been of great use. "It will only cost you (says he) a dozen grenadiers." "That would do very well," replied the maréchal, "were it only a dozen lieutenant-generals."

It was impossible for maréchal Saxe, the natural brother of the king of Poland, elected sovereign of Courland, and possessed of a vigorous and reticent imagination, to be delirious with ambition. He constantly entertained the notion that he would be a king. After losing the crown of Prussia by his inconstancy in love, he formed, it is said, the project of appeasing the Jews, and of being the sovereign of a nation which for 1700 years had neither possessed chief nor country. When this chimerical idea could not be realized, he called his eyes upon the kingdom of Corsica. After failing in this project also, he was hastily employed in planning a settlement in some part of America, particularly Brazil, when death surprised him.

He had been educated and died in the Lutheran religion. "It is a pity (said the queen of France, when she heard of his death) that we cannot say a single De profundis (prayer for the dead) for a man who has made us sing so many Te Deums." All France lamented his death.

By his will, which is dated at Paris, March 1, 1748, he directed that his body should be buried in quicklime: "that nothing (says he) may remain of me in this world but the remembrance of me among my friends." These orders, however, were not complied with; for his body was embalmed, put into a leaden coffin, which was inclosed in another of copper, and this covered with one of wood, bound about with iron. His heart was put into a silver gis box, and his entrails into another coffin. Louis XV. was at the charge of his funeral. By his order his corpse was interred with great pomp and splendor in the Lutheran church of St. Thomas, at Stralsburgh, on the 8th of February 1751.

The maréchal was a man of ordinary stature, of a robust constitution, and extraordinary strength. To an aspect, noble, warlike, and mild, he joined the excellent qualities of the heart. Affable in his manners, and disposed to sympathy with the unfortunate, his generosity sometimes carried him beyond the limits of his fortune. On his deathbed he reviewed the errors of his life with remorse, and expressed much penitence.

The first edition of his Reveries was printed at Paris 1757, in 2 vols 4to. It was compared with the greatest attention with the original manuscript in the king's library. It is accompanied with many designs exactly engraved, and a life of the author. The Life of maréchal Saxe was written by M. d'Etpagnac, 2 vols. 12mo. This history is written in the panegyric style. The author is, however, impartial enough to remark, that in the three battles upon which the reputation of maréchal Saxe is founded, he engaged in the most favourable circumstances. "Never did a general (says he) stand in a more advantageous situation. Honoured with the confidence of the king, he was not restrained in any of his projects. He always commanded a numerous army; his soldiers were steady, and his officers possessed of great merit."

SAXIFRAGA, Saxifraga, in botany: A genus of the digynia order, belonging to the decandria class of plants; and in the natural method ranking under the 15th order, Succulenta. The calyx is quinquepartite; the corolla pentapetalous; the calyptra biformed, unicellular, and polyseemous.

There are 38 species; of which the most remarkable are, 1. The granulata, or white saxifrage, which grows naturally in the meadows in many parts of England. The roots of this plant are like grains of corn, of a reddish colour without; from which arise kidney-shaped hairy leaves, slanting upon pretty long footstalks.—The flasks are thick, a foot high, hairy, and furrowed: the branch took from the bottom, and have a few small leaves like those below, which closelie to the flask: the flowers terminate the flask, growing in small clusters; they have five white petals, including ten flaminous and the two styles. There is a variety of this with double flowers, which is very ornamental. 2. The pyramidatis, with a pyramidal flask, grows naturally on the mountains of Italy. The leaves are tongue-shaped, gathered into heads, rounded at their points, and have cartilagineous and fawed borders. The flask rises two feet and a half high, branching out near the ground, forming a natural pyramid to the top. The flowers have five white wedge-shaped petals, and ten flaminous, placed circularly the length of the tube, terminated by roundish purplish summitts. When these plants are strong, they produce very large pyramids of flowers, which make a fine appearance. 3. The paniculata, commonly called Londo pride, or none-lo-petty, grows naturally on the Alps, and also in great plenty on a mountain of Ireland called Mongerston, in the county of Kerry in that island. The roots of this are perennial: the leaves are oblong, oval, and placed circularly at bottom. They have broad, flat, furrowed footstalks, and are deeply crenated at their edges, which are white. The flask rises a foot high, is of a purple colour, stiff, slender, and hairy. It sends out from the side on the upper part several short footstalks, which are terminated by white flowers spotted with red. 4. The oppositifolia, grows natural-
SAXONY, the name of two circles of the German empire, an electorate, and a duchy of the same. The lower circle is bounded to the south by the circle of Upper Saxony, and a part of that of the Upper Rhine; to the north, by the duchy of Sleswick, belonging to the king of Denmark, and the Baltic; to the west, by the circle of Weftphalia; and to the east by the circle of Upper Saxony. The states belonging to it are the dukes and princes of Magdeburg and Bremen, Zell, Grubenhagen, Calenburg, Wolfenbuttel, Halberstadt, Mecklenburg-Schwerin, Mecklenburg-Güstrow, Holstein-Glückstadt, Holstein-Gottorp, Hildesheim, Saxo-Lauenburg; the archbishopric of Lubeck; the principalities of Schwerin, Ratzeburg, Blankenburg, Ranzau; the imperial cities of Lubeck, Gotzlar, Muhlhausen, Nordhausen, Hamburg, and Bremen. The dukes of Bremen and Magdeburg are alternately directors and summing princes; but, ever since the year 1682, the electors which used generally to be held at Brunswick or Luneburg have been discontinued. Towards the army of the empire, which, by a decree of the empire in 1681, was settled at 40,000 men, this circle was to furnish 1322 horsemen and 2707 foot; and of the 300,000 florins granted to the imperial court in 1707, its quota was 14,271 florins; both of which amounts are the same with those of Upper Saxony, Burgundy, Swabia, and Weftphalia. This circle at present nominates only two ailefors in the chamber-judicature of the empire, of one of which the elector of Brunswick-Luneburg has the nomination, who must be a Lutheran, and is the ninth in rank. The inhabitants of this circle are almost all Lutherans.

The circle of Upper Saxony is bounded by that of Franconia, the Upper Rhine, and Lower Saxony; and also by the Baltic sea, Prussia, Poland, Silesia, Lusatia, and Bohemia. It is of great extent, and contains the following states, viz. the electors of Saxony and Brandenburg, Saxo-Weimar, Saxo-Eisenach, Saxo-Cobourg, Saxo-Gotha, Saxo-Altenburg, Saxo-Querfurt, the Hither and Farther Pomerania, Camin, Anhalt, Quilenburg, Gernrode, Waldenried, Schwarzburg, Sonderhausen, Schwarzburg-Rudolstadt, Mansfeld, Stolberg, Barby, the counts of Reußen, and the counts of Schonberg. No diets have been held in this circle since the year 1683. The elector of Saxony has always been the sole summoning prince and director of it. Most of the inhabitants profess the Protestant religion. When the whole empire furnishes 40,000 men, the quota of this circle is 1322 horse and 2707 foot. Of the 300,000 florins granted by the empire in 1707, it contributed only 14,271 florins, 28 kruitzers, being rated no higher than those of Weftphalia, Lower Saxony, Swabia, and Burgundy, though it is much larger. Agreeable to a resolution, and regulation in 1654, this circle nominates now only two ailefors of the chamber-court.

The electorate consists of the duchy of Saxony, the greatest part of the margravate of Meffen, a part of the Vogtland, and the northern half of the landgraviate of Thuringia. The Lusatias also, and a part of the country of Henneberg, belong to it, but are not part of this circle. The foil of the electoral dominions lying in this circle is in general exceeding rich and fruitful, yielding corn, fruits, and pulpit in abundance, together with hops, flax, hemp, tobacco, aniseed, wild saffron, wood; and in some places wood, wine, coal, porcelain clay, terra sigillata, fullers earth, fine shiver, various sorts of beautiful marble, ferronite stone, and almost all the different species of precious stones. Sulphur also, alum, vitriol, sand, and free-tome, salt-springs, amber, turf, cinnabar, quicksilver, antimony, bismuth, arsenic, coal, and other minerals, are found in it. This country,

(a) Some authors have erroneously conjectured, from his name Saxo, that he was born in Saxony; but Saxo was no uncommon appellation among the ancient Danes. See Olavi Wormius Monumenta Danica, p. 186, and Stephens's Prolegomena, p. 109.
country, besides the above articles, contains likewise valuable mines of silver, copper, tin, lead, and iron; and abounds in many places with horned cattle, sheep, horses, and venison. The principal rivers by which it is watered are the Elbe, the Schwere-Ellter, the Mulde, the Saale, the Unbfrot, the Weiss-Ellter, and the Pleisse. These rivers, as well as the lakes and rivulets, abound in fish; and in the White-Ellter are found beautiful pearls. This electorate is extremely well cultivated and inhabited, and is said to include about 250 great and small towns, upwards of 5000 villages, 196 royal mansors, and near as many royal castles, besides private estates, and commanderies. The provincial diets here consist of three classes. The first is composed of the prelates, the counts, and lords, and the two universities of Leipsic and Wittenberg. To the second belong the nobility in general, immediate or mediating, that is, such as stand immediately under the siefe-chancery or the several judicatories, and such as are immediately under the jurisdiction of the amman. The third class is formed of the towns in general. The general provincial diets are ordinarily held every six years; but there are others called election diets, which are convened commonly every two years. We would here observe, that not only these diets, but those in most of the other states of Germany, have lost their ancient importance, retaining little more than the shadow of their former power and privileges; for even the petty princes, though they depend upon their more potent neighbours, and must be careful not to give them any umbrage, are almost as absolute in their respective territories as the grand seignior himself. As to religion, it was in this country that the reformation took its rise in the 16th century, to which it hath ever since adhered, according to the doctrines of Luther*. The two late electors, when they embraced popery in order to qualify themselves to be elected kings of Poland, gave the mostlemmel affronts to their people, that they would inviably maintain the established religion and its professors in the full and free enjoyment of all their ecclesiastical rights, privileges, and prerogatives whatsoever, in regard to churches, worship, ceremonies, usages, universities, schools, benefices, incomes, profits, jurisdictions, and immunities. The electoral families still continue Roman Catholics, though they have long since abandoned the practice of Pope-ry. With respect to ecclesiastical matters, the country is divided into parishes, and these again into spiritual inspections and confessions, all subordinate to the ecclesiastical council and upper consistory of Drefden, in which city and Leipsic the Calvinists and Roman Catholics enjoy the free exercise of their religion. Learning flourishes in this electorate; in which, besides the free-schools and gymnasia in most of the chief towns, are the two celebrated universities of Wittenburg and Leipzig, in the last of which are also societies for the liberal arts and the German language, with book-sellers and printers of the greatest eminence. A great variety of manufactories are also carried on in this country. The principal are those of fine and coarse linen, thread, fine lace, paper, fine glasses and mirrors; porcelain, equal if not superior to that of China; iron, brass, and steel wares; manufactures of gold and silver, cotton, wool, and flax; gloves, caps, hats, and trowsers; in which, and the natural productions mentioned above, together with dyeing, an important foreign commerce is carried on. A great addition has been made since the year 1718 to the electoral territories, by the extension of the collateral branches of Zeitz, Merseburg, and Weifenhofen, whose dominions devolved to the elder electoral branch, descended from the margraves of Meifen. The first of these, who was elector of Saxony, was Frederick the Warlike, about the beginning of the 15th century.

This elector styles himself duke of Saxony, Juliers, Cleve, and Berg, as also of Engern and Welfenhofen, arch-marshals and elector of the Holy Roman empire, landgrave in Thuringia, margrave of Meifen, and of Upper and Lower Lusatia, burggrave of Magdeburg, prince-count of Henneberg, count of La Mark, Ravenberg, Barby, and Hauan, and lord of Ravenstein. Among the electors he is reckoned the fifth, as great-marshall of the empire, of which he is also vicar, during an interregnum, in all places not subject to the vicariate of the count palatine of the Rhine. He is moreover sole director of the circle; and in the vacancy of the see of Mentz claims the directorium at the diet of the empire. His particular affinements, on account of the electorate, is 158 florins, besides what he pays for other districts and territories. To the chamber-court he contributes, each term, the sum of 1545 rix-dollars, together with 83 rix-dollars and 62 kruitzers on account of the county of Mansfield. In this electorate, subordinate to the privy-council, are various colleges for the departments of war, foreign affairs, the finances, siefs, mines, police, and ecclesiastical affairs, together with high tribunals and courts of justice, to which appeals lie from the inferior. The revenues of this elector are as considerable as those of any prince in the empire, if we except those of the house of Austria. They arise from the ordinary and extraordinary subsidies of the flies; his own demesnes, consisting of 72 bailiwicks; the impont on beer, and the fine porcelain of the country; tents of corn, fruit, wine, &c., his own silver mines, and the tenth of those that belong to particulars: all which, added together, bring in a yearly revenue of between 700,000 and 800,000 rix-dollars; yet the electorate is at present deeply in debt. The regular troops commonly amount to 20,000 men, exclusive of the militia of the ban, the arriere-ban, and the body of miners and huntsmen, who are obliged in time of war to bear arms. The whole electorate is divided into circules.

The electoral circle, or the duchy of Saxony, is bounded by the circles of Meifen, Leipzig, and Thuringia, the principality of Anhalt, the march of Brandenburg, and Lusatia. The principality of Anhalt lies across it, and divides it into two parts. Its greatest length and breadth is computed at about 40 miles; but though it is watered by the Elbe, the Black-Elter, and the Mulde, it is not very fruitful, the soil for the most part consisting of sand. It contains 42 towns, three boroughs, between 400 and 500 villages, 164 noblemen's estates, 11 superintendencies, three inspections, under one consistory, and 11 prefectures or distriks. The present duchy of Saxony is not to be confounded with the old; for the latter was of a much greater extent, and contained in it those large tracts anciently called Eupphiolita, Engern, and Welfenhofen, of which the electoral circle was no part, but was taken by Albert the Bear, margrave of Salzwedel, from the Venedi. His
The country of Saxon is remarkable for being the mother of the present English nation; but concerning the Saxons themselves, previous to that period, we have very few particulars. The Saxons (says Mr Whetaker) have been derived by our historians from very different parts of the globe: India, the north of Asia, and the forests of Germany. And their appellation has been equally referred to very different causes; the name of their Indian progenitor, the plundering disposition of their Aisatic fathers, and the short hooked weapons of their warriors. But the real origin of the Saxons, and the genuine derivation of their name, seem clearly to be other.

In the earlier period of the Gallic history, the Celts of Gaul crossed the Rhine in considerable numbers, and planted various colonies in the regions beyond it. Thus the Volcæ Tetuages settled on one side of the Hercynian forest and about the banks of the Neckar, the Helvetii upon another and about the Rhine and Maine, the Boii beyond both, and the Senones in the heart of Germany. Thus also we see the Treviri, the Nervii, the Suevi, and the Marcomanni, the Quadri, the Veneti, and others, in that country; all plainly betrayed to be Gallic nations by the Gallic appellations which they bear, and all together posseffing the greatest part of it. And, even as late as the conclusion of the first century, we find one nation on the eastern side of this great continent actually speaking the language of Gaul, and another upon the northern using a dialect nearly related to the British.

But as all the various tribes of the Germans are considered by Strabo to be θεος, θεος, or genuine Gaules in their origin; so those particularly that lived immediately beyond the Rhine, and are affected by Tacitus to be indubitably native Germans, are expressly denominated τοιος, or Gauls, by Diodorus, and as expressly declared by Dio to have been distinguished by the equivalent appellation of Cela from the earliest period. And the broad line of nations, which extended along the ocean, and reached to the borders of Scythia, was all known to the learned in the days of Diodorus, by the name significant appellation of τοιος, or Gauls.

Of these, the most noted were the Si-Cembali and Cimbri; the former being seated near the channel of the Rhine, and the latter inhabiting the peninsula of Jutland. And the denominations of both declare their original; and show them to have been derived from the common stock of the Cela, and to be of the same Celtic kindred with the Cimbri of English Somersetshire, and the Cymbr or Cambrians of British Wales. The Cimbri are accordingly denominated Cela by Strabo and Appian. And they are equally affected to be Gauls by Diodorus; to be the descendants of that nation which sacked the city of Rome, plundered the temple of Delphi, and subdued a great part of Europe and some of Asia.

Immediately to the south of these were the Saxons, extending from the ismus of the Cherfonesus to the current of the Elbe. And they were equally Celtic in their origin as their neighbours. They were denominated Ambroses as well as Saxons; and, as such, are included by Tacitus under the general appellation of Cimbri, and comprehended in Plutarch under the equal one of Celta-Sytha. And the name of Ambroses appears particularly to have been Gallic; being common to the Saxons beyond the Elbe, and the Ligurians in Cilician Gaul; as both found to their surprize, on the irruption of the former into Italy with the Cimbri. And, what is equally surprising, and has been equally unnoticed by the critics, the Welsh distinguishes England by the name of Loget or Liguria, even to the present moment. In that irruption these Saxons, Ambroses, or Ligurians, composed a body of a more than 30,000 men, and were principally concerned in cutting to pieces the large armies of Manlius and Capito. Nor is the appellation of Saxons left Celtic than the other. It was originally the fame with the Belgic Suevones of Gaul; the capital of that tribe being now intituled Soissons by the French, and the name of the Saxons pronounced Saït in the Welsh, Sefon by the Scotch, and Saxon or Saxen by the Irish. And the Suevones or Saxones of Gaul derived their own appellation from the position of their metropolis on a river, the stream at Soissons being now denominated the Aine, and formerly the Axon; Ueffon or Axon importing only waters or a river, and S-ueff-on or S-axon the waters of the river. The Suevones, therefore, are actually denominated the Ueffones by Ptolemy; and the Saxones are actually intituled the Axones by Lucan.

These, with their brethren and allies the Cimbri, having been more formidable enemies to the Romans by land, than the Sammites, Carthaginians, Spaniards, Gauls, or Parthians, in the second century applied themselves to navigation, and became nearly as terrible by sea. They soon made themselves known to the inhabitants of the British islands by their piracies in the northern channels, and were denominated by them Lachlyn or Lachlynach; lac-llyn signifying the people of the wave, and the D being quiuent in the pronunciation. They took possession of the Orkney islands, which were then merely large shoals of sand, uncovered with woods, and overgrown with rushes; and they landed in the north of Ireland, and ravaged the country. Before the middle of the third century they made a second descent upon the latter, disembarked a considerable body of men, and deigned the absolute subjection of the island. Before the conclusion of it, they carried their naval operations to the south, infelting the British channel with their little vessels, and made frequent descents upon the coast. And in the fourth and fifth centuries, acting in conjunction with the Picts of Caledonia and the Scots of Ireland, they ravaged all the eastern and south-eastern shores of Britain, began the formal conquest of the country, and finally extolled their victorious soldiery in Lancashire.

SAY, or Saye, in commerce, a kind of large much used abroad for linens, and by the religious for shirts; with us it is used for aprons by several sorts of artificers, being usually died green.

SCAB. See itch and medicine.

SCAB in sheep. See sheep.

SCABIOSA, SCABIOUS, in botany: A genus of the monogynia order, belonging to the tetrandria class of
SCABRITA, in botany: A genus of the monogynia order, belonging to the tetrandra class of plants. The corolla is monopetalous, and silver-shaped; there are two seeds emarginated superior; the calyx is truncated.

SCALE, in music, sometimes denominated a gamut, a diagram, a series, an order, a diapason. It consists of the regular gradations of sound, by which a composer or performer, whether in rising or descending, may pass from any given tone to another. These gradations are seven. When this order is repeated, the first note of the second is confonantious with the lowest note of the first; the second of the former with the second of the latter; and so through the whole octave. The second order, therefore, is justly esteemed only a repetition of the first. For this reason the scale, among the moderns, is sometimes limited to an octave; at other times extended to the compass of any particular voice or instrument. It likewise frequently includes all the practical gradations of musical sound, or the whole number of octaves employed in composition or execution, arranged in their natural order.

SCALD CREAM, sometimes also called Closted cream: a curious method of preparing cream for butter, almost peculiar to Devonshire. Dr Hales, in Philosophical Transactions, volume 49, page 345, 1755, part 1f, gives some account of the method of preparing this delicate and luxurious article: other writers also speak of it. With an elucidation of two, we shall nearly quote Mr Feltham’s account from the Gentleman’s Magazine, volume 61, part 2. It is there observed, that the purpose of making scalded cream is to render butter that can be procured from the usual raw cream, being preferable for flavour and keeping; to which the scalded butter is applied to, and to the quantity in it: the precise time of removing it from the fire must be particularly attended to, and is, when the surface begins to wrinkle, or to gather in a little, showing signs of being near the agitation of boiling, which must by no means do; it is then instantly to be taken off, and placed in the dairy until the next morning, when the fine cream is thrown up, and may be taken for the table, or for butter, into which it is now soon converted by stirring it with the hand. Some know when to remove it from the fire by founding the pan with the finger, it being then luxurious: but this is only acquired by experience. Dr Hales observes, that this method of preparing milk will take off the ill taste it sometimes acquires from the cows feeding on turnips, cabbage, &c.

SCALDS, in the history of literature, a name given by the ancient inhabitants of the northern countries to their poets; in whose writings their history is recorded.

SCALE, a mathematical instrument consisting of several lines drawn on wood, brass, silver, &c. and variously divided, according to the purposes it is intended to serve; whence it acquires various denominations, as the plain scale, diagonal scale, plotting scale, &c. See Geometry.

SCALE, in music, sometimes denominated a gamut, a diagram, a series, an order, a diapason. It consists of the regular gradations of sound, by which a composer or performer, whether in rising or descending, may pass from any given tone to another. These gradations are seven. When this order is repeated, the first note of the second is consonant with the lowest note of the first; the second of the former with the second of the latter; and so through the whole octave. The second order, therefore, is justly esteemed only a repetition of the first. For this reason the scale, among the moderns, is sometimes limited to an octave; at other times extended to the compass of any particular voice or instrument. It likewise frequently includes all the practical gradations of musical sound, or the whole number of octaves employed in composition or execution, arranged in their natural order.

SCALDO, or Scalade, in the art of war, a furious assault made on the wall or rampart of a city, or other fortified place, by means of ladders, without carrying on works in form, to secure the men.
SCALIGER, (Julius Caesar), a learned critic, poet, physician, and philosopher; was born at the castle of Riga, in the territories of Verona, in 1503: and is said to have been descended from the ancient princes of Verona, though this is not mentioned in the letters of naturalization he obtained in France in 1528. He learned the first rudiments of the Latin tongue in his own country; and in his 12th year was presented to the Emperor Maximilian, who made him one of his pages. He served that emperor 17 years, and gave signal proofs of his valour and conduct in several expeditions. He was present at the battle of Ravenna in April 1512, in which he had the misfortune to lose his father Benedict Scaliger, and his brother Titus; on which his mother died with grief: when being reduced to needful circumstances, he entered into the order of the Franciscans and applied himself to study at Bologna; but soon after changing his mind with respect to his becoming a monk, he took leave of his monastery, and also learned Greek; and at last the gout determined him, at 40 years of age, to abandon a military life. He soon after settled at Agen, where he married, and began to apply himself seriously to his studies. He learned first the French tongue, which he spoke perfectly in three months; and then made himself master of the Gallican, Italian, Spanish, German, Hungarian, and Slavonian: but the chief object of his studies was polite literature. Meanwhile, he supported his family by the practice of physic. He did not publish any of his works till he was 47 years of age; when he soon gained a great name in the republic of letters. He had a grateful person, and fo firing a memory, even in his old age, that he dictated to his son 200 verses which he had composed the day before, and retained without writing them down. He was so charitable, that his house was as it were an hospital for the poor and sick; and he had such an aversion to lying, that he would have no correspondence with those who were given to that vice; but, on the other hand, he had much vanity, and a fardinal spirit, which created him many enemies. He died of a retention of urine in 1558. He wrote in Latin. 1. A Treatise on the Art of Poetry. 2. Exercitations against Carden: which works are much esteemed. 3. Commentaries on Aristotle’s History of Animals, and on Theophrastus on Plants. 4. Some Treatises on Phylic, 5. Letters, Orations, Poems, and other works.

SCALIGER (Joseph Julius), one of the most learned critics and writers of his time; he was the son of the former, and was born at Agen in France in 1540. He studied in the college of Bourdeaux: after which his father took him under his own care, and employed him in transcribing his poems; by which means he obtained such a taste for poetry, that before he was 17 years old he wrote a tragedy upon the subject of Oedipus, in which he introduced all the poetical ornaments of style and sentiment. His father dying in 1558, he went to Paris the year following, with a design to apply himself to the Greek tongue. For this purpose he for two months attended the lectures of Turnebus; but finding that in the usual course he should be a long time in gaining his point, he shut himself up in his closet, and by constant application for two years gained a perfect knowledge of that language. After which he applied to the Hebrew, which he learned by himself with great facility. He made no less progress in the sciences; and his writings procured him the reputation of one of the greatest men of that or any other age. He embraced the reformed religion at 22 years of age. In 1563, he attached himself to Lewis Castlignier de la Roch Pozay, whom he attended in several journeys; and in 1593, was invited to accept of the place of honorary professor of the university of Leyden, which he complied with. He died of a dropy in that city in 1609. He was a man of great temperance; was never married, and was so close a student, that he often spent whole days in his study without eating; and though his circumstancies were always very narrow, he constantly refused the presents that were offered him. He published many works; the principal of which are, 1. Notes on Seneca’s Tragedies, on Varro, Aufonius, Pompeius Fessius, &c. 2. His Latin Poems. 3. A Treatise of Enumeram Temporum. 4. Elisius’s Chronicle with Notes. 5. Canones Lingui: and many other works. The collections intitled Scaligeriana, were collected from his conversations by one of his friends; and being ranged into alphabetical order, were published by Isaac Vossius.

SCALLOP, in ichthyology. See PECTEN.

In the Highlands of Scotland, the great scallop shell is made use of for the skimming of milk. In old times, it had a more honourable place; being admitted into the halls of heroes, and was the cup of their felicity when the tribe assembled in the hall of their chief.

SCALPEL, in surgery, a kind of knife used in anatomical dissections and operations in surgery.

SCALPFR, or SCALPING-IRON, a surgeon’s instrument used for scraping foul carious bones.

SCALPING, in military history, a barbarous custom, in practice among the Indian warriors, of taking off the tops of the scalps of the enemies’ skulls with their hair on. They preserve them as trophies of their victories, and are rewarded by their chiefs according to the number of scalps they bring in.

SCALPRA DENTALIA, instruments used by the surgeons to take off those black, livid, or yellow clouds which infet the teeth, and not only loose and destroy them, but taint the breath.

SCAMMONY, a concrated vegetable juice of a species of convolvulus, partly of the resin, and partly of the gum kind. See CONVOLVULUS.

The scammony comes from Aleppo, in light sponge mlasses, easily friable, of a shining ash-colour verging to black; when powdered, of a light grey or whitish-colour: an inferior sort is brought from Smyrna, in more compact ponderous pieces, of a darker colour, and full of sand and other impurities. This juice is chiefly of the resinous kind; redifies spirit divides five ounces out of it, the remainder is a mucilaginous substance mixed with dregs; proof spirit totally dissolves it, the impurities only being left. It has a faint unpleasing smell, and a bitterish, somewhat acrimonious taste.

Scammony is an efficacious and strong purgative. Some have condemned it as unsafe, and laid many ill qualities to its charge; the principal of which is, that
it is uncertain, a full dose proving sometimes ineffectual, whilst at others a much smaller one occasions dangerous hypercathartics. This difference, however, is owing entirely to the different circumstances of the patient, and not to any ill quality or irregularity of operation of the medicine; where the intellestines are lined with an excessive load of mucus, the scammony passes through without exerting itself upon them; where the natural mucus is deficient, a small dose of this or any other refrinous cathartic irritates and inflames. Many have endeavoured to abate the force of this drug, and correct its imaginary virulence, by exposing it to the flame of sulphur, dissolving it in acid juices, and the like; but this could do no more than destroy as it were a part of the medicine, without making any alteration in the rest. Scammony in substance, judiciously managed, frands not in need of any correction; if triturated with sugar or with almonds, it becomes sufficiently safe and mild in operation. It may likewise be conveniently diffolved by trituration in a strong decoction of liquorice, and then poured off from the faces: the college of Wurtemberg affures us, that by this treatment it becomes mildly purgative, without being attended with gripes, or other inconveniences; and that it likewise proves inoffensive to the palate. The common dose of scammony is from three to twelve grains.

SCANDALUM MAGNATUM, in law, is a defamatory speech or writing to the injury of a person of dignity; for which a writ that bears the same name is granted for the recovery of damages.

SCANDERBEG, the surname of George Castriot, king of Albania, a province of Turkey in Europe, dependent on the Ottoman empire. He was delivered up with his three elder brothers as hostages, by their father, to Amurath II., sultan of the Turks, who poisoned his brothers, but spared him on account of his youth, being likewise pleased with his juvenile wit and amiability. In a short time he became one of the most renowned generals of the age; and revolting from Amurath, he joined Humnaide Corvin, a most formidable enemy to the Ottoman power. He defeated the sultan’s army, took Amurath’s secretary prisoner, obliged him to sign and seal an order to the governor of Croia, the capital of Albania, to deliver up the citadel and city to the bearer of that order, in the name of the sultan. With this forged order he repaired to Croia; and thus recovered the throne of his ancestors, and maintained the independency of his country against the numerous armies of Amurath and his successor Mahomed II., who was obliged to make peace with this hero in 1461. He then went to the assistance of Ferdinand of Aragon, at the request of Pope Pius II. and by his assistance Ferdinand gained a complete victory over his enemy the count of Anjou. Scanderbeg died in 1467.

SCANDERBOON. See ALEXANDRETTA.

SCANDINAVIA, a general name for the countries of Norway, Sweden, and Denmark, anciently under the dominion of one prince. The inhabitants of these countries, in former times, were excessively addicted to war. From their earliest years they applied themselves to the military art, and accustomed themselves to cold, fatigue, and hunger. Even the very spots of youth and childhood were dangerous.
ginning of the ninth century, had founded on the
coasts of Pomerania a city named Jomborg.
To this place he sent a colony of young Danes, be-
flowing the government on a celebrated warrior called
Palnaiko. In this colony it was forbidden to mention
the word fear, even in the most imminent dangers.
No citizen of Jomborg was to yield to any number of
enemies however great. The sight of inevitable death
was not to be taken as an excuse for showing the small-
eft apprehension. And this legislator really appears
to have eradicated from the minds of most of the youths
bred up under him, all traces of that sentiment so
natural and so universal, which makes men think on the
destruction with horror. Nothing can show this better
than a single fact in their history, which deserves to
have place here for its singularity. Some of them
having made an irruption into the territories of a power-
ful Norwegian lord, named Haquin, were overcome in
spite of the obstinacy of their resistance; and the most
distinguished among them being made prisoners, were,
according to the custom of those times, condemned
to death. The news of this, far from afflicting them, was
on the contrary received with joy. The first who
was led to punishment was content to say, without changing
countenance, and without expressing the least sign of
fear, "Why should not the fame happen to me as did
to my father? He died, and so must I." A warrior,
named Thorchill, who was to cut off the head of the fs-
cond, having asked him what he felt at the sight of
death, he answered, "that he remembered too well the
laws of Jomborg to utter any words that denoted fear."
The third, in reply to the same question, said, "he re-
joyed too in the glory, which makes men think on such a
death of an infamous life like that of Thorchill's."
The fourth made an answer much longer and more ex-
traordinary. "I suffer with a good heart; and the
present hour is to me very agreeable. I only beg of
you (added he, addressing himself to Thorchill) to be
very quick in cutting off my head; for it is a question
often debated by us at Jomborg, whether one re-
tains any fentiment after being beheaded. I will therefore
grasp this knife in my hand; if, after my head is cut
off, I strike it towards you, it will show I have not loft
all fentiment; if I let it drop, it will be a proof of the con-
trary. Make haste, therefore, and decide the difpute."
Thorchill, adds the historian, cut off his head in a
most expeditious manner; but the knife, as might be ex-
pected, dropped from his hand. The fifth showed the
same tranquillity, and died railing and jeering his en-
emies. The fixth begged of Thorchill, that he might not
be led to punishment like a sheep: "Strike the blow
in my face (said he), I will fit fill without
shrinkings; and take notice whether I once wink my
eyes, or betray one fign of fear in my countenance:
for we inhabitants of Jomborg are used to exercise our-
selves in trials of this sort, fo as to meet the fcore of
death without once moving." He kept his promise
before all the speculators, and received the blow without
betraying the least sign of fear, or fo much as winking
with his eyes. The seventh, says the historian, was a
very beautiful young man, in the flower of his age.
His long hair, as fine as silk, floated in curls and ring-
lets on his shoulders. Thorchill asked him, what he
thought of death? "I receive it willingly (said he), since
I have fulfilled the greateft duty of life, and have seen
all those put to death whom I would not survive. I
only beg of you one favour, not to let my hair be
 touched by a flave, or stained with my blood."

Neither was this intrepidity peculiar to the inhabi-
tants of Jomborg; it was the general character of all
the Scandinavians, of which we shall only give this
further instance. A warrior, having been thrown upon
his back in wrestling with his enemy, and the latter
finding himself without his arms, the vanquished per-
son promised to wait, without changing his posture,
till his antagonist fetched a fword to kill him; and he
thoughtfully kept his word.—"To die with his arms in his
hand was the ardent and fervile desire of the pleas-
ing idea which they had of this kind of death led
them to dread such as proceeded from old age and dif-
ease. The history of ancient Scandinavia is full of
instances of this way of thinking. The warriors who
found themselves lingering in fickness, often availed
themselves of their few remaining moments to shake
off life, by a way that they supposed to be more glori-
some. Some of them would be carried into a field of
battle, that they might die in the engagement. Others
flew themselves: many procured this melancholy-ser-
vice to be performed by their friends, who considered
it as a most facred duty. "There is, on a mountain of
Icealand, (fays the author of an old Icealand
romance), a rock fo high, that no animal can fall from the
top and live. Here men betake themselves when they
are afflicted and unhappy. From this place all our an-
cedtors, even without waiting for ficknefs, have depar-
ted into Eden. It is usefull, therefore, to give ourfelves
up to groans and complaints, or to put our relations to
needles and expences, in order to procure fuch an ex-
ample of our fathers, who have all gone by the way of
this rock."—When all these methods failed, and at laft
when Christianity had banifhed fuch barbarous prac-
tices, the difconsolate heroes confoled themselves by
putting on complete armour as soon as they found
their end approaching.

SCANDIX, SHEPHERDS NEEDLE, or Venus Comb,
in botany: A genus of the digynia order, belonging to
the pentandria clafs of plants; and in the natural me-
thod ranking under the 45th order, Umbellate. The
corolla is radiating; the fruit fubulatate; the petals
emarginated; the florets of the disk frequently male.
The moft remarkable species is the odorata, with angu-
lar furrowed feeds. It is a native of Germany; and
has a very thick perennall root, composed of many
fibres, of a fweet aromatic taitfe like anifeed, from
which come forth many large leaves that branch out
fomewhat like thoife of fern, from whence it is named
sweet-fern. The flarks grow four or five feet high,
are fulbulous and hairy; the flowers are disposed in an
umbel at the top of the flaft, are of a white colour,
and have a fweet aromatic fcent.—This species is eas-
ily propagated by feeds, which, if permitted to scat-
ter, will fupply an abundance of young plants, that
may be put into any part of the garden, and require
no care.

SCANNING, in poetry, the meafuring of verfe by
feet, in order to fee whether or not the quantities be
duly observed. The term is chiefly ufed in Greek
and Latin verfe. Thus an hexamer verfe is fccamed
by refoving it into fix feet; a pentameter, by refoving
it into five feet, &c.
SCANTO, or SPAVENTO, a sudden impression of horror upon the mind and body. It is extremely dreaded by the inhabitants of Sicily; and the wild ideas of the vulgar part of the inhabitants respecting it are almost incredible, and their dread of a sudden shock is no less surprising. There is scarce a symptom, disorder, or accident, to which they do not think may befall the human frame in consequence of the canto. They are persuaded that a man who has been frightened only by a dog, a viper, scorpion, or any other creature, which he has an antipathy to, will soon be seized with the same pains he would really feel, had he been torn with their teeth or wounded with their venomous sting; and that nothing can remove the nervous imaginary pangs but a strong dose of dilera, a species of cantharides found in Sicily.

SCAPE-GOAT, in the Jewish antiquities, the goat which was let at liberty on the day of solemn expiation. For the ceremonies on this occasion, see Levit. xvi. 5, 6, &c.

Some say, that a piece of scarlet cloth, in form of a tongue, was tied on the forehead of the scape-goat. Hoff. Lex. Univ. in voc. Lingua.

Many have been the disputes among the interpreters concerning the meaning of the word scape-goat; or rather of azazel, for which scape-goat is put in our version of the Bible.

Spencer is of opinion, that azazel is a proper name, signifying the devil or evil demon. See his reasons in his book De leg. Hebr. ritual. Differt. viii. Among other things, he observes, that the ancient Jews used to substitute the name Samael for Azazel; and many of them have ventured to affirm, that at the feal of expiation they were obliged to offer a gift to Samael to obtain his favour. Thus also the goat, sent into the wilderness to Azazel, was understood to be a gift or oblation. Some Christians have been of the same opinion. But Spencer thinks that the genuine reasons of the ceremony were, 1. That the goat, loaded with the sins of the people, and sent to Azazel, might be a symbolical representation of the miserable condition of sinners. 2. God sent the goat thus loaded to the evil demons, to show that they were impure, thereby to deter the people from any conversation or familiarity with them. 3. That the goat sent to Azazel, sufficiently expiating all evils, the Israelites might the more willingly abstain from the expiatory sacrifices of the Gentiles.

SCAPULA, in anatomy, the shoulder, or shoulder-bone.

SCAPULA (John), the reputed author of a Greek lexicon, published at Lausanne. His name is recorded in the annals of literature, neither on account of his talents nor learning, nor virtuous industry, but for a gross act of disingeniuty and fraud which he committed against an eminent literary character of the 16th century. Being employed by Henry Stephens as a corrector to his press while he was publishing his Theaurus lingus Graecae, Scapula extracbed these words and explications which he reckoned most useful, comprised them in one volume, and published them as an original work, with his own name.

The compilation and printing of the Theaurus had cost Stephens immense labour and expense; but it was so much admired by those learned men to whom he had shown it, and seemed to be of such essential importance to the acquisition of the Greek language, that he renounced his labours would be crowned with honour, and that the money he had expended would be repaid by a rapid and extensive sale. But before his work came abroad, Scapula's abridgement appeared; which, from its fine and price, was quickly purchased, while the Theaurus itself lay neglected in the author's hands.

The consequence was a bankruptcy on the part of Stephens, while he who had occasioned it was enjoying the fruits of his treachery. Scapula's Lexicon was first printed in 1570, in 4to. It was afterwards enlarged, and published in folio. It has gone through several editions, while the valuable work of Stephens has never been reprinted. Its successes, however, not owing to its superior merit, but to its price and more commodious size. Stephens charges the author with omitting a great many important articles. He accuses him of misunderstanding and perverting his meaning; and of tracing out absurd and trifling etymologies, which he himself had been careful to avoid. He composed the following epigram on Scapula:

Quidam ventosus me capulo tenis addidit ensim \[\text{Eger eram a Scapulis, fanus at huc redeo.}\]

Doctor Bulby, so much celebrated for his knowledge of the Greek language, and his successes in teaching it, would never permit his scholars at Westminster school to make use of Scapula.

SCAPULAR, in anatomy, the name of two pair of arteries, and as many veins.

SCAPULAR, or SCAPULARY, a part of the habit of several religious orders in the church of Rome, worn over the gown as a badge of peculiar veneration for the Blessed Virgin. It consists of two narrow slips or breadth of cloth covering the back and the breast, and hanging down to the feet.—The devotees of the scapulary celebrate its festival on the 10th of July.

SCARABÆUS, the BEETLE, in zoology, a genus of insects of the coleoptera order; the antennæ of the beetles are of a clavated figure, and filifie longitudinally; and their legs are frequently dentated. There are 47 species; all, however, concurring in one common formation of having cases to their wings, which are the more necessary to those insects, as they often live under the surface of the earth, in holes which they dig out by their own industry. The cases prevent the various injuries their real wings might suffer by rubbing or crushing against the sides of their abode. These, though they do not affit flight, yet keep the internal wings clean and even, and produce a loud buzzing noise when the animal rises in the air.

If we examine the formation of all animals of the beetle kind, we shall find, as in shell fish, that their bones are placed externally, and their muscles within. These muscles are formed very much like those of quadrupeds; and are formed with such surprising strength, that, bulk for bulk, they are a thousand times stronger than those of a man. The strength of these muscles is of use in digging the animal's subterraneous abode, whether it most frequently returns, even after it becomes a winged insect capable of flying.

Besides the difference which results from the shape and colour of these animals, the size also makes a considerable one; some beetles being not larger than the
head of a pin; while others, such as the elephant beetle, are as big as one's fist. But the greatest difference among them is, that some are produced in a month, and in a single season go through all the stages of their existence; while others take near four years to their production, and live as winged insects a year more.

The may-bug, dor beetle, or cock-chaffer, has, like all the rest, a pair of cates to its wings, which are of a reddish brown colour, sprinkled with a whitish dust, which easily comes off. In some years their necks are seen covered with a red plate, and in others with a black; these, however, are distinct forts, and their difference is by no means accidental. The fore-legs are very short, and the better calculated for burrowing in the ground, where this insect makes its retreat. It is well known, for its evening buzz, to children; but still more formidably introduced to the acquaintance of the husbandman and gardener, for in some seasons it has been found to swarm in such numbers as to eat up every vegetable production.

The two sexes in the may-bug are easily distinguished from each other, by the superior length of the tufts, at the end of the horns, in the male. They begin to copulate in summer; and at that season they are seen joined together for a considerable time. They fly about in this state, the one hanging pendant from the tail of the other. It has been supposed, that, like fishes, they are hermaphrodites, as there seems to be a mutual intimation.

The female being impregnated, quickly falls to boring a hole into the ground, wherein to deposit her burden. This is generally about half a foot deep; and in it she places her eggs, which are of an oblong shape, with great regularity, one by the other. They are of a bright yellow colour, and no way wrapped up in a common covering, as some have imagined. When the female is lightened of her burden, the again ascends from her hole, to live, as before, upon leaves and vegetables, to buzz in the summer evening, and to lie hid among the branches of trees in the heat of the day.

In about three months after these eggs have been thus deposited in the earth, the contained insects begins to break its shell, and a small grub or maggot crawls forth, and feeds upon the roots of whatever vegetable it happens to be nearest. All substances, of this kind, seem equally grateful; yet it is probable the mother insect has a choice among what kind of vegetables she shall deposit her young. In this manner these voracious creatures continue in the worm state for more than three years, devouring the roots of every plant they approach, and making their way under ground in quest of food with great dispatch and facility. At length they grow to above the size of a walnut, being a great thick white maggot with a red head, which is seen most frequently in new turned earth, and which is so eagerly sought after by birds of every species. When largest, they are found an inch and a half long, of a whitish yellow colour; with a body consisting of twelve segments or joints, on each side of which there are nine breathing holes, and three red feet. The head is larger in proportion to the body, of a reddish colour, with a pincer before, and a semicircular lip, with which it cuts the roots of plants, and sucks out their moisture. As this insect lives entirely under ground, it has no occasion for seeing its eyes, and accordingly it is found to have none; but it is furnished with two feelers, which, like the crust of a blind man, serve to direct its motions. Such is the form of this animal, that lives for years in the worm state under ground, still voracious, and every year changing its skin.

It is not till the end of the fourth year that this extraordinary insect prepares to emerge from its subterranean abode, and even this is not effected but by a tedious preparation. About the latter end of autumn, the grub begins to perceive the approaches of its transformation; it then buries itself deeper and deeper in the earth, sometimes fix feet beneath the surface; and there forms itself a capacious apartment, walls of which it renders very smooth and shining by the exertions of its body. Its abode being thus formed, it begins soon after to shorten itself, to swell, and to burst its last skin in order to assume the form of a chrysalis. This, in the beginning, appears of a yellowish colour, which heightens by degrees, till at last it is seen nearly red. Its exterior form plainly discovers all the veigles of the future winged insects, all the fore parts being distinctly seen; while behind, the animal seems as if wrapped in swaddling clothes. The young may-bug continues in this state for about three months longer; and it is not till the beginning of January that the aurelia dives itself of all its impediments, and becomes a winged insect completely formed. Yet still the animal is far from attaining its natural strength, health, and appetite. It undergoes a kind of infant imbecility; and unlike most other insects, that the infant they become flies are arrived at their state of full perfection, the may-bug continues feeble and sickly. Its colour is much brighter than in the perfect animal; all its parts are soft; and its voracious nature seems for a while to have entirely forsaken it. As the animal is very often found in this state, it is suppos'd, by those acquainted with its real history, that the old one, of the former season, have buried themselves for the winter, in order to revisit the fun the ensuing summer. But the fact is, the old one never survives the season; but dies, like all the other winged tribe of insects, from the severity of cold in the winter.

About the latter end of May, these insects, after having lived for four years under ground, burst from the earth when the first mild evening invites them abroad. They are at that time seen rising from their long imprisonment, from living only upon roots, and imbibing only the moisture of the earth, to visit the mildness of the summer air, to choose the sweetest vegetables for their banquet, and to drink the dew of the evening. Whenever an attentive observer then walks abroad, he will see them bustling up before him in his pathway, like ghouls on a theatre. He will see every part of the earth, that had its surface beaten into hardnefs, perforated by their eggression. When the season is favourable for them, they are seen by myriads buzzing along, hitting against every object that intercepts their flight. The mid-day sun, however, seems too powerful for their constitutions: they then lurk under the leaves and branches of some shady tree; but the willow seems particularly their most favourite food; there they lurk in clusters, and seldom quit.
SCARABÆUS, quit the tree till they have devoured all its verdure. In those seasons which are favourable to their propagation, they are seen in an evening as thick as flakes of snow, and hasting against every object with a fort of capricious blindness. Their duration, however, is but short, as they never survive the secon day. They begin to join shortly after they have been let loose from their prison; and when the female is impregnated, the cautiously bores a hole in the ground, with a tunnel fitted for that purpose with which she is furnished at the tail; and there deposits her eggs, generally to the number of threesome. If the secon and the soil be adapted to their propagation, these soon multiply as already described, and go through the various stages of their contemptible existence. This insect, however, in its worm state, though prejudicial to man, makes one of the chief repasts of the feathered tribe, and is generally the first nourishment with which they supply their young. Hogs will root up the land for them, and at first eat them greedily; but seldom meddle with them a second time. Rooks are particularly fond of these worms, and devour them in great numbers. The inhabitants of the county of Norfolk, some time since, went into the practice of destroying their rookeries; but in proportion as they destroyed one plague, they were pestered with a greater; and these insects multiplied in such an amazing abundance, as to destroy not only the verdure of the fields, but even the roots of vegetables not yet set forth. One farm in particular was so injured by them in the year 1751, that the occupier was not able to pay his rent; and the landlord was not only content to lose his income for that year, but also gave money for the support of the farmer and his family. In Ireland they suffered so much by these insects, that they came to a resolution of setting fire to a wood, of some extent, to prevent their mischievous propagation.

Neither the severest frosts in our climate (says Mr. Rack), nor even keeping them in water, will kill them. I have kept some in water near a week; they appeared motionless; but on exposing them to the sun and air a few hours, they recovered, and were as lively as if set forth. On examining them with a microscope, I could never discover any organs for respiration, or perceive any pulsation. When numerous, they are not destroyed without great difficulty; the best method is, to plough up the land in thin furrows, and employ children to pick them up in baskets; and then strew salt and quicklime, and harrow in. About 30 years since I remember many farmers crops in Norfolk were almost ruined by them in their grub-state; and in the next season, when they took wing, the trees and hedges in many parishes were stripped bare of their leaves as in winter. At first the people used to bash them down with poles, and then sweep them up and burn them. One farmer made oath that he gathered 80 bushels; but their number seemed not much lessened, except just in his own fields.

The scarabæus carnivorus, which the Americans call the tumble-dung, particularly demands our attention. It is all over of a dusky black, rounder than those animals are generally found to be, and five strong, though not much larger than the common black beetle, that if one of them is put under a brass candlestick, it will cause it to move backwards and forwards, as if it were by an invisible hand, to the admiration of those who are not accustomed to the sight: but this strength is given it for much more useful purposes than those of exciting human curiosity; for there is no creature more laborious, either in seeking subsistence, or providing a proper retreat for its young. They are endowed with sagacity to discover subsistence by their excellent smell, which directs them in flights to excrements just fallen from man or beast, on which they instantly drop, and fill unceasingly to work on, until the skull or pellets thereof, in the middle of which they lay an egg. These pellets, in September, they convey three feet deep in the earth, where they lie till the approach of spring, when the eggs are hatched and build their cells, and the insects find their way out of the earth. They assist each other with indefatigable industry in rolling these globular pellets to the place where they are to be buried. This they do with the tail, foremost, by raising up their hinder part, and hewing along the wall with their hind feet. They are always accompanied with other beetles of a larger size, and of a more elegant figure and colour. The breath of this is covered with a shield of a crimson colour, and shining like metal; the head is of the like colour, mixed with green; and on the crown of the head stands a shining black horn, bending backwards. These are called the lings of the beetles; but for what reason is uncertain, since they partake of the same dirty drudgery with the rest. The elephant-beetle is the largest of this kind hitherto known; and is found in South America, particularly in Guiana and Surinam, as well as about the river Oroono. It is of a black colour; and the whole body is covered with a very hard shell, full as thick and as strong as that of a small crab. Its length, from the hinder part to the eyes, is about four inches; and from the same part to the end of the proboscis or trunk, four inches and three quarters. The transverse diameter of the body is two inches and a quarter; and the breadth of each elytron, or case for the wings, is an inch and three-thirds. The antennæ or feelers are quite hard; for which reason the proboscis or trunk is moveable at its insertion into the head, and seems to supply the place of feelers; the horns are eight-thenths of an inch long, and terminate in points. The proboscis is an inch and a quarter long, and turns upwards; making a crooked line, terminating in two horns, each of which is near a quarter of an inch long; but they are not perforated at the end like the proboscis of other insects. About four-thenths of an inch above the head, on that side next the body, is a prominence or small horn; which, if the rest of the trunk were away, would cauise this part to resemble the horn of a rhinoceros. There is indeed a beetle so called; but then the horn or trunk has no fork at the end, though the lower horn resembles this. The feet are all forked at the end, but not like lobsters claws. See Plate CCCXLIV.

SCARBOROUGH, a town of the North Riding of Yorkshire, seated on a steep rock, near which are some craggy cliffs that it is almost inaccessible on every side. On the top of this rock is a large green plain, with two wells of fresh water springing out of the rock. It has of late been greatly frequented on account of its mineral waters called the Scarborougli-spa; on which account it is much mended in the number and beauty of the buildings. The spring was under the cliff, part of which...
which fell down in 1737, and the water was lost; but in clearing away the ruins in order to rebuild the wharf, it was recovered, to the great joy of the town. The waters of Scarborough are chalybeate and purging. The two wells are both impregnated with the same principles, in different proportions; though the purging well is the most celebrated, and the water of this is usually called the Scarborough water. When these waters are poured out of one glass into another, they throw up a number of air-bubbles; and if they are shaken for some time in a phial close stopped, and the phial be suddenly opened before the commotion ceases, they disseplode an elastic vapour, with an audible noise, which shows that they abound in fixed air. At the fountain they have a brisk, pungent, chalybeate tafte; but the purging water tafes bitterish, which is not usually the cafe with the chalybeate one. They lofe their chalybeate virtues by exposure and by keeping; but the purging water the fooneft. They both putrefy but by keeping; but in time recover their sweetnefs. Four of five half pints of the purging water drank within an hour, give two or three easy motions, and raise the fpirits. The like quantity of the chalybeate purges less, but exhilarates more, and passes off chiefly by urine. These waters have been found beneficial in hectic fevers, weakneffes of the stomuch, and indigetion; in relaxation of the fystem; in nervous, hysterical, and hypochondriacal disorders; in the green ficknefs, scurvy, rheumatism, and affmatic complaints; in gleetts, the fluor albus, and other preternatural evolutions; and in habitual colicnefs. Here are affembles and balls in the fame manner as at Tunbridge. It is a place of some trade, has a very good harbour, and fends two members to parliament. E. Long. c. 3. N. Lat. 54. 18.

SCARDOONA, a fea-port town of Dalmatia, feated on the eaftern banks of the river Cherca, with a bishop’s fee. It has been taken and retaken feveral times by the Turks and Venetians; and thofe laft ruined the fortifications and its principal buildings in 1537; but they have been since put in a flate of defence.

No veftiges (fays Fortin) now remain visible of that ancient city, where the fates of Liburnia held their af­fembly in the times of the Romans. I however trans­cribed these two beautiful infcriptions, which were dif­covered fome years ago, and are preferved in the houfe of the reverend Canon Mercati. It is to be hoped, that, as the population of Scardona continues increa­sing, new lands will be brought up, and confequently more frequent discoveries made of the preci­ous monuments of antiquity. And it is to be wish’d, that the few men of letters, who have a fhare in the regulation of this reviving city, may bellow fome particular attention on that article, fo that the honourable memorialis of their ancient and illuftrious country, which once held fo eminent a rank among the Liburnian cities, may not be loll, nor carried away. It is almoft a fhame, that only five legible infcriptions actually exit at Scardona; and that all the others, fince many more certainly muft have been dug up there, are either miserably broken, or loll, or transported to Italy, where they lofe the great­eft part of their merit. Roman coins are very frequent­ly found about Scardona, and feveral valuable ones were fhewn to me by that hospitable prelate Montignor Tre­vifani, bishop and father of the rising fettlement. One of the principal gentlemen of the place was fo kind as to give me feveral feptulchar lamps, which are marked by the name of Fortin, and by the elegant form of the letters appear to be of the fhort times. The repeated deviations to which Scardona has been expof’d, have left it no traces of grandeur. It is now, however, be­ginning to rife again, and many merchants of Servia and Bosnia have fettled there, on account of the con­venient situation for trade with the upper provinces of Turkey. But the city has no fortifications, notwithstanding the affliction of P. Farlati to the contrary,” E. Long. 17. 25. N. Lat. 43. 55.

SCARIFICATION, in furgery, the operation of making feveral incifions in the skin by means of lance­ts or other instruments, particularly the cupping instru­ment. See SURGERY.

SCARLET, a beautiful bright red colour. In painting in water-colours, minium mixed with a little vermillion produces a good scarlet: but if a flower in a print is to be painted a scarlet colour, the lights as well as the shades should be covered with minium, and the shaded parts finifhed with carmine, which will produce an admirable scarlet.

SCAVE, or Scaue (Scutum, plate), is the interior talus or slope of the ditch next the place, at the foot of the rampart. SCARE, in heraldry, the scarf which military com­manders wear for ornament. It is borne somewhat like a battoon finifer, but is broader than it, and is continued out to the edges of the field, whereas the battoon is cut off at each end.

SCARPANTO, an illand of the Archipelago, and one of the Sporades, lying to the south-weft of the ille of Rhodes, and to the north-east of that of Candia. It is about 22 miles in length and 8 in breadth; and there are feveral high mountains. It abounds in cattle and game; and there are mines of iron, quarries of marble, with feveral good harbours. The Turks are maffers of it, but the inhabitants are Greeks.

SCARPE, a river of the Netherlands, which has its source near Aubigny in Artois, where it washes Arras and Douay; after which it runs on the confines of Flanders and Hainault, paffing by St Amand, and a little after falls into the river of the Sever.

SCARRON (Paul), a famous burlesque writer, was the fon of a counfellor in parliament, and was born at Paris about the end of the year 1610, or in the begin­ning of the succeeding year. His father marrying a second time, he was compelled to effume the ecclefia­flical profefion. At the age of 24 he visited Italy, where he freely indulged in licentious pleasures. After his return to Paris he perfifted in a life of difipation till a long and painful difeafe convinced him that his confi­tution was almoft worn out. At length when engaged in a party of pleafure at the age of 27, he loft the use of his leg, which danced fo gracefully, and of his hands which could paint and play on the lute with fo much eleg­ance. In the year 1638 he was attending the carnival at Mens, of which he was a canon. Having drefted himself one day as a savage, his fingular appearance excited the curiofity of the children of the town. They followed him in multitudes, and he was obliged to take shelter in a marsh. This wet and cold-fituation produ­ced a numbness which totally deprived him of the use of his limbs; but notwithstanding this misfortune he con­tinued gay and cheerful. He took up his residence at Paris,
S C A

Paris, and by his pleasant humour soon attracted to his house all the men of wit about the city. The loss of his health was followed by the loss of his fortune. On the death of his father he entered into a procès with his mother-in-law. He pleaded the cause in a judicious manner, though his whole fortune depended on the decision. He accordingly lost the cause. Madame de Hautefort, compassionating his misfortunes, procured for him an audience of the queen. The poet requested to have the title of Valetudinarian to her majesty. The queen smiled, and Scarron considered unworthy of a title. When Fouquet gave him a pension of 500 crowns, but that minister having received disdainfully the dedication of his Typhon, the poet immediately wrote a Maazarinade, and the pension was withdrawn. He then attached himself to the prince of Condé, and celebrated his victories. He at length formed the extraordinary resolution of marrying, and was, accordingly, in 1651, married to Mademoiselle d'Avignon (afterwards the famous Madame de Maintenon), who was then only 16 years of age. "At that time (says Voltaire) it was considered as a great acquisition for her to gain for a husband a man who was disfigured by nature, impotent, and very little enriched by fortune." When Scarron was questioned about the contract of marriage, he said he acknowledged to the bride two large invincible eyes, a very beautiful shape, two fine hands, and a large portion of wit. The notary demanded what dowry he would give her? Immediately replied Scarron, "The names of the wives of kings die with them, but the name of Scarron's wife shall live for ever." She restrained by her modesty his indecent buffooneries, and the good company which had formerly retorted to his house were not less frequent in their visits. Scarron now became a new man. He became more decent in his manners and conversation: and his gaiety, when tempered with moderation, was still more agreeable. But, in the mean time, he lived with so little economy, that his income was soon reduced to a small annuity and his marquise of Quinet. By the marquise of Quinet, he meant the revenue he derived from his publications, which were printed by one Quinet. He was accustomed to talk to his superiors with great freedom in his jocular style. In the dedication to his Don Japhet d'Armenie, he thus addresses the king, "I shall endeavour to per dane your majesty, that you would do yourself no injury were you to do me a small favour; for in that case I should become more gay: if I should become more gay, I should write sprightly comedies: and if I should write sprightly comedies, your majesty would be amused, and thus your money would not be lost. All this appears so evident, that I should certainly be convinced of it if I were as great a king as I am now a poor unfortunate man."

Though Scarron wrote comedies, he had neither time nor patience to study the rules and models of dramatic poetry. Ariosto and Horace, Plautus and Terence, would have frightened him; and perhaps he did not know that there was ever such a person as Ariosto and Plautus. He saw an open path before him, and he followed it. It was the fashion of the times to pillage the Spanish writers. Scarron was acquainted with that language, and he found it easier to use the materials which were already prepared, than to rack his brain in inventing a subject; a restraint to which a genius like his could not easily submit. As he borrowed liberally from the Spanish writers, a dramatic piece did not cost him much labour. His labour consisted in making his comic characters talk humorously, but in keeping up serious characters; for the serious was a foreign language to him. The great successes of his Jodelet Majeur were a vast allurement to him. The comedians who acted it eagerly requested more of his productions. They were written without much toil, and they procured him large sums. They served to amuse him. If it be necessary to give more reasons for Scarron's readiness to engage in these works, abundance may be had. He dedicated his books to his sister's greyhound bitch; and when she failed him, he dedicated them to a certain Monseigneur, whom he praised higher, but did not much esteem. When the office of historiographer became vacant, he solicited for it without success. At length Fouquet gave him a pension of 1600 livres. Christina queen of Sweden having come to Paris, was anxious to see Scarron. "I permit you (said the to Scarron) to fall in love with me. The queen of France has made you her valetudinarian, and I create you my Roland," Scarron did not long enjoy that title: he was feized with so violent a hiccough, that every person thought he would have expired. "If I recover (he said), I will make a fine satire on the hiccough." His gaiety did not forsake him to the last: Within a few minutes of his death, when his domestics were shedding tears about him, "My good friends (said he), I shall never make you weep so much for me as I have made you laugh." Just before expiring, he said, "I could never believe before that it is so easy to laugh at death." He died on the 14th of October 1660, in the 51st year of his age.

His works have been collected and published by Bruz de la Martiniere, in 10 vols 12mo, 1737. There are, 1. The Enid travelled, in 8 books. It was afterwards continued by Moreau de Brafey. 2. Typhon, or the gigantomachia. 3. Many comedies; as, Jodelet, or the Malter Valet; Jodelet cuffed; Don Japhet d'Armenie; The Ridiculous Heir; Every Man his Master; The Disguised Suitor. 4. Many productions. As, the only one of his works that deserves attention. It is written with much purity and gaiety, and has contributed a little to the improvement of the French language. Scarron had great pleasure in reading his works to his friends as he composed them; he called it trying his works. Segrains and another of his friends coming to him one day, "Take a chair (says Scarron to them) and sit down, that I may examine my comic Romance." When he observed the company laugh, "Very well (said he), my book will be well received since it makes perfoms of such delicate taste laugh." Nor was he deceived. His Romance had a prodigious run. It was the only one of his works that Boileau could submit to read. 5. Spanish novels translated into French. 6. A volume of Letters. 7. Poems; collecting Songs, Epitaphs, Stanzas, Odes, and Epigrams. The whole collection abounds with sprightliness and gaiety. Scarron can
can raise a laugh in the most serious subjects; but his fallacies are rather those of a buffoon than the effusions of digression and taste. He is continually falling into the mean and the obscene. If we should make any exception in favour of some of his comedies, of some passages in his Ened, and his Comic Romance, we must acknowledge that all the jests of his works are only fit to be read by footmen and buffoons. It has been said that he was the most eminent man in his age for burlesque. This might make him an agreeable companion to those who chose to laugh away their time; but as he has left nothing that can instruct posterity, he has but little title to posthumous fame.

SCENE, in its primary sense, denoted a theatre, or the place where dramatic pieces and other public shows were exhibited; for it does not appear that the ancient poets were at all acquainted with the modern way of changing the scenes in the different parts of the play, in order to raise the idea of the persons represented by the actors being in different places.

The original scene for acting of plays was as simple as the representations themselves: it consisted only of a plain plot of ground proper for the occasion, which was in some degree shaded by the neighbouring trees, whose branches were made to meet together, and their vacancies supplied with boards, sticks, and the like; and to complete the shelter, trees were sometimes covered with skins, and sometimes with only the branches of other trees newly cut down, and full of leaves. Afterwards more artificial scenes, or scenical representations, were introduced, and paintings used instead of the objects themselves. Scenes were then of three sorts: tragic, comic, and satyric. The tragic scene represented lately magnificent edifices, with decorations of pilasters, statues, and other things suitable to the palaces of kings: the comic exhibited private houses with balconies and windows, in imitation of common buildings: the satyric was the representation of groves, mountains, dens, and other rural appearances; and these decorations either turned on-pivots, or slid along grooves, as those in our theatres.

To keep close to nature and probability, the scene should never be shifted from place to place in the course of the play: the ancients were pretty severe in this respect, particularly Terence, in some of whose plays the scene never shifts at all, but the whole is transacted at the door of some old man's house, whither with inimitable art he occasionally brings the actors. The French are pretty strict with respect to this rule; but the English pay very little regard to it.

Scene is also a part or division of a dramatic poem. Thus plays are divided into acts, and acts are again subdivided into scenes; in which sense the scene is properly the person present at or concerned in the action on the stage at such a time; whenever, therefore, a new actor appears, or an old one disappears, the action is changed into other hands; and therefore a new scene then commences.

It is one of the laws of the stage, that the scenes be well connected; that is, that one succeed another in such a manner as that the stage be never quite empty till the end of the act. See POETRY.

SCENEROGRAPHY, (from the Greek, σκηνη σκηνα, and μείον μείον, description), in perspective, a representation of a body on a perspective plane; or a description thereof in all its dimensions such as it appears to the eye. See PERSPECTIVE.

SCETIC, scepticism, from σκέπτομαι, "I consider, look about, or deliberate," properly signifies confiderative and inquisitive, or one who is always weighing reasons on one side, and the other without ever deciding between them. It is chiefly applied to an ancient sect of philosophers founded by Pyrrho (see PYRRHO), who, according to Laertius, had various other denominations. From their matter they were called Pyrrhonians; from the distingushing tenets or characteristics of their philosophy they derived the name of Apocriton from σεπτικος, "to doubt," from their suspension and betwixt they were called ephebic, from επιθες, "to play or keep back," and lastly, they were called satirici or fescitri, from their never getting beyond the search of truth.

That the sceptical philosophy is absurd, can admit of no dispute in the present age; and that many of the followers of Pyrrho carried it to the most ridiculous height, is no less true. But we cannot believe that he himself was so extravagantly sceptical as has sometimes been averted, when we reflect on the particulars of his life, which are still preserved, and the respectful manner in which we find him mentioned by his contemporaries and writers of the first name who flourished soon after him. The truth, as far as at this distance of time it can be discovered, seems to be, that he learned from Democritus to deny the real existence of all qualities in bodies, except those which are essential to primary atoms, and that he referred every thing else to the perceptions of the mind produced by external objects, in other words, to appearance and opinion. All knowledge of ours appeared to him to depend on the fallacious report of the scenes, and consequently to be uncertain; and in this notion he was confirmed by the general spirit of the Eleatic school in which he was educated. He was further confirmed in his scepticism by the subtleties of the Dialectic schools, in which he had been instructed by the son of Stilpo; choosing to overturn the cavils of sophistry by recurring to the doctrine of universal uncertainty, and thus breaking the knot which he could not undo. For being naturally and habitually inclined to consider immovable tranquility as the greatest end of all philosophy, he was easily led to delip the definitions of the dogmatists, and to infer from their endless disputes, the uncertainty of the questions on which they debated; contrary to its often happened to others, becoming also with respect to him the parent of scepticism.

Pyrrho's doctrines, however new and extraordinary, were not totally disregarded. He was attended by several scholars, and succeeded by several followers, who preserved the memory of his notions. The most eminent of his followers was Timon (see TIMON), in whom the public censure of professors in the Pyrrhonic school terminated. In the time of Cicero it was almost extinct, having suffered much from the jealousy of the dogmatists, and from a natural aversion in the human mind to acknowledge total ignorance, or to be left in abstinence. The disciples of Timon, however, still continued to profess scepticism, and their notions were embraced privately at least by many others. The school itself was afterwards revived by Pro'emetes a Cyrenian, and was continued by Anaxidemus a contemporary of Cicero, who wrote a treatise on the principles of the Pyrrhonic philosophy, the heads of which are preferred by Photius.
Photius. From this time it was continued through a series of preceptors of little note to Sextus Empiricus, who also gave a summary of the sceptical doctrine.

A system of philosophy thus founded on doubt, and clouded with uncertainty, could neither teach tenets of any importance, nor preside a certain rule of conduct; and accordingly we find that the followers of scepticism were guided entirely by chance. As they could form no certain judgment respecting good and evil, they accidentally learned the folly of eagerly pursuing any apparent good, or of avoiding any apparent evil; and their minds of course settled into a state of undisturbed tranquillity, the grand polibulum of their system.

In the schools of the sceptics we find ten different topics of argument urged in support of the doctrine of uncertainty, with this precaution, however, that nothing could be positively affirmed either concerning their number or their force. These arguments chiefly respect objects of sense: they place all knowledge in appearance; and, as the fame things appear very different to different people, it is impossible to say which appearance most truly expresses their real nature. They likewise say, that our judgment is liable to uncertainty from the circumstance of frequent or rare occurrence, and that mankind are continually led into different conceptions concerning the same thing by means of custom, law, fabulous tales, and established opinions. On all these accounts they think every human judgment is liable to uncertainty; and concerning any thing they can only affirm, that it seems to be, not that it is what it seems.

This doubtful reasoning, if reasoning it may be called, the sceptics extended to all the sciences in which they discovered nothing true, or which could be absolutely affayed. In all nature, in physics, morals, and theology, they found contradictory opinions, and inexplicable or incomprehensible phenomena. In physics, the appearances they thought might be deceitful; and respecting the nature of God and the duties of morality, men were, in their opinion, equally ignorant and uncertain. To overturn the sophistical arguments of these sceptical reasoners would be no difficult matter, if their reasoning were worthy of confutation. Indeed, their great principle is sufficiently, though shortly, refuted by Plato, in these words. "When you lay all things incomprehensible (says he), do you comprehend or conceive that they are thus incomprehensible, or do you not? If you do, then something is comprehensible; if you do not, there is no reason we should believe you, since you do not comprehend your own assertion."

But scepticism has not been confined entirely to the ancients and to the followers of Pyrrho. Numerous sceptics have arisen also in modern times, varying in their principles, manners, and character, as chance, prejudice, vanity, weakness, or indolence, prompted them. The great object, however, which they seem to have in view, is to overturn, or at least to weaken, the evidence of analogy, experience, and testimony; though some of them have even attempted to show, that the axioms of geometry are uncertain, and its demonstrations inconclusive. This last attempt has not indeed been often made; but the chief aim of Mr. Hume's philosophical writings is to introduce doubts into every branch of physics, metaphysics, history, ethics, and theology. It is needless to give a specimen of his reasonings in support of modern scepticism. The most important of them have been noticed elsewhere (see Miracul, Metaphysics, and Philosophy, n° 411); and such of our readers as have any relish for speculations of that nature can no strangers to his Essays; or to the able confutations of them by the Doctors Reid, Campbell, Gregory, and Beattie, who have likewise exposed the weaknesses of the sceptical reasonings of Des Cartes, Malbranche, and other philosophers of great fame in the fame school.

SCEPTICISM, the doctrines and opinions of the sceptics. See the preceding article.

SCEPTRE, a kind of royal staff, or baton, borne on solemn occasions by kings, as a badge of their command and authority. Nicod derives the word from the Greek σκεπτρον, which he says originally signified "a javelin," which the ancient kings usually bore as a badge of their authority; that instrument being in very great veneration among the heathens. But σκεπτρον does not properly signify a javelin, but a staff to rest upon, from σκέπτομαι, innum, "I lean upon." Accordingly, in the simplicity of the earlier ages of the world, the sceptres of kings were no other than long walking-staves: and Ovid, in speaking of Jupiter, describes him as reposing his sceptre (Met. i. v. 178.) The sceptre is an ensign of royalty of greater antiquity than the crown. The Greek tragic and other poets put sceptres in the hands of the most ancient kings they ever introduce. Justin observes, that the sceptre, in its original, was an ὄφθαλμος or spear. He adds, that, in the most remote antiquity, men adored the ὄφθαλμος or sceptres as immortal gods; and that it was upon this account, that, even in his time, they still furnished the gods with sceptres.—Neptune's sceptre is his trident. Tarquin the Elder was the first who assumed the sceptre among the Romans. Le Gendre tells us, that, in the first race of the French kings, the sceptre was a golden rod, almost always of the same height with the king who bore it, and cooked at one end like a crozier. Frequently instead of a sceptre, kings are seen on medals with a palm in their hand. See REGALIA.

SCHAEFFERA, in botany: A genus of the tetrandra order, belonging to the diccia class of plants; and in the natural method ranking with those that are doubtful. The calyx is quadripetalous; the corolla is quadrirpetalous, quinquepetalous, and often wanting; the fruit is a baccus berry with one seed. Of this there are two species, both natives of Jamaica; and grow in the lowlands near the sea: viz. 1. The Completa. 2. Jatrophera.

SCHAFFHAUSEN, a large, handsome, and strong town of Swisserland, capital, of a canton of the same name, with a castle in the form of a citadel. It is well built, with fine large streets, and adorned with several foundations; and the greatest part of the houses are painted on the outside. It is well fortified, and the cathedral is the largest church in Swisserland; besides which, the minster, with the monastery adjoining there to, the arsenal, the town-houses, the great clock (which shows the course of the sun and moon with their eclipses), and the stone bridge over the Rhine, are well worth the observation of a traveller. That river is of great confluence to the inhabitants with regard to trade. E. Long. 8. 51. N. Lat. 47. 39.

The Caixer of Schaaffhausen, in Swisserland, is bounded on the north and west by the Saab; on the east by the canton of Zurich, and the biphoprick of Constance;
It is 22 miles in length, and 10 in breadth; but produces all the necessaries of life, as wine, flax, wood, flax, horn's, sheep, wool, black cattle, and deer. The principal town is of the same name.

SCHEDULE, a scroll of parchment, or a roll of paper, containing the inventory of goods, or some other matter omitted in the body of the deed. — The word is a diminutive of the Latin schedae, or Greek χεδα, a leaf or piece of paper.

Scheele (Charles-William), was born on the 19th of December 1742, at Stralfund, where his father kept a shop. When he was very young, he received the usual instructions of a private school; and was afterwards advanced to an academy. At a very early age he showed a strong desire to follow the profession of an apothecary, and his father suffered him to gratify his inclinations. With Mr Bauch, an apothecary at Gottenburgh, he paffed his apprenticeship, which he completed in fixed years. He remained, however, some time longer at that place, and it was there that he formed the beautiful pigment called the Scheele's hint on this chemist, and he observed the same. The Duke asked him what countryman he was, and seemed to be much pleased when Scheele informed him that he was born at Stralfund. At their departure they told the professor, who was present, that they should esteem it a favour if he would permit the young man to have free access to the laboratory, as often as he chose, to make experiments.

In the year 1777 Scheele was appointed by the Medical College to be apothecary at Koping. It was at that place that he soon showed the world how great a man he was, and that no place or situation could confine his abilities. When he was at Stockholm he showed his acuteness as a chemist, as he discovered there the new and wonderful acid—contained in the sparry flour. It has been confidently affirmed, that Scheele was the first who discovered the nature of the aerial acid; and that whilft he was at Upfal he made many experiments to prove its properties. This circumstance might probably have furnished Bergman with the means of handling this subject more fully. At the same place he began the series of excellent experiments on that remarkable mineral subfance, manganese; from which investigation he was led to make the very valuable and interesting discovery of the dephlogiificated marine acid.

At the same time he first observed the ponderous earth.

At Koping he finished his dissertation on Air and Fire; a work which the celebrated Bergman most warmly recommended in the friendly preface which he wrote for it. The theory which Scheele endeavours to prove in this treatise, is, that fire consists of pure air and phlogiston. According to more recent opinions (if inflammable air be phlogiston), water is composed of these two principles. Of these opinions we may say, in the words of Cicero, "Opiones tam variis sunt, tamque inter se diffidentes, ut alterum profello fieri potest, ut carum nulla, alterum certe non potest, ut plus una, vera fiat." The author's merit in this work, exclusive of the encomiums of Bergman, was sufficient to obtain the approbation of the public; as the ingenuity displayed in handling so delicate a subject, and the many new and valuable observations (a) which are dispersed through the treatise, duly entitled the author to that fame which his book procured him. It was speed abroad through every country, became soon out of print, was reprinted, and translated into many languages. The English translation is enriched with the notes of that accurate and truly philosophic genius Richard Kirwan, Esq.

Scheele now diligently employed himself in contributing to the Transactions of the Academy at Stockholm. He first pointed out a new way to prepare the salt of benzoin. In the same year he discovered that arsenic, freed in a particular manner from phlogiston, partakes of all the properties of an acid, and has its peculiar affinities to other subfances.

(a) Scheele mentions in this work, in a cursory way, the decomposition of common salt by the calc of lead. Mr Turner, a gentleman who happily unites the skill of the manufacturer with the knowledge of the philosophic chemist, has also all the merit of this discovery, as he observed the same, without having been indebted to Scheele's hint on this subject. Mr Turner has done more; he has converted this discovery to fame use in the arts; he produces mineral alkali for sale, arising from this decomposition; and from the lead which is united to the marine acid he forms the beautiful pigment called the patent yellow
Scheele. In a Dissertation on Flint, Clay, and Alum, he clearly overturned Beaumé's opinion of the identity of the siliceous and argillaceous earths. He published an Analysis of the Human Calculus. He shewed also a mode of preparing mercurius duleus in the humid way, and improved the process of making the powder of Algaroth. He analyzed the mineral substance called molybdena, or flexible black lead. He discovered a beautiful green pigment. He shewed us how to decompose the air of the atmosphere. He discovered that some neutral salts are decomposed by lime and iron. He decomposed plumbago, or the common black lead. He observed, with peculiar ingenuity, an acid in milk, which decomposes acetated alkali; and in his experiments on the sugar of milk, he discovered another acid, different in some respects from the above-mentioned acid and the common acid of sugar. He accomplished the decomposition of tungselen, the component parts of which were before unknown, and found in it a peculiar acid earth united to lime. He published an excellent dissertation on the different sorts of acid and the common acid of sugar. He accomplished clearly overturned his investigations of the colouring matter in the cavity of the vitriolic acid. He precipitated acetated lead of the acid of forreL He found not one species of acid alone, but another also, which he denominated the malleaceous acid, from its being found in the greatest quantity in apples.

By the decomposition of Bergman's new metal (fide-rite) he shewed the truth of Meyer's and Klaproth's conjecture concerning it. He boiled the calx of fide-rite with alkali of tartar, and precipitated nitrated mercury by the middle falt which he obtained by this operation; the calx of mercury which was precipitated was found to be united to the acid of phosphorus; so that he demonstrates that this calx was phosphorated iron. He found also, that the native Prussian blue contained the same acid. He discovered by the same means, that the perlate acid, as it was called, was not an acid fur genus, but the phosphoric united to a small quantity of the mineral alkali. He suggested an improvement in the process of obtaining magnesia from Epson falt; he advises the adding of an equal weight of common falt to the Epson falt, so that an equal weight of Glauber's falt may be obtained; but this will not succeed unless in the cold of winter. These are the valuable discoveries of this great philosopher, which are to be found in the Translations of the Royal Society at Stockholm. Most of his essays have been published in French by Madame Picardet, and Montf. Moreau de Dijon. Dr Beddoes has also made a very valuable present to his countrymen of an English translation of a greater part of Scheele's dissertations, to which he had added some useful and ingenious notes. The following discoveries of Scheele are not, we believe, published with the rest. He shewed what that substance is, which has been generally called 'the earth of the fluor spar.' It is not produced unless the fluor acid meet with siliceous earth. It appears from Scheele's experiments to be a triple salt, consisting of fift, acid of fluor, and fixed alkali. Scheele proved also, that the fluor acid may be produced without any addition of the vitriolic or any mineral acid: the fluor is melted with fixed alkali, and the fluorated alkali is decomposed by acetated lead. If the precipitate be mixed with charcoal dust, and exposed in a retort to a strong heat, the lead will be revived, and the acid of fluor, which was united to it, will pass into the receiver, possessed of all its useful properties. This seems to be an original and unanswerable proof of its existence. He observed, that no pyrophorus can be made unless an alkali be present; and the reason why it can be prepared from alum and coal is, that the common alum always contains a little alkali, which is added in order to make it crysallize; for if this be separated from it, no pyrophorus can be procured from it. His last dissertation was his very valuable observations on the acid of the gullnut. Ehnhart, one of Scheele's most intimate friends, ascertains, that he was the discoverer of both of the acids of fugar and tartar. We are also indebted to him for that masterpiece of chemical decomposition, the separation of the acid of phosphorus from bones. This appears from a letter which Scheele wrote to Gahn, who has generally had the reputation of this great discovery. This acid, which is so curious in the eye of the chemist, begins to draw the attention of the physician. It was first used in medicine, united to the mineral alkali, by the ingenious Dr Pearson. The value of this addition to the materia medica cannot be better evinced than from the increase of the demand for it, and the quantity of it which is now prepared and sold in London. We may stamp the character of Scheele as a philosopher from his many and important discoveries. What concerns him as a man we are informed of by his friends, who affirm, that his moral character was irreproachable.

On the 19th of May 1786, he was confined to his bed; on the 21st he bequeathed all of which he was possessed to his wife (who was the widow of his predecessor at Koping, and whom he had lately married); and on the same day he departed this life. So the world loth, in less than two years, Bergman and Scheele, of whom Sweden may justly boast; two philosophers, who were beloved and lamented by all their contemporaries, and whose memory posterity will never cease most gratefully to revere.

SCHENER (Christoph), a German mathematician astronomer, and Jesuit, eminent for being the first who discovered spots on the sun, was born at Schwaben in the territory of Middleheim in 1575. He first discovered spots on the sun's disk in 1611, and made observations on those phenomena at Rome, until at length reducing them to order, he published them in one vol. folio in 1630. He wrote also some smaller things relating...
SCH, in botany: A genus of the decandria order, belonging to the dioecia class of plants; and in the natural method ranking under the 43d order, Danna. The male calyx is quinquefid; the petals five. The female flower is the same as in the male; the berry tricoccus.

SCHIRAB, or Schiraz, a large and famous town of Persia, capital of Farfistan, is three miles in length from east to west, but not much in breadth. It is seated at the north-west end of a spacious plain surrounded with very high hills, under one of which the town stands. The houses are built of bricks dried in the sun; the roofs are flat and terraced. There are 15 handsome

mosques, tiled with flowers of a bluish green colour, and lined within with black polished marble. There are many large and beautiful gardens, surrounded with walls fourteen feet high, and four thick. They contain various kinds of very fine trees, with fruits almost of every kind, besides various beautiful flowers. The vines of Schiras are not only the best in Persia, but, as some think, in the whole world. The women are much addicted to gallantry, and Schiras is called an earthly paradise by some. The ruins of the famous Persepolis are 50 miles to the north-east of this place. E. Long. 56° c. N. Lat. 29° 36'.

SCHISM, (from the Greek, éxipn, eis, siphure), in its general acceptation signifies division or separation; but is usually used in speaking of separations happening from diversity of opinions among people of the same religion and faith.

Thus we say the schism of ten tribes of Judah and Benjamin, the schism of the Persians from the Turks and other Mohammedans, &c.

A young ecclesiastical author, the great schism of the West is that which happened in the times of Clement VII. and Urban VI. which divided the church for 40 or 50 years, and was at length ended by the election of Martin V. at the council of Constance.

The Romans number 34 schismata in their church.

—They beftow the name Eugis schismata on the reformation of religion in that kingdom. Those of the church of England apply the term schisma to the separation of the nonconformists, viz. the presbyterians, independents, and anabaptists, for a further reformation.

SCHISTUS, in mineralogy, a name given to several different kinds of stones, but especially to some of the argillaceous kind.

1. The bluish purple schistus, schistus tegularis, or common roof-flate. This is so thin that it may be slightly scraped with the nail, and is of a very brittle lamellated texture, of the specific gravity of 2,876. It is fusible in a strong heat, and runs into a black fritaria. By a chemical analysis it is found to consist of 26 parts of argillaceous earth, 46 of silica, 8 of magnesia, 4 of calcareous earth, and 14 of iron. The dark-blue flate, or schistus scoriatus, contains more magnesia and less iron than the common purple schistus, and effervesces more briskly with acids. Its specific gravity is 2,701.

2. The pyriticaceous schistus is of a grey colour, brown, blue, or black; and capable of more or less decomposition by exposure to the air, according to the quantity of pyritic matter it contains and the flate of the iron in it. When this last is in a semi-phlogilicated flate it is easily decomposed; but very slowly, or not at all, if the calx is much dephlogilicated. The aluminoius schistus belongs to this species.

3. The bituminous schistus is generally black, and of a lamellated texture, of various degrees of hardnes, not giving fire with steel, but emitting a strong smell when heated, and sometimes without being heated. M. Magellan mentions a specimen which burns like coal, with a strong smell of mineral bitumen, but of a yellowish brown, or rather dark ash-colour, found in Yorkshire. This kind of schistus does not flow any white mark when scratched like the other schistus.

SCHMEDELIA, in botany: A genus of the dicytyna order, belonging to the ceandria class of plants,
The calyx is diphylous; the corolla tetrapetalous; the gemmae pedicellated, and longer than the flower.

**SCHOENOBATES** (from the Greek, εξσώνος, a rope; and βατις, a walk), a name which the Greeks gave to their rope-dancers; by the Romans called funambulis. See Rope-dancer and Funambulus.

The funambuli were flaves who walkers made money of them, by entertaining the people with their feats of agility. Mercurealis de arte gymnastica, lib. III. gives us five figures of funambuli engraved after ancient statues.

**SCHOENUS, in botany:** A genus of the monogynia order, belonging to the tiantricia class of plants; and in the natural method ranking under the 3d order, Calomaria. The glumes are paleaceous, univalved, and thickset; there is no corolla, and only one roundish seed between the glumes.

**SCHOLASTIC, something belonging to the schools.** See School.

**Scholastic divinity:** is that part or species of divinity which clears and discourses questions by reason and arguments; in which fende it stands, in some measure, opposed to positive divinity, which is founded in the authority of fathers, councils, &c. The school-divinity is now fallen into contempt; and is scarce regarded anywhere but in some of the univerfities, where they are still by their churhers obliged to teach it.

**SCHOLIAST, or Commentator, a grammarian who writes scholia, that is, notes, glosses, &c. upon ancient authors who have written in the learned languages.** See the next article.

**Scholium, a note, annotation, or remark, occasionally made on some passage, proposition, or the like.** This term is much used in geometry and other parts of mathematics, where, after demonstrating a proposition, it is customary to point out how it might be done some other way, or to give some advice or precaution in order to prevent mistakes, or add some particular use or application thereof.

**SCHOMBERG (Frederic-Armand Duke of), a distinguished officer, sprung from an illustrious family in Germany, and the son of Count Schomberg by an English lady, daughter of Lord Dudley, was born in 1608.** He was initiated into the military life under Frederick-Henry of Orange, and afterwards served under his son William II. of Orange, who highly esteemed him. He then repaired to the court of France, where his reputation was so well known, that he obtained the government of Gravelines, of Furnes, and the surrounding countries. He was reckoned inferior to no general in that kingdom except marechal Turenne and the prince of Condé; men of such exalted eminence that it was no disgrace to acknowledge their superiority. The French court thinking it necessary to diminish the power of Spain, sent Schomberg to the assistance of the Portuguese, who were engaged in a war with that country respecting the succession to their throne. Schomberg's military talents gave a turn to the war in favour of his allies. The court of Spain was obliged to solicit for peace in 1668, and to acknowledge the house of Braganza as the just heirs to the throne of Portugal. For his great services he was created count Mentola in Portugal, and a pension of 5000 l. was bestowed upon him, with the reverend to his heirs.

In 1673 he came over to England to command the army; but the English at that time being disgusted with the French nation, Schomberg was suspected of coming over with a design to corrupt the army, and bring it under French discipline. He therefore found it necessary to return to France, which he soon left, and went to the Netherlands. In the month of June 1676, he forced the prince of Orange to raise the siege of Maastricht; and it is said he was then raised to the rank of mareschal of France. But the French Dictionnaire Historique, whose information on a point of this nature ought to be authentic, says, that he was invested with this honour the same year in which he took the fortresses of Bellegarde from the Spaniards while serving in Portugal.

Upon the revolution of the edit of Nantes, when the persecution commenced against the Protestants, Schomberg, who was of that persuasion, requested leave to retire into his own country. This request was refused; but he was permitted to take refuge in Portugal, where he had reason to expect he would be kindly received on account of past services. But the religious zeal of the Portugal, though it did not prevent them from accepting assistance from a heretic when their kingdom was threatened with subversion, could not permit them to give him shelter when he came for protection. The inquisition interfered, and obliged the king to send him away. He then went to Holland by the way of England. Having accepted an invitation from the elector of Brandenburg, he was invested with the government of Duci Prussia, and appointed commander in chief of the elector's forces. When the prince of Orange failed to England to take possession of the crown which his father-in-law James II. had abdicated, Schomberg obtained permission from the elector of Brandenburg to accompany him. He is supposed to have been the author of an ingenious stratagem which the prince employed after his arrival in London to diffuse the sentiments of the people respecting the revolution. The stratagem was, to spread an alarm over the country that the Irish were approaching with fire and sword. When the prince was established on the throne of England, Schomberg was appointed commander in chief of the forces and master of the ordinance. In April 1689 he was made a knight grand cross, and naturalized by act of Parliament; and in the same year he was created a baron, earl, marquis, and duke of the kingdom of England, by the name and title of baron Teys, earl of Bretford, marquis of Harwich, and duke of Schomberg. The House of Commons voted to him L. 100,000 as a reward for his services. Of this he only received a small part; but after his death a pension of L. 5000 a-year was bestowed upon his son.

In August 1689 he was sent to Ireland to reduce that kingdom to obedience. When he arrived, he found himself at the head of an army consisting only of 12,000 foot and 2000 horse, while king James commanded an army three times more numerous. Schomberg thought it dangerous to engage with superior force, and being disappointed in his promised supplies from England, judged it prudent to remain on the defensive. He therefore posted himself at Dundalk, about five or six miles distance from James, who was encamped at Ardee. For six weeks he remained in this position, without attempting to give battle, while from the wetness of the season he lost nearly the half of his army. Schomberg was, much
much blamed for not coming to action; but some excellent judges admired his conduct as a display of great military talents. Had he risked an engagement, and been defeated, Ireland would have been lost. At the famous battle of the Boyne, fought on the 1st July 1690, which decided the fate of James, Schomberg passed the river at the head of his cavalry, defeated eight squadrons of the enemy, and broke the Irish infantry. When the French Protestants left their commander, Schomberg went to rally and lead them on to charge. While thus engaged, a party of king James’s guards, which had been separated from the rest, passed Schomberg, in attempting to rejoin their own army. They attacked him with great fury, and gave him two wounds in the head. As the wounds were not dangerous, he might soon have recovered from them; but the French Protestants, perhaps thinking their general was killed, immediately fired upon the guards, and shot him dead on the spot. He was buried in St Patrick’s cathedral.

Bishop Burnet says, Schomberg was “a calm man, of great application and conduct, and thought much better than he spoke; of true judgment, of exact probity, and of an humble and obliging temper.”

SCHOOL, a public place, wherein the languages, the arts, or sciences, are taught. Thus we say, a grammar school, a writing school, a school of natural philosophy, &c. The word is formed from the Latin schola, which, according to Du Cange, signifies discipline and correction; he adds, that it was anciently used, in general, for all places where several persons met together, either to study, to converse, or do any other matter. Accordingly, there were schola palatinae, being the several posts wherein the emperor’s guards were placed; schola externorum, schola gentilium, &c. At length the term passed also to civil magistrates; and accordingly in the code we meet with schola chartulariorum, schola agentium, &c. and even to ecclesiastics, as schola caesarii, schola facierdotii, &c.

The Hebrews were always very diligent to teach and study the laws that they had received from Moses. The father of the family studied and taught them in his own family. The Rabbins taught them in the temple, in the synagogues, and in the academies. They pretend, that even before the deluge there were schools for knowledge and piety, of which the patriarchs had the direction. They place Adam at their head, then Enoch, and lately Noah. Melchisedec, as they say, kept a school in the city of Kajrath-sepher, otherwise Hebron, in Pa­le­di­ne. Abraham, who had been instructed by Heber, taught in Chaldea and in Egypt. From him the Egyptians learned astronomy and arithmetic. Jacob succeeded Abraham is the office of teaching. The scripture says, he was “a plain man dwelling in tents;” which, according to the Chaldee paraphrast, is, “that he was a perfect man, and a minister of the house of doctrine.”

All this, indeed, must be very precocious and uncertain. It cannot be doubted but that Moses, Aaron, and the elders of Israel, instructed the people in the wilderness, and that many good Israelites were very industrious to instruct their families in the fear of God. But all this does not prove to us that there were any such schools as we are now inquiring after. Under Joshua we see a kind of academy of the prophets, where the children of the prophets, that is, their disciples, lived in the exercise of a retired and aultere life, in study, in the meditation and reading of the law of God. There were schools of the prophets at Naioth in Ramah; 1 Sam. xix. 12, 20, &c. See the article Prophet.

These schools, or societies of the prophets, were succeeded by the synagogues. See the article Synagogue.

Charity-Schools are those schools which are set apart by public contributions or private donations for the instruction of poor children, who could not otherwise enjoy the benefits of education. In few countries are these more numerous than in Great Britain, where charity and benevolence are characteristic of the nation at large. They following is a summary view of the number of charity schools in Great Britain and Ireland, according to the best information at present, 1795.

Sunday-Schools are another species of charity-schools lately instituted, and now pretty common in Great Britain. The institution is evidently of the first importance; and if properly encouraged must have a very favourable effect on the morals of the people, as it tends not only to preserve the children of the poor from spending Sunday in idleness, and of consequence in disputation and vice, but enables them to lay in for the comfort of their future life a stock of useful knowledge and virtuous principles, which, if neglected in early life, will seldom be bought for or obtained amidst the hurry of busines; and the cares and temptations of the world.

The excellent founder of Sunday-schools was Mr. Raikes, a gentleman of Gloucestershire, who, together with Mr Stock, a clergyman in the same county, and who, we believe, was equally instrumental in the benefits with Mr Raikes, shewed the example, and convinced many of the utility of the plan. From Gloucestershire the institution was quickly adopted in every county and almost every town and parish of the kingdom; and we have only further to remark on a plan so generally known, so much approved, and so evidently proper, that we hope men of eminence and weight will always be found sufficiently numerous and willing to bellow their time and countenance in promoting it to the utmost of their power.
SCHOONER, in sea-language, a small vessel with two masts, whose main-tail and fore-tail are suspended from gaffs, reaching from the mast towards the stern, and stretched out below by booms, whose foremost ends are hooked to an iron, which claps the mast so as to turn therein as upon an axis, when the after-ends are swung from one side of the vessel to the other.

SCHORL, a precious stone of the second order, of which the varieties are, Siberian, ruby coloured, reddish, green, brown, blue, and black; mother of emeralds, dark green; lapis crucifer, or the croft' stone; bar schorl; horn blend, black, green, or blue; Chalcedony, blue schorl; Thuamme, Laxman's quadrangular schorl. Transparent schorl is crys tallized in polygonal prisms, generally with four, six, or nine sides; some of them are so fine as to pass for gems of the first order, especially for the emerald. In the femitransparent schorls there are likewise some of great beauty, as the ruby coloured, lately discovered in Siberia by counsellor Herman, in a bed of redish argilla, mixed with fragments of felt spath, quartz, and mica, on a low granite mountain. The bed of argilla is evidently produced by the decomposition of granite; which operation Herman supposes must have set at liberty the ruby schorl formerly pent up in the chinks of fissures of the decomposed part of the mountain. The discovery is quite new, no such species being before known, as it is as hard as the first order of precious stones, the diamond excepted, takes like needles on another in glass, and melts enamelled with the blow-pipe on a white transparent glass, and melts imperf ectly with borax when calcined, as it does with microcosmic salt and mineral alkali, into a small vitreous globe, with little spots of a white enamel colour. Acids have no effect upon it, even when calcined. Laitly, it lost its colour in the fire, after having first turned blue. The mother of emeralds is likewise a semitransparent schorl, in the opinion of some able naturalists, although Mr Born alters it to be a jade, we know not upon what authority.

The structure of the semitransparent schorls, and some of the transparent that are not so perfectly diaphanous as to conceal their texture, is obscurely sparry; but that of the opaque is either filamentous, like felspar, or hard and brittle like threads of glas, or it is composed of scales. Of this last kind is that called horn blend, which is generally green or black; but there is a beautiful variety of it found on the mouth St Gobard, in Switzerland, of a fine sky-blue colour covered with silver tacks. Bar schorl has been found on the Carpathian mountains chry s tallized in prisms. Lapis crucifer, or the croft' stone, is found sometimes near Brazil in Switzerland, and there named Taulstein, or chry s tallizing stone; but oftener at Thum in Saxony, and therefore named there Thumstein. It is a schorl in form of a croft; that of Brazil consists of two hexagonal crystals. The exact crystallization of the other is unknown to us.

Most countries produce schorls. Russia is particularly rich in schorls. It is even difficult to point out all the different places of the empire which produce them; but we shall take notice of those most remarkable, particularly new discoveries. The ruby-coloured schorl mentioned above was found by Mr Herman at Sarapoulsky, a village in the government of Perm, ten versts from Mourinskiy Slabe, in Siberia. The Siberian inspector, Mr Laxman, has lately discovered in the mountain Alpsteinia, on the river Staldeka near the lake Baikal, the following new schorls. First, a green transparent schorl, of so brittle a nature as not to bear carriage without breaking into small pieces truncated. Pallis is positive in declaring this dark green schorl a hyacinth. This last has often some of the small yellowish white garnets sticking in it, described in the article Garnet, where an account will be found of the species of matrix that contains them all. Schorls are likewise found in the mountains and mines of Neflga, Krafnavolok, and Tondola, as likewise between the Onega Lake and the White Sea. Black schorl is likewise found near the White Sea, and in the Altai, Ural, and Daurian mountains.

None of the transparent schorls have been found in Scotland as far as we have heard; but many varieties of the opaque kinds have been found in various places, particularly in the island of Arran, where there is a bed of greenish horn like schorl of immense extent near the harbour of Lamlath. Fine specimens of schorl are dear; the ruby schorl from Siberia, 25 to 50 rubles a ring stone; the green, when fine, from 15 to 30. The high price of the ruby schorl is owing to its novelty and rarity; and of the green, is owing to its palling for an emerald. The specific gravity of schorl is 3.6.

SCHOTIA, in botany: A genus of the monogyna order, belonging to the decandria class of plants; and in the natural method ranking under the 33d order, Lomentaceae. The calyx is semiquinquepartite; the corolla has five petals, which are equal; the tube is turbinated, carnose, and persistent. The legumen pedicellated, and contains two seeds; there is only one species, viz. the speciosa, or African Lignum vitae.

SCHREBERA, in botany: A genus of the digyna order, belonging to the pentandria class of plants; and in the natural method ranking with those of which the order is doubtful. The calyx is quinquepartite; the corolla funnel shaped, with the filaments in the throat, and having each a scale at the base.

SCHREVELIUS (Cornelius), a laborious Dutch critic and writer, who has given the public some editions of the ancient authors more elegant than correct; his Greek Lexicon is esteemed the best of all his works. He died in 1657.

SCHULTENS (Albert), professor of Hebrew and of the eastern languages at Leyden, and one of the most learned men of the 18th century, was born at Groningen, where he studied till the year 1706, and from thence continued his studies at Leyden and Utrecht, Schultens at length applied himself to the study of Arabic books, both printed and in manuscript, in which he made great progress. A short time after he became minister of Waffenaar, and two years after professor of the eastern tongues at Franeker. At length he was invited to Leyden, where he taught Hebrew and the eastern languages with extraordinary reputation till his death, which happened in 1750. He wrote many learned works; the principal of which are,
are, 1. A Commentary on Job, 2 vols 4to. 2. A Commentary on the Proverbs. 3. Vetus & regia via Hebrazandi. 4. Animadversiones philologicae & criticæ ad varia loca Vetris Testamenti. 6. An excellent Hebrew grammar, &c. Schultens discovered in all his works found criticism and much learning. He maintained against Gouffet and Driessin, that in order to have a perfect knowledge of Hebrew, it is necessary to join with it, not only the Chaldee and Syriac, but more particularly the Arabic.

SCHURMAN (Anna Maria), a most extraordinary German lady. Her natural genius discovered itself at six years of age, when she cut all sorts of figures in paper with her scissors without a pattern. At eight, she learned, in a few days, to draw flowers in a very agreeable manner. At ten, she took but three hours to learn embroidery. Afterwards she was taught music, vocal and instrumental; painting, sculpture, and engraving; in all of which she succeeded admirably. She excelled in miniature-painting, and in cutting portraits upon glasses with a diamond. Hebrew, Greek, and Latin, were so familiar to her, that the most learned men were astonished at it. She spoke French, Italian, and English, fluently. Her handwriting, in most all languages, was so inimitable; that the curious preferred specimens of it in their cabinets. But all this extent of learning and uncommon penetration could not protect her from falling into the errors of Labadie, the famous French enthusiast, who had been banished France for his extravagant tenets and conduct. To this man she entirely attached herself, and accompanied him wherever he went; and even attended him in his last illness at Altena in Holstein. Her works, consisting of De vita humana termino, and Differentia de institutis religiosis et melioribus literis apostolica, and her Letters to her learned correspondents, were printed at Leyden in 1648; but enlarged in the edition of Utrecht, 1662, in 12mo, under the following title: A. M. Schurman Opera hæc Hebrew, Graeca, Latina, Gallica, Provenca, et Metrica. She published likewise at Altena, in Latin, A Defence of her attachment to Labadie, while she was with him in 1673; not worth reading. She was born at Cologne in 1607, but refided chiefly in Holland, and died in Frieland in 1678.

SCHALBEA, in botany: A genus of the angiopermia order, belonging to the didynamia class of plants. The calyx is quadripart, with a superior lobe; the lowermost longest, and emarginated.

SCHWARTENBURG, a town and castle of Germany, and circle of Upper Saxony, in the landgrave of Thuringia, and capital of a county of the same name belonging to a prince of the house of Saxony. It is seated on the river Schwart, 5 miles south-east of Erford, and 35 north of Cullenbach. E. (Long. 11° 27' N. Lat. 50° 45'.

SCHWARTZEMBERG, a town of Germany, in the circle of Franconia, and capital of a principality of the same name. The castle is seated on the river Lec, 5 miles north-west of Nuremberg, and 20 east of Wurtz burg, subject to its own prince. E. (Long. 10° 27' N. Lat. 49° 43'.

SCHWEIDNITZ, a strong town of Germany, in Silesia, and capital of a province of the same name, with a castle. It is the handsomest town of Silesia, next to Breslaw. The streets are large, the church fine, and the houses well built. The fortifications are not very considerable, and the royal palace is turned into a convent. All the magistrates are Roman Catholics; but most of the inhabitants are Protestants, who have a church without the town, as also a public school and bells. It is seated on an eminence on the river Weitritz, 27 miles south-east of Lignitz, and 22 south-west of Breslaw. E. (Long. 16° 48' N. Lat. 50° 46'.

SCHWEINFURT, a very strong, free, and imperial town of Germany, in Franconia, with a magnificent palace, where the senators meet, who are 12 in number. The environs are rich in cattle, corn, and wine; the inhabitants are Protestants, and not very rich. However, they carry on a large trade in woollen and linen cloth, goose-quills, and feathers. It is seated on the river Main, 27 miles north-east of Wurtz burg, and 22 west of Bamberg. E. (Long. 10° 25' N. Lat. 50° 4'.

SCHWENKFELDERS, a denomination of Christians, so called after Caspar Schwenkel von Ossing, a noted nobleman, in the sixteenth century. He was born 1490, in the Principality of Liegnitz in Silesia. He studied several years at Cologne and other universities, after this he was in service by the duke of Münsterberg, and Brigg, until he was disabled by bodily infirmities from attending the business of that court. He then applied himself to divinity; about this time the reformation was begun in Germany, which attracted his whole attention. The chief reformers, Luther, Melancthon, &c. he held in high esteem, but was decided in his opinion, that they still retained several relics of popery in their doctrine. He differed from Luther about the eucharist, in which he could not agree with him, that the body and blood of Christ were materially present in the Lord's supper, whether in bread or wine: The words of Christ, Matt. xxvi. ver. 26, and 28, "This is my body; this is my blood," he took in this sense: That as bread and wine are a substantial nourishment of our bodies in this natural life, so were likewise the body and blood of our Saviour, a substantial nourishment to the souls of the faithful, in the new spiritual life received from above. The object of this supper among Christians, should be the remembrance of their Saviour's unbounded love, and to show his death. Schwenfeld wrote 12 Questions to Luther, concerning the impanation of the body of Christ, which he answered in his usual rough style, telling him that he should not irritate the church
of Christ, that the blood of those he should fudge, would fall upon his head. Notwithstanding this, he still experimented with Luther, and defined a candid examination of his arguments, which so irritated Luther, that he wrote a very indecent maledictory letter to Schwenkfeld.

He wrote about 90 treatises and pamphlets in German and Latin, on religious subjects, most of which were printed, and are yet extant, though whole editions were confiscated and destroyed; he had an extensive correspondence all over the empire, with per sons of every rank and description. The most material of his Letters were printed, whereas three large folio volumes are yet left; in his writings he displayed a penetrating judgement, with a true Christian moderation. He often declared in his writings, that it was by no means his object to form a separate church, expressing an ardent desire to be serviceable to all Christians of whatever denomination; but his freedom in giving admonition to those whom he thought erroneous, brought on him the implacable enmity of Protestants and Papists: his writings were forbid to be printed, such as were printed, were often confiscated and destroyed; and his per son was in danger from his persecutors. He died in the city of Ulm 1562, in the 72d year of his age; his learning and exemplary piety is generally acknowledged, even by his bitterest antagonists (a).

After his death, there were numbers of people in different parts of Germany, who thought themselves convinced that his doctrine was right and orthodox; they were generally called Schwenkfelders, and were everywhere reproached and persecuted, by the established clergy. The greatest numbers of them were in Silesia, particularly in the principalities of Lenggries and Jawr. The established clergy there being Lutherans, used every intrigue to oppress them; in particular if they assembled for religious worship, they were thrown into prisons and dungeons, where many of them perished.

Such was often their fate, until in 1719 the Jesuits thought the conversion of the Schwenkfelders an object worth their attention. They sent missionaries to Silesia, who preached to that people the faith of the emperor; they produced imperial edicts that all parents should attend the public worship of the missionaries, and bring their children to be instructed in the holy catholic faith, under severe penalties. The Schwenkfelders sent deputies to Vienna, to solicit for toleration and indulgence, and though the emperor apparently received them with kindness and condensation, yet the Jesuits had the address to procure another imperial edict, ordering that such parents as would not bring every one of their children to the midnight prayers for instruction, should at last be chained to the wheel, harrow, and put to hard labour on the public works, and their children should by force be brought to the monasteries. Upon this, many families fled in the night into Lutetia and other parts of Saxony, leaving behind them their effects, real and personal, (the roads being befet in the day time by guards to stop all emigrants); of these in 1734, a small number emigrated over Alsona and Holland into Pennsylvania, where they settled and formed themselves into a religious society.

The last mentioned edict was not put in its fullest rigour by the missionaries, till after the death of Charles VI. when another edict was published, which threatened the total extermination of the remaining Schwenkfelders, from which they were unexpectedly relieved by the king of Prussia making a conquest of all Silezia, who immediately published an edict in which he recalled all those Schwenkfelders that were emigrated, and promised them their estates, with toleration and protection not only in Silezia, but in all other parts of his dominions.

SCHWENKFELDIA, in botany; A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking with those that are doubtful. The calyx is quinquelocular; the corolla funnel-shaped; the stigma parted into five; the berry quinquelocular, with a number of fees. Of this there are three species, viz. 1. Cineraria, 2. Apera; 3. Hirta. The two first are natives of Guiana, the other of Jamaica. The leaves of all of them are remarkably rough, and stick to the fingers or clothes.

SCHWENKIA, in botany; A genus of the monogynia order, belonging to the diandria class of plants. The corolla is almost equal, plaited at the throat, and glaucous; there are three barren flamina; the capsule bicolour and polypermous.

SCHWINBURG, a town of Denmark, on the eastern coast of the island of Fionia, over against the islands of Arroa and Langeland. E. Long. 10° 55'. N. Lat. 55° 8'.

SCHWITZ, or SWITZ, a canton of Switzerland, which gives name to them all. It is bounded on the west by the lake of the four cantons, on the south by the canton of Uri, on the east by that of Glaris, and on the north by those of Zurich and Zug. Its principal riches consist in cattle, and the capital town is of the same name. This is a large, handsome place, seated near the lake of the four cantons, in a pleasant country among the mountains. E. Long. 8° 41'. N. Lat. 47° 2'.

SCIACCA, anciently called Thermis Selinuntiae, in Sicily, derives its present denomination from the Arabic word Scheich. It is a very ancient place, being mentioned in the account of the wars between the Greeks and Carthaginians, to the latter of whom it belonged. It is defended by ancient walls and the castle of Luna. It stands upon a very steep rock, hanging over the sea, and excavated in every direction into prodigious magazines, where the corn of the neighbouring territory is deposited for exportation; there is no harbour, but a small bay formed by a wooden pier, where lighters lie to load the corn which they carry out about a mile to ships at anchor.

The town is irregularly but substantially built, and contains 13,000 inhabitants, though Amico's Lexicon Topographicum says the last enumeration found only 9484. His accounts do not take in ecclesiastics, and several denominations of lay persons.

SCIÆNA, in ichthyology, a genus belonging to the order of thoracids. The membrane of the gills

(a) The above particulars, with many others, can also be found in G. Arnoldus, M. Salig, and other impartial historians, and are produced from authentic documents.
though this, the most admirable, it proves emetic, and sometimes purgative. The principal use of this medicine is the prime, viz. to abound with mucus matter, and the lungs are oppressed by tenacious phlegm. It has been recommended in hydroptic cafes, taken in powder, from four to ten grains in a dose, mixed with a double quantity of nitre. The most commodious mode of exhibiting this root is as a bolus or pill. Liquid forms are too disagreeable to most people; though this may be remedied in some degree by the addition of some aromatic distilled waters. It yields the whole of its virtues to aqueous and vinous menstrua, and likewise to vegetable acids.

SCILLY, or SIlley, a cluster of small islands and rocks, situated in the Atlantic Ocean, in W. Long. 7° N. Lat. 50°.

These islands were first called Caffiterides, or the Tin Islands, from their being rich in that metal. The common opinion is, that this is a Greek appellation, which is the most obvious sense is true: but as the Phoenicians were familiar with the metal, and in the country that produced it, it is very likely they introduced the names of both from their own language. Strabo says these islands were ten in number, lying close together, of which only one was uninhabited: the people led an erratic life, lived upon the produce of their cattle, wore an under-garment which reached down to their ankles, and over that another, both of the same colour, which was black, girt round a little below the girdle, and walked with flaves in their hands. The riches of their islands were tin and lead, which, with the skins of their cattle, they exchanged, with foreign merchants, that is, the Phoenicians from Cadiz, for earthen-ware, salt, and utensils made of brass. An author of great or greater antiquity, seems to include a part at least of Cornwall among these islands; or rather he suggests, that they were not perfect islands except at full sea, but that at ebb the inhabitants passed from one to another upon the sands, and that they even transported their tin in large square blocks upon carriages from one island to another. He farther takes notice, that such as inhabited about Belerium (the Land’s End) were in their conversation with strangers remarkably civil and courteous. Other ancient writers style these islands helperides, from their western situation, and Osfrymisides, alighting that the land was extremely fertile, as well as full of mines; and that the people, though very brave, were entirely addicted to commerce, and boldly paddled the seas in their leather boats.

The Romans were exceedingly desirous of having a share in this commerce, which the Phoenicians as carefully laboured to prevent, by concealing their navigation to these islands as much as it was in their power. At length, however, the Romans prevailed; and Publius Craflus coming thither, was so well pleased with the industry and manners of the people, that he taught them various improvements, as well in working their mines, which till that time were but shallow, as in carrying their own merchandise to different markets. There is no room to doubt that they followed the fate of the rest of Britain, and particularly of Cornwall, in becoming subject to the Roman empire. We find them called in the Itinerary of Antoninus, Sigella; by Solpius,
fowl and Silly. All we know of them during this period is, that their tin trade continued, and that sometimes state-prisoners, were exiled, or, to use the Roman phrase, relegated hither as well as to other islands.

When the legions were withdrawn, and Britain with its dependencies left in the power of the natives, there is no reason to question that these islands shared the fame lot with the rest. As to the appellation which from this period prevailed, the ordinary way of writing it is Scilly; in records we commonly find it spelt Silly, Silley, or Sulley; but we are told the old British appellation was Sullee, or Syleh, which signifies rocks consecrated to the fun. We have not the least notice of any thing that regards them from the fifth to the tenth century. It is, however, with much appearance of truth conjectured, that some time within this space they were in a great measure destroyed by an earthquake, attended with a sinking of the earth, by which most of their lowlands, and of course the greatest part of their improvements, were covered by the sea, and those rich mines of tin which had rendered them so famous swallowed up in the deep. They have a tradition in Cornwall, that a very extensive tract of country called the Lanyon, in the old Cornish Lethanous, supposed to lie between that country and Scilly, was lost in that manner; and there are many concurrent circumstances which render this probable. In reference to these islands, the case is still stronger; for at low ebb their fence-inclosures are full visible from almost all the islands, and thereby afford an ocular demonstration that they were formerly of far greater extent, and that in remoter ages their inhabitants must have been very numerous, and at the same time very industrious. This sufficiently proves the fact, that by such an earthquake they were destroyed; and that it happened at some period of time within those limits that have been alligned, appears from our hearing nothing more of their tin trade, and from our having no notice of it at all in any of our ancient chronicles, which, if it had fallen out later, from their known attention to extraordinary events, must certainly have happened.

It is generally supposed, and with great appearance of truth, that king Athelstan, after having overcome a very powerful confederacy formed against him, and having reduced Exeter, and driven the Britons beyond the river Tamar, which he made the boundary of their Cornish dominions, passed over into these islands, (then surely in a better state than now, or they would not have been objects of his vengeance), and reduced them likewise. History does not inform us, that the Dunes ever fixed themselves in these islands; but as their method of fortifying is very well known, it has been conjectured that the Giant's Castle in the Isle of St Mary was erected by them; and indeed, if we consider the convenient situation of these islands, and the trade of piracy which that nation carried on, there seems to be nothing improbable in that conjecture. It is more certain that there were churches erected in these isles, and that there were in them also many monks and hermits, before the conquest.

The fertility of the isles is much infifted upon in all the accounts; and it is expressly faid of St Mary's that it bears exceeding good corn, in muchm much that if men did but cast corn where wine had rooted, it would come up. There is mention made of a breed of wild swine, and the inhabitants had great plenty of fowl and fift. But notwithstanding the fertility of the country, and the many commodities that men had or might have there, it was nevertheless but thinly peopled; and the reason asigned is, because they were liable to be frequently spoiled by French or Spanish pirates. In Leland's time, one Mr Davies of Wiltshire, and Mr Whittington of Gloucestershire, were proprietors of Scilly, and drew from thence, in rents and commodities, about 40 marks a-year.

The inhabitants at that juncture, and long before, appear to have carried on a small trade in dried skate and other fish to Bretagne, with which they purchased falt, canvas, and other necessaries. This seems to be the remains of a very old kind of commerce, since, for many ages, the people of that country, thofe of the Scilly isles, and the people of Cornwall, looked upon themselves as countrymen, being in truth no other than remnants of the ancient Britons, who, when driven out by the Saxons, took refuge in those islands, and in that part of France which had before been called Armorica, and from hence styled Bretagne, Brittany, or Little Britain, and the people Britons. This, in all probability, was a great relief to thofe who dwelt in those isles; who, during the long civil war between the houses of York and Lancaster, had their intercourse with England so much interrupted, that if it had not been for this commerce with their neighbours on the French coast, they might have been driven to the last dilfrefs.

The Scilly, or Silly islands, lie due weft from the Lizard about 17 leagues: west and by south from the old Land's End, next Mount's Bay, at the diftance of 10 leagues; and from the western Land's End, they lie west-south-west, at the diftance of something more than nine leagues. There are five of them inhabited; and that called Sampson has one family in it. The largelst of these is St Mary's, which lies in the north latitude of 49 degrees 55 minutes, and in the longitude of 6 degrees 40 minutes west from Greenwich. It is two miles and a half in length, about one and a half in breadth, and between nine and ten miles in compass. On the weft side there projects an iflimus. Beyond this there is a peninsula, which is very high; and upon which stands Star Castle, built in 1593, with some outworks and batteries. On these there are upwards of three hundred pieces of cannon mounted; and for the defence of which there is a garrison of an entire company, with a master-gunner and five other gunners. In the magazine there are arms for 3000 foldiers, who, when summoned, are bound to march into the fortres. Underneath the castle barracks and lines stands Hugh Town, very improperly built, as lying so low as to be subject to inundations. A mile within land stands Church Town, so denounced from their place of worship; it consists of a few houses only, with a court-house. About two furlongs eaf: of this lies the Old Town, where there are more houses, and none of them very convenient dwellings. The number of inhabitants in this ifland is about 600 or 700; and it produces to the lord proprietor 300l. per annum.

Trefcau lies directly north from St Mary's, at the distance of two miles. It was formerly styled St Nicholas' ifland; and was at least as large as St Mary's, though at present about half the size. The remains of
of the abbey are yet visible, the situation well chosen, with a fine bank of fresh water before it, half a mile long and a furlong wide, with an ever-green bank high enough to keep out the sea, and serving at once to protect the island and shelter the abbey. In this pond there are most excellent eels, and the lands lying round it are by far the best in the island. There are about half a score stone houses, with a church, which are called *Dolphin Town*; an old castle built in the reign of Henry VIII. called Oliver's Castle; and a new blockhouse, raised out of the ruins of that castle, which is of far greater use. This island is particularly noted for producing plenty of the finest sapphire, and the only tin works that are now visible are found here. There are upon it at present about 40 families, who are very industrious, and spin more wool than in St Mary's. Its annual value is computed at 80l. a-year.

A mile to the east of Treecaw, and about two miles from the most northern part of St Mary's, lies the isle of *St Martin's*, not much inferior in size to that of Treecaw. It very plainly appears to have been formerly extremely well cultivated; notwithstanding which it was entirely deserted, till within somewhat less than a century ago, that Mr Thomas Enes, a considerable merchant, engaged some people to settle there. He likewise caustrd to be erected a hollow tower twenty feet in height, with a spire of as many feet more; which being neatly covered with lime, serves as a daymark for directing ships crossing the channel or coming into Scilly. St Martin's produces some corn, affords the best pasture in these islands, nourishes a great number of sheep, and has upon it 17 families, who pretend to have the secret of burning the best kelp, and are extremely attached to their own island. As a proof of this, it is observable, that though some of the inhabitants rent lands in St Mary's, yet they continue to reside here going thither only occasionally.

*St Agnes*, which is also called the *Light-house Island*, lies near three miles south-west of St Mary's; and is, though a very little, a very well cultivated island, fruitful in corn and grasses. The only inconvenience to which the people who live in it are subject, is the want of good water, as their capital advantage consists in having several good coves or small ports, where boats may lie with safety; which, however, are not much used. The light-house is the principal ornament and great support of the island, which stands on the most elevated ground, built with stone from the foundation to the lighthouse, which is fifty one feet high, the gallery four, the faith lights eleven feet and a half high, three feet two inches wide, and sixteen in number. The floor of the lighthouse is of brick, upon which stands a substantial iron grate, square, barred on every side, with one great chimney in the canopy-roof, and several lesser ones, to let out the smoke, and a large pair of smith's bellows are fixed as to be easily used whenever there is occasion. Upon the whole, it is a noble and commodious structure; and being plaited white, is a useful day-mark to all ships coming from the southward. The keeper of this lighthouse has a salary from the Trinity-house at Deptford of 40l. a year, with a dwelling-house and ground for a garden. His assistant has 20l. a-year. It is supplied with coals by an annual ship; and the carriage of these coals from the sea-side to the lighthouse is looked on as a considerable benefit to the poor inhabitants. They have a neat little church, built by the Godolphin family. There are at present 50 households in the island, which yield the proprietor 40l. a-year.

Breanor, or, as pronounced, *Breanor island*, lies north-west of St Mary's, and to the west of Treecaw, to which, when the sea is very low, they sometimes pass over the sand. It is very mountainous, has some fine land, and contains a few pleasant harbours, excellent sapphire, and a great variety of medical herbs. There are at present thirteen families, who have a pretty church, and pay 30l. a-year to the proprietor.

South from hence, and west from Treecaw, stands the island of *Samphon*, in which there is not above one family, who subsist chiefly by the making of kelp. To the westward of these there lie four islands, which contain in the whole 360 acres of meadow and arable land. The eastern isle, so darkly denominated from their position in respect to St Mary's, contain 123 acres; and there are also seven other rocky and scattered islands, that have each a little land of some use; and besides these, innumerable rocks on every side, among which we must reckon Scilly, now nothing more than a large, ill-shaped, craggy, inaccessible island, lying the farthest north-west of any of them, and consequently the nearest to the continent.

The air of these islands is equally mild and pure, their winters are seldom subject to frost or snow. When the former happens, it lasts not long; and the latter never lies upon the ground. The heat of their summers is much abated by sea-breezes. They are indeed frequently incommode by sea fogs, but these are not wholesome. Agues are rare, and fevers more so. The most fatal distemper is the small-pox, yet those who live temperately survive commonly to a great age and are remarkably free from diseases.

We must now pass to the sea, which is of more consequence to these isles than that small portion of land which is distributed amongst them. St Mary's harbour is very safe and capacious, having that islet on the south; the eastern islands, with that of St Martin, on the east; Treecaw, Breanor, and Samphon, to the north; St Agnes and several small islands to the west. Ships ride here in three to five fathom water, with good anchorage. Into this harbour there are four inlets, viz. Broad Sound, Smith's Sound, St Mary's Sound, and Crow Sound: so that hardly any wind can blow with which a ship of 150 tons cannot safely pass through one or other of them. Crow Sound only exceptioned, where they cannot pass at low water, but at high there is from 16 to 24 feet in this passage. Besides these there are two other harbours: one called *New Gryfey*, which lies between Breanor and Treecaw, where ships of 300 tons may ride securely. The other is called *Old Gryfey*, and lies between Treecaw, St Helen's, and Theon, for smaller ships. The former is guarded by the batteries at Oliver's Castle; the latter by the Blockhouse, on the eastern side of Treecaw, called *Dover*. Small coasters bound to the northward have more convenient outlets from these little harbours than from St Mary's, where, at the west end of Hugh Town, there is a fine pier built by the present earl of Godolphin, 430 feet long, 20 feet wide in the narrowest part, and 23 in height, with 16 feet of water at a spring, and 10 at a neap tide; so that under the shelter of this pier, vessells of 150 tons may lie securely, not only close to the quay, but all along the strand of the town.
In this harbour, and in all the little coves of the several isles, prodigious quantities of mackerel may be caught in their season; also sole, turbot, and plaice, remarkably good in their kind; and ling, which from its being a thicker fish, mellerower, and better fed, is very justly preferred to any caught nearer the British coasts. Salmon, cod, pollock, are in great plenty, and pilchards in vast abundance. To these we may add the alga marina, fucus, or ore-weed, which serves to feed both their small and great cattle, manures their lands, is burned into kelp, is of use in phyric, is sometimes preferred, sometimes pickled, and is in many other respects very beneficial to the inhabitants, of whom we are next to speak.

The people of Scilly in general are robust, handsome, active, hardy, industrious, generous, and good-natured; speak the English language with great propriety; have strong natural parts (though for want of a good school they have little education), as appears by their conduct in the several employments to which they are bred. They cultivate most of their lands as well as can be expected under their present circumstances. They are bred from their infancy to the management of their boats, in which they excel; are good fishermen, and excellent pilots. Their women are admirable housewives, spin their own wool, weave it into coarse cloth, and knit stockings. They have no timber of their own growth, and not much from England; yet they have many joiners and cabinet-makers, who, out of the fine woods which they obtain from captains of ships who put in here, make all kinds of domestic furniture in a very neat manner. They are free from the land-tax, malt-tax, and excise; and being furnished with plenty of liquors from the vessels which are driven into their roads for refreshment, for necessary repairs, or to wait for a fair wind, in return for provisi1ns and other conveniences; this, with what little fish they can cure, makes the best part of their trade, if we except their kelp, which has been a growing manufacture for the four or five years, and produces at present about 500l. per annum.

As to the civil government, it is administered by what is called the Court of Twelve; in which the commander in chief, the proprietor’s agent, and the chaplain, have their seats in virtue of their offices: the other nine are chosen by the people. These decide, or rather compromise, all differences; and punish small offences by fines, whippings, and the ducking stool: as to greater enormities, we may conclude they have not been hitherto known; since, except for the soldiers, there is no prison in the islands. But in case of capital offences, the criminals may be transported to the county of Cornwall, and there brought to justice.

The great importance of these islands arises from their advantageous situations, as looking equally into St George’s Channel, which divides Great Britain from Ireland, and the English Channel, which separates Britain from France. For this reason, most ships bound from the southward strive to make the Scilly islands, in order to steer their course with greater certainty. It is very convenient also for vessels to take shelter amongst them; which prevents their being driven to Milford Haven, or sometimes into some port in Ireland, if the wind is strong at east; or, if it blows hard at north-west, from being forced back into some of the Cornish harbours, or even on the French coasts. If the wind should not be very high, yet if unfavourable or undependable, as between the channels often happens, it is better to put into Scilly, than to beat about at sea in bad weather. The intercourse between these two channels is another motive why ships come in here, as choosing rather to wait in safety for a wind, than to run the hazard of being blown out of their course; and therefore a strong gale at east feldom fails of bringing thirty or forty vessels, and frequently a larger number, into Scilly; not more to their own satisfaction than to that of the inhabitants. Ships homeward-bound from America often touch there, from the desire of making the first land in their power, and for the sake of refreshment. These reasons have an influence on other ships, as well as British; and afford the natives an opportunity of showing their wonderful dexterity in conducting them safely into St Mary’s harbour, and, when the wind serves, through their sounds. Upon firing a gun and making wait, a boat immediately puts off from the nearest island, with several pilots, and, bringing with amazing activity drawn one of them into every ship, till only two men are left in the boat, these return again to land, as the wind and other circumstances direct, in one of their little coves.

Respecting a current which often prevails to the westward of Scilly, Mr. Rennel has published some observations of much importance. “It is a circumstance (says he) well known to seamen, that ships, in coming from the Atlantic, and steering a course for the British channel, in a parallel somewhat to the south of the Scilly islands, do notwithstanding often find themselves to the north of those islands; or, in other words, in the mouth of St George’s or of the Bristol channel. This extraordinary error has passed for the effects either of bad weather, bad observations of latitude, or the indraft of the Bristol channel: but none of these account for it satisfactorily; because, admitting that at times there may be an indraft, it cannot be supposed to extend to Scilly; and the course has happened in weather the most favourable for navigating and for taking observations. The consequences of this deviation from the intended track have very often been fatal; particularly in the loss of the Nancy packet in our own times, and that of Sir Cloudesley Shovel and others of his fleet at the beginning of the present century. Numbers of cafes, equally melancholy, but of less celebrity, have occurred; and many others, in which the danger has been imminent, but not fatal, have fearfully reached the public ear.

All of these have been referred to accident; and therefore no attempt seems to have been made to investigate the cause of them.

“I am, however, of opinion, that they may be attributed to a specific cause: namely, a current; and I shall therefore endeavour to investigate both that and its effects, that seamen may be approved of the times when they are particularly to expect it in any considerable degree of strength; for then only it is likely to occasion mischief, the current that prevails at ordinary times being probably too weak to produce an error in the reckoning, equal to the difference of parallel between the south part of Scilly and the tract in which a commander, prudent in his measures, but unfacipulous of a current, would choose to fail.”

The original cause of this current is the prevalence of westerly winds in the Atlantic, which impel the waters along the north coast of Spain, and accumulate them.
them in the Bay of Biscay; whence they are projected along the coast of France, in a direction north-west by west to the west of Scilly and Ireland. The major affinities are reasons for the existence of this current between Ushant and Ireland, in a chart of the track of the Lords and Atlas, East India ships, in 1778 and 1787. The following remarks on the effect of this current are abridged from the author's work, which is well worthy the perusal of all sailors and shipmasters. 11th, If a ship crosses it obliquely, that is, in an easterly direction, the will continue much longer in it, and of course be more affected by it, than if she crossed it more directly. The same sequence will happen if the ship crosses it with light winds. 2dly, A good observation of latitude at noon would be a sufficient warrant for running eastward during a long night; yet as it may be possible to remain in the current long enough to be carried from a parallel, which may be deemed a very safe one, to that of the rocks of Scilly, it would appear prudent, after experiencing a continuance of strong westerly winds in the Atlantic, and approaching the Channel with light southerly winds, either to make Ushant in time of peace, or at all events to keep in the parallel of 48° 45' at the highest. 3dly, Ships bound to the westward, from the mouth of the Channel, with the wind in the south west quarter, should prefer the larboard tack. 4thly, Rennel approves the design of removing the light-house of Scilly (if it be not already moved) to the south-west part of the high rocks. 5thly, He recommends the sending a vessel, with time-keepers on board, to examine the foundings between the paralels of Scilly and Ushant; from the meridian of the Lizard Point as far west as the moderate depths extend. A set of time-keepers, he observes, will effect much in one summer, in skilful hands, than all the science of Dr Hailey could do in the course of a long life.

In time of war, the importance of these islands is still more conspicuous; and it is highly probable, that they afforded the allies a place for assembling their fleets. The Britons, Danes, Scots, and Irish, failed under the command of Anlaff, to attack King Athelstan; which convinced him of the necessity of adding them to his dominions. Upon the like principle, Henry VIII. when upon bad terms with his neighbours, caused an old fortress to be repaired; and Queen Elizabeth, who had more to fear, directed the construction of a castle, which, in part at least, still remains. But the most singular influence of the detriment that might arise from these islands falling into other hands than British happened in 1651, when Sir John Grenville took shelter in them with the remains of the Cornish cavaliers. For the depredations committed by his frigates soon made it evident that Scilly was the key of the English commerce; and the claus of the merchants thereupon rose so high, that the parliament were forced to lend a fleet of fifty sail, with a great body of land-forces on board, under Sir George Ayscue and admiral Blake, who with great difficulty, and no inconsiderable loss, made themselves masters of Treaws and Brebar; where they erected those lines and fortifications near the remains of the old fortresses that are called Oliver's Castle. But at length, finding that little was to be done in that way, they chose to grant Sir John Grenville a most honourable capitulation, as the safest means to recover places of such consequence: with which the parliament were very little satisfied, till Mr Blake gave them his reasons; which appeared to be so well founded, that they directed the articles he had concluded to be punctually carried into execution.

Scio, or Chio, a celebrated island of the Archipelago (see Chio.) It is 32 miles long and 15 broad, is a mountainous but very pleasant country. The principal mountain, called anciently Pelinaus, presents to view a long lofty range of bare rock, reflecting the sun; but the recesses at its feet are diligently cultivated, and reward the husbandman by their rich produce. The slopes are clothed with vines. The groves of lemon, orange, and citron-trees, regularly planted, at once perfume the air with the odour of their blossoms, and delight the eye with their golden fruit. Myrtles and jalmues are intermixed, with olive and palm-trees, and cypresses. Amid these the tall minarets rise, and white houses glitter, dazzling the beholder. The inhabitants export a large quantity of pleasant wine to the neighbouring islands, but their principal trade is in silk. They have also a small commerce in wool, cheese, figs, and malic. The women are better bred than in other parts of the Levant; and though the dress is odd, yet it is very neat. The paridges are tame, being sent every day into the fields to get their living, and in the evening are called back with a whistle. The town called Scio is large, pleasant, and the best built of any in the Levant, the houses being beautiful and commodious, some of which are terraced, and others covered with tiles. The streets are paved with flint-stones; and the Venetians, while they had it in their possession, made a great many alterations for the better. The castle is an old citadel built by the Genoese, in which the Turks have a garrison of 1400 men. The harbour of Scio is the rendezvous of all shipping that goes to or comes from Constantinople, and will hold a fleet of four-score vessels. They reckon there are 10,000 Turks, 100,000 Greeks, and 10,000 Latins, on this island. The Turks took it from the Venetians in 1695. Scio is a bishop's seat, and is feated on the sea-flats, 47 miles west of Smyrna, and 210 south-west of Constantinople.

There are but few remains of antiquity in this place. "The most curious of them (says Dr Chandler) is which has been named without reason the School of Homer. It is on the coast at some distance from the city northward, and appears to have been an open temple of Cybele, formed on the top of a rock. The slope is oval, and in the centre is the image of the goddess, the head and an arm wanting. She is represented, as usual, sitting. The chair has a lion carved on each side, and on the back. The area is bounded by a low rim or seat, and about five yards over. The whole is hewn out of the mountain, is rude, indifferently, and probably of the most remote antiquity. From the slope higher up is a fine view of the rich vale of Scio, and of the channel, with its shining islands, beyond which are the mountains on the mainland of Asia."

Scippus (Gaspar), a learned German writer of the 17th century, was born at Neumark in the Upper Palatinate on the 27th of May 1576. He studied at the university with so much success, that at the age of 16 he became an author; and published books, says Ferrari, which deserved to be admired by old men. His dispositions did not correspond with his genius. Naturally passionate and malevolent, he assaulted without

Scioppius, lie about the mercy the he

length, convenient be,.

length, convenient be,

merit the character of eminent men. He abjured the

system of the Protestants, and became a Roman catholic

about the year 1599; but his character remained

the same. He possessed all those qualities which fitted

him for making a distinguished figure in the literary

world; imagination, memory, profound learning, and

invincible impudence. He was familiar with the terms

of proloach in most of the languages. He was entirely

ignorant of the manners of the world. He neither howed

respect to his superiors, nor did he behave with

decency to his equals. He had the spirit of an uncommon kind: he was indeed a perfect firebrand, flattering around him, as if for his amusement, the most atrocious calumnies. Joseph Scaliger, above all

others, was the object of his hate. That learned

man, having drawn up the history of his own family, and

deduced its genealogy from princes, was severely

attacked by Scipio, who ridiculed his high

spirit. Scaliger in his turn wrote a book intitled: The

Life and Parentage of Gaifer Scioppius, in which

he informs us, that the father of Scipio had been suc-

cessively a grave-digger, a journeyman stationer, a haw-

ker, a soldier, a miller, and a brewer of beer. We

are told that his wife was long kept as a milkmaid, and

at length seduced by a debauched man whom he fol-

lowed to Hungary, and obliged to return to her husband;

that then he treated her harshly, and condemned her to the

lowest offices of servitude. His daughter too, it

said, was as disdained as her mother; that after the

flight of her husband, who was going to be burned for

some infamous crime, she became a common prostitute;

and at length grew so infamous, that she was com-

mitted to prison. Those severe accusations against

the family of Scipio inflamed him with more eagerness
to attack his antagonist anew. He collected all the cal-

umnies that had been thrown out against Scaliger, and

formed them into a huge volume as if he had intended to

erush him at once. He treated with great contempt

the King of England, James I. in Eclogues, &c., and in his

Collyrium Regium Britanniae Regi praeviser ex

ascen laboravit mavece miliam; that is, “An Eye-false

for his Britannic Majesty.” In one of his works he had the

audacity to abuse Henry IV. of France in a most flor-

uous manner, on which account his book was burned

at Paris. He was hung in effigy in a garce which was

represented before the king of England, but he gloried

in his lathoonour. Provoked with his insolence to their

sovereign, the freemen of the English ambassad-er aff-

aulted him at Madri, and corrected him severely; but

he bullied of the wounds he had received. He pub-

lished more than thirty defamatory libels against the

Jesuits; and, what is very surprizing, in the very place

where he declaim with most virulence against that so-

ciety, he subordinates his own name with expressions of

piety. I Gaifer Scipio, already on the brink of the

gave, ready to appear before the tribunal of 

Christ to give an account of my works. Towards the end

of his life he employed himself in studying the Apoca-

lypse, and affirmed that he had found the key to that

mythous book. He sent some of his expostitions to

Cardinal Mazarine, but the cardinal did not find it con-

venient to read them.

Ferrari tells us, that during the last fourteen years of

his life he flux in a small apartment, where he devoted himself solely to study. The fame writer

acquaints us, that he could repeat the Scriptures almost

entirely by heart; but his good qualities were eclipsed

by his vices. For his love of flattery, and the furious

affilius which he made upon the most eminent men, he

was called the Corruptus of literature. He accuses even

Cicero of barbarisms and impurities. He died on the

19th November 1649, at the age of 74, at Padua, the

only retreat which remained to him from the mul-

titude of enemies whom he had created. Four hundred

books are ascribed to him, which are said to discover

great genius and learning. He translated 

Periplus Libri IV. 1588, in 8vo. 1. Commenta-

rius de arte criticis, 1661, in 8vo. 3. De fia ad Catho-

licos migratione, 1680, in 8vo. 4. Notiones Criticas in

Petri, in Pragia, Petwii, 1664, in 8vo. 5 Suf-

pectarum libannum Libri V. 1665, in 8vo. 6. Chorale belli facri, 1619, in 4to. 7. Collyrium region, 1611,

in 8vo. 8. Grammati a Philosophi, 1614, in 8vo. 9. Re-

latio ad Reges et Principes de Stratagamibus et Societatis

Jesu, 1641, in 12mo. This last mentio ned book was

published under the name of Alphonso d’Argos. He

was at first well disposed to the Jesuits; but these

fathers on one occasion opposed him. He presented a

petition to the diet of Ratibon in 1630, in order to

obtain a pension; but the Jesuits, who were the

confiders both of the emperor and the electors, had

influence to prevent the petition from being granted.

From that moment Scipio turned his whole artillery against

the Jesuits.

SCIPIO (Publius Cornelius), a renowned Roman
general, famouled Africanus, for his conquests in that

country. His other fnal military exploits were his

taking the city of New Carthage in a single day; his

complete victory over Hannibal, the famous Carthag-

inian general; the defeat of Syphax king of Numidia,

and of Antiochus in Afia. He was as eminent for his

chastity, and his generous behaviour to his prisoners, as

for his valour. He died 180 B.C. aged about 51.

Scipio (Lucius Bornelius), his brother, furnished

Africanus, for his complete victory over Antiochus at

the battle of Magnesia, in which Antiochus lost 50,000

infantry and 4000 cavalry. A triumph, and the

furnme of Africanus, were the rewards of his valour.

Yet his ungrateful countrymen accused him, as well as his

brother, of peculation; for which he was fined; but

the public face of his effects proved the falsehood of the

charge; for they did not produce the amount of the

fine. He starved about 160 B.C.

Scipio (Publius Emilianus), the son of Paulus

Emilianus; but being adopted by Scipio Africanus, he

was called Scipio Africanus junus. He showed himself

worthy of adoption, following the footsteps of Scipio

Africanus, with whom he equalled in military fame and

public virtue. His chief victories were the conquest of

Carthage and Numantia; yet these fnal services to his

country could not protect him from an untimely fate.

He was strangled in his bed by order of the

Decemviri, who dreaded his popularity, 129 B.C.

aged 56.

Sciro, an island of the Archipelago, to the west of

Myrtia, to the northeast of Negropont, and to the

south-east of Sutti. It is 15 miles in length, and

8 in breadth. It is a mountainous country, but has

no mines. The vines make the beauty of the island,

and the wine is excellent, nor do the natives want

wood.
wood. There is but one village; and that is built on a rock, which runs up like a sugar loaf, and is 10 miles from the harbour of St George. The inhabitants are all Greeks, the cadi being the only Turk among them.

SCIROCO, or Sirocho, a name generally given in Italy to every unfavourable wind. In the south-west it is applied to the hot suffocating blasts from Africa, and in the north-east it means the cold bleak winds from the Alps.

SCIRRUS, in botany: A genus of the monogynia order, belonging to the triandria class of plants; and black; size of a half-grown rabbit. — Inhabits the woods of Northern Asia, North America, Peru, and Chili. They are very numerous in North America, do incredible damage to the plantations of maize, run up the stalks and eat the young ears. Descend in vast flocks from the mountains, and join those that inhabit the lower parts; were proscripted by the provinces, and a reward of three-pence per head given for every one that is killed. Such a number was destroyed one year, that Pennsylvania alone paid in rewards L.8000 of its currency. Make their nests in hollow trees, with moss, straw, wool, &c. Feed on maize in the season, and on pine-cones, acorns, and masts of all kinds; form holes underground, and there deposit a large flock of winter provision. Descend from the trees, and visit their magazines when in want of meat; are particularly busy at the approach of bad weather; during the cold season keep in their nest for several days together; seldom leap from tree to tree, only run up and down the bodies; their hoards often destroyed by fowls; when their magazines are covered with deep snow, the squirrels often perish for want of food; are not easily shot, nimble changing their place when they see the gun levelled; have the actions of the common squirrel; are easily tamed; and their flesh is esteemed very delicate. Their furs, which are exported under the name of petit-gris, are valuable, and used as linings to cloaks.

S.CITAMINEÆ. See Botany, p. 459.

SCIRUS, the squirrel; a genus of quadrupeds belonging to the order of glires. It has two fore-teeth in each jaw, the superior ones compressed, the inferior ones compressed. There are 11 species; of which the most remarkable are,

1. The vulgus, or common squirrel, with ears terminated with long tufts of hair; large, lively, black eyes; head, body, legs, and tail, of a bright reddish brown; breast and belly white; hair on each side the tail lies flat. In Sweden and Lapland, it changes in winter into grey. In Ruffia it is sometimes found black.

In many parts of England there is a beautiful variety, with milk white tails. — This species inhabits Europe and North America, the northern and the temperate parts of Asia: and a variety is even found as far south as the Alps.

It is a neat, lively, active animal; lives always in woods: in the spring, the female is seen pursued from tree to tree by the males, feigning an escape from their embraces; makes its nest of mosses and dried leaves between the fork of two branches; brings three or four young at a time; has two holes to its nest; flops up that on the side the wind blows, as Pliny justly remarks; lays in a hoard of winter provision, such as nuts, acorns, &c.; in summer, feeds on buds and young shoots; is particularly fond of theo of fir, and the young cones; fits up to eat, and uses its forefeet as hands; covers itself with its tail; leaps to a surprising distance; when distended with its food, a piece of bark is its bed, its tail the fail; in great plenty in Dunsadile, and there called Conn. Boys frequently nurse this beautiful and active animal under cats. "There are three creatures, the squirrel, the field-mouse, and the bird called the muchatchy, which live much on hazel nuts; and yet they open them each in a different way. The first, after rasping off the small end, split the shell in two with his long fore-teeth, as a man does with his knife; the second nibbles a hole with his teeth, so regular as if drilled with a wimble, and yet so small, that one would wonder how the kernel can be extracted through it; while the last pecks an irregular ragged hole with its bill; but as this artific has no paws to hold the nut firm while he pierces it, like an adroit workman, he fixes it, as it were, in a vice, in some cleft of a tree, or in some crevice; when, standing over it, he perforates the thornail shell. White at work, they make a rattling noise, that may be heard at a considerable distance." — *White's Selborne.*

2. The cinereus, or grey squirrel, with plain ears; Plate hair of a dull grey colour, mixed with black, and often tinged with dirty yellow; belly and insides of the legs white; tail long, bushy, grey, and striped with black; size of a half-grown rabbit. — Inhabits the woods of Northern Asia, North America, Peru, and Chili. They are very numerous in North America, do incredible damage to the plantations of maize, run up the stalks and eat the young ears. Descend in vast flocks from the mountains, and join those that inhabit the lower parts; were proscripted by the provinces, and a reward of three-pence per head given for every one that is killed. Such a number was destroyed one year, that Pennsylvania alone paid in rewards L.8000 of its currency. Make their nests in hollow trees, with moss, straw, wool, &c. Feed on maize in the season, and on pine-cones, acorns, and masts of all kinds; form holes underground, and there deposit a large flock of winter provision. Descend from the trees, and visit their magazines when in want of meat; are particularly busy at the approach of bad weather; during the cold season keep in their nest for several days together; seldom leap from tree to tree, only run up and down the bodies; their hoards often destroyed by fowls; when their magazines are covered with deep snow, the squirrels often perish for want of food; are not easily shot, nimble changing their place when they see the gun levelled; have the actions of the common squirrel; are easily tamed; and their flesh is esteemed very delicate. Their furs, which are exported under the name of petit-gris, are valuable, and used as linings to cloaks.

3. The niger, or black squirrel, with plain ears; sometimes wholly black, but often marked with white on the nose, the neck, or end of the tail; the tail shorter than that of the former; the body equal. It inhabits the north of Asia, North America, and Mexico; breeds and associates in separate troops; is equally numerous with the former; commits great ravages among the maize; makes its nest in the same manner, and forms, like them, magazines for winter food. The finest are taken near the lake Baikal, and about Bakingis-koi-oilrog, upon the Upper Angara, in the district of Nertchink, which are the best in all Siberia; these continue black the whole year, the others grow rufly in summer. — There is a variety with plain ears; coaré fur mixed with dirty white and black; throat and insides of the legs and thighs black; tail much shorter than those of squirrels usually are; of a dull yellow colour, mixed with black; body of the size of the grey squirrel. It inhabits Virginia; the planters call it the cat squirrel.

4. The flavus, or fair squirrel, with the body and tail of a flavous colour; of a very small size, with plain round ears, and rounded tail. Inhabits the woods near Amanabad, the capital of Guzurat, in great abundance, leaping from tree to tree. *Lineanus* says it is an inhabitant of South America.

5. The striatus, or ground squirrel, with plain ears; ridge
SCIRUS [713] SCLERANTHUS

ridge of the back marked with a black streak; each side with a pale yellow stripe, bounded above and below with a line of black; head, body, and tail, of a reddish brown; the tail, the darkest; breast and belly white; nose and feet pale-red; eyes full. — Inhabits the north of Asia; found in the greatest abundance in the forests of North America. They never run up trees except they are pursued, and find no other means of escaping: they burrow, and form their habitations under ground, with two entrances, that they may get access to the one in case the other is flopped up. Their retreats are formed with great skill, in form of a long gallery, with branches on each side, each of which terminates in an enlarged chamber, as a magazine to store their winter provision in; in one they lodge the acorns, in another the maize, in a third the hickory nuts, and in the last their favourite food the chinquapin chestnut.

They very seldom dig out their winter provision in; in one they lodge the acorns, in another the maize, in a third the hickory nuts, and in the last their favourite food the chinquapin chestnut. They very seldom dig out, winter, at least as long as their provision lasts; but if that fails, they will dig into cellars where apples are kept, or barns where maize is stored, and do a great deal of mischief; but at that time the cat destroys great numbers, and is as great an enemy to them as to mice. During the maize harvest these squirrels are very busy in biting off the ears, and filling their mouths full with the corn that their cheeks are quite distended. It is observable that they give great preference to certain food; for if, after filling their mouths with rye, they happen to meet with wheat, they fling away the rye, that they may indulge in the wheat. They are very wild, bite severely, and are scarcely ever tamed; the skins are of little use, but are sometimes used to line cloaks.

6. The *gus*, or fat squirrel, with thin naked ears; body covered with soft, pale-coloured hair; belly whitish; tail full of long hair; from nose to tail, near six inches; tail, four and, a half; thicker in the body than the common squirrel. — Inhabits France and the south of Europe; lives in trees, and leaps from branch to branch; feeds on fruits and acorns; lodges in the hollows of trees; remains in a torpid state during winter, and grows very fat. It was esteemed a great delicacy by the Romans, who had their gairaria, places contrived to keep and feed them in.

7. The *fagitta*, or arrow squirrel, with a small round head, cloven upper lip; small blunt ears, two small warfs at the utmost corner of each eye, with hairs growing out of them; neck short; four toes on the fore feet; and instead of a thumb, a slender bone two inches and a half long, lodged under the lateral membrane, serving to Chest it out; from thence to the hind legs extends the membrane, which is broad, and a continuation of the skin of the sides and belly: there are five toes on the hind feet; and on all the toes, sharp, curved nails; the tail is covered with long hairs disposed horizontally; colour of the head, body, and tail, a bright bay; in some parts inclining to orange; breast and belly of a yellowish white; length from nose to tail, eighteen inches; tail, fifteen. — Inhabits Java, and other parts of the Indian islands; leaves from tree to tree as it flies; will catch hold of the branches with its tail.

Newhoff, p. 354, describes this under the name of the flying cat, and says the back is black.

8. The *volans*, or flying squirrel, with round naked ears, full black eyes, and a lateral membrane from the side to the hind legs; tail with long hairs disposed hori-

zontally, longest in the middle; its colour above, a brownish; beneath, white tinged with yellow; much less than the common squirrel. — Inhabits Finland, Lapland, Poland, Russia, North America, and New Spain; lives in hollow trees; sleeps in the day; during the night is very lively; is gregarious, numbers being found in one tree; leaps from branch to branch at the distance of ten yards; this action has improperly been called flying; for the animal cannot go in any other direction than forward; and even then cannot keep an even line, but flits considerably before it can reach the place it aims at; senile of this, the squirrel mounts the higher in proportion to the distance it wishes to reach; when it would leap, it stretches out the forelegs, and extending the membranes becomes specifically lighter than it would otherwise be, and thus is enabled to spring further than other squirrels that have not this apparatus. When numbers leap at a time, they seem like leaves blown off by the wind. Their food the same as the other squirrels. They are easily tamed; bring three or four young at a time. See fig. 5 & 6, one representing the animal in what is called a flying, the other in a sitting posture.

SCIRUS, in botany: A genus of the monogynia order, belonging to the diandria class of plants; and in the natural method ranking with those that are doubtful. The calyx is quinquedentate; the corolla bilabiated; the filaments are barren; the capsules five, and joined together; bivalved, unilocular, with one seed. Of this there is one species, *Sclerenchyma aromatica*, a native of Guiana.

SCLAVONIA, a country of Europe, between the rivers Save, the Drave, and the Danube. It is divided into six counties, viz. Porcgra, Zabrab, Creis, Waradel, Zreci, and Walpon, and belongs to the house of Austria. It was formerly called a kingdom; and is very narrow, not being above 75 miles in breadth; but 300 in length, from the frontiers of Austria to Belgrade. The eastern part is called Rutenia, and the inhabitants Rutenians. Theirs, from a particular notion, are of the Greek church. The language of Sc słowenia is the mother of four others, namely, that of Hungary, Bohemia, Poland, and Ruffia.

SCLERANTHUS, in botany: A genus of the diandria order, belonging to the dodecandria class of plants, and in the natural method ranking under the 2nd order, Caryophyllaceae. The calyx is monophyllous; there is no corolla; there are two seeds contained in the calyx.

SCLERANTHUS, in botany: A genus of the tetrandria order, belonging to the monoea class of plants, and in the natural method ranking under the 4th order, Gramineae. The calyx has a glume, with from two to five valves; the flowers numerous; the seed a sort of nut, small, oblong, and shining. There are six species, all of them natives of the West Indies.

SCLERANTHUS, in botany: A genus belonging to the order of gramineae. The back is cylindrical, obtuse, and longer than the head; the nostrils are linear; the face is covered; and the feet have four toes. There are 18 species; of which the following are the principal.
1. *The arquata*, or curlew, frequents our sea-coasts and marishes in the winter time in large flocks, walking on the open sands; feeding on shells, frogs, crabs, and other marine insects. In summer they retire to the mountaneous and unfrequented parts of the country, where they pair and breed. Their eggs are of a pale olive colour, marked with irregular but distinct spots of pale brown. Their flesh is very rank and filthy, notwithstanding an old English proverb in its favour. Curlews differ much in weight and size; some weighing 37 ounces, others not 22; the length of the largest to the tip of the tail, 25 inches; the breadth, three feet five inches; the bill is seven inches long; the head, neck, and coverts of the wings, are of a pale brown; the middle of each feather, black; the breast and belly white, marked with narrow oblong black lines: the back is white, spotted with a few black strokes; the quill-feathers are black, but the inner webs spotted with white; the tail is white, tinged with red, and beautifully barred with black; the legs are long, strong, and of a bluish grey colour; the bottoms of the toes flat and broad, to enable it to walk on the soft mud, in search of food.

2. *The phaeopus*, or whimbrel, is much less frequent on our shores than the curlew; but its haunts, food, and general appearance, are much the same. It is observed to visit the neighbourhood of Spalding (where it is called the *curlew knot*) in vall flocks in April, but continues there no longer than May; nor is it seen there any other time of the year: it feeds at that season to on its passage to its breeding place, which Mr. Pennant suspects to be among the highlands of Scotland. The specific difference is the size; this never exceeding the weight of 12 ounces.

3. *The arcula*, or woodcock, during summer inhabits the Alps of Norway, Sweden, Polith Prussia, the march of Brandenburg, and the northern parts of Europe; they all retire from those countries the beginning of winter, as soon as the frosts commence; which force them into milder climates, where the ground is open, and adapted to their manner of feeding. They live on worms and insects, which they search for with their long bills in soft grounds and moist woods. Woodcocks generally arrive here in flocks, taking advantage of the night or a mist; they soon separate; but before they return to their native haunts, pair. They feed and fly by night; beginning their flight in the evening, and return the same way or through the same glades to their day retreat. They leave England the latter end of February, or beginning of March; not but they have been known to continue there accidentally. These birds appear in Scotland first on the eastern coasts, and make their progress from east to west. They do not arrive in Breadalbane, a central part of the kingdom, till the beginning or middle of November; nor the coasts of Nether Lorn, or of Rosshire, till December or January: they are very rare in the remote Hebrides, and in the Orkneys. A few stragglers now and then arrive there. They are equally scarce in Caithness. This species of woodcock is unknown in North America: but a kind is found that has the general appearance of it; but is scarce half the size, and wants the bars on the breast and belly. The weight of the woodcock is usually about 12 ounces; the length near 14 inches; and the breadth, 2½; the bill is three inches long, dusky towards the end, reddish at the base; tongue slender, long, sharp, and hard at the point; the eyes large, and placed near the top of the head, that they may not be injured when the bird thrusts its bill into the ground; from the bill to the eyes is a black line; the fore-head is a reddish ash colour; the crown of the head, the hind part of the neck, the back, the coverts of the wings, and the scapulars, are prettily barred with a ferruginous red, black, and grey; but on the head the black predominates: the quill feathers are dusky, indented with red marks. The chin is of a pale yellow; the whole under side of the body is of a dirty white, marked with numerous transverse lines of a dingy colour. The tail consists of 12 feathers, dusky or black on the one web, and marked with red on the other; the tips above, are ash-coloured, below white; which, when shooting on the ground was in vogue, was the sign the fowler discovered the birds by. The legs and toes are livid; the latter divided almost to their very origin, having only a very small web between the middle and interior toes; as those of two species of snipes found in England.

4. *The agocephalus*, or godwit, weighs 12 ounces and a half; the length is 16 inches; the breadth 27; the bill is four inches long, turns up a little, black at the end, the rest a pale purple; from the bill to the eye is a broad white stroke; the feathers of the head, neck, and back, are of a light reddish brown, marked in the middle with a dusky spot; the belly and vent feathers white, the tail regularly barred with black and white. The fix first quill-feathers are black; their interior edges of a reddish brown; the legs in some are dusky, in others of a greyish blue, which perhaps may be differing to different ages; the exterior toe is connected as far as the first joint of the middle toe with a strong serrated membrane. The male is distinguished from the female by some black lines on the breast and throat; which in the female are wanting. These birds are taken in the fens, in the same season and in the same manner with the rails and reeves; and when fattened are esteemed a great delicacy, and fall for half a crown or 10 shillings a piece. A stake of the same species is placed in the net. They appear in small flocks on our coasts in September, and continue with us till the whole winter they walk on the open sands like the curlew, and feed on insects.

5. *The glareus*, or greenhank, is in length to the end of the tail, 14 inches; to that of the toe, 20; its breadth, 25. The bill is two inches and a half long; the upper mandib. black, slanting, and very slender; the lower reflects a little upwards; the head and upper part of the neck are ash-coloured, marked with small dusky lines pointing down; over each passes a white line; the coverts, the scapulars, and upper part of the back, are of a brownish ash colour; the quill-feathers dusky, but the inner webs speckled with white; the breast, belly thighs and lower part of the back, are white; the tail is white, marked with undulated dusky bars; the inner coverts of the wings finely crossed with double and treble rows of a dusky colour. It is a bird of an elegant shape, and small weight in proportion to its dimensions, weighing only six ounces. The legs are very long and slender, and bare above two inches higher than the knees. The exterior toe is united to the middle toe, as far as the second joint, by a strong
These birds appear on the English coasts and wet grounds in the winter-time in but small numbers.

6. The *cathirius*, or red-thank, is found on most of our shores; in the winter-time it conceals itself in the gutters, and is generally found single or at most in pairs. It breeds in the fens and marshes; and flies round its nest when disturbed, making a noise like a lapwing. It lays four eggs whitish tinged with olive, marked with irregular spots of black chiefly on the thicker end. It weighs five ounces and a half; the length is 12 inches, the breadth 21; the bill near two inches long, red at the base, black towards the point. The head, hind part of the neck, and scapulars, are of a dusky ath-colour obscurely spotted with black; the back is white, sprinkled with black spots; the tail elegantly barred with black and white; the cheeks, under side of the neck, and upper part of the breast, are white, streaked downward with dusky lines; the belly white; the exterior webs of the quill-feathers are dusky; the legs long, and of a fine bright orange colour; the utmost toe connected to the middle toe by a small membrane; the inmost by another still smaller.

7. The *gallinago*, or common snipe, weighs four ounces; the length, to the end of the tail, is near 12 inches; the breadth about 14; the bill near two inches long, the legs pale green; the toes divided to their origin. In summer they disperse to different parts, and are twice the length of the head, and turned backwards, form a kind of forked tail. The quill-feathers are white, variegated with black and yellow; the quill-feathers above each eye: between the bill and the eyes that are very painful and dangerous. A sailor that was bit by one on board a ship felt excessive pain, and his life was supposed to be in danger; but by the application of raked onions to the part he recovered. Some of the species live in holes in the earth: others under stones, and among rotten wood; so that the removing of these is exceedingly dangerous in the countries where the *scolopendra* breed. These insects, like the scorpion, are supposed to be produced perfect from the parent or the egg, and to undergo no change after their first exuination. They are found of all sizes; which is a sufficient reason for believing that they preserve their first appearance through the whole of their existence. It is probable, however, that, like most of this class, they often change their skins; but of this we have no certain information. The *scolopendra fuscata* is the largest in this country, of a dun colour, smooth and composed of nine scaly segments, without reckoning the head. The feet are 15 in number on each side, and the left longer than the right, and turned backwards, form a kind of forked tail. The antennae are twice the length of the head, and consist of 42 short segments. The infel's progressive motion is very quick, and sometimes serpentine. It is found under stones on the ground, under flower-pots and garden boxes.

**Scolopus**, in botany: A genus of the polygama egalis order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, Composite. The receptacle is paleaceous; the calyx imbricated and prickly, without any pappus.

**Scomber**, the Mackerel, in ichthyology, a genus belonging to the order of thoracici. The head is smooth and compressed, and there are seven rays in the gill membrane. There are ten species; of which the most remarkable are the following.

1. The *scomber*, or common mackerel, a summer-fish of passage that visit our shores in vast shoals. It is less useful than other species of gregarious fish, being very tender, and unfit for carriage; but that it may be preferred by pickling and salting, a method, we believe, practiced in many places, where it proves a great relief to the poor during winter. It was a fish greatly esteemed by the Romans, because it furnished the precious garum, a sort of pickle that gave a high relish to their sauces; and was besides used medicinally. It was drawn from different kinds of fish, but that made from the mackerel had the preference: the bell was made at

Car-
This in that city, bore a high price, and was by the title of , vind, which is thence called a by a bait; but the *Veight,* the *weight,* weighed upwards of five. The nofe is taper and the ocean was observed, and situations for taking them were established in places it most frequented. There are still very considerable tunny fisheries on the coasts of Sicily, as well as several other parts of the Mediterranean where they are cured, and make a great article of provision in the adjacent kingdoms. They are caught in nets, and quantities are taken; for they come in hares. When the tunny is caught, it is stept to its country a hoop and cut up, either to serve as hooked, it is held with a strong hook baited with a herring, and fastened to a rope, is instantly flung out, which the tunny seldom fails to take. As soon as hooked, it lofts all spirit; and after a very little resistance submits to its fate. It is dragged to the shore and cut up, either to be sold fresh to people who carry it to the country markets, or is preferred salted in large casks. The pieces, when fresh, look exactly like raw beef; but when boiled turn pale, and have something of the flavour of salmon.

One that was taken when Mr Pennant was at Inverary in 1769, weighed 462 pounds. The fish was seventeen feet ten inches long: the greatest circumference five feet seven; the least near the tail one foot six. The body was round and thick, and grew suddenly very slender towards the tail, and near that part was angular. The irides were of a plain green: the teeth very minute. The tail was in form of a crescent; and two feet seven inches between tip and tip. The skin on the back was smooth, very thick, and black. On the belly the scales were visible. The colour of the sides and belly was silvery, tinged with carmine and pale purple: near the tail marbled with grey.

They are known on the coast of Scotland by the name of mackrell; from being of that genus; and flure, from the Danish, flór "great."

SCONE, a town of Scotland, remarkable for being the place where the kings were anciently crowned.

W. Long. 3. 10. N. Lat. 56. 28. Here was once an abbey of great antiquity, which was burnt by the reformers at Dundee. Kenneth II. upon his conquest of the Picts in the ninth century, having made Scone his principal residence, delivered his laws, called the *Malapin laws,* from a tumulus, named the *Mote Hill of Scone.* The present palace was begun by the earl of Gowrie; but was completed by Sir David Murray of Gofpatrie, the favourite of king James VI. to whom that monarch had granted it; and the new prince, attended by his courtiers, put up the king's arms in several parts of the house. It is built around two courts. The dining room is large and handsome; and has an ancient and magnificent chimney-piece, and the king's arms, with this motto:

*Nobis hæc inviolata miserunt centum sex provoi.*

Beneath are the Murray arms. In the drawing room is some good old tapestry, with an excellent figure of Mercury. In a small bed-chamber is a medley scripture-piece in needle-work, with a border of animals, pretty well done, the work of queen Mary during her confinement in Loch Leven Castle. The gallery is about 155 feet long, the top arched, divided into compartments filled with paintings in water-colours. The pieces represented are various kinds of hunting; that of Nimrod, and king James and his train, appear in every piece. Till the destruction of the abbey, the kings of Scotland were crowned here; fitting in the fame wooden chair which Edward I. used. Edward I. crowned the king in Westminster abbey, to the great mortification of the Scots, who looked upon it as a kind of palladium. Charles II. before the battle of Worcester, was crowned in the present chapel. The old pretender refided for some time at Scone in 1715; and his son paid it a visit in 1745.

SCOPARIA, in botany: A genus of the monogynia order, belonging to the tetradylla class of plants; and in the natural method ranking under the 40th order, *Peronastes.* The calyx is quadripartite; the corolla the same, and roaceous; the capsule unilocular, bivalved, and polypermous.

SCOPER, or scupper holes, in a ship, are holes made through the sides, close to the deck, to carry off the water that comes from the pump.

SCOPARIA, in botany: A genus of the octandria order, belonging to the gynandria class of plants; and in the natural method ranking under the 11th class, *Sarcenices.* The calyx is diphyllous; the corolla quadrifid; the anthers coalescing in two columns, one placed above the other. Of this there is only one species, viz. *Sporobola.*

SCORRUTUS, the Scurvy. See Medicina, no. 8.

SCORDIUM, or Water-germander, in botany, a species of *Teucrium.*

SCORIA, or Dross, among metallurgists, is the remelted metal from in furnaces; or, more determinately speaking, is that mass which is produced by melting metals and ores: when cold, it is brittle, and not dissoluble in water, being properly a kind of glass.
SCORIFICATION, in metallurgy, is the art of reducing a body, either entirely or in part, into scoria.

SCORPION, in ichthyology, a genus belonging to the order of thoracics. The head is large and sharp; the eyes are near each other; there are teeth in the membrane of the gill. The species are three, viz. the *pereus*, *ferris*, and *horrida*. According to Mr. Willoughby, the scorpæna is a fish of the anguilliform kind, called by the people of Cornwall father fisher. Scorpena is also the name of a fish caught in many parts of the Mediterranean. It seldom grows to more than a pound weight. Its body is long, but not flattened, and is moderately thick. Its head is extremely large, and is armed with prickles, and it grows gradually less from thence to the tail. The prickles about the head are accounted venomous, and the fishermen usually cut them off as soon as the fish is caught. Its tail is not forked, but rounded at the end. The belly and belly-fins are redish.

Plate CCCXLV. SCORPIO, in zoology, a genus of insects belonging to the order of apertura. It has eight feet, besides two frontal claws; the eyes are eight in number, three on each side of the thorax, and two on the back. It has two claw-shaped palpi, a long jointed tail, with a pointed weapon at the extremity; it has likewise two combs situated between the breast and abdomen. There are six species, all natives of southern climates.

Of all the classes of noxious insects, the scorpion is the most terrible, whose shape is hideous, whose size among the insects is enormous, and whose sting is generally fatal. Happy for Britain, the scorpion is entirely a stranger there! In several parts of the continent of Europe it is but too well known, though it seldom grows above four inches long; but in the warm tropical climates, it is seen a foot in length, and in every respect as large as a lobster, which it somewhat resembles in shape. There have been enumerated nine different kinds of this dangerous insect, including species and varieties, chiefly distinguished by their colour; there being scorpions yellow, brown, and ash coloured; others that are the colour of rusty iron, green, pale yellow, black, clarét colour, white, and grey. There are four principal parts distinguishable in this animal; the head, the breast, the belly, and the tail. The scorpion's head seems, as it were, jointed to the breast; in the middle of which are seen two eyes; and a little more forward, two more eyes, placed in the fore part of the head: these eyes are so small, that they are scarcely perceptible; and it is probable the animal has but little occasion for seeing. The mouth is furnished with two jaws: the undermost is divided into two, and the parts notched into each other, which serves the animal as teeth, and with which it breaks its food, and thrusts it into its mouth: these the scorpion can at pleasure pull back into its mouth, so that no part of them can be seen. On each side of the head are two arms, each composed of four joints; the last of which is large, with strong muscles, and made in the manner of a lobster's claw. Below the breast are eight articulated legs, each divided into six joints; the two hindmost of which are each provided with two crooked claws, and here and there covered with hair. The belly is divided into seven little rings; from the lowest of which is continued a tail, composed of six joints, which are bristly, and formed like little globes, the last being armed with a crooked fling. This is that fatal instrument which renders this insect so formidable: it is long, pointed, hard, and hollow: it is pierced near the base by two small holes, through which, when the animal stings, it ejects a drop of poison, which is white, caustic, and fatal. The reflexor in which this poison is kept, is in a small bladder near the tail, into which the venom is discharged by a peculiar apparatus. If this bladder be greatly prised, the venom will be seen flowing out through the two holes above mentioned; so that it appears, that when the animal stings, the bladder is prised, and the venom issues through the two apertures into the wound.

We have here given the common account of the sting of these noxious animals; but though we cannot pretend to determine between them, we shall lay before our readers the following observations from a treatise on *Tropical Diseases*, &c. by Dr. Mofley of the Chelsea Hospital. "Galen justly observes, that a person who had not witnessed the fact, would not suppose that so small an injury as the sting of a scorpion, or the bite of a poisonous spider, could produce the violent effect which they do in the whole body. He says, the aculeus, or sting, of a scorpion ends in the minutest point; and has no perforation through which any poison can pass into the wound. Yet, he says, we must suppose the venom to be some spiritual substance, or moisture, in which a great power is concentrated in a small compass. Before I had an opportunity (says Dr. Mofley) of examining this subject, my respect for the opinion of Galen made me doubt the accuracy of Leewenhoek, Redi, Mead, and others, who affect that there is an aperture near the cutis of a scorpion's sting; and that through this aperture a liquid poison is injected when a wound is inflicted. Repeated experiments, with the best glasses, have never enabled me to discover any foramen, or opening; whatever."

The following cure may also be worth the reader's notice. "Mrs. Pidgeley, at Kingston in Jamaica, in January 1781, was stung by a scorpion in the foot, above the little toe. The part became instantly red and painful; and soon after livid. The pain increased to great severity. Some rum was applied to the wound, on which the pain immediately left the foot, and passed up to the groin, with great agony. The pain still passed upwards, and diffused itself about the pit of the stomach, neck, and throat, attended with tremors, cold sweats and languors. As the pain passed the abdomen, it occasioned a violent purging and fainting, which ceased on its advancing higher. I was called to her, and gave her the following medicines, a few doses of which removed every symptom. She had been extremely ill for thirty-six hours. Sal. Succis. 3 ij; Camphor. gr. xiij; Cinabar. Antimon. gr. x; Confit. Gard. q. f. Junt bell. 3 f. One of these was taken every hour, with four spoonfuls of the following mixture: Aq. Moneh. 3 viij; Liss. Purgat. 3 ij; Syr. Cresi 2 li; Mydriac."
In some of the towns of Italy, and in France, in the province of Languedoc, it is one of the greatest pests that torments mankind; but its malignity in Europe is trifling, when compared to what the natives of Africa and the east are known to experience. In Batavia, where they grow twelve inches long, there is no removing any piece of furniture, without the utmost danger of being stung by them. Bofman affires us, that along the Gold Coast they are often found larger than a lobster; and that their sting is inevitably fatal. In Europe, however, they are by no means so large, so venomous, or so numerous. The general size of this animal does not exceed two or three inches; and its sting is very seldom found to be fatal. Maupertius, who made several experiments on the scorpion of Languedoc, found it by no means so invariably dangerous as had till then been represented. He provoked one of them to sting a dog, in three places of the belly where the animal was without hair. In about an hour after, the poor animal seemed greatly swollen, and became very sick; he then cast up whatever he had in his bowels; and for about three hours continued vomiting a whitish liquid. The belly was always greatly swollen when the animal began to vomit; but this operation always seemed to abate the swelling; which alternately welled, and was thus emptied, for three hours successively. The poor animal after this fell into convulsions, bit the ground, dragged himself along upon his fore-feet, and at last died, five hours after being bitten. He was not partially swollen round the place which was bitten, as is usual after the sting of a wasp or a bee; but his whole body was inflated, and there only appeared a red spot on the places where he had been stung.

Some days after, however, the same experiment was tried upon another dog, and even with more aggravated cruelty: yet the dog seemed no way affected by the wounds; but, howling a little when he received them, continued alert and well after them; and soon after was set at liberty, without showing the slightest symptoms of pain. So far was this poor creature from being terrified at the experiment, that he left his own master's house, to come to that of the philosopher, where he had received more plentiful entertainment. The same experiment was tried by fresh scorpions upon seven other dogs, and upon three hens; but not the smallest deadly symptom was seen to ensue. From hence it appears, that many circumstances, which are utterly unknown, must contribute to give efficacy to the scorpion's venom. Whether its food, long fasting, the season, or the nature of the vessels it wounds, or its state of maturity, contribute to or retard its malignity, is yet to be ascertained by succeeding experiment. In the trials made by our philosopher he employed scorpions of both sexes, newly caught, and seemingly vigorous and active. The successes of this experiment may serve to prove, that the feeling of its sting, owe their successes rather to accident than their own efficacy. They only happened to cure when their sting was no way dangerous; but in cases of actual malignity, they might probably be utterly unfervicable.

The scorpion of the tropical climates being much larger than the former, is probably much more venomous. Heilbigius, however, who refrained for many years in the east, assures us, that he was often stung by the scorpion, and never received any material injury from the wound; a painful tumor generally ensued; but he always cured it by rubbing the part with a piece of iron or stone, as he had seen the Indians practice before him, until the flesh became infensible. Seba, Moore, and Bofman, however, give a very different account of the scorpion's malignity; and assert, that, unless speedily relieved, the wound becomes fatal.

It is certain, that no animal in the creation seems endowed with such an irascible nature. They have often been seen, when taken and put into a place of security, to exert all their rage against the sides of the glass-vessel that contained them. They will attempt to sting a stick when put near them: and attack a mouse or a frog, while those animals are far from offering any injury. Maupertius put three scorpions and a mouse into the same vessel together, and they soon stung the little animal in different places. The mouse, thus assaulted, stood for some time upon the defensive, and at last killed them all, one after another. He tried this experiment, in order to see whether the mouse, after it had killed would eat the scorpions; but the little quadruped seemed satisfied with the victory, and even survived the severity of the wounds it had received. Wolkamer tried the courage of the scorpion against the large spider, and included several of both kinds in glass vessels for that purpose. The successes of this combat was very remarkable. The spider at first used all its efforts to entangle the scorpion in its web which it immediately began spinning; but the scorpion refused itself from the danger, by flinging its adversary to death: it soon after cut off, with its claws, all the legs of the spider, and then sucked all the internal parts at its leisure.—If the scorpion's skin had not been so hard, Wolkamer is of opinion that the spider would have obtained the victory; for he had often seen one of these spiders destroy a toad.

The fierce spirit of this animal is equally dangerous to its own species; for scorpions are the cruellest enemies to each other. Maupertius put about 100 of them together in the same glass; and they scarce came into contact when they began to exert all their rage in mutual destruction: there was nothing to be seen but one universal carnage, without any distinction of age or sex; so that in a few days there remained only 14, which had killed and devoured all the rest.

But their unnatural malignity is still more apparent in their cruelty to their offspring. He included a female scorpion, big with young, in a glass vessel, and she was seen to devour them as fast as they were excluded: there was but one only of the number that escaped the general destruction, by taking refuge on the back of its parent; and this soon after revenged the cause of its brethren, by killing the old one in its turn.

Such is the terrible and unrelenting nature of this insect, which neither the bonds of society nor of nature can reclaim: it is even affected, that, when driven to any extremity, the scorpion will often destroy itself. The following experiment was intentionally tried by Maupertius: "But," says Mr Goldsmith, "I am too well assured of it by many eye-witnesses, who have seen it both in Italy and America, that I have no doubt remaining of its veracity. A scorpion, newly caught,
Fig. 1. *Scaplepus Phaenopis* or Whimbrel

Fig. 2. *Scaplepus Rapio* or Woodcock

Fig. 3. *Scaplepus Vergula* or Grey Squirrel in a flying posture

Fig. 4. *Scaplepus Squirrel* or Sailing Squirrel
is placed in the midst of a circle of burning charcoal and thus an egress prevented on every side: the scorpion, as I am assured, runs for about a minute round the circle, in hopes of escaping; but finding that impossible, it bites itself on the back of the head; and in this manner the undaunted fulcle indefinitely expires.”

It is happy for mankind that these animals are thus defructive to each other; since otherwise we would multiply in so great a degree, as to render some countries uninhabitable. The male and female of this insect are very easily distinguishable; the male being smaller and less hairy. The female brings forth her young alive, and perfect in their kind. Redi having brought a quantity of scorpions, selected the females, which, by their size and roughness, were easily distinguishable from the rest, and putting them in separate glafs vessels, he kept them for some days without food. In about five days one of them brought forth 38 young ones, well-shaped, and of a milk-white colour, which hatched vessels.

Another female, in a different vessel, brought forth 27 of the same colour, and the day following the young ones seemed all fixed to the back and belly of the female. For near a fortnight all these continued alive and well; but afterwards some of them died daily; until, in about a month, they all died except two.

Were it worth the trouble, these animals might be kept living as long as curiosity should think proper. Their chief food is worms and insects; and upon a proper supply of these, their lives might be lengthened to their natural extent. How long that may be, we are not told; but if we may argue from analogy, it cannot be less than seven or eight years; and perhaps, in the larger kind, double that duration. As they are somewhat the form of caterpillars, the sign of Scorpio, which is cultivated in the garden of this country, both for culinary and medicinal purposes. The root is carrot-shaped, the thick stems are covered with a dark brown skin, and has a milky juice. The plant rises three feet high, is smooth, branching at the top, and garnished with a few narrow leaves, whose bâres half embrace the stalk. The flowers are of a bright yellow colour, and terminate the stalks in feally emplacements composed of many narrow tongue-shaped hermaphrodite florets lying imbricatim over each other like the scales of a fish, and are of a bright yellow colour. After these are decayed, the germ, which fits in the common emplacements, turns to oblong cornered seeds, having a roundish ball of feathered down at the top. This plant is propagated by seeds; and must be carefully thinned and kept free from weeds, otherwise the plants will be weak.

The roots of scorzonera were formerly much celebrated for their alepharmic virtues, and for throwing out the small-pox; but now almost entirely left their character; however, as they abound with an acid juice, they may sometimes be of use for strengthening the vitæra, and promoting the fluid secretions.

SCOT, a customary contribution laid upon all subjects, according to their abilities. Whoever were afflicted in any sum, though not in equal proportions, were said to pay foot and lot.

Scor (Michael) of Balwitre, a learned Scottish author of the 15th century. This singular man made the tour of France and Germany; and was received with some distinction at the court of the emperor Frederick II. Having travelled enough to gratify his curiosity or his vanity, he returned to Scotland and gave himself up to study and contemplation. He was skilled in languages; and, considering the age in which he lived, was no mean proficient in philosophy, mathematics, and medicine. He translated into Latin from the Arabic, the history of animals by the celebrated physician...

S C O

Nova Scotia.

Scot, man Agricola. He published the whole works of Athanasius, with notes, and added much to reason on the principles of that great philosopher. He wrote a book concerning The Secrets of Nature, in which he treats of generation, phlogiston, and the signs by which we judge of the temperaments of men and women. We have also a tract of his On the Nature of the Sun and Moon. He there speaks of the grand operation, as it is termed by alchemists, and is exceedingly solicitous about the projected powder, or the philosopher's stone. He likewise published what he calls Magia Philosofica, a treatise replete with astrology and chiroancy. He was much admired in his day, and was even suspected of magic; and had Roger Bacon and Cornelius Agrippa for his panegyrists.

Scot (Reginald), a judicious writer in the 16th century, was the younger son of Sir John Scot of Scot's-hall, near Smeeth in Kent. He studied at Hart-hall in the university of Oxford; after which he retired to Smeeth, where he lived a floridus life, and died in 1599. He published, The perfect platform of a Hop-garden; and a book entitled, The Discovery of Witches; in which he showed that all the relations concerning magicians and witches are chimerical. This work was not only censured by King James I. in his Demesneology, but by several eminent divines; and all the copies of it that could be found were burnt.

 Scot, or Scotia, is where any officer of a forest keeps an house within the forest, by colour of his office, making people come to his house, and there spend their money for fear of his displeasure. We find it mentioned in the charter of the forest, cap. 8. "Nullus forestarius faciat Scoto, vel garbas coligat, vel aliquam collectam faciam." See Manwood, 216.

—The word is compounded of fest and ale, and by transposition of the words is otherwise called alebou.

SCOTER. See Ana., no. 6.

Nova Scotia, or New Scotland, one of the British settlements in North America, situated between 43° and 49° north latitude, and between 60° and 67° west longitude, is bounded by the river St. Lawrence on the north; by the gulf of St. Lawrence and the Atlantic ocean on the east; by the same ocean on the south; and by Canada and New England on the west. —In the year 1764, this province was divided into two governments. The province and government now styled New Brunswick is bounded on the westward of the mouth of the river St. Croix, by the said river to its source; and by a line drawn due north from thence to the southern boundary of the province of Quebec, to the northward by the said boundary as far as the western extremity of the Bay de Chaleur, to the eastward by the said bay to the gulf of St. Lawrence to the bay called Bay Vert, to the south by a line in the centre of the bay of Fundy, from the river St. Croix aforesaid, to the mouth of the Minquaut river, by the said river to its source, and from thence by a due east line across the Minquaut into the Bay Vert, to join the eastern lot above described, including all islands within six leagues of the coast.

The chief rivers are, the river of St. Lawrence, which forms the northern boundary. The rivers Rigoche and Nipiguit run from west to east, and fall into the bay of St. Lawrence. The rivers of St. John, Palla-maquadi, Penobscot, and St. Croix, which run from north to south, fall into Fundy Bay, or the sea a little to the eastward of it.

The seas, adjoining to it, are, the Atlantic ocean, Fundy Bay, and the gulf of St. Lawrence. The left bays are, Chenigio and Green Bay upon the isthmus which join the north part of Nova Scotia to the south; and the Bay of Chaleur on the north-east; the Bay of Chedabucto on the south-east; the Bay of the Islands, the Ports of Bart, Chebequi, Porters, St. Margaret, La Hève, port Malfois, port Rydial, port Vert, and port Joly, on the south; port La Tour on the south-east; port St. Mary, Annapolis, and Minas on the south side of Fundy Bay, and port Rofeway, now the most populous of all. —The chief capes are, Cape Portage, Ecomenac, Tourmentin, Cape Port, and Eps, on the east; Cape Fogerie and Cape Cancean on the south-east; Cape Blanco, Cape Vert, Cape Theodore, Cape Dore, Cape La Hève, and Cape Negro, on the south; Cape Sable and Cape Fourche on the south-west.—The lakes are very numerous, but have not yet received particular names.

The face of the country, when viewed at a distance, presents a pleasingly variegated appearance of hills and valleys, with scarcity anything like mountains to interrupt the prospect, especially near the sea. A nearer approach discovers those sublime and beautiful sceneries which are so far superior to the gaudy embellishments of art. Immense forests, formed of the tallest trees, the growth of ages, and returning almost to the clouds, everywhere cover and adorn the land: Those leaves falling in autumn, add continually to that crust of moss, vegetables, and decaying wood, that has for many centuries been accumulating; whilst the rays of the sun, unable to pierce the thick shade which everywhere covers the ground, leaves it in a perpetual state of damp and rottenness; a circumstance which contributes, in no small degree, to increase the sharpness of the air in winter.

The clouds, flying over the higher grounds, which are covered in every direction with one vast forest, and arrested by the attraction of the woods, fill the country with water. Every rock has a spring, and every spring causts a swamp or morass, of greater or less extent in proportion to its cause; hence it is, that travelling becomes almost impracticable in summer, and is seldom attempted, but in the fall of the year, when winter begins to set in, and the ground is already frozen.

The land throughout the peninsula is in no part mountainous, but frequently rises into hills of gradual ascent, everywhere cloathed with wood. From these arise innumerable springs and rivulets, which not only fertilize and adorn the country, but have formed, in the midst of it, a large lake or piece of fresh water, which is of various depths, and of which, however, little more is known, than that it has upon its borders very large tracts of meadow-land highly improvable. That part of the province which is beyond the Bay of Fundy, and extends to the river St. Lawrence, rises alto gradually as we advance from the sea quite to Canada, but is, however, hardly anywhere mountainous. Its lands are for the most part very rich, particularly at a distance from the sea; and its woods abound with the hardiest and leftiest trees.

Though this country, like Canada, is subject to long
and severe winters, succeeded by sudden and violent
heats, often much greater than what are felt in the same
latitudes in Europe; yet it cannot be accounted an un-
healthy climate. The air in general in winter is very
sharp, frosty, and dry; the sky serene and unclouded,
by which every kind of exercise adapted to the season
is rendered pleasant and agreeable. The fogs are fre-
quent near the sea, but seldom spread themselves to
any distance inland.

The winter commonly breaks up with heavy rains,
and the inhabitants experience hardly any of the de-
lights of the spring, which in England is accounted the
most agreeable season of the year. From a lifeless and
drearly appearance, and the gloomy scenes of winter
wrapped around the vegetable world, the country
throws off its diffiultful attire, and in a few days exhi-
bits a grand and pleafant prospect; the vegetation be-
ing inconceivably rapid, nature paifes suddenly from one
extreme to another, in a manner utterly unknown to
countries accustomed to a gradual progression of fea-
sons. And, strange as it may appear, it is an acknow-
dledged fact which furnishes a certain proof of the
purity of the air, that these sudden changes seldom, if
ever, affect the health of strangers or Europeans.

In this country agriculture has yet made but small
progress. Nova Scotia is almost a continued forest,
producing every kind of wood which grows in the
neighbouring states of New England. Four-fifths of
all the lands in the province are covered with pines,
which are valuable not only for furnishing masts, spars,
lumber for the sugar plantations, and timber for build-
ing, but for yielding tar, pitch, and turpentine, com-
modities which are all procured from this useful tree,
and with which the mother-country may in a few years
easily be supplied.

All the various species of birch, beech, and maple,
and several sorts of spruce, are found in all parts in
great abundance; as also numerous herbs and plants,
either not common to, or not known in, England.
Amongst these none is more plentiful than Farfparilla,
and a plant which both relishes rhubarb in colour,
taste, and effects; likewise the Indian or moontea,
and maize-hair, an herb much in repute for the fame
purposes, with shrubs producing strawberries, raspberries,
and many other piantant fruits, with which the woods
in summer are well fored: Of these wild productions
the cherries are best, though smaller than ours, and
-growing in bunches somewhat resembling grapes. The
faafafras tree grows plentifully in common with others;
but amongst them none is more useful to the inhabi-
tants than a species of maple, distingufhing by the name
of the Sugar tree, as affording a considerable quantity
of that valuable ingredient. See Sugar.

Amongst the natural productions of Nova Scotia, it
is necessary to enumerate their iron-ore, which it is
supposed equally good with that found in any part
of America.

Lime-tine is likewise founid in many places: it is
extremely good, and is now much used for building;
indepedent of which, it gives the farmers and land-
holders a great advantage for improving the ground,
as it is found by experience to be one of the most
approved things in the world for that purpose.

Several of the useful and most common European
fruits have been planted in many places; so that the
province now produces great quantities of apples, some
pears, and a few plums, which are all good of their
kind, especially the former. The smaller fruits, such
as currants, gooseberries, &c. grow to as great perfec-
tion as in Europe; and the same may be said of all the
common and useful kinds of garden plants. Among
these their potatoes have the preference, as being the
most serviceable in a country abounding with fish; and
indeed they are not to be exceeded in goodness by any
in the world. The maize, or Indian corn, is a native
of much warmer climates; and, though planted here,
ever arrives at more than two-thirds of its natural
degree; a defect which arises as well from the short-
ness of the summer as the gravelly nature of the soil.
Tobacco may likewise be cultivated with ease in Nova
Scotia, as it is already everywhere in Canada, from
Lake Champlain to the line of Orleans, for the purpose
of internal consumption.

This country is not deficient in the animal produc-
tions of the neighbouring states, particularly deer, bea-
ves, and others. Wild fowls, and all manner of game,
and many kinds of European fowls and quadrupeds,
have from time to time been brought into it, and
thrive well. At the close of March the fish begin to
spawn, when they enter the rivers in fuch fhrds as are
incredible. Herrings come up in April, and the sturgeon
and salmon in May. But the most valuable appen-
dage of New Scotland is the Cape Sable coast, along
which is one continued range of cod-fishing banks and
excellent harbours. This fishery employs a great num-
ber of men, in some fefons not lefs than 10,000, when
120,000 quintals will be caught, of which 40,000 may
be exported. These, at the lowest price, must bring
into the colony £26,000 Sterling, either in cattle or in
commodities necessary to the inhabitants.

Notwithstanding the comparatively uninviting ap-
pearance of this country, it was here that some of the
first European settlements were made. The first grant
of lands in it was given by James I. to his secretary Sir
William Alexander, from whom it had the name of
New Scotia or New Scotland. Since that period it has
frequently changed hands from one private proprietor
to another, and from the French to the English nation
backward and forward.

It was in 1604 that the French first fettled in Nova
Scotia, to which they gave the name of Acadia. In
stead of fixing towards the east of the peninsula, where
they would have had larger seas, an easy navigation,
and plenty of cod, they chose a small bay, afterwards
called French Bay, which had none of these advantages.
It has been faid, that they were invited by the beauty
of Port Royal, where a thousand ships may ride in safety
from every wind, where there is an excellent bottom,
and at all times four or five fathoms of water, and
eighteen at the entrance. It is more probable that the
founders of this colony were led to choose this situation,
from its vicinity to the countries abounding in furs, of
which the exclusive trade had been granted to them.

This conjecture is confirmed by the following circum-
fance: that both the first monopolizers, and those
who succeeded them, took the utmost pains to divert
the attention of their countrymen, whom an unsettled
dispofition, or necessity, brought into these regions,
from the clearing of the woods, the breeding of cattle,
fishing, and every kind of culture; choosing rather to
engage...
engage the industry of these adventurers in hunting or in trading with the savages.

This colony was yet in its infancy when the settlement, which has since become so famous under the name of New England, was first established in its neighbourhood. The rapid success of the plantations in this new colony did not much attract the notice of the French. This kind of prosperity did not excite any jealousy between the two nations. But when they began to suspect that there was likely to be a competition for the beaver trade and furs, they endeavoured to secure to themselves the sole property of it, and were unfortunate enough to succeed.

At their first arrival in Acadia, they had found the peninsula, as well as the forests of the neighbouring continent, peopled with small savage nations, who went under the general name of Abnaki. Though equally fond of war as other savage nations, they were more formidable in their manners. The millionaires easily intimidated themselves among them, had so far inculcated their tenets, as to make enthusiasts of them. At the same time that they taught them their religion, they inspired them with that hatred which they themselves entertained for the English name. This fundamental article of their new worship, being that which made the strongest impression on their fentiments, and the only one that favoured their passion for war, they adopted it with all the rage that was natural to them. They not only refused to make any kind of exchange with the English, but also frequently disturbed and ravaged the frontiers of that nation.

This produced perpetual hostilities between the New Englanders and the French settlers in Acadia, till that province was, at the peace of Utrecht, for ever ceded to the English, who seemed not for a long time to discover the value of their new acquisition. They referred to it its ancient name of Nova Scotia; and having built a fortress at Port-Royal, which they called Annapolis in honour of Queen Anne, they contended themselves with putting a very small garrison into it. In process of time, however, the importance of Nova Scotia to the commerce of Great Britain began to be perceived; and at the peace of 1749, the ministry offered particular advantages to all persons who chose to go over and settle in Acadia. Every soldier, sailor, and workman, was to have 50 acres of land for himself, and ten for every person he carried over in his family. All non-commissioned officers were allowed 80 for themselves, and 15 for their wives and children; ensigns 200; lieutenants 300; captains 400; and all officers of a higher rank 600; together with 30 for each of their dependents. The land was to be tax free for the first ten years, and never to pay above one livre and a sous six deniers* for fifty acres. Besides this the government engaged to advance or reimburse the expenses of passage, to build houses, to furnish all the necessary instruments for fishery or agriculture, and to defray the expenses of subsistence for the first year. These encouragements determined 3750 persons, in the month of May 1749, to go to America, in hopes of bettering their fortune.

Thus encouraged, the province of Nova Scotia began to flourish, though in 1769 it sent out only 14 vessels and 148 boats, which together amounted to 7324 tons, and received 22 vessels and 120 boats, which together made up 7006 tons. They constructed three floops, which did not exceed 110 tons burden. Their exportation for Great Britain and for the other parts of the globe did not amount to more than 729,850 livres 12 sous 6 deniers. Continuing, however, true to its allegiance when the other colonies threw of the dominion of Great Britain, it has now become a place of great consequence both to the mother-country and the West Indies. Its shipping and seamen are rapidly increasing, as well as its produce, which affords the pleasing prospect of being able to supply itself with all the necessaries of life. The number of persons who have abandoned their habitations in the more southern states, and settled either there or in Canada, cannot be estimated, by the most moderate calculation, at less than 80,000; and it is without doubt the most convenient in point of situation of any province in America for a maritime power of Europe to be possessed of.

Scotland, in architecture, a semicircular cavity or channel between the tiers in the bays of columns. SCOTISTS, a sect of school-divines and philosophers, thus called from their founder J. Duns Scotus, a Scotch cordelier, who maintained the immaculate conception of the virgin, or that she was born without original sin, in opposition to Thomas Aquinas and the Thomists.

As to philosophy, the Scotists were, like the Thomists, Peripatetics (see PERIPATETICS); only distinguished by this, that in each being, as many different qualities as it had, so many different formalities did they distinguish; all distinct from the body itself, and making as it were so many different entities; only these were metaphysical, and as it were superradicalized to the being. The Scotists and Thomists likewise disagreed about the nature of the divine co-operation with the human will, the measure of divine grace that is necessary to salvation, and other abstruse and minute questions, which it is needless to enumerate.

Scotland, the country of the Scots, or that part of Great Britain lying to the north of the Tweed; is situated between the 54th and 59th degrees of north latitude, and extends in length about 278 miles, and in some places near 180 in breadth; containing an area of 27,794 miles. On the south it is bounded by England; on the north, eait, and west, by the Dene-cladonian, German, and Irish seas. It is extremely difficult to give any satisfactory account of the origin of the appellation of Scots, from the name, which the country has derived its name. It has puzzled the most eminent antiquaries, whose conjectures serve rather to perplex than to clear up the difficulty. Nor is this to be wondered at, when Varro and Dionysius could not agree about the etymology of Italic, nor Plutarch and Salinas about that of Rome. All that we know with any degree of certainty, concerning the appellation of Scot, amounts to this—that it was at first a term of reproach, and consequently framed by enemies, rather than assumed by the nation distinguished by that name. The Highlanders, who were the genuine descendants of the ancient Scots, are absolutely strangers to the name, and have been so from the beginning of time. All those who speak the Gaelic language call themselves Albanach or Gael, and their country Alba or Gaeldom.
ers, and in a latter period also the more southerly division of North Britain, were at first more powerful than the Caledonians of the west. It is therefore probable, that the Picts, from a principle of malevolence and pride, were ready to traduce and ridicule their weaker neighbours of Argyle. These two nations spoke the same language, the Gaelic. In that language Scot, or Scots, signifies a corner or small division of a country. Accordingly, a corner of North Britain is the land of the ancient Scots, before the annexation of Pictavia, comprehended all that side of Caledonia which lies along the north and western ocean, from the frith of Clyde to the Orkneys. Towards the east, their dominions were divided from the Pictish territories by those high mountains which run from, Dumbarton to the frith of Tain.—In process of time the Scots, under the reign of Kenneth the son of Alpin, became so powerful as to subdue entirely their neighbours the Picts, and gave their own denomination to all Caledonia, Pictavia, and Valency; all which are still comprehended under the general name of Scotland.

Like those of all other nations, the historians of Scotland assume too great an antiquity for their countrymen; however, they are much less extravagant in this respect than many others. By them the reign of Ferugus the first Scots monarch, is placed in 330 B. C. He was the son of Ferchard an Irish prince; and is said to have been called into Scotland by the Caledonians, to affult them against the southern Britons, with whom they were then at war. Having landed on one of the Eubuds or western isles, he had a conference with the Caledonians, whose language and manners he found to be the same with those of his countrymen. Having then landed in Scotland, and taken the field at the head of his new allies, he engaged the Britons under their king Colius. Victory declared in favour of the Scots; Colius was defeated and killed; and from him the province of Kyle first received its name. After this Fergus was declared king of the Scots, with the solemnity of an oath. But he did not long enjoy his new dignity: for having been recalled to Ireland to quiet some commotions there, he was drowned, by a sudden tempest, on his return, at a place in Ireland called from him Knock-Fergus, or Carrick-Fergus; i.e. Fergus’s Rock. Ferugus was succeeded by his brother Feritharis, to the prejudice of his two sons, Ferlegus and Mainus. This, we are told by the ancient Scotch writers, was done in conformity to a law, by which it was ordained, that whilst the children of their kings were infants, one of their relations who was reckoned the most fit for the government should be raised to the throne, but that after his death the sovereignty should return to the sons of the former king. This was the case at present; however, Ferlegus, impatient for the crown, made a formal demand of it from his uncle. The dispute being referred to an assembly of the states, Feritharis was confirmed on the throne; and Ferlegus would have been condemned for sedition, had not his uncle interposed. However, he was imprisoned; but having made his escape, he fled first to the Picts, and then to the Britons, in order to excite them against Feritharis. With both he failed in accomplishing his purpose; but, in the mean time, his uncle being stabbed in his bed, the suspicion fell upon Ferlegus, who was thereupon set aside from the succession, and died in obscurity, the throne being conferred upon his brother Mainus.

The reigns of Mainus, Dornadill, and Nothadh, afford nothing remarkable, excepting that Dornadill, who was a great hunter, instituted the laws of hunting in his country. Nothadh was killed in a battle with Reuther his nephew; upon which the latter was immediately invested with the sovereignty. A bloody war ensued, in which both parties were reduced to the last extremity, and glad at length to conclude a peace. The fate of Reuther is not known; but it is generally supposed that he ended his life in the year 187 B. C.

The reigns of Reuther, Thereus, Jailna, and Finnan, afforded...
Scotland. afford no remarkable transactions, excepting that un-der the lalt we find the first beginnings of the Scott-ishe parliament; as he enacted, that kings should do nothing without the consent of their grand council. After him followed Durnius, Even, and Gillius, whose reigns afford nothing of consequence. Even II. the nephew of Finnan, who succeeded Gillius, is said to have built the towns of Inverlochy and Inverness. He overcame Belus king of the Orkneys, who had invaded Scotland; and was succeeded by his son Eder, in whose time Julius Cæsar invaded the southern parts of Britain. Eder is said to have affiled the Britons against the common enemy. He was succeeded, after a reign of 48 years, by his son Efin. who is re-presented as a monter of cruelty and luft. Not content with having 100 noble concubines of his own, he made a law that a man might marry as many wives as he could maintain; and that the king should have the first night with every noble bride, and the nobles the like with the daughters of their tenants. Nor was he less remarkable for his cruelty and rapacity, which, at that time the inhabitants formed a great council to receive him. Tacitus has given us a speech of Galgacus, which he has undoubtedly fabricated for him, to the Romans that they had hitherto received. This, Galgacus resolved to attack the Romans. The Romans, however, certainly advanced very consider-ably, and the Scots as constantly retreated, till they came to the foot of the Grampian mountains, where the enemy could not follow them. In the eighth year of the war, Agricola advanced to the centre, but, the Britons endeavouring to dexterously manage their bucklers, their bucklers terminating in a point, to attack the Romans, who had the advantage, by the dexterous management of their bucklers: but Agricola having ordered three Tuscanian and Argyle, which at that time was inhabited by a people called Cang, though some historians place there as far south as Chefield in England, and the north part of Wales. This supposition, however, can scarcely be admitted, when we consider that Tacitus expressly informs us, that the people whom Agricola conquer-ed had never before been known to the Romans. Agricola still pursued the same prudent measures by which he had already secured the possession of such a large tract of country, that is, advancing but slowly, and building forts as he advanced, in order to keep the people in obedience. The Scots, though commanded by their king, who is said to have been well acquainted with the manner of fighting and discipline of the Romans, were yet obliged to retreat; but at last, finding that the enemy made such progress as endangered the subjugation of the whole country, he resolved to cut off their communication with the southern parts, and likewise to prevent all possibility of a retreat by sea. Agricola, though solicited by some of his officers, refused to retreat; but divided his troops into three bodies, having a communication with each other. Upon this, Galgacus resolved to attack the weakest of the three, which confined only of the ninth legion, and lay at that time, as is said, at a place called Lochore, about two miles from Loch-Leven in Fife. The at-tack was made in the night: and as the Romans were both unprepared and inferior in number, the Scots penetrated into the heart of their camp, and were making a great slaughter, when Agricola detached some light-armed troops to their assistance; by whom the Caledonians in their turn were routed, and forced to fly to the marches and inaccessible places, where the enemy could not follow them. This engagement has been magnified by the Roman historians into a victory, though it can scarce be admitted from the testimonies of other historians. The Romans, however, certainly advanced very consider-ably; and the Scots as constantly retreated, till they came to the foot of the Grampian mountains, where the enemy could not follow them. By the eighth year of the war, Agricola advanced to the foot of the mountains, where he found the enemy ready to receive him. Tacitus has given us a speech of Galgacus, which he has undoubtedly fabricated for him, in which he sets forth the aspiring disposition of the Romans, and encourages his countrymen to defend themselves vigorously, as knowing that every thing valuable was at stake. A desperate engagement accordingly ensued. In the beginning, the Britons had the advantage, by the dexterous management of their bucklers: but Agricola having ordered three Tuscanian and two Batavian cohorts, armed with short swords, and embossed bucklers terminating in a point, to attack the Scots, who were armed with long swords, the latter soon found these weapons useless in a close encoun-ter; and as their bucklers only covered a small part of their bodies, they were easily cut in pieces by their adversaries. The most forward of their cavalry and charioteers fell back upon their infantry, and disor-dered the centre: but, the Britons endeavouring to out-flank their enemies, the Romans general opposed them with his horse; and the Caledonians were at last routed with great slaughter, and forced to fly into the woods, whether the Romans pursued with so little caution, that numbers of them were cut off. Agricola, however, having ordered his troops to proceed more regulariy, prevented the Scots from attacking and cut-ting off his men in separate parties, as they had expect-ed: so that this victory proved the greatest stroke to the Caledonians that they had hitherto received. This battle is supposed by some to have been fought in Strath-earn, half a mile south from the kirk of Comrie; but others imagine the place to have been near Fortingal-Camp, a place somewhat farther on the other side of the Tay.

Great as this victory was, it seems not to have been pro-
Scotland.

productive of any fold or lasting advantage to the Romans; since we find that Agricola, instead of putting an end to the war by the immediate conquest of all Caledonia, retreated into the country of the Forét, commonly supposed to be Forfarshire, though others imagine it to have been the county of Fife. Here he received hostages from part of the Caledonians; and ordered part of his fleet to sail round Britain, that they might discover whether it was an island or a continent. The Romans no sooner had left that part of the country, than the Caledonians demolished all the forts they had raised: and Agricola being soon after recalled by Domitian, the further progress of the Roman arms was stopped; Caligauus proving superior to any of the successors of that general.

From the time of Agricola to that of Adrian, we know little of the affair of Scotland, excepting that during this interval the Scots must have entirely driven the Romans out of their country, and reconquered all that tract which lay between Agricola's chain of forts and Carlisle on the west, and Newcastle or Tynemouth on the east; which Adrian, on visiting Britain, thought proper to fix as the northern boundary of the Roman dominions. Here he built a wall of turf between the mouth of the Tine and the Solway frith, with a view to shut out the barbarians; which, however, did not answer the purpose, nor indeed could it be thought to do so, as it was only built of turf, and guarded by no more than 18,000 men, who could not be supposed a sufficient force to defend such an extent of fortification.

On the departure of Adrian, he left Julius Severus as his lieutenant: but this man, though one of the greatest commanders of his age, did not carry his arms to the northward of Adrian's wall; and this long interval of peace gave to much security to Mogold the Scottith monarch, that he degenerated into a tyrant, and was murdered by some of his noblemen. The only instance of his tyranny which is produced, however, is a law by which it was enacted, that the estates of such as were condemned should be forfeited to his exchequer, without any part thereof being allotted to their wives and children; an act which subverts almost in its full force to this day in Great Britain and the best regulated European governments.

In the reign of Antoninus Pius, the propraetor Lollius Urbius drove the Scots far to the northward, and repaired the chain of forts built by Agricola, which lay between the Carron on the frith of Forth and Dunglaes on the Clyde. These were joined together by turf walls, and formed a much better defence than the wall of Adrian. However, after the death of Antoninus, Commodus having recalled Calpurnius Agricola, an able commander, who kept the Scots in awe, a more dangerous war broke out than had ever been experienced by the Romans in that quarter. The Scots having paffed the wall, put all the Romans they could meet with to the sword: but they were soon repulsed by Ulpius Marcellus, a general of consummate abilities, whom Commodus sent into the island. In a short time the tyrant also recalled this able commander. After his departure, the Roman discipline in Britain suffered a total relaxation; the soldiery grew mutinous, and great disorders ensued: but these were all happily removed by the arrival of Claudius Albinus, a person of great skill and experience in military affairs. His presence for some time restrained the Scots within proper bounds; but a civil war breaking out between him and Severus, Albinus crossed over to the continent with the greatest part of the Roman forces in Britain; and meeting his antagonist at Lyons, a dreadful battle ensued, in which Albinus was utterly defeated, and his army cut in pieces. See Rome, n° 375.

The absence of the Roman forces gave encouragement to the Scots to renew their depredations, which they did with such success, that the emperor became apprehensive of losing the whole island; on which he determined to go in person and quell these troublesome enemies. The army he collected upon this occasion was far more numerous than any the Romans had ever sent into Britain; and being commanded by such an able general as Severus, it may easily be supposed that the Scots must have been very hard pressed. The particulars of this important expedition are very imperfectly related; however, we are assured that Severus lost a vast number of men, it is said not less than 50,000, in his march through Scotland. Notwithstanding, being penetrated, it is said, to the most northern extremity of the island, and obliged the enemy to yield up their arms. On his return, he built a much stronger fortification to secure the frontiers against the enemy than had ever been done before, and which in some places coincided with Adrian's wall, but extended farther at each end. But in the mean time, the Scots, provoked by the brutality of the emperor's son Caracalla, whom he had left regent in his absence, again took arms: on which Severus himself took the field, with a design, as it would seem, to extirpate the whole nation; for he gave orders to his soldiery "not to spare even the child in the mother's belly." The event of his furious declaration is unknown; but in all probability the death of the emperor, which happened soon after, put a stop to the execution of this revenge; and it is certain that his son Caracalla, who succeeded Severus, ratified the peace with the Scots.

During all these important transactions, Scotland was governed by Donald I., who is said to have been the first Christian king of this country. From him to the time of Eugene I., no remarkable occurrence offers; but under the latter, the Roman and Pictish forces were united against the Scots. The Picts were commanded by their king, named Haryuff; and the Romans by Maximus, who murdered Valentinian III., and afterwards assumed the empire. The allies defeated Eugene in the county of Galloway; but Maximus being obliged to return southward on account of an insurrection, the Picts were in their turn defeated by the Scots. Next year, however, Maximus marched against the Scots; who being now reduced to extremity, brought into the field not only all the men capable of bearing arms, but the women also. In this engagement the Picts would have been utterly defeated, had not they been supported by the Romans; but Eugene being killed, with the greatest part of his nobility, the Scots were defeated; and so well did the conquerors improve their victory, that their antagonists were at last totally driven out of the country. Some of them took refuge in the Æbude islands, and some in Scandinavia and Ireland, from whence they made frequent descents upon Scotland. The Picts were at first mightily pleased with
with the victory they had gained over their antagonists; but being commanded to adopt the laws of the Romans, and to choose no king who was not sent them from Rome, they began to repent of their having contributed to the expulsion of the Scots; and in the year 421, when Atualphus king of the Goths sent over a body of exiled Scots to Britain, under Fergus, a descendant of the royal family of Scotland, the Picts immediately joined them against the common enemy. The consequence of this was, that the Britons were pulled to the last extremity; and the Romans being obliged, on account of the inundation of northern barbarians who poured in upon them, to recall their forces from Britain, the inhabitants were reduced to the most miserable situation that can be imagined. In the time of Fergus II. they were obliged to give up all the country which lies to the north of Adrian's wall; and the reign of Grimus or Graham, the successor of Fergus, they were obliged to write that remarkable letter to Rome, intituled, "The groans of the Britons." This, however, not being attended with success, the Britons were obliged to call in the Saxons to their assistance. By these new allies the Scots were defeated in a great battle, and their king (Eugene) drowned in the river Humber; which put a stop for some time to these incursions.

Hitherto we have seen the Scots very formidable enemies to the southern Britons. But when the Saxons became the enemies of the Britons, the Scots joined in a strict alliance with the latter; and the famous king Arthur is said to have been affiliated by the Scots in all his battles with the Saxons; neither does it appear that this league was ever dissolved again, though the united efforts of the Scots and Britons were not sufficient to preserve the independency of the latter.

The next remarkable event in the history of Scotland is the war with the Picts, which took place in the ninth century. The occasion of the quarrel was, that Dongal king of Scotland pretended a right to the Pictish throne; which, however, was rejected by the Picts: upon which both parties had recourse to arms; but when every thing was ready for the campaign, Dongal was drowned in crossing the river Spey.

At this time the dominions of the Scots comprehended the western islands, together with the counties of Argyle, Knapdale, Kyle, Kintryre, Lochaber, and a part of Breadalbane; while the Picts possessed all the rest of Scotland, and part of Northumberland; so that the Picts seem to have been by much the most powerful people of the two. However, the Scots appear to have been superior in military skill; for Alpin, the successor of Dongal, having engaged the Pictish army near Forfar, after an obstinate engagement defeated them, and killed their king, though not without the loss of a great number of his own men. The Picts chose Brudus, the son of their former king, to succeed him; but soon after depo.sed and put him to death, on account of his stupidity and indolence. His brother Kenneth shared the same fate on account of his cowardice; till at last another Brudus, a brave and spirited prince, ascended the throne. Having raised a powerful army, he began with offering terms of peace to the Scots; which, however, Alpin rejected, and insisted upon a total surrender of his crown. Brudus on this endeavoured to procure the assistance of Edwin king of Northumberland. Edwin accepted the money; but pretending to be engaged in other wars, he refused the assistance which he at first promised. Brudus, not dismayed by this disappointment, marched resolutely against his enemies; and the two armies came to an engagement near Dundee. The superior skill of the Scots in military affairs was about to have decided the victory in their favour, when Brudus bethought himself of the following stratagem to preferve his army from destruction. He caused all the attendants, and even the women who attended his army, to assemble and show themselves at a distance as a powerful reinforcement coming to the Picts. This struck the Scots with such a panic, that all the efforts of Alpin could not recover them; and they were accordingly defeated with great slaughter. Alpin himself was taken prisoner, and soon after beheaded by order of the conqueror. This execution happened at a place now called Pit-alpine, but in former times Bu-ai-panor, which in the Gaelic language signifies the death of Alpin. His head was afterwards stuck upon a pole, and exposed on a wall.

Alpin was succeeded by his son Kenneth II. who being a brave and enterprising prince, resolved to take a more severe revenge for his father's death. The Scots, however, were so dispirited by their late defeat, that they were exceedingly averse to any renewal of the war; while, on the other hand, the Picts were so much elated, that they made a law by which it became death for any man to propound peace with the Scots, whom they resolved to exterminate; and some of the nobility were expelled the council on account of their opposition to this law. The consequence of this was, that civil dissensions took place among them, and a bloody battle was fought between the opposite parties, before the Scots had thought of making any further resistance.

By these distractions Brudus, who had in vain endeavoured to appease them, was so much affected, that he died of grief; and was succeeded by his brother Druisen.—The new prince also failed in his endeavours to accommodate the civil differences; so that the Scots, by gaining so much repose, at last began to recover from their consternation; and some of them having ventured into the Pictish territories, carried off Alpin's head from the capital of their dominions, supposing to have been Abernethy. In the mean time, Kenneth found means to gain over the nobility to his side by the following stratagem; which, however ridiculous, is not incredible, if we consider the barbarism and superstition of that age. Having invited them to an entertainment, the king introduced into the hall where they fept a person clothed in a robe made of the skins of felines, which made such a luminous appearance in the dark, that he was mistaken for an angel or some supernatural messenger. To add to the terror of those who saw him, he denounced, through a speaking trumpet, the most terrible judgments, if war was not immediately declared against the Picts, the murderers of the late king. In consequence of this celestial admonition, war was immediately renewed with great vigour. The Picts were not deficient in their preparations, and had now procured some assistance from England. The first battle was fought near Stirling; where the Picts, being defeated by their English auxiliaries, were utterly defeated. Druisen escaped by the swiftness...
After the conclusion of this treaty, so humiliating to the Scots, the Picts, finding that their interest had been entirely neglected, fled to Norway, while those who remained in England were massacred. Donald shared the common fate of unfortunate princes, being dethroned and shut up in prison, where he at last put an end to his own life in the year 858.—In justice to this unhappy monarch, however, it must be observed, that the character of Donald, and indeed the whole account of these transactions, rests on the credit of a single author, namely Boece; and that other writers represent Donald as a hero, and successful in his wars: but the obscurity in which the whole of this period of Scotch history is involved, renders it impossible to determine any thing satisfactory concerning these matters.

Donald was succeeded by his nephew Constatine, the son of Kenneth Mac Alpin, in whose reign Scotland was first invaded by the Danes, who proved such formidable enemies to the English. This invasion is said to have been occasioned by some exiled Picts who fled to Denmark, where they prevailed upon the king of that country to send his two brothers, Hungar and Hubba, to recover the Pictish dominions from Constance. These princes landed on the coast of Fife, and by the Danes, sparing even the ecclesiastics who had taken refuge in the island of May at the mouth of the Forth. Constatine defeated one of the Danish armies commanded by Hubba, near the water of Leven; but was himself defeated and taken prisoner by Hungar, who caused him to be beheaded at a place since called the Devil’s Cave, in the year 874.

This unfortunate action cost the Scots 10,000 men; but the Danes seem not to have purchased their victory very easily, as they were obliged immediately afterwards to abandon their conquests, and retire to their own country. However, the many Danish monuments that are still to be seen in Fife, leave no room to doubt that many bloody scenes have been acted here between the Scots and Danes before that above-mentioned.

Constatine was succeeded by his brother Liuthi, who, by his name the Swift-footed, from his agility. Concerning him we find nothing memorable; indeed the accounts are so confused and contradictory, that it is impossible to form any opinion of his actions.
to form any decisive opinion concerning the transi-
tions of this reign. All agree, however, that it was but 
short; and that he was succeeded by Gregory, the son 
of Dong-l, contemporary with Alfred of England, 
and that both princes deferredly acquired the name of Great. 
The Danes at their departure had left the Picts in pos-
lion of Picts. Against them Gregory immediately 
marched, and quickly drove them into the north of 
England, where their confederates were already matters 
of Northumberland and York. In their way thither 
they threw a garrison into the town of Berwick; but 
this was presently reduced by Gregory, who put to the 
sword all the Danes, but spared the lives of the Picts. 
From Berwick, Gregory pursu’d the Danes into North-
umberland, where he defeated them; and passed the 
winter in Berwick. He then marched against the 
Cumbrians, who being mostly Picts were in alliance 
with the Danes. Them he easily overcame, and 
oblige’d to yield up all the lands they had formerly pos-
sessed belonging to the Scots, at the same time that he agreed 
to protect them from the power of the Danes. In a 
short time, however, Conflantine the king of the Cumb-
rians violated the convention he had made, and invaded 
Annapda; but was defeated and killed by Gregory near Lochmaben. 
After this victory Gregory entirely 
reduced the counties of Cumberland and Westmoreland, 
which, it is said, were ceded to him by Alfred the Great; 
and indeed the situation of Alfred’s affairs at 
this time renders such a cession by no means impro-
vable.

We next find Gregory engaged in a war with the 
Irish, to support Donach, an Irish prince, against 
two rebellious noblemen. The Irish were the first 
aggressors, and invaded Galloway; but being repul-
sed with great loss, Gregory went over to Ireland 
in person, where the two chief men, who had been 
ennemies to each other before, now joined their forces 
in order to oppose the common enemy. The first 
engagement proved fatal to one of their chiefs named 
Brian, who was killed with a great number of his 
followers. After this victory Gregory reduced Dundalk 
and Drogheda. On his way to Dublin he was opposed 
by a chieftain named Coenred, who shared the fate of 
his confederate, being also killed, and his army entirely 
defeated. Gregory then became guardian to the young 
prince whom he came to aiffil, appointed a regency, and 
obliged them to swear that they would never admit 
into the country either a Dane or an Englishman with-
out his consent. Having then placed garrisons in the 
strongest fortresses, he returned to Scotland, where he 
built the city of Aberdeen; and died in the year 923, 
at his castle of Dundonore in the Garioch.

18

Gregory was succeeded by Donald III. the son of 
Conflantine, who imitated the virtues of his predeces-
sor. The Scots historians unanimously agree that Nor-
thumberland was at that time in the hands of their 
countrymen; while the English as unanimously affirm 
that it was subject to the Danes, who paid homage to 
Alfred. Be this as it will, however, Donald continued 
to live on good terms with the English monarch, and 
sent him a body of forces, who proved of considerable 
advantage to him in his wars with the Danes. The 
reign of Donald was but short; for having marched 
against some robbers (probably no other than the 
Danes) who had invaded and ravaged the counties of 
Murray and Rois, he died at Forres soon after, having 
defeated and subdued them in the year 903. He was 
succeeded by Conflantine III. the son of Edh the Swith-
footed, concerning whom the most remarkable particu-
lar we find related is his entering into an alliance 
with the Danes against the English. The occasion of 
this confederacy is said to have been, that the Eng-
lish monarch, Edward the Elder, finding the Scots 
in possession of the northern counties of England, made 
such extravagant demands upon Conflantine as obli-
ged him to ally with the Danes in order to preserve 
his dominations in security. However, the league sub-

diction of his holding it as fief of the crown of England, and affiling in defence of the northern border. Soon after the conclusion of this treaty Malcolm died, and was succeeded by his son Indulfus. In his reign the Danes became extremely formidable by their invasions, which they now renewed with greater fury than ever, being exasperated by the friendship for the Scots and English monarchs. Their first descent was upon East Lothian, where they were soon expelled, but crossed over to Fife. Here they were a second time defeated, and driven out; and so well had Indulfus taken care to guard the coasts, that they could not find an opportunity of landing; till having seemed to feer towards their own country, the Scots were thrown off their guard, and the Danes on a sudden made good their landing at Cullen, in Banffshire. Here Indulfus soon came up with them, attacked their camp, and drove them towards their ships, but was killed in an ambuscade, into which he fell during the pursuit. He was succeeded by Duffus, to whom historians give an excellent character; but, after a reign of five years, he was murdered in the year 965. He was succeeded by Cullen the son of Indulfus, who had been nominated prince of Cumberland in his father's lifetime, as heir-apparent to the throne. He is represented as a very degenere prince; and is said to have given himself up to enormities,ohnson the most incredible, being guilty of incontinence not only with women of all ranks, but even with his own sisters and daughters. The people in the mean time were feced, in order to support the extravagance and luxury of their prince. In consequence of this, an assembly of the states was convened at Scone for the resettling of the government; but on his way thither Cullen was assassinated, near the village of Methven, by Rohard, thane or thirff of Fife, whose daughter the king had debauched.

The provocations which Cullen had given to his nobility seem to have rendered them totally untractable and licentious; which gave occasion to a remarkable revolution in the reign of Kenneth III. who succeeded Cullen. This prince, being a man of great resolution, began with relieving the common people from the oppression of the nobility, which were now intolerable; and this plan he pursued with so much success, that having nothing to fear from the great barons, he ordered them to give up before him at Lanerc, but the greatest part, conscious of their demerits, did not attend. The king so well dismembered his disaffection, that those who came were quite charmed with his affability, and the noble entertainment he gave them; in consequence of which, when an assembly was called next year, the guilty were encouraged to appear as well as the innocent. No sooner had this assembly met, however, than the place of meeting was beset with armed men. The king then informed them that none had anything to apprehend excepting such as had been notorious offenders; and they he ordered to be immediately taken into custody, telling them, that their submitting to public justice must be the price of their liberty. They were obliged to accept the king's offer, and the criminals were accordingly punished according to their deserts.

About this time Edgar, king of England, finding himself hard pressed by the Danes, found means to unite the king of Scotland and the prince of Cumberland along with himself in a treaty against the Danes; which gave occasion to a report that Kenneth had become tributary to the king of England. This, however, is utterly denied by all the Scots historians; who affirm that Kenneth cultivated a good correspondence with Edgar, as well because he expected affiance in defending his coasts, as because he intended entirely to alter the mode of service to the throne. About this time the Danes made a dreadful invasion. Their original intention seems to have been to land on some part of the English coasts; but finding them probably too well guarded, they landed at Montrose in Scotland, committing everywhere the most dreadful ravages. Kenneth at that time was at Stirling, and quite unprepared; however, having collected a handful of troops, he cut off many of the enemy as they were straggling up and down, but could not prevent them from besieging Perth. Nevertheless, as the king's army constantly increased, he resolved to give the enemy battle. The scene of this action was at Loncarty, near Perth. The king is said to have offered ten pounds in silver, or the value of it in land, for the head of every Dane which should be brought him; and an immunity from all taxes to the fowlers who served in his army, provided they should be victorious; but, notwithstanding the utmost efforts of the Scots, their enemies fought so desperately, that Kenneth's army must have been totally defeated, had not the fugitives been stopped by a yeoman and his two sons of the name of Hay, who were coming up to the battle, armed with such rude weapons as their condition in life afforded. Buchanan and Boccus inform us, that these countrymen were ploughing in a field hard by the scene of action, and perceiving that their countrymen fled, they loosed their oxen, and made use of the yokes as weapons, with which they first obliged their countrymen to stand, and then annoyed their enemies. The fight was now renewed with such fury on the part of the Scots, that the Danes were utterly defeated; and, after the battle, the king rewarded Hay with the barony of Errol in the Carse of Gowrie, enabled his family, and gave them an armorial bearing alluding to the rustic weapons with which they had achieved this glorious exploit.

In the year 994, Kenneth was murdered at the instigation of a lady named Fenella, whose son had been castrated in death. The murder was perpetrated in Fenella's castle, where she had persuaded the king to pay her a visit. His attendants waited long near the place; but being at length tired out, they broke open the doors, and found the king murdered: upon which they laid the castle in ashes; but Fenella escaped by a stratagem. The throne was then seized by an usurper named Constantine; who, being killed in battle after a reign of a year and a half, was succeeded by Grime, the grandson of king Duffus; and he again was defeated and killed by Malcolm the son of Kenneth, the lawful heir of the Scottish throne. After this victory, however, Malcolm did not immediately assume the sovereignty; but asked the crown from the nobles, in consequence of a law passed in the reign of Kenneth, by which the succession to the throne of Scotland became hereditary. This they immediately granted, and Malcolm was accordingly crowned king. He joined himself in strict alliance with the king of England; and proved so successful against the Danes in England, that

[729]
The Scots defeated by the Danes.

Malcolm in the mean time was at hand with his army, and encamped at a place called Barr, in the neighbourhood of which both parties prepared to decide the fate of Scotland; for as Moray and the northern provinces again were already in the possession of the Danes, it was evident that a victory at this time must put them in possession of the whole. The engagement was desperate, and so bloody, that the rivulet which proceeds from Loch Tay is said to have had its water dyed with the blood of the slain; but at last the Danes gave way and fled. There was at that time in the army of Malcolm, a young prince of the name of Keith (a). He pursued them long, and having overtaken him, engaged and killed him; but another Scots officer coming up at the same time, disputed with Keith the glory of the action. While the dispute lasted, Malcolm came up; who suffered them to decide it by single combat. In this second combat Keith proved also victorious, and killed his antagonist. The dying person confessed the justice of Keith's claim; and Malcolm dipping his finger in his blood marked the shield of Keith with three strokes, pronouncing the words Veritas viniet, "Truth overcomes," which has ever since been the armorial bearing and motto of the family of Keith (b).

The shattered remains of the Danish forces reached their ships; but being driven back by contrary winds, and provisions becoming scarce, they put ashore 500 men on the coast of Buchan, to procure them some food; but their communication with the mainland was cut off, they fortified themselves as well as they could, and made a desperate resistance; but at last all was put to the sword. The place where this massacre happened is still called Crudane; being probably an abbreviation of Cruar Danorum, the blood of the Danes, a name imposed on it by the ecclesiastics of the day.

Sweyn, not yet discouraged, sent his son Canute, after the other kings of England, and one of the greatest war-invaders of that age, into Scotland, with an army more powerful than any that had yet appeared. Canute landed in Buchan; and, as the Scots were much weakened by such a long continued war, Malcolm thought proper to act on the defensive. But the Scots, who now thought themselves invincible, demanded to be led on to a general engagement. Malcolm complied with their desire, and a battle ensued; in which though neither party had much reason to boast of victory, the Danes were so much reduced, that they willingly concluded a peace on the following terms, viz. That the Scots should immediately depart Scotland; that as long as Malcolm and Sweyn lived, neither of them should wage war with the other; or help each other's enemies; and

(a) This prince is said to have commanded a colony of the Catti, a German nation who settled in the north-west part of Scotland, and from whom the county of Caithness takes its name.

(b) Mr Gordon, in his Itinerarium Septentrionale, observes, that in all probability the Scots gained two victories over the Danes on the present occasion: one near the place called Karboddo, already mentioned; and the other at Aberlemno, four miles from Brechin. At both places there are monuments with rude sculptures, erected most probably in memory of a victory. That at Karboddo is called "Camus's croft;" near which, somewhat more than a century ago, a large sepulchre, supposed to be that of Camus, was discovered. It consisted of four great stones; and in it was a huge skeleton, supposed to be that of the Danish prince. The fatal stroke seemed to have been given him on the back part of the head; a considerable portion of the skull being cut away, probably by the stroke of the sword.
Scotland.

and that the field in which the battle was fought
should be set apart and consecrated for the burial of
the dead. These stipulations were punctually fulfilled
by Malcolm, who built in the neighbourhood a chapel
dedicated to Olaus, the tutelar saint of these northern
nations.

After all these glorious exploits, and becoming the
second legislator in the Scottish nation, Malcolm is said
to have stained the latter part of his reign with avarice
and oppression; in consequence of which he was mur-
dered at the age of 80 years, after he had reigned above
30. This affassination was perpetrated when he was on
his way to Glamis. His own domestics are said to
have been privy to the murder, and to have fled along
with the conspirators; but in passing the lake of For-
far on the ice, it gave way with them, and they were
all drowned, their bodies being discovered some days
after. The latter part of this account is confirmed by
the sculptures upon some stones erected near the spot;
one of which is still called Malcolm's grave-stone; and
all of them exhibit some rude representations of the
murder and the fate of the affassins.

Malcolm was succeeded, in the year 1034, by his
grandson Duncan I, but he is said to have had another
grandson, the famous Macbeth; though some are of
opinion that Macbeth was not the grandson of Mal-
colm, but of Fenella who murdered Kenneth III. The
first years of Duncan's reign were passed in tranquillity,
but domestic broils soon took place on the following
occasion. Banquo, thane of Lochaber, and ancelor
to the royal family of Stuart, acted then in the capacity
of regent to Duncan, by collecting his rents; but
being very rigid in the execution of his office, he was
way-laid, robbed, and almost murdered. Of this outra-
ging Banquo complained as soon as he recovered of his
wounds and could appear at court. The robbers were
summoned to render themselves to justice; but in-
stead of obeying, they killed the messenger. Macbeth
represented this in such strong terms, that he was sent
with an army to reduce the insurgents, who had already
destroyed many of the king's friends. This commissi-
ion he performed with such success, that the rebel chief
put an end to his own life; after which Macbeth sent
his head to the king, and then proceeded with the un-
merited severity against the insurgents, who were composed
of Iarmen, Macbeth and Banquo serving under him. The Danes were
commanded by Sweyn king of Norway, and eldest son of
Canute. He proceeded with all the barbarity natural
to his nation, putting to death men, women, and chil-
ren who fell in his way. A battle was fought between
the two nations near Culrofs, in which the Scots were
defeated: but the Danes punished their victory so
dearly, that they could not improve it; and Duncan re-
treated to Perth, while Macbeth was sent to raise more
forces. In the mean time Sweyn laid siege to Perth,
which was defended by Duncan and Banquo. The
Danes were so much distressed for want of provisions,
that they at last consented to treat of a peace, upon
which Macbeth at first confined to treat of a peace, provided
the pressing necessities of the army were relieved.
The Scots historians inform us, that this treaty was set
on foot in order to amuse Sweyn, and gain time for the
first attack which Duncan was preparing. This was no
other than a barbarous contrivance of infusing intox-
cating herbs into the liquors that were sent along with
him, and the other provisions to the Danish camp. These sopori-
fics had their intended effect; and whilst the Danes
were under their influence, Macbeth and Banquo broke
into their camp, where they put all to the sword, and
it was with difficulty that some of Sweyn's attendants
carried him on board; and we are told that he was the
only ship of all the fleet that returned to Norway.
It was not long; however, before a fresh body of Danes
landed at Kinghorn in the county of Fife: but they
were entirely defeated by Macbeth and Banquo. Such
of the Danes as escaped fled to their ships; but before
they departed they obtained leave to bury their dead
in Inchcolm, a small island lying in the Forth, where
one of their monuments is still to be seen.

Thus ended the formidable invasions of the Danes;
after which Duncan applied himself to the adminis-
tration of justice, and the reformation of the manners
of his subjects. Macbeth, however, who had obtained
great reputation by his success against the Danes, be-
gan to form ambitious designs, and to aspire to the
crown itself. The fables relating to his usurpation are
so well known from the tragedy composed by Shake-
speare which bears the name of Macbeth, that we shall
not take notice of them here; but only observe, that
in 1037 Duncan was murdered by Macbeth, who
assumed the throne.

During the greater part of the reign of the usurper,
Malcolm, the true heir to the crown of Scotland, kept
close in his principality of Cumberland, without any
thoughts of ascending his father's throne. Macbeth
for some time governed with moderation, but at last
became a tyrant. Becoming jealous of Banquo, the most
powerful subject in his dominions, he invited him to an
entertainment, and caused him to be treacherously mur-
dered. His son Fleance was destined to the same
fate, but Fleance, though he was not the murderer of
his father, was put to death by Macbeth, who
succeeded him in the throne.

And killed.

and that the field in which the battle was fought
should be set apart and consecrated for the burial of
the dead. These stipulations were punctually fulfilled
by Malcolm, who built in the neighbourhood a chapel
dedicated to Olaus, the tutelar saint of these northern
nations.

After all these glorious exploits, and becoming the
second legislator in the Scottish nation, Malcolm is said
to have stained the latter part of his reign with avarice
and oppression; in consequence of which he was mur-
dered at the age of 80 years, after he had reigned above
30. This affassination was perpetrated when he was on
his way to Glamis. His own domestics are said to
have been privy to the murder, and to have fled along
with the conspirators; but in passing the lake of For-
far on the ice, it gave way with them, and they were
all drowned, their bodies being discovered some days
after. The latter part of this account is confirmed by
the sculptures upon some stones erected near the spot;
one of which is still called Malcolm's grave-stone; and
all of them exhibit some rude representations of the
murder and the fate of the affassins.

Malcolm was succeeded, in the year 1034, by his
grandson Duncan I, but he is said to have had another
grandson, the famous Macbeth; though some are of
opinion that Macbeth was not the grandson of Mal-
colm, but of Fenella who murdered Kenneth III. The
first years of Duncan's reign were passed in tranquillity,
but domestic broils soon took place on the following
occasion. Banquo, thane of Lochaber, and ancelor
to the royal family of Stuart, acted then in the capacity
of regent to Duncan, by collecting his rents; but
being very rigid in the execution of his office, he was
way-laid, robbed, and almost murdered. Of this outra-
ging Banquo complained as soon as he recovered of his
wounds and could appear at court. The robbers were
summoned to render themselves to justice; but in-
stead of obeying, they killed the messenger. Macbeth
represented this in such strong terms, that he was sent
with an army to reduce the insurgents, who had already
destroyed many of the king's friends. This commissi-
ion he performed with such success, that the rebel chief
put an end to his own life; after which Macbeth sent
his head to the king, and then proceeded with the un-
merited severity against the insurgents, who were composed
of Iarmen, Macbeth and Banquo serving under him. The Danes were
commanded by Sweyn king of Norway, and eldest son of
Canute. He proceeded with all the barbarity natural

That they should place the king in his chair of state at the coronation. 2. That they should lead the van of all the royal armies. 3. That they should have a regality within themselves: and, 4. That if any of Macduff's family should happen to kill a nobleman unremittently, he should pay 24 marks of silver, and, if a plebeian, 12. The king's next care was to reestablish in their fathers possessions all the children who had been disinherit ed by the late tyrant; which he did in a convention of his acclaves held at Forfar. In the time of William the conqueror, we find Malcolm engaged in a dangerous war with England, the occasion of which as follows. On the death of Edward the Confessor, Harold feized the throne of England, to the prejudice of Edgar Atheling the true heir to the crown. However, he created him earl of Oxford, and treated him with great respect; but on the defeat and death of Harold, William discovered some jealousy of Edgar. Soon after, William having occasion to pay a visit to his dominions in Normandy, he appointed Edgar to attend him, along with some other noblemen whom he suspected to be in his interest; but on his return to England, he found the people so much disaffected to his government, that he proceeded with great severity, which obliged great numbers of his subjects to take refuge in Cumberland and the southern parts of Malcolm's dominions. Ed. ar had two filters, Margaret and Christ­ tina: thefe, with his two chief friends, Gospatrick and Mar­ tewilson, soon made him fensible how precarious his life was under fuch a jealous tyrant, and persuaded him to make preparations for flying into Hungary or some foreign country. Edgar accordingly fet falf with his mother Agatha, his two filters, and a great train of Anglo-Saxon noblemen: but by ftreets of weather was forced into the firth of Forth, where the illuftrious exiles landed at the place fince that time called the Queen's Ferry, Malcolm no sooner heard of their landing than he paid them a visit in person: and at this visit he fell in love with the princess Margaret. In confequence of this, the chief of Edgar's party repaired to the court of Scotland. William foon made a formal demand of Edgar; and on Malcolm's refufal, declared war againft him.

William was the moft formidable enemy the Scots had ever encountered, as having not only the whole force of England, but of Normandy, at his command. However, as he had tyrannized moft unmercifully over his Englifh fubj ects, they were much more inclined to ad lil his enemies than their own prince; and he even found himself obliged to give up the county of Northumberland to Gospatrick, who had followed Edgar, upon examination of his making war on the Scots. This nobleman accordingly invaded Cumberland; in return for which Malcolm ravaged Northumberland in a dreadful manner, carrying off an immense booty, and inviting at the fame time the Irish and Danes to join him. Even at this time the Danes kept up their claims upon the crown of England, fo that they could not be supposed very zealous for the interest of Edgar. The Irish were also interested in advancing the caufe of Harold's three sons, who had put themselves under their protection; and besides, their chief view seems to have been to obtain plunder at the expense of any party. However, as all these views tended to the pulling down of William's power, an union was formed againft him; but when they came to particular dilputations, the parties immediately disagreed. The three sons of Harold, with a body of Irish, made a defcent upon Somer­ feathire, and defeated a body of English; but the Irish having thus obtained an opportunity of acquiring some booty, immediately retired with it, after having ravaged the country. The Danes landed at the mouth of the Humber from 40 small fhips, where they were joined by Edgar and his party: and had the ailes been unanimous, it is probable that William's government would have been overthrown.

By this time William had taken from Gospatrick the earldom of Northumberland, and given it to Robert Cummin one of his Norman barons; but the Northum­ brians having joined Gospatrick, and received the Danes as their countrymen, murdered Cummin and all his followers at Durham, where they had been guilty of great cruelties. After this they laid siege to the forts built by William in Yorkshire; but not being able to reduce them, the English, Scots, and Danes, united their forces, took the city of York itself, and put to the sword three thousand Normans who were there in garri­ fon; and this success was followed by many incursions and rages, in which the Danes and Northumbrians acquired great booty. It soon appeared, however, that these allies had the interest of Edgar no more at heart than the Irish; and that all the dependence of this for­ mer prince was upon Malcolm, and the few Englifhmen who had followed his fortune; nor the booty was no sooner obtained, than the Danes retired to their ships, and the Northumbrians to their habitations, as though they had been in perfect safety. But in the mean time William, having raised a considerable army, advanced northwards. He first took a severe revenge upon the Northumbrians; then he reduced the city of York, and put to death all the inhabitants; and perceiving that danger was still threatened by the Danes, he bribed them with a sum of money to depart to their own country.

Malcolm was now left alone to encounter this formidable adversary; who, finding himfelf unable to oppofe fo great a force, withdrew to his own dominions, where he remained for some time on the defensive, but not without making great preparations for invading England once more. His second invasion took place in the year 1071, while William was employed in quelling an insurrection in Wales. He is paid at this time to have behaved with the greatest cruelty. He invaded England by Cumberland; ravaged Tees­dale; and at a place called Hundreds-held, he maffacred some English noblemen, with all their followers. From thence he marched to Cleveland in the north-riding of Yorkshire; which he also ravaged with the utmost cruelty, fending back the booty with part of his army to Scotland: after which, he pillaged the bishopric of Durham, where he is said not to have spared the moft furred edifices, but to have burned them to the ground. In the mean time Gospatrick, to whom William had again ceded Northumberland, attempted to make a diversion in his favour, by invading Cumberland; but being utterly defeated by Malcolm, he was obliged to fluit himfelf up in Bamborough caflle; while Malcolm returned in triumph with his army to Scotland, where he married the princess Margaret.

The next year William, having greatly augmented his
his army, invaded Scotland in his turn. The particulars of the war are unknown; but it certainly ended much to the disadvantage of the Scots, as Malcolm agreed to pay him homage. The English historians contend that this homage was for the whole of his dominions; but the Scots with more show of reason affirmed, that it was only for those he possessed in England. On the conclusion of the peace, a crofs was erected at Stanmore in Richmondshire, with the arms of both kings, to serve as a boundary between the possessions of William and the feudal dominions of Malcolm. Part of this monument, called Re-crofs, or rather Rep-crofs, or The crofs of the kings, was entire in the days of Camden.

This peace between Malcolm Canmore and William produced the greatest alteration in the manners of the Scots. What contributed chiefly to this was the excellent disposition of queen Margaret; who was, for that age, a pattern of piety and politeness: and next to this was the number of foreigners who had settled in Scotland; among whom were five Frenchmen, who laid the foundation of that friendship with the kings which lasted for ages. Malcolm himself, also, though by his ravages in England he seemed naturally to have been a barbarian, was far from being averse to a reformation, and even set the example himself. During her husband's abscence in England queen Margaret had chosen for her confessor one Turgoft, whom she also made her confidant in her intended reformation. She began with new-modelling her own court; into which she introduced the offices, furniture, and manner of living, common among the more polite nations of Europe. She disdained from her service all those who were noted for immorality and impiety; and charged Turgoft, on pain of her displeasure, to give his real sentiments on the fate of the kingdom, after the betroth she could make. By him she was informed, that faction reigned among the nobles, rapine among the commons, and incontinence among all degrees of men. Above all, he complained that the kingdom was deluged of a learned clergy, capable of reforming the people by their example and doctrine. All this the queen represented to her husband, and prevailed upon him to set about the work of reformation immediately; in which, however, he met with considerable opposition. The Scots, accustomed to oppress their inferiors, thought all restrictions of their power were as many steps towards their slavery. The introduction of foreign offices and titles confirmed them in this opinion; and such a dangerous insurrection happened in May and some of the northern counties, that Malcolm was obliged to march against the rebels in person. He found them, indeed, very formidable; but they were so much intimidated by his resolution, that they intreated the clergy who were among them to intercede with the king in their favour. Malcolm received their submission, but refused to grant an unconditional pardon. He gave all the common people indeed leave to return to their habitations, but obliged the better sort to surrender themselves to his pleasure. Many of the most guilty were put to death, or condemned to perpetual imprisonment; while others had their estates confiscated. This feverity checked the rebellious spirit of the Scots, upon which Malcolm returned to his plans of reformation. Still, however, he found himself opposed even in those abuses, which were most obvious and glaring. He durst not entirely abolish that infamous practice of the landlord claiming the first night with his tenant's bride; though, by the queen's influence, the privilege was changed into the payment of a piece of money by the bridegroom, and was afterwards known by the name of mer-cha mulierum, or the woman's mark.
of England, and therefore refused to treat with him as a sovereign prince; but offered to enter into a negociation with his brother Robert, surnamed Curt huf, from the shortness of his legs. The two princes accordingly met; and Malcolm, having shown Robert the disposition of his army, offered to cut off his brother William, and to pay to him the homage he had been accustomed to pay the Conqueror for his English dominions. But Robert generously answered, that he had resigned to Rufus his right of primogeniture in England; and that he had even become one of William's subjects, thereby accepting of an English estate.

An interview with William then followed; in which it was agreed that the king of England should restore to Malcolm all his southern possessions, for which he should pay the same homage he had been accustomed to do to the Conqueror, that he should restore to Malcolm 12 disputed manors, and give him likewise 12 merks of gold yearly, besides reforming Edgar to all his English estates.

This treaty was concluded in Lothian, according to the English historians; but at Leeds in Yorkshire, according to the Scots. However, the English monarch looked upon the terms to be so very dishonourable, that he resolved not to fulfill them. Soon after his departure Edgar and Robert began to press him to fulfill his engagements; but receiving only evasive answers, they pulled over into Normandy. After their departure, William applied himself to the fortification of his northern boundaries, especially Carlisle, which had been destroyed by the Danes 200 years before.—As this place lay within the feudal dominions of Malcolm, he complained of William's proceeding, as a breach of the late treaty; and soon after repaired to the English court at Gloucester, that he might have a personal interview with the king of England, and obtain redress.

On his arrival, William refused him admission to his presence, without paying him homage. Malcolm offered this in the same manner as had been done by his predecessors, that is, on the confines of the two kingdoms; but this being rejected by William, Malcolm returned to Scotland in a rage, and prepared again for war.

The first of Malcolm's military operations now proved fatal to him; but the circumstances of his death are variously related. According to the English historians, Malcolm having laid siege to Alnwick, and reduced the place to such straits, that a knight came out of the castle, having the keys on the point of a spear, and pretending that he designed to lay them at Malcolm's feet; but instead of this, he ran him through the eye with the spear, as soon as he came within reach. They add, that prince Edward, the king's eldest son, was mortally wounded in attempting to revenge his father's death.

The English historians, on the other hand, contend, that the Scots were surprised in their camp, their army entirely defeated, and their king killed. On this occasion the Scots historians also inform us, that the family of Piercy received its name; the knight who killed the Scots king having been surnamed Pierce-eye, from the manner in which he gave that monarch the fatal stroke. Queen Margaret, who was at that time lying ill in the castle of Edinburgh, died four days after her husband.

After the death of Malcolm Canmore, which happened in the year 1093, the throne was usurped by his brother Donald Bane; who, notwithstanding the great virtues and glorious achievements of the late king, had been at the head of a strong party during the whole of his brother's reign. The usurper, giving way to the barbarous prejudices of himself and his countrymen, expelled out of the kingdom all the foreigners whom Malcolm had introduced, and obliged them to take refuge in England. Edgar himself had long resided at the English court, where he was in high reputation; and, by his interest there, found means to refute his nephew young Edgar, the king of Scotland's eldest son, out of the hands of the usurper Donald Bane. The favour he shewed to him, however, produced an accusation against himself, as if he designed to adopt young Edgar as his son, and set him up as a pretender to the English throne. This accusation was preferred by an Englishman whose name was Orgar; but, as no legal proofs of the guilt could be obtained, the custom of the times rendered a single combat between the parties unavoidable. Orgar was one of the strongest and most active men in the kingdom; but the age and infirmities of Edgar allowed him to be defended by another. For a long time none could be found who would enter the lists with this champion; but at last one Godwin of Wincelmer, whose family had been under obligations to Edgar or his ancestors, offered to defend his cause. Orgar was overcome and killed: and, when dying, confessed the falsehood of his accusations. The conqueror obtained all the lands of his adversary, and William lived ever afterwards on terms of the strictest friendship with Edgar.

This combat, trifling as it may seem to us, produced very considerable effects. The party of Edgar and his brother's (who had likewise taken refuge at the English court) revived in Scotland, to such a degree, that Donald was obliged to call in the Danes and Norwegians to his assistance. In order to engage them more effectually to his interest, the usurper yielded up to them the Orkney and Shetland islands; but when his new allies came to his assistance, they behaved in such a manner as to become more intolerable to the Scots than ever the English had been. This discontent was greatly increased when it was found that William designed to place on the throne of Scotland a natural son of the late Malcolm, named Duncan, who had served in the English armies with great reputation. Donald attempted to maintain himself upon the throne by the assistance of his Norwegian allies; but, being abandoned by the Scots, he was obliged to fly to the isles, in order to raise more forces; and in the mean time Duncan was crowned at Scone with the usual solemnity.

The Scots were now greatly disquieted by two usurpers who contended for the kingdom, each of them supported by a foreign army. One of them, however, was soon dispatched. Malpedir, thane of Mearns, surprised Duncan in the castle of Mentieth, and killed him; after which he replaced Donald on the throne. The affections of the Scots, however, was by this time entirely alienated from Donald, and a manifest intention of calling in young Edgar was shown. To prevent this, Donald offered the young prince all that part of Scotland which lay to the southward of the Forth; but the terms were rejected, and the messengers who brought
brought them were put to death as traitors. The king of England also, dreading the neighbourhood of the Norwegian, interposed in young Edgar's favour, and gave Athelred the command of an army in order to restore his nephew. Donald prepared to oppose his enemies with all the forces he could raise; but was defeated by the Scots, and obliged to flee: his enemies pursued him so closely, that he was slain; and being brought before Edgar, he ordered his eyes to be put out, condemning him at the same time to perpetual banishment, in which he died some time after.

The historians of these times inform us, that this revolution was owing to the interposition of St Cuthbert, who appeared to Edgar, informing him that he should prove victorious, provided he repaired next day to his church, and received his banner from the hands of the canons; which he accordingly did, and proved ever afterwards a most grateful votary to his patron. During his reign a firm friendship subsisted between the courts of England and Scotland; owing to the marriage of Henry I. of England with the Princess Matilda, sister to Edgar. This has given occasion to the English historians to assert that Edgar held the kingdom of Scotland as a feudatory of Henry; and to this purpose have forged certain writings, by which Edgar acknowledges "That he held the kingdom of Scotland by gift from his Lord William king of England; and with consent of his said lord, he gives to Almighty God, and the church of Durham, and to the glorious bishop of St Cuthbert, and to bishop William, and to the monks of Durham, and their successors, the mansions of Berwick and Coldingham, with several other lands possessed by his father Malcolm: and this charter is granted in the presence of bishop William, and Turgoth the prior; and confirmed by the croffes of Edgar his brother, and other noblemen." But that these writings are forged, appears from the non-existence of the original charter, and from the narrative being related in a quite a different manner by some other authors. For the same purpose a seal has been forged of Edgar sitting on horseback, with a sword in his right-hand, and a shield on his left arm, within a border of France. But this last circumstance is a sufficient proof of the forgery; since, in the same repository in which this seal is kept, there are five charters of the same Edgar which are undoubtedly genuine; and on the seals belonging to them he is represented sitting on two swords placed across, with a sceptre in one hand, a sword in the other, a royal diadem on his head, with this inscription round it, Scotorum Basileus, which the belth English antiquaries allow to have been a title denoting independency.

After a reign of nine years, Edgar died at Dundee, in the year 1107: and was succeeded by his brother Alexander I., furnished the force from the impetuosity of his temper. On his accession to the throne, however, the Scots were so ignorant of his true character, on account of his appearance of piety and devotion, that the northern parts of the kingdom were soon filled with ravages and bloodshed, by reason of the wars of the chiefs with each other. Alexander immediately raised an army, and marching into Moray and Ross-shire, attacked the insurgents separately; and having subdued them all, he put great numbers of them to death. He then set himself to reduce the exorbitant power of the nobles, and to deliver the common people from the oppression under which they groaned. A remarkable instance of this appeared on his return from the expedition just now mentioned. In passing through the Mearns, he met with a widow, who complained that her husband and son had been put to death by the young earl their superior. Alexander immediately alighted from his horse, and swore that he would not remit him till he had inquired into the justice of the complaint; and, finding it to be true, the offender was hanged on the spot. These vigorous proceedings prevented all attempts at open rebellion; but produced many conspiracies among the profligate part of his private subjects, who had been accustomed to live under a more remiss government. The most remarkable of these took place while the king was engaged in building the castle of Bledgar, so called in memory of his brother Edgar, who had laid the foundation-stone. It was situated in the Carle of Gowrie, which, as we are told, had formerly belonged to Donald Bane, but afterwards came to the crown, either by donation or forfeiture. The conspirators chiefly resided in the Mearns, to which Alexander once more repaired at the head of an army; but the rebels retreated northwards, and crossed the Spey. The king pursued them across that river, defeated them, and brought to justice all that fell into his hands. In this battle, Carron distinguished himself so eminently, that he obtained the name of Skirmeour or Skrimzeour; which indeed is no other than the English word skirmisher or fighter.

The next remarkable transaction of Alexander's reign, as recorded by the English historians, was his journey into England, where he paid a visit to Henry I. whom he found engaged in a war with the Welsh. The occasion of it was this: Henry had planted a colony of Flemings on the borders of Wales, in order to keep that turbulent people in awe, as well as to introduce into his kingdom the manufactures for which the Flemings were famous. The Welsh, jealous of this growing colony, invaded England; where they defeated the earl of Chester and Gilbert Strongbow, the two most powerful of the English subjects. Alexander, in virtue of the fealty which he had sworn for his English possessions, readily agreed to lead an army into Wales. There he defeated one of the chieffains, and reduced him to great distress; but could not prevent him from escaping to Griffith prince of North Wales, with whom he was closely allied. Henry also marched against the enemy, but with much more success in the field than Alexander; for he left two-thirds of his army, with almost his whole baggage, by fatigue, famine, and the attacks of the Welsh. This loss, however, he made up in some measure by his policy; for having found means to raise a jealousy between the two Welsh chiefs, he induced them to conclude a peace, but not without restoring all his lands to the one, and paying a considerable sum of money to the other. Alexander died in 1134, after a reign of seventeen years; and was buried at Dunfermline.

This prince, dying a bachelor, was succeeded by his younger brother David, who interfered in the affairs of Scotland.
Scotland, of England, and took part with the empress Maud in the civil war she carried on with Stephen. In 1156, David met his antagonist at Durham; but as neither party cared to venture an engagement, a negotiation took place, and a treaty was concluded. This, however, was observed but for a short time; for, in the following year, David again invaded England, and some frivolous pretences. He defeated Stephen at Roxburgh; and forced him to retreat precipitately, after losing one half of his army. Next year he renewed his invasion; and, though he himself was a man of great mildness and humanity, he suffered his troops to commit such outrages, as firmly united the English in opposition to him. His grand-nephew William cut in pieces the vanguard of the English army at Clithero; after which he ravaged the country with such cruelty, that the inhabitants became exasperated beyond measure against him. New associations were entered into against the Scots; and the English army receiving great reinforcements from the southward, advanced to Northallerton, where the famous standard was produced. The body of this standard was a kind of box which moved upon wheels, from which arose the mast of a ship surmounted by a silver cross, and round it were hung the banners of St. Peter, St. John de Beverly, and St. Wilfred. Standards of this kind were common at that time on the continent of Europe; and so great confidence had the English in this standard, that they now thought themselves invincible. They had, however, a much more solid ground of confidence, as being much better armed than their antagonists. The armies met at a place called Calton Moor. The first line of the Scots army was composed of the inhabitants of Galloway, Carrick, Kyle, Cunninghame, and Renfrew. These by some historians are called Piets, and are said to have had a prince of their own, who was a vassal to David. The second line consisted of the Lothian men, by which we are to understand the king's subjects in England as well as the south of Scotland, together with the English and Normans of Maud's party. The third line was formed of the clans under their different chieftains; but who were subject to no regular command, and were always impatient to return to their own country when they had acquired any booty. The English soldiers having ranged themselves round their standard, disembowled their horses, in order to avoid the long lances which the first line of the Scots army carried. Their front-line was intermixed with archers; and a body of cavalry, ready for pursuit, hovered at some distance. The Piets, besides their lances, made use of targets; but, when the English closed with them, they were soon disordered and driven back upon the centre, where David commanded in person. His son made a gallant resistance, but was at last forced to yield; the long lances seem to have never been engaged. David, seeing the victory decided against him, ordered some of his men to save themselves by throwing away their badges, which it seems Maud's party had worn, and mingling with the English; after which he himself, with his shattered forces, retreated towards Carlisle. The English historians say, that in this battle the Scots were totally defeated, with the loss of 10,000 men; but this seems not to be the case, as the English did not pursue, and the Scots were in a condition for carrying on the war next year. However, there were now no great exploits performed on either side; and a peace was concluded, by which Henry prince of Scotland was put in possession of Huntingdon and Northumberland, and took an oath of fealty to Stephen. David continued faithful to his niece the empress as long as he lived; and died at Carlisle in the year 1155, after a glorious reign of somewhat more than 29 years.

David was succeeded by his grandson Malcolm IV., furname the Maidon, on account of his continence. He appears to have been a weak and superfluous prince, and died of a depression of spirits in the year 1165. He was succeeded by his brother William I., who immediately entered into a war with Henry II. of England, on account of the estate of Northumberland, which had been given up by Malcolm; but Henry, finding his affairs in a very embarrased situation, contented to yield up this county, on William's paying him homage, rather than continue the miseries of war. In 1172, he attempted to avail himself of the unnatural war which Henry's sons carried on against their father, and invaded England. He divided his army into three columns; the first of which took Carlisle; the second he himself led into Northumberland; and the king's brother, David, advanced with the third into Leicestershire. William reduced the castles of Burgh, Appleby, Warkworth, and Garby; and then joined that division of his army which was besieging Carlisle. The place was already reduced to such straits, that the governor had agreed to surrender it by a certain day, but it was not relieved before that time; on which the king, leaving some troops to continue the siege, inviolate a castle with some of the forces he had under his command, at the same time sending a strong reinforcement to his brother David; by which means he himself was left with a very small army, when he received intelligence that a strong body of English under Robert de Stuteville and his son were advancing to surprise him.—William, certain of his inability to resist them, retired to Alnwick, to which he instantly laid siege; but in the mean time acted in such a careless and unthinking manner, that his enemies actually effected their designs. Having dresed a party of their soldiers in Scots habits, they took the king himself prisoner, and carried him, with his feet tied under the belly of a horse, to Richmond Castle. He was then carried in chains before Henry to Northampton, and ordered to be transported to the castle of Balaie or Normandy, where he was shut up with other state prisoners. Soon after this an accommodation took place between Henry and his sons, and the prisoners on both sides were set at liberty. William only excepted, who bore his confinement with great impatience. Of this Henry took the advantage, to make him pay homage for the whole kingdom of Scotland, and acknowledge that he held it only as a feft of the crown of England; and, as a security, he was obliged to deliver into the hands of Henry all the principal forts in Scotland, viz. the castles of Roxburgh, Berwick, Jedburgh, Edinburgh, and Stirling; William at the same time agreeing to pay the English garrisons which were put into these castles. David, the king's brother, with 20 barons, who were present at the signing of this shameful convention, were put into the hands of Henry as hostages for William's good faith; after which the king was set at liberty, and returned to Scotland.
Scotland.

The affairs of Scotland were now in the greatest confusion. The people of Galloway, at the head of whom were two noblemen or princes called Othred and Gilbert, had taken the opportunity of asserting their independency on the crown of Scotland; and, having expelled all the Scots officers out of the country, they demolished all the forts which William had erected in their country, and put to death all the foreigners. But in the mean time a quarrel ensued between the two chiefs, Othred was murdered by Gilbert, who immediately applied to Henry for protection.

Henry, in order to give all possible sanction to the convention between him and William, summoned him to meet him and his son at York. William obeyed the summons, and along with him appeared all the great nobility and landholders; who confirmed the convention of Falaise, swore fealty to Henry, and put themselves and their country under his protection. In the mean time, Gilbert, who was at the head of the rebels in Galloway, had offered to put himselves and his people under the protection of the king of England, and to pay to him 1000 marks of silver yearly, with 500 cows and as many hogs, by way of tribute: however, Henry, that he might oblige his new feudatory William, refused to have any concern in the affair. On this, William ordered his general Gilchrist to march against him; which he did with such success, that Gilbert was entirely defeated, and Galloway again reduced under the dominion of Scotland.

Very soon after this victory, Gilchrist fell under the king's displeasure on the following occasion. He had married Matilda, sister to William, and on suspicion, or proof, of her incontinence, put her to death at a village called Magness, near Dundee. The king being highly displeased at such a gross affront to himself, summoned Gilchrist to take his trial for the murder: but as the general did not choose to make his appearance, his land and the other northern counties: but these were all finally adjusted to the mutual satisfaction of both parties; and William continued a faithful ally of the English monarch till his death, which happened in the year 1214, after a reign of 49 years.

William was succeeded by his son Alexander II. a year after he left the youth of 16. He revived his claim to Northumberland and the other northern counties of England; but John, supposing that he had now thoroughly subdued the English, not only refused to consider the demands of Alexander, but made preparations for invading Scotland. John had given all the country between Scotland and the river Tweed to the traitor Robert, who, with the help of another nobleman, upon condition of their defending it against the Scots, fell upon Northumberland, which he easily reduced, while John invaded Scotland. Alexander retired to Melrose, in order to defend his own country; upon which John burnt the towns of Wark, Alnwick, and Morpeth, and took the strong castles of Roxburgh and Berwick. He next plundered the abbey of Coldingham, reduced Dunbar and Haddington, ravaging the country as he passed along. His next operation was directed against Edinburgh; but being opposed by Alexander at the head of an army, he precipitately marched back. Alexander did not fail to pursue; and John, to cover his retreat, burnt the towns of Berwick and Coldingham. In this retreat the king of England himself set his men an example of barbarity, by setting fire every morning to the houses in which he had lodged the preceding night. In short, such defection did John spread all around him, that Alexander found it impossible to continue his pursuit; for which reason he marched westward, and invaded England by the way of Carlisle. This place he took and fortified; after which he marched south as far as Richmond, receiving homage from all the great barons as he went long.
Alexander, notwithstanding his youth, replied with great
sence and modesty, that his business in England was ma-
trimony; that he had come thither under Henry's pro-
tection and invitation; and that he was no way prepared
to answer such a difficult question.

Henry seems to have been encouraged to make this
attempt by the disfamed state of the Scots at that
time; for, during the minority of the king, the
nobility threw every thing into confusion by their dif-
fusions with one another. The family of Cummin were
now become exceedingly powerful; and Alexander II.
was blamed by Buchanan for allowing them to obtain such
an exorbitant degree of power, by which they were en-
abled almost to shake the foundation of government.
Notwithstanding the king's refusal to submit to the
homage required of him, they imagined that Henry's
fluence was now too great; and fearing bad con-
fquences to themselves, they withdrew from York, leav-
ing Henry in full possession of his son-in-law's peron.
Henry, however, to show that he deferred all the con-
fusion which could be reposed in him, publicly declared,
that he dropped all claim of superiority with regard
to the crown of Scotland, and that he would ever
afterwards act as the father and guardian of his son-in-
law; confirming his assurances by a charter. Yet when
Alexander returned to Scotland, he found they had
made a strong party against his English connections.
They now exclaimed, that Scotland was no better than
a province of England; and having gained almost all
the nobility over to this opinion, they kept the king
and queen as two state-prisoners in the castle of Edin-
burgh. Henry had secret intelligence of these pro-
ceedings; and his queen privately sent a physician whom
the could trust, to inquire into her daughter's situation.
Having found means of being admitted into the young
queen's presence, she gave him a most lamentable ac-
count of her situation. She said, that the place of their
confinment was very unwholesome, in consequence of
which their health was in imminent danger; and that
they had no concern in the affairs of government. His-
torians do not inform us by what means they were re-
duced to this dismal situation; only in general, that
the Cummins usurped the whole power of the state.
Henry did not well know how to act. If he proceed-
ed at once to violent measures, he was afraid of the lives
of his daughter and son-in-law; and, on the other hand,
by a more cautious conduct, he left them exposed to the
wicked attempts of those who kept them in thral-
dom, some of whom, he very well knew, had designs
on the crown itself. By advice of the Scots royalists, he
sent liber-
among whom were the earls of Dunbar, Fife, Strath-
erne, Carric, and Robert de Bruce, Henry assembled his
ry military tenants at York, from whence he himself
advanced to Newcastle, where he published a manifeuto,
disclaiming all designs against the peace or independency
of Scotland; declaring, that the forces which had been
collected at York were designed to maintain both; and
that all he meant was to have an interview with the
king and queen—upon the borders. From Newcastle
he proceeded to Wark, where he privately dispatched
the earl of Glocester, with his favourite John Manfel,
and a train of worthy followers, to gain admittance into
the castle of Edinburgh, which was then held by John
Daliol and Robert de Rois, noblemen of great influence
both in England and Scotland. The Earl and Manfel

In 1250, the king, though no more than ten years
of age, was married to the daughter of Henry, who
now thought it a proper opportunity to cause him to do
homage for the whole kingdom of Scotland. But Alex-

Scotland.
Scotland gained admittance into the castle in disguise, on pretence of their being tenants to Baliol and Ross; and their followers obtained access on the same account, without any suspicion, till they were sufficiently numerous to have mastered the garrison, had they met with any resistance. The queen immediately informed them of the thraldom and tyranny in which she had been kept; and among other things declared, that she was still a virgin, as her jailors obliged her to keep separate from her husband. The English, being masters of the castle, ordered a bed to be prepared that very night for the king and queen; and Henry, hearing of the success of his party, sent a false conduct for the royal pair to meet him at Alnwick. Robert de Ross was summoned by Henry to answer for his conduct; but throwing himself at the king's feet, he was punished only by the sequestration of his estate, as was John Baliol by a heavy fine, which the king of England referred entirely to his own use.

Alexander and his queen were attended to Alnwick by the heads of his party; and when they arrived, it was agreed that Henry should act as his son-in-law's guardian; in consequence of which, several regulations were made in order to suppress the exorbitant power of the Cummins. That ambitious family, however, were all this time privately strengthening their party in Scotland, though they outwardly appeared satisfied with the arrangements which had been made. This rendered Alexander secure; so that, being off his guard, he was surprised when asleep in the castle of Kinroes by the earl of Menteith, who carried him to Stirling. The Cummins were joined in this treason by Sir Hugh de Abernethy, Sir David Lochore, and Sir Hugh de Barclay; and, in the mean time, the whole nation was thrown into the utmost confusion. The great seal was forcibly taken from Robert Stuterville, substitutus to the chancellor the bishop of Dunkeld; the estates of the royalities were plundered; and even the churches were not spared. The king at last was delivered by the death of the earl of Menteith, who was killed to have been poisoned by his wife, in order to gratify her passion for a young English gentleman named John Ruffel. This charge, however, was never proved; but it is certain that the earl died at a juncture very critical for Scotland, and that his death disconcerted all the schemes of his party, which never afterwards could make head against the royalists.

Alexander being thus restored to the exercise of regal authority, acted with great wisdom and moderation. Hepardoned the Cummins and their adherents, upon their submitting to his authority; after which, he applied himself to the regulation of his other affairs: but a storm was now ready to break upon him from another quarter. We have already seen, that the usurper Donald Bane, brother to Malcolm Canmore, had engaged to deliver up the isles of Orkney and Shetland to the king of Norway, for affisting him in making good his pretensions to the crown of Scotland. Haquin, the king of Norway, at this time alleged, that these engagements extended to the delivering up the isles of Bute, Arran, and others in the Frith of Clyde, as belonging to the Ebroë or Western isles; and as Alexander did not think proper to comply with these demands, the Norwegian monarch appeared with a fleet of 160 sail, having on board 20,000 troops, who landed and took the castle of Air. Alexander immediately dispatched ambassadors to enter into a treaty with Haquin; but the latter, flushed with success, would hear nothing to terms. He made himself master of the isles of Bute and Arran; after which he passed over to Cunningham. Alexander, prepared to oppose him, divided his army into three bodies. The first was commanded by Alexander high steward of Scotland (the great grandfather of Robert II.) and consisted of the Argyle, Athol, Lenox, and Galloway men. The second was composed of the inhabitants of Lothian, Fife, Merie, Berwick, and Stirling, under the command of Patrick earl of Dunbar. The king himself led the centre, which consisted of the inhabitants of Pernshire, Angus, Mearns, and the northern counties. Haquin, who was an excellent commander, disposed his men in order of battle, and the engagement began at a place called Largs. Both parties fought with great resolution; but at last the Norwegians were defeated with dreadful slaughter, no fewer than 16,000 of them being killed on the spot. The remainder escaped to their ships; which were so completely wrecked the day after, that Haquin could scarce find a vessel to carry him with a few friends to Orkney, where he soon after died of grief.

In consequence of this victory, Owen or John king of the isle of Man submitted to Alexander; and his example was followed by several other princes of the islands belonging to the Norwegians. Haquin's son, Magnus, a wise and learned prince, soon after arrived in Scotland with fresh reinforcements, and proposed a treaty: but Alexander, instead of listening to an accommodation, sent the earls of Buchan and Murray, with Allen the chamberlain, and a considerable body of men, to the western islands, where they put to the sword some of the inhabitants, and hanged their chiefs for having encouraged the Norwegian invasion. In the mean time, Magnus returned to Norway; where a treaty was at last concluded between him and Alexander. By this Magnus renounced all right to the coveted isles; Alexander at the same time confenting to pay him 1000 marks of silver in the space of two years, and 100 yearly ever after, as an acknowledgment for these isles. To cement the friendship more firmly, a marriage was concluded between Margaret, the daughter of Alexander, and Eric the son and heir of Magnus, who was also a child; and, some years after, when the parties were of proper age, the marriage was conunitted.

From this time to the accession of Edward I. of England, we find nothing remarkable in the history of Scotland. That prince, however, proved a more cruel enemy to that country than it had ever experienced. Alexander was present at the coronation of Edward, who was then newly arrived from the Holy Land, where he had been on a crusade. Soon after this Alexander paid him homage for his English estates, particularly for the lands and lordship of Penrith and others, which Henry had given him along with his daughter. He proved an excellent ally to Edward in his wars against the French; and the latter passed a charter, by which he acknowledged that the services of the king of Scotland in those wars were not in consequence of his holding lands in England, but as an ally to his crown. Even at this time, however, Edward
Scotland. [740]

Deligns of Edward I. against the liberties of Scotland.

had formed a design on the liberties of that kingdom; for in the charter just mentioned, he inserted a falvo, acknowledging the suzerainty, by which he referred his right to the homage of the kingdom of Scotland, when it should be claimed by him or his heirs.

The bishop of Norwich fugggested this falvo, and this was the reason why Alexander would not perform the homage in person, but left it to be performed by Robert Bruce earl of Carric; Alexander standing by, and in express declaration, that it was only paid for the lands he held in England.—No acts of hostility, however, took place during the lifetime of Alexander, who was killed on the 19th of March 1285, in the 45th year of his age, by his horse rushing down the black rock near Kinghorn as he was hunting.

Both before and after the death of Alexander, the great subjects of Scotland seemed to have been favourable of Edward’s ambitious designs. On the marriage of Margaret with Eric prince of Norway, the states of Scotland paifed an act obliging themselves to receive her and her heirs as queen and sovereigns of Scotland. Edward at that time was in no condition to oppose this measure, in which the Scots were unanimous; and therefore contented himself with forming factions among the leading men of the country. Under pretence of reforming the crofs, he renewed his intrigues at the court of Rome, and demanded leave from the pope to collect the tenths in Scotland; but his holiness replied, that he could make no such grant without the assent of the states of Scotland. On the death of Margaret queen of Norway, her daughter, in consequence of the act above mentioned, was recognized by the states as queen of Scotland. As she was then but two years old, they came to a resolution of excluding from all share in the government, not only Edward, but their queen’s father; and they accordingly established a regency from among their own number, consisting of the six following noblemen: viz. Robert Wilhart bishop of Glasgow, Sir James Cummin of Badenoch, senior, James lord high steward of Scotland, who were to have the superintendency of all that part of Scotland which lay to the south of the Forth; William Fraser bishop of St Andrews, Duncan McDuff earl of Fife, and Alexander Cummin earl of Buchan, who were to have the direction of all affairs to the north of the same river.—With these arrangements Eric was exceedingly displeased, as considering himself as the only rightful guardian of his own child. He therefore cultivated a good correspondence with Edward, from whom he had received considerable pecuniary favours; and perceiving that the states of Scotland were unanimous in excluding all foreigners from the management of their concerns, he fell in with the views of the king of England, and named commissioners to treat with those of Edward upon the Scots affairs. These negociations terminated in a treaty of marriage between the queen of Scotland and Edward prince of Wales, young as they both were. This alarmed the states of Scotland, who resolved not to suffer their queen to be dispossessed of their own dominions. It was therefore agreed by the commissioners on both sides, to acquaint them with the result of their conferences, and to demand that a deputation should be sent up for settling the regency of Scotland, or, in other words, for putting the foreign power into the hands of the two kings. As the two parties, however, were within the prohibited degrees of consanguinity, being first cousins, a dispensation was applied for to Pope Boniface, who granted it on condition that the peers of Scotland conformed to the match.

Though the Scots nobility were very much against this match, they could not refuse their consent to it when proposed by the father and grand-uncle of their young queen. They therefore appointed the bishops of St Andrew’s and Glasgow, with Robert Bruce lord of Annandale, and John Cummin, to attend as their deputies, but with a falvo to all the liberties and honours of the realm of Scotland; to which Edward agreed. These deputies met at Salisbury with those of England and Norway; and it was at last agreed, 1. That the young queen should be sent from Norway (free of all marriage-engagements) into England or Scotland. 2. That if the queen came to England, she should be at liberty to repair to Scotland as soon as the distractions of that kingdom should be settled; that she should, on her arrival in her own dominions, be free of all matrimonial contracts; but that the Scots should engage not to dispose of her in marriage without her father or Edward’s consent. 3. The Scots deputies promised to give such security as the Norwegian commissioners should require, that the tranquillity of the nation should be settled before her arrival. 4. That the commissioners of Scotland and Norway, joined with commissioners from England, should remove such regents and officers of state in Scotland as should be suspected of disaffection, and place others in their stead. 5. That the commissioners of Scotland and Norway, should agree on that or any other head relating to the government of Scotland, the decision was to be left to the arbitration of English commissioners.

The party of Edward was now so strong in Scotland, that no opposition was made to the late agreement, in a parliament held at Brechin to deliberate upon the settlement of the kingdom. It is uncertain whether he communicated in form to the Scottish parliament the pope’s dispensation for the marriage; but most probably he did not; as, in a letter written to him by the states of Scotland, they mention this as a matter with which Edward was highly approved of the marriage, upon certain conditions to which Edward was previously to agree; but the latter, without waiting to perform any conditions, immediately sent for the young queen from Norway. This exceedingly displeased Eric, who was by no means inclined to put his daughter into the hands of a prince whose sincerity he suspected, and therefore shifted off the departure of the princess till he should hear farther from Scotland. Edward, alarmed at this, had again recourse to negotiation; and ten articles were at last drawn up, in which the Scots took all imaginable precautions for the safety and independency of their country. These articles were ratified by Edward on the 28th of August 1289; yet, even after the affair of the marriage was fully settled, he left no time in procuring as strong a party as he could. At the head of these were the bishop of St Andrew’s and John Baliol. That prelate, while he was in England, was highly cared for by Edward, from whom he had great expectations of preferment; and Baliol, having great estates in England, considered the latter as his sovereign. The bishop,
shop, on his return to Scotland, acted as a spy for Edward, and carried on with him a secret correspondence, informing him of all public transactions. It appears from this correspondence, that the Scots were far from being unanimous as to the marriage. Bruce earl of Annandale suspected, for some reason or other, that the young queen was dead; and, soon after Michaelmas 1290, assembled a body of forces, and was joined by the earl of Mar and Athol. Intelligence of these communications was carried to Edward by Baliol; and the bishop of St Andrew's advised Edward, in case the report of the queen's death should prove true, to march a body of troops towards Scotland, in order to secure such a successor as he thought proper.

Edward, in the mean time, contented to allow ambassadors to be sent from Scotland to bring over the young queen; previous to which, he appointed the bishop of Durham to be lieutenant in Scotland for the queen and her future husband; and all the officers there, both civil and military, obliged themselves to surrender their employments and fortresses to the king and queen (that is, to Edward) immediately on their arrival in Scotland. But while the most magnificent preparations were making for the reception of the young queen, certain intelligence of her death was received; but it is not certainly known whether this event happened before the arrival of the ambassadors in Norway or after her departure from that country.

The Scots were thrown into the utmost consternation by the news of their queen's death; while, on the other hand, Edward was as well prepared as if he had to his uttermost to prevent them. The act of succession established by the late king had no farther operation, being determined by the death of the queen; and since the crown was rendered hereditary, there was no precedent by which it could be settled. The Scots, in general, however, turned their eyes upon the posterity of David earl of Huntingdon, brother to the two kings Malcolm the Maiden and his successor William, both of whom died without lawful issue. The earl had three daughters. Margaret, the eldest, was married to Allan lord of Galloway; the only issue of which marriage was Derverguill wife to John Baliol, who had a son of the same name, a competitor for the crown. The second daughter, Isabella, was married to Robert Bruce; and their son Robert was a candidate likewise. The third daughter, Ada, had been married to Henry Halsting, an English nobleman, and predecessor to the present earl of Huntingdon. John Halsting, the son of this marriage, was a third competitor; but as his claim was confessedly the weakest of the three, he only put in for a third of the kingdom, on the principle that his mother was joint-heir with her two fillers (c). Several other claims now started up. Florence earl of Holland pretended to the crown of Scotland in right of his great grandmother Ada, the eldest lawful sister of William, sometime king; as did Robert de Pynkeney, in the right also of his great grandmother Marjory, second sister of the same king William. Patrick Gallighty was the son of Henry Gallighty, a bastard of William; William de Ros's was descended of Isabel, Patrick earl of March, of Ida or Ada; and William de Vexi, of Marjory; who were three natural daughters of King William. Roger de Mandeville, descended from Aubrie, another natural daughter of William, also put his claim; but the right of Nicholas de Soulis, if baffled it could give a right, was better than the former. His grandmother Marjory, the wife of Allan le Huidier, was a natural daughter of Alexander II., and consequently sister to Alexander III. John Cummin lord of Badenech derived his claim from a more remote source, viz. Donald Bane, who usurped the crown about 200 years before this time; but he was willing to resign his pretensions in favour of John Baliol. The latter indeed had surely the better right; and, had the succession been regulated as it is in all hereditary kingdoms at this day, he would undoubtedly have carried it. Bruce and Halsting, however, pleased that they were preferable, not only to John Baliol, the grandchild of Margaret, but also to Derverguill her daughter and his mother, for the following reason. Derverguill and they were equally related to their grandfather earl David: she was indeed the daughter of his eldest daughter; but she was a woman, they were men; and, said they, the male in the same degree ought to succeed to sovereignties, in their own nature impartible, preferable to the female.

Notwithstanding this number of candidates, however,

---

(c) The pedigree of the three principal competitors will be fully understood from the following scheme.

David I. King of Scots.

ever, it was soon perceived, that the claims of all of them might be cut off excepting two, viz, Baliol and Bruce, of whom the former had the preference with respect to hereditary right, and the latter as to popularity. Baliol had strongly attached himself to Edward's party, which being by far the most powerful in Scotland, gave him a decided superiority over Bruce. The event was, that Edward, by his own party most probably, though, some say, by the unanimous voice of the Scotch parliament, was appointed to decide between the two competitors. It soon appeared, however, that Edward had no mind to adjudge the crown to any person but himself; for, in an assembly held at Norham on the 10th of May 1291, Brabazon, the chief justice of England informed the members, "That his master was come thither in consideration of the state of the realm of Scotland, which was then without a king, to meet them, as direct suzerain of that kingdom, to do justice to the claimants of his crown, and to establish a solid tranquility among his people; that it was not his intention to retard justice, nor to usurp the right of any body, or to infringe the liberties of the kingdom of Scotland, but to render to every one his due. And to the end this might be done with the more effect, he required the assent of the states ex abundantes, and that they should own him as direct suzerain of the kingdom; offering, upon that condition, to make use of their counsels to do what justice demanded." The deputies were astonished at this declaration, and replied, that they were by no means prepared to decide on Edward's claim of superiority; but that Edward ought previously to judge the cause between the two competitors, and require homage from him whom he should choose to be king. Edward treated this excuse as trifling, and gave them till the next day to consider of his demand. Accordingly, on that day, the assembly was held in Norham church, where the deputies from Scotland infitted upon giving no answer to Edward's demands, which could be decided only by the whole community; representing, at the same time, that numbers of the noblemen and prelates were absent, and that they must have time to know their sense of the affair. In consequence of this, Edward gave them a delay of three weeks; which interval he employed in multiplying claimants to the crown of Scotland, and in flattering each with hopes, if he would acknowledge his superiority. But when the assembly met, according to appointment, on the 2d of June following, they found the place of meeting surrounded by a numerous army of English. Edward had employed the bishop of Durham to draw up the historical evidence of his right to the crown of Scotland; which has since been published. In this paper mention is made of the fealty and homage performed by the kings of Scotland to the Anglo-Saxon kings of England; but no sufficient evidence is brought of any such homage being actually performed. As to the homage performed by the kings of Scotland from the time of William the Conqueror to that of the dispute between Bruce and Baliol, the Scots never denied it; but they contended, and indeed with justice, that it was performed for the lands which they held from the crown of England; and they alleged, that it was as far removed from any relation to a fealty or homage performed for the crown of Scotland, as the homage paid by the English monarchs to the crown of France was removed from all relation to the crown of England. With regard to the homage paid by William king of Scotland to Henry II. of England, it was not denied that he performed it for the whole kingdom of Scotland: but they pleaded, that it was void of itself, because it was extorted when William was a prisoner to Henry; and they produced Richard I.'s charters, which pronounced it to have been compulsory and iniquitous.

But, however urgent these reasons of the Scots might be, Edward was by no means disposed to examine into their merits. Instead of this, he cloathed the several pretenders to the crown; and having found them all ready to comply with his measures, he drew up the following charter of recognition to be signed by them all.

"To all who shall hear this present letter.

"We Florence earl of Holland, Robert de Bruce The candid lord of Annandale, John Baliol lord of Galloway, John dates sign Haftmgs lord of Abercenvny, John Cummin lord of Badenoch, Patrick de Dunbar earl of March, John Vecci for his father Nicholas Soulis, and William de Rois, greeting in the Lord:

"Whereas we intend to pursue our right to the kingdom of Scotland; and to declare, challenge, and aver the same before him that hath most power, judgment, and reason to try it; and the noble prince Edward, by the grace of God king of England, &c., having informed us, by good and sufficient reasons, that to him belongs the sovereign signory of the same: We therefore promise, that we will hold firm and stable ad, and that he shall enjoy the realm to whom it shall be adjudged before him. In witness whereof, we have set our feals to this writing, made and granted at Norham, the Tuesday after the Ascension, in the year of Grace 1291."
compliance with this last demand of Edward, the regency of Scotland without hesitation yielded to it also; for which they gave the following reasons. "That whereas they (the states of Scotland) had, with one consent, already granted that King Edward, as superior lord of Scotland, should give sentence as to their several rights and titles to the crown of Scotland, &c., but as the said king of England cannot put his judgement in full execution to answer effectually without the possession or fein of the said country and its castles; we will, grant, and consent, that he, as sovereign lord thereof, to perform the things aforesaid, shall have fein of all the lands and castles in Scotland until right be done to the demandants, and to the guardians and community of the kingdom of Scotland, to reform both it and its castles, with all the royalties, dignities, franchises, customs, rights, laws, usages, and possessions, with their appurtenances, in the same state and condition they were in when he received them; saving to the king of England the homage of him that shall be king; so as they may be restored within two months after the day the rights shall be determined and admitted; and that the profits of the nation which shall be received in the mean time shall be kept in the hands of the chamberlain of Scotland that now is, and one to be joined with him by the king of England; so as the charge of the government, castles, and officers of the realm, may be deducted. In witness whereof, &c."

For these reasons, as it is said, the regency put into the hands of Edward all the forts in the country. Gilbert de Umfrerville alone, who had the command of the castles of Dundee and Forfar, refused to deliver them up, until he should be indemnified by the states, and by Edward himself, from all penalties of treason of which he might afterwards be in danger.

But though Edward had thus got into his hands the whole power of the nation, he did not think proper to determine everything by his own authority. Instead of this he appointed commissioners, and promised to grant letters-patent declaring that sentence should be made in due time. It had been all along foreseen that the great dispute would be between Bruce and Balliol; and though the plea of Cummin was judged firm in the hands of Edward all the forts in the country.

The commissioners having met on the second of June 1292, ambassadors for Norway presented themselves in the assembly, demanding that their matter should be admitted into the number of the claimants, as father and next heir to the late queen. This demand too was admitted by Edward, after the ambassadors had acknowledged his superiority over Scotland; after which he proposed that the claims of Bruce and Balliol should be previously examined, but without prejudice to those of the other competitors. This being agreed to, he ordered the commissioners to examine by what laws they ought to proceed in forming their report. The discussion of this question was attended with such difficulty, and the opinions on it were so various, that Edward once more adjourned the assembly to the 12th of October following; at which time he required the members to give their opinions on the two following points: 1. By what laws and customs they ought to proceed to judgment; and, supposing there could be no law or precedent found in the two kingdoms, in what manner? 2. Whether the kingdom of Scotland ought to be taken in the same view as all other states, and to be awarded in the same manner as earldoms and baronies? The commissioners replied, that Edward ought to give justice conformable to the usage of the two kingdoms; but that if no certain laws or precedents could not be found, he might, by the advice of his great men, enact a new law. In answer to the second question they said, that the succession to the kingdom might be awarded in the same manner as to other estates and great baronies. Upon this, Edward ordered Bruce and Balliol to be called before him; and both of them urged their respective pleas, and answers, to the following purpose.

Bruce pleaded, 1. That Alexander II. despairing of heirs of his own body, had declared that he held him to be the true heir, and offered to prove by the testimony of perfons still alive, that he declared this with the advice and in the presence of the good men of his kingdom. Alexander III. also had declared to those with whom he was intimate, that, failing issue of his own body, Bruce was his right heir. The people of Scotland had taken an oath for maintaining the succession of the nearest in blood to Alexander III. who ought of right to inherit, failing Margaret the Maiden of Norway and her issue. Balliol answered, that nothing could be concluded from the acknowledgment of Alexander II. for that he left heirs of his body; but made no answer to what was said of the sentiments of Alexander III. and of the oath made by the Scottish nation to maintain the succession of the next of blood. 2. Bruce pleaded, that the right of reigning ought to be decided according to the natural law, by which kings reign; and not according to any law or usage force between subject and subject: That by the law of nature, the nearest collateral in blood has a right to the crown; but that the confitutions which prevail among vassals, bind not the lord, much less the sovereign: That although in private inheritances, which
are divisible, the eldest female heir has a certain prerogative, it is not so in a kingdom that is indivisible; there the nearest heir of blood is preferable whenever the succession opens. — To this Baliol replied, that the claimants were in the court of their lord paramount; and that he ought to give judgment in this case, as in the case of any other tenements, depending on his crown, that is, by the common law and usage of his kingdom, and no other. That by the laws and usages of England, the eldest female heir is preferred in the succession to all inheritances, indivisible as well as divisible.

3. It was urged by Bruce, that the manner of succession to the kingdom of Scotland in former times, made for his claim; for that the brother, as being nearer in degree, was wont to be preferred to the son of the deceased king. Thus, when Kenneth Macalpin died, his brother Donald was preferred to his son Constantine, and this was confirmed by several other authentic instances in the history of Scotland. Baliol answered, that if the brother was preferred to the son of the king, the example proved against Bruce; for that the son, not the brother, was the nearest in degree. He admitted, that after the death of Malcolm III, his brother usurped the throne; but he contended, that the son of Malcolm complained to his liege lord the king of England, who dispossessed the usurper, and placed the son of Malcolm on the throne; that after the death of the son the brother of Malcolm III, again usurped the throne; but the king of England again dispossessed him, and raised Edgar, the second son of Malcolm, to the sovereignty.

4. Bruce pleaded, that there are examples in other countries, particularly in Spain and Savoy, where the son of the second daughter excluded the grandson of the eldest daughter. Baliol answered, that examples from foreign countries are of no importance; for that according to the laws of England and Scotland, where kings reign by succession in the direct line, and earls and barons succeed in like manner, the issue of the younger sister, although nearer in degree, excludes not the issue of the eldest sister, although more remote; but the succession continues in the direct line.

5. Bruce pleaded, that a female ought not to reign, as being incapable of governing; that at the death of Alexander III. the mother of Baliol was alive; and as she could not reign, the kingdom devolved upon him, as being the nearest male heir of the blood royal. But to this Baliol replied, that Bruce’s argument was inconsistent with his claim: for that if a female ought not to reign, Isabella, the mother of Bruce ought not, nor must Bruce himself claim through her. Besides, Bruce himself had sworn fealty to a female, the maiden of Norway.

The arguments being thus sifted on both sides, Edward demanded an answer from the council as to the merits of the competitors. He also put the following question to them: By the laws and usages of both kingdoms, does the issue of the eldest sister, though more remote in one degree, exclude the issue of the second sister, though nearer in one degree? or ought the nearer in one degree, infuing from the second sister, to exclude the more remote in one degree infuing from the eldest sister? To this it was answered unanimously, That by the laws and usages of both kingdoms, in every heritable succession, the more remote in one degree descended from the eldest sister, was preferred to the nearer in degree infuing from the second sister. In consequence of this, Bruce was excluded from the succession; upon which he entered a claim for one third of the kingdom: but being baffled in this also, the kingdom of Scotland being determined an indivisible fee, Edward ordered John Baliol to have seisin of Scotland; with this caveat, however, “That this judgment should not impair his claim to the property of Scotland.”

After so many disgraceful and humiliating concessions on the part of the Scots, John Baliol was crowned king at Scone on the 30th November 1292; and finished the ceremony by doing homage to the king of England. All his submissions, however, could not satisfy Edward, as long as the least shadow of independence remained to Scotland. A citizen of Berwick appealed from a sentence of the Scots judges appointed by Edward, in order to carry his cause into England. But this was opposed by Baliol, who pleaded a promise made by the English monarch, that he should observe the laws and usages of Scotland, and not withdraw any cause from Scotland into his English courts.” Edward replied, that it belonged to him to hear the complaints made against his own ministers; and concluded with altering his right, not only to try Scots causes in England, but also to summon the king of Scotland, if necessary, to appear before him in person. Baliol had not spirit to rebel; and therefore signed a most disgraceful instrument, by which he declared, that all the obligations which Edward had come under were already fulfilled, and therefore that he discharged them all.

Edward now thought proper to give Baliol some marks of his favour, the most remarkable of which was giving him seisin of the Isle of Man; but it soon appeared that he intended to exercise his rights of superiority in the most provoking manner. The first instance was in the case of Malcolm earl of Fife. This nobleman had two sons, Colban his heir, and another who is constantly mentioned in history by the family-name of Macduff. — It is said, that Malcolm put Macduff in possession of the lands of Reres and Crey. Malcolm died in 1266; Colban his son, in 1270; Duncan the son of Colban, in 1288. To this last earl, his son Duncan, an infant, succeeded. During the minority of this Duncan, grand-nephew of Macduff, William bishop of St Andrew’s, guardian of the earldom, dispossessed Macduff. He complained to Edward; who, having ordered his cause to be tried, restored him again to possession. Matters were in this state when Baliol held his first parliament at Scone, 16th February 1292. There Macduff was cited to answer for having taken possession of the lands of Reres and Crey, which were in possession of the king since the death of the last earl of Fife. As his defences did not satisfy the court, he was condemned to imprisonment; but an action was referred to him against Duncan, when he should come of age, and against his heirs. In all this defence, it is surprising that Macduff should have omitted his strongest argument, viz. that the regents, by Edward’s authority, had put him in possession, and that Baliol had ratified all things under Edward’s authority. However, as soon as he was set at liberty, he petitioned Baliol for a rehearing; but this being refused, he appealed
to Edward, who ordered Baliol to appear before him in person on the 25th of March 1293; but as Baliol did not obey this order, he summoned him again to appear on the 14th of October. In the mean time the English parliament drew up certain standing orders in cases of appeal from the king of Scots; all of which were hard and capitans. One of these regulations provided, "that no excuse of absence should ever be received either from the appellant, or the king of Scotland respondent; but that the parties might have counsel if they demanded it."

Though Baliol had not the courage to withstand the second summons of Edward, he behaved with considerable resolution at the trial. The cause of Macduff being come on, Edward asked Baliol what he had to offer in his own defence; to which he replied, "I am king of Scotland. To the complaint of Macduff, or to answer, of any, the kingdom was obliged to yield up his personal attendance on the English court; but as Baliol did not ask a longer day, nor consent to an adjournment."—It was then resolved by the parliament of England, that the king of Scotland had offered no defence; that he had made an answer, in Edward's right of Scotland; all of which was ratified. One of the principal castles of Scotland, with the towns wherein they were situated, and the royal jurisdiction thereof, should be taken into the custody of the king, and there remain until the king of Scots should make satisfaction for his contempt and disobedience. To make recompense to Macduff for his suffering, he was ordered damages from the king of Scots, to be taxed by the court; and it was also determined that Edward should inquire, according to the usages of the country, whether Baliol recovered the tenements in question by the judgment of the king's court, and whether he was dispossessed by the king of Scots. It was also resolved, that the three principal castles of Scotland, with the towns wherein they were situated, and the royal jurisdiction thereof, should be taken into the custody of the king, and there remain until the king of Scots should make satisfaction for his contempt and disobedience. But, before this judgment was publicly intimated, Baliol addressed Edward in the following words: "My lord, I am your liege-man for the kingdom of Scotland; that, whereof you have lately treated, respects my people no less than myself: I therefore pray you to delay it until I have consulted my people, lest I be surprised through want of advice: They are now with me, neither will nor dare advise me in absence of the rest of my kingdom. After I have advised with them, I will in your first parliament after Easter report the result, and do to you what I ought."

In consequence of this address, Edward, with consent of Macduff, stopped all proceedings till the day after the feast of Trinity 1294. But before this term Edward was obliged to suspend all proceedings against the Scots, by a war which broke out with France. In a parliament held this year by Edward, the king of Scotland appeared, and consented to yield up the whole re-

---

5 B of
of war, after having sworn never to bear arms against
England.

In the mean time, Baliol, by the advice of his par-
liament, solemnly and openly renounced his allegiance
to Edward, sending the following declaration.

“To the magnanimous prince, Edward, by the grace
of God, king of England; John, by the same grace,
king of Scotland.

“Whereas you, and others of your kingdom, you
not being ignorant, or having cause of ignorance, by
your violent power, have notoriously and frequently
done grievous and intolerable injuries, contempts, griev-
ances, and strange damages against us, the liberties of
our kingdom, and against God and justice; citing us,
at your pleasure, upon every flight suspicion, out:
of our kingdom; unduly vexing us; seizing our
citizens, and pollileons, in your kingdom; unjustly,
and for no fault of ours, taking the goods of our subiects,
as well by sea as land, and carrying them into your
kingdom; killing our merchants, and others of our
kingdom; carrying away our subjects and imprisoning
them: For the reformation of which things, we sent
our messengers to you, which remain not only underraf-
ed, but there is every day an addition of worse things
to them: for now you are come with a great army
upon the borders, for the disquieting us, and the
habitants of our kingdom; and, proceeding, have in-
humanly committed slaughter, burning, and violent
invasions, as well by sea as land: We not being able
to sustain the said injuries, grievances, and damages any
longer, nor to remain in your fealty or homage, exorted
by your violent oppression, we retort them to you,
for ourself, and all the inhabitants of our kingdom, as
well for the lands we hold of you in your kingdom, as
for your pretended government over us.”

Edward was presented with this renunciation by the
hands of the intrepid Henry abbot of Aberbrough; and
as it was favourable to his political views, he re-
ceived it rather with contempt than anger. “The
foolish traitor,” said he to the abbot, “since he will
not come to us, we will go to him.” The abbot had
been perfused by his enemies, of whom he had many
in Scotland, to present this letter, in hopes that Ed-
ward would have put him to death; but he had ad-
ressed enough to escape safe out of his hands, without
receiving any other answer.

Though this scheme of renunciation had been con-
certed some time before, the declaration was not sent
to Edward till after the taking of Berwicke. The fate
of Scotland, however, after it, was soon decided. The
Earl of March had taken part with Edward, but the
counters betrayed his castle of Dunbar into the hands of
the Scots. Edward sent a chosen body of troops to re-
cover the place. The whole force of Scotland opposed
them on the heights above Dunbar; but leaving their
advantageous post, and pouring down on their enemies
in confusion, they were dispersed and defeated.

The castle of Dunbar surrendered at discretion; that
of Roxburgh followed the same example; the castle of
Edinburgh surrendered after a short siege; and Stirling
was abandoned. The Scots, in the mean time, were
 guilty of the greatest extravagances. During the short
interval between the loss of Berwick and the defeat at
Dunbar, an order was made for expelling all the Engli-
heraldaries who held benefits in England; all the
partizans of England, and all neutrals, were declared
traitors, and their estates confiscated. But the great
successes of Edward soon put an end to their impotent
acts of fury. Baliol was obliged to implore the mercy
of the conqueror. Divested of his royal ornaments,
and bearing a white rod in his hand, he performed a
most humiliating penance; confessing, that by evil and
false counsel, and through his own simplicity, he had
grievously offended his liege lord. He recapitulated
his various transgressions, in concluding an alliance
with France while at enmity with England; in con-
trasting his fon with the niece of the French king; in
renouncing his fealty; in attacking the English terri-
tories, and in refiling Edward. He acknowledged
the injustice of the English invasion and conquest; and
therefore he, of his own free consent, resigned Scotland,
its people, and their homage, to his liege-lord Edward,
dd July 1296.

The king of England pursued his conquests, the
barons everywhere crowding in to swear fealty to him,
and renounce their allegiance with France. His jour-
ney ended at Elgin, from whence he returned south-
ward; and, as an evidence of his having made an abso-
lute conquest of Scotland, he carried off from Scone
the wooden chair in which the kings were wont to be
crowned. This chair had for its bottom the fatal stone
regarded as the national palladium (n). Some of the
charters

(p) “This flower is thus described by W. Hemingford, T. i. p. 37. “Apud monasterium de Scone postitus
erat lapis pergrantis in ecclesia Dei, juxta magnam altare, concavus quidem ad modum rotunda cathedra confectus,
in quo futuri reges loco quasi coronationis ponebantur ex more. Rege itaque novo in lapide poftito, millarum
folemnia incepta peraguntur, et praterquam in elevatione facri dominici corporis, femper lapidatus, manit.”
And again, T. i. p. 100. “In redeundo per Scone, praecepit tolli et Londonias caeari, lapidem illum, in qua, ut
supra dictum est, Reges Scotiae sollemniter ponere, loco coronationis sua et hoc in signum regni conquirit et regnant;”
Wallingham mentions the use to which Edward put this flower: “Ad Velitam monasterium transtult illum, jubens
inde fieri celebrantium cathedram facerdotum.” This account of the fatal stone is here transcribed, that it may
be compared with the appearance of the stone that now bears its name at Wallminster.
Fordun has preferred the ancient rhymes concerning it; L. xi. c. 25.

“Hic rex sic totam Scotiae fecit fabi notam,
Qui fine menura tuit inde jocalia plurar;
Et pariter lapidem, Scotorum quem fore fedem
Regum decevrit fatum; quod sic inolevit,
Ni fallat fatum, Scoti quacunque locatum
Inveniet lapidem, regnare tenentur ibidem.”

This
charters belonging to the abbey were carried off, and
the seals torn from others: "which," says Lord Hailes,
"is the only well-vouched example which I have found
of any outrage on private property committed by Ed-
ward's army. It is mentioned in a charter of Robert I.
and we may be assured that the outrage was not dimi-
nished in the relation."

On the 28th of August 1296, Edward held a parlia-
mament at Berwick, where he received the fealty of
the clergy and laity of Scotland. It is said, that
while the English monarch was employed in the contest
of Scotland, he had promised the sovereignty to Robert
Bruce, lord of Annandale, in order to secure his fidelity;
but being put in mind of his promise, he answerted,
"Have I no other business but to conquer king-
doms for you?" Bruce silently retired, and passed
his days in obscurity. Among those who professed
their allegiance at this parliament was Robert Bruce the
younger, earl of Carrick. After this, Edward took
the most effectual methods of securing his new con-
quered. He ordered the estates of the clergy to be re-
stored; and having received the fealty of the widows
of many of the Scottish barons, he put them in posse-
ssion of their jointure-lands, and even made a decent
provision for the wives of many of his prisoners. Yet,
though in every thing he behaved with great modera-
tion towards the Scots, he committed the government of
certain districts, and of the chief castles in the south
of Scotland, to his English subjects, of whose fidelity
and vigilance he thought himself assured. In order to
conciliate the affections of the clergy, he granted to
the Scottish bishops, for ever, the privilege of bequeath-
ing their effects by will, in the same manner as that
privilege was enjoyed by the archbishops and bishops of
England. In honour of the "glorious Confessor St.
Cuthbert," he gave to the monks of Durham an annual
penion of 40 pounds, payable out of the revenues of
Scotland, by the tenure of maintaining, before the
throne of the saint, two wax-tapers of 20 pounds weight
each, and of distributing twice a-year one penny each
to 3000 indigent persons. At last, having settled every
thing, as he thought, in tranquillity, he departed for
England, with all the pride of a conqueror.

The tranquillity established by Edward, however, was
of short duration. The government of Scotland at that
time required many qualities which Edward's viceroy-
gens had not. Warrenne, earl of Surry, who had been
appointed governor, took up his abode in England, on
pretence of recovering his health. Crellingham, the
treasurer, was a voluptuous, proud, and selfish eccle-
siastic; while Ormelyn the justiciary was hated for his se-
verity. Under these officers the administration of Ed-
ward became more and more feeble; bands of robbers
infested the highways, and the English government was
universally deplored. At this critical moment arose Sir
William Wallace, the hero so much celebrated in Scot-
tish fables, and by which indeed his real exploits are so
much obscured, that it is difficult to give an authentic
relation of them. The most probable account is, that
he was the younger son of a gentleman (Wallace of
Elginshire) in the neighbourhood of Paulet. Having
been outlawed for some offence (generally supposed to
have been the killing of an Englishman), he associated
with a few companions, of fortunes equally desperate
with his own. Wallace himself was endowed with
great strength and courage, and an active and ambitious
spirit; and by his activity, eloquence, and wisdom, he
maintained an authority over the rude and undisciplined
multitudes who flocked to his standard. In May 1297,
he began to infest the English quarters; and being suc-
cessful in his predatory incursions, his party became
more numerous, and he was joined by Sir William
Douglas. With their united forces, these two allies
attempted to surprise Ormelyn the justiciary, while he
held his courts at Scone; but he saved himself by a
precipitate flight. After this the Scots roved over the
whole country, assaulted castles, and massacred the
English. Their party was joined by many persons of
rank; among whom were Robert Wileheart bishop of
Glaisgow, the Steward of Scotland and his brother
Alexander de Lindfay, Sir Richard Lundin, and Sir
Andrew Moray of Bothwell. Young Bruce would have
been a vast accession to the party; for he poiffessed
all Carrick and Annandale, so that his territories reach-
ed from the firth of Clyde to Solway. But the war-
dens of the western marches, of England suspected his
fidelity, and summoned him to Carlisle. He obeyed,
and made oath on the consecrated holt, and on the
sword of Becket, to be faithful and vigilant in the caufe
of Edward; and to prove his sincerity he invaded
his

The Scots, however, ruined every thing by their difaffections. Wallace was envied on account of
his felicity, and commoned him to Carlisle. He obeyed,
and made oath on the consecrated holt, and on the
sword of Becket, to be faithful and vigilant in the caufe
de Edward; and to prove his sincerity he invaded
his

The tranquillity established by Edward, however, was
of short duration. The government of Scotland at that
time required many qualities which Edward's vice-
gens had not. Warrenne, earl of Surry, who had been
appointed governor, took up his abode in England, on
pretence of recovering his health. Crellingham, the
treasurer, was a voluptuous, proud, and selfish eccle-
siastic; while Ormelyn the justiciary was hated for his se-
verity. Under these officers the administration of Ed-
ward became more and more feeble; bands of robbers
infested the highways, and the English government was
universally deplored. At this critical moment arose Sir
William Wallace, the hero so much celebrated in Scot-
tish fables, and by which indeed his real exploits are so
much obscured, that it is difficult to give an authentic
relation of them. The most probable account is, that

This was the stone which Gathelus sent from Spain with his son when he invaded Ireland, which king Fergus
won in Ireland, brought over with him, and placed at Scone. As the most proper authority for a story of this
nature, see Act of Sir William Wallace, by Blind Harry, B. i. c. i.
his treachery, by saying, "I will remain no longer of a party that is at variance with itself" without considering that he himself, and his party, were partly the occasion of that variance. Other leaders entered into a negotiation with the English. Bruce, the Steward and his brother Alexander de Lindecey, and Sir William Douglas, acknowledged their offences, and made submissions to Edward for themselves and their adherents.

This scandalous treaty seems to have been negotiated by the bishop of Glasgow, and their recantation is recorded in the following words.—"Be it known to all men: Whereas we, with the commons of our country, did rise in arms against our lord Edward, and against his peace, in his territories of Scotland and Galloway, did burn, slay, and commit divers robberies; we therefore, in our own name, and in the name of all our adherents, agree to make every reparation and atonement that shall be required by our sovereign lord; referring always what is contained in a writing which we have procured from Sir Henry Percy and Sir Robert Clifford, commanders of the English forces; at Irvine, 9th July 1297." To this instrument was appended, "Erit a Sire William?" the meaning of which Lord Hailes supposes to be, that the barons had notified to Sir William Wallace their having made terms of accommodation for themselves and their party.

Edward accepted the submissions of the Scottish barons who had been in arms, and granted liberty to those whom he had made prisoners in the course of the former year, on condition that they should serve him in his wars against France. The inconstancy of Bruce, however, was so great, that acknowledgments of submissions or oaths of fealty were not thought sufficiently binding on him; for which reason the bishop of Glasgow, the Steward, and Alexander de Lindecey, became sureties for his loyalty and good behaviour, until he should deliver his daughter Marjory as hostage.

Wallace alone refused to be concerned in these shameful submissions; and, with a few resolute followers, resolved to submit to every calamity rather than give up the liberty of his country. The barons had undertaken to procure his submissions as well as their own; but finding that to be impossible, the bishop of Glasgow and Sir William Douglas voluntarily surrendered themselves prisoners to the English. Edward, however, ascribed this voluntary surrender, not to any honourable motive, but to treachery. He asserted, that Wallace repaired to the castle of Roxburgh under pretence of yielding himself up, but with the concealed purpose of forming a conspiracy in order to betray that castle to the Scots; and in proof of this, Edward appealed to intercepted letters of Wallace. On the other hand, Wallace, ascribing the bishop's conduct to traitorous perfidiousness, plundered his house, and carried off his family captives.

Immediately after the defection of the barons at Irvine, Wallace with his band of determined followers attacked the rear of the English army, and plundered their baggage; but was obliged to retire, with the loss of 1000 men. He then found himself deserted by almost all the men of eminence and property. His army, however, increased considerably by the accession of numbers of inferior rank, and he again began to act on the offensive. While he employed himself in besieging the castle of Dundee, he was informed that the English army approached Stirling. Wallace, having charged the citizens of Dundee, under the pain of death, to continue the blockade of the castle, hastened with all his troops to guard the important pass of the Forth; and encamped behind a rising ground in the neighbourhood of the abbey of Cambuskenneth. Brian Fitz-Alban had been appointed governor of Scotland by Edward; but Warenne, who waited the arrival of his successor, remained with the army. Imagining that Wallace might be induced by fair means to lay down his arms, he dispatched two friars to the Scottish camp, with terms of capitulation. "Return," said Wallace, "and tell your masters, that we came not here to treat but to avert our right, and to set Scotland free. Let them advance, they will find us prepared." The English, provoked at this answer, demanded impatiently to be led on to battle. Sir Richard Lundin renounced against the absurdity of making a numerous army pass by a long narrow bridge in presence of the enemy. He told them, that the Scots would attack them before they could form on the plain to the north of the bridge, and thus certainly defeat them at the same time he offered to show them a ford, which, having crossed with 500 horse, and a chosen detachment of infantry, he proposed to come round upon the rear of the enemy, and by this diversion facilitate the operations of the main body. But this proposal being rejected, the English army began to pass over; which was no sooner perceived by Wallace, than he rushed down upon them, and broke them in a moment. Creffingham the treasurer was killed, and many thousands were slain on the field, or drowned in their flight. The loss of the Scots would have been incon siderable, had it not been for that of Sir Andrew Moray, the intimate friend and companion of Wallace, who was mortally wounded in the engagement. The Scots are said to have treated the dead body of Creffingham with the utmost indignity; to have flayed him, and cut his skin into pieces, which they divided among themselves; while others told us, they used it for making girths, and saddles.

The victory at Stirling was followed by the surrender of Dundee castle, and other places of strength in Scotland; at the same time the Scots possessed possession of Berwick, which the English had evacuated. But as a famine now took place in Scotland by the bad seasons and miseries of war, Wallace marched with his whole army into England, that he might in some measure relieve the necessities of his countrymen by plundering the enemy. This expedition lasted three weeks, during which time the whole tract of country from Cockermouth and Carlisle to the gates of Newcastle was laid waste with all the fury of revenge and rapacity; though Wallace endeavoured as far as possible, to repref the licentiousness of his soldiers.

In 1298, Wallace assumed the title of "Governor of Scotland, in name of King John, and by consent of the Scottish nation;" but in what manner this office was obtained, is not now in a great measure unknown. In a parliament which he convoked at Perth, he was confirmed in his authority; and under this title he conferred the onibubary of Dundee on Alexander firmed Skreingeour and his heirs, on account of his faithful aid in bearing the royal standard of Scotland. This
Edward instantly marched against them. His army lay that night in the fields. While Edward slept on the ground, his war-horse trampled him, and broke two of his ribs. The alarm arose, that the king was wounded. They who knew not the cause, repeated the cry, “The king is wounded; there is treason in the camp; the enemy is upon us.” Edward mounted on horseback, and by his presence dispelled the panic. With a fortitude of spirit superior to pain, he led on his troops. At break of day, the Scottish army was defeated, forming on a fliny field at the site of a small eminence in the neighbourhood of Falkirk.

Wallace ranged his infantry in four bodies of a circular form. The archers, commanded by Sir John Stewart, were placed in the intervals. The horse, amounting to no more than a thousand, were at some distance in the rear. On the front of the Scots lay a morass. Having drawn up his troops in this order, Wallace pleasantly said, “Now I have brought you to the ring, dance according to your skill.”

Edward placed his chief confidence in the numerous and formidable body of horsemen whom he had selected for the Scottish expedition. Their he ranged in three lines. The first was led by Bigot earl Marshall, and the earls of Hereford and Lincoln; the second by the bishop of Durham, having under him Sir Ralph Badger of Drayton; the third, intended for a reserve, was led by the king himself. No mention is made of the disposition of his infantry: it is probable that they were drawn up behind, to support the cavalry, and to annoy the Scots with their arrows and other missile weapons.

Bigot, at the head of the first line, rushed on to the charge. He was checked by the moats, which in his impetuosity he had overlooked. This obliged him to incline to the solid ground on his left, towards the right flank of the Scotch army. The bishop of Durham, who led the second line, inclined to the right, turned the moats, and advanced towards the left flank of the Scotch army. He proposed to halt till the reserve should advance. “To make, bishop,” cried Badger, and instantly charged. The shock of the English cavalry on each side was violent, and gallantly withstood by the Scottish infantry; but the Scotch cavalry, dismayed at the number and force of the English men-at-arms, immediately quitted the field. Stewart, while giving orders to his archers, was thrown from his horse and slain. His archers crowded round his body and perished with him. Often did the English strive to force the Scotch circle. “They could not penetrate into that wood of spears,” as one of their historians speaks. By defeated repeated charges, the outermost ranks were brought to the ground. The English infantry incessantly galled the Scots with showers of stones and arrows. Macduff and Sir John Graham fell. At length the Scots were broken by the numbers and weight of the English cavalry, and the rout became universal.

The number of the Scots slain in this battle must have been very great. As is commonly the case, it is exaggerated by the historians of the victors, and reduced too low by the historians of the vanquished.

On the side of the English the loss was incomparable. The only persons of note who fell were Brian le Jay, master of the English Templars, and the prior of Tov-
The Scots in their retreat burnt the town and castle of Stirling. Edward repaired the castle, and made it a place of arms. He then marched to the west. At his approach, Bruce burnt the castle of Ayer, and retired. Edward would have pursued him into Carrick; but the want of provisions stopped his further progress. He turned into Annandale, took Bruce's castle of Lochmaben, and then departed out of Scotland by the western borders.

Here may be remarked the fatal precipitancy of the Scots. If they had studied to protract the campaign, instead of hazarding a general action at Falkirk, they would have foiled the whole power of Edward, and reduced him to the necessity of an ignominious retreat.

In 1299 Edward thought proper to release John Baliol the unfortunate king of Scotland, whom he had kept close prisoner ever since the year 1296. Before this time Baliol had used the most disgraceful methods to recover his liberty. He had solemnly declared, that "he would never have any intercourse with the Scots; that he had found them a fickle and treacherous people; and that he had reason to suspect them of an intention to poison him." However, notwithstanding all his pretensions, Edward still detained him in captivity; but at last released him at the mediation of the pope, though after a singular form: He ordered the governor of Dover to convey him to the French coast, and there to deliver him to the papal nuncio, "with full power to the pope to dispose of Baliol and his English estate." In consequence of which he was conveyed to Wiltland, delivered to the nuncio in presence of a notary and witnesses, and a receipt taken for his person. Notwithstanding this abject state, however, the Scots continued to own him for their king, and to assert their national independency. The misfortune at Falkirk had deprived them of a very considerable extent of territory, they were still in possession of the whole country beyond the Forth, as well as the county of Galloway. By general consent William Lamberton bishop of St Andrew's, Robert Bruce earl of Carrick, and John Cummin the younger, were chosen guardians of Scotland in name of Baliol. Wallace at this time was reduced to the condition of a private man; nor had he any longer the command of the Scots armies, nor any share in their councils.—The new guardians undertook to reduce the castle of Stirling, and Edward prepared to defend it. The Scots posted themselves at the Torwood, and chose Edward obliged to have raised the siege without dislodging them; which finding it impossible for him to do, he returned home in disgust. Next year he invaded Scotland on the west side, waited Annandale, and reduced Galloway; but the Scots being now taught by experience to avoid a general action, chose their posts with such skill, that Edward

"This account of the action at Falkirk, extracted from Lord Hailes's Annals, is drawn, his Lordship informs us, from the testimony of the English historians. "They have done justice (he observes) to the courage and steadiness of their enemies; while our historians represented their own countrymen as occupied in frivolous unmeaning contents, and, from treachery or resentment, abandoning the public cause in the day of trial. "It would be tedious and unprofitable to recite all that has been said on this subject by our own writers from Fordun to Abercrombie. How Wallace, Stewart, and Comyn, quarrelled on the point of leading the van of an army which stood on the defensive: How Stewart compared Wallace to 'an owl with borrowed feathers': How the Scottish commanders, buffed in this frivolous altercation, had no leisure to form their army: How Comyn traitorously withdrew with 10,000 men: How Wallace, from resentment, followed his example: How by such dishonourable incidents, the Scottish army was enfeebled, and Stewart and his party abandoned to destruction. Our histories abound in truth of this kind: There is scarcely one of our writers who has not produced an inveigh against Comyn, or an apology for Wallace, or a lamentation over the deserted Stewart. What dilations may have prevailed among the Scottish commanders, it is impossible to know. It appears not to me that their dissensions had any influence on their conduct in the day of battle. The truth seems to be this: The English cavalry greatly exceeded the Scottish in numbers, were infinitely better equipped and more adroit: the Scottish cavalry were greatly intimidated, and fled. Had they remained on the field, they might have preferred their honour; but they never could have turned the chance of that day. It was natural, however, for such of the infantry as survived the engagement, to impute their disaster to the defection of the cavalry. National pride would ascribe their flight to treachery rather than to pusillanimity. It is not improbable that Comyn commanded the cavalry: hence a report may have been spread, that Comyn betrayed his country; this report has been embellished by each successive relator. When men are seized with a panic, their commander must from necessity, or will from prudence, accompany them in their flight. Earl Warrene fled with his army from Stirling to Berwick; yet Edward I did not punish him as a traitor or a coward.

"The tale of Comyn's treachery, and Wallace's ill-timed resentment, may have gained credit, because it is a pretty tale, and not improbable in itself; but it amazes me that the story of the congress of Bruce and Wallace after the battle of Falkirk should have gained credit. I lay aside the full evidence which we now possess, that Bruce was not, at that time, of the English party, nor present at the battle. For it must be admitted, that our historians knew nothing of those circumstances which demonstrate the impossibility of the congress. But the wonder is, that men of sound judgment should not have seen the absurdity of a long conversation between the commander of a flying army, and one of the leaders of a victorious army. When Fordun told the story, he placed a 'narrow but inaccessible glen' between the speakers. Later historians have substituted the river Carron in the place of the inaccessible glen, and they make Bruce and Wallace talk across the river like two young declaimers from the pulpits in a school of rhetoric."
ward could not penetrate farther; and the same year a truce was concluded with the Scots, to continue till Whitsunday 1301. This year a new competitor appeared for the crown of Scotland. Boniface VIII. in a bull directed to Edward, averred, that Scotland belonged anciently, and did still belong, to the holy see; and supported his extravagant claim by some strange authorities; such as, that Scotland had been miraculously converted by the relics of St Andrew; after which he proceeded to show the futurity of Edward’s pretensions, and that Scotland never had any feudal dependence on England. He required Edward to set at liberty all the Scottish ecclesiastics, particularly Wilheird bishop of Glasgow, and to remove his officers from the patrimony of the church; ‘But (added he) should you have any pretensions to the whole, or any part of Scotland, fend your prelacies to me within six months; I will hear and determine according to justice; I take the cause under my own peculiar cognizance.’

His pretensions answered by Edward and his parliament. This interpolation of the pope had probably been prepared by Scottish emissaries at the court of Rome; but, however ridiculous his pretensions might be, they afforded matter of very serious consideration to Edward. After spending a whole winter in deliberations, Edward and his parliament made separate answers to the pope. The answer of the parliament was to the following purpose: ‘All England knows, that ever since the first establishment of this kingdom, our kings have been liege-lords of Scotland. At no time has the kingdom of Scotland belonged to the church. In temporals, the kings of England are not amenable to the fee of Rome. We have with one voice resolved, that, as to temporals, the king of England is independent of Rome; that he shall not suffer his independency to be questioned; and therefore, that he shall not rend comminatory to Rome. Such is, and such, we trust in God, ever will be, our opinion. We do not, we cannot, we must not, permit our king to follow measures subversive of that government which we have freely and of our own free will, and which we will maintain.’

The king entered into a more full refutation of the pope’s arguments; and having, as he thought, answered them sufficiently, he marched again into Scotland; but, by the mediation of France, another truce was concluded, to last till St Andrew’s day 1302. After the expiration of the truce, Edward sent an army into Scotland, under the command of John de Segrave. This general divided his troops into three bodies; but, keeping them so far distant that they could not support each other, they were all engaged and defeated in one day by the Scots, near Rollin (see Roslin). This, however, was the last successful exploit of the Scots at this period. The pope deferted them; and the king of France concluded a peace with England, in which all mention of the Scots was indiscriminately avoided; so that they were left alone to bear the whole weight of Edward’s resentment, who now invaded their country in person with a mighty army. He met with no resistance in his progress, except from the castle of Brecchin, which was commanded by Thomas Maul, a brave and experienced officer. He held out for 20 days against the whole power of the English army; but at last, being mortally wounded, the place capitulated.

From thence he proceeded northward, according to some historians, as far as Caithness. He then returned towards the south, and wintered in Dunfermline. In that place there was an abbey of the Benedictine order; a building so spacious, that, according to an English historian, three sovereign princes with all their retinue might have been lodged conveniently within its precincts. Here the Scottish nobles sometimes held their assemblies. The English soldiers utterly demolished this magnificent fabric.

The only fortress that remained in the possession of the Scots was the castle of Stirling, where Sir William Oliphant commanded. To protect this single place of refuge, Comyn assembled all his forces. He posted his army on the south bank of the river, in the neighbourhood of Stirling, that he might have the last hand for the national liberty. The Scots fondly imagined, that Edward would attempt to force the passage, as the impetuous Crelingham had attempted in circumstances not dissimilar. But the prudence of Edward frustrated their expectations. Having discovered a ford at some distance, he crossed the river at the head of his whole cavalcade. The Scots gave way, and dispersed themselves.

All resources but their own courage had long failed them; that last resource failed them now, and they hastened to conciliate the favour of the conqueror. Previous to this, Bruce had surrendered himself to John de St John, the English warden. Comyn and his followers now submitted to Edward. They stipulated for their lives, liberties, and estates: referring always to Edward the power of inflicting pecuniary mulcts on them as he should see fit.

From the general conditions of this capitulation, the following persons were excepted: Wilheird bishop of Glasgow, the Steward, Sir John Soulis, David de Graham, Alexander de Lindelay, Simon Fraer, Thomas Bois and Wallace. With respect to them, it was provided, that the bishop of Glasgow, the Steward, and Soulis, should remain in exile for two years, and should not pass to the north of Trent; that Graham and Lindelay should be banished from Scotland for six months; that Fraer and Bois should be banished for three years from all the dominions of Edward, and should not be permitted, during that space, to repair to the territories of France. “As for William Wallace, it is agreed, that he shall render himself up at the will and mercy of our sovereign lord the king, if he shall seem good to him.” These were all the conditions that the Scottish nation stipulated for the man who had vanquished the English at Stirling, who had expelled them from Scotland, and who had once fet his country free!

Amid this wreck of the national liberties, Wallace scorned submission. He lived a free man; a free man he resolved to die. Fraer, who had too oft compassed with the times, now caught the same heroic sentiment. But their endeavours to route their countrymen were in vain. The feafon of resistance was past. Wallace perceived that there remained no more hope; and fought out a place of concealment, where, eluding the vengeance of Edward, he might silently lament over his fallen country.

Edward assembled at St Andrew’s what is called a parliament.
Edward's precautions for settling the Scots affairs.

Edward, therefore, took care to preserve the ancient forms as far as was consistent with the dependent state of the nation. It has been said, indeed, that Edward abrogated all the Scottish laws and customs, and endeavored to substitute the English in their stead; but this is denied by others. Lord Hailes gives us at length the record with respect to these laws, in the following words: "And, with respect to the laws and usages of the government of Scotland, it is ordained, that the custom of the Scots and the Breton shall for the future be prohibited, and be no longer practiced. It is also ordained, that the king's lieutenant shall forthwith assemble the good people of Scotland; and that, at such an assembly, shall be read over the statutes made by David king of Scots, and also the additions and amendments which have been made by other kings; and that the lieutenant, with the assistance which he shall then have, as well as of Englishmen as of Scots, shall amend such of these statutes and usages as are plainly against the laws of God and reason, as they both may in so short a space, and in so far as they can without consulting the king; and as to matters which they cannot undertake to correct of themselves, that they be put in writing, and laid before the king by the lieutenant, and any number of commissioners, with parliamentary powers, whom the Scots shall think fit to choose. That they shall meet with commissioners appointed by the king, and finally determine as to the premises."

This is the record by which it is generally supposed that the law of Scotland was abrogated. But Lord Hailes is of opinion, that the usage of the Scots and Breton did not here mentioned was something different from the common law of the land. "We know (says he) from our statute book, that the people of Galloway had certain usages peculiar to themselves; Stat. Alex. II. c. 2. One was, that caufes were tried among them without juries [Quorn. Attch. c. 72. 73. placed in some ancient MSS. among LL. David L. c. 15.7], and this may probably have been the usage which Edward abolished. The people of Galloway were sometimes distinguished by the name of Scots: thus the wild Scot of Galloway is an expression to be found in ancient instruments, and is proverbial even in our own days. The usage of the Breton, I take to be what relates to the judge called britibek, or brehon; in Ireland, brehan; and consequentlv, that the thing here abolished was the commutation of punishments by exacting a pecuniary mulct."

An indemnity was now granted to the Scots upon certain conditions. Various fines were imposed, as granted to one to five years rent of the estates of the delinquents, the Scots. One year's rent was to be paid by the clergy, excluding the bishop of Glasgow; two by those who were more early in their submissions than Comyn; three by Comyn and his associates, and by the bishop of Glasgow; four years rent was to be paid by William de Baliol and John of the castle; and five by Engelam de Umfraville, because they had stood out longer. Three years rent was also paid by the vaillants of Baliol, William, and Umfraville. These fines were to be paid in moieties. The person taxed was to pay half his income annually; and thus Umfraville, taxed in five years rent, was allowed...

the ments, until he fhould test: againfl:

which fettng Baliol of this event loway had a fon, John Baliol, and a daughter named Marjory. John Comyn was the fon of Marjory, and, thoſe who had not yet ſubmitted the competitor, and ſware fealty to the conqueror; repeatedly renounced all earl of Carrick. This young nobleman’s grandfather, 

lier years he Scotland, Comyn might now be conſidered as the following estate, and I will ſupport crown. But his crown and I will give you my whole to Edward. letters of his accuſer, and the next day. The earl of Glouceſter, a pair of ſpurſ, as if he had meant to reſtore his lords that he but the latter found means to pacify him by mild and vered with ſnow, which meſſage, and prepared for Right. The ground king having drank ree y feemed to be fufpicious, and whom he ſoon diſcovered after 

repaired to Dumfries, where Comyn happened to be the bearer of letters from Comyn to the Englifh 

door of Edward. His defendants, Lindsay and Kirpatrick, perceiving them that it was better to ſubmit quietly to the government afſerting his right to the crown of Scotland; that the daughter of Comyn was occeoned by a haſy quarrel between two ſtrong-spirited rivals; and that Bruce, from neceffity and defpair, did then aſſert his pretenſions to the crown.”

The death of Comyn afſected the Scots variously, according to their diﬀerent views and intereſts. The reſtions of the deceased viewed it as a cruel afſaffination, and joined with Edward in ſchemes of revenge. Some who wished well to the peace of their country, thought that it was better to ſubmit quietly to the government of the English, than to attempt a revolution, which could not be eﬀected without much danger and blooded; but, on the other hand, the friends of Bruce now saw the neceſsity they were under of proceeding to the coronaion of the new king without losſ of time. The Ro- 

ences of March 1306, in presence of two earls, the bishops of St. Andrew’s and Glafgow, the abbot of Scone, John de Athol, and John de Menteth. It had been customαry, since the days of Macbeth, for one of the family of Fife to put the crown on the king’s head; and Bruce found the prepoſſeion of the Scots in favour of this circumstance fo ſtrong, that he was oblied to feck for an expedient to ſatisfy them. Macduff the earl of Fife was at that time in England, where he had married a near relation of Edward. His ſiſter was wife to the earl of Buchan, one of the heads of the family of Comyn, and conſequently the determined enemy of Robert. By an uncommon eﬀort of female patriottism, he poſponed all private quarrels to the good of her country, and in her husband’s abſence repaired, with all his warlike acconterments, to Bruce, to whom she delivered them up, and placed the crown upon his head. This crown is faid to have been made by one Comyn, an Engliſhman, who narrowly ecape being punished for it by Edward.

The king of England received intelligence of all these
proceedings with astonishment; and without delay sent a body of troops under the command of Aymer de Valence earl of Pembroke, to suppress the rebellion. Bruce omitted nothing for his defence. He had always been considered by his countrymen as a promising accomplished young nobleman, but firmly attached to Edward's person and government; for which reason he had not been trusted by those independent patriots, who joined Wallace. But their confidence was now gained by his rendering himself so obnoxious to Edward, that no possibility of a reconciliation was left; and he soon saw himself at the head of a small army. With these, who consisted of raw and inexperienced soldiers, Bruce formed a camp at Methven near Perth, which left was the head-quarters of the enemy; but knowing the disadvantage under which he laboured from the inexperience of his men, he resolved to act upon the defensive. The English general at first sent Bruce a challenge to fight him, which was accepted; but the day before the battle, was to have been fought by agreement, the Scots were attacked by surprise, and totally defeated. Bruce behaved with the greatest valour, and had three horses killed under him. Being known by the vaunting which he made, John Mowbray, a man of great courage and resolution, rushed upon him, and catching hold of his horse's bridle, cried out, "I have hold of the new-made king!" but he was delivered by Christopher Scatton. Some Scottish historians have affurred that on tis occasion all the prisoners of note were put to death; but others inform us, that though Edward did send orders to that purpose, the English general pardoned all those who were willing to swear fealty to his master. However, it is certain, that after the battle of Methven, many prisoners were hanged and quartered.

This disaster almost gave the finishing stroke to the affairs of Bruce. He now found himself deserted by a great part of his army. The English had taken prisoners great numbers of women whole husbands followed Bruce; and all those were now ordered, on pain of death, to accompany their husbands. Thus was Bruce burdened with a number of useless mouths, and found it hard to subsist. The consequence was, that most of his men departed with their families, so that in a few days his army dwindled down to 50. With these he retreated to Aberdeen, where he was met by his brother Sir Neil, his wife, and a number of other ladies, all of whom offered to follow his fortune through every adversity. But, however heroic this behaviour might be, it put Bruce to some inconvenience, as he could scarce procure subsistence; and therefore he persuaded the ladies to retire to his castle of Kildromney, under the protection of Sir Neil Bruce and the Earl of Athol. In the mean time the defection among Bruce's troops continued, so that now he had with him no more than 200 men; and as winter was coming on, he resolved to go into Argyleshire, where Sir Neil Campbell's estate lay, who had gone before to prepare for his reception. In his way thither he encountered incredible difficulties; and some of his followers being cut off at a place called Dalry, the rest were so disheartened, that they all forsook him, excepting Sir Gilbert Hay, Sir James (sometimes called Lord) Douglas, and a few domestics. Bruce, however, kept up the spirits of his little party by recounting to them the adventures of princes and patriots in circumstances similar to his own. Having crossed Lochlomond in a small crazy boat, he was discovered by his trusted friend the Earl of Lenox, who had been proscribed in England, and now lived in a kind of exile on his own estate. The meeting between these friends was very affecting, and drew tears from the eyes of all present. Lenox, who had heard nothing of Bruce's misfortunes, furnished him and his half-famished attendants with plenty of provisions: but being soon made sensible that it was impossible for them to live in a place where they were well known, and surrounded by enemies, Bruce resolved to seek out some more safe habitation. For this purpose Sir Neil Campbell had already provided shipping; but our adventurers had scarcely set sail, when they were purveyed by a large squadron of the enemy's fleet. The bark which carried the earl of Lenox escaped with the utmost difficulty to Cantire, where Bruce was already landed: and, at their meeting, both agreed that their persons should never afterwards be separated while they remained alive.

In the mean time Edward, having compromised some differences with his English subjects, resumed his old project of entirely subduing Scotland; and his intention now appears to have been to divide the lands of such as he suspected of defection among his English followers he ordered a proclamation to be made, that all who had any title to the honour of knighthood, either by heritage or estate, should repair to Wallminster to receive all military ornaments, their horses excepted, new invasions of Scotland.

In this matter Edward's preparations for a great expedition were attended with various accidents. In the mean time Edward, having compromised some differences with his English subjects, resumed his old project of entirely subduing Scotland; and his intention now appears to have been to divide the lands of such as he suspected of defection among his English followers he ordered a proclamation to be made, that all who had any title to the honour of knighthood, either by heritage or estate, should repair to Wallminster to receive all military ornaments, their horses excepted, from his royal wardrobe. As the prince of Wales came under this denomination, he was the first who endeavoured to put the ceremony; which gave him a right to confer the like honour on the sons of above 300 of the chief nobility and gentry of England. The prince then repaired to the head of this gallant train, to Edward; who received them, surrounded by his nobility, in the most solemn manner. The king then made a speech on the treachery of the Scots, whose entire destruction he vowed. He declared his resolution of once more heading his army in person; and he desired, in case of his death, that his body might be carried to Scotland, and not buried till final vengeance was taken on the perfidious nation. Having then ordered all present to join him within fifteen days, with their attendants and military equipages, he prepared for his journey into Scotland. He entered the country soon after Bruce's defeat at Methven. The army was divided into two bodies; one commanded by the king himself, the other by the prince of Wales, and, under him, by the earls of Lancaster and Hereford, with orders to proceed northwards, and penetrate into the countries, where the interest of Bruce was strongest. As he passed along, Edward caused all that fell into his hands, whom he suspected of favouring Bruce's party, to be immediately executed. The Bishop of Glasgow was the only exception to this barbarity; he was taken, but had his life spared on account of his function.

In the mean time, as the prince of Wales continued his march northwards, Bruce's queen began to be alarmed for her own safety. She was advised to take sanctuary at the shrine of St Duthac in Ross-shire; but there she was made prisoner by William earl of Rothes, who was of the English party. By Edward's order she was sent to London; her daughter, who was taken at the same time, being shut up in a religious house. The directions given to the queen's attendants were to supply her with what she required for the first few days. As she was a woman of great sensibility, the manner of her treatment was such as to make her suffer much.
directions for the entertainment of the queen are still preferred. She was to be conveyed to the manor of Bruttwick, to have a waiting woman and a maid-servant, advanced in life, sedate, and of good conversation: a butler, two men-servants and a foot-boy for her chamber, fober, not riotous, to make her bed: three greyhounds when she inclines to hunt; venison, filh, and the fairest hirk in the manor. In 1308, she was removed to another prison; in 1312, she was removed to Windfor castle, 20 hillings per week being allowed for her maintenance. In 1314, she was committed to Rochefelt caflle, and was not set at liberty till the clofe of that year.

The only fortefs which Bruce possessed in Scotland was the caflle of Kildrommey; and it was soon befieged by the earls of Lancaftcr and Hereford. One Oiburn treacherously burnt the magazine; by which means the garrifon, deputifte of provifions, was obliged to surrender at difcretion. The common foldiers were hanged; Sir Neil Bruce and the earl of Athol were fent prifoners to Edward, who caused them to be hanged on a gallows 50 feet high, and then beheaded and burnt. The countefs of Buchan, who had crowned King Robert, was taken prifoner; as was Lady Mary Bruce, the king’s filher. Some historians fay, that Edward ordered these two ladles to be shut up in wooden cages, one to be hung over the walls of the caflle of Roxburgh, and the other over thofe of Berwick as public fpectacles; but Lord Hailes only tells us that the countefs of Buchan was put into fiofe confinement in the caflle of Berwick.(f)

About this time alfo many others of Bruce’s party were put to death; among whom were Thomas and Alexander Bruce, two of the king’s brothers, and John Wallace, brother to the celebrated Sir William. Bruce himfelf, in the mean time, was in fuch a defpicable fitation, that it was thought he never could give more disturbance; and it was even reported that he was dead. All his misfortunes, however, could not notfice him, or prevent his meditating a molt fevere revenge upon the defroyers of his family. He first removed to the caflle of Dumbarton, where he was hospitably received and entertained by Angus lord of Kintyre; but, fufpecting that he was not safe there, he failed in three days to Rachrim, a small island on the Irith coaft, where he fecured himfelf efectually from the purfuit of his enemies. It was during his fia on this island, that the report of his death was generally propagated. Notwithstanding this, his party increafed confiderably; and, even when he landed on this island, he was attended by 300 men. However, after having lived for some time in this retreat, being apprehensive that the report of his death might be generally credited among his friends in Scotland, it was resolved to attempt the furprife of a fort held by the English under Sir John Haftings, on the ifle of Arran. This was performed with fuccefs by his two friends Douglas and Sir Robert Boyd, who put the greatest part of the garrifon to the sword. The king, hearing of their fuccefs, paffed over into Arran; but, not knowing where his people reufed, is faid to have found them out by blowing a horn. He then fent a trufly fervant, one Culhbert, into his own country of Carrick; with orders, in cafe he found it well affected.

(f) M. Weftminfter, p. 455, fays, “Capitur etiam illa impifiima conjuraatrix de Buchan, de qua consoltus rex, ait, Quia gladio non percult, gladio non peribit; verum, propter illiciam conjurationem quam fecit, in domicilio lapideo et ferreo, in modo corone fabricato, firmiffe obturat, et apud Bervicum sub dio fornicatus subfendatur, ut fit data, in vita et poit mortem, speculum viatoribus, et opprobrium sempiternum.” Other English historians, copying M. Weftminfter, have faid the fame thing. We cannot, therefore, blame Abercrombie for faying, “She was put in a wooden caflle shaped like a crown, and in that tormenting pofture hung out from high hill or turrets to be gazed upon and reproached by the meaneft of the multitude.” Vol. I. p. 579. Hemingford, Vol. I. p. 221, relates the ftrory in a manner somewhat different. He fays, that the earl of Buchan her husband fought to kill her for treafon; but that Edward relaffained him, and ordered her to be confined in a wooden caflle.

The intentions of Edward I. touching the durance of the countefs of Buchan, will be more certainly learned from his own orders, than from the report of M. Weftminfter. His orders run thus: “By letters under the privy-seal, he commanded, that the chamberlain of Scotland, or his deputy at Berwick upon Tweed, do, in one of the turrets of the faiid caflle, and in the place which he fhall find most convenient, caufe conftuct a caflle ftrongly latticed with wood (de fejd), i.e. beams of timber or paffiades), crofs-barred, and fecured with iron, in which he fhall put the countefs of Buchan. And that he take care that the be fo well and fafely guarded there, in, that in no fort the may iffue therefrom. And that he appoint one or more women of Berwick, of Englifh extraction, and liable to no fufpicion, who fhall minifter to the faiid countefs in eating and drinking, and in all things elfe convenient in her lodging place. And that he do caufe her to be fo well and furely guarded in the caflle, that she may not speak with any one, man or woman, of the Scotch nation, or with any one elfe, faving with the women that fhall be appointed to attend her, or with the guard who fhall have the cuftody of her perfon. And that the caflle be fo conftucted, that the countefs may have therein the convenience of a decent chamber (element de chambrec courtcoife); neverthelefs, that all things be fo well and furely ordered, that no peril arife touching the right cuftody of the faiid countefs. And that he to whom the charge of her is committed fhall be reponible, body for body; and that he be allowed his charges.” Fuderis, T.II. p. 1014.

Such were the orders of Edward I. and he furely was not a man who would fuffer his orders to be difobeyed. Here, indeed, there is a detail concerning the cuftody of a female prifoner, which may feem ridiculously minute, but which is inconfident with the ftrory related by M. Weftminfter and other historians. To thofe who have no notion of any cage but one for a parrot or a squirrel, hung out at a window, we defpair of rendering this mandate intelligible.

Linlithgow, surprised and made prisoners Thomas Randolph, the king's nephew, and Alexander Stewart of Bonhill, who had hitherto continued inimical to the interests of Robert. Randolph was conducted to the king, but talked to him in a haughty strain; upon which his uncle put him into close confinement.

The next exploit of Robert was against the lord of Lorn, a division of Argyleshire. It was this nobleman who had reduced the king to such straits after his defeat at Methven; and he now resolved to take ample revenge. Having entered the country, the king arrived at a narrow pass, where the troops of Lorn lay in ambush. This pass had a high mountain on the one side, and a precipice washed by the sea on the other; but Robert having ordered Douglas to make a circuit and gain the summit of the mountain with part of the army he entered himself with the rest. He was immediately attacked; but Douglas with his men rushed down the hill, and decided the victory in favour of the king; who soon after took the castle of Dunstaffnage, the chief residence of this nobleman.

While Robert and his associates were thus gaining the admiration of their countrymen by the exploits which they daily performed, the English were so unfettered and fluctuating in their councils, that their party knew not how to act. Edward full imagined that there was a possibility of reconciling the Scots to his government; and for this purpose he employed William de Lamberton, bishop of St. Andrews', who, after having been taken prisoner, and carried from one place of confinement to another, had at last made such submisions, as procured him his liberty, and then the confidence of Edward. This ecclesiastic having taken a most solemn oath of fidelity to Edward, now resolved to ingratiate himself, by publishing against Robert and his adherents a sentencé of excommunication, which had been resolved on long before. This, however, produced no effect; and the event was, that in 1309, through the mediation of the king of France, Edward conferred to a truce with the Scots. This pacific arrangement was thus gaining ground; but their governor, a Frenchman, having passed his word, violated it, and summoned his barons to meet him in arms at Newcastle; yet, probably being doubtless of the success of the war, he empowered Robert de Umfraville, and three others, to conclude a new truce; declaring, however, that he did this at the request of Philip king of France, as his dearest father and friend, but who was in no fort to be considered as the ally of Scotland.

The new negociations were soon interrupted. They were again renewed; and in the beginning of the year 1310 the truce was concluded, but entirely disregarded by the Scots. The progress of Bruce now became very alarming. The town of Perth, a place at that time of great importance, was threatened; and to relieve it, Edward ordered a fleet to sail up the river Tay: he also commanded the earl of Ulster to assemble a body of troops at Dublin, and from thence to invade Scotland; his own barons were ordered to meet him in arms at Berwick. About the end of September, he entered Scotland: passed from Roxburgh, through the forest of Selkirk, to Biggar; from thence he penetrated into Renfrew; and turning back by the way of Linlithgow, he retreated to Berwick, where he continued inactive for eight months.

During this invasion, Robert had carefully avoided a battle with the English; yet knowing, that an invasion undertaken in autumn would ruin the heavy armed cavalry, on which the English placed their chief dependence. His cause was also favoured by a scarcity which prevailed at this time in Scotland; for as magazines and other resources of modern war were then unknown, the English army were greatly retarded in their operations, and found it impossible to subsist in the country.

The spirit of enterprise had now communicated itself to all ranks of people in Scotland. In 1311, the castle of Linlithgow was surprised by a poor peasant named William Binnock. The English garrison were secure, and kept but a slight guard; of which Binnock being informed, concealed eight resolute men in a load of hay, which he had been employed to drive into the castle. With these, as soon as the gate was opened, he fell upon the feeble guard, and became master of the place; which was dismantled by Robert, as well as all the other castles taken in the course of the war.

Edward now resolved to invade Scotland again; and for this purpose ordered his army to assemble at Roxburgh. But Robert, not contented with defending his own country, resolved in his turn to invade England. He accordingly entered that country, and cruelly ravaged the bishopric of Durham. He returned, loaded with spoil, and fled to Perth. After remaining six weeks before that place, he raised the siege, but returned in a few days; and having providedscaling ladders, approached the works with a chosen body of infantry. In a dark night he made the attack: and having waded through the ditch though the water flowed to his throat, he was the second man who reached the top of the walls. The town was then soon taken; after which it was plundered and burnt, and the fortifications levelled with the ground. This happened on the 8th of January 1312.

Edward was now become averse to the war, and resolved his negotiation for a truce; but they still came to nothing. Robert again invaded England, burnt a great part of the city of Durham; and even threatened to besiege Berwick, where the king of England had, for the time, fixed his residence. He next reduced the castles of Butel, Dumfries, and Dalfwinton, with many other fortresses. The castle of Roxburgh, a place of the utmost importance, next fell into his hands. The walls were scaled while the garrison was revelling on the eve of Lent. They retreated into the inner tower; but their governor, a Frenchman, having received a mortal wound, they capitulated.

Randolph, the king's nephew, who had been imprisoned, as we have already observed, was now received into favour, and began to distinguish himself in the cause of his country. He blockaded the castle of Edinburgh so closely, that all communication with the Edinburghshire country was cut off. The place was commanded by one Leland, a knight of Galloway; but the garrison suspected his fidelity, imprisoned him in a dungeon, and chose another commander in his stead. One William Frank presented himself to Randolph, and informed him how the walls might be scaled. This man in his youth had refided in the castle; and having

The engagement began with great fury. As both parties were violently exasperated, the English entirely defeated the Scots as confining of one great compact body. The main body was brought up by Edward in person, attended by Aymer de Valence earl of Pembroke, and Sir Giles d’Argentine, two experienced commanders. Maurice abbott of Inchafray, placing himself on an eminence, celebrated mas in the flight of the Scottish army. He then passed along the front, barefooted, with a crucifix in his hands, and in few words exhorted the Scots to fight for their rights and liberty. The Scots fell down on their knees; which being perceived by Edward, he cried out, “They yield! See, they implore mercy.” “They do,” answered Umfraville, one of his commanders, “they do implore mercy, but not from us. On that field they will be victorious or die.”

The English were too much elated with their victory in order to concert any new plan of action; for the defeat of the archers had decided the victory in favour of the Scots. The young and gallant earl of Gloucester attempted to rally the fugitives, but was thrown from his horse, and cut in pieces, which increased the general confusion. At this critical moment, the numerous attendants on the Scottish camp, prompted by curiosity or the desire of plunder, issued from their retirement. The English mistook them for a body of fresh troops coming to the assistance of their enemies, and fled with precipitation on all sides. Many fought refuge among the rocks in the neighbourhood of Stirling, and were drowned in the rivers. Pembroke and Sir Giles d’Argentine had never quitted Edward during the action; but now, seeing the battle irretrievably lost, Pembroke constrained the king to quit the field. D’Argentine refused to fly. He was a man of great valour, and had a high reputation in Scotland. According to the vulgar opinion, the three most eminent worthies in that age were the emperor Henry of Luxemburg, Robert Bruce, and Giles d’Argentine. He is said to have three times encountered two Saracen warriors in Palestine, and to have killed them both each time. His valour now availed him but little; for rushing into the midst of the Scots army, he was instantly cut in pieces. Douglas, with 60 horsemen, purified Edward close. At the Torwood he met Sir Laurence Abernethy, who was halting to the English rendezvous with twenty horsemen. The latter, when abandoned, the cause of the vanquished, and joined Douglas in the pursuit of Edward, who fled to Linlithgow. He had fearely arrived there, when he was alarmed by the approach of the Scots, and again obliged to fly. Douglas and Abernethy followed him with such vigilance, that (as Lord Hailes chooses to Latinize the expression of an ancient historian) ne vel mingendi locum concideretur; but notwithstanding their utmost efforts, Edward got safe to Dunbar, where he was received by the earl of March, who protected him till he could be conveyed by sea to England.

Such was the decisive battle of Bannockburn, the greatest defeat the English ever sustained from the Scots. On the side of the latter no persons of note were slain, excepting Sir William Vipont, and Sir Walter Rels the favourite of Edward Bruce; and so grievously was Edward afflicted by the death of this man, that he exclaimed, “O that this day’s work were undone, so Rels had not died!” On the English side were slain 27 barons and bannerets, and 22 taken prisoners; of knights there were killed 42, and 60 taken prisoners; of esquires fell 50; but the number of the common men who were killed or taken was never known with any certainty. The Welsh who had served in the English army were scattered over the country, and cruelly butchered by the Scottish partisans. The English, who had taken refuge among the rocks in the neighbourhood of Stirling, surrendered at discretion; the cattle was surrendered, and the private property of England fell into the hands of the king of Scots. The spoil of the English camp was immense, and enriched the conquerors, along with the ransom of many noble prisoners who fell into their hands. Robert showed such generosity in his treatment of the prisoners who fell to his share. He set at liberty Ralph de Monthermer, and Sir Marmaduke Teverse, two officers of high rank, without ransom; and by humane and generous offices alleviated the misfortune of the rest. The dead bodies of the earl of Gloucester and the lord Clifford were sent to England, that they might be interred with the usual solemnity. There was one Baillon, a Carmelite friar and poet, whom Edward is said to have brought with him in his train to be spectator of his achievements, and to record his triumphs. Baillon was made prisoner, and obliged to celebrate the victory of Robert over the English. This he did in wretched Latin Rhymes; which, however, procured his liberty. After the battle of Bannockburn, the earl of Hereford retreated to the castle of Bothwell, where he was besieged by Edward Bruce, and soon obliged to surrender. He was exchanged for the wife, sister, and daughter of the king, the young earl of Murr, and the bishop of Glasgow.

The terror of the English after the defeat at Bannockburn is almost incredible. Wallingford affairs, that many of them revolted to the Scots, and afflicted them in plundering their own country. “The English,” says he, “were so bereaved of their wonted intrepidity, that an hundred of their nation would have fled from two or three Scotsmen.” Edward Bruce and Douglas entered England on the eastern side, ravaged Northumberland, and laid the bishopric of Durham under contribution. From thence they proceeded to Richmond, laid Appleby and some other towns in ashes, and returned home loaded with plunder. Edward summoned a parliament at York, in order to concert means for the public security; and appointed the earl of Pembroke, formerly the guardian of Scotland, to be guardian of the country between the Trent and the Tweed. Robert, however, sent ambassadors to treat of peace; but the Scots were too much elated with their good fortune to make concessions, and the English were not yet sufficiently humbled to yield to all their demands. The ravages of war were again renewed; the Scots continued their incursions into England, and levied contributions in different places.

In 1315, the English affairs seemed a little to revive. The
The Scots, indeed, plundered Durham and Hartlepool; but they were repulsed from Carlisle, and failed in an attempt on Berwick. The Irish of Ulster, oppressed by the English government, implored the assistance of Robert, and offered to acknowledge his brother Edward as their sovereign; who accordingly landed at Carrickfergus on the 25th of May 1315, with 6000 men. This was an enterprise evidently beyond the power of Scotland to accomplish, and which could not but be perceived by Robert. However, there were motives which induced him to contend. The offer of a crown, though ever so visionary, inflamed the ambition of Edward Bruce, whose impetuous valour made no account of difficulties, however great. It might have been deemed ungenerous, and perhaps would not have been politic or safe, to have rejected the proposals of the Irish for the advancement of his brother, to whom the king owed more than he could repay. Besides, the invasion of Ireland seemed a proper expedient for dividing the English forces. The event proved unfortunate. Edward, after performing and suffering more than could almost have been expected from human nature, was at last defeated and killed by the English, as is related under the article IRELAND, p. 42.

The king himself had gone over into Ireland, in order to assist his brother in attempting the subjection of that country; and during his absence the English had made several attempts to disturb the tranquillity of Scotland. The earl of Arundel invaded the forest of Jedburgh with a numerous army; but being drawn into an ambuscade by Douglas, he was defeated with great loss. Edmund de Cailaud, a knight of Gascony and governor of Berwick, invaded and wasted Teviotdale; but while he was returning home loaded with spoil, he was attacked, defeated, and killed by Douglas. Soon after this, intelligence was conveyed to Douglas that one Robert Neville had boasted that he would encounter whenever he saw his banner displayed. Douglas did not long delay to give him an opportunity. He advanced to the neighbourhood of Berwick, displayed his banner, and burnt some villages. Neville, provoked at these ravages, took the field, encountered Douglas, and was defeated and killed. By sea the English invaded Scotland, and anchored off Inverkeithing in the frith of Forth, where they soon after landed. Five hundred men, under the command of the earl of Fife and the sheriff of that country; attempted to oppose their landing, but were intimidated by the number of their enemies. William Sinclair bishop of Dunkeld happened to meet the fugitives; and having by his reproaches obliged them to rally, he led them on again to the charge, and drove the English to their ships with considerable loss. For this exploit Robert conferred the title of the king's bishop on Sinclair; and he was long remembered by his countrymen on this account.

In 1317, after king Robert had returned from his Irish expedition, a bull was issued by the pope (John XXII.) commanding a two years truce between England and Scotland, under pain of excommunication. Two cardinals were dispatched into Britain to make known his commands; and they were privately empowered to inflict the highest spiritual censures on Robert Bruce, or whomsoever else they thought proper. About the beginning of September 1317, two messengers were sent to Robert by the cardinals. The king gave them a gracious reception; and after consulting with his barons returned an answer, that he very much desired a good and perpetual peace, either by the mediation of three cardinals, or by any other means. He allowed the open letters from the pope, which recommended peace, to be read in his presence, and listened to them with due respect. But he would not receive the sealed letters addressed to Robert Bruce governor of Scotland, alleging, that there might be many of his barons whom names were Robert Bruce, and that these barons might probably have some share in the government. Unles, therefore, the letters were addressed to him as king of Scotland, he could not receive them without advice of his parliament, which he promised immediately to assemble on the occasion. The messengers attempted to apologise for the omission of the title of King. "The holy church was not won," they said, "during the dependence of a controversy, to write or say any thing which might be interpreted as prejudicial to the claims of either of the contending parties." "Since then," answered the king, "my spiritual father and my holy mother would not prejudice the cause of my adversary by betowing on me the appellation of king during the dependence of the controversy, they ought not to have prejudiced my cause by withdrawing that appellation from me. I am in possession of the kingdom of Scotland; all my people call me king; and foreign princes address me under that title; but it seems that my parents are partial to their English son. Had you preferred to present letters with such an address to any other sovereign prince, you might perhaps have been answered in a harsher style; but I reverence you as the messengers of the holy see." The messengers, quite abashed with this reply, changed the discourse, and requested the king that he would confer to a temporary cessation of hostilities; but to this he declared, that he never would consent, while the English daily invaded and plundered his people. His counsellors, however, informed the messengers, that if the letters had been addressed to the king of Scots, the negotiations would instantly have been opened. This disrespectful omission they imputed to the intrigues of the English at the court of Rome, hinting at the same time that they had received this intelligence from Avignon.

When the messengers had informed the cardinals of these proceedings, the latter determined to proclaim the papal truce in Scotland; in which hazardous office they employed Adam Newton, guardian of the monastery of Minorites at Berwick, who was charged with letters to the clergy of Scotland, particularly to the bishop of St Andrew's. The monk found the king encamped with his army in a wood near old Cambus, making preparations for assaulting Berwick. Personal access was denied to the king; but the monk, in obedience to his masters, proclaimed the truce by the authority of the pope. The king sent him for answer, that he would listen to no bull, till he was treated as king of Scotland, and had made himself master of Berwick.

The poor monk, terrified at this answer, requested which is either a safe conduct to Berwick, or permission to pass disregarded into Scotland, and deliver his letters to the Scottih clergy. Both were refused; and he was commanded to leave the country without loss of time. He set out for Berwick; but in his way thither was attacked by robbers,
The most remarkable transaction of this year, however, was the defeat and death of Edward Bruce in Ireland; of which an account is given under the article Ireland, No. 42. His body was quartered, and distributed for a public spectacle over Ireland; and his head was presented to Edward by John lord Bermingham the commander of the English army, in return for which service, he was rewarded with the title of Earl of Llewellyn.

In the mean time Edward, who had summoned a parliament to meet at Lincoln, was obliged to postpone it on account of the Scottish invasion, and to assemble an army at York for the defence of his country. At Michaelmas it was determined, in a parliament held at London, that every city and town in England should furnish a certain proportion of men completely armed. Thus a considerable body of troops was soon raised; but, when they assembled at York, their party-animities and mutual distrust rote to such an height, that it was found necessary to send them back to their habitations.

In 1319, Edward, having succeeded so well in his negotiations with the court of Rome, resolved to make similar attempts with other powers to the prejudice of the Scottish nation. Accordingly he requested the count of Flanders to prohibit the Scots from entering his country: but to this request he received the following remarkable reply: “Flanders is the common country of all men; I cannot prohibit any merchants from trafficking thither, for such prohibition would prove the ruin of my people.” Finding himself baffled in this attempt, the English monarch once more again is determined to have recourse to war; and with this view commanded his army to assemble at Newcastle upon Tyne, on the 24th of July 1319: but before he proceeded, he requested the prayers of the clergy for the success of his expedition; and to render their prayers the more effectual, he at the same time demanded from them a great sum of money by way of loan.

Every thing being now in readiness, the English army approached Berwick, which was commanded by Walter the Steward of Scotland. This nobleman had long apprehended an attack on the English, and had taken every means of defence in his power. The enemy, however, confounding in their numbers, made a general assault; but were repulsed on the 7th of September, after a long and obstinate conflict. Their next attempt was on the side of York, where they were of an inconsiderable height; and it was proposed to bring a vassel close to them, from whence the troops might enter by a drawbridge let down from the mait. But the Scots answered the affaltants so much, that they could not bring this vessel within the proper distance; and at the ebb of the tide it grounded, and was burnt by the besiegers.

The English had then recourse to a new-invented engine which they called a foss, but for what reason it is unknown. In many particulars it resembled the rafio of the ancients. It appears to have been a large fabric composed of timber, and well-roofed, having stages within it, and in height surpassing the wall of the town. It was moved upon wheels, and served for the double purpose of conducting the miners to the foot of the wall, and armed men to the form. This machine was counteracted by one constructed by John Crab,
Commanded a Tintinnabulum engine in the Scots service. This was a kind of moveable crane, whereby great stones might be raised on high, and then let fall upon the enemy. The English made a general assault on the quarter towards the sea, as well as on the land side; so that the garrison, exhausted by continual fatigue, could scarce maintain their posts. The great engine moved on to the walls; and, though stones were incessantly discharged against it from the crane, their effect was so small that all hope of preserving Berwick was lost.

At length a huge stone struck it with such force, that the beams gave way, and the Scots pouring down combustibles upon it, was reduced to ashes. The English, however, still continued the attack. The Steward, with a reserve of 100 men, went from post to post, relieving those who were wounded or unfit for combat. One soldier of the reserve only remained with him when an alarm was given that the English had burnt a banner at the post called St Mary’s. They pitched themselves of the drum bridge, and fired the gate. The Steward ordered thither, called down the guard from the rampart, entered the gate to be open, and rushed out upon the enemy. A desperate combat ensued, and continued till the close of the day, when the English commanders withdrew their troops.

Notwithstanding this brave defence, it was evident that the town could not hold out long without a speedy relief; and Robert could not, with any probability of success, attack the fortified camp of the English. He therefore determined to make a powerful diversion in England, in order to oblige Edward to abandon the undertaking. By order of the king, 15,000 men entered England by the western marches. They had concerted a plan for carrying off the queen of England from her residence near York; but being disappointed in this attempt they laid waste Yorkshire. The archbishop of York hastily collected a numerous body of commons and ecclesiastics, with whom he encountered the Scots at Mixton, near Boroughbridge, in the northern part of Yorkshire. The English were instantly routed; 3000 were left dead on the field, and great part of those who fled perished in the river Swale. In this action 300 ecclesiastics lost their lives. The news of this successful inroad alarmed the besiegers of Berwick.

The barons whose estates lay to the southward remote from the Scotch depredations were eager for continuing the siege. But they were opposed by those of the north, who were left eager to abandon the enterprise, and return to the defence of their own country. With them the Earl of Lancaster concurred in opinion; who, understanding that his favourite manor of Pontecraft was exposed to the ravages of the Scots, departed with all his adherents. Edward, upon this, drew off the remainder of his army, and attempted to intercept Randolph and Douglas; but they eluded him, and returned in safety to Scotland.

The unsuccessful event of this last attempt induced Edward Fierionly to think of peace; and accordingly a truce between the two nations was concluded on the 21st of December 1319; which interval of tranquility the Scots made use of in addressing a manifesto to the pope in justification of their cause. This was drawn up in a spirited manner, and made a very considerable alteration in the councils of Rome. The pope, foreseeing that Robert would not be terrified into submission, ordered Edward to make peace with him in the left manner he could. A negotiation was accordingly first on foot, which soon terminated ineffectually; the truce was not renewed, and in 1322 a mutual invasion took place. The Scots penetrated into Lancashire by the western marches; and, after plundering the country, returned home with an extraordinary booty; while Edward made great preparations for an expedition into Scotland, which took place in August the same year.

In this, however, he was not attended with success. Robert had caused all the cattle to be driven off, and all the effects of any value to be removed from Lothian and the Merse; fixing his camp at Culroes, on the north side of the firth of Forth. His orders for removing the cattle were so punctually obeyed, that, according to common tradition, the only prey which fell into the hands of the English was a tame bull at Traint in East Lothian. Edward, however, still proceeded, and penetrated as far as Edinburgh, but without any hope of subduing the kingdom. His provisions were consumed, many of his soldiers perished for want; and he was oblig’d to retire, not having been able to return. On their return, his followers, burning the abbeys of Holyrood, Melrose, Dryburgh, &c., killed many of the monks, and committed other flagrations; but when they returned to their own country, and began again to enjoy a plentiful living, they indulged themselves in such excesses as were productive of mortal diseases; insomuch that, according to an English historian, almost one half of the great army which Edward had brought from England with him were destroyed either by hunger or glutony.

No sooner were the English retired than they were pursued by the Scots, who laid siege to the castle of Norham. Edward lay at the abbey of Biland in Yorkshire, with a body of troops advantageously posted in the neighbourhood. The Scots, invited, as is said, by some traitors about the king’s person, attempted to surprize him; and it was with the utmost difficulty that he made his escape to York, abandoning all his baggage and treasure to the enemy. The English camp was supplied in part by a narrow pass, but Douglas undertook to force it, and Randolph prefent’d himself as a volunteer in this dangerous service under his friend Douglas. The Highlanders and men of the Isles climbed the precipice on which the English camp stood, and the enemy were driven out with great loss. The Scots pursued them to the very gates of York, wafting the country without control, and returned home unmolested.

Edward, disheartened by repeated losses, agreed to a cessation of arms* with the men of Scotland who were engaged in war with him.” But the king of Scotland would not consent to it in that form; however, he gave his consent, on the proper form being employed, to which Edward now made no objection. This treaty was concluded on the 30th of March 1323, and was to endure until the 12th of June 1336. It was agreed that, during the continuance of it, no new forresses should be erected in Cumberland, to the north of the Tyne, or in the counties of Berwick, Roxburgh, or Dumfries, and by a very singular article it was prov’d, that “Bruce and the people of Scotland might procure absolution from the pope; but in case there was no peace concluded before the expiration of the truce,
truce, that the sentence of excommunication should revive." The treaty was ratified by Robert, under the style of the King of Scotland, 7th of June 1323.

The next care of Robert was to reconcile himself to the church, and to obtain from the pope the title of King, which had been so long denied him; which at last, though not without great difficulty, was obtained. This year a son was born to the King of Scotland at Dunfermline, and named David. The court-poets of the time foretold, that this infant would one day rival his father's fame, and prove victorious over the English. But fear not had this future hero come into the world, when a rival began to make his appearance. John Baliol, the unfortunate king of Scotland, had long been dead; but left a son named Edward, heir to his pretenions to the crown. The young prince had resided on his paternal estate in Normandy, neglected and forgotten; but in 1324, was called to the court of England, for the purpose, undoubtedly, of setting him up as a rival to young David Bruce, in case his father, now broken with fatigue, should die in a short time. The negotiations for peace, however, still went on; but the commissioners appointed for this purpose made little progress, by reason of demands for feudal service, fully made by the English. The reconciliation with the church was also broken off, by reason of the Scots keeping possession of Berwick. This had been taken during the papal truce; and Robert thought proper still to lie under the sentence of excommunication rather than to part with such an important fortress.

In the beginning of the year 1327, Edward III. was deposited, and succeeded by his son Edward III. in his 15th year. He renewed the negotiations for peace, and ratified the truce which his father had made; but hearing that the Scots had resolved to invade England if a peace was not immediately concluded, he summoned his barons to meet him at arms at Newcastle, and fortified York.—We are not certainly informed of the reasons which induced the Scots at this time to disregard the truce; however, it is certain, that on the 15th of June 1327, Douglas and Randolph invaded England with the wearthen marches, with an army of 20,000 horsemen. Against them Edward III. led an army, consisting at the lowest calculation, of 30,000 men, who assemblled at Durham on the 13th of July. The Scots proceeded with the utmost cruelty, burning and destroying every thing as they went along; and on the 18th of the same month, the English discovered them by the smoke and flames which marked their progress. They marched forward in order of battle towards the quarter where the smoke was perceived; but, meeting with no enemy for two days, they concluded that the Scots had retired. Dismounting themselves from their heavy baggage, they resolved by a forced march to reach the river Tyne, and, by polluting themselves on the north bank of that river, to intercept the Scots on their return. On the 20th of July, the cavalry having left the infantry behind, crossed the river at Hadrian's gate; but before the rear of the army could come up, the river was fo swollen by broken rains, that it could no longer be forded; and thus the troops remained divided for several days, without any accommodation for quarters, and in the greatest want of provision and forage. The followers now began to murmur: and it was resolved by the king to proceed southwards. The king proclaimed a reward of 1,000 livers to the value of 100 l. yearly for life, to the object person who should first discover the enemy "on dry or off the ground, where they might be attacked," and many noblemen and esquires swam across the river on this strange errand. The army continued its march for three days without any news of the Scots; but on the fourth day, certain accounts of them were brought in by esquires, Thomas Rokeby: who reported, that "the Scots had made prisoner; but that their leaders, understanding his business, had set him at liberty, saying, that they had remained for eight days on the same ground, as ignorant of the motions of the English as the English were of theirs, and that they were defirous and ready to combat." With this man for their guide, the English soon came in view of the Scots. They were advantageously posted on a rising ground, having the river between, and their flanks secured by rocks and precipices. The English dismounted and advanced, hoping to allure the Scots from their fire-poit; but in vain. Edward then sent a herald to Randolph and Douglas, with a message in the style of chivalry: "Either," says he, "suffer me to pass the river, and leave me room for ranging my forces; or do you pass the river, and I will leave you room to range yours; and thus shall we fight on equal terms." To this the Scottish commanders answered, "We will do neither. On our road hither we have burnt and spoiled the country; and here we are fixed while to us it seems good: and if the king of England is offended let him come over and challenge us."

The armies continued in sight of each other for two days; after which the English, understanding that their enemies were disordered for provisions resolved to maintain a close blockade, and to reduce them by famine. Next day, however, they were surprised to find that the Scots had secretly decamped, and taken poft two miles up the river in ground still stronger, and of more difficult access, amid a great wood. The English encamped opposite to them near Stanhope park. At midnight Despencer, the best of Douglas undertook a most desperate enterprise, some what resembling those of the ancient heroes. With 200 horsemen he advanced the English camp, and entered it under the guise of a chief commander calling the rounds. Having thus eluded the sentinels, he passed on to the royal quarters, overthrew everything that opposed him, and furiously assaulted the king's tent. The domestics of Edward desperately defended their master; and his chaplain, with many others of his household, were slain. However, the king himself escaped; and Douglas, disappointed of his prey rushed through the enemy, and effected a retreat with considerable loss.—The following day, the English learned from a prisoner, that orders had been given in the Scottish camp for all men to hold themselves in readiness that evening to follow the banner of Douglas: on which, apprehending an attack in the night, they prepared for battle, lighting great fires, and keeping a strict watch; but in the morning, they were informed by two trumpeters whom they had taken prisoners, that the Scots had decamped before midnight, and were returning to their own country. This report could scarcely be credited, and the army remained for some hours in order of battle; but at length some scouts having crossed the river,
The treaty domics (terranl. 197 though they had in determined fallop that fail led his army 4000 for forfeiture of former fame way. Their return of Douglas, toasting them upon thin iron plates, which appear to have been part of their armour.

On the return of Douglas and Randolph, the king led his army against the easter boundaries, and besieged the castle of Norham. However, in 1328, Edward, wearied out with continual losses and disappointments, contented to a perpetual peace between the two kingdoms on the following conditions. 1. The stone on which the kings of Scotland were wont to sit at the time of their coronation, shall be restored to the Scots. 2. The king of England engages to employ his good offices at the papal court for obtaining a revocation of all spiritual preceptives depending before the holy see against the king of Scots, or against his kingdom or subjects. 3. For these causes, and in order to make preparation for the ravages committed in England by the Scots, the king of England, which thus terminates in disappointment and dishonour, had toft an immense sum. Every preparation had been made for opposing an enemy, and auxiliaries had even been procured at a most enormous expense from Hainault. These auxiliaries consisted of heavy-armed cavalry; and they were now so much worn out, that they could scarcely move. Their horses were all dead, or had become unserviceable, in a campaign of three weeks; so that they were obliged to procure horses to convey themselves to the south of England. Edward having rested at Durham for some days, marched to York, where he disbanded his army. Barbour a Scots historian, relates, that there was a morose in the rear of the Scottish camp, which he calls the two mile morosj; that the Scots made a way over it with brusuwood, and burned it as they went along, that the English might not pursue them by the same way. The English historians are filled with descriptions of the strange appearance of the deferted camp of the Scots. They found there a number of their brethren, stretched between stakes, which served for kettles to boil their meat; and for bread, each soldier carried along with him a bag of oatmeal, of which he made cakes, toasting them upon thin iron plates, which appear to have been part of their armour.

The treaty of Northampton.

The treaty of Northampton.

The treaty of Northampton.
During a long course of war, the common people had been accustomed to plunder and bloodshed; and having now no English enemies to employ them, they robbed and murdered one another. The methods by which Randolph repriessed these crimes were much the same with those which have been adopted in latter times; for he made the counties liable for the severest penalties committed within their bounds. He even ordered the farmers and labourers not to house the tools employed by them in agriculture during the nighttime, that the sheriff's officers might be the more vigilant in securing them. He gave orders for severely punishing all vagabonds, and obliged them to work for their livelihood; making proclamation, that no man should be admitted into a town or borough who could not earn his bread by his labour. These regulations were attended with the most salutary effects. A fellow who had deserted his own plough-irons, pretending that they were stolen, being detected by the sheriff's officers, was instantly hanged. A certain man having killed a priest, went to Rome, and obtained absolution from the pope; after which he boldly returned to Scotland. Randolph ordered him to be tried, and, on his conviction, to be executed: "Because," said he, "although the pope may grant absolution from the spiritual consequences of sin, he cannot screen offenders from civil punishment."

King Robert, just before his death, had defined that his heart might be deposited in our Saviour's sepulchre at Jerusalem; and on this errand the great commander Douglas was employed, who fell in June 1330 with a numerous and splendid retinue. He anchored off Slays in Flanders, the great emporium of the low countries, where he expected to find companions in his pilgrimage; but learning that Alphonso XI. the young king of Leon and Castile, was engaged in a war with O'may the Moor, he could not refit the temptation of fighting against the enemies of Christianity. He met with an honourable reception at the court of Spain, and by obtained leave to enter into what was thought the common cause of Christianity. The Spaniards first came in sight of their enemy near Theby, a castle on the frontiers of Andalufia, towards the kingdom of Granada. The Moors were defeated; but Douglas giving way to his impetuous valour pursued the enemy too eagerly, and throwing among them the cauldron which contained the heart of his sovereign, cried out, "Now pass thou onward as thou wentest; Douglas will follow thee or die." The fugitives rallied and surrounded Douglas; who, with a few of his followers, was killed in attempting to rescue Sir Walter St Clair of Roslin. His body was brought back to Scotland, and interred in the church of Douglas. His countrymen perpetuated his memory by bestowing upon him the epithet of the good Sir James Douglas. He was one of the greatest commanders of the age; and is said to have been engaged in 70 battles, 57 of which he gained, and was defeated in 13.—Of him it is reported, that meeting with an officer at the court of Alphonso, who had his face quite disfigured with scars, the latter said to him, "It afflicts me, that you, who are said to have seen so much service, should have no marks of wounds on your face." "Thank heaven," answered Douglas, "I had always an arm to protect my face."

In 1331, Edward Baliol began to renew his pretensions to the crown of Scotland, about the same time that David II. and his consort Johanna were crowned at Scone; which ceremony was performed on the 24th of November. Some historians relate, that he was excited to this attempt by one Twynham Lawrinson, a person who had been excommunicated for refusing to do penance for adultery, and afterwards was obliged to fly on account of his having way-laid the official, beat him, and extorted a sum of money from him. But however this may be, it is certain, that in this year differences began to arise with England, on the following account. It had been provided by an article of the treaty of Northampton, that "Thomas lord Wake of Ledel, Henry de Beaumont, called earl of Buchan, and Henry de Percy, should be restored to their estates, of which the king of Scots, by reason of the war between the two nations, had taken possession." This article had been executed with respect to Percy, but not to the other two; and though Edward had repeatedly complained of this neglect, he could not obtain any satisfaction (c).

The disinherited barons now resolved to invade Scotland, though their force consisted of no more than 3000 infantry.

(c) As this is an important period of history, we shall here transcribe the opinion of lord Hailes concerning the causes of this strange delay of executing an article seemingly of little importance where a nation was concerned. "By the treaty of Northampton," says he, "all the claims of the English barons to inheritances in Scotland were disregarded, excepting those of Henry de Percy, Thomas lord Wake of Ledel, and Henry de Beaumont. Percy procured satisfaction; but the others did not. "Henry de Beaumont, in the reign of Edward II. had associated himself with the nobility against the Ely彭fers, and on that account had suffered imprisonment and exile. He aided queen Isabella in the invasion which proved the cause of the deposition, captivity and death of her husband. Although, under the administration of Mortimer, he had obtained a share in the partition of the spoils of the Ely彭fers, he perfided in opposing the measures of the new favourite; and although his own interests were secured by the treaty of Northampton, he boldly exclaimed against the injurious terms of that treaty. He joined the princes of the blood royal in their attempt to relieve the young king from the hands of Isabella and her minion, and place him in their own; and, on the failure of that ill-advised conspiracy, he again took refuge in foreign parts. It appears that lord Wake, having followed the political opinions of Henry de Beaumont, was involved in like calamities and disgrace. While the queen-dowager and Mortimer retained their influence, the claims of these two barons were altogether overlooked: But within forty-eight hours after the execution of Mortimer, a peremptory demand was made by Edward III. to have their inheritance restored.

The demand was unexpected and alarming. Made at the very moment of the fall of Isabella and Mortimer,
in the neighbourhood of Duplin; and another, nearly as numerous had advanced from the south, through the Lothians and Stirlingshire, and fixed its quarters at Auchterarder, eight miles to the west of Perth. The Hilarians differ as to the number of the two armies. Fordon says, that the regent had with him 30,000 men, and the earl of March as many; and that Baliol had between 500 and 600 men at arms, that is, horsemen completely armed. Hemingford reckons 1500 of the Scots armies at 40,000, and Baliol's at 300 armed men. Knighton says, that Baliol, when he landed in Fife, had 500 armed men, and 3000 more of different sorts; but that he had in all only 2500 men in his camp at Earl's. In this desperate situation, the English general formed a design of attacking the Scots in their camp. They were directed to a ford by Andrew Murray of Tullibardine. The Scots kept no watch, but abandoned themselves to intemperance and riotous mirth; whilst their enemies, led by Alexander Mounbray, crossed the river at midnight. They ascended a rising ground, came unperceived on the right flank of the Scottish army, and made a dreadful slaughter. At the first attack, young Randolph halted with 320 men at arms to oppose the enemy; and being seconded by Murdoch earl of Menteith, Alexander Frazer, and Robert Bruce natural son to the late king, he gave a check to the English, and maintained the combat on equal terms. But now the regent himself, along with the whole multitude rushed forward to battle without the least order or discipline; and, whilst the hindmost pressed on, the foremost were thrown down, trodden upon, and suffocated. The slaughter lasted many hours, and the remains of this vast army were utterly dispersed. Many men of eminence were killed; among whom were Donald earl of Marr, author of the whole catastrophe; Thomas earl of Moray, Murdoch earl of Menteith, Robert earl of Carrick, and in behalf of men who had loudly protested against the treaty of Northampton, it indicated a total and perilous change in the system of the English.

Randolph, of late years, had beheld extraordinary vicissitudes in England. The D'Eipenfers alternately perjured and triumphant, and at length absolved in the dust. The fugitive Mortimer elevated to supreme authority, victorious over the princes of the bloody-royal, and then dragged to a gibbet. Hence it was natural for Randolph to wish, and even to look, for some new revolution, which might prove more favourable to the Scottish interests. Meanwhile, with great reason and good policy, he delayed the restitution of the inheritances claimed under the treaty of Northampton, in behalf of the avowed opposers of that treaty.

Besides, it was necessary for Randolph to be assured that the English, while they urged the performance of one article of that treaty, did, on their part, sincerely purpose to perform its more important articles, by continuing to acknowledge the succession in the house of Bruce, and the independency of the Scotch nation.

Of this, however, there was much reason to doubt, and had granted him a passport to come into England, with permission to reside there during a whole year (10th October 1330). These things had no friendly or pacific appearance.

Be this as it will, the event too fatally justified the apprehensions of Randolph; for, while Edward III., was demanding restitution of the estates refused by the treaty of Northampton, his subjects were arming in violation of that treaty.

It is remarkable, that, on the 24th March 1331-2, Edward appears to have known of the hostile association of the disinherited barons. His words are, "Quis et ipsi accepimus plurimum, quod diversi homines de regno nostrorum, et alii (meaning Baliol and his attendants), pacem inter nos, et Robertum de Brus, super Regem Scotiae, iniuriam et reconcilia machinant, diversitates congregations hominum ad arma inditis faciunt, et, per mercibus regni nostri, dictam terram Scotiae, ad eam modo guerro impugnandum, ingredi intentum?" Fudera, T. iv. p. 511. And yet, on the 24th April following he demanded restitution of the inheritances of lord Wake, one of the barons in arms; Fudera, T. iv. p. 518.

(h) This place does not now exist; having been overwhelmed by the sea many centuries ago.
Scotland.

Alexander Frazer, and Robert Bruce. The daughter of the infantry and of the men at arms was very great; the most probable accounts make it 2000 men at arms, and upwards of 15,000 common soldiers. The loss of the English was incomconsiderable.

The day after this victory, Baliol took possession of Petri; and apprehending an attack from the earl of March, caused the ditch to be cleared, and to be fortified with palisades. The first information which the earl received of this dreadful defeat was from a common soldier, who fled from the place mortally wounded. When this poor wretch came up, he had time to do no more than to throw his wounds; after which he fell down and expired. On his arrival at the field of battle, he found a dreadful confirmation of the intelligence given by the soldier; lest instead of taking his measures with gravity, he and his men had risen on heading to Perth, seduced only by a blind impulse to revenge. At first they designed to assault the place; but their hearts failing them, they next determined to reduce it by famine. This, however, could not be done unless the Scots were masters at sea. One John Crab, a Flemish engineer (who had distinguished himself by destroying the famous engine called the faw at the siege of Berwick), had continued for many years to annoy the English on the eastern coasts.

After the blockade of Petri was removed, he came with ten vessels to the mouth of the Tay, where the English fleet was, and took the ship belonging to Henry de Beaumont; but soon after all his ten vessels were burnt by the English in a general engagement. After this the blockade of Petri was raised, the earl of March disbanded his army, and Edward Baliol was crowned king of Scotland at Scone, on the 24th of September 1332.

The new monarch was too soon put in possession of the kingdom, than he left Petri in the hands of the earl of Fife, while he himself repaired to the southern parts of the kingdom. But the party of king David was far from being extinguished. Baliol was farce gone, when the town of Petri was surprised, and its fortifications razed, by James Frazer, Simon Frazer, and Robert Keith. The earl of Fife was made prisoner, with his family and vassals. Andrew Murray of Tollibardine, who had directed the English to a ford on the river Earn, was put to death as a traitor. Such of the Scots as still adhered to the interest of their infant prince, chose Sir Andrew Murray of Bothwell regent. He was a brave and active man, but had not as yet sufficient force to attempt anything considerable.

In the mean time, Baliol behaved in a most scandalous manner. At Roxburgh, he made a solemn surrender of the liberties of Scotland; acknowledged Edward for his liege-lord; and, as if this had not been sufficient, he became bound to put him in possession of the town, castle, and territory of Berwick, and of other lands on the marches, extending in all to the yearly value of 2000 l. "On account," as the instrument bears, "of the great honours and emoluments which we have procured through the grace and of our lord the king, and by the powerful and acceptable aid which we have received from his good subjects." He also promised to marry the princes Joanna, whom he considered as only betrothed to David Bruce, and to add 500 l. to her jointure; and this under the penalty of 10,000 l. Scotland, to be appropriated as a portion to the young lady, or otherwise disposed of for her behoof. He further engaged to provide for the maintenance of David Bruce as the king of England should advise; and, lastly, he became bound to serve Edward in all his wars, excepting in England, Wales, and Ireland, for the space of a year together, with 200 men at arms, and all at his own charges; and he bound his successors to perform the like service with 100 men at arms. But afterwards Edward having engaged to maintain him on the throne of Scotland, Baliol bound himself to serve him in all his wars whatever.

Though the greatest part of the nation submitted to this shameful treaty, it roused the indignation of those who wished well to the liberties of their country. John, the second son of Randolf, now earl of Moray, by the death of his brother Archibald, the youngest brother of the renowned Douglas; together with Simon Frazer, assembled a body of horsemen at Moffat in Annandale; and, suddenly traversing the country, assaulted Baliol unexpectedly at Aunon. His brother Henry made a gallant resistance for some time; but prived, and was at last overpowered with numbers, and killed, together with several other personages of distinction. Baliol himself escaped almost naked, with a single attendant, and fled to England. After his departure, the Scots began to make depredations on the English frontiers. Edward issued a proclamation, in which he solemnly averred, that the Scots, by their hostile depredations, had violated the peace of Northampton. Baliol, in the mean time, being joined by some English barons, returned to Scotland; took and burnt a castle where Robert de Colville commanded; and, establishing his quarters in the neighbourhood of Roxburgh, began to make preparations for besieging Berwick. Just after his arrival, Archibald Douglas, with 3000 men, invaded England by the western marches, plundered the country, and carried off much booty; in revenge for which, Sir Anthony de Lucy made an inroad into Scotland, defeated and took prisoner Sir William Douglas, celebrated in history by the appellation of the "Knight of Liddesdale," whom Edward caufed to be put in irons. About the same time, Sir Andrew Murray the regent attacked Baliol, with a view to disembarrass him before the reinforcements which he expected out of England could arrive. A sharp conflict ensued at Roxburgh, in which the regent, attempting to rescue a falier, was taken prisoner; and thus Scotland was at once deprived of its two ablest commanders.

Archibald Douglas was now declared regent; and Edward prepared to invade Scotland, in order to take vengeance on its inhabitants, as he said, for the wrongs they had done, and to seek such redress as might seem good to himself. He ordered possession to be taken of the isle of Man in his own name; and soon after made it over to Sir William de Montague, who had some claim of inheritance in it. The chief design of Edward in this expedition, however, was to obtain possession of the town of Berwick, which had been already ceded to him by Baliol. This appeared to Berwick, the Scots a place of no lfs importance than it did to Edward; and therefore they took all the precautions in their power to prevent the loss of it. The earl of March was appointed to command the castle, and Sir William...
Scotland. William Keith the town. The Scots made an obstinate defence; yet it was evident that they must soon have yielded if they had not been relieved. At length the regent, with a numerous army, appeared in the neighbourhood. He endeavoured to convey succours into the town, or to provoke the enemies to quit the advantage of the ground, and engage in battle. But all his efforts were in vain; the English obtruded every paffage, and ftood on the defensive.

The regent then entered Northumberland, wafted every country, and even assaulted Bamborough caftle, where Philippa the young queen of England had her residence. He fondly imagined that Edward III. would have abandoned the siege of Berwick, after the example of his father, in circumstances not difsimilar. Edward nevertheless persevered in his enterprise.

During a general allaffe, the town was fett on fire, and in a great measure confumed. The inhabitants having experienced the evils of a flege, and dreading the worse evils of a forra f, implored the earl of March and Sir William Keith to feking terms of capitulation. A truce was obtained; and it was agreed, that the town and caftle should be delivered up on terms fair and no- nourable, unless fuccours arrived before the hour of ves- pers on the 19th July.

It was specially provided, "that Berwick fhand be held as relieved, in cafe 200 men at arms, in a body, fhould force their paffage into the town."

By the treaty, Sir William Keith was permitted to have an interview with the regent. He found him with his army in Northumberland; urged the neceffity of his return; and fhowed him, that Berwick, if not in- fantly relieved, was loft for ever. Perfaide by his impor- tunities, the regent refolved to combat the English, and either to evade Berwick or lose the kingdom.

On the afternoon of the 19th of July, the regent prepared for battle. He divided his army into four bodies. The fleft was led by John earl of Moray, the fon of Randolph; but as he was young and inexperienced in war, James and Simon Frafer, foldiers of approved reputation were joined with him in the command. The fcond body was led by the fteward of Scotland, a youth of 16, under the inspection of his uncle Sir James Stewart of Rofyth. The third body was led by the regent himfelf, having with him the earl of Carrick and other barons of eminence. The fourth body, or reserve, appears to have been led by Hugh earl of Rofyth.

The numbers of the Scottifh army on that day are variously reported by historians. The continuator of Hemingford, an author of that age, and Knyghton, who lived in the fucceding age, afferm their numbers with more precision than is generally required in historical facts.

The continuator of Hemingford minutely records the numbers and arrangement of the Scottifh army. He fays, that, besides earls and other lords or great barons, there were 55 knights, 1,100 men at arms, and 13,500 of the commons lightly armed, amounting in all to 14,655.

With him Knyghton appears to concur, when his narrative is cleared from the errors of ignorant or care- less transcribers.

It is probable, however, that the fervants who tended the hories of persons of distinction, and of the men at arms, and the ufls followers of the camp, were more numerous than the actual combatants.

The English were advantageously pdled on a rising ground at Halydon, with a markly hollow in their front. Of their particular difposition we are not informed, further than that Balfiol had the command of one of the wings.

It had been provided by the treaty of capitulation, "That Berwick fhould be considered as relieved, in cafe 200 men at arms forced their paffage into the town." This the Scottifh men at arms attempted; but Edward, aware of their purpose, opposed them in person, and repelled them with great flaughter. The Scottifh army rushed on to a general attack; but they had to defend into the markly hollow before mount- ing the eminences of Halydon. After having fluggled with the difficulties of the ground, and after having been incessantly gallied by the English archers, they reached the enemy. Although fatified and disordered in their ranks, they fought as it became men who had conquered under the banners of Robert Bruce. The English, with equal valour, had great advantages of situation, and were better disciplined than their antagonifs. The earl of Rofy led the revere to attack in flank that wing where Balfiol commanded; but he was repelled and flain. There fell with him Kenneth earl of Sutherland, and Murdoch earl of Menteith.

In the other parts of the field, the events were equally dilafurious. The regent received a mortal wound, defeated, and the Scotts everywhere gave way. In the field, and the during a purfuit for many miles, the number of slain regent and prisoners was fo great, that few of the Scottifh killed the army escaped.

Besides the earls of Rofyth, Sutherland, and Men- teith, there were among the slain Malcolm earl of Leno- nox, an aged baron; he had been one of the foremost to repair to the standard of Robert Bruce, and his laft exertions were for his country; Alexander Bruce earl of Carrick, who atoned for the short defection from the family of his benefactor; John Campbell earl of Athole, nephew of the late king; James Frafer, and Simon Frafer; John de Graham, Alexander de Lindelay, Alan Stewart, and many other persons of eminent rank.

The fteward had two uncles, John and James. John was killed, and James mortally wounded and made prisoner (1).

The regent, mortally wounded, and abandoned on the field of battle, only lived to fee his army diminished and himself a prisoner.

This victory was obtained with very inconsiderable loss.

(1) Fordun, l. xiii. c. 28, relates, that Sir James Stewart was slain; the English historians, that he was mor- tally wounded and made prisoner. It may be remarked, that at Halydon, two Stewarts fought under the banner of their chiefs; the one Alan of Dreghorn, the paternal ancellor of Charles L and the other James of Rofyth, the paternal ancestor of Oliver Cromwell.
Scotland. It is related by the English historians, that, on the side of their countrymen, there were killed one knight, one esquire, and 12 foot-fencers. Nor will this appear altogether incredible, when we remember, that the English ranks remained unbroken, and that their archers, at a secure distance, incessantly annoyed the Scottish infantry.

According to capitulation, the town and castle of Berwick surrendered. The English king took twelve hostages, for securing the fidelity of the citizens of Berwick. Thus was the whole of Scotland reduced under the subjection of Baliol, excepting a few fortresses; so that it became necessary to provide for the safety of the young king and queen. Accordingly, they were conveyed to France, where they were honourably entertained. Meanwhile, Baliol employed himself in making new concessions to his liege-lord Edward; and in 1334 the work of submilion was completed by a solemn instrument drawn up by Baliol, in which he surrendered great part of the Scottish dominions, to be forever annexed to the crown of England. In this instrument Baliol said, that "he had formerly become bound to make a grant to Edward of lands on the marches, to the amount of two thousand-pound lands; that the Scottish parliament had ratified his obligation; and that he had accordingly surrendered Berwick and its territory; and now, for completely discharging his obligation, he made an absolute surrender to the English crown of the forests of Jedburgh, Selkirk, and Ettrick; of the counties of Roxburgh, Peebles, and Dumfries; together with the county of Edinburgh, and the conflagrations of Linlithgow and Haddington." This extraordinary surrender was made with so much precipitancy, that Baliol forgot to except his own private estate out of it. This, however, was generously restored to him by Edward; who proclaimed, that, "having already received satisfaction in full, he had too much reverence for God, justice, and good faith to man, to allow the cession to be prejudicial to the private rights of the king of Scots." At the same time Baliol presented himself before his liege-lord; did homage, and swore fealty, "for the whole kingdom of Scotland and the isles adjacent." A quarrel now arose among the disinherited lords, to whom this revolution had been owing, which produced the worst consequences to the interest of Baliol. The brother of Alexander de Moubray died, leaving daughters, but no issue male. Moubray having claimed a preference to the daughters of his brother, Baliol countermanded his fuit, and, as it appears, put him in possession of the inheritance. Henry de Beaumont earl of Buchan, and David de Strathbolgie or Strathbollie, earl of Atholl, espoused the cause of the heirs-general; but perceiving that their solicitations were not heard, they left the court in disgust, and retired to their castles about the end of August 1334. Baliol soon perceived his error in offending these two powerful lords; and in order to regain their favour, dismissed Moubray, and conferred on David de Strathbolgie the whole estates of the young feward of Scotland. Thus he alienated the affections of Moubray, and added to the power of the earl of Atholl, who was by far too powerful before.

About this time Sir Andrew Murray of Bothwell, having regained his freedom, began to assemble the friends of liberty, and was unanimously joined by Moubray. In a moment every thing was in confusion. Baliol's Geffray de Moubray, governor of Roxburgh, revolted; party every where deserted. Henry de Beaumont was besieged in his castle of Dunbar by Murray and Moubray, and forced to surrender, but obtained liberty to depart into England. Richard Talbot, endeavouring to pass into England with a body of troops, was defeated and taken prisoner by Sir William Keith of Gallow. The feward of Scotland, who had laboured so much for the King, was allowed freedom only after a great number of his followers had been executed by order of Sir John de Stirling. John de Stirling was friendly to the English commander, and, in a moment, every thing was in confusion. Baliol foon perceived his error in offending the young feward of Scotland. Thus he alienated the affections of Moubray, and added to the power of the earl of Atholl, who was by far too powerful before.

The year 1335 is remarkable for the siege of Lochleven castle by the English, under John de Strivelin. This fort was built on a small island, and very difficult of access. The English commander erected a fort in the cemetery of Kinrois; and at the lower end of the lake, from whence runs the stream called the Water of Leven, he raised a strong and lofty bulwark, by means of which he hoped to lay the island under water, and oblige the garrison to surrender. But four of the Scotch soldiers, having found means to approach the bulwark undiscovered, pierced it so dexterously, that the waters, rushing out with a prodigious force, overflowed part of the English camp, and the garrison, falling out during the confusion occasioned by this unexpected inundation, stormed and plundered the fort at Kinrois. At this time the English commander, with many of his soldiers, happened to be absent at Dunfermline, celebrating the festival of St. Margaret. On his return, he swore that he would never defeat till E he
The inhabitants of Aberdeen attacked one Thomas Rothe, who had landed at Dunnotar. They were defeated; but Rothe fell in the action. Edward chastised the vanquished severely for their temerity, and laid the town in ashes. He then began to repair the castles whose fortifications had been demolished by king Robert. He put in a state of defence the castles of Dunottar, Kincleven, Lawreidton, Stirling, Bothwell, Edinburgh, and Roxburgh; greatly augmented the fortifications of Perth, and left a considerable body of troops in the place. The Scots began to reduce these castles as soon as Edward was departed; and in 1337, under Sir Andrew Murray, invaded Cumberland. No great exploits, however, were now performed on either side. Edward being employed in preparations for invading France, had little leisure to attend to the affairs of Scotland; and the Scots, divided among themselves, and delitig of those leaders under whom they had acquired so much glory, could not now annoy their enemies as formerly. The most remarkable transaction was the siege of the castle of Dunbar, belonging to the earl of March. The English commander was the earl of Salisbury. The earl of March was absent; but his wife, the daughter of Randolph, from her complexion, was commonly called Black Agnes, undertook to defend it in her husband's absence. The English again employed that huge machine called a foss, formerly mentioned in our account of the siege of Berwick: it met with the same fate now as at that time; an huge flame, let fall upon it from the top of the walls, crushed it to pieces. The English, baffled in every attack, turned the siege into a blockade; but Sir Alexander Ramsay having found means to enter it with 4000 men, the garrison made a sally, and cut in pieces the advanced guard of the enemy. The English, disheartened by so many misfortunes, abandoned the enterprise.

In 1338, Sir Andrew Murray the regent died, and was succeeded in his office by Robert the Steward of Scotland. In 1339 he reduced the town of Perth and the castle of Stirling; and gained over to the Scottish interest William Bullock, governor of the castle of Coupar: after which, having expelled the enemy from every point to the northward of the Forth, he employed himself in settling the affairs of the nation as well as he could.

In 1341, the castle of Edinburgh was surprized by a device of Sir William Bullock. According to his appointment, one Walter Currie of Dundee privately received into his ship the knight of Liddesdale, with William Frazer, Joachim of Kinbum, and 2000 men. Currie cast anchor in Leith road, pretending to be an English shipmaster, who had a cargo of wine and provisions, with which he proposed to furnish the commander of the castle. His barrels and hampers were brought to the castle gate, and suddenly thrown down in such a manner as to obstruct the flushing of it. Currie and his men then flew the sentinels; and the knight of Liddesdale, with a party who lurked in the neighbourhood, rushed in, overpowered the garrison, and made themselves masters of the place.—On the 4th of March this year, the king and queen arrived from France, and landed at Inverbervie in Kincardineshire.

In 1342, Sir Alexander Ramfay took the strong forres of Roxburgh; for which important service the king bestowed upon him the charge of the rife of Teviotdale; at that

of New-

This pacification was but short-lived. In 1345 the

again prepared to invade England, while Edward

took all necessary measures for opposing them: however, this year the Scots were successful, ravaging

Welfmoreland, and burning several towns. The year ended with a new truce between the two nations; and hostilities were not renewed till 1346, when David entered England with an army of 50,000 men. His first exploit was the taking of the fortresses of Liddel, and massacring all whom he found in it. The commander, Sir Walter Selby, capitulated with a Scots knight for his life; but the bargain being disapproved of by David, he ordered two of Selby’s sons to be hanged in his presence, and then the father’s head to be cut off. From hence the Scots marched to Lancrout, which they plundered; then passing into Northumberland, they pillaged the priory of Hexham, but spared the town, that it might serve as a magazine. Three other towns, Corbridge, Durham, and Darlington, were spared for the same reason. In his march to Durham, it is said that he would have made the county a desert, had not some of the monks paid him a contribution of a thousand pounds to spare their estates: however, according to Knighoton, every Englishman who fell into David’s hands was put to death, unless he could redeem his life by paying three pence.

To put a stop to the cruelties of this barbarous invader, the queen of England, in her husband’s absence, assembled a powerful army, which was divided into four bodies; the first commanded by Lord Henry Percy; the second by the bishop of Lincoln, the lord Moubay, and Sir Thomas Rokey; and the fourth and principal division was headed by Edward Baliol. The king of Scotland headed a chosen battalion, composed of the flower of his nobility, and the auxiliaries with which he had been supplied by France. The high reward of Scotland headed the second line; and the third was commanded by the earls of Moray and Douglas. While the English were approaching, Lord Douglas and Sir David Graham skirmished with them, but were defeated with the loss of 500 of their men; which seemed an omen of the disaster that was about to ensue. The general engagement began between the archers on both sides; but the English being much superior in the use of the bow, the reward of Scotland advanced to the relief of his countrymen. The English archers, unable to bear his attack, fell back upon Lord Henry Percy’s division, which was thus put in confusion, and would have been totally defeated, had not Baliol advanced to their relief with a body of 4000 horse. The reward was then obliged to retire; by which means the flank of that division commanded by David, and which was then engaged with another line of the English, was left exposed to an attack. Baliol perceived the advantage; and, without pursuing the reward, attacked the king’s division, which was immediately cut in pieces or dispersed. David was left with about 80 noblemen and gentlemen, but still maintained the fight with obstinacy; nor would he yield even when wounded in the head and with an arrow, expecting every moment to be relieved by the reward and that line of his army which was still prisoner.

David invaded England, and behaves with the utmost cruelty.

The Scots defeated, and their king taken.

The battle of Durham.

Account of king David after the battle.

King David, after this unfortunate battle, was carried to the castle of Bamborough, where he was kept with so much privacy, that for some time it was not known where he was, or that he had been taken prisoner. As soon as the truth was known, the queen of England demanded the royal prisoner from Copeland; but the latter positively refused to part with him even to the queen, unless she could produce an order to that purpose under Edward’s hand and seal. This inhumate behaviour was resented by the queen, and a complaint made to the king; in consequence of which Copeland was summoned to appear before Edward, after having resigned David to the custody of Lord Nevil. The English monarch, at that time in France, approved of all that he had done, rewarded him with 500 l. a year, and sent him back to England with the honour of

3...knight.
Scotland.

David was then escorted by Copeland, attended, it is said, by 20,000 men, from the castle of Ogle in Northumberland, till the Lord Nevill, by incognito, delivered him into the hands of Sir Thomas Rolby, sheriff of Yorkshire. In the same pompous manner he was conducted all the way to London, which he entered on a black courier. He was received in the capital with the greatest solemnity by the lord mayor and other magistrates, the city-companies under arms lining all the streets through which he passed, the houses loaded with spectators, who expressed a generous concern for his captivity. Being arrived at the Tower, he was delivered, by indenture likewise, to the custody of the confable, the Lord John Darcy, on the 2d of January 1347.

Baliol now, encouraged by the misfortune of his rival, made an effort once more to establisht himself on the throne of Scotland; and before the end of the year reduced the castles of Hermitage and Roxburgh, the forest of Ettrick, the Merse, with the counties of Annandale, Teviotdale, and Tweeddale. The Scots continued faithful to the cause of their king, notwithstanding his misfortune, and chose the Steward for the guardian of the kingdom. He behaved with a prudence equal to the high station he filled; nevertheless the progress of Baliol was so rapid, that it is scarcely probable he could have maintained his ground, had not Edward again contested to a truce; which, however, seems to have been ill observed on the part of the Scots. In fact, though both Scots and English historians are silent as to particulars, we find, that about the end of the year 1348, all Scotland was recovered out of the hands of the English; excepting Berwick, Roxburgh, Hermitage, and Lanrice, which was part of Baliol's hereditary estate, and defended by him with an army. The Scots historians inform us, that the English, in revenge for the damages done to their country by the breach of the peace, proclaimed a tournament and other military exercises at Berwick, to which they invited the Scots; but in their way thither the latter fell into an ambuscade, and were cut all in pieces.

The years 1349 and 1350 were remarkable only for a dreadful plague which invaded Scotland, after having ravaged the continent of Europe. According to Fordun, one-third of the people of Scotland perished at this time. The patient's flesh swelled exceedingly, and he died in two days ill: but the mortality chiefly affected the middling and lower ranks of people. The same dreadful calamity continued throughout the years 1351 and 1352;occasioning a cessation of arms not only in Scotland, but throughout all Europe.

All this time King David remained a prisoner in England; for though several treaties had been proposed, they had hitherto come to nothing, because the English monarch insisted upon being indemnified for the ravages the Scots had committed in his territories. At last it was agreed, that the king of Scotland should be immediately set at liberty, on paying 90,000 marks for his ransom, by equal proportions, within the space of nine years; and if a truce be made at the Feast of Candelmas next to come, the second at Candelmas 1357, and to on till complete payment should be made of the whole: That, during the said space of nine years, there should be a truce between the two kingdoms; That 20 Scots gentlemen of the best families in the kingdom, should remain in England as hostages and sureties for the said sum; and that, if any part thereof was not paid at the precise time appointed, then David should remain a prisoner in England till it was paid; or, if he was detained by any just cause, that the lord high steward, the lord Douglas, John of the Isles, and others of the highest rank, should come and supply his place.

These terms were rejected by the Scots nobility, and, Rejected by in 1355, war was recommenced with England, at the instigation of France, who sent 40,000 crowns to Scotland as a supply for defraying the expenses.

With this sum the guardian, having raised an army, once more took the field; but not before the English had destroyed the Lothians and Douglasdale. A battle was fought on Nebbit-moor: in which the English being drawn into an ambuscade, were totally defeated. The next attempt of the Scots was against the town of Berwick, which they designed to surprize by an escadade. They met, however, with such a vigorous resistance, that many persons of distinction were killed. The attack proved unsuccessful; but the acquisition was of no great importance as the castle fell held out. Edward, in the mean time, hearing of the loss of the town, hurried back from France to London. Here he lay but three days, and marched northward to raise the siege. He reached Durham on the 23d of December 1355, where he appointed all his military tenants to meet him on the 11th of January 1356. On the 14th of the same month he arrived before Berwick, which was instantly retaken; but the Scots were allowed to depart for their own country. The reduction of this place produced an extraordinary effect: for Baliol now perceiving that Edward meant not to establish him on the throne of Scotland, but to retain in his own possession as many places of that country as he could, came at last to the resolution of giving up the king of England the whole of Scotland. This indeed was no more than a form, because at that time he was not possessed of the kingdom. However, the ceremony was performed at Roxburgh; and Baliol presented his crown and some earth and stones by way of investiture. Baliol in return was to have a revenue of 2000 pounds a year; and as Edward was at the head of an excellent army, he had little doubt of being able to force the Scots to submit.

The affairs of Scotland were now in a very critical situation; and it was necessary to gain time. For this reason Edward was amusied with a negotiation; and to this he the more willingly listened, as he was at that time waiting for his fleet, from which he had great expectations. A little time, however, discovered the deceit. The Scots plainly told Edward, that they would die rather than submit to his demands; and he, in return threatened a most dreadful retribution. His fleet in the mean time arrived in the Frith of Forth; the mariners destroyed and pillaged all that was within their reach, without sparing even the sacred edifices, carrying off the statues of the blessed virgin, loading the monks with chains, and committing every thing in those days called impiety and sacrilege. Edward had by this time marched as far as Haddington, but was obliged to receive provisions all the way from his fleet; for the Scots had defolated the country through which he passed. During his march his army was haraessed, and his
his forgers cut off, so that he was reduced to distress; and at last his fleet being totally destroyed by a storm, he was obliged to return to England without accomplishing any thing.

In the mean time the prince of Wales, who had been left by his father to carry on the war in France, defeated and took prisoner John king of France, at the battle of Poitiers. In this battle were 30,000 Scots, who had given over as auxiliaries to the French monarch, and who suffered extremely. However, the success of Edward, instead of rendering him haughty, seemed to have a contrary effect; and, by the mediation of Pope Innocent, a truce for two years was concluded with France, in which the Scots were comprehended. During this interval the ransom of the king of Scots was settled at £100,000, to be paid in ten years; for which 20 hostages were to be given as formerly. In consequence of this treaty, David at last obtained his liberty in 1358; and Edward laid himself aside all hopes of ever subduing Scotland. As for Baliol, he was now sunk in oblivion; and it is not known what became of him, or when he died.

David, though now restored to liberty, found himself greatly embarrassed with the payment of such a large sum as had been stipulated for his ransom; the kingdom of Scotland being then in a most miserable and exhausted situation. After finding his queen, and going into England himself, he could obtain no greater favour than a repite of a few months for the payment of the second moiety; so that he was a last constrained to seek assistance from France. This could fearfully be expected in the distressed situation of that kingdom; however, it was at last agreed, that 50,000 marks should be paid to Scotland, in case the Scots would content to renew the war the following year. Neither party, however, kept their word; and David, being still greatly distressed about the remainder of his ransom, at last entered into a very extraordinary negotiation with Edward, by which he confessed that the king of England should be his successor to the throne of Scotland. But this negotiation was defeated through the invincible hatred with which the Scots bore to an English governor. David then, being entirely unable to discharge the remainder of his ransom, was obliged to enter into a new treaty; by which the kingdom of Scotland became indebted to Edward the sum of 100,000 pounds sterling, to be paid by equal proportions within the space of 25 years, during which there should be a truce between the two nations.

From this time we meet with little more of any moment in the reign of king David. After the death of his queen Johanna, the sister of Edward, he married a Scottish woman, named Margaret Logie; but by neither of his wives had he any children. Queen Margaret he divorced, on what pretence is not known; however, the left the kingdom, and complained personally to the Pope, who treated her as David's lawful wife, and enjoined her husband to receive her as such under the most severe penalties. What effect these threats had on the king is not known; but it is certain that Margaret never returned to Scotland; and, on the 22d of February 1371, David himself died, leaving the kingdom to his nephew Robert Stewart, the first of that family who sat on the throne of Scotland.

(k) Concerning the origin of the Stewart family, we have the following account by the Scots historians. Fleance, the son of the celebrated Banquo, after his father's murder by Macbeth, fled into Wales, where he had a son named Walter, by a princess of that country. After the restoration of Malcolm Canmore, this Walter returned to Scotland, where he was promoted to the high stewardship, a dignity held by service, and which intituled the possessor to all the privileges of a baron. Walter was now distinguished, from this office, by the title of Walter the Stewart, which descended to his posterity; and Stewart, afterwards Stewart, or Stuart, became their surname.

On this subject Lord Hailes has the following remarks. "Our historians have recorded the achievements of Walter the Steward of Scotland in the reign of Malcolm III. He is said to have been the father of Alan, and the grandfather of that Walter who was indeed Stewart of Scotland in the reign of David I. and Malcolm IV. It may perhaps be ascribed to strange prejudices, or to a spirit of scepticism, when I declare, that hitherto I have seen no evidence that such a person as Walter Stewart of Scotland, in the reign of Malcolm III., did ever exist.

"We are gravely told, 'That Walter the son of Fleance, the son of Banquo, Thane of Lochaber, having killed a man at the court of Griffith, prince of Wales, sought refuge with Edward the Conqueror; and having killed another man at Edward's court, sought refuge with Alan the Red, earl of Brittany; That, on the Norman invasion, he came to England with the earl of Brittany, and signalized himself at the battle of Hastings in 1066: That the earl of Brittany, by his first wife Emma, daughter of Siward earl of Northumberland, had an only child Christina; and that he bestrawed her in marriage on the young hero.' This is the story which, after various improvements since the days of Boccaccio, has had the good fortune to obtain credit.

"That Walter, before he had well attained to the age of manhood, should have slain two men in private quarrels, is a circumstance improbable, yet possible; and therefore I object not to it. But his alliance with the earl of Brittany cannot be so easily admitted.

"Alan, surtamed le Roux, a younger son of Siward earl of Brittany, was one of the gallant adventurers who came over with William the Conqueror; he had neither territories nor court. The historians of Brittany positively assert that he had no children. Besides, it is hard to say by what accident Alan le Roux should have become acquainted with Emma the daughter of Siward earl of Northumberland! I suppose that our historians invented this alliance, in order to strengthen the connection between Walter the Stewart and Malcolm III.

"According,
Some authors tell us, that at the accession of Robert II., his title was disputed by William, earl of Douglas. If any such claim was preferred, an assembly of the States set it aside, and it was resolved that Robert should be crowned at Scone; and to take away for the future all disputes concerning the succession, a particular act was framed, by which the kingdom was secured to Robert and his heirs.

The new king being thus established on the throne, endeavoured to renew the war with England, in order to recover from them the town of Berwick, and some other places on the borders. In this, however, he failed; and as 56,000 pounds of David's ransom remained unpaid, Robert bound himself to discharge it at the rate of 4000 marks every midsummer. He then proposed an alliance with France; but the terms demanded by that kingdom, that Scotland should be obliged to make war with England whenever France should require it, Robert could not by any means be induced to consent to such a requisition, which would have obliged him to break through the most solemn treaties, whenever the king of France should think proper to break with England. A new treaty, therefore, was entered into, by which it was provided, Scotland that neither Scotland nor France should be obliged to make war with England; and by another clause, that the dispensation or authority even of the pope himself should never free the kings or kingdoms of France and Scotland from the obligations they lay under to assist one another, as often as required, in opposition to the kingdom of England. In case of a competition for the crown of Scotland, the king of France and his heirs were to take care that no English influence was used; but that the matter being by the greatest and best part of the nation decided conformably to the laws and establishments of Scotland, he should with all his power defend and assist the person so established. Lastly, it was agreed that no Frenchman should ever henceforth serve for wages, or otherwise, against Scotland, nor any Scotman against France.

This last article occasioned a recall of all the Scots soldiers from the English armies, which Edward looked upon twixt the Scots and English borders.

According to one account, the genealogies of their families stand thus:

<table>
<thead>
<tr>
<th>Emma = Alan earl of Brittany.</th>
<th>Another daughter = Duncan king of Scots.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chriflina = Walter the Stewart.</td>
<td>Malcolm III.</td>
</tr>
</tbody>
</table>

Thus Walter the Stewart and Malcolm III. were cousins-german.

According to another account, the genealogy of their families stands thus:

<table>
<thead>
<tr>
<th>Sward Earl of Northumberland.</th>
<th>His father = wife of Duncan.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Emma = Alan Earl of Brittany.</td>
<td>Malcolm III.</td>
</tr>
</tbody>
</table>

Thus the mother of Walter the Stewart and Malcolm III. were cousins-german.

It is said that, 'Walter the Stewart had a son, Alan, also Stewart of Scotland.' The evidence of this is to be found in a charter granted by Earl Gospatrick, and in another charter granted by his son Waldeve Earl of March, at Dunbar. In them Alden, or Aldan Dapifer, is mentioned as a witness; that is, one of our antiquaries, Alan, the Stewart of Scotland.

This is the fundamental proposition on which the genealogy of the house of Stuart, as it is commonly understood, may be laid to rest. It will be remarked, that this hypothesis takes it for granted, that Alan or Allen, and Alan, are the same; upon what authority I know not. The Alden mentioned in the two charters seems to have been the steward of Earl Gospatrick, and of Earl Waldeve, not the steward of Scotland.

To the charter by Earl Gospatrick, there are eight witnesses: 'Andrew the arch-deacon; Adam his brother; Nigel the chaplain; Ketel the son of Dolphin; Ernald; Alden the steward (Dapifer); Adam the son of Alan; Adam the son of Gospatrick.' Is it possible for credulity itself to believe, that the Alden placed so low in such company, was the high steward of Scotland, a man at least as honourable as Gospatrick himself? I can have no doubt, that the witnesses to this charter were the dependants or household-servants of Earl Gospatrick; and that if we interpret Nigelius Capellanus to be Nigel the earl's chaplain, we must interpret Aldenus Dapifer to be Alden the earl's steward.

To the charter granted by Earl Waldeve, there are nine witnesses. Alden Dapifer is the seventh in order. There are only three among them who seem to have been landed men: 'Elias de Haldelanda (probably Haldenden),

* There was a certain prince of Denmark who brought forth a son to a bear. This son was called Brian, and natural enough like, had ears like a bear. He was the father of Sward earl of Northumberland. Brumpton, p. 915. ap. Twilden.
extended not only through the lower ranks, but had per-
vaded the higher classes also. The inhabitants of the
borders, indeed, paid very little regard to the orders of
their respettive soveraigns; so that daily hollitiies were
committed by them upon each other when there was
peace between the soveraigns. The inhabitants of these
countries had oft-blifhed with one another certain
conventions, which have since been collectcd, and go by
the name of the Border-laws. The families of Doug-
las and Percy, whoke estates lay contiguous to one an-
other, were at perpetual variance. It had been com-
mon for the borderers of both kingdoms, during a truc-
to frequent each others fairs; and a servant of the
earl of March had been killed in a fray at that of
 Roxburgh, which was fill in the hands of the Englifh.
Justice for this murder was demanded from lord Percy;
but he flied the complaint. On this the earl of
March, with his brother the earl of Moray, afTembling
their followers, entered the felf that was held in
Roxburgh, plundered and burnt the town, and killed
all the Englifh who fell into their hands. The Englifh
borderers were ordered to lay waste the lands of the
earl of March; but, in their way thither, destroyed the
estate of Sir John Gordon, a man of great property in
the south of Scotland. Sir John in his turn invaded
England, from whence he drove off a large booty in
cattle, and a number of prisoners. In his retreat he
was attacked by a body of fresh troops under Sir John
Liiburn, at a place called Carum. An obline en-
counter followed. The Scots were five times repul-
sed; but at last they renewed the charge with such fury,
that they made Liiburn, his brother, and several other
persons of distinction, prisoners, together with all their
surviving soldiers. On this Lord Percy with 7000 men
encamped at Duns, in the south of Scotland; but was
obliged to retire, probably for want of subsidence for
his army. In the mean time, Mu1grave, the governor
of Berwick, who had been ordered to join Percy with
detachment trom the garrison, was on his march in-
tercepted, defeated, and taken prisoner by Sir John
Gordon; after which the border became general on
both sides. The issue of these disturbances is but little
known; however, in 1777, we find them raging with
more violence than ever. The fair of Roxburgh was
once more the scene of action, and the town was again
burnt down by the Scots. Lord Percy, who was now
earl

Huffenden, William de Copland, and William de Hellebat (q. Elbottle); all the three are placed before Alden
Dapifer.

"It has been remarked, 'That in those days the title of steward or dapifer was too high a title to be given
to the retainers of an earl.' I answer, that the Saxen Chronicle, anno 1093, says, 'Moral of Boebbehurh
was then eares flourward,' i.e. Moracel of Bamboar,h was this earl's steward, or the steward of Robert earl of
Northum berland. Besides, to a charter granted by Earl Gospatrick the Elder, Lambertus Dapifer is a witnefs.
If Lambertus Dapifer, in a charter of Gospatrick the Elder, implies Lambert the steward of the family of
March, why should Aldenus Dapifer, in the charters of the son and grandson of Gospatrick, imply the steward
of Scotland?"

"I believe that no defender of the common hypothesis will anfiwer this objection, by pretending that
Lambertus Dapifer was indeed steward of Scotland. Such an anfiwer would leave no room for Walter steward of Scotland,
who is held to have been a distinguished perfonage in the reign of Malcolm III.

"It is curious to fee upon what flight grounds our antiquaries have established the connection between
Aldenus Dapifer and the house of Stewart. Walterus flius Alani appears to have flourished in the reign of Da-
vid I. In the reign of Malcolm IV. he is termed Dapifer. Hence it has been rashly concluded, that Wal-
terus Dapifer flius Alani was the fon of that Aldenus Dapifer who is a witnefs to the charters of Gospatrick and
Waldce.

"I persuade myself, that Alden Dapifer, and Alen the father of Walter steward of Scotland, in the reign of
Malcom IV. were different persons; and that they had nothing in common but the christian name, if indeed
they had that in common.

"Some of my readers may demand, 'Who then was Alen the father of Walter, steward of Scotland in
the reign of Malcolm IV.?'

"I can only anfiwer this quifion by demanding, 'Who was the father of Martach Earl of Marre in the reign of Malcolm III. ; of Gilefrft Earl of Angus in the reign of Alexander I. ; of Fergus Lord of Col-
loway in the reign of Malcolm IV. ; or of Frikinus de Moravia, ancestor of the family of Sutherland, in
the reign of William the Lion? Or, to keep in the fuppofed line of the royal family of Stewart, 'Who
was the father of Banquho Thane of Lochabar?'

"Many anfiwers may no doubt be made to this lat quifion. Kennedy fays, that the father of Banquho was
one of the seven sons of Corc king of Munfter; Sir George McKenzie, Of Fergushard, the fon of Kenneth III. ;
and Simpson, the fon of Ferquhard Thane of Lochabar, the fon of Kenneth, the fon of Murdoch, the fon of
Doug, the fon of Eth king of Scotland.

"It is remarkable, that Abercrombie relates all these contradictory stories, without ever suspecting the
natural inference arising from them, 'That if noble persons are not satisfied with a long pedigree, proved
by authentic instruments, they must believe in flattering and ignorant fictions; and that if they scorn to
wait for the dawn of record to enlighten their defect, they must bewilder themselves in dark and fabulous
genealogies.'

"In the reign of David I. before the middle of the 12th century, the family of the Stewarts was opulent
and powerful. It may therefore have subsifted for many ages previous to that time; but when, and what was its
commencement, we cannot determine.'
earl of Northumberland, resolved to take signal vengeance. He ravaged the Scots borders, particularly the

%S%8

earl of March's estate, for three days, at the head of

10,000 men. Some time after this, the Scots insurgents became powerful enough to surprise Berwick; which, however, was quickly retaken by the English, who soon after invaded Scotland. In this expedition, however, they succeeded so ill, that Percy thought proper to debit from his expedition. The Scots in the mean time began hostilities by sea, under one Mercer, an experienced sailor; but he had the misfortune to be taken prisoner by the English, with all his fleet. In 1379, England was afflicted with a dreadful plague, of which the Scots took advantage to invade the country. The English historians tell us that they behaved with the utmost barbarity, killing and plundering the defenceless inhabitants without mercy.

This predatory war continued, generally to the disadvantage of the English, till the beginning of November 1380, when a truce was concluded, to continue for a year; which, however, related only to the borders. This truce, like the others, was but very different; the misfortune of which had of late been impressed on England. That fervice was thrown into the hands of parties of the enemy, who had fled thither for refuge. King Richard took the field with a more numerous army than had ever been mustered in England before. Hostilities were begun by the Scots, who, according to custom, invaded the northern parts of England, and carried off a considerable booty; however, in their retreat, they were in the utmost danger of being cut off by the duke of Lancaster, who had been sent with an army to intercept them. The English army proceeded northwards; but could accomplish nothing, on account of the country being destitute, till they came to Edinburgh, which they laid in ashes. Being, however, incessantly harassed by parties of the enemy, they were obliged to retreat.

Nothing remarkable happened till the year 1387, when, after a short truce, the war was renewed with fresh fury. Northumberland and Wensmoreland were ravaged by the earls of Fife and Douglas, and Lord Nithdale defeated a body of 3000 English; after which he formed the plan of invading Ireland, the inhabitants of which had of late been very active against the Scots. In 1388, Douglas obtained permission to raise a body of forces for this invasion; and having landed in safety, defeated the Irish, plundered the town of Carlingford, and loaded fifteen ships with the booty. From hence the Scots retired to the Isle of Man, which in manner was plundered and laid wae; after which they returned with their booty to Loch Rian in Scotland.

Encouraged by this success, Robert determined to proceed on a more enlarged plan. Having assembled an invading army at Aberdeen, a double invasion of England was resolved upon. Two armies were raised; the one, confisting of 25,000 men, commanded by the earls of Mentieth and Fife, Douglas lord of Galloway, and Alexander Lindsay; the other army, confisting of the like number, was commanded by the earls of Douglas, March, Crawford, Moray, the lord high constable of Scotland, and other persons of distinction. The former entered Cumberland, and the latter Northumberland, both of which countries they laid waste, and both armies were to meet within ten miles of Newcastle. The English were thrown into the greatest consternation. Newcastle was defended by the earl of Northumberland, whose age and infirmities rendered him incapable of taking the field; but his place was abundantly supplied by his two sons Henry and Ralph, the former of whom is known in English history by the name of Hotspur. The town was garrisoned by the flower of the English nobility and gentry, as well as the inhabitants of the adjacent countries, who had fled thither for refuge. Douglas selected 2000 foot and 300 horsemen out of the two armies, and encamped on the north side of the town, with a view, according to the Scotch historians, of forming it next day. In the mean time, he was challenged by Hotspur to fight him hand to hand, with sharp ground pikes, in fight of both armies. Douglas accepted the challenge, and Percy was unhorsed in the first encounter, and obliged to take refuge within the fort of Percy.
portcullis or gate of the town; from whence Douglas brought off his antagonist’s lance, with a pennon attached to it, and swore in his hearing that he would carry it into Scotland. Next day Douglas attempted to storm the town; but, being repulsed in the attack, he decamped in the night. Percy, breathing furious revenge, pursued and overtook the Scots at Otterburn. His arrival was quite unexpected, so that the principal commanders of the Scottish army were sitting down to supper unarmed. The folders, however, were instantly prepared for battle; but, in the hurry necessarily attending a surprize of this kind, Douglas forgot to put on his cuirass. Both leaders encouraged their men by the most animating speeches; and both parties waited for the rise of the moon, which happened that night to be unusually bright. The battle being joined on the moon’s first appearance, the Scots began to give ground; but, being rallied by Douglas, who fought with a battle-axe, the English, though greatly superior in number, were totally routed. Twelve hundred were killed on the spot; and 100 persons of distinction, among whom were the two Percies, were made prisoners by Keith marischal of Scotland. On the side of the Scots the greatest loss was that of the brave earl Douglas, who was killed in consequence of going to battle without his armour, as above related. It was this single combat between Douglas and Percy, and the subsequent battle, which gave rise to the celebrated ballad of Cheyke Chace.

In the mean time the bishop of Durham was marching towards Newcastle with an army of 10,000 men; but was informed by the runaways of Percy’s defeat, which happened on the 21st of July 1388. In a council of war it was resolved to pursue the Scots, whom they hoped easily to vanquish, as being wearied with the battle of the preceding day, and laden with plunder. The earl of Moray, who commanded in chief, having called a consultation of his officers, resolved to venture a battle. The prisoners were almost as numerous as the whole Scots army; however, the generals required no more of them than their words of honour that they should continue inactive during the battle, and remain prisoners still. This condition being complied with, the Scots drew out their army for battle. Their rear was secured by marshes, and their flanks by large trees which they had felled. In short, their appearance was so formidable, that the English, dreading to encounter a resolute enemy so strongly secured, retired to Newcastle, leaving the Scots at liberty to continue their march to their own country.

Robert, being now oppressed with age, so that he could no longer endure the fatigues of government, the administration of affairs devolved upon his second son the earl of Fife; for his eldest son was by nature indolent, and besides being an unlucky blow he had received in a horse. Early in the spring of 1389, he invaded England with success; but the same year a truce was concluded, to last from the 19th of June 1389 to the 16th of August 1392; in which the allies of both crowns were included. This truce was violently opposed by the nobility, who suspected their king of being too much under French influence. Upon this the court of France thought proper to send over ambassadors to persuade the nobility to comply; informing them, that in case of a refusal, they could expect no

affiance either of men or money from the continent.

With difficulty they prevailed, and peace between England and Scotland was once more restored. Scarcely, however, was this truce finished, when the peace of the nation was most scandalously violated by Robert’s thirst for the earl of Buchan. This prince having a quarrel with the bishop of Murray, burnt down the fine cathedral of Elgin, which has been called by historians the lanthorn and ornament of the north of Scotland. The king for this crime caused his son to be imprisoned; and a civil war would have been the consequence, had it not been for the veneration which the Scots retained for their old king. However, they did not long enjoy their beloved monarch; for he died on the 19th of April 1390, in the 75th year of his age, and the 19th of his reign.

On the death of Robert II., the crown devolved upon his eldest son John; but the name being thought unlucky in Scotland, he changed it for that of Robert, though he was still called by the commonality Robert John Fernzier. He had been married to Annabella, the daughter of Sir John Drummond, ancestor to the noble family of Perth; and was crowned along with his consort at Scone, on the 13th of August 1390. He confirmed the truce which had been entered into with England, and renewed the league with France; but the beginning of his reign was disturbed by the wars of the petty chieftains with each other. Duncan Stewart, son to Alexander earl of Buchan, who had died in the earl of the prison for burning the cathedral of Elgin, assembling his followers under pretence of revenging his father’s death, laid waste the country of Angus. Walter Ogilvy, the sheriff of Angus, attempting to repel the invaders, was killed, with his brother and 60 of his followers. The king then gave a commission to the earl of Crawford to suppress them; which he soon did, and most of them were either killed or executed. The followers of the earl of Buchan were composed of the wilder Highlanders, distinguished by the title of Catterlance, which answers to that of banditti. That such a race of people existed is certain from the records of Scotland; but it is not easy to determine how they obtained their subsistence, being void of the knowledge of agriculture and of every civil art. There is some reason to believe that many of them came from the Western Isles; and that they or their ancestors had emigrated from the eastern parts of Ireland. The lands they inhabited were never cultivated till towards the middle of the last century; and, according to the most authentic accounts, they lived entirely upon animal food.

The earl of Crawford’s success against the followers of Buchan encouraged Robert to intrust him with a commission for subduing other insurgents by whom the peace of the country was disturbed. The most remarkable of these were the Clan Chattan and Clan Kay. As between the both these tribes were numerous and brave, Crawford was not without apprehensions that they might unite against him as a common enemy, and defeat him if he attempted to suppress them by force. He proposed, therefore, that the two rival clans should each choose 40 men, to determine their differences by the sword, without being allowed the use of any other weapon. The king and his nobility were to be spectators of the combat; the conquered clan were to be pardoned for all their former offences, and the conquerors honoured

This proposal was readily accepted by both parties, and the north inch of Perth was to be the scene of action. But, upon mooting the combatants, it was found that one of them, belonging to the clan Chattan, had abstained himself. It was proposed to balance this difference by withdrawing one of the combatants from the clan Kay; but not one of them could be prevailed on to resign his place. At last one Henry Wind, a soldier, though no way connected with either party, offered to supply the place of him that was absent, on condition of his receiving a French crown of gold (about 7 s. 6 d. Sterling) which was immediately paid him. The combat then began with incredible fury; but at last, through the superior valour and skill of Henry Wind, victory declared in favour of the clan Chattan. Only ten of the conquerors, besides Wynd, were left alive; and all of them desperately wounded. Of the clan Kay only one remained; and he having received no hurt escaped by swimming across the Tay.

While these internal broils were going on, the truce which had lately been concluded with England was so ill observed, that it became necessary to enter into fresh negotiations. These, like others which had taken place before, had very little effect. The borders on both sides had been so accustomed to ravage and plunder, that they could not live in quiet. King Robert also was thought to be too much attached to the king of England. He had introduced the new title of duke, which he bestowed first on the prince royal; but making an offer of that honour to one of the heads of the Douglas family, it was rejected with disdain. That powerful family had never left fight of an ancient claim they had upon the castle of Roxburgh, which was still in the possession of the English; and this year the son of the earl of Douglas, Sir William Stewart, and others, broke down the bridge of Roxburgh, plundered the town, and destroyed the forage and corn there and in the neighbouring country. The English applied for satisfaction; but obtained none, as the conclusion which involved the kingdom by the deposition of Richard II. and the accession of Henry IV. prevented them from having recourse to arms, the only argument to which the Scots patriots in those days would listen.

No sooner was the catastrophe of Richard known in Scotland, than they resolved to avail themselves of it; and invading the north parts of England, demolished the castle of Wark, and laid the neighbouring country under contribution. The situation of Henry's affairs did not admit of his resenting this insult. He contented himself with nominating his brother the earl of Woolermore, to treat with the Scots about a truce or peace; or, if that could not be obtained, to make a mutual agreement, that the towns of Dumfries in Scotland, and Perth in England, should be free from hostilities during the war. To this proposal the Scots paid no regard; and being encouraged by the court of France, who resented the deposition of Richard, they renewed their ravages in England. In 1400, the king of England called a parliament, in order to consult on the most proper means of repelling the Scotch invasions; and in this he was greatly assailed by the divisions of the Scots among themselves. The duke of Rothesay, the heir-apparent of the crown, was now grown up to man's estate, and it was thought proper to provide a suitable comfort for him. The king is said to have scandalously Mercenary behaviour put up his son's marriage at auction, and offered him to the lady whose father could give him the highest price. The earl of March was the highest bidder; and advanced a considerable sum in ready money, on condition that his daughter should become the royal bride. The continuator of Fordun informs us, that the earl of Douglas paid a larger sum for his daughter's fortune than that which had been advanced by the earl of March, and that the earl of Douglas's daughter was married to the duke of Rothesay: that before the marriage was celebrated, March demanded that the money he had advanced should be reimbursed; but receiving an unsatisfactory answer, he declared, that as the king had not fulfilled his bargain, he would bring unexpected calamities upon the country. Accordingly he fled into England, leaving his castle of Dunbar to the custody of his nephew Robert Maitland, who soon after put it into the hands of the earl of Douglas, called in history Archibald the Grim, from the termination of his vogue.

As soon as Robert heard of the revolt of the earl of March, he sent ambassadors demanding back his subject; but the request was disregarded. On the other hand, the earl of March demanded reparation of the castle of Dunbar, pleading, that he had committed no act of treason, but had come to England under a safe conduct from king Henry, on purpose to negotiate his private affairs: but this request was disregarded; upon which he sent for all his family and followers to England, where they joined him in great numbers. This produced a war between the two kingdoms. The earl of March with Henry Percy for his named Hotspur, invaded Scotland, penetrating as far as Haddington, and carrying off great numbers of the inhabitants into captivity. From thence they went to Peebles, and then to Linton, ravaging the country all the way as they pleased along. They next besieged the castle of Hales, and took several of the neighbouring forts; but Archibald the Grim, or rather his son, having raised an army against them, they were unfrocked with terror, and fled to Berwick, to the gates of which they were pursued by the Scots. At this time the Scotch admiral, Sir Robert Logan, was at sea with a squadron; but miscarried in an attempt he made upon some English ships of war that protected their fleet when sailing upon the coast of Scotland. After this the English plundered the Orkney islands; which, though belonging...
ing to the crown of Norway, were at that time governor, or rather farmed, by Sinclair the Scots earl of Orkney and Caithness.

All this time the earl of March continued under the protection of the king of England. He had received repeated invitations to return to his allegiance; but all of them being rejected, he was proclaimed a traitor; and the Scottifh governor made a formal demand of him from king Henry. With this the latter not only refused to comply, but renewed his league with the lord of the Isles. He pretended also, that at this time he denounced his homage, fealty, and service, to the king of France, in order to avoid the

Who is spared to death.

A body of Scots cut off by the English.

immediately furnished with a considerable army, according to some, consisting of 10,000; according to others of 13,000; and according to the English historians, of 20,000 men. Murdoc, the son of the duke, attended the earl on this expedition, as did also the earls of Moray, Angus, Orkney, and many others of the chief nobility, with 80 knights. The Scots; on this occasion conducted themselves with the same impudence they had done before. Having penetrated too far into the country, they were intercepted by the English on their return, and obliged to engage at a place called Home dal, under great disadvantages. The consequence was, that they were utterly defeated, and almost the whole army either killed or taken.

Henry Hotpur, to whom this victory was chiefly owing, refusing to pursue the advantage he had gained, entered the southern parts of the kingdom, and laid siege to a castle called Cocklawys, on the borders of Teviotdale. The castle was for some time bravely defended: but at last the governor entered into a treaty, by which it was agreed to deliver up the castle, in case it was not relieved by the king or governor in six weeks; during which time no additional fortifications were to be made. But while the English were retreating, one of Perey's soldiers pretended that the Scots had broke the capitulation, by introducing a mattock into the place. The governor, hearing of this charge, offered to fight a gentleman who should engage to make it good. A champion was accordingly fingly out, but was defeated by the Scotsman; and the English army retired according to agreement. The matter then being debated in the Scottish council, it was resolved to send relief to the castle. Accordingly the duke of Albany, with a powerful army, set out for the place; but before he came there, certain news were received of the defeat and death of Hotpur, at Shrewsbury, as related under the article England, n° 182.

In the year 1404, king Henry, exceedingly desirous of a peace with Scotland, renewed his negotiations for that purpose. The king, however, not being attended with success, hollities were still continued, but without any remarkable transaction on either side. In the mean time, king Robert was informed of the miserable fate of his eldest son the duke of Roxefay; but was unable to relent it by executing justice on such a powerful murderer. After giving himself up to grief, therefore, for some time, he resolved to provide for the safety of his second son James, by sending him into France. This scheme was not communicated to the duke of Albany; and the young prince took shipping with all imaginable secrecy at the Barf, under the care of the English of the earl of Orkney. On his voyage he was taken by an English privateer off Flamborough-head, and brought before Henry. The English monarch having examined the attendants of the prince, they told him that they were carrying the prince to France for his education. "I understand the French tongue (replied Henry), and your countrymen ought to have been kind enough to have treated me with their prince's education." He then committed the prince and his attendants close prisoners to the tower of London. The news of this disaster arrived at the castle of Roxefay in the isle of Bute (the place of Robert's residence) while the king was at supper. The news threw him into such an agony of grief, that he died in three days.
days, the 29th of March 1405, after having reigned near 15 years.

By the death of Robert, and the captivity of the prince, all the power devolved upon the duke of Albany, who was appointed regent by a convention of the estates assembled at Scone. The allegiance of the people, however, to their captive prince could not be shaken; so that the regent was obliged to raise an army for the purpose of rescuing him. Henry summoned all his military tenants, and made great preparations: but, having agreed to treat of a final peace with Ireland and the lord of the Isles, the regent laid hold of this as a pretence for entering into a new negotiation with the English monarch; and a truce was concluded for a year during which time all differences were to be settled. In consequence of this agreement, Rutherfay, king at arms, was appointed commissary-general for the king and kingdom of Scotland; and in that quality repaired to the court of England. At the time when the prince of Scotland was taken, it seems that there had been a truce, however ill observed on both sides, subsisting between the two nations. Rutherfay produced the record of this truce, which provided that the Scots should have a free navigation; and in consequence of this, he demanded justice of the captain and crew of the privateer who had taken the prince. Henry ordered that matter to be inquired into; but the English brought their complaints as well as the Scots; and the claims of both were so intricate, that the examination fell to the ground, but at the same time the truce was prolonged.

In the end of the year 1409, or the beginning of 1410, the war was renewed with England, and Henry prepared to strike a fatal blow which he had long meditated against Scotland. He had, as we have seen, entered into a league with the lord of the Isles, where a considerable revolution then happened. Walter Leefley had succeeded to the estate and honours of the earl of Roef, in right of his wife, who was the heir. By that marriage, he had a son named Alexander, who succeeded him; and a daughter, Margaret, who was married to the lord of the Isles. This Alexander had married one of the regent's daughters; and dying young, he left behind him an only daughter, Euphanie, who was deformed, and became a nun at North Berwick. Her grandfather, the regent, procured from her a resignation of the earldom of Roef, to which she was undoubt-ed heir, in favour of John earl of Buchan, but in prejudice of Donald lord of the Isles, who was the son of Margaret, sister to the earl Alexander, and consequently the nearest heir to the estate after the nun. Donald applied for redress; but this suit being rejected, he, with his brother John, fled into England, where he was most grudgingly received by king Henry. According to the instructions given him by the English monarch, Donald returned to his own dominions in the Isles, where he raised an army, and passing over into Ross-shire, violently seized on the estate in dispute. In a short time he found himself at the head of 10,000 Highlanders; with whom he marched into the province of Moray, and from thence to Strathbogie and Garioch, which he laid under contribution. Advancing towards Aberdeen, with a view to pay his troops with the plunder of that city, which was then a place of considerable trade, he was met by the earl of Marr, whom the regent had employed to command against him, at a village called Harlaw, in the neighbourhood of Aberdeen. A fierce engagement ensued, in which great numbers were killed on both sides, and the victory remained uncertain: but Donald, finding himself in the midst of an enemy's country, where he could raise no recruits, began to retreat next day; and the shattered state of the royal army preventing him from being pursu-ed, he escaped to his own dominions, where in a short time he submitted, and swore allegiance to the crown of Scotland.

In the mean time, Henry continued the war with Scotland, and refused to renew the truce, though frequently solicited by the Scots. He had now, however, sustained a great loss by the defection of the earl of March, who had gone over to the Scots, though the historians have not informed us of his quarrel with the English monarch. On his return to Scotland, he had been fully reconciled to the Douglas family, and now tried to distinguish himself in the cause of his country. This, with the countenance which was shown by the Scots through the court of France, a bull published by the pope in their favour, and the vigorous behaviour of the regent himself, contributed to reduce Henry to reason; and we hear of no more hostilities between the two nations till after the death of the English monarch, which happened in the year 1413.

In 1415, the truce being either broken or expired, the Scots made great preparations for besieging Berwick. The undertaking, however, came to nothing; all that was done during the campaign being the burning of Penrith by the Scots, and of Dumfrries by the English. Next year a truce was agreed upon, and a treaty entered into for the ransom of King James; which was so far advanced, that the English king agreed to his visiting Scotland, provided he engaged to forfeit 100,000 pounds Sterling in case of his failure to return by a certain day. For reasons now unknown, this treaty was broken off, and various preparations were made for a new invasion of Scotland; which, however, was executed with so little success, that it became known among the common people of Scotland by the name of the Sue ride, or the foolish expedition.

In 1420, died Robert duke of Albany, regent of Scotland, at the age of 80; and such was the veneration which the Scots had for his memory, that his position of regent was conferred upon his eldest son Murdoch, though a person no way qualified for that station.—The war with England was now discontinued; but in France Henry met with the greatest opposition from the Scots auxiliaries, inasmuch, that at last he proclaimed all the Scots in the service of the Dauphin to be rebels against their lawful sovereign, and threatened to treat them as such wherever they found them. It was not long before he had an opportunity of putting this menace in execution; for the town and castle of Melun being obliged through famine to capitulate, one of the articles of capitulation was, that all the English and Scots in the place should be resigned to the absolute disposi-tion of the king of England; and, in consequence of his resolution abovementioned, caused twenty Scots soldiers, whom he found in the place to be hanged as traitors. In 1421, Henry returned to England, and with him James the Scots king. On his arrival
arrived there, he was informed that the Scots, under the earl of Douglas, had made an irruption into England, where they had burned Newark, but had been forced to return to their own country by a persuasion, though a new invasion was daily expected. Instead of resenting this insult, Henry invited the earl of Douglas to a conference at York; in which the latter agreed to serve him during life, by sea and land, abroad or at home, against all living, except his own liege-lord the king of Scotland, with 200 foot and as many horses, at his own charges; the king of England, in the mean time, allowing an annual revenue of 300l.f for paying his expense in going to the army.

At the same time, a new negotiation was set on foot for the ransom of king James; but he did not obtain his liberty till the year 1424. Henry V. was then dead; and none of his generals being able to supply his place, the English power in France began to decline. They then became sensible how necessary it was to be at peace with Scotland, in order to detach such a formidable ally from the French interest. James was now highly cared for, and at his own liberty, within certain bounds. The English even consulted him about the manner of conducting the treaty for his ransom; and one Dougal Drummond, a priest, was sent with a safe conduct for the bishop of Glasgow, chancellor of Scotland, Dunbar earl of March, John Montgomery of Ardries, Sir Patrick Dunbar of Bele, Sir Robert Lawder of Edington, Sir William Bothwic of Bothwic, and Sir John Forrester of Corthorphin, to have an interview, at Pomfret, with their master the captive king of Scotland, and there to treat of their common interests. Most of these noblemen and gentlemen had before been nominated to treat with the English about their king's return; and Dougal Drummond seems to have been a domestic favourite with James. Hitherto the Scottish king had been allowed an annual revenue of 300 pounds: but while he was making ready for his journey, his equipages and attendants were increased to those befitting a sovereign, and he received a present from the English treasury of 100l., for his private expenses. That he might appear with a grandeur every way suitable to his dignity, at every stage were provided relays of horses, and all manner of flesh, flesh, and fowl, with cooks and other servants for furnishing out the most sumptuous royal entertainment. In this meeting at Pomfret, James acted as a kind of a mediator between the English and his own subjects, to whom he fully laid himself open; but, in the mean time, the English regency issued a commission for settling the terms upon which James was to be restored, if he and his commissioners should lay a proper foundation for such a treaty. The English commissioners, were the bishops of Durham and Worcester, the earls of Northumberland and Westmoreland, the lords Nevil, Cornwall, and Chaworth, with master John Wodeham, and Robert Waterton. The instructions they received form one of the most curious pages of this history; and we shall here give them, as they are necessary for confirming all we have said concerning the dispositions of the two courts at this juncture.

First, To make a faint opposition to any private conference between the king of Scotland and the Scotch commissioners.

Secondly, To demand that, before the said king shall have his full liberty, the kingdom of Scotland should pay to the English government at least thirty-six thousand pounds as equivalent, at two thousand pounds a-year, for the entertainment of King James, who was maintained by the court of England, and not to abate any thing of that sum; but if possible to get forty thousand pounds.

Thirdly, That if the Scots should agree to the payment of the said sum, the English commissioners should take sufficient security and hostages for the payment of the same; and that if they should not (as there was great reason for believing they would) be so far mollified, by such easy terms, as to offer to enter upon a negotiation for a final and perpetual peace between the two people, that then the English should propose the same in the most handsome manner they could. Further, that if such difficulties should arise as might make it impracticable immediately to conclude such perpetual peace, that the English ambassadors should, under pretence of pavening a way for the same, propose a long truce.

Fourthly, That in case the English commissioners should succeed in bringing the Scots to agree to the said truce, they should further urge, that they should not lend to Charles of France, or to any of the enemies of England, any succours by sea or land. Further, that the said English commissioners should employ their utmost endeavours to procure the recall of the troops already furnished by the Scots to France. The English are commanded to insist very strenuously upon this point, but with discretion.

Fifthly, If the Scots should, as a further bond of amity between the two nations, propose a marriage between their king and some noblewoman of England, the English commissioners are to make answer, "That the king of the Scots is well acquainted with many noblewomen, and even thole of the blood-royal, in England; and that if the king of the Scots shall please to open his mind more freely on that head, the English commissioners shall be very ready to enter upon conferences thereupon." But (continues the record) in case the Scotch commissioners should make no mention of any such alliance by marriage, it will not appear decent for the English to mention the same, because the women of England, at least the noblewomen, are not used to offer themselves in marriage to men.

Sixthly, If there should be any mention made concerning reparation of damages, that the commissioners should then proceed upon the same as they should think most proper; and that they should have power to offer safe-conduct to as many of the Scots as should be demanded, for to repair to the court of England.

Those instructions are dated at Westminster, July 6th, 1425.

Nothing definitive was concluded at this treaty, but that another meeting should be held at York instead of Pomfret. This meeting accordingly took place. The English commissioners were, Thomas bishop of Durham, chancellor of England, Philip bishop of Winchester, Henry Percy earl of Northumberland, and Mr. Wodeham. Those for Scotland were, William bishop of Glasgow, George earl of March, James Douglas of Balveny, his brother. Patrick abbot of Cambuskenneth, John abbot of Balmerino, Sir Patrick Dunbar.
The marriage of James with the lady Joan Beauchamp was celebrated in the beginning of February 1524. The young king of England presented him with a suit of cloth of gold for the ceremony; and the next day he received a legal discharge of 10,000 pounds, to be deducted from the 40,000 at which his ransom was fixed, and which sum was given as the marriage-portion of the lady. The ceremony being performed, the king and queen set out for Durham, where the hostages were waiting; and arrived at his own dominions, along with the earl of Northumberland and the chief of the northern nobility, who attended him with great pomp. On the 20th of April the same year, he was crowned at Scone; after which ceremony, he followed the example practised by other sovereigns at that time, of knighting several noblemen and gentlemen.

During the dependence of the treaty for James’s release, the Scots had emigrated to France in such numbers, that no fewer than 15,000 of them now appeared in arms under the duke of Touraine; but as the history of the war in that country has already been given under the article France, we shall take no farther notice of it at present, but return to the affairs of Scotland.

On his return James found himself in a disagreeable situation. The great maxim of the duke of Albany, when regent, had been to maintain himself in power by exempting the lower classes of people from taxes of every kind. This plan had been continued by his son and successor; but as the latter was deficient in his father’s abilities, the people abused their happiness, and Scotland became such a scene of rapine, that no commoner could say he had a property in his own estate. The Stewart family, on their accession to the crown of Scotland, were possessed of a very considerable patrimonial estate, independent of the standing revenues of the crown, which consisted chiefly of customs, wards, and reliefs. The revenues of the paternal estate, belonging to James, had been regularly transmitted to him, would have more than maintained him in a splendid style equal to his dignity, while he was in England; nor would he in that case have had any occasion for an allowance from the king of England. But as the duke of Albany never intended that his nephew should return, he parcelled out among his favourites the estate of the Stewart family, in such a manner that James upon his return found all his patrimonial revenues gone, and many of them in the hands of his best friends; so that he had nothing to depend on for the support of himself and his court but the crown revenues above-mentioned, and even some of these had been mortgaged during the late regency. This circumstance, of itself sufficiently disagreeable, was attended with two others, which tended to make it more so. The one was, that the hostages which had been left for the king’s ransom in England, being all of them persons of the first rank, were attended by their wives, families, children, and equipages, which rivaled those of the same rank in England, and drew a great deal of ready money out of the nation. The other circumstance arose from the charge of the Scots army in France; where Charles, who had never been in a condition to support it, was now reduced to the utmost necessity: while the revenues of James himself were both scanty and precarious. To remedy these inconveniences, therefore, the king obtained from his parliament an act obliging the sheriffs of the respective counties to inquire what lands and estates had belonged to his ancestors David II. Robert II. and Robert III.; and James formed a resolution of recovering the lands wherever they could be discovered, without regard to persons or circumstances. On this occasion...
occupation many of the most illustrious personages of the kingdom were arrested: the duke of Albany, with his two sons, and the earl of Lennox the duke's father-in-law, were put to death, though their crimes are not specified by historians. Buchanan mentions a tradition, that James barbarously sent to the countess of Lennox the heads of her father, husband, and sons: for the following more barbarous reason, that in the bitterness of her grief she might drop some expressions tending to involve others in the same catastrophe. The countess, however, calmly said, "That, if the charges against the criminals were proved, they deserved their fate."

James now proceeded with great spirit to reform the abuses which had pervaded every department of the state; protected and encouraged learning and learned men, and even kept a dairy in which he wrote down the names of all the learned men whom he thought deserving of his encouragement. James himself wrote some poetry; and in music was such an excellent composer, that he is with good reason looked upon as the father of Scots music, which has been so much admired for its elegant simplicity. He introduced organs into his chapels, and a much better style of architecture into all buildings whether civil or religious. Neither did he confine his cares to the fine arts, but encouraged and protected those of all kinds which were useful to society; and, in short, he did more towards the civilization of his people than had been done by any of his predecessors.

In the mean time the truce continued with England. James, however, seemed not to have any inclination to enter into a perpetual alliance with that kingdom. On the contrary, in 1428, he entered into a treaty with France; by which it was agreed, that a marriage should be concluded between the dauphin of France, afterwards Louis XI, and the young princes of Scotland; and so great was the necessity of king Charles for troops at that time, that he demanded only 6000 forces as a portion for the princes.

The rest of the reign of James was spent in reforming abuses, curtailing the authority of the great barons, and recovering the royal estates out of the hands of usurpers. In this, however, he used so much severity, that he was at last murdered, in the year 1437. The perpetrators of this murder were the earl of Athol; Robert Grahame, who was connected with the earl, and who was discontented on account of his losing the estate of Strathern, which had been re-annexed to the crown; and Robert, grandchild and heir to the earl of Athol, and one of the king's domestics. The king had diffused his army, without even referring to himself a body-guard, and was at supper in a Dominican convent in the neighbourhood of Perth. Grahame had for some time been at the head of a gang of outlaws, and is said to have brought a party of them to Perth in the dead of the night, where he posted them near the convent. Walter Straton, one of the king's cup-bearers, went to bring some wine to the king while at supper; but perceiving armed men standing in the passage, he gave the alarm, and was immediately killed. Catharine Douglas, one of the queen's maids of honour, ran to bolt the outer door; but the bar was taken away by Robert Stuart, in order to facilitate the entrance of the murderers. The lady thrust her arm into the flap; but it was instantly broken, and the conspirators rushed in upon the king. Patric Dunbar, brother to the earl of March, was killed in attempting to defend his sovereign, and the queen received two wounds in attempting to interpose herself between her husband and the daggers of the assassins. James defended himself as long as he could; but at last expired under the repeated strokes of his murderers, after having received 28 wounds.

After the murder of James I, the crown devolved on his son James II, at that time only seven years of age. A parliament was immediately called by the queen-mother, at which the most cruel punishments were decreed to the murderers of the late king. The crime, no doubt, deserved an exemplary punishment; but the barbarities inflicted on some of those wretches are shocking to relate. Within less than six weeks after the death of the king, all the conspirators were brought to Edinburgh, arraigned, condemned, and executed. The meaner sort were hanged; but on the earl of Athol and Robert Graham the most cruel torments were inflicted, such as pinching with hot irons, dislocation of the joints, &c. The earl of Athol, had besides, a crown of red-hot iron put on his head; and was afterwards cut up alive, his heart taken out, and, thrown into a fire. In short, so dreadful were those punishments, that Aneas Sylvius, the pope's nuncio, who beheld them, said, that he was at a loss to determine whether the crime committed by the regicides, or the punishment inflicted upon them, was the greater.

As the late king had prescribed no form of a regency in case of his death, the settlement of the government became a matter of great difficulty as well as importance. Archibald earl of Douglas, who had been created duke of Touraine in France, was by far the greatest subject in the kingdom; but as he had not been a favourite in the preceding reign, and the people were now dispossessed of regencies, he was not formally appointed to the administration, though by his high rank he in fact enjoyed the supreme power as long as he lived; which, however, was but a short time. He died in the same year (1438); and Sir Alexander Livingstone of Callendar was appointed to succeed him as governor of the kingdom, that is, to have the executive power, while William Crichton, as chancellor, had the direction of the civil courts. This was a most unfortunate partition of power for the public. The governor and the chancellor quarrelled; the latter took possession of the king's pernon and the castle of Edinburgh, to neither of which he had any right; but the former had on his side the queen-mother, a woman of intrigue and spirit. Her son was shut up in the castle of Edinburgh; and in a short time there was no appearance either of law or government in Scotland. The governor's edicts were counteracted by those of the chancellor under the king's name, and those who obeyed the chancellor were punished by the governor; while the young earl of Douglas, with his numerous followers and dependents, was a declared enemy of both parties, whom he equally fought to destroy.

The queen-mother demanded access to her son, which the chancellor could find no pretext for denying her; and she was accordingly admitted with a small train into the castle of Edinburgh. She played her part so well, and...
The chancellor, imagining she had become a convert to his cause, treated her with unbounded confidence, and suffered her at all hours to have free access to her son's person. Pretending that she had vowed a pilgrimage to the white church of Buchan, he recommended the care of her son's person, till her return, to the chancellor, in the most pathetic and affectionate terms; but, in the mean time, the secretly sent him to Leith, packed up in a clothes­-scheif; and both she and James were received at Stirling by the governor before the escape was known. As every thing had been managed in concert with Livingston, he immediately called together his friends; and laying before them the tyrannical behaviour of the chancellor, it was resolved to belittle him in the castle of Edinburgh, the queen permitting to open her own granaries for the use of the army. The chancellor foresaw the storm that was likely to fall upon him, and sought to prevent it by applying to the earl of Douglas. That haughty nobleman answered him in the terms already mentioned, and that he was preparing to exterminate both parties. The siege of Edinburgh castle being formed, the chancellor demanded a parley, and to have a personal interview with the governor; which the latter, who was no stranger to the sentiments of Douglas, readily agreed to. Common danger united them in a common cause; and the chancellor resigning to the other the custody of the castle and the king's person, with the highest professions of duty and loyalty, the two competitors swore an inviolable friendship for each other. Next day the king cemented their union, by confirming both of them in their respective charges.

The lawless example of the earl of Douglas encouraged the other great landholders to gratify their private animosities, sometimes at the expense of their honour as well as their humanity. A family-difference happened between Sir Allan Stuart of Darnley, and Thomas Boyd of Kilmarnock; but it was concluded that both parties should come to a peaceable agreement at Pol-maitlhorn, between Linlithgow and Falkirk, where Stuart was treacherously murdered by his enemy. Stuart's death was revenged by his brother, Sir Alexander Stuart of Beilmouth, who challenged Boyd to a pitched battle, the principals being attended by a retinue which carried the resemblance of small armies. The conflict was fierce and bloody, each party retiring in its turn, and charging with frenzied fury; but at last victory declared itself for Stuart, the bravest of Boyd's attendants being cut off in the field. About this time, the islanders, under two of their chiefstains, Lauchlan Maclean and Murdoch Gibson, invaded Scotland, and ravaged the province of Lenox with fire and sword. They were opposed by John Colquhoun of Lus, whom they slew, some say treacherously, and others, in an engagement at Lochlomond, near Inchmaron. After this, the robbers grew more outrageous than ever, not only pillaging all the neighboring country with rapine, but murdering the aged, infants, and the defenseless of both sexes. At last, all the labouring hands in the kingdom being engaged in domestic broils, none were left for agriculture; and a dreadful famine ensued, which was attended, as usual, by a pestilence. James was now about ten years of age; and the wifef part of the kingdom agreed, that the public distresses were owing to a total disrespect of the royal authority. The young earl of Douglas never had fewer than 1000, and sometimes 2000 horses in his train; so that none was found hardy enough to control him. He pretended to be independent of the king and his courts of law; that he had a right of jurisdiction upon his own large estates; and that he was entitled to the exercise of royal power. In consequence of this he issued his orders, gave protections to thieves and murderers, afforded to brave the king, made knights, and, according to some writers, even noblemen, of his own dependents, with a power of fitting in parliament.

The queen-mother was not wholly guiltless of those abuses. She had fallen in love with and married Sir James Stuart, who was commonly called the Black Knight of Lorn, brother to the lord of that title, and a descendant of the house of Darnley. Affection for her husband caused her to renew her political intrigues; and not finding a ready compliance in the governor, her interest inclined towards the party of the Douglases. The governor sought to strengthen his authority by restoring the exercise of the civil power, and the reverence due to the person of the sovereign.

The conduct of the lord Callendar was in many respects not to be defensible, either as to prudence or policy. The queen expressed her inclination that her husband might be admitted to some part of the administration, the governor threw both him and his brother the lord Lorn into prison, on a charge of undutiful practices against the state, and abetting the earl of Douglas in his enormities. The queen, taking fire at her husband's imprisonment, was herself confined in a mean apartment within the castle of Stirling; and a convention of the states was called, to judge in what manner she was to be proceeded against. The case was unprecedented and difficult; nor can we believe the governor would have carried matters to such extremity, had he not had strong evidences of her illegal behaviour. She was even obliged to dissemble her resentment, by making an open profession before the states, that she had always been entirely innocent of her husband's practices, and that she would for the future behave as a peaceable and dutiful subject to the laws and the sovereign. Upon making this purgation (as Lindsay calls it), she was released, as also her husband and his brother, being bailed by the chancellor and the lord Gordon, who became sureties for their good behaviour in the penalty of 4000 marks. The governor was afterwards accused of many arbitrary and partial acts of power; and indeed, if we consider his situation, and the violence of the parties which then divided Scotland, it was almost impossible, consistently, with his own safety, to have exerted the virtues either of patriotic or moderation.

The chancellor was exceedingly vexed at the small regard which the governor paid to his person and dignity, and secretly connected himself with the queen-mother; but in the mean time he remained at Edin­burgh. The king and his mother continued all this time at Stirling; where the governor, on pretence of confuting the public safety, and that of the king's person, maintained a strong guard, part of which attend­ed James in his juvenile exercises and diversions. The queen-mother did not fail to represent this to her son.
The chancellor gets the king's person into his hands.

...as a restraint upon his liberty; and obtained his consent to put himself into the chancellor's hands. The latter, who was a man of activity and courage, knew well how to avail himself of this permission; and crossing the Forth in the dark with a strong body of horse, they surrounded the king as he was hunting next morning by break of day. It was easy to perceive from the behaviour of James, that he was no stranger to the chancellor's attempt; but some of the king's guard offering to dispute the possession of his person, Sir William Livingstone, the governor's eldest son, restrained them, and suffered the king to depart quietly. This surprisal happened on a day when the governor was absent from Stirling; and the chancellor, to make sure of his royal acquisition, entered Edinburgh at the head of 4000 horse, where the king and he were received by the citizens with loud acclamations of joy.

The governor showed no emotion at what had happened; on the contrary, he invited the chancellor to an interview, and settled all differences with him in an amicable manner. The young lord Douglas, however, continued to brave both parties. As if he had been a sovereign prince, he demanded by his ambassadresses, Malcolm Fleming of Cumbernauld, and Allan Lawdow, the investiture of the sovereignty of Touraine from Charles the seventh of France; which being readily granted him, served to increase his pride and insolence. The first fruits of the accommodation between the two great officers of state was the holding of a parliament at Edinburgh, for redressing the public disorders occasioned by the earl of Douglas; and encouragement was given to all persons who had been injured to make their complaints. The numbers which on that occasion reftored to Edinburgh were incredible; parents, children, and women, demanding vengeance for the murder of their relations, or the plunder of their estates; till, by the multiplicity of their complaints, they became without remedy, none being found bold enough to encounter the earl of Douglas, or to endeavour to bring him to a fair trial. The parties therefore were dismissed without relief, and it was resolved to proceed with the haughty earl in a different manner. Letters were written to him by the governor and chancellor, and in the name of the states, requiring him, every friend in parliament, and to take that lead in public affairs to which they were entitled by their high rank and great possessions. The manner in which those letters were penned made the thoughtless earl consider them as a tribute due to his greatness, and as proceeding from the inability of the government to continue the adinistration of public affairs without his countenance and direction. Without dreaming that any man in Scotland would be so bold as to attack him, even sngle or unarmed, he answered the letters of the chancellor and governor, by affurimg them that he intended to set out for Edinburgh: the chancellor, on pretence of doing him honour, but in reality to quiet his inscriptions, met him while he was on his journey; and inviting him to his castle of Crichton, he there entertained him for some days with the greatest magnificence and appearance of hospitality. The earl of Douglas believed all the chancellor's professions of friendship, and even sharply checked the wife of his followers, who counselled him not to depend too much on appearances, or to trust his brother and himself at the same time in any place where the chancellor had power. The latter had not only removed the earl's suppofe, but had made him a kind of convert to patriotism, by painting to him the miseries of his country, and the glory that must redound to him and his friends in removing them. It was in vain for his attendants to remind him of his father's maxim, never to risk himself and his brother at the same time: he without hesitation attended the chancellor to Edinburgh; and being admitted into the castle, they dined at the same table with the king. Towards the end of the entertainment, a bull's head, the certain prelude of immediate death, was served up. The earl and his brother flrst to their feet, and endeavoured to make their escape: but armed men rushing in, overpowered them, and tying their hands and those of Sir Malcolm Fleming with cords, they were carried to the hill and beheaded. The young king endeavoured with tears to procure their pardon; for which he was feverely checkered by his unrelenting chancellor.

...in 1443, the king being arrived at the age of 14, declared himself out of the years of minority, and took upon himself the administration of affairs. He appeared to have been a prince of great spirit and resolution; and he had occasion for it. He had appointed one Robert Sempl of Fulwood to be chief governor of the castle of Dumbarton; but he was killed by one Galbraith (a noted partisan of the earl of Douglas), who seized upon the government of the castle. The popularity of the family of Douglas having somewhat subsided, and the young earl finding himself not supported by the chief branches of his family, he began to think, now that the king was grown up, his safest course would be to return to his duty. He accordingly repaired to the king at Stirling; and voluntarily throwing himself at his majesty's feet, implored his pardon for all his transgressions, and solemnly promised that he would ever after set a pattern of duty and loyalty to all the rest of his subjects. The king, finding that he infiltrated on no terms but that of pardon, and that he had unconditionally put himself into his power, not only granted his request, but made him the partner of his inmost councils.

Janes had always disdained the murder of the earl of Douglas and his brother; and the chancellor, perceiving the ascendency which this earl was daily gaining at court, thought it high time to provide for his own safety. He therefore resigned the great seal, and retired to the castle of Edinburgh, the custody of which he pretended had been granted to him by the late king during his life, or till the present king should arrive at the age of 21; and prepared it for a siege. The lord Callendar, who knew himself equally obnoxious to the earl of Douglas, and that he could not maintain his footing by himself, resigned likewise all his posts, and retired to one of his own houses, but kept possession of the castle of Stirling. As both that and the castle of Edinburgh were royal forts, the two lords were summoned to surrender them; but instead of complying, they justified their conduct by the great power of their enemies, who fought their destruction, and who had been so lately at the head of robbers and outlaws; but promised to surrender themselves to the king as soon as he was of lawful age (meaning, we suppose, either 18 or 21). This answer being deemed con-
Scotland.

...contumacious, the chancellor and the late governor, with his two sons Sir Alexander and Sir James Living-

...ton, were proclaimed traitors in a parliament which was summoned on purpose to be held at Stirling. In

...another parliament held at Perth the same year, an act passed, that all the lands and goods which had belonged to

...the king should be possessed by the present king to the time of his lawful age, which is not specified. This act was levies made against the late governor and chancellor, who were accused of having alienated to their own uses, or to those of their friends, a great part of the royal estates and jewels; and their estates being confiscated, the execution of the sentence was committed to John Forrester of Cortorphin, and other adherents of the earl of Douglas.

This sentence threw all the nation into a flame. The castle of Crichton was besieged; and being surrendered upon the king's summons and the display of the royal banner, it was levelled with the ground. It soon appeared that the governor and chancellor, the latter especially, had many friends; and in particular the head of a body of men, who carried fire and sword into his estates and those of the late governor, his own lands and those of the Douglas's were overrun. Cortorphin, Abercorn, Blackness, and other places, were plundered; and Crichton carried off from them more booty than he and his adherents had lost. Particular mention is made of a fine breed of mares which Douglas had lost on this occasion. That nobleman was so much exasperated by the great damages he had sustained, that he engaged his friends the earl of Crawford and Alexander Ogilvy of Inverquharity, to lay waste the lands of the bishop of St. Andrew's, whom he considered as the chief supporter of the two ministers. This prelate was not more considerate by his high birth, than he was venerable by his virtue and sanctity; and had, from a principle of conscience, opposed the earl of Douglas and his party. Being conscious he had done nothing that was illegal, he first admonished the earl of Crawford and his coadjutor to desist from destroying his lands; but finding his admonitions unheeded, he laid the earl under an excommunication.

That nobleman was almost as formidable in the northern as the earl of Douglas had been in the southern, parts of Scotland. The Benedictine monks of Aberbrothwic, who were possessed of great property, had chosen Alexander Lindsay, his eldest son, to be the judge or bailiff of their temporalities; as they themselves, by their profession, could not sit in civil or criminal courts. Lindsay proved so chargeable, by the great number of his attendants, and his high manner of living, to the monks, that their chapter removed him from their polt, and substituted in his place Alexander Ogilvy of Inverquharity, guardian to his nephew John Ogilvy of Airlie, who had an hereditary claim upon the bailiwick. This, notwithstanding their former intimacy, created an irreconcileable difference between the two families. Each competitor strengthened himself by calling in the assistance of his friends; and the Lord Gordon taking part with the Ogilvies, to whom he was then paying a visit, both parties immediately murdered in the neighborhood of Aberbrothwic. The earl of Crawford, who was then at Dundee, immediately posted to Aberbrothwic, and placing himself between the two armies, he demanded to speak with Ogilvy; but, before his request could be granted, he was killed by a common soldier, who was ignorant of his quality. His death exasperated his friends, who immediately rushed on their enemies; and a bloody conflict ensued, which ended to the advantage of the Lindfays, that is, the earl of Crawford's party. On that day the Ogilvies were killed Sir John Oliphant of Aberdargy, John Forbes of Pitligo, Alexander Barclay of Gartley, Robert Maxwell of Teling, Duncan Campbell of Campbelfther, William Gordon of Burrowfield, and others. With those gentlemen, about 500 of their followers are said to have fallen; but some accounts diminish that number. Innerquharity himself, in flying, was taken prisoner, and carried to the earl of Crawford's house at Finhaven, where he died of his wounds; but the Lord Gordon (or, as others call him, the earl of Huntley) escaped by the swifdness of his horse.

This battle serves to have let loose the fury of civil discord all over the kingdom. No regard was paid to magnificacy, nor to any description of men but that of clergy. The more numerous, fierce, and belt allied families, wreaked its vengeance on its foes, either by force or treachery; and the enmity that actuated the parties, filled every sentiment of honour, and every feeling of humanity. The Lindfays, secretly abetted and strengthened by the earl of Douglas, made no other use of their victory than carrying fire and sword through the estates of their enemies; and thus all the north of Scotland pretented scenes of murder and devastation. In the west, Robert Boyd of Duchal, governor of Dunbarton, treacherously surprized Sir James Stuart of Achmynty, and treated his wife with such inhumanity, that she expired in three days under her confinement in Dumbarton castle. The castle of Dunbar was taken by Patrick Hepburn of Hales. Alexander Dunbar disputed the latter of his castle of Hales; but it was retaken by the partisans of the earl of Douglas, whose tenants, particularly those of Anjaldale, are said to have behaved at that time with peculiar feroceness and cruelty. At last, the gentlemen of the country, who were unconnected with those robbers and murderers, which happened to be the cafe with many, that themselves up in their several houses; each of which, in those days, was a petty fortress which they vitiulated, and provided in the best manner they could for their own defence. This wise regulation seems to have been the first measure that composd the public commotions.

The earl of Douglas, whose power and influence at court still continued, was sensible that the clergy, with the wiser and more disinterested part of the kingdom, considered him as the source of the dreadful calamities which the nation suffered; and that James himself, when better informed, would be of the same opinion. He therefore sought to avail himself of the juncture, by forming secret but strong connections with the ears of Crawford, Rifs, and other great noblemen, who wanted to see their feudal powers restored to their full vigour. The queen dowager and her husband made little or no figure during this season of public confusion; the
Scotland had retired to the castle of Dunbar, while it was in Hepburn's possession, where she died soon after. She left by her second husband three sons; John, who in 1455 was made earl of Athol, by his younger brother the king; James, who under the next reign, in 1469, was created earl of Buchan; and Andrew, who afterwards became bishop of Murray. As the earl of Douglas was an enemy to the queen-dowager's husband, the latter retired to England, where he obtained a pass to go abroad, with 20 in his train; but being taken at sea by the Flemish pirates, he died in his confinement.

The great point between the king and Sir William Crichton, whether the latter should give up the castle to his majesty, remained still undecided; and by the advice and direction of the earl of Douglas, who had been created lord-lieutenant of the kingdom, it had now suffered a nine months siege. Either the strength of the castle or an opinion entertained by Douglas that Crichton would be a valuable acquisition to his party, procured better terms for the latter than he could otherwise have expected; for he and his followers were offered a full indemnity for all past offences, and a promise was made that he should be restored not only to his king's favour, but to his former post of chancellor.

He accepted of the conditions; but refused to enter any public capacity till they were confirmed by a parliament, which was soon after held at Perth, and in which he was restored to his estate and honours. By this reconciliation between Douglas and Crichton, the former was left at full liberty to prosecute his vengeance against the Lord Callendar, the late governor, his friends and family. That vengeance was exercised with rigour. The governor himself, Sir James Dundas of Dundas, and Sir Robert Bruce of Clackmannan, were forced to save their lives by the los of their estates; but even that could not preserve their liberty, for they were sent prisoners to the castle of Dunbarton. The fate of Alexander, the governor's eldest son, and of two other gentlemen of his name and family, was still more lamentable; for they were condemned to lose their heads. Tho' forfeitures being inflicted after the manner readmitted the sufferers into his favour, swelled the public outcry against the earl of Douglas.

We have in Lindsay an extract of the speech which Alexander Livingston, one of the most accomplished gentlemen of his time, made upon the scaffold, in which he complained, with great bitterness, of the cruel treatment his father, himself, and his friends, had undergone; and that he suffered by a packed jury of his enemies.

The king being now about 18 years of age, it was thought proper that a suitable comfort should be provided for him; and, after various consultations, Mary, the daughter of Arnold duke of Gueldrec, was chosen, at the recommendation of Charles king of France, though the marriage was not completed till some time after. This produced an immediate rupture with England. The earls of Salisbury and Northumberland entered Scotland at the head of two separate bodies. The former burnt the town of Dumfries, as the latter did that of Dunbar; while Sir John Douglas of Balveny made reprisals by plundering the county of Cunningham, and burning Aikvick. Upon the return of the English armies to their own country, additional levies were made, and a fresh invasion of Scotland was resolved upon under the earl of Northumberland, who had along with him a lieutenant, whom the Scots of those days, from the buliness and colour of his beard, called Magnus with the red mane. He was a soldier of fortune, but an excellent officer, having been trained in the French wars; and he is said to have demanded no other remuneration for his services from the English court, but that he should enjoy all he could conquer in Scotland. The Scots, in the mean time, had raised an army commanded by George Douglas earl of Ormond, and under him by Wallace of Craigsie, with the Lords Maxwell and Johnston. The English having passed Solway Frith, ravaged all that part of the country which belonged to the Scots; but hearing that the earl of Ormond's army was approaching, called in their parties, and fixed their camp on the banks of the river Sark. Their advanced guard was commanded by Magnus; their centre by the earl of Northumberland; and the rear, which was composed of Welch, by Sir John Pennington, an officer of courage and experience.

The Scots drew up in three divisions likewise. Their right wing was commanded by Wallace, the centre by Sir John Pennington, and their left wing by the Lords Maxwell and Johnston. Before the battle joined, the earl of Ormond harangued his men, and inspired them with very high resentment against the English, who, he said, had treacherously broken the truce. The signal for battle being given, the Scots under Wallace rushed forward upon their enemies; but, as usual, were received by so terrible a discharge from the English archers that their impetuosity must have been stopped, had not their brave leader Wallace put them in mind, that their forefathers had always been defeated in distant fights by the English, and that they ought to tryst to their swords and pikes; commanding them at the same time to follow his example. They obeyed, and broke in upon the English commanded by Magnus, with such fury, as soon fixed the fortune of the day on the side of the Scots, their valour being suitably seconded by their other two divisions. The slaughter (which was the more considerable as both parties fought with the utmost animosity) fell chiefly upon the division commanded by Magnus, who was killed, performing the part of a brave officer; and all his body-guard, consisting of picked soldiers, were cut in pieces.

The battle then became general: Sir John Pennington's division, with that under the earl of Northumberland, entirely routed the English army, defeated, struck by the loss of their champion, fled towards the Solway, where, the river being swelled by the tides, numbers of them were drowned. The loss of the English in slain amounted to at least 3000 men. Among the prisoners were Sir John Pennington, Sir Robert Harrington, and the earl of Northumberland's eldest son the Lord Percy, who lost his own liberty in forwarding his father's escape. Of the Scots about 600 were killed; but none of note, excepting the brave Wallace, who died three months after of the wounds he had received in this battle. The bootie that was made on this occasion is said to have been greater than any that had fallen to the Scots since the battle of Bannockburn.

The rest of the history of this reign consists almost entirely of a relation of the cabals and conspiracies of the great men. The earl of Douglas had entered into a con-
confederacy with the earls of Crawford, Moray, and
Rofs, and appeared on all occasions with such a train of
followers as bade defiance to royal power itself. This
infolence was detected by the wiser part of the nation;
and one Macellant, who is called the Tutor of Bombyk,
was nephew to Sir Patrick Gray, captain of the
king's guard, refused to give any attendance upon the
earl, or to concur in his measures, but remained at
home as a quiet subject. This offensive behaviour was
by the earl considered as treason against himself; and
violently fixing upon Macellant's house and person, he
sent him close prisoner to the castle of Douglas. As
Macellan was a gentleman of great worth and reputation,
his uncle Gray applied earnestly to James in favour;
and such was that prince's regard for Macellan,
that he wrote and signed a letter for his release, ad-
ressed to the earl of Douglas. Upon Gray's deliv-
ering this letter to Douglas at his castle, the latter
seemed to receive it with the highest respect, and to
treat Gray with the greatest hospitality, by inviting
him to dinner; but, in the mean time, he gave private
orders that Macellan's head should be struck off, and
his body exposed upon the green before the castle
covered with a linen cloth. After dinner, the earl told
Gray, that he was ready to obey the king's commands;
and conducting him to the green, he showed him the
lifeless trunk, which he said Gray might dispose of as
he pleased. Upon this, Gray mounted his horse, and
trusted to his swiftness for his own safety; for he was
purposely by the earl's attendants to the gates of Edin-
burgh.

The conspiracy against James's government was now
no longer a secret. The lords Balveny and Hamilton,
with such a number of other barons and gentlemen, had
accessed, that it was thought to be more powerful
than all the force the king could bring into the field.
Even Crichton advised James to dissemble. The con-
 federates entered into a solemn bond and oath never to
defeat one another during life; and, to make use of
Drummond's words, "That injuries done to any one
of them should be done to them all, and be a common
quarrel; neither should they defect, to their own
ability, to revenge them: that they should concur in
differently against whatsoever perils within or without the
realm, and spend their lives, lands, goods, and fortunes, in
defence of their debates and differences whatsoever." All
who did not enter into this association were treated as
enemies to the public; their lands were destroyed, their
effects plundered, and they themselves imprisoned or
murdered. Drummond says, that Douglas was then
able to bring 40,000 men into the field; and that his
intention was to have placed the crown of Scotland up-
on his own head. How far he might have been influ-
enced by a scene of the same nature that was then pass-
ing between the houses of York and Lancaster in Eng-
land, we shall not pretend to determine; though it
does not appear that his intention was to wear the
crown himself, but to render it deprecable upon his
sovereign's head. It is rather evident, from his beha-
viour, that he did not affect royalty; for when James
invited him to a conference in the castle of Stirling, he
offered to comply provided he had a safe conduct. This
condition plainly implied, that he had no reliance
upon the late act of parliament, which declared the
proclamation of the king's peace to be a sufficient se-
curity for life and fortune to all his subjects; and there
is no denying that the safe conduct was expedited in the
form and manner required.

This being obtained, the earl began his march to-
wards Stirling with his usual great retinue; and ar-
ived there on Shrove-Tuesday. He was received by
the king as if he had been the lord of his friends, as
well as the greatest of his subjects, and admitted to sup-
port his majesty in the castle, while his attendants were
dispersed in the town, the supposing the catastrophe
that followed. The entertainment being over, the king
told the earl with an air of knavekne——* That as he was
now of age, he was resolved to be the father of all his
people, and to take the government into his own hands;
that his lordship, therefore, had no reason to be under
any apprehensions from his old enemies Callendar and
Crichton; that there was no occasion to form any con-
 federacies, as the law was ready to protect him; and
that he was welcome to the principal direction of af-
fairs under the crown, and to the first place in the royal
confidence; nay, that all former offences done by him-
self and his friends should be pardoned and forgot.*

This speech was the very reverse of what the earl of
Douglas aimed at. It rendered him, indeed, the first
subject of the kingdom; but still he was controllable
by the civil law. In short, upon the king's perempto-
arily putting the question to him, he not only refused to
disolve the confederacy, but upbraided the king for his
government. This produced a passionate rejoinder on
the part of James; but the earl represented that he was
under a safe conduct, and that the nature of his confe-
deracy was such, that it could not be broken but by
the common consent of all concerned. The king in-
filtrated upon his setting the example; and the earl con-
 tinued more and more obstinate, James stabbing him
with his dagger; and armed men rushing into the room,
finished the slaughter.

After the death of the earl of Douglas, the confede-
 racy came to nothing. The insurgents excused them-
sehems as being too weak for such an enterprise; and
were contented with trailling the safe conduct at a
horse's tail, and proclaiming, by trumpets and horns,
the king a perjured traitor. They proceeded no far-
ther; and each departed to his own habitation, after
agreeing to assemble with fresh forces about the begin-
ing of April. James lost no time in improving this
short respite; and found the nation in general much
better disposed in his favour than he had reason to ex-
pect. The intolerable oppressions of the great barons
made his subjects esteem the civil, far preferable to the
federal, subjection; and even the Douglasesses were di-
vided among themselves; for the earl of Angus and Sir
John Douglas of Dalkeith were among the most for-
ward of the royalists. James at the same time wrote
letters to the earl of Huntley, and to all the noblemen
of his kingdom who were not parties in the confede-
racy, besides the ecclesiastics who remained firmly at-
tached to his prerogative. Before the effect of these
letters could be known, the insurgents had returned to
Stirling (where James still wisely kept himself upon the
defensive); repeated their insinuations, and the oppro-
brious treatment of his safe conduct; and at last they
plundered the town, and laid it in ashes. Being still
unable to take the castle, partly through their own di-
versions, and partly through the diversity of the op-
tions they were obliged to supply, they left Stirling, and destroyed the estate of Sir John Douglas of Dalkeith, whom they considered as a double traitor, because he was a Douglas and a good subject. They then besieged his castle; but it was so bravely defended by Patrick Cockburn, a gentleman of the family of Langton, that they raised the siege, which gave the royal party farther leisure for humbling them.

All this time the unhappy country was suffering the most cruel devastations; for matters were now come to such extremity, that it was necessary for every man to be a royalist or a rebel. The king was obliged to keep on the defensive; and though he had ventured to leave the castle of Stirling, he was in no condition to face the rebels in the field. They were in possession of all the strong places by which his friends were to march to his assistance; and he even confided with his attendants on the means of escaping to France, where he was sure of an hospitable reception. He was diverted from that purpose, for the event of the earl of Huntley's attempts for his elevation he issued Circular letters to the chief ecclesiastics, importing, "That the rebellion rage more fiercely than ever; and at last, the confederates, in fact, disowned their allegiance to James. The earls of Douglas, Crawford, Moray, the Lord Balveny, Sir James Hamilton, and others, signed with their own hands public manifests, which were pasted on the doors of the principal churches, importing, "That they were resolved never to obey command or charge, nor answer citation for the time coming; because the king, so far from being a just master, was a blood sucker, a murderer, a transgressor of hospitality, and a surprier of the innocent." It does not appear that those and the like atrocious proceedings did any service to the cause of the confederates. The earl of Huntley continued victorious in the north; where he and his followers, in revenge for the earl of Moray's having burnt his castle of Huntley, feized or ravaged all that nobleman's great estate north of the Spey. When he came to the town of Forres, he burnt one side of the town, because it belonged to the earl, and spared the other, because it was the property of his own friends. James thought himself, from the behaviour of the earl of Douglas and his adherents, now warranted to come to extremities; and marching into Annandale, he carried fire and sword through all the estates of the Douglases there. The earl of Crawford, on the other hand, having now recruited his strength, destroyed the lands of all the people of Angus and of all others who had abandoned him at the battle of Brechin; though there is reason to believe, that he had already secretly resolved to throw himself upon the king's mercy.

Nothing but the most obstinate pride and resentment could have prevented the earl of Douglas, at this time, from taking the advice of his friends, by returning to his

tirely exposed to the royalists. He himself lost one of his brothers; and fled with another, Sir John Lindsay, to his house at Finhaven, where it is reported that he broke out into the following ejaculation: "That he would be content to remain seven years in hell, to have in so timely a season done the king his master that service; for the earl of Huntley had performed, and carried that applause and thanks he was to receive from him."
his duty; in which case, James had given sufficient intimations that he might expect pardon. He coloured his correspondence with the specious pretext, that his brother's fate, and that of his two kinmen, sufficiently intrusted him never to tru1 to James or his ministers; that he had gone too far to think of any reparation; and that kings, when once offended, as James had been, never pardoned in good earnest. Such were the chief reasons, with others of lesser consequence, which Drummond had put into the mouth of Douglas at this time. James, after his expedition into Annandale, found the season too far advanced to continue his operations; and returning to Edinburgh, he marched northwards to Angus, to reduce the earl of Crawford, who was the second rebel of power in the kingdom. That nobleman had nitherto deferred throwing himself at the king's feet, and had refused his arms, in the manner related, only in hopes that better terms might be obtained from James for himself and his party. Perceiving that the earl of Douglas's obstinacy had cooled some of the other lords of the confederacy, and that they had put an end to all hopes of a treaty, he resolved to make a merit of breaking the confederacy, by being the first to submit. James having arrived in Angus, was continuing his march through the country, when the earl and some of his chief followers fell on their knees before him on the road, bareheaded and barefotned. Their dreamy looks, their supplicant postures, and the tears which streamed abundantly from the earl, were expressive of the most affective contrition. This was followed by a penitential speech made by the earl, acknowledging his crimes, and imploring forgiveness.

James was then attended by his chief counsellors, particularly bishop Kennedy, who, he resolved, should have some share in the favour he meant to extend to the earl. He asked their advice; which proving to be on the merciful side, James promised to the earl and his followers restitution of all their estates and honours, and full pardon for all that had passed. The earl, as a grateful retribution for this favour, before the king left Angus, joined him with a noble troop of his friends and followers; and, attending him to the north, was extremely active in suppressing all the remains of the rebellion there.

The submission of the earl of Crawford was followed by that of the earl of Douglas; which, however, continued only for a short time. This powerful nobleman, forsook his rebellious practices; and, in the year 1434, raised an army to fight against the king. The king erected his standard at St. Andrew's, marched thence to Falkland; and ordered all the forces of the earl of Angus, and Strathern, with those of the northern part, to rendezvous by a certain day at Stirling; which they did to the number of 100,000. Douglas assembled his forces, which amounted to 40,000, some say 60,000 men, on the south side of the river Carron, about half way between Stirling and Abercorn. However, notwithstanding this superiority of force, the earl did not think it proper to fight his sovereign. Bishop Kennedy, the prelate of St. Andrew's, had advised the king to divide his enemies by offering them pardon separately; and so good an effect had this, that in a few days the earl found himself deserted by all his numerous army, excepting about 100 of his nearest friends and domestics, with whom he retired towards England. His friends had indeed advised him to come to a battle immediately; but the earl, for reasons now unknown, refused. However, in his journey southward, he raised a considerable body of forces, consisting of his own tenants, of outlaws, robbers, and borderers, with whom he renewed his depredations on the loyal subjects of the king. He was opposed by the earl of Angus, who, though of the name of Douglas, continued him in the royal cause. An engagement ensued at Aucherman; he was defeated, and he himself barely escaped with great difficulty to an adjacent wood. What his fate was after this battle does not appear; but it is certain that his estates were afterwards forfeited to the king.

The rest of the reign of James II. was spent in making proper regulations for the good of his people. In 1460 he was killed at the siege of Roxburgh castle, by the bursting of a cannon, to which he was too near when it was discharged. This siege he had undertaken in favour of the queen of England, who, after losing several battles, and being reduced to distress, was obliged to apply to James for relief. The nobility who were present concealed his death, for fear of discouraging the soldiers; and in a few hours after, the queen appeared in the camp, and presented her young son, James III. as their king.

James III. was not quite seven years of age at his accession to the crown. The administration naturally devolved on his mother: who pulled the siege of Roxburgh castle with so much vigour, that the garrison was obliged to capitulate in a few days; after which the army ravaged the country, and took and dismantled the castle of Wark. In 1466, negotiations were begun for marriage a between the young king and Margaret, princess of Denmark. In 1468, the following conditions were stipulated: 1. That the annual rent thereto paid for the northern isles of Orkney and Shetland should be for ever remitted and extinguished. 2. That king Chriilien, then king of Denmark, should give 60,000 florins of gold for his daughter's portion, whereof 10,000 should be paid before her departure from Denmark; and that the isles of Orkney should be made over to the crown of Scotland, by way of pledge for the remainder; with this express proviso, that they should return to that of Norway after complete payment of the whole sum. 3. That king James should, in case of his dying before the said Margaret his spouse, leave her in possession of the palace of Linlithgow and castle of Dun in Menteith, with all their appurtenances, and the third part of the ordinary revenues of the crown, to be enjoyed by her during life, in case she should choose to reside in Scotland. 4. But if the rather choose to return to Denmark, that in lieu of the said lenger, palace, and castle, she should accept of 120,000 florins of the Rhine; from which sum the 50,000 due for the remainder of her portion being deducted and allowed, the isles of Orkney should be reannexed to the crown of Norway as before.

When these articles were agreed upon, Chriilien found himself unable to fulfill his part of them. Being at that time engaged in an unsuccessful war with Sweden, he could not advance the 10,000 florins which he had promised to pay down as part of his daughter's fortune. He was therefore obliged to apply to the pleipotentaires to accept of 2000, and to take a further
mortgage of the isles of Shetland for the other 8,000. The Scotch plenipotentiaries, of whom Boyd earl of Arran was one, gratified him in his request; and this concession is thought to have proved fatal to the earl. Certain it is, that his father was beheaded for treasonable practices alleged to have been committed long before, and for which he produced a parliamentary indemnity to no purpose: the earl himself was divorced from his wife the king's sister, and obliged to live in perpetual exile, while the countess was married to another.

In 1476, those misfortunes began to come on James which afterwards terminated in his ruin. He had made his brother, the duke of Albany, governor of Berwick; and had entrusted him with very extensive powers upon the borders, where a violent propensity for the feudal laws still continued. The Humes and the Hepburns, then the most powerful subjects in those parts, could not brook the duke of Albany's greatness, especially after he had forced them, by virtue of a late act, to part with some of the estates which had been inconsiderably granted them in this and the preceding reign. The pretended science of judicial astrology, by which James happened to be incredibly infatuated, was the easiest as well as most effectual engine that could work their purposes. One Andrew, an infamous impollor in that art, had been brought over from Flanders by James; and he and Scheve, then archbishop of St Andrew's, concurred in persuading James that the Scotch lion was to be devoured by his own whelps; a prediction that, to a prince of James's turn, amounted to a certainty.

The condition to which James reduced himself by his belief in judicial astrology, was truly deplorable. The princes upon the continent were smitten with the same infatuation; and the wretches who befieged his person had no safety but by continuing the delusion in his mind. According to Lindsay, Cochran, who had some knowledge of architecture, and had been introduced to James as a master-mason, privately procured an old woman, who pretended to be a witch, and who heighten'd his terrors by declaring that his brothers intended to murder him. James believed her; and the unguarded manner in which the earl of Mar treated his weaknesses, exasperated him so much, that the earl giving a farther loafe to his tongue in railing against his brother's unworthy favourites, was arrested, and committed to the castle of Craig Miller; from whence he was brought to the Canongate, a suburb of Edinburgh, where he suffered death.

The duke of Albany was at the castle of Dunbar, and James could not be easy without having him likewise in his power. In hopes of surpring him, he marched to Dunbar: but the duke, being apprised of his coming, fled to Berwick, and ordered his castle of Dunbar to be surrendered to the lord Evendale, though not before the garrison had provided themselves with boats and small vessels, in which they escaped to England. He ventured to come to Edinburgh; where James was so well served with spies, that he was seized, and committed close prisoner to the castle, with orders that he should speak with none but in the presence of his keepers. The duke had probably suspected and provided against this disagreeable event; for we are told that he had agents, who every day repaired to the castle, as if they had come from court, and reported the state of matters between him and the king, while his keepers were present, in so favourable a light, that they made no doubt of his soon regaining his liberty, and being readmitted to his brother's favour. The ensuing negotiation, at last, went so prosperously on, that the duke gave his keepers a kind of a farewell entertainment, previous to his obtaining a formal delivery; and they drank so immoderately, that being intoxicated, they gave him an opportunity of escaping over the castle wall, by converting the fleets of his bed into a rope. Whoever knows the situation of that fortress, must be amazed at the boldness of this attempt; and we are told that the duke's valet, the only domestic允许 he was allowed to have, making the experiment before his master, broke his neck: upon which the duke, lengthening the rope, slid down unhurt; and carrying his servant on his back to a place of safety, he went on board a ship which his friends had provided, and escaped to France.

In 1482, the king began to feel the bad consequences of taking into his favour men of worthless characters, which seems to have been one of this prince's pernicious foibles. His great favourite at this time was Cochran, whom he had raised to the dignity of earl in the king's Mar. All historians agree that this man made a most infamous use of his power. He obtained at last a liberty of coinage, which he abused so much as to endanger an insurrection among the poor people; for he issued a base coin, called black money by the common people, which they refused to take in payments. This favourite's skill in architecture had first introduced him to James; but he maintained his power by other arts; for, knowing that his master's predominant passion was the love of money, he procured it by the meanest and most opprobrious methods. James, however, was inclined to have relieved his people by calling in Cochran's money; but he was diverted from that resolution, by considering that it would be agreeable to his old nobility. Besides Cochran, James had other favourites, whose professions rendered them still less worthy of the royal censure; James Hommil, a taylor, Leonard a blacksmith, Torifan a dancing-maifer, and some others. The favour shown to these men gave so much offence to the nobility, that, after some deliberation, they resolved to remove the king, with some of his least exceptionable domesties (but without offering any violence to his person) to the castle of Edinburgh; but to hang all his worthless favourites over Lawder-bridge, the common place of execution. Their deliberation was not kept so secret as not to come to the ears of the favourites; who suspiciong the worst, weakened James before day-break, and informed him of the meeting. He ordered Cochran to repair to it, and to bring him an account of its proceedings (1). According to Lindsay, Cochran(lays he), the earl of Mar, came from the king to the council (which

---

(1) Lindsay's description of this upstart's magnificence is very particular, and may serve to give the reader an idea of the finery of that age. "Cochran (says he), the earl of Mar, came from the king to the council (which
In 1487, James of Edinburgh, and even refused to pardon those who had confined him, with the church, Swtland.

He is seized the church, and even refused to pardon those who had confined him, with the church, Swtland.

323 With others of the king's favourites.

The earl of Angus, with some of the chief lords, attended by a detachment of troops, then repaired to the king's tent, where they feigned his other favourites, Thomas Preston, Sir William Rogers, James Hammill, William Torfill, and Leonard; and upbraided himself, in very rude terms, with his misconduct in government, and even in private life, in not only being counselled by the above minions, but for keeping company with a lady who was called the Dafy. We know no refusal made by James. He only interceded for the safety of a young gentleman, one John Ramsey of Balmain. Cochran, with his worthless favourites, were hanged over Lawder-bridge before his eyes; and he himself was conducted, under an easy restraint, to the castle of Edinburgh.

James, though confined, behaved with great spirit; and even refused to pardon those who had confined him, or who had any hand in the execution at Lawder. At last, however, he was relieved by the duke of Albany, who, at the queen's desire, undertook to deliver her husband from confinement. This he accomplished as some say, by surprizing the castle of Edinburgh; though, according to others, the gates were opened, upon a formal requisition made for that purpose by two heralds at arms. After he had obtained his liberty, the king repaired to the abbey of Holyroodhouse with his brother, who was now acted as his first minister. All the lords who were near the capital came to pay him their compliments; but James was so much exasperated at what had happened, that he committed 16 of them prisoners to the castle of Edinburgh. After his release, James granted a patent to the citizens of Edinburgh, and enlarged their privileges.

In 1487, James finished some secret negotiations in which he had engaged with Henry king of England sometime. The principal articles agreed on between the two monarchs were, That king James's second son should marry Catherine the third daughter of Edward IV, and sit on the throne of England; and that James himself, who was now a widower, should marry queen Elizabeth. A third marriage was also to be concluded between the duke of Rothesay and another daughter of Edward IV. That in order to these treaties, and for ending all controversies concerning the town of Berwick, which the king of Scotland desired so much to possess, a congress should be held the ensuing year.

But in the mean time a most powerful confederacy was formed against the king; the origin of which was as follows. James was a great patron of architecture; and being pleased with the situation of Stirling castle, against the time he resolved to give it all the embellishments which that king could bestow, and about this time he made it the chief place of his residence. He rallied within it a hall, which at that time was deemed a noble structure; and a college, which he called the chapel-royal. This college was endowed with an archdeacon who was a bishop's suffragan, a treasurer, a chancellor, and abbot, with a double set of other officers usually belonging to such institutions. The expenses necessary for maintaining these were considerabl, and the king had resolved to align the revenues of the rich priory of Coldingham for that purpose. This priory had been generally held by one of the name of Hume; and that family, through length of time, considered it as their property; they therefore strongly opposed the king's intention. The dispute seems to have lasted some years: for the former parliament had passed a vote, annexing the priory to the king's chapel-royal; and the parliament of this year had passed a statute, strictly prohibiting all persons, spiritual and temporal, to attempt any thing, directly or indirectly, contrary or prejudicial to the said union and annexation. The Humes referred their being stripped of so gainful a revenue, the loss of which affected most of the gentlemen of that name; and they united themselves with the Hepburns, another powerful clan in that neighbourhood, under the lord Hales. An association was soon formed; by which both families engaged to stand by each other, and not to suffer any prior to be received for Coldingham, if he was not of one of their surnames. The lords Gray and Drummond soon joined the association; as did many other noblemen and gentlemen, who had their particular causes of discontent. Their agents gave out, that the king was grasping at arbitrary power; that he had acquired his popularity by deep hypocrisy; and that he was resolved to be signally revenged upon all who had any hand in the execution at Lawder. The earl of Angus, who was the sole of the confederacy, advised the conspirators to apply to the old earl of Douglas to head them: but that nobleman was now dead to all ambition, and instead of...
of encouraging the conspirators, he pathetically entreated them to break off all their rebellious connections, and return to their duty; expressing the most sincere contrition for his own past conduct. Finding he could not prevail with them, he wrote to all the numerous friends and dependants of his family, and particularly to Douglas of Cavers, his. to Teviotdale, dismissing them from entering into the conspiracy; and some of his original letters to that effect are said to be still extant. That great man survived this application but a short time; for he died without issue at Lindores, on the 15th of April 1488; and in him ended the first branch of that noble and illustrious house. He was remarkable for being the most learned of all the Scots nobility, and for the comeliness of his person.

James appears to have been no stranger to the proceedings of the conspirators; but though he dreaded them, he depended upon the protection of the law, as they did upon his puillanimity. His degeneracy in this respect is remarkable. Defended from a race of heroes, he was the first of his family who had been branded with cowardice. But his conduct at this time fully justifies the charge. Instead of enforcing the execution of the laws in his own person, he flung himself up in his beloved castle of Stirling, and raised a body-guard; the command of which he gave to the lord Bothwell, master of his household. He likewise issued a proclamation, forbidding any person in arms to approach the court; and Bothwell had a warrant to seize the same put into execution. Though the king's proceedings in all this were perfectly agreeable to law, yet they were given out by his enemies as so many indications of his aversion to the nobility, and served only to induce them to parade, armed, about the country in more numerous bodies.

The connections entered into by James with Henry alarmed the conspirators, and made them resolve to strike the great blow before James could avail himself of an alliance that seemed to place him above all opposition either abroad or at home. The acquisition of Berwick to the crown of Scotland, which was looked upon to be as good as concluded, the marriage of the duke of Rothsay with the daughter of the dowager and sister to the comfort queen of England; and, above all, the first harmony which reigned between James and the states of his kingdom, rendered the conspirators in a manner desperate. Besides the earl Angus, the earls of Argyle and Lenox favoured the conspirators; for when the whole of James's convention with England is considered, and compared with after events, nothing can be more plain, than that the successes of the conspirators was owing to his English connections; and that they made use of them to affirm, that Scotland was soon to become a province of England, and that James intended to govern his subjects by an English force.—These seditious allegations did the conspirators great service, and inclined many, even of the moderate party, to their cause. They soon took the field, appointed their rendezvous, and all the south of Scotland was in arms. James continued to rely upon the authority of his parliament; and summoned, in the terms of law, the insurgents to answer at the proper tribunals for their repeated breaches of the peace. The conspirators, far from paying any regard to his citations, tore them in pieces, buffeted and otherwise maltreated the messengers, and set the laws of their country at open defiance. Scotland

Even north of the Forth, the heads of the houses of Gray and Drummond spread the spirit of dissatisfaction through the populous counties of Fife and Angus; but the counties north of the Grampians continued firm in their duty.

The duke of Rothsay was then a promising youth about fifteen years of age; and the subjection of Scotland to that of England being the chief, if not the only cause urged by the rebels for their appearing in arms, they naturally threw their eyes upon that prince, as his appearance at their head would give strength and vigour to their cause; and in this they were not deceived. James in the mean time, finding the inhabitants of the southern provinces were either engaged in the rebellion, or at best observed a cold neutrality, embarked on board of a vessel which was then lying in the frith of Forth, and palled to the north of that river, not finding it safe to go by land to Stirling. Arriving at the castle, he gave orders that the duke of Rothsay (as foreseeing what afterwards happened) should be put under the care of one Schaw of by put. Without whom he had made his governor, charging him not to suffer the prince upon any account to depart out of the fort. The rebels giving out that James had fled to Flanders, plundered his equipage and baggage before they palled the Forth; and they there found a large sum of money, which proved to be the utmost consequence to their affairs. They then surprized the castle of Dunbar, and plundered the houses of every man to the south of the Forth whom they suspected to be a royalist.

James was all this time making a profefs, and holding courts of justice, in the north, where the great families were entirely devoted to his service, particularly the earls of Huntley, Errol, and Marthail—Every day brought him fresh alarms from the south, which left him no farther room either for delay or deliberation. The conspirators, notwithstanding the promising appearance of their affairs, found, that in a short time their cause must languish, and their numbers dwindle, unless they were furnished with fresh pretences, and headed by a person of the greatest authority. While they were deliberating who that person should be, the earl of Angus boldly proposed the duke of Rothsay; and an immediate application was made to Schaw, the young prince's governor, who secretly favoured their cause, and was prevaild upon by a considerable sum of money to put the prince into their hands, and to declare for the rebels.

James having ordered all the force in the north to assemble, hurried to Perth (then called St John's town), where he appointed the rendezvous of his army, which amounted to 30,000 men. Among the other noblemen who attended him was the famous lord David Lindsay of the Byres (an officer of great courage and experience, having long served in foreign countries), who headed 3000 foot and 1000 horse, mostly raised in Fife and Stirlingshire. Upon his approaching the king's person, he presented him with a horse of remarkable spirit and beauty; and informed his majesty, that he might trust his life to his agility and sure-footedness. The lord Ruthven, who was sheriff of Strathern, and anctelon (if we mistake not) to the unfortunate earl of Gowry, joined James at the head of 3000 well armed men.
Scotland.

The whole army being assembled, James proceeded to Stirling; but he was arrested, when he was not only denied entrance into the castle, but saw the guns pointed against his person, and understood, for the first time, that his son was at the head of the rebels. Schaw pretended that the duke of Roxfort had been carried off against his will; but the king's answer was, “Fie, traitor, thou hast deceived me; and if I live I shall be revenged on thee, and shalt be rewarded as thou hast served.” James lay that night in the town of Stirling, where he was joined by all his army; and understanding that the rebels were advancing, he formed his line of battle. The earl of Athol, his uncle, who was trusted by both parties, proposed an accommodation; which was accordingly effected, if we are to believe Abercomby and other historians; but we know not the terms, for none are mentioned on either side. James is said to have fallen on his part; but had there been any grounds for such a charge against him, there can scarcely be a doubt that the rebels would have published it. The treaty was entered into in past dispute; and the earl of Athol forsook himself as a hostage into the hands of the rebels.

James was sensible of the advantage; which public clamour gave to his enemies; and he applied to the kings of France and England, and the pope, for their interposition. His holiness named Adrian de Castello for his nuncio on that occasion; and the two kings threatened to raise troops for the service of James. He, by a fatality not uncommon to weak princes, left the strong castle of Edinburgh, where he might have been in safety till his friends, who had deserted themselves upon the faith of the late negociation, could be reassembled; and crossing the Forth, he made another attempt to be admitted into the castle of Stirling; but was disappointed, and informed that the rebels were at Torwood in the neighbourhood, and ready to give him battle. He was in possession of the castle of Blackness; his admiral, Wood, commanded the Forth; and his loyal vassals in the north were upon their march to join him. Hawthornen says, that the rebels had made a show of dismilling their troops, that they might draw James into the field; and that while he remained at Blackness, he was attended by the earls of Montrose, Glencairn, and the lords Maxwell and Ruthven. To give his northern troops time to join him, he proposed a negociation; but that was then at an end, upon the rebels peremptorily requiring him to resign his crown to his son, that is, to themselves.

The rebels had been inured to war. They conspired chiefly of borderers, well armed and disciplined; in which they had the advantage of the king's Lowland's subjets, who had not been accustomed to arms. What the numbers on both sides were does not clearly appear; but it is probable that the forces of James were superior to the rebels. They were then at Falkirk; but they soon passed the Carron, encamped above the bridge near Torwood, and made such dispositions as rendered a battle unavoidable, unless James would have dispersed his army, and gone on board Wood's ships; but he did not know himself, and resolved on a battle. He was encamped at a small brook named Sauchie-burn, near the same spot of ground where the great Bruce had defeated the English under Edward the second. The earl of Menteith, the lords Erkine, Graham, Ruthven, and Maxwell, commanded the first line of the king's army. The second was commanded by the earl of Glencairn, who was at the head of the Weald and Highland men. The earl of Crawford, with the lord Boyd and Lindsay of Byres, commanded the rear, wherein the king's main strength consisted, and where he himself appeared in person, completely armed, and mounted upon the fine horse which had been presented to him by Lindsay.

The first line of the royalists obliged that of the rebels to give way; but the latter being supported by the Annandale men and borderers, the first and second line of the king's army were beat back to the third. The little courage James possessed had forsook him at the first onset; and he had put spurs to his horse, intending to gain the banks of the Forth, and to go on board one of Wood's ships. In passing through the village of Bannockburn, a woman was seen urging her pitcher at the brook, frightened at the sight of a man in armour galloping full speed, left it behind her; and the horse taking fright, the king was thrown to the ground, and carried, bruised and maimed, by a miller and his wife, into their hovel. He immediately called for a priest to make his confession; and the rustics demanding his name and rank, “I was (said he incouutably) your king this morning.” The woman, overcome with astonishment, clapped her hands, and running to the door called for a priest to confess the king. “I am a priest (said one passing by), lead me to his majesty.” Being introduced into the hovel, he saw the king covered with a coarse cloth; and kneeling by him, he asked James whether he thought he could recover, if properly attended by physicians? James answering in the affirmative, the villain pulled out a dagger, and stabbed him to the heart. Such is the dark account we are able to give of this prince's unhappy end. The name of the person who murdered him is said to have been Sir Andrew Barathwick, a priest, one of the pope's knights. Some pretend that the lord Gray, and others that Robert Stirling of Keir, was the ringleader; and even Buchanan (the tenor of whose history is a justification of this murder), is uncertain as to the name of the person who gave him the fatal blow.

It is probable that the royalists loft the battle through the cowardice of James. Even after his flight his troops fought bravely; but they were damped on receiving the certain accounts of his death. The prince, young as he was, had an idea of the unnatural part he was acting, and before the battle he had given a strict charge for the safety of his father's person. Upon hearing that he had retired from the field, he sent orders that none should pursue him; but they were in the field, the rebels being sensible that they could have no safety but in the king's death. When that was certified, facilities seemed to cease; nor were the royalists pursued. The number of slain on both sides is uncertain; but it must have been considerable, as the earl of Glencairn, the lords Sempil, Erkine, and Ruthven, and other gentlemen of great eminence, are mentioned. As to the duke of Rothesay, who was Grief of his now king, he appeared incom condolable when he heard of his father's death; but the rebels endeavoured to efface his grief, by the profusion of honours they paid him when he was recognized as king.

The remorse and anguish of the young king, on re-
petitioning upon the unnatural part he had acted, was inexpressible; and the noblemen who had been engaged in the rebellion became apprehensive for their own safety. The catastrophe of the unfortunate James III. however, was not yet become public; and it was thought by many that he had gone abroad some of the ships belonging to the Scottish admiral Sir Andrew Wood. James, willing to indulge hope as long as it was possible, defired an interview with the admiral; but the latter refused to come on shore, unless he had sufficient hortages for his safety. These being delivered, Sir Andrew waited upon the king at Leith. He had known nothing of the late king; and he had even offered to allow his ships to be searched; yet such was the anxiety of the new king, that he could not be satisfied till he had examined him in person. Young James had been long a stranger to his father, so that he could not have distinguished him easily from others. When Wood, therefore, entered the room, being struck with his noble appearance, he asked him, "Are you my father?" "I am not," replied Wood, bursting into tears; "but I was your father's true servant, and while I live I shall be the determined enemy of his murderers." This did not satisfy the lords, who demanded whether he knew where the king was. The admiral replied, that he knew not; and upon their questioning him concerning his manoeuvres on the day of battle, when his boats were seen plying backwards and forwards, he told them, that he and his brother had determined to affist the king in person; but all they could do was to save some of the royalists in their ships. "I would to God (says he), my king was there safely, for I would defend and keep them faithful from all the traitors who have cruelly murdered him; for I think to see the day to behold them hanged and drawn for their demerits." This spirited declaration, and the freedom with which it was delivered, struck the guilty part of the council with dismay; but the fear of sacrificing the hostages procured Wood his freedom, and he was suffered to depart to his ships. When he came on board, he found his brother preparing to hang the two lords who had been left as hostages; which would certainly have been their fate, had the admiral been longer detained.

Wood had fearfully reached the ships, when the lords, calling the inhabitants of Leith together, offered them a large premium if they would fit out a sufficient force to destroy that bold pirate and his crew, as they called Wood; but the townspeople, who, it seems, did not much care for the service, replied, that Wood's ships were a match for any ten ships that could be fitted out in Scotland. The council then removed to Edinburgh, where James IV. was crowned on the 24th of June 1487.

In the month of October this year, the nobility and others who had been present at the king's coronation, converted themselves into a parliament, and passed an act by which they were indemnified for their rebellion against their late sovereign; after which, they ordered the act to be exemplified under the great seal of Scotland, that it might be productive in their justification if called for by any foreign prince. They next proceeded to the arduous task of vindicating their rebellion in the eyes of the public; and so far did they gain upon the king by the force of flattery, that he consented to summon the lords who had taken part with his father, before the parliament, to answer for their conduct. In consequence of this, no fewer than 28 lords were cited to appear at Edinburgh in the space of 40 days. The first upon the list was the lord David Lindsay, whose form of arraignment was as follows. "Lord David Lindsay of the Byres, answer for the cruel coming against the king at Bannockburn with his father, giving counsel to have devoured the king's grace here present; and, to that effect, gave him a sword and a good horse to fortify him against his son. Your answer hereto." Lord Lindsay was remarkable for the bluntness of his conversation and the freedom of his sentiments; and being irritated by this charge, he delivered himself in such a manner concerning the treason of the rebellious lords, as abashed the boldest of his accusers. As they were unable to answer him, all they could do was to press him to throw himself upon the king's clemency; which he refused, as being guilty of no crime. His brother, Patrick Lindsay, undertook to be his advocate, and apologized upon his knees for the roughness of his behaviour, and at last obtained an indemnity in the proceedings of the court; in consequence of which Lindsay was released. The regicides now endeavoured to gain the public favour by affisting a strict administration of justice. The king was advised to make a progress round the new kingdom, attended by his council and judges; while, in the mean time, certain noblemen and gentlemen were appointed to execute justice, and to suppress all kinds of disorders in their own lands and in those adjoining to them, till the king came to the age of 21. The memory of the late king was branded in the most opprobrious manner. All justices, sheriffs, and stewarts, who were possessions of heritable offices, but who had taken arms for the late king, were either deprived of them for three years, or rendered incapable of enjoying them for ever after. All the young nobility who had been dispossessed by their fathers for taking arms against the late king, were, by act of parliament, restored to their several successions in the most ample manner. At last, in order to give a kind of proof to the world that they intended only to retaliate the state of the nation, without prejudice to the lower ranks of subjects, who did no more than follow the examples of their superiors, it was enacted, "That all goods and effects taken from burgesses, merchants, and those who had only personal estates, or, as they were called, unlanded men, since the battle of Stirling, were not only to be restored, but the owners were to be indemnified for their losses; and their persons, if in custody, were to be set at liberty. Churchmen, who were taken in arms, were to be delivered over to their ordinances, to be dealt with by them according to the law." The castle of Dunbar was ordered to be demolished; and some statutes were made in favour of commerce, and for the exclusion of foreigners.

These last acts were passed with a view to recompose the boroughs, who had been very active in their opposition to the late king. However, the lords, before they dissolved their parliament, thought it necessa-
They were opposed by the Pope.

Attempts to revenge the death of James III.

Henry VII. sends five ships for this purpose.

Who act piratically, and are all taken by Sir Andrew Wood.

The Scottish admiral's ships had been fitted out for commerce as well as war, and Henry commanded his fleet-foicer, Sir Stephen Bull to intercept him on his return from Flanders, whether he had gone upon a commercial voyage. Wood had no more than two ships with him: the English admiral had three; and their much larger, and carrying a greater weight of metal, than the Scottish vessels. The English took their station at the island of May, in the mouth of the Frith of Forth, and, having come unawares upon their enemies, fired two guns as a signal for their surrendering themselves. The Scottish commander encouraged his men as well as he could; and finding them determined to stand by him to the last, began the engagement in sight of numberless spectators who appeared on both sides of the frith. The fight continued all that day, and was renewed with redoubled fury in the morning; but, in the mean time, the ebb-tide and a south wind had carried both squadrons to the mouth of the Tay. Here the English fought under great disadvantages, by reason of the sand-banks; and before they could get clear of them, all the three were obliged to submit to the Scots, who carried them to Dundee. Wood treated his prisoners with great humanity; and having afterwards presented them to King James, the latter dismissed them not only without ransom, but with presents to the officers and crews, and a letter to King Henry. To this Henry returned a polite answer, a truce was concluded, and all differences for the present were accommodated.

James all this time had continued to display such moderation in his government, and appeared to have the advantage of his subjects so much at heart, that they became gradually well affected to his government, and in 1490 all parties were fully reconciled. We may from thence date the commencement of the reign of James IV.; and the next year the happiness of his kingdom was completed, by taking off the pope's interdict, and giving the king absolution for the hand he had in his father's death.

Tranquility being thus restored, the negotiations concerning the king's marriage began to take place, but met with several interruptions. In 1493, Henry VII. proposed a match between the king of Scotland and his cousin the prince of Catharine. James was too much attached to France to be fond of English connections, and probably thought this match below his dignity; in consequence of which the proposal was treated with contempt. However, notwithstanding this ill success, Henry made another offer of alliance with James; and, in 1495, proposed a marriage between him and his eldest daughter Margaret. This proposal was accepted; but the match seems not to have been at all agreeable to James; for, at the very time in which he was negotiating the marriage, he not only protected Perkin Warbeck, the avowed enemy and pretender to the crown of Henry, but invaded England on his account. This conduct was highly refented by the English parliament; but Henry himself forgave even this gross insult, and the marriage negotiations were once more resumed. The bride was no more than ten years and six months old; and being only the fourth degree of blood from James, it was necessary to procure a dispensation from the pope. This being obtained, a treaty of perpetual peace was concluded between the two nations.
nations, on the 17th of July 1503, being the first that had taken place for 170 years, since the peace of Northampton, concluded between Robert I. and Edward III.

One of the great ends which Henry had in view in promoting this marriage, was to detach James from the French interest: no sooner, therefore, was the treaty signed, than he wrote to his son-in-law to this purpose; who, however, politely declined to break with his ancient ally. On the 16th of June, the royal bride set out from Richmond in Surrey, in company with her father, who gave her the convoy as far as Colleweft, the residence of his mother, the countess of Richmond. After passing some days there, the king resigned his daughter to the care of the earls of Surrey and Northumberland, who proceeded with her to the borders of Scotland. Here a number of the company were permitted to take their leave; but those who remained till made a royal appearance. At Lamberton church they were met by James, attended by a numerous train of his nobility and officers of state. From Lamberton they proceeded to Dalkeith, and next day to Edinburgh; where the nuptials were celebrated with the greatest splendor. On this occasion, it is said that the Scots surpassed all their guests in extravagance and luxury: which must have been owing to the great intercourse and commerce which James and his subjects maintained with foreign courts and countries.

After the celebration of the nuptials, James appears to have enjoyed a tranquillity unknown almost to any of his predecessors; and began to make a considerable figure among the European potentates. But the magnificence of his court and embassies, his liberality to strangers and to learned men, his costly edifices, and, above all, the large sums he laid out in ship-building, had now brought him into some difficulties; and he too far attended to the advice and example of his father-in-law, that he supplied his necessities by who took dormant penal laws, particularly with regard to wardships and old titles of estates, by which he raised large sums. Though he did this without assembling his parliament, yet he found agents who justified those proceedings, in the same manner as Epton and Dudley did those of Henry, under the sanction of law. At last, however, touched with the sufferings of his subjects, he ordered all prosecutions to be stopped. He even went farther: for, sensible of the detestation into which his father-in-law's aversion had brought himself and his administration, he ordered the ministers who had advised him to those shameful courtesies to be imprisoned; and some of them, who probably had exceeded their commission, actually died in their confinement.

About this time, James applied himself, with incredible alacrity, to the building of ships; one of which, the St Michael, is supposed to have been the largest then in the world (m). He worked with his own hands in building it; and it is plain, from his conduct, that he was aspiring to be a maritime power, in which he was encouraged by the excellent leafrn which Scotland then produced. The first essay of his arms by sea was in favour of his kinsman John king of Denmark. This prince was brother to Margaret queen of Scotland; and had partly been called to the throne of Sweden, and partly possefl by force. He was opposed by the administratur, Sture, whom he pardoned after he was crowned. Sture, however, renewing his rebellion, and the Norwegians revolting at the same time, John found himself under such difficulties, that he was forced to return to Denmark; but he left his queen in possession of the castle of Stockholm, which the bravely defended against Sture and the Swedes. This heroic prince became a great favourite with James; and several letters that passed between them are still extant. The king of Denmark, next to the French monarch, was the favourite ally of James; who, early in his reign, had compromised some differences between them. It likewise appears, from the histories of the north, that both James and his father had given great assistance to his Danish majesty in reducing the Norwegians; and he resolved to become a party in the war against the Swedes, and the Lubeckers who assisted them, if the former

(m) Of this ship we have the following account by Lindsay of Pitcrotie. "In the same year, the king of Scotland bigged a great ship, called the Great Michael, which was the greatest ship, and of most strength, that ever failed in England or France. For this ship was of so great figure, and took so much timber, that, except Falkland she wafted all the woods in Fife, which was oak-wood, by all timber that was gotten out of Norway; for she was so strong, and of so great length and breadth (all the weights of Scotland, yea, and many other strangers, were at her device, by the king's commandment, who wrought very busily in her; but it was a year and day ere she was complete); to wit, the was twelve score feet of length, and thirty-six foot within the fides. She was ten foot thick in the wall, cutted jels of oak in her wall, and boards on every side, so stark and so thick, that no cannon could go through her. This great ship cumbered Scotland to get her to the sea. From that time that she was adow and her masts and sails complete, with taws and anchors affeiring thereeto, she was counted to the king to be thirty thousand pounds of expenses, by her artillery, which was very great and costly to the king, by all the reet of her orders; to wit, she had many cannons, fix on every side, with three great baflins, two behind in her dock, and one before, with three hundred shot of small artillery, that is to say, myyan and battret-falcon, and quarter-falcon, flings, pelletten, serpents, and double-dogs, with hogtor and culvering, corb-bows and hand-bows. She had three hundred mariners to fill her; she had six score of gunners to use her artillery; and had a thousand men of war, by her captain, flippers, and quarter-masters. When this ship paft to the sea, and was lying in the road, the king gart shoot a cannon at her, to effay her if she was strong; but I heard say, it dazed her not, and did her little damage. And if any man believe that this description of the ship be not of verity, as we have written, let him pass to the gate of Tillibardin, and there, at forth the same, ye will fee the length and breadth of her, planted with hawthorn, by the wight that helped to make her. As for other properties of her, Sir Andrew Wood is my author, who was quarter-master of her; and Robert Barteye, who was master-shipper."
former continued in their revolt. Previous to this, he sent an ambassador to offer his mediation between John and his subjects. The mediation was accordingly accepted of, and the negotiations were opened at Copenhagen. The deputies of Sweden not attending, John prevailed with those of Denmark and Norway to pronounce sentence of forfeiture against Suren and all his adherents. In the meantime, the siege of the castle of Stockholm was so warmly pressed, that the garrison was diminished to a handful, and these in defect of all kind of provisions; so that the brave queen was forced to capitulate, and to surrender up the fortresses, on condition that she would be suffered to depart for Denmark; but the capitulation was peremptorily broken by Suren, and she was confined in a monastery. It was on this occasion that James resolved to employ his maritime power. He wrote a letter, conceived in the strongest terms, to the archbishop of Uppsala, the primate of Sweden, exhorting him to employ all his authority in favour of the king; and another letter to the Lubeckers, threatening to declare war against them as well as the Swedes, if they jointly continued to afflict the rebels. According to Hollinshed, James, in consequence of king John's application, gave the command of an army of 10,000 men to the earl of Arran, who replaced John upon his throne. Though this does not strictly appear to be true, yet it is certain, that, had it not been for James, John must have sunk under the weight of his enemies. Suren, whose arms had made great progress, hearing that a considerable armament was fitting out in Scotland, and knowing that James had prevailed with the French king to affix John likewise, agreed to release the queen, and to conduct her to the frontiers of Denmark; where he died. By this time, James's armament, which was commanded by the earl of Arran, had failed; but perceiving that all matters were adjusted between John and the Swedes, the ships returned sooner than James expected, which (says he, in a very polite letter he wrote to the queen upon the occasion) they durst not have done, had they not brought me a council-board. The severity of John having occasioned a fresh revolt, James again sent a squadron to his assistance, which appeared before Stockholm, and obliged the Lubeckers to conclude a new treaty.

James, having thus honourably discharged his engagement with his uncle the king of Denmark, turned his attention towards the Flemings and Hollanders, who had insulted his flag, on account of the assistance he had afforded the duke of Guelders, as well as from motives of rapacity, which distinguished those traders, who are said not only to have plundered the Scotch ships, but to have thrown their crews overboard to conceal their villainy. James gave the command of a squadron to Barton; who put to sea, and, without any ceremony, treated all the Dutch and Flemish traders who fell into his hands as pirates, and sent their heads in hogheads to James. Soon after, Barton returned to Scotland, and brought him a number of rich prizes, which rendered his reputation as a man famous all over Europe. James was then so much respected among the contemporaries, that we know of no resentment shown either by the court of Spain, whose subjects those Netherlanders were, or of any other power in Europe, for this vigorous proceeding.

The peace with England continued all the time of Henry VII. nor did his son Henry VIII. though he had not the same reason as his father to keep well with the Scots, for some time throw any disposition to break with them. A breach, however, did very soon take place, which was never afterwards thoroughly made up.

About 30 years before, one John Barton (a relation, probably, to the famous Barton) commanded a trading vessel, which was taken by two Portuguese sea-captains in the port of Sluys; and the captain, with several Scotchmen, were killed in endeavouring to defend their property. The action was esteemed cowardly as well as piratical, because it was done under the protection of a large Portuguese squadron. The ship and the remaining part of the crew, with the cargo, were carried to Portugal, from whence no redress could be obtained; and James III. granted letters of marque to John and Robert Bartons, heirs to the Barton who had been murdered. Upon the accension of James IV. to the crown of Scotland, the letters of marque were recalled, and a friendly correspondence was entered into between James and his Portuguese majesty. No redress, however, was to be had from the latter; and Robert Barton being made a prisoner, and his ship a prize, he was detained in Zealand, till James procured his deliverance, by applying in his favour to the emperor Maximilian. Sir Andrew Barton took part in the quarrel and having obtained a like letter of marque, he made dreadful depredations on the Portuguese trade, and, according to English authors, he plundered many English ships, on pretence of their carrying Portuguese property, and made the navigation of the narrow seas dangerous to Englishmen. The court of London received daily complaints of Barton's depredations; but Henry being at this time very averse to a quarrel with James, these complaints being heard with great severity, James was recalled, and accordingly granted letters of marque, which was a most extraordinary step. The court of Versailles, however, had then two sons, gallant noblemen; and he declined to Henry's face, that while he had an estate that could furnish out a ship, or a son who was capable of commanding one, the narrow seas should not be infested. Henry could not discourage this generous offer; and letters of marque were accordingly granted to the two young noblemen, Sir Thomas and Sir Edward Howard. The prizes that Barton had taken had rendered his ships immensely rich, consequently they were very laden, and unfit for fighting; while we may easily suppose, that the ships of the Howards were clean, and of a superior force in every respect to those of Barton. After encountering a great deal of foul weather, Sir Thomas Howard came up with the Lyon, which was commanded by Sir Andrew Barton in person; and Sir Edward fell in with the Unicorn, Barton's other ship. The event was such as might be expected from the inequality of the match. Sir Andrew Barton was killed, while he was animating, with his whole, his men to hold out to the last; and both the Scotch ships being taken, were carried in triumph to London, with their crews prisoners.
