ENCYCLOPÆDIA; OR, A DICTIONARY OF ARTS, SCIENCES, AND MISCELLANEOUS LITERATURE; Constructed on a Plan, by which the different sciences and arts are digested into the form of distinct treatises or systems, comprehending the history, theory, and practice, of each, according to the latest discoveries and improvements; and full explanations given of the various detached parts of knowledge, whether relating to natural and artificial objects, or to matters ecclesiastical, civil, military, commercial, &c.

Including elucidations of the most important topics relative to religion, morals, manners, and the economy of life. Together with a description of all the countries, cities, principal mountains, seas, rivers, &c. throughout the world; a general history, ancient and modern, of the different empires, kingdoms, and states; and an account of the lives of the most eminent persons in every nation, from the earliest ages down to the present times.

Compiled from the writings of the best authors in several languages; the most approved dictionaries, as well of general science as of its particular branches; the transactions, journals, and memoirs, of various learned societies, the ms. lectures of eminent professors on different sciences; and a variety of original materials, furnished by an extensive correspondence.

THE FIRST AMERICAN EDITION, IN EIGHTEEN VOLUMES, GREATLY IMPROVED.

ILLUSTRATED WITH FIVE HUNDRED AND FORTY-TWO COPPERPLATES.

PHILADELPHIA:
PRINTED BY THOMAS DODSON, AT THE STONE-HOUSE, No. 41, SOUTH SECOND-STREET.
M.DCC.XCVIII.
[Copy-Right secured according to law.]
Rana, the frog, in zoology; a genus belonging to the order of amphibia reptilia. The body is naked, furnished with four feet, and without any tail. There are 17 species. The most remarkable are,

1. The temporaria, or common frog. This is an animal so well known, that it needs no description; but some of its properties are very singular.

Its spring, or power of taking large leaps, is remarkably great, and it is the footed animals. Nature hath finely adapted its parts for those ends, the fore members of the body being very lightly made, the hind legs and thighs very long, and furnished with very strong muscles.

While in a tadpole state, it is entirely a water animal; the work of generation is performed in that element, as may be seen in every pond during spring, when the female remains oppressed by the male for a number of days.

The work of propagation is extremely singular, it being certain that the frog has not a penis intrant. There appears a strong analogy in this case between a certain class of the vegetable kingdom and those animals; for it is well known, that when the female frog deposits its spawn, the male instantaneously impregnates it with what we may call a farina fucundans, in the same manner as the palm-tree conveys fructification to the flowers of the female, which would otherwise be barren.

As soon as the frogs are released from their tadpole state, they immediately take to land; and if the weather has been hot, and there fall any refreshing showers, you may see the ground for a considerable space perfectly blackened by myriads of these animalcules, seeking for some secure lurking places. Some philosophers, not giving themselves time to examine into this phenomenon, imagined them to have been generated in the clouds, and showered on the earth; but had they, like Derham, but traced them to the next pool, they would have found a better solution of the difficulty. See Preternatural Rains.

As frogs adhere closely to the backs of their own species, so we know they will do the same by chin.—Walton mentions a strange story of their destroying pike; but that they will injure, if not entirely kill carp, is a fact indubitable, from the following relation. Not many years ago, on fishing a pond belonging to Mr Pitt of Encomb, Dorsetshire, great numbers of the carp were found with a frog mounted on it, the hind legs clinging to the back, and the fore legs fixed in the corner of each eye of the fish, which were thin and greatly wasted, seized by carrying so disagreeable a load. These frogs Mr Pennant supposes to have been males disappointed of a mate.

The croaking of frogs is well known; and from that in fenny countries they are distinguished by ludicrous titles: thus they are styled in England Dutch nightingales, and Boston owls.

Yet there is a time of the year when they become mute, neither croaking nor opening their mouths for a whole month: this happens in the hot season, and that is in many places known to the country people by the name of the paddock moon. It is said, that during that period their mouths are so closed, that no force (without killing the animal) will be capable of opening them.

These, as well as other reptiles, feed but a small space of the year. The food of this genus is flies, insects, and snails. Toads are said to feed also on bees, and to do great injury to those useful insects.

During winter, frogs and toads remain in a torpid state: the last of which will dig into the earth, and cover themselves with almost the fame agility as the mole. See Physiology, n° 48 and note (a), and n° 52.

2. The esculenta, or edible frog, differs from the former, in having a high protuberance in the middle of the back, forming a very sharp angle. Its colours are also more vivid, and its marks more distinct: the ground colour being a pale or yellowish green, marked with rows of black spots from the head to the rump.—This, and (Mr Pennant thinks) the former, are eaten. He has seen in the markets at Paris whole hampers full, which the vendors were preparing for the table, by skinning and cutting off the fore-parts, the loins and legs only being kept; but his strong dislike to these reptiles prevented a close examination into the species.

3. In the state of Pennsylvania, and some other parts of North America, there is a very large species of frogs called the bull-frog, or rana ocellata. Their irises are of a dusky red, surrounded with a yellow ring. The auricles are covered with a thin circular skin, which forms a spot behind each eye. They have four toes on the fore-feet, and five palmated toes behind. Their colour is a dusky brown, mixed with yellowish green, and spotted with black. The belly is yellowish, and faintly spotted. These make a monstrous roaring noise like a bull, only somewhat more hoarse. Their size is superior to that of any other of the genus, and they can spring forward three yards at a leap. By this means they will equal in speed a very good horse in its swiftest course. Their places of abode are ponds, or bogs with stagnant water; but they never frequent streams. When many
of them are together, they make such a horrid noise, that two people cannot understand each other's speech. They croak all together, and then stop for a little and begin again. It seems as if they had a captain among them; for when he begins to croak, all the others follow; and when he stops, they also become silent. When this captain gives the signal for stopping, you hear a note like pop coming from him. In the daytime they seldom make any great noise, unless the sky is covered; but in the night-time they may be heard at the distance of a mile and an half.

When they croak, they are commonly near the surface of the water, under the bushes, and have their heads out of the water. By going slowly, therefore, one may get up almost quite close to them before they go away. As soon as they are quite under water, they think themselves safe, though it be ever so shallow. These creatures kill and eat young ducklings and goslings, and sometimes carry off chickens that come too near the water; when beaten, they cry out almost like little children. As soon as the air begins to grow a little cool in autumn, they hide themselves under the mud in the bottom of stagnant waters, and lie there torpid during the winter. As soon as the weather grows mild towards summer, they begin to get out of their holes and croak. They are supposed by the people of Virginia to be the purifiers of waters, and are respected as the genii of the fountains. Some of them were taken to England alive several years ago.

4. To bufo, or toad, is the most deformed and hideous of all animals. The body is broad; the back flat, and covered with a dimply rough hide; the belly large, the legs short, and its pace laboured and laggings; its retreat gloomy and filthy; in short, its general appearance is such as to strike one with disgust and horror. Yet it it said by those who have resolution to view it with attention, that its eyes are fine; to this it seems that Shakespeare alludes, when he makes his Juliet remark:

Some say the lack and leathred toad change eyes:
As if they would have been better befownd on so charming a wognter than on this rauncous reptile.

But the hideous appearance of the toad is such as to make this one advantageous feature overlooked, and to have rendered it in all ages an object of horror, and the origin of most tremendous inventions. Elian makes its venom so potent, that bait-like it conveyed death by its very look and breath; but Juvenal is content with making the Roman ladies who were weary of their husbands form a potion from its entrails, in order to get rid of the good man. This opinion begot others of a more dreadful nature; for in after-times superstition gave it preternatural powers, and made it a principal ingredient in the incantations of nocturnal hags.

This animal was believed by some old writers to have a stone in its head fraught with great virtues medical and magical: it was distinguished by the name of the reptile, and called the toad-stone, byfanites, crapaudine, krottenstein; but all its fancied powers vanished on the discovery of its being nothing but the foill tooth of the sea-wolf, or of some other flat-toothed

fifth, not unfrequent in Britain as well as several other countries.

But these fables have been long exploded. And as to the notion of its being a poisonous animal, it is probable that its exeuctive defemity, joined to the faculty it has of emitting a juice from its pimples, and a dulky liquid from its hind parts, is the foundation of the report.

That it has any noxious qualities there seem to have been no proofs in the smallest degree satisfactory; tho' we have heard many strange relations on that point. Of the contrary, there have been many who have taken them in their naked hands, and held them long without receiving the least injury: it is also well known that quacks have eaten them, and have besides squeezed their juices into a glass and drank them with impunity. We may lay also, that these reptiles are a common food to many animals; to buzzards, owls, Norfolk plovers, ducks, and snakes, who would not touch them were they in any degree noxious.

So far from having venomous qualities, they have of late been considered as if they had beneficent ones; particularly in the cure of the most terrible diseases, the cancer, by suction: (See British Zoology vol. iii. Append. p. 389, et seq.) But, from all circumstances, as Mr Pennant observs they seem only to have rendered a horrible complaint more loathsome.

The most full information concerning the nature and qualities of this animal is contained in the following letters from Mr Arscott and Mr Pfitlfield to Dr Milles. "It would give me great pleasure (says Mr Arscott) to be able to inform you of any particulars which Mr Pennant's notes, concerning the toads, who lived so many years with us, and was so great a favourite. The greatest curiosity in it was its becoming so remarkably tame. It had frequented some steps before the hall-door some years before my acquaintance commenced with it, and had been admired by my father for its size (which was of the largest I ever met with), who constantly paid it a visit every evening. I knew it myself above 30 years; and by constantly feeding it, brought it to be so tame, that is always came to the candle, and looked up as if expecting to be taken up and brought upon the table, where I always fed it with insects of all sorts; it was fond of fleth maggots, which I kept in bran; it would follow them, and, when within a proper distance, would fix its eye, and remain motionless for near a quarter of a minute, as if preparing for the stroke, which was an instantaneous throwing its tongue at a great distance upon the insect, which stuck to the tip by a glutinous matter; the motion is quicker then the eye can follow (a).

"I always imagined that the root of its tongue was placed in the forepart of its under jaw, and the tip towards its throat, by which the motion must be a half circle; by which, when its tongue recovered its situation, the insect at the tip would be brought to the place of deglutition. I was confirmed in this by never observing any internal motion in its mouth, excepting one swallow the insect its tongue returned. Possibly I might be mistaken; for I never dissected one, but contented

(a) This rapid capture of its prey might give occasion to the report of its fascinating powers, Linnaeus says,

Insecta in faucie captus recens.

RAN

[See Animalia.]
tented myself with opening its mouth, and slightly inspecting it.

"You may imagine, that a toad, generally deceived, (although one of the most insenstive of all animals), so much taken notice of and befriended, excited the curiosity of all comers to the house, who all desired to see it fed; so that even ladies so far conquered the horror instilled into them by nurses, as to desire to see it. This produced innumerable and improbable reports, making it as large as the crown of a hat, &c. &c."

The following are answers from the same gentleman to some queries propounded by Mr Pennant.

"Firstly, I cannot say how long my father had been acquainted with the toad before I knew it; but when I first was acquainted with it, he used to mention it as the old toad I've known so many years; I can answer for 30 years.

"Secondly, No toads that I ever saw appeared in the winter season. The old toad made its appearance as soon as the warm weather came. When we new-lay'd the fires, I felt it feed; so that even ladies so far conquered the horror instilled into them by nurses, as to desire to see it. This produced innumerable and improbable reports, making it as large as the crown of a hat, &c. &c."

Thirdly, It was seldom provoked: neither that toad, nor the multitudes I have seen tormented with great cruelty, ever showed the least desire of revenge, by spitting or emitting any juice from their pimples. Sometimes, upon taking it up, it would let out a great quantity of clear water, which, as I have often seen it do the fame upon the fires when quite quiet, was certainly its urine, and no more than a natural evacuation.

Fourthly, A toad has no particular enmity for the spider; he used to eat five or six with his millipedes (which I take to be its chief food). I generally provided for it before I found out that fleas maggots, by their continual motion, was the most tempting bait; but, when offered, it cat blowing flies and humble bees that came from the rat-tailed maggot in gutters, or in short any insect that moved. I imagine, if a bee was to be put before a toad, it would certainly eat it to its cost; but as bees are seldom found in the same place that toads are, they can seldom come in their way; as they seldom appear after funning or before sunning. In the heat of the day they will come to the mouth of their hole, I believe, for air. I once from my parlour window observed a large toad I had in the bank of a bowing green, about 12 at noon, a very hot day, very busy and active upon the grass; so uncommon an appearance made me go out to see what it was, when I found an innumerable swarm of winged ants had dropped round his hole, which temptation was as irresistible as a turtle would be to a luxurious alderman.

"Fourthly, Whether our toad ever propagated its species, I know not; rather think not, as it always appeared well, and not leavened in bulk, which it must have done, I should think, if it had discharged so large a quantity of spawn as toads generally do. The females that are to propagate in the spring, I imagine, instead of retiring to dry holes, go into the bottom of ponds, and lie torpid among the weeds; for to my great surprise, in the middle of the winter, having for amusement put a long pole into my pond, and twisted it till it had gathered a large volume of weed, on taking it off I found many toads; and having cut some affunder with my knife, by accident, to get off the weed, found them full of spawn not thoroughly formed. I am not positive, but think there were a few males in March; I know there are 50 males (a) to one female, 12 or 14, of whom I have seen clinging round a female; I have often dived her, and put her to a solitary male, to see with what eagerness he would seize her. They impregnate the spawn as it is drawn (c) out in long strings, like a necklace, many yards long, not in a large quantity of jelly, like frogs' spawn.

A 2

Sithly,

(a) Mr John Hunter has assured me, that during his residence at Belleisle, he dissected some hundreds of toads, yet never met with a single female among them.

(c) I was incredulous as to the obstetrical offices of the male toad, but since the end is so well accounted for, and the facts established by such good authority, belief must take place.

Mr Demours, in the Memoirs of the French Academy, as translated by Dr Templeman, vol. i. p. 371, has been very particular in respect to the male toad as acting the part of an accoucheur: His account is curious, and claims a place here.

"In the evening of one of the long days in summer, Mr Demours, being in the king's garden, perceived two toads coupled together at the edge of an hole, which was formed in part by a great stone at the top.

"Curiosity drew him to see what was the occasion of the motions he observed, when two facts equally new surprised him. The first was the extreme difficulty the female had in laying her eggs, insomuch that she did not seem capable of being delivered of them without some assistance. The second was, that the male was mounted on the back of the female, and exerted all his strength with his hinder feet in pulling out the eggs, whilst his fore feet embraced her breast.

"In order to apprehend the manner of his working in the delivery of the female, the reader must observe, that the paws of these animals, as well those of the fore-feet as of the hinder, are divided into several toes, which can perform the office of fingers.

"It must be remarked likewise, that the eggs of this species of toads are included each in a membranous coat that is very firm, in which is contained the embryo; and that these eggs, which are oblong and about two lines in length, being fastened one to another by a short but very strong cord, form a kind of chaplet, the beads of which are distant from each other about the half of their length. It is by drawing this cord with his paw that the male performs the function of a midwife, and acquires himself in it with a dexterity that one would not expect from so lumpish an animal.

"The presence of the observer did not a little discompose the male: for some time he stopped short, and
Sixthly, Insects being their food, I never saw any toad show any liking or dislike to any plant (d).

Seventhly, I hardly remember any persons taking it up except my father and myself; I do not know whether it had any particular attachment to us.

Eighthly, In respect to its end, I answer this last query. Had it not been for a tame raven, I make no doubt but it would have been now living; who one day seeing it at the mouth of its hole, pulled it out, and although I rescued it, pulled out one eye, and hurt it so, that notwithstanding its living a twelvemonth it never enjoyed itself, and had a difficulty of taking its food, missing the mark for want of its eye: before that accident it had all the appearance of perfect health.

6. The rubeta, or natter-jack, frequents dry and sandy places: it is found on Putney common, and also near Revely abbey, Lincolnshire. It never leaps, neither does it crawl with the flow pace of a toad, but its motion is liker to running. Several are found commonly together, and like others of the genus they appear in the evenings. The upper part of the body is of a dirty yellow, clouded with brown, and covered with po­rous pimples of unequal sizes: on the back is a yellow line. The upper side of the body is of a paler hue, marked with black spots, which are rather rough. On the fore-feet are four divided toes; on the hind five, a little webbed. The length of the body is two inches and a quarter; the breadth, one and a quarter: the length of the fore-legs, one inch one-sixth; of the hind legs, two inches. We are indebted to Sir Joseph Banks, for this account.

7. The pipal, or Surinam toad, is more ugly than even the common one. The body is flat and broad; the head small; the jaws, like those of a mole, are extended, and evidently formed for rooting in the ground: the skin of the neck forms a sort of wrinkled collar; the colour of the head is of a dark chestnut, and the eyes are small; the back, which is very broad, is of a lightish grey, and seems covered over with a number of small eyes, which are round, and placed at nearly equal distances. These eyes are very different from what they seem: they are the animal’s eggs, covered with their shells, and placed there for hatching. These eggs are buried deep in the skin, and in the beginning of incubation but just appear, and are very visible when the young animal is about to burst from its confinement. They are of a reddish, shining yellow colour; and the spaces between them are full of small masts, resembling pearls.

This is their situation previous to their coming forth; but nothing so much demands our admiration as the manner of their production. The eggs, when formed in the ovary, are pent, by some internal canals, which anatomists have not hitherto described, to lie and come to maturity under the bony substance of the back: in this state they are impregnated by the male, whose seed finds its way by pores very singularly contrived, and pierces not only the skin but the perioleum: the skin, however, is still apparently entire, and forms a very thick covering over the whole brood; but as they advance to maturity, at different intervals, one after another, the egg seems to start forward, and burgeons from the back, becomes more yellow, and at last breaks; when the young one puts forth its head: it still, however, keeps its situation until it has acquired a proper degree of strength, and then it leaves the shell, but still continues to keep upon the back of the parent. In this manner the pipal is seen travelling with her wondrous family on her back, in all the different stages of maturity. Some of the strange progeny, not yet come to sufficient perfection, appear quite torpid, and as yet without life in the egg: others seem just beginning to rise through the skin; here peeping forth from the shell, and there having entirely forsaken their prilons: some are sporting at large upon the parent’s back, and others descending to the ground to try their own fortune below. The male pipal is every way larger than the female, and has the skin left tightly drawn round the body. The whole body is covered with protubences, resembling pearls; and the belly, which is of a bright yellow, seems as if it were furred up from the throat to the vent, a seam being seen to run in that direction. This animal, like the rest of the frog kind, is most probably harmless.

8. The water frog of Cateby has large black eyes, yellow irises, and long limbs: the upper part of the head and body is of a dusky green, spotted with black; and from each eye to the nose is a white line; and also a yellow line along the sides to the rump. They frequent rivulets and ditches, which they do not quit for the dry land. It is said they will spring five or six yards at a leap.

9. The rana arborosa, or green tree frog of Cateby, is of a fiendish shape and bright green colour, marked on each side with a line of yellow: the eyes are black; the irides yellow; they have four toes before and five behind; at the end of each toe there is a round membrane, concave beneath, and not unlike the mouth of a leech. They lurk under the lower sides of leaves, even of the tallest trees, and adhere firmly, by means of the membranes at the ends of their toes, flicking to the smoothest surface: a looking-glass was held before one, at the curious impression a fixed look that marked his quietness and fear; but he soon returned to his work with more precipitation than before, and a moment after he appeared undetermined whether he should continue it or not. The female likewise discovered her uneasiness at the sight of the stranger, by motions that interrupted sometimes the male in his operation. At length, whether the silence and steady posture of the spectator had diffused their fear, or that the sight was urgent, the male resumed his with the same vigour, and successfully performed his function.”

(d) This question arose from an affection of Linnaeus, that the toad delighted in filthy herbs. Delictatur caulis, actea, falsa pedis. The unhappy deformity of the animal seems to be the only ground of this as well as another misrepresentation, of its conveying a poison with its pimples, its touch, and even its breath. Ferra ca latrocontes venenato infusis sedibus, anebitis.
at four yards distance; it reached it at one leap, and stuck closely to it. At night these frogs make an incessant chirping, and leap from spray to spray in search of insects. This species is common to America and the warmer parts of Europe.

10. The land frog of Catesby has much the appearance of a toad: above it is grey or brown, spotted with dusky; below white, faintly spotted; the irides are red; and the legs short. They frequent the high-lands, and are seen most frequently in wet weather and in the hottest time of the day: they leap, feed on insects, particularly the fire-fly and ant. Sometimes the Americans bake and reduce this species to powder, which, mixed with orrice, is taken as a cure for a tympany.

11. The cinereous frog has a gibbous, cinereous, and smooth back; the belly is yellow and granulated: on each side, from the nose to the rump, there is a white line; and there is the same on the outside of the thighs and legs; the toes are bulbated at their ends. They inhabit Carolina.

RANAI, one of the Sandwich islands discovered by Captain Cooke, is about nine miles distant from Mowee and Morotai, and is situated to the south-west of the passage between those two islands. The country towards the south is elevated and craggy; but the other parts of the island had a better appearance, and seemed to be well inhabited. It abounds in roots, such as sweet potatoes, tare, and yams; but produces very few plantains and bread-fruit trees. The south point of Ranai is in the latitude of 20° 46' north, and in the longitude of 193° 8' east.

RANCID, denotes a fatty substance that has become rank or mousy, or that has contracted an ill smell by being kept close.

RANDIA, in botany: A genus of the monognynia order, belonging to the pentandria class of plants; and in the natural method ranking with those of which the order is doubtful. The calyx is monophyllous; the corolla salver-shaped; the berry unilocular, with a capsular rind. There are two species, viz. the mitis and aculeata.

RANDOLPH (Thomas), an eminent English poet in the 17th century, was born in Northamptonshire 1605. He was educated at Westminster and Cambridge, and very early distinguished for his excellent genius; for at about nine or ten years of age he wrote the History of the Incarnation of our Saviour in verse. His subsequent writings established his character, and gained him the esteem and friendship of some of the greatest men of that age, particularly of Ben Johnson, who adopted him one of his sons in the muses. He died in 1654, and was honourably interred. He wrote, 1. The Muses Looking-glass, a comedy. 2. Amyntas, or the Impossible Dowry, a pastoral, acted before the king and queen. 3. Ariophilus, or the Jovial Philosopher. 4. The Conceited Pedlar. 5. The Jealous Lovers, a comedy. 6. Hey for Honesty, down with Knavery, a comedy; and several poems.

RANDOM shot, in gunnery, is a shot made when the muzzle of a gun is raised above the horizontal line, and is not designed to shoot directly or point blank. The utmost random of any piece is about ten times as far as the bullet will go point-blank. The bullet will go farthest when the piece is mounted to about 45° above the level range. See GUNNERY and PROJECTILES.

RANGE, in gunnery, the path of a bullet, or the line it describes from the mouth of the piece to the point where it lodges. If the piece lie in a line parallel to the horizon, it is called the right or level range; if it be mounted to 45°, it is said to have the utmost range; all others between 00 and 45° are called the intermediate ranges.

RANGER, a sworn officer of a forest, appointed by the king's letters patent; whose business is to walk through his charge, to drive back the deer out of the pursius, &c. and to prevent all trespasses within his jurisdiction at the next forest-court.

RANK, the order or place assigned to a person suitable to his quality or merit.

RANK, is a straight line made by the soldiers of a battalion or squadron, drawn up side by side: this order was established for the marches, and for regulating the different bodies of troops and officers which compose an army.

RANK and Precedence, in the British army and navy, are as follow:

Engineers RANK. Chief, as colonel; director, as lieutenant-colonel; sub-director, as major; engineer in ordinary, as captain; engineer extraordinary, as captain lieutenant; sub-engineer, as lieutenant; practicioner-engineer, as ensign.

Navy RANK. Admiral, or commander in chief of the British fleet, has the rank of a field-marshall; admirals, with their flags on the main-top-mast-head, rank with generals of horse and foot; vice-admirals, with lieutenant-general; rear-admirals, as major-generals; commodores, with broad pendants, as brigadier-generals; captains of post-ships, after three years from the date of their first commission, as colonels; other captains, as commanding post-ships, as lieutenant-colonels; captains, not taking post, as majors; lieutenants, as captains.

### Doubling of the Ranks

Doubling of the Ranks is the placing two ranks in one, frequently used in the manoeuvres of a regiment.

**Ranks and Files** are the horizontal and vertical lines of folders when drawn up for service.

**Ransom**, a sum of money paid for the redemption of a slave, or the liberty of a prisoner of war. In our law-books, ransom is also used for a sum paid for the pardon of some great offence, and to obtain the offender's liberty.

**Ranula**, a tumour under a child's tongue, which, like a ligature, binds it from speaking or fucking.

**Ranunculus**, crow-foot: A genus of the polygama order, belonging to the polyandria class of plants; and in the natural method ranking under the 26th order, Multiflora. The calyx is pentaphyllous: there are five petals, each with a melliferous pore on the inside of the heel; the seeds naked.

**Species.** There are near 40 different species of this genus, five or eight of which claim general esteem as flowery plants for ornamenting the gardens, and a great number are common weeds in the fields, waters, and purlieu ground, not having merit for garden culture. Of the garden kinds, the principal fort is the Asiatic or Turkey and Perian ranunculus, which comprises many hundred varieties of large, double, most beautiful flowers of various colours: but several other species having varietis with fine double flowers, make a good appearance in a collection, though as those of each species consist only of one colour, some white, others yellow, they are inferior to the Asiatic ranunculus, which is large, and diversified a thousand ways in rich colours, in different varieties. However, all the garden kinds in general effect a very agreeable diversity in assemblage in the flower compartments, &c. and they being all very hardy, succeed in any open beds and borders, &c.

**Culture.** The Asiatic species in all its varieties will succeed in any light, rich, garden earth; but the florists often prepare a particular compost for the fine varieties, consisting of good garden-mould or pasture-earth, sand and all, a fourth part of rotted cow-dung and the like portion of sea-fish and with this they prepare beds four feet wide and two deep; however, in default of such compost, use beds of any good light earth of your garden; or, if necessary, it may be made light and rich with a portion of drift-fish and rotten dung, cow-dung is most commonly recommended; but they will also thrive in beds of well-wrought kitchen-garden earth, and they often proceed well in the common flower-borders.

The season for planting the roots is both in autumn and spring; the autumn plantings generally flower strongest and soonest by a month at least, and are succeeded by the spring-planting in May and June. Perform the autumnal planting in October and early part of November, but some plant towards the latter end of September in order to have a very early bloom; but those planted in that month and beginning of October often come up with rank leaves soon after, in winter, so as to require protection in hard frosts; those, however, planted about the middle or latter end of October, and beginning of November, rarely shoot up strong till towards spring, and will not require so much care of covering during winter; and the spring-planting may be performed the end of January or beginning of February, or as soon as the weather is settled; they will not require any trouble of covering, and will succeed the autumnal plants regularly in bloom, and will flower in good perfection. Thus by two or three different plantings you may obtain a succession of these beautiful flowers in constant bloom from April till the middle of June; but the autumnal plants, for the general part, not only flower strongest, but the roots increase more in size, and furnish the best offsets for propagation: it is, however, proper to plant both in spring and autumn.

Prepare for the choicer sorts four-foot beds of light earth, and rake the surface smooth; then plant the roots in rows lengthwise the beds, either by drilling them in two inches deep, and six inches distance in the row, and the rows six or eight inches further; or you may plant them by bedding-in, or by dibble-planting, the same depth and distance. These designed for the borders should be planted generally
Ranunculus

Rape

Rape, in law, the carnal knowledge of a woman forcibly and against her will. This, by the Jewish law, was punished with death, in case the damsel was betrothed to another man; and, in case she was not betrothed, then a heavy fine of fifty shekels was to be paid to the damsel, and the wife was to be the wife of the ravisher all the days of his life; without that power of divorce, which was in general permitted by the Mosaic law.

The civil law punishes the crime of ravishment with death and confiscation of goods; under which it includes both the offence of forcible abduction, or taking away a woman from her friends; and also the present offence of forcibly dishonouring her; either of which, without the other, is in that law sufficient to constitute a capital crime. Also the stealing away a woman from her parents or guardians, and debauching her, is equally penal by the emperor's edict, whether the consort or not is forced. And this, in order to take away from women every opportunity of offending in this way; whom the Roman laws sponde never to go altray without the seduction and arts of the other sex; and therefore, by restraining and making so highly penal the solicitations of the men, they meant to secure effectually the honour of the women. But the English law does not entertain quite such sublime ideas of the honour of either sex, as to lay the blame of a mutual fault upon one of the transgressors only; and therefore makes it a necessary ingredient in the crime of rape, that it must be against the woman's will.

Rape was punished by the Saxon laws, particularly those of Athelstan, with death; which was also agreeable to the old Gothic or Scandinavian constitution. But this was afterwards thought too hard: and in its stead another severe, but not capital, punishment was inflicted by William the Conqueror, viz. castration and loss of eyes; which continued till after Bracton wrote, in the reign of Henry III. But in order to prevent malicious accusations, it was then the law (and, it seems, still continues to be so in appeals of rape), that the woman should, immediately after, go to the next town, and there make discovery to some credible persons of the injury she has suffered; and afterwards should acquaint the high constable of the hundred, the coroners, and the sheriff, with the outrage. This seems to correspond in some degree with the laws of Scotland and Arragon, which require that complaint must be made within 24 hours: though afterwards by statute Westm. 1. c. 13. the time of limitation in England was extended to 40 days. At present there is no time of limitation fixed: for, as it is usually now punished by indictment at the suit of the king, and the maxim of law takes place, that "nullum tempus occurrit rei," but the jury will rarely give credit to a stale complaint. During the former period also it was held for law, that the woman (by consent of the judge and her parents) might redeem the offender from the execution of his sentence, by accepting him for her husband; if he also was willing to agree to the exchange, but not otherwise.

In the 3 Edw. I. by the statute Westm. 1. c. 13. the punishment of rape was much mitigated: the offence itself, of ravishing a damsel within age, (that is, twelve years old) either with her consent or without, or of any other woman against her will, being reduced to a treipass, if not prosecuted by appeal within 40 days, and subjecting the offender only to two years imprisonment, and a fine at the king's will. But this lenity being productive of the most terrible consequences, it was in ten years afterwards, 15 Edw. I. found necessary to make the offence of forcible rape felony by statute Westm. 2. c. 13. And by statute 18 Eliz. c. 7. it is made felony without benefit of clergy: and is also the abominable wickedness of carnally knowing or abusing any woman-child under the age of ten years; in which case the consent or non-consent is immaterial, as by reason of her tender years she is incapable of judgment and discretion. Sir Matthew Hale is indeed of opinion, that such profligate actions committed on an infant under the age of twelve years, the age of female discretion by the common law, either with or without consent, amount to rape and felony; as well as before the statute of queen Elizabeth: but that law has in general been held only to extend to infants under ten; though it should seem that damselfs between ten and twelve are still under the protection of the statute Westm. 1. the law with respect to their seduction not having been altered by either of the subsequent statutes.

A male infant, under the age of fourteen years, is
Raphael.  

presumed by law incapable to commit a rape, and therefore it seems cannot be found guilty of it. For though in other felonies "maliitia supplet statum;" yet, as to this particular species of felony, the law supposes an imbecility of body as well as mind.

The civil law seems to suppose a prostitute or common harlot incapable of any injuries of this kind: not allowing any punishment for violating the chastity of her, who hath indeed no chastity at all, or at least hath no regard to it. But the law of England does not judge so hardly of offenders, as to cut off all opportunity of retreat even from common harquebs, and to treat them as never capable of amendment. It therefore holds it to be felony to force even a concubine or harlot; because the woman may have forfeited that unlawful course of life: for, as Bradton well observes, "hic materixa fuerit antea, certe tune temporis non fuit, cum reclamando nesciuit ejus contentire noluit."

As to the material facts requisite to be given in evidence and proved upon an indiction of rape, they are of such a nature, that, though necessary to be known and settled, for the conviction of the guilty and preservation of the innocent, and therefore to be found in such criminal treatises as discourse of these matters in detail, yet they are highly improper to be publickly discussed, except only in a court of justice. We shall therefore merely add upon this head a few remarks from Sir Matthew Hale, with regard to the competency and credibility of witnesses; which may, fæpe pudore be considered.

And, first, the party ravished may give evidence upon oath, and is in law a competent witness; but the credibility of her testimony, and how far forth she is to be believed, must be left to the jury upon the circumstances of fact that concur in that testimony. For instance, if the witness be of good fame; if she perfectly discovered the offence, and made search for the offender; if the party accused fled for it; these and the like are circumstances, which give greater probability to her evidence. But, on the other side, if the be of evil fame, and stand unsupported by others; if she concealed the injury for any considerable time after the had opportunity to complain; if the place, where the fact was alleged to be committed, was where it was possible she might have been heard, and she made no outcry: none and the like circumstances carry a strong, but not conclusive, presumption that her testimony is false or feigned.

Moreover, if the rape be charged to be committed on an infant under 12 years of age, she may still be a competent witness, if the hath sense and understanding to know the nature and obligations of an oath; and, even if she hath not, it is thought by Sir Matthew Hale, that she ought to be heard without oath, to give the court information; though that alone will not be sufficient to convict the offender. And he is of this opinion, first, Because the nature of the offence being secret, there may be no other possible proof of the actual fact; though afterwards there may be concurrent circumstances to corroborate it, proved by other witnesses: and, secondly, Because the law allows what the child told her mother, or other relations, to be given in evidence, since the nature of the cafe admits frequently of no better proof; and there is much more reason for the court to hear the narration of the child herself, than to receive it at second-hand from those who swear they heard her say so. And indeed it seems now to be settled, that in these cases infants of any age are to be heard; and, if they have any idea of an oath, to be also sworn, it being found by experience, that infants of very tender years often give the clearest and truest testimony. But in any of these cases, whether the child be sworn or not, it is to be weighed, in order to render her evidence credible, that there should be some concurrent testimony of time, place, and circumstances, in order to make out the fact; and that the conviction should not be grounded singly on the unsupported accusation of an infant under years of discretion. There may be therefore, in many cases of this nature, witnesses who are competent, that is, who may be admitted to be heard: yet, after being heard, may prove not to be credible, or such as the jury are bound to believe. For one excellence of the trial by jury is, that the jury are triers of the credit of the witnesses, as well as of the truth of the fact.

"It is true (says this learned judge), that rape is a most detestable crime, and therefore ought severely and impartially to be punished with death; but it must be remembered, that it is an accusation easy to be made, hard to be proved, but harder to be defended by the party accused, though innocent." He then relates two very extraordinary cases of malicious prosecution for this crime that had happened within his own observation; and concludes thus: "I mention these instances, that we may be the more cautious upon trials of offences of this nature, wherein the court and jury may with much ease be imposed upon, without great care and vigilance; the heinousness of the offence many times transporting the judge and jury with so much indignation, that they are over-hasty carried to the conviction of the persons accused thereof, by the confused testimony of sometimes false and malicious witnesses."

RAFAEL (D'Urbino), the greatest, most sublime, and most excellent painter that has appeared, since the revival of the fine arts, was the son of an indifferent painter named Sansino, and was born at Urbino on Good Friday 1482. The popes Julius II. and Leo X. who employed him, loaded him with wealth and honour; and it is said that cardinal De St Bibiana had such a value for him that he offered him his niece in marriage. His genius is admired in all his pictures; his contours are free, his ordainances magnificent, his designs correct, his figures elegant, his expressions lively, his attitudes natural, his heads graceful; in fine, everything is beautiful, grand, sublime, just and adorned with graces. These various perfections he derived not only from his excellent abilities, but from his study of antiquity and anatomy; and from the friendship he contracted with Ariosto, who contributed not a little to the improvement of his taste. His pictures are principally to be found in Italy and Paris. That of the Transfiguration, preferred at Rome in the church of St Peter Monterio, passes for his masterpiece. He had a handsome person, was well proportioned, and had great sweetness of temper; was polite, affable, and modell,
RAP [ 9 ]

RAPHAIM, or REPHAIM, (Moses, a name signifying Giants, as they really were, and an actual people too, situated in Bashan or Batanea, beyond Jordan, separated from the Zannahum by the river Jabbok. Also a valley near Jerusalem; Joshua 17.

RAPHAELUS, RADISH; a genus of the silphoza order belonging to the tetradynamia clafs of plants, and in the natural method ranking under the 39th order, Silphozae. The calyx is clofe; the silphoza torofe, or swelling out in knots, subarticulated, and round. There are two melliforous glands between the shorter flamina and the pilif; and two between the longer flamina and the calyx.

There is only one species, viz. the fatius, or common garden radish; of which there are several varieties. They are annual plants, which being fowed in the spring, attain perfection in two or three months, and fhoot up foon after into flalks for flower and feed, which, ripening in autumn, the whole plant, root and top, perifhes; fo that a fresh supply must be raised annually from feed in the spring, performing the fowings at different fcveral times, from about Christmas until May, in order to continue a regular fcuccion of young tender radifhes throughout the fefon: allowing only a fortnight or three weeks interval between the fowings; for one crop will not continue good longer than that space of time, before they will either run to feed, or become tough, ficky, and too hot to eat.

RAPHANIDOSIS, a punishment inflficted at Athens upon adulterers. The manner of it was this: The hair was plucked off from the privates of the offender, hot ashes laid upon the place, and a radifh or mullet thrust up his fundament, as has been mentioned under ADULTERY. To this Juvenal alludes, Sat. x. ver. 317. Quodiam maceres magis intrat. Perfons who had been thus punished were called VITIARIA. The word raphanides is derived from raphaia, a radifh.

RAPHIDIA, in zoology; a genus of insects, of the neuroptera order; the characters of which are these: The head is of a horni fulfinate, and depreffed or flattened: the mouth is armed with two teeth, and furnished with four palpi: the flammenta are three in number: the wings are defepted: the antennæ are filiform, as long as the thorax: the anterior part of which is lengthened out, and of a cylindrical form: the tail of the female is terminated by an appendix, reftmbling a flexible crooked brifle.—There are three fpecies: The molt remarkable is the ophiopis; which for its fhape is one of the molt fingular that can be fecn. It has an oblong head, fha ped like a heart, with its point joined to the thorax, and the broad part before. It is smooth, black, развития, continually shaking, with short antennæ, yellowish maxille, and four palp. Toward the middle of the upper part of the head, between the eyes, are the three flemmata, placed in a triangle. The thorax, to which this head is falfened, is narrow, long, and cylindrical. The abdomen, broader, is black like the ref of the body, with the segments margined yellow. The feet are of a yellowifh eaf. The wings, which are faltigalated, are white, diaphanous, veined, and as it were covered with a very fine net-work of black. This infed, in the figure of its head, reftemles a flake. It is found but feldom, and in woods only. Its larva, chryfalis, and habitation, are absolutely unknown.

RAPIER, formerly signified a long old-fashioned fword, fuch as thofe worn by the common foldiers: but it now denotes a small fword, as contradiftinguifh-ed from a back-fword.

RAPIN (Rene), a Jefuit and eminent French writer, was born at Tours in 1621. He taught polite literature in the fociety of the Jefuits with great ap­ plafue, and was juftly esteemed one of the molt Latin poets and grea tent wits of his time. He died at Paris in 1687. He wrote, 1. A great number of Latin poems, which have rendered him famous throughout all Europe; among which are his Horatian libri quatuor, which is reckoned his master-piece. 2. Re­ flections on Eloquence, Poetry, History, and Philo­ fphy. 3. Comparisons between Virgil and Homer, Demo­ philenes and Cicero, Plato and Aristotle, Thuc­ dides and Titus Livius. 4. The his­ tory of Juf­ nifieum. 5. Several works on religious subjects. The fift edition of his Latin poems is that of Paris in 1723, in 3 vols 12mo.

RAPIN de Thoyras (Paul de), a celebrated his­ torian, was the son of James de Rapin lord of Thoyras, and was born at Caftres in 1661. He was educated at firft under a tutor in his father's house; and afterwards sent to Puylaurenis, and thence to Saumur. In 1679 he returned to his father, with a defign to apply him­ self to the fudy of the law, and was admitted an ad­ vocate: but fome time after, reftecting that his being a Protestant would prevent his advancement at the bar, he resolved to quit the præfence of the law, and apply him­ self to that of the fword; but his father would not content to it. The revocation of the edict of Nantes in 1685, and the death of his father, which happened two months after, made him resolve to go to England; but as he had no hopes of any settlement there, his flay was but fhort. He therefore foon after went to Holland, and lifted himfelf in the company of French volunteers at Utrecht, commanded by M. Rapin his cousin-german. He attended the Prince of Orange into England in 1688: and the following year the Lord Kinglton made him an enfign in his regiment, with which he went into Ireland, where he gained the eife of his officers at the fiege of Carrickfergus, and had foon a lieutenant's commiffion. He was pre­ fent at the battle of the Boyne, and was fhot thro' the fhoiid at the fiege of Limerick. He was then after cafpain of the company in which he had been enfign: but, in 1693, resigned his company to one of his brothers, in order to be tutor to the earl of Portland's...
In 1699, he married Marianne Telfard; but this marriage neither abated his care of his pupil nor prevented his accompanying him in his travels. Having finished this employment, he returned to his family, which he had settled at the Hague; and here he continued some years. But as he found his family increase, he resolved to retire to some cheap country; and accordingly removed, in 1707, to Wefel, where he wrote his History of England, and some other pieces. Though he was of a strong constitution, yet seventeen years application (for so long was he in composing the history just mentioned) entirely ruined his health. He died in 1723. He wrote in French, 1. A Differtation on the Whigs and Tories. 2. His History of England, printed at the Hague in 1726 and 1727, in 9 vols 4to, and reprinted at Trevoux in 1728, in 10 vols 4to. This last edition is more complete than that of the Hague. It has been translated into English, and improved with Notes, by the Reverend Mr Tindal, in 2 vols folio. This performance, though the work of a foreigner, is deservedly esteemed as the fullest and most impartial collection of English political transactions extant. The readers of wit and vivacity, however, may be apt to complain of him for being sometimes rather tedious and dull.

RAPINE, in law, the taking away another's goods &c. by violence.

RAPPESWIL, a town of Swisserland, on the confines of the canton of Zurich, and of the territory of Galler, with an old castle. It is strong by situation, being seated on a neck of land which advances into the lake of Zurich, and over which there is a bridge 850 paces long. It is subject to the cantons of Zurich and Berne. E. Long. 8. 57. N. Lat. 47. 20.

RAPPOLSTEIN, a town of France in Upper Alsace, which, before the Revolution, had the title of a barony. All the musicians of Alsace likewise depended upon this baron, and were obliged to pay him a certain tribute, without which they could not play upon their instruments. E. Long. 7. 28. N. Lat. 48. 15.

RAPTURE, an ecstacy or transport of mind. See EXTASY.

RARE, in physics, stands opposed to dense; and denotes a body that is very porous, whose parts are at a great distance from one another, and which is supposed to contain but little matter under a large bulk. See the following article.

RAREFACTION, in physics, the act whereby a body is rendered rare; that is, brought to possess more room, or appear under a larger bulk, without acquisition of any new matter. This is very frequently the effect of fire, as has long been universally allowed. In many cases, however, philosophers have attributed it to the action of a repulsive principle. However, from the many difficulties occasioned by the properties of the electric fluid and fire, there is the greatest reason to believe, that this repulsive principle is no other than elementary fire. See REPULSION.

RAS-EL-FEEI, one of the frontier provinces of Abyssinia, of which the late celebrated traveller Mr Bruce was made governor while in that country. It is but of small extent, and in its most prosperous state contained only 39 villages. The climate is extremely hot, in Mr Bruce's opinion one of the hottest in the world. He informs us, that on the first day of March, at three o'clock in the afternoon, the thermometer stood at 114° in the shade, and in the evening at 82°; though at noon it had been no higher than 61. Notwithstanding this appearance of extreme heat, however, the sensation was by no means intolerable; they could hunt at mid-day, and felt the evenings rather cold. The soil is a fat, loofe, black earth, which our author says is the same from 13° to 16° of north latitude; at least till we come to the deserts of Atbara, where the tropical rains cease. This country divides that of the Shangalla into two parts, nearly equal. These people inhabit a belt of land about 65 miles broad, all along the northern frontier of Abyssinia, excepting two large gaps or spaces which have been left open for the sake of commerce, and which are inhabited by strangers, to keep the Shangalla in awe. The latter trade in gold, which they pick up in the fires as it is washed down from the mountains; for there are no mines in their country, neither is there any gold in Abyssinia, excepting what is imported from this or some other country. The Shangalla are the natural enemies of Ras-el-Feel, and much blood has been shed in the various incursions they have made upon one another; though of late those of Ras-el-Feel, by the affiduity of the emperors, have been enabled to keep the Shangalla at bay.

RAS SEM, a city of Tripoli in Barbary, concerning which a number of fables were told by the Tripoline ambassador, all of which were believed in England and other parts of Europe in the beginning of this century. (See Prefixed-City). Mr Bruce informs us, that it is situated about five days journey south from Bengazi; but has no water excepting one fountain, which has a disagreeable taste, and seems to be impregnated with alum. Hence it has obtained the name of Ras-sem, or the fountain of poison. The only remains of antiquity in this place consist of the ruins of a tower or fortification, which, in the opinion of Mr Bruce, is as late as the time of the Vandals; but he says he cannot imagine what use they made of the water, and they had no other within two days journey of the place.—Here our travellers saw many of the animals called Ierbous, a kind of mice; which, he says, seem to partake as much of the nature of a bird as of a quadruped.

RASAY, one of the Hebrides Islands, is about 13 miles long and 2 broad. It contains 700 inhabitants, has plenty of lime-stone, free-stone; and feeds great numbers of black cattle; but has neither deer, hares, nor rabbits. The only appearance of a harbour in Rasay is at Clachan Bay, where Mr Macleod the proprietor of the island resides. Rasay presents a bold shore, which rises to the height of mountains; and here the natives have, with incredible labour, formed many little corn and potato grounds. The heights decrease at the south end, where there are 6 or 7 farm-lands and a good-looking country. Mr Macleod is sole proprietor of this island, and of Roma and Fladha at the north end of it, which are only proper for grazing. The huffs of Rasay is pleasantly situated near the south-west end of the island, which is the most level part of it. It has an extensive and excellent garden, and is surrounded with forest trees of considerable magnitude; another proof that trees will grow upon the edge of the sea, though it must be allowed that the
channel here is narrow. Immediately behind the house of Rafay are the ruins of an ancient chapel, now used as the family burying-place.

Dr Johnion, in his Tour, expresses the highest satisfaction at the reception he met with when in Rafay from Mr Macleod.

RASCiANS, a poor oppressed people who dwelt on both sides of the Danube, and who, about the year 1594, being weary of the Turkish thraldom, first took 13 of their vessels upon that river; and then drawing together a body of fifteen thousand men between Buda and Belgrade, twice defeated the pâhâ of Temetwar with a body of fourteen thousand Turks. They afterwards took Backerek, four miles from Belgrade, and the castle of Otttad; then laying siege to that of Bocce, on the Teyhia, the old pâhâ of Temetwar marched to relieve it with eleven thousand men; but the Rascians encountering them, slew near ten thousand, and took 18 pieces of cannon. The consequence of this victory was the reduction of Weripsca and Luts. Then, sending to the archduke for aid and gunners, they offered to put themselves and their country under the emperor's protection.

RASOR-BILL. See ALCA, p. 4.
RASOR-FISH. See SOLEN.

RASTALL (John), a printer and miscellaneous writer, was born in London, probably about the end of the 15th century, and educated at Oxford. Returning from the university, he settled in the metropolis, and commenced printer; but was esteemed (says Wood) a profession fit for any scholar or ingenious man. He married the sister of Sir Thomas More, with whom, we are told, he was very intimate, and whose writings he read more than any other kind of their country. From the title-page of one of his books, he appears to have lived in Cheapside, at the sign of the mermaid. He died in the year 1536; and left two sons, William and John; the first of whom became a judge in queen Mary's reign, and the latter a justice of peace. This John Rastall, the subject of the present article, was a zealous Papist; but says, that he changed his religion before his death. He wrote; 1. Natura naturata. Pits calls it a copious (prodius) and ingenious comedy, deferving Europe, Asia, and Africa; with cuts. What fort of a comedy this was, is not easy to conceive. Probably it is a cosmographical description, written in dialogue, and therefore styled a comedy. 2. The tale of the people; the chronicles of diverse realmes, and most especially of the realm of England, brevly compiled and emprinted in Cheapside, at the sign of the mermaid, next Pollygate, cum præfation. fol. 3. Ecloga Johannis Rastall, 1542. Was one of the prohibited books in the reign of Henry VIII. 4. Legum Anglicarum vocabula explicata. French and Latin. Lond. 1567, 8vo. And some other works.

RASTADT, a town of Germany, in the circle of Stutia and munificat of Baden, with a handsome castle. It is remarkable for a treaty concluded here between the French and Imperialists in 1714; and is seated on the river Merg, near the Rhine. E. Long. 9. 14. N. Lat. 48. 52.

RASTENBURG, a fine city in Prussia, on the Gu- ber, surrounded with a wall, and since 1629 also with a rampart.

RAT, in zoology. See Mus. The following receipt is said to have been found effectual for the destruction of rats. Take of the seeds of flax, loo-wort, powdered or powdered, more or less as the occasion requires, one part; of oat-meal, three parts; mix them well, and make them up into a paste with honey. Lay pieces of it in the holes, and on the places where mice and rats frequent, and it will effectually kill or rid the place of thofe kind of vermin by their eating thereof.

Some time ago, the society for encouraging arts proposed a premium of 50 l. for a preparation capable of alluring or fascinating rats so that they might be taken alive. In consequence of this, a great number of new traps, &c. were invented; and the following methods of alluring the rats to a certain place were published.

One of those most easily and efficaciously practised is the trailing some pieces of their most favourite food, which should be of the kind that has the strongest scent, such as toasted cheese or boiled red herrings, from the holes or entrances of the closet to their receivies in every part of the house or contiguous building. At the extremities and in different parts of the course of this trailed track, small quantities of meal, or any other kind of their food, should be laid, to bring the greater number into the tracks, and to encourage them to pursue it to the place where they are intended to be taken: at that place, when time admits of it, a more plentiful repast is laid for them, and the trailing repeated for two or three nights.

Besides this trailing and way-baiting, some of the most expert of the rat-catchers have a shorter and perhaps more effectual method of bringing them together; which is the calling them, by making with a whistling noise as resembles their own calls; and by this means, with the assistance of the way-baits, they call them out of their holes, and lead them to the repast prepared for them at the place designed for taking them. But this is much more difficult to be practised than the art of trailing; for the learning the exact notes or cries of any kind of beasts or birds, so as to deceive them, is a peculiar talent which is seldom attained: though some persons have been known who could call together a great number of cats; and there was a man in London who could bring nightingales, when they were within hearing, about him, and even allure them to perch on his hand, so as to be taken.

In practicing either of these methods, of trailing or calling, great caution must be used by the operator to prevent the scent of his foot and body from being perceived; which is done by overpowering that scent by others of a stronger nature. In order to this, the feet are to be covered with cloths rubbed over with afsesida, or other strong-smelling substances; and even oil of rhodium is sometimes used for this purpose, but sparingly, on account of its dearness, though it has a very alluring as well as disgusting effect. If this caution of avoiding the scent of the operator's feet, near the track, and in the place where the rats are proposed to be collected, be not properly observed, it will very much obtrude the senses of the attempt to take them; for they are very shy of coming where the scent of human feet lies very fresh, as it intimates to their fagacious instinct the presence of human creatures, whom they naturally
naturally dread. To the abovementioned means of alluring by trailing, way-baiting, and calling, is added another of a very material efficacy, which is, the use of oil of rhodium, which, like the marum Syracicum in the wake of cats, has a very extraordinary fascinating power on these animals. This oil is extremely dear, and therefore sparingly used. It is exalted in a small quantity in the place, and at the entrance of it, where the rats are intended to be taken; particularly at the time when they are to be last brought together, in order to their destruction; and it is used also by smearing it on the surface of some of the implements used in taking by the method below described; and the effect it has in taking off their caution and dread, by the delight they appear to have in it, is very extraordinary.

It is usual, likewise, for the operator to disguise his figure as well as scent, which is done by putting on a suit of gown or cloak, of one colour, that hides the natural form, and makes him appear like a poll or some such inanimate thing; which habit much likewise be scented as above, to overpower the smell of his person; and besides this, he is to avoid all motion till he has cured the place by which they entered, all other ways of retreat being stopped, or barrel, placed between the place, and at the entrance of it, where the buildings are intended to be cleared of the rats that are not disturbed the night before are brought afterwards, either by their fellows, or the effects of the trailing, &c. and will not fail to come duly again, if they are not disturbed or molested. But many of the rat-catchers make shorter work, and content themselves with what can be brought together in one night or two; but this is never effectual, unless where the building is small and entire, and the rats but few in number.

The means of taking them, when they are brought together, are various. Some entice them into a very large bag, the mouth of which is sufficiently capacious to cover nearly the whole floor of the place where they are collected; which is done by smearing some vessel, placed in the middle of the bag, with oil of rhodium, and laying in the bag baits of food. This bag, which before lay flat on the ground with the mouth spread open, is to be suddenly closed when the rats are all in. Others drive or fright them, by flight noises or motions, into a bag of a long form, the mouth of which, after all the rats are come in, is drawn up to the opening of the place by which they entered, all other ways of retreat being secured. Others, again, intoxicate or poison them, by mixing with the repellant prepared for them the cocculus Indicus, or the nux vomica. They direct four ounces of the cocculus Indicus, with twelve ounces of oatmeal, and two ounces of treacle or honey, made into a moist paste with strong-beer: but if the nux vomica be used, a much less proportion will serve than is here given of the cocculus. Any similar composition of these drugs, with that kind of food the rats are most fond of, and which has a strong flavour, to hide that of the drugs, will equally well answer the end. If indeed the cocculus Indicus be well powdered, and infused in strong-beer for some time, at least half the quantity here directed will serve as well as the quantity before-mentioned. When the rats appear to be thoroughly intoxicated with the cocculus, or sick with the nux vomica, they may be taken with the hand, and put into a bag or cage, the door of the place being first drawn to, left those who have strength and sense remaining escape.
of the simplicity of the service in the royal dock-yards.
The British fleet is accordingly distributed into six rates, exclusive of the inferior vessels that usually attend on naval armaments; as sloops of war, armed ships, bomb-ketches, fire-ships and cutters, or schooners commanded by lieutenants.

Ships of the first rate mount 100 cannon, having 42-pounders on the lower deck, 24-pounders on the middle deck, 12-pounders on the upper deck, and 6-pounders on the quarter-deck and fore-castle. They are manned with 950 men, including their officers, seamen, marines, and servants.

In general, the ships of every rate, besides the captain, have the master, the boatswain, the surgeon, the chaplain, the purser, the surgeon, and the carpenter; all of whom, except the chaplain, have their mates or assistants, in which are comprehended the sail-maker, the master at arms, the armorer, the captain's clerk, the gunsmith, &c.

The number of other officers are always in proportion to the rate of the ship. Thus a first rate has six lieutenants, six master's mates, twenty-four midshipmen, and five surgeon's mates, who are considered as gentlemen: besides the following petty officers: quarter-masters and their mates, fourteen; boatswain's mates and yeomen, eight; gunner's mates and assistants, six; quarter-gunnners, twenty-five; carpenter's mates, two, besides fourteen assistants; with oneeward, and reward's mate to the purser.

If the dimensions of all ships of the same rate were equal, it would be the simplest and most perspicuous method to collect them into one point of view in a table: but as there is no invariable rule for the general dimensions, we must content ourselves with a few remarks on ships of each rate, so as to give a general idea of the difference between them.

The Victory, one of the last built of the British first rates, is 222 feet 6 inches in length, from the head to the stern; the length of her keel, 151 feet 3 inches; that of her gun-deck, or lower deck, 186 feet; her extreme breadth is 51 feet 10 inches; her depth in the hold, 21 feet 6 inches; her burden, 2162 tons; and her poop reaches 6 feet before the mizen-mast.

Ships of the second rate carry 90 guns upon three decks, of which those on the lower battery are 32-pounds; those on the middle, 18-pounds; on the upper deck, 12-pounds; and those on the quarter-deck, 6-pounds, which usually amount to four or five. Their complement of men is 750, in which there are six lieutenants, four master's mates, 24 midshipmen, and four surgeon's mates, 14 quarter-masters and their mates, eight boatswain's mates and yeomen, six gunner's mates and yeomen, with 22 quarter-gunners, two carpenter's mates, with 10 assistants, and one reward and reward's mate.

Ships of the third rate carry from 64 to 80 cannon, which are 32, 18, and 9-pounds. The 80-gun ships however begin to grow out of repute, and to give way to those of 74, 70, &c. which have only two whole batteries; whereas the former have three, with 28 guns planted on each, the cannon of their upper deck being the same as those on the quarter-deck and fore-castle of the latter, which are 9-pounds. The complement in a 74 is 650, and in a 64, 500 men; having, in peace, four lieutenants, but in war, five; and when an admiral is aboard, six. They have three master's mates, 16 midshipmen, three surgeon's mates, 10 quarter-masters and their mates, six boatswain's mates and yeomen, four gunner's mates and yeomen, with 18 quarter-gunniers, one carpenter's mate, with eight assistants, and one reward and reward's mate under the purser.

Ships of the fourth rate mount from 60 to 90 guns, upon two decks, and the quarter-deck. The lower tier is composed of 24-pounders, the upper tier, of 12- pounders, and the cannon on the quarter-deck and fore-castle are 6-pounds. The complement of a 90 gun ship is 350 men, in which there are three lieutenants, two master's mates, 10 midshipmen, two surgeon's mates, eight quarter-masters and their mates, four boatswain's mates and yeomen, one gunner's mate and one yeoman, with 12 quarter-gunniers, one carpenter's mate and six assistants, and a reward and reward's mate.

All vessels of war, under the fourth rate, are usually comprehended under the general name of frigates, and never appear in the line of battle. They are divided into the 5th and 6th rates; the former mounting from 40 to 32 guns, and the latter from 28 to 20. The largest of the fifth rate have two decks of cannon, the lower battery being of 18-pounds, and that of the upper deck of 9-pounds; but those of 36 and 32 guns have one complete deck of guns, mounting 12-pounds; besides the quarter-deck and fore-castle, which carry 6-pounds. The complement of a ship of 44 guns is 280 men; and that of a frigate of 36, 240 men. The frigate has three, and the second two, lieutenants; and both have two master's mates, six midshipmen, two surgeon's mates, six quarter-masters and their mates, two boatswain's mates, and one yeoman, one gunner's mate and one yeoman, with 10 or 12 quarter-gunniers, and one purser's reward.

Frigates of the sixth rate carry 9-pounds, those of 28 guns having 3-pounds on their quarter-deck, with 200 men for their complement; and those of 24, 160 men: the former has two lieutenants, the latter, one; and both have two master's mates, six midshipmen, one surgeon's mate, four quarter-masters and their mates, one boatswain's mate and one yeoman, one gunner's mate and one yeoman, with six or seven quarter-gunniers, and one purser's reward.

The sloops of war carry from 18 to 8 cannon, the largest of which have six-pounds; and the smallest, viz., those of 8 or 10 guns, four-pounds. Their officers are generally the same as in the 6th rate, with little variation; and their complements of men are from 120 to 60, in proportion to their force or magnitude.

N. B. Bomb-veils are on the same establishment as sloops; but fire-ships and hospital-ships are on that of fifth rates.

Nothing more evidently manifests the great improvement of the marine art, and the degree of perfection to which it has arrived in Britain, than the facility of managing their first rates; which were formerly esteemed incapable of government, unless in the most favourable weather of the summer.

Ships of the second rate, and those of the third, which have three decks, carry their sails remarkably well, and labour very little at sea. They are excellent in a general action, or in cannonading a fortress. Those of the third rate, which have two tiers, are fit for the
line of battle, to lead the convoys and squadrons of ships of war in action, and in general to suit the different exigencies of the naval service.

The fourth-rates may be employed on the same occasions as the third-rates, and may be also defined among the foreign colonies, or on expeditions of great distance; since these vessels are usually excellent for keeping and sustaining the sea.

Vessels of the fifth rate are too weak to suffer the shock of a line of battle; but they may be defined to lead the convoys of merchant ships, to protect the commerce in the colonies, to cruise in different stations, to accompany squadrons, or to be sent express with necessary intelligence and orders. The fame may be observed of the sixth rates.

The frigates, which mount from 28 to 38 guns upon one deck, with the quarter-deck, are extremely proper for cruising against privateers, or for short expeditions, being light, long, and usually excellent sailors.

RATEEN, or RATTEN, in commerce, a thick woolen fluff, quilled, woven on a loom with four treadles, like ferges and other fluffs that have the whale or quilling. There are some rateens dressed and prepared like cloths; others left simly in the hair, and others where the hair or knapris frizzed. Rateens are chiefly manufactured in France, Holland, and Italy, and are mostly used in linings. The frize is a fort of coarse rateen, and the drugget is a rateen half linen half woolen.

RATIFICATION, an act approving of and confirming something done by another in our name.

RATIO, in arithmetic and geometry, is that relation of homogeneous things which determines the quantity of one from the quantity of another, without the intervention of a third.

Two numbers, lines, or quantities, A and B, being proposed, their relation one to another may be considered under one of these two heads: 1. How much A exceeds B, or B exceeds A? And this is found by taking A from B, or B from A, and is called arithmetic reason, or ratio. 2. Or how many times, and parts of a time, A contains B, or B contains A? And this is called geometric reason or ratio; or, as Euclid defines it, it is the mutual halitude, or respect, of two magnitudes of the same kind, according to quantity; that is, as to how often the one contains, or is contained in, the other; and is found by dividing A by B, or B by A. And here note, that that quantity which is referred to another quantity is called the antecedent of the ratio: and that to which the other is referred is called the consequent of the ratio; as, in the ratio of A to B, A is the antecedent, and B the consequent. Therefore any quantity, as antecedent, divided by any quantity as a consequent, gives the ratio of that antecedent to the consequent.

Thus the ratio of A to B is \( \frac{A}{B} \); but the ratio of B to A is \( \frac{B}{A} \); and, in numbers, the ratio of 12 to 4 is \( \frac{12}{4} = 3 \), or triple; but the ratio of 4 to 12 is \( \frac{4}{12} = \frac{1}{3} \), or subtriple.

And here note, that the quantities thus compared must be of the same kind; that is, such as by multiplication may be made to exceed one the other, or as these quantities are said to have a ratio between them, which, being multiplied, may be made to exceed one another. Thus a line, how short soever, may be multiplied, that is, produced so long as to exceed any given right line; and consequently these may be compared together, and the ratio expressed; but as a line can never, by any multiplication whatever, be made to have breadth, that is, to be made equal to a superficies, how small soever; these can therefore never be compared together, and consequently have no ratio or respect one to another, according to quantity; that is, as to how often the one contains, or is contained in, the other. See QUANTITY.

RATION, or Ratio, in the army, a portion of ammunition, bread, drink, and forage, distributed to each soldier in the army, for his daily subsistence, &c. The horse have rations of hay and oats when they cannot go out to forage. The rations of bread are regulated by weight. The ordinary ration of a foot soldier is a pound and a half of bread per day. The officers have several rations according to their quality and the number of attendants they are obliged to keep.

When the ration is augmented on occasion of rejoicing it is called a double ration. The ship's crews have also their rations or allowance of billet, pulle, and water, proportioned according to their rank.

RATIONALE, a solution or account of the principles of some opinion, action, hypothesis, phenomenon, or the like.

RATIBOR, a town of Germany, in Silesia, and capital of a duchy of the same name, with a castle. It has been twice taken by the Swedes, and is seated on the river Oder, in a country fertile in corn and fruits, 15 miles north-east of Troppau, and 142 east of Prague. E. Long. 22. 24. N. Lat. 50. 14.

RATISEN, an ancient, large, rich, hanseatic, and strong city of Germany, in Bavaria, free and imperial, with a bishop's see, whose bishop is a prince of the empire. It is called by the Germans Regensburg, from the river Regens, which runs under a fine stone bridge, and throws itself into the Danube below the city; and the rivers Luber and Lander, which runs under a fine stone bridge, and throws itself into the Danube below the city; and the river Regens, which runs under a fine stone bridge, and throws itself into the Danube below the city. The French call it Ratibor, in imitation of the Latins; it hath formerly been subject to the kings of Bavaria, who made it the place of their residence; but it was declared free by the emperor Frederick I., which does not however, hinder the dukes of Bavaria from dividing the town with the citizens, according to an agreement between them. These princes have also the criminal jurisdiction, for which the magistrates of the city pay them homage. It is the first city of the bench of the empire; and contains at present within its walls five different free states of the empire; namely, the bishop, the abbot of St. Emmeran, the abbots of the Low and High Munster, and the city. The inhabitants of Ratibor have the privilege not to be cited before other tribunals, unless for actions above 400 florins. The senate is composed of 17 members, and there is a council of 10, which is charged with the government of the state. The citizens have a right to elect a chief, who judges of the affairs of police. The catholics have the exercise of their religion in the cathedral church, and others, and
RAV [15] RAV

Ratlines, or, as the sailors call them ratlines, those lines which make the ladder steps to go up the masts and puttocks, hence called the ratlines of the frigates.

RATOLFZEL, a strong town of Germany, in Suabia, near the west end of the lake Constance. It is seated on the part of it called Bedenfe, and belongs to the house of Austria, who took it from the duke of Wirtemburg, after the battle of Nordlingen. It is twelve miles west of the city of Constance. It is defended by the impregnable castle of Hohen DweL, on an inaccessible hill in the middle of a plain, the rock of which is flint, so that a few men may hold it out against an army.

RATZBURG, or Ratzburg, an ancient town of Germany, in the circle of Lower Saxony, and in the duchy of Lawenburg, with a bishop's see and a castle. The town depends on the duchy of Lawenburg, and the cathedral church on that of Ratzburg. It is seated on an eminence, and almost surrounded with a lake twenty-five miles in length and three in breadth. The Duke of Lawenburg feized and fortified it in 1689, and the king of Denmark took it in 1693; but it was dismantled, and restored in 1700 to the Duke, who re-fortified it. This town has been frequently pillaged, particularly in 1552, by Francis duke of Saxe Lawenburg, because the canons refused to elect his son Magnus their bishop. It lies nine miles south of Lubeck. This place is noted for its excellent beer.

RAVEN, in ornithology. See Corvus.

RAVENNA, or Corvo marino of Kongo in Africa, in ichthyology, is about six feet long, and big in proportion; but the most singular circumstance appertaining to this creature is the bone found in its head, to which the natives ascribe some medicinal virtues, and the delicate taste of its hard Roe, which is still much admired, when dried in the sun, and becomes as hard as a bone.

RAVENGLAS, a town of Cumberland in England, situated between the rivers Irk, and Elk, which, with the sea, encompass three parts of it. It is a well built place, and has a good road for shipping, which brings it some trade.

RAVENNA, capital of the city. The seat of the western or Roman Empire was by Honorius translated to Ravenna about the year 404, and hence the country in which it stood was called Romania, in the p.e.'s territory. It had a very flourishing trade till the tide withdrew two miles from it, which has been a great detriment. The fortifications are of little importance, and the citadel is gone to ruin. It is now most remarkable for the excellent wine produced in its neighborhood. The manufactory of Theodoric is still to be seen, remarkable for being covered by a single stone 28 feet in diameter and 13 thick. It was at Ravenna that the duke of Normandy fell, after having gained a most decisive victory over the confederate army, in 1511.

RAVENSWBURG, a county of Germany, in Welfphalia, bounded on the north by the bishoprics of Osnaburg and Minden, on the east by Lengow, on the south by the bishopric of Paderborn, and on the west by that of Munster. It belongs to the king of Prussia, and has its name from the castle of Ravenburg.

RAVENSWBURG, a free and imperial town of Germany, in Alsace, in the circle of Suabia. It is well built, and the public structures are handsome. The inhabitants are partly Protestants and partly Papists. It is seated on the river Chems. In E. Long. 9. 46. N. Lat. 47. 44.

RAVET, an insect shaped like a may-bug, or cockchafer (see Scarabeus), with which the island of Guadaloupe is much pestered. It has a stinking smell, preys upon paper, books, and furniture, and whatever they
they do not gnaw is discoloured by their ordure. These mally infects, which are very numerous, and appear chiefly by night, would be intolerable, were it not for a large spider, some of them as long as a man's fist, which intangles them in its web, and otherwise purifies them. On which account the inhabitants of the island are very careful of these spiders.

RAVILLIAC (Francis), the infamous assassin of Henry IV. of France, was a native of Angouleme, and at the time of his execution he was about one or two and thirty years of age. See France, n° 146, and Henry IV. of France. Ravilliac was the son of parents who lived upon alms. His father was that sort of inferior retainer to the law, to which the vulgar gave the name of a porter, and at the time of his death was living, and might recover, he was said, he would do it, if it were to do what he had been bid by the seditionary sermons and books of the Jesuits, whom Henry, rather out of fear than against his conscience, sacrificed that monarch to their old resentments; the execution was to be dragged to pieces by four horses, one of those that were brought appearing to be but weak, one of thespectators offered his own, with which the criminal was much moved: he is said to have then made a confession, which was so written by the greiller Voisin, that not so much as one word of it could ever be read. He was very earnest for absolution, which his confessor refused, unless he would reveal his accomplices; "Give me conditionally (said he); upon condition that I have told the truth," which they did. His body was so robust, that it resisted the force of the horses; and the executioner was at length obliged to cut him into quarters, which the people dragged through the streets. The house in which he was born was demolished; and a column of infancy erected; his father and mother were banished from Angouleme, and ordered to quit the kingdom upon pain of being hanged, if they returned, without any form of process; his brothers, sisters, uncles, and other relations, were commanded to lay aside the name of Ravilliac, and to assume some other. Such was the fate of this execrable monster, who, according to his own account, suffered himself to be impelled to such a fact by the frequent sermons and addresses of the Jesuits, whom Henry, rather out of fear than love, had recalled and cared for, and to whom he had bequeathed his heart.

Neither the dying words of Ravilliac, nor so much of his process as was published, were credited by his contemporaries. Regal the historian says, that there were two different opinions concerning this affidavitation; one, that it was conducd by some grandes, who sacrificed that monarch to their old resentments; the other, that it was done by the eminaries of the Spaniards. Letters from Brusells, Antwerp, Mechlin, and other places, were received before the 15th of May, with a report of the king's death. Though nothing occurs in the examinations of Ravilliac that were first published, in reference to his journeys to Naples and other places; yet as these are set down as certain truths by good authors, so there are probable grounds to believe that they were not fictitious. It appears from Ralph Winwood's Memorials, that Ravilliac had been not long before at Brusells. Amongst other circumstances that created a very great doubt, whether the assassin spoke truth, were the things found in his pockets at the time he was seized; amongst which was a chaplet, the figure of a heart made in cotton, in the centre of which he said there was a bit of the true Cross, but when cut there was none, which he affirmed was given him by a canon at Angouleme, a piece of paper with the arms of France painted upon it, another full of characters, and a third containing verses for the meditation of a criminal going to execution. The provost of Pluviers, or Petiviers, in Beauce, about six miles from Paris, had laid openly on the day that Henry IV. was murdered, "This day the king is either faint or dangerously wounded," After the king's death was known, he was seized and sent prisoner to Paris; but, before he was examined, he was found hanged in the streets of his drawers. His body was, notwithstanding, hung up by the heels on the common gibbet on the 19th of June. What increased the suspicion grounded...
grounded on this man’s end, was his having two sons
Johnson, and his being a dependent on the family of
Monfort d’Entraguues.

R.A.U.N., upon the river Miza, a town of some
strength, remarkable for a bloody skirmish between
the Prussians and Austrians, in August 1744. The
king of Prussia, intending to get possession of Boraun, sent
thither six battalions, with eight cannon, and 800 hussars;
but General Feliciuz being there with a great
party of his corps, and M. Luchefchi with 1000 horse,
they not only repulsed the Prussians, but attacked them
in their turn, and, after a warm dispute, obliged them
to retire with considerable loss.

R.A.U.R.I.C.U.M (anc. geogr.), a town of the Raurei,
situated over against Abnoba, a mountain from which
the Danube takes its rise. A Roman colony led by
L. M. Antonius Planetus the scholar and friend of Cicero:
called Colonia Raurensis (Pliny), Raureia (Inscription),
Aquilia Raurensium. The town was destroyed in Ju­lian’s time. It is now commonly called Augsburg, a village
greatly decayed from what it formerly was. It is situa­ted on the Rhine, distant about two hours to the east of
Basel. The country is now the canton of Basel.

R.A.Y (John), a celebrated botanist, was the son of
Mr Roger Ray a blacksmith, and was born at Black
Notley in Essex in 1628. He received the first rudimen­
t s of learning at the grammar-school at Braintree;
and in 1644 was admitted into Catherine hall in
Cambridge, from whence he afterwards removed to
Trinity college in that university. He took the de­gree
of master of arts, and became at length a fellow of the
college; but his intense application to his studies having injured his health, he was obliged at
his leisure hours to exercise himself by riding or walk­ing in the fields, which led him to the study of plants.
He noted from Johnson, Parkinson, and the Physiologia
Britannica, the places where curious plants grew; and
in 1658 rode from Cambridge to the city of Chester,
from whence he went into North Wales, visiting many
places, and among others the famous hill of Snowdon;
returning by Shrewsbury and Gloucester. In 1660 he
published his Catalogus Plantarum circa Cantabrigen­num nat­centum, and the same year was ordained deacon and
priest. In 1661 he accompanied Francis Willoughby,
Esq.; and others in search of plants and other natural
curiosities, in the north of England and Scotland; and
the next year made a western tour from Chester, and
through Wales to Cornwall, Devonshire, Dorsetshire,
Hampshire, Wiltshire, and other counties. He after­wards travelled with Mr Willoughby and other gen­tlemen through Holland, Germany, Italy, France, &c.
took several tours in England, and was admitted fel­low of the Royal Society. In 1672, his intimate and
beloved friend Mr Willoughby died in the 37th year of
his age, at Middleton Hall, his seat in Yorkshire;
“to the infinite and unspeakable loss and grief (says Mr
Ray) of myself, his friends, and all good men.” There
having been the closest and sincerest friendship between
Mr Willoughby and Mr Ray, who were men of simi­lar
natures and tastes, from the time of their being
fellow collegians, Mr Willoughby not only confided in
Mr Ray, in his lifetime, but also at his death:
for he made him one of the executors of his will, and
charged him with the education of his son Francis and
Thomas, leaving him also for life 60l. per annum.

The eldest of these young gentlemen not being four
years of age, Mr Ray, as a faithful trustee, betook
himself to the instruction of them; and for their tile
composed his Nomenclator Clasius, which was publish­ed
this very year, 1672. Francis the eldest dying be­fore he was of age, the younger became Lord Middle­ton. Not many months after the death of Mr Wil­loughby, Mr Ray lost another of his best friends, 
bishop Wilkins; whom he visited in London the 18th of
November 1672, and found near expiring by a total
suppression of urine for eight days. As it is natural
for the mind, when it is hurt in one part, to seek
relief from another; so Mr Ray, having lost some of his
best friends, and being in a manner left delitute, con­ceived thoughts of marriage; and accordingly, in June
1673, did actually marry a gentlewoman of about 20
years of age, the daughter of Mr Oakly of Launton
in Oxfordshire. Towards the end of this year, came
forth his “Observations Topographical, Moral, &c.”
made in foreign countries; to which was added his
Catalogus Stirpiurn in exteri regionibus observatum; and
about the same time, his Collection of unfual or local
English words, which he had gathered up in his travels
through the counties of England. After having pub­lished many books on subjects foreign to his profession,
his at length resolved to publish in the character of a
divine, as well as in that of a natural philosopher; in
which view he published his excellent demonstration of
the being and attributes of God, entitled The Wisdom
of God manifested in the Works of the Creation, 8vo, 1697.
The rudiments of this work were read in some college
lectures; and another collection of the same kind he
enlarged and published under the title of Three Physio­logical Discourses, concerning the Chaos, Deluge, and
Dissolution of the World, 8vo, 1692. He died in 1705.
He was modest, affable, and communicative; and was
distinguished by his probity, charity, forbearance, and piety.
He wrote a great number of works; the principal of
which, besides those already mentioned, are, 1. Cata­
logus Plantarum Anglicus. 2. Dictionarium Trilingue fo­
cundum locos communcs. 3. Flora Britannica, Specier­
haten us editis, aliique inferius multas noviter inventas et
descriptas complectens, 3 vols. 4. Methodus Plantarum
nova, cum Tabulis, 8vo, and several other works on
plants. 6. Synopsis Methodica Animalium quadruped­
um et Serpantin genus, 8vo. 6. Synopsis Methodica A­
imam et Pisces. 7. Flora Inferiorum, opus posthumum.

R.A.V. in optics, a beam of light emitted from a
radiant or luminous body. See Light and Optics.

Inflected Rays, those rays of light which, on their
near approach to the edges of bodies, in passing by them,
are bent out of their course, being turned either from
the body or towards it. This property of the rays of
light is generally termed diffraction by foreigners, and Dr
Hooke sometimes called it deflection.

Reflected Rays, those rays of light which, after fail­ing
upon the body, do not go beyond the surface of
it, but are thrown back again.

Refraated Rays, those rays of light which, after fail­ing
upon any medium, enter its surface, being bent ei­ther
towards or from a perpendicular to the point on
which they fell.
RAZOR, a well-known instrument, used by surgeons, barbers, &c., for shaving off the hair from various parts of the body.—As having to many people is a most painful operation, cutlers in different countries have long applied their skill to remove that inconvenience. Some have invented foops of a peculiar kind to make the operation more easy, and some have invented irrops. With regard to razors, some artists have succeeded rather by accident than from any fixed principle; and therefore we have found great inequality in the goodness of razors made by the same artist.

A correspondent affures us, that he has for 40 years paft been at much pains to find out razors made by the best makers both in England and Scotland, and was fortunate enough, about 22 years ago, to discover a kind made by a Scotchman of the name of Logan, which he called magnetic razors, because they were directed to be touched with an artificial magnet before using. These, our friend affures us, are most excellent razors, and he has used them for upwards of 20 years. He says likewise that they continue in good order, without requiring to be ground; but that the great drawback for that on their being generally used, is the price, which is higher than the price of above Pall Mall, after numberless experiments, in the course of perfection, mankind soon became pretty well acquainted with them, and this in different degrees, according to their discernment, sensibility, &c. experience shows us that these latter repeaters (as we call them) might conceive and use a manner of delivery which, though less characteristic perhaps, would on the whole be no way inferior to the first, as to the common natural expression proper for their situation. It appears, therefore, that repeaters of every degree may be esteemed upon a level as to animation, and that our twofold distinction above contains accurately enough the whole variety of ordinary delivery;—we say ordinary, because

There is another very peculiar kind of delivery sometimes used in the person of a repeater, of which it will in this place be necessary to take some notice. What we mean here is mimicry; an accomplishment which, when perfectly and properly displayed, never fails of yielding a high degree of pleasure. But since this form of mimicry results from the principle of imitative respecting manner, and not from the purport of the matter communicated; since, comparatively speaking, it is only attainable by a few persons, and practiced only on particular occasions;—on these accounts it must be refused a place among the modes of useful delivery taught us by general nature, and esteemed a qualification purely anomalous.

These distinctions with regard to a speaker's situation of mind premised, let us see to which of them an author and his reader may most properly be referred, and how they are circumscribed with regard to one another.

The matter of all books is, either what the author says in his own person, or an acknowledged recital of the words of others; hence an author may be esteemed both an original speaker and a repeater, according as what he writes is of the first or second kind. Now a reader must be supposed either actually to perforate the author, or one whose office is barely to communicate what he has said to an auditor. But in the first of these suppositions he would, in the delivery of what is the author's own, evidently commence mimic; which being, as above
Reading above observed, a character not acknowledged by general nature in this department, ought to be rejected as generally improper. The other supposition therefore must be accounted right; and then, as to the whole matter of the book, the reader is found to be exactly in the situation of a reporter, save that he takes what he delivers from the page before him instead of his memory. It follows then, in proof of our initial proposition, that, if we are directed by nature and propriety, the manner of our delivery in reading ought to be interior in warmth and energy to what we should use, were the language before us the spontaneous effusions of our own hearts in the circumstances of those out of whose mouths it is supposed to proceed.

Evident as the purport of this reasoning is, it has not so much as been glanced at by the writers on the subject we are now entered upon, or any of its kindred ones; which has occasioned a manifest want of accuracy in several of their rules and observations. Among the rest, this precept has been long reverberated from author to author as a perfect standard for propriety in reading. "Deliver yourselves in the same manner you would do, were the matter your own original sentiments uttered directly from the heart." As all kinds of delivery must have many things in common, the rule will in many articles be undoubtedly right; but, from what has been said above, it must be as certainly faulty in respect to several others; as it is certain nature never confounds by like signs two things so very different, as a copy and an original, an emanation darted immediately from the fun, and its weaker appearance in the lunar reflection.

The precepts we have to offer for improving the abovementioned rule, shall be delivered under the heads of accent, emphasis, modulation, expression, pauses, &c.

I. Accent. In attending to the affections of the voice when we speak, it is easy to observe, that, independent of any other consideration, one part of it differs from another, in force, energy, or force of utterance. If words we find one syllable differing from another with respect to this mode; and in sentences one or more words as frequently vary from the rest in a similar manner. This stress with regard to syllables is called accent, and contributes greatly to the variety and harmony of language. Respecting words, it is termed emphasis; and its chief office is to affilit the sense, force, or peripetieity of the sentence—of which more under the next head.

"Accent (as described in the Lectures on Elocution) is made by us two ways: either by dwelling longer upon one syllable than the rest, or by giving it a firther percussive of the voice in utterance. Of the first of these we have influences in the words glory, father, list, of the last in battle, habbit, lor'row. So that accent with us is not referred to tune, but to time, to quantity, not quality; to the more equable or precipitate motion of the voice, not to the variation of the notes or inflexions."

In theoretic declaration, in order to give it more pomp and folemunity, it is usual to dwell longer than common upon the unaccented syllables; and the author now quoted has endeavored to prove (p. 51. 54.) the practice faulty, and to show (p. 55.) that "though it (i.e. true folemunity) may demand a flower utterance than usual, yet (it) requires that the same proportion in point of quantity be observed in the syllables, as there is in musical notes when the same tune is played in quicker and flower time." But that this deviation from ordinary speech is not a fault, as our author affirms; may, that on the contrary it is a real beauty when kept under proper regulation, the following observations it is hoped will sufficiently prove.

(I.) It is a truth of the most obvious nature, that those things which on their application to their proper senses have a power of raising in us certain ideas and emotions, are ever differently modified in their constituent parts when different effects are produced in the mind: and also (II.) that, within proper bounds, were we to supposethee constituent parts to be proportionally increased or diminished as to quantity, this effect would still be the same as to quality.—For instance: The different ideas of strength, swiftness, &c. which are raised in us by the same species of animals, is owing to the different form of their corresponding parts: the different effects of music on the passions, to the different sized and movements of the melody: and the different expressions of human speech, to a difference in tone, speed, &c. of the voice. And these peculiar effects would still remain the same, were we to supposes the animals above alluded to, to be greater or lesser, within their proper bounds; the movement of the music quicker or slower, provided it did not palpably interfere with that of some other species; and the pitch of the voice higher or lower, if not carried out of the limits in which it is observed on similar occasions naturally to move. Farther (III.) since, respecting the emotions more especially, there are no rules to determine a priori what effect any particular attribute or modification of an object will have upon a percipient, our knowledge of this kind must evidently be gained from experience. Lastly, (IV.) in every art imitating nature we are pleased to see the characteristic members of the pattern heightened a little farther than perhaps it ever was carried in any real example, provided it be not bordering upon some ludicrous and disagreeable provinces of excess.

Now for the application of these premises.—To keep pace and be confident with the dignity of the tragic muse, the delivery of her language should necessarily be dignified; and this it is plain from observation (I.) cannot be accomplished otherwise than by something different in the manner of it from that of ordinary speech; since dignity is essentially different from familiarity. But how must we discover this different manner? By attending to its nature: and in this case he tells us, that besides using a slower delivery, and greater distinctness of the words (which every thing merely grave requires, and gravity is a concomitant of dignity, though notions, of emotion), we must dwell a little longer upon the unaccented syllables than we do in common. As to what our author observes in the above quotation, of dignity's only requiring a slower utterance than ordinary, while the proportion of the syllables as to quantity continues the same; it is apprehended the remark (II.) respecting quickness and slowness of movement, will show it to be not altogether true. For since the delivery is not altered in form, its expression must be still of the same kind, and perhaps what may be rightly suggested by the term greatly familiar.
But something farther may be yet said in defence of this artificial delivery, as our author calls it. Is not the movement of any thing, of whatever species, when dignified or solemn, in general of an equal and deliberate nature (as in the minute, the military step, &c.)? And in theatrical declamation, is not the propensity to introduce this equableness so strong, that it is almost impossible to avoid it wholly, were we ever so determined to do it? If these two queries be answered in the affirmative (as we are persuaded they will), while the first supports our argument for the propriety of the manner of delivery in question, the second discovers a kind of necessity for it. And that this manner may be carried a little farther in quantity on the stage than is usual in real life, the principle (IV.) of heightening nature will justify, provided fashion (which has ever something to do in these articles) give it a sanction; for the precise quantity of several heightenings may be varied by this great legislator almost at will.

II. Emphaxis. As emphasis is not a thing annexed to particular words, as accent is to syllables, but owes its rise chiefly to the meaning of a passage, and must therefore vary its feat according as that meaning varies, it will be necessary to explain a little farther the general idea given of it above,

Of man’s first disobedience, and the fruit
Of that forbidden tree, whose mortal taste
Brought death into the world, and all our woes, &c.
Sing heavily mute, &c.

Supposing, in reference to the above well-known lines, that originally other beings, besides men, had disobeyed the commands of the Almighty, and that the circumstance were well known to us, there would fall an emphasis upon the word man’s in the first line, and hence it would be read thus:

Of man’s first disobedience, and the fruit, &c.

But if it were a notorious truth, that mankind had transgressed in a peculiar manner more than once, the emphasis would fall on first, and the line be read,

Of man’s first disobedience, and the fruit, &c.

Again, admitting death (as was really the case) to have been an unheard-of and dreadful punishment brought upon man in consequence of his transgression; on that supposition the third line would be read,

Brought death into the world, &c.

But if we were to suppose mankind knew there was such an evil as death in other regions, though the place they inhabited had been free from it till their transgression; the line would run thus,

Brought death into the world, &c.

Now from a proper delivery of the above lines, with regard to any one of the suppositions we have chosen, out of several others that might in the same manner have been imagined, it will appear that the emphasis they illustrate is effected by a manifest delay in the pronunciation, and a tone something fuller and louder than is used in ordinary; and that its office is chiefly to determine the meaning of a sentence with reference to something said before, presupposed by the author as general knowledge, or in order to remove an ambiguity where a passage is capable of having more senses given it than one.

But, supposing in the above example, that none of the senses there pointed out were precisely the true one, and that the meaning of the lines were no other than what is obviously suggested by the simple construction; in that case it may be asked, if in reading them there should be no word dignified with the emphatical accompaniments above described?—The answer is, Not one with an emphasis of the same kind as that we have just been illustrating; yet it is nevertheless true, that on hearing these lines well read, we shall find some words distinguished from the rest by a manner of delivery bordering a little upon it (a). And these words will in general be such as seem the most important in the sentence, or on other accounts to merit this distinction. But as at best it only enforces, graces, or elevates, and not fixes the meaning of any passage, and even caprice and fashion (b) have often a hand in determining its place and magnitude, it cannot properly be reckoned an essential of delivery. However, it is of too much moment to be neglected by those who would wish to be good readers; and, for the sake of distinction, we may not

(a) The following lines will illustrate both these kinds of stresses: For, to convey their right meaning, the word any is evidently to be pronounced louder and fuller than those with the accents over them.

Get wealth and place, if possible with grace;

If not, by any means get wealth and place. Pope.

This couplet is accented in the manner we find it in the Essay on Eloquence by Mason. And if, according to the judgment of this author, the words thus distinguished are to have an emphatical stress, it must be of the inferior kind above mentioned, and which a little farther on we call emphasis of force; while the word any in a different type alone possesses the other sort of energy, and which is there contradistinguished by the term emphasis of sense.

(b) Among a number of people who have had proper opportunities of learning to read in the best manner it is now taught, it would be difficult to find two, who, in a given instance, would use the emphasis of force alike, either as to place or quantity. Nay some scarce use any at all, and others will scruple to carry it much beyond any thing we have a precedent for in common discourse; and even now and then throw it upon words for very trifling in themselves, that it is evident they do it with no other view, than for the sake of the variety it gives to the modulation.—This practice, like the introduction of discords into music, may without doubt be indulged now and then, but were it too frequent, the capital intent of these energies would manifestly either be destroyed or rendered dubious.
Reading. not unaptly denominate both the kinds of energies in question, by the terms emphasis of sense, and emphasis of force (c).

Now from the above account of these two species of emphasis it will appear, that in reading, as in speaking, the first of them must be determined entirely by the sense of the passage, and always made alike: But as to the other, sense alone seems to have a right of fixing its situation and quantity."—Farther: Since the more essential of these two energies is solely the work of nature (as appears by its being constantly found in the common conversation of people of all kinds of capacities and degrees of knowledge), and the most ignorant person never fails of using it rightly in the effusions of his own heart, it happens very luckily, and ought always to be remembered, that provided we understand what we read, and give way to the dictates of our own feeling, the emphasis of sense can scarce ever avoid falling spontaneously upon its proper place.

Here it will be necessary to lay something by way of reply to a question which will naturally occur to the agreeable, and to what is there called modulation peculiar to every country, yet which in some measure resembles the movement of a tune. These sounds, however, are evidently nothing like so much varied as those that are strictly musical; and we have attempted to show in the preceding chapter, that, besides this, they have an essential difference in themselves. Nevertheless, from the general similitude of these two articles, they possess several terms in common; and the particular we have now to examine is in both of them called modulation. This affectation of the voice, being totally arbitrary, is differently characterized in different parts of the world; and, through the power of custom, every place is inclined to think their own the only one natural and agreeable, and the rest affected with some barbarous twang or unseemly variation (e). Yet it may be observed, however, that though there is a general uniform call or fashion of modulation peculiar to every country, yet it by no means follows, that there is or can be any thing fixed in its application to particular passages; and therefore we find different people will, in any given instance, use modulations something different, and nevertheless be each of them equally agreeable.

But, quitting these general remarks, we shall (as our purpose requires it) consider the properties of modulation a little more minutely.

First, then, we may observe, that, in speaking, there is a particular found (or key-note, as it is often called) in which the modulation for the most part runs, and to which

(c) The first of these terms answers to the simple emphasis described in the Lectures on Elocution, and the second nearly to what is there called complex. The difference lies in this. Under complex emphasis the author seems (for he is far from being clear in this article) to include the tones simply considered of all the emotions of the mind; as well the tender and languid, as the forcible and exciting. Our term is intended to be confined to such modes of expression alone as are marked with an apparent force or increase of the voice.

(p) The author of the Introduction to the Art of Reading, not allowing that there is any variation of tone, as to high and low, in the delivery of a complete period or sentence, places modulation solely in the diversification of the key-note and the variety of syllables, as to long or short, suave or sour, strong or weak, and loud or soft. As we are of a different opinion, our idea of modulation is confined purely to harmonious inflexions of voice. These qualities of words, it is true, add greatly both to the force and beauty of delivery; yet, since some of them are fixed and not arbitrary (as long and short), and the others (of suave and sour, strong and weak, loud and soft), may be considered as modes of expression which do not affect the modulation as to tones, it will agree best with our plan to illicit their properties as respectively belonging to the established laws of pronunciation and the imitative branch of expression mentioned in the end of the ensuing head.

(s) From what accounts we have remaining of the modulation of the ancients, it appears to have been highly ornamented, and apparently something not unlike our modern recitative; particularly that of their theoric declamation was musick in the strictest sense, and accompanied with instruments. In the course of time and the progress of refinement, this modulation become gradually more and more simple, till it has now loft the genius of music, and is entirely regulated by taste. At home here, every one has heard the fung-fung cant, as it is called, of

Ti ti dum dum, ti ti dum dum de,
Ti dum ti dum, ti ti dum dum de;

which, though difficult now to all but mere rustics on account of its being out of fashion, was very probably the favourite modulation in which heroic verses were recited by our ancestors. So fluctuating are the taste and practices of mankind! But whether the power of language over the passions has received any advantage from the change just mentioned, will appear at least very doubtful, when we recollect the stories of its former triumphs, and the inherent charms of musical sounds.
Reading which its occasional inflexions, either above or below, may in some respects be conceived to have a reference, like that which common music has to its key-note. Yet there is this difference between the two kinds of modulation, that whereas the first always concludes in the key-note, the other frequently concludes a little below it (r). This key-note, in speaking, is generally the found given at the outset of every complete sentence or period; and it may be observed on some occasions to vary its pitch through the limits of a musical interval of a considerable magnitude. The tones, that fall a little lower than the key at the close of a sentence or period, are called cadences. These cadences, if we are accurate in our diffusions, will, with respect to their offices, be found of two kinds; though they meet so frequently together, that it may be beth to conceive them only as anwilling a double purpose. One of these offices is to assist the enfe, and the other to decorate the modulation. An account of the first may be seen in the section on Paujes; and the latter will be found to flow itself pretty frequently in every thing grave and plaintive, or in poetic description and other highly convenient some things differ from speaking; and the particular epithets signify or ornamental. We have already observed, that reading should in some things differ from speaking; and the particular under consideration seems to be one which ought to vary a little in these arts. For,

Modulation in reading serves a twofold purpose. At the same time that it gives pleasure to the ear on the principles of harmony, it contributes through that medium to preserve the attention. And since written language (when not purely dramatical) is in general more elegant in its construction, and musical in its periods, than the oral one; and since many interesting particulars are wanting in reading, which are present in speaking, that contribute greatly to fix the regard of the hearers; it seems reasonable, in order to do justice to the language, and in part to supply the inscriptions of attention just alluded to, that in the former of these two articles a modulation should be used something more harmonious and artificial than in the latter. Agreeably to this reasoning, it is believed, we shall find every reader, on a narrow examination, adopt more or less a modulation thus ornamented: though, after all, it must be acknowledged there are better grounds to believe, that the practice has been hitherto directed intuitively by nature, than that it was discovered by the inductions of reason. We shall conclude this head with a rule for modulation in reading. "In every thing dramatic, colloquial, or of simple narrative, let your modulation be the same as in speaking; but when the subject is flowery, solemn, or dignified, add something to its harmony, diversify the key-note, and increase the frequency of cadences in proportion to the merit of the composition."

It will readily be seen, that the precepts here drawn from a comparison between speaking and reading, would be very inadequate were they left destitute of the assistance of taste, and the opportunity of frequently hearing and imitating masterly readers. And indeed, to these two great auxiliaries we might very properly have referred the whole matter at once, as capable of giving sufficient directions, had we not remembered that our plan required us to found several of our rules as much on the principles of a philosophical analysis, as on those more familiar ones which will be found of greater efficacy in real practice.

IV. Expression. 1. There is no composition in music, expression however perfect as to key and melody, but, in order as to the tones of the voice, to do justice to the subject and ideas of the author, will require, in the performing, something more than an express adherence to time and time. This something is of a nature, too, which perhaps can never be adequately pointed out by any thing graphic, and results entirely from the taste and feeling of the performer. It is that which chiefly gives music its power over the passions, and characterizes its notes with what we mean by the words sweet, harsh, dull, lively, plaintive, joyous, &c. for it is evident every found, considered abstractedly without any regard to the movement, or high and low, may be thus modified. In practical music, this commanding particular is called expression; and as we find certain tones analogous to it frequently coalescing with the modulation of the voice, which indicate our passions and affections (thereby more particularly pointing out the meaning of what we say), the term is usually applied in the same sense to speaking and reading.

These tones are not altogether peculiar to man.—Every animal, that is not dumb, has a power of making several of them. And from their being able, unadvised by words, to manifest and raise their kindred emotions, they constitute a kind of language of themselves. In the language of the heart man is eminently conversant; for we not only understand it in one another, but also in many of the inferior creatures subjected by providence to our service.

The expression here illustrated is one of the most essential articles in good reading, since it not only gives a finilhing to the sentence, but on the principles of sympathy and antipathy, has also a peculiar efficacy in engaging the heart. It is likewise an article of most difficult attainment; as it appears from what follows, that a masterly reader ought not only to be able to incorporate it with the modulation properly as to quality, but in any degree as to quantity.

Every thing written being a proper imitation of speech, expressive reading must occasionally partake of all

(r) As musical sounds have always an harmonical reference to a key or fundamental note, and to which the mind is still secretly attending, no piece of music would appear perfect, that did not close in it; and so naturally put an end to expectation. But as the tones used in speech are not musical, and therefore cannot refer harmonically to any other sound; there can be no necessity that this terminating sound (and which we immediately below term the cadence) should either be used at all, or follow any particular law as to form, &c. farther than what is imposed by taste and custom.
Reading. all its tones. But from what was said above, of the

difference between reading and speaking, it follows,

that these signs of the emotions should be less strongly

characterized in the former article than in the latter.

Again, as several of these tones of expression are in

themselves agreeable to the mind, and raise in us agreeable

emotions (as those of pity, benevolence, or whatever

indicates happiness, and goodness of heart), and others

disagreeable (as those of a boisterous, malevolent, and
depressed nature, &c.) it further appears, since reading is

an art improving and not imitating nature, that, in whatever
degree we abate the expressions of the tones above
alluded to in the first case, it would be eligible to make

a greater abatement in the latter. But as to the
quantities and proportional magnitudes of these abate-
ments, they, like many other particulars of the same
nature, must be left solely to the taste and judgment of

the reader.

To add one more remark, which may be of service
on more accounts than in fuggelling another reason for
the doctrine above. Let it be remembered, that tho'
in order to acquit himself agreeably in this article of
expression, it will be necessary every reader should feel
his subject as well as understand it; yet, that he may
prefer a proper ease and mannerliness of delivery, it is
also necessary he should guard against discovering too
much emotion and perturbation.

From this reasoning we deduce the following rule,
for the tones which indicate the passions and emotions.

"In reading, let all your tones of expression be bor-
rowed from those of common speech, but something
more faintly characterized. Let those tones which
signify any disagreeable passion of the mind, be still more
faint than those which indicate their contrary; and pre-
serv yourself so far from being affected with the sub-
ject, as to be able to proceed through it with that pecu-
nar kind of ease and mannerliness, which has its charms
in this as well as every other art."

We shall conclude this section with the following ob-
ervation, which relates to speaking as well as reading.
When words fall in our way, whole "founds seem an
echo to the fonce, as squirr, buzz, hum, rattle, life, jar,
&c. we ought not to pronoucer them in such a manner
as to heighten the imitation, except in light and ludi-
crous subjects. For insinuate, they should not in any
other case be pronounced squirr.-r-buzz,-z.-hum,-m.-
r.r.rattle, &c. On the contrary, when the imitation
lies in the movement, or frefly and ftructure of a whole pa-
fage (which frequently happens in poetry), the delivery
may always be allowed to give a heightening to it with
the greatest propriety; as in the following instances,
out of a number more which every experienced reader
will quickly recollect.

In these deep solitudes and awful cells,
Where heav'ly-profufe Contemplation descends,
And ever-musing Melancholy reigns—

_Pope's Elofia to Abelard._

With easy course
The veffels glide, unless their fpeed be fepp'd
By dead calms, that oft lie on thefe smooth seas.

_Dyer's Fleece._

Softly sweet in Lydian measure,
Soon be feat'd his fcel to pleaure.

Dryden's Ode on St Cecilia's day,

Still gathering force it smokes, and, urg'd amain,
Whirls, leaps, and thunders down impetuous to the plain.

_Pope's Iliad, B. 13._

For who to dumb forgetfulness a prey,
This pleasing anxious being ere reign'd,
Left the warm preludes of the cheerful day,
Nor call one lingering lingering look behind?

_Grey's Elegy._

2. Besides the particular tones and modifications of Expreffion

voice above described, which always accompany and as to the

express our inward agitations, nature has in these cafes

and endow'd us with another language, which, instead of

the ear, addresses itself to the eye, thereby giving the

communications of the heart a double advantage over

those of theunderstanding, and as a double chance to

preserve the ineliminable a bleeding. This language is

what arises from the different, almost involuntary

movements and configurations of the face and body

in our emotions and passions, and which, like that of
tones, every one is formed to understand by a kind of

intuition.

When men are in any violent agitation of mind, this

co-operating expreffion (as it is called) of face and ge-
sure is very strongly marked, and totally free from the

mixture of any thing which has a regard to gracef-

ness, or what appearance they may make in the eyes of

others. But in ordinary conversation, and where the

emotions are not so warm, fashionable people are perpe-
tually infatuating, into their countenance and action,

whatever they imagine will add to the eas: and elegance

of their deportment, or impress on the spectator an idea

of their amiableness and breeding. Now, though the

abovementioned natural organical signs of the emotions

should accompany every thing spoken, yet from what

was observed in the introductory part of this article

(lke the tones we have just treated upon), they should

in reading be much less strongly expressed, and those

suffer the greatest diminution that are in themselves

the most ungainly. And as it was in the last section re-

commended to the reader to preferve himself as far from

being affected in all passionate subjedts as to be able to

keep a temperate command over the various affections

of the voice, &c. so under the fuffion of this subor-
dinate feeling he may accompany his delivery more fre-
nuently with any easy action or change of face, which

will contribute to set off his manner, and make it agree-
bale on the principles of art.

As these calm decorations of action (as we may call
them) are not altogether natural, but have their rise
from a kind of imitation, they must be modelled by
the practices of the polite. And though mankind dif-

fer from one another scarce more in any particular than

in that of talents for adopting the graceful actions of

the body, and hence nothing determinate can be said of
their nature and frequency, yet even those, most

happily calculated to acquit themselves well in their
use, might profit by considering that it is better greatly
to abridge the display, than to over-do it ever fo little.
For the peculiar modesty of deportment with which
the most amiable characters are endowed, makes them
in common endeavour to fuppress many signs of an
agitated mind; and in such cafes the bodily ones in par-

icular are very sparingly used. They have also a natural

and rooted dislike to any kind of affecdance; and to no

species,
The pauses are in part to distinguish the members of sentences from one another, the terminations of complete periods, and to afford an opportunity for taking breath. Besides this, they have a very graceful effect in the modulation, on the same account they are so essential in music. In both articles, like blank spaces in pictures, they set off and render more conspicuous whatever they disjoin or terminate.

Were language made up of nothing but short colloquial sentences, these pauses, though they might do no harm, and would generally be graceful, would however be superfluous as to use by the completeness and narrumy, as we may say, of the meaning. But in more diffuse language, composed of several detached sentences, and which require some degree of attention in order to take in the sense, the intermissions of voice under consideration are of the greatest service, by signifying to the mind the progress and completion of the whole passage. Now, though in extensive and differently formed periods there may be members whose completeness of sense might be conceived of various degrees, and hence might seem to require a set of pauses equally numerous; yet, since the sentence does not altogether depend upon these intermissions, and their ratios to one another, if capable of being defined, could not be accurately observed, grammarians have ventured to conceive the whole class of pauses as reducible to the four or five kinds now in use, and whose marks and ratios are well known (e); pretending that under the eye of taste; and with the assistance of a particular to be next mentioned, they would not fail in all cases to suggest intermissions of voice suitable to the sense. But in many of these extensive and complex periods, rounded with a kind of redundancy of matter, where the full sentence is long suspended, and the final words are not very important, there would be some hazard of a misapprehension of the termination, had we not more evident and infallible notice of it than that which is given by the pause. This notice is the cadence, referred to in the section on Modulation; which, as is there observed, besides the ornamental variety it affords, appears from these remarks to be a very necessary and serviceable article in periphrastic delivery.

As this cadence naturally accompanies the end of every sentence, circumstantial as abovementioned, it may sometimes fall before the semicolon, but more generally before the colon, as well as the period: For these marks are often found to terminate a complete sentence; and in these cases, the relation what follows has to what went before, is signified to the mind by the relative orness of the flop, and the form of introducing the additional matter. Nor can any bad consequence

(a) Supposing the comma (,) one time, the semicolon (;) will be two; the colon (:), three, and the period (.) as also the marks of interrogation (?) and admiration (!) four of these times. The blank line (— or ——), and the break between paragraphs, intimate still greater times; and by the same analogy may be reckoned a double and quadruple period respectively. Now and then these blank lines are placed immediately after the ordinary points, and then they are conceived only as separating for the eye the different natures of the matter; as a question from an answer,—precept from example,—premises from inferences, &c., in which case their import is evident. But of late some authors have not scrupled to confound these distinctions: and to make a blank serve for all these purposes universally, or the mark of an indefinite rest, the quantity of which is left to the determination of the reader's taste. A practice, it is imagined, too destructive of the intended precision of these typical notices to be much longer adopted.
quence arise from thus founding distinctions on ratios of time, which it may be said are too nice to be often rightly hit upon: for if a confusion should happen between that of the color and period, there is perhaps too trifling a difference between the nature of the paragraph they succeed, as to make a small inaccuracy of no consequence. And as to the reits of the semicolon and period, it will not be easy to mistake about them, as their ratio is that of two to one. Add to this the power which the matter and introduction of the subsequent paragraph have to rectify any slip of error here made, and we shall be fully satisfied, that the pauses as usually explained, with the cadence above described, and a proper knowledge of the language, will convey sufficient information to the understanding of the constructive nature of the paragraph after which they are found.

It may be observed, that in natural speech, according to the warmth and agitation of the speaker, the reits are often short and injudiciously proportioned, and hence that every thing thus delivered cannot be so graceful as it might have been from a proper attention to their magnitude and effects.

Pauses then, though chiefly subjected to the sense, are, as was remarked at the outset, serviceable in beautifying the modulation, &c.—And since books, are often inaccurately printed as to points, and people's talents differ some little about their place and value, it appears, that, "although in reading great attention should be paid to the stops, yet a greater should be given to the sense, and their correspondent times occasionally lengthened beyond what is usual in common speech;" which observation contains all that we shall pretend to lay down by way of rule for the management of pauses in the delivery of written language.

As there are two or three species of writing, which have something singular in them, and with regard to the manner in which they should be read, a few particular remarks seem necessarily required, we shall conclude this article with laying them before the reader:

1. OF PLAYS, and such like conversation-pieces. Writings of this kind may be considered as intended for two distinct purposes; one to unfold subject matter for the exercise of theoric powers; and the other to convey amusement, merely as able replete with pleasing incidents and characteristic manners. Hence there appears to be a great latitude for the display of a complete delivery of these performances: for while, on one hand, a good reader of very inferior talents for mimicry may be heard with a tolerable degree of pleasure; on the other, if any person is qualified to give a higher degree of life and force to the dialogue and characters by delivering them as an actor, he must be fully at liberty to flirt from the confinement of a chair to a posture and area more suited to his abilities; and, if he be not deceived in himself, his hearers will be considerable gainers by the change.—The next article is,

2. Sermons or other Orationes, which in like manner may be conceived intended for a double purpose. First, as matter for the display of oratorical powers; and, secondly, as persuasive discourses, which may be read like any other book. Therefore it appears (for reasons similar to those above) that according as cler- 

manner of an extemporary harangue, or deliver them in the more humble capacity of one who is content to entertain and instruct his hearers with reading to them his own or some other person's written discourse.

That either of these manners of delivery (or a mixture of them), in either of the cafes abovementioned, is agreeable, we find on a careful examination. For this will show us how frequently they run into one another; and that we are so far from thinking such transitions wrong, that, without a particular attention that way, we scarce ever perceive them at all.

3. Poetry is the next and last object of our present remarks. This is a very peculiar kind of writing, and as much different from the language of ordinary discourse as the movements of the dance are from common walking. To ornament and improve whatever is subfervient to the pleasures and amusements of life, is the delight of human nature. We are also pleased with a kind of excess in any thing which has a power to amuse the fancy, inspire us with enthusiasm, or awaken the soul to a conjealurie of its own importance and dignity. Hence one pleasure, at least, takes its rise, that we feel in contemplating the performances of every art; and hence the language of poetry, consisting of a measured rhythm, harmonious cadences, and an elevated picturesque diction, has been studied by the ingenious, and found to have a powerful influence over the human breath in every age and region. There is such an affinity between this language and music, that they were in the earlier ages never separated; and though modern refinement has in a great measure destroyed this union, yet it is with some degree of difficulty in rehearsing these divine compositions we cannot forget the singing of the muse.

From these considerations (and some kindred ones mentioned in feat. iii.) in repeating verses, they are generally accompanied with a modulation rather more ornamented and musical than is used in any other kind of writing. And accordingly, as there seems to be the greatest propriety in the practice, the rule for this particular in the section just referred to, will allow any latitude in it that can gain the sanction of taste and pleasure. Rhymes in the lighter and more soothing provinces of poetry are found to have a good effect; and hence (for reasons like those just suggested) it is certainly absurd to endeavour to smooth them by a feeble pronunciation, and running one line precipitately into another, as is often attempted to be done by many of our modern readers and speakers. By this method they not only destroy one source of pleasure intended by the composer (which though not great is nevertheless genuine), but even often supply its place with what is really disagreeable, by making the rhymes, as they are intermittingly perceived, appear accidental blemishes of a different style, arising from an unmeaning recurrence of similar sounds. With regard then to reading verses terminated with rhyme, the common rule, which directs to pronounce the final words full, and to dilute them by a slight pause even where there is none required by the sense, seems the most rational, and consequently most worthy, of being followed. See Declamation, Narra-

tion, and Oratory.

Reading. A town of Berkshire in England, pleasantly seated on the river Kenneth, near the confluence with the Thames. It had once a fine rich monastery, of which there are large ruins remaining. It had also a
cattle built by king Henry I. but it was afterwards levelled with the ground. It is a corporation, enjoys several privileges, and sends two members to parliament. The two navigable rivers render it a fit place for trade. W. Long. i. o. N. Lat. 51. 25.  

Reading, a port-town of Pennsylvania, and capital of Berks county; situated on the N. E. side of the river Schuylkill. It is regularly laid out, and contains about 600 houses, a stone jail, court-house, a church for German Lutherans, one for Calvinists, one for Quakers, and one for Roman Catholics; also a large building for the public offices. It is chiefly inhabited by Germans. This town is remarkable for the manufacture of wool hats, which is carried on largely by individuals. Contiguous to the town is a remarkable spring, which is one hundred feet square, and 140 feet deep, with a stream of water issuing from it large enough to turn a mill, and affording an abundance of fish: the water is clear and transparent. A court of quarter sessions is held here the first Monday in January, April, and November. It is 54 miles N. W. of Philadelphia. W. Lon. 75. 54. N. Lat. 40. 21.  

Readings, or Various Readings, in criticism, are the different manner of reading the texts of authors in ancient manuscripts, where a diversity has arisen from the corruption of time, or the ignorance of glosses. A great part of the business of critics lies in settling the readings by confronting the various readings of the manuscripts, and considering the agreement of the words and sense. Readings are also used for a fort of commentary or gloss on a law, text, passage, or the like, to show the sense an author takes it in, and the application he conceives to be made of it.  

Re-aggravation, in the Roman ecclesiastical law, the last monitory, published after three admonitions, and before the last excommunication. Before they proceed to fulminate the last excommunication, they publish an aggravation, and a re-aggravation. Fevret observes, that in France the minister is not allowed to come to re-aggravation, without the permission of the bishop or official, as well as that of the lay-judge. See Excommunication.  

REAL (Cezar Vivard de St), a polite French writer, son of a councillor to the senate of Chambrey in Savoy. He came young to France, disdained himself at Paris by several ingenious productions, and resided there a long time without title or dignity, intent upon literary pursuits. He died at Chambrey in 1692, advanced in years, though not in circumstances. He was a man of great parts and penetration, a lover of the sciences, and particularly fond of history. A complete edition of his works was printed at Paris, in 3 vols 4to, 1745; and another in 6 vols 12mo. See Transubstantiation.  

Real. See Chemistry. n. 1279.  

Reality, is the schools, a diminutive of ret, "thing," first used by the Scottites, to denote a thing which may exist of itself; or which has a full and absolute being of itself, and is not considered as a part of any other.  

REALM, a country which gives its head or governor the denomination of a king.  

Re-animation means the reviving or restoring to life those who are apparently dead. Sudden death is dreaded by every human being, and it is one of those evils against which the Church of England prays in her Litany. Accidents, however, cannot always be prevented; but, after they have happened, it is often possible to prevent their effects. This, by the establishment of what with great propriety has been called the Human Society, has been abundantly proved: for, in the course of 12 years immediately after their institution, they were the means of saving the lives of 520 persons, who otherwise would in all human probability have been lost to the community. Since that period, they have saved many more; and various persons, in different countries of the world, by following their directions, have done the same. To preserve one human being from premature death, we must consider as of the utmost consequence both as citizens and Christians; how much more the preservation of thousands. It appears from the writings of Doctors Mend, Winlow, Bruhier, Fothergill, Haller, Lefiat, Tiffot, Van Engelen, Gummer, and others, that they had prepared the way for institutions similar to the Humane Society: for in their works they have elucidated the principles on which they go, and furnished directions for the practice they favour. See Death, Premature Interment, and Drowning.  

Rear, a term frequently used in composition, to denote something behind, or backwards, in respect of another; in opposition to van.  

ReaR of an army, signifies, in general, the hindermost part of an army, battalion, regiment, or squadron; also the ground behind either.  

ReaR-Guard, is that body of an army which marches after the main-body; for the march of an army is always composed of an advance-guard, a main-body, and a rear-guard: the first and last commanded by a general. The old grand-guards of the camp always form the rear-guard of the army, and are to see that every thing come safe to the new camp.  

ReaR Half-files, are the three hindmost ranks of the battalion, when it is drawn up fix deep.  

ReaR-Line, of an army encamped, is always 1200 feet at least from the centre line; both of which run parallel to the front line, as also to the referee.  

ReaR-Rank, is the last rank of a battalion, when drawn up, and generally 16 or 18 feet from the centre line when drawn in open order.  

Reason, a faculty or power of the mind, whereby it distinguishes good from evil, truth from falsehood. See Metaphysics.  

Reasoning, Ratiocination, the exercise of that faculty of the mind called reason; or it is an act or operation of the mind, deducing some unknown proposition from other previous ones that are evident and known. See Logic, Part III.  

Reaumur (Rene Antoine Ferchault, Sieur de), a perfon disdained for his laborious researches into natural knowledge, was born at Rochelle in 1689, of a family belonging to the law. After having finished his early studies in the place of his birth, he began a course of Philosophy at Poitiers, and of civil law at Bourges; but soon relinquished the latter, to apply himself, according to his taste, to mathematics, physics, and natural history. Being come to Paris, he was received into the Academy of Sciences in 1708. From that hour he was wholly employed in natural history, to which his inclination
clination particularly led him, and his inquiries were not confined to any one part of it. His memoirs, his observations, his discoveries on the formation of shells, fishers, mussels, the marine flea, the berry which affords the purple colour, and on the cause of the number of the torpedo, excited the curiosity of the public, and early procured our author the character of an able, curious, and entertaining naturalist. Filled with zeal for the welfare and advantage of society, and the progress and perfection of arts, he endeavoured in all his researches to promote the public good. We were indebted to him for the discovery of the Turquois in Languedoc. He also found out a sublimate, which is used to give false tones a colour, which is obtained from a certain fish called in the French Able or Athlete* on account of its whiteness, and which is the Bleak or Belay of our writers †. His experiments on the art of turning iron into steel obtained him a pension of 12,000 livres; and this reward has been continued to the Academy to support the expense which might accrue in this art.

He continued his inquiries on the art of making tin and porcelain ‡, and endeavoured to render our thermometers more useful than those of former times: he composed a curious history of rivers where gold is found in France; and gave so simple and easy a detail of the consequence of a fall, which happened at the instance, a very great number of memoirs and observations on different parts of natural history; they are printed in the collections of the Academy of Sciences. 2. A large work printed separately in 6 vols in 4to, intitled, A Natural History of Insects. This important work contains a description of vast numbers of caterpillars, moths, gall insects, flies with two and four wings, lady-birds, and those ephemeron flies which live only for a form a few hours; and lastly, of those singular and wonderful insects which are called pollinaceus, which being cut into several pieces, each piece lives, grows, and becomes an insect, and affords to our eyes a great number of prodigies*. The works of M. de Reaumur are exact, curious, interesting, and very ingenious. They are written with much candour, clearness, and elegance; but it must be acknowledged his manner is somewhat too diffuse. But we must not deceive the reader; he often raises our expectations, and does not give us all the satisfaction we promise ourselves from his writings. His method of raising poultry, in particular, rather disappoints us. He spared neither care, time, nor expense, to render it practicable: he flattered himself and his countrymen with the greatest hopes; but notwithstanding his affluent industry, and vast charges, it proved abortive. The late M. l’Avocat recommended him to search in Egypt for better information from Egypt on the subject; and if possible to procure a person versed in the art to instruct him in it; but his death prevented the completion of the scheme. If the native of Egypt had arrived, showed M. de Reaumur a better method than his own, and practised it with success, as in his country, the community would have been benefited; on the other hand he would have seen, had it failed, that the climate of France was not proper for such experiments. M. Maillet, confult at Cairo, to whom Monsieur the regent had written to obtain the art, offered to send over a native of Egypt, if the government would pay the expense of his voyage, and allow him a pension of 1500 livres. M. Maillet rightly judged, when he preferred this method of proceeding. M. de Reaumur was not ignorant of the design; but he flattered himself, that his efforts would be successful without further aid, and thought he should acquire some honour. He certainly had great talents, industry, sagacity, and every other requisite which are necessary in such attempts; but it is morally impossible that a single man, in a different climate, can attain such knowledge in an art as those who live in a more favourable country, and have had the experience of many ages to profit by: however M. de Reaumur may have been unsuccessful, posterity is indebted to him for his repeated trials. He has removed some difficulties in the road, and those that travel it may discover what he only saw at a distance.

REAUURIA, the botany: A genus of the pentagnia order, belonging to the pentandria class of plants; and in the natural method ranking under the 13th order, Succulentia. The calyx is hexaphyllous, and there are five petals; the capsule is unilocular, quinquelocular, and polypermous. REBATE, or Rebatement, in commerce, a term much used at Amsterdam for an abatement in the price of several commodities, when the buyer, instead of taking time, advances ready money. Rebatement, in heraldry, a diminution or abatement, of the bearings in a coat of arms. See Abatement.

REBELLION, Rebellion, among the Romans, was where those who had been formerly overcome in battle, and yielded to their sujection, made a second resistance: but in England it is generally used for the taking up.
Rebellious Assembly, is a gathering together of twelve persons or more, intending or going about to practice or put in use unlawfully, of their own authority, any thing to change the law or statutes of the realm; or to destroy the inclosures of any ground, or banks of any pond, pool, or conduit, to the intent the same shall lie waste and void; or to destroy the deer in any park, or any Warren of conies, dove-houses, or fishes in ponds; or any house, barns, mills, or bayes; or to burn flakes of corn; or abate rents, or prices of virgules, &c.

REBUS, an enigmatical representation of some name, &c. by using figures or pictures instead of words, or parts of words. Camden mentions an instance of this blunder kind of wit in a gallant who expressed his love to a woman named Rehe Hill, by painting in the border of his gown a rose, a hill, an eye, a loaf, and a well; this kind of wit was long practised by the great, who took the pains to find devices for their names. It was, however, happily ridiculed by Ben Jonson, in the humorous description of Abel Dragger's device in the Alchemist; by the Spectator, in the device of Jack of Newberry; at which time the rebus, being raised to sign-posts, was grown out of fashion at court.

REBUS is also used by the chemical writers sometimes to signify four milk, and sometimes for what they call the ultimate matter of which all bodies are composed. Rebus, in heraldry, a coat of arms which bears an allusion to the name of the person; as three cattles, for Caftleton; three cups, for Butler; three conies, for Coniby; a kind of bearings which are of great antiquity.

REBUTTER (from the Fr. bonter i.e. repellere, to put back or bar), is the answerer to the plaintiff's querist; and plaintiff's answer to the rebutter is called a farrebuter; but it is very rare the parties go so far in pleading.

Rebutter is also where a man by deed or fine grants to warranty any land or hereditament to another; and the person making the warranty, or his heir, is sued to whom the warranty is made, or his heir or assignee, for the same thing; if he is so sued plead the deed or fine with warranty, and pray judgment, if the plaintiff shall be received to demand the thing which he ought to warrant to the party against the warranty in the deed, &c. this is called a rebutter. And if I grant to a tenant to hold without imprisonment of waife, and afterwards impel him for waife done, he may debar me of this action by shewing my grant, which is a rebutter.

RECEPCITATION, is a summary, or a concise and transient enumeration of the principal things included in the preceding discourse, whereby the force of the whole is collected into one view. See Oratory, nos 37 and 127.

RECEIPT, or Receipt, in commerce, an acquittance, or discharge, in writing, intimating that the party has received a certain sum of money, either in full for the whole debt, or in part, or on account.

RECEIVER, in pneumatics, a glass vessel for containing the thing on which an experiment in the air-pump is to be made.

RECEIVER, receptor or receptacle, in English law, is commonly understood in a bad sense, and used for such as knowingly receive stolen goods from thieves, and conceal them. This crime is felony, and the punishment is transportation for 14 years.

RECESSION was an account taken by the censors, every lulrum, of all the Roman people. It was a general survey, at which the equites as well as the rest of the people, were to appear. New names were now put upon the censor's list, and old ones cancelled. The receipt, in short, was a more solemn and accurate sort of probatio, and answered the purpose of a review, by showing who were fit for military service.

RECEPTACULUM, in botany, one of the seven parts of fruition, defined by Linearus to be the base which connects or supports the other parts.

RECEPTACULUM Chyli, or Pocquet's Refeptory, the refervoir or receptacle for the chyle, situated in the side of the upper vertebra of the loins, under the aorta and the vessels of the left kidney.

RECHABITES, a kind of religious order among the ancient Jews, instituted by Jonadab the son of Rechab, comprehending only his own family and posterity. Their founder prescribed them three things: first, not to drink any wine; secondly, not to build any houses, but to dwell in tents; and thirdly, not to sow any corn, or plant vines.

The Rechabites observed these rules with great strictness, as appears from Jer. xxxv. 6. &c. Whence St Jerome, in his 13th epistle to Paulinus calls them momachons, Jonadab, their founder, lived under Jehoahaz, king of Judah, contemporary with Jehu king of Israel; his father Rechab, from whom his posterity were denounced descended from 'Raguel or Jethe, father-in-law to Moses, who was a Kenite, or of the race of Ken whom Kenite and Rechabite are used as synonymous in Scripture.

RECHEAT, in hunting, a lesson which the huntsman plays on the horn, when the hounds have lost their game, to call them back from pursuing a counter scent.

RECIPE, in medicine, a prescription, or remedy, to be taken by a patient: so called because always beginning with the word recipi, i.e. take; which is generally denoted by the abbreviation R.

RECI PROCAL, in general, something that is mutual, or which is returned equally on both sides, or that affects both parties alike.

RECI Procal Terms, among logicians, are those which have the same signification; and consequently are convertible, or may be used for each other.

RECI PROCAL, in mathematics, is applied to quantities
Reduction of figures. The antecedents and consequents of the citation; such as that in which the several parts of the liturgy are rehearsed in cathedrals; or that wherein the actors in demonstrating the laws of motion.

RECITAL, in law, means the rehearsal or making mention in a deed or writing of something which has been done before.

RECITATIVO, or RECITATIVE, in music, a kind of finging, that differs but little from ordinary pronunciation; such as that in which the several parts of the liturgy are rehearsed in cathedrals; or that wherein the actors commonly deliver themselves at the theatre or the opera, when they are to express some action or passion; to relate some event; or reveal some design.

RECKENHAUSEN, a strong town of Cologne, in Germany, in the middle territory of that name. The abbess of its nunnery has power of punishing offenders with death, and the alone is obliged to the vow of chastity.

RECKONING, or a Ship's Reckoning, in navigation, is that account whereby at any time it may be known where the ship is, and on what course or courses she is to steer, in order to gain her port; and that account taken from the log-board is called the dead reckoning. See Navigation.

RECLAIMING, or Reclaiming, in the ancient customs, a lord's pursuing, prosecuting, and recalling, his vassal, who had gone to live in another place without his permission.

Reclaiming is also used for the demanding of a person, or thing, to be delivered up to the prince or state to which it properly belongs; when, by any irregular means, it is come into another's possession. See CONFISCATION. Reclaiming, in falconry, is taming a hawk, &c. and making her gentle and familiar.

A partridge is said to reclaim, when she calls her young ones together, upon their scattering too much from her.

RECONCILIATION of a plane in dialling. See Dialling.

RECLUSE, among the Paphites, a person shut up in a small cell of an hermitage, or monastery, and cut off, not only from all conversation with the world but even with the house. This is a kind of voluntary imprisonment, from a motive either of devotion or penance.

The word is also applied to incontinent wives, whom their husbands procure to be thus kept in perpetual imprisonment in some religious house.

Recluses were anciently very numerous. They took an oath never to stir out of their retreat; and having entered it, the bishop set his seal upon the door; and the recluse was to have every thing necessary for the support of life conveyed to him through a window. If he was a priest, he was allowed a small oratory, with a window, which looked into the church, through which he might make his offerings at the mass, hear the singing, and answer those who spoke to him; but this window had curtains before it, so that he could not be seen. He was allowed a little garden, adjoining to his cell, in which he might plant a few herbs, and breathe a little fresh air. If he had disciples, their cells were contiguous to his, with only a window of communication, through which they conveyed necessaries to him, and received his instructions. If a recluse fell sick, his door might be opened for persons to come in and assist him, but he himself was not to stir out.

RECOGNITION, in law, an acknowledgement; a word particularly used in the law-books for the first chapter of the statute 1 Jac. I. by which the parliament acknowledged, that, after the death of queen Elizabeth, the crown had rightfully descended to king James.

RECOGNIZANCE, in law, is an obligation of record, which a man enters into before some court of record or magistrate duly authorized, with condition to do some particular act; or to appear at the assizes, to keep the peace, to pay a debt, or the like. It is in most respects like another bond: the difference being chiefly this, that the bond is the creation of a fresh debt or obligation de novo, the recognizance is an acknowledgement of a former debt upon record; the form whereof is, "that A. B. doth acknowledge to owe to our lord the king, to the plaintiff, C. D. &c. the sum of ten pounds," with condition to be void on performance of the thing stipulated: in which case the king, the plaintiff, C. D. &c. is called the cognizee, and the other, as he that enters into the recognizance, is called the cognizor, or cognizee; as he that enters into the recognizance is called the cognizor, or cognizee. This being certified to, or taken by the officer of some court, is witnessed only by the record of that court, and not by the party's seal: so that it is not in strict propriety a deed, though the effects of it are greater than a common obligation: being allowed a priority in point of payment, and binding the lands of the cognizor from the time of enrolment on record.

RECOIL, or REBOUND, the starting backward of a fire-arm after an explosion. Mercurius tells us, that a cannon 12 feet in length, weighing 6400 lb. gives a ball of 24 lb. an uniform velocity of 640 feet per second. Putting, therefore, \( W = 6400, w = 14, V = 640, \) and \( v = \) the velocity with which the cannon recoils; we shall have (because the moments of the cannon and ball are equal) \( W v = wV; \) and so \( v = \frac{wV}{W} = \frac{24 \times 64}{6400} = 2.4; \) that is, it would recoil at the rate of 2.4 feet per second, if free to move.

RECOLLECTION, a mode of thinking, by which ideas sought after by the mind are found and brought to view.

RECONNOITRE, in military affairs, implies to view and examine the state of things in order to make a report thereof.

Parties ordered to reconnoitre are to observe the country and the enemy; to remark the routes, conveniences, and inconveniences of the first; the position, march, or forces of the second. In either case, they should have an expert geographer, capable of taking plans
The trial, therefore, of this issue, is merely by the record; and he may be required to bring it in his pleadings, and the opposite party pleads, not the record, that there is no such matter of record existing. Upon this issue, it is tendered and joined in the following form, "and this he prays may be inquired of by the record, and the other doth the like," and hereupon the party pleading the record has a day given to him to bring it in, and proclamation is made in court for him to produce the record by him in pleading alleged, or else he shall be condemned," and, on his failure, his antagonist shall have judgment to recover. The trial, therefore, of this issue is merely by the record; for, as Sir Edward Coke observes, a record or enrolment is a monument of so high a nature, and importeth in itself such absolute verity, that if it be pleaded that there is no such record, it shall not receive any trial by witness, jury, or otherwise, but only by itself. Thus titles of nobility, as whether earl or not earl, baron or not baron, shall be tried by the king's writ or patent only, which is matter of record. Also in cases of an alien, whether alien friend or enemy, shall be tried by the league or treaty between his sovereign and ours; for every league or treaty is of record. And also, whether a manor be held in ancient demesne or not, shall be tried by the record of demesne in the king's exchequer.

RECOVERER, a person whom the mayor and other magistrates of a city or corporation associate to them, for their better direction in matters of justice and proceedings in law; on which account this person is generally a counselor, or other person well skilled in the law.

The recorder of London is chosen by the lord mayor and aldermen; and as he is held to be the mouth of the city, delivers the judgment of the courts therein, and records and certifies the city-customs. See London, n° 38.

RECOVERY, or Common Recovery, in English law, a species of assurance by matter of record; concerning the original of which it must be remarked, that common recoveries were invented by the ecclesiastics to elucidate the statutes of mortmain (see Tails); and afterwards encouraged by the fineble of the courts of law in 22 Edward IV, in order to put an end to all fettered inheritances, and bars not only estates-tail, but all all remainders and reversions expectant thereon. We have here, therefore, only to consider, first, the nature of a common recovery; and, secondly, its force and effect.

1. A common recovery is a suit or action, either actual or fictitious; and in it the lands are recovered against the tenant of the freehold; which recovery, being a supposed abjuration of the right, binds all persons, and vests a free and absolute fee-simple in the recoverer. To explain this as clearly and concisely as possible, let us, in the first place, suppose David Edwards to be tenant of the freehold, and desirous to suffer a common recovery, in order to bar all entails, remainders, and reversions, and to convey the same in fee-simple, recovery, to Francis Golding. To effect this, Golding is to bring an action against him for the lands; and he accordingly files out a writ called a praecipe praind et reddit, because there were its initial or most operative words when the law-proceedings were in Latin. In this writ the defendant Golding alleges, that the defendant Edwards (here called the tenant) has no legal title to the land; but that he came into possession of it after one Hugh Hunt had turned the defendant out of it. The subsequent proceedings are made up into a record or recovery roll, in which the writ and complaint of the defendant are first recited: whereupon the tenant appears, and calls upon one Jacob Morland, who is supposed, at the original purchase, to have warranted the title to the tenant; and thereupon he prays, that the said Jacob Morland may be called in to defend the title which he so warranted. This is called the vocatio, or calling of Jacob Morland to warranty; and Morland is called the vouchee. Upon this, Jacob Morland, the vouchee, appears, is impelled, and defends the title.

Whereupon Golding the demandant desires leave of the court to imparl, or confer with the vouchee in private; which (as usual) allowed him. And soon afterwards the demandant Golding returns to court; but Morland the vouchee disappears, or makes default. Whereupon judgment is given for the demandant Golding, now called the recoverer, to recover the lands in question against the tenant Edwards, who is now the recoveree: and Edwards has judgment to recover of Jacob Morland lands of equal value, in recompense for the lands so warranted by him, and now lost by his default; which is agreeable to the doctrine of warranty mentioned in the preceding chapter. This is called the recompense, or recovery in value. But Jacob Morland having no lands of his own, being usufrually the crier of the court, who, from being frequently thus vouched, is called the common vouchee, it is plain that Edwards has only a nominal recompense for the lands so recovered against him by Golding; which lands are now absolutely vested in the said recoverer by judgment of law, and fein thereof is delivered by the sheriff of the county. So that this collusive recovery operates merely in the nature of a conveyance in fee-simple, from Edwards the tenant in tail to Golding the purchaser.

The recovery here described, is with a single vouchee only; but sometimes it is with a double, treble, or farther vouchee, as the exigency of the case may require. And indeed it is now usual always to have a recovery with double vouchees at the least: by first conveying an estate of freehold to any indifferent person, against whom the praecipe is brought; and then he vouches the tenant in tail, who vouches over the common vouchee. For, if a recovery be had immediately against tenant in tail, it bars only such estate in the premises of which he is then actually seized; whereas if the recovery be had against another peron, and the tenant in tail be vouched, it bears every latent right and interest which he may have in the lands recovered. If Edwards therefore be tenant of the freehold in possession, and John Barker be tenant in tail in remainder, here Edwards doth first vouch Barker, and then Barker vouches Jacob Morland the common vouchee; who is always the last person vouched, and always makes default; whereby the demandant Golding recovers the land against the tenant Edwards.
Edwards, and Edwards recovers a recompense of equal value against Barker the first vouchée; who recovers the like against Morland the common vouchée, against whom such ideal recovery in value is always ultimately awarded.

This supposed recompense in value is the reason why the issue in tail is held to be barred by a common recovery. For, if the recoveree should obtain a recompense in lands from the common vouchée (which there is a possibility in contemplation of law, though a very improbable one, of his doing), these lands would supply the place of those so recovered from him by collusion, and would defend to the issue in tail. The reason will also hold with equal force as to most remainder-men and reverśioners, to whom the possibility will remain and revert, as a full recompense for the reality which they were otherwise entitled to; but it will not always hold; and therefore, as Pigott says, the judges have been ever aōfbi, in inventing other reasons to maintain the authority of recoveries. And, in particular, it hath been said, that though the estate-tail is gone from the recoveror; yet it is not destroyed, but only transferred, and still subsists; and will ever continue to subsist (by construction of law) in the recoveror, his heirs and assigns: and as the estate-tail so continues to subsist for ever, the remainders or reversons exceptable on the determination of such estate-tail can never take place.

To such awkward shifts, such subtle refinements, and such strange reasoning, were our ancestors obliged to have recourse, in order to get the better of that stubborn statute de donis. The design for which these contrivances were fet on foot, was certainly laudable; the unriveting the fetters of estates-tail, which were attended with a legion of mischief to the commonwealth: but, while we applaud the end, we cannot but admire the means. Our modern courts of justice have indeed adopted a more manly way of treating the subject; by considering common recoveries in no other light than as the formal mode of conveyance by which tenant in tail is enabled to alien his lands. But, since the ill consequences of fettered inheritances are now generally seen and allowed, and of course the utility and experience of setting them at liberty are apparent, it hath often been wished that the process of this conveyance was shortened, and rendered less subject to niceties, by either totally repealing the statute de donis; which perhaps, by reviving the old doctrine of conditional fees, might give birth to many litigations: or by vesting in every tenant in tail, of full age, the fame absolute fee-simple at once, which now he may obtain whenever he pleases, by the collective fiction of a common recovery; though this might possibly bear hard upon those in remainder or reversion, by abridging the chances they would otherwise frequently have, as no recovery can be suffered in the intervals between term and term, which sometimes continue for near five months together: or, lastly, by empowering the tenant in tail to bar the estate-tail by a solemn deed, to be made in term-time, and enrolled in some court of record; which is liable to neither of the other objections, and is warranted not only by the usage of our American colonies, but by the precedent of the statute 21 Jac. I. c. 19. which, in the case of a bankrupt tenant in tail, empowers his commissioners to fell the estate at any time, by deed indented and enrolled. And if, in so national a concern, the emoluments of the officers concerned in palling recoveries are thought to be worthy attention, those might be provided for in the fees to be paid up on each enrollment.

2. The force and effect of common recoveries may appear, from what has been said, to be an absolute bar not only of all estates tail, but of remainders and reversons exceptable on the determination of such estates. So that a tenant in tail may, by this method of allowance, convey the lands held in tail to the recoverer, his heirs and assigns, absolutely free and discharged of all conditions and limitations in tail, and of all remainders and reversons. But, by statute 34 & 35 H. VIII. c. 20. no recovery had against tenant in tail of the king's gift, whereof the remainder or reversion is in the king, shall bar such estate-tail, or the remainder or reversion of the crown. And by the statute 11 H. VII. c. 20. no woman, after her husband's death, shall suffer a recovery of lands settled on her by her husband, or settled on her husband and her by any of his ancestors. And by statute 14 Eliz. c. 8. no tenant for life, of an estate, can suffer a recovery of lands to bind them in remainder or reversion. For which reason, if there be tenant for life, with remainder in tail, and other remainders over, and the tenant for life is de facto to suffer a valid recovery, either he, or the tenant to the precipe by him made, must vouch the remainder-man in tail, otherwise the recovery is void; but if he does vouch such remainder-man, and he appears and vouches the common vouchée, its is then good; for it is a man be vouched and appears, and suffers the recovery to be had, it is as effectual to bar the estate-tail as if he himself were the recoveree.

In all recoveries, it is necessary that the recoveree, or tenant to the precipe, as he is usually called, be actually feized of the freehold, else the recovery is void. For all actions to recover the seisin of lands must be brought against the actual tenant of the freehold, else the suit will lose its effect; since the freehold cannot be recovered of him who has it not. And, though these recoveries are in themselves fabulous and fictitious, yet it is necessary that there be actores fabales properly qualified. But the nicety thought by some modern practitioners to be requisite in conveying the legal freehold, in order to make a good tenant to the precipe, is removed by the provisions of the statute 14 Geo. II. c. 20. which enacts, with a retrospect and conformity to the antient rule of law, that, though the legal freehold be vested in leesees, yet those who are entitled to the next freehold estate in remainder, or reversion, may make a good tenant to the precipe; and that, though the deed or fine which creates such tenant be subsquent to the judgment of recovery, yet if it be in the same term, the recovery shall be valid in law: and that though the recovery itself do not appear to be entered, or be not regularly entered on record, yet the deed to make a tenant to the precipe, and declare the uses of the recovery, shall after a possession of 20 years be sufficient evidence on behalf of the purchaser for valuable consideration, that such recovery was duly suffered.

Recovery of persons drowned, or apparently dead. See Re-animation, and the articles there referred to. RECREANT, Cowardly, Faint-hearted; formerly a word very reproachful. See Battle.

RECREMENT, in chemistry, some superfluous matter separated from some other that is useful; in which
RECTORY, in law, an accusation brought by the accuser against the accused upon the same fact.

RECRUITS, in military affairs, new-raised soldiers designed to supply the place of those who have left their lives in the service, or who are disabled by age or wounds.

RECTANGLE, in geometry, the figure with a right-angled parallelogram. See GEOMETRY.

RECTIFICATION, in chemistry, is nothing but the repetition of a distillation or sublimation several times, in order to render the substance purer, finer, and free from aqueous and earthy parts.

RECTIFICATION OF SPIRITS. See DISTILLATION.

RECTIFIER, in navigation, an instrument consisting of two parts, which are two circles, either laid one gum from the upper part of the thorax: to the larynx.

RECTOR, a term applied to several persons whose offices are very different: as 1. The rector of a parish is a clergyman that has the charge and cure of a parish, and possesses all the tithes, &c. 2. The same name is also given to the chief eclecive officer in several foreign universities, particularly in that of Paris, and also in those of Scotland. It is also applied to the head master of large schools in Scotland, as in the high school of Edinburgh. 3. Rector is also used in several convents for the superior officer who governs the house: and the Jesuits give this name to the superiors of fuch of their houses as are either seminaries or colleges.

RECTORY, a parish church, parsonage, or spiritual living, with all its rights, tithes, and glebes.
REDCRIMSON

Red Sea. - The whiteness is produced by the cold climate of Hudson's Bay, from which he received it, and that they assume their brown feathers during the summer. It appears that several species of this bird have spread further into America, and have even reached the southern provinces: for Sloane found our third species in Jamaica; and Fernandez seems to indicate two of them in New Spain, by the names chiquatoit and eliotatoit; the former being the woodcock, and the latter lodging under the flarks of maize.

A bird of this kind, Mr Latham says, was sent from Hudson's Bay, and from the figure, has every appearance of an avolet: however, in Edwards's plate, the toes appear cloven to the bottom; a circumstance seeming to overturn the supposition, and only to be authenticated when other specimens shall have come under the eye of the well-informed naturalist.

RECLUSANTS, in England such persons as acknowledge the pope to be the supreme head of the church, and refuse to acknowledge the king's supremacy: who are hence called Popish recusants. The penal laws against Papists are now abolished in Britain and in Ireland; and in all probability they will quickly be allowed the ampler privilege.

RED, one of the colours called simple or primary: being one of the shades into which the light naturally divides itself when refracted through a prism. See CHROMATICS.

Red, in dyeing, see that article. - Some reckon six kinds or caifs of red, viz. scarlet-red, crimson-red, madder-red, half-grain red, lively orange-red, and scarlet of cochineal: but it is easy to see that there can be but one proper species of red: namely, the reflection of the light exactly in such a manner as it is refracted by the prism; all other shades being adulterations of that pure colour, with yellow, brown, &c.

Red, in heraldry, See Gules.

Red-Bird. See Muscicapa, n° 7.

Red-Breath, in ornithology. See Motacilla.

Red-Book of the British exchequer, an ancient record or manuscript volume, in the keeping of the king's remembrancer, containing divers miscellaneous treaties relating to the times before the conquest.

Red Precipitate of Mercury. See Chemistry, n° 1264.

Red-Ruffia, or Little Ruffia, a province of Poland, bounded on the west by Upper Poland, on the north by Lithuania, on the east by the country of the Little Tartars, and on the south by Moldavia, Transylvania, and a part of Hungary. It comprehends Ruffia properly so called, Volhynia, and Podolia. It is about 650 miles in length, and from 150 to 250 in breadth. It consists chiefly of large fields, but little cultivated on account of the frequent inroads of the Tartars, and because there is no water-carriage. It had the name of Red Ruffia, from the colour of the hair of its inhabiters. Red, properly so called, comprehends the three palatines of Leopoli or Lemburg, Beltho, and Chelm.

Red-Sea or Arabic Gulph, so much celebrated in sacred history, separates Arabia from Upper Ethiopia and part of Egypt. This sea is 350 leagues in length and 40 in breadth. As no river falls into it of itself, it is more affected by the motions of the great ocean than any of the inland seas nearly in the same latitude. It is not much exposed to tempests: the winds usually ground from north to south, and being periodical, like the monsoons of India, invariably determine the motion of falling into or out of this sea. It is divided into two gulphs; that to the east was called the Atlantic gulph, from the city A Elana at the north end of it; and that to the west the Heropolis, from the city of Heropolis; the former of which belongs to Arabia, and the latter to Egypt.

Mr Bruce has made many observations on this sea, which are worthy of notice. - With regard to the name, he says it was certainly derived from Edom or Edom, the son of Jacob; though in another place he says, he wonders that writers have not rather supposed it to have got the epithet of Red, from the colour of the sand on its coasts, than for other reasons they have alleged. With regard to any redness in the water itself, or in the bottom, which some have observed, our traveler assures us that there is no such thing. It is more difficult to assign a reason for the Hebrew name of it, which signifies the Sea of Weeds, as he never saw a weed through the whole extent of it. "Indeed," (says he) upon the lightest consideration, it will occur to any one, that a narrow gulph, under the immediate influence of the monsoons, blowing from contrary points six months each year, would have too much agitation to produce such vegetables, seldom found but in stagnant waters, and seldom, if ever, found in salt ones. My opinion then is, that it is from the large trees or plants of white coral, spread everywhere over the bottom of the Red Sea, perfectly in imitation of plants on land, that the sea has obtained this name. - I saw one of these, which, from a root nearly central, threw out ramifications of an almost circular form, measuring 26 feet every way.

Our author has also made many useful observations on the navigation of this sea. "All the western shore (he says) is bold, and has more depth of water than the east; but on this side there is neither anchoring ground nor foulds. It is rocky, with a considerable depth of water everywhere; and there are a number of rocky rocks, which, though not visible, are sufficiently near the surface to destroy a large ship." The cause of this, in Mr Bruce's opinion, is, that the mountains on the side of Abyssinia and Egypt are all of hard stone, porphyry, many different kinds of marble, granite, slate, &c., which, being composed of solid materials, therefore, can part with very little dust or sand, which might otherwise be blown from them into the sea. On the opposite coast, viz. that of Hejaz and Tahamah, on the Arabian side, the whole consists of moving sands; a large quantity of which is blown from the south-east by the dry winter monsoons; which being lodged among the rocks on that side, and confined there by the north-east or summer monsoons, which is in a contrary direction, hinders them from coming over to the Egyptian side. Hence the western coast is full of rocky rocks for want of sand to cover them, with which they would otherwise become islands. They are naked and bare all round, with sharp points like spears; while, on the east side, many rock become
Red Sea, an island, and every two or three islands become a harbour. On the ends of the principal of these harbours the people have piled up great heaps of stones to serve as signals: and it is in these (says Mr Bruce) that the large vessels from Cairo to Jidda, equal in size to large 74 gun-ships (but from the cisterns of the magazine work built within for holding water, I suppose double their weight, after navigating their portion of the channel in the day-time, come safely and quietly to at four o'clock in the afternoon; and in these little harbours pass the night, to fail into the channel again next morning.

The western channel of the Red Sea was chosen, in the days of the Ptolemies, for the track of the Indian and African. These monarchs erected a great number of cities all along the western coast; and notwithstanding the dangers of the navigation, we do not hear that it was ever abandoned on account of them.

From the observations made by our author on the navigation of the Red Sea, he undertakes to point out a safe passage for large ships to the gulf of Suez, so that they may be able to judge of the propriety of their own course themselves, without trusting implicitly to the pilotsthey meet with, who are often very ignorant of their profession. This fea, according to Mr Bruce, may be divided into four parts, of which the channel occupies two, till near the latitude of 26°, or that of Coffee. On the west it is deep water, with many rocks; and on the east it is full of islands, as has been already mentioned. Between these islands there are channels and harbours of deep water, where ships may be protected in any wind; but a pilot is necessary in falling among these from Mocha to Suez, and the voyage besides can be continued only during part of the day. Ships bound to Suez without the consent of the sheriffs of Mecca, that is, without any intention of selling their cargo at Jidda, or paying custom there, ought to take in their fresh water at Mocha; or if there be any reason against this, a few hours will carry them to Azab or Saba on the Abyssinian coast, where they may be plentifully supplied: but it must be remembered, "that the people here are Galla, the most treacherous and villainous wretches on earth." Here not only water may be procured, but plenty of sheep, goats, with some myrrh, and incense in the proper season.—Great caution, however, must be used in dealing with the people, as even those of Mocha, who are absolutely necessary to them in their commercial dealings, cannot trust them without certainty or hostages. Not many years ago, the Surgeon and mate of the Elgin East India man, with several other sailors, were murdered by these hostages as they went a-shore to purchase myrrh, though they had a letter of safe conduct from the sheikh.

To such as do not want to be known, our author recommends a low black island on the coast of Arabia, named Camarans, in latitude 15° 20'. It is distinguished by a white house or fortress on the west end of it; where water is to be had in still greater plenty than at Azab; but no provisions, or such only as are very bad, can be procured. If it is necessary not to be seen at all on the coast, the island of Foolsat is recommended by our author as having excellent water, with a fluent or monk, whose office is to keep the wells clean. This is one of the chain of islands which stretches almost across the gulf from Loheia to Mafubah, and from actual observation by Mr Bruce, is found to be situated in N. Lat. 15° 59', E. Long. 42° 47'. From this to Yambo there is a safe water-place; and there is an absolute necessity for having a pilot before you come to Ras Mahomet; because, over the Ælanitic gulf, the mountains of Aucha, and the Cape itself, there is often a thick haze which lasts for many days together, and a number of ships are lost by mistaking the eastern bay or Ælanitic gulf for the entrance of the gulf of Suez; the former has a ridge of rocks nearly across it. After reaching Sheduán, a large island, about three leagues farther in a north by west direction, there is a bare rock distinguished by no particular name; but so situated that ships ought not to come within three leagues of it. This rock is to be left to the westward at the distance just mentioned; after passing which you meet with shoals forming a pretty broad channel, with soundings from 15 to 30 fathoms; and again, on standing directly for Tor, there are two other oval sands with sunk rocks in the channel, between which you are to steer. Tor may be known at a distance by two hills that stand near the water side; which, in clear weather, may be seen eight leagues off. Jull to the south-east of the isle is the town and harbour, where there are some palm-trees about the houses, the more remarkable, as being the firft that are seen on the coast. The soundings in the way to Tor harbour are clean and regular; and, by giving the beacon a small light on the larboard hand, you may haul in a little to the northward, and anchor in five or six fathoms. In spring-tides, it is high water at Tor nearly about 12 o'clock: in the middle of the gulf there is no perceptible tide, but at the sides it runs at the rate of more than two knots in the hour. Tor itself is but a small village, with a convent of monks belonging to the place of Mount Sinai. It was taken by Don John de Castro, and fortified soon after its discovery by the Portuguese; but has never since been a place of any consideration; serving now only for a watering place to the ships trading to or from Suez.—From this place there is a distinct view of mounds Horab and Sinai, which appear above and behind the others, with their tops frequently covered with snow in the winter.

Mr Bruce next proceeds to consider some questions which may be reckoned matters of curiosity rather than any thing else. One of these is concerning the level of the water of this sea itself, which has been supposed several feet above that of the Mediterranean. "To this (says our author) I answer, that the fact has been supposed to be fo by antiquity, and alleged as a reason why the Ptolemes' canal was made from the bottom of the Heropolitic gulf rather than brought due north across the isthmus of Suez; in which case it was feared it would submerge a great part of Asia Minor. But who has ever attempted to verify this by experiment? or who is capable of settling the difference of levels, amounting, as supposed, to some feet and inches, between two points 120 miles distant from each other, over a desert that has no settled surface, but is changing its height every day? Besides, since all seas are in fact but one, what is it that hinders the Indian ocean to flow to its level? What is it that keeps the Indian ocean up? Till this last branch of the question is resolved, I shall take it for granted that no such difference of
of level exits, whatever Etolemy's engineers might have
preted to him; because, to suppose it fact, is to sup-
pose the violation of one very material law of nature.

The next thing considered by our author is the
passage of the Israelites through the Red Sea. At the
place where he supposes the passage to have been, the
sea is not quite four leagues broad, so that it might easi-
ly have been crossed in one night without any miracle.

There is about 14 fathom water in the channel, and 9
at the sides, with good anchorage everywhere; the far-
thest side is a low sandy coast, and a very easy landing
place. "The draught of the bottom of the gulph
(fays he) given by Dr Pococke, is very erroneous in
every part of it. It was proposed to Mr Niebuhr, when
in Egypt, to inquire upon the spot, whether there were
not some ridges of rocks where the water was shallow,
so that an army at particular times might pass over?
Secondly, whether the Etefian winds, which blow
strongly all summer from the north-west, could not
blow to violently against the sea, as to keep it back on
a heap, so that the Israelites might have passed with-
out a miracle? And a copy of these queries was left
for me to join my inquiries likewise. But I must con-
ceive, however learned the gentlemen were who propo-
sed these doubts, I did not think they merited any
attention to solve them. If the Etefian winds, blowing
from the north-west in summer, could heap up the sea as a
wall on the right or to the south, of 50 feet high,
still the difficulty would remain of building the wall on
the left hand or to the north. Besides, water floating
in that position for a day, must have loft the nature of
a fluid. Whence came that cohesion of particles that
hindered that wall to escape at the sides? This is as
great a miracle as that of Moses. If the Etefian winds
had done this once, they must have repeated it many
times before and since, from the same causes. Yet Dio-
dorus Siculus says, the Troglodites, the indigenous in-
habitants of that very spot, had a tradition from father to
son, from their very earliest and remotest ages, that
once this division of the sea did happen there; and that,
after leaving the bottom some time dry, the sea again
came back and covered it with great fury. The words
of this author are of the most remarkable kind. We
cannot think this heathen is writing in favour of reve-
lation. He knew not Moses, nor fays a word about
Pharoah and his host; but records the miracle of the
division of the sea in words nearly as strong as those
of Moses, from the mouths of unblasted undersigning
pagans.

Red-Start, in ornithology. See Scolopax.

Red-Shank. See Turdus.

Redans, in field fortification. See the article
Redans.

Redendum, in law, is used substantively for
the clause in a lease wherein the rent is reserved to the
lessor. 'The proper place for it is next after the limita-
tion of estate.

Reddito, was the third part of the sacrifice of
the heathens, and confisted of the solenm act of putting
in again the entrails of the victims, after they had been
religiously inspected. See Sacrifice.

Reddle, a soft, heavy, red marle, of great use
in colouring; and being washed and freed from sand
is often sold by the druggists under the name of lase
armoric.

Remption, in law, a faculty or right of re-
entering upon lands, &c. that have been sold and af-
signed, upon reimbursing the purchase-money with leg-
gal costs.

Redemption, in theology, denotes the recovery of
mankind from sin and death, by the obedience and fa-
crifice of Christ, who on this account is called the Re-
demer of the world. See Theology.

Redens, Redans, or Redant, in fortification, a
kind of work indented in form of the teeth of a faw,
with salient and re-entering angles; to the end that one
part may flank or defend another. It is likewise called
faw-work and indented work. The lines or faces in this
flank one another.

Redens are used in fortifying walls, where it is not
necessary to be at the expense of building battions; as
when they stand on the side of a river running
through a garrison town,ward the sea, &c. But the
fault of such fortification is, that the besiegers from one
battery may ruin both the sides of the tenaille or front
of a place, and make an assault without fear of being
emblazed, since the defences are mined. The parapet
of the corridor is likewise often redented or carried on
by the way of redens. The redens was used before
battions were invented, and some people think them pre-
ferable.

Redi (Francis), an Italian physician and polite
scholar, was born at Arezzo in Tuscany in 1626. His
ingenuity and learning recommended him to the office
of firit physician to Ferdinand II. duke of Tuscany;
and he contributed not a little toward the compiling of
the Dictionary of La Cruca. He wrote upon vipers,
upon the generation of infects, and composed a good
deal of poetry. All his writings, are in Italian; and his
language is so fine and pure, that the authors of the
Dictionary of La Cruca have often cited them as Stan-
dards of perfection. He died in 1697.

Redoubt, in fortification, a small figure fort,
without any defence but in front; used in trenches,
lines of circumsallation, contravallation, and approach;
as also for the lodgings of corps-de-guard, and to de-
defend passages.

Reduction, in the schools, a manner of bring-
ing a term or proposition, which was before opposite
to some other, to be equivalent to it.

Reduction, in arithmetic, that rule whereby
numbers of different denominations are brought into one
denomination. See Arithmetic.

Reduction of Equations, in algebra, is the clear-
ing them from all superfluous quantities, bringing them
to their lowest terms, and separating the known from the
unknown, till at length only the unknown quantity is
found on one side, and known ones on the other. The
reduction of an equation is the last part of the resolu-
tion of the problem. See Algebra.

Reduction of a figure, design, or draught, is the
making a copy thereof, either larger or smaller than
the original; still preserving the form and proportion.
The great use of the proportional compasses is the re-
duction of figures, &c. whence they are called compasses
of reduction. See the article Compasses.

There are various methods of reducing figures, &c.

The third redundant consists of two tones and a feminine, as fa, la, sharp. Its proportion is as 96 to 125.

The fourth redundant is the fame with the tritone.

From these examples compared with the fame intervals in their natural state, the reader may form a general idea of what is meant by redundant.

REE, Reis, or Reis, a little Portuguese coin. See Mone-Table.

Redundant, in music. What the French call une accord inépuisable, which we have translated a redundant chord in the article Music (from D'Alembert), has by others been rendered a chord extremely sharp, as in the translation of Rameau's Principles of Composition. Their nature will be best understood by a few examples, and an account of the number of tones, feminines, or lefer intervals, contained in each.

The second redundant is composed of a major tone, and a minor feminine; as from fa to fa sharp. Its proportion is as 64 to 75.

Redundant, in surgery, denotes an operation whereby a dislocated, luxated, or fractured bone, is reduced to its former place or state.

Redundancy, a fault in discourse, consisting in the use of a superfluity of words. Words perfectly synonymous are redundant, and ought to be restrained.

Redundant, in botany. See Arundo and Bamboo.

There are two sorts of reeds, says Haffelquist, growing near the Nile. One of them has scarce any branches; but is furnished with numerous leaves, which are narrow, smooth, channelled on the upper surface; and the plant is about 11 feet high. The Egyptians make ropes of the leaves. They lay them in water like hemp, and then make them into good strong cables. These, with the bark of the date-tree, form almost the only cable used in the Nile. The other sort is of great consequence. It is a small reed, about two or three feet high, full branched, with short, sharp, lance-shaped leaves. The roots, which are as thick as the fleem, creep and mat themselves together to a considerable distance. This plant seems ufeful in common life: but to it, continues the learned author, is the very soul of Egypt owing; for the matted roots have stopped the earth which floated in the waters, and thus formed, out of the sea, a country that is habitable.

Fire-Reeds. See Fire-Ship.

Reed, a term in the west of England for the straw used by thatchers, which is wheat straw finely combed, consisting of fluff, unbruised, and unbroken stalks of great length, carefully separated from the straw used for fodder by the thrasher, and bound in sheaves or nitches, each of which weighs 28 lb. and are sold from 21 s. to 31 s. per hundred nitches, according to the season. This is a great improvement in the art of thatching, as it gives a finish to the work which cannot be attained by straw, rough and tumbled together, without any separation of the long and short; it also is a readier mode of working.

Reef, a term in navigation. When there is a great gale of wind, they commonly roll up part of the sail below that it may be made smaller, and not draw so much wind; which contracting or taking up the sail they call a reef, or reefing the sail: as also when a top-mast is sprung, as they call it, that is, when it is cracked, or almost broken in the cap, they cut off the lower piece that was near broken off, and setting the other part, now much shorter, in the step again, they call it a reefed top-mast.

Reel, in the manufactories, a machine serving for the office of reeling. There are various kinds of reels; some very simple, others very complex.

Reeling, in the manufactories, the winding of flax, cotton, or the like, into a skain, or upon a button, to prevent its entangling. It is also used for the charging or discharging of bobbins, or quills, to use them in the manufacture of different fluids, as thread, flax, cotton, &c. Reeling is performed in different ways, and on different engines.

Reevy, in the sea-language, the putting a rope through a block; hence to pull a rope out of a block is called unreving.

Re-exchange, in commerce, a second payment of the price of exchange, or rather the price of

Reduction, in metallurgy, is the bringing back metallic substances which have been changed into scories or ashes, or otherwize divested of their metallic form, into their natural and original state of metals again. See Metallurgy, passim; and Chemistry, No 140, and 320.

Reduction, in surgery, denotes an operation whereby a dislocated, luxated, or fractured bone, is restored to its former place or state.

Redundant, in the pentagram, or parallelogram; but this hath its defects. See the article Pentagram.

The bell and most usual methods of reduction are as follow: 1. To reduce a figure, as ABCDE (n° 1.), into a less compass. About the middle of the figure, as e, pitch on a point, and from this point draw lines to its several angles A, B, C, &c. then drawing the line ab parallel to AB, bc parallel to BC, &c. you will have the figure ade bc defcribed to ABCDE.

If the figures ab de had been required to be enlarged, there needed nothing but to produce the lines from the point beyond the angles, as s D, s C, &c. and to draw lines, viz. DC, CB, &c. parallel to the sides de, es, &c.

2. To reduce a figure by the angle of proportion, suppose the figure ABCDE (n° 2.) required to be diminifhed in the proportion of the line AB to ab (n° 3.), draw the indefinite line GH (n° 4.), and from G to H set off the line AB. On G describe the arch Hi. Set off the line ab as a chord on HI, and draw GI. Then with the angle IGH, you have all the meafures of the figure to be drawn. Thus to lay down the point e, take the interval BC, and upon the point G describe the arch KL. Also on the point G describe MN; and upon A, with the diftance MN, describe an arch cutting the preceding one in e, which will determine the fide bc. And after the fame manner are the other fides and angles to be determifed. The fame process will also ferve to enlarge the figure.

3. To reduce a figure by a fcale. Measure all the fides of the figure, as ABCDE (n° 2.) by a fcale, and lay down the fame meafures repectively from a smaller fcale in the proportion required.

4. To reduce a map, design, or figure, by fquares. Divide the original into little squares, and divide a frefh paper of the dimensions required into the fame number of fquares, which are to be larger or lefs than the former, as the map is to be enlarged or diminifhed. This done in every square of the fecton figure, draw what you find in its correspondent one in the firft.

Reduction, in surgery, denotes an operation whereby a dislocated, luxated, or fractured bone, is restored to its former place or state.

Redundant, in discourse, consisting in the use of a superfluity of words. Words perfectly synonymous are redundant, and ought to be restrained.

Redundant, in the sea-language, the putting a rope through a block; hence to pull a rope out of a block is called unreving.
REF [37] REFINING, among ecclesiastics, a spare meal or repast, just sufficing for the support of life: hence the hall in convents, and other communities, where the monks, nuns, &c., take their refectory or meals in common, is called the refectory.

REFERENCE, in writing, &c., a mark relative to another similar one in the margin, or at the bottom of the page, where something omitted in the text is added, and which is to be inserted either in reading or copying.

REFINING, in general, is the art of purifying a thing; including not only the effaying or refining of metals, but likewise the depuration or clarification of liquors. See Metallurgy, Part II. Clarification; and Pharmacy.

Gold and silver may be refined by several methods, which are all founded on the essential properties of these metals, and acquire different names according to their kinds. Thus, for instance, gold having the property which no other metal, not even silver, has of refining the action of sulphur, of antimony, of nitrous acid, of marine acid, may be purified by these agents from all other metallic substances, and consequently may be refined. These operations are distinguished by proper names, as purifying gold by antimony, parting, concavation, &c.

* See Part. trated parting, dry parting &c. In a similar manner, as silver has the property, which the imperfect metals have not, of refining the action of nitre, it may be refined by this salt: but the term refining is chiefly applied to the purification of gold and silver by lead in the cupel.

This is performed by the defluxion, vitrification, and freezification, of all the extraneous and detractive metallic substances with which they are alloyed.

As none but the perfect metals can refit the combined action of air and fire, without losing their inflammable principle, and being changed into earthy or vitreous matters, incapable of remaining any longer united. It floats upon the surface of the melted mass; because, by losing part of its phosphoric acid, it loses also part of its specific gravity, and thereby it vitrifies.

These vitrified and melted matters accumulating more and more upon the surface of the metal while the operation advances, would protect this surface from the contact of air which is so absolutely necessary for the freezification of the refit, and would thus stop the progress of the operation, which could never be finished, if a method had not been contrived for their removal. This removal of the vitrified matter is procured either by the nature of the vessel in which the melted matter is contained, and which being porous, absorbs and imbibes the vitrified matter as fast as it is formed, or by a channel cut in the edge of the vessel through which the matter flows out.

The vessel in which the refining is performed is flat and shallow, that the matter which it contains may present to the air the greatest surface possible. This form resembles that of a cup, and hence it has been called cupel. The furnace ought to be vaulted, that the heat may be applied upon the surface of the metal during the whole time of the operation. Upon this surface a crust of dark-coloured pellicle is continually forming. In the instant when all the imperfect metal is destroyed, and consequently the vitrification ceases, the surface of the perfect metal is seen, and appears clean and brilliant. This forms a kind of fulguration or coronation. By this mark the metal is known to be refined. If the operation be so conducted that the metal retains only the precise degree of heat necessary to keep it fused before it be perfectly refined, we may observe that it fixes or becomes solid all at once in the very instant of the coronation; because a greater heat is required to keep silver or gold in fusion when they are pure than when alloyed with lead.

The operation of refining may be performed in small or in large quantities, upon the same principles, but only with some differences in the management. As the refining of small quantities of perfect metals is performed in the same manner as these metals are effaced, the
Reflection being only a very accurate refining, we refer to the article Essay of the Value of Silver.

Large quantities of silver are thus purified, after the operations by which that metal is obtained from its ores. This silver, being always much alloyed, is to be mixed with a sufficient quantity of lead to complete its purification, unless lead has been added in its first fusion from the ore, or unless it has been extracted from an ore which also contains lead; in which latter case, it is allowed, naturally with a sufficient quantity, or more than sufficient, for the refining of it.

Reflection, the return or progressive motion of a moving body, occasioned by some obstacle which hindered it from pursuing its former direction.

Circular Instrument of Reflection an instrument for measuring angles to a very great degree of accuracy. It was invented by the celebrated astronomer Mr. Tobias Mayer of Göttingen, principally with a view to the description, rectification, and use of this instrument, see the article Navigation, and Mackay on the Longitudes, vol. i. p. 44.

Reflection of the Rays of Light, in catoptrics, is their return, after approaching so near the surface of bodies as to be thereby repelled or driven backwards. For the cases of reflection, see Optics. Index at Rays of Light and Reflection of Lights, &c. For the application of the doctrine of reflection to mirrors, see Optics, p. 347—349. See also Mirror, Burning-Glass, and Glass-Grinding; and for the coating or foliating of mirrors, see the article Foliating of Looking-Glass, &c. See also Telescope.

Reflection is also used, figuratively, for an operation of the mind, whereby it turns its views backwards as it were upon itself, and makes itself and its own operations the object of its disquisition; and by contemplating the manner, order, and laws, which it observes in perceiving ideas, comparing them together, reasoning, &c. it frames new ideas of the relations discovered therein. See Metaphysics.

Reflect, in painting, means those places in a picture which are supposed to be illuminated by light reflected from some other body in the same piece. See Painting, Part I. art. 2. and 5.

Reflex, the backward course of water, has the same meaning as the ebbing of the sea, and is opposed to flood, flux, or the flowing of the sea. See Tides.

Reform means a change from worse to better, a re-establishment or revival of former neglected discipline, or a correction of abuses therein. The term is much used in a monastic sense for the reducing an order or congregation of religious to the ancient severity of the rule from which it had gradually swerved, or even for improving on the ancient rule and institution itself, and voluntarily making it more severe. In this sense the order of St. Bernard is said to be only a reform of that of St. Benedict. In this country it is applied both to politics and religion, and may innocently be applied to any endeavours to change an establishment from worse to better. But it appears at present to have been chiefly made a pretence for designs which could not fairly or safely be avowed.

A reform in religion and in parliament (see Parliament) has, in England been alleged to be most loudly called for by men whose religious notions are immensely different from what has been generally reckoned Christianity, and whose designs, as has been suggested, went to the overthrow of all civil order. For infulous purposes like these, this word reform is a good cloak, especially if any thing can be fixed upon, either in the religion or government of the state, which, with the help of exaggeration and distortion, can be represented to the weak and unthinking as extremely defective and erroneous.

The general error of these men is said to be, that having picked up a set of speculative notions which flatter their own pride and the pride of those who listen to them, they will allow nothing to the arguments of their opponents or the experience of mankind. They think too often and too much upon their ideal reforms, that while they imagine their notions are liberal and extensive, they become contracted beyond imagination; while their judgments, of course, are warped with the most inveterate prejudices (see Prejudice.) They see, or think they see, the propriety of their schemes; but it is said they seldom, perhaps never reflect, that that may be true in speculation or in theory which cannot possibly be reduced to practice. They will not take the world as it is, and allow it to profit by the wisdom and experience of ages; but they will reform it according to those ideas of right which they have learned from their own speculations and airy theories; seldom considering what may be done, they are determined to do what they think ought to be done. Liberty of conscience, and liberty of action, have been claimed by them as the unalienable rights of man; and so we ourselves are disposed to think them; and it has been urged that in this country they have not been denied to any man, or set of men, so far as has been thought consistent with the safety of the state, and that of the other individuals who compose it. At the same time, the very same men hesitate not to blame, with acrimony the most violent, and to the utmost of their power to restrain, the actions and opinions of those who with equal conviction, often on different grounds, and generally with much modesty, differ from them.

Amidst that excessive ardour, too, with which they propagate their opinions, they forget the extreme danger of withdrawing the attention of that part of the community, who must earn their bread by the sweat of their brow, from their proper occupations, to the tempestuous sea of political debate, for which their education and mode of life cannot possibly have qualified them. It requires but very little penetration, however, to be able to see, that it can be of no real service either to the individuals themselves, or to the community at large, in whatever light we look upon it. Indeed, to make those the judges of the law, and the reformers of the legislature, who have all their lives been employed in manual labour, is the extreme of folly; and yet it is what some men of considerable abilities, have judged highly proper and have more than once attempted. The effect of such a mode of seduction (if it deserves that name), when it shall become general, instead of serving the purposes of a real reform, must be to annihilate all civil order. Dissatisfaction
Reformation is the most powerful check to honest industry; and dissatisfaction and idleness must be the effect of the wanderings of such men in the labyrinths of politics; which, for uncultivated minds especially, paves the way for every species of vice, and gradually ripens them for any wickedness, however atrocious. For the truth of these remarks, appeals are made to the history of mankind from the Creation to the present time: however, the sober friends of reform, and many such, we doubt not, there are, will undoubtedly reflect, that in the present day we have as much to fear from licentiousness as from delpotism; from reform carried to an extreme as much as from the pretended attempts of magistrates to annihilate real liberty (See Revolution).

It may also be worth their while to consider, that times of public danger are not generally the best adapted to attempt changes of government; because what might satisfy one party would probably be thought too little by another, and divisions at such a period are most dangerous. When, therefore, attempts are made for reform which appear to be inconsistent with the safety of the state, restrictions must be used, which may by speculative men be thought severe and unnecessary, but of which they themselves are the causes. These restrictions too will be patiently submitted to by the wiser part of the community, when in more peaceable times they would neither have been thought of nor allowed.

Speculative reasoners may speak as much as they will of enlightening the minds of men, and of reforming government by the dictates of a refined and dispassionate philosophy; but when they come to apply their notions to practice, they will either find their representations little better than empty sounds, and therefore ineffectual; or, as is more generally found to be the case, those schemes which in theory appeared to be perfect, will in practice, when combined with the malignant and ambitious passions of men, lead to ruin and disorder. The first institution of government, except among the Jews, was unquestionably the effect of passion and interest combined; and this passion and this interest, restrained within due bounds, is productive of much happiness. That government, we believe, too, will be best supported and most productive of happiness, in which the mutual passions and interests of the individuals who compose it are so equally poised as to support one another, and to promote each the ends and success of the other: and this by the ablest reasoners and the best men has been thought to be the case with the British constitution. If the modern followers of reform should think this an unattainable support, if they will consider the world as it ever has been, and as it is, they will find the only one we have, except religion; and they will thence be inclined to make the best of it. If, after all, however, they should be disposed to doubt the position, we have only further to request them, with the sincerity of men and of Christians, to consult their own breasts, and seriously to consider the probable motives of those who act with them. They will then perhaps see, and they surely ought to acknowledge, that few men have acted more according to the impulse of passion, interest, and ambition, than those who have for some time past founded the tocsin of reform.

REFORMATION, in general, an act of reforming or correcting an error or abuse in religion, discipline, or the like. By way of eminence the word is used for that great alteration and reformation in the corrupted system of Christianity, begun by Luther in the year 1517.

Under the article HISTORY (fctd. ii.), the various corruptions in religion, the oppressions and usurpations of the clergy, and the extreme infolence of the popes, have been so fully treated of, that any further detail here is unnecessary. It is sufficient to observe, that, before the period of the Reformation, the Pope had in the most audacious manner declared himself the sovereign of the whole world. All the parts of it which were inhabited by those who were not Christians, he accounted to be inhabited by no-body and if Christians took it into their heads to pollute any of those countries, he gave them full liberty to make war upon the inhabitants without any provocation, and to treat them with no more humanity than they would have treated wild beasts. The countries, if conquered, were to be parcelled out according to the pope's pleasure; and dreadful was the situation of that prince who refused to obey the will of the holy pontiff, of which many instances will occur to the reader in the various historical articles of this work. In consequence of this extraordinary authority which the pope had assumed, he at last granted to the king of Portugal all the countries to the eastward of Cape Non in Africa, and to the king of Spain all the countries to the westward of it. In this, according to the opinions of some, was completed in his person the character of Antichrist sitting in the temple of God, and throwing himself as God. He had long before, say they, assumed the supremacy belonging to the Deity himself in spiritual matters; and now he assumed the same supremacy in worldly matters also, giving the extreme regions of the earth to whom he pleased. The Reformation, therefore, they consider as the immediate effect of divine power taking vengeance on this and all other deviations from the system of truth; while others consider it merely as an effect of natural causes, and which might have been foreseen and prevented, without abridging the papal power in any considerable degree.

Be this as it will, however, the abovementioned partition was the last piece of infolence which the pope ever had, or in all probability ever will have, in his power to exercise, in the way of parceling out the globe to his adherents. Everything was quiet, every heretic exterminated, and the whole Christian world sufficiently acquainted with the enormous absurdities which were inculcated upon them; when, in 1517, the empire of superstition began to decline, and has continued to do so ever since. The person who made the first attack on the extravagant superstititions then prevailing was Martin Luther; the occasion of which is fully related under LUTHER, the article Reforma-
cannot wonder at finding one man in the world who had
sense enough to discern it, and virtue enough to oppose
such an infamous practice. In all probability, however,
the insignificance of the first reformer was the reason
why he was not persecuted and exterminated at his first
beginning, as others had been before him. Another
reason probably might be, that he did not once attac-
the whole errors of Popery; but brought about his
reformation gradually, probably as it occurred to him-
self, and as we have related in the account of his life.

The Reformation began in the city of Wittemberg
in Saxony, but was not long confined either to that ci-
ty or province. In 1520 the Francisan friars, who
did the care of promulgating indulgences in Swit-
zerland, were opposed by Zuinglius, a man not inferior
in understanding and knowledge to Luther himself.
He proceeded with the greatest vigour, even at the very
beginning, to overturn the whole fabric of Popery; but
his opinions were declared erroneous by the universities
of Cologne and Louvain. Notwithstanding this, the
magistrates of Zurich approved of his proceedings; and
that whole canton, together with those of Bern, Balil,
and Chaffouin, embraced his opinions.

In Germany, Luther continued to make great ad-
vances, without being in the least intimidated by the
ecclesiastical censures which the German princes either from religious or political
motives, so that his adversaries could not accomplish his
destruction as they had done that of others. The princes,
who were upon bad terms with the court of Rome,
took advantage of the success of the new doctrines; and
in their own dominions easily overturned a church which
had lost all the respect and veneration of the inferior
ranks. The court of Rome had disobligecl some of the
smaller princes in the north of Germany, whom the
Pope probably thought too insignificant to be worth
the managing, and they universally established the Re-
formation in their own dominions. Melanachus, Carl-
philius, and other men of eminence, also greatly for-
warded the work of Luther; and in all probability the
Papacy hierarchy would have soon come to an end, in
the northern parts of Europe at least, had not the
per Charles V. given a new impulse to the progress
of reformation in Germany. In order to follow out the
schemes dictated by his ambition, he thought it neces-
sary to ingratiate himself with the pope; and the most
effectual method of doing this was by destroying Luther.
The Pope's legates infilled that Luther ought to be
condemned by the diet of Worms without either trial
or hearing; as being a most notorious, avowed, and in-
conceivable heretic. However, this appeared unjust to
the members of the diet, and he was summoned to appear;
which he accordingly did without hesitation. There
is not the least doubt that his appearance there had been
his last in this world, had not the affonishing respect
that was paid him, and the crowds who came daily to
see him, deterred his judges from delivering the church
from the author of such a pestilent heresy; which they
were strongly solicitcd by the pope's party to do. He
was therefore permitted to depart with a safe condonc
for a certain time; after which he was in the flate of a
proscribed criminal, to whom it was unlawful to perform
any of the offices of humanity.

During the confinement of Luther in a cattle near
Warburg, the Reformation advanced rapidly; almost
every city in Saxony embracing the Lutheran opinions.
At this time an alteration in the established forms of
worship was first ventured upon at Wittemberg, by abol-
ishing the celebration of private masses, and by giving
the cup as well as the bread to the laity in the Lord's
supper. In a short time, however, the new opinions were
condemned by the university of Paris, and a refutation
of them was attempted by Henry VIII. of England.
But Luther was not to be thus intimidated. He pub-
lished his animadversions on both with as much acrimo-
nity as if he had been refuting the meanest adverary;
and a controversy managed by such illustrious antago-
nists drew a general attention, and the Reformers daily
 gained new converts both in France and England.

But while the efforts of Luther were thus everywhere
successful, the divisions began to prevail among the
Reformers.

In Switzerland (see Zuinglius) concerning the manner in which the body and
blood of Christ were present in the eucharist. Luther
and his followers, though they had rejected the notion of
transubstantiation, were nevertheless of opinion that the
body and blood of Christ were really present in the
Lord's supper, in a way they could not pretend to explain.
Carloff, who was Luther's colleague, first sug-
gested another view of the subject, which was afterwards
confirmed and illustrated by Zuinglius, namely, that the
body and blood of Christ were not really present in the
eucharist; and that the bread and wine were no more
than external symbols to excite the remembrance of
Christ's sufferings in the minds of those who received
it. Both parties maintained their tenets with the ut-
moft obstinacy; and, by their divisions, first gave their
adversaries an argument against them, which to this day
the Catholics urge with great force; namely, that the
Protestants are so divided, that it is impossible to know
who is right or wrong; and that there cannot be a
stronger proof than their divisions, that the whole doc-
trine is false.

To these intestine divisions were added the horrors
ricturated of a civil war, occasioned by oppression on the one hand, es in Ger-
many and enthusiasm on the other. In 1525, a great num-
er of the most seditious fanatics which they could not pretend
to know the mind of the people, made war against the empire, laying waste the
Saxony, and Thuringia exceedingly increased, of which an account is given under the article
Anabaptists.

In the mean time Frederic, surnamed the Wyt, elec-
tor of Saxony, and Luther's greatest patron, departed this
life, and was succeeded by his brother John. Frederic,
though he had protected and encouraged Luther, yet
was at pains to introduce the reformed religion into
his
The Reformation in Saxony.

Reformations, but with his successor it was otherwise; for he, convinced that Luther's doctrine must soon be totally destroyed and suppressed unless it received a speedy and effectual support, ordered Luther and Melancthon to draw up a body of laws relating to the form of ecclesiastical government, the method of public worship, &c., which was to be proclaimed by heralds throughout his dominions. This example was followed by all the princes and states of Germany who renounced the papal supremacy; and a like form of worship, discipline, and government, was thus introduced into all the churches which differed from that of Rome. This open renunciation of the Romish jurisdiction soon changed the face of affairs: and the patrons of Popery soon intimated, in a manner not at all ambiguous, that they intended to make war on the Lutheran party; which would certainly have been put in execution, had not the troubles that took place in Europe disconcerted their measures. On the other hand, the Lutherans, apprised of their hostile intentions, began also to deliberate on a proper plan of defence against that superfluous violence with which they were in danger of being affiled. The diet of the empire assembled at Spire, in the year 1526; where the emperor's ambassadors were deputed to use their utmost endeavours to suppress all disputes about religion, and to inflict upon the rigorous execution of the sentence which had been pronounced against Luther and his followers at Worms. The greatest part of the German princes opposed this motion with the utmost resolution, declaring that they could not execute that sentence, nor come to any determination with regard to the doctrines by which it had been occasioned, before the whole matter was submitted to the decision of a council lawfully assembled; alleging farther, that the decision of controversies of this nature belonged properly to it, and to it alone. This opinion, after long and very warm debates, was adopted by a great majority, and at length confined to the whole assembly: for it was unanimously agreed to present a solemn address to the emperor, intreating him to assemble, without delay, a free and general council; while in the mean time it was also agreed, that the princes of the empire should, in their respective dominions, be at liberty to manage ecclesiastical affairs in the manner they should think most proper; yet so as to be able to give to God and the emperor a proper account of their administration when it should be required of them.

These resolutions proved extremely favourable to the cause of reformation; neither had the emperor any leisure for some time to give disturbance to the reformed. The war, which at this time ensued between him and the pope, gave the greatest advantage to the friends of the reformed, and considerably augmented their numbers. Several princes, whom the fear of persecution and punishment had hitherto prevented from lending their assistance, publicly renounced the Romish superstition, and introduced among their subjects the forms of religious worship, and the same system of doctrine, that had been received in Saxony. Others, though placed in such circumstances as discouraged them from acting in an open manner against the interests of the Roman pontiff, were, however, far from discovering the least opposition to those who withdrew the people from his despotical yoke; nor did they molest the private assemblies of those who had separated themselves from the church of Rome. And in general, all the Germans, who, before these resolutions of the diet of Spire, had rejected the papal discipline and doctrine, were now, in consequence of the liberty they enjoyed, wholly employed in bringing their schemes and plans to a certain degree of consistence, and in adding vigour and firmness to the cause in which they were engaged. But this tranquility and liberty was of no long duration. In 1529, a new diet was assembled at the same place by the emperor, after he had quieted the troubles in various parts of his dominions, and concluded a peace with the pope. The power which had been granted to princes of managing ecclesiastical affairs till the meeting of the emperor's general council, was now revoked by a majority of votes; and every change declared unlawful that should be introduced into the doctrine, discipline, or worship of the established religion, before the determination of the approaching council was known. This decree was considered as iniquitous and intolerable by the elector of Saxony, the landgrave of Hesse, and other members of the diet, who were persuaded of the necessity of a reformation. The promise of speedily assembling a general council, they looked upon to be an artifice of the church of Rome; well knowing, that a free and lawful council would be the last thing to which the pope would consent. When, therefore, they found that all their arguments and remonstrances made no impression upon Ferdinand the emperor's brother, who prefided in the diet, Charles himself being then at Barcelona, they entered a solemn protest against this decree on the 19th of April, and appeared to the emperor and a future council. Hence arose the denomination of Protestants, from which this period has been given to those who separated from the communion of the church of Rome. The princes of the empire who entered this protest were, John elector of Saxony; George elector of Brandenburg; Ernest and Francis dukes of Lauenburg; the landgrave of Hesse; and the prince of Anhalt. These were seconded by 13 imperial towns, viz. Strasburg, Ulm, Nuremberg, Constance, Rottingen, Wiem, Nortingen, Lindaw, Kempton, Heilbron, Wiltemburg; and St Gall.

The differing princes, who were the protectors and heads of the reformed churches, had no sooner entered their protest, than they sent proper pel to the emperor, who was then upon his passage from Spain to Italy, to acquaint him with their proceedings in this matter. The ministers employed in this commission executed it with the greatest intrepidity and preference of mind; but the emperor, exasperated at the audacity of those who preferred to differ from him, caused the ambassadors to be arrested. The news of this violent step made the Protestant princes conclude, that their personal safety, and the success of their cause, depended entirely upon their own courage and union. They determined, therefore, to enter into a solemn confederacy: for which purpose they held several meetings at Rot, Nuremberg, Smalecd, and other places: but so different were their opinions and views, that they could determine upon nothing.

One great obstacle to the intended confederacy was the dispute which had arisen between Luther and Zuinglius concerning the real presence of Christ in the Luther and Lord's Supper. To terminate this dispute, if possible, Zuinglius, Philip, landgrave of Hesse, invited, in the year 1529, to
a conference at Marburg, Luther and Zuinglius, together with several other of the more eminent doctors who adhered to the respective parties of these contending chiefs: but this measure was not attended with the salutary effects which were expected from it. The divines disputed for four days in presence of the landgrave. Luther attacked Occolampadius, and Zuinglius was attacked by Melancthon. Zuinglius was accused of hereby, not only on account of his explanation of the nature and design of the Lord's Supper, but also in consequence of the false notions he was supposed to have adopted concerning the divinity of Christ, the efficacy of the divine word, original sin, and some other parts of the Christian doctrine. This illustrious reformer, however, cleared himself from the greatest part of these charges with the most triumphant evidence, and in such a manner as appeared satisfactory even to Luther himself: but their collision concerning the manner of Christ's presence in the eucharist still remained; nor could either of the contending parties be persuaded to abandon, or even to modify, their opinions on that matter. The only advantage, therefore, which resulted from the meeting was, that the jarring doctors formed a kind of truce, by agreeing to a mutual toleration of their sentiments, and leaving to the disposal of Providence the cure of their divisions.

In the mean time news were received that the emperor designed to come into Germany, with a view to terminate all religious differences at the approaching diet of Augsburg. Having foreseen some of the consequences of those disputes, and, besides, taken the advice of men of wisdom, sagacity, and experience, he became at certain times more cool in his proceedings, and more impartial in his opinions both of the contending parties and the merits of the cause. He, therefore, in an interview with the pope at Bologna, infilled, in the most serious and urgent manner on the necessity of a general council. His remonstrances and expostulations, however, could not move the pontiff; who maintained with zeal the papal prerogatives, reproached the emperor with an ill-judged clemency, and alleged that it was the duty of that prince to support the church, and to execute speedy vengeance upon that obstinate heretical faction who dared to call in question the authority of Rome and its pontiff. To this discourse the emperor paid no regard; looking upon it as a most iniquitous thing, and a measure directly opposite to the laws of the empire, to condemn unheard a set of men who had always approved themselves good citizens, and deserved well of their country in several respects. Moreover indeed it was not easy for the emperor to form a clear idea of the matters in debate, since there was no regular system as yet composed, by which it might be known with certainty what were the true causes of Luther's opposition to the pope. The elector of Saxony, therefore, ordered Luther, and other eminent divines, to commit to writing the chief articles of their religious system, and the principal points in which they differed from the church of Rome. Luther, in compliance with this order, delivered to the elector at Torgau 17 articles which had been agreed upon in a conference at Sulzbach in 1529; from whence these received the name of the articles of Torgau. But though these were deemed by Luther a sufficient declaration of the sentiments of the reformers, yet it was judged proper to enlarge them, in order to give perspicuity to their arguments, and strength to their cause. In this work M. Landthun was employed; in which he showed a proper deference to the councils of Luther, and expressed his sentiments and doctrine with the greatest elegance and perspicuity; and thus came forth to view the famous Confession of Augsburg.

On the 15th of June 1530, Charles arrived at Augsburg, and the diet was opened five days after. The Protestants received a formal permission to present an account of their tenets to the diet on the 25th of the same month; in consequence of which, at the time appointed, Christian Bayer, chancellor of Saxony, read, in the German language, before the emperor and the princes assembled, the confession of Augsburg above-mentioned. It contained 28 chapters, of which 21 were employed in representing the religious opinions of the Protestants, and the other seven in pointing out the errors and superstitions of the church of Rome. The princes heard it with the deepest attention and recollection of mind: it confirmed some in the principles they had embraced; surprised others; and many, who before this time had little or no idea of the religious sentiments of Luther, were now not only convinced of their innocence, but delighted with their purity and simplicity. The copies of this Confession, which after being read were delivered to the emperor, were signed by the elector of Saxony, George marquis of Brandenburg, Ernest duke of Lauenburg, Philip landgrave of Hesse, Wolfgang prince of Anhalt, and by the imperial cities of Nuremberg and Reutlingen.

The creatures of the church of Rome who were present at this diet employed John Faber, afterwards bishop of Vienna, together with Eckius, and another doctor named Cockaus, to draw up a refutation of the Protestant confession: which refutation having been publicly read, the emperor required the Protestant members to acquiesce in it, and put an end to the religious disputes by an unlimited submission to the opinions and doctrines contained in this answer. But this demand was far from being complied with. The Protestants declared on the contrary, that they were by no means satisfied with the reply of their adversaries; and earnestly desired a copy of it, that they might more fully demonstrate its extreme insufficiency and weakness. But this reasonable request was refused by the emperor; who interpolated his supreme authority to prevent any farther proceedings in this matter, and solemnly prohibited the publication of any new writings or declarations that might contribute to lengthen out these religious debates. This, however, did not reduce the Protestants to silence. The divines of that communion, who had been present at the diet, endeavoured to recollect the arguments and objections employed by Faber, and had again recourse to the pen of Melancthon, who refused them in an ample and satisfactory manner in a piece which was presented to the emperor on the 22d of September, but which Charles refused to receive. This answer was afterwards enlarged by Mephanth, when he had obtained a copy of Faber's reply; and was published in the year 1531, with the other pieces that related to the doctrine and discipline of the Lutheran church, under the title of A Defence of the Confession of Augsburg.

Matters now began to draw towards a crisis. There were only three ways of bringing to a conclusion these religious
religious differences. 1. To grant the protestants a
tolerance and privilege of serving God as they thought 
proper: 2. To compel them to return to the church of 
Rome by the violent methods of persecution: or, 3. That a reconciliation should be made, upon fair, can-
did, and equitable terms; by engaging each of the par-
ties to temper their zeal with moderation, to abstain re-
ciprocally the vigour of their pretensions, and remit
something of their respective claims. The third ex-
dient was most generally approved of, being peculiarly 
agreeable to all who had at heart the welfare of the 
empire; nor did the pope seem to look upon it either 
with avertement or contempt. Various conferences there-
fore were held between persons eminent for piety and 
learning on both sides; and nothing was omitted that 
might have the least tendency to calm the animosities 
and heal the divisions which reigned between the con-
tending parties. But the differences were too great to 
admit of a reconciliation; and therefore the votaries of 
Rome had recourse to the powerful arguments of im-
perial editis, and the force of the secular arm. On the 
19th of November, a severe decree was issued out by 
the express order of the emperor (during the absence 
of the Hessian and Saxon princes, who were the chief 
supporters of the protestant cause), in which every thing 
was manifestly adapted to deject the friends of religious 
liberty, excepting only a faint and dubious promise of 
engaging the pope to assemble a general council about 
six months after the separation of the diet. In this de-
cree the dignity and excellence of the Popish religion 
were extolled beyond measure, a new degree of severity 
and force was added to that which had been published at 
Worms against Luther and his adherents, the changes 
which had been introduced into the doctrine and discri-
pline of the Protestant churches were severely cenosed, 
and a solemn order was addressed to the princes, cities, and 
states, who had thrown off the papal yoke, to return to 
their allegiance to Rome, on pain of incurring the indigna-
tion and vengeance of the emperor as the patron and 
protector of the church. Of this formidable decree the 
elector of Saxony and confederated princes were no sooner 
informed, than they assembled in order to deliberate on 
the measures proper to be taken in such a crisis. In 
the years 1530 and 1531 they met, first at Smallafl, and 
and afterwards at Frankfort, where they formed a 
fevere alliance and confedery, with the intention of de-
defending vigorously their religion and liberties against the 
dangers and encroachments with which they were thre-
thened by the edicts of Augsburg, without attempting, 
however, any thing offensive against the votaries of 
Rome; and into this confedery they invited the kings 
of England, France, Denmark, etc. leaving no means 
enmployed that might corroborate and cement this 
important alliance.

This confedery was at first opposed by Luther, 
from an apprehension of the calamities and troubles 
which it might produce; but at last, perceiving the 
necesity of it, he consented; though he uncharitably, 
as well as imprudently, refused to comprehend in it the 
followers of Zuinglius among the Swiss, together with the 
German states and cities who had adopted the fen-
timents and confession of Bucer. In the invitation ad-
dressed to Henry VIII. of England, whom the con-
 federated princes were willing to declare the head and 
protector of their league, the following things, among 
others, were expressly stipulated: That the king should 
encourage, promote, and maintain, the true doctrine of 
Christ as it was contained in the confession of Augs-
burg, and defend the same at the next general council: 
that he should not agree to any council summoned by 
the bishop of Rome, but protest against it; and neither 
submit to its decrees, nor suffer them to be repea-
ted in his dominions; that he should never allow the 
Rome pontiff to have any pre-eminence or jurisdiction 
in his dominions; that he should advance 100,000 crowns 
for the use of the confeders, and double that sum if 
it became necessary: all which articles the confederate 
princes were equally obliged to observe on their par-

To these demands the king replied, he would main-
tain and promote the true doctrine of Christ; but, at 
the same time, as the true ground of that doctrine lay 
only in the holy Scriptures, he would not accept at 
any one's hand what should be his own faith, or that of 
his kingdom; and therefore desired that they would send 
over two learned men to confer with him, in order to 
promote a religious union between him and the con-
fepeates. However, he declared himself of their opinion 
with regard to the meeting of a free general council, 
and promised to join with them in all such councils for 
the defence of the true doctrine; but thought the regu-
lation of the ceremonial part of religion, being a mat-
ter of indifference, ought to be left to the choice of each 
sovereign for his own dominions. After this the king 
gave them a second answer more full and satisfactory; 
but after the execution of queen Anne, this negotiation 
came to nothing. On the one hand, the king grew 
cold when he perceived that the confederales were no 
longer of use to him in supporting the validity of his 
maturity; and, on the other hand, the German princes 
became inflexible that they could never succeed with Hen-
ry unless they allowed him an absolute dictatorship in 
matters of religion.

While every thing thus tended to an open war be-
tween the two opposite parties, the elector Palatine, 
and the elector of Ments, offered their mediation, and 
devised not to produce a reconciliation. The emperor 
himself, for various reasons, was at this time inclined to 
peace: for, on the one hand, he flood in need of succours 
against the Turks, which the Protestant princes 
refused to grant as long as the edicts of Worms and 
Augsburg remained, in force; and, on the other, the 
election of his brother Ferdinand to the dignity of king of 
the Romans, which had been carried by a majority 
of votes at the diet of Cologne in 1531, was by the 
Sime princes contested, as being contrary to the funda-
mental laws of the empire. In consequence of all this, 
after many negotiations and projects of reconciliation, 
a treaty of peace was concluded at Nuremberg in 1532, 
between the emperor and the protestant princes, on the 
following conditions: viz. That the latter should fur-

ish a subsidy for carrying on the war against the Turks, 
and acknowledge Ferdinand lawful king of the Romans; 
and that the emperor on his part should abrogate and 
annul the edicts of Worms and Augsburg, and allow the 
Lutherans the free and undisturbed exercise of their re-
ligious doctrine and discipline, until a rule of faith was 
fixed either in the free general council that was to be 
assembled in the space of six months, or in a diet of the 
empire.

Soon after the conclusion of the peace at Nuremberg 
Henry VIII. of England died.
die John elector of Saxonv, who was succeeded by his son John Frederic, a prince of invincible fortitude and...The conference, however, was, for certain reasons, removed to the diet which was to be held at Ratibon that same year, and in which the principal subject of deliberation was a memorial presented by a person unknown, containing a project of peace. But the conference produced no other effect than a mutual agreement of the contending parties to refer their matters to a general council, or, if the meeting of such a council should be prevented, the next German diet.

This resolution was rendered ineffectual by a variety of incidents, which widened the breach, and put off to a farther day the deliberations which were designed to heal it. The pope ordered his legate to declare to the diet of Spire, assembled in 1542, that he would, according to the promise he had already made, assemble a general council, and that Trent Trent should be the place of its meeting, if the diet had no objection to that city. Ferdinand, and the princes who adhered to the cause of the pope, gave their consent to this proposal; but it was vehemently objected to by the Protestants, both because the council was summoned by the authority of the pope only, and, because the place was within the jurisdiction of the Pope; whereas they desired a free council, which should not be biassed by the dictates, nor awed by the proximity, of the pontiff. But this protestation produced no effect. Paul III. perilled in his purpose, and issued out his circular letters for the convocation of the council with the approbation of the emperor. In justice to this pontiff, however, it must be observed, that he showed himself not to be averse to every reformation. He appointed four cardinals, and three other persons eminent for their learning, to draw up a plan for the reformation of the church in general, and of the church of Rome in particular. The reformation proposed in this plan was indeed extremely superficial and partial, yet it contained some particulars which could scarcely have been expected from those who composed it. They complained of the pride and ignorance of the bishops, and proposed that none should receive orders but learned and pious men; and that therefore care should be taken to have proper masters for the instruction of youth. They condemned translations from one benefice to another, grants of reversion, non-residence, and pluralities. They proposed that some convents should be abolished; that the liberty of the prel should be restrained and limited; that the colleges of Erasmus should be suppressed: that no ecclesiastic should enjoy a benefice out of his own country; that no cardinal should have a bispophic; that the questors of St Anthony and several other offices should be abolished; and, which was the best of all their proposals, that the effects and personal estates of ecclesiastics should be given to the poor. They concluded with complaining of the prodigious number of indigent and ragged priests who frequented St Peter's church; and declared, that it was a great scandal to see the whores lodged so magnificently at Rome, and riding through the streets on fine mules, while the cardinals and other ecclesiastics accompanied them in the most courteous manner.

This plan of reformation was turned into ridicule by Luther and Sturmii; and indeed it left unredressed the most intolerable grievances of which the Protestants complained.

All this time the emperor had been labouring to war he persuaded the Protestants to confer to the meeting of the council at Trent; but when he found them fixed in their opposition to this measure, he began to listen to the fanguineous measures of the pope, and resorted to terminate the disputes by force of arms. The elector of Saxony and landgrave of Hesse, who were the chief supporters of the Protestant cause, upon this took proper
proper measures to prevent their being surprised and overwhelmed by a superior force; but, before the horrors of war commenced, the great reformer Luther died in peace at Aydelben, the place of his nativity, in 1546.

The emperor and the pope had mutually resolved on the destruction of all who should dare to oppose the council of Trent. The meeting of it was to serve as a signal for taking up arms; and accordingly its deliberations were scarcely begun in 1546, when the Protestants perceived undoubted signs of the approaching storm, and a formidable union between the emperor and pope, which threatened to crush and overwhelm them at once. This year indeed there had been a new conference at Ratibon upon the old subject of accommodating differences in religion; but from the manner in which the debates were carried on, it plainly appeared that these differences could only be decided in the field of battle. The council of Trent, in the mean time, promulgated their decrees; while the reformed princes, in the diet of Ratibon, protested against their authority, and were on that account proscribed by the emperor, who raised an army to reduce them to obedience. See Father Paul's History of the Council of Trent, and our articles Paul (Father), and Trent.

The elector of Saxony and the landgrave of Heife led their forces into Bavaria against the emperor, and cannonaded his camp at Ingoldstalt. It was supposed that this would bring on an engagement, which would probably have been advantageous to the cause of the reformed; but this was prevented, chiefly by the perfidy of Maurice duke of Saxony, who invaded the dominions of his uncle. Divisions were also fomented among the confederate princes, by the dissimulation of the emperor; and France failed in paying the subsidy which had been promised by its monarch: all which so discouraged the heads of the Protestant party that their army soon dispersed, and the elector of Saxony was obliged to direct his march homewards. He was purfued by the emperor, who made several forced marches, with a view to destroy his enemy before he should have time to recover his vigour. The two armies met near Muhlberg, on the Elbe, on the 24th of April 1547; and, after a bloody action, the elector was entirely defeated, and himself taken prisoner. — Maurice, who had so basely betrayed him, was now declared elector of Saxony; and by his intruces Philip landgrave of Heife, the other chief of the Protestants, was persuaded to throw himself on the mercy of the emperor, and to implore his pardon. To this he consented, relying on the promise of Charles for obtaining forgiveness, and being restored to liberty; but, notwithstanding these expectations, he was unjustly detained prisoner, by a scandalous violation of the most solemn convention. It is said that the emperor rattrad his promise, and deluded this unhappy prince by the ambiguity of two German words. History indeed can scarce afford a parallel to the perfidious, mean-spirited, and despotic behaviour of the emperor in the present cafe. After having received in public the humble submission of the prince on his knees, and after having set him at liberty by a solemn treaty, he had him arrested anew without any reason, nay, without any pretence, and kept him close prisoner for several years. When Maurice remonstrated against this new confinement, the emperor answered, that he had never promised that the landgrave should not be imprisoned anew, but only that he should be exempted from perpetual imprisonment; and, to support this afferion, he produced the treaty, in which his ministers had perambiously foiled einiger gefangnis, which signifies a "perpetual prison," instead of einiger gefangnis, which signifies "any prison." This, however, is contended by some historians.

The affair of the Protestants now seemed to be desperate. In the diet of Augsburg, which was soon after called, the emperor required the Protestants to leave the decision of these religious disputes to the wisdom of the council which was to meet at Trent. The greatest part of the members consented to this proposal, being convinced by the powerful argument of an imperial army, which was at hand to disper the darknes from the eyes of such as might otherwise have been blind to the force of Charles's reasoning. However this general submission did not produce the effect which was expected from it. A plague which broke out, or was said to do so, in the city, caused the greatest part of the bishops to retire to Bologna; by which means the council was in effect dissolved, nor could all the intreaties and remonstrances of the emperor prevail upon the pope to reassemble it without delay. During this interval therefore, the emperor judged it necessary to fall upon some method of accommodating the religious differences, and maintaining peace until the council so long expected should be finally obtained. With this view he ordered Julius a formulae of the church of Rome, Michael Sidonius, a dymanent creature of the pope, and John Agricola, a native of Ayeleben, to draw up a formulary which might serve as a rule of faith and worship, till the council should be assembled; but as this was only a temporary expedient, and had not the force of a permanent or perpetual institution, it thence obtained the name of the Interim.

This project of Charles was formed partly with a design to vent his resentment against the pope, and partly to answer other political purposes. It contained all the essential doctrines of the church of Rome, though considerably softened by the artful terms which were employed, and which were quite different from those employed before and after this period by the council of Trent. There was even an affected ambiguity in many of the expressions, which made them susceptible of different senses, and applicable to the sentiments of both communions. The consequence of all this was, that the imperial creed was represented both by the Schismatics and the Pope. However, it was promulgated with great solemnity by the emperor at Augsburg. The elector of Mentz, without even asking the opinion of the princes, preface, gave a sanction to this formulary, as if he had been commissioned to represent the whole diet. Many kept silence through fear, and that silence was interpreted as a tacit consent. Some had the courage to oppose it, and these were reduced by force of arms; and the most deplorable scenes of bloodshed and violence were acted throughout the whole empire. Maurice, elector of Saxony, who had hitherto kept neutral, now assembled the whole of his nobility and clergy, in order to deliberate on this critical affair. At the head of the latter was Melanthon, whose word was respected as a law among the Protestants. But this
this plan had not the courage of Luther; and was therefore on all occasions ready to make conciliations, and to prepare schemes of accommodation. In the present case, therefore, he gave it as his opinion, that the whole of the book called Interim could not by any means be adopted by the protestants; but at the same time he declared, that he saw no reason why this book might not be approved, adopted, and received, as an authoritative rule in things that did not relate to the essential parts of religion, and which he accounted indifferent. But this scheme, instead of cementing the differences, made them much worse than ever; and produced a division among the Protestants themselves, which might have overthrown the Reformation entirely, if the emperor and pope had feiz'd the opportunity.

In the year 1549, the pope (Paul III.) died; and was succeeded by Julius III, who, at the repeated solicitations of the emperor, contented to the re-assembling of a council at Trent. A diet was again held at Augsburg under the cannon of an imperial army, and Charles laid the matter before the princes of the empire. Most of those present gave their consent to it, and among the rest Maurice elector of Saxony; who contented on the following conditions: 1. That the points of doctrine which had already been decided there, should be re-examined. 2. That this examination should be made in presence of the Protestant divines. 3. That the Saxony Protestants should have a liberty of voting as well as of deliberating in the council. 4. That the pope should not pretend to preside in that assembly, either in person or by his legates. This declaration of Maurice was read in the diet, and his deputies inquired upon its being entered into the regula that the archbishop of Mentz obstinately refused. The diet was concluded in the year 1551; and, at its breaking up, the emperor declared the assembled princes and states to prepare all things for negotiating a league or war of Smalcald. After various debates, the following acts were passed, on the 25th of September: That the Protestants, who followed the Confession of Augsburg should be for the future considered as entirely free from the jurisdiction of the Roman pontiff, and from the authority and superintendence of the bishops; that they were left at perfect liberty to enact laws for themselves relating to their religious sentiments, discipline, and worship; that all the inhabitants of the German empire should be allowed to judge for themselves in religious matters, and to join themselves to that church whose doctrine and worship they thought the most pure and consonant to the spirit of true Christianity; and that all those who should injure or persecute any person under religious pretences, and on account of their opinions, should be declared and proceeded against as public enemies of the empire, invaders of its liberty, and disturbers of its peace.

Thus was the Reformation established in many parts of the German empire, where it continues to this day; nor have the efforts of the Popish powers at any time been able to suppress it, or even to prevent it from gaining ground. It was not, however, in Germany alone that a reformation of religion took place. At the same moment all the kingdoms of Europe began to open their eyes to the truth about the same time. The reformed religion was propagated in Sweden, soon after Luther's rupture with the church of Rome, by one of his disciples named Olaus Petri. The zealous efforts of this missionary were seconded by Gustavus Vasa, whom the Swedes had raised to the throne in place of Christian king of Denmark, whose horrid barbarity left him the crown. This prince, however, was as prudent
prudent as he was zealous; and, as the minds of the Swedes were in a fluctuating state, he wisely avoided all kind of vehemence and precipitation in spreading the new doctrine. Accordingly, the first object of his attention was the instruction of his people in the sacred doctrines of the Holy Scriptures: for which purpose he invited into his dominions several learned Germans, and spread abroad through the kingdom the Swedish translation of the Bible that had been made by Olaus Petri. Some time after this, in 1526, he appointed a conference at Upsal, between this reformer and Peter Gallius, a zealous defender of the ancient superstition, in which each of the champions was to bring forth his arguments, that it might be seen on which side the truth lay. In this dispute Olaus obtained progress very early. Margaret queen of Navarre, a signal victory; and her piety, once more confirmed and multiplied, was established in her dominions by the death of her husband the empifer in 1530. The reformation in Sweden was entirely overthrown, and Gustavus declared head of the church. with a view to please his clergy in general, even some of the episcopal order. But as their cruelty, as well as their ignorance, and the fanaticism of the people, were in a fluctuating state, the authority of the king intervened, and many persons eminent for their virtue and piety were put to death in the most barbarous manner. Indeed Francis, who had neither the means of toleration nor the power of persecution, conformed himself towards the Protestants in such a manner as beat answered his private views. Sometimes he resolved to invite Melanthon into France, probably with a view to please his litter the queen of Navarre, whom he loved tenderly, and who had strongly imbibed the Protestant principles. At other times he exercised the most infernal cruelty towards the reformed; and once made the following mad declaration, That if he thought the blood in his arm was tainted by the Lutheran heresy, he would have it cut off; and that he would not spare even his own children, if they entertained sentiments contrary to those of the state of Luther.

About this time the famous Calvin began to draw the attention of the public, but more especially of the queen of Navarre. His zeal exposed him to danger; and the friends of the reformation, whom Francis was daily committing to the flames, placed him more than once in the most perilous situation, from which he was delivered by the interposition of the queen of Navarre. He therefore retired out of France to Basle in Switzerland; where he published his Christian Institutes, and became afterwards so famous.

These among the French who first renounced the jurisdiction of the Romish church, are commonly called Lutherans by the writers of those early times. Hence it has been supposed that they had all imbibed the peculiar sentiments of Luther. But this appears by no means to have been the case: for the vicinity of the cities of Geneva, Lausanne, &c., which had adopted the doctrines of Calvin, produced a remarkable effect upon the French Protestant churches; insomuch that, about the middle of this century, they all entered into communion with the church of Geneva. The French Protestants were called Huguenots by their ad-
In England, the principles of the reformation begun to be adopted, not as an account of Luther's land, but the duties could be conveyed thither. In that kingdom there were still great remains of the sect called Lollards, whose doctrine resembled that of Luther; and among whom, of consequence, the sentiments of our reformers gained great credit. Henry VIII. king of England at that time was a violent partisan of the church of Rome, and had a particular veneration for the writings of Thomas Aquinas. Being informed that Luther spoke of his favourite author with contempt, he conceived a violent prejudice against the reformer, and even wrote against him, as we have already observed. Luther did not hesitate at writing against his majesty, overcame him in argument, and treated him with very little ceremony. The first step towards public reformation, however, was not taken till the year 1520. Great complaints had been made in England, and of a very ancient date, of the usurpations of the clergy; and by the prevalence of the Lutheran opinions, these complaints were now become more general than before. The House of Commons, finding the occasion favourable, passed several bills, restraining the impositions of the clergy: but what threatened the ecclesiastical order with the greatest danger were the severer reproaches thrown out almost without opposition in the house against the diabolic lives, ambition, and avarice of the priests, and their continual encroachments on the privileges of the laity. The bills for regulating the clergy met with opposition in the House of Lords; and bishop Fisher imputed them to want of consultation. The Commons, and to a formed design, proceeding from heretical and Lutheran principles, of robbing the church of her patrimony, and overthrowing the national religion. The Commons, however, complained...
ed to the king, by their speaker Sir Thomas Audley, of these reflections thrown out against them; and the bishop was obliged to retract his words.

Though Henry had not the least idea of rejecting any, even of the most absurd Roman superfluities, yet as the operations of the clergy futed very ill with the violence of his own temper, he was pleased with every opportunity of lessening their power. In the parliament of 1531, he showed his design of humbling the clergy in the most effectual manner. An obloste statute was revived, from which it was pretended that it was criminal to submit to the legate's power which had been exercised by cardinal Wolsey. By this stroke the whole body of clergy was declared guilty at once. They were too well acquainted with Henry's disposition, however, to reply, that their ruin would have been the certain consequence of their not submitting to Wolsey's commission which had been given by royal authority. Instead of making any defence of this kind, they chose to throw themselves on the mercy of their sovereign; which, however, it well knew 118,849, to procure. A confession was likewise extorted from them, that the king was protector and supreme head of the church of England; though some of them had the dexterity to get a clause inferred, which invalidated the whole subliminon, viz. in so far as is permitted by the law of Christ.

The king, having thus begun to reduce the power of the clergy, kept no bounds with them after wards. He did not indeed attempt any reformation in religious matters; nay, he persecuted most violently such as did attempt this in the least. Indeed, the most essential article of his creed seems to have been his own supremacy; for whoever denied this, was sure to suffer the most severe penalties, whether Protestant or Papist. But an account of the absurd and cruel conduct of this prince, and of his final quarrel with the pope on account of his refusing a dispensation to marry Anne Boleyn, is given under the article England, n° 253—292.

He died in 1547, and was succeeded by his only son Edward VI. This amiable prince, whose early youth was crowned with that wisdom, sagacity, and virtue, that would have done honour to advanced years, gave new spirit and vigour to the Protestant cause, and was its brightest ornament, as well as its most effectual supporter. He encouraged learned and pious men of foreign countries to settle in England, and addressed a particular invitation to Martin Bucer and Paul Fagius, whose moderation added a lustre to their other virtues, that, by the ministry and labours of these eminent men, in concert with those of the friends of the Reformation in England, he might purg his dominions from the forcid fetions of popery, and establish the pure doctrines of Christianity in their place. For this purpose, he inflicted on the wisest orders for the reformation of true religion; but his reign was too short to accomplish fully such a glorious purpose. In the year 1553, he was taken from his loving and afflicted subjects, whose sorrow was insupportable, and joined to their lofs.

His sister Mary (the daughter of Catharine of Arragon, from whom Henry had been separatcd by the famous divorce), a furious bigot to the church of Rome, and a princess whose natural character, like the spirit of her religion, was deplorable and cruel, succeeded him on the thronc, and imposed anew the abjura ry laws and the tyrannical yoke of Rome upon the people of England. Nor were the methods the employed in the cause of superstition better than the cause itself, or tempered by any sentiments of equity or compassion. Barbarous tortures and death, in the most shocking forms, awaited those who opposed her will, or made the least stand against the restoration of popery. And among many other victims, the learned and pious Cranmer, archbishop of Canterbury, who had been one of the most illustrious instruments of the Reformation in England, fell a sacrifice to her fury. This odious scene of persecution was happily concluded in the year 1558, by the death of the queen, who left no issue; and, as soon as her successor, the lady Elizabeth ascended the throne, all things assumed a new and a pleasing aspect. This illustrious princess, whose sentiments, counsels, and projects, breathed a spirit superior to the natural subordination and delicacy of her sex, exerted this vigorous and manly spirit in the defence of oppressed conscience and expiring liberty, broke anew the despotic yoke of papal authority and superstition, and, delivering her people from the bondage of Rome, established that form of religious doctrine and ecclesiastical government which still subsists in England. This religious establishment differs, in some respects, from the plan that had been formed by those whom Edward VI. had employed for promoting the cause of the Reformation, and approaches nearer to the rites and discipline in former times; though it is widely different, and, in the most important points, entirely opposite to the principles of the Roman hierarchy. See England, n° 293, &c.

The cause of the reformation underwent in Ireland in Ireland, the same vicissitudes and revolutions that had attended it in England. When Henry VIII. after the abolition of the Papal authority, was declared supreme head upon earth of the church of England, George Brown, a native of England, and a monk of the Augustinian order, whom that monarch had created, in the year 1535, archbishop of Dublin, began to act with the utmost vigour in consequence of this change in the hierarchy. He purged the churches of his diocese from superstitious in all its various forms, pulled down images, destroyed relics, abolished absurd and idolatrous rites, and, by the influence as well as authority he had in Ireland, cauèd the king's supremacy to be acknowledged in that nation. Henry showed, soon after, that this supremacy was not a vain title; for he banished the monks out of that kingdom, confiscated their revenues, and destroyed their convents. In the reign of Edward VI., still farther progress was made in the removal of Popish superfluities, by the zealous labours of bishop Brown, and the auspicious encouragement he granted to all who exerted themselves in the cause of the Reformation. But the death of this excellent prince, and the accession of queen Mary, had like to have changed the face of affairs in Ireland as much as in England; but her designs were disappointed by a very curious adventure, of which the following account has been copied from the papers of Richard earl of Cork.

"Queen Mary having dealt severely with the Protestants in England, about the latter end of her reign signed a commission for to take the same course with them in Ireland; and to execute the same with greater force, the nominates Dr. Cole one of the commissioners. This Doctor coming, with the commission, to Chelter

Vol. X VI.
on his journey, the mayor of that city hearing that her majesty was sending a messenger into Ireland, and being a churchman, waited on the Doctor, who in discourse with the mayor taketh out of a clote-bag a leather box, saying unto him, Here is a commiffion that shall lye the Heretics of Ireland, calling the Protestants by that title. The good woman of the house being well affected to the Protestant religion, and also having a brother named John Edmonds of the same, then a citizen in Dublin, was much troubled at the Doctor’s words; but watching her convenient time while the mayor took his leave, and the Doctor complimented him down the flairs, she opens the box, takes the commiffion out, and places it in lieu thereof a sheet of paper with a pack of cards wrapt up therein, the knave of clubs being faced up-permoft. The doctor coming up to his chamber supped nothing of what had been done put up the box as formerly. The next day going to the water-fide, wind and weather serving him, he sails towards Ireland and landed on the 7th of October 1558 at Dublin. Then coming to the castle, the Lord Fitz-Walters being lord-deputy, went for him to come before him and the privy-council; who, coming in, after he had made a speech relating upon what account he came over, he presents the box unto the lord-deputy; who causing it to be opened, that the secretary might read the commiffion, there was nothing save a pack of cards with the knave of clubs uppermoft; which not only startled the lord-deputy and council, but the Doctor, who affured them he had a commiffion, but knew not how it was given. Then the lord-deputy made answer: Let us have another commiffion; and they shall shuffte the cards in the meanwhile. The Doctor being troubled in his mind, went away, and returned into England, and coming to the court obtained another commiffion; but staying for a wind on the water-side, news came to him that the queen was dead: and thus God preferred the Protestants of Ireland.” Queen Elizabeth was so delighted with this story, which was related to her by lord Fitz-Walter on his return to England, that she sent for Elizabeth Edmonds, whose husband’s name was Matterlad, and gave her a pension of 40 l. during her life.

In Scotland, the seeds of reformation were very early sown, by several noblemen who had refided in Germany during the religious disputes there. But for many years it was suppressed by the power of the pope, seconded by inhuman laws and barbarous executions. The most eminent opponent of the Papal Juridiction was John Knox, a disciple of Calvin, a man of great zeal and invincible fortitude. On all occasions he raised the drooping spirits of the reformers, and encouraged them to go on with their work notwithstanding the opposition and treachery of the queen-regent; till at last, in 1561, by the affi*ance of an English army sent by Elizabeth, Porper was in a manner totally extirpated throughout the kingdom. From this period the form of doctrine, worship, and discipline established by Calvin at Gheyva, had the ascendancy in Scotland. But for an account of the difficulties which the Scottifh reformers had to struggle with, and the manner in which they were overcome, &c. see Scotland.

For further information on the subject of the reformation in general, we refer our readers to the works of Burnet and Brandt, to Beaufobre’s Histoire de la Réformation dans l’Empire, et les États de la Conféffion d’Auguebourg depuis 1517—1550, in 4 vol. 8vo. Berlin Refeditor 1785, and Melchior’s Ecclesiastical History. See also Sleidan De Status Religionis & Republica Croelo V.; C参保ar Commentarii; and father Paul’s history of the Council of Trent.

REFRACTION, in general, is the deviation of a moving body from its direct course, occasioned by the different densitv of the medium in which it moves; or it is a change of direction occasioned by a body’s falling obliquely out of one medium into another. The word is chiefly made use of with regard to the rays of light. See Optics (Index) at Refraction.

REFRANGIBILITY OF LIGHT, the disposition of rays to be refracted. The term is chiefly applied to the disposition of rays to produce different colours, according to their different degrees of refrangibility. See Chromatics and Optics paffim.

REFRIGERATIVE, in medicine, a remedy which refrethes the inward parts by cooling them; as cydters, pilfins, &c.

REFRIGERATORY, in chemistry, a vessel filled with cold water, through which the worm paffes in dilfolution; the use of which is to condense the vapours as they pass through the worm.

Cities of Refuge, were places provided as Asylums, for such as against their will should happen to kill a man. Of these cities there were three on each side Jordan; on this side were Kedesh of Naphtali, Hebron, and Schechem; beyond Jordan were Bezer, Golon, and Ramoth-Gilead. When any of the Hebrews, or strangers that dwelt in their country, happened to spill the blood of a man, they might retire thither to be out of the reach of the violent attempts of the relations of the deceased, and to prepare for their defence and justification before the judges. The manflayer underwent two trials: first before the judges of the city of refuge to which he had fled; and secondly before the judges of his own city. If found guilty, he was put to death with all the severity of the law. If he was acquitted, he was not immediately set at liberty; but, to inspire a degree of horror against even involuntary homicide, he was conduc¢ed to the place of refuge, and obliged to continue there in a fort of banishment till the death of the high-priest. If, before this time, he ventured out, the revenger of blood might freely kill him, but after the high-priests death he was at liberty to go where he pleased without molestation. It was necessary that the person who fled to any of the cities of refuge should understand some trade or calling that he might not be burdensome to the inhabitants. The cities of refuge were required to be well supplied with water and necessary provisions. They were also to be of easy access to have good roads leading to them, with commodious bridges where there was occasion. The width of the roads was to be 42 cubits or 48 feet at least. It was further required, that at all cross-ways direction-poles should be erected, with an inscription pointing out the road to the cities of refuge. The 15th of Adar, which answers to our February moon, was appointed for the city magistrates to see that the roads were in good condition. No person in any of these cities was allowed to make weapons, lest the relations of the deceased should be furnished with the means of gratifying their revenge. Deut. xix. 3. iv. 41. 43.; Joh. xx. 7. Three other cities of refuge were conditionally promised, but never granted. See Asylum.
REFUGEES, a term at first applied to the French Protestants, who, by the revocation of the edict of Nantes, were constrained to fly from persecution, and take refuge in foreign countries. Since that time, however, it has been extended to all such as leave their country in times of danger or distress; and hence, since the American Revolution, the English frequently heard of American refugees.

REGALE, a magnificent entertainment or treat, given to ambassadors and other persons of distinction, to entertain or do them honour.

It is usual in Italy, at the arrival of a traveller of eminence, to send him a regale, that is, a present of sweetmeats, fruits, &c. by way of refreshment.

REGALIA, in law, the rights and prerogatives of a king. See Prerogative.

Regalia is also used for the apparatus of a coronation; as the crown, the sceptre with the cross, that with the dove, that with the shield, the globe, and the orb with the cross, four several swords, &c. — The regalia of Scotland were deposited in the castle of Edinburgh in the year 1707, in what is called the Jewel Office. This room was lately opened by some commissioners appointed by the king, when the large chest in which it is supposed they were placed was found; but as it has not, that we have heard of, been opened, it is impossible to say whether they be there or not. It is very generally thought they were carried to the Tower of London in the reign of Queen Anne; and a crown is there shewn which is called the Scotch crown. We do not believe, however, that that is the real crown of Scotland; and think it probable that the Scotch regalia are in the chest which was lately found. If they are not there, they must have been taken away by theft, and either destroyed or melted down, for we do not believe that they are in the Tower of London.

Lord of Regality, in Scots law. See Law, n° 245. See Forest-Courts.

REGARDS, in heraldry, signifies looking behind; and it is used for a lion, or other beast, with his face turned towards his tail.

REGARDER, an ancient officer of the king's forest, sworn to make the regard of the forest every year; that is, to take a view of its limits, to inquire into all offences and defaults committed by the foresters within the forest, and to observe whether all the officers executed their respective duties. See Forest-Laws.

REGATA, or Regatta, a species of amusement peculiar to the republic of Venice. This spectacle has the power of exciting the greatest emotions of the heart, admiration, enthusiasm, and sense of glory; and the whole train of our poetical feelings. The grand regata is only exhibited on particular occasions, as the visits of foreign princes and kings at Venice.

It is difficult to give a just idea of the ardour that the notice of a regata spreads among all classes of the inhabitants of Venice. Proud of the exclusive privilege of giving such a spectacle, through the wonderful local circumstances of their city, they are highly delighted with making preparations a long time before, in order to contribute all they can towards the perfection and enjoyment of the spectacle. A thousand interests are formed and augmented every day; parties in favour of the different competitors who are known; the protection of young noblemen given to the gondoliers in their service; the desire of honours and rewards in the aspirants; and, in the midst of all this, that ingenuous national industry, which awakes the Venetians from their habitual indolence, to derive advantage from the business and agitation of the moment: all these circumstances united give to the numerous inhabitants of this lively city a degree of spirit and animation which render it during that time a delightful abode in the eyes of the philosopher and the stranger. Crowds of people flock from the adjacent parts, and travellers joyfully repair to this scene of gaiety and pleasure.

Although it is allowable for any man to go and inscribe his name in the list of combatants until the fixed number is complete, it will not be amiss to remark one thing, which his relation to more ancient times. The rate of a gondolier is of much consideration among the people; which is very natural, that having been the cola.

The grand regata is only carried so far, that, in the disputes frequently arising among the gondoliers in their ordinary passage of the canals, we sometimes see a quarrel instantly made up by the simple interposition of a third person, who has chanced to be of this reverend body. They are rigid with respect to alliances in their families, and they undertake reciprocally to give and take their wives among those of their own rank. But we must remark here, with pleasure, that those distinctions infer no inequality of condition, nor admit any oppression of inferiors, being founded solely on laudable and virtuous opinions. Distinctions derived from fortune only, are those which always outrage nature, and often virtue.

In general, the competitors at the great regatas are chosen from among these families of reputation. As soon as they are fixed upon for this exploit, they spend the intermediate time in preparing themselves for it, by a daily affiduous and fatiguing exercise. If they are in service, their masters during that time not only give them their liberty, but also augment their wages. This custom would seem to indicate, that they look upon them as persons consecrated to the honour of the nation, and under a sort of obligation to contribute to its glory.

At last the great day arrives. Their relations assemble together: they encourage the heroes, by calling to their minds the records of their families; the women present the oak, beseeching them, in an epic tone, to remember that they are the sons of famous men, whose steps they will be expected to follow: this they do with as much solemnity as the Spartan women presented the shield to their sons, bidding them either return with or upon it. Religion, as practised among the lower class of people, has its share in the preparations for this enterprise. They cause altars to be raised; they make vows to some particular church; and they arm their boats for the contest with the images of those gods who are most in vogue. Sorcerers are not forgotten upon
REGEL, RIGEL, a fixed star of the first magnitude, in Orion's left foot.

REGENERATION, in theology, the act of being born again by a spiritual birth, or the change of heart and life experienced by a person who forlakes a course of vice, and sincerely embraces a life of virtue and piety.

REGENSBOURG, or RATSBURG. See RATS'BOHN.

REGENT, one who governs a kingdom during the minority or absence of the king.

In France, the queen-mother had the regency of the kingdom during the minority of the king, under the title of queen-regent.

In England, the methods of appointing this guardian or regent have been so various, and the duration of his power so uncertain, that from hence alone it may be collected that his office is unknown to the common law; and therefore (as Sir Edward Coke says, 4 Inst. 58.) the surest way is to have him made by authority of the great council in parliament. The earl of Pembroke by his own authority assumed in very troubled some times the regency of Henry III. who was then only nine years old; but was declared of full age by the pope at 17, confirmed the great charter at 18, and took upon him the administration of the government at 20.

A guardian and council of regency were named for Edward III. by the parliament, which deposed his father; the young king being then 15, and not assuming the government till three years after. When Richard II. succeeded at the age of 11, the duke of Lancaster took upon him the government of the kingdom till the parliament met, which appointed a nominal council to assist him.

Henry V. on his death-bed named a regent and a guardian for his infant son Henry VI. then nine months old; but the parliament altered his disposition, and appointed a protector and council, with a special limited authority. Both these princes remained in a state of pupilage till the age of 23. Edward V. at the age of 13, was recommended by his father to the care of the duke of Gloucester; who was declared protector by the privy-council. The statutes 25 Hen. VIII. c. 12. and 28 Hen. VIII. c. 7. provided, that the successor, if a male and under 18, or if a female and under 16, should be till such age in the government of his or her natural mother, (if approved by the king,) and such other uncials as his majesty should by will or otherwise appoint: and he accordingly appointed his 16 executors to have the government of his son Edward VI., and the kingdom, which executors elected the earl of Hartford protector.

The statutes 24 Geo. II. c. 24. in case the crown should descend to any of the children of Frederick late prince of Wales under the age of 18, appointed the princess dowager; and that if of Geo. III. c. 27. in case of a like descent to any of his present Majesty's children, empowers the king to name either the queen...
REG

REGIAM MAJESTATEM. See Law, No. clv. 3.

REGICIDE, KIng-KIllER, a word chiefly used in England in speaking of the persons concerned in the trial, condemnation, and execution, of king Charles I.

REGIFUGIUM was a feast celebrated at Rome on the 24th of February, in commemoration of the expulsion of Tarquinius Superbus, and the abolition of regal power. It was also performed on the 26th of May, when the king of the Lucanians, or Rex Sacrorum, offered bean flour and bacon, in the place where the assemblies were held. The sacrifice being over, the people halted away with all speed, to denote the precipitate flight of King Tarquin.

REGIMEN, the regulation of diet, and, in a more general sense, of all the non-naturals, with a view to preserve or restore health. See Abstinence, Aliment, Food, Diet, Drink, and Medicine.

The vicissitude of exercise and rest forms also a necessary part of regimen. See Exercise.

It is beneficial to be at rest now and then, but more frequently to use exercise, because inaction renders the body weak and lillifes, and labour strengthens it. But a medium is to be observed in all things, and too much fatigue is to be avoided; for frequent and violent exercise overpowers the natural strength, and weakens the body; but moderate exercise ought always to be used before meals. Now, of all kinds of exercise, riding on horseback is the most convenient: or if the person be too weak to bear it, riding in a coach, or at least in a litter; next follow fencing, playing at ball, running, walking. But it is one of the inconveniences of old age, that there is seldom sufficient strength for using bodily exercise, though it be extremely requisite for health: wherefore frolics with the flesh-brush are necessary at this time of life; which should be performed by the person himself, if possible; if not, by his servants.

Sleep is the sweetest food of cares, and restorer of strength; as it repairs and replaces the waifies that are made by the labours and exercises of the day. But excessive sleep has its inconveniences; for it blunts the senses, and renders them less fit for the duties of life. The proper time for sleep is the night, when darkness and silence invite and bring it on; day-sleep is lefs refreshing; which rule if it be proper for the multitude to observe, much more is the observance of it necessary for persons addicted to literary studies, whose minds and bodies are more susceptible of injuries.

Regimen, in grammar, that part of syntax, or construction, which regulates the dependency of words, and the alterations which one occasions in another.

Regimen for Seamen. See Seamen.

REGIMENT, is a body of men, either horse, foot, or artillery, commanded by a colonel, lieutenant-colonel, and major. Each regiment of foot is divided into companies; but the number of companies differs: though in Britain the regiments are generally 10 companies, one of which is always grenadiers, exclusive of the two independent companies. Regiments of horse are commonly 10 troops, but there are some of nine. Dragoon regiments are generally in war-time 8 troops, and in time of peace but 6. Each regiment has a chaplain, quarter-master, adjutant, and surgeon. Some German regiments consist of 2000 foot; and the regiment of Picardy in France consisted of 6000, being 120 companies, of 50 men in each company.

Regi.
Regiments were first formed in France in the year 1558, and in England in the year 1660.

REGION, in geography, a large extent of land, inhabited by many people of the same nation, and enclosed within certain limits or bounds.

The modern astronomers divide the moon into several regions, or large tracts of land, to each of which they give its proper name.

Region, in physiology, is a division or part of the body, or the whole expanse of the. atmosphere.

In this region reign a perpetual, equable, quiet state, in which the clouds rise; and where meteors are formed, extending from the extremity of the lowest to the tops of the highest mountains. The least region is that in which we breathe, which is bounded by the reflection of the sun's rays; or by the height to which they rebound from the earth. See Atmosphere and Air.

Ethereal Region, in cosmography, is the whole extent of the universe, in which is included all the heavenly bodies, and even the orb of the fixed stars.

Elementary Region, according to the Aristotleans, is that sphere terminated by the concavity of the moon's orb, comprehending the atmosphere of the earth.

Region, in anatomy a division of the human body, otherwise called cavity, of which anatomists reckon three, viz. the upper region, or that of the head; the middle region, that of the thorax or breast; and the lower, the abdominal, or belly. See Anatomy.

Region, in ancient Rome, was a part or division of the city. The regions were only four in number, till Augustus Caesar's time, who divided the city into fourteen; over each of which he settled two surveyors, called curatores viarum, who were appointed annually, and took their divisions by lot. These fourteen regions contained four hundred and twenty-four streets, thirty-one of which were called greater or royal streets, which began at the girt pillar that stood at the entrance of the open place in the middle of the city. The extent of these divisions varied greatly, some being from 1200 to 2000 feet, others to 3000 feet or upwards in circumference.

Authors, however, are not agreed as to the exact limits of each. The curatores viarum wore the purple, had each two lictors in their proper divisions, had flaves under them to take care of fires, that happened to break out. They had also two officers, called denunciatores, in each region to give account of any disorders. Four vice-magistrati also were appointed in each street, who took care of the streets allotted them, and carried the orders of the city to each citizen.

REGISTER, a public book, in which are entered and recorded memoirs, acts, and minutes, to be had recourse to occasionally for knowing and proving matters of fact. Of these there are several kinds; as,

1. Register of deeds in Yorkshire and Middlesex, in which are registered all deeds, conveyances, wills, &c. that affect any lands or tenements in those counties, which are otherwise void against any subsequent purchasers or mortgagors, &c. but this does not extend to any copyhold estate, nor to leases at a rack-rent, or where they do not exceed 21 years. The registered memorials must be ingrossed on parchment, under the hand and seal of some of the grantors or grantees, attestted by witnesses who are to prove the signing or sealing of them and the execution of the deed. But these registers, which are confined to two counties, are in Scotland general, by which the laws of North Britain are rendered very easy and regular. Of these there are two kinds; the one general, fixed at Edinburgh, under the direction of the lord-register; and the other is kept in the several shires, deaneries, and regalities, the clerks of which are obliged to transfer the registers of their respective courts to the general register.

2. Parish-registers are books in which are registered the baptisms, marriages, and burials, of each parish.

Registers were kept both at Athens and Rome, in which were inscribed the names of such children as were to be brought up, as soon as they were born. Marcus Aurelius required all free persons to give in accounts of their children, within 30 days after the birth, to the treasurer of the empire, in order to their being deposited in the temple of Saturn, where the public acts were kept. Officers were also appointed as public regis­ ters in the provinces, that the urine might be had to their lists of names, for settling disputes, or proving any person's freedom.

Register-ships, in commerce, are vessels which obtain a permission either from the king of Spain, or the council of the Indies, to traffic in the ports of the Spanish West Indies; which are thus called, from their being registered before they set sail from Cadiz for Buenos Ayres.

Registers, in chemistry, are holes, or chimneys, the flues of furnaces, to regulate the fire; that is, to make the heat more intense or remiss, by opening them to let in the air, or keeping them close to exclude it. There are also registers in the steam-engine. See Steam-engine.

REGISTRAR, an officer in the English universities, who has the keeping of all the public records.

REGIUM, Regium Lepidum, Regium Lepidum. (anc. geog.) a town of Cisalpine Gaul, on the Via Emilia, called from C. Flaminius; but whence it was named Regium is altogether uncertain. Tacitus relates, that at the battle of Bedriacum, a bird of ambuscade fire, was seen perching in a famous grove near Regium Lepidum. Now called Reggio, a city of Modena. E. Long. 11. c. N. Lat. 44. 45. See Reggio.

REGNARD (John Francis), one of the best French comic writers after Moliere, was born at Paris in 1647. He had early finished his studies, when an ardent passion for travelling carried him over the greatest part of Europe. When he settled in his own country, he was made a treasurer of France, and lieutenant of the waters and forests: he wrote a great many comedies; and, though naturally of a gay genius, died of chagrin in the 52d year of his age. His works, consisting of comedies and travels, were printed at Rouen, in 5 vols 12mo, 1732.

REGNIER (Mathurin), the first French poet who succeeded in satire, was born at Chartres in 1573. He was brought up to the church, a place for which his debaucheries rendered him very unfuitable; and these by his own confession were so excessive, that at 30 he had all
all the infirmities of age. Yet he obtained a canonry in the church of Chartres, with other benefices; and died in 1613. There is a neat Elzevir edition of his works, 12mo, 1652, Leyden; but the most elegant is that with notes by M. Broclette, 4to, London.

Regnier des Marets (Seraphin), a French poet, born at Paris in 1632. He distinguished himself early by his poetical talents, and in 1684 was made perpetual secretary to the French academy on the death of Mazeray; it was he who drew up all those papers in the name of the academy against Furetiere: the king gave him the priory of Grammont, and he had also an abbey. He died in 1713, and his works are, French, Italian, Spanish, and Latin poems, 2 vols; a French grammar; and an Italian translation of Anacreon's odes, with some other translations.

Regnum (anc. geog.), a town of the Regni, a people in Britain, next the Cantii, now Sutry, Suffolk, and the coast of Hampshire, (Camden); a town situated by the Itinerary numbers, on the confines of the Belge, in a place now called Ringwood, in Hampshire, on the rivulet Avon, running down from Salisbury, and about ten miles or more distant from the sea.

Regulator, signifies him who buys and sells any wares or viands in the same market or fair: and regulators are particularly deputed to be those who buy, or get into their hands, in fairs or markets, any grain, fish, butter, cheese, sheep, lambs, calves, swine, pigs, geese, capons, hens, chickens, pigeons, conies, or other dead viands whatsoever, brought to a fair or market to be fold there, and do sell the same again in the same fair, market, or place, or in some other within four miles thereof.

Regulating is a king of buckstry, by which viands are made dearer; for every seller will gain something, which must of consequence enhance the price. And, in ancient times, both the engroffer and regulator were comprehended under the word fordistaler. Regulators are punishable by loss and forfeiture of goods, and imprisonment, according to the first, second, or third offence, &c.

Regensberg, a handsome, though small town of Switerland, in the canton of Zurich, and capital of the order he has embraced to the rules of art: thus we get into their hands, in fairs or markets, any grain, fish, butter, cheese, sheep, lambs, calves, swine, pigs, geese, capons, hens, chickens, pigeons, conies, or other dead viands whatsoever, brought to a fair or market to be sold there, and do sell the same again in the same fair, market, or place, or in some other within four miles thereof.

Regional, denotes any thing that is agreeable to the rules of art: thus we get into their hands, in fairs or markets, any grain, fish, butter, cheese, sheep, lambs, calves, swine, pigs, geese, capons, hens, chickens, pigeons, conies, or other dead viands whatsoever, brought to a fair or market to be sold there, and do sell the same again in the same fair, market, or place, or in some other within four miles thereof.

Regulatus, or regulium. (Notitia Imperii); mentioned nowhere else more early: a town of the Cantii, in Britain. Now Reculver, a village on the coast, near the island Thanet, towards the Thames, to the north of Canterbury, (Camden).

Regulus (M. Attilius), a conful during the first Punic war. He reduced Brundusium, and in his second consulship he took 64 and sunk 30 galleys of the Carthaginian fleet, on the coasts of Sicily. Afterwards he landed in Africa; and so rapid was his march, that in a short time he made himself master of about 200 places of consequence on the coast. The Carthaginians sued for peace, but the conqueror refused to grant it; and soon after he was defeated in a battle by Xanthippus, and 30,000 of his men were left on the field of battle, and 15,000 taken prisoners. Regulus was in the number of the captives, and he was carried in triumph to Carthage. He was sent by the enemy to Rome, to propose an accommodation and an exchange of prisoners; and if his mission was unsuccessful, he was bound by the most solemn oaths to return to Carthage without delay. When he came to Rome, Regulus distributed his countrymen from accepting the terms which the enemy proposed; and when his opinion had had due influence on the senate, Regulus retired to Carthage according to his engagements. The Carthaginians told their offer of peace had been rejected at Rome by the means of Regulus; and therefore they prepared to punish him with the greatest severity. His eyebrows were cut, and he was exposed for some days to the execrable heat of the meridian sun, and afterwards confined in a barrel, whose fides were everywhere filed with large iron spikes, till he died in the greatest agonies. His sufferings were heard of at Rome; and the senate permitted his widow to inflict whatever punishment she pleased on some of the most illustrious captives of Carthage which were in their hands. She confined them all in presses filled with sharp iron points; and was so exquisite in her cruelty, that the senate interfered, and stopped the barbarity of her punishment. Regulus died about 251 years before Christ.—Memmius, a Roman, made governor of Greece by Caligula. While Regulus was in his province, the emperor wished to bring the celebrated statue of Jupiter Olympus by Phidias to Rome, but this was supernaturally prevented; and according to ancient authors, the ship which was to convey it was destroyed by lightning, and the workmen who attempted to remove the statue were terrified away by sudden noises.—A man who condemned Sejanus.—Rofcius, a man who held the consulsip but for one day, in the reign of Vitellius.

Regulus, in chemistry, an imperfect metallic substance that falls to the bottom of the crucible, in the melting of ores or impure metallic substances. It is the finest or purest part of the metal; and, according to the alchemists, is denominated regulus, or little king, as being the first-born of the royal metallic blood. According to them, it is really a son, but not a perfect man; i.e. not yet a perfect metal, for want of time and proper nourishment. To procure the regulus or mercurial parts of metals, &c. flux powders are commonly used; as nitre, tartar, &c. which purge the fulphurous part adhering to the metal, by attracting and absorbing it to themselves.

Regulus of Antinony. See Chemistry, No 1252—1257; and see Index there, at Antinony.

Regulus. Sulphur of arsenic confinled in mixing four parts of arsenic with two parts of black flux, one part of borax, and one part of filings of iron or of copper, and quickly fusing the mixture in a crucible. After the operation is finishted, a regulus of arsenic will be found at the bottom of the crucible of a white livid colour, and of considerable solidity. The iron and copper employed in this process are not intended, as in the operation for the metail regulus of antimony, to precipitate the arsenic, and to separate it from sulphur or any other substance; for the white arsenic is pure, and nothing is to be taken from it; but, on the contrary, the inflammable principle is to be added to reduce it to a regulus. The true use of the iron is in mixing with the regulus of arsenic, to give it more body, and to prevent its entire dissipation in vapours. Hence the addition of iron, while it procures these advantages, has the inconvenience of altering the purity of the regulus; for the metallic sub stance obtained is a regulus of arsenic alloyed with iron. It may, however, be purified from the iron by sublimation in a close vessel; by which operation the regulus arsenical part, which is very volatile, is sublimed to the top of the vessel, and is separated from the iron, which being of a fixed nature remains at the bottom. We are not, however, very certain, that in this kind of purification the regulus of arsenic does not carry along with it a certain quantity of iron; for, in general, a volatile sub stance raises along with it, in sublimation, a part of any fixed matter with which it happened to be united.

Mr. Brandt proposes another method, which we believe is preferable to that described. He directs that white arsenic should be mixed with loam. Instead of the flux, olive oil may be used, which to unite with the regulus of arsenic, to give it more body, and to prevent its entire dissipation in vapours. Hence the addition of iron, while it procures these advantages, has the inconvenience of altering the purity of the regulus: for the metallic substance obtained is a regulus of arsenic alloyed with iron. It may, however, be purified from the iron by sublimation in a close vessel; by which operation the regulus arsenical part, which is very volatile, is sublimed to the top of the vessel, and is separated from the iron, which being of a fixed nature remains at the bottom. We are not, however, very certain, that in this kind of purification the regulus of arsenic does not carry along with it a certain quantity of iron; for, in general, a volatile sub stance raises along with it, in sublimation, a part of any fixed matter with which it happened to be united.

Mr. Brandt proposes another method, which we believe is preferable to that described. He directs that white arsenic should be mixed with loam. Instead of the flux, olive oil may be used, which to unite with the regulus of arsenic, to give it more body, and to prevent its entire dissipation in vapours. Hence the addition of iron, while it procures these advantages, has the inconvenience of altering the purity of the regulus: for the metallic substance obtained is a regulus of arsenic alloyed with iron. It may, however, be purified from the iron by sublimation in a close vessel; by which operation the regulus arsenical part, which is very volatile, is sublimed to the top of the vessel, and is separated from the iron, which being of a fixed nature remains at the bottom. We are not, however, very certain, that in this kind of purification the regulus of arsenic does not carry along with it a certain quantity of iron; for, in general, a volatile sub stance raises along with it, in sublimation, a part of any fixed matter with which it happened to be united.

Mr. Brandt proposes another method, which we believe is preferable to that described. He directs that white arsenic should be mixed with loam. REICHENBERG, in Bohemia, 95 miles west of Prague, 205 north-west of Vienna, Lat. 50. 2. E. Long. 12. 25. is only remarkable as the place where the Prussian army defeated the Austrians on the 21st of April 1757. The Austriam army, commanded by Count Königfleck, was posted near Reichenberg, and was attacked by the Prussians under the command of the prince of Brunswick Bevern. The Prussians were 20,000, and the Austrians 28,000: the action began at half after six in the morning, when the Prussian lines were formed, and attacked the Austrian cavalry, which was ranged in three lines of 30 squadrons; and their two wings sustained by the infantry, which was posted among tall trees and entrenchments. The Austrians had a village on their right, and a wood on their left, where they were intrenched. The Prussian dragons and grenadiers cleared the intrenchment and wood, and entirely routed the Austrian cavalry; at the same time, the redoubts that covered Reichenberg were taken by General Leichtweitz; and the Austrians were entirely defeated. The Prussians had seven officers and 270 killed, 14 officers and 150 men wounded. The Russians had 1000 men killed and wounded; 20 of their officers and 400 men taken prisoners. The action ended at eleven.

REJOINDER, or Tirana. See CREWS, n° 4. REJOINDER, in anatomy, the same with Kidneys. See ANATOMY, n° 101.

REMS OF A P. Zise, are two long slips of leather, fastened on each side a curb or smally, which the rider holds in his hand, to keep the horse in subjection. There is also what it is called false reins; which is a sheet of leather, passed sometimes through the arch of the bucket, to bend the horse's neck.

REJOINDER, in law, is the defendant's answer to the plaintiff's replication or reply. Thus, in the court of chancery, the defendant puts an answer to the plaintiff's bill, which is sometimes also called an exception; the plaintiff's answer to that is called a replication, and the defendant's answer to that a rejoinder.

RELAND (Adrian), an eminent Orientalist, born at Ryp, in North Holland, in 1676. During three years study under Surenhusius, he made an uncommon progress in the Hebrew, Syrian, Chaldee, and Arabic languages; and these languages were always his favourite study. In 1701, he was, by the recommendation of King William, appointed professor of Oriental languages and ecclesiastical antiquities in the university of Utrecht; and died in the small-pox in 1718. He was distinguished by his modesty, humanity, and learning; and carried on a correspondence with the most eminent scholars of his time. His principal works are:

1. An excellent description of Palestine. 
2. Five dissertations on the Medals of the ancient Hebrews, and several other dissertations on different subjects. 
3. An Introduction to the Hebrew Grammar.
4. The Antiquities of the ancient Hebrews. 
5. On the Mahometan Religion. These works are all written in Latin.

RELATION, the mutual respect of two things, or what each is with regard to the other. See METAPHYSICS, n° 95, &c. and 128, &c.

RELATION, in geometry. See RATIO. 
RELATION, is also used for analogy. See ANATOMY, and METAPHYSICS, p. 529, &c.

RELATIVE, something relating to or respecting another.

RELATIVE, in music. See MODE.

RELATIVE-Terms, in logic, are words which imply relation: such are master and servant, husband and wife, &c.

In grammar, relative words are those which answer to some other word forgoing, called the antecedent; such are the relative pronouns qui, que, qual, &c. and in English, who, whom, which, &c. The word answering to these relatives is often understood, as, "I know whom you mean," for " I know the person whom you mean;"

RELAXATION, in medicine, the act of loosening or slackening; or the loosening or slackening of the fibres, nerves, muscles, &c.

RELAY, a supply of horses, placed on the road, and appointed to be ready for a traveller to change, in order to make the greater expedition.

RELEASE, in law, is a discharge or conveyance of a man's right in lands or tenements, to another that hath
The words generally used therein are "remifed, released and for ever quit-claimed." And these releases may enure, either, 1. By way of enlarging an estate, or enlarger estates: as, if there be tenant for life or years, remainder to another in fee, and he in remainder releases all his right to the estate in fee. But in this case the releftee must be in possession of some estate, for the releftee to work upon; for if there be lease for years, and, before he enters and is in possession, the lessor releases to him all his right in the reversion, such release is void for want of possession in the relefsee.

2. By way of passing an estate, or miter P{	extipa{e}}s: as, when one of two coparceners releases all his right to the other, this patch the fee-simple of the whole. And, in both these cases, there must be a privy of estate between the relefser and relefsee; that is, one of their estates must be so related to the other, as to make but one and the same estate in law.

3. By way of passing a right, or miter le droit: as if a man be diffeifed, and releafeth to his diffeifor all his right; hereby the diffeifor acquires a new right, which changes the quality of his estate, and renders that lawful which before was tortious. 4. By way of extinguishment: as if my tenant for life makes a lease to A for life, remainder to B and his heirs, and I releafe to A; this extinguishes my right to the reversion, and shall entitle to the advantage of B's remainder as well as to A's particular estate.

5. By way of entry and feoffment: as if there be two joint diffeifors, and the diffeifee releafes to one of them, he shall be fully feoffed, and shall keep out his former companion; which is the same in effect as if the diffeifee had entered, and thereby put an end to the diffeifin, and afterwards had enfeoffed one of the diffeifors in fee. And hence we may observe, that when a man has in himself the possession of lands, he must at the common law convey the freehold by feoffment and livery; which makes a notoriety in the country: but if a man has only a right or a future interest, he may convey that right or interest by a mere releafe to him that is in possession of the land: for the occupancy of the relefsee is a matter of sufficient notoriety already.

RELEVANCY, in Scots law. See Law, No clxxxvi. 48.

RELICTIONS, in the Romish church, the remains of the bodies or clothes of saints or martyrs, and the instruments by which they were put to death, devoutly preserved, in honour to their memory; kissed, revered, and carried in procession.

The respect which was justly due to the martyrs and teachers of the Christian faith, in a few ages increased almost to adoration; and at length adoration was really paid both to departed saints and to relics of holy men or holy things. The abuses of the church of Rome, with respect to relics, were very flagrant and notorious. For such was the rage for them at one time, that, as F. Mabillon a Benedictine juftly complains, the altars were loaded with suspected relics; numerous spurious ones being everywhere offered to the piety and devotion of the faithful. He adds, too, that bones are often consecrated, which, so far from belonging to saints, probably do not belong to Christians. From the catacombs numerous relics have been taken, and yet it is not known who were the person interred therein. In the 11th century, relics were tried by fire, and those which did not consume were reckoned genuine, and the rest not. Relics were, and still are, preferred on the altars whereon mass is celebrated; a square hole being made in the middle of the altar, big enough to receive the hand, and herein is the relic deposited, being first wrapped in red silk, and inclosed in a leaden box.

The Romanists plead antiquity in behalf of relics: For the Manichees, out of hatred to the heath, which they considered as an evil principle refused to honour the relics of saints; which is reckoned a kind of proof that the Catholics did it in the first ages.

We know, indeed, that the touching of linen cloths on relics, from an opinion of some extraordinary virtue derived thencefrom, was as ancient as the first ages, there being a hole made in the coffins of the 40 martyrs at Conflantinople expressly for this purpose. The honouring the relics of saints, on which the church of Rome afterwards founded her superflitions and lucrative use of them, as objects of devotion, as a kind of charms or amulets, and as instruments of pretended miracles, appears to have originated in a very ancient custom, that prevailed among Christians, of adorning at the cemeteries or burying-places of the martyrs, for the purpose of commemorating them, and of performing divine worship. When the profeflion of Chriftianity obtained the protection of the civil government, under Conftantine the Great, frately churches were erected over their sepulchres, and their names and memories were treated with every possible token of affection and respect. This reverence, however, gradually exceeded all reasonable bounds: and those prayers and religious services were thought to have a peculiar sanctity and virtue, which were performed over their tombs. Hence the practice which afterwards obtained, of depositing relics of saints and martyrs under the altars in all churches. This practice was then thought of such importance, that St Ambrose would not consecrate a church because it had no relics; and the council of Conflantinople in Trullo ordained, that those altars should be demolished under which there were found no relics. The rage of procuring relics for this and other purposes of a similar nature, became so excessive, that, in 368 the emperor Theodosius the Great was obliged to pass a law, forbidding the people to dig up the bodies of the martyrs, and to traffic in their relics.

Such was the origin of that respect for sacred relics, which afterwards was perverted into a formal worship of them, and became the occasion of innumerable proclamations, pilgrimages, and miracles, from which the church of Rome hath derived incredible advantage.—In the end of the ninth century, it was not sufficient to reverence departed saints, and to confide in their intercessions and succours, to clothe them with an imaginary power of healing diseases, working miracles vering from all sorts of calamities and dangers; their bones, their clothes, the apparel and furniture they had possessed during their lives, the very ground which they had touched, or in which their putrefied carcases were laid, were treated with a rapid veneration, and supposéd to retain the marvellous virtue of healing all disorders, both of body and mind, and of defending such as possessed them against all the assaults and devices of the devi-
The consequence of all this was, that every one was eager to provide himself with these salutary remedies; consequently, great numbers undertook fatiguing and perilous voyages, and subjected themselves to all sorts of hardships; while others made use of this delusion to accumulate their riches, and to impose upon the superstitious multitude by the most impious and shocking inventions. As the demand for relics was prodigious and universal, the clergy employed the utmost dexterity to satisfy all demands, and were far from being nice in the methods they used for that end. The bodies of the saints were sought for by falling and prayer, instituted by the priest in order to obtain a divine answer and an infallible direction, and this pretended direction never failed to accomplish their desires; the holy canons were always found, and that always in consequence, as they impiously gave out, of the fuggelation and inspiration of God himself. Each discovery of this kind was attended with excellent demonstrations of joy, and animated the zeal of those devout followers of the gospel, they might comfort themselves, make a profitable commerce of this new devotion. And many travelled with this view into the Eastern provinces, and frequented the places which Christ and his disciples had honoured with their presence; that, with the bones and other sacred remains of the first heralds of the gospel, they might comfort dejected minds, and make their inhabitants live in hope. Nor did these pious travellers return home empty; the craft, dexterity, and knavery of the Greeks, found a rich prey in the stupid credulity of the Latin relic-hunters, and made a profitable commerce of this new devotion. The latter paid considerable sums for legs and arms, skulls and jaw-bones (several of which were Pagan, and some not human), and other things that were supposed to have belonged to the primitive worthies of the Christian church; and thus the Latin churches came to the possession of those celebrated relics of St. Mark, St. James, St. Bartholomew, Cyprian, Pan­ taleon, and others, which they have ever since with so much ostentation. But there were many who, unable to procure for themselves these spiritual treasures by voyages and prayers, had recourse to violence and theft; for all sorts of means, and all sorts of attempts in a cause of this nature, were considered, when successful, as pious and acceptable to the Supreme Being.

Belides the arguments from antiquity to which the Papists refer, in vindication of their worship of relics, of which the reader may form some judgment from this article, Bellarmine appeals to Scripture in support of it, and cites the following passages, viz. Exod. xiii. 19; Deut. xxxiv. 6; 2 Kings xiii. 21; 2 Kings xxiii. 16, 17, 18; I Paral. vi. 10; Matthew xi. 20, 21, 22; Acts v. 12—15; Acts xii. 11, 12. See Popery.

The Roman Catholics in Great Britain do not acknowledge any worship to be due to relics, but merely a high veneration and respect, by which means they think they honour God, who, they say, has often wrought very extraordinary miracles by them. But, however proper this veneration and respect may be, its abuse has been so great and so general, as fully to warrant the rejection of them altogether.

Reliefs are forbidden to be used or brought into England by several statutes; and justices of peace are empowered to search houses for popish books and relics, which, when found, are to be defaced and burnt, &c. 3 Jac. I. cap. 26.

RELIQUE, in law, the same with WITNESS.

RELIQUARY (Reliquem; but, in D. mediæv. Relevium, R. Relicarium), signifies a certain sum of money, which the tenant, holding by knight's service, grand serjeancy, or other tenure, (for which homage or legal service is due), and being at full age at the death of his ancestor, paid unto his lord at his entrance. See Primer.

Though relics had their original while feuds were only life-estates; yet they continued after feuds became hereditary; and were therefore looked upon, very justly, as one of the greatst grievances of tenure; especially when, at the first, they were merely arbitrary and at the will of the lord; so that, if he pleased to demand an exorbitant relief, it was in effect to disinherit the heir. The English ill brooked this consequence of their new-adopted policy, and therefore William the Conqueror by his laws offer. ind. the relief, by dreading (in imitation of the Danoth he­ riots), that a certain quantity of arms and habiliments of war, should be paid by the earls, barons, and vassals respectively; and, if the latter had no arms, they should pay 100s. William Rufus broke through this composition, and again demanded arbitrary uncertain reliefs, as due by the feudal laws; thereby in effect obliging every heir to new-purchase or relieve his land; but his brother Henry I. by the charter before-mentioned, restored his father's law; and ordained, that the relief to be paid should be according to the law so established, and not an arbitrary redemption.

But afterwards, when, by an ordinance in 27 Hen. II. called the serf of armis, it was provided, that every man's armour should descend to his heir, for defence of the realm, and it thereby became impracticable to pay these acknowledgments in arms according to the laws of the Conqueror, the composition was universally accepted of 100s, for every knight's fee, as we find it ever after established. But it must be remembered, that this relief was only then payable, if the heir at the death of his ancestor had attained his full age of 21 years.

To RELIEVE the Guard, is to put fresh men upon guard, which is generally every 24 hours.

To RELIEVE the Trenches, is to relieve the guard of the trenches, by appointing those for that duty who have been there before.

To RELIEVE the Sentinels, is to put fresh men upon that duty from the guard, which is generally done every two hours, by a corporal who attends the relief, to see that the proper orders are delivered to the soldier who relieves.

RELIASE, or RELIEF, in sculpture, &c, is the projection or standing out of a figure which arises prominent from the ground or plane on which it is formed; whether that figure be cut with the chisel, moulded, or cast.

There are three kinds or degrees of relief, viz. alto, bassi, and demi-relief. The alto-relief, called altorelievo, or high-relief, is when the figure is formed after nature and projects as much as the life. Bass-relief, bas-relief, or low-relief, is when the work is raised a little from the ground, as in medals, and the frontispieces of buildings; and particularly in the histo-
RELIGION (RELIGIO), is a Latin word derived, according to Cicero, from religere, “to re-consider;” but according to Servius and most modern grammarians, from religare, “to bind fast.” The reason assigned by the Roman orator for deducing religio from religare, is in these words, “qui autem omnia, qua ad cultum deorum pertinent, diligentiter redditur, et tanyquam religere, sunt dixi religiis ex religendo.” The reason given by Servius for his derivation of the word is, “quod mentem religit religem.” If the Ciceronian etymology be the true one, the word religion will denote the diligent study of whatever pertains to the worship of the gods; but according to the other derivation, which we are inclined to prefer, it denotes that obligation which we feel on our minds from the relation in which we stand to some superior power. In either case, the import of the word religion is different from that of theology, as the former signifies a number of practical duties, and the latter a system of speculative truths. Theology is therefore the foundation of religion, or the science from which it springs; for no man can study what pertains to the worship of superior powers till he believe that such powers exist, or feel any obligation on his mind from a relation of which he knows nothing.

This idea of religion, as distinguished from theology, comprehends the duties not only of those more refined and complicated system of theism or polytheism which have prevailed among civilized and enlightened nations, such as the polytheism of the Greeks and Romans, and the theism of the Jews, the Mahometans, and the Christians; it comprehends every sentiment of obligation which human beings have ever conceived themselves under to superior powers, as well as all the forms of worship which have ever prevailed through the world, however fantastic, immoral, or absurd.

When we turn our eyes to this feature of the human character, we find it peculiarly interesting. Mankind are distinguished from the brutal tribes, and elevated to an higher rank, by the national and moral faculties with which they are endowed; but they are still more widely distinguished from the inferior creation, and more highly exalted above them, by being made capable of religious notions and religious sentiments. The slightest knowledge of history is sufficient to inform us, that religion has ever had a powerful influence in moulding the sentiments and manners of men. It has sometimes dignified, and sometimes degraded, the human character. In one region or age it has been favourable to civilization and refinement; in another, it has occasionally cramped the genius, deprived the morals, and deformed the manners of men. The varieties of religion are innumerable; and the members of every distinct sect must view all who differ from them as more or less mistaken, with regard to the most important concerns of man. Religion seems to be congenial to the heart of man; for wherever human society subsists, there we are certain of finding religious opinions and sentiments.

It must, therefore, be an important subject of speculation concerning religion, to inquire, How far religion in general has a tendency to promote or to injure the order and happiness of society? and, above all, to examine, What particular religion is best calculated to produce an happy influence on human life?

We shall endeavour to give a satisfactory answer to each of these questions, referring to the article Theology the consideration of the dogmas of that particular religion which, from our present inquiries, shall appear to be true, and to have the happiest influence on human life and manners.

The foundation of all religion rests on the belief of the existence of one or more superior beings, who govern the world, and upon whom the happiness or misery of mankind ultimately depends. Of this belief, as it may be said to have been universal, there seems to be but three sources that can be conceived. Either the image of Deity must be stamped on the mind of every human being, the savage as well as the sage; or the founders of societies, and other eminent persons, tracing by the efforts of their own reason visible effects to invisible causes, must have discovered the existence of superior powers, and communicated the discovery to their associates and followers; or, lastly, the universal belief in such powers must have been derived by tradition from a primitive revelation, communicated to the progenitors of the human race.

One or other of these hypotheses must be true, because a fourth cannot be framed. We shall therefore (Polytheism, no 2.) examine the reasoning which has been employed to establish the first, and shew that it proceeds upon false notions of human nature. We should likewise pronounce it contrary to fact, could we believe, on the authority of some of its patrons, who are not ashamed to contradict one another, that the Kamtschatkans, and other tribes, in the lowest state of reasoning and morals, have no ideas whatever of Deity. We proceed, therefore, to consider the second hypothesis, which is much more plausible, and will bear a stricter scrutiny.

That the existence and many of the attributes of the Deity are capable of rigid demonstration, is a truth which cannot be controverted either by the philosopher or the Christian; for “the invisible things of Him from the creation of the world are clearly seen, being under-stood by the things that are made, even His eternal power and Godhead,” (see Metaphysics, Part III. chap. 1.)
But surely it would be rash to infer, either that every truth for which, when it is known, the ingenuity of man can frame a demonstration, is therefore discoverable by human sagacity, or that all the truths which have been discovered by a Newton or a Locke might therefore have been discovered by untaught barbarians. In mathematical science, there are few demonstrations of easier comprehension than that given by Euclid, of the theorem of which Pythagoras is the reputed author; yet no man ever dreamed that a boy capable of being made to understand that theorem, might therefore have sagacity equal to the sage of Samos; or that such a boy, having never heard of the relation between the hypothenuse and other two sides of a right angled triangle, would be likely to discover that the square of the former is precisely equal to the sum of the squares of the latter. Jult so it seems to be with the fundamental truths of theology. There can hardly be conceived a demonstration less intricate, or more conclusive, than that which the man of science employs to prove the existence of at least one God, possessed of boundless power and perfect wisdom. And could we suppose that the human race had remained without any knowledge of God in the world, till certain lucky individuals had by some means or other made themselves masters of the rules of logic, and the philosophy of causes, there can be no doubt but that these individuals might have discovered the existence of superior powers, and communicated their discovery to their associates and followers. But this supposition cannot be admitted, as it is contradicted by the evidence of all history. No nation or tribe has ever been found, in which there is not reason to believe that some notions were entertained of superior and invisible powers, upon which depends the happiness or misery of mankind; and from the most authentic records of antiquity, it is apparent that very pure principles of theism prevailed in some nations long before the rules of logic, and the philosophy of causes, were thought of by any people under heaven.

The supposition before us is inadmissible upon other accounts. Some modern philosophers have fancied that the original progenitors of mankind were left entirely to themselves from the moment of their creation; that they wandered about for ages without the use of speech and in the lowest state of savagery; but that they gradually civilized themselves, and at last stumbled upon the contrivance of making articulate sounds significant of ideas, which was followed by the invention of arts and sciences, with all the blessings of religion and legislation in their train. But this is a wild reverie, inconsistent with the phenomena of human nature. It is a well known fact, that a man blind from his birth, and suddenly made to see, would not by means of his newly acquired sense discern either the magnitude or figure or distance of objects; but would conceive every thing which communicated to him visible sensations as inseparably united to his eye or his mind (See Metaphysics, sect. 49—53). How long his sense of sight would remain in such an imperfect state, we cannot positively say; but from attending to the visible sensations of infants, we are confident that weeks, if not months, elapse before they can distinguish one thing from another. We have indeed been told, that Cheifelden's famous patient, though he was at first in the rate which we have described, learned to distinguish objects by the course of a few hours, or at the most of a few days; but admitting this to a certain extent to be true, it may easily be accounted for. The disease called cataracta seldom occurs before infancy; but let us suppose the eyes of this man to have been so completely dimmed as to communicate no sensation whatever upon being exposed to the rays of light; still we must remember that he had long possessed the power of loco-motion and all his other senses in perfection. He was therefore well acquainted with the real, i.e. the tangible magnitude, figure, and distance of many objects; and having been often told that the things which he touched would, upon his acquisition of sight, communicate new sensations to his mind, differing from each other according to the distance, figure, and magnitude of the objects by which they were occasioned, he should soon learn to infer the one from the other, and to distinguish new sensations from his sight.

The progenitors of the human race, however, if left to themselves from the moment of their creation, had not the same advantages. When they first opened their eyes, they had neither moved, nor handled, nor heard, nor smelted, nor tasted, nor had a single idea or notion treasured up in their memories; but were in all these respects in the state of new-born infants. Now we should be glad to be informed by those fages who have conducted mankind through many generations in which they were mutum et turpe pecus to that happy period when they invented language, how the first men were taught to distinguish objects by their sense of sight, and how they contrived to live till this most necessary faculty was acquired? It does not appear that men are like brutes, provided with a number of instincts which guide them blindfold and without experience to whatever is necessary for their own preservation (see Instinct). On the contrary, all voyagers tell us, that in savage and uninhabited countries, they dare not venture to taste unknown fruits unless they percieve that these fruits are eaten by the fowls of the air. But without the aid of instinct, or of some other guide equally to be depended upon, it is not in our power to conceive how men dropt from the hands of their Creator, and left from that infant wholly to themselves, could move a single step without the most imminent danger, or even stretch out their hands to lay hold of that food which we may suppose to have been placed within their reach. They could not, for many days, distinguish a precipice from a plane, a rock from a pit, or a river from the meadows through which it rolled. And in such circumstances, how could they possibly exist, till their sense of sight had acquired such perfection as to be a sufficient guide to all their necessary motions? Can any consilient theif suppoee that the God whoso goodnefs is so conspicuously displayed in all his works, would leave his noblest creature on earth, a creature for whose comfort alone many other creatures seem to have been formed, in a situation so forlorn as this, where his immediate destruction appears to be inevitable? No! This supposition cannot be formed, because mankind still exist.

Will it then be said, that when God formed the first men, he not only gave them organs of sensation, and faculties capable of arriving by discipline at the exercise of reason, but that he also impressed upon their minds adequate
adequate ideas and notions of every object in which they were interested, brought all their organs, external and internal, at once to their utmost possible state of perfection; taught them instantaneously the laws of reasoning; and, in one word, stored their minds with every branch of useful knowledge? This is indeed our own opinion; and it is perfectly agreeable to what we are taught by the Hebrew lawgiver. When God had formed Adam and Eve, Moses does not say that he left them to acquire by slow degrees the use of their senses and reasoning powers, and to distinguish as they would from thence that were salutary from those that were poisonous. No: he placed them in a garden where every object but one bore fruit fit for food; he warned them particularly against the fruit of that tree; he brought before them the various animals which roamed through the garden; he arranged these animals into their proper genera and species; and by teaching Adam to give them names, he communicated to the first pair the elements of language. This condescension appears in every respect worthy of perfect benevolence; and indeed without it the helpless man and woman could not have lived one whole week. But it cannot be supposed, that amidst so much useful instruction the gracious Creator would neglect to communicate to his rational creatures the knowledge of himself; to inform them of their own origin, and the relation in which they stood to him; and to state in the plainest terms the duties incumbent on them in return for so much goodness.

In what manner all this knowledge was communicated, cannot be certainly known. It may have been in either of the following ways conceivable by us, or in others of which we are formed no conception. God may have miraculously stored the minds of the first pair with adequate ideas and notions of sensible and intellectual objects; and then by an internal operation of his own Spirit enabled them to exert at once their rational faculties to as to discover his existence and attributes, together with the relation in which as creatures they stood to him their Almighty Creator. Or, after rendering them capable of distinguishing objects by means of their senses, of comparing their ideas, and understanding a language, he may have exhibited himself under some sensible emblem, and conducted them by degrees from one branch of knowledge to another, as a schoolmaster conducts his pupils, till they were sufficiently acquainted with every thing relating to their own happiness and duty as rational, moral, and religious, creatures. In determining the question before us, it is of no importance whether infinite wisdom adopted either of these methods, or some other. Different from them both which we cannot conceive. The ordinary process in which men acquire knowledge is, by the laws of their nature, extremely tedious. They cannot reason before their minds be stored with ideas and notions; and they cannot acquire these but through the medium of their senses long exercised on external objects.

The progenitors of the human race, left to inform themselves by this process, must have inevitably perished before they had acquired one distinct notion; and it is the same thing with respect to the origin of religion, whether God preferred them from destruction by an internal or external revelation. If he stored their minds at once with the rudiments of all useful knowledge, and rendered them capable of exerting their natural faculties in ways, as, by tracing effects to their causes, to discover his being and attributes, he revealed himself to them as certainly as he did afterwards to Moses, when to him he condescended to speak face to face.

If this reasoning be admitted as fair and conclusive, such a revelation must not be considered as ill-founded, we have added no farther to prove that mankind must have been originally enlightened by a revelation. But it is necessary to observe, that this revelation must have been handed down through succeeding generations. It could not fail to reach the era of the deluge. It is not absurd to suppose, that he who spake from heaven to Adam, spake also to Noah. And both the revelation which had been handed down to the postdeluvian patriarchs by tradition, and that which was communicated immediately to himself, would be by him made known to his descendants. Thus it appears almost impossible that some part of the religious sentiments of mankind should not have been derived from revelation; and that not of the religious sentiments of one particular family or tribe, but of almost all the nations of the earth.

This conclusion, which we have deduced by fair reasoning from the benevolence of God and the nature of man, is confirmed by the authority of the Jewish and Christian Scriptures, which are entitled to more implicit credit than all the other records of ancient history.

When we review the internal and external evidence of the authenticity of these sacred books, we cannot for a moment hesitate to receive them as the genuine word of God. If we examine their internal character, they every where appear to be indeed the voice of Heaven. The creation of the world—the manner in which this globe was first peopled—the deluge which swept away its inhabitants—the succeeding views of the state of mankind in the next ages after the deluge—the calling of Abraham—the legislation of Moses—the whole series of events which befell the Jewish nation—the prophecies—the appearance of Jesus Christ, and the pro­mulgation of his gospel, as explained to us in the Scriptures—form one series, which is, in the highest degree, illustrative of the power, wisdom, and goodness of the Supreme Being.

While it must be allowed that the human mind is ever prone to debate the sublime principles of true religion by enthusiasm and superstition, reason and candour will not for a moment hesitate to acknowledge, that the whole system of revelation represents the Supreme Being in the most sublime and amiable light: that, in it, religion appears essentially connected with morality: that the legislative code of Moses was such as no legislator ever formed and established among a people equally rude and uncultivated: that the manners and morals of the Jews, vicious and savage as they may in some instances appear, yet merit a much higher character than those either of their neighbours, or of almost any other nation, whose circumstances and character were in other respects similar to theirs: that there is an infinite difference between the Scripture prophecies and the oracles and predictions which prevailed among heathen nations: and that the miracles recorded in those writings which we esteem sacred were attended with circumstances which entitle them to be ranked in a very different
The five books of Moses proved to be divine.

The evidence of the divine origin of the primeval religion rests particularly on the authority of the first five books of the Old Testament, it may be thought incumbent on us to support our reasoning on this subject, by proving, that the author of those books was indeed inspired by God. This, we shall endeavour to do by an inductive argument; for the nature of the article, and the limits prescribed us, admit not of our entering into a minute detail of all that has been written on the divine legation of Moses.

If the miracles recorded in the book of Exodus, and the other writings of the Hebrew lawgiver, were really performed; if the first-born of the Egyptians were all cut off in one night, as is there related; and if the children of Israel passed through the Red sea, the waters being divided, and forming a wall on their right hand and on their left—it must necessarily be granted, that Moses was sent by God; because nothing less than a divine power was sufficient to perform such wonderful works. But he who supposes that those works were never performed, must affirm that the books recording them were forged, either at the era in which the miracles are said to have been wrought, or at some subsequent era: There is no other alternative.

That they could not be forged at the era in which they affirm the miracles to have been wrought, a very few reflections will make incontrovertibly evident. These books inform the people for whose use they were written, that their author, after having inflicted various plagues upon Pharaoh and his subjects, brought them to the number of 600,000, out of Egypt with a high hand; that they were led by a pillar of cloud through the day, and by a pillar of fire through the night, to the brink of the Red sea, where they were almost overtaken by the Egyptians, who had pursued them with chariots and horses; that, to make a way for their escape, Moses stretched out his rod over the sea, which was immediately divided, and permitted them to pass through on dry ground, between two walls of water; and that the Egyptians, pursuing and going in after them to the midst of the sea, were all drowned by the return of the waters to their usual state, as soon as the Hebrews arrived at the further shore. Is it possible now that Moses or any other man could have persuaded 600,000 persons, however barbarous and illiterate we suppose them, that they had been witneses of all these wonderful works, if no such works had been performed? Could any art or eloquence persuade all the inhabitants of Philadelphia, that they had yesterday walked on dry ground through a sea twenty or thirty miles wide, the waters being divided and forming a wall on their right hand and on their left? If this question must be answered in the negative, it is absolutely impossible that the books of Moses, supposing them to have been forged, could have been received by the people who were alive when those wonders are said to have been wrought.

Let us now inquire, whether, if they be forgeries, they could have been received as authentic at any subsequent period; and we shall soon find this supposition as impossible as the former. The books claiming Moses for their author speak of themselves as delivered by him and from his days kept in the ark of the covenant; an ark which, upon this supposition, had no existence prior to the forgery. They speak of themselves likewise, not only as a history of miracles wrought by their author, but as the statutes or municipal law of the nation, of which a copy was to be always in the possession of the priests, and another in that of the supreme magistrates.

Now, in whatever age we suppose these books to have been forged, they could not possibly be received as authentic; because no copy of them could then be found either with the king, with the priests, or in the ark, though they contain the statute law of the land, it is not conceivable that, if they had existed, they could have been kept secret. Could any man, at this day, forge a book of statutes for England or America, and make it pass upon these nations for the only book of statutes which they had ever known? Was there ever since the world began a book of shame, and the Egyptian, too, multiform and burdensome, imposed upon any people as the only statutes by which they and their fathers had been governed for ages? Such a forgery is evidently impossible.

But the books of Moses have internal proofs of authenticity, which no other books of a similar character have. They not only contain the laws, but also give an historical account of their enactment, and the reasons upon which they were founded. Thus they tell us, that in the rite of circumcision was instituted as a mark of the covenant between God and the founder of the Jewish nation, and that the practice of it was enforced by the declaration of the Almighty, that every uncircumcised man-child should be cut off from his people. They inform us that the annual solemnity of the passover was instituted in commemoration of their deliverance when God flew, in one night, all the first-born of the Egyptians; that the first-born of Israel, both of men and beasts, were on the same occasion dedicated for ever to God, who took the Levites instead of the first-born of the men; that this tribe was consecrated as priests, by the first-born of every tribe and of the whole nation, and that Aaron's budding rod was kept in the ark in memory of the wonderful destruction of Korah, Dathan, and Abiram, for their rebellion against the priesthood.

Is it possible now, if all these things had not been practised among the Hebrews from the era of Moses, with a retrospect to the signal mercies which they are said to have commemorated, that any man or body of men could have persuaded a whole nation, by means of forged books, that they had always religiously observed such institutions? Could it have been possible, at any period posterior to the Exodus, to persuade the Israelites that they and their fathers had all been circumcised on the eighth day from their birth, if they had been conscious themselves that they had never been circumcised at all? Or that the passover was kept in memory of their deliverance from Egyptian bondage, if no such festival was known among them?

But let us suppose that circumcision had been practiced, and all their other rites and ceremonies observed from time immemorial, without their knowing any reason of such institutions; still it must be confessed that the forger of these books, if they were forged, conducted his narrative in such a manner as that no man...
II. Of the Influence of Religion on Society.

Religion of common sense could receive it as authentic. He says it was death to touch the ark! As such an affection was never heard of before, and as the ritual he was endeavouring to make them esteem sacred was oppressively multifarious, surely some during spirit would have ventured to put his velocity to the test by moving the ark and even offering sacrifices; and such a test would at once have exposed the imposture. The budding rod, two, and the pot of manna, which, though long preferred, were never before heard of, must have produced inquiries that could not fail to end in detection. These books speak likewise of weekly sabbaths, daily sacrifices, a yearly expiation, and monthly festivals, all to be kept in remembrance of great things particularly specified as done for the nation at an early period of its existence. If this was not the case, could the forger of the books have persuaded the people that it really was so? The enlightened reasoners of this nation would be offended were we to compare them with the ancient Israelites; but surely they will not deny that we are partial to that people, if we bring them to a level with the most savage tribes of the Roman empire, who profess Christianity? Now, were a book to be forged containing an account of many strange things done a thousand years ago in Siberia by Apollonius, or any other philosopher or hero, numbers of the barbarians inhabiting that country would, doubtless, not, give implicit credit to the legend. But were the authors, in confirmation of his narrative, to affirm, that all the Siberians had from that day to this kept the first day of the week in memory of his hero; that they had all been baptized or circumcised in his name; that in their public judicatories they had sworn by his name, and upon that very book which they had never seen before; and that the very same book was their law and their gospel, by which for a thousand years back the actions of the whole people had been regulated—surely the grossest vapour among them would reject with contempt and indignation a forgery so palpable.

If this reasoning be conclusive, the books of Moses must indubitably be authentic, and he himself must have been inspired by the spirit of God. But this point being established, the question respecting the origin of the primeval religion is completely answered. The writer of the book of Genesis informs us, that Adam and Noah received many revelations from the Author of their being, and that their religion was founded on the principles of the purest theism. How it degenerated among the greater part of their descendants into the grossest idolatry, has been shown at large in another place. See Polytheism.

III. Having thus answered the first question proposed for discussion in the present article, we now proceed to consider the second, and to inquire whether and how far religious sentiments have a tendency to injure or to promote the welfare of society? This is a subject of the utmost importance; and if we prove successful in our inquiries, we shall be enabled to determine whether the governors of mankind ought carefully to support religious establishments, or whether the philosopher who calls himself a citizen of the world, and professes to feel the most eager desire to promote the interests of his species, acts consistently when he labours to exterminate religion from among men.

A celebrated French financier *, a man of abilities and virtue, who has published a book on the importance of religious opinions, labours to show that religious establishments are indispensably necessary for the maintenance of civil order, and demonstrates how weak the influence of political institutions is on the morals of mankind; but he refuses to review the history of past ages in order to discover how far religious opinions have actually been injurious or beneficial to the welfare of society; choosing rather to content himself with the result of a series of metaphysical disquisitions.

We admire the spirit which induced a man who had spent a considerable part of his life amid the hurry of public business, to become the zealous advocate of religion; but we cannot help thinking that, notwithstanding the eloquence, the acuteness, and the knowledge of mankind which he has displayed, his refusing to admit the evidence of facts concerning the influence of religion on society may possibly be regarded by its enemies as a tacit acknowledgement that the evidence of facts would be unfavourable to the cause which he wishes to defend. The fallacy of general reasonings, and the inutility of metaphysics for the purposes of life, are so universally acknowledged, that they have long been the theme of declamation. Though the abuses of religion, as well as the abuses of reason, the perversion of any of the principles of the human mind, and the misapplication of the gifts of providence, may have often produced effects hurtful to the virtue and the happiness of mankind; yet, after tracing religion to a divine origin, we cannot for a moment, allow ourselves to think that the primary tendency of religion must be hostile to the interests of society, or that it is necessary to view it abstractively in order that we may not behold it in an odious light. Often has the sceptic attacked religion with artful malice; but perhaps none of his attacks has been so skilfully directed as that which has first ridiculed the absurdity of the most absurd superstitions, and afterwards laboured to prove that the most absurd system of polytheism is more favourable to the interests of society than the purest and most sublime theism. Instances in which the abuse of religion had tended to deprave the human heart, and had led to the most shocking crimes, have been ably and artfully collected, and displayed in all the aggravating colours in which eloquence could array them, till at length even the friends of true religion have been abashed; and it has become a fashionable opinion, that nothing but self-interest or bigotry can prompt men to represent religion as the friend of civil order. But let us try if, by a candid consideration of what effects have resulted to society from religious principles, in general, without comparing these with regard to truth or falsehood, we can advance anything to vindicate the character of religion.

Notions of Deity in general, of various orders of divinities, of their moral character, of their influence on human life, of a future state, and of the immortality of the human soul, constitute the leading articles of religion. Let us view these together with the rites to which they have given rise; and we may perhaps be enabled to form some well-grounded notions on this important point.

1. Having proved that the first religious principles entertained by men were derived from revelation, it is impossible to suppose that they could produce effects injurious to society.
The effect of atheism on the manners of nations.

Would be more malignant than that of the most absurd paganism.

Religious to society. If religion of any kind has ever lubricated the virtue or disturbed the peace of men, it must have been that religion which springs from a belief in a multitude of superior powers actuated by passions, and of whom some were conceived as benevolent, and others as malicious beings. That such sentiments should have produced vices unknown in societies where pure theism is professed, will be readily admitted. Even the few atheists who live in Christian or Mahometan countries are restrained by the laws, by a desire to promote the honour of the sects, and by many other considerations, from indulging in practices which the example of the false gods of antiquity sanctioned in their vitiates. But in determining the present question, we must not compare the vices of the pagan world with those of individual atheists in modern Europe, but with those of nations professing atheism; and such nations are nowhere to be found. We can however easily conceive, that in a society unbound by any notions of God or a future state, no such laws would be enacted as those which contain the fœtid appetites; or of which the criminal indulgence was one of the greatest ligaments on the pagan worship of antiquity. In such societies, therefore, those vices would be practised constantly to which paganism gave only an occasional sanction; and many others, in spite of the utmost vigilance of human laws, would be perpetrated in secret, which the most profligate pagans viewed with horror. Confidence, though acting with all her energy, would not be able to command any regard to the laws of morality: No virtue would be known: Social order would be nowhere observed; the midnight affluence would everywhere be found; and in the general scramble mankind would be exterminated from the face of the earth.

The worst species of paganism, even that which prevails among savages who worship evil spirits, affords greater security than this. It is indeed shocking to think that demons should be worshipped, while deities, who are regarded as being all benevolence, are treated with contempt: And it has been asked, If the influence of such religious sentiments on the moral practice of the idolaters must not naturally be, to cause them to treat their friends and benefactors with ingratitude, and to humble themselves with mean submission before a powerful enemy?

They do not appear to have produced such effects on the morality of the savages by whom they were entertained. The benevolent deities were neglected, only because their benevolence was necessary. A voluntary favour merits a grateful return: a设计ed injury provokes resentment. But when you become, by accident, the instrument of any man's good fortune, the world will scarce consider him as owing you any obligation: the flame which brandishes your foot excites only a momentary emotion of resentment. Those gods who could not avoid doing good to men might not receive a profession of thanks for their services; and yet a favour conferred by a human benefactor commands the warmest gratitude. But those rude tribes appear to have had so much wisdom as to confer a sort absolute malice on their malevolent deities, than the benevolence which they attributed to their more amiable order of superior beings: though the latter could not possibly do them any thing but good, and that constantly; yet the former were not under an equally indefinable necessity of persevering in depressing them under calamities. On their malevolent deities they conferred a freedom of agency which they denied to the benevolent. No wonder, then, that they were more injurious in their court to the one than to the other. They might with much propriety have thought of being grateful to the barest flag whose flesh supported them, as to deities who were always benevolent, because they could not possibly be otherwise. Though negligent of such deities, this can scarce be thought to have had any tendency to render them ungrateful to benefactors like themselves. And yet, it must not be dissembled, that the American Indians, among whom such religious sentiments have been found to prevail, are said to be very little sensible to the emotions of gratitude. An Indian receives a present without thinking of making any grateful acknowledgments to the bestower. He pleases his fancy or gratifies his appetite with what you have given, without seeming to consider himself as under the smallest obligation to you for the gift.

It may be doubted, however, whether this spirit of ingratitude originates from, or is only collateral with, that indifference which refuses adoration and worship to the benevolent deities. If the former be actually the case, we must acknowledge that those religious notions which we now consider, though preferable to general atheism, are in this respect unfriendly to virtue. But if the Indians may be thought to owe the ingratitude for which they are distinguished to the opinion which they entertain of the existence of a benevolent order of deities, whose benevolence is necessary and involuntary, their ideas of the nature of their malevolent demons do not appear to have produced equal effects on their moral sentiments. However submissive to those dreaded beings, they are far from showing the same tameness and cowardly submission to their human enemies: towards them they seem rather to adopt the sentiments of their demons. Invertebrate rancour and brutal fury, inhuman cruelty and inconceivable cunning, are displayed in the hostilities of tribes at war; and we know not, after all, if these sentiments do not owe somewhat of their force to the influence of religion.

Yet let us remember that these same Indians have not been always represented in so unamiable a light; or, at least, other qualities have been attributed to them which seem to be inconsistent with those barbarous dispositions. They have been described as peculiarly susceptible of conjugal and parental love; and he who is so cannot be defolite of virtue.

2. But leaving the religion of savages, of which very little is known with certainty, let us proceed to examine what is the natural influence of that mixed system of theology which represents to the imagination men a number of superior and inferior divinities, actuated by the same passions and feelings with themselves, and often making use of their superior power and knowledge for no other purpose but to enable them to violate the laws of moral order with impunity. This is the celebrated polytheism of the Greeks and Romans, and most other nations of antiquity (see Polytheism). Could its influence be favourable to virtue?

At a first view every person will readily declare, that apparently such a fylem must have been friendly to profligacy. If by friendly you commit the government of the universe, and the profligate insinuation of human society, to a lot of beings who are
often disposed to regard vice with a no less favourable eye than virtue, and who, though there be an established order by which virtue is discriminated from vice, and right from wrong, yet scruple not to violate that order in their own conduct; you cannot expect them to require in you a degree of rectitude of which they themselves appear incapable. A Mercury will not discourage the thievish arts of the trader; a Bacchus and a Venus cannot prevent upon debauchery; Mars will be hold with savage delight all the cruelties of war. The Thracians indeed, one of the most barbarous nations of antiquity, whose ferocity was little if at all inferior to that of the Indians who had been distinguished as cannibals, was the favourite nation of Mars; among whom stood his palace, to which he repaired when about to mount his chariot, and arm himself for battle. Even Jupiter, who had been guilty of so many acts of tyrannical caprice, had been engaged in such a multitude of amorous intrigues, and seemed to owe his elevated station as monarch of the sky, not to superior goodness or wildom, but merely to a superior degree of brutal force, could not be feared as the avenger of crimes, or however the idea which connected the prosperity of nations, and in which they entertained for a future state of retribution, is often hard to say for what ends they could be supposed to be performed, in order to appease the wrath of the offended deities; it is plain that the means were not at all suited to accomplish the end proposed by them; yet still they were highly beneficial. When the attention of the whole people was turned entirely to those solemnities by which the wrath of heaven was to be averted, they were rooted from that dependency under which the sense of the public diitres or danger might have otherwise caused them to sink: the public union was at the same time more closely cemented, and the hearts of the people knit together; and when perfused, that by propitiating the gods they had removed the cause of their distresses, they acquired such calmness and strength of mind as enabled them to take more direct and proper measures for the safety of the state.

Could we view the ancient Greeks and Romans acting in public or in private life under the influence of that system of superstition which prevailed among them; could we perceive how much it contributed to the maintenance of civil order; could we behold Numa and Lycurgus establishing their laws, which would otherwise have met with a very different reception under the棍ction of divinities; could we observe all the beneficial effects which arose to communities from the celebration of religious ceremonies—we should not longer hesitate to acknowledge, that those principles in the human heart by which we are susceptible of religious sentiments, are so eminently calculated to promote the happiness of mankind, that even when perverted and abused, their influence is still favourable.

The ideas which prevailed among the nations of the heathen world concerning a future state of retribution of a were, it must be confessed, not very correct. Some of those poets, the belief, have represented them in an unfair light: both Homer and Virgil have conducted their heroes through the realms of Pluto, and have taken occasion to unfold to us the secrets of those dreary abodes. The scenes are wild and fanciful; the rewards of the just and virtuous are of no very refined or dignified nature: and of the punishments inflicted on the guilty, it is often hard to say for what ends they could be inflicted; whether to correct and improve, or for the gratification of revenge or whim: they are often so whimsical and unsuitable, that they cannot with any degree of propriety be ascribed to any cause but blind chance or wanton caprice. A great dog with three tongues, a peevish old boatman with a leaky ferry-boat, demanding

A numerous series of facts occur in the Roman history, which show the happy effects of their religious opinions and ceremonies on their sentiments concerning civil order and the public welfare. How powerful was the influence of the sacramentum administered to the soldiers when they enlisted in the service of their country? The promises made, the idea of the powers invoked, and the rites performed on that occasion, produced so deep and so awful an impression on their minds, that do danger, nor direst, nor discontent could prompt them to violate their engagements. The responses of the oracles, too, though the dictates of deceit and impurity, were often of singular service to those to whom they were uttered; when they inspired the warrior, as he marched out to battle, with the confidence of success, they communicated to him new vigour, and more heroic valour, by which he was actually enabled to gain or at least to deserve, the success they promised. Again, when in times of public distress, the augur and the priest directed some games to be celebrated, certain sacrifices to be offered, or some other solemnities to be performed, in order to appease the wrath of the offended deities; it is plain that the means were not at all suited to accomplish the end proposed by them; yet still they were highly beneficial. When the attention of the whole people was turned entirely to those solemnities by which the wrath of heaven was to be averted, they were rooted from that dependency under which the sense of the public distress or danger might have otherwise caused them to sink: the public union was at the same time more closely cemented, and the hearts of the people knit together; and when perfused, that by propitiating the gods they had removed the cause of their distresses, they acquired such calmness and strength of mind as enabled them to take more direct and proper measures for the safety of the state.

Could we view the ancient Greeks and Romans acting in public or in private life under the influence of that system of superstition which prevailed among them; could we perceive how much it contributed to the maintenance of civil order; could we behold Numa and Lycurgus establishing their laws, which would otherwise have met with a very different reception under the function of divinities; could we observe all the beneficial effects which arose to communities from the celebration of religious ceremonies—we should not longer hesitate to acknowledge, that those principles in the human heart by which we are susceptible of religious sentiments, are so eminently calculated to promote the happiness of mankind, that even when perverted and abused, their influence is still favourable.

The ideas which prevailed among the nations of the heathen world concerning a future state of retribution of a were, it must be confessed, not very correct. Some of those poets, the belief, have represented them in an unfair light: both Homer and Virgil have conducted their heroes through the realms of Pluto, and have taken occasion to unfold to us the secrets of those dreary abodes. The scenes are wild and fanciful; the rewards of the just and virtuous are of no very refined or dignified nature: and of the punishments inflicted on the guilty, it is often hard to say for what ends they could be inflicted; whether to correct and improve, or for the gratification of revenge or whim: they are often so whimsical and unsuitable, that they cannot with any degree of propriety be ascribed to any cause but blind chance or wanton caprice. A great dog with three tongues, a peevish old boatman with a leaky ferry-boat, demanding
manding his freight in a fully tone, and an unxious monarch, are objects too familiar and ludicrous not to degrade the dignity of those awful scenes which are represented as the mansions of the dead, and to prevent them from making a deep enough impression on the imagination. The actions and qualities, too, for which departed spirits were admitted into Elyfium, or doomed to the regions of suffering, were not always of such a nature as under a well-regulated government on earth would have thought to merit reward, or to be worthy of punishment. It was not always virtue or wisdom which conducted to the Elysian fields, or gained admission into the society of the immortal gods.— Ganymede was for a very different reason promoted to be the cup-bearer of Jove; and Hercules and Bacchus could not surely plead that any merits of that kind entitled them to seats in the council, and at the banquets of the immortals. That doctrine, likewise, which represented mortals as hurried by fate to the commission of crimes, which they could no more abstain from committing than the sword can avoid to obey the impulse of a powerful and furious arm plunging it into the breast of an unresisting antagonist, could not but produce effects unfavourable to virtue; and it afforded a ready excuse for the most extravagant crimes.

Yet, after all, he who attentively considers the ideas of the Greeks and Romans concerning the moral government of the world and a future state of rewards and punishments, will probably acknowledge, that their general influence must have been favourable to virtue and moral order. Allow them to have been incorrect and dafhed with absurdity; still they represent punishments prepared for such qualities and actions as were injurious to the welfare of society; whilst, for those qualities which rendered men eminently useful in the world, they held forth a reward. Though incorrect, their ideas concerning a future state were exceedingly diffient; they were not vague or general, but such as might be readily conceived by the imagination, in all their circumstances, as really existing. When a man is told that for such a deed he will be put to death, he may shudder and be alarmed, and think of the deed as what he must by no means commit; but place before him the scene and the apparatus for his execution, call him to behold some other criminal mounting the scaffold, address his last words in a wild storm of despair to the surrounding spectators, and then launching into eternity—his horror of the crime, and his dread of the punishment, will now be more much more powerfully excited. In the same manner, to encourage the offender marching out to battle, or the mariner setting sail under the prospect of a storm, promise not, merely in general terms, a liberal reward; be sure to specify the nature of the reward which you mean to bestow; describe it so as that it may take hold on the imagination, and may rife in opposition to the images of death and danger with which his course is to be allied.

If their phenomena of the human mind are fairly stated, if it be true that general ideas produce no very powerful effects on the sentiments and dispositions of the human heart, it must then be granted, that though the scenes of future reward and punishment, which the heathens considered as prepared for the righteous and the wicked, were of a somewhat motley complexion; yet still, as they were distinct and even minute details, they must have been favourable to virtue, and contributed in no inconsiderable degree to the support of civil order.

Another thing of which we may take notice under this head, is the vast multiplicity of deities with which the Greek and Roman mythology peopled all the regions of nature, flocks and fields, and woods and oaks, and flowers, and many much more minute objects, had all their guardian deities. These were somewhat capricious at times, it is true, and expected to have attention paid them. But yet the faithful shepherd, and the industrious farmer, knew generally how to acquire their friendship; and in the idea of deities enjoying the same simple pleasures, partaking in the same labours, protecting their possessions, and bringing forward the fruits of the year, there could not but be something of a very pleasing nature, highly favourable to industry, which would animate the labour, and cheer the feelings, of the good people who entertained such a notion: may, would diffuse a new charm over all the scenes of the country, even in the gayest months of the year.

From all of these particular observations, we think ourselves warranted to conclude, that notwithstanding the mixed charaters of the deities who were adored by the celebrated nations of antiquity; though they are in many instances represented as conspicuous for vices and frolicks, however vain, absurd, and morally criminal, some of the rites by which they were worshipped may have been, and however incorrect the notions of the heathens concerning the moral government of the universe and a future state of retribution; yet still, after making a just allowance for all these imperfect ideas, the general influence of their religious system was rather favourable than unfavourable to virtue and to the order and happiness of society.

It was not without good reason that the earliest legislators generally endeavoured to establish their laws and constitutions on the basis of religion; government needs the support of opinion; the governed must be impressed with a belief that the particular establishment to which they are required to submit, is the best calculated for their security and happiness, or is supported on some such solid foundation, that it must prove impossible for them to overturn it, or is connected with some awful sanction, which it would be the most horrid impolicy to oppose. Of these several notions, the last will ever operate on most men with the most steady influence. We are frequently blind to our own interest; even when eager for the attainment of happiness, we often refuse to take the wisest measures for that end. The great bulk of the people in every community are too little capable of reasoning and foresight, that the public minister who shall most steadily direct his views to the public good will often be the most unpopular. Those laws, and that system of government, which are the most beneficial, will often excite the strongest popular discontent. Again, it is not always easy to persuade people that your power is superior to theirs, when it is not really so. No one man will ever be able to persuade a thousand that he is stronger than they all together; and therefore, in order to persuade one part of his subjects or army that it is absolutely necessary for them to submit to him, because any attempts to resist his power would prove ineffectual, a monarch or general must take care first to persuade another part that it is for their int
Religion.

terest to submit to him; or to impress the whole with a belief that, weak and pitiful as he himself may appear, when viewed singly in opposition to them all, yet by the assistance of some awful beings, his friends and protectors, he is so powerful, that any attempts to re- 
light his authority must prove preposterous folly. Here, then, the aid of religion becomes requisite. Religious sentiments are the most happily calculated to serve this purpose. Sacred was ever there a society formed, a mode of government established, or a code of laws framed and enacted, without having the religious sentiments of mankind, their notions of the existence of 
superior invisible beings, and their hopes and fears from 
those beings, as its fundamental principle. Now, we
believe, it is almost universally agreed, that even the 
rudest form of society is more favourable to the happi-
ness of mankind, and the dignity of the human char-
acter, than a solitary and savage state. And if this, with 
what we have asserted concerning religion as the basis of civil government, be both granted, it will follow, 
that even the most imperfect religious notions, the most 
foolish and absurd rites, and the wildest ideas that have 
been entertained concerning the moral government of 
the universe by superior beings, and a future state of 
retribution, have been more advantageous than atheism 
to the happiness and virtue of human life. We have al-
ready granted, nor can it be denied, indeed, that many 
of the religious opinions which prevailed among the an-
cient heathens, did contribute, in some degree, to the 
depravity of their morals: and all that we argue for is, 
that on a comparative view of the evil and the good 
which resulted from them, the latter must appear more 
than adequate to counterbalance the effects of the 
former.

But if such be the natural tendency of those prin-
ciples by which the human heart is made susceptible of 
religious sentiments, that even enthusiastic and absurd 
perfections are productive of beneficial effects more than 
sufficient to counterbalance whatever is malignant in 
their influence on society—surely a pure rational reli-
gion, the doctrines of which are founded in undeniable 
truth, and all the observances which it enjoins, calculated 
to promote by their direct and immediate effects 
more useful purposes, must be in a very high degree 
conducive to the dignity and the happiness of human 
nature. Indeed one collateral proof of the truth of 
any religion, which must have very considerable weight 
with all who are not of opinion that the system of the 
universe has been produced and hitherto maintained in 
order and existence by blind chance, will be its having 
a stronger and more direct tendency to others to pro-
mote the interests of moral virtue and the happiness of 
mankind in the present life. Even the testimony of 
thousands, even miracles, prophecies, and the sanction of 
remote antiquity, will scarce have sufficient weight to 
persuade us, that a religion is of divine origin, if its 
general tendency appear to be rather unfavourable than 
advantageous to moral virtue.

While we shall therefore, in the next place, en-
davour to determine, from a comparative view of the 
effects produced on the character and circumstances of 
society by the most eminent of these various systems of 
religion which have been in different ages or in dif-
ferent countries established in the world, how far any 
one of them has in this respect the advantage over the 
rest, and, if the utility of a system of religion were to 
be received as a test of its truth, what particular sys-
tem might, with the best reason, be received as true, while 
the rest were rejected.

Religion.

The principle upon which we here set out is, that 
all, or almost all, systems of religion with which we 
are acquainted, whether true or false, contribute more 
or less to the welfare of society. But as one field is 
more fruitful, and one garden less overgrown with 
weeds than another; so, in the same manner, one system 
of religious opinions and ceremonies may be more hap-
pily calculated than others to promote the truest inter-
ests of mankind. In opposition to those philosophers 
who are to vehement in their declamations against the 
inequality of ranks, we have ever been of opinion, that 
refinement and civilization contribute to the hap-
piness of human life. The character of the solitary 
savage is, we are told, more dignified and respectable 
than that of the philosopher and the hero, in propor-
tion as he is more independent. He is indeed more independent; but his independence is that of a 
alone, which receives no nourishment from the 
earth or air, and communicates none to animals or 
vegetables around it. In point of happiness, and in 
point of respectable ability, we cannot hesitate a moment, let philosophers say what they will, to prefer a 
virtuous, enlightened, and polished citizen to any of 
the rudest savages, the least acquainted with the restraints 
and the sympathies of social life, that wander through 
the wild forests of the western world. But if we pre-
fer civilization to barbarism, we must admit, that in 
this view Christianity has the advantage over every 
other religious system which has in any age or country 
prevailed among men; for nowhere has civilization and 
useful science been carried to such a height as among 
Christians.

It is not, indeed, in any considerable degree that the 
view of the superstitious of those rude tribes, who can scarce the 
views of those who are not of the same opinion, can con-
trive to contribute to their happiness. Among them the faculty 
of reason is but in a very low state; and the moral prin-
ciple usually follows the improvement or the depression of 
the reasoning faculty. Their appetites and merely 
animal passions are almost their only principles of ac-
petition; and they are guided by them, and not by 
conscience, reason, or sentiment, as is the case with 
us, when we are the guides of our actions. To these, 
however wild and fanciful, it is not improbable that they may 
owe some of their earliest moral notions. The idea of 
superior powers naturally leads to the thought that 
these powers have some influence on human life. From 
this they will most probably proceed to fancy one set 
of actions agreeable, another offensive, to those beings 
to whom they believe themselves subject. And this, 
perhaps, is the first distinction that savages are sup-
pended to form between actions, as right or wrong, to 
be performed or to be avoided. But if this be the 
case, we must acknowledge that the religious notions of 
the savage, however absurd, contribute to elevate 
his character, and to improve his happiness, when 
they call forth the moral principle implanted in his 
breast.

But if the social state be preferable to a state of wild 
and solitary independence, even the rude superstitions of 
unenlightened tribes of savages are in another respect 
beneficial to those among whom they prevail. They 
usually...
Religion. Usually form, as has been already observed under this article, the basis of civil order. Religious opinions may lead the great body of the community to reverence some particular set of institutions, some individual, or some family, which are represented to them as peculiarly connected with the gods whom they adore. Under this sanction some form of government is established; they are taught to perform social duties, and rendered capable of social enjoyments. Not only Num\-ma and Lycurgus, but almost every legislator who has fought to civilize a rude people, and reduce them under the restraints of legal government, have endeavoured to impress their people with an idea that they acted with the approbation, and under the immediate direction, of superior powers. We cannot but allow that the rude superstitions of early ages are productive of these advantages to society; but we have already acknowledged, and it cannot be denied, that they are also attended with many unhappy effects. When we view the absurdities intermixed with the systems of religion which prevailed among most of the nations of antiquity, we cannot help admiring, that their absolute and blind adherence to idolatry, was to induce them to the greatest vices, to sacrifice to the gods, to burn, to dash themselves from precipices, or cut their throats, in order to obtain the enjoyment of the present life with disgust or contempt, that they might there be employed in the service of the gods, to whom they were supposed to be subject, and the fidelity of which their existence depended. The vast number of the inhabitants of Guinea are said to have been thus employed, in order to obtain their subsistence, slaves of spirits, by performing certain ceremonies, as means of propitiating superior powers, and obtaining their favours, or serving the same purposes, as on earth. Such are the ideas of futurity that were entertained by the inhabitants of Guinea. And by these ideas they were induced, when a king or great man died among them, to provide for his comfortable accommodation in the world of spirits, by burying with him meat and drink for his subsistence, to attend and serve him, and wives with whom he might still enjoy the pleasures of love. His faithful subjects vied with each other in offering, one a servant, another a wife, a third a son or daughter, to be sent to the other world in company with the monarch, that they might there be employed in his service. In New Spain, in the island of Java, in the kingdom of Benin, and among the inhabitants of Indostan, similar practices on the same occasion, owing no doubt to similar notions of futurity, have been prevalent. But such practices as these cannot be viewed with greater contempt on account of the opinions which have given rise to them, than horror on account of their unhappy effects on the condition of those among whom they prevail. A lively impression of the enjoyments to be obtained in a future state, together with some very false or incorrect notions concerning the qualities or actions which were to entitle the departing soul to admission into the society of those enjoyments, is said to have produced equally unhappy effects among the Japanese. They not only bribed their priests to solicit for them; but looking upon the enjoyments of the present life with disgust or contempt, they used to dash themselves from precipices, or cut their throats, in order to get to paradise as soon as possible. Various other superstitions subsisting among rude nations might here be enumerated, as instances of the perversion of the religious principles of the human heart, which render them injurious to virtue and happiness. The austerities which have been practised, chiefly among rude nations, as means of propitiating superior powers, are especially worthy of notice.—When the favourite idol of the Banians is carried in solemn procession, some devotees prostrate themselves on the ground, that the chariot in which the idol is carried may run over them; others, with equal enthusiasm, dash themselves on spikes fastened on purpose to the car. Innumerable are the ways of torture which have been invented and practised on the accused, in the belief that they are ignobly striving to recommend themselves to the favour of heaven. These we lament as instances in which religious sentiments have been so ill directed by the influence of imagination, and unenlightened error, as to produce unfavourable effects on the human character, and oppose the happiness of social life.—Though we have argued, that even the most absurd systems of religion that have prevailed in the world, have been upon the whole rather injurious than injurious to the dignity and happiness of human nature; yet it shall not appear, as we proceed farther in our comparative view of the effects of religion on society, that others have been attended with happier effects than those superstitions which belong to the rude ages of society, we may scarcely venture to brand the infidel with the appellation of fool, for refusing to give his assent to religious doctrines, or to act under their influence.

2d. The polytheism of the Greeks and Romans, and other heathen nations in a similar state of civilization, we have already considered as being, upon the moral principles of the whole, rather favourable than unfavourable to virtue, but we must not partially conceal its defects. The vicious characters of the deities which they worshipped, the incorrect notions which they entertained concerning the moral government of the universe and a future retribution, the absurdities of their rites and ceremonies, and the criminal practices which were intermixed with them, must have altogether had a tendency to pervert both the reasonings and the moral principles of the human mind. The debaucheries of the monarchs of the gods, and the fidelity with which his example in that respect was followed by the whole crowd of the inferior deities, did, we know, displease the devout heathen, when he felt the same passions which had a tendency to gratify them without scruple. It is a fact, however, and we will not attempt to deny or conceal it, that the genius of the polytheism of the Greeks and Romans was friendly to the arts; to such of them especially as are raised to excellence by the vigorous exertion of a fine imagination; music, poetry, sculpture, architecture, and painting, all of these arts appear to have been considerably indebted for that perfection to which they attained, especially among the Greeks, to the splendid and fanciful system of mythology which was received among that ingenious people.
But we cannot give an equally favourable account of its influence on the sciences. There was little in that system that could contribute to call forth reason. We may grant indeed, that if reason can be so shocked with absurdity as to be routed to a more vigorous exertion of her powers, and a more determined affront of her rights in consequence of surveying it; in that case this system of mythology might be favourable to the exercise and improvement of reason; not otherwise.

The connection of paganism with morality was too imperfect for it to produce any very important effects on the morals of its votaries. Sacrifices and prayers, and temples and festivals, not purity of heart and integrity of life, were the means pretended for propagating the favour of the deities adored by the Pagans. There were other means, too, besides true heroism and patriotism, of gaining admission into the Elysonian fields, or obtaining a seat in the hall of the gods. Xenophon, in one of the most beautiful parts of his Memoirs of Socrates, represents Hercules wooed by Virtue and Pleasure in two fair female forms, and delivering with much anxiety which of the two he should prefer. But this is the fiction of a philosopher defirous to improve the fables of antiquity in such a way as to render them truly useful. Hercules does not appear, from the tales which are told us of his adventures, to have been at any such pains in choosing his way of life. He was received into the palace of Jove, without having occasion to plead that he had through life been the faithful follower of that goddess to whom the philosopher makes him give the preference; his being the son of Jove, and his wild adventures, were sufficient without any other merits to gain him that honour. The fame may be said concerning many of the other demi-gods and heroes who were advanced to heaven, or conveyed to the blissful fields of Elyium. And whatever might be the good effects of the religion of Greece and Rome in general, upon the civil and political establishments, and in some few instances on the manners of the people, yet still it must be acknowledged to have been but ill calculated to impress the heart with such principles as might in all circumstances direct to a firm, uniform, tenor of virtuous conduct.

But after what has been said on the character of this religion elsewhere (see Polytheism), and in the second part of this article, we cannot without repetition enlarge farther on it here. Of the Jewish religion, however, we have as yet said little, having on purpose referred to this place whatever we mean to introduce under the article, concerning its influence on society.

34. When we take a general view of the circumstances in which the Jewish religion was established, the effects which it produced on the character and fortune of the nation, the rites and ceremonies which it enjoined, and the singular political institutions to which it gave a foundation, it may perhaps appear hard to determine, whether it were upon the whole more or less beneficial to society than the polytheism of the Egyptians, Greeks, and Romans. But if such be the judgment which preconceived prejudices, or an hasty and careless view, have induced some to form of this celebrated system; there are others who, with equal keenness, and founder reasoning, maintain, that it was happily calculated, not only to accomplish the great design of preparing the way for the promulgation of the Gospel, but likewise to render the Jews a more refined and virtuous people, and a better regulated community, than any Neighbor nation. In the first place, the attributes of the Deity were very clearly exhibited to the Jews in the establishment of their religion. The miracles by which he delivered them from servitude, and conducted them out of Egypt, were striking demonstrations of his power; that condescension with which he forgave their repeated acts of perseverance and rebellion, was a most convincing proof of his benevolence; and the impartiality with which the observance and the violation of his laws were rewarded and punished, even in the present life, might well convince them of his justice. A part of the laws which he dictated to Moses are of eternal and universal obligation; others of them were local and particular, fitted to the character of the Jews, and their circumstances in the land of Canaan. The Jewish code, taken altogether, is not to be considered as a complete system of religion, or laws calculated for all countries and all ages of society. When we consider the expediency of this system, we must take care not to overlook the design for which the Jews are said to have been separated from other nations, the circumstances in which they had lived in Egypt, the customs and manners which they had contracted by their intercourse with the natives of that country, the manner in which they were to acquire to themselves settlements by exterminating the nations of Canaan, the rank which they were to hold among the nations of Syria and the adjacent countries, together with the difficulty of restraining a people so little civilized and enlightened from the idolatrous worship which prevailed among their neighbours: All these circumstances were certainly to be taken into account; and had the legislator of the Jews not attended to them, his institutions must have remained in force only for a short period; nor could they have produced any lasting effects on the character of the nation. With a due attention to these circumstances, let us descend to an examination of particulars.

Although in every religion or superstition that has The Sabbath prevailed through the world, we find one part of its institution to consist in the enjoining of certain festivals to be celebrated by relaxation from labour, and the performance of certain ceremonies in honour of the gods; yet in none, or almost none besides the Jewish, do we find every seventh day ordained to be regularly kept holy. One great end which the legislator of the Jews had in view in the institution of the Sabbath was, to impress them with a belief that God was the maker of the universe. In the early ages of the world a great part of mankind imagined the stars, the sun, the moon, and the other planets, to be eternal, and consequently objects highly worthy of adoration. To convince the Israelites of the absurdity of this belief, and prevent them from adopting that idolatry, Moses taught them that those conspicuous objects which the Gentile nations regarded as eternal, and endowed with divine power and intelligence, were created by the hand of God; who, after bringing all things out of nothing, and giving them form, order, and harmony, in the space of six days, rested on the seventh from all his works. Various passages in the Old Testament concur to show, that this was one great end of the institution of the Sabbath.
The Hebrews had other solemn feasts of devotion besides the weekly Sabbath and these annual festivals. Every seventh year they rested from labour: they were then neither to plough, to sow, nor to prune; and whatever the earth produced spontaneously that year belonged rather to strangers, orphans, and the poor, than to the proprietors of the ground. On this year involuntary debtors were discharged from all debts contracted by purchasing the necessaries of life: and the great end of this relief from debts contracted during the preceding six years, appears to have been to prevent the Hebrew from flying to the Gentiles and forsaking his religion when embarrassed in his circumstances. None but native Israelites or proselytes of righteousness were admitted to this privilege; it was refused to strangers, and even to proselytes of the gate. The jubilee was a festival to be celebrated every fiftieth year. It produced the same effects with the sabbatical year as to rest from labour and the discharge of debts; with this addition, that on the year of the jubilee slaves obtained their freedom, and the lands reverted to the old proprietors. On the year of the jubilee, as on the sabbatical year, the lands were to rest uncultivated, and lawsuits were to now to terminate. The chief design of this institution appears to have been, to preserve the order of ranks and property originally established in the Hebrew state. None but Israelites or circumcised converts could enjoy the benefit of this institution; nor could even these hopes to regain their estates on the year of the Jubilee, if they sold them for any other purpose but to supply their necessities. The law relative to slavery was evidently founded on the same plan of policy with respect to property. To almost any other nation such a law, it must be confessed, would have been unsuitable and unjust: but as the Jews were not designed for a trading nation, they could have little occasion to borrow, unless to relieve dills; and as an indulgence to people in such circumstances, the Jew was forbidden to exact usury from his brother to whom he had lent money.

The Jewish legislator, we may well think, would be disposed to adopt every proper method to prevent his nation from falling away into the idolatry of heathen nations. Probably one reason of the distinctions between clean and unclean beasts which they were permitted to eat, and unclean beasts, the eating of which they were taught to consider as pollution, was to prevent them from convidual intercourse with profane nations, by which they might be seduced to idolatry. We do not readily fit down at table with people who are fond of dills which we regard with abhorrence. And if the Jews were taught to loathe the flesh of some of those animals which were among the greatest delicacies of the Gentiles, they would naturally of consequence avoid fitting down at meat with them, either at their ordinary meals or at those entertainments which they prepared in honour of their deities; and this we may with good reason consider as one happy mean to preserve them from idolatry. Besides, the Jews were permitted, or rather enjoined, to eat animals which the Gentiles revered as sacred, and from which they religiously withheld all violence. Goats, sheep, and oxen, were worshiped in Egypt (see POLYTHEISM and PAN); and several learned writers are of opinion that Moses directed his people to sacrifice and eat certain of the favourite animals of the Egyptians, in order to remove from their minds any opinions which they might have otherwise entertained of the fancies of those pretended deities. Many of the observances which Moses enjoined with regard to food, appear to have been intended to inspire the Israelites with contempt for the imperfections of the people among whom they had so long sojourmed. They were to kill the animal which the Egyptians worshipped; to roast the flesh which that people ate raw; to eat the head, which they never ate; and to dress the entrails, which they set apart for divination. These distinctions concurred with the peculiarities of their dress, language, government, customs, places, and times of worship, and even the natural situation of their country, by which they were in a manner confined and fortified on all sides, to separate them in such a manner from neighboring nations, that they might escape the infection of their idolatry. And if we reflect both on the design for which Providence separated the Israelites from other nations,
In comparing it with other objects, and not in the delineations of meats, and between clean and unclean animals, does the legislator of the Jews appear to have laboured to fix a barrier between them and other nations which might influence them from the contagion of idolatry—whether not err, perhaps, if we ascribe many particulars of their worship to this design in the institution. The heathens had gods who presided over woods, rivers, mountains, and valleys, and to each of these they offered sacrifices, and performed other rites of worship in a suitable place. Sometimes the grove, sometimes the mountain top, at other times the bank of the river or the brink of the spring, was the scene of their devotions. But as the unity of the divine nature was the truth the most earnestly inculcated on the children of Israel; so in order to impress that truth on their minds with the most powerful efficacy, they were taught to offer their sacrifices and other offerings only in one place, the place chosen by the Lord; and death was threatened to those who dared to disobey the command. To confirm this idea, one of the prophets intimates, that when idolatry should be abhorr'd, the worship of God should not be confined to Jerusalem, but it would then be lawful to worship him anywhere.

The whole institutions and observances of the Jewish religion appear to have been designed and happily calculated to impress the minds of the people with reverence and respect for the Deity. All the festivals which either commemorated some gracious dispensation of his providence towards their ancestors, or served as days of thanksgiving for the constant returns of his goodness to those whom they celebrated, and all the other rites designed to fortify them against idolatry, served at the same time to impress their hearts with awful reverence for the God of Jacob. Various other particulars in the institutions of the Jewish economy appear to have been designed solely to that end. Into the most sacred place, the Holy of Holies, none but the high priest was admitted, and he only once a year. No fire was used in facrifice but what was taken from the altar. Severe punishments were on various occasions inflicted on such as presumed to intermediate in the service of the sanctuary in a manner contrary to what the law had directed. All the laws respecting the character, the circumstances, and the services, of the priests and the Levites, appear plainly to have a similar tendency.

In compliance with the notions of Deity which naturally prevailed among a gross and rude people, though no visible object of worship was granted to the Jews, yet they were allowed in their wanderings through the wilderness to have a tabernacle or portable temple, in which the soveraign of the universe sometimes designed to display some rays of his glory. Incapable as they were of conceiving aright concerning the spiritual nature and the omnipresence of the Deity, they might possibly have thought Jehovah careless and indifferent about them, had they not been surrounded with a visible demonstration of his presence. The sacrifices in use among the Gentiles in their worship of idols were permitted by the Jewish legislature; but he directed them to be offered with views very different from those with which the Gentiles sacrificed to their idols. Some of the sacrifices of the Jewish ritual were designed to avert the contamination of the Deity; one to expiate offences and purify the heart; and all of them to abolish and remove idolatry. Lustrations or ablutions entered likewise into the Jewish ritual; but these were recommended and enjoined by Moses for purposes widely different from those which induced the heathens to place so high a value upon them. The heathens professed them with magical and superstitious ceremonies; but in the Jewish ritual they were intended simply for the cleansing away of impurities and pollutions.

The theoretical form of government to which the Jews were subject, the rewards which they were to receive, and the punishments which they were equally liable to suffer in the present life, had a powerful effect to remove superstition and preserve them from idolatry, as well as to support all the social virtues among them. They were promised a numerous offspring, a land flowing with milk and honey, long life, and victory over their enemies, on the condition of their paying a faithful obedience to the will of their heavenly Sovereign; plague, famine, death, were threatened as the punishments to be inflicted on those who violated his laws; and these sanctions, it must be allowed, were happily accommodated to the genius of a rude and carnal-minded people, attentive only to present objects, and not likely to be influenced by remote and spiritual considerations.

There were other rites and prohibitions in the Mosaic law, which appear to have had but little connection with religion, morals, or policy. These may be more liable to be objected against, as adding an unnecessary weight to a burden which, though heavy, might yet have been otherwise borne in consideration of the advantages connected with it. Even these, however, may perhaps admit of being viewed in a light in which they shall appear to have been in no way unbeneficial to the happiness of those to whom they were enjoined. They appear to have had none of them an immoral tendency: all of them had, in all probability, a tendency to remove or prevent idolatry, or to support, in some way or other, the religious and the civil establishment to which they belonged.

From these views of the spirit and tendency of the Jewish religion, we may fairly conclude it to have been admirably calculated to promote the welfare of society. In comparing it with other religions, it is necessary to reflect on the peculiar purposes for which it was given; that its two principal objects were to preserve the Jews a separate people, and to guard them against the contagion of the surrounding idolatry. When these things are taken into consideration, every candid mind acquainted with the history of ancient nations will readily acknowledge that the whole system, though calculated indeed in a peculiar manner for them, was as happily adapted for the purposes for which it had been wisely and graciously intended, as it is possible to imagine any such
such a system to be. It would be unhappy, indeed, if, on a comparison of pure theism with polytheism, the latter, with all its absurdities, should be found more beneficial to mankind than the former. The theism of the Jews was not formed to be disseminated through the earth; that would have been inconsistent with the purposes for which it is said to have been designed. But while the Jews were separated by their religion from all other nations, and perhaps, in some degree, fixed and rendered stationary in their progress towards refinement, they were placed in circumstances, in respect to laws, and government, and religion, and moral light, which might with good reason render them the envy of every other nation in the ancient world.

IV. The Christian religion next demands our attention. It is to be considered as an improvement of the Jewish, or a new superstructure raised on the same basis. If the effects of the Jewish religion were beneficial to those among whom it was established, they were confined almost to them alone. But is the spirit of Christianity equally pure and benign? Is its influence equally pure and beneficent? Is the spirit of Judaism? Does it really merit to have triumphed over both the theism of the Jews and the polytheism of the heathens?

If we consider the doctrines and precepts of the Christian religion, nothing can be more happily calculated to raise the dignity of human nature, and promote the happiness of mankind. The happiness of the individual is best promoted by the exercise of love and gratitude towards God, and resignation to his providence; of humanity, integrity, and good will towards men; and by the due government of our appetites and passions. Social happiness again proceeds from the members of society entertaining a disinterested regard for the public welfare; being actively industrious each in his proper sphere of exertion; and being strictly just and faithful, and generously benevolent in their mutual intercourse. The tenor of the Gospel inculcates these virtues; it seems, therefore, through the whole of the Christian code to have been the great design of its Author to inspire mankind with mild, benevolent, and peaceable dispositions, and to form them to courteous manners. Christianity again represents the Deity and his attributes in the fairest light; even so as to render our ideas of his nature, and the manner in which he exerts his power, consistent with the most correct principles of morality that can be collected from all the other religions that have prevailed in the earth, and from the writings of the most admired philosophers. The ritual observances which Christianity enjoins are few in number, easy to perform, decent, expressive, and edifying. It inculcates no duties but what are founded on the principles of human nature, and on the relation in which men stand to God, their Creator, Redeemer, and Sanifier; and it prescribes accurate rules for the regulation of the conduct. The affinities of the spirit of God is promulgated in this sacred volume to those who assiduously labour to discharge the duties which it enjoins; and it exhibits a striking example of spotless purity, which we may safely venture to imitate. The gospel teaches that worldly attachments are incident to both good and bad men; a doctrine highly conducive to virtue, which consoles us in distress, prevents despair, and encourages us to persevere firmly in our integrity under every difficulty and trial. Christianity represents all men as children of the same God, and heirs of the same salvation, and levels all distinctions of rich and poor, as accidental and insignificant in the sight of him who rewards or punishes with impartiality according to the merits or demerits of his creatures. This doctrine is highly favourable to virtue, as it tends to humble the proud, and to communicate dignity of sentiment to the lowly; to render princes and inferior magistrates moderate and just; gentle and condescending, to their inferiors. It further requires husbands to be affectionate and indulgent to their wives, wives to be faithful and respectful to their husbands, and both to be true and constant to each other. Such is the purity of the Gospel, that it forbids us even to harbour impure thoughts; it requires us to abandon our vices, however dear to us; and to the cautious wisdom of the serpent it directs us to join the innocent simplicity of the dove. The Christian dispensation, to prevent a perseverance in immorality, offers pardon for the past, provided the offender forgoes his vicious practices, with a firm resolution to act differently in future. The functions of the Gospel have a natural tendency to exalt the mind above the paltry pursuits of this world, and to render the Christian incorruptible by wealth, honours, or pleasures. The true Christian not only abstains from injustice towards others, but even forgives those injuries which he himself suffers, knowing that he cannot otherwise hope for forgiveness from God. Such are the precepts, such the spirit, and such the general tendency of the Gospel. Every one who refused to give credit to its doctrines and history has yet acknowledged the excellence of its precepts. They have acknowledged, that "no religion ever yet appeared in the world of which the natural tendency was so much directed to promote the peace and happiness of mankind as the Christian; and that the Gospel of Christ is one continued lesson of the strictest morality, of justice, benevolence, and universal charity." These are the words of Bolingbroke, one of its keenest and most insidious opponents. Without examining the effects of this religion on society, we might almost venture to pronounce with confidence, that a religion, the precepts of which are so happily formed to promote all that is just and excellent, cannot but be in the highest degree beneficial to mankind. By reviewing the effects which it has actually produced, the favourable opinion which we naturally conceive of it, after considering its precepts, cannot but be confirmed.

One circumstance we must take notice of as rather unfavourable to this view. It is really impossible to use it to re-do justice to Christianity by such a disquisition of its merits, as that in which its virtues and its success have been speculatively discussed. The virtues which it has a natural tendency to produce and cherish in the human heart, are not of a ostentatious kind; they often escape the observation of the world. Temperance, gentleness, patience, benevolence, justice, and general purity of manners, are not the qualities which most readily attract the admiration and obtain the applause of men. The man of parts, whom Mr Pope has so justly celebrated, was a private character; his name is now likely to live, and his virtues to be known to the latest posterity; and yet, however disinterested his virtues, however beneficial his influence to all around him, had his character not attracted the notice of that eminent poet, his name would...
Religion.

would perhaps ere this time have been lost in oblivion. Individuals in private life seldom engage the attention of the historian; his object is to record the actions of princes, warriors, and statesmen. Had not the professors of Christianity in the earlier ages of its existence been exposed to perjuries, and unjust accusations from which they were called on to vindicate themselves, we should be strangers to the names and virtues of saints and martyrs, and to the learning and endowments of the first apologists for Christianity. We can therefore only trace the general influence of the institutions of Christianity on society. We cannot hope to make an accurate enumeration of particulars. In many of the countries in which it has been estabJished, it has produced a very favourable change on the circumstances of domestic life. Polygamy, a practice repugnant to the will of our Creator (see Polygamy), who has declared his intentions in this instance in the plainest manner, by casting nearly equal numbers of males and females to be brought into the world, was never completely abolished but by Christianity.

The practice of divorce, too, though in some cases proper and even necessary, had been so much abused at the time of our Saviour's appearance in the world, that he found reason to declare it unlawful, unless in the case of adultery. The propriety and reasonableness of this prohibition will sufficiently appear, if we consider, that when divorces are easily obtained, both parties will often have nothing else in view at the period of marriage than the dissolusion of their nuptial engagements after a short cohabitation; the interests of the husband and the wife will almost always be separate; and the children of such a marriage are scarce likely to enjoy the cordial affection and tender watchful care of either parent. The husband in such a case will naturally be to his wife, not a friend and protector, but a tyrant; fear and dejection; not love, gratitude, or a sense of duty, will be the principles of the wife's obedience.

In another instance, likewise, Christianity has produced an happy change on the circumstances of domestic life; it must be acknowledged to have contributed greatly to the abolition of slavery, or at least to the mitigation of that rigour of former times. The eradication of the slave in laws of the Romans in relation to slaves were cruel and severe. Masters were often so inhuman as to remove aged, sick, or infirm slaves, into an island in the Tiber, where they suffered them to perish without pity or assistance. The greater part of the subjects of many of those republics which enjoyed the most liberty, groaned under tyrannical oppression; they were condemned to drag out a miserable existence in hard labour, under inhuman usage, and to be transferred like beasts from one master to another. The hardships of slavery were eased, not by any particular precept of the Gospel but by the gentle and humane spirit which breathed through the general tenor of the whole system of doctrines and precepts of which the Gospel consists. It must indeed be allowed, that a trade in slaves is at present carried on by people who profane to call themselves Christians, and protected by the legislature of Christian states: but the spirit of the Christian code condemns the practice, and the true Christian will not engage in it.

Partly by the direct and conspicuous, partly by the secret and unseen, influence of Christianity since its promulgation in the world, the hearts of men have been gradually softened; even barbarians have been formed to mildness and humanity; the influence of selfishness has been checked and restrained; and even wars, amid all the terrible improvements by which men have fought to render it more terrible, has assumed much more of the spirit of mildness and peace than ever entered into it during the reign of heathenism.

If we review the history of mankind with a view to their political circumstances, we shall find, that by some means or other, it has happened, since the time when the Gospel was first preached, that both systems of legislation and forms of government have been raised to much greater perfection, at least in those parts of the world into which the religion of Jesus has made its way, and obtained an establishment.

The popular government of the Romans, notwithstanding the multiplicity of their laws, and the imperfections of their political constitution, was, no doubt, happily enough adapted to promote the increase of power and the extension of the empire of Rome. In Greece there were various republics, the wisdom and impartiality of whose laws have been highly celebrated. But we apprehend that there is a sufficient number of pernicious indications to warrant us to affirm, that since Christianity has been propagated, and has had sufficient time to produce its full effect on arts, manners, and literature, even under governments the form of which might appear least favourable than the celebrated models of antiquity to the liberty and happiness of the people in general, these actually have been much better provided for than under the laws of Athens or Sparta, or even of Rome in the days of the confuls. It is a just and happy observation of Montefquieu, who has attributed so much to the influence of climate and local circumstances, that the mildness so frequently recom
But on no occasion has the mild influence of Christianity been more eminently displayed, or more happily exerted, than in softening and humanizing the barbarians who overturned the Roman empire. The idolatrous religion which prevailed among those tribes before their conversion to Christianity; instead of disposing them to cultivate humanity and mildness of manners, contributed strongly to render them fierce and blood-thirsty, and eager to distinguish themselves by deeds of savage valour. But no sooner had they settled in the dominions of Rome, and embraced the principles of Christianity, than they became a mild and generous people.

We are informed by Mosheim, who was at pains to collect his materials from the most authentic sources, that in the tenth century Christian princes exerted themselves in the conversion of nations whose forefathers they had experienced, in order to soften and render them more gentle. The mutual humanity with which nations at war treat each other in modern times, is certainly owing, in a great measure, to the influence of the mild precepts of the Gospel. It is a fact worthy of notice too, that during the barbarous ages, the spiritual courts of justice were more rational and impartial in their decisions than civil tribunals.

How many criminal practices which prevailed among heathen nations have been abolished by their conversion to Christianity! Christians of all nations have been observed to retain the virtues, and reject the vicious practices of their respective countries. In Parthia, where polygamy prevailed, they are not polygamists; in Persia, the Christian father does not marry his own daughter. By the laws of Zoroaster the Persians committed incest until they embraced the Gospel; after which period they abstained from that crime, and observed the duties of chastity and temperance, as enjoined by its precepts. Even the polished and enlightened Romans were cruel and blood-thirsty before the propagation of the Gospel. The breaking of a glass, or some such trifling offence, was sufficient to provoke Vittus Pollio to call his slaves into fish-ponds to be devoured by lampreys. The effusion of human blood was their favourite entertainment; they delighted to see men combating with beasts, or with one another; and we are informed on respectable authority, that no wars ever made such havoc on mankind as the fights of gladiators, which sometimes deprived Europe of 20,000 lives in one month. Not the humanity of Titus, nor the wisdom and virtue of Trajan, could abate the barbarous spectacle. However humane and wise in other influences, in this practice those princes complied with the custom of their country, and exhibited splendid shows of gladiators, in which the combatants were matched by pairs; who, though they had never injured nor offended each other, yet were obliged to main and murder one another in cold blood. Christian divines soon excercised their pen against these horrid practices; the Christian emperor Constantine restrained them by edicts, and Honorius finally abolished them. It would be tedious to proceed through an enumeration of particulars; but wherever Christianity has been propagated, it has constantly operated to the civilization of the manners of mankind, and to the abolition of abusid and criminal practices. The Irish, the Scotch, and all the ancient inhabitants of the British isles, were, notwithstanding their intercourse with the Romans, rude barbarians, till such time as they were converted to Christianity. The inhuman practice of exposing infants, which once prevailed so generally over the world, and still prevails among some Pagan nations, even under very humane and enlightened legislatures, yielded to the influence of Christianity.

Let us likewise remember, in honour of Christianity, Learning that it has contributed eminently to the diffusion of much knowledge, the preservation and the advancement of learning. When the barbarians overthrew Europe, what must have become of the precious remains of polished, enlightened antiquity, had there been no other depositaries to preserve them but the heathen priests? We allow that even the Romish clergy during the dark ages did not study the celebrated models of ancient times with much advantage themselves, and did not labour with much affinity to make the laity acquainted with them. It must even be acknowledged, that they did not always preserve those monuments of genius with sufficient care, as they were often ignorant of their real value. Yet, after all, it will be granted, it cannot be denied, that had it not been for the clergy of the Christian church, the lamp of learning would, in all probability, have been entirely extinguished, during that night of ignorance and barbarity in which all Europe were buried for a long series of centuries, after the irruption of the barbarians into the Roman empire.

Such is the excellence of the Christian system, and the beneficial influence to mitigate the human character, and to prevent the propagation of such a character as the apostle Julian were surely owing in no inconsiderable degree to his acquaintance with Christianity; and it is an undeniable fact, that after the propagation of Christianity through the Roman empire, even while the purity of that holy religion was gradually debauched, the manners of those Pagans who remained unconverted became more pure, and their religious doctrines and opinions are in more esteem, and their religious doctrines and worship less immoral and absurd.—We might here adduce a tedious series of facts to the same purpose. Whenever Christians have had any intercourse with Pagan idolaters, and have not concealed the laws of the Gospel, nor shown by their conduct that they disdained them, even those who have not been converted to Christianity have, however, been improved in their dispositions and manners by its influence. The emperor, whose virtues we have mentioned as ariling, in a certain degree, from his acquaintance with Christianity, in a letter to an Heathen pontiff, desires him to turn his eyes to the means by which the superstition of Christians was propagated: by kindness to strangers, by simplicity of life, and by the attention which they paid to the burial of the dead. He recommends an imitation of their virtues, exorts him to caufe the priests of Britain to be attentive to the worship of their gods, and authorizes him to strip them of the ceremonial function, unless they obliged their wives, children, and servants,
Analysis of the text:

- **Religion** to pay attention to the same duties. He likewise enjoins works of beneficence, defies the priest to relieve the distressed, and to build houses for the accommodation of strangers of whatever religion; and says, it is a disgrace for Pagans to disregard those of their own religion, while Christians do kind offices to strangers and enemies. This is indeed an eminent instance of the happy influence of Christianity even on the sentiments and manners of those who regarded the Christian name with abhorrence.

- Upon the whole then, may we not, from the particular notice taken in this work, concerning the influence of this religion on the manners and habits of nations, conclude that Christianity is infinitely superior to the superstitions of Paganism, as being in its tendency unfavourable to the virtue and the happiness of mankind, and even to the system of religion and laws delivered by Moses to the children of Israel: because, while the religion of the Jews was calculated only for one particular nation, and it may almost be said for one particular stage in the progress of society, Christianity is an universal religion, formed to exert its happy influence in all ages and among all nations; and has a tendency to dispel the shades of barbarism and ignorance, to promote the cultivation of the powers of the human understanding, and to encourage every virtuous refinement of manners.

- V. Another religion, which has made and still makes a conspicuous figure in the world remains yet to be examined. The religion of Mahomet is that which we here allude to. Whether we consider through what an extensive part of the globe that religion prevailed, the political importance of the religious system to which it is professed, or the striking peculiarity of character by which it is distinguished from all other religious systems—it is for all these reasons well worthy of particular notice. Like the Jewish religion, it is not barely a system of religious doctrines and general moral precepts; it forms both the civil legislature and the religious system of those nations among whom it is professed; and, like it too, it would appear to be calculated rather for one particular period in the progress of mankind from rudeness to refinement, than for all ages and all states of society.

- The history of its origin is pretty well known, and we have had occasion to enlarge upon it under a former article (see Mahomet and Mahometanism). We are not here to trace the impurities of the prophet, or to consider the arts by which he so successfully accomplished his designs; but merely to consider the morality of his religion, and its influence on civil order and the happiness of societies.

- If we view the state of the nations among whom it is established, we cannot hesitate a moment to declare it friendly to ignorance, to dechristianism, and to impurity of manners. The Turks, the Persians, and the Malays, are all Mahometans; and in reviewing their history and considering their present state, we might find a sufficient number of facts to justify the above assertion: and we must not neglect to observe, that, as those nations are not known to have been ever since their conversion to Mahometanism under a much happier government, or in a much more civilized state than at present, it cannot be, with any degree of fairness, argued, with respect to Mahometanism as with respect to Christianity, that it is only when its influence is so opposed by other causes as to prevent it from producing its full effects, that it does not conduct those societies among which it is established to an high state of civilization and refinement.

- One, and that by no means an inconsiderable, part of the Koran, was occasionally invented to solve some difficulty with which the prophet found himself at the time perplexed, or to help him to the gratification of his ruling passions, love and ambition. When he and his followers were, at any time, unsuccessful in those wars for which he fought to propagate his religion, to prevent them from falling away into infidelity, or sinking into depravity, he took care to inform them that God suffered such misfortunes to befal believers, as a punishment for their sins, and to try their faith. The doctrine of predetermination, which he affiduously inculcated, had an happy effect to persuade his followers to walk boldly into the midst of death and danger at his command. He prevailed with Zeyd to put away his wife, married her himself, and pretended that his crime had the approbation of heaven; and, in the Koran, he introduces the Deity approving of this marriage. Being repulsed from the siege of Mecca, he made a league with the inhabitants; but on the very next year, finding it convenient to purify the city, by violating this treaty, he justified his perfidy by teaching his followers to disregard promises or leagues made with infidels. In some instances again, we find absurd prohibitions enjoined for similar reasons: his officers, having on some occasion drunk to excess, excited much riot and confusion in the camp, he prohibited the use of wine and other intoxicating liquors among the followers in future. Now, though it must be acknowledged that many evils arise from the use of these liquors, yet we cannot but think that, when used in moderation, they are in many cases beneficial to men; and certainly as much allowed by God as opium, which the Mahometans have substituted in their place.

- Mahomet is allowed to have copied from the Christian and the Jewish religions, as well as from the idolatrous superstitions which prevailed through Arabia, and thus to have formed a motley mixture of reason and absurdity, of pure theism and wild superstition. He considered also the circumstances of his country, and the prejudices of his countrymen. When he attended to the former, he was generally judicious enough to suit his doctrines and decisions to them with sufficient skill; the latter he also managed with the greatest art: but he entered into accommodation with them in instances when a true prophet or a wise and upright legislator would have had them opposed with decisive vigour. Where the prophet indulges his own fancy, or borrows from the superstitions of his countrymen, nothing can be more ridiculous than that hepy of lies, contradictions, and extravagant fables, which he delivers to his followers. Amazing are the absurdities which he relates concerning the patriarchs, concerning Solomon, and concerning the animals that were assembled in Noah's ark.

- But in the whole tissue of absurdities of which his Notion of God consists, there is nothing more absurd, or more heaven and happily calculated to promote impurity of manners, than hell. His descriptions of heaven and hell; the ideas of future rewards and punishments which he sought to impress...
Religion. [77] Rel

Religion. [50] Religion

The whole result of our inquiries under this article, therefore, is. That as man, by the constitution of his mind, is naturally fitted for acquiring certain notions concerning the existence of invincible, superior beings, and their influence on human life; so the religious ideas which we find to have in all ages of the world, and in all the different stages of the progress of society, prevailed among mankind, appear to have originated partly from the natural exertions of the human imagination, understanding, and passions, in various circumstances, and partly from supernatural revelation.

2. That though religious opinions, together with the moral precepts, and the rites of worship connected with them, may appear to have been in numerous instances injurious to the virtue and happiness of society; yet, as they have often contributed to lead the mind to form moral distinctions, when it would otherwise in all probability have been an entire stranger to such distinctions; and as they have always contributed in an essential manner to the establishment and the support of civil government—it must therefore be acknowledged that they have always, even in their humblest state, been more beneficial than hurtful to mankind.

3. That when the different systems of religion that have prevailed in the world are comparatively viewed with respect to their influence on the welfare of society, we find reason to prefer the polytheism of the Greeks and Romans to the ruder, wilder, religious ideas and ceremonies that have prevailed among heathens; Mahometanism, perhaps in some respects, to the polytheism of the Greeks and Romans; Judaism however to Mahometanism; and Christianity to all of them.

REMEMBRANDT (Van Rhin), a Flemish painter and engraver of great eminence, was born in 1606, in a mill upon the banks of the Rhine, from whence he derived his name of Van Rhin. This matter was born with a creative genius, which never attained perfection. It was void of him, that he would have invented painting, if he had not found it already discovered. Without study, without the assistance of any master, but by his own infinite, formed rules, and a certain practical method for colouring; and the mixture produced the desired effect. Nature is not set off to the greatest advantage in his pictures; but there is such a striking truth and simplicity in them, that his heads, particularly his portraits, seem animated, and rising from the canvas. He was fond of strong contrasts of light and shade. The light entered in his working room, only by a hole, in the manner of a camera obscura, by which he judged with greater certainty of his productions. This artist considered painting like the stages,
Rembrandt, where the characters do not strike unless they are exaggerated. He did not pursue the method of the Flemish painters of finishing his pieces. He sometimes gave his light thick touches, that it seemed more like modelling than painting. A head of his has been shown, the nose of which was as thick of paint, as that which he copied from nature. He was told one day, that by his peculiar method of employing colours, his pieces appeared rugged and uneven—he replied, he was a painter, and not a dyer. He took a pleasure in dwarfing his figures in an extraordinary manner; with this view he had collected a great number of easel caps, ancient armour, and drapery long since out of fashion. When he was advised to consult antiquity to attain a better taste in drawing, as his was usually heavy and uneven, he took his counsellor to the closet where these old vestments were deposited, saying, by way of prices. Being one day at work painting a whole his monkey was dead, he was so sensible of the loss, that, without paying any attention to the persons who were fitting for their portraits, he painted the monkey upon the same canvas. This whim could not fail of displeasing those the piece was designed for: but he would not efface it, choosing rather to lose the sale of his picture.

This freak will appear still more extraordinary in Rembrandt, when it is considered that he was extremely avaricious; which vice daily grew upon him. He practised various stratagems to sell his prints at a high price. The public were very desirous of purchasing them, and not without reason. In his prints the fame tale prevails as in his pictures; they are rough and irregular, but picturesque. In order to heighten the value of his prints, and increase their price, he made his son tell them as if he had perjured them from his father; others he exposeė under public files, and went thither himself in disguise to bid for them; sometimes he gave out that he was going to leave Holland, and settle in another country. These stratagems were successful, and he got his own price for his prints. At other times he would print his plates half finished, and expose them to sale; he afterwards finished them, and they became fresh plates. When they wanted retouching, he made some alterations in them, which promoted the sale of his prints a third time, though they differed but little from the first impressions.

His pupils, who were not ignorant of his avarice, one day painted some pieces of money upon cards; and Rembrandt no sooner saw them, than he was going to take them up. He was not angry at the pleasantry, but his avarice still prevailed. He died in 1674.

REMEMBRANCE, is the idea of something formerly known recur again to the mind without the operation of a like object on the external sensoy. See MEMORY and REMINISCENCE.

REMEMBRANCERS, in England, anciently called clerks of the remembrance, certain officers in the exchequer, whereof three are distinguished by the names of the king's remembrancer, the lord treasurer's remembrancer, and the remembrancer of the first fruits. The king's remembrancer enters in his office all recognizances taken before the barons for any of the king's debts, for appearances or obviating of orders; he also takes all bonds for the king's debts, &c. and makes out processes thereon. He likewise issues processes against the collectors of the customs, excise, and others, for their accounts; and informations upon penal statutes are entered and filed in his office, where all proceedings in matters upon English bills in the exchequer-chamber remain. His duty further is to make out the bills of compositions upon penal laws, to take the statement of debts; and into his office are delivered all kinds of indentures and other evidences which concern the affuring any lands to the crown. He every year in cratina animarum, reads in open court the statute for election of sheriffs; and likewise openly reads in court the oaths of all the officers, when they are admitted.

The lord treasurer's remembrancer is charged to make out processes against all sheriffs, escheators, receivers, and bailiffs, for their accounts. He also makes out writs of fieri facias, and extent for debts due to the king, either in the pipe or with the auditors; and processes for all such revenue as is due to the king on account of his tenures. He takes the account of sheriffs; and also keeps a record, by which it appears whether the sheriffs or other accountants pay their provers due at Easter and Michaelmas; and at the same time he makes a record, whereby the sheriffs or other accountants keep their prefixed days: there are likewise brought into his office all the accounts of customers, comptrollers, and accounts, in order to make entry thereof on records; also all effects and amercements are certified here, &c.

The remembrancer of the first-fruits takes all compositions and bonds for the payment of first-fruits and tenth; and makes out processes against such as do not pay the same.

REMINISCENCE, that power of the human mind, whereby it recollects itself, or calls again into its remembrance such ideas or notions as it had really forgotten; in which it differs from memory, which is a treasuring up of things in the mind, and keeping them there, without forgetting them.

REMISSION, in physics, the abatement of the power or efficacy of any quality; in opposition to the increase of the same, which is called intension.

REMISSION, in law, &c. denotes the pardon of a crime, or the giving up the punishment due thereto.

REMISSION, in medicine, is when a dihæmper abates for a time, but does not go quite off.

REMITTANCE, in commerce, the traffick or return of money from one place to another, by bills of exchange, orders, or the like.

REMONSTRANCE, an expostulation or supplication, addresed to the chief magistrate, or other superior, beseeching him to reflect on the inconveniences or ill consequences of some order, edict, or the like. This word is also used for an expostulatory counsel, or advice; or a gentle and handomc reproof, made either in general, or particular, to apprize of or correct some fault, &c.

REMORA, of Sucking-fish, a species of Ecmenis. Many incredible things are related of this animal by the ancients; as that it had the power of stopping the largcst and swiftest vessel in its course: and even to this day it is allertcd by the fishermen in the Mediterranean, that it has a power of retarding the motion of their boats by attaching itself to them; for which
REMORSE, in its worst sense, means that pain or anguish which one feels after having committed some bad action. It also means tenderness, pity, or sympathetic sorrow. It is most generally used in a bad sense, and is applied to persons who feel compunction for some great crime, as murder and such like. Murders which have been committed with the utmost circum­spection and secrecy, and the authors of which could never have been discovered by any human investigation have been frequently unfolded by the remorse and confession of the perpetrators, and that too, many years afterwards. Of this there are numerous instances, which are well authenticated, and which are so generally known that it is needless to relate them here. See Rem­pance.

REMPHAN, an idol or Pagan god whom St Stephen says the Israelites worshipped in the wilderness as they passed from Egypt to the land of Promised: “Yea, ye took up the tabernacle of Moloch, and the star of your god Remphan; figures which ye made to worship them.” That the martyr here quotes the following words of the prophet Amos, all commentators are agreed: “Ye have borne the tabernacle of your Moloch, and Chiun your images, the star of your god, which ye made to yourselves.” But if this coincidence between the Christian preacher and the Jewish prophet be admitted, it follows, that Chiun and Remphan are two names of one and the same deity. This is indeed farther evident from the LXX translators having substituted in their version the word Chiun instead of Chiun, which we read in the Hebrew and English Bibles. But the question which still remains to be answered is, what god was worshipped by the name of Remphan, Raiphon, or Chiun? For about the other divinity here mentioned there is no dispute. See Moloch.

That Chiun or Remphan was an Egyptian divinity, cannot be questioned; for at the era of the Exodus the Hebrews must have been strangers to the idolatrous worship of all other nations; nor are they ever accused of any other than Egyptian idolatries during their 40 years wanderings in the wilderness, till towards the end of that period that they became infected by the Moabites with the worship of Baal-por. That Moloch, Mo­loch, Melch, or Miltom, in its original acceptance denotes a king or chief, is known to every oriental scholar; and therefore when it is used as the name of a god, it undoubtedly signifies the sun, and is the same divinity with the Egyptian Osiris. Reasoning in this way many critics, and we believe Seldon is in the number, have concluded that Chiun, and of course Remphan, is the planet Saturn; because Chiun is written Cian, Cenau, Cenau Chevea; all of which are modern oriental names of that planet.

But against this hypothesis insurmountable objections present themselves to our minds. It is universally allowed (see Polytheism), that the first objects of idolatrous worship were the sun and moon, considered as the king and queen of heaven. The fixed stars, indeed, and the planets, were afterwards gradually admitted into the Pagan rubric; but we may be sure that those would be first associated with the two prime luminaries which most resembled them in brightness, and were supposed to be most beneficent to man. But the planet Saturn appears to the naked eye with so feeble a luster, that, in the infancy of astronomy, it could not make such an impression on the mind as to excite that admiration which we must conceive to have always preceded planetary worship. It is to be observed, too, that by the Pagan writers of antiquity Saturn is constantly represented as a star of baleful influence. He is termed the leaden planet; the planet of malevolent aspect; the dismal, the inhumane star. That the Egyptians, at so early a period as that under con­federation, should have adored one of their greatest gods a planet obscure in its appearance, disdainful in its situation, and baleful in its influence, is wholly incredible.

There is, however, another star which they might naturally adore, and which we know they actually did adore, as one of their most beneficent gods, at a very early period. This is the astrakhoi or stellas of the Greeks, the canis or stella canicularis of the Romans, and the dog-star of modern Europe. By the Egyptians it was called Sothis or Seth, which signifies safety, beneficence, fecundity; and it received this name, because making its appearance in the heavens at the very time when the Nile overflowed the country, it was supposed to regulate the inundation. On this account Plutarch (Life of Isis) tells us, they believed the soul of their illustrious benefactor Isis to have transmigrated into the star Sothis, which they therefore worshipped as the divinity which rendered their country fruitful. It made its appearance, too, on the first day of the month Thoth (A), which was the beginning of the Egyptian year, and as such celebrated with feasting and festivity; and being by much the brightest star in the heavens, Horopollo (cap. 3) informs us it was considered as sovereign over the rest. A combination of so many important circumstances might have induced a people less superstitious, than the Egyptians to pay divine homage to that glorious luminary, which was confounded with Isis, who had been long regarded with the highest vener­ation; and as Isis was the wife and sister of Osiris, and always associated with him, the star of Isis or Remphan was naturally associated with Moloch, the same with Osiris.

But it will be asked, how this star which by the E­gyptians was called Seth or Sethis came to be worshiped by the Hebrews under the appellation of Chiun or Remphan? This is a very pertinent question, and we shall endeavor to answer it.

Every one knows that the pronunciation of oriental words is very uncertain; and that as the vowels were often omitted in writing, it is of very little importance to the meaning how they are supplied, provided we re­tain the radical consonants. The word Chiun may with equal propriety be written Kian, Kion, or even Kyon, he
REMPHAN, the Hebrew job being convertible into the Greek or the Roman y; but the words Can, Cohen, Kon, or Khan, which are often diversified into Kon Ken, Cohen, Cabah, signifying Head, Chief, Prince, King, &c. are diffused through a great part of Asia and Europe. In the Chinefe language, which signifies a King, is to fumiliar to the word Chum or Khun under confideration, that no etymology will hesitate to pronounce them of the fame original and the fame import. The word Khan or Khan is universally known to be an honorary title in Tartary; and Kanin or Kain, which is manifeftly cognate of the word Chum or Khun, is, in the Phenevi or old Persian language, the epithet applied to the dynasty of princes which succeeded Cyrus the Great. Among the Scythians or ancient Tartars, Chum signifies the Sun and likewise the day; and Kung, Khan, runs through all the dialects of the Gothic tongue, where denoting a chief or sovereign. In the Syrian dialect, Kan signifies a prince; and hence the Almighty is styled (Gen. xiv. 19.) Kanah, which is translated pelf fur; but might have, with perhaps more propriety, been rendered Sovereign of heaven and earth.

In Hebrew, the word Kaban or Kaben, which is the very fame with Khan or Kan, signifies either a prifon or a prince; and in Egypt Kon was the name of the fril Hercules or the sun. Hence the fame word in composition denotes greatness, as Can-ahui the great fortress; Can-abab, the great Thoth or Mercury; Canofris, the great Osiris.

From this deduction we would conclude, that the word, which is found in fo many tongues, and always denotes Chief, Prince, Sovereign, is the very word Chum which the Egyptians and Hebrews applied to Sothos, as being, in their conceptions, the chief or sovereign of all the fars. This will appear still more probable, when we have accertained the import of the word Remphan, or, as the LXX have it, Raiphan.

Phan, the latter part of this word, is unquestionably the fame with Pan, the most ancient of the Egyptian gods (see Pan). It is likewise a cognate of the Hebrew Phanah, confecrated, fpectat, visit; and the radical word feems to be phah, which signifies fometimes the countenance, and fometimes light. Hence Phanah, which is compounded of pha light, efh or elf fire, and on strength, came to be one of the names of the sun. Rai, which we commonly write Rajah, has long signified, among the Indians, a fubordinate prince; and we know, that between India and Egypt there was a very early intercourse. Raiphan, therefore, may be either the royal light or the bright prince, fubordinate to Oliris; and in either fene, it was a very proper epithet of Sothos in the Egyptian calendar. The word Rem or Rom, again (for it is fometimes written Remphan, and sometimes Rompha), is no other than the Hebrew Raun "high, exalted." Hence Remphan is the high or exalted light, which Sothos certainly was.

For this etymological diftribution we are indebted to Dr Doig, the learned author of Letters on the Savage State, who has written a differtation on Chum and Remphan, of fuch value that we hope it will not be much longer witheld from the public. The accertaining the identity of thofe names, and the god to which they belonged, is the leaf of its merit; for it will be found to throw much light upon many paflages in the Old Testament. What confirms his interpretation is, that the idol confeprated by the Egyptians to Sobis or the dogstar, was a female figure with a far on her head; and hence the prophet upbards his countrymen with having borne the Star of their deity.

Action of REMOVING, in Scots law. See Law, No. clxviii. 18.

REMURIA, festivals ftabilished at Rome by Romulus to appease the manes of his brother Remus. They were afterwards called Lemuria, and celebrated yearly.

REMUS, the brother of Romulus, was expofed together with his brother by the cruelty of his grandfather. In the content which happened between the two brothers about building a city, Romulus obtained the preference, and Remus, for ridicking the rising walls, was put to death by his brother's orders, or by Romulus himself (see Romulus). The Romans were affiliated with a plague after this murder; upon which the oracle was confulted, and the manes of Remus appealed by the institution of the Remuria.

RENAI, something belonging to the reins or kidneys.

RENCOUNTER, in the military art, the encounter of two little bodies or parties of forces. In which fene encounter is used in oppofition to a pitched battle.

RENDEZVOUS, or RENDEVOUS, a place appointed to meet in at a certain day and hour.

RENAELMIA, in botany; a genus of the monogynia order, belonging to the monandria class of plants. The corolla is trisid; the nectarium oblong; the calyx monophyllous; the anthera fiddle, oppofite to the nectarium; the berry is fleshy. There is only one fpecies, which is a native of Surinam.

RENEGADE, or RENEGADO, a perfon who has apostatized or renounced the Christian faith, to embrace some other religion, particularly Mahometanism.

RENFREW, the county-town of Renfrewshire, standing on the small river Cathcart, which flows into the Clyde at the distance of five miles from Glasgow, is a small but ancient royal borough, the seat of the feigners court and of a prebytery. The town is neatly built, and the inhabitants enjoy a tolerable flate of commerce. Renfrew was originally joined to Lanark, but was made an independent fheriffdom by Robert II., who had a palace here. W. Long. 5. 26. N. Lat. 55. 51.

RENFREWSHIRE, a county of Scotland, fyled by way of eminence the barony, because it was the ancient inheritance of the Stewarts, is a small county, extending about 20 miles from north to south, and 13 from east to west, parted from Dumbartonshire by the river Clyde on the west, bordering on the east with Lanarkshire, and on the north with Cunningham. The face of the country is varied with hill and vale, wood and stream; adhered with populous villages, and adorned with the feats of gentlemen. The soil is in general fertile, producing rye, barley, oats, peas, beans, flax, and some wheat: it likewise yields plenty of coal, and turf for fuel: and affords abundance of pastureage for sheep and cattle. The inhabitants are Lowlanders and Prebyterians; wealthy and industrious, addicted to traffic, and particularly expert in the linen manufacture. Their
Rennes. Their genius is stimulated to commerce, by the example of their neighbours of Glasgow, as well as the convenience of the river and frith of Clyde, along the course of which they are situated.

RENNES, a town of France, in Bretagne, and capital of that province. Before the revolution it had a bishop’s see, two abbey’s, a parliament, and a mint. It is very populous; the houses are near, or very close together, and the suburbs of larger extent than the town itself. The cathedral church is large, and the parliament-house a handsome structure. The great square belonging to it is surroundered with handsome houses. There is a tower, formerly a pagan temple, which now contains the town-clock. It is seated on the river Vilaine, which divides it into two parts, and was anciently fortified, but the walls are now in ruins, and the ditch nearly filled up. The siege of the city by Edward III, king of England, is very celebrated in history. The English and Breton army consisted of 40,000 men; and nevertheless, after having remained before it six months, were obliged to retire without success. E. Long. o. 23. N. Lat. 48.

RENNET. See Runnet.

RENT, in law, a sum of money, or other consideration, illuming yearly out of lands or tenements.

RENTERING, in the manufactories, the fame with fine-drawing. It consists in sewing two pieces of cloth edge to edge, without doubling them, so that the seam scarcely appears; and hence it is denominated fine-drawing. It is a French word meaning the fame thing, and is derived from the Latin retinere, or re, in, and trahere, because the seam is drawn in or covered. We are told, that in the East Indies, if a piece of fine muffin be torn and afterwards mended by the fine-drawers, it will be impossible to discover where the rent was. In Britain the dexterity of the fine-drawers is no fo great as that of those in the East; but it is still such as to enable them to defraud the revenue, by sewing a head or flip of English cloth on a piece of Dutch, Spanish, or other foreign cloth; or a flip of foreign cloth on a piece of English, so as to pass the whole as a piece; and by that means avoid the duties, penalties, &c. The trick was first discovered in France by M. Savary.

RENTINING, in tapestry, is the working new warp into a piece of damaged Tapestry, whether eaten by the rats or otherwise destroyed, and on this warp to restore the ancient pattern or design. The warp is to be of woollen, not linen. Among the titles of the French tapestry makers is included that of renterers. Fine-drawing is particularly used for a rent or hole, which happens in dresling or preparing a piece of cloth artificially sewed up or mended with silk. All fine-drawings are reckoned defects or blemishes, and should be allowed for in the price of the piece.

REVERSE, INVERTED, in heraldry, is when any thing is set with the head downwards, or contrary to its natural way of standing. Thus, a chevron renversé, is a chevron with the point downwards. They use also the same term when a beast is laid on its back.

RENUCATION, the act of renouncing, abdicating, or relinquishing any right, real or pretended.

REPEE, a smart, ready reply, especially in matters of wit, humour, or raillery. See Railery.

REPEALING, in law, the revoking or annulling of a statute or the like. Vol. XVI.

No act of parliament in England shall be repealed the repealer's fame feeion in which it was made. A deed or will may be repealed in part, and stand good for the rest. It is held that a pardon of felony may be repealed on disproving the. fuggelion thereof.

REPELLENTS, in medicine, remedies which drive back a morbid humour, or the mafs of blood, from whence it was unduly secreted.

REPENTANCE, in general, means sorrow for anything past. In theology it means such a sorrow for sin, as produces newness of life, or such a conviction of the evil and danger of a sinful course as is sufficient to produce shame and sorrow in the review of it, and effectual resolutions of amendment. In this sense the evangelical writers use metathesis and mutatio. See Penitence and Theology.

REPERCUSSION, in music, a frequent repetition of the same found.

REPERTORY, a place wherein things are orderly disposed, so as to be easily found when wanted. The indices of books are repertories, showing where the matters sought for are treated of. Common-place books are also kinds of repertories.

REPEITION, the reiterating of an action.

REPETITION, in music, denotes a reiterating or playing over again the fame part of a composition, whether it be a whole strain, part of a strain, or double strain, &c.

When the song ends it be comes over, or the repetition begins, or part of it, the repetition is denoted by da capo, or D. C. i.e. “from the beginning.”

REPETITION, in rhetoric, a figure which gracefully and emphatically repeats either the fame word, or the same sense in different words. See Oratory, no. 67.

The nature and design of this figure is to make deep impressions on those we address. It expresses anger and indignation, full assurance of what we affirm, and a vehement concern for what we have espoused.

REPHIDIM (anc. geog.), a station of the Israelites near mount Horeb, where they murmured for want of water; when Moses was ordered to smite the rock Horeb, upon which it yielded water. Here Joshua discomfited the Amalekites. This rock, out of which Moses brought water, is a stone of a prodigious height and thickness, rising out of the ground; on two sides of which are several holes, by which the water ran. (Thevenot.)

REPLEGARE, in law, signifies to redeem a thing taken or detained by another, by putting in legal sureties.

DE HOMINE REPLEGIANDO. See Homine.

REPLEVIN, in law, a remedy granted on a distress, by which the first possessor has his goods restored to him again, on his giving security to the sheriff that he will pursue his action against the party distressing, and return the goods or cattle if the taking them shall be adjudged lawful.

In a replevin the person disstraining becomes plaintiff; and the person distressing is called the defendant or accou­untant, and his justication an accou­nt.

At the common law replevins are by writ, either out of the king’s-bench or common-pleas; but by statute, they are by plaint in the sheriff’s court, and court-baron, for a person’s more speedily obtaining the goods disstrained.
If a plaint in repleni be removed into the court of
king's-bench, &c. and the plaintiff makes default and
becomes non-suIt, or judgment is given against him
the defendant in repleni shall have the writ of return
habitato of the goods taken in distress. See the next
article.

REPLEVY, in English law, is a tenant's bringing
a writ of repleni, or reprisiari facias, where his goods
are taken by distress for rent; which must be done with
in five days after the distress, otherwise at the five days
end they are to be apprais’d and sold.

This word is also used for bailing a person, as in
the case of a homine replegiando.

REPORT, the relation made upon oath, by officers
or persons appointed to visit, examine, or estimate
the state, expenses, &c. of any thing.

REPORT, in English law, is a public relation of cases
judiciously argued, debated, resolved, or adjudged in any
of the king's courts of justice, having the causes and reasons
of the fame, as delivered by the judges. Also when the
court of chancery, or any other court, refers the
fitting of a case, or the comparing of an account, to a
matter of chancery, or other referee, his certificate
thereon is called a report.

REPORT, in poetry, &c. the same with repre-
sentation.

REPRESENTATION, in the drama, the exhibition
of a theatrical piece, together with the scenes,
machinery, &c.

REPRESENTATIVE, one who parfonates or sup-
plies the place of another, and is invested with his right
and authority. Such, for instance, are the Representatives
of the United States in Congress.

REPRIEVE, in criminal law (from reprendere, "to
take back"), is the withdrawing of a sentence for an
interval of time; whereby the execution is suspended.
See JUDGMENT.

This may be, firstly, ex arbitrio judicii, either before or
after judgment; as, where the judge is not satisfied with
the verdict, or the evidence is suspect, or the indictment
is insufficient, or he is doubtful whether the offence
be within the law; or sometimes if it be a small felony, or
any favourable circumstances appear in the criminal's character, in order to give room to apply to
the crown for either an absolute or conditional pardon.
These arbitrary reprievs may be granted or taken off
by the justices of gaol-delivery, although their sefion
be finished, and their commis:ion expired; but this
rather by common usage than of strict right.

Reprives may alto be ex neictitate legis: as when
a woman is legally convicted, and pleads her pregnancy.
Though this is no cause to stay judgment, yet
it is to repite the execution till she be delivered. This
is a mercy dictated by the law of nature, in favorem pro-
biti; and therefore no part of the bloody proceedings in
the reign of Queen Mary has been more justly detest-
ed, than the cruelty that was exercised in the island of
Guerney, of burning a woman big with child; and,
when through the violence of the flames the infant
sprang forth at the flame, and was preserved by the by-
standers, after some deliberations of the priests who af-
filled at the sacrifice, they cast it into the fire as a young
heretic. A barbarity which they never learned from
the laws of ancient Rome; which direct, with the fame
humanity as our own quod gravidatis multiliiis damnum
pena deferat, quod partum: which doctrine has also
prevailed in England, as early as the first memorials of
their law will reach. In cases this plea be made in stay
of execution, the judge must direct a jury of twelve ma-
trons or discreet women to inquire into the fact: and
if they bring in their verdict quick with child (for bare-
ly with child, unless it be alive in the womb, is not suf-
ficient), execution shall be stayed generally till the next
session; and fo from session to session, till either she be
delivered, or proves by the course of nature not to have
been with child at all. But if the once hath had the
benefit of this reprieve, and been delivered, and after-
wards becomes pregnant again, the shall not be intitned
to the benefit of a further repite for that cause. For
the may now be executed before the child is quick in the
womb; and shall not, by her own incontinence, evade the sentence of justice.

Another cause of regular reprieve is, if the offender
become non compas between the judgment and the award
of execution: for regularly, though a man be compas
when he commits a capital crime, yet if he becomes
non compas after, he shall not be indicted; if after in-
dictment, he shall not be convicted; if after conviction,
he shall not receive judgment; if after judgment, he
shall not be ordered for execution: for furiusus solo fu-
ore punira; and the law knows not but he might have
offered some reason, if in his fenses, to have stayed these
respective proceedings. It is therefore an invariable
rule, when any time intervenes between the attainer
and the award of execution, to demand of the prisoner
what he hath to allege why execution should not be
awarded against him; and, if he appears to be insane,
the judge in his discretion may and ought to reprieve
him. Or, the party may plead in bar of execution;
which plea may be either pregnancy, the king's par-
don, an act of grace, or diversity of person, &c. that
he is not the same that was attainted, and the like. In
this least case a jury shall be impannelled to try this col-
collateral issue, namely, the identity of his person; and not
whether guilty or innocent, for that has been decided
before. And in these collateral issues the trial shall
be infirante; and no time allowed the prisoner to make
his defence or produce his witnesses, unless he will
make oath that he is not the person attainted; nei-
ther shall any peremptory challenges of the jury be
allowed the prisoner, though formerly such challenges
were held to be allowable whenever a man's life was
in question. If neither pregnancy, insanity, non-iden-
tity, nor other plea, will avail to avoid the judgment,
and stay the execution consequent thereupon, the last
and surest resort is in the king's most gracious par-
don; the granting of which is the most amiable pre-
rrogative of the crown. See the article PARSON.

REPRISALS, a right which governments claim
of taking from their enemies any thing equivalent to
what they unjustly detain from them or their citizens.
For as the delay of making war may sometimes be detri-
mental to individuals who have suffered by depredations
from
Reprifals from foreign potentates, our laws have in some respects armed the subject with powers to impel the prerogative; by directing the ministers of the crown to issue letters of marque and reprifal upon due demand: the prerogative of granting which is nearly related to, and plainly derived from, that other of making war; this being indeed only an incomplete state of hostilities, and generally ending in a formal denunciation of war. These letters are grantable by the law of nations, whenever the subjects of one state are oppressed and injured by those of another; and justice is denied by that power which is acting upon the ground of a third person, to take him, except he be feloniously slain; but must have recourse to an action at law.

Reprobation, in theology, means the act of abandoning, or state of being abandoned, to eternal destruction, and is applied to that decree or resolve which God has taken from all eternity to punish sinners who shall die in impenitence; in which sense it is directly opposed to election. When a sinner is so hardened as to feel no remorse or misgiving of conscience, it is considered as a sign of reprobation; which by the calvinists has been distinguished into positive and negative. The first is that whereby God is supposed to create men with a positive and absolute reprobation to damn them eternally. This opinion is countenanced by St. Augustine and other Christian fathers, and is a peculiar tenet of Calvin and most of his followers. The church of England, in The thirty-nine Articles, teaches something like it; and the church of Scotland, in the Confession of Faith, maintains it in the strongest terms. But the notion is generally exploded, and is believed by no rational divine in either church, being totally injurious to the justice of the Deity. Negative or conditional reprobation is that whereby God, though he has a fincerity and dire to save men, and furnishes them with the necessary means, so that all if they will may be saved, yet fees that there are many who will not be saved by the means, however powerful, that are afforded them; tho' by other means which the Deity sees, but will not afford them, they might be saved. Reprobation respects angels as well as men, and respects the latter either fallen or unfallen. See Predestination.

Reproduction, is usually understood to mean the restoration of a thing before existing, and since destroyed. It is very well known that trees and plants may be raised from slips and cuttings; and some late observations have shown, that there are some animals which have the same property. The polyp was the * See Presbyterian infant we had of this; but we had scarce time. To wonder at the discovery Mr. Trembley had made, when Mr. Bonett discovered the same property in a species of water-worm. Amongst the plants which may be raised from cuttings, there are some which seem to perform this quality in so eminent a degree, that the smallest portion of them will become a complete tree again.

It derives inquiry, whether or not the great Author of nature, when he ordained that certain insects, as these polyps and worms, should resemble those plants in that particular, allowed them this power of being reproduced in the same degree? or, which is the same thing, whether this reproduction will or will not take place in whatever part the worm is cut? In order to try this, Mr. Bonett entered on a course of many experiments on the water-worms which have this property. These are, at their common growth, from two to three inches long, and of a brownish colour, with a cuff of reddish. From one of these worms he cut off the head and tail, taking from each extremity only a small piece of a twelfth of an inch in length; but neither of these pieces were able to reproduce what was wanting. They both perished in about 24 hours; the tail first, and
and afterwards the head. As to the body of the worm from which these pieces were separated, it lived as well as before, and seemed indeed to suffer nothing by the loss, the head-part being immediately used as if the head was thereon, boring the creature's way into the mud. There are, besides this, two other points in which the reproduction will not take place; the one of these is about the fifth or sixth ring from the head, and the other at the same distance from the tail; and in all probability the condition of the great artery in these parts is the cause of this.

What is said of the want of the reproductive power of these parts relates only to the head and tail ends; for as to the body, it feels very little inconvenience from the loss of what is taken off, and very speedily reproduces those parts. Where then does the principle of life reside in such worms, which, after having their heads cut off, will have not only the same motions, but even the inclinations, that they had before? and yet this difficulty is very small, compared to several others which at the same time offer themselves to our reason. Is this wonderful reproduction of parts only a natural consequence of the laws of motion? or is there lodged in the body of the creature a chain of minute buds or shoots, a sort of little embryos, already formed and placed in such parts where the reproductions are to begin? Are these worms only mere machines? or are they, like more perfect animals, a sort of compound, the springs of whose motions are actuated or regulated by a sort of soul? And if they have themselves such a principle, how is it that this principle is multiplied, and is found in every separate piece? Is it to be granted, that there are in these worms, not a single soul (if it is to be so called) in each, but that each contains as many souls as there are pieces capable of reproducing perfect animals? Are we to believe with Malpighi, that these sorts of worms are all heart and brain from one end to the other? This may be; but yet if we knew that it was so, we should know in reality but very little the more for knowing it; and it seems, after all, that in cases of this kind we are only to admire the works of the great Creator, and fit down in filence.

The nice fenfe of feeling in spiders has been much talked of by naturalists; but it appears that these worms have yet somewhat more surprizing in them in regard to this particular. If a piece of flick, or any other substance, be brought near them, they do not fly for its touching them, but begin to leap and frisk about as soon as it comes towards them. There want, however, some farther experiments to ascertain whether this be really owing to feeling or to flight; for though we can discover no distinct organs of flight in these creatures, yet they seem affected by the light of the sun or a candle, and always frisk about in the same manner at the approach of either; nay, even the moon-light has some effect upon them.

A twig of willow, poplar, or many other trees, being planted in the earth, takes root, and becomes a tree, every piece of which will in the same manner produce other trees. The case is the same with these worms: they are cut to pieces, and these pieces become perfect animals; and each of these may be again cut into a few pieces, each of which will in the same manner produce an animal. It had been supposed by some that these worms were oviparous; but Mr Bonett, on cutting one of them to pieces, having observed reproduction a slender substance, resembling a small filament, to move at the end of one of the pieces, separated it; and on examining it with glafles, found it to be a perfect worm, of the same form with its parent, which lived and grew larger in a vessel of water into which he put it. These small bodies are easily divided, and very readily complete themselves again, a day usually serving for the production of a head to the part that wants one; and, in general, the smaller and flender the worms are, the sooner they complete themselves after this operation. When the bodies of the large worms are examined by the microscope, it is very easy to see the appearance of the young worms alive, and moving about within them:

but it requires great precifion and exactness to be certain of this; since the ramifications of the great artery have very much the appearance of young worms, and they are kept in a sort of continual motion by the syftoles and diaftoles of the several portions of the artery, which serve as so many hearts. It is very certain, that what we force in regard to these animals by our operations, is done also naturally every day in the brooks and ditches where they live. A curious observer will find in these places many of them without heads or tails, and some without either; as also other fragments of various kinds, all which are then in the act of completing themselves; but whether accidents have reduced them to this state, or they thus purposely throw off parts of their own body for the reproduction of more animals, it is not easy to determine. They are plainly liable to many accidents, by which they lose the several parts of their body, and must perish very early if they had not a power of reproducing what was lost: they often are broken into two pieces, by the resistence of some hard piece of mud which they enter; and they are subject to a disease, a kind of gangrene, rotting off the several parts of their bodies, and must inevitably perish by it, had they not this surprizing property.

This worm was a second instance, after the polype, of the surprizing power in an animal of recovering its most essential parts when lost. But Nature does not seem to have limited her beneficence in this respect to these two creatures. Mr Bonett tried the same experiments on another species of water-worm, differing from the former in being much thicker. This kind of worm, when divided in the summer-season, very often shows the same property: for if it be cut into three or four pieces, the pieces will lie like dead for a long time, but afterwards will move about again; and will be found in this state of rest to have recovered a head, or a tail, or both. After recovering their parts, they move very little; and, according to this gentleman's experiments, seldom live more than a month.

It should seem, that the more difficult success of this last kind of worm, after cutting, and the long time it takes to recover the lost parts, if it do recover them at all, is owing to its thickness; since we always find in that species of worms which succeeds belt of all, that those which are thinnest always recover their parts much sooner than the others.

The water-insects also are not the only creatures which have this power of recovering their lost parts. The earth affords us some already discovered to grow in this manner from their cuttings, and these not left deferving our admiration than those of the water; the common
common earth-worms are of this kind. Some of these worms have been divided into two, others into three or four pieces; and some of these pieces, after having been cut two or three months without any appearance of life or motion, have then begun to reproduce a head or tail or both. The reproduction of the anus, after such a state of rest, is no long work; a few days do it: but it is otherwise with the head, that does not seem to perform its functions in the divided pieces till about seven months after the separation. It is to be observed, that in all these operations both on earth and water-worms, the hinder part suffers more greatly than the fore part in the cutting; for it always twists itself about a long time, as if actuated by strong convulsions; whereas the head usually crawls away without the appearance of any great uneasiness.

The reproduction of several parts of lobsters, crabs, &c. makes all of one the great curiosities in natural history. That, in lieu of an organical part of an animal broken off, another shall rise perfectly like it, may seem inconsistent with the modern system of generation, where the animal is supposed to be wholly formed in the egg. Yet has the matter of fact been well attested by the fishermen, and even by several virtuosi who have taken the point into examination, particularly M. de Reaumur and M. Perrault, whose skill and exactness in things of this nature will hardly be questioned. The legs of lobsters, &c. confit each of five articulations: now, when any of the legs happen to break by an accident, as in walking, &c. which frequently happens, the fracture is always found to be in a part near the fourth articulation; and what they thus lose is precisely reproduced some time afterwards; that is, a part of a leg shoots out, confilting of four articulations, the first whereof has two claws as before; so that the loss is entirely repaired.

If a lobster's leg be broken off by design at the fourth or fifth articulation, what is thus broken off always comes again; but it is not so if the fracture be made in the fifth, second, or third articulation. In these cases, the reproduction is very rare if things continue as they are. But what is exceedingly surprising is, that they do not; for, upon visiting the lobster maimed in these barren and unhappy articulations, at the end of two or three days, all the other articulations are found broken off to the fourth; and it is suspected they have performed the operation on themselves, to make the reproduction of a leg certain.

The part reproduced is not only perfectly like that transplanted, but also, in a certain space of time, grows equal to it. Hence it is that we frequently see lobsters, which have their two big legs unequal, and that in all proportions. This shows the smaller leg to be a new one.

A part thus reproduced being broken, there is a second reproduction. The survivor, which is the only feaon of the year when the lobsters eat, is the most favourable time for the reproduction. It is then performed in four or five weeks; whereas it takes up eight or nine months in any other season. The small legs are sometimes reproduced; but more rarely, as well as more flowly, than the great ones: the horns do the same. This matter is most easily tried on the common crab. See Metaphysics, p. 574, note (y); and Physiology, B2 261.

REPTILES, in natural history, a kind of animals denominated from their creeping or advancing on the belly. Or reptiles are a genus of animals and insects, which, instead of feet, rest on one part of the body, while they advance forward with the rest. Such are earthworms, snakes, caterpillars, &c. Indeed, most of the clas of reptiles have feet; only these very small, and the legs remarkably short in proportion to the bulk of the body.

Naturalists observe a world of artifical contrivance for the motion of reptiles. Thus, particularly in the earthworm, Dr. Willis tells us, the whole body is only a chain of annular muscles; or, as Dr. Derham says, it is only one continued spiral muscle, the orbicular fibres whereof being contracted, render each ring narrower and longer than before; by which means it is enabled, like the worm of an auger, to bore its passage into the earth. Its reptile motion might also be explained by a wire wound on a cylinder, which when flipped off, and one end extended and held fast, will bring the other near to it. So the earthworm having shot out or extended his body (which is with a wreathing), it takes hold by these small feet it hath, and so contracts the hinder part of its body. Dr. Tyfon adds, that when the forepart of the body is stretched out, and applied to a plane at a distance, the hind part relaxing and shortening is easily drawn towards it as a centre.

Its feet are disposed in a quadruple row the whole length of the worm, with which, as with so many hooks, it goes down sometimes this and sometimes that part of the body to the plane, and at the same time stretches out or drags after it another. The creeping of serpents is effected after a somewhat different manner; there being a difference in their structure, in that their tail have a compas or bones articulated together.

The body here is not drawn together, but as it were complicated, part of it being applied on the rough ground, and the rest elevated and shot from it, which being set on the ground in its turn, brings the other after it. The spine of the back variously wreathed has the same effect in leaping, as the joints in the feet of other animals; they make their leaps by means of muscles, and extend the plice or folds. See Zoology.

REPUBLIC, or commonwealth, a popular state or government; or a nation where the people have the government in their own hands. See Government, Aristocracy, Democracy, and Monarchy.

REPUBLIC OF LETTERS, a phrase used collectively of the whole body of the studious and learned people.

REPUDIATION, in the civil law, the act of divorcing. See Divorce.

REPUSSION, in physics, that property of bodies whereby they recede from each other, and, on certain occasions, mutually avoid coming into contact. Repulsion, as well as attraction, has of late been considered as one of the primary qualities of all matter, and has been much used in explaining the phenomena of nature: thus the particles of air, fire, steam, electric fluid, &c. are all said to have a repulsive power with respect to one another. That this is the case with the air, and vapour of all kinds, is certain; because when they are compressed into a small space, they expand with
with great force: but as to fire, light, and electricity, our experiments fail; nay, the supposition of a repulsive power among the particles of the electric fluid is inconsistent with the phenomena, as has been demonstrated under the article: Electricity, Sect. V. and VI. Even in those fluids, air and steam, where a repulsive power most manifestly exists, it is demonstrable that the repulsion cannot be a primary quality; since it can be increased to a great degree by heat, and diminished by cold: but it is impossible that a primary quality of matter can be increased or diminished by any external circumstances whatever; for whatever property depends upon external circumstances, is not a primary but a secondary one.—The repulsion of electrified bodies is explained under the article: Electricity: that of others is left subject to investigation; and the moat that can be said concerning it is, that in many cases it seems to be the consequence of a modification of fire, and in others of electricity.

REPUTATION means credit, honour, or the character of good; and since we are destined to live in society, is necessary and useful more or less to every human being. There is no man, except one who is overgrown with pride and self-conceit, or whose actions are bad, but pays attention to his reputation, and with- es to possess the good opinion of his neighbours or the world. The love of reputation and of fame are most powerful springs of action; but though they proceed from the same principle, the means of attaining them, and the effects of them, are not altogether the same.

Many means indeed, serve equally to support the reputation and to increase the fame, differing only in degrees; others, however, belong peculiarly either to the one or to the other. An honest reputation is within the reach of the bulk of mankind: it is obtained by the social virtues and the constant practice of the common duties of life. This kind of reputation indeed is neither extensive nor brilliant, but it is often the most useful in point of happiness. Wit, talents, and genius, are the necessary requisites for fame; but tho' advantages are perhaps less real in their consequences than those arising from a good reputation. What is of real use costs little; things rare and splendid require the greatest labour to procure, and yield perhaps a more ideal happiness.

Fame can be possessed, comparatively speaking, but by few individuals; as it requires either very superior abilities, supported by great efforts, or very fortunate circumstances. It is constituted by the applause of mankind, or at least by that of a single nation; whilst reputation is of much less extent, and arises from different circumstances. That reputation which is founded on deceit and artifice is never solid; and the most honourable will always be found to be the most useful. Every one may safely, and indeed ought to, aspire to the consideration and praise due to his useful and meritorious services; but he who aspires to more, or who seeks it by dishonest means, will at length meet with contempt.

REQUEST, in law, a supplication or petition preferred to a prince, or to a court of justice; begging relief in some convenient cafe where the common law grants no immediate redress.

Court of Requests (curia requisitum) was a court of equity, of the same nature with the court of chancery, but inferior to it: principally instituted for the relief of such petitioners as in convenient cafes addressed themselves by supplication to his majesty. Of this court the lord privy-seal was chief judge, assisted by the masters of requests; and it had beginning about the 9 Hen. VII. according to Sir Julius Caesar's tractate upon this subject: though Mr Gwyn, in his preface to his Reading, hath it begun from a commission first granted by king Henry VIII.—This court, having afforded great power to itself, so that it became by statute, 40 Geo. I. and 41 Edw. in the court of common pleas it was adjudged upon solemn argument, that the court of requests was no court of judicature, &c. and by Stat. 16 & 17 Car. I. c. 10. it was taken away.

There are still courts of request, or courts of conscience, constituted in London and other trading and populous districts for the recovery of small debts. The first of these was established in London fo early as the reign of Henry VIII. by an act of their common council; which however was certainly insufficient for that purpose, and illegal, till confirmed by Statute 3 Jac. I. c. 15, which has since been explained and amended by Statute 14 Geo. II. c. 10. The constitution is this:—two aldermen and four commoners sit twice a week to hear all causes of debt not exceeding the value of forty shillings; which they examine in a summary way, by the oath of the parties or other witnesses, and make such order therein as is sufficient to equity and good conscience. The time and expense of obtaining this summary redress are very considerable, which makes it a great benefit to trade; and thereupon divers trading towns and other districts have obtained acts of parliament for establishing in them courts of conscience upon nearly the same plan as that in the city of London.

By 25 Geo. Ill. c. 45. (which is confined to prosecutions in courts of conscience in London, Middlesex, and the borough of Southwark), and by 26 Geo. III. c. 38. (which extends the provisions of the former act to all other courts instituted for the recovery of small debts), it is enabled, that after the first day of September 1786, no person whatsoever, being a debtor or defendant, and who has been or shall be committed to any gaol or prison by order of any court or commissioners authorized by any act or acts of parliament for constituting or regulating any court or courts for the recovery of small debts, where the debt does not exceed twenty shillings, shall be kept or continued in custody, on any pretence whatsoever, more than twenty days from the commencement of the said act; or from the time of his, her, or their commitment to prison; and where the original debt does not amount to or exceed the sum of forty shillings, more than forty days from the commencement of the said act, or from the time of his, her, or their commitment to aforesaid: and all gaolers are thereby required to discharge such persons accordingly. And by S. 2. if it shall be proved to the satisfaction of the court, that such debtor has money or goods which he has wilfully and fraudulently concealed; in that case the court shall have power to enlarge the aforesaid time of imprisonment for debts under twenty shillings, to any time not exceeding thirty days, and for debts under forty shillings, to any time not exceeding sixty days; which said ground of farther detention shall be specified in the said commitment. And that (by S. 5.) at the expiration of the said respective times of imprisonment, every such person shall immediately be discharged, without paying any sum of money,
money, or other reward or gratuity whatsoever, to the
- House on any pretence whatever, and
every gaoler demanding or receiving any fee for the
discharge of any such person, or keeping any such
- person prisoner after the said respective times limited by the
- said act, shall forfeit five pounds, to be recovered in a
summary way before two justices of the peace, one moiety
thereof to be paid to the overseers of the poor of the
parish where the offence shall be committed, and
the other to the informer.

REQUIEM, in the Roman history, a muf ung
- for the rest of the soul of a person deceased.

RESCISSION, in the civil law, an action intended for
annulling or setting aside any contract, deed, &c.

A genus of the order of trigynia, belonging to
the dodecandria class of plants; and in the natural
method ranking under the 54th order, Misellinae.
The calyx is monophyllous and parite; the petals
lanceolated; the capsule unilocular, and opening at the
mouth. There are 11 species; of which the most
- remarkable is the luteola or common dyer's weed, growing
- naturally in waste places in many parts of Britain.
The young leaves are often undulated; the flank is a
yard high, or more, terminated with a long naked
spike of yellowish-green flowers: the plant is cultivated and
used for dyeing flax and wool of a yellow colour.
The great recommendation of the plant is, that it will
grow with very little trouble, without dung, and on the
very worst soils. For this reason it is commonly grown
with, or immediately after, barley or oats, without any
additional care, except drawing a bulk over it to harvest
it. The reaping of the corn does it little or no hurt,
as it grows but little the first year; and the next summer
it is pulled and dried like flax. Much care and nicety,
however, is requisite, so as not to injure either the
flank or flax; or, which sometimes happens, dam-
aging both, by letting it stand too long, or pulling it
too green. To avoid these inconveniences, a better method
of culture has been devised. This new method
is to plough and harrow the ground very fine,
without dung, as equally as possible, and then sowing
about a gallon of seed, which is very small, upon an
acre, some time in the month of August. In about
- two months it will be high enough to hoe, which
must be carefully done, and the plants left about six
inches apostrophic. In March it is to be hoed again, and
this labour is to be repeated a third time in May.
About the close of June, when the flower is in full
vigour, and the flax is become of a greenish-yellow,
it should be pulled; a sufficient quantity of items
being left growing for seed till September. By this
means the flower and flax, both of them being care-
fully dried, will fall at a good price to the dyers, who
employ it constantly, and in large quantities; and add to
this, that the seed being good and in perfect order, will
yield a very considerable profit. In a tolerable year,
when the reafons have not been unfavourable, the
advantages derived from this vegetable will answer very
well; but if the summer be remarkably fine,
and proper care is taken in getting it in, there will be

a very large produce upon an acre. The crop being,
as has been shown, so early removed, the ground may
be conveniently prepared for growing wheat the next
year. Upon the whole, weld is in its nature a very
valuable commodity in many respects, as it serves
equally for woollen, linen, or flax; dying not only
a rich and lasting yellow, but all, properly managed,
the different shades of yellow with brightness
and beauty; and if these be previously dipped blue,
ye are by the weld changed into a very pleasing
green, which the artists can also diversify into a great
variety of shades.

RESEMBLANCE, and DISSIMILITUDE, the relations
of likenesses and difference among objects. See
COMPARISON.

The connection that man hath with the beings around
him, requires some acquaintance with their nature, their
powers, and their qualities, for regulating his conduct.
For acquiring a branch of knowledge so essential to our
well-being, natures alone of reason and interest are not
sufficient; nature hath providentially superadded curio-
sity, a vigorous propensity, which never is at rest. This
propensity alone attaches us to every new object, and see
- resembles to compare objects, in order to discover
their very

differences and resemblances.

Resemblance among objects of the same kind, and
dissimilitude among objects of different kinds, are too
obvious and familiar to gratify our curiosity in any de-
gree: its gratification lies in discovering differences
among things that resemblance prevails, and resem-
blances where difference prevail. Thus a difference
in individuals of the kind of plants or animals, is
deemed a discovery, while the many particulars in which
they agree are neglected; and in different kinds, any
resemblance is generally remarked, without attending to
the many particulars in which they differ.

A comparison of the former neither tends to gra-
tify our curiosity, nor to set the objects compared in
a stronger light: two apartments in a palace, similar
in shape, size, and furniture, make separately as good
a figure as when compared; and the same observation
is a pleasurable to two similar compartments in a garden;
on the other hand, one regular building to a fall
of water, or a good picture to a towering hill, or even
a little dog to a large horse, and the contrast will pro-
duce no effect. But a resemblance between objects of
different kinds, and a difference between objects of
the same kind, have remarkably an enlivening effect.
The poets, such of them as have a just taste, draw all
their inferences from things that in the main differ wide-
ly from the principal subject; and they never attempt
a contrast, but where the things have a common gen-
us, and a resemblance in the capital circumstances:
place together a large and a small-sized animal of the
same species, the one will appear greater, the other
lesser, than when viewed separately: when we oppose
beauty to deformity, each makes a greater figure by
the comparison. We compare the dregs of different
nations with curiosity, but without surprise; because
they have no such resemblance in the capital parts as
to please us by contrasting the smaller parts. But a
new cut of a scone, or of a pocket, enchant by its
novelty; and, in opposition to the former edicion, raises
some degree of surprise.

That resemblance and dissimilitude have an enliven-
ing
ing effect upon objects of fight, is made sufficiently
evident; and that they have the same effect upon ob-
jects of the other senses, is also certain. Nor is that
law confined to the external senses; for characters con-
trasted make a greater figure by the opposition: Iago,
in the tragedy of Othello, says:

He hath a daily beauty in his life
That makes me ugly.

The character of a frown, and of a rough warrior, are
nowhere more successfully contrasted than in Shakes-
peare:

Help! My liege, I did deny no prisoners;
But I remember, when the fight was done,
When I was dry with rage, and extreme toil,
Breathless and faint, leaning upon my sword,
Came there a certain lord, neat, trimly dress'd,
Trest as a bridegroom; and his chin, new reap'd,
Show'd like a stubble-field at harvest-time.
He was perfumed like a milliner;
And 'twixt his finger and his thumb he held
A poucet-box, which ever and anon
He gave his nose: —and fill he smil'd and talk'd;
And as the soldiers bare dead bodies by,
He call'd them untaught knaves, unmanfully.
To bring a lovenly, unhandorne corse
Betwixt the wind and his nobility.
With many holiday and lady terms
He question'd me: among the rest, demanded
My prisoners in your majesty's behalf.
I then, all sink'd with my wounds; being gall'd
To be so pester'd with a popinjay,
Out of my grief, and my impatience,
Answer'd, negligently, I know not what:
He should, or should not; for he made me mad,
To see him shine so brisk, and smell so sweet,
And to talk like a waiting gentlewoman,
Of guns, and drums, and wounds. (God save the mark!) -
And telling me, the sovereign suit thing on earth
Was parnecacy for an inward bruise;
And that it was great pity, so it was,
This villainous faint-petre should be dagg'd
Out of the bowels of the harmless earth,
Which many a good, tall fellow had destroy'd
So cowardly: and but for these vile guns,
He would himself have been a fileder. —

Fiefl part, Henry IV. ad 1. fe. 4.

Passions and emotions are also enflamed by compa-
rition. A man of high rank humbles the bystanders
even to annihilate them in their own opinion: Caesar,
beholding the stature of Alexander, was greatly mor-
tified, that now, at the age of 32, when Alexander died,
he had not performed one memorable action.

Our opinions also are much influenced by compa-
rition. A man whose opulence exceeds the ordinary
standard is reputed richer than he is in reality; and
wisdom or weaknes, if at all remarkable in an indi-
vidual, is generally carried beyond the truth.

The opinion a man forms of his present distresses is heightened by contrasting it with his former hap-
pliefs:

———— Could I forget
What I have been, I might the better bear
What I'm delin'd to. I'm not the first

That have been wretched: but to think how much
I have been happier.

Southern's Innocent Adultery, ad 2.

The distress of a long journey makes even an indif-
f erent inn agreeable; and, in travelling, when the road
is good, and the horseman well covered, a bad day
may be agreeable, by making him tolerable how snug
he is.

The same effect is equally remarkable, when a man
opposes his condition to that of others. A ship to-
eled about in a storm, makes the spectator reflect upon
his own ease and security, and puts these in the strong-
eft light.

A man in grief cannot bear mirth; it gives him a
more lively notion of his unhappiness, and of course
makes him more unhappy. Satan, contemplating the
beauties of the terrestrial paradise, has the following
exclamation:

With what delight could I have walk'd thee round,
If I could joy in aught, sweet interchange
Of hill and valley, rivers, woods, and plains,
Now land, now sea, and shores with forest crown'd,
Rocks, dens, and caves! but I in none of these
Find place or refuge; and the more I see
Pleasures about me, so much more I feel
Torment within me, as from the hateful siege
Of contraries: all good to me becomes
Bane, and in heav'n much worse would be my fate.

The appearance of danger gives sometimes pleasure,
sometimes pain. A timorous person upon the battle-
ments of a high tower, is fired with fear, which even
the conscientiousness of security cannot dissipate. But upon
one of a firm head, this situation has a contrary effect: the
appearance of danger heightens, by opposition, the
consciousness of security, and consequently the satisfac-
tion that arises from security: here the feeling resem-
bles that above mentioned, occasioned by a ship labour-
ing in a storm.

The effect of magnifying or lessening objects by
means of comparison is to be attributed to the in-
fluence of passion over our opinions. This will evidently
appear by reflecting in what manner a spectator is af-
fected, when a very large animal is for the first time pla-
ced beside a very small one of the same species. The
first thing that strikes the mind is the difference be-
tween the two animals, which is so great as to occasion
surprise; and this, like other emotions, magnifying its
object, makes us conceive the difference to be the
greatest that can be: we fee, or seem to see, the one
animal extremely little, and the other extremely large.
The emotion of surprise arising from any unusual re-
semblance, serves equally to explain, why at first view
we are apt to think such resemblance more entire than
it is in reality. And it must be observed, that the cir-
cumstances of more and less, which are the proper
subjects of comparison, raise a perception so indistinct
and vague as to facilitate the effect described; we
have no mental standard of great and little, nor of the
several degrees of any attribute; and the mind, thus
unrestrained, is naturally disposed to indulge its sur-
prise to the utmost extent.

In exploring the operations of the mind, some of
which are extremely nice and slippery, it is necessary
to proceed with the utmost circumspection; and after all, seldom it happens that speculations of that kind afford any satisfaction. Luckily, in the present case, our speculations are supported by facts and solid argument. First, a small object of one species opposed to a great object of another, produces not, in any degree, that deception which is so remarkable when both objects are of the same species. The greatest disparity between objects of different kinds, is so common as to be observed with perfect indifference; but such disparity between the objects of the same kind being uncommon, never fails to produce surpris: and may we not fairly conclude, that surpris, in the latter case, is what occasions the deception, when we find no exception in the former? In the next place, if surpris be the sole cause of the deception, it follows necessarily that the deception will vanish as soon as the objects compared become familiar. This holds for unanimously, as to leave no reasonable doubt that surpris is the prime mover: our surpris is great, the first time a small lapdog is seen with a large maliff; but when two such animals are contantly together, there is no surpris, and it makes no difference whether they be viewed separately or in company. We see no bounds to the riches of a man who has recently made his fortune; the surprisng disproportion between his present and his past situation being carried to an extreme; but with regard to a family that for many generations hath enjoyed great wealth, the same false reckoning is not made. It is equally remarkable, that a trite figure has no effect: a lover compared to a moth scouring itself at the flame of a candle, originally a sprightly figure, has by frequent use lost all force; love cannot now be compared to fire, without some degree of disgust. It has been justly observed against Homer, that the lion is too often introduced into his families; all the variety he is able to throw into them not being sufficient to keep alive the reader’s surpris.

To explain the influence of comparison upon the mind, we have chosen the simplest cafe, viz. the first sight of two animals of the same kind, differing in size only; but to complete the theory, other circumstances must be taken in. And the next supposition we make, is where both animals, separably familiar to the spectator, are brought together for the first time. In that case, the effect of magnifying and diminishing is found remarkably greater than in that first mentioned; and the reason will appear upon analyzing the operation: the first feeling we have is of surpris at the uncommon difference of two creatures of the same species; we are next sensible, that the one appears less, the other larger, than they did formerly; and that new circumstance increasing our surpris, makes us imagine a still greater opposition between the animals, than if we had formed no notion of them beforehand.

Let us make one other supposition, that the spectator was acquainted beforehand with one of the animals only; the lapdog, for example. This new circumstance will vary the effect; for, instead of widening the natural difference, by enlarging in appearance the one animal, and diminishing the other in proportion, the whole apparent alteration will rest upon the lapdog; the surpris to find it less than it appeared formerly, directs to it our whole attention, and makes us conceive it to be a most diminutive creature: the maliff in the mean time is quite overlooked. To illustrate this effect by a familiar example. Take a piece of paper or of linen tolerably white, and compare it with a pure white of the same kind: the judgment we form of the first object is instantly varied; and the surpris occasioned by finding it less white than was thought, produced a half conviction that it is much less white than it is in reality: withdrawing now the pure white, and putting in its place a deep black, the surpris occasioned by that new circumstance carries us to the other extreme, and makes us conceive the object first mentioned to be a pure white; and thus experience compels us to acknowledge, that our emotions have an influence even upon our eye-light. This experiment leads to a general observation, that whatever is found more strange and beautiful than was expected, is judged to be more strange and beautiful than it is in reality. Hence a common artifice, to depress beforehand what we will to make a figure in the opinion of others.

The comparisons employed by poets and orators are of the kind last mentioned; for it is always a known object that is to be magnified or diminished. This is effected by likening it to some great object; or by contriving it with one of an opposite character. To effectuate the latter, the method must be reversed: the object must be contrasted with something superior to it, or likened to something inferior. The whole effect is produced upon the principal object; which by that means is elevated above its rank, or depressed below it.

In accounting for the effect that any unusual resemblance or dissimilarity hath upon the mind, no cause has been mentioned but surpris; and to prevent confusion, it was proper to difdus those causes first. But surpris is not the only cause of the effect described: another occurs, which operates perhaps not less powerfully, viz a principle in human nature that lies still in obscurity, not having been unfolded by any writer, though its effects are extensive: and as it is not distinguished by a proper name, the reader must be satisfied with the following description. Every man who figures himself or others, must be sensible of a tendency or propensity in the mind to complete every work that is begun, and to carry things to their full perfection. There is little opportunity to display that propensity upon natural operations, which are seldom left to complete the set. But in the operations of art it hath great scope; it impels us to perfevere in our own work, and to with for the completion of what another is doing; we feel a sensible pleasure when the work is brought to perfection; and our pain is not less sensible when we are disappointed. Hence our uneasiness when an interesting story is broken off in the middle, when a piece of music ends without a close, or when a building or garden is left unfinished. The same propensity operates in making collections; such as the whole works, good and bad, of any author. A certain person attempted to collect prints of all the capital paintings, and succeeded except as to a few. La Bruyere remarks, that an anxious search was made for these; not for their value, but to complete the set.

The final cause of the propensity is an additional proof of its existence. Human works are of no significance till they are completed; and reason is not always a sufficient counterbalance to indolence: some principle

VOL. XVI.
Remembrance.

We need not lose time to describe the co-operation of the foregoing propensity with surprisef, in producing the effect that follows any usual resemblance or diffimilitude. Surprisef first operates, and carries our opinion of the resemblance or diffimilitude beyond truth. The propensity we have been describing carries us still farther; for it forces upon the mind a conviction, that the resemblance or diffimilitude is complete. We need no better illustration, than the resemblance that is fancied in some pebbles to a tree or an insect; which resemblance, however faint in reality, is conceived to be wonderfully perfect. The tendency to complete a resemblance acting jointly with surprisef, carries the mind sometimes so far, as even to prelude upon future events. In the Greek tragedy entitled Phineus, those unhappy women seeing the place where it was intended they should be slain, cried out with anguish, "They now saw their cruel destiny had condemned them to die in that place, being the fame where they had been expofed in their infancy."

The propensity to advance every thing to its perfection, not only co-operates with surprisef to deceive the mind, but of itself is able to produce that effect. Of this we see many instances where there is no place for surprisef; and the first we shall give is of resemblance. Unumquaque edam modo dissolvitur quo colligatum est, is a maxim in the Roman law that has no foundation in truth; for tying and loofing, building and demolishing, are acts opposite to each other, and are performed by opposite means: but when these acts are connected by their relation to the fame subject, their connection leads us to imagine a fort of resemblance between them, which by the foregoing propensity is conceived to be as complete as possible. The next inflance shall be of contrast. Addifon observes, "That the paleft features look the moft agreeable in white; that a face which is overflooded appears to advantage in the deepest scarlet; and that a dark complexion is not a little alleviated by a black hood." The foregoing propensity serves to account for these appearances; to make this evident, one of the cafes shall suffice. A complexion, however dark, never appears to black when these colours appear together, their oppofition strikes us; and the propensity we have to complete the oppofition, makes the darknes of complexion vanifh out of sight.

The operation of this propensity, even where there is no ground for surprisef, is not confined to opinion or conviction: it powerful it is, as to make us sometimes proceed to action, in order to complete a resemblance or diffimilitude. If this appear obscure, it will be made clear by the following infance. Upon what principle is the lex talonis founded, other than to make the punishment reffemble the mischief? Reason dictates, that there ought to be a conformity or resemblance between a crime and its punishment; and the foregoing propensity impels us to make the resemblance as complete as possible. Titus Livius, under the influence of that propensity, accounts for a certain punishment by a resemblance between it and the crime, too fubtle for common apprehenfion. Speaking of Mettus Fufetius, the Alban general, who, for treachery to the Romans his allies, was sentenced to be torn to pieces by horses, he puts the following speech in the mouth of Tullus Hollius, who decreed the punishment. "Mettus Fufetius, inequit, si tibe differo paines fdem ac federe fervare, video tibi ea difciplina a me adhibita effe. Nunc, quantum tum infanae ingenium effe, at tuum sapficito deus humanum genus ea fama credere, qua a te violata sunt. Ut ignar fides ante animum inter Titonem Romanumque venientiop gaffelli, ha jam corpus paffim diiulrandum dabis!" By the fame influence, the sentence is often executed upon the very spot where the crime was committed. In the Eleftra of Sophocles, Egilethus is dragged from the theatre into an inner room of the supposed palace, to suffer death where he murdered Agamemnon. Shakespeare, whose knowledge of nature is not less profound than extensive, has not overlooked this propensity.

"Othello. Get me some poifon, Iago, this night. I'll not expofulate with her, left her body and her beauty unprovide my mind again. This night, Iago."

"Iago. Do it not with poifon; strangle her in her bed, even in the bed she hath contaminated."

"Othello. Good, good: the juifice of it pleafes very good."

Othello, act 4, fe. 5.

Perfons in their latt moments are generally feized with an anxiety to be buried with their relations. In the Amynta of Tafio, the lover, hearing that his missi re was torn to pieces by a wolf, expresses a defire to die the fame death.

Upon the subjeft in general we have two remarks to add. The firft concerns resemblance, which, when too entere, hath no effet; however different in kind the things compared may be. The remark is applicable to works of art only; for natural objects of different kinds have scarce ever an entire resemblance. To give an example in a work of art: Marble is a fort of matter very different from what composes an animal; and marble cut into a human figure, produces great pleasure by the resemblance: but if a marble figure be coloured like a picture, the resemblance is fo entire as at a distance to make the statue appear a real perfom: we discover the mistake when we approach; and no other emotion is raised, but surprisef occasioned by the deception: the figure still appears a real perfom, rather than an imitation; and we muft use reflection to correct the mistake. This cannot happen in a picture; for the resemblance can never be fo entire as to disguise the imitation.

The other remark belons to contrast. Emotions make the greateft figure when conftrasted in fuccedion; but then the fuccedion ought neither to be rapid, nor immoderately flow: if too flow, the effet of contratif becomes faint by the distance of the emotions; and if rapid, no single emotion has room to expand itfelf to its full size, but is flattened, as it were, in the birth by a fucceding emotion. The funeral oration of the bishop of Meaux upon the duchef of Orleans, is a perfect hodge-podge of cheerful and melancholy reprefenta¬tions, following each other in the quickeft fuccedion: opposite emotions are felt in fuccedion; but each emotion separately should be raised to its due pitch, before another is introduced.

What
With grandeur, dissimilar emotions have a fine effect in a slow succession; but in a rapid succession, which approaches to co-existence, they will not be relished. In the midst of a laboured and elevated description of battle, Virgil introduces a ludicrous image, which is certainly out of its place:

Obvius ambulat torrem Chorioneus ab ara
Corripit, et venienti Ebuo plagamque ferenti
Occupat os famnios: illi ingenus barba reliquit,
Nidorumque ambula dedit.  

E qual tauro ferito, it fuo dolore
Verfo muggiando e iofpirando fuoiere.

Ginnafal. cant. 4. ft. 1.

It would however be too subtle to banish altogether ludicrous images from an epic poem. This poem doth not always soar above the clouds; it admits great variety; and upon occasion can descend even to the ground without flinicking. In its more familiar tones, a ludicrous scene may be introduced without impropiety. This is done by Virgil in a foot-race: the circumstance, cumlimities of which, not excepting the ludicrous part, are copied from Homer. After a fit of merriment, if ill, we are, it is true, the leis disposed to the serious and sublime: but then, a ludicrous scene, by unbending the mind from severe application to more interesting subjects, may prevent fatigue, and preserve our relish entire.

RESEN, (Moses) a town on the Tigris, built by Nimrod; thought to be the Larissa of Xenophon; which see. But as Larissa is a name in imitation of a Greek city; and as there were no Greek cities, consequently no Larissa in Assyria, before Alexander the Great; it is probable that the Greeks asking of what city those were the ruins they saw, the Assyrians might answer, Larsia, "Of Resen;" which word Xenophon exprest by Larissa, a more familiar sound to a Greek ear, (Wells).

RESENTMENT, means a strong perception of good or ill, generally a deep sense of injury, and may be distinguished into anger and revenge. "By anger (says Archdeacon Paley), I mean the pain we suffer upon the receipt of an injury or affront, with the usual effects of that pain upon ourselves. By revenge, the inflicting of pain upon the person who has injured or offended us, farther than the just ends of punishment or reparation require. Anger prompts to revenge; but it is possible to suspend the effect when we cannot altogether quell the principle. We are bound also to endeavour to qualify and correct the principle itself. So that our duty requires two different applications of the mind: and for that reason anger and revenge should be confidered separately." See Revenge.

RESERVATION, in law, an action or clause whereby something is reserved, or secured to one's self.  

Mental Reservation, a proposition which, strictly taken, and according to the natural import of the terms, is false; but, if qualified by something concealed in the mind, becomes true.

Mental reservations are the great refuge of hypocrites, who use them to accommodate their confidences with their interests: the Jesuits are zealous advocates for mental reservations; yet are they real lies, as including an intention to deceive.
RESERVE, in law, the same with reservation. See Reservation.

Body of RESERVES, or Corps de Reserve, in military affairs, the third or last line of an army, drawn up for battle; so called because they are reserved to sustain the rest as occasion requires, and not to engage but in case of necessity.

RESERVOIR, a place where water is collected and reserved, in order to be conveyed to distant places through pipes, or supply a fountain or jet d'eau.

RESET, in law, the receiving or harbouring an outlawed person. See Outlawry.

Resist of Theft, in Scots law. See Law, n. clixvi.

29. RESIDENCE, in the canon or common law, the abode of a person or incumbent upon his benefice; and his affidavit in attending on the same.

RESIDENT, a public minister, who manages the affairs of a kingdom or state, at a foreign court.

They are a class of public ministers inferior to ambassadors or envoys; but, like them, are under the protection of the law of nations.

RESIDUE, the remainder or balance of an account, debt, or obligation.

RESIGNATION, in general, signifies the implicit submission of ourselves, or of something we possess, to the will of another. In a religious sense it signifies a perfect submission, without discontent, to the will of God. See Moral Philosophy, p. 110.

RESIN, in natural history, a viscid juice oozing either spontaneously, or by incision, from several trees, as the pine, fir, &c.—A premium for several years has been offered by the London Society for Encouraging Arts, &c. for discovering a mode of reducing the inflammable quality of resin, so as to adapt it to the purposes of making candles; but no such discovery has yet been made.

Éthyllic Resin. See CAOUTCHOUC.

Gum Resin, a mixture of gum and resin. See Pharmacy, n. 38.

Red Gum Resin, is procured from the red gum tree, or eucalyptus refinifer a tree fo large and lofty as to exceed in size the English oak. The wood of the tree is brittle, and of little use but for fire-wood, from the large quantity of resinous gum it contains. The tree is distinguished by having innundated flowers, and an acute or pointed conical calyptra. To obtain the juice from these tree incisions are made in the trunk of it, and sometimes upwards of 60 gallons of red resinous juice have been obtained from one of them. "When this juice is dried, it becomes a very powerful altringent gum-resin, of a red colour, much resembling that known in the shops by the name of kino, and, for all medical purposes, fully as efficacious. Mr White administered it to a great number of patients in the distemper, which prevailed much, soon after the landing of the convicts, and in no one instance found it to fail. This gum-resin diffolves almost entirely in spirit of wine, to which it gives a blood-red tincture. Water dissolves about one fifth part only, and the watery solution is of a bright red. Both these solutions are powerfully altringent.

Yellow Gum Resin, is procured from the yellow resin tree, which is as large as the English walnut tree. The properties of this resin are equal to those of the most fragrant balms. It exudes from the bark spontaneously, but more readily if incisions are made. The colour of it is yellow, and at first it is fluid; but after being impregnated in the sun, it becomes solid. When burnt on hot coals, it smells like a mixture of balsam of Tolu and benzoin, approaching somewhat to storax. "It is perfectly soluble in spirit of wine, but not in water, nor even in essential oil of turpentine, unless it be digested in a strong heat. The varnish which it makes either is very weak, and of little use. With respect to its medicinal qualities, Mr White has found it, in many cases, a good pectoral medicine, and very balsamic. It is not obtainable in so great abundance as the red gum produced by the eucalyptus resinifer a. The plant which produces the yellow gum seems to be perfectly unknown to botanists, but Mr White has communicated no specimens by which its genus or even class could be determined."

RESINOUS ELECTRICITY, is that kind of electricity which is produced by exciting bodies of the resinous kind, and which is generally negative. See Electricity p. 75.

RESISTANCE, or RESISTING Force, in philosophy, denotes, in general, any power which resists the action of another, so as to destroy or diminish its effect. See Mechanics, Hydrostatics, and Pneumatics.

Of all the resistances of bodies to each, there is unimportance undoubtedly none of greater importance than the resistance or reaction of fluids. It is here that we must look for a theory of naval architecture, for the impulse of the air is our moving power, and this must be modified so as to produce every motion we want to make our ship proceed in her course; and this must also be modified to our purpose, that the ship may not drive like a log to leeward, but on the contrary may ply to windward, that she may answer her helm briskly, and that she may be easy in all her motions on the surface of the troubled ocean. The impulses of wind and water makes them ready and indefatigable servants in a thousand shapes for driving our machines; and we should lose much of their service did we remain ignorant of the laws of their action; they would sometimes become terrible masters, if we did not fall upon methods of eluding or softening their attacks.

We cannot refuse the ancients a considerable knowledge of this subject. It was equally interesting to them as to us; and we cannot read the accounts of the naval exertions of Punicia, Carthage, and of Rome, exertions which have not been furnepassed by any thing of modern date, without believing that they possessed much practical and experimental knowledge of this subject. It was not, perhaps, possessed by them in a strict and systematic form, as it is now taught by our mathematicians; but the master-builders, in their dockyards, did undoubtedly exercise their genius in comparing the forms of their ships, and in marking those circumstances of form and dimensions which were in fact accompanied with the desirable properties of a ship, and thus framing to themselves maxims of naval architecture in the same manner as we do now. For we believe
believe that our naval architects are not disposed to grant that they have profited much by all the labours of the mathematicians, it proceeds on principles or assumptions which are not only gratuitous, but even false. But it affords such a beautiful application of geometry and calculus, that mathematicians have been as it were fascinated by it, and have published systems so elegant and so extensively applicable, that one cannot help lamenting that the foundation is so flimsy.

But its utility is still furnishes (as was expected by its illustrious author) many propositions of immense practical use, they being the limits to which the real phenomena of the impulse and resistance of fluids really approximate. So that when the law by which the phenomena deviate from the theory is once determined by a well chosen series of experiments, this hypothetical theory becomes almost as valuable as a true one. And we may add, that although Mr d' Alembert, by treading warily in the steps of Sir Isaac Newton in another route, has discovered a genuine and unexceptionable theory, the process of investigation is so intricate, requiring every fineness of the most abstruse analysis, and the final equations are so complicated, that even their most expert author has not been able to deduce more than one simple proposition (which too was discovered by Daniel Bernouilli by a more simple process) which can be applied to any case. The hypothetical theory of Newton, therefore, continues to be the groundwork of all our practical knowledge of the subject.

We shall therefore lay before our readers a very short view of the theory, and the manner of applying it. We shall then show its defects (all of which were pointed out by its greatest author) and give an historical account of the many attempts which have been made to amend it or to substitute another; in which we think it our duty to show, that Sir Isaac Newton took the lead, and pointed out every path which others have taken, if we except Daniel Bernouilli and d'Alembert; and we shall give an account of the chief facts of experiments which have been made on this important subject, in the hopes of establishing an empirical theory, which may be employed with confidence in the arts of life.

We know by experience that force must be applied to a body in order that it may move through a fluid, such as air or water; and that a body projected with any velocity is gradually retarded in its motion, and generally brought to rest. The analogy of nature makes us imagine that there is a force acting in the opposite direction, or opposing the motion, and that this force resides in, or is exerted by, the fluid. And the phenomena resemble those which accompany the known resistance of active beings, such as animals. Therefore we give to this supposed force the metaphorical name of Resistance. We also know that a fluid in motion will hurry a solid body along with the firebrand, and that it requires force to maintain it in its place. A similar analogy makes us suppose that the fluid exerts force, in the same manner as when an active being impels the body before him; therefore we call this the Impulsion of a Fluid.

It must be acknowledged, that the results of this theory agree but ill with experiment; and that, in the way in which it has been rashly projected by some

But even now it is not perfectly understood.

Sir Isaac Newton was the first (as far as we can recollect) who attempted to make the motions and actions of fluids the subject of mathematical discussion. He had invented the method of fluxions long before he engaged in his physical researches; and he proceeded in these fluid mathes facem preferentes. Yet even with this guide he was often obliged to grope his way, and to try various by-paths, in the hopes of obtaining a legitimate theory. Having exerted all his powers in establishing a theory of the lunar motions, he was obliged to content himself with an approximation instead of a perfect solution of the problem which affects the motions of three bodies mutually acting on each other. This convinced him that it was vain to expect an accurate investigation of the motions and actions of fluids, where millions of unequal particles combine their influence. He therefore said about to find some particular case of the problem which would admit of an accurate determination, and at the same time furnish circumstances of analogy or parallelism sufficiently numerous for giving limiting cases, which should include between them those other cases that did not admit of this accurate investigation. And thus, by knowing the limit to which the case supposed did approximate, and the circumstances which regulated the approximation, many useful propositions might be deduced for directing us in the application of these doctrines to the arts of life.

He therefore figured to himself a hypothetical collection of matter which possessed the characteristic property of fluidity, viz. the quidquidserumptum propagation of pressure, and the most perfect intermixture (pardon the uncouth term) of parts, and which formed a physical whole or aggregate, whole parts were connected by mechanical forces, determined both in degree and in direction, and such as rendered the determination of certain important circumstances of their motion susceptible of precise investigation. And he concluded, that the laws which he should discover in these motions must have a great analogy with the laws of the motions of real fluids; and from this hypothesis he deduced a series of propositions, which form the basis of almost all the theories of the impulse and resistance of fluids which have been offered to the public since his time.

Which does not, however, agree with experiment.

RES [93] RES
If similar, each corresponding body describing similar figures, proportional to the velocities communicated, that is, to the squares of the velocities, the quantities of motion produced in the two systems in the same time will be proportional to the densities; and if the densities are the same, and uniform in each system, the numbers of particles impressed by similar bodies will be as the surfaces of these bodies.

Now the diminutions of the motions of the projected bodies are (by Newton's third law of motion) equal to the motions produced in the systems; and the diminutions are the measures of what are called the resistances opposed to the motions of the projected bodies. Therefore, combining all these circumstances, the resistances are proportional to the similar surfaces of the moving bodies, to the densities of the systems through which the motions are performed, and to the squares of the velocities, jointly.

We cannot form to ourselves any distinct notion of a fluid, otherwise than as a system of small bodies, or a collection of particles, similarly or symmetrically arranged, the centres of each being situated in the angles of regular solids. We must form this notion of it, whether we suppose, with the vulgar, that the particles are little globules in mutual contact, or, with the partitions of corporeal attractions and repulsions, we suppose the particles kept at a distance from each other by means of these attractions and repulsions mutually balancing each other. In this last case, no other arrangement is consistent with a quiescent equilibrium; and in this case, it is evident, from the theory of curvilinear motions, that the agitation of the particles will always be such, that the connecting forces, in actual exertion, will
will be proportional to the squares of the velocities directly, and to the chords of curvature having the direction of the forces inveterly.

From these premises, therefore, we deduce, in the first instance in the manner of the demonstration of the leading theorem of the rectifiitude of the rest and impulse of fluids; namely,

Prop. I. The rectifie, and (by the third law of motion), the impulses of fluids on similar bodies, are proportioned to the surfaces of the solid bodies, to the densities of the fluids, and to the squares of the velocities, jointly.

We must now observe, that when we supposing the particles of the fluid to be in mutual contact, we may either suppose them elastic or unelastic. The motion communicated to the collection of elastic particles must be double of what the same body, moving in the same manner, would communicate to the particles of an unelastic fluid. The impulse and rectility of elastic fluids must therefore be double of those of unelastic fluids.—But we must caution our readers not to judge of the elacticity of fluids by their sensible compellibility. A diamond is incomparably more elastic than the finest football, though not compellible in any sensible degree.—It remains to be decided, by well chosen experiments, whether water be not as elastic as air. If we suppose, with Boscovich, the particles of perfect fluids to be at a distance from each other, we shall find it difficult to conceive a fluid void of elasticity. We hope that the theory of their impulse and rectility will suggest experiments which will decide this question, by pointing out what ought to be the absolute impulse or rectility in either case. And thus the fundamental proportion of the impulse and rectility of fluids, taken in its proper meaning, is infensible to a rigid demonstration, relative to the only distinct notion that we can form of the interior constitution of a fluid. We say, taken in its proper meaning; namely, that the impulse or rectility of fluids is a pressure, opposed and measured by another pressure, such as a pound weight, the force of a spring, the pressure of the atmosphere, and the like. And we apprehend that it would be very difficult to find any legitimate demonstration of this leading proposition different from this, which we have now borrowed from Sir Issac Newton, Prop. 29. B. II. Princip. We acknowledge that it is prolix and even circuitous; but in all the attempts made by his commentators and their disciples to simplify it, we see great defects of logical argument, or assumption of principles, which are not only gratuitous, but insupportable. We shall have occasion, as we proceed, to point out some of their defects; and doubt not but the illustrious author of this demonstration had exercised his uncommon patience and sagacity in similar attempts, and was dissatisfied with them all.

Before we proceed further, it will be proper to make a general remark, which will have a great deal of diffusion. Since it is a matter of universal experience, that every action of a body on others is accompanied by an equal and contrary reaction; and since all that we can demonstrate concerning the rectility of bodies during their motion, or the action of fluids proceeding on this impulse (the rectility of the body being affirmed as equal and opposite to the sum of motions communicated to the particles of the fluid, estimated in the direction of the body’s motion), we are limited to proceed in the contrary order, and to consider the impulsions which refresh each of the particles of fluid exerts on the body at rest, as equal and opposite to the motion which the body would communicate to that particle if the fluid were at rest, and the body were moving equally in the opposite direction. And therefore the whole impulse of the fluid must be conceived as the measure of the whole motion which the body would thus communicate to the fluid. It must therefore be also considered as the measure of the rectility which the body, moving with the same velocity, would sustain from the fluid. When, therefore, we shall demonstrate any thing concerning the impulse of a fluid, estimated in the direction of its motion, we must consider it as demonstrated concerning the rectility of a quiescent fluid to the motion of that body, having the same velocity in the opposite direction. The determination of these impulsions being much easier than the determination of the motions communicated by the body to the particles of the fluid, this method will be followed in most of the subsequent discussions.

The general proposition already delivered is by no means sufficient for explaining the various importants phenomena observed in the mutual actions of solids and fluids. In particular, it gives us no assistance in ascertaining the modifications of this impulse, or actions, which depend on the shape of the body and the inclination of its impelled or reflected surface to the direction of the motion. Sir Issac Newton found another hypothesis necessary; namely, that the fluid should be in extremely rare that the particles of the fluid may be incomparably greater than their diameters. This additional condition is necessary for considering their actions as so many separate collisions or impulsions on the solid body. Each particle must be supposed to have abundant room to rebound, or otherwise escape, after having made its stroke, without sensibly affeding the situations and motions of the particles which have not yet made their stroke; and the motion must be so swift as not to give time for the sensible exertion of their mutual forces of attractions and repulsions.

Keeping these conditions in mind, we may proceed to determine the impulses made by a fluid on surfaces of every kind; and the most convenient method to pursue in this determination, is to compare them all either with the impulse which the same surface would receive from the fluid impinging on it perpendicularly, or with the impulse which the same stream of fluid would make when coming perpendicularly on a surface of such extent as to occupy the whole stream.

It will greatly abbreviate language, if we make use Terms explained.

By a stream, we shall mean a quantity of fluid moving in one direction, that is, each particle moving in parallel lines; and the breadth of the stream is a line perpendicular to all these parallels.

A filament means a portion of this stream of very small breadth, and it consists of an indefinite number of particles following one another in the same direction, and successively impinging on, or sliding along, the surface of the solid body.

The base of any surface exposed to a stream of fluid, is that portion of a plane perpendicular to the stream, which is covered or protected from the action of the stream by the surface exposed to its impulse. Thus the base of a sphere exposed to a stream of fluid is its great circle,
The angle of incidence is the angle FGC contained between the direction of the stream FG and the plane BC.

The angle of obliquity is the angle OGC contained between the plane and the direction GO, in which we wish to estimate the impulse.

PROP. II. The direct impulse of a fluid on a plane surface, face, is to its absolute oblique impulse on the same surface, as the square of the radius to the square of the fine of the angle of incidence.

Let a stream of fluid, moving in the direction DC, (fig. 1.), act on the plane BC. With the radius CB describe the quadrant ABE; draw CA, perpendicular to CE, and draw MNBS parallel to CE. Let the particle F, moving in the direction FG, meet the plane in G, and in FG produced take GH to represent the magnitude of the direct impulse, or the impulse which the particle would exert on the plane AC, by meeting it in V. Draw GI and HK perpendicular to BC, and HI perpendicular to GI. Also draw BR perpendicular to DC.

The force GH is equivalent to the two forces GI and GK; and GK being in the direction of the plane has no force in the impulse. The absolute impulse, therefore, is represented by GI; the angle GHI is equal to FGC, the angle of incidence; and therefore GH is to GI as radius to the sine of the angle of incidence: Therefore the direct impulse of each particle or filament is to its absolute oblique impulse as radius to the sine of the angle of incidence. But further, the number of particles or filaments which strike the surface AC, is to the number of those which strike the surface BC as AC to NC: for all the filaments between LA and MB go past the oblique surface BC without striking it. But BC : NC = rad. : sin. NDC = rad. : sin. FGC = rad. : sin. incidence.

Now the whole impulse is as the impulse of each filament, and as the number of filaments exerting equal impulses jointly; therefore the whole direct impulse on AC is to the whole absolute impulse on BC, as the square of radius to the square of the sine of the angle of incidence.

Let S express the extent of the surface, \( i \) the angle of incidence, \( \phi \) the angle of obliquity, \( v \) the velocity of the fluid, and \( d \) its density. Let \( F \) represent the direct impulse, \( f \) the absolute oblique impulse, and \( \phi \) the relative or effective impulse; and let the tabular sines and cosines be considered as decimal fractions of the radius unity.

This proposition gives us \( F : f = R : \sin^2 i = 1 : \sin^2 i \), and therefore \( f = F \times \sin^2 i \). Also, because impulses are in the proportion of the extent of surface similarly impelled, we have, in general, \( f = F \times S \times \sin^2 i \).

The first who published this theorem was Paracelsus, in his "Oeuvres de Mathematique," in 1673. We know that Newton had investigated the "chief propositions of the Principia before 1670."

PROP. III. The direct impulse on any surface is to the effective oblique impulse on the same surface, as the cube of radius to the solid, which has for its base the square of the sine of the angle of incidence, and the sine of obliquity for its height.
Cor. 1. The effective impulse in the direction of the stream on any plane surface BC, is to the direct impulse on its base BR, or SE, as the square of the line of the angle of incidence to the square of the radius.

2. If an isosceles wedge ABC (fig. 2.) be exposed to a stream of fluid moving in the direction of its height CD, the impulse on the sides is to the direct impulse on the base as the square of half the base AD to the square of the side AC, or as the square of the line of half the angle of the wedge to the square of the radius. For it is evident, that in this case the two transverse impulses, such as GP in fig. 1, balance each other, and the only impulse which can be observed is the sum of the two impulses, such as GQ of fig. 1, which are to be compared with the impulses on the two halves AD, DB of the base. Now AC : AB = rad. sin. ACD, and ACD is equal to the angle of incidence.

Therefore, if the angle ACD is a right angle, and ACD is half a right angle, the square of AC is twice the square of AD, and the impulse on the sides of a rectangular wedge is half the impulse on its base.

Also, if a cube ACBE (fig. 3.) be exposed to a stream moving in a direction perpendicular to one of its sides, and then to a stream moving in a direction perpendicular to one of its diagonal planes, the impulse in the first case will be to the impulse in the second as \( \sqrt{2} \) to 1. Call the perpendicular impulse on a side \( F \), and the perpendicular impulse on its diagonal plane \( f \), and the effective oblique impulse on its sides \( g \);—we have

\[ F : f = AC : AB = 1 : \sqrt{2}, \text{ and} \]
\[ f : g = AC : ACD' = 2 : 1. \text{ Therefore} \]
\[ F : g = 2 : 2 \sqrt{2} : \sqrt{2} = 1, \text{ or very nearly as 10 to 7.} \]

The same reasoning will apply to a pyramid whose base is a regular polygon, and whose axis is perpendicular to the base. If such a pyramid is exposed to a stream moving in the direction of the axis, the direct impulse on the base is to the effective impulse on the pyramid, as the square of the radius to the square of the line of the angle which the axis makes with the sides of the pyramid.

And, in like manner, the direct impulse on the base of a right cone is to the effective impulse on the conical surface, as the square of the radius to the square of half the base, the velocity of the cone. This is demonstrated, by supposing the cone to be a pyramid of a number of sides.

We may in this manner compare the impulse on any polygonal surface with the impulse on its base, by comparing apart the impulses on each plane with those in their corresponding bases, and taking their sum.

And we may compare the impulse on a curved surface with that on its base, by revolving the curved surface into elementary planes, each of which is impelled by an elementary filament of the stream.

The following beautiful proposition, given by Le Suer and Jaquier, in their Commentary on the second Book of Newton's Principia, with a few examples of its application, will suffice for any further account of this theory.

**Prop. V.**—Let ADB (fig. 4.) be the section of a surface of simple curvature, such as is the surface of a cone or a cylinder. Let this be exposed to the action of a pared with fluid moving in the direction AC. Let BC be the
The section of the plane (which we have called its base), perpendicular to the direction of the stream. In AC produced, take any length CG; and on CG describe the semicircle CHG, and complete the rectangle BCGO. Through any point D of the curve draw ED parallel to AC, and meeting BC and OG in Q and P. Let DF touch the curve in D, and draw the chord GH parallel to DF, and HKM perpendicular to CG, meeting ED in M. Suppose this to be done for every point of the curve ADB, and let LMN be the curve which passes through all the points of intersection of the parallels ED and the corresponding perpendiculars HKM.

The effective impulse on the curve surface ADB in the direction of the stream, is to its direct impulse on the base BC as the area of BCNL is to the rectangle BCGO.

Draw e a q m p parallel to EP and extremely near it. The arch D of the curve may be conceived as the section of an elementary plane, having the position of the tangent DF. The angle ED is the angle of incidence of the filament ED on the element Q of the base, CG or its equal DP, will represent the Legislature CRG incidence of the filament ED on the tangent D F. The angle EDF is the angle of incidence of the filament ED on the element Q of the base, CG or its equal DP, will represent the effective impulse on the point Q of the base, CG or its equal QM, will represent the effective impulse on the point D of the curve. And thus, Q g p P will represent the direct impulse of the filament on the element Q of the base, and Q g m M will represent the effective impulse of the elementary filament on the element D d of the curve. And, as this is true of the whole curve ADB, the effective impulse on the whole curve will be represented by the area BCNML; and the direct impulse on the base will be represented by the rectangle BCGO; and therefore the impulse on the curve surface is to the impulse on the base as the area BLMNC is to the rectangle BOCG.

It is plain, from the construction, that if the tangent to the curve at A is perpendicular to AC, the point N will coincide with G. Also, if the tangent to the curve at B is parallel to AC, the point L will coincide with B.

Whenever, therefore, the curve ADB is such that an equation can be had to exhibit the general relation between the abscissa AR and the ordinate DE, we shall deduce an equation which exhibits the relation between the abscissa CK and the ordinate KM of the curve LMN; and this will give us the ratio of BLNC to BOGC.

Thus, if the surface is that of a cylinder, so that the curve BDA b (fig. 5), which receives the impulse of the fluid, is a semicircle, make CG equal to AC, and construct the figure as before. The curve BMG is a parabola, whose axis is CG, whose vertex is G, and whose parameter is equal to CG. For it is plain, that CG = DC, and GH = CQ = MK. And CG × GK = GH² = KM². That is, the curve is such, that the square of the ordinate KM is equal to the rectangle of the abscissa GK and a constant line GC; and it is therefore a parabola whose vertex is G. Now, it is well known, that the parabolic area BMGC is two thirds the resistance of the parabolic area BCGO. Therefore the impulse on the quadrant ADB is two thirds of the impulse on the base BC. The same may be said of the quadrant A db and its base c b. Therefore, The impulse on a cylinder or half cylinder is two thirds of the direct impulse on a surface parallel to the axis; or it is two thirds of the direct impulse on one side of a parallelopiped of the same breadth and height.

The effective impulse or reaction on a cylinder on a cylinder is one half of the direct impulse on its great circle, or on the sphere, base of a cylinder of equal diameter.

For in this case the curve BMN (fig. 5) which generates the solid expressing the impulse on the sphere is a parabola, and the solid is a parabolic cone. Now this cone is to the cylinder generated by the revolution of the rectangle BOGC round the axis CG, as the sum of all the circles generated by the revolution of ordinates to the parabola such as KM, to the sum of all the squares described on the ordinates KM to the sum of as many squares of ordinates as the sum of as many squares described on the ordinates KT. Draw BG cutting MK in S. The square on MK is to the square on BC or TK as the abscissa GK to the abscissa GC (by the nature of the parabola), or as SK to BC; for it is plain, that SK and BC are respectively equal to GC and CG. Therefore the sum of all the squares on ordinates, such as MK, is to the sum of as many squares on ordinates, such as TX, as the sum of all the lines SK to the sum of as many lines TK; that is, as the triangle BGC to the rectangle BOGC; that is, as one to two; and therefore the impulse on the sphere is one half of the direct impulse on its great circle.

From the same construction we may very easily deduce a very curious and seemingly useful truth, that of fruitum of all conical bodies having the circle whose diameter is a cone. AB (fig. 2) is its base, and FD for its height, the one which sustains the smallest impulse or-resists with the smallest resistance is the fruitum AGHB of a cone ACB so constructed, that EF being taken equal to ED, EA is equal to EC. This fruitum, though more capacious than the cone AFO of the same height, will be least resisted.

Also, if the solid generated by the revolution of BDAC (fig. 4) has its anterior part covered with a fruitum of a cone generated by the lines D a, a A, forming
Different impulins compared with the pressure of gravity.

The reader cannot fail to observe, that all that we have hitherto delivered on this subject, relates to the comparison of different impulins or resistances. We have always compared the oblique impulins with the direct, and by their intervention we compare the oblique impulins with each other. But it remains to give absolute measures of same individual impulsion; to which, as to an unit, we may refer every other. And as it is by their pressure that they become useful or hurtful, and they must be opposed by other pressures, it becomes extremely convenient to compare them all with that pressure with which we are most familiarly acquainted, the pressure of gravity.

The manner in which the comparison is made, is this. When a body advances in a fluid with a known velocity, it puts a known quantity of the fluid into motion (as is supposed) with this velocity; and this is done in a known time. We have only to examine what weight will put this quantity of fluid into the same motion, by acting on it during the same time. This weight is conceived as equal to the resistance.

Thus, let us suppose that a stream of water, moving at the rate of eight feet per second, is perpendicularly obstructed by a square foot of solid surface held fast in its place. Conceiving water to act in the manner of the hypothetical fluid now described, and to be without elasticity, the whole effect is the gradual annihilation of the motion of eight cubic feet of water moving eight feet in a second. And this is done in a second of time. It is equivalent to the gradually putting eight cubic feet of water into motion with this velocity; and doing this by acting uniformly during a second. What weight is able to produce this effect? The weight of eight feet of water, acting during a second on it, will, as is well known, give it the velocity of thirty-two feet per second; that is, four times greater. Therefore, the weight of the fourth part of eight cubic feet, that is, the weight of two cubic feet, acting during a second, will do the same thing, or the weight of column of water whose base is a square foot, and whose height is two feet. This will not only produce this effect in the same time with the impulsion of the solid body, but it will also do it by the same degrees, as any one will clearly perceive, by attending to the gradual acceleration of the mass of water urged by 4 of its weight, and comparing this with the gradual production or extinction of motion in the fluid by the progress of the refilled surface.

Now it is well known that 8 cubic feet of water, by falling one foot, which it will do in one-fourth of a second, will acquire the velocity of eight feet per second by its weight; therefore the force which produces the same effect in a whole second is one-fourth of this. This force is therefore equal to the weight of a column of water, whose base is a square foot, and whose height is two feet; that is, twice the height necessary for acquiring the velocity of the motion by gravity. The conclusion is the same whatever be the surface that is refilled, whatever be the fluid that refills, and whatever be the velocity of the motion. In this indicative and familiar manner we learn, that the direct impulse or resistance of an oblique fluid on any plane surface, is equal to the weight of a column of fluid having the surface for its base, and twice the fall necessary for acquiring the velocity of motion for its height: and if the fluid is considered as elastic, the impulse or resistance is twice as great.

Thus, let us suppose that a stream of water, moving at the rate of eight feet per second, will do the same thing, or the same effect, whether it falls two feet, or twice as much. This is one of the facts that furnishes a distinct and sure proof of the elasticity of water, one of the most beautiful and most important distinctions of fluids. We shall mention the experiments which seem to have been made with the greatest judgment and care. Those of Sir Isaac Newton were chiefly made by the oscillations of pendulums in water, and by the descent of balls both in water and in air. Many have been made by Mariotte (Traité de Mouvement des Eaux). Graveland has published, in his System of Experimental Philosophy, experiments made on the resistance or impulins on solids in the midit of a pipe or canal. They are extremely well contrived, but are so small a deal that they are of very little use. Daniel Bernoulli, and his pupil Professsor Krafft, have published, in the Comment. Acad. Petropol. experiments on the impulse of a stream or vein of water from an orifice or tube: These are of great value. The Abbé Boffut has published others of the same kind in his Hydrodynamique. Mr Robins has published, in his New principles of Gunnery, many valuable experiments on the impulse and resistance of air. The Chev. de Borda, in the Mem. Acad. Paris, 1763 and 1767, has given experiments on the resistance of air and also of water, which are very interesting. The most complete collection of experiments on the resistance of water are those made at the public expense by a committee of the academy of sciences, consisting of the marquis de Condorcet, Mr d'Alembert, Abbé Boffut, and others. The Chev. de Buat, in his Hydrodraulique, has published some most curious and valuable experiments, where many important circumstances are taken notice of, which had never been attended to before, and which give a view of the subject totally different from what is usually taken of it. Don George d'Ullon, in his Examine Maritime, has also given some important experiments, similar to those adduced by Bougeur in his Manœuvre des vaisseaux, but leading to very different conclusions. All these should be consulted by such as would acquire a practical knowledge of this subject. We must content ourselves with giving their most general and steady results. Such as,

1. It is very consonant to experiment that the resistances are proportional to the squares of the velocities. When the velocities of water do not exceed a few feet per second, no sensible deviation is observed. In very small velocities the resistances are sensibly greater than in this proportion, and this excess is plainly owing to the viscidity or imperfect fluidity of water.

Sir Isaac Newton
Newton has shown that the resistance arising from this cause is constant, or the same in every velocity; and when he has taken off a certain part of the total resistance, he found the remainder was very exactly proportional to the square of the velocity. His experiments to this purpose were made with balls a very little heavier than water, so as to descend very slowly; and they were made with his usual care and accuracy, and may be depended on.

In the experiments made with bodies floating on the surface of water, there is an additional resistance arising from the inertia of the water. The water heaped up a little on the anterior surface of the floating body, and is depressed behind it. Hence arises a hydrostatical pressure, acting in concert with the true resistance. A similar thing is observed in the resistance of air, which is condensated before the body and rarefied behind it, and thus an additional resistance is produced by the unbalanced elasticity of the air; and also because the air, which is actually displaced, is denser than common air. These circumstances cause the resistances to increase faster than the squares of the velocities: but, even independent of this, there is an additional resistance arising from the tendency to rarefaction behind a very swift body; because the pressure of the surrounding fluid can only make the fluid fill the space left with a determined velocity.

We have had occasion to speak of this circumstance more particularly under GUNNERY and PNEUMATICS, when considering very rapid motions. Mr. Robins had remarked that the velocity at which the observed resistance of the air began to increase so prodigiously, was that of about 1100 or 1200 feet per second, and that this was the velocity with which air would rush into a void. He concluded, that when the velocity was greater than this, the ball was exposed to the additional resistance arising from the unbalanced elastic pressure of the air, and that this constant quantity behaved to be added to the resistance arising from the air's inertia in all greater velocities. This is very reasonable: But he imagined that in smaller velocities there was no such unbalanced pressure. But this cannot be the case: for although in smaller velocities the air will fill fill up the space behind the body, it will not fill it up with air of the same density. This would be to suppose the motion of the air into the deserted place be instantaneous. There must therefore be a rarefaction behind the body, and a pressure backward arising from unbalanced elasticity, independent of the condensation on the anterior part. The condensation and rarefaction are caused by the same thing, viz. the limited elasticity of the air. Were this infinitely great, the smallest condensation before the body would be instantly diffused over the whole air, and so would the rarefaction, so that no pressure of unbalanced elasticity would be observed; but the elasticity is such as to propagate the condensation with the velocity of found only, i.e. the velocity of 1142 feet per second. Therefore this additional resistance does not commence precisely at this velocity, but is sensible in all smaller velocities, as is very justly observed by Euler. But we are not yet able to ascertain the law of its increase, although it is a problem which seems susceptible of a tolerably accurate solution.
Resistance, a void. He never saw the wake perfectly transparent (and therefore completely filled with water) when the velocity exceeded 9 or 10 feet per second. While this broken water is ob served, there can be no doubt that there is a void and an additional resistance. But even when the space left by the body, or the space behind a still body exposed to a stream, is completely filled, it may not be filled sufficiently fast, and there may be (and certainly is, as we shall see afterwards) a quantity of water behind the body, which is moving more slowly away from the rear, and therefore hangs in some shape by the body, and is dragged by it, increasing the resistance. The quantity of this void will depend partly on the velocity of the body or stream, and partly on the rapidity with which the surrounding water comes in behind. This last must depend on the pressure of the surrounding water. It would appear, that when this adjoining pre ssure is greatest, as much happen when the depth is great, the augmentation of resistance now spoken of would be less. Accordingly this appears in Newton's experiments, where the balls were less retarded as they were deeper under water. The simple experiments are so simple in their nature, and were made with such care, and by a person so able to detect and appreciate every circumstance, that they deserve great credit, and the conclusions rightly drawn from them deserve to be considered as physical laws. We think that the present deduction is unexceptionable: for in the motion of balls, which hardly defended, their preponderancy being hardly sensible, the effect of depth must have borne a very great proportion to the whole resistance, and must have greatly influenced their motions; yet they were observed to fall as if the resistance had no way depended on the depth.

The same thing appears in Borda's experiments, where a sphere which was deeply immersed in the water was less resisted than one that moved with the same velocity near the surface; and this was very constant and regular in a course of experiments. D'UHoa, however, affirms the contrary: He says that the resistance of a board, which was a foot broad, immersed one foot in a stream moving two feet per second, was 15½ lbs. and the resistance to the fame board, when immersed 2 feet in a stream moving 1¾ feet per second (in which case the surface was 2 feet), was 26½ pounds (A).

We are very sorry that we cannot give a proper account of this theory of resistance by Don George Juan D'UHoa, an author of great mathematical reputation, and the inspector of the marine academies in Spain. We have not been able to procure either the original or the French translation, and judge of it only by an extract by Mr Prony in his Architecture Hydraulique, § 868. &c. The theory is enveloped (according to Mr Prony's enlom) in the most complicated expressions, so that the physical principles are kept almost out of sight. When accommodated to the simplest possible case, it is nearly as follows.

Let $\rho$ be an elementary orifice or portion of the surface of the side of a vessel filled with a heavy fluid, and let $b$ be its depth under the horizontal surface of the fluid. Let $\rho$ be the density of the fluid, and $q$ the accelerative power of gravity, $=32$ feet velocity acquired in a second.

If a stream or eddy $u$ is drawn across the orifice $\beta$, the pressure $P$ is equal to $\frac{1}{2} \rho \beta (u^2 - v^2)$.

Now let this little surface $\beta$ be supposed to move with the velocity $v$. The fluid would meet it with the velocity $u + v$, or $u - v$, according as it moved in the opposite or in the same direction with the efflux. In the equation $p = \frac{1}{2} \rho \beta (u^2 - v^2)$, we have the pressure on $\beta = p = \frac{\rho \beta (u^2 - v^2)}{2}$.

This pressure is a weight, that is, a mass of matter $m$ actuated by gravity $g$, or $p = \frac{\rho \beta (u^2 - v^2)}{2} = \frac{mg}{g}$.

This elementary surface being immersed in a stagnant fluid, and moved with the velocity $v$, will sustain on one side a pressure $\rho \beta (\sqrt{u^2 - v^2})^2$ and on the other side a pressure $\rho \beta (\sqrt{v^2 - u^2})^2$; and the sensible resistance will be the difference of these two pressures, which is $\rho \beta 4 \sqrt{h u^2}$ or $\rho \beta 4 \sqrt{h v^2}$ that is, $\rho \beta \sqrt{h v}$, because $\sqrt{2} = 8$; a quantity which is in the subduplicate ratio of the depth under the surface, and the simple ratio of the velocity of the resplendent surface jointly.

There is nothing in experimental philosophy more certain than that the resistances are very nearly in the duplicate ratio of the velocities; and we cannot conceive by what experiments the ingenious author has supported this conclusion.

But there is, besides, what appears to us to be an indelible defect in this investigation. The equation $p = \frac{1}{2} \rho \beta (u^2 - v^2)$ shows us that the resistance should exhibit the retardation arising from inertia alone, and should distinguish it from that arising from other causes: and moreover, while it affirms an ultimate sensible resistance proportional (ceteris paribus) to the simple velocity, it affirms as a first principle that the pressure $p$ is as $u^2 - v^2$. It also gives a false measure of the rational pressures: for there (in the case of bodies immersed in our waters at least) are made up of the pressure of the incumbent water, which is measured by $h$, and the pressure of the atmosphere, a constant quantity.

Whatever reason can be given for setting out with the principle that the pressure on the little surface $\beta$, moving with the velocity $u$, is equal to $\frac{1}{2} \rho \beta (u^2 - v^2)$, makes it indispensably necessary to take for the velocity $u$.

---

(A) There is something very unaccountable in these experiments. The resistances are much greater than any other author has observed.
not, that with which water would issue from a hole whose depth under the surface is $h_1$ but the velocity with which it would issue from a hole whose depth is $h + 33$ feet. Because the pressure of the atmosphere is equal to that of a column of water 33 feet high: for this is the acknowledged velocity with which it would rush in to the void left by the body. If therefore this velocity (which does not exist) has any share in the effort, we must have for the fluxion of pressure not $\frac{4\sqrt{h}}{\sqrt{2}}$ but $\frac{4\sqrt{h} + 33\sqrt{v}}{\sqrt{2}}$. This would not only give pressure or resistances many times exceeding those that have been observed in our experiments, but would also totally change the proportions which this theory determines. It was at any rate improper to embarrass an investigation, already very intricate, with the pressure of gravity, and with two motions of efflux, which do not exist, and are necessary for making the pressures in the ratio of $u + \sqrt{v}$ and $u - \sqrt{v}$.

Mr Prony has been at no pains to inform his readers of his reasons for adopting this theory of resistance, so contrary to all received opinions, and to the most distinct experiments. Those of the French academy, made under greater pressures, gave a much smaller resistance; and the very experiments adduced in support of this theory are extremely deficient, wanting fully 3d of what the theory requires. The resistances by experiment were 15$\frac{1}{2}$ and 26$\frac{1}{2}$, and the theory required 20$\frac{1}{2}$ and 39.

The equation, however, deduced from the theory is greatly deficient in the expression of the pressures caused by the accumulation and depression, rating the heights of them as $\frac{v^3}{2\rho}$. They can never be so high, because the heaped up water flows off at the sides, and it also comes in behind by the sides; so that the pressure is much less than half the weight of a column whose height is $\frac{v^3}{2\rho}$; both because the accumulation and depression are less at the sides than in the middle, and because, when the body is wholly immered, the accumulation is greatly diminished. Indeed in this case the final equation does not include their effects, though as real in this case as when part of the body is above water.

Upon the whole, we are somewhat surprised that an author of D'Uillot's eminence should have adopted a theory so unnecessarily and so improperly embarrassed with foreign circumstances; and that Mr Prony should have inferred it with the explanation by which he was to abide, in a work defined for practical use.

This point, or the effect of deep immersion, is still much contended; and it is a received opinion, by many not accustomed to mathematical researches, that the resistance is greater in greater depths. This is assumed as an important principle by Mr Gordon, author of A theory of Naval Architecture; but on very vague and flight grounds; and the author seems unacquainted with the manner of reasoning on such subjects. It shall be considered afterwards.

With these corrections, it may be asserted that theory and experiment agree very well in this respect, and that the resistances may be ascertained to be in the duplicate ratio of the velocity.

We have been more minute on this subject, because it is the leading proposition in the theory of the action of fluids. Newton's demonstration of it takes no notice of the manner in which the various particles of the fluid are put into motion, or the motion which each in particular acquires. He only shows, that if there be nothing concerned in the communication but pure inertia, the sum total of the motions of the particles, estimated in the direction of the body's motion, or that of the stream, will be in the duplicate ratio of the velocity. It was therefore of importance to show that this part of the theory was just. To do this, we had to consider the effect of every circumstance which could be combined with the inertia of the fluid. All these had been foreseen by that great man, and are most briefly, though perpendicularly, mentioned in the last scholium to prop. 36. B. II.

2. It appears from a comparison of all the experiments, that the impulses and resistances are very nearly in the proportion of the surfaces. They appear, however, to increase somewhat faster than the surfaces. The Chevalier Borda found that the resistance, with the same velocity, to a surface of

\[
\begin{array}{c|c|c}
9 & 16 & 9 \\
16 & 36 & 17.535 \\
36 & 81 & 42.775 \\
81 & 104.735 & \end{array}
\]

instead of

\[
\begin{array}{c|c|c}
9 & 16 & 9 \\
16 & 36 & 104.735 \\
36 & 81 & 104.735 \\
81 & 104.735 & \end{array}
\]

The deviation in these experiments from the theory increases with the surface, and is probably much greater in the extensive surfaces of the falls of mills and windmills, and the hulls of ships.

3. The resistances do by no means vary in the duplicate ratio of the lines of the angles of incidence.

As this is the most interesting circumstance, having a chief influence on all the particular modifications of the resistance of fluids, and as on this depends the whole theory of the construction and working of ships, and the action of water on our most important machines, and seems most immediately connected with the mechanism of fluids, it merits a very particular consideration. We cannot do a greater service than by rendering more generally known the excellent experiments of the French academy.

Fifteen boxes or vessels were constructed, which were two feet wide, and two feet deep, and four feet long. One of them was a parallelopiped of these dimensions; the others had prows of a wedge-form, the angle ACB (fig. 7.) varying by 12° degrees from 120° to 180°; so that the angle of incidence increased by 5° from one to another. These boxes were dragged across a very large basin of smooth water (in which they were immered two feet) by means of a line passing over a wheel connected with a cylinder, from the which the actuating weight was suspended. The motion became perfectly uniform after a very little way; and the time of passing over 96 French feet with this uniform motion was very carefully noted. The resistance was measured by the weight employed, after deducting a certain quantity (properly estimated) for friction, and for the accumulation of the water against the anterior surface. The results of the many experiments are given in the following table; where column 1st contains the angle of the prow, column 2d contains the resistance as given by the preceding theory, column 3d contains the resistance exhibited in the experiments, and column 4th contains the deviation of the experiment from the theory.
The resistance of a square foot, French measure, moving with the velocity of 2,56 feet per second, was very nearly 7,625 pounds French.

Reducing these to English measures, we have the surface = 1,1363 feet, the velocity of the motion equal to 2,7263 feet per second, and the resistance equal to 8,234 pounds avoirdupois. The weight of a column nearly equal to the whole weight of the vessel at rest may be considered as somewhat extraordinary, and having for its height the fall necessary for communicating this velocity, is 8,266 pounds avoirdupois.

The resistances to other velocities were accurately proportional to the squares of the velocities.

There is great diversity in the value which different authors have deduced for the absolute resistance of water from their experiments. The value now given is that of the experiments made by other philosophers on bodies totally immersed or surrounded by the fluid; and sufficiently shows, that there must be some fallacy in the principles or reasoning by which this result of the theory is supposed to be deduced. We shall have occasion to return to this again.

But we see that the effects of the obliquity of incidence deviate enormously from the theory, and that this deviation increases rapidly as the acute angle of the prow increases. In the prow of 60° the deviation is nearly equal to the whole resistance pointed out by the theory, and in the prow of 12° it is nearly 40 times greater than the theoretical resistance.

The resistance of the prow of 90° should be one half the resistance of the bafe. We have not such a prow; but the medium between the resistance of the prow of 96° and 84° is 5790, instead of 500.

These experiments are very conformable to those of other philosophers on plane surfaces. Mr. Robins found the resistance of the air to a pyramid of 45°, with its apex foremost, was to that of its base as 1000 to 1411, instead of one to two. Chevalier Borda found the resistance of a cube, moving in water in the direction of the side, was to the oblique resistance, when it was moved in the direction of the diagonal, in the proportion of 5.4 to 7; whereas it should have been that of √2 to 1, or of 10 to 7 nearly. He also found, that a wedge whose angle was 90°, moving in air, gave for the proportion of the resistances of the edge and base 7251:10000, instead of 5000:10000. Also when the angle of the wedge was 60°, the resistances of the edge and base were 52 and 100, instead of 25 and 100.

In short, in all the cases of oblique plane surfaces, the resistances were greater than those which are assigned by the theory. The theoretical law agrees tolerably with observation in large angles of incidence, that is, in incidences not differing very far from the perpendicular; but in more acute prows the resistances are more nearly proportional to the sines of incidence than to their squares.

The academicians deduced from these experiments an expression of the general value of the resistance, which corresponds tolerably well with observation. Thus let x be the complement of the half angle of the prow, and let P be the direct pressure or resistance, with an incidence of 90°, and p the effective oblique pressure:

\[
p = P \times \cos(x) \times \left(1 + \frac{1}{2} x^2 \sin^2(x) \right)
\]

This gives for a prow of 12° an error in defect about 1/100, and in larger angles it is much nearer the truth; and this is exact enough for any practice.
The theory gives some resistances too small and others too great.

As the very nature of naval architecture seems to require curvilinear forms, in order to give the necessary strength, it seemed of importance to examine more particularly the deviations of the resistances of such prows from the resistances assigned by the theory. The academicians therefore made vessels with prows of a cylindrical shape; one of these was a half cylinder, and the other was one-third of a cylinder, both having the same breadth, viz. two feet, the same depth, also two feet, and the same length, four feet. The resistance of the half cylinder was to the resistance of the perpendicular prow in the proportion of 13 to 25, instead of being as 13 to 15½. The Chevalier Borda found nearly the same ratio of the resistances of the half cylinder, and its diametrical plane when moved in air. He also compared the resistances of two prisms or wedges, of the same breadth and height. The first had its sides plane, inclined to the base in angles of 60°; the second had its sides portions of cylinders, of which the planes were the chords, that is, their sections were arches of circles of 60°. Their resistances were as 123 to 100, instead of being as 175 to 220, as required by the theory; and as the resistance of the first was greater in proportion to that of the base than the theory allows, the resistance of the half was less.

Mr. Robins found the resistance of a sphere moving in air to be to the resistance of its great circle as 1 to 2.7; whereas theory requires them to be as 1 to 2. He found, at the same time, that the absolute resistance was greater than the weight of a cylinder of air of the same diameter, and having the height necessary for acquiring the velocity. It was greater in the proportion of 49 to 40 nearly.

Borda found the resistance of the sphere moving in water to be to that of its great circle as 1000 to 2508, and it was one-ninth greater than the weight of the column of water whose height was that necessary for producing the velocity. He also found the resistance of air to the sphere was to its resistance to its great circle as 1 to 2.45.

It appears, on the whole, that the theory gives the resistance of oblique plane surfaces too small, and that of curved surfaces too great; and that it is quite unfit for ascertaining the modifications of resistance arising from the figure of the body. The most prominent part of the prow changes the action of the fluid on the succeeding parts, rendering it totally different from what it would be were that part detached from the rest, and exposed to the stream with the same obliquity. It is of no consequence, therefore, to deduce any formula from the valuable experiments of the French academy. The experiments themselves are of great importance, because they give us the impulses on plane surfaces with every obliquity. They therefore put it in our power resistances to select the most proper obliquity in a thousand important cases. By appealing to them, we can tell what is the proper angle of the sail for producing the greatest impulse in the direction of the ship's course; or the sail inclination of the fall of a wind-mill, or the sail inclination of the float of a water-wheel, &c. &c. These deductions will be made in their proper places in the course of this work. We see also, that the deviation from the simple theory is not very considerable till the obliquity is great; and that, in the inclinations which other circumstances would induce us to give to the floats of water-wheels, the falls of wind-mills, and the like, the results of the theory are sufficiently agreeable to experiment, for rendering this theory of very great use in the construction of machines. Its great defect is in the impuluses on curved surfaces, which puts a stop to our improvement of the science of naval architecture, and the working of ships.

But it is not enough to detect the faults of this theory; we should try to amend it, or to substitute another. It is a pity that so much ingenuity should have been thrown away in the application of a theory so defective. Mathematicians were seduced, as has been already observed, by the opportunity which it gave for exercising their calculi, which was a new thing at the time of publishing this theory. Newton saw clearly the defects of it, and makes no use of any part of it in his subsequent discussions, and plainly has used it merely as an introduction, in order to give some general notions in a subject quite new, and to give a demonstration of one leading truth, viz. the proportionality of the impuluses to the squares of the velocities. While he professes the highest respect for the talents and labours of the great mathematicians who have followed Newton in this most difficult research, we cannot help being sorry that some of the greatest of them continued to attach themselves to a theory which he neglected, merely because it afforded an opportunity of displaying their profound knowledge of the new calculus, of which they were willing to ascribe the discovery to Leibnitz. It has been in a great measure owing to this that we have been so late in discovering our ignorance of the subject. Newton had himself pointed out all the defects of this theory; and he set himself to work to discover another which should be more conformable to the nature of things, retaining only such deductions from the other as his great sagacity assured him would stand the test of experiment. Even in this he seems to have been mistaken by his followers. He retained the proportionality of the resistance to the square of the velocity. This they have endeavoured to demonstrate in a manner conformable to Newton's determination of the oblique impulses of fluids; and under the cover of the agreement of this proposition with experiment, they introduced into mechanics a mode of expression, and even of conception, which is inconsistent with all accurate notions on these subjects. Newton's proposition was, that the motions communicated to the fluid, and therefore the motions lost by the body, in equal times, were as the squares of the velocities; and he conceived these as proper measures of the resistances. It is a matter of experience, that the forces or preflures by which a body must be supported in opposition to the impulses of fluids, are in this very proportion. In determining the
The comparison of pure pressure with pure percussion

In consequence of the many objections to

The pressures are observed; but the impulses or pressures, whose accumulation produces these pressures, are only supposed. The rare fluid, introduced by Newton for the purpose already mentioned, either does not exist in nature, or does not act in the manner we have said, the particles making their impulses, and then escaping through among the rest without affecting their motion. We cannot indeed say what may be the proportion between the diameter and the distance of the particles. The first may be incomparably smaller than the second, even in mercury, the densest fluid which we are familiarly acquainted with; but although they do not touch each other, they act nearly as if they did, in consequence of their mutual attractions and repulsions. We have seen air a thousand times rarer in some experiments than in others, and therefore the distance of the particles at least ten times greater than their diameters; and yet, in this rare state, it propagates all pressures or impulses made on any part of it to a great distance, almost in an instant. It cannot be, therefore, that fluids act on bodies by impulse. It is very possible to conceive a fluid advancing with a flat surface against the flat surface of a solid. The very first and superficial particles may make an impulse; and if they were annihilated, the next might do the same: and if the velocity were double, these impulses would be double, and would be withstood by a double force, and not a quadruple, as is observed; and this very circumstance, that a quadruple force is necessary, should have made us conclude that it was not to impulse that this force was opposed. The first particles having made their stroke, and not being annihilated, must escape literally. In their escaping, they effectually prevent every farther impulse because they come in the way of those filaments which would have struck the body. The whole process seems to be somewhat as follows:

When the flat surface of the fluid has come into contact with the plane surface \( AD \) (fig. 6.), perpendicular to \( \text{Vol. XVI.} \)}
section 106

The action of fluids on solid bodies may and must be opposed by preffures, and may be compared with and measured by the preffure of gravity. We are not comparing forces of different kinds, perconnections with preffures, the action but preffures with each other. Let us see whether of fluids, this view of the subject will afford us any method of comparison or adequate measurement.

When a filament of fluid, that is, a row of corpuscles, are turned out of their course EF (fig. 6.), and forced to take another course IH, force is required to produce this change of direction. The filament is prevented from proceeding by other filaments which lie between it and the body, and which deflect it in the same manner as if it were contained in a bended tube, and it will press on the concave filament next to it as it would press on the concave side of the tube. Suppose such a bended tube ABE (fig. 9.), and that a ball A is projected along it with any velocity, and moves in it without friction; it is demonstrated, in elementary mechanics, that the ball will move with undiminished velocity, and will press on every point, such as B, of the concave side of the tube, in a direction BF perpendicular to the plane CBD, which touches the tube in the point B. This preffure on the adjoining filament, on the concave side of its path, must be withstood by that filament which deflects it; and it must be propagated across that filament to the next, and thus augment the preffure upon the next filament already preffed by the deflection of that intermediate filament; and there is a preffure towards the middle filament, and towards the body, arising from the deflections of all the outer filaments; and their accumulated sum must be considered as immediately exerted on the middle filaments and on the body, because a perfect fluid transmits every preffure undiminished.

The preffure BF is equivalent to the two BH, BG one of which is perpendicular, and the other parallel, to the direction of the original motion. By the first, (taken in any point of the curvilinear motion of any filament), the two halves of the stream are preffed together; and in the case of fig. 6. and 7. exactly balance each other. But the preffures, such as BG, must be ultimately withstood by the surface ACB; and it is by these accumulated preffures that the solid body is urged down the stream; and it is these accumulated preffures which we observe and measure in our experiments. We shall anticipate a little, and say that it is most easily demonstrated, that when a ball A (fig. 9.) moves with undiminished velocity in a tube so incurvated that its axis at E is at right angles to its axis at A, the accumulated action of the preffures, such as BG, taken for every point of the path, is precisely equal to the force which would produce or extinguish the original motion.

This being the case, it follows most obviously, that if the two motions of the filaments are such as we have described and represented by fig. 6. the whole preffure in the direction of the stream, that is, the whole preffure which can be observed on the surface, is equal to the weight of a body column of fluid having the surface for its base, and twice elastic or the fall productive of the velocity for its height, precisely as Newton deduced it from other considerations; and it seems to make no odds whether the fluid be elastic or unelastic, if the deflections and velocities are the same. Now it is a fact, that no difference in the rect
Resistance can be observed in the actions of air and water; and this had always appeared a great defect in Newton's theory; but it was only a defect of the theory attributed to him. But it is also true, that the observed action is but one-half of what is just now deduced from this improved view of the subject. Whence arises this difference? The reason is this: We have given a very erroneous account of the motions of the filaments. A filament EF does not move as represented in fig. 6, with two rectangular inflations at I and at H, and a path IH between them parallel to CB. The process of nature is more like what is represented in fig. 10. It is observed, that at the anterior part of the body AB, there remains a quantity of fluid ADB, almost, if not altogether, flagrant, of a singular shape, having two curved concave sides A D, B b D, along which the middle filaments glide. This fluid is very slowly changed. - The late Sir Charles Knowles, an officer of the British navy, equally eminent for his scientific professional knowledge and for his military talents, made many beautiful experiments for ascertaining the paths of the filaments of water. At a distance up the stream, he allowed small jets of a coloured fluid upon folds. The pressure in the duplicate them. There was, however, a considerable intricacy and eddy in this motion. Some (seemingly superficial) water was continually, but slowly, flowing outward from the line DC, while other water was seen within and below it, coming inwards and going backwards.

The coloured lateral filaments were most confluent in their form, while the body was the same, the whole stream was quadruplicated. Any change which this produced seemed confined to the superficial filaments. As the filaments were deflected, they were also constricted, that is, the curved parts of the filaments were nearer each other than the parallel straight filaments up the stream; and this conformation was more considerable as the prow was more obtuse and the deflection greater.

The inner filaments were ultimately more deflected than those without them; that is, if a line be drawn touching the curve EFH in the point H of contrary flexure, where the concavity begins to be on the side next the body, the angle HKC, contained between the axis and this tangent line, is so much the greater as the filament is nearer the axis.

When the body exposed to the stream was a box of upright sides, flat bottom, and angular prow, like a wedge, having its edge also upright, the filaments were not all deflected laterally, as theory would make us expect; but the filaments near the bottom were also deflected downwards as well as laterally, and glided along at some distance under the bottom, forming lines of resistance.

The breadth of the stream that was deflected was much greater than that of the body; and the sensible deflection began at a considerable distance up the stream, especially in the outer filaments.

Lastly, the form of the curves was greatly influenced by the proportion between the width of the trough and that of the body. The curve was always left when the trough was very wide in proportion to the body.

Great varieties were also observed in the motion or velocity of the filaments. In general, the filaments increased in velocity outwards from the body to a certain small distance, which was nearly the same in all cases, and then diminished all the way outward. This was observed by inequalities in the colour of the filaments, by which one could be observed to outstrip another. The retardation of these next the body seemed to proceed from friction; and it was imagined that without this the velocity there would always have been greater.

The experiments give us considerable information respecting the mechanism of these motions, and the accelerations and retentions of fluids, as well as the definizione and resolution of the velocities comes here again into view. We found, that although the velocities were very different, the curves were precisely the same. Now the observed pressures arise from the transverse forces by which each particle of a filament is retained in its curvilinear path; and we know that the force by which a body is retained in any curve is directly as the square of the velocity, and inversely as the radius of curvature. The curvature, therefore, remaining the same, the transverse forces, and consequently the pressure on the body, must be as the square of the velocity: and, on the other hand, we can see pretty clearly (indeed it is rigorously demonstrated by D'Alembert), that whatever be the velocities, the curves shall be the same. For it is known in hydraulics, that it requires a fourfold or ninefold pressure to produce a double or triple velocity. And as all pressures are propagated through a perfect fluid without diminution, this fourfold pressure, while it produces a double velocity, produces also fourfold transverse pressures, which will retain the particles, moving twice as fast, in the same curvilinear paths. And thus we see that the impulses, as they are called, and resistances of fluids, have a certain relation to the weight of a column of fluid, whose height is the height necessary for producing the velocity. How it happens that a plane surface, immersed in an extended fluid, sustains just half the pressure which it would have sustained had the motions been such as are sketched in figure 6th, is a matter of more curious and difficult investigation. But we see evidently that the pressure must be less than what is there assigned; for the flagrant water a-head of the body greatly diminishes the ultimate deflections of the filaments: And it may be demonstrated, that when the part BE of the canal, fig. 9, is inclined to the part AB in an angle less than 90°, the pressures BG along the whole canal are as the vered sine of the ultimate angle of deflection, or the vered sine of the angle which the part BE makes with the part AB. Therefore, since the deflections resemble more the sketch given in fig. 10, the accumulated sum of all these forces $BG$ of fig. 9, must be less than the similar sum corresponding to fig. 6, that is, less than the
We must return to the labours of Sir Isaac Newton. After many beautiful observations on the nature and mechanism of continued fluids, he says, that the resitance which they occasion is but one-half of that occasioned by the rare fluid which had been the subject of his former proposition; “which truth,” (says he, with his usual caution and modesty), “I shall endeavour to shew.”

He then enters into another, as novel and as difficult an investigation, viz. the laws of hydraulicis, and endeavours to ascertain the motion of fluids through orifices when urged by prefaces of any kind. He endeavour to ascertain the velocity with which a fluid escapes through a horizontal orifice in the bottom of a vessel, by the action of its weight, and the pressure which this vein of fluid will exert on a little circle which occupies part of the orifice. To obtain this, he employs a kind of approximation and trial, of which it would be extreme difficult to give an extract; but Newton, by no means to display great sagacity, but admire the efforts and sagacity of this great philosopher, who, after having discovered so many sublime truths of mechanical nature, ventured to trace out a path for the solution of a problem which no person had yet attempted to bring within the range of mathematical investigation. And his solution, though inaccurate, shines throughout with that inventive genius and that fertility of resource, which no man ever possessed in so eminent a degree.

Those who have attacked the solution of Sir Isaac Newton have not been more successful. Most of them, instead of principles, have given a great deal of calculus; and the chief merit which any of them can claim is that of having deduced some fingle proposition which happens to quadrat with some sngle case of experiment, while their general theories are either inapplicable, from difficulty, and obscurity, or are discordant with more general observation.

We must, however, except from this number Daniel Bernoulli, who was not only a great geometer, but one of the first philosophers of the age. He possessed all the talents, and was free from the faults of that celebrated family; and while he was the mathematician of Europe who penetrated farthest in the investigation of this great problem, he was the only person who felt, or at least who acknowledged, its great difficulty.

In the 2d volume of the Comment. Petropol. 1727, he proposes a formula for the resistance of fluids, deduced from confiderations quite different from those on which Newton founded his solution. But he delivers it with moderate diffidence; because he found that it gave a resistance four times greater than experiment. In the same dissertation he determines the resistance of a sphere to be one half of that of its great circle. But in his subsequent theory of Hydrodynamics (a work which must ever rank among the first productions of the age, and is equally eminent for refined and elegant mathematics, and ingenious and original thoughts in dynamics), he calls this determination in question. It is indeed founded on the same hypothetical principles which have been unskillfully detached from the rest of Newton's physics, and made the groundwork of all the subsequent theories on this subject.

In 1741 Mr Daniel Bernoulli published another dissertation on Rhes.

Resistance. 50
He treats the subject in a particular cæs; namely, to the impulse of a vein of fluid falling perpendicularly upon an infinite extended plane surface. This he demonstrates to be equal to the weight of a column of the fluid whose base is the area of the vein, and whose height is twice the fall producing the velocity. This demonstration is drawn from the true principles of mechanics and the acknowledged laws of hydraulics, and may be received as a third physical demonstration. As it is the only proposition in the whole theory that has as yet received a demonstration accessible to readers not versant in all the refinement of modern analysis; and as the principles on which it proceeds will undoubtedly lead to a solution of every problem which can be proposed, once that our mathematical knowledge shall enable us to apply them—we think it our duty to give it in this place, although we must acknowledge, that this problem is so very limited, that it will hardly bear an abstract demonstration. As it is the only proposition in the whole effort of the expelling forces. This is a conclusion as evident as any proposition in mechanics. It is thus that a gun recoils and a rocket rises in the air; and on this is founded the operation of Mr. Parent's or Dr. Barker's mill, described in all treatises of mechanics, and most learnedly treated by Euler in the Berlin Memoirs.

Now, let this stream of water be received on a circular plane MN, perpendicular to its axis, and let this circular plane be of such extent, that the vein escapes from its sides in an infinitely thin sheet, the water flowing off in a direction parallel to the plane. The vein by this means will expand into a trumpet-like shape, having curved sides, EKG, FLH. We abstract at present the action of gravity, which would cause the vein to bend downwards, and occasion a greater velocity at H than at G; and we suppose the velocity equal in every point of the circumference. It is plain, that the action of gravity be neglected after the water has flowed through the orifice EF, the velocity in every point of the circumference of the plane MN will be that of the efflux through EF.

Now, because EKG is the natural shape assumed by the vein, it is plain, that if the whole vein were covered by a tube or mouth piece, fitted to its shape, and perfectly polished, so that the water shall slide along it, without any friction (a thing which we may always suppose), the water will exert no preface whatever on this trumpet mouth-piece. Lastly, let us suppose that the plane MN is attached to the mouth-piece by some bits of wire, so as to allow the water to escape all round by the narrow chink between the mouth-piece and the plane: We have now a vessel confining the upright part ABDC, the trumpet GKEFLH, and the plane MN; and the water is escaping from every point of the circumference of the chink GHNW with the velocity v. If any part of this chink were shut up, there would be a preface on that part equivalent to the force of efflux from the opposite part. Therefore, when all is open, these efforts of efflux balance each other all round. There is not otherwise any tendency in this compound vessel to move to any side. But take away the plane MN, and there would immediately arise a preface in the direction E equal to the weight of the column 2. B. This is therefore balanced by the pressure on the circular plane MN, which is therefore equal to this weight, and the proposition is demonstrated.

A number of experiments were made by Professor Kraft at St. Petersburg, by receiving the vessel on a plane MN (fig. 11) which was fastened to the arm of a balance OPQ, having a scale R hanging on the opposite arm. The resistance or preface on the plane was measured by weights put into the scale R; and the velocity of the jet was measured by means of the distance KH, to which it spouted on a horizontal plane.
The results of these experiments were as conformable to the theory as could be wished. The resistance was always a little less than what the theory required, but greatly exceeded its half; the result of the general received theories. This defect should be expected; for the demonstration supposes the plane MN to be infinitely extended, so that the film of water which lies through the chink may be accurately parallel to the plane. This never can be completely effected. Also it was supposed, that the velocity was justly measured by the amplitude of the parabola EGK. But it is well known that the very putting the plane MN in the way of the jet, though at the distance of an inch from the orifice, will diminish the velocity of the efflux through this orifice. This is easily verified by experiment. Observe the time in which the vellum will be emptied when there is no plane in the way. Repeat the experiment with the plane in its place; and more time will be necessary. The following is a note of a course of experiments, taken as they stand, without any felection.

In order to demonstrate this proposition in such a manner as to furnish the means of investigating the whole mechanism and action of moving fluids, it is necessary to premise an elementary theorem of curvilinear motions.

If a particle of matter describes a curve line ABC, (fig. 13) by the continual action of deflecting forces, which vary in any manner, both with respect to intensity and direction, and if the action of these forces, in every point of the curve, be resolved into two directions, parallel and perpendicular to the initial direction AK; then,

The accumulated effect of the deflecting forces, estimated in a direction AD perpendicular to AK, is to the final quantity of motion as the sine of the final change of direction is to radius.

1. The accumulated effect of the deflecting forces, estimated in a direction AD perpendicular to AK, is to the final quantity of motion as the sine of the final change of direction is to radius.

Let us first suppose that the accelerating forces act by starts, at equal intervals of time, when the body is in the points A, B, C, E. And let AN be the deflecting force, which, acting at A, changes the original direction AK to AB. Produce AB till BH = AH, and complete the parallelogram BFCH. Then FB is the force which, by acting at B, changed the motion BH (the continuation of AB) to BC. In like manner make CM (in BC produced) equal to BC, and complete the parallelogram CMFG. CM is the deflecting force at C, &c. Draw BO parallel to AN, and GBK perpendicular to AK. Also draw lines through C and E perpendicular to AK, and draw through B and C lines parallel to AK. Draw also BL, BH perpendicularly, and FG, HI, IJ parallel to AK.

It is plain that BK is BO or AN estimated in the direction perpendicular to AK, and that BG is BF estimated in the same way. And since BH = AB, HI or IM is equal to BX. Also CM is equal to KG. Therefore CM is equal to AP + BG. By similar reasoning it appears that EM = E + f/ = C + CM = BC + B + AP.

Therefore if CE be taken for the measure of the final velocity or quantity of motion, EM will be the accumulated effect of the deflecting forces estimated in the direction AD perpendicular to AK. But EM is to CE as the sine of mCE is to radius; and the angle Resilience of CE is the angle contained between the initial and final directions, because CM is parallel to AK. Now let the intervals of time diminish continually and the frequency of the impulses increase. The deflect becomes eventually continuous, and the motion curvilinear, and the proposition is demonstrated.

We see that the initial velocity and its subsequent changes do not affect the conclusion, which depends entirely on the final quantity of motion.

2. The accumulated effect of the accelerating forces, when estimated in the direction AK of the original motion, or in the opposite direction, is equal to the difference between the initial quantity of motion and the product of the final quantity of motion by the cosine of the change of direction.

For C m = C l = m l = BM f q
BM = BL = ML = AK = FG
AK = AO = OK = AO = PN.

Therefore PN + FG + Q (the accumulated impulse in the direction OA) = AO CM = AO CE x cosine of ECM.

Cor. 1. The same action, in the direction opposite to that of the original motion, is necessary for causing a body to move at right angles to its former direction as for stopping its motion. For in this case, the cosine of the change of direction is the same as the product of the original quantity of motion by the verified sine of the change of direction.

The application of these theorems, particularly the second, to our present purpose is very obvious. All the filaments of the jet were originally moving in the direction of its axis, and they are finally moving along the refilling plane, or perpendicular to their former motion. Therefore their transverse forces in the direction of the axis are (in cumula) equal to the force which would stop the motion. For the aggregate of the simultaneous forces of every particle in the whole filament is the same with that of the successive forces of one particle, as it arrives at different points of its curvilinear path. All the transverse forces, estimated in a direction perpendicular to the axis of the vein, precisely balance and sustain each other; and the only forces which can produce a sensible effect are those in a direction parallel to the axis. By these all the inner filaments are pressed towards the plane MN, and must be withstood by it. It is highly probable, may certain, that there is a quantity of stagnant water in the middle of the vein which sustains the pressures of the moving filaments without it, and transmits it to the solid plane. But this does not alter the cafe. And, fortunately, it is of no consequence what changes happen in the velocities of the particles while each is describing its own curve. And it is from this circumstance, peculiar to this particular case of perpendicular impulse, that we are able to draw the conclusion. It is by no means difficult to demonstrate that the velocity of the external surface of this jet is constant, and indeed of every jet which is not acted on by external forces after it has quitted the orifice: but this discussion is quite unnecessary here. It is however extremely difficult to ascertain, even in this most simple case,
It is therefore without proper authority that the absolute impulse of a vein of fluid on a plane which receives it wholly, is ascribed to be proportional to the finite of incidence. If indeed we suppose the velocity in G and H are equal to that at A, then \( b = \delta = a \), and the whole impulse is \( 2a \sqrt{1 - \epsilon^2} \), as is commonly supposed. But this cannot be. Both the velocity and quantity at H are less than thoese at G. Nay, frequently there is no efflux on the side H when the obliquity is very great. We may conclude in general, that the oblique impulse will always bear to the direct impulse a greater proportion than that of the finite of incidence to radius. If the whole water escapes at G, and none goes off laterally, the pressure will be \( 2a + 2a - 2bcX \sqrt{1 - \epsilon^2} \). The experiments of the Abbe Boffut shew in the plainest manner that the pressure of a vein, striking obliquely on a plane which receives it wholly, diminishes farther than in the ratio of the square of the finite of incidence; whereas, when the oblique plane is wholly immersed in the stream, the impulse is much greater than in this proportion, and in great obliquities is nearly as the finite.

Nor will this proposition determine the impulse of a fluid on a plane wholly immersed in it, even when the impulse is perpendicular to the plane. The circumstance is now wanting on which we can establish a calculation, namely, the angle of final deflection. Could this be ascertained for each filament, and the velocity of the filament, the principles are completely adequate to an accurate solution of the problem. In the experiments which we mentioned to have been made under the inspection of Sir Charles Knowles, a cylinder of six inches diameter was exposed to the action of a stream moving precisely one foot per second; and when certain deductions were made for the water which was held adhering to the posterior base (as will be noticed afterwards), the impulse was found equal to 34 ounces avoidopter. There were 36 coloured filaments distributed on the fire, in such situations as to give the most useful indications of their curvature. It was found necessary to have some which passed under the body and some above it; for the form of these filaments, at the same distance from the axis of the cylinder, was considerably different; and those filaments which were situated in planes neither horizontal nor vertical took a double curvature.

In short, the curves were all traced with great exactness; and the deflecting forces were computed for each, and reduced to the direction of the axis; and they were summed up in such a manner as to give the impulse of the whole stream. The deflections were marked as far ahead of the cylinder as they could be assuredly observed. By this method the impulse was computed to be 2.4 ounces, differing from observation \( \frac{p}{h} \) of an ounce, or about \( \frac{p}{h} \) of the whole; a difference which may most reasonably be ascribed to the adherence of the water, which must be most sensible in such small velocities. These experiments may therefore be considered as giving all the information that can be derived of the fulness of the principles. This indeed hardly admits of a doubt; but, alas! it gives us but small assistance; for all this is empirical, in as far as it leaves us in every case the task of observing the form of the curves and the velocities in their different points. To derive service from this most judicious method of Daniel Bernoulli, we must discover some method of determining...
In the meantime, we may probably owing to adhesion, and the measure of the real resistance is probably precisely this weight. The velocity of a sprouting fluid was found, in fact, to be that acquired by falling from the surface of the fluid; and it was by looking at this, as at a pole star, that Newton, Bernoulli, and others, have with great sagacity and ingenuity discovered much of the laws of hydraulics, by searching for principles which would give this result. We may hope for similar success.

In the mean time, we may receive this as a physical truth, that the perpendicular impulse or resistance of a plane surface, wholly immersed in the fluid, is equal to the weight of the column having the surface for its base, and the fall producing the velocity for its height.

This is the medium result of all experiments made in these precise circumstances. And it is confirmed by a set of experiments of a kind wholly different, and which seem to point it out more certainly as an immediate consequence of the common rules of hydrostatics, of the fluid, and plane surface, wholly immersed in the fluid. The observation of Sir Isaac Newton has pointed out the only method of arriving at a solution of the problem; and that if we could discover what motions are not necessary for the quiescent passage of the water, and could thus determine the form and magnitude of the flagrant water which adheres to the body, we should much more easily ascertain the real motions which occasion the observed resistance. We are here disposed to refer to the economy of nature, the improper use of which causes the greatest harm.

Mr. Maupertuis published a great discovery of his principle of small action, where he showed that in all the mutual actions of bodies, the quantity of action was a minimum; and he applied this to the solution of many difficult problems with great success, imagining that he was really reasoning from a contingent law of nature, selected by its infinite power Author. viz., that in all occasions there is the smallest possible extension of natural powers. Mr. D'Alembert, however, shown (vid. Encyclopédie Françoise, Action) that this was but a whim, and that the minimum observed by Maupertuis is merely a minimum of calculus, peculiar to a formula which happens to express a combination of mathematical quantities which frequently occur in our way of considering the phenomena of nature, but which is no natural measure of action.

But the chevalier D'Arcy has shown, that in the trains of natural operations which terminate in the production of motion in a particular direction, the intermediate communications of motion are such that the smallest possible quantity of motion is produced. We seem obliged to conclude, that this law will be observed in the present instance; and it seems a problem not above our reach to determine the motions which result from it.

We would recommend the problem to the eminent mathematicians in some simple cases, such as the proposition already demonstrated by Daniel Bernoulli, or the perpendicular impulse on a cylinder included in a circular canal; and if they succeed in this, great things may be expected. We think that experience gives great encouragement. We see that the resistance to a plane surface is a very small matter greater than the weight of a column of the fluid having the fall productive of

A method recommended for obtaining a general theory.

Analysis: magis sedendum is a frequent assertion with him. Though...
fuch motion will produce an inequality of pressure, which will determine the succeeding motions. He therefore endeavoured to reduce all to the discovery of those disturbing pressures, and thus to the laws of hydrostatics. He had long before this hit on a very refined and ingenious view of the action of bodies on each other, which had enabled him to solve many of the most difficult problems concerning the motions of bodies, such as the centre of oscillation, of spontaneous conversion, the precession of the equinoxes, &c. &c. with great facility and elegance. He saw that the same principle would apply to the action of fluid bodies. The principle is this.

"In whatever manner any number of bodies are sup-posed to act on each other, and by these actions come to change their present motions, if we conceive that the motions which each body would have in the following instant (if it become free), is resolved into two other motions; one of which is the motion which it really takes in the following instant; the other will be such, that if each body had no other motion but this second, the whole bodies would have remained in equilibrio." We here observe, that "the motion which each body would have in the following instant, if it became free," is a continuation of the motion which it has in the first instant. If may therefore perhaps be better expressed thus:

If the motions of bodies, by any action on each other, be considered in two consecutive instants, and if we conceive the motion which it has in the first instant as compounded of two others, one of which is the motion which it actually takes in the following instant, the other is such, that if each body had only those second motions, the whole system would have remained in equilibrio.

The proposition itself is evident. For if these second motions be not such as that an equilibrium of the whole system would result from them, the other component motions would not be those which the bodies really have after the change; for they would necessarily be altered by these unbalanced motions. See D'Alembert Eflai de Dynamique.

Affixed by this incontestable principle, Mr d'Alembert demonstrates, in a manner equally new and simple, those propositions which Newton had so cautiously deduced from his hypothetical fluid, showing that they were not limited to this hypothesis, viz, that the motions produced by similar bodies, similarly projected in them, would be similar; that whatever were the pressures, the curves described by the particles would be the same; and that the resistances would be proportional to the squares of the velocities. He then comes to consider the fluid as having its motions contrained by the form of the canal or by solid obstacles interposed.

We shall here give a summary account of his fundamental proposition.

It is evident, that if the body ADCE (fig. 16:.) did not form an obstruction to the motion of the water, the particles would describe parallel lines TF, OK, PS, &c. But while yet at a distance from the body in F, K, S, they gradually change their directions, and describe the curves FM, K m, S n, so much more incurvated as they are nearer to the body. At a certain distance ZY this curvature will be inelutable, and the fluid included in the space ZYHQ will move uniformly as if the solid body were not there. The motions on the other side of the axis AC will be the same; and we need only attend...
No body changes either its direction or velocity otherwise than by inensible degrees: therefore the particle which is moving in the axis will not reach the vertex A of the body, where it behaved to deflect instantaneously at right angles. It will therefore begin to deflect at some point F ahead of the body, and will describe a curve FM, touching the axis in F, and the body in M; and then, gliding along the body, will quit it at some point L, describing a tangent curve, which will join the axis again (touching it) in R; and thus there will be a quantity of flagrant water FAM before or ahead of the body, and another LCR behind or after it.

Let \( a \) be the velocity of a particle of the fluid in any instant, and \( a' \) its velocity in the next instant. The velocity \( a \) may be considered as compounded of \( a' \) and \( a'' \). If the particles tended to move with the velocities \( a'' \) only, the whole fluid would be in equilibrio (general principle), and the pressure of the fluid would be the same as if all were flagrant, and each particle were urged by a force \( \frac{a''}{t} \) expressing an indefinitely small moment of time. \( \text{(N. B. } a'' \text{ is the improper expression of} \frac{a''}{t} \text{.)} \)

The accelerating force, which, by acting during the moment \( t \), would generate the velocity \( a'' \); and \( a'' \) is supposed an indeterminate quantity, different perhaps for each particle. Now let \( a \) be supposed constant, or \( a = a' \). In this case \( a'' = 0 \). That is to say, no pressure whatever will be exerted on the solid body unless there happen changes in the velocities or directions of the particles.

Let \( a \) and \( a' \) then be the motions of the particles in two consecutive instants. They would be in equilibrio if urged only by the forces \( a'' \). Therefore if \( \gamma \) be the point where the particles which describe the curve FM begin to change their velocity, the pressure in D would be equal to the pressure which the fluid contained in the canal \( \gamma \) FMD would exert, if each particle were solicited by its force \( \frac{a''}{t} \). The question is therefore reduced to the finding the curvature in the canal \( \gamma \) FMD, and the accelerating forces \( \frac{a''}{t} \) in its different parts.

It appears, in the first place, that no pressure is exerted by any of the particles along the curve FM; for suppose that the particle \( a \) (fig. 17) describes the indeterminately small straight line \( ab \) in the first instant, and \( bc \) in the second instant; produce \( ab \) till \( bd = ab \), and joining \( dc \), the motion \( ab \) or \( bd \) may be considered as composed of \( bc \), which the particle really takes in the next instant, and a motion \( dc \) which should be destroyed. Draw \( bd \) parallel to \( dc \), and \( ie \) perpendicular to \( bc \). It is plain that the particle \( b \) solicited by the forces \( b' \) (equivalent to \( dc \)) should be in equilibrio. This being established, \( be \) must be \( = 0 \), that is, there will be no accelerating or retarding force at \( b \); for if there be, draw \( bm \) (fig. 18) perpendicular to \( bF \), and the parallel \( m \) infinitely near it. The part \( bm \) of the fluid contained in the canal \( bmq \) would sustain some pressure from \( b \) towards \( n \), or from \( n \) towards \( b \). Therefore since the fluid in this flagrant canal should be in equilibrio, there must also be some action, at least in one of the parts \( bm \), \( m \), \( bq \) or \( n \), to counterbalance the action on the part \( bn \). But the fluid is flagrant in the space FAM (in consequence of the law of continuity). Therefore there is no force which can act on \( b \), \( m \), \( q \) or \( n \); and the pressure in the canal in the direction \( bn \) or \( n \) is nothing, or the force \( be = 0 \), and the force \( ve \) is perpendicular to the canal; and there is therefore no pressure in the canal FM, except what proceeds from the parts \( \gamma \) F, or from the force \( el \); which last being perpendicular to the canal, there can be no force exerted on the point M, but what is propagated from the part \( \gamma \) F.

The velocity therefore in the canal FM is constant if finite, or indefinitely small if variable: for, in the first case, the force \( be \) would be absolutely nothing; and in the second case, it would be an infinite small of the second order, and may be considered as nothing in comparison with the velocity, which is of the first order. We shall see by and by that the last is the real state of the case. Therefore the fluid, before it begins to change its direction in F, begins to change its velocity in some point \( \gamma \) ahead of the body, and by the time that it reaches F its velocity is as it was annihilated.

Cor. 1. Therefore the pressure in any point D arises both from the retardations in the part \( \gamma \) F, and from the particles which are in the canal MD: as these last move along the surface of the body, the force \( a'' \), destroyed in every particle, is compounded of two others, one in the direction of the surface, and the other perpendicular to it; call these \( p \) and \( p' \). The point D is pressed perpendicularly to the surface MD; 1st, by all the forces \( p \) in the curve MD; 2d, by the force \( p' \) acting on the single point D. This may be neglected in comparison of the indeterminate number of the others: therefore taking in the arch MD, an infinitely small portion \( Nm = \xi \), the pressure on \( D \), perpendicular to the surface of the body, will be \( = \int p \xi \); and this fluent must be taken as to be \( = 0 \) in the point M.

Cor. 2. Therefore, to find the pressure on D, we must find the force \( p \) on any point N. Let \( u \) be the velocity of the particle \( N \), in the direction \( Nm \) in any instant, and \( u' \) its velocity in the following instant; we must have \( p = \frac{au'}{t} \). Therefore the whole question is reduced to finding the velocity \( u \) in every point \( N \), in the direction \( Nm \).

And this is the aim of a series of propositions which follow, in which the author displays the most accurate equation and precise conception of the subject, and great address in solving and elegance in his mathematical analysis. He at length presents the problem, but brings out an equation which expresses the pressure on the body in the most general and unexceptionable manner. We cannot give an abstract, because the train of reasoning is already concilié in the extreme; nor can we even exhibit the final equation; for it is conceived in the most refined and abstruse forms of indeterminate functions, in order to embrace every possible circumstance. But we can assure our readers, that it truly expresses the solution of the problem. But, alas! it is of
So imperfect is our mathematical knowledge, that even Mr. d'Alembert has not been able to exemplify the application of the equation to the simplest case which can be proposed, such as the direct impulse on a plane surface wholly immersed in the fluid. All that he is enabled to do, is to apply it (by some modifications and substitutions which take it out of its state of extreme generality) to the direct impulse of a vein of fluid on a plane which defeds it wholly, and thus to show its conformity to the solution given by Daniel Bernouilli, and to observation and experience. He shows, that this impulse (independent of the deficiency arising from the plane's not being of infinite extent) is somewhat less than the weight of a column whose base is the section of the vein, and whose height is twice the full necessary for communicating the velocity. This great philosopher and geometer concludes by saying, that he does not believe that any method can be found for solving this problem that is more direct and simple; and imagines, that if the deductions from it shall be found not to agree with experiment, we must give up all hopes of determining the refilliance of fluids by theory and analytical calculus. He says analytical calculus is for all the physical principles on which the calculus proceeds are rigorously demonstrated, and will not admit of a doubt. There is only one hypothesis introduced in his investigation, and this is not a physical hypothesis, but a hypothesis of calculation. It is, that the quantities which determine the ratios of the second fluxions of the velocities, estimated in the directions parallel and perpendicular to the axis AC (fig. 16.) are functions of the abscissa AP, and ordinate PM of the curve. Any person, in the least acquainted with mathematical analysis, will see, that without this supposition no analysis or calculus whatever can be instituted. But let us see what is the physical meaning of this hypothesis. It is simply this, that the motion of the particle M depends on its situation only. It appears impossible to form any other opinion; and if we could form such an opinion, it is as clear as day-light that the case is desperate, and that we must renounce all hopes.

We are sorry to bring our labours to this conclusion; but we are of opinion, that the only thing that remains is, for mathematicians to attach themselves with firmness and vigour to some simple cases; and, without aiming at generality, to apply Mr. d'Alembert's or Bernouilli's mode of procedure to the particular circumstances of the case. It is not improbable but that, in the solutions which may be obtained of these particular cases, circumstances may occur which are of a more general nature. These will be so many laws of hydrostatics to be added to our present very scanty store; and these may have points of resemblance, which will give birth to laws of still greater generality. And we repeat our expression of hopes of some success, by endeavouring to determine, in some simple cases, the minimum probable of motion. The attempts of the Jelini commentators on the Principia to ascertain this on the Newtonian hypothesis do them honour, and have really given us great assistance in the particular case which came through their hands.

And we should multiply experiments on the resistance of bodies. Those of the French academy are undoubtedly of inestimable value, and will always be applied more than proper for a general theory, and which therefore limit the conclusions which we wish to draw from them. The bodies were floating on the surface. This greatly modifies the defections of the filaments of water, causing fome to deject laterally, which would otherwise have remained in one vertical plane; and this circumstance also necessarily produced what the academicians called the rexon, or accumulation on the anterior part of the body, and depression behind it. This produced an additional resistance, which was measured with great difficulty and uncertainty. The effect of adhesion must also have been very confiderable, and very different in the different cases; and it is of difficult calculation. It cannot perhaps be totally removed in any experiment, and it is necessary to consider it as making part of the resistance in the most important practical cases, viz. the motion of ships. Here we see that its effect is very great. Every seaman knows that the speed, even of a copper-fleached ship, is greatly increased by greasing her bottom. The difference is too remarkable to admit of a doubt: nor should we be surprized at this, when we attend to the diminution of the motion of water in long pipes. A smooth pipe four and an half inches diameter, and 500 yards long, yields but one-fifth of the quantity which it ought to do independent of friction. But adhesion does a great deal which cannot be compared with friction. We see that water flowing thro' a hole in a thin plate will be increased in quantity fully one-third, by adding a little tube whose length is about twice the diameter of the hole. The adhesion therefore will greatly modify the action of the filaments both on the solid body and on each other, and will change both the forms of the curves and the velocities in different points; and this is a sort of objection to the only hypothesis introduced by d'Alembert. Yet it is only a sort of objection; for the effect of this adhesion, too, must undoubtedly depend on the situation of the particle.

The form of these experiments of the academy is ill-suited to the examination of the resistance of bodies, wholly immersed in the fluid. The form of experiment adopted by Robins for the resistance of bodies, and afterwards by the Chevalier Borda for water, is preferable. Plate ccxxvii.

65 The experiments of Robins and Borda follow the general

straight lines and with an accelerated motion, and at last darted into the orifice with great rapidity. He had observed a thing similar to this in a horizontal canal, in which he had set up a small board like a dam or bar, over which the water flowed. He had thrown a gooseberry into the water, in order to measure the velocity at the bottom, the gooseberry being a small matter heavier than water. It approached to the dam uniformly till about three inches from it. Here it almost stood still, but it continued to advance till almost in contact. It then rose from the bottom along the side of the dam with an accelerated motion, and quickly escaped over the top.

Hence he concluded, that the water which covers the anterior part of the body exposed to the stream is not perfectly stagnant, and that the filaments recede from the axis in curves, which converge to the surface of the body as different hyperbolæ converging to the same asymptote, and that they move with a velocity continually increasing till they escape round the sides of the body.

He had established (by a pretty reasonable theory, confirmed by experiment) a proposition concerning the pressure which water in motion exerts on the surface along which it glides, viz. that the pressure is equal to that with which it would exert if at rest minus the weight of the column of water whose height would produce the velocity of the paffing stream. Consequently the pressure which the stream exerts on the surface perpendicularly exposed to it will depend on the velocity with which it glides along it, and will diminish from the centre to the circumference. This, says he, may be the reason why the impulse on a plane wholly immersed is but one half of that on a plane which deflects the whole stream.

And of the instrument he contrived for examining his theory.

He contrived a very ingenious instrument for examining this theory. A square brass plate ABGF (fig. 20.) was pierced with a great number of holes, and fixed in the front of a shallow box represented edgewise in fig. 21. The back of this box was pierced with a hole c, in which was inserted the tube of glass CDE, bent square at D. This instrument was exposed to a stream of water, which beat on the brass plate. The water having filled the box through the holes, flowed at an equal height in the glass tube when the surounding water was stagnant; but when it was in motion, it always flowed in the tube above the level of the smooth water without, and this indicated the pressure occasioned by the action of the stream.

When the instrument was not wholly immersed, there was always a considerable accumulation against the front of the box, and a depression behind it. The water before it was by no means stagnant; indeed it should not be, as Mr Bunt observes; for it consists of the water which was escaping on all sides, and therefore upwards from the axis of the stream, which meets the plate perpendicularly in c considerably under the surface. It escapes upwards; and if the body were sufficiently immersed, it would escape in this direction almost as easily as laterally. But in the present circumstances, it heaps up, till the elevation occasions it to fall off sidewise as fast as it is renewed. When the instrument was immersed more than its half-millimeter under the surface, the water filled rofe above the level, and there was a great depression immediately behind this elevation. In consequence of this difficulty of escaping upwards, the water flows off laterally; and if the horizontal dimensions of the surface is great, this lateral efflux becomes more difficult, and acquires a greater accumulation. From this it happens, that the resistance of broad surfaces equally immersed is greater than in the proportion of the breadth. A plane of two feet wide and one foot deep, when it is not completely immersed, will be more refitted than a plane two feet deep and one foot wide; for there will be an accumulation against both; and even if these were equal in height, the additional surface will be greatest in the wide body; and the elevation will be greater, because the lateral escape is more difficult.

The circumstances chiefly to be attended to are these.

The pressure on the centre was much greater than towards the border, and, in general, the height of the water in the tube DE was more than 3 of the height necessary for producing the velocity when only the central hole was open. When various holes were opened at different distances from the centre, the height of the water in DH continually diminished as the hole was nearer the border. At a certain distance from the border the water at E was level with the surrounding water, so that no pressure was exerted on that hole. But the most unexpected and remarkable circumstance was, that, in great velocities, the holes at the very border, and even to a small distance from it, not only sustained no pressure, but even gave out water; for the water in the tube was lower than the surrounding water. Mr Bunt calls this a non-preffion. In a case in which the velocity of the stream was three feet, and the pressure on the central hole caused the water in the vertical tube to find 33 lines or 3 of an inch above the level of the surrounding smooth water, the action on a hole at the lower corner of the square caused it to find 12 lines lower than the surrounding water. Now the velocity of the stream in this experiment was 56 inches per second. This requires 214 lines for its productive fall; whereas the pressure on the central hole was 33. This approaches to the pressure on a surface which defeats it wholly. The intermediate holes gave every variation of pression, and the diminution was more rapid as the holes were nearer the edge; but the law of diminution could not be observed.

This is quite a new and most unexpected circumstance. Not insconsequence in the action of fluids on solid bodies, and consistent with the principles of hydrostatics or hydraulics. In as far as Mr Bunt, or hydraulic man, a proposition concerning the pressure of moving fluids, it is true, it is very reasonable to say, that when the lateral velocity with which the fluid tends to escape exceeds the velocity of percussion, the height necessary for producing this velocity must exceed that which would produce the other, and a non-pressure must be observed. And if we consider the forms of the lateral filaments near the edge of the body, we see that the concavity of the curve is turned towards the body, and that the centrifugal forces tend to diminish their pressure on the body. If the middle alone were struck with a considerable velocity, the water might even rebound, as is frequently observed. This actual rebounding is here prevented by the surrounding water, which is moving with the same velocity; but
the pressire may be almost annihilated by the tendency
to rebound of the inner filaments.

Part (and perhaps a coniderable part) of this apparent non-pressure is undoubtedly produced by the tenacity of the water, which sticks off with it the water lying in the hole. But, at any rate, this is an important fact, and gives great value to these experiments. It gives a key to many curious phenomena in the relaftance of fluids; and the theory of Mr. Buat deferves a very serious consideration. It is all contained in the two following propositions.

1. "If, by any caufe whatever, a column of fluid, whether making part of an indefinite fluid, or contained in solid canals, comes to move with a given velocity, the pressure which it exerted laterally before its motion, either on the adjoining fluid or on the sides of the canal, is diminished by the weight of a column having the height necessary for communicating the velocity of the motion.

2. "The pressure on the centre of a plane surface perpendicular to the stream and wholly immersed in it, is \( \frac{1}{3} \) of the weight of a column having the height necessary for communicating the velocity. For \( \text{the ratio of horizontal and vertical pressure} \)."

He attempted to ascertain the medium pressure on the whole surface, by opening 625 holes dispersed all over it. With the same velocity of current, he found the height in the tube to be 29 lines, or \( 7\frac{3}{4} \) more than the height necessary for producing the velocity. But he justly concluded this to be too great a measure, because the holes were \( \frac{1}{3} \) of an inch from the edge: had there been holes at the very edge, they would have obtahned a non-pressure, which would have diminished the height in the tube very considerably. He exposed to the same stream a conical funnel, which raised the water to 34 lines. But this could not be considered as a measure of the pressure on a plane solid surface; for the central water was undoubtedly scooped out, as it were, and the filaments much more deflected than what would have been by a plane surface. Perhaps something of this happened even in every small hole in the former experiments. And this suggests some doubt as to the accuracy of the measurement of the pressure and of the velocity of a current by Mr. Pitot's tube. It fully renders some corrections absolutely necessary. It is a fact, that when exposed to a vein of fluid coming through a short passage, the water in the tube stands on a level with that in the reservoir. Now we know that the velocity of this stream does not exceed what would be produced by a fall equal to \( \frac{4}{25} \) of the head of water in the reservoir. Mr. Buat made many valuable observations and improvements on this most useful instrument, which will be taken notice of in the articles Rivers and Water Works.

Mr. Buat, by a ferupulous attention to all the circumstances, concludes, that the medium of pressure on the whole surface is equal to \( \frac{255}{215} \) of the weight of a column, having the surface for its base, and the productive fall for its height. But we think that there is an uncertainty in this conclusion; because the height of the water in the vertical tube was undoubtedly augmented by an hydraulical pressure arising from the accumulation of water above the body which was exposed to the stream.

Since the pressures are as the squares of the velocities, or as the heights \( b \) which produce the velocities, \( \frac{255}{215} \) of the weight of the column, we may express this pressure by the symbol \( \frac{255}{215} \) or \( \frac{1}{186} \) or \( m \), the value of \( m \) being 1,866. This exceeds considerably the result of the experiments of the French academy. In these it does not appear that \( m \) sensibly exceeds unity. Note, that in these experiments the body was moved through still water; here it is exposed to a stream. These are generally supposed to be equivalent, on the authority of the third law of motion, which makes every action depend on the relative motions. We shall by and by see some causes of difference.

The writers on this subject seem to think their task completed when they have considered the action of the fluid on the anterior part of the body, on that part of it which is before the broadest section, and have paid little or no attention to the hinder part. Yet those who are most interested in the subject, the naval architects, seem convinced that it is of no less importance to attend to the form of the hinder part of a ship. And the universal practice of all nations has been to make the hinder part more acute than the fore part. This has undoubtedly been deduced from experience; for it is in direct opposition to any notions which a perfon would naturally form on this subject. Mr. Buat therefore thought it very necessary to examine the action of the water on the hinder part of a body by the same method. And, previous to this examination, in order to acquire some scientific notions of the subject, he made the following very curious and instructive experiment.

Two little conical pipes \( A \) and \( B \) were filled with a prismatic vessel. They were an inch long, and their diameters at the inner and outer ends were five and four lines. \( A \) was 57 lines under the surface, and \( B \) was 73. A glass syphon was made of the shape represented in the figure, and its internal diameter was 14 lines. It was placed with its mouth in the axis, and even with the base of the conical pipe. The pipes being full, the vesiel was filled with water, and it was made to stand on a level in the two legs of the syphon, the upper part being full of air. When this syphon was applied to the pipe \( A \), and the water running freely, it rose 32 lines in the short leg, and sunk as much in the other. When it was applied to the pipe \( B \), the water rose 41 lines in the one leg of the syphon, and sunk as much in the other.

He reasons in this manner from the experiment. The water comprehended between the end of the syphon and the sides of the conical tube being the narrow part of the orifice, the water filled with the velocity corresponding to the height of the water in the vesiel above the orifice, diminished for the contraction. Therefore the cylinder of water immediately before the mouth of the syphon filled with the same velocity, the tube would be emptied through a height equal to this head of water. If, on the contrary, this cylinder of water, immediately before mouth of the syphon, were stagnant, the water in it would exert its full pressure on the mouth of the syphon, and the water in the syphon would be level with the water in the vesiel. Between these extremes we must find the real state of the cafe, and we must measure the force of non-pressure by the rise or the water in the syphon.

We see that in both experiments it bears an accurate pro-

---

[Image 0x0 to 611x810]
proportion to the depth under the surface. For 57: 73 = 32: 41 very nearly. He therefore estimates the non-preasure to be \( \frac{3}{5} \) of the height of the water above the orifice.

We are disposed to think that the ingenious author has not reasoned accurately from the experiment. In the first place, the force indicated by the experiment, whatever be its origin, is certainly double of what he supposes it must be measured by the sum of the rise of the water in one leg, and its depression in the other, the weight of the air in the bend of the syphon being neglected. It is precisely analogous to the force acting on the water oscilliating in a syphon, which is acknowledged to be the sum of the elevation and depression. The force indicated by the experiment therefore is \( \frac{11}{5} \) of the height of the water above the orifice. The force exhibited in this experiment bears a still greater proportion to the producive height; for it is certain that the water did not issue with the velocity acquired by the fall from the surface, and probably did not exceed \( \frac{1}{2} \) of it. The effect of contraction must have been considerable and uncertain. The velocity ought to have been measured both by the amplitude of the jet and by the quantity of water discharged. In the next place, we apprehend that much of the effect is produced by the tenacity of the water, which drag along with it the water which would have slowly issued from the syphon, and the other end not dipped into the water of the vessel. We know, that if the horizontal part of the syphon had been continued far enough, and if no retardation were occasioned by friction, the column of water in the upright leg would have accelerated like any heavy body; and when the last of it had arrived at the bottom of that leg, the whole in the horizontal part would be moving with the velocity acquired by falling from the surface. The water of the vessel which issues through the surrounding ring very quickly acquires a much greater velocity than what the water descending in the syphon would acquire in the same time, and it drags this last water along with it both by tenacity and friction, and it drag's it out till its action is opposed by want of equilibrium produced in the syphon, by the depression in the one leg and the elevation in the other. We imagine that little can be concluded from the experiment with respect to the real non-preasure.

Nay, if the sides of the syphon be supposed infinitely thin, so that there would be no curvature of the filament of the surrounding water at the mouth of the syphon, we do not very distinctly see any source of non-preasure: For we are not altogether satisfied with the proof which Mr. Buat offers for this measure of the preasure of a stream of fluid gliding along a surface, and obstructed by friction or any other cause. We imagine that the passing water in the present experiment would be a little retarded by accelerating continually the water descending in the syphon, and renewed a-top, supposing the upper end open; because this water would not of itself acquire more than half this velocity. It however drags it out, till it not only refills with a force equal to the weight of the original column the vertical column of so many feet of water, but somewhat exceeds it by \( \frac{1}{2} \). This is able to do, because the whole preasure by which the water issues from an orifice has been shown (by Daniel Bernoulli) to be equal to twice this weight. We therefore consider this beautiful experiment as chiefly valuable, by giving us a measure of the tenacity of the water; and we will that it were repeated in a variety of depths, in order to discover what relation the force exerted bears to the depth. It would seem that the tenacity, being a certain determinate thing, the proportion of 100 to 112 would not be constant; and that the observed ratio would be made up of two parts, one of them constant, and the other proportional to the depth under the surface.

But still this experiment is intimately connected with the matter in hand; and this apparent non-preasure on the hinder part of a body exposed to a stream, from whatever cause it proceeds, does operate in the action of water on this hinder part, and must be taken into the account.

We must therefore follow the Chevalier de Buat in his disquisitions on this subject. A prismatic body, having its prow and poop equal and parallel surfaces, and plunged horizontally into a fluid, will require a force to keep it firm in the direction of its axis precisely equal to the difference between the real preasures exerted on its prow and poop. If the fluid is at rest, this difference will be nothing, because the opposite dead pressures of the fluid will be equal; but in a stream, there is superadded to the dead pressure on the prow the active pressure arising from the deflections of the filaments of this fluid.

If the dead pressure on the poop remained in its full intensity by the perfect flagration of the water behind it, the whole sensible pressure on the body would be the active pressure only on the prow, represented by \( mb \). If, on the other hand, we could suppose that the water behind the body moved continually away from it (being renewed laterally) with the velocity of the stream, the dead pressure would be entirely removed from its poop, and the whole sensible pressure, or what must be opposed by some external force, would be \( mb + h \). Neither of these can happen; and the real state of the case must be between these extremes.

The following experiments were tried: The perforated box with its vertical tube was exposed to the stream, the brass plate being turned down the stream. The velocity was again 56 inches per second.

The central hole A alone being opened, gave a non-preasure of \( \frac{1}{13} \) line.

A hole B, \( \frac{1}{8} \) of an inch from the edge, gave \( \frac{1}{15} \) line.

A hole C, near the surface, gave \( \frac{1}{15} \) line.

A hole D, at the lower angle, gave \( \frac{1}{15} \) line.

Here it appears that there is a very considerable non-preasure, increasing from the centre to the border. This increase undoubtedly proceeds from the greater lateral velocity with which the water is gliding in from the sides. The water behind was by no means flagrant, although moving off with a much smaller velocity than that of the passing stream, and it was visibly removed from the sides, and gradually licked away at its further extremity.

Another box, having a great number of holes, all open, indicated a medium of non-preasure equal to \( \frac{1}{13} \) line.

Another of larger dimensions, but having fewer holes, indicated a non-preasure of \( \frac{1}{13} \) line.

But the most remarkable, and the most important phenomena, were the following:

The first box was fixed to the side of another box,
The apparatus, being now exposed to the stream, with the perforated plate looking down the stream,

The hole A indicated a non-pressure

- 7.2

B

- 8

C

- 6

Here was a great diminution of the non-pressure produced by the distance between the prow and the poop.

This box was then fitted in the same manner, so as to make the poop of a box three feet long. In this situation the non-presures were as follow:

Hole A

- 1.5

B

- 3.2

The non-presures were still further diminished by this increase of length.

The box was then exposed with all the holes open, in three different situations:

1st, Single, giving a non-pressure

- 13.1

2d, Making the poop of a cube

- 5.3

3d, Making the poop of a box three feet long

- 3.0

Another larger box:

1st, Single

- 12.2

2d, Poop of a cube

- 5

3d, Poop of the long box

- 3.2

These are most valuable experiments. They plainly show how important it is to consider the action on the hinder part of the body. For the whole impulse or resistance, which must be withstood or overcome by the external force, is the sum of the active pressure on the fore-part and of the non-pressure on the hinder-part; and they show that this does not depend solely on the form of the prow and poop, but also, and perhaps chiefly, on the length of the body. We see that the non-pressure on the hinder-part was prodigiously diminished (reduced to one-fourth) by making the length of the body triple the breadth. And hence it appears, that merely lengthening a ship, without making any change in the form either of her prow or her poop, will greatly diminish the resistance to her motion through the water; and this increase of length may be continued in the form of the midship frame in several timbers along the keel, by which the capacity of the ship, and her power of carrying full, will be greatly increased, and her other qualities improved, while her speed is augmented.

It is only of importance to consider a little the physical cause of this change. The motions are extremely complicated, and we must be contented if we can but perceive a few leading circumstances.

The water is turned aside by the anterior part of the body, and the velocity of the filaments is increased, and they acquire a divergent motion, by which they also push aside the surrounding water. On each side of the body, therefore, they are moving in a divergent direction, and with an increased velocity. But as they are on all sides pressed by the fluid without them, their motions gradually approach to parallelism, and their velocities to an equality with the stream. The progressive velocity, or that in the direction of the stream, is checked, at least at first. But since we observe the filaments constituted round the body, and that they are not deflected at right angles to their former direction, it is plain that the real velocity of a filament in its obsolete liquet path is augmented. We always observe, that a stone lying in the sand, and exposed to the wash of the sea, is laid bare at the bottom, and the sand is generally washed away to some distance all round. This is owing to the increased velocity of the water which comes into contact with the stone. It takes up more sand than it can keep floating, and it deposits it at a little distance all around, forming a little bank, which surrounds the stone at a small distance. When the filaments of water have passed the body, they are pressed by the ambient fluid into the place which it has quitted, and they glide round its stern, and fill up the space behind. The more divergent and the more rapid they are, when about to fall in behind, the more of the circumambient pressure must be employed to turn them into the trough behind the body, and least of it will remain to press them to the body itself. The extreme of this must obtain when the stream is obstructed by a thin plane only. But when there is some distance between the prow and the poop, the divergency of the filaments which had been turned aside by the prow, is diminished by the time that they have come abreast of the stern, and should turn in behind it. They are therefore more readily made to converge behind the body, and a more considerable part of the surrounding pressure remains unexpended, and therefore presses the water against the stern; and it is evident that this advantage must be so much the greater as the body is longer. But the advantage will soon be susceptible of no very considerable increase; for the lateral and divergent, and accelerated filaments, will soon become so nearly parallel and equally rapid with the rest of the stream, that a great increase of length will not make any considerable change in these particulars; and it must be accompanied with an increase of friction.

These are very obvious reflections. And if we attend minutely to the way in which the almost flagrant fluid behind the body is expanded and renewed, we shall see all these effects confirmed and augmented. But as we cannot say anything on this subject that is precise, or that can be made the subject of computation, it is needless to enter into a more minute discussion. The diminution of the non-pressure towards the centre must probably arise from the smaller force which is necessary to be expended in the inflection of the lateral filaments, already inflected in some degree, and having their velocity diminished. But it is a subject highly deserving the attention of the mathematicians; and we presume to invite them to the study of the motions of these lateral filaments, passing the body, and pressed into its wake by forces which are susceptible of no difficult investigation. It seems highly probable that if a prismatic box, with a square stern, were fitted with an addition precisely shaped like the water which would (abrating tenacity and friction) have been flagrant behind it, the quantity of non-pressure would be the smallest possible. The mathematician would surely discover circumstances which would furnish some maxims of contraction for the hinder part as well as for the prow. And as his speculations on this last have not been wholly fruitless, we may expect advantages from his attention to this part, so much neglected.

In the mean time, let us attend to the deductions which Mr de Buat has made from his few experiments.
When the velocity is three feet per second, requiring the productive height 21.5 lines, the heights corresponding to the non-preasure on the prop of a thin plane is 14.41 lines (taking in several circumstances of judicious correction, which we have not mentioned), that of a foot cube is 5.83, and that of a box of triple length is 3.51.

Let \( q \) express the variable ratio of the height producing the velocity, so that \( q \) may express the non-preasure in every case; we have,

For a thin plane, a cube, a box = 3 cubes,

- \( q = 0.67 \)
- \( q = 0.271 \)
- \( q = 0.153 \)

It is evident that the value of \( q \) has a dependence upon the proportion of the length, and the transverse section of the body. A series of experiments on prismatic bodies showed Mr de Buit that the deviation of the filaments was similar in a similiar body, and that this obtained even in dissimilar prisms, when the lengths were as the square roots of the transverse sections. Although therefore the experiments were not sufficiently numerous for deducing the precise law, it seemed not impossible to derive from them a very useful approximation. By a dexterous comparison he found, that if \( L \) expresses the length of the prism, \( z \) the area of the transverse section, and \( L \) expresses the common logarithm of the quantity to which it is prefixed, we shall express the non-preasure pretty accurately by the formula

\[
q = L \left( \frac{1.42}{\sqrt{z}} \right).
\]

Hence arises an important remark, that when the height corresponding to the non-preasure is greater than \( \sqrt{z} \) and the body is little immersed in the fluid, there will be a void behind it. Thus a surface of a square inch, just immersed in a current of three feet per second, will have a void behind it. A foot square will be in a similar condition when the velocity is 12 feet.

We must be careful to distinguish this non-preasure from the other causes of resistance, which are always necessarily combined with it. It is superadditive to the active preasure on the drop, to the friction preasure of the accumulation behind the body, the fluidic preasure arising from the depression behind it, the effects of friction, and the effects of tenacity. It is indeed next impossible to estimate them separately, and many of them are actually combined in the measures now given. Nothing can determine the pure non-preasures still we can ascertain the motions of the filaments.

Mr de Buit here takes occasion to controvert the universally adopted maxim, that the preasure occasioned by a litre of fluid on a fixed body is the same with that on a body moving with equal velocity in a quiescent fluid. He repeated all these experiments with the perforated box in still water. The general distinction was, that both the preasures of the non-preasure in this case was less, and that the odds was chiefly to be observed near the edges of the surface. The general factor of the preasure of the stream on the anterior surface was \( m = 1.186 \); but that on a body moving through a still fluid is only \( m = 1 \). He observed no non-preasure, even at the very edge of the bow, but even a sensible preasure. He ascertained the preasure of the prop by the means of the prop on the propeller. He also found that the resistance was proportioned in a feet ratio than the squares of the velocity, especially in small velocities.

The non-preasures increased in a greater ratio than the squares of the velocities. The ratio of the velocities to a small velocity of \( 0.5 \) inches per second increased geometrically, the value of \( q \) increased arithmetically; and we may determine \( q \) for any velocity \( v \) by this proportion

\[
L \frac{\sqrt{2}}{v^2} = o_5 : q, \quad \text{and} \quad q = \frac{2.2}{2.8}.
\]

That is, let the common logarithm of the velocity, divided by \( 2.5 \), be considered as a common number; divide this common number by \( 2.5 \), the quotient is \( q \), which must be multiplied by the productive height. This product is the preasure.

When Plout's tube was exposed to the stream, we had \( m = 1 \); but when it is carried through still water, \( m \) is \( 1.42 \). When it was turned from the stream, we had \( q = 0.157 \); but when carried through still water, \( q \) is \( 0.138 \). A remarkable experiment.

When the tube was moved latey along by the wind. And further, so that the motion was in the direction of the plane, the mouth of its mouth, the non-preasure was \( m = 1 \). This is one opinion by the marl of his chief arguments for his theory of non-preasure explicable experiments. He does not give the detail of the experiments and only infers the result in his table.

As a body exposed to a stream deflects the fluid, has its up, and increases its velocity; so a body moved through a still fluid turns it aside, causes it to swell up before it, and gives it a real motion alongside of it in the opposite direction. And as the body exposed to a stream has a quantity of fluid almost stagnant both before and behind; so a body moved through a still fluid carries it before it and drags after it a quantity of fluid, which accompanies it with nearly an equal velocity. This addition to the quantity of matter in motion must make a diminution of its velocity; and this forms a very considerable part of the observed resistance.

We cannot, however, help remarking that it would be necessary to require very distinct and strong proof indeed to overcome the common opinion, which is founded upon a well-founded and simple conceptions of motion, and on a law of nature to which we have never observed an exception. Mr de Buit's experiments, though most judiciously contrived, and executed with scrupulous care, are by no means of this kind. They were, of absolute necessity, very complicated; and many circumstances, impossible to avoid or to appreciate, rendered the observation, or at least the comparison, of the velocities, very uncertain.

We can see but two circumstances which do not admit of an easy or immediate comparison in the two states of the problem. When a body is exposed to a stream in our experiments, in order to have an impulse made on it, there is a force tending to move the body towards, or away from, the current. And besides its own tendency to move out or move closer, the body has a stream except in consequence of a sloping surface. Suppose a body floating on the stream. It will not only fail down along with the stream, but it will fall down the stream, and will therefore go slower along the canal than the stream does; for it is floating on an inclined plane; and if we examine it by the laws of hydrostatics, we shall find, that besides its own tendency to move forward, there is an added resistance, or preasure, which depresses it down this plane. It will therefore go along the canal faster than the stream. For this acceleration depends on the difference of preasure at the two ends, and will be more remarkable.

Vol. XVI.
Mr Buat's calculation of resistance.

Mr Buat found the total sensible resistance of a plate 12 inches square, and measured, not by the height of water in the tube of the perforated box, but by weights adding on the arm of a balance having its centre 15 inches under the surface of a stream moving three feet per second, to be 19,46 pounds; that of a cube of water which is supported by a piece of matter which is thus dragged into motion, and it may be employed for its measurement. Thus, let \( a \) be the length of a pendulum swinging seconds in vacuo, and \( l \) the length of a second's pendulum swinging in a fluid. Let \( p \) be the weight of the body in the fluid, and \( P + p \) will express its weight in vacuo, and \( \frac{P + p}{p} \) will be the ratio of these weights. We shall therefore have \( \frac{P + p}{p} = \frac{a}{\sqrt{l}} \).

Hence Mr Buat concludes, that the resistances in these two states are nearly in the ratio of 13 to 10. This, he thinks, will account for the difference observed in the experiments of different authors.

Mr Buat next endeavours to ascertain the quantity of water which is made to adhere in some degree to a body which is carried along through water, or which remains nearly stagnant in the midst of a stream. He takes the sum of the motions in the direction of the stream, viz., the sum of the actual motions of all those particles which have lost part of their motion, and he divides this sum by the general velocity of the stream. The quotient is equivalent to a certain quantity of water perfectly stagnant round the body. Without being able to determine this with precision, he observes, that it augments as the resistance diminishes; for in the case of a longer body, the filaments are observed to converge to a greater distance behind the body. The flagnant mass a-head of the body is more confluent; for the deflection and resistance at the prow are observed not to be affected by the length of the body. Mr Buat, by a very nice analysis of many circumstances, comes to this conclusion, that the whole quantity of fluid, which in this manner accompanies the solid body, remains the same whatever is the velocity. He might have deduced it at once, from the consideration that the curves described by the filaments are the same in all velocities.

He then relates a number of experiments made to ascertain the absolute quantity thus made to accompany the body. These were made by causing pendulums to oscillate in fluids. Newton had determined the resistances to such oscillation by the diminution of the arches of vibration. Mr Buat determines the quantity of dragged fluid by the increase of their duration; for this stagnation or dragging is in fact adding a quantity of matter to be moved, without any addition to the moving force. It was ingeniously observed by Newton, that the time of oscillation was not sensibly affected by the resistance of the fluid: a compensation, almost complete, being made by the diminution of the arC hes of vibration; and experiment confirmed this. If, therefore, a great augmentation of the time of vibration be observed, it must be ascribed to the additional quantity of matter which is thus dragged into motion, and it may be employed for its measurement. Thus, let \( a \) be the length of a pendulum swinging seconds in vacuo, and \( l \) the length of a second's pendulum swinging in a fluid. Let \( n P \) express the sum of the fluid displaced by it; \( P + p \) will express its weight in vacuo, and \( \frac{P + p}{p} \) will be the ratio of these weights. We shall therefore have \( \frac{P + p}{p} = \frac{a}{\sqrt{l}} \).

Let \( n P \) express the sum of the fluid displaced, and the fluid dragged along, \( n \) being a number greater than unity, to be determined by experiment. The mass in motion is no longer \( P + p \), but \( P + nP \), while its weight in the fluid is still \( P \). Therefore we must have \( \frac{P + nP}{P} = \frac{a}{\sqrt{l}} + n = \frac{a}{\sqrt{l}} \left( \frac{l + 1}{l} \right) \).
He made similar experiments with prisms, pyramids, and other bodies, and found a complete corroboration of his assertion, that prisms of equal lengths and sections, though dissimilar, dragged equal quantities of fluid; that similar prisms and prisms not similar, but whose length were as the square-root of their sections, dragged quantities proportional to their bulks.

He found a general value of \( n \) for prismatic bodies, which alone may be considered as a valuable truth; namely, that
\[
n = 0.705 \frac{22}{7} + 1.13.
\]

From all these circumstances, we see an intimate connection between the resistances, non-prepressures, and the fluid dragged along with the body. Indeed this is immediately deducible from the first principles; for what Mr. Prout calls the dragged fluid is in fact a certain portion of the whole change of motion produced in the direction of the body's motion.

It was found, that with respect to thin planes, spheres, and pyramidal bodies of equal bases, the resistances were inversely as the quantities of fluid dragged along.

The intelligent reader will readily observe, that these views of the Chevalier Buat are not so much discoveries of new principles as they are classifications of consequences, which may all be deduced from the general principles employed by D'Alembert and other mathematicians. But they greatly assist us in forming notions of different parts of the procedure of nature in the mutual action of fluids and solids on each other. This must be very acceptable, since it is by no means probable that we shall be able to investigate with mathematical precision. We have given an account of these last observations, that we may omit nothing of consequence that has been written on the subject; and we take this opportunity of recommending the *Hydraulique* of Buat as a most ingenious work, containing more original, ingenious, and practically useful thoughts, than all the performances we have met with. His doctrine of the principle of uniform motion of fluids in pipes and open canals, will be of immense service to all engineers, and enable them to determine with sufficient precision the most important questions in their profession; questions which at present they are hardly able to guess at. See *Rivers and Water-Works*.

The only circumstance which we have not noticed in detail, is the change of resistance produced by the void, or tendency to a void, which obtains behind the body; and we omitted a particular discussion, merely because we could find nothing sufficiently precise on the subject. Persons not accustomed to the difficulties in the phlegmonic sciences, are apt to entertain doubts or false notions connected with this circumstance, which we shall attempt to remove; and with this we shall conclude this long and unsatisfactory dissertation.

If a fluid were perfectly incompressible, and were contained in a vessel incapable of extension, it is impossible that any void could be formed behind the body; and in this case it is not very easy to see how motion could be performed in it. A sphere moved in such a medium could not advance the immeasurable distance, unless some particles of the fluid, in filling up the space left by it, moved with a velocity next to infinite. Some degree of compressibility, however small, seems necessary. If this be indestructible, it may be rigidly demonstrated, that an external force of compression will make no sensible change in the internal motions, or in the resistances. This indeed is not obvious, but is an immediate consequence of the *quaguarumque* preassure of fluids. As much as the preassure is augmented by the external compressions on one side of a body, so much it is augmented on the other side; and the same must be fluid of every particle. Nothing more is necessary for securing the same motions by the same partial and internal forces; and this is fully verified by experiment. Water remains equally fluid under any compressions. In some of Sir Isaac Newton's experiments balls of four inches diameter were made to light as to preponderate in water only three grains. These balls defended in the same manner as they would have defended in a fluid where the resistance was equal in every part; yet, when refused near the bottom of a vessel nine feet deep, the compression round them was at least 2400 times the moving force; whereas, when near the top of the vessel, it was not above 50 or 60 times.

But on a fluid sensibly compressible, or which is not confined, a void may be left behind the body. Its motion may be so swift that the surrounding pressure may not suffice for filling up the deserted space; and, in this case, a flatistical pressure will be added to the resistance. This may be the case in a vessel or pond of water having an open surface exposed to the finite or limited pressure of the atmosphere. The question now is, whether the resistance will be increased by an increase of external preassure? Supposing a sphere moving near the surface of water, and another moving equally fast at four times the depth. If the motion be so swift that a void is formed in both cases, there is no doubt but that the sphere which moves at the greatest depth is most resistent by the preassure of the water. If there is no void in either case, then, because the quadruple depth would cause the water to flow in with only a double velocity, it would seem that the resistance would be greater; and indeed the water flowing in lateral with a double velocity produces a quadruple non-precessure.

But, on the other hand, the pressure at a small depth may be insufficient for preventing a void, while that below efficiently prevents it; and this was observed in some experiments of Chevalier de Bordi. The effect, therefore, of greater immersion, or of greater compression, in an elastic fluid, does not follow a precise ratio of the pressure, but depends partly on absolute quantities. It cannot, therefore, be stated by any very simple formula what increase or diminution of resistance will result from a greater depth; and it is chiefly on this account that experiments made with models of ships and mills are not conclusive with respect to the performance of a large machine of the same proportions, without corrections, sometimes pretty intricate. We assert, however, with great confidence, that this is of all methods the most concrete, and infinitely more certain than any thing that can be deduced from the most elaborate calculation from theory. If the resistances at all depths be equal, the proportionality of the total resistance to the body is exact, and perfectly conformable to observation. It is only in great velocities where the depth has any material influence, and the influence is not near so considerable as we should, at first sight, suppose; for, in estimating the effect of immersion, which has a relation...
to the difference of pressure, we must always take in the pre"ure of the atmosphere; and thus the pre"ure at 33 feet deep is not 33 times the pre"ure at one foot deep, but only double, or twice as great. The atmospheric pre"ure is omitted only when the refilled plane is at the very surface. D’Ullioa, in his "Examine Marine," has introduced an equation ex"ressing this relation; but, except with very limited conditions, it will not lead us prodigiously. To give a general notion of its foundation, let AB (fig. 23.) be the section of a plane moving through a fluid in the direction CD, with a known velocity. The fluid will be heaped up before it above its natural level CD, because the water will not be pushed up before it like a solid body, but will be pushed aside. And it cannot acquire a lateral motion any other way than by an accumulation, which will diffuse itself in all directions by the law of undulatory motion. The water will also be left lower behind the plane, because time must elapse before the pre"ure of the water behind can make it fill the space. We may acquire some notion of the extent of both the accu"mulation and deprefion in this way. There is a certain depth CF ( = \frac{v}{2g}, where v is the velocity, and g the accelerating power of gravity) under the surface, such that water would flow through a hole at F with the velocity of the plane’s motion. Draw a horizontal line FG. The water will certainly touch the plane at G, and we may suppose that it touches it no higher up. Therefore there will be a hollow, such as CGE. The elevation HE will be regulated by considerations nearly similar. ED must be equal to the velocity of the plane, and HE must be its productive height. Thus, if the velocity of the plane be one foot per second, HE and EG will be \frac{v}{g} of an inch. This is sufficient (though not exact) for giving us a notion of the thing. We see that from this must arise a pre"ure in the direction DC, viz. the pre"ure of the whole column FG.

Something of the same kind will happen although the plane AB be wholly immersed, and this even to some depth. We see such alleviations in a swift running stream, where there are large stones at the bottom.—This occasions an excess of pre"ure in the direction opposite to the plane’s motion; and we see that there must, in every case, be a relation between the velocity and this excess of pre"ure. This D’Ullioa expresses by an equation.

It is very exceptionable, not taking properly into the account the comparative facility with which the water can heap up and diffuse itself. It must always heap up till it acquires a sufficient head of water to produce a lateral and progressive diffusion sufficient for the purpose. It is evident, that a smaller elevation will suffice when the body is more immersed, because the check or impulse given by the body below is propagated, not vertically only, but in every direction; and therefore the elevation is not confined to that part of the surface which is immediately above the moving body, but extends so much farther laterally as the force of attraction is deeper. Thus, the elevation necessary for the passage of the body is much smaller; and it is the height only of this accumulation or wave which determines the backward pre"ure on the body. D’Ullioa’s equation may happen to quadrate with two experiments at different depths, without being nearly just; for any two points may be in a curve, without exhibiting its equation. Three points will do it with some approach to precision; but four, at least, are necessary for giving any notion of its nature. D’Ullioa has only given two experiments, which we mentioned in another place.

We may here observe, that it is this circumstance which immediately produces the great resistence to the motion of a body through a fluid in a narrow canal — The fluid cannot pass the body, unless the area of the section be sufficiently extensive. A narrow canal prevents the extension sidewise. The water must therefore heap up, till the section and velocity of diffusion are sufficiently enlarged, and thus a great backward pre"ure is produced. (See the second series of Experiments by the French Academicians; see also Franklin’s Essays.) It is important, and will be considered in another place.

Thus have we attempted to give our readers some account of one of the most interesting problems in the whole of mechanical philosophy. We are sorry that so little advantage can be derived from the theories of the six mathemations of Europe, and that there is so little hope of greatly improving our scientific knowledge of this subject. What we have delivered will, however, enable our readers to peruse the writings of those who have applied the theories to practical purposes. Such, for instance, are the treatises of John Bernouilli, of Bouguer, and of Euler, on the construction and working of ships, and the occasional discussions of different authors on water-mills. In this last application the ordinary theory is not without its value, for the impulses are nearly perpendicular; in which case they do not materially deviate from the duplicate proportion of the force of incidence. But even here this theory, applied as it commonly is, miffleads us exceedingly. The impulse on one float may be accurately enough stated by \( \text{fr} \); but the authors have not been attentive to the motion of the water after it has made its impulse; and the impulse on the next float is stated as if the parallel filaments of water, which were not stopped by the preceding float, did impinge on the opposite part of the second, in the same manner, and with the same obliquity and energy, as if they were detached from the first. But this does not in the least re"semble the real process of nature.

Suppose the floats B, C, D, H (fig. 24.) of a wheel immersed in a stream whose surface moves in the direction AK, and that this surface meets the float B in E. The part BE alone is supposed to be impelled; whereas the water, checked by the float, heaps up on it to e. Then drawing the horizontal line BF, the part CF of the next float is supposed to be all that is impelled by the parallel filaments of the stream; whereas the water bends round the lower edge of the float B by the surrounding pre"ure, and rises on the float e all the way to f. In like manner, the float D, instead of receiving an impulse on the very small portion DG, is impelled all the way from D to g, not much below the surface of the stream. The floating impelled at once, therefore, greatly exceed what this theory allows of. As for the whole application of this theory, the influence of the first part gives no idea of the whole impulse is much greater; but this is a fault in the application, and not in the theory. It will not be a very difficult thing to acquire a knowledge of the motion of the water which has passed the preceding float, which, though not accurate, will yet approximate considerably to the truth; and...
Resolution then the ordinary theory will furnish maxims of construction which will be very serviceable. This will be attempted in its proper place; and we shall endeavour, in our treatment of all the practical questions, to derive useful information from all that has been delivered on the present occasion.

 Resolution of Ideas. See Logic, Part I. ch. 3.

 Resolution, in music. To resolve a discord or dissonance, fays Rousseau, is to carry it according to rule into a consonance in the subsequent chord. There is for that purpose a procedure prescribed, both for the fundamental basis of the dissonant chord, and for the part by which the dissonance is formed.

 There is no possible manner of resolving a dissonance which is not derived from an operation of cadence: it is then by the kind of cadence which we wish to form, that the motion of the fundamental basis is determined, (see Cadence). With respect to the part by which the dissonance is formed, it ought neither to continue in its place, nor to move by disjointed gradations; but to rise or descend diatonically, according to the nature of the dissonance. Theorists say, that major dissonances ought to rise, and minor to descend; which is not however without exception, since in particular chords of harmony, a seventh, although major, ought not to rise, but to descend, unless in that chord which is, very incorrectly, called the chord of the seventh redundant. It is better then to say, that the seventh and all its derivative dissonances ought to descend; and that the sixth superadded, and all its derivative dissonances, should rise. This is a rule truly general, and without any exception. It is the same rule with the rule of resolving dissonances. There are some dissonances which cannot be prepared; but there is by no means one which ought not to be resolved.

 With respect to the sensible note, improperly called a major dissonance, if it ought to ascend, this is left on account of the rule for resolving dissonances, than on account of that which prescribes a diatonic procedure, and prefers the shortest road; and in reality, there are cases, as of that of the interrupted cadence, in which this sensible note does not ascend.

 In chords by supposition, one single chord often produces two dissonances; as the seventh and ninth, the ninth and fourth, &c. Then these two dissonances ought to have been prepared, and both must likewise be resolved; it is because regard should be paid to every thing which is discordant, not only in the fundamental, but even in the continued basis.

 Resolution, in chemistry, the reduction of a mixed body into its component parts or first principles, as far as can be done by a proper analysis.

 Resolution, in medicine, the dissipation of any tumor without coming to suppuration or forming an abscess.

 RESOLVENTS, in medicine, such as are proper for dissipating tumors, without allowing them to come to suppuration.

 Resonance, Resounding, in music, &c., a sound returned by the air included in the bodies of stringed instruments, such as lutes, &c. or even in the bodies of wind instruments, as flutes, &c.

 Respiration, the act of respiring or breathing the air. See Anatomy, n° 118. Blood, n° 29. Physiol.
RESTORATION, the same with restoration. See Restoration.

In England, the return of king Charles II. in 1660, is, by way of eminence, called the Restoration; and the 29th of May is kept as an anniversary festival, in commemoration of that event, by which the regal and episcopal government was restored.

RESTORATIVE, in medicine, a remedy proper for restoring and retrieving the strength and vigour both of the body and animal spirits. All under this class, says Quincy, are rather nutritious than medicinal; and are more administered to repair the waifs of the constitution, than to alter and rectify its disorders.

RESTRICTION, among logicians, is limiting a term, so as to make it signify less than it usually does.

RESTRICTIVE, in medicine, the same with astringent. See Astringents.

RESULT, what is gathered from a conference, inquiry, meditation, or the like; or the conclusion and effect thereof.

RESURRECTION, in theology, is a rising again from the state of the dead; and is that event, the belief of which constitutes one of the principal articles in the Christian creed.

In treating of this object of our faith, it has been usual to mention, first, the resurrection of our Blessed Lord, with the character of the witnesses, and the authenticity of the gospel history by which it has been proved, and from which, as a consequence, ours is inferred. But as most of the arguments for his resurrection are contained in the gospels, and as merely to repeat them would afford, we hope, but little information to most of our readers, we mean here to take a view of the several grounds on which the belief of a future existence is supposed to be founded; to collect together some of the sentiments of authors and nations concerning the place where departed spirits reside; concerning the nature of their present state; concerning the kinds of their future destination; that we may afterwards see how far their notions differ and agree with what we consider as the doctrines of Scripture.

Of a future state, there have sometimes been found a few wandering and obscure tribes who seemed to entertain no notion at all; though it should be remarked, that some of these were likewise observed in so low a degree of savage barbarity as not to be acquainted with the use of the bow, the dart, or the fling, and as not knowing how to wield a club, or to throw a stone, as a weapon of defence.*

Wherever the human mind has been cultivated, or properly speaking, begun to be cultivated, the opinion has likewise generally prevailed that human existence is not confined to the present scene; nay, so very general has this notion been found among mankind, that many are puzzled how to account for what they suppose to be almost next to its universality.

To explain the phenomenon, some have imagined that it is a notion derived by tradition from primeval revelation. They suppose that the first parent of mankind, as a moral agent accountable for his conduct, was informed by his Maker of every thing which it was of importance for him to know; that he must have been acquainted with this doctrine of a future state in particular; and that he could hardly fail to communicate a matter so interesting to his posterity. They suppose, too, that the history of the translation of Enoch must have made a great noise in the world, and that the remembrance of it must have been long retained and widely diffused; and they find in the book of Job plain intimations of a resurrection from the dead, which, from the manner in which they are introduced, they think that very ancient patriarch must have received through this channel.

It is not thought to be any objection to these suppositions, that the Most High, when delivering his laws from the top of Mount Sinai, did not enforce them by the awful sanctions of a future state. The intelligent reader of the Scriptures knows that the sanctions of a future state belong to a different and more universal dispensation than was that of Moses; that the primeval revelation related to that dispensation; and that the Jewish law, with its temporal sanctions, was introduced only to preserve the knowledge and worship of the true God among a people too gross in their conceptions to have been properly influenced by the view of future rewards and punishments, of such a nature as eye hath not seen, nor ear heard, neither hath it entered into the heart of man to conceive. He fees at the same time, everywhere scattered through the Old Testament, plain indications of the Mosaic economy, being no more preparatory to the bringing in of a better hope; and he thinks it evident, that such Jews as understood any thing of the nature of that better hope, must have been convinced, that, however the ceremonial rites of their religion might be sufficiently guarded by temporal sanctions, the fundamental principles of all religion and virtue are supported by rewards and punishments to be dispensed in a state beyond the grave. See Prophecy and Theology.

That the progenitors of the human race must have been inspired by their Creator with the knowledge of support of their immortality, and of every thing necessary to their ever-lasting welfare, cannot, we should think, be questioned by any one who believes that the world had a beginning, and that it is under the government of good-nets and justice. The progress from sense to science is so slow, that however capable we may suppose the earliest inhabitants of this earth to have been of making philosophical discoveries, we cannot believe that the Father of mercies left his helpless creature to discover for himself his future existence. Death, when first presented to him, must have been a ghastly object; and had he been left without any hope of redemption from it, he would undoubtedly have sunk into littlest depredancy.

But a prospect of immortality is so pleasing to the human mind, that if it was communicated to the first man, it would of course be cherished by his posterity; and there is no difficulty in conceiving how it might be handed down by tradition to very remote ages, among the descent of his descendents as were not feared over the face of the earth in small and savage tribes.—In the course of its progress, it would frequently be new-modelled by the ever active imagination; and at last many absurd and fantastic circumstances would double be combined with the original truth, that death puts not an end to human existence.

But though we are firmly convinced that the first principles of useful knowledge, and among them the doctrine of a future state, were communicated to man by
by his Maker; and though this doctrine, in large and permanent societies, might certainly be conveyed more or less pure to late posterity through the channel of tradition—we are far from attributing so much to tradition as some writers are disposed to do, or thinking it the only source from which mankind could derive the belief of their existence beyond the grave. In small tribes of savages such a tradition could hardly be preferred; and yet some indistinct notions of a future state have been found among tribes who are said to have left all traditional notions even of the being of a God.

Others, therefore, are inclined to believe that, independent of any traditions, mankind might be led by certain phenomena to form some conjectures of a future state. They observe, that although a few individuals perhaps may, yet it seldom happens that the whole individuals of any nation are exempted from dreaming; they observe, too, and this observation is founded on experience, that the images of the dead are from the remaining impressions of memory frequently fummoned up in the fancy; and that it appears from all the languages of rude nations, who pay the greatest attention to their dreams, and who speak of seeing the dead in their visions, that these images (A) have always been taken by them for realities; nay, some of the learned, and the celebrated Baxter is of the number, are disposed to doubt whether these appearances be not something more than illusions of the brain: But whether they really be so or not, one thing is certain, that all nations in all countries, in the darkest ages and the rudest periods, are accustomed to dream; and whether sleeping or waking, in the fullness of the night, in the gloom of solitude, in the fondness of friendship, in the rovings of love, the delirium of fever, and the anguish of remorse, to see and converse with the shades of the departed; and Lucretius * has remarked, that even the inferior animals are not exempted from such illusions of a reflcile fancy.

For often sleeping racers pant and sweat, From the short, as if they ran their second heat; As if the barrier down with eager pace They stretch'd, as when contending for the race; And often hounds, when sleek hath clo'es their eyes, They toil, and stumble, and attempt to rise; They open often, often sniff the air, As if they pretend the footsteps of the deer; And sometimes wake'd, pursue their fancy'd prey, The fancy'd deer, that seem to run away, Till quite awake'd, the followed shapes decay. And fofter curs, that lie and sleep at home; Do often rise, and walk about the room, And bark, as if they faw some strangers come, And birds will start, and seek the woods, by night, Whene'er the fancy'd hawk appears in flight, Whene'er they fe the wing or hear him fligh.

These powers of fancy extend wide over animal creation; and it is on this general principle that necromancers and dreamers have in all ages established their trade, that the stories of goblins have at all times so very easily procured belief, and that

The village matron, round the blazing hearth, Suspends the infant audience with her tales, Breathing astonishment! Of witching rhymes And evil spirits; of the deathbed call Of him who robb'd the widow and devour'd The orphan's portion; of unquiet souIs Ris'n from the grave to eafe the heavy guilt Of deeds in life conceal'd; of shapes that walk At dead of night, and clank their chains, and wave The torch of hell around the murderer's head.

Mankind in general would willingly dispense with these troublesome visits of the dead. To prevent the return of the zumbi or the ghost, some nations of Africa use many superstitious rites; and Kolben tells us, that the frightened Hottentots leave in the hut where a person has died all the utensils and furniture, left the angry ghoSt, incensed at their absence, should haunt them in their dreams, and infest them in the night. Divines and moralists have laboured to show that these are merely imaginary terrors: but God and nature seem to have determined that they shall produce the same effects upon certain minds as if they were real; and that while there is any possibility in the heart, there is any remembrance of the past, and any conjuring power in the fancy; the ignorant, the benighted, the timid, shall often meet with the goblins of darkness, the spectres of the tomb, the apparitions that hover round the grave, and the forms of the dead in the midnight dream. See Specula.
Pythagoras believed, with the rest of his country, that annihilation was never the end, and that nothingness was never the beginning, of anything that is. His general doctrine upon this subject was shortly explained in very few words: _Omnia mutantur, nihil interit._ He afterwards learned from Egyptian priests that the soul migrates into new bodies; and being, it seems, a person of a most extraordinary and astonishing memory, he found there was some truth in the story: for after musing, he began to remember that he was Euphorbus, the son of Pantheus, that was slain by Menelaus in the Trojan war; and upon a jaunt to Pelopennesus, recollected the shield which he had worn at the time of the siege, in one of the temples of Juno at Argos. That some might question the truth of his assertion, his followers presently removed all doubts by the famous argument, the _rex dixit of Egyptian origin._

As Pythagoras taught that human souls are frequently thrust into brute shapes, and, as some imagined, by way of punishment; it occurred to Plato that all bodies, even the human, are a sort of prisons; and that, in consequence of this confinement, the soul was subjected to the rage of desire, appetite, and passion, and to all the wretched miseries of a jail. To explain this, mysteriously, he supposed that desires and appetites belong to a soul that is purely animal residing in the body. But, he was perplexed with another difficulty; for as he thought highly of the goodness of Deity, he could not imagine how the Should imprison us without a crime. He supposed, therefore, that prior to its union with the present body, the soul had existed in one of other, which it still retains; but that even in this ethereal body, it had felt something of impure desire; and happening to indulge the vicious appetites, had contracted some stains of pollution, for which it was confined in its present body as a house of correction to do penance and improve its morals.

To prove this ideal pre-existence of the soul, Plato availed himself of an opinion that was general in his time, that coincided with the doctrines of Pythagoras, and that was partly founded on a sort of reasoning and observation. He thought that matter and intelligence are coeternal (see PLATONISM); that there are various orders of souls; that those of both the man and the brute are parts or emanations (c) of the _anima mundi_, or soul of the world; that all are ultimately parts or emanations of Deity itself; and that all their faculties are more or less restricted and confined, according to those organized systems with which they are connected.

Know first, that heav'n and earth's compac'd frame,
And flowing waters, and the fiery flame,
And both the radiant lights, one common soul
Inspires, and feeds, and animates, the whole.

This...
The ancient Gnostics, who derived their tenets from this source, believed, with Pythagoras and Plato, in a great number of subordinate genii; and said, that Demiurgus, the god of matter and the soul or spirit of this world, had contrived the bodies of men and brutes; and in the former particularly, as in so many prisons, had confined a number of celestial spirits, that by exposing them to the low desires of appetite and passion, he might seduce them from their allegiance to the God of light, and render them more submissive to himself. From these prisons the Supreme Being was continually making attempts to rescue them; and in the mean time was frequently sending divine messengers to enlighten and instruct them, and to render them capable of returning to the regions of light and happiness, to which they had belonged.

The Stoics attempted to simplify this system, which appears anciently to have pervaded Egypt and the east, and which would seem to be no more than variously modified by Orpheus, Pythagoras, Plato, and others of the more northern and western nations. None of them allowed a creation out of nothing; and the shaping and moulding of matter into forms was variously explained, according as they happened to be most addicted to perfection, to morals, or to physics. Some ascribed these operations to ancient Time, Chaos, and Darkness, and explained the future changes in nature by the genealogies of these deities; some observing attraction and repulsion, or at least a sort of agreement and discordance among bodies, were inclined to ascribe them to Friendship and Hatred, or Love and Antipathy; some observing, that while one body rose another descended, made Levity and Gravity primary agents; and some taking notice that living bodies sprang from corruption, were disposed to confine the same powers on Moiure and Heat.

The physical hypotheses were what had most charms of the for the Stoics. From their system immortal beings were openly excluded; all things were regulated by physical laws or inexorable fate; and all things originated in the Tetra or the First One, which was probably suggested by the Mors of Pythagoras. This Tetra appears to have been a materia prima devoid of all the qualities of body. In their language it was an Aper or a first principle, not subject to change. When it was involved with the properties of body, it then became

{n} The general doctrine, as delivered here in these verses of Virgil, is the same with that not only of Pythagoras, but of the Stoics.

{s} Plato made the stars the native residence of inferior souls; and when these were thoroughly purified below, returned them home again; and therefore, says Virgil, alluding to his doctrine,

--Some have taught--

That bees have portions of ethereal thought,
Endued with particles of heavenly fires;
For God the whole created mass inspires:
Through heaven, and earth, and ocean's depth, he throws
His influence round, and kindles as he goes.
Hence flocks, and herds, and men, and beasts, and fowls,
With breath are quickened, and attract their souls.
Hence take the forms his preference did ordain,
And into him at length resolve again,
No room is left for death, they mount the sky,
And to their own congenial planets fly.

Dryden.
A Stoic or an Element; and then, so far as respected its qualities, especially its forms, it was subject to changes almost perpetual. The gods themselves and the souls of men were in this system only modifications of matter. Man was composed of their four elements, Fire, Air, Water, and Earth; and upon dissolution, every part returned to the element from which it had come, as the water of a vessel swimming in the sea unites with the ocean when the vessel is broken. This system, it is plain, cannot possibly admit of any separate consciousness of existence. The same may be said of the systems of Democrates and Epicurus, and all those who undertook to explain things upon the principles of the ancients. The chief merit of the physical systems appears to be this: Absurd as they were, it would seem from the whimsical and the almost childish reasoning of Lucretius, that they had a tendency to lead mankind from extravagant hypotheses to something that was similar to observation.

What Aristotle thought of the separate existence of the soul after death is not very certain. The soul he calls an 

Of the Jews.

Another opinion of very old date was that of the late ingenious Mr Hunter. According to him, the living principle refides in the blood. This opinion, which is mentioned by Mofes, was adopted by Crisias and others of the ancients. Harvey likewise embraced it. But Mr Hunter, who always wished to be thought an original, inclines to stand at the head of the opinion, and supports it by experiments similar to those of the famed Taliacitus in mending noes. Should any of our readers wish to extract the soul's immortality from such an opinion, we must refer them to the many resources of ingenuity, sophistry, and logic.

Among the Jews, the belief of a future and separate existence for a long time was deemed no essential article of their creed. Some thought that the soul was a spark in the moving of the heart; some imagined that it was the breath, and that upon the dissolution of the body it naturally vanished into soft air. The Sadducees denied the existence of either angel or spirit. Many believed the doctrine of ghosts, and were accustomed to invoke them at the grave. It is hence that we hear the prophets complaining that they were seeking from the living God unto dead men. Some imagined that there was a pre-existence of souls; and, in the case of a blind man, asked our Saviour whether the man or his parents had sinned that he was born blind? Others inclined to a revolution of soul and body, and thought that our Saviour was either Elias or one of the old prophets returned; and a great many new-modelled their opinion of the soul's immortality according to certain passages in Scripture. The inspired mother of Samuel had said, "The Lord killeth and maketh alive; he bringeth down to the grave, and bringeth up." IEsaias had exclaimed, "Thy dead shall live; together with my dead body shall they arise: Awake, and sing, ye that dwell in the dust; for thy dew is as the dew of herbs, and the earth shall call out the dead." Daniel had declared, that many of them that sleep in the dust of the earth shall awake to everlasting life, and some to shame and everlasting contempt. In the vision of the valley of dry bones, Ezekiel had seen that "at the word of the Lord" the bones came together, bone to his bone, the sinews and the flesh came upon them, and the skin covered them above, and the breath came into the bodies, and they lived and stood upon their feet. And a passage of Job led them to suppose, that at some distant and future period a particular time, which was called the last or the latter day, was appointed by heaven for the general resurrection of all those who are sleeping in their graves. "I know (says Job) my Redeemer liveth, and that he shall stand at the latter day upon the earth; and though after my skin worms destroy this body, yet in my flesh shall I see God."

Whether these passages were fairly interpreted agreeably to their true and original meaning, it is not here our business to inquire. It is sufficient for us to observe, that from them many of the Jews inferred the reality of a general resurrection. In this persuasion, Martha, speaking of her brother Lazarus, says to our Lord, "I know that he shall rise again in the resurrection at the last day." This resurrection appears to
to have been a general opinion among the Pharisees; for although it was a notion of the sect of the Sadducees that there was no resurrection, neither angel nor spirit, yet the Pharisees, we are told, confessed both. And this assertion is plainly confirmed by St Paul himself when his countrymen accused him before Felix, "I confess unto thee (says this eminent apostle), that after the way which they call hereby to worship I the God of my fathers, believing all things which are written in the law and in the prophets, and having hope toward God, which they themselves also allow, that there shall be a resurrection of the dead, both of the just and unjust."

This resurrection of the dead to judgment, though not perhaps in the same sense in which the old Pharisees conceived it, is now generally and almost universally (l) maintained by Christians (m). Yet the Christians differ considerably with respect to the nature of the human soul. Some imagine, that this spirit is naturally mortal, and that it is propagated along with the body from the loins of the parent. In support of this opinion, it has been observed that a great number of insects and plants transfer their lives to their posterity, and die soon after the act of propagation; that after this act the vital principle is in the most vigorous of plants and animals always found to be much exhausted; and that Tertullian a father of the church, in attempting some experiments of the kind, became a momentary blindnes, and felt a portion of his soul going out of him (n).

Thee imagine that immortality was only conditionally promised to man; that Adam forfeited this immortality by his disobedience; and that Christ has restored us to the hopes of it again by his sufferings and death: for as in Adam we have all died, so in Christ, they say, we shall all be made alive; and that now the thing is taken from death, and the victory over our foes from the grave.

Others have conceived the human soul as naturally immortal, and as setting death and the grave at defiance. Adam, they say, died only in a figure; and only from the consequences of this figure, which means the soul of it itself is naturally immortal, and that it depends not either for its existence or the exercise of its faculties upon the body; that the properties of matter, as figure, magnitude, and motion, can produce nothing that is like to perception, memory, and consciousness. This is true, rejoins their opponents; but besides these few properties of matter, which are only the objects of that philosophy which has lately and properly been termed mechanical, the chemical philosophy has discovered other properties of matter; has found that matter is of various kinds; that it very often does not act mechanically; that it acquires many new properties by combination; and that no man, till further experiment and observation, should venture to assert how far the soul is or is not dependent on its present organized body. The others, proceeding on their hypothesis, maintain that the soul, as being immaterial, is not divisible; and though the body of a frog may live without the head for a whole day; though the body of a tortoise may live without the head for a whole month; though a human limb may for some minutes after amputation continue to perform a vital motion, independent of a brain, a stomach, or a heart; and though the parts of a plant, a polype, or a worm, may survive their separation and become living wholes*, yet the soul, they observe, is not to be compared with pus and its surrounding external matter, which are only the effects of propagation; that after this act the vital principles of plants and animals, nor ought to be divided on reasons so slender as those of analogy. Even granting, they say, that the soul were not naturally immortal of itself; yet the justice of God, which is not remarkable for its equal distribution of rewards and punishments in the present world, is bound to make some amends in the next. And to this again their opponents answer, as to the equal distribution of justice in a future world, of that we are assured on much better

---

(l) The sect of the Quakers explain it figuratively.

(m) The late quoted author (Resurrection of the same Body, ascertained from the traditions of the Heathens, § Holy the ancient Jews, and the primitive Church) has endeavoured to show that this doctrine, in the same sense as we understand it, has been ascribed by the ancient magi, and by the present heathen gurus of Persia, the relics of the ancient magi; by some of the ancient Arabians; by some of the baniats of India; by the present inhabitants of the island of Ceylon, of Java, of Pegu, of Tranysia; by some among the Chinese; by the Ardarians in Guinea; and by the ancient Prussians. The proofs which he brings, it must be confessed, are not however always very satisfactory. It appears, even from his own account, that some of these had derived their notions from certain Christians, Mahometans, or Jews. But the reader may judge of the great accuracy of his ideas from his bringing old Pythagoras and the Stoics, and even Democritus and Epocrates, in support of the same or a similar opinion.

(n) In illo ipso voluptatis ultimae aequo quo genitale virus expellitur, nonne aliquid de anima quoque sint, ascre, atque adeo marcescimus et degiscitum cum lucis detrimento.
place it in the west (q), where the night begins and resurrection the day ends. That part of the world which, in the division of his father's dominions, fell to Pluto the infernal god, and where, according to Laconius, Satan in the holds the empire of darknes, the Friendly Islanders well, have placed to the westward of a certain island which they call Tejco; some tribes of American Indians, in a country beyond the western mountains; and Homer, somewhere to the westward of Greece at the boundaries of the ocean.

Where in a lonely land and gloomy cells
The dusky nation of Cimmeria dwells;
The fun ne'er views th' uncomfortable seats
When radiant he advances nor retreats.
Unhappy race! whom endless night invades,
Clouds the dull air, and wraps them round in shades.

Another opinion entertained by the Greeks and some other nations was, that the place of departed spirits is earth under the earth. This opinion is frequently mentioned in Homer, in Virgil, and alluded to by the Jewish prophets. As for the prophets, we know the circumstance from which they borrowed it: it was borrowed from thofe subterraneous vaults where their chiefs were buried, and which have been described by modern travelers. In the sides of these caverns there is ranged a great number of cells; and in these cells the mighty lay in a sort of flat, with their weapons of war and their swords at their head. To these kinds of Egyptian cemeteries Ezekiel alludes, when he says, "that they shall not lie with the mighty that are fallen of the uncircumcised, who are gone down to hell with their weapons of war, and they have laid their swords under their head."

And Isaiah, when thus speaking of the prince of Babylon, "Thou shalt be brought down to hell, to the sides of the pit. Hell from beneath is moved for thee, to meet thee at thy coming; it stirreth up the dead for thee, even all the chief ones of the earth; it hath raised up from their thrones all the kings of the nations. All the kings of the nations, even all of them, lie in glory, every one in his own house."

Many of the ancient fathers of the church affected in hidden only, that the dead are now in abitis receptaculis, or in receptacles hidden and concealed places.

Orpheus, Origen, and some others of the fathers, in the air, with the ancient Caledonian bard Odiain, and the learned Disdwell among the moderns, imagined that the soul, when it left the body, went into the air, and resided somewhere between the surface of the earth and the moon.

Those who believed in a transmigration called the new body at death only to enter a new body, and kept the dead departed always with the living. This creed has been found in India, in Egypt, in Mexico, and in all those countries where picture-writing has been much used. In this species of writing, the same picture is on fancied analogy transferred by metaphor to signify either

(q) An Historical View of the Controversies concerning an Intermediate State, and the Separate Existence of the Soul.

(r) Some Turkish ghosts are an exception, who use lamps or candles in their tombs, when their friends chuse to supply them with these luxuries.

(s) The west and darkness are synonymous in Homer. (r) φως  γας δ' ειδαι η τον νυκτον ζωον ουδεν. (Ody.) "O my friends! which is the west, or which is the east, the place of darkness, or that of the morning, we cannot learn."
There is a god or a man, a brute or a plant; and in those countries where it was practised, men had usually their names from animals, and were represented by their figure in writing (a). From this last stage of the process, a transmigration was easily suppos'd: and hence we hear of the gods of Egypt wandering about like so many vagrants in brute shapes, and of princes being translated into stars, because a star was their emblem in hieroglyphic, or flood for their name in figurative language. And, in like manner, we see, from the specimen of this character which is still preserved on celestial globes, how the heavens at first came to be filled with bears, scorpions, and dragons, and with a variety of other animals.

The opinions concerning the state of the dead are still more numerous than those concerning the place where they reside. Rude nations have generally thought that the future state is similar to the present; that plants, animals, and inanimate things there, have their hades; and that these contribute as much to the pleasures and conveniences of the dead as their realities do to the living. That husbands have their wives (x), lovers their mistresses, warriors their battles, hunters their sport; and that all their passions, amusements, and buffoons, are the same as formerly. For this reason, that the dead may not appear unprovided in the next world, like the ancient Gauls, some tribes of India, America, and Africa, bury with them in the same grave their wives, their arms, their favourite animals, and their necessary utensils.

The ancient Egyptians, who believed in transmigration, suppos'd that the soul was after death obliged to animate every species of bird and quadruped, of reptile and insect, and was not to return to a human form till after a period of 3500 years. Others have confined their transmigrations to particular animals, as the soul of man to the human form, and the soul of the brute to the bodies of the species to which it belonged. Some have changed the brute into man, and man into the brute, that man might suffer injuries similar to what he had inflicted; and the brute retaliate what he had suffered. Others have confined the human soul in plants and in flames; and Bell of Antermony mentions an Indian who suppos'd that his ancestors might be in fishes.

The notions of Homer were probably those of many of his time. But these notions were diametrical. When his hero Ulysses visited the hades, many of the ghosts seemed to retain the mangled and ghastly appearance which they had at death; and, what is worse, seemed to be all starving with hunger, innumerable multitudes, with loud shrieks, flocking to the stems of his slain victim as to a most sumptuous and delicious banquet.

For scarcely had the purple torrent flowed,
And all the caverns smok'd with streaming blood,
When, lo! appear'd along the deeps of the coast
Thin airy fancies of visionary ghosts;
Fair penitent youths, and soft enamour'd maidens,
And wither'd elders, pale and wrink'd shades.
Ghastly with wounds, the forms of warriors slain,
Stalk'd with majestic port, a martial train.
Theirs, and a thousand more, swarnd o'er the ground,
And all the dire assembly shriek'd around.
Ulysses saw, as ghost by ghost arose,
All wailing with unutterable woes.

Alone, apart, in discontented mood,
A gloomy shade, the fullen Ajax stood;
For ever sad, with proud disdain he pinn'd,
And the loft arms for ever fu'n his mind.
Upon Ulysses saying to Achilles,
Alive, we hail'd thee with our guardian gods;
And, dead, thou rule'st in these abodes;
The shades reply'd:
'Talk not of ruling in this dolorous gloom,
Nor think vain words (he cry'd) can ease my dooms;
Rather I choose laboriously to bear
A weight of woes, and breathe the vital air,
A toil of some poor mind that toils for bread,
Than live a scept'r'd monarch of the dead.'

In this gloomy region no one is rewarded for his virtues, nor is punished for his crimes, unless committed, like those of Sisyphus, Tantalus, and Ixion, with punishments suited to the affections and dispositions of the gods. All indeed are improved on this hint of the poet; and men have now got rational, animal, and vegetable souls, to which sometimes a fourth one is added, as properly belonging to man in general. Homer intimates, that Menelaus was to be translated to Elysium without suffering death. This Elysium is the habitation of men, and not of ghosts, and is described as being similar to the feast of the gods. Compare Odys. iv. 1. 565, and Odys. vi. 1. 43, in the Greek.

(a) A military gentleman who resided at Penobscot during the late American war, assured us that the Indians, when desirous to inscribe a written agreement, drew always the picture of the object or animal whose name they bore. But for fuller information on this subject, see Clavigero's Hist. of Mexico.

(x) The question which the Sadducees put to our Saviour about the wife of the seven brothers, is a proof that the Pharisees thought there was marriage and giving in marriage in the future state, and that it was somewhat similar to the present.

(r) Homer fends the ghost of Hercules to the hades, while Hercules himself is quaffing nectar with Hebe in the skies. One soul of the hero is therefore released with the ghosts of mortals in the regions below, while the other is enjoying all the happiness of the gods above. (See Odyssey, B. II. near the end.) Philosophers since have improved on this hint of the poet; and men have now got rational, animal, and vegetable souls, to which sometimes a fourth one is added, as properly belonging to man in general. Homer intimates, that Menealus was to be translated to Elysium without suffering death. This Elysium is the habitation of men, and not of ghosts, and is described as being similar to the feast of the gods. Compare Odys. iv. 1. 565, and Odys. vi. 1. 43, in the Greek.
When thus purified, they become fitted to receive the rewards of their past virtues, and now enter into those regions of happiness and joy.

With either vestal, and a purple sky,
The blissful seats of happy souls below,
Stars of their own, and their own gods they know;
Where patriots live, who, for their country's good,
In fighting fields were prodigal of blood.

Priests of unblemish'd lives here make abode,
And poets worthy their inspiring god,
And searching wits, of more mechanic parts,
Who grace'd their age with new-invented arts.

Those who to worthy their bounty did extend;
And those who knew that bounty to commend.

These good men are engaged in various amusements, according to the taste and genius of each. Orpheus is still playing on his harp, and the warriors are still delighted with their chariots, their horses, and their arms.

The place of torment is at some distance.

A gaping gulph, which to the centre lies,
And twice as deep as earth is distant from the skyes;
From hence are heard the groans of ghosts, the pains
Of founding latches, and of dragging chains.

Here, those who brother's better claim divour,
Expel their parents, and usurp the throne;
Defraud their clients, and, to lucre fold,
Sit brooding on unprofitable gold.

Who dare not give, and even refuse to lend,
To their poor kindred, or a wanting friend.

Wail is the throng of those; nor lets the train
Of youthful youths for soul adult'ry slain.

Hunts of deferters, who their honour sold,
And basely broke their faith for bribes of gold:
All these within the dungeon's depth remain,
Defpairing pardon, and expecting pain.

The souls of babes, of unhappy lovers, and some others, seem to be placed in a paradise of fools residing in a quarter distinct from Elysian Tartarus and Hades.

It is curious to observe, how much these ideas of a future state differ from the vague and simple conjectures of rude nations; and yet from their simple and rude conjectures, we can easily trace the successive changes in the writings of Homer, Plato, and Virgil; and may easily show, that those laws which different nations have prescribed for their dead, have always borne the strongest analogy to their state of improvement, their system of opinions, and their moral attainments. Some nations, as those of India, have fancied a number of heavens and hell's, corresponding to some of their principal shades in virtue and vice; and have filled each of these places respectively with all the scenes of happiness and misery, which friendship and hatred, admiration, contempt, or rancour, could suggest. But having already observed the progress of the human mind in forming the grand and leading ideas of a future state, we mean not to descend to the modifications which may have occurred to particular nations, sects, or individuals.

The belief of Christians respecting futurity demands our attention, as being founded on a different principle, of the dead namely, on express revelation from heaven. From as revealed many express declarations in Scripture, all Christians in Scripture to be agreed, that there is a heaven appointed for the
The good and a hell for the wicked. In this heaven the saints dwell in the presence of God and the uninterrupted splendors of day. Those who have been wise shine as the firmament, and those who have converted many to righteousness as the stars. Their bodies are glorious, immortal, incorruptible, not subjected to death, pain, or to death. Their minds are leaders to sorrow, to crying, to disappointment; all their desires are perfectly satisfied; while they are calling, they are answered; while they are speaking, they are heard. Their mental faculties are also enlarged; they no more fee obscurely, and as through a cloud, but continually beholding new wonders and beauties in creation, are constantly exclaiming, “Holy, holy, holy! is the Lord of Hosts, worthy is he to receive glory, and honor, and thanksgiving; and to him be ascribed wisdom, and power, and might; for great and marvellous are his works, and the whole universe is filled with his glory.”

Their notions of hell differ considerably. Some understanding the Scriptures literally, have plunged the wicked into an abyss without any bottom; some have made this abyss darker than night; have filled it with ravenous and malignant spirits, that are worse than furies; and have described it as full of sulphur, burning for ever. This frightful gulph is by fome been placed in the bowels of the earth; by fome in the sun; by fome in the moon; and by fome in a comet; but as the Scriptures have determined nothing on the subject, all fuch conjectures are idle and groundless.

Others imagine, that the fire and sulphur are here to be taken in a figurative sense. These suppose the torments of hell to be troubles of mind and remorses of conscience; and support their opinion by observing, that matter cannot act upon spirit; forgetting, perhaps, that at the resurrection the spirit is to be clothed with a body, and, at any rate, that it is not for man vaine to prescribe bounds to Omnipotence.

What seems to have tortured the genius of divines much more than heaven or hell, is a middle state. On this subject there being little revealed in Scripture, many have thought in incumbent upon them to supply the defect; which they seem to have done in different ways. From the Scriptures speaking frequently of the dead asleep in their graves, those who imagine that the powers of the mind are dependent on the body, suppose that they sleep till the resurrection, when they are to be awakened by the trump of God, reunited to their bodies, have their faculties restored, and their sentence awarded.

This opinion they support by what St Peter says in the Acts, that David is not ascended into heaven; and that this patriarch could not possibly be speaking of himself when he said, “Thou wilt not leave my soul in hell, i.e. the place of the dead.” They observe, too, that the victory of Christ over death and the grave seems to imply, that our souls are subject to their power; that accordingly the Scripture speaks frequently of the soul’s drawing near to, of its being redeemed from, and of its descending into, the grave; that the Psalmist, however, declares plainly, that when the breath of man goeth forth, he returneth to his earth, and that very day his thoughts perish. And should any one choose to consult Ecclesiastes, he will find, that the living know that they shall die, but that the dead know not any thing: that their love, and their hatred, and their envy, are eradicated, and that there is no work, nor device, nor wisdom, nor knowledge, in the grave, whither they are gone.

Those who believe that the soul is not for the exercise of its faculties dependent on the body, are upon its separation at death obliged to dispose of it some other way. In establishing their theory, they usually begin with attempting to prove, from Scripture or tradition, both its active and separate existence; but with proofs from tradition we intend not to meddle. Their arguments from Scripture being of more value, defer our serious consideration; and are nearly as follow.

Abraham, they say, Isaac, and Jacob, are still living, because Jehovah is their God, and he, it is allowed, is not the God of the dead, but of the living. But their opponents reply, That this is the argument which our Saviour brought from the writings of Moses to prove a future resurrection of the dead; and that any person who looks into the context, will see it was not meant of a middle state. From the dead living unto God, our Saviour infers nothing more than that they shall live at the resurrection; and that these gentlemen would do well in future to make a distinction between simply living and living unto God: For though Abram, Isaac, and Jacob, be living unto God, our Saviour has allured us that Abraham is dead, and the prophets dead.

A second argument is that glimpse which St Paul had of paradise about 14 years before he had written his Second Epistle to the Corinthians. To this argument their opponents reply, That as St Paul could not tell whether, on that occasion, he was out of the body or in the body, it is more than probable that the whole was a vision; and, at any rate, it is no proof of a separate existence.

A third argument is, St Paul’s wishing to be absent from the body, and present with the Lord. But, say their opponents, St Paul desired not to be unclothed, but to be clothed upon: and as some of those who maintain a separate existence, bring Scripture to prove that the body continues united to Christ till the resurrection; i.e. if he wished to be present with the Lord, should have rather remained with his body than left it.

A fourth argument is, the appearance of Moses and Elias upon the mount of transfiguration. To which their opponents reply, that these saints appeared in their bodies; that Elias was never divested of his body; and that the account which we have of the burial of Moses, has led some of the ablest critics and profoundest divines to conclude, that he was likewise translated to heaven without tainting death. At any rate, say they, he might have been raised from the dead for the very purpose of being present at the transfiguration, as the bodies of other saints certainly were, to bear testimony to our Lord’s resurrection and victory over the grave.

A fifth argument is, what our Saviour said to the thief, “Verily I say unto thee, to-day shalt thou be with me in paradise.” The objection usually made here is, that the expression is evidently ambiguous, and that the sentence depends entirely on the punctuation; for if the point be placed after to-day, the meaning will be “Verily, even now, I tell thee, thou shalt be with me in paradise.” But the import of paradise in this place, say the opponents, is likewise doubtful. We learn from St Peter’s explanation of the 16th Psalm, that our Saviour’s

The soul is not to be left in hell; and we know that on the day of his crucifixion he went not to heaven: for after he had riven from the place of the dead, he forbade one of the women to touch him, as he had not yet ascended to the Father. Hell, therefore, and paradise, continue they, seem to be in this passage the very same thing; the place of the dead; and our Saviour, in that place, they add, was not to go to heaven at that time, but to show his victory over death and the grave, to whose power all mankind had become subject by the disobedience of their first parents.

Without pretending to enter into the merits of this dispute, the ingenious Burnet, in His Theory of the Earth, endeavours to prove, upon the authority of the ancient fathers, that paradise lies between the earth and the moon; and the learned Dodwell, on the same authority, has made it the common receptacle of souls till the reformation; but has not told us whether or not they are to be accountable for the actions of this separate existence at the latter day, or are only to be judged according to the deeds that were done in their bodies.

This notion of a common receptacle has displeased many. The state of purgation, obscurely hinted in the doctrines of Pythagoras, and openly avowed by Plato and Virgil, has been adopted by the Romish divines, who support their opinion of certain obscure passages of scripture, which are always of a yielding and a waxen nature, may easily be twitted to any hypothesis, and like general lovers espouse rather from interest than merit.

It has displeased others, because they are anxious that the righteous should have a fore-taste of their joys, and the wicked of their torments, immediately after death, which they infer to be certainly the case from the parable of the rich man and Lazarus (u). But to this it is objected, that the rich man is supposed to be in hell, the place of torments, and this punishment ought not to take place on their own hypothesis till after the sentence at the reformation.

Another argument used for the intermediate state is the vision of St John in the Apocalypse. In this vision the Evangelist saw under the altar the souls of those that were slain for the word of God and for the testimony which they held. Their opponents doubt whether those visible souls were immaterial, as St John heard them cry with a loud voice, and for white robes given unto every one of them. If they had bodies, that circumstance might chance to prove a resurrection immediately after death, and supersede the general resurrection at the last day.

While such conclusions as are here drawn from the parable and vision, say the opposers of an intermediate conscious existence, imply that the dead are already raised, and are now receiving the respective rewards of their virtues and their crimes; those who maintain an intermediate separate existence, who speak of the body as a prison, and of the soul as receiving an increafe of power when freed from the body, are certainly not more than consistent with themselves, when they think that this soul would derive an advantage from its after union with either a new system of matter or the old one, however much altered. Baxter, they say, who saw the invisible confidency, was disposed to reason somewhat like St. Whitby.

O, Father! can it be that souls sufficiently Return to visit our terrestrial clime? Or that the generous mind, released at death, Should covet lazy limbs and mortal breath?

In no one instance, they continue, have Christians perhaps more apparently than in this argument wrested the Scriptures to their own hurt: by thus rashly attempting to accommodate the sacred doctrines of religion to a preconceived philosophical hypothesis, they have laid themselves open to the ridicule of daft, and have been obliged, for the sake of consistency, either to deny or to speak lightly of the resurrection; which is certainly the surest foundation of their hope, seeing St Paul hath assured us, that if there be no resurrection of the dead, then they which are fallen asleep in Christ are perished, and those who survive may eat and drink, and act as they please, for to-morrow they die; and die, too, never to live again.

Though this reprehension may be rather severe, we are sorry to observe that there seems to have been sometimes too much reason for it. A certain divinity, who gave Dr. Watts, piety was eminent, and whose memory we respect, having written "An Essay toward the proof of a separate State of Souls between Death and the Resurrection," and the Commencement of the Rewards of Virtue and Vice immediately after death," has taken this motto, "Because sentence against an evil work is not executed speedily, therefore the heart of the sons of men is fully set in them to do evil." "The doctrine, he says, of the resurrection of the body and the consequent states of heaven and of hell, is a guard and motive of divine force, but it is renounced by the enemies of our holy Christianity; and should we give up the recompenses of separate souls, while the deceit denies the resurrection of the body, I fear, between both we should falsely enfeble and expose the cause of virtue, and leave it too naked and defenceless.

This author, who wishes much that the punishment of crimes should follow immediately after death, is of opinion, that if heaven intended to check vice and impiety in the world, it has acted unwisely, if it really has deferred the punishment of the wicked to so late a period as the resurrection. "For such, he observes, is the weakness and folly of our natures, that men will not be so much influenced and alarmed by distant prospects, nor so solicitous to prepare for an event which they suppose to be so very far off, as they would for the same event if it commences as soon as ever this mortal life expires. The vicious man will indulge his sensuality, and lie down to sleep in death with this comfort, I shall take my rest here for 100 or 1000 years, and perhaps in all that space my offences may be forgotten; or let the world come that can come, I shall have a long sweet nap before my forrows begin; and thus the force of divine terrors is greatly enervated by this delay of punishment."

Thus far our author, who thinks that his hypothesis, if not true, is at least expedient, and that from motives of expediency it ought to be inculcated as a doctrine

(u) Whitby shows that this parable was conformable to the notions of the Jews at that time; and even the Mahometans, who believe in the resurrection of the dead, suppose likewise a state of rewards and punishments in the grave.
The possibility of these miracles being wrought in the presence of a number of witnesses, yet the left, owing to particular circumstances, produced a much greater noise among the Jews. It was performed on a person seemingly of some note, in the village of Bethany, not far from Jerusalem, and in the presence of a great many persons who from the metropolis had come to condole with Mary and Martha. No doubts were entertained of the reality of Lazarus's death. Our Lord was at a distance when he expired, and his body had already been lying for some days in the grave. When he came forth at the voice of our Lord, all were astonished. Those from Jerusalem, on returning home, are impatient to relate what they had seen; those who heard of so memorable an event cannot conceal it; the report reaches the ears of the Pharisees and chief priests. They are soon made acquainted with every circumstance; and dreading the infamy, they think it necessary to call a council upon the occasion, and concert the measures that ought to be pursued in a matter which was likely to be attended with so many and important consequences. In this council, it seemed to be agreed that our Lord had performed, and was still continuing to perform, many miracles: That this last miracle, as being of an extraordinary kind, would make many converts; and that if measures were not speedily taken to prevent these uncommon displays of his power, all would believe on him: the jealousy of the Romans would be excited, the rulers depopled, and the nation of the Jews deprived of its few remaining privileges. Yet, notwithstanding these private concessions made in the council, the members who dreaded to let their sentiments be known to the people, affect in public to treat our Saviour as an impostor. But he who already had disapproved the absurdity of their opinion, who supposed that his miracles were wrought by Beelzebub prince of the devils, is again ready to confute the ridiculous asseriton of those who pretended to say that they were a deception. His friend Lazarus was full living at the distance of only a few miles, and many of the Jews who had gone to see him were ready to attest the truth of the report. If the rulers, apprehending the consequences of the truth, be afraid to know it, and if they are unwilling to go to Bethany, or to send for Lazarus and thee who were present at his resurrection, our Lord gives them a fair opportunity of detecting his fraud, if there was any such to be found in him. To preserve their power, and remove the jealous suspicion of the Romans, it had been already determined in council to put him to death; and our

(x) Perhaps no man has been more culpable in this respect than the celebrated Warburton, who seems at first to have himself denied an intermediate state of conscious existence. He afterwards imagined that such a state is supposed, though not expressly affirmed, in Scripture; and at last he maintained it with all the zeal and warmth of a prologue. To prove the sincerity of his conversion, he treated his adversaries with scurrilous nicknames, banter, and abuse; a species of reasoning which seldom succeeds in recommending a bad cause, and which never confers credit on one that is good.
our Lord foretells that the third day after his death he shall rise from the grave. Here no place was reserved for deception. The law of the Pharisees and the chief priests are openly warned and put upon their guard; and, very fortunately for the cause of Christianity, this singular prediction was not heard with scorn, or indeed, if with scorn, it was only affected. We know from the sentiments expressed in the council, that our Lord was secretly dreaded by the rulers; that his miracles were far from being discredited; and that his predictions in their private opinion, were not to be sighted. The means accordingly which they employed to prevent, even in the very appearance, the completion of his prophecy, were admirably calculated to remove the scruples of the most wary and sceptical inquirers, if their object was only to search after truth. At the next festival of the passover, when the scheme of Caiphas was put in execution, and when it was deemed expedient by the council that he should die, to save the nation from the jealousy of the Romans; as a proof of their steady loyalty to Rome he agains open violence. In spite, however, of all the soldiers was stationed around it, precautions, the watch were to be capital in Deeping, the name of wonder, to be bed in their order, becaufe they imagine the threat was made against God. Whatever credit may be given by modern infidels to the ill-framed story, it is past dispute that it had none among the Jewifh rulers at the time that it was current. Not long after our Saviour's resurrection, the apostles were called before the council, and threatened with death for teaching in the name of Jesus. Their boldness upon that occasion was so provoking to the rulers, that the threat would have been instantly put in execution, had not Gamaliel, a doctor of the law of high reputation, put them in mind of other impostors who had perished in their attempts to mislead the people; and concluded a very sensible speech with these remarkable words: "And now, I say unto you, refrain from these men, and let them alone; for it this counsel, or this work, be of men, it will come to nought; but if it be of God, ye cannot overthrow it, left haply ye be found even to fight against God." This advice the council followed. But is it possible that Gamaliel could have given it, or the council paid the least regard to it, had the story of the disciples stealing the body been then credited? Surely some among them would have observed, that a work or counsel, founded on imposture and fraud, could not be supposed to be of God, and they would unquestionably have lain the apostles.

The story of stealing the body is indeed one of the most senseless fictions that ever was invented in support of a bad cause. Our Lord was on earth forty days after he arose. He appeared frequently to his disciples. He ate and drank in their presence; and when some of them doubted, he bade them handle him and see that he was not a spirit, shewed the mark of the spear in his side, and the prints of the nails in his feet and hands. Besides this appearing to his disciples, he was seen by more than five hundred brethren at one time; all of whom, as well as his disciples, must necessarily have known him previous to his suffering, and could therefore attest that he was the person who was once dead but was then alive. Yet for strangers in general, who had not seen him previous to his death, and could not therefore identify his person after he arose, our Lord referred to other proofs that were equally convincing. Before his ascension, he bade his disciples wait till they received power, by the Holy Ghost descending upon them: That then they should be witnesses with him, both in Jerusalem, and in all Judea, and in Samaria, and unto the uttermost ends of the earth; in order that the people of all these nations, observing the miracles, wrought in his name, might themselves become ocular witnesses that those who preached his resurrection were warranted to do so by his authority; and that this authority, on which so numerous miracles attended, must be divine.

We intend not here to examine the minute objections and cavils that have been advanced respecting the truth of this important fact. The kinds, however, we shall mention in general. Some have doubted of our Lord's resurrection, as being an event which is not confirmed by general experience, because they imagine that what happens once should happen again, and even repeatedly, in order to be true. Some, taking their own to be preferable schemes, have objected to the way in which it happened, and to the manner in which it is narrated. Some have imagined, that possibly the gospel history may be false; that possibly the disciples were very ignorant, and might be deceived; that possibly, too, they were deep politicians, and a set of impostors; and that possibly the writings which detected their falsehoods may have been destroyed. It is difficult to reason, and worse to convince, against this evidence of possibilities: but we flatter ourselves, that to the candid reader it will appear sufficiently overturned in our article Miracle; where it is shown that neither clowns nor politicians could have acted the part that was acted by the apostles, had not the resurrection been an undoubted fact.

Some of the objections to it have also maintained, that possibly there is nothing material without us, that there is nothing mental within us, and that possibly the whole world is ideas. This mode of arguing we pretend not to explain; it is thought by some to proceed entirely from a perverseness of mind or disposition, while in books
of medicine it is always considered as a symptom of disease, and the patient recommended to be treated in the hospital, and not in the academy.

By his raising others, and particularly by raising himself, from the dead, our Saviour demonstrated that a resurrection from the dead is possible. And on that authority, which by his miracles he proved to be divine, he declared to his followers, that there is to be a general resurrection both of the just and of the unjust, instructing his disciples to propagate this doctrine through all nations; St Paul confessing, that if there be no resurrection of the dead, preaching is vain, and our faith is vain.

As to the order of succession in which the dead are to be raised, the Scriptures are almost silent. St Paul says, that every man is to rise in his own order, and that the dead in Christ are to rise first: and St John observed in his vision, that the souls of them which were beheaded for the name of Jesus, and for the word of God, and which had not worshipped the beast, neither his image, neither had received his mark upon their foreheads, or in their hands, lived and reigned with Christ a thousand years; but the rest of the dead lived not again until the thousand years (v) were finished.

A question that has much oftener agitated the minds of men, is, with what sort of bodies are the dead to be raised? St Paul has answered, with incorruptible and immortal bodies (z). And to silence the disputations of caviller of his day, he illustrated his doctrine by the growth of grain. "Thou fool (said he), that which thou sowest, thou sows not that body that shall be, but bare grain, it may chance of wheat or of some other grain." "To us it appears very surprising, that any one who reads this passage with the slightest attention, should perplex himself, or disturb the church with idle attempts to prove the identity of the bodies with which we shall die and rise again at the last day. The apostle expressly affirms, that "flesh and blood cannot inherit the kingdom of God; that we shall all be changed, in a moment, in the twinkling of an eye, at the last trump; that there are celestial bodies and bodies terrestrial; and that the glory of the celestial is one, and the glory of the terrestrial another."

That this implies a total change of qualities, will admit of no dispute; but still it has been considered as an article of the Christian faith, that we are to rise with the same bodies in respect of substance. What is meant by the identity of substance, with qualities wholly different, it is not very easy to conceive. Perhaps the meaning may be, that our incorruptible bodies shall consist of the same material particles with our mortal bodies, though these particles will be differently arranged to produce the different qualities. But as the particles of our present bodies are constantly changing, and as different particles compose the body at different times, a question has been put, With what sort of particles shall we rise? Here a singular variety of opinions have been held. Some contend, that we shall rise with the original flamma of our bodies derived from our parents; some are for rising with that set of particles which they had at birth; some with the set which they have to have at death; and some with the particles which remain after maceration in water; though God knows, that if his maceration be continued long, these may arise with new or no particles at all. Another query has given much alarm. What if any of these particles should enter a vegetable, compose its fruit, and be eaten by a man, woman, or a child? Will not a dispute, similar to that apprehended by the Sadducees about the wife of the seven brothers, necessarily follow, whose particles are they to be at the resurrection? Against this confusion they truth that the good and wisdom of heaven will take all the proper and necessary measures; and they even venture to point out a way in which that may be done. A foot deep of earth, they observe, in two or three of the counties of England, supposing each person to weigh on an average about seven stones and a few pounds, would amply supply with material bodies 600,000,000 of souls for no less a space than 20,000 years; and therefore there seems to be no necessity for the vamping up of their old materials to lodge and accommodate new souls.

But, to return, the question is not about the possibility of keeping the particles of different bodies separate and distinct. The question is rather, What have the Scriptures determined on the subject? Now the Scriptures say, that the spirit returns unto God who gave it. And should it be asked, in what place does he refer it to the resurrection? the Scriptures reply, in the place of the dead; because the soul descends into the pit, is redeemed from the grave; and the place of the dead lived at the last, the dead that died and risen, the place of the dead. But, after the resurrection, the soul descends into the pit, is redeemed from the grave. The Scriptures reply, in the place of the dead; because the soul descends into the pit, is redeemed from the grave; and shall come forth. There is not here so much a word concerning the body; and therefore, it was asked, with what bodies are the dead to be raised? To which it was answered, the vile body is to be changed. The body which is, is not the body which shall be; for the corruptible shall put on incorruption, and that which is mortal, put on immortality.

This curious discovery of the sentiments of Scripture we owe to a layman, the celebrated Locke; who, in one of his controversies with the bishop of Worcester, came to understand what he knew not before, namely, that nowhere have the Scriptures spoken of the resurrection of the same body in the sense in which it is usually conceived. The resurrection of the same person is indeed promised; and how that promise may be fulfilled, notwithstanding the constant change of the particles of the body, has been shown in another place. See Metaphysics, Part III. Chap. iii.

The advocates, therefore, for the resurrection of the mortal body, have again been obliged to betake themselves to the shifts of reasoning. It is proper, say they, that

(v) These thousand years formed the happy millenium so often mentioned in the ancient fathers; and the learned Burnet, in his Theory of the Earth, has endeavoured to prove, that a similar notion prevailed among the Jews. See Millenium.

(z) Our Saviour rose with the same body, both as to substance and qualities; because it was necessary that his person should be known and identified after his resurrection.
that the same bodies which have been accomplies in our vices and virtues, should also share in our rewards and punishments. Now, granting they will, shall one set of particles be bound for the crimes, or be entitled to receive the rewards, of the animal system, from its first commencement to its dissolution? or shall every particle rise up successively, and receive its dividend of rewards and punishments for the vices and virtues that belonged to the system during the time that they were in union with the sentient principle? and is the hand that fell in defending the father to be (as is supposed in some of the eastern countries) rewarded in heaven; while the other that struck him when the son became vicious, is dimissed into torments?

Finding this hypothesis supported by neither Scripture nor reason, they next appeal to the ancient fathers. And they, it is confessed, are for the resurrection of the very same flesh. But this notion is directly contrary to the Scriptures, which have said, that flesh and blood are not to inherit the kingdom of God.

But whatever be the bodies with which the dead are to be raised at the general resurrection, all mankind must appear in judgment, and receive sentence according to the deeds done in the body, without regard, so far as we know, to their actions and conduct in the middle state. After this sentence, the righteous are to enter into celestial and eternal joys, and the wicked to suffer the punishments of hell. These punishments some have supposed to be everlasting; others think, that after some temporary punishment, the souls of the wicked are to be annihilated; and others imagine, that after doing purgatorial penance for a while in hell, they are to be again received into favour; inclining to explain the denunciations of the Almighty as a child would do the threatenings of his mother, or a lover the affected sighings of his mistress (a).

RESURRECTION, the same with resurrection and revivification. See preceding article and Resurrection.

The term resurrection, however, is more particularly used by chemists for the reproducing a mixed body from its ashes; an art to which many have pretended, as to reproduce plants, &c. from their ashes.

RETAIL, in commerce, is the selling of goods in small parcels, in opposition to wholesale. See Commerce.

RETAILER, a servant who does not continually dwell in the house of his master, but only attends upon special occasions.

RETAILING FEE, the first fee given to a serjeant or counsellor at law, in order to make him sure, and prevent his pleading on the contrary side.

RETALIATION, among civilians, the act of returning like for like.

RETARDATION, in physics, the act of diminishing the velocity of a moving body. See Gunnery, Mechanics, Pneumatics, and Projectiles.

RETE MIRABILE, in anatomy, a small pleura or network of vessels in the brain, surrounding the pituitary gland.

RETENTION is defined by Mr. Locke to be, a faculty of the mind, whereby it keeps or retains, those simple ideas it has once received, by sensation or reflection. See Metaphysics, Part I. Chap. ii.

Retention is also used, in medicine, &c. for the state of contradiction in the solid or vascular parts of the body, which makes them hold fast their proper contents. In this sense, retention is opposed to evacuation and excretion.

RETECULAR BODY (corpus reticular), in anatomy, a very fine membrane, perforated, in the manner of a net, with a multitude of oramina. It is placed immediately under the cuticle; and when that is separated from the cutis, whether by art or accident, this adheres firmly to it, and is scarce possibly to be parted from it, seeming rather to be its inner superficies than a distinct substance. In regard to this, we are to observe, first, the places in which it is found, being all those in which the sense of feeling is most acute, as in the palms of the hands, the extremities of the fingers, and on the soles of the feet. The tongue, however, is the part where it is most accurately to be observed: it is more easily distinguishable there than anywhere else, and its nature and structure are most evidently seen there.

Iq. colour in the Europeans is white; but in the negroes and other black nations it is black; in the tawny it is yellowish: the skin itself in both is white; and the blackness and yellowness depend altogether on the colour of this membrane.

The uses of the corpus reticulare are to preserve the structure of the other parts of the integuments, and keep them in their determinate form and situation. Its apertures give passage to the hairs and sweat through the papille and excretory ducts of the skin; it retains there in a certain and determinate order, that they cannot be removed out of their places, and has some share in preserving the softness of the papille, which renders them fit for the sense of feeling. See Anatomy, n° 83.

RETECULUM, a Latin word, signifying a little or casting net. It was applied by the Romans to a particular mode of constructing their buildings. In the city of Salino (see Salino) are still to be seen remains of some walls, evidently of Roman origin from the reticum. This structure consists of small pieces of baked earth cut to shape, and disposed with great regularity on the angles, so as to exhibit to the eye the appearance of cut diamonds; and was called reticular, from its resemblance to fishing-nets. The Romans always concealed it under a regular coating of other matter; and Mr Houel informs us, that this was the only specimen of it which he saw in all his travels through Sicily, Malta, and Lipari. It appears to be the remains of some baths, which

(a) French convention, some of whose principles are equally new, daring and destructive of all that is decent or of good report, have decided this question in a very summary way, by decreasing death to be an eternal sleep, a decree equally absurd in itself and fatal in its consequences. Since this article went to the press, however, we have learned, from the most respectable authority, that wild and absurd as the opinion is, it has been industriously propagated in this country, and that in some it has gained ground. The consequences of this, were it to become general, might indeed be baneful beyond all conception; and we shall afterwards take occasion to expose the opinion and its nefarious consequences at greater length than it is now possible to do in this place. See Theology.
RET

RETINO, or RETINUM, in anatomy, the expansion of the optic nerves over the bottom of the eye, where the sense of vision is first received. See Anatomy, No. 142, and Optics (Index) at Eye and Vision.

RETINUE, the attendants or followers of a prince or person of quality, chiefly in a journey.

RETIRADE, in fortification, a kind of retrenchment made in the body of a bastion, or other work, which is to be disputed, inch by inch, after the defences are dismantled. It usually consists of two faces, which make a re-entering angle. When a breach is made in a bastion, the enemy may also make a retirade or new fortification behind it.

RETIREMENT, means a private way of life or a secret habitation. "Few (says an elegant writer) are able to bear solitude; and though retirement is the oftentimes object of the greater part, yet, when they are enabled by success to retire, they feel themselves unhappy. Peculiar powers and elegance of mind are necessary to enable us to draw all our resources from ourselves. In a remote and solitary village the mind must be internally alive in a great degree, or it will be miserable for want of employment. But in great and populous cities, even while it is passive, it will be constantly amused. It is impossible to walk the streets without finding the attention powerfully solicited on every side. No exertion is necessary. Objects pour themselves into the senses, and it would be difficult to prevent their admittance. But, in retirement, there must be a spirit of philosophy and a store of learning, or else the fancied scenes of bliss will vanish like the colours of the rainbow. Poor Cowley might be made to be melancholy mad. He languished for solitude, and wished to hide himself in the wilds of America. But, alas! he was not able to support the solitude of a country village within a few miles of the metropolis." With a virtuous and cheerful family, with a few faithful and good-humoured friends, with a well-selected collection of elegant books, and with a competency, one may enjoy comforts even in the defverted village, which the city, with all its diversions, cannot supply."

RETORT, in chemistry, an oblong or globular vessel with its neck bent, proper for distillation. See Chemistry, No. 576.

In the fifth volume of the Transactions of the London Society for the Encouragement of Arts, p. 96, we find a paper containing a method for preventing flone retorts from breaking; or stopping them when cracked, during any chemical operation, without losing any of the contained subject. "I have always found it necessary (says the writer) to use a previous coating for filling up the interstices of the earth or flone, which is made by dissolving two ounces of borax in a pint of boiling water, and adding to the solution as much flaked lime as will make it into a thin paste; this, with a common painter's brush, may be spread over several retorts, when dry are then ready for the proper preferv ing coating. The intention of this first coating is, that the substances thus spread over, readily vitrifying in the fire, prevent any of the distilling matters from pervading the retort, but does in nowise prevent it from cracking.

"Whenever I want to use any of the above coated retorts; after I have charged them with the substance to be distilled, I prepare a thin paste, made with common linseed oil and flaked lime well mixed, and perfectly plastic, that it may be easily spread: with this let the retorts be covered all over except that part of the neck which is to be inserted into the receiver; this is readily done with a painter's brush: the coating will be sufficiently dry in a day or two, and they will then be fit for use. With this coating I have for several years worked my flone retorts, without any danger of their breaking, and have frequently used the same retort four or five times; observing particularly to coat it over with the last mentioned composition every time it is charged with fresh materials: Before I made use of this expedient, it was an even chance, in conducting operations in flone and earthen retorts, whether they did not crack every time; by which means great losses have been sustained. If at any time during the operation the retorts should crack, spread some of the oil composition thick on the part, and sprinkle some powdered flaked lime on it, and it immediately fills the fissure, and prevents any of the distilling matter from pervading; even that tubile penetrating substance the flid phosphorus will not penetrate through it. It may be applied without any danger, even when the retort is red hot; and when it is made a little thicker, is more proper for loting veesses than any other I ever have tried; because if properly mixed it will never crack, nor will it indurate so as to endanger the breaking the necks of the vessels when taken off."

RETRACTS, among horsemens, pricks in a horse's feet, arising from the fault of the farrier in driving nails that
that are weak, or in driving them ill-pointed, or otherwise amis.

RETREAT, in a military sense. An army or body of men are said to retreat when they turn their backs upon the enemy, or are retiring from the ground they occupied: hence every march in withdrawing from the enemy is called a retreat.

That which is done in sight of an active enemy, who purifies with a superior force, is the most important part of the subject; and is, with reason, looked upon as the glory of the profession. It is a manoeuvre the most delicate, and the proper tool to display the prudence, genius, courage, and address, of an officer who commands; the historians of all ages testify it; and historians have never been so lavish of eulogiums as on the subject of the brilliant retreats of our heroes. If it is important, it is no less difficult to regulate, on account of the variety of circumstances, each of which demands different principles, and an almost endless detail. Hence a good retreat is esteemed, by experienced officers, the masterpiece of a general. He should therefore be well acquainted with the situation of the country through which he intends to make it, and careful that nothing is omitted to make it safe and honourable. See War.

Retreat, is also a beat of the drum, at the firing of the evening gun; at which the drum-major, with all the drums of the battalion, except such as are upon duty, beats from the camp-colours on the right to those on the left, on the parade of encampment: the drums of all the guards beat alto; the trumpets at the same time sounding at the head of their respective troops. This is to warn the soldiers to forbear firing, and the sentinels to challenge, till the break of day that the reveille is beat. The retreat is likewise called setting the watch.

RETRENCHMENT literally signifies something cut off or taken from a thing; in which sense it is the same with subtraction, diminution, &c.

Retrenchment, in the art of war, any kind of work is said to cover and fortify it against the enemy, such as fascines loaded with earth, gabions, barrels of earth, sand-bags, and generally all things that can cover the men and flop the enemy. See Fortification and War.

Retribution, a handsome present, gratuity, or acknowledgment, given instead of a formal salary or hire, to persons employed in affairs that do not immediately fall under estimation, nor within the ordinary commerce in money.

Retromingents, in natural history, a class or division of animals, whose characteristic is, that they flake or make water backwards, both male and female.

Return (returns or retum), in law, is used in divers senses. 1. Return of writs by sheriffs and bailiffs is a certificate made by them to the court, of what they have done in relation to the execution of the writ directed to them. This is wrote on the back of the writ by the officer, who thus sends the writ back to the court from whence it issued, in order that it may be filed. 2. Return of a commission, is a certificate or answer sent to the court from whence the commission issued, concerning what has been done by the commissioners. 3. Returns, or days in bank, are certain days in each term, appointed for the return of writs, &c. Thus Hillary term has four returns, viz. in the king's bench, on the day next after the octave, or eighth day after Hillary day; on the day next after the fifteenth day from St Hillary; on the day after Purification; and on the next after the octave of the Purification. In the common pleas, in eight days of St Hillary: from the day of St Hillary, in fifteen days: on the day after the purification: in eight days of the Purification. Easter term has five returns, viz. in the king's-bench, on the day next after the fifteenth day from Easter: on the day next after the three weeks from Easter: on the day next after one month from Easter: on the day next after five weeks from Easter: and on the day next after the day following Ascension-day. In the common pleas, in fifteen days from the feast of Easter: in three weeks from the feast of Easter: in one month from Easter day: in five weeks from Easter day: on the day after the Ascension-day. Trinity term has four returns, viz. on the day following the second day after Trinity: on the day following the eighth day after Trinity: on the day next after the fifteenth day from Trinity: on the day next after three weeks from Trinity. In the common pleas, in eight days of Trinity: in fifteen days from Trinity: in three weeks from Trinity. Michaelmas term has six returns, viz. on the day next after three weeks from St Michael: on the day next after one month of St Michael: on the day following the second day after All-souls: on the day after the second day after St Martin: on the day following the octave of St Martin: on the day after fifteen days of St Martin. In the common pleas, in three weeks from St Michael: in one month from St Michael: on the day after All-souls: on the day after St Martin: on the octave of St Martin: in fifteen days from St Martin. It is to be observed, that, as in the king's-bench, all returns are to be made on some particular day of the week in each term, care must be taken not to make the writs out of that court returnable on a non-judicial day; such as Sunday, and All-saints, in Michaelmas term, the Purification in Hillary, the ascension in Easter, and Midsummer-day, except it should fall on the first day of Trinity term.

Returns, in a military sense, are of various forts, but all tending to explain the state of the army, regiment, or company; namely, how many capable of doing duty, on duty, sick in quarters, barracks, &c., and garrison, the former of whom amount to about 12,000, the latter to 15,000. The island affords a small quantity of pasture, produces vegetables, and a few fruits, such as apples, currants, gooseberries, and straw-berries, which thrive in this northern climate.

RETE, (Cardinal de). See Gondi.

RETZIA; in botany; a genus of the monogynia order, belonging to the pentadria class of plants, and
REV

REV

REV

REVELATION, the act of revealing, or making a thing public that was before unknown; it is also used for the discoveries made by God to his prophets, and by them to the world; and more particularly for the books of the Old and New Testament. See Bible, Christianity, Miracle, Religion, and Theology.

The principal parts of the truth of any revelation, are the tendency of its practical doctrines; its consistency with itself, and with the known attributes of God; and some satisfactory evidence that it cannot have been derived from a human source.

Before any man can receive a written book as a revelation from God, he must be convinced that it exists, and that he is possessed of almighty power, infinite wisdom, and perfect justice. Now should a book teaching absurd or immoral doctrines (as many chapters of the Koran do, and as all the traditionary systems of Paganism did), pretend to be revealed by a God of wisdom and justice, we may safely reject its pretensions without further examination than what is necessary to satisfy us that we have not misunderstood its doctrine. Should a book claiming this high origin, enjoin in one part of it, and forbid in another, the same thing to be done under the same circumstances, we may reject it with contempt and indignation; because a being of infinite wisdom can never act capriciously or absurdly.

Still, however, as it is impossible for us to know how far the powers of men may reach in the investigation or discovery of useful truth, some further evidence is necessary to prove a doctrine of divine origin, than its mere consistency with itself, and with the principles of morality; and this evidence can be nothing but the power of working miracles exhibited by him by whom it was originally revealed. In every revelation confirmed by this evidence, many doctrines are to be looked for which human reason cannot fully comprehend; and these are to be believed on the testimony of God, and suffered to produce their practical consequences.

At this kind of belief the shallow infidel may smile contemptuously; but it has place in arts and sciences as well as in religion. Whoever avails himself of the demonstrations of Newton, Bernoulli, and others, respecting the resistance of fluids, and applies their conclusions to the art of ship-building, is as implicit a believer, if he understands not the principles of fluxions, as any Christian; and yet no man will say that his faith is not productive of important practical consequences. He believes, however, in man, while the Christian believes in God; and therefore he cannot pretend that his faith rests on a surer foundation.

Mr Locke, in laying down the different provinces of reason and faith, observes, 1. That the same truths may be discovered by revelation which are discoverable to us by reason. 2. That no revelation can be admitted against the clear evidence of reason. 4. That there are many things of which we have but imperfect notions, or none at all; and others, of whose past, present, or future existence, by the natural use of our faculties we cannot have the least knowledge: and these, being beyond the discovery of our faculties, and above reason, when revealed, become the proper object of our faith. He then adds, that our reason is not injured or disturbed, but assisted and improved by new discoveries of truth coming from the fountain of knowledge. Whatever God has revealed is certainly true; but whether it be a divine revelation or not, reason must judge, which can never permit the mind to reject a greater evidence to embrace what is less evident.
REVENUE.

There can be no evidence that any traditional revelation is of divine original, in the words we receive it, and the sense we understand it, so clear and so certain as that of the principles of reason; and, therefore, nothing that is contrary to the clear and self-evident dictates of reason, has a right to be urged or allotted to as a matter of faith, wherein reason has nothing to do.

Revelation of St. John. See Apocalypse.

REVENGE, means the return of injury for injury, and differs materially from that sudden resentment which rises in the mind immediately on being injured; which, so far from being culpable when restrained within due bounds, is absolutely necessary for self-preservation. Revenge, on the contrary, is a cool and deliberate wickedness, and is often executed years after the offence was given; and the desire of it is generally the littleness, weakness, and vice; while, to do right, and to suffer wrong, is an argument of a great soul, that learns to floop to suggested revenges.

Revenge is but a frailty incident To craz'd and sickly minds; the poor content Of little souls, unable to surmount An injury, too weak to bear affront. Dryden.

Revenge is generally the concomitant of savage minds, of minds impicable, and capable of the most horrid barbarities; unable to fet any limits to their displeasure, they can confine their anger within no bounds of reason.

Cruel revenge, which still we find The weakest frailty of a feeble mind. Dryden.

Degenerate passion, and for man too base, It feizes his empire in the savage race.

The institution of law prevents the execution of private revenge, and the growth of civilization shows its impropriety. Though in modern times a species of revenge is sanctioned by what is called the law of honour, which evades the law of the land, indeed, but which is equally mean and disgraceful as the other kinds, and is of consequences equally baneful. See Anger, Duelling, and Resentment.

REVENUE, the annual income a person receives from the rent of his lands, houses, interest of money in the stocks, &c.

Royal Revenue, that which the British constitution hath vested in the royal person, in order to support his dignity and maintain his power; being a portion which each subject contributes of his property, in order to secure the remainder. This revenue is either ordinary or extraordinary.

1. The king's ordinary revenue is such as has either subsisted time out of mind in the crown; or else has been granted by parliament, by way of purchase or exchange for such of the king's inherent hereditary revenues as were found inconvenient to the subject.—In saying that it has subsisted time out of mind in the crown, we do not mean that the king is at present in the actual possession of the whole of his revenue. Much (nay the greatest part) of it is at this day in the hands of subjects; to whom it has been granted out from time to time by the kings of England: which has rendered the crown in some measure dependent on the people for its ordinary support and subsistence. So that we must be obliged to recount, as part of the royal revenue, what lords of manor and others, or the crown, have been and are entitled to a part of it, which is extant in the hands of subjects. See Anger, Duelling, and Resentment.

2. The king is entitled to a corodory, as the law calls it, out of every bishopric; that is, to send one of his chaplains to be maintained by the bishop, or to have a pension allowed him till the bishop promotes him to a benefice. This is also in the nature of an acknowledgement to the king, as founder of the fee, since he had formerly the same corodory or pension from every abbey or priory of royal foundation. It is supposed to be now fallen into total disuse; though Sir Matthew Hale says, that it is due of common right, and that no prescription will discharge it.

3. The king is also entitled to all the tithes arising in extraparochial places: though perhaps it may be doubted how far this article, as well as the last, can be properly reckoned a part of the king's own royal revenue; since a corodory supports only his chaplains, and these extraparochial tithes are held under an implied trust that the king will distribute them for the good of the clergy in general.

4. The next branch consists in the first-fruits and tenths of all spiritual preferments in the kingdom. See Tithes.

5. The next branch of the king's ordinary revenue (which, as well as the subfequent branches, is of a lay or temporal nature) consists in the rents and profits of the demeine lands of the crown. These demeine lands, terra dominicales regis, being either the share referred to the crown at the original distribution of landed property, or such as came to it afterwards by forfeitures or other means, were anciently very large and extensive; comprising divers manors, honours, and lordships; the tenants of which had very peculiar privileges, when we speak of the tenure in ancient demeine. At present they are contracted within a very narrow compass, having been almost entirely granted away to private subjects. This has occasioned the parliament frequently to interpose; and particularly after King William III. had greatly impoverished the crown, an act passed, whereby all future grants or leases from the crown for any longer term than 31 years or three lives, are declared to be void; except with regard to houses, which may be granted for 50 years. And no reversionary lease can be made, fo as to exceed, together with the estate in being, the same term of three lives or 31 years; that is, when there is a subsisting lease, of which there are 20 years still to come, the king cannot grant a future interest, to commence after the expiration of the former, for any longer term than 11 years.
The tenant must also be made liable to be punished for committing waste; and the usual rent must be referred, or where there has usually been no rent, one-third of the clear yearly value. The misfortune is, that this act was made too late, after almost every valuable possession of the crown had been granted away for ever, or else upon very long leases; but may be of benefit to posterity, when these leases come to expire.

6. His heir might have been referred the advantages which were used to arise to the king from the profits of his military tenures, to which most lands in the kingdom were subject, till the statute 12 Car. II. c. 24, which is great mischief abolished them all. Hitherto also might have been referred the profitable prerogative of purveyance and pre-emption: which was a right enjoyed by the crown of buying up provisions and other necessaries, by the intervention of the king's purveyors, for the use of his royal household, at an appraised valuation, in preference to all others, and even without consent of the owner: and also of forcibly impressing the carriages and horses of the subject, to do the king's business on the public roads, in the conveyance of timber, baggage, and the like, however inconvenient to the proprietor, upon paying him a settled price. A prerogative which prevailed pretty generally throughout Europe during the scarcity of gold and silver, and the high valuation of money consequent thereupon. In those early times, the king's household (as well as those of inferior lords), were supported by specific renders of corn, and other viands, from the tenants of the respective demesnes; and there was also a continual market kept at the palace-gate to furnish viands for the royal use. And this answered all purposes, in those ages of simplicity, so long as the king's court continued in any certain place. But when it removed from one part of the kingdom to another (as was formerly very frequently done), it was found necessary to send purveyors beforehand, to get together a sufficient quantity of provisions and other necessaries for the household; and, lest usual demands should raise them to an exorbitant price, the powers beforementioned were vested in these purveyors, who in process of time very greatly abused their authority, and became a great oppression to the subject, though of little advantage to the crown; ready money in open market (when the royal residence was more permanent, and specie began to be plenty) being found upon experience to be the best provender of any. Wherefore, by degrees, the powers of purveyance have declined, in foreign countries as well as our own: and particularly were abolished in Sweden by Gustavus Adolphus, towards the beginning of the last century. And, with us, in England, having fallen into disuse during the suspension of monarchy, King Charles at his restoration, conferred, by the same statute, to reign entirely those branches of his revenue and power: and the parliament, in part of recompense, settled on him, his heirs, and successors, for ever, the hereditary excise of 1d. per barrel on all beer and ale sold in the kingdom, and a proportionate sum for certain other liquors. So that this hereditary excise now forms the sixth branch of his majesty's ordinary revenue.

7. A seventh branch might also be computed to have arisen from wine-licences; or the rents payable to the crown by such persons as are licensed to sell wine by retail throughout Britain, except in a few privileged places. These were first settled on the crown by the statute 12 Car. II. c. 25, and together with the hereditary excise, made up the equivalent in value for the lots sustained by the prerogative in the abolition of the military tenures, and the right of pre-emption and purveyance: but this revenue was abolished by the statute 30 Geo. II. c. 19, and an annual sum of upwards of L. 7000 per annum, issuing out of the new stamp-duities imposed on wine-licences, was settled on the crown in its stead.

8. An eighth branch of the king's ordinary revenue is usually reckoned to consist in the profits arising from his forests. See Forest. These consist principally in the aments or fines levied for offences against the forest-laws. But as few, if any, courts of this kind for levying aments have been held since 1632, 8 Char. I. and as, from the accounts given of the proceedings in that court by our histories and law-books, nobody would wish to see them again revived, it is needless to pursue this inquiry any farther.

9. The profits arising from the king's ordinary courts of justice make a ninth branch of his revenue. And these consist not only in fines imposed upon offenders, forfeitures of recognizances, and aments levied upon defaulters; but also in certain fees due to the crown in a variety of legal matters, as, for setting the great seal to charters, original writs, and other forensic proceedings, and for permitting fines to be levied of lands in order to bar entail, or otherwise to infure their title. As none of these can be done without the immediate intervention of the king, by himself or his officers, the law allows him certain perquisites and profits, as a recompense for the trouble he undertakes for the public. These, in proceeds of time, have been almost all granted out to private persons, or else appropriated to certain particular uses: so that, though our law proceedings are still loaded with their payment, very little of them is now returned into the king's exchequer; for a part of whom royal maintenance they were originally intended. All future grants of them, however, by the statute 1 Ann. & 2. c. 7, are to endure for no longer time than the prince's life who grants them.

10. A tenth branch of the king's ordinary revenue, said to be grounded on the consideration of his guarding and protecting the seas from pirates and robbers, is the right to royal fifhs, which are whale and sturgeon: and these, when either thrown ashore, or caught near the coasts, are the property of the king, on account of their superior excellence. Indeed, our ancestors seem to have entertained a very high notion of the importance of this right; it being the prerogative of the kings of Denmark and the dukes of Normandy; and from one of these it was probably derived to our princes.

11. Another maritime revenue, and founded partly upon the same reason, is that of shipwrecks. See Wreck.

12. A twelfth branch of the royal revenue, the right to mines, has its original from the king's prerogative of coinage, in order to supply him with materials; and
13. To the same original may in part be referred the revenue of 

befides the particular reasons, given in the different articles, why the king should have the several revenues of royal fish, shipwrecks, treasure-trove, waifs, and estrays, there is also one general reason which holds for them all; and that is, because they are bona vacantia, or goods in which no one else can claim a property.

And, therefore, by the law of nature, they belonged to the first occupant or finder; and so continued under the imperial law. But, in settling the modern constitutions of most of the governments in Europe, it was thought proper (to prevent that forfeiture and contention which the mere title of occupancy is apt to create and continue, and to provide for the support of public authority in a manner the least burdensome to individuals) that these rights should be annexed to the supreme power by the positive laws of the state. And so it came to pass, that, as Bracton expresses it, "hoc que nullius in bonis funt, et olim fuerunt inventoris "de jure naturali, iam efficientur principis de jure gentium."

16. The next branch of the king's ordinary revenue consists in forfeitures of lands and goods for offences; bona confisita, as they are called by the civilians, because they belonged to the regis or imperial treasury; or, as our lawyers term them, foris fallata, that is, such whereof the property is gone away or departed from the owner. The true reason and only substantial ground of any forfeiture for crimes, consist in this; that all property is derived from society, being one of those civil rights which are conferred upon individuals, in exchange for that degree of natural freedom which every man must sacrifice when he enters into social communities. If, therefore, a member of any national community violates the fundamental contract of his association, by transgressing the municipal law, he forfeits this right to such privileges as he claims by that contract; and the state may very justly refuse that portion of property, or any part of it, which the laws have before enjoined him. Hence, in every offence of an atrocious kind, the laws of England have exacted a total confiscation of the moveables or personal estate; and, in many cases, a perpetual, in others only a temporary, loss of the offender's immovables or landed property; and have vaunted them both in the king, who is the person supposed to be offended, being the visible magistrate in whom the majesty of the public resides. See Forfeiture and Deoband.

18. The last branch of the king's ordinary revenue consists in the custody of lands, which happen upon the defect of heirs to succeed to the inheritance; whereupon they in general revert to and vest in the king, who is esteemed, in the eye of the law, the original proprietor of all lands in the kingdom. This may suffice for a short view of the king's ordinary revenue, or the proper patrimony of the crown; which was very large formerly, and capable of being increased to a magnitude truly formidable: for there are very few estates in the kingdom that have not, at some period or other since the Norman conquest, been vested in the hands of the king, by forfeiture, eichétat, or otherwise. But, fortunately for the liberty of the subject, this hereditary landed revenue, by a series of improvident management, is sunk almost to nothing; and the casual profits, arising from the other branches of the confis regalis, are likewise almost all of them alienated from the crown. In order to supply the deficiencies of which, we are now obliged to have recourse to new methods of raising money, unknown to our early ancestors; which methods constitute.

11. The king's extraordinary revenue. For, the public patrimony being got into the hands of private subjects, it is but reasonable that private contributions should supply the public service. Which, though it may perhaps fall harder upon some individuals, whose ancestors have had no share in the general plunder, than upon others, yet, taking the nation throughout, it amounts to nearly the same; provided the gain by the extraordinary should appear to be no greater than the loss by the ordinary revenue. And perhaps, if every gentleman in the kingdom was to be stripped of such of his lands as were formerly the property of the crown, was to be again subject to the inconveniences of purveyance and pre-emption, the opprobrium of forfeit-laws, and the slavery of feudal-tenures; and was to resign into the king's hands all his royal franchises of waifs, wrecks, estrays, treasure-trove, mines, deobands, forfeitures, and the like; he would find himself a greater loser than by paying his quota to such taxes as are necessary to the support of government. The thing, therefore, to be wished and aimed at in a land of liberty, is by no means the total abolition of taxes, which would draw after it very pernicious consequences, and the very supposition of which is the height of political absurdity. For as the true idea of government and magistracy will be found to consist in this, that some few men are deputed by many others to preside over public affairs, so that individuals may the better be enabled to attend their private concerns; it is necessary that those individuals should be bound to contribute a portion of their private gains, in order to support that government, and reward that magistracy, which protects them in the enjoyment of their respective properties. But the things to be aimed at are wisdom and moderation, not only in granting, but also in the method of raising, the necessary supplies; by contriving to do both in such a manner as may be most conducive to the national welfare, and at the same time most convenient with economy and the liberty of the subject; who, when properly taxed, contributes only, as was before observed, some part of his property in order to enjoy the rest.

These extraordinary grants are usually called by the synonymous names of aids, subfutes, and supplies; and are granted by the commons of Great Britain, in parliament assembled. See Parliament and Tax.

The clear nett produce of the several branches of the revenue, after all charges of collecting and management paid, amounted in the year 1786 to about L. 15,397,000 Sterling, while the expenditure was found
The respective produce of the several taxed were originally separate and distinct funds; being securities for the sums advanced on each several tax, and for then only. But at last it became necessary, in order to avoid confusion, as they multiplied yearly, to reduce the number of these separate funds, by uniting and blending them together; superadding the faith of parliament for the general security of the whole. So that there are now only three capital funds of any account, the aggregate fund, and the general fund, so called from such union and addition; and the South-Sea fund, being the produce of the taxes appropriated to pay the interest of such part of the national debt as was advanced by that company and its assignees. Whereby the separate funds, which were thus united, are become mutual securities for each other; and the whole produce of them, thus aggregated, liable to pay such interest or annuities as were formerly charged upon each distinct fund: the faith of the legislature being moreover enunciated from the time of payment of such part of the national debt. To this have been since augmented to £800,000, and that certain annuity accepted by his present majesty at first was at first £800,000, but it has been since augmented to £900,000. The expenses themselves being put under the same care and management as the other branches of the public patrimony, produce more, and are better collected than heretofore; and the public is a gainer of upwards of £100,000 per annum by this disinterested bounty of his majesty.

The sinking fund, though long talked of as the last resource of the nation, proved very inadequate to the purpose for which it was established. Ministers found pretences for diverting it into other channels; and the diminution of the national debt proceeded slowly during the intervals of peace, whilst each succeeding war increased it with great rapidity. To remedy this evil, and restore the public credit, to which the late war had given a considerable shock, Mr Pitt conceived a plan for diminishing the debt by a fund, which should be rendered unalienable to any other purpose. In the session 1786, he moved that the annual surplus of the revenue above the expenditure should be raised, by additional taxes, from £900,000 to one million Sterling, and that certain commissioners should be vested with the full power of disposing of this fund in the purchase of stock (ice annuities), for the public, in their own names. These commissioners should receive the annual million, quarterly payments of £250,000, to be filled out of the exchequer before any other money, except the interest of the national debt itself; by these provisions, the fund would be secured, and no deficiencies in the national revenues could affect it, but such must be separately provided for by parliament.

The accumulated compound interest on a million yearly, together with the annuities that would fall into that fund, would, he said, in 28 years amount to a sum as would leave a surplus of four millions annually, to be applied, if necessary, to the exigencies of the state. In appointing the commissioners, he should, he said, endeavour to choose persons of such weight and character as corresponded with the importance of the commission they were to execute. The speaker of the house of commons, the chancellor of the exchequer, the master of the rolls: the governor and deputy governor of the bank of England, and the accountant-general of the high court of chancery, were persons who, from their several situations, he should think highly proper to be of the number.

The principle of this bill no objection was made, though several specious but ill-founded ones were urged against the sufficiency of the mode which the chancellor of the exchequer had adopted for the accomplishment of so great and so desirable an end. He had made a clause in his bill, that the accumulating million should never be applied but to the purchase of stock. To this clause Mr Fox objected, and moved that the commission
fioners therein named should be empowered to accept so much of any future loan as they should have cash belonging to the public to pay for. This, he said, would relieve that diftreff the country would otherwise be under, when, on account of a war, it might be necessary to raise a new loan; whenever that should be the case, his opinion was, that the minister should not only raise taxes sufficiently productive to pay the interest of the loan, but also sufficient to make good to the sinking fund whatever had been taken from it.

If, therefore, for instance, at any future period a loan of six millions was proposed, and there was at that time one million in the hands of the commissioners, in such case they should take a million of the loan, and the loan, but whatever had been taken from it. However, as the whole sum of millions was proposed, and there was at that time one million in the hands of the commissioners, thereupon should be received by them for the public. Thus government would only have five millions to borrow instead of six; and from such a mode of proceeding, he said, it was evident great benefit would arise to the public.

This clause was received by Mr Pitt with the strongest marks of approbation, as was likewise another, moved by Mr Pulteney, enabling the commissioners named in the bill to continue purchasing stock for the public when it is above par, unless otherwise directed by parliament. With these additional clauses the bill was read a third time on the 15th of May, and carried up to the Lords, where it also paifed without meeting with any material opposition, and afterwards received the royal assent.

The operation of this bill fulfilled perhaps the minister's most fanguine expectation. The fund was ably managed, and judiciously applied; and in 1793 the commissioners had extinguished five millions of the public debt. The war, however, into which the nation was then involved, and of which there is yet no certain prospect of a near end, has made it necessary to borrow additional sums, so large, that many years of peace must elapse before the operation of the fund can contribute sensibly to the relief of the people. The clear produce of the taxes raised on the people of this country was, in the year 1792, very near L. 17,000,000; and it must henceforth, from the accumulation of the debt, and the enormous expense of the present war, be necessarily rendered greater.

Revenue, in hunting, a fleetly lump formed chiefly by a cluster of whitefth worms on the head of the deer, supponoed to occasion the casting of their horns by gnawing them at the root.

REVERBERATION, in physics, the act of a body repelling or reflecting another after its impinging thereon.

REVERBERATION, in chemistry, denotes a kind of circulation of the flame by means of a reverberatory furnace.

REVERBERATORY, or Reverberating Furnace. See Chemistry-Index at Furnace, and Furnace.

REVEREND, a title of respect given to ecclesiastics. — The religious abroad are called reverend fathers, and abbots; priories, &c. reverend mothers. In England, bishops are right reverend, and archbishop's most reverend. In France, before the Revolution, their bishops, archbishops, and abbots, were all alike most reverend.

In Scotland the clergy individually are reverend; a synod is very reverend, and the general assembly is reverend.

REVERIE, the name with delirium, raving, or distraction. It is used also for any ridiculous, extravagant imagination, adition, or proposition, a chimera, reverential, or visionary. But the most ordinary use of the word among English writers, is for a deep disorderly musing or meditation.

REVERSAL of Judgment, in law. A judgment may be falsified, reversed, or voided, in the first place, without a writ of error, for matters foreign to or debors the record, that is, not apparent upon the face of it; so that they cannot be aligned for error in the inferior court, which can only judge from what appears in the record itself; and therefore, if the whole record be not certified, or not truly certified, by the inferior court, the party injured thereby (in both civil and criminal cases) may allege a diminution of the record, and cause it to be rectified. Thus, if any judgment whatever be given by persons who had no good commis­sion to proceed against the pern condemned, it is void; and may be falsified by shewing the facial matter, without writ of error. As, where a commis­sion includes to A and B, and twelve others, or any two of them, of which A or B shall be one, to take and try indictions; and any of the other twelve proceed without the interposition or preference of either A or B; in this case all proceedings, trials, convictions, and judgments, are void for want of a proper authority in the commissioners, and may be falsified upon bare inspection, without the trouble of a writ of error; it being a high misdemeanour in the judges to proceeding, and little (if any thing) short of murder in them all, in case the person so attainted be executed and suffer death. So likewise if a man purch­ases land of another; and afterwards the vender is, either by outlawry or his own confession, convicted and attainted of treason or felony previous to the sale or alienation: whereby such land becomes liable to forfeiture or escheat: now, upon any trial, the purchaser is at liberty, without bringing any writ of error, to falsify not only the time of the felony or treason falsified, but the very point of the felony or treason itself; and is not concluded by the confession or the outlawry of the vender, though the vender himself is concluded, and not suffered now to deny the fact, which he has by confession or flight acknowledged. But if such avow a of the vender was by verdict, on the oath of his peers, the alienee cannot be received to falsify or contradict the fact of the crime committed; though he is at liberty to prove a mistake in time, or that the offence was committed after the alienation, and not before. Secondly, a judgment may be reversed, by writ of error, which lies from all inferior criminal jurisdictions to the court of king's-bench, and from the king's bench to the house of peers; and may be brought for notorious mistakes in the judgment or other parts of the record: as where a man is found guilty of perjury, and receives the judgment of felony, or for other less palpable errors; such as any irregularity, omission, or want of form in the proceeds of outlawry, or proclama­tion; the want of a proper addition to the defendant's name, according to the statute of additions; for not properly naming the sheriff or other officer of the court, or not duly describing where his county-court was held: for laying an offence, committed in the time of the late king, to be done against the peace of the present; and for many other similar causes, which (though allowed out of tenderness to life and liberty) are not much to the credit or advancement of the national justice.- These writs of error, to reverse judgments in cause of mild.
In order to render the doctrine of reversions easy, we proceed to give the following table, which shows the present value of one pound, to be received at the end of any number of years not exceeding 40; discounting at the rate of 5, 4, and 3 per cent. compound interest.

</table>

The use of the preceding table.—To find the present value of any sum to be received at the end of a given term of years, discounting at the rate of 3, 4, or 5 per cent. compound interest. Find by the above table the present value of 11. to be received at the end of the given term; which multiply by the number of pounds proposed, (cutting off four figures from the product on account of the decimals), then the result will be the value sought: For example, the present value of 1,000, to
REV [ 150 ] REV

Revivification— to be received 10 years hence, and the rate of interest 5 per cent. is equal to $6139 \times 10,000 = 61,390,000$.

The present value of $10,000.1$ due in ten years, the rate of interest being 3 per cent. is

\[ 7441 \times 10,000 = 744,100 \]

Reversion of Series, in algebra, a kind of reversed operation of an infinite series. See Series.

REVIVIFICATION, in chemistry, a term generally applied to the distillation of quicksilver from cinnabar.

Commission of Review, is a commission sometimes granted, in extraordinary cases, to revise the sentence of the court of delegates, when it is apprehended they have been led into a material error. This commission the king may grant, although the statutes prohibit it; but green, with an abrupt descent, and sometimes granted, in extraordinary cases, to reviše the decisions, when they have been led into a material error. This sentence of the court of delegates, when it is confirmed by royal warrant, although the statutes prohibit it, may grant, although the statutes prohibit it.

At all reviews, the officers should be properly armed, ready in their exercise, salute well, in good time, and with a good air; their uniform genteel, &c. The intention of the manual exercise must be performed in good time, and with life; and the men carry their arms well; march, wheel, and form with exactness. All manoeuvres must be performed with the utmost regularity, both in quick and slow time. The firings are generally 36 rounds; viz. by companies; by grand divisions; by sub-divisions; obliquely, advancing, retreating; by files; in the squares; street firings, advancing, and retreating; and lastly, a volley. The intention of a review is to know the condition of the troops, see that they are complete and perform their exercises and evolutions well.

Review is also applied to Literary Journals, which give a periodical view of the state of literature—as the Monthly Review, the Critical Review, the British Critic, and Analytical Review, &c.

RE-UNION ISLAND, an island in the South Sea, discovered by the French on the 16th December 1773; lying, according to M. de Pages, in latitude 48° 21' and longitude 66° 47', the variation of the needle being 30° always towards north-west. The road and harbour are extremely good, and the latter from 16 to 8 fathoms deep at the very flore. The coast on each side is lofty, but green, with an abrupt descent, and swarms with a species of buffalos. The penguins and seals, which swarmed on the sands, were nowise alarmed at the approach of those who landed; from whence M. de Pages concluded that the country was wholly uninhabited. The soil produces a kind of grass, about five inches long, with a broad black leaf, and seemingly of a rich quality—but there was no vestige of a tree or human habitation. See Travels round the World by M. de Pages, Vol. III. chap. viii. and ix.

REVOLUTION, in politics, signifies a change in the constitution of a state; and is a word of different import from revolve, with which it is sometimes contended. When a people withdraw their obedience from their governors for any particular reason, without overturning the government, or waging an offensive war against it, they are in a state of revolt; when they overturn the government and form a new one for themselves, they effect a revolution.

That which is termed the revolution in Britain is the British Revolution, which, in 1688, took place in consequence of the forced abdication of king James II. When the Protestant succession was established, and the constitution restored to its primitive purity. Of this important tranfition, which confirmed the rights and liberties of Britons, we have endeavoured to give an impartial account under another article (see Britain, no. 281, &c.).

Of the rise and progress of the American revolution, American which is still fresh in the memory of our readers, a large detail is given under the article America: But there are two other revolutions yet pending, of which some account will be expected in this place.

The Polish revolution, which, in all its circumstances, was perhaps the least exceptional of any in the records of history, we have already traced to the period when the amiable king, overawed by the arms of Russia, was obliged to undo his patriotic work, and give his sanction to the restoration of the old and wretched government (see Poland). Since that period, Kossuth's army has been completely defeated, himself made a prisoner, Warfaw taken, and the whole kingdom subdued by the powers combined against it. What will be the consequences of this success may perhaps be conceived, but the rumours of the day are various. At one time we are told, that Poland is to be no longer an independent state, but to be divided among the three great powers which formerly wrested it from some of its most valuable provinces. At another time, we hear of the disinterested intention of the Emperor, to restore the king to his original authority; although he has, in the mean time, driven him from his capital, where he herself exercises sovereign power. And a third report says, that Stanislavus is to retire with a large pension, and a Russian prince to step into his throne. The first of these rumours we think much more probable than the other two; especially as it seems confirmed by the following letter sent from Grodno, on the 18th of January, by the unfortunate king to the British ambassador.

"My dear Gardner—The characters with which you and I have been invested seem to be now almost at an end. I do not expect to see you again, but it is of importance to me to bid you farewell; and this I do from the bottom of my heart. You will preserve a place in my heart till death; and I hope that at last we shall meet again, in a place where upright minds, according to my opinion, will be for ever united.

"Every thing belonging to the usual etiquette has been so much changed and interrupted by my sad fate, that most probably neither you nor I will be able to fulfill the diplomatic duties."

"But be assured, that I love and honour your king and
Revolution and nation. This will apprise you of. Be assured also, that I wish you should preferve an affection towards your friend. If I am able to speak to you in no prose, may picture will speak to you for me! (Signed) STANISLAUS AUGUSTUS, King.

This shows, at least, the fate of the king; and leaving that of the kingdom to be ascertained by time, we proceed to fill up a promise which we made respecting another question, to which all the nations of Europe are still looking with anxiety and alarm.

When treating of France under a former article, we stated a few of the most striking historical facts which led to the commencement of the revolution; and we now come to trace the series of transactions which have marked its terrible career. In doing this, we shall compree our ideas as much as possible; and out of the endless variety of materials of which the public are in possession, we shall endeavour to extract a short and, if possible, a tolerably clear detail. For this purpose, however, it will be necessary that we begin, by stating the internal situation of France at the period immediately preceding the revolution, along with the more obvious political circumstances which contributed to the production of that event. The moral history of man is always more important than the mere recital of any physical occurrences that may take place in his lot. It is not the fall of a mighty monarch and the dispersion of his family; it is not the convulsion of empires, and the oceans of human blood which have been shed, that render the French revolution peculiarly interesting. Such events, however deplorable, are far from being without example in the history of mankind. In the populous regions of the eart, where supberiion and servility have always prevailed, they are regarded as forming a part of the ordinary course of human affairs; because an intrepid and skilful usurper finds it easy to intimidate or enslave millions of weak and credulous men. In Europe the case is very different; no adventurer can advance far without encountering thousands as artful and as daring as himself. Events are not the result either of blind hazard or of individual skill; conspiracies or plots produce little effect. Like other arts, the art of government has been brought to such perfection; and an established constitution can only be shaken by the strong convulsion produced by national passions and efforts. The wonderful spectacle which we are now to contemplate, is that of a mild and polite people becoming an infallible instrument and source of all felicity, and which antiquity had hallowed or education taught them to respect; a superfluous people treating the religion of their fathers with contempt; a long enslaved people, whose very chains have become dear to them, occupied in their public councils in the discussion of refined, and even visionary schemes of freedom: in short, 25,000,000 of persons suddenly treading under foot every sentiment and every prejudice that they themselves had once regarded as sacred and venerable.

Like the other nations of Europe, France was formerly governed by a barbarous aristocracy, whose different members were feebly united by the authority of a succession of kings deficient in power or influence. The nobles, within their own territories, enjoyed privileges entirely royal: they made peace and war; they coined money; they were judges in the last resort; their valets were their slaves, whom they bought and sold along with the lands; the inhabitants of cities, although freemen, were depressed and poor, depending for protection upon some tyrannical baron in their neighbourhood. At length, however, by the progress of events, the cities rose into considerable importance, and their inhabitants, along with such freemen of low rank as refused in the country, were considered as entitled to a representation in the *States-General* of the kingdom, under the appellation of the *third estate*. The clergy and the nobles forming the first two estates. But the sovereign, having speedily become despotic, the meetings of the *States-General* were laid aside. This absolute authority, on the part of the crown, was not acquired, as it was in England by the house of Tudor, by abolishing the pernicious privileges of the nobles and elevating the communes; but by skilful encroachments, by daring exertions of prerogative, and the use of a powerful military force. In France, therefore, the monarch was absolute, yet the nobles retained all their feudal privileges, and the ecclesiastical hierarchy did the same. The higher orders of them enjoyed immense revenues; the clergy formed the first estate of the kingdom, to which all the richest and most respectable exceptions were admitted into it. The lower clergy, or great body of acting clergy, formed more than about 130,000, and their *visites* about half that sum. A few of their dignified clergy were men of great piety, who reigned constantly in their dioceses, and attended to the duties of their office; but for the greater number of them passed their lives at Paris and Versailles, immersed in all the intrigues and dissipation of a gay and corrupted court and capital. They were almost exclusively elected from among the younger branches of the families of the most powerful nobility, and accounted it a kind of honour to the order of bishops for any person of low rank to be admitted into it. The lower clergy, on the contrary, were persons of mean birth, and had little chance of preference. At the same time, we find several respectable exceptions to this last rule. The clergy, as a body, independent of the tithes, possessed a revenue arising from their property in land, amounting
The nobility was nominally the second order of the state, but it was in reality the first. The nobles amounted to no less than 200,000 in number. The title and rank descended to all the children of the family, but the property to the eldest alone; hence vast multitudes of them were dependent upon the bounty of the court. They regarded the useful and commercial arts as dishonourable, and even the liberal professions of the law and physic as in a great measure beneath their dignity, disdainful to intermarry with the families of their professors.

The feudal system in its purity was extremely favourable to the production of respectable qualities in the minds of those who belonged to the order of the nobles; but the introduction of commerce has rendered its decline equally unfavourable to that class of men.

Instead of the ancient patriarchal attachment between the feudal chief and his vassals, the nobility had become greedy landlords in the provinces, that they might appear in splendour at court and in the capital. There, lost in intrigue, sensuality, and vanity, their characters became frivolous and contemptible. Such of the French noblesse, however, as remained in the provinces, regarded with indignation this degradation of their order, and still retained a proud sense of honour and of courage, which has always rendered them respectable. The order of the nobles was exempted from the payment of taxes, although the property of some of them was immense. The elates of the prince of Conde, for example, were worth L. 200,000 a year, and those of the duke of Orleans nearly twice as much. The crown had indeed imposed some trifling taxes upon the noblesse, which, however, they in a great measure contrived to elude.

Next to the nobles, and as a privileged order professing a secondary kind of nobility of their own, we may mention the parlements. These were large bodies of men, in different provinces, appointed as courts of law for the administration of justice. In consequence of the corruption of the officers of the state, the members purchased their places, which they held for life; but the fee was usually preferred when he offered to purchase his father's place. In consequence of this lax circumstance, the praetitious lawyers had little chance of ever becoming judges. Courts thus constituted consisted of a motley mixture of old and young, learned and ignorant men.

Justice was ill administered. The judges allowed the public funds and were only to be openly solicited by the parties or their friends. No wife man ever entered into a litigation against a member of one of these parlements; no lawyer would undertake to plead his cause; it never came to a successful issue, and usually never came to any issue at all. After the states-general had fallen into disuse, the parlements acquired a certain degree of political consequence, and formed the only check upon the absolute power of the crown.

The laws, or royal edicts, before being put in force, were always sent to be registered in the books of the parlements. Taking advantage of this, in favourable times and circumstances, they often delayed or refused to register the royal edicts, and presented remonstrances against them. This was done under a kind of legal fiction: for they pretended that the obnoxious edicts being injurious to the public happiness, could not be the will of the king, but must either be a forgery or an imposition by the ministers. These objections were got the better of, either by a positive order from the king, or by his coming in person and ordering the edict to be registered. The parlements, however, often carried their opposition very far, even to the ruin of themselves and their families as individuals. This rendered them extremely popular with the nation, and enabled them to embarrass a weak administration. After all, however, the opposition of the parlements was so feeble, that it was never thought worth while to abolish them entirely till towards the end of the reign of Louis XV, but they were restored as a popular measure at the beginning of the reign of Louis XVI.

The tiers état, or commons, formed the lowest order of the state in France, and they were depressed and miserable in the extreme. To form a conception of their situation, it is necessary to observe that they bore the whole pecuniary burdens of the state: They alone were liable to taxation. An expensive and ambitious system of court; an army of 200,000 men in time of peace, and of twice that number in war; a considerable marine establishment, public roads and works, were all supported exclusively by the lowest of the people. To add to the evil, the revenues were ill collected. They were let out to farmers-general at a certain sum, over and above which they not only acquired immense fortunes to themselves, but were enabled to advance enormous presents to those favourites or minister's of the king or the minister, by means of whom they procured their places. To raise all this money from the people, they were guilty of the cruelest oppression, having it in their power to obtain whatever revenue laws they pleased, and executing them in the severest manner. For this last purpose they kept in pay an army of clerks, subalterns, scouts, and spies, amounting to 80,000 men. These men were indeed detested by the king, whom they deceived and kept in poverty; by the people, whom they oppressed; and by the ancient nobility, as purse-proud upstarts. But the court of France could never contrive to manage without them. The pettifogs could be called out by the intendants of the provinces in what they called corvées, to work upon the high roads for a certain number of days in the year, which was a source of severe oppression, as the intendant had the choice of the time and place of their employment, and was not bound to accept of any commutation in money. They were moreover subject to the nobles in a thousand ways. The nobles retained all their ancient manorial or patriarchal jurisdictions. The common people being anciently slaves, had obtained their freedom upon different conditions. In many places they and their posterity remained bound to pay a perpetual tribute to their feudal lords. Such tributes formed a considerable part of the revenue of many of the provincial nobles. No man could be an officer of the army, by a late regulation, who did not produce proofs of nobility for four generations. The parlements, although originally of the tiers, attempted also to introduce a rule that none but the noblesse should be admitted into their order. In such a situation, it will not be accounted surprising that the common people of France were extremely superstitious.
the truth and ignorant. They were, however, passionately devoted to their monarch, and whatever concerned him. In 1754, when Louis XV. was taken ill at Mentz, the whole nation was truly in a kind of despair. The courier and his horse that brought the news of his recovery to Paris were both almost suffocated by the embraces of the people.

We have said that the French monarch was despotic. His power was supported by his army and by a watchful police, having in pay an infinite host of spies and other servants. In France no man was safe. The secrets of private families were searched into. Nothing was unknown to the jealous inquisition of the police. Men were seized by *lettres de cachet* when they least expected it, and their families had no means of discovering their fate. The sentence of a court of law against a nobleman was usually reversed by the minister. No book was published without the licence of a censor-general appointed by the court, and the minister was accountable to none but the king. No account was given of the expenditure of the public money. Enormous gratifications and pensions were given as the reward of the most infamous services. The supreme power of the state was usually lodged with a favourite minister, and he was sometimes a woman taken from public prostitution. This was not indeed the case under Louis XVI. but it was nevertheless one of the misfortunes of his life that he was far from being absolute in his own family. Still, however, with all its faults, the French court was the most splendid and polished in Europe. It was more the resort of men of talents and literature of every kind, and there they met with more ample protection, than anywhere else. The court was often jealous of their productions, but they met with the most distinguished attention from men of fortune and rank; infomuch that for a century past the French have given the law to Europe in all questions of taste, of literature, and of every polite accomplishment. The gay elegance that prevailed at court diffused itself through the nation; and amidst much internal misery, gave it to a foreigner the appearance of happiness, or at least of levity and vanity.

Such as it was, this government had fobbed for ages, and might have continued, had not a concurrence of causes contributed to its overthrow. The inferior orders of clergy, excluded from all chance of preferment, regarded their superiors with jealousy and envy, and were ready to join the party of their own rank in any popular commotion. The inferior provincial nobility beheld with contempt and indignation the vices and the power of the courtiers, and the higher nobility wished to diminish the power of the crown. The practicing lawyers, almost entirely excluded from the chance of becoming judges, wished eagerly for a change of affairs, not doubting that their talents and professional skill would render them necessary amidst any alterations that could occur. Accordingly, they were the first instruments in producing the revolution, and have been its most active supporters. The middle interest wished eagerly for the downfall of the ancient nobility. As for the great mass of the common people, they were too ignorant, too superstitiously attached to old establishments, and too much depressed, to have any conception of the nature of political liberty, or any hope of obtaining it. We have already stated the leading circumstances which led to the French revolution (Acad. Francaise, vol. 184, &c.); but there were other circumstances which contributed in an equal degree both to its commencement and its progress.

For 40 years the principles of liberty had been diffused with eagerness in France by some men of great talents, as Rouffian, Helvetius, and Raynal, to whom the celebrated Montesquieu had led the way. Besides these, there was in France a vast multitude of what were called men of letters, or persons who gave this account of the manner in which they spent their time. All these were deeply engaged on the side of some kind of political reform. The men of letters in Paris alone are said to have amounted to 20,000. One of the first editions of the administration of the archbishop of Thoulouse was, on the 5th July 1788, to publish a resolution of the king in council, inviting all his subjects to give him their advice with regard to the state of affairs. This was considered as a concession of an unlimited liberty of the press; and it was scarcely possible to form an idea of the infinite variety of political publications which from that period diffused among the people a dissatisfaction with the order of things in which they had hitherto lived.

The established religion of France had for some time past been gradually undermined. It had been solemnly assailed by philosophers in various elaborate performances; and men of wit, among whom Voltaire took the lead, and attacked it with the dangerous weapon of ridicule. The Roman Catholic religion is much expounded in this respect, in consequence of the multitude of false miracles and legendary tales with which its history abounds. Without discriminating between the respectable principles on which it rests, and the unworthy follies by which they have been defaced, the French nation learned to laugh at the whole, and rejected instead of reforming the religion of their fathers. Thus the first order in the state had already begun to regard as useless, and the minds of men were prepared for important changes.

The immense population of the city of Paris, amounting to upwards of 800,000 souls, rendered it an important engine in the hands of the conductors of the revolution. An overgrown capital has always proved dangerous to a government that is or attempts to be despotic, as appears from the history of ancient Babylon and Rome, as well as of modern Conflantinople, of London under Charles I. and Paris under several of its kings.

We cannot here avoid mentioning a physical event, which afflicted not a little in producing many of the convulsions attending the revolution, a general scarcity of grain, which occurred about that period. On Sunday the 13th of July 1788, about nine in the morning, without any eclipse, a dreadful darkness suddenly spread several parts of France. It was the prelude of such a tempest as is unexampled in the temperate climates of Europe. Wind, rain, hail, and thunder, seemed to contend in impiety; but the hail was the great instrument of ruin. Instead of the rich prospects of an early autumn, the face of nature in the space of an hour presented the dreary aspect of universal winter. The foil was converted into a morass, the flanding corn blotted into the quagmire, the vines broken to pieces, the fruit trees demolished, and unmelted hail lying in heaps like rocks of solid ice. Even the robust forest
the fury of the storm. The hail was composed of enormous, solid, and angular pieces of ice, some of which weighed from eight to ten ounces. The country people, beaten down in the fields on their way to church, amidst this conflagration of the elements, concluded that the last day was arrived; and scarcely attempting to extricate themselves, lay despairing and half suffocated amidst the water and the mud, expecting the immediate dissolution of all things. The storm was irregular in its devastations. While several rich districts were laid entirely waste, some intermediate portions of country were comparatively little injured. One of 60 square leagues had not a single ear of corn or a fruit of any kind left. Of the 66 parishes in the district of Pontoise, 43 were entirely desolated, and of the remaining 23 some lost two-thirds and others half their harvest. The isle of France, being the district in which Paris is situated, and the Orleans, appear to have suffered chiefly. The damage there, upon a moderate estimate, amounted to 80,000,000 of livres, or between three and four millions Sterling. Such a calamity must at any period have been severely felt; but occurring on the eve of a great political revolution, and amidst a general fear and alarm throughout Europe, it was peculiarly unfortunate, and gave more embarrassment to the government than perhaps any other event whatever. Numbers of families found it necessary to contract their mode of living for a time, and to diminish their servants, who were thus left without a subsistence. Added to the public discontent and alarm, was a period of much distress, and a scarcity of bread. Added to the public discontent and alarm, was a period of much distress, and a scarcity of bread. Added to the public discontent and alarm, was a period of much distress, and a scarcity of bread. Added to the public discontent and alarm, was a period of much distress, and a scarcity of bread. Added to the public discontent and alarm, was a period of much distress, and a scarcity of bread.

The spring of the year 1789 was a period of much political anxiety in France. The superior orders wished to reduce the power of the crown, but were jealous of their own privileges, and determined to retain them; while the popular philosophers and others were endeavouring to render them odious, and to reduce the people to a love of freedom. Still, however, the great body of the common people remained careless spectators of the struggle and unobservant of the approaching commotion. Such was their indifference, that few of them took the trouble even to attend and vote at the elections of the deputies to the Estates-General. In many places, where a thousand voters were expected, not fifty came forward; but such of them as did appear showed that a desire was afoot which might take one day rise into important events. In the instructions which they gave to their deputies, the British constitution was in general the model of what they wished their government to be. They demanded equal taxation, the abolition of "lettres de cachet" or arbitrary imprisonment, the responsibility of ministers, and the extinction of the feudal privileges of the nobles; but they wished that the three orders of the state should fit and vote in one house, well knowing that their nobility were not prepared to act the moderate part of the British house of lords. The nobles, on the contrary, although willing to renounce some of their pecuniary privileges, and to sacrifice the power of the crown, were most decisively resolved neither to surrender their feudal prerogatives nor the right of sitting in three separate assemblies; by means of which each of the orders could easily resist the encroachment of the other two. Mr Neckar has been improperly cen-110 sured for not deciding this last important question previous to the meeting of the Estates-General; but it must be observed, that the very purpose of calling that assembly was to overturn the unjust privileges of the higher orders through its medium, and without any direct interposition on the part of the ministers. Had the king positively decided in favour of three chambers, the nobles and the clergy would have retained all those ancient abuses established in their own favour, of which it was his wish to deprive them, and the crown and its prerogatives would have been the only objects of sacrifice. It was therefore thought safer to leave the "État à

States-General [1789-1791]

The States-General assembled at Verailles. They commenced business by going in solemn procession, preceded by the clergy, and followed by the king, according to ancient custom, to church, to perform an act of devotion. The nobles were arrayed in a splendid robe, and they and the higher clergy glittered in gold and jewels. The commons appeared in black, the drabs belonging to the law. The assembly
The assembly was thereafter opened by a short speech from
the throne, in which the king congratulated himself upon
thus meeting his people assembled; alluded to the
national debt, and the taxes, which were severely felt
because unequally levied; he took notice of the general
dissentient and spirit of innovation which prevailed,
but declared his confidence in the wisdom of the assem-
by for remedying every evil. “May an happy union
(added he) reign in this assembly; and may this epocha
become ever memorable for the happiness and prosperi-
ty of the country. It is the will of my heart; it is
the most ardent desire of my prayers; it is, in short,
the price which I expect from the sincerity of my in-
tentions and my love for my people.”

M. Barretin, the keeper of the seals, next addressed the
assembly in a congratulatory and uninterrupting speech.
He was followed by the popular minister M. Neckar,
who spoke for three hours. Though much applauded
on account of the clear financial details which his speech
contained, he encountered a certain degree of cen-
sure from all parties, on account of the cautious ambiguity
which he observed with regard to the further proceedings
of the states-general.

Next day the three orders assembled separately. The
deputies of the tiers état amounted to 600 in num-
ber, and those of the nobles and clergy to 300 each.
During their first sittings much time was spent in
unimportant debates about trifling points of form;
but the first important question, that necessarily be-
came the subject of their discussion, was the verification
of their powers, or production of the commissions of the
members, and investigation of their authenticity. The
commons (tiers état) laid hold of this as a pretext for
opening the grand controversy, whether the states-general
should sit in one or in three separate chambers? They
sent a deputation inviting the nobles and the clergy to meet
along with them in the common hall for the pur-
puse of verifying their powers in one common assembly.
In the chamber of the clergy 114 members voted for
the performance of this ceremony in the general assembly;
and 133 against it. But in the more haughty order
of the nobles, the revolution for the verification in their
own assembly was carried by a majority of 188 against
47. The commons paid no regard to this. They
were conducted by bold and skilful leaders, who dis-
cerned the importance of the point in contest, and
resolved not to abandon it. Aware of the exigencies of
the state, they knew that the crown was nearly verging
upon bankruptcy; and that such were the deficiencies
of the revenue that only a short delay was necessary to
accomplish the absolute dissolution of the government.
They suffered five weeks to pass away therefore in to-
tal inactivity. During this period proposals were made
on the part of the ministry for a pacification between
the three orders, and conferences were opened by com-
missioners from each. But no art could induce the
counsel from their original purpose, or prevail with
them to enter upon the business of the state.

The nation had expected much from the assembling
of the states-general, and learnt the news of their inac-
tion with no small degree of concern. The tiers état was
naturally popular, and the public censure could not
readily devolve upon that favourite order. Moreover
from the first period of their assembling the commons
made every effort to augment their own natural popu-
lariry. They admitted all persons promiscuously into
the galleries, and even into the body of their hall. No
restraint was attempted to be laid upon the most vehe-
ment marks of popular applause or cenfure. Lists of
the voters names were publicly taken and sent to Paris
upon every remarkable occasion; and the members sud-
denly found themselves become, according to their po-
itical sentiments, the objects of general execration or
applause. The new and bold notions of liberty that
were daily advanced by the leaders of the tiers état were
received with acclamation by their hearers. The capi-
tal became interested in the issue of every debate; and
the political fervor was eagerly imbied by the nation
with that vivacity which is so peculiar to the French.
The commons accused the nobles of obliquely impe-
ding the business of the state, by refusing to verify their
powers in one common assembly. The accusation was
swallowed by the multitude, who saw not, or were un-
willing to see, that the attack was made by their own
favourite order. In the mean time the nobles became
rapidly more and more unpopular. Their inactivity was
infulted, new publications daily came forth, and were
greedily bought up, which reviled their whole order,
and represented them as an useless or pernicious body
of men, whose existence ought not to be tolerated in a
free state. Whoever adhered to them was branded with
the odious appellation of Arifocrate. The clergy, from
the influence of the parifs curés or parsons, seemed ready
to desert their cause. They were ever opposed by a mi-
nority of their own body, which derived lucre from hav-
ing at its head the duke of Orleans, the first prince of
the blood. Still, however, the majority of the
nobles remained firm; well aware, that if they once
confronted to sit in the same assembly, and to vote promi-
cuously, with the ambitious and more numerous body of
the commons, their whole order, and all its splendid
privileges, must speedily be overthrown.

The leaders of the commons saw the change that
was taking place in the minds of men; and they at vantage
length regarded the period as arrived when they ought
this popularly, they seize the legislative authority
in the country. They declared that the representa-
tives of the nobles and the clergy were only the deputies of par-
cular incorporations whom they would allow to
vote along with themselves; but who had no
right to a collective capacity to act as the legislators of
France. For conducting business with more facility,
they appointed 20 committees. In consequence of a
propal by the Abbé Sieyes, a final mefage was
sent to the privileged orders requiring their attendance
as individuals, and intimating that the commons, as the
deputies of 96 out of every hundred of their country-
men, were about to assume the exclusive power of li-
gislation. None of the nobles obeyed this summons;
but three curés, Meffrs Cetve, Ballard, and Jalot, pre-
sented their commissions, and were received with loud
acclamations. They were next day followed by five
more, among whom were Meffrs Gregoire, Dillon, and
Bodineau. After some debate concerning the appella-
tion which they ought to assume, the commons, with
such of the clergy as had joined them, solemnly voted
themselves the sovereign legislators of their country un-
der the name of the National Assembly. The result of
the vote was no sooner declared, than the hall resounded
with
And their own

Fears of the

Affairs were now come to a crisis, and the nobles perceived that they must infantly make a decisive stand, or yield up their cause as finally lost. Such was their alarm, that M. d'Etiennemar proposed, at one of the sittings of their order, to address the king, entreating him to dissolve the states-general. Hiltherto that prince had gone along with M. Neckar in favouring the popular cause in opposition to the aristocracy. But every art was now used to alarm his mind upon the subject of the late assumptions of power on the part of the commons, and these arts were at length successful. Repeated counsels were held; M. Neckar was absent attending a dying sister, and the king was prevailed upon to act agreeably to the advice of the leaders of the nobles. But the first measure which they adopted was so ill conducted as to afford little prospect of final success. The latter day was no longer thought sufficient. Repeated counsels were held; M. Neckar was absent attending a dying sister, and the king was prevailed upon to act agreeably to the advice of the leaders of the nobles. 25

Royal seifion proclaimed.

The situation of France was now become truly alarming. Encouraged by these events, and by the applause of surrounding multitudes, the assembly now expected with firmness the measures about to be adopted.

The royal seifion was held in the most splendid form, difficulties but altogether in the style of the ancient despotism, of the king. The two superior orders were seated, while the representatives of the people, left standing a full hour in the rain, were in no humour, when at last admitted, to receive with much complacency the commands of their sovereign. The king read a discourse, in which he declared null and void the resolutions of the 17th, but at the same time prefented the plan of a constitution for France. It contained many good and patriotic principles, but preferred the dissolution of orders, and the exercise of letters de cachet; it said nothing about any active share in the legislative power to be possessed by the states-general, and was not both about the responsibility of ministers and the liberty of the press. The king concluded by commanding the deputies immediately to retire, and to assemble again on the following day. He then withdrew, and was followed by all the nobles and a part of the clergy. The commons remained in gloomy silence on their seats. It was interrupted by the grand master of the ceremonies, who reminded the president of the intentions of the king. Infantly the vehement count de Mirabeau, flaring from his seat, exclaimed with indignation, “The commons of France have determined to debate. We have heard the intentions that have been suggested to the king; and you, who cannot be his agent with the states-general, you who have here neither ear nor voice, nor a right to speak, are not the person to remind us of his speech. Go tell your master, that we are here by the power of the people, and that nothing shall expel us but the bayonets.” The applause of the assembly concurred the enthusiasm of the orator, and the master of the ceremonies withdrew in silence.

M. Camus then rose; and in a violent speech indignantly stigmatized the royal seifion by the obnoxious term of a bed of suffrage; he concluded by moving that the assembly should declare their unqualified adherence to their former decrees. This motion was followed by another, pronouncing the perjury of the deputies inviolable. Both were supported by Miers Petion, Barnave, Glaizne, the Abbé Gregoire, Sieyes, and many others, and were unanimously decreed. The assembly therefore continued their sittings in the usual form. On the following day the majority of the clergy attended as members; and on the 27th the duke of Orleans, along with 49 of the deputies belonging to the order of nobles, joined them also. The remaining nobles, as well as the small minority of the clergy, now found themselves awkwardly situated. Whether on this account, or because their leaders had by this time formed a plan for carrying their point not by peaceable means but by the aid of a military force, the king, on the 27th, invited by a pressing letter both orders to join the commons. This request was immediately complied with, although many of the nobility disapproved of the measure.

The situation of France was now become truly alarming. When the king retired from the assembly after the seifion of the royal seifion, he was followed by more than 6000 France citizens this period.
citizens, from whom loud clamours and every mark of disapprobation broke forth. All Versailles was speedily in an uproar. M. Necker had repeatedly solicited his dismission, and the report of this had increased the popular clamour. The court was in confusion. The king probably discovered, with no great satisfaction, that his minister was more popular than himself. At fix o'clock in the evening the queen sent for M. Necker. When he returned from the palace, he offered the crowd that waited for him that he would not abandon them; upon which they retired satisfied. At the same time the news of the royal fission had thrown the king of Paris into violent agitation. The peace of that capital was at this time endangered by a variety of causes. A dreadful famine of bread was at this time endangered by a variety of causes. Every officer to produce proofs of the king probably discovered, with no great crowd that waited for him that he would not abandon them; upon which they retired satisfied. of the troops, offering to be responsible for the public peace, and to proceed in a body to Paris to encounter personally every danger that might occur. But they were coolly told, that the king was the best judge of the mode of employing the troops, and that the presence of the assembly was necessary at Versailles. From a sovereign who doubted not the proceedings of the long parliament of England, a different reply could not in reason be expected. On receiving it, however, it was instantly decreed, on the motion of the ducs de la Fayette, that the late ministry had carried with them the confidence of the assembly; that the troops ought to be removed; that the ministry and shall be responsible to the people for their conduct; that the assembly perished in all its former decrees; and that it had taken the public debt under the protection of the nation, no power in France was entitled to pronounce the infamous word bankruptcy.

The city of Paris was thrown into deep consternation by the news of M. Necker's retreat. His biut and that of the Duke d'Orléans were dressed in mourning, and carried through the streets. The royal Allemund, a German regiment, broke in pieces the bulwarks, and dispersed the populace. The Prince de Lambeth, grand ecyer of France, was ordered to advance with his regiment of cavalry, and take post at the Thilleries. Being a man of a violent temper, and enraged by the appearances of disapprobation which were visible around him, he furiously cut down with his sword a poor old man who was walking peaceably in the gardens. The consequences of this act of inhumanity were such as might have been expected; a shout of execration instantly arose; the cry to arms was heard; the military were assaulted on all sides; the French guards joined their countrymen, and compelled the Germans, overpowered by numbers, and unsupported by the rest of the army, to retire.

All order was now at an end, and as night approached an universal terror diffused itself through the city. Bands of robbers were collecting; and from them or from the foreign soldier a general pillage was expected. The night passed away in confusion and tumult. It was found in the morning that the hospital of St. Lazare was already plundered. The alarm bells were rung; the citizens assembled at the Hotel de Ville, and adopted a proposal that was there made, of enrolling themselves as a militia for general defence, under the appeal of the national guard. This day and the succeeding night were spent in tolerable quietness, without any attempt on the part of the army. On the morning of the memorable 14th of July, it was discovered that the troops encamped in the Champs Elysées had moved off, and an immediate assault was expected. The national guard now amounted to 150,000 men; but they were in general defective of arms. They had assumed a green cockade; but on recollecting that this was the livery of the Count d'Artois, they adopted one of red, blue, and white. M. de la Salle was named commander in chief, officers were chosen, and detachments sent around in quest of arms. In the Hotel des Invalides upwards of 30,000 stand of arms were found, along with 20 pieces of cannon; a variety of weapons was also procured from the garde mobile de la couronne, and from the shops of armourers, cutters, &c.

The celebrated fortresses of the Bastille was an object of much jealousy to the Parisians. At 11 o'clock in the morning, M. de la Rozière, at the head of a numerous deputation, waited upon M. de Launay the governor, who promised, along with the officers of his garrison, that they would not fire upon the city unless they should be attacked. But a report was soon spread through Paris, that M. de Launay had, in a short time thereafter, admitted into the fortress a multitude of perfons, and then treacherously massacred them. The cause of this piece of perfidy has never been explained. The garrison itself has been denied; but it was attacked at the time by the duke of Dorset, the British ambas­ador at the court of France. The effect of the report was, that a sudden resolution was adopted of assailing the Bastille; an immense and furious multitude rushed into its outer, and soon forced their way into its inner courts, where they received and returned a severe fire for the space of an hour. The French guards, who were now embodied into the national guard, conducted the attack with skill and coolness: they dragged three waggons loaded with straw to the foot of the walls, and there set them on fire; the smoke of these broke the aim of the garrison, while it gave no disturbance to the more distant assailants. The besieging multitude pressed the attack with incredible obstinacy and vigour for the space of four hours; the garrison was in confusion; the officers served the cannon in person, and fired their muskets in the ranks; the governor in despair, thrice attempted to blow up the fortres. A capitulation, when at last fought, was refused to the garrison, and an unconditional surrender took place. The governor, and M. de Lombarbi his major, an un­ gentleman of distinguished humanity and honour, became victims of popular fury in spite of every effort that could be made for their protection; but the French guards succeeded in procuring the safety of the garrison. Only seven prisoners were found in the Bastille. A guard was placed in it, and the keys were sent to the celebrated M. Briffot de Wareville, who a few years before had inhabited one of its caverns.

The remaining part of this eventful day was spent at Paris in a mixture of triumph and alarm. In the pocket of the Governor of the Bastille a letter was found, encouraging him to resistance by the promise of speedy succours, written by M. de Flesselles, the provost of marchands, and chief c?y magistrate, who had pretended to be a most zealous patriot. This piece of treachery was punished by instant death; and his bloody head was carried through the city on a pole, along with that of M. de Launay. At the approach of night a body of troops advanced towards the city, at the Barriere d'Enfer. The new national guard hurried thither, preceded by a train of artillery, and the troops withdrew upon the first fire; barricades were every where formed, the alarm-bells were rung, and a general illumination continued during the whole of this night of confusion.

In the mean time, it was obvious that the new ministry were entering upon a difficult scene of action, where one false step might lead to ruin, and where their own plans of conduct ought to be maturely digested. Marshal Broglio was made minister of war, the baron de Breteuil president of finance, M. de la Gail­ziere comptroller-general, M. de la Porte intendant of the war department, and M. Fouron intendant of the navy;
But the person of the monarch was still beloved.— Early next morning the king went to the assembly, but with none of the usual solemnities. He regretted the collisions of the capital, disavowed any knowledge of an intention against the persons of the deputies, and intimated that he had commanded the removal of the troops. A deep and expressive silence prevailed for a few moments; this was succeeded by vehement and universal shouts of applause. The king arose to depart, and-infantly the whole assembly crowded around, and attended him to his palace. The queen appeared at a balcony with the dauphin in her arms; the music played the pathetic air of "Où peut-on être mieux qu'au sein de la famille." The enthu Fairfax of loyalty communicated itself to the surrounding multitudes, and nothing was heard but acclamations of joy.

On the following day, the king declared his resolution to visit the city of Paris in person. Accordingly day after day went by that prince, who never wanted personal courage, however deficient he might be in political sagacity, till he was attended by some members of the assembly and by the militia of Versailles. He was met by the celebrated M. de la Fayette, at the head of a body of the national guard, of which he had now been chosen commander in chief. M. Bailly, in whose per son the ancient office of mayor of Paris had been revived, received the king at the gates, and delivered him the keys. All this while no shout was heard from the crowd of innumerable spectators but that of "Vive la nation." The king advanced to the Hotel de Ville, where the new cockade was presented to him, which he put on, and presented himself with it at a window. At the sight of this badge of patriotism an universal shout of "Vive le Roi" burst forth from every quarter; and he returned to Versailles amidst general triumph and applause.

Much confusion still prevailed in the capital; but in which there was more appearance of regularity than could have been expected at the conclusion of such important fusión events. This arose from a casual concurrence of circumstances. To conduct with ease the elections to the states-general, Paris had been divided into 60 districts, each of which had a separate place of meeting. The people did not elect the members to the states-general; but they chose delegates, who under the name of electors, voted for the members. At the commencement of the disturbances, the electors, at the request of their fellow citizens, assumed a temporary authority; of which, however, they were soon weary, and as soon as possible procured the public election of 120 persons as municipal officers for the government of the city. The citizens having got the habit of assembling in their districts, grew fond of it: they assembled frequently, made rules for their own government, and sent commissioners to communicate with other districts. The tumultuous nature of these meetings, and the vehemence of debate which prevailed in them, will be conceived from the ludicrous contrivance of one of their preluders, who flattened a drummer at the back of his chair, and when the confusion and noise became altogether unGovernable, gave the signal for beating the drum, which speedily overpowered every other noise. These meetings, however, gradually ripened into clubs, in which much dexterity and intrigue were exerted.

The whole of the late ministry escaped excepting M. Foula.
Foulon. His character, it may well be imagined, was extremely unpopular; for he is said to have asserted, that he would "make the people of Paris eat hay." He had retired to the country, but was seized by his own valets, and brought to Paris with a bundle of hay tied to his back. In spite of every effort made by M. M. Bailly and Fayette to have him put on a fair trial at last, he was carried to the Place de Greve, and hanged at a lamp-iron by the enraged multitude. His fon-in-law, M. Berthier, attempting to defend himself with a similar fate, fell, covered with wounds. Their heads were carried round on poles; and thus the populace became habituated to the sight of blood and murder: they were even taught by popular fongs to glory in such actions, and particularly by the well known song Ca-ira.

In consequence of an invitation from the king, M. Necker returned to France. He was received by the assembly with great applause, and in Paris with infinite solemnity and triumph. He here, however, committed a political error that made some noise. In deploiting the late excesses and murders, and taking notice of the arrest of M. Bezenval, an officer of the Swiss guards he requested of the electors at the Hotel de Ville, in a solemn harangue, that the pafl should be forgotten; that the proclamations should cease, and a general amnesty be proclaimed. In a moment of enthusiasm this was agreed to, and the electors decreed what unquestionably exceeded their powers. The disfracts of Paris were infailly in commotion; the electors alarmed, declared that they only meant that "henceforth the people would punish no man but according to law;" and, at the same time, to prove that they themselves were free from ambition, they formally renounced all their own powers. The assembly took up the question. Meff. Lally, Tolendal, Mouner, Clermont, Tonnerre, Garat junior, and others, declared that no peron ought to be arraigned without a formal accusation. While Meff. Mirabeau, Robespierre, Barnave, and Gleize, alleged, or the contrary, that the people were entitled to lay hold of any man without a fair trial at all, publicly appeared at the head of their enemies. The debate ended, by admitting the explanation of the electors, and by a declaration that it was the duty of the assembly to see justice executed in all cases.

The commotions and enthusiasm of the capital were speedily communicated to the provinces. In every quarter the people feized upon all the arms that could be found, and the military uniformly refused to act against them. Many acts of outrage were committed in Brittany, at Strafbourg, in the Lionnois, and elsewhere, in which the nobility were the sufferers. The mischiefs that occurred were usually magnified at a distance; but that very circumstance was an additional evil. For example: It was stated in the National Assembly that M. de Mesmes, lord of Quincy, invited a number of patriots, among whom were the officers of a neighbouring garrison, to a splendid entertainment at his house, to celebrate the happy union of the three orders: That in the midst of the feast the master of the house contrived to withdraw unnoticed, and to set fire to a train previously laid, which communicated with a quantity of gunpowder in the cellars, in consequence of which the whole company, by a sudden explosion, were blown into the air. It was found on inquiry, that there was not one word of truth in the whole story.
ty a prey to infinite multitudes of animals reserved for
payment, had always been numbered among the severe
grievances of the French peasantry. These were there-
fore renounced, along with the exclusive rights of rab-
bit, deer, game, fisheries, and dovecotes. The fate of of-
ciles was abolished, and the fees exacted from the poor,
together with the privilege of holding a plurality of liv-
ings, were relinquished by the clergy. The deputies of
the Paix d'Etat, or privileged provinces, with the
deputies of Dauphiné at their head, next came forward,
and offered a surrender of their ancient privileges, re-
 questing that the kingdom might no longer remain par-
celled out among Dauphinois, Bretons, Provençaux, &c.
but that they should all form one great mass of French
citizens. They were followed by the representatives of
Paris, Marseilles, Lyons, Bourdeaux, Strasbourg, &c.
who requested leave to renounce all their separate privi-
elges as incorporations, for the sake of placing every man
and every village in the nation upon a footing of
equality. Thus the Assembly proceeded, till every
member had exhausted his imagination upon the subje-
t of reform. To close the whole, the Duc de Liancourt
proposed that a solemn Te Deum should be performed,
that a medal should be struck in commemoration of the
events of that night; and that the title of Restorer
of Gallic Liberty should be bestowed upon the
reigning monarch. A deputation was accordingly ap-
pointed to wait upon the king, respectfully to inform
him of these decrees.

Several succeeding days were necessary to form into
laws the decrees of the 4th August, and committees were
appointed to make out reports for that purpose. One of
these reports having included the tithes and revenues of
the clergy among the abuses that were to be done away,
and having proposed in lieu of them to grant a certain
fipend to the different ministers of religion to be pay-
able by the nation, the clergy attempted to make a
stand in defence of their property, and violent debates
ensued. In these they were ably supported by the Abé
Sieyes; but as the clergy had formerly deferted the
nobles, so they were now in their turn abandoned to
their fate by the hereditary a¡hocracy. The popular
party had long regarded the wealth of the church as
an easy resource for supplying the wants of the state.
Never was there a more complete proof of the influence
of opinion over the affairs of men. The Catholic
clergy of France, though poffeffed of more property
than they enjoyed at the time when princes took up
arms or laid them down at their command, now found
few defenders, that they were terrified into a volun-
tary surrender of all that they and their predecessors
had poffeffed for ages. In their overthrow, they scarcely
enjoyed even the barren honour of having fallen the
lAuft of those privileged orders that so long had ruled
over this ancient kingdom. They and the nobles, and
the king, still poffeffed their former titles and nominal
dignity; but all of them were now subdued, and at the
mercy of the commons of France, who speedily dif-
miffed them at their pleasure.

As a short season of tranquillity in the Court and the
National Assembly succeeded the great popular facri-
fices, the king had hold of it as a fit opportunity for
the appointment of a new ministry. They consisted of
the Archbishops of Vienne, the Archbishops of Bour-
deuex, M. Neckar, the Count de St Priest, Count de
Montmorin, the Count de la Luzerne, and the Count
de la Tour du Pin Paulin. M. Neckar, as minister of
finance, having stated the diftressed situation of the re-
venue, presented the plan of a loan of thirty millions of
livres. But M. Mirabeau, from a spirit of rivalry, as
it would seem, to M. Neckar, prevailed with the As-
sembly to alter and to narrow the conditions of it in
such a degree that very few subscribers were found, and
the loan could not be filled up. This failure involved
the Assembly in a considerable degree of unpopularity;
in consequence of which they allowed M. Neckar to
preferne his own terms for the purpose of obtaining a
loan of eighty millions. But the happy infant of pub-
lic confidence had been allowed to pass away, and this
loan was never more than half filled up. Recourse was
next had to patriotic contributions; and great numbers
of gold rings, silver buckles, and pieces of plate, were
presented to the Assembly. The Royal family them-
1 selves sent their plate to the mint, either to give count-
nance to these donations, or, as M. Neckar has since
afferted, through absolute necessity, for the purpose of
supporting themselves and their family. The confusion
into which the nation had been thrown by the late
events had produced a fluxion of the payment of all
taxes. There existed, in fact, no efficient government;
and if society escaped entire dissolution, it was merely
in consequence of those habits of order which are pro-
duced by a state of long continued civilization. The
buinefs of government could not be transferred without
money, and many vain efforts were made by the mini-
istry to procure it. At length M. Neckar was driven
to the desperate resource of proposing a compulsory
loan, or that every individual poffeffed of property shoul
d advance to the state a sum equal to one-fourth of his an-
nual income. This bold proposition was supported by
Mirabeau, and adopted by the Assembly; but it does
not appear to have ever been effedually executed.

In the mean time, the Assembly was busily occupied
in framing the celebrated declaration of the Rights of
Man, which was afterwards prefixed to the new consti-
tution. This was followed by the diffusion of a point
of much delicacy and difficulty; viz. What share of
legislative authority the king ought to poffeff under the
new constitution; whether an abolute negative or veto,
a fufpenfive veto, or no veto at all? This question oper-
atived like a touchstone for trying the fentiments of every
peron; and the assembly, consisting of 1200 men,
was now seen to arrange itself into two violent contend-
ing factions. The debates were vehement and tumul-
tuous, and continued for many days. As the assembly
in public, and as multitudes of people of all descriptions
were admitted into the galleries, and even into the
body of the hall among the members, many inde-
cent scenes took place in consequence of the interfe-
rice of the speclators to applaud or cenflure the senti-
ments which were delivered. Thus the public at large
became speedily interested in the diffusion; the city of
Paris took a fide in opposition to the veto, and the
whole empire was thrown into agitation by new and
speculative questions. The distinguished place which
France holds among the nations of Europe rendered
these singular events and diffufions the object of uni-
verful attention. The contagious love of novelty spread
rapidly abroad, and gave rise to that watchful jea-
40ly on the part of the monarchs of Europe, which

French Revolution

1789.

was specially to burst forth in a bloody tempest. — In the present cafe, the people of Paris became most eagerly interested. Rumours of plots were spread through the country, and a new storm was obviously gathering, when the question was thus got quit of. M. Mounier remarked, that the executive power could positifs no negative against the decrees of the present assembly, which had been nominated by the nation with supreme powers for the express purpose of framing a constitution, which was to remain binding over all orders of men in the state; and with regard to future legislatures, the king declared by a manifesto, that he wished to positifs no more than a submersion veto. It is remarkable that the popular Mirabeau concluded a speech in favour of the absolute veto of the crown with these words, "That it would be better to live in Constantinople than in France, if laws could be made without the royal function." This political adventurer is, however, accused of having taken care to circulate in Paris a report that he had opposed the veto with all his influence; and to give credit to the story, he is said to have written the assembly just before the division, that his vote might not appear on record against it.

In the debates about the veto the month of August was spent; and in the beginning of September a new constitutional question was presented to the assembly by one of its numerous committees. This was, whether the legislative body ought to consist of one or of two chambers? Mounier, Lally, Tollendal, Clermont-Tonneur and others, who were zealous lovers of freedom upon what were then accounted moderate principles, supported eagerly the idea of establishing two independent chambers in imitation of the British constitution; but they were defeated both by the democratic and aristocratic parties. The first of these regarded an upper house or senate as a refuge for the old aristocracy, or as the cradle of a new one; while the higher nobles and clergy feared lest such an arrangement might prevent the future re-establishment of the ancient division into three orders. Of 1000 members who voted, only 89 supported the proposal for dividing the legislature into two chambers.

Soon after this, the king gave his function to the important decrees of the 4th of August, but not without some hesitation, and expressing doubts of the wisdom of some of them in a letter to the assembly. At the same time the inviolability of the person of the monarch was decreed, the indivisibility of the throne, and its hereditary descent from male to male in the reigning family. — But we shall not here attempt to enter into a detail of the various articles of the new constitution as connected with the circumstances under which they became the subject of debate. We shall only state those more remarkable circumstances which tend to ascertain the peculiar changes which the sentiments of the nation underwent in the progress of a revolution the most remarkable that occurs in human history.

In consequence of the debates upon the questions of the veto and the two chambers, the minds of parties had become much irritated. Paris wore the fame threatening aspect that it had done in the months of June and of July preceding; and every thing seemed tending towards an important crisis. The aristocratic party accused their antagonists of a design to excite new insurrections; and the charge was retorted, by circulating a report that a plot for conveying the king to Metz was already ripe for execution.

From the period of the defection of the French guards, who were now in the pay of the capital, the protection of the royal family had been entrusted to the militia or national guards of Versailles, together with the regiment of the gardes du corps, which was composed entirely of gentlemen. Upon the circulation of the report of the intended flight of the king, the French guards began to wish to be reforted to their ancient employment of attending his person, for the purpose of preventing any attempt of this nature. This idea was eagerly cherished by the capital; and, in spite of every effort used by M. de la Fayette, the obvious appearance of approaching disturbances could not be prevented. The popular party saw the advantages which they would derive from placing the assembly and the king in the midst of that turbulent metropolis which had given birth to the revolution, and upon the attachment of which they could most securely depend. Every encouragement was therefore given by the most active leaders of what was now called the Democratic party to the project of establishing the court at Paris. The ministry were under no small degree of alarm; and the count d'Estaing, who commanded the national guard of Versailles, requested the aid of an additional regiment. The regiment of Flanders was accordingly sent for: it arrived caused no small degree of anxiety; and every effort was instantly made to gain over both officers and soldiers to the popular cause.

On the 1st of October the garde du corps, probably for the purpose of gratifying themselves with the newly arrived regiment, and perhaps to attach them more readily to the royal cause, invited the officers of the regiment of Flanders to a public entertainment. Several officers of the national guard, and others of the military, were invited. The entertainment was given in the opera house adjoining to the palace; several loyal toasts were drunk; but it was deferred, when the favourite popular toast, "The Nation," was given, it was rejected by the garde du corps. In ordinary cafes, such a trifling circumstance as this, or even any other of the transgressions of a night of festivity, would justly be regarded as unworthy of notice in recording the more remarkable events in the history of a great nation; but such was now the singular state of affairs, that the most trivial occurrences were instrumental, by their combination, in the production of important consequences. The queen, having seen from a window of the palace the gaiety which prevailed among the military, prevailed with the king, who was just returned from hunting, to visit them along with herself and the dauphin. Their sudden appearance in the salon kindled in an instant the ancient enthusiasm of French loyalty. The grenadiers of the regiment of Flanders, along with the Swiss chasseurs, had been admitted to the defert; and they, as well as their officers, drank the health of the King, Queen, and Dauphin, with their swords drawn. The royal family having bowed with politeness to the company, retired. — Of all nations, the French are most liable to the influence of sudden impressions: the music played the favourite air, O Ricard! O mon Roi! l'univers t'abandonne, "O Richard! O my king! the world abandons thee." In the eagerness of loyalty,
loyalty, the national cockade, which had been adopted by some of the gardes du corps, was thrown aside, and white cockades were supplied as quickly as they could be made by the ladies of the court.

When these events were next day reported at Paris, accompanied by a multitude of exaggerations, they gave rise to the most violent alarm. The capital was at that time suffering all the horrors of famine; and in such a situation, the news of a feast which others have enjoyed, seldom gives much pleasure to hungry men. To the former report of an intended flight on the part of the royal family, it was now added, that a counter revolution was speedily to be attempted by force of arms; and that the present scarcity was artificially created by the court for the purpose of reducing the people to subjection. Their aristocratic antagonists have since asserted, that the famine was indeed artificial; but that it was created by a portion of the violent party in the national assembly, which was then denominated the Cabal, whose object was to excite commotions as the means of procuring an opportunity of setting the duke of Orleans at the head of the state, either as regent, or in some other form. To this last party Mirabeau is said to have belonged.

For four days no notice was taken in the assembly of what had passed at the entertainment given by the gardes du corps. On the 5th of November M. Petion mentioned it for the first time, and a violent debate ensued during which Mirabeau rose and exclaimed, "Declare that the king's perfidy alone is facred, and I myself will bring forward an impeachment," thereby alluding to the conduct of the queen. While this debate was proceeding at Versailles, the city of Paris was in commotion. A vast multitude of women of the lowest rank, with some men in women's clothes, had assembled at the Hotel de Ville, and were calling aloud for arms and bread. They resolved to proceed instantly to Versailles to demand bread from the king and from the national assembly. La Fayette opposed them in vain; for his own soldiers refused to turn their bayonets against the women. Upon this one Stanislaus Mauillard, who had distinguished himself at the taking of the Bastile, offered himself as a leader to the insurgents. He had the address to prevail with them to lay aside such arms as they had procured; and he set out for Versailles about noon with as much order among his followers as could well be expected from such an assemblage. Either because the passion for going to Versailles had suddenly become too infectious to be repressed, or because the multitude already gone thither was now accounted dangerous, the mayor and municipality of Paris thought fit to give orders to La Fayette instantly to set out for that place at the head of the national guard.

In the mean time, Maillard approached Versailles with his tumultuous troop; he arranged them in three divisions, and persuaded them to behave with tolerable decency. The king was hunting in the woods of Médon when he was informed of the arrival of a most formidable man of women calling aloud for bread. "Alas! (replied he) if I had it, I should not want to be asked." Maillard entered the assembly accompanied by a deputation of his followers to state the object of their journey. The assembly, to pacify them, sent a deputation of their own number along with them to lay their complaints before the king. His majesty received the whole with great politeness, and readily agreed to go into any measures for the supply of the capital that could be suggested. The report of this behaviour had such an effect upon the multitude collected around the palace, that they began to disperse; but they were speedily succeeded by another crowd not less numerous. A sudden resolution of flight seems now to have been propounded by the court; for the king's carriages were brought to the gate of the palace which communicates with the Orangery: but the national guard of Versailles refused to allow them to pass, and the king himself refused to remove, or to allow any blood to be shed in his cause.

La Fayette with his army at length arrived about 10 o'clock at night, and found the assembly in a very unpleasant situation. Their hall and galleries were crowded by the Parisian spinners and others of the mob, who, at every instant, interrupted the debates. At night La Fayette waited upon the king, and informed him of the proceedings of the day, planted guards in every corner; and after a short but solemn address had been procured for the multitude, he prevailed with the assembly to clothe their fitting for the night. In this last part of his conduct, M. La Fayette has been much cenured, and probably not without reason; for it could scarcely be expected that such a night would be spent in peace by the immense assemblage of turbulent characters that were now brought together. All was quiet however, till about six in the morning of the 6th, when a great number of women and desperate persons rushed forward to the palace, and attempted to force their way into it. Two of the gardes du corps were killed; the crowd ascended the stairs leading to the queen's apartments, but were bravely repulsed by M. Mieumandre a Centinel, who gave the alarm, and defended his post till he fell covered with wounds, of which, however, he afterwards fortunately recovered. The ruffians, reeling with his blood, rushed into the chamber of the queen, and pierced with bayonets and poniards through the bed wherein this persecuted woman had but just time to fly almost naked, and, through ways unknown to the murderers, had obtained to seek refuge at the feet of the king, who was already alarmed, and had gone to seek her.

The tumult became more violent every moment, and the royal family declared that the threat of the royal family would be threatened. La Fayette was by this time at the head of his troops, whom he beheld earnestly to fawe the gardes du corps from mischief. In this he was successful; some that had been taken prisoners were surrounded by the grenadiers of the French guards who protected them, and the retreat of the whole corps was easily secured. The crowd was speedily driven from the square quarters of the palace, which they were already beginning to pillage; and the royal family ventured to show themselves at a balcony. A few voices now exclaimed, "Le Roi à Paris!" "the King to Paris." The shout came general; and the king, after consulting with La Fayette, declared that he had no objection to take up his residence at Paris, provided he was accompanied by the queen and his children. When the proposal was reported to the assembly, the popular leaders expressed much satisfaction. They ordered a deputation of 100 members to attend the king thither; they voted the national assembly inseparable from the king. His majesty...
set out at two o'clock a prisoner in the custody of the mob. Two gentlemen were selected from his body guard, and, with all the parade of an execution, beheaded in the court of his palace. Their heads were stuck upon spears, and led the procession; whilst the royal captives who followed in the train, and beheld this spectacle, were conducted so slowly, that a short journey of twelve miles was protracted to fix hours. The king, the queen, and their children, were lodged in the old palace of the Louvre, while Monfieur went to reside at the Luxembourg. The city was illuminated, and the evening spent in triumph by the Parisians.

The removal of the king to Paris was regarded as a triumph by the popular party. The higher order of nobles considered it as completely ruinous to their hopes; and even many men of talents, such as Mounier and Lally-Tollendal, whom we cannot avoid regarding as friends to the popular cause, in its out-set, regarded every prospect of attaining a happy constitution-al freedom as an at end, as the national representatives must be for ever explosed to the insults, and overawed by the influence, of a turbulent capital. Many members of the assembly took refuge in foreign countries, and used every effort to excite the other nations of Europe: to hostility against France. As the duke of Orleans had been regarded as a chief agent in promoting the late disturbances, the marquis de la Fayette waited upon him, and inflinced upon his leaving the kingdom for a time. The duke was overawed, and, on pretence of public business, went to England, where he remained for several months.

On the 19th of October, the National Assembly held its first session in Paris. The king was closely guarded in his own palace; and no apparent opposition now stood in the way to prevent the popular party from giving to their country such a constitution as they might judge expedient. Much, however, was yet to be done, and many difficulties remained, in its out-set, from the refusal of every prospect of attaining a happy constitution-al freedom as an at end, as the national representatives must be for ever explosed to the insults, and overawed by the influence, of a turbulent capital. Many members of the assembly took refuge in foreign countries, and used every effort to excite the other nations of Europe: to hostility against France. As the duke of Orleans had been regarded as a chief agent in promoting the late disturbances, the marquis de la Fayette waited upon him, and inflinced upon his leaving the kingdom for a time. The duke was overawed, and, on pretence of public business, went to England, where he remained for several months.

Decrees, in which the interests of so vast a multitude of individuals were involved, could not be carried into effect without much murmuring and opposition. The parliaments, in particular, began to exert themselves with vigour, and, by protests and other publications, attempted to invalidate the deces of the Assembly. But these privileged bodies, who had often been accustomed to contend with some success against the despotic administration of their country, and on that account had been for ages the objects of public animosity, now found themselves utterly forlorn, and unable to resist the mandate of a popular Assembly. After a few fruitless struggles, they were all of them under the necessity of submitting to their fate.

Nothing remarkable now occurred for some time. Municipalities ceased to exist, and the establishment of municipalities, and by reforming the jurisprudence of the country, it is to be observed, however, that when the parliament of Paris was abol...
During the whole of this winter the King had been very strictly watched by numerous guards placed around his palace, inasmuch that the other nations of Europe considered him as in a state of captivity. To do away this impression, if possible, and to make their king appear a voluntary agent in the measures that had lately been adopted, was now regarded as a matter of some importance. Every effort was therefore made to prevail with him to come to the Assembly suddenly, and, as it were, of his own voluntary motion, there to declare his adherence to the measures which had lately been adopted. For some time he refrained this proposal; but at length, on the 4th of February, he did suddenly appear in the National Assembly, where he complained of the attempts that had been made to shake the new constitution. He declared his with "that it should be universally known that the monarch and the representatives of the nation were united, and their wishes were the same; that he would defend the constitutional liberty of the state; that in conjunction with the Queen, he would early form the sentiments of his fon for that new order of things which the circumstances of the empire had introduced." This declaration dispirited the aristocratic party in no small degree, and increased that unhappy tendency of looking for aid from foreign countries which they had always been too apt to indulge.

On the 13th of February, monastic establishments were suppressed, and their lands confiscated; but the present friars and nuns were allowed pensions for their subsistence, and to continue the observance of their monastic vows, if they thought fit. We may observe here, that in consequence of the evacuation of the monasteries, it is probable that about this time the Breton committee began to assume the appellation of the Jacobin Club, from the hall belonging to the Jacobin friars at Paris, in which their meetings were now held.

An event occurred at this time which tended in no small degree to increase the odium under which the old government already laboured. This was the publication of the Red Book, or list of pensions and donations granted by the crown. In consequence of the most pressing insinuations, it had been communicated by M. Neckar to a committee of the National Assembly, after many intertiaies, and the most solemn promises of secrecy. It afforded, however, too striking an advantage to the popular party not to be made use of, and in a few days M. Neckar, to his no small surprise, saw this register publicly sold by every bookseller in Paris. He ought not, indeed, to have been surprised; and the giving up of this list is one of the many proofs which the transactions of that period afford of his great unfitness for the office which he held. With much indignation, however, he demanded why the committee had published it without the permission of the Assembly or the King? But he was told by the committee, that "as to the Assembly, they were of its approbation; and as to the King, they were not his representatives." To give an idea of the effect of this publication, it is only necessary to remark that the two brothers of the King had received from the public treasury, independent of their legitimate income, nearly two millions sterling, and that L. 600,000 had been granted to an individual, because he was the husband of Madame de Polignac. M. Neckar's opposition to this publication tended in no small degree to injure his popularity, and the rest of the ministry began to lose the confidence of the public. Indeed, at this time, fertile cauées of alarm prevailed on all sides. The clergy were apprehending to revive in the provinces the ancient animosities between the Roman Catholics and the Protestants, ascribing the late decrees of the Assembly to the latter. The German princes who possessed property in the north of France were complaining loudly of the violation of their rights by the abolition of the feudal system, although the National Assembly had voted to them a compensation. The most melancholy intelligence was received from their colonies in the West Indies. In regulating these, the Assembly had not recognized the right of the free Negroes to enjoy the same privileges with other citizens; at the same time, they did not go the length of denying these privileges. This uncertain conduct produced infinite calamities. The whites contended with these commonly called people of colour. These again sometimes flooded in opposition to the free negroes, or to the slaves; and hence it sometimes happened that no less than three hostile assemblies were held at the same time in the same colony, which made war upon each other with the most invertebrate fury. Each party found protectors in the National Assembly of the parent state. Those who favoured or opposed the existence of distinctions at home, in general followed out the same principles with regard to the colonies.

On the 14th of May, M. de Montmorency communicated to the National Assembly the preparations for war in which England and Spain were engaged. This brought forward the constitutional question, "Who ought to possess the power of declaring peace and war?" The Count Clermont Tonnerre, Meffrs de Serent, Virei, and Dupont, supported the royal prerogative; while on the other side, the exclusive right of the legislative body to exercise this important prerogative was supported by Meffrs d'Aiguillon, Garat jun., Freteau, Jelliot, Charles Lameth, Sillery, Petion, Robespierre, &c. M. Petion proposed a decree "that the French nation renounced for ever all idea of conquest, and confined itself entirely to defensive war," which was passed with universal acclamation. The Count de Mirabeau at length successfully proposed that peace and war should be declared by the king and the legislative body in conjunction; and the decree that was passed on the subject is a strange farce of contradictions and absurdities. It enjoined the King to "guard the state from external attacks." But how could this be done, without repelling any attack that might be made upon it? This, however, he could not do, without previously informing the National Assembly; and if that body chance...
not to be fitting at the time, he was bound to let the
enemy advance without opposition till he had convened
his orators, dispersed over 24,000 square leagues, and
listened to their metaphysical quibbles in Paris.

On the 19th of June, a very singular farce was acted
in the Assembly. A Prussian refugee, who called himself
Anacharsis Cloots, and who was struggling hard to
bring himself into public notice, on an evening fitting
(which, it is to be observed, was generally ill attended
by the persons of the highest rank), introduced to the
Assembly a number of persons drested in the different
habits of all the different countries that could be thought
of. In a formal address, he told the Assembly that he
was come as the orator of the human race, at the
head of the representatives of all nations, to congratul-
ate them upon the formation of their new constitution.
He was answered by the President with abundance of
solemnity, and retired with his motley group. This
fantastical piece of folly, which in any other country
than France would scarcely, perhaps, have excited a
smile, was treated by the Assembly in a serious light.
Alexander Lameth proposed, that the figures of differ-
ent nations exhibited in chains at the feet of Louis XIV.
should be destroyed as an insult upon mankind.
M. Lambel, a lawyer, at this moment proposed the
abolition of all hereditary titles. He was supported by
La Fayette, St. Targeau, and the Vicomte de Noailles.
The decree was passed, along with another supprifing
all armorial bearings. It is our intention at present ra-
ther to state facts than to hazard any political opinion
concerning the wild or folly of the transactions which
we record. It may here, however, be remarked, that
no part of the proceedings, be they the Assembly that
itself was visited by persons of rank upon the Con-
tinent of Europe with so much indignation as this.—
The feudal system had been overthrown, and the prop-
erty of the church wrested from it, with little com-
parative notice; but when those nominal distinctions
were attacked which antiquity had sanctioned, and per-
sonal vanity rendered dear, the surrounding nations were
instantly alarmed, and beheld with terror the levelling
precedent. We may likewise add, that this part of
their proceedings was considered inimical to rational
and practical freedom. To preserve a perfect equality
of ranks is impossible. In a commercial nation, industry
will procure wealth, and wealth will everywhere pro-
cure dependents. It is alleged nothing more contributes
to keep within some tolerable bounds the infolence of
newly acquired wealth, than the rank attached to birth
and nobility, which time and prejudice have conspired
to make respectable. It is not a little remarkable, that
of all the King's ministers, Necker alone, a plebeian,
and remarkable born and bred in a democracy, advised his
Majesty to refuse his assent to this foolish decree, as a
violent but useless encroachment upon the prejudices of
a powerful order of the state.

In the mean time, the capital was entirely engrossed
by hurry and bustle. M. Bailly had propозed a plan
for commemorating the anniversary of the taking of
the Bastille. It was adopted, because it flattered the
vanity of the people, by presenting them with a splen-
did spectacle in commemoration of their own exertions.
—The army had been much disorganized; and it was
resolved to attempt to unite all its branches, as well as
the whole departments of the state, in one common at-
tachment to the new order of things, by collecting into
one place deputations, for the purpose of swearing fide-
lity to the new constitution. In the middle of the
Champ de Mars an altar was erected, at which the ci-
vic oath, as it was called, was to be taken. Around
the altar an amphitheatre was thrown up capable of con-
taining 400,000 spectators; 2000 workmen were em-
ployed in this operation; and the people of Paris, fear-
ing lest the plan might not be completed, affiiled in the
air. All ranks of persons, the nobles, clergy, and even ladies, with the eagerness for novelty so pecu-
liar to that people, united their efforts. Crowds of
foreigners as well as natives hurried to the capital to be
present at this solemnity, which was called the Confir-
ratation. The long-expected 14th of July at length ar-
rived. At six o'clock in the morning the procession
was arranged on the Boulevards, and consisted of the
electors of the city of Paris, the representatives of the
commons, the administrators of the municipality, a bat-
talion of children, with a standard, inscribed "The
hopes of the nation;" deputies from the troops of
France wherever quartered, and of every order, along
with deputies from all the departments; these were
added immense detachments of the military, and of the
national guards, along with an almost infinite multitude
of drums, trumpets, and musical instruments. The pro-
cession was extremely splendid, as every district had its
peculiar decorations. The national assembly passed
through a grand triumphal arch, and the king and
queen, attended by the foreign ministers, were placed
in a superb box. After a solemn invocation to God,
the King approached the altar, and, amid the deepest
punctualities, took the following vow: "I, the King of
the French do swear to the nation, that I will not carry
the whole power delegated to me by the constitutional
law of the state, to maintain the constitution, and enforce
the execution of the law." The president of the
national assembly then went up to the altar, and took
the civic oath, "I swear to be faithful to the nation, the
law, and the king; and to maintain with all my powers
the constitution decreed by the national assembly, and
accepted by the king." Every member of the assembly
standing up, said, "That I swear." La Fayette then
advancing, took the oath for himself; the other deput-
es of the national guards pronouncing after him,
"That I swear;" and their words were solemnly pro-
nounced by every individual of this immense assembly.
Te Deum was then sung. The performance was sublime
beyond the powers of description. Never perhaps be-
fore was there such an orchestra, or such an audience:
their numbers baffled the eye to reckon, and their shrill
shouts in full chorus rent the skies. It is impossible to
enumerate all the means which were employed to add splen-
dor to this day. It ended with a general illumination,
and no accident disturbed the public tranquility.

The assembly now proceeded in the formation of the
The following constitution with considerable tranquility, which, how-
ever, was disturbed by an unhappy event at Nancy. Moit of the offic-
ers of the army were unfriendly to the late revolution, and every means had been employed
by them to disgust the soldiers with it. At Nancy, in
particular, necessaries had been denied them, and their
pay was kept back; under pretence that this was the
will of the national assembly. Driven to despair, the
regiments in garrison threw off their allegiance, and de-
manded
French Revolution

The King's regiment was prevented from acting against Bouillé by the intrepidity of a young officer of the name of Délille, who, however, died of the wounds which he received on the occasion. The news of these events filled Paris with indignation. The assembly afterwords revered its own decrees against the insurgents at Nancy. Public honours were decreed to the memory of Délille; but Bouillé could not be punished, because he had only acted in obedience to authority.

M. Neckar's popularity had been gradually declining, as he was unwilling to go all the lengths that the ruling party wished. He gave in his resignation on the 4th of September, and speedily thereafter left the kingdom. He was regretted by no party. He was regarded, on the one side, as having conducted the kingdom to its ruin, by the concessions which he originally advised the king to make in favour of the tierce d'at; while he was defpised by the opposite party as a lukewarm politician, of narrow views, and a feeble mind. He departed, however, with the unblemished reputation of strict integrity. M. Neckar does not seem to have penetrated deeply into the characters of men, or to have had any conception of the effects of that terrible and relentless energy which is called forth in a nation which attempts to make important changes in its ancient manners and government. Having no conception of the important era which was about to open upon that country of which he was the minister, he was far from being qualified to direct or control it amidst the convulsions which it was destined to encounter. Unable to break the ties of his popularity, he peevishly retired to Switzerland, where he published a work, which shows to the conviction of every unprejudiced reader the integrity of the French king, and the wicked projects of the leading democrates, whom he himself had armed with power.

The remaining part of this year was occupied in attempts to introduce some degree of subordination into the navy of France, which had been much disorganized, and in farther regulating the affairs of the clergy. It was now declared, that such clergymen as should not take the following oath, which had been prescribed some months before, should be considered as ejected from their benefices: "To watch carefully over the faithful in the parish or diocese which was entrusted to his care; to be faithful to the nation, the law, and the king; and to maintain to the utmost of his power the new constitution of France, and particularly the decrees relative to the civil constitution of the clergy." This decree rendered the situation of conscientious men extremely perplexing; especially as the pope testified in marked terms his disapprobation of the oath. The people were reduced to the dilemma of choosing between their new political and their old religious prejudices, and the result was extremely unfavourable to the interest of religion.

The assembly commenced the new year with a decree, announcing the termination of its session, which was to take place as soon as it should have finished the discussion of a list of constitutional articles. In the mean time, on the side of Germany, Spain, Italy, and Savoy, hostile appearances began to be exhibited, and bodies of troops advanced around the French frontier. The Emperor Leopold was, however, too cautious to announce his intentions; and the King soon communicated a letter from him, containing protests of amicable dispositions, but adding, that "the innovations occasioned by the decrees of the 4th of August ought to be done away." The king treated this merely as an official measure on the part of the Emperor, that he might not appear to renounce the claims of certain German princes connected with Lorraine and Alsace. But the assembly expressed some alarm, and voted an augmentation of the national force. About this period several new efforts were made by the disaffected clergy in various parts of the kingdom to excite disturbances, which it is unnecessary to mention in detail. On the 20th of February the public attention was roused by a circumstance in France that in any other state of affairs would have been accounted unimportant. The King announced to the assembly, that his aunts, the daughters of Louis XV. Paris, had that morning left Paris; but as he did not apprehend that the existing laws laid them under any restraint in this respect, he had not opposed their departure. After some debate, the assembly agreed that the King had judged well; and these princesses were left to pursue their journey to Rome, which they reached after some delays occasioned by the jealousy of certain municipalities through which they passed. Thus the kingdom was gradually deserted by every branch of the royal family, excepting the King and his eldest brother Monfieur. The assembly, however, continued its labours with considerable quietness. In the end of the month of March died the celebrated M. de Mirabeau, at the age of 42 years; a man whose integrity has for many good reasons been much suspected, but whose political address and intrepidity, and whose splendid powers of eloquence, have been seldom equalled. He received from his countrymen at his death marks of respect unparalleled in modern history. During his short illness, his door was besieged by anxious citizens. A mourning of eight days was decreed by the assembly, and also a grand procession, which was attended by all the public functionaries. He was the first who was interred in the new magnificent Pantheon, consecrated to the reception of the remains of illustrious men. But his ashes were afterwards removed, in consequence of very clear proofs that he had not been incorruptible by money.

During the whole of this spring, much fear was entertained that some attempts at a counter revolution were about to be made. The emigrant army assembled at the borders of Alsace was reviewed by the prince of Condé. Their uniform was black, faced with yellow, with
with a death's head, surrounded by a laurel wreath on one cuff, and a sword on the other; with the motto, "Conquer or die." The king was also surrounded by crowds of nonjurin priests and other disaffected persons. Thus, that popular jealousy which in every period of the revolution has strikingly marked the French character, was kept on the alarm. On the 18th of April, therefore, when the royal family was preparing to go to St Cloud to pass some days, a report was instantly spread that the king was about to fly from the country. The carriages were immediately surrounded by the people. La Fayette drew out the national guard, but they refused to act. "We know (exclaimed they) that we are violating the laws, but the safety of our country is the first law." The king immediately went to the assembly, and with much spirit complained of the insult. He was answered respectfully by the president, and continued his journey. As the royal family had enjoyed a considerable degree of freedom for some time past, which was demonstrated by the unsuccessful opposition made to this journey—the present opportunity was embraced for intimidating foreign courts his acceptance of the constitution; and all obnoxious persons were diffimilated from about his person. The breach of discipline on the part of the national guard on this occasion was so much resented by La Fayette, that he resigned his command. Paris was thrown into consternation; and it was not till after the departure of the monarchs of the universe. Touching at his departure, the king had imprudently left behind him a memorandum, in which he declared, that he never had thought himself too great for the restoration of order; but that the destruction of the kingdom, and the triumph of anarchy, being the only reward of all his efforts, he thought it necessary to depart from it. He then takes a review of the faults of the new constitution, the grievances he has suffered; and protests against every thing that he had been compelled to do during his captivity.

Different parties were very differently affected by this ill-conducted and unfortunate flight of the King. A number of the small republican party had already begun to appear, and during the king's absence, attempts were made to induce the public at large to consider the royal authority as no necessary part of a free constitution. But the minds of men were by no means prepared for the reception of this new doctrine. The idea, however, having been thus publicly proposed, left some impressions, which in time contributed to give rise to important events. By far the greater number of leading men, however, were at present convinced, that it was impos- sible to conduct a great empire like France, well and prosperously, without the assistance of an hereditary chief. They therefore determined to pass over the affair with as much silence as possible, and to hasten the period when their new constitution should be complete. But there is reason to believe, that this journey was at the long-run highly instrumental in producing very fatal effects to the personal safety of the monarch.

His flight seemed a signal for emigration. Many of the aristocratic and other party fent in regiments or their seats in the national assembly. Troops were levied on the frontier near the King's house, and later on at the Tuileries, that the king, the queen, the dauphin, with monfieur and madame, had quitted the palace and the capital, without leaving any information of their intention or their route. The motion excited by this news among the multitude was a mixture of consternation and rage. The national assembly, however, acted with much coolness. They instantly took upon themselves the government, and decreed their fittings permanent. They sent meffengers, at the same time, in all directions, to attempt to lay hold of the fugitives. Thesè had taken different routes. Monfieur and madame arrived safely at Bruxelles on the 23rd. The king, queen, and their children, when they came to a considerable distance from the capital, were furnished by Bouillé with a guard of dragoons, under pretence of protecting treasure for the pay of the troops. At the distance of 156 miles, and when only a few leagues from the frontiers, they were arrested at St Menehould by the postmaster, M. Drouet, formerly a dragon in the regiment of Condé. At half past seven o'clock in the evening the carriages flopped to change horses at his house; he thought he recollected the queen, and imagined that the king's face resembled the impressions stamped upon alligants. The efforts of dragoons increased the confusion. He suffered them to depart at 11 o'clock without notice; but taking a companion with him, he went by a shorter road to Varennes.

With the assistance of the postmaster there he gave the alarm, and overthrew a carriage on the bridge, which detained the royal travellers till the national guard of the place had assembled, and the arrest was effected without bloodshed. They were brought back to Paris by a deputation from the assembly. At his departure, the king had imprudently left behind him a memorandum, in which he declared, that he never had thought himself too great for the restoration of order; but that the destruction of the kingdom, and the triumph of anarchy, being the only reward of all his efforts, he thought it necessary to depart from it. He then takes a review of the faults of the new constitution, the grievances he has suffered; and protests against every thing that he had been compelled to do during his captivity.

But there is reason to believe, that this journey was at the long-run highly instrumental in producing very fatal effects to the personal safety of the monarch.
flood to have been intended for the purpose of concluding a league for the invasion of France, the new-modeling of its government, and the partition of some of its fairest provinces. The following paper has been repeatedly published as the copy of a treaty concluded and signed at Pavia, and is generally understood to have been identical with, and therefore known by, the name of the Treaty of Pavia. We are far from vouching for its authenticity. It may have been fabricated by the French assembly, to unite all parties in the nation against the foreign powers which threatened to invade them. But in flating the events of this revolution, it is perhaps still more necessary, for the purpose of rendering the actions of men comprehensible, to give an account of what was at the time believed to have occurred, than it now is to ascertain what was actually true.

Partition Treaty between the Courts in Concert, concluded and signed at Pavia, in the Month of July 1791.

His majesty the emperor will take all that Louis XIV. conquered in the Austrian Netherlands, will give them to his serene highness the elector Palatine; so that these new possessions, added to the Palatinate, may hereafter have the name of Austrasia.

His majesty will preserve for ever the property and possession of Bavaria, to make in future an indivisible mass with the domains and hereditary possessions of the house of Austria.

Her serene highness the archduchess Maria Christi tina shall be, conjointly with her serene highness her nephew the archduke Charles, put into hereditary possession of the duchy of Lorraine.

Alsace shall be restored to the empire; and the bishop of Strasbourg, as well as the chapter, shall recover their ancient privileges, and the ecclesiastical sovereigns of Germany shall do the same.

If the Swiss Cantons consent to accede to the coalition, it may be proposed to them to annex to the Helvetic league the bishoprics of Porrentruy, the defiles of Franche Comté, and even those of Tyrol, with the neighbouring taillwicks, as well as the territory of Ver sailles, which interferes the Pays de Vaud.

Should his majesty the king of Sardinia subscribe to the coalition, La Breve, Le Bugey, and the Pays de Gex, usurped by France from Savoy, shall be restored to him.

In case his Sardinian majesty can make a grand diversion, he shall be suffered to take Dauphiné, to belong to him for ever as the nearest descendant of the ancient dauphins.

His majesty the king of Spain shall have Rouffillon and Bearn, with the island of Corfica; and he shall have the French part of the island of St Domingo.

Her majesty the empress of all the Russian shall take upon herself the invasion of Poland, and at the same time retain Kamieniec, with that part of Podolia which borders on Moldavia.

His majesty the emperor shall oblige the Porte to give up Chocelin, as well as the small forts of Servia, and those on the river Lurna.

His majesty the king of Prussia, by means of the abovementioned invasion of the empress of all the Russian into Poland, shall make an acquisition of Thorn and Dantzce, and there unite the Palatinate on the east of the confines of Silesia.
time as he has been declared guilty, if it shall be deemed absolutely necessary to arrest a man, every kind of rigour employed, not necessary to secure his person, ought to be severely repressed by the law.

X. No person shall be molested for his opinions, even such as are religious, provided that the manifestation of those opinions does not disturb the public order established by the law.

XI. The free communication of thought, and of opinion, is one of the most precious rights of man. Every citizen, therefore, may freely speak, write, and publish, his sentiments; subject, however, to answer for the abuse of that liberty, in cases determined by the law.

XII. The guarantee of the Rights of Man and Citizens, involves a necessity of public force; this force is then instituted for the advantage of all, and not for the particular utility of those to whom it is confined.

XIII. For the maintenance of public force, and for the expences of administration, a common contribution is indispensably necessary: this contribution should be equally divided amongst all the citizens, in proportion to their abilities.

XIV. Every citizen has a right, by himself, or by his representatives, to decide concerning the necessity of the public contribution; to consent to it freely; to look after the employment of it; to determine the quantity, the distribution, the collection, and duration.

XV. The society has a right to demand from every public agent an account of his administration.

XVI. Every society, in which the guarantee of rights is not affurred, nor the separation of powers determined, has no constitution.

XVII. Property being a right inviolable and sacred, no person can be deprived of it, except when the public necessity, legally ascertained, shall evidently require it, and on condition of a just and previous indemnification.

The constitution guarantees, as natural and civil rights,

1. That all citizens are admissible to places and employments without any distinction, but that of ability and virtue.

2. That all contributions shall be divided equally among all the citizens, in proportion to their means.

3. That the same crimes shall be subject to the same punishments, without any distinction of persons.

The constitution in like manner guarantees, as natural and civil rights,

Liberty to all men of going, staying, or departing, without being arrested, or detained, but according to the forms prescribed by the constitution.

Liberty to all men of speaking, writing, printing, and publishing their thoughts, without having their writings subjected to any examination or inspection before publication; and of exercising the religious worship to which they are attached.

Liberty to all citizens of assembling peaceably, and without arms, complying with the laws of police.

Liberty of addressing to all constitutional authorities petitions individually signed.

The constitution guarantees the inviolability of property, or a just and previous indemnity for that of which public necessity, legally proved, shall require the sacrifice.

A public instruction shall be created and organized, common to all citizens, gratuitous with regard to those parts of tuition indispensible for all men, and of which the establishment shall be gradually distributed in a proportion combined with the division of the kingdom.

“The kingdom is one and indivisible;” its territory, for administration, is distributed into 83 departments, each department into districts, each district into cantons.

Those are French citizens,

Who are born in France, of a French father;
Who having been born in France of a foreign father, have fixed their residence in the kingdom;
Who having been born in a foreign country, of a French father, have returned to settle in France, and have taken the civic oath:
In fine, who having been born in a foreign country, being descended in whatever degree from a Frenchman or a Frenchwoman, who have left their country from religious motives, come to reside in France, and take the civic oath.

The right of French citizenship is lost,

1st, By naturalization in a foreign country;
2dly, By being condemned to penalties which involve the civic degradation, provided the person condemned be not reinstated;
3dly, By a sentence of contumacy, provided the sentence be not annulled;
4thly, By initiation into any foreign order or body which supposes either proofs of nobility, “or distinctions of birth, or requires religious vows.”

“The law considers marriage only as a civil contract.”

The sovereignty is one, indivisible, “inalienable, and imprescriptible,” and it belongs to the nation: no fiction of the people, or individual, can arrogate the exercise of it.

The nation, from which alone flow all powers, cannot exercise them but by delegation.

The French constitution is representative: the representatives are the legislative body and the king.

The National Assembly, forming the legislative body, is permanent, and consists of one chamber only.
It shall be formed by new elections, every two years.
The legislative body cannot be dissolved by the king.
The number of representatives to the legislative body shall be 745, on account of the 83 departments of which the kingdom is composed; and independent of those that may be granted to the colonies.
The representatives shall be distributed among the 83 departments, according to the three proportions of land, of population, and the contribution direct.

Of the 745 representatives 247 are attached to the land. Of these each department shall nominate three, except the department of Paris, which shall nominate only one.
Two hundred and forty-nine representatives are attached to the population. The total mass of the active population of the kingdom is divided into 249 parts, and each department nominates as many of the deputies as it contains parts of the population.
Two hundred and forty-nine representatives are attached to the contribution direct. The sum total of the direct contribution of the kingdom is likewise divided into 249 parts; and each department nominates as many deputies as it pays parts of the contribution.
In order to form a legislative national assembly, the active citizens shall convene, in primary assemblies, every two years in the cities and cantons.

"The primary assemblies shall meet of full right on the first Sunday of March, if not convoked sooner by the public officers appointed to do so by the law."

To be an active citizen, it is necessary,
To be a Frenchman, or to have become a Frenchman;
To have attained 25 years complete;
To have resided in the city or the canton from the time determined by the law;
To pay in any part of the kingdom a direct contribution, at least equal to the value of three days labour, and to produce the acquaintance;
Not to be in a menial capacity, namely, that of servant receiving wages;
To be inscribed in the municipality of the place of his residence in the lift of the national guards;
To have taken the civic oath.

The primary assemblies shall name electors in the proportion of the number of active citizens residing in the city or canton;
There shall be named one elector to the assembly, or not, according as there shall happen to be present 100 active citizens.
There shall be named two, when there shall be present from 151 to 250, and so on in this proportion.

The electors named in each department shall convene, in order to choose the number of representatives, whose nomination shall belong to their department, and a number of substitutes equal to the third of the representatives.

"The assemblies shall be held of full right on the last Sunday of March, if they have not been before convoked by the public officers appointed to do so by law."

All active citizens, whatever be their state, profession, or contribution, may be chosen representatives of the nation.
Excepting, nevertheless, the ministers and other agents of the executive power, &c.

The members of the legislative body may be re-elected to a subsequent legislature, but not till after an interval of one legislature.
No active citizen can enter or vote in an assembly if he is armed.

The representatives shall meet on the first Monday of May, in the place of the fittings of the last legislature.

The royalty is indivisible, and delegated hereditarily to the race on the throne from male to male, by order of primogeniture, to the perpetual exclusion of women and their descendants.
Nothing is prejudged on the effect of renunciations in the race on the throne.

The person of the king is inviolable and sacred; his only title is king of the French.
If the king put himself at the head of an army, and direct the forces of it against the nation, or if he do not oppose, by a formal act, any such enterprise undertaken in his name, he shall be held to have abdicated.
If the king having gone out of the kingdom, do not return to it, after an invitation by the legislative body, within the space which shall be fixed by the proclamation, "and which cannot be less than two months," he shall be held to have abdicated the royalty.

After abdication, express or legal, the king shall be in the class of citizens, and may be accused and tried like them, for acts posterior to his abdication.

The nation makes provision for the splendour of the throne by a civil lift, of which the legislative body shall fix the sum at the commencement of each reign, for the whole duration of that reign.

The king is a minor till the age of 18 complete; and during his minority there shall be a regent of the kingdom.

The regency belongs to the relation of the king, next in degree according to the order of succession to the throne who has attained the age of 25; provided he be a Frenchman resident in the kingdom, and not presumptive heir to any other crown, and have previously taken the civic oath.

The presumptive heir shall bear the name of Prince Royal.

"The members of the king's family called to the eventual succession of the throne, shall add the denomination of French Prince to the name which shall be given them in the civil act proving their birth; and this name can neither be patronymic nor formed of any of the qualifications abolished by the present constitution."

"The denomination of prince cannot be given to any individual, and shall not carry with it any privilege or exception to the common right of all French citizens."

To the king alone belongs the choice and dismissal of ministers.

"The members of the present national assembly, and of the subsequent legislatures, the members of the tribunal of appeal, and those who shall be of the high jury, cannot be advanced to the ministry, cannot receive any place, gift, pension, allowance, or commissary of the executive power or its agents during the continuance of their functions, or during two years after ceasing to exercise them: the same shall be observed respecting those who shall only be inscribed on the list of high jurors as long as their inscription shall continue."

No order of the king can be executed if it be not signed by him, and countersigned by the minister or controller of the department

In no case can the written or verbal order of a king shelter a minister from responsibility.

The constitution delegates exclusively to the legislative body the powers and functions following;
To propose and decree laws—The king can only invite the legislative body to take an object into consideration;
To fix the public expenses;

To establish the public contributions, to determine the nature of them, the amount of each fort, the duration, and the mode of collection, &c.

War cannot be resolved on but by a decree of the national assembly, passed on the formal and necessary proposition of the king, and sanctioned by him.

During the whole course of war, the legislative body may require the king to negotiate peace; and the king is bound to yield to this regulation.

It belongs to the legislative body to ratify treaties of peace,
The judicial power can in no case be exercised either by the legislative body or the king. Justice shall be gratuitously rendered by judges chosen from time to time by the people, and instituted by letters patent of the king, who cannot refuse them.

"The public accuser shall be nominated by the people."

"The right of citizens to terminate disputes definitively by arbitration, cannot receive any infringement from the acts of the legislative power."

In criminal matters, no citizen can be judged except on an accusation received by jurors, or decreed by the legislative body in the cases in which it belongs to it to prosecute the accusation.

After the accusation shall be admitted, the fact shall be examined, and declared by the jurors. The person accused shall have the privilege of challenging 20, "without assigning any reason."

The jurors who declare the fact shall not be fewer than 12.

The application of the law shall be made by the judges. The proceeds shall be public; "and the person accused cannot be denied the aid of counsel."

No man acquitted by a legal jury can be apprehended or accused on account of the same fact.

For the whole kingdom there shall be one tribunal of appeal, established near the legislative body.

A high national court, composed of members of the tribunal of appeal and high jurors, shall take cognizance of the crimes of ministers, and the principal agents of the executive power; and of crimes which attack the general safety of the state, when the legislative body shall pass a decree of accusation.

It shall not be possible but on the proclamation of the legislative body; "and at the distance of 30,000 toises at least from the place of meeting of the legislative body."

The national guards do not form a military body, or an institution in the state; they are the citizens themselves called to assist the public force.

Officers are chosen for a time, and cannot again be chosen till after a certain interval of service as privates. None shall command the national guard of more than one district.

All the parts of the public force employed for the safety of the state from foreign enemies are under the command of the king.

Public contributions shall be debated and fixed every year by the legislative body, and cannot continue in force longer than the last day of the following session, if they are not expressly renewed.

"Detailed accounts of the expense of the ministerial departments, signed and certified by the ministers or comptrollers-general, shall be printed and published at the commencement of the sessions of each legislature."

"The same shall be done with the statements of the receipt of the different taxes, and all the public revenues."

The French nation renounces the undertaking of any war with a view of making conquests, and will never employ its forces against the liberty of any people.

The confituting national assembly declares, "That the..."
the nation has the impreparable right of changing its constitution; and nevertheless considering that it is more conformable to the national interest to employ only by means provided in the constitution itself, the right of reforming those articles of it, of which experience shall have shown the inconveniences, decrees, that the proceeding by an assembly of revision shall be regulated in the form following: "When three successive legislatures shall have expressed an uniform wish for the change of any constitutional article, the revision demanded shall take place."

"The next legislature, and the following, cannot propose the reform of any constitutional article:"

"The fourth legislature, augmented with 249 members, chosen in each department, by doubling the ordinary number which it furnishes in proportion to its population, shall form the assembly of revision."

The French colonies and possessions in Asia, Africa, and America, "though they form part of the French empire," are not included in the present constitution.

With respect to the laws made by the national assembly which are not included in the act of constitution, and those anterior laws which it has not altered, they shall be observed, so long as they shall not be revoked or modified by the legislative power.

On the 13th of September the King announced, by a letter to the President of the Assembly, his acceptance of the constitution. This event was ordered to be notified to all the foreign courts, and the Assembly decreed a general amnesty with respect to the events of the revolution. On the following day the King repaired in person to the National Assembly; and being conducted to the throne, where prepared for him by the side of the President, he signed the constitutional act, and took an oath of fidelity to it. He then withdrew, and was attended back to the Thullahery by the whole Assembly, with the President at their head. On the 26th of September, this National Assembly, which has since been known by the name of the Constitutional Assembly, dissolved itself, and gave place to the succeeding Legislative National Assembly, which had been elected according to the rules prescribed by the new constitution.

On the character and labours of the Constitutional Assembly, we shall only remark, that it contained many men of talents, and, in all probability, a considerable number of men of integrity. Towards the close of its session, it assumed a very striking character of moderation, and appears to have been completely monarchical, although its jealousy of the ancient aristocracy prevented it from sufficiently guarding the throne against popular violence; for a very striking defect in the new constitution soon appeared. The King notified a veto, or negative, upon the resolutions of the legislative body; but this negative he was bound to exercise in person, without responsibility, and without the intervention of his ministers. He had no senate, or upper chamber, to stand between him and popular violence; and there was something apparently absurd in setting the vote of an individual, in opposition to the collective wisdom and will of a whole nation. In consequence of this, he was reduced to the hard alternative of yielding to every vote of the National Assembly, or of exposing himself personally to public odium.

The new Assembly was opened by the King on the 7th of October, with much apparent union on all sides. His speech, recommending unanimity and confidence between the legislative and executive powers, was received with unbounded applause. The character of the men who composed the new National Assembly was unapproachable to the Court. At the commencement of the revolution, the great body of the people at a distance from the capital were little interested in those projects of freedom which occupied the more enlightened or more turbulent inhabitants of Paris. They had gradually, however, been roused from their lethargy. The variety of powers referred by the constitution upon the people at large, and the multiplicity of offices which it gave them the patronage, had kindled in the minds of men a love of dominion, and a wish to interfere in public affairs. This attached them to the new order of things. The love of power, which is the least disguised passion in the human heart, and equally strong in the breast of the meanest and of the highest of mankind, was thus, under the name of liberty, become a leading passion throughout this wide empire. They who flattered it most, and were most loud in praise of the rights of the people, became speedily the favourites of the public. The consequence of this was, that the new National Assembly was chiefly composed of country gentlemen, of principles highly democratic, or of men of letters who had published popular books, or conducted periodical publications. The members of the Constituent Assembly had been excluded by their own decree from holding feats in the new legislature. The members of the latter, therefore, had little regard for a constitution which they themselves had not framed, and which was not protected by the venerable sanction of antiquity.

When this Assembly first met, it showed a very striking attention to formalities, and a peevish jealousy of the minis- ters of the crown. In the mean time, the treaty of Pbnitz, already mentioned, began to be rumoured abroad, and France was thrown into a state of anxious jealousy for the safety of its newly-acquired liberties. Although the Prussians and Germans (the Elector of Mentz alone excepted) all continued to temporize, the northern powers, Sweden and Russia, entered into first engagements to restore the old despotism of France. On the 3d of November, a decree was passed, that the emigrant's who, after the 1st of January next, should be found assembled, as at present, in a hostile manner, beyond the frontiers, should be suspected as guilty of a conspiracy, and suffer death; that the French Princes, and public functionaries, who should not return before that period, should be punishable in the same manner, and their property forfeited during their own lives. On the 18th of November, a series of severe decrees was also passed against such of the ejected clergy as still refused to take the civic oath. To both these decrees the King opposed his veto, or negative.—The moderate party, who were attached to the constitution, rejoiced at this as a proof of the freedom of their sovereign. But, on the other side, it excited a most violent clamour, and became the means of exciting new suspicion of the wills of the Court. At this time answers were received from the different foreign Courts to the notification sent them of the King's acceptance of the new constitution. These were generally conceived in a spirit of caution, and avoided giving open
REV

French Revolution
1791-

At this period the moderate men, who were friends of emigrants within his states; and the King intimated to the assembly that he had declared to the Elector of Treves, that unless the emigrants should cease before the 15th of January to make hostile preparations within his territories, he would be considered as the enemy of France. All this, however, did not preserve the court from suspicion; for although the different foreign courts had openly declared pacific intentions, yet the French emigrants boldly asserted, that all Europe was actually arming in their favour. Accordingly they ceased not to solicit their equals in rank, who still remained within the country, to leave it to join with them in what they called the royal cause.—The unhappy Louis, placed between a republican party that was gradually gathering strength, and an aristocratical party that was routing Europe to arms against a nation of which he was the constitutional chief, and a combination of Princes justly suspected of wifling to feize upon a part of his dominions, flood in a situation which would have perplexed the most skilful statesman; and it is no proof of incapacity that he fell a sacrifice to circumstances which might have overwhelmed any known measure of human ingenuity. Addresses were crowding into the Assembly, disapproving the conduct of the court. M. Montmorin resigned; M. Deleffart succeeded him; and M. Cahier de Vergueville became minister of the interior. M. du Portail resigned also, and M. Narbonne succeeded him as minister of war. In the month of November, M. Bailly's majority terminated; and the once popular La Fayette appeared as a candidate to succeed him. But he was successfully opposed by M. Petion, a violent Jacobin, and a declared republican, who was elected mayor of Paris by a great majority.

At this period the moderate men, who were friends of the constitution, attempted to counteract the influence of the Jacobin club by the establishment of a similar one. It derived its name from the vacant convent of the Feuillants, in which it assembled. The most active members of the Constituent Assembly belonged to it, such as M. M. D'André, Barnave, the Lameths, Du Port, Rauband, Sieyes, Chapelier, Thouret, Laborde, Taleynrand, Montefquieu, Beaumetz, &c. The Jacobins contrived to excite a riot at the place of their meeting, which was in the vicinity of the hall of the National Assembly. This afforded a pretext for applying to the Assembly for the removal of the new club. The Assembly showed their disapprobation, by complying with this request.

At the end of this year, the kingdom of France was by no means prosperous. The public revenue had fallen far short of the expenditure. The emigrant nobility had carried out of the kingdom the greater part of the current coin, and a variety of manufacturers, who depended upon their ostentation luxury, were reduced to much distress. The dispositions of foreign courts appeared very doubtful. The new year, however, opened with delusive prospects of tranquillity.—The German Princes appeared satisfied with the mode of compenstation which the French had offered for the loss of their possessions in Allace and Lorraine. The Prince of Lowelien accepted of an indemnification.—The Princes of Hohenlohe and Salm-Salm declared themselves ready to treat upon the same terms. Prince Maximilian, and the Dukes of Wirtemberg and Deux-Ponts, freely negotiated. It is unnecessary to state in detail the subterfuges employed, in the mean time, by the emigrant Leopold, for pursuing the French with the appearances of peace. M. Deleffart, minister for foreign affairs, fell a sacrifice to them, and probably to the undecided character of Louis. He was accused by M. Briot of not having given timely notice to the National Assembly of the dispositions of foreign powers, and of not pressing proper measures for securing the honour and safety of the nation. A decree of accusation passed against him in his absence. He was apprehended, tried by the high national court at Orleans, and executed in confquence of its sentence.

The sudden death of Leopold on the first of March gave rise to a transient hope that peace might still be preserved. A supposition of poison fell upon the French court, but it was removed by the detail of his disease that was speedily published. On the 16th of the same month, the King of Sweden was wounded by a nobleman of the name of Anckarstrom, and died on the 29th. This enterprising prince had overthrown the constitution of his own country, and he had formed the project of concluding in person his troops to the frontiers of France, and of commanding or accompanying the combined armies of Europe in their attempt to avenge the cause of insulted royalty. In was in a great measure to counteract this scheme that he was assassinated.

The sudden fall, however, of these two enemies rather accelerated than retarded the meditated hostilities. The young king of Hungary, who succeeded to the empire, made no secret either of his own intentions or of the existence of a concert of Princes against France. M. Dumasaurier was now at the head of the war-office. M. Rolland was minister of the interior, and M. Claviere: minister of finance. The Jacobins were all-powerful. The Court gave way to the torrent. The property of the emigrants was confiscated, reviving the rights of creditors. The Imperial minister, Prince Kaunitz demanded three things of France; 1stly, The restitution of their feudal rights to the German Princes; 2dly, To restore Avignon to the Pope, the inhabitants of which had some time before thrown off their allegiance, and prevailed with the Constitute Assembly to apply their country as a part of France; and lastly, Prince Kaunitz demanded, that "the neighbouring powers should have no reason for apprehension from the present weakness of the internal government of France." On receiving these demands, the king proposed a declaration of war, which was decreed by the National Assembly on the 20th of April, against the King of Hungary and Bohemia.

The French immediately began the war, by attacking in three different columns the Austrian Netherlands. The minister for foreign affairs, M. Theobald Dillon advanced from Lille to Tournay, where he found a strong body of Austrians ready to receive him. The national troops, unaccustomed to sustain the fire of regular soldiers, were instantly thrown back into confusion, and fled even to the gates of Lille. The French army of treachen reflowed on all sides; and their commander, an experienced and faithful officer, was murdered by his own soldiers and the mob. A second division of 10,000 men, under Lieutenant-General Biron, took possession of Quiveron on the 29th, and marched towards Mons. General Biron was here attacked by the
nings and harangues; and in both these the noted incendiary Marat took the lead.

On the 20th of June M. Roederer, the procureur general syndic informed the national assembly, that contrary to law, formidable bodies of armed men were proceeding to the king, and to the national assembly. A part of them speedily appeared with St. Hugue and Santerre a brewer at their head. They marched through the hall in a procession that lasted two hours, at four o'clock in the afternoon, to the number of about 40,000. They surrounded the Tuilleries. The gates were thrown open; and on an attempt to break the door of the apartment, where the king then was, he ordered them to be admitted. His sifter the princesse Elizabeth never departed from his side during four or five hours that he was surrounded by the multitude, and compelled to listen to every indignity. All this while Peton, the mayor of Paris, was unaccountably absent. He at length, however, arrived, and also a deputation from the assembly. The queen, with her children and the princesse de Lamballe, were in the mean time in the council-chamber, where, though protected from violence, they were yet exposed to much insult. At last, in confederation of the approach of evening, and of the entreaties of Peton, the multitude gradually dispersed.

The indignities suffered on this day by the royal family were in some respects not unfavourable to their cause. A great number of the most respectable inhabitants of Paris were a thousand times in petition to the assembly, and addresses to the same purpose were received from several departments. The directory of the department of Paris, at the head of which were M. Rochefoucault and M. Talleyrand, published a declaration disapproving of the conduct of the mayor, and of M. Manuel the procureur of the commune, whom they afterwards suspended from their offices, although they were speedily restored by a decree of the assembly. At the same time, La Fayette leaving his army suddenly, appeared on the 20th at the bar of the national assembly. He declared that he came to express the indignation which the whole army felt on account of the events of the 20th: he declared upon the assembly to punish the promoters of these events, and to dissolve the faid clubs. The sudden appearance of La Fayette threw the Jacobins into confusion, and from that period they never ceased to calumniate him.

On the 1st of July, on the motion of M. Jean de Brie, the assembly ordered a proclamation to be made, that the country was in danger. On the 6th, the king gave intimation that the king of Prussia was marching with 50,000 men to co-operate against France. The French arms were at this time somewhat successful in the Austrian Netherlands; but the cabinet speedily thought it necessary to order the armies to retreat: a measure which was afterwards publicly cenured by Marshal Luckner.

On the 7th, a singular scene occurred in the national assembly. At the infant that M. Briffot was about speech to commence an oration, M. Lommersette bishop of the bishop of Lyons requested to be heard for a few minutes. He expatiated on the necessity of union among the members of the assembly, and of facilitating their pallions and prejudices.
On the 25th of July, the duke of Brunswick issued a proclamation in which he declared that the sample of the French king to full authority, that he declared the national guard of France responsible for the preservation of tranquillity, and threatened with the punishment of death, as rebels to the king, those who should appear in arms against the allied powers. All men holding offices, civil or military, were threatened in the same manner, as well as the inhabitants of all cities. The city of Paris in particular, and the national assembly, were declared responsible for every insult which might be offered to the royal family. It was declared, that if they were not immediately placed in safety, the allies were resolved to inflict “on those who should deserve it the most exemplary and ever memorable avenge punishments, by giving up the city of Paris to military execution, and exposing it to total destruction; and the rebels who should be guilty of illegal resistance should suffer the punishments which they should have deserved.” This flagrancy and imprudent manifesto operated as a warrant for the disfranchisement of the unfortunate Louis XVI. It left no middle party in the nation. All who wished to preserve freedom in any form, and all who loved the independence of their country, were infamously united. At the same time, the reproaches cast on the king by the Jacobins now gained universal credit. The kings of Prussia and of Hungary told the French nation, that their monarch was secretly hostile to the constitution; and the revolution of him and his family to despotic power was made the sole pretence for a bloody and dangerous war.

The republican party saw the advantage which they had now gained, and resolved upon the deposition of the king. The chief engine which they meant to employ in this service consisted of about 1500 men, who had come to Paris at the period of the conference on the 14th of July, and therefore called Frédéric, and who were also sometimes denominated Marcellis, from the place from which the greater number of them came. Next to these, dependence was placed in the populace of the suburbs of the capital. The designs of the republicans were not unknown to the court, and both parties were forming plans of operation. It is said that the royal party intended that the king and his family should suddenly leave the capital, and proceed to a great distance as the constitution permitted. The republicans are said to have intended to seize the person of the king, and to confine him in the castle of Vincennes till a national convention should decide upon his fate. Both allegations are probably true. Every motive which can influence the mind of man must have induced Louis to wish to be at a distance from the factions and factional capital. And the subsequent conduct of the republicans authorizes us to believe them capable of the worst crime that was laid to their charge.

Various charges had been brought forward in the assembly against La Fayette, and the 8th of August was appointed for their discussion. In the mean time, on acquitted the 3d of August, Petion the mayor, at the head of a deputation from the festivities of Paris, appeared at the bar, and in a solemn speech demanded the deposition of the king. The deposition of the assembly against La Fayette was considered as a trial of strength between the parties: he was acquitted, however, by a majority of nearly 200; and the republican party, despairing of carrying their point by a vote of the national assembly, resolved to have recourse to insurrection and force.

On the evening of the 9th of August, about 1500 gentlemen, officers of the army, and others, repaired to the palace, resolved to protect the royal family or to die in their defence; added to these were 750 Swiss guards, with a body of cavalry amounting to about 1500. Mandat, the commander of the national guards, a man who was firmly attached to the constitution, had procured 2400 of that body and 12 pieces of cannon. With such a force, it has been generally thought that, by vigorous and steady councils, the palace, which is a kind of castle, might have been successfully defended; and what is now called a revolution might have born the name of a rebellion. Meanwhile the assembly declared its fittings permanent. Petion was at the palace late on the evening of the 9th. Some apprehensions were entertained, or pretended to be entertained, for his safety (for the whole of this business was, on the part of the republicans, a deep laid scheme), and a deputation from the assembly brought him away. At midnight the tocsin or alarm bell was sounded, and the drums beat to arms through the city. At this instant a number of the most active leaders of the republican party assembled, and elected a new common council or commune. The perfons thus irregularly chosen in that town, and, after conquering the lawful members, who, with that weakness with which men are apt to shrink from flations of responsibility in perilous times, readily gave place to the usurpers. The new commune sent repeated messeages to M. Mandat, requiring his attendance upon important business. He was occupied in arranging the troops in the best order around the palace; but suspicioning nothing, he went to the common hall, and was there assassinated to find a different assembly from what he expected. He was unmercifully accused of a plot to massacre the people, and ordered to prison; but as he defended the streets, he was shot with a pistol, and Santerre was appointed in his stead to command the national guard.

On this eventful night no person in the palace went to bed. About six o’clock in the morning of the 10th the king descended into the gardens to review the troops. He was received with huzzas of Vive le roi excepting from the artillery, who shouted Vive la nation. The king returned to the palace, and the multitude continued to collect. The national guard seemed undecided about what they were to do, as they assembled in divisions near the palace; and had a steady re
The royal family fled for safety to the hall of the national assembly.

The royal family fled for safety to the hall of the national assembly.

A bloody conflict in the palace in which most of the Swiss guards were massacred.

The royal authority was now decreed, and the nation was invited to elect a Convention to determine the nature of its future government. On this uncommon occasion all Frenchmen of 21 years of age were declared capable of electing, and of being elected, deputies to the new national Convention. Commissioners were, in the mean time, sent on the same evening to give to the armies a false and favourable account of these transactions. The royal family were sent to the old palace of the Temple in the midst of the city, to remain there under a strict guard; and all persons of rank who had been attached to them were seized and committed to the different prisons.

To give an idea of the temper of the people of Paris at this time, it is proper to remark, that at the same instant when the multitude with bloody fury were massacring the menial servants in the palace, and could scarcely be restrained from offering violence to the Swiss who were made prisoners, they would suffer no act of pilage to pass unpunished. Several attempts of this kind were accordingly followed by the instantaneous death of the criminals. The plate, the jewels, and money found in the Tuileries were brought to the national assembly, and thrown down in the hall. One man, whose drest and appearance bespoke extreme poverty, cast upon the table an hat full of gold.—But the minds of these men were elevated by enthusiasm; and they conceived themselves as at this moment the champions of freedom, and objects of terror to the kings of the earth.

In the mean time, the situation of France was extremely critical, and it appeared very doubtful if the situation of new Convention would ever be suffered to assemble. The whole La Fayette had accidentally got speedy notice of the events of the 10th of August. He advised the magistrates of the town of Sedan to imprison the commissioners from the national assembly when they should arrive there; which was accordingly done. He, at the same time, published an address to his army, calling upon them to support the king and the constitution; but La Fayette finding that they were not to be depended upon, on the 19th August he left his camp in the night, accompanied only by his staff and a few servants. They took the route of Rochefort in Liege, which was a neutral country; but were met by a party of the enemy, who took them prisoners, and they were detained in Prussian and Austrian dungeons till autumn 1794, when it was said that La Fayette himself made his escape; the report, however, was premature. The severe treatment of this man was probably a considerable error in policy on the part of the allies. His fidelity to the king is very generally admitted; and his attachment to the constitution, his love of his country, his bravery, and many amiable qualities merited a better fate.

To return from this digression. The commissioners were soon set at liberty at Sedan, and received with applause by the army of La Fayette. General Arthur Dillon at first entered into the sentiments of La Fayette; but the politic Dumourier diverted him from his purpose, and by this means regained his credit with the Jacobins; and was appointed commander in chief. The other generals, Biron, Montefquiou, Kellerman, and Culline, made no opposition to the will of the national assembly.

Meanwhile, the combined armies of Austria and Prussia had entered France. The duke of Brunswick’s army was above 90,000 strong. General Clairfait had joined him with 15,000 Austrians, and a considerable body
body of Hessians, along with 20,000 French emigrants; amounting in all to 90,000 men. To oppose these, Dumourier had only 17,000 men collected near the point from which the enemy were approaching in Luxembourg. The French emigrants had given the duke of Brunswick such an account of the disaffected state of their own country, and of the pretended disaffection of all orders of men towards the ruling faction in Paris, that no resistance of any importance was expected. When the combined troops, consisting either of steady Austrian or Hungarian battalions, or of those well disciplined Prussians which the great Frederick had inured to the best military discipline, were reviewed in Germany before setting out on their march, it is said that the spectators, among whom the French cause was not unpopular, beheld them with anxiety and regret, and pitied the unhappy country against which this irresistible force was directed. The soldiers and their officers regarded themselves as departing for a hunting match, or an excursion of pleasure; and many of the usual accommodations of an army were ill attended to, such as hospitals, &c. The beginning of their progress into France justified these expectations. Longwy surrendered after a siege of 15 hours, although well fortified, possessed of a garrison of 3,500 men, and defended by 71 pieces of cannon. The news of this event irritated the assembly so much, that they decreed, that, when retaken, the houses of the citizens should be razed to the ground; and, distrustful of the officers of the army, they decreed that the municipal officers of a town should hereafter have power to control the deliberations of the council of war. Verdun was next summoned; and here the municipality compelled the governor M. Beaurepiere to surrender. That officer, disappointed and enraged, shot himself dead with a pistol in presence of the council, and on the 2d of September the Prussian troops entered the town.

The news of this second capture, and of the approach of the Prussians, spread an infant alarm through Paris. It was proposed to raise a volunteer army, which should set out immediately to meet the enemy. The common council, which was now led by Robespierre, Danton, Marat, and others of the most fanatical character, ordered the alarm-guns to be fired, and the populace to be summoned to meet in the Champ de Mars to enroll themselves to march against the enemy. The people assembled, and either in consequence of a premeditated plan, or, which is not very probable, of an instantaneous movement, a number of voices exclaimed, that “the domestic foes of the nation ought to be destroyed before its foreign enemies were attacked.”

Parties of armed men proceeded without delay to the prisons where were the non-juring clergy, the Switz officers, and whose confiscation the 10th of August on account of practices against the state, were detained in custody. They took out the prisoners one by one, gave them a kind of mock trial before a jury of themselves, acquitted some few, and murdered the rest. Among these last was the prinsces de Lamblie. She was taken from her bed before this bloody tribunal, and massacred; her head was carried by the populace to the Temple, to be seen by the queen, whose friend she was. These massacres lasted for two days, and upwards of 1,000 persons were put to death. There is scarce any thing in history that can be represented as parallel to them; they were committed, it is said, by less than 300 men, in the midst of an immense city, which heard of them with horror, and in the vicinity of the national assembly, which, by going in a body, could have put an end to them. But such was the confusion and dilatory of these two disgraceful days, that no man dared to stir from his own house; and every one believed that the whole city, excepting his own street, was engaged in massacre and bloodshed. The national guards were all ready at their respective posts, but no man directed them to act; and there is too much reason to suspect that Santerre and the chiefs of the commune connived, at least, at the massacre.

In the mean time, general Dumourier was taking State of the safety measures to protract the march of the enemy till the army of Kellermann, consisting of 60,000 men, army, and could join him from Lorraine, and that of Bournonville from Flanders, amounting to 13,000; together with whatever new levies Luckner might be able to send him from Chalon. The forest of Angonne extends from north to south upwards of 40 miles; it lay directly in the route of the duke of Brunswick, who must either force his way across it, or make a circuit of 40 miles by the passes of Grandpré on the north, or by Bareluc on the south. The passes that lay directly in his route was that of Bieffe. After surveying Dillon's position here, he left a party of 20,000 men to watch it; and with the main body of his army took the circuitous route by Grandpré on the north. Here Dumourier waited to receive him, and was attacked on the 12th and 13th without success; but on the 14th, the Prussians was irresistible, and Dumourier retreated, gave up the passes. On his march he was violently pursued by the advanced cavalry of the Prussians, that his army, at one time, was feized with a panic, and fled before 1,500 men; who, if they had pushed their advantage, might have dispersed it. On the 15th, however, Dumourier encamped at St Menchol, and began to fortify it. Bournonville's army joined Dumourier on the 17th. The duke of Brunswick formed a plan of attacking Kellermann before his junction could be completed. That general arrived on the 19th within a mile of Dumourier's camp; the projected attack took place; the Prussians maneuvred with their usual coolness and address; they attempted to surround Kellermann's army, but this could not be accomplished. The French troops preferred excellent order, while the national vivacity was constantly flowing itself in their shouts and patriotic songs: 4,000 French were killed, and 5,000 wounded; the loss of the Prussians was much greater; and, in the face of the enemy, Kellermann joined Dumourier at the end of the engagement without opposition. At the time that the attack was made on the army of Kellermann, an attempt was made to force Dillon's camp at Bieffe by the 20,000 men that had been left in its vicinity, but without success; and this large detachment was thus prevented from cutting the forest of Argonne and joining the duke of Brunswick. It is to be observed, that in these engagements the French owed their superiority chiefly to the excellence of their artillery; a circumstance which served to convince their enemies that they had...
The Prussian army was thrown into the city, though for the purpose of attaching to the form of speech to the besieged city. The French army was vigorously laid against it. The French army was much more numerous than that of Dumourier, and it was defeated in such a situation as they had already received the summons of the council-general. The consequences of this was, that an epidemical delirium commenced and spread through the army to such an extent, that 10,000 men at one time were unfit for duty. The duke of Brunswick, however, still commanded a force much more numerous than that of Dumourier; and he had been much engaged for not attacking his camp, and forcing him to engage. It has been said, that the veteran and numerous force which he commanded would have marched to certain victory against the raw troops that opposed them; but having defeated Dumourier's army, there was nothing to oppose their march to Paris. But the duke of Brunswick had entered France upon the supposition, that in its present distressed state no regular army could be brought into the field against him, and that the people at large were hostile to the ruling faction. The contrary of all this had turned out to be true. He found himself in the midst of an hostile people, and opposed by skilful military chiefs. A defeat in such a situation would have brought certain ruin to his army; and even the losses sustained in the acquisition of a victory might have proved equally fatal. The remains of the French army would not fail to hang upon his rear; and from the disposition of the people it appeared impossible to ascertain to what amount that army might be suddenly increased. After propounding a truce, therefore, which lasted eight days, he commenced his retreat towards Grandpré, and no advantage was gained over him in the course of it. Verdun was retaken by the French on the 12th of October, and Longwy on the 18th; the siege of Thionville was at the same time raised. That small, but strong fortresses, under the command of general Felix Wimpffen, had held in check an army of 15,000.

While the Prussians were advancing from the north-east, the Austrians under the duke of Saxe-Tetchen laid siege to Lille. The council-general of the commune answered the summons of the besiegers thus, "We have just renewed our oath to be faithful to the nation, and to maintain liberty and equality, or to die at our post. We will not parjure ourselves." Such was the answer of these men who had already parjured themselves by contributing to overturn the constitution which they had repeatedly sworn to defend. The Austrian batteries began to play upon the town on the 29th, and were chiefly directed against that quarter which was inhabited by the lower classes of citizens, for the purpose of making them miutinous and rebellious. This procedure was ill-judged. The lower classes of mankind are always much accustomed to hardships, and they go farthest in support of any enthusiastic principle they have been perjured to adopt. Accordingly, though a great part of the city was reduced to a heap of ruins, the citizens of Lille became daily more obstinate. They received each other into the houses that were still standing, and the vaults and cellar was occupied. Although upwards of 30,000 red-hot balls and 6000 bombs were thrown into the city, besides the efforts made by an immense battering train of artillery, yet the lofs both to the garrison and people did not exceed 500 persons, most of whom were women and children. After a fortnight of fruitless labour the Austrians raised the siege.

War had been declared against the kingdom of Sardinia, on account of the threatening appearances exhibited in that quarter. On the 20th of September general Montefquieu entered the territories of Savoy, and was received at Chambery and throughout the whole country with marks of unabounded welcome. On the 29th general Anselm, with another body of troops, took possession of Nice and the country around it. On the 30th general Cufline advanced to Spires, when he found the Austrians drawn up in order of battle. He attacked and drove them through the city, taking 5000 of them prisoners. The capture of Worms succeeded that of Spire; Mentz surrendered by capitulation; and Frankfort fell into the hands of the French on the 23d. Out of this last place, however, they were afterwards driven on the 2d of December.

On the 20th of September the French National Convention assembled. It was found to contain men of all classes, characters, orders, and ranks. Many distinguished members of the Constituting Assembly were elected into it, and also several that had belonged to the Legislative Assembly; even foreigners were invited to become French legislators. The famous Thomas Paine and Dr Priestley of England were elected by certain departments; but the latter declined accepting. Clouts a Prussian, whom we formerly noticed as bringing a deputation to the bar of the constituent assembly, confiding of persons representing all the nations of the earth, was also chosen. The general aspect of the new convention showed that the republican party had acquired a decided superiority. On the first day of meeting M. Collot D'Herbois, who had formerly been an actor, attended the tribune, and proposed the eternal abolition of royalty in France. The question was carried by acclamations, and the house adjourned. Messages were sent to all parts of the country to intimate the decree; and by the influence of the Jacobins they were everywhere received with applause. It was next day decreed, that all public acts should be dated by the year of the French republic; and all citizens were declared eligible to all the vacant offices and places. The rage of republicanism soon went far, that the ordinary titles of Monfieur and Madame were abolished, and the appellation of Citizen substituted in their stead, as more suitable to the principles of liberty and equality. — It may be remarked, that in this last trifling circumstance an attachment to the form of speech which they had been accustomed appears even in its abolition: For, although the Roman orators addressed their countrymen when assembled by the honourable appellation of Citizen, yet they never, in addressing an individual, called him Citizen Cato, or Citizen Cicero, according to the mode now adopted in France.
It was soon discovered that the leading republicans had divided into two opposite factions. The one of these was called Girondists, because Vergniaud, Genoulongue, Guadet, and some others of its leaders, were members from the department of La Gironde. The celebrated Condorcet belonged to this party; and they were sometimes denominated Brissotins, from M. Brissot de Warville their principal leader. They supported the ministry now in office, at the head of which was Roland; and the majority of the convention was obviously attached to them. In opposition to these was the smaller party of the Mountain; so called from its members usually sitting in the convention on the upper parts of the hall. They were men possessed of less personal respectability, and fewer literary accomplishments, but of daring and fanatical characters, whom the revolution had brought into public notice. At the head of this party were Danton and Robespierre; and subordinate to these were Couthon, Buzot, Thuriot, Merlin de Thionville, St André, Camille Desmoulins, Chaubon, Collot D’Herbois, Sergeant, Legendre, Fabre D’Egmont, Paris, and Marat.

These two parties showed the diversity of their characters in the manner in which they treated the malcontents of the 2d and 3d of September. The Girondists, with the majority of the convention wished to bring the murderers to trial; but the question was always eluded by the other party, with the affiance of the Jacobin club and of the populace.

On the 9th of October it was decreed, that all emigrants, when taken, should suffer death; and on the 15th of November, in consequence of an insurrection in the duchy of Deux Ponts, and an application on the part of the insurgents to the convention for aid, the following decree was passed: “The national convention declare, in the name of the French nation, that they will grant to all those who wish to procure liberty, and charge the executive power to send orders to the generals to give assistance to such people as have suffered, or are now suffering, in the cause of liberty.” Of this decree foreign nations, with great reason, complained much, as will shortly appear.

To return to the military affairs of the new republic. On the 18th of October General Dumourier came to Paris and was immediately sent to commence a winter campaign in the Netherlands. He suddenly attacked the Austrians at the village of Bousi, and drove them from their ground. On the 5th of November he came in sight of the enemy upon the heights of Jenappe. Three rows of fortifications arose above each other defended by 100 pieces of cannon. Their right was covered by the village and a river, and their left by thick woods. The French were by their own account 30,000, whilst others with great probability of truth computed them at double that number, and the number of the Austrians was at least 20,000. At seven in the morning of the following day a heavy cannonade commenced on both sides, and at noon a close attack was determined on by the French, whose right wing was commanded by Generals Bouronville and Dampierre, and the centre by Generals Égalité (son to the duke of Orleans who had assumed that name), Steetenboffe, Desprez, and Drouet. The music played the popular march of the Marisellois, and the soldiers rushed on with enthusiasm, shouting “Vive la nation.” The engagement was warm and bloody; the French were twice repelled; but their impetuosity was at last irresistible, and about two o’clock the enemy fled from their last entrenchments. The loss on both sides was very great; that of the Austrians amounting to 4000. This victory was decisive of the fate of the Netherlands. Mons and Brussells surrendered to Dumourier; Tourneay, Malines, Ghent, and Antwerp, were taken possession of by General Labourdonnay; Louvain and Namur were taken by General Valence; and the whole Austrian Netherlands, Luxembourg only excepted, fell into the hands of the French: Liege was taken on the 28th of November after a successful engagement, in which the Austrians lost 5 or 600 men and an immense train of artillery.

France was now in a situation not unusual in the history of those nations that either are free, or are attempting to become so; successful in all quarters abroad, but distracted by factions at home. The two parties in the convention were engaged in a struggle, which daily became more incapable. The party called the Mountain did not hesitate about the nature of the means they were to employ to bring about the ruin of their antagonists. They were even fulfilled of having, through the medium of Pache, the war-minister, retarded the supply of the armies, to render the ruling party odious by want of success. They were for some time, however, unfortunate in this respect; and the daily news of victories supported with the public the credit of the Girondists. A new subject was therefore fallen upon, which was the question, how the dethroned king was to be disposed of? The moderate party wished to save him; and this was a sufficient reason for their antagonists to resolve upon his ruin. A committee was appointed to give in a report upon his conduct. A variety of accusations were brought against him; and the convention infamously resolved to act the part of accusers and of judges.

It was on the 11th of December when the ill-fated The king monarch was ordered to the bar of the convention; the act of accusation was read, and the king was summoned by the president, Barrere, to answer to each separate charge.

Prof. “Louis, the French nation accuses you of having committed a multitude of crimes to establish your tyranny, in destroying her freedom. You, on the 20th of June 1789, attempted the sovereignty of the people, by suspending the assemblies of their representatives, and expelling them with violence from the places of their fittings. This is proved in the proofs verbal entered at the Tennis-court of Verfailles by the members of the constituent assembly. On the 23d of June you wanted to dictate laws to the nation; you surrounded their representatives with troops; you pretended to them two royal declarations, subversive of all liberty, and ordered them to separate. Your own declarations, and the minutes of the assembly, prove these attempts. What have you to answer?”

Louis. “No laws were then existing to prevent me from it.”

Prof. “You ordered an army to march against the citizens of Paris. Your satellites have fixed the blood of several of them, and you would not remove this army till the taking of the Bailiff and a general information announced to you that the people were victorious. The speeches
speeches you made on the 9th, 12th, and 14th of July to the deputies of the constituent assembly, shew what were your intentions; and the massacres of the Thulleries rise in evidence against you.—What have you to answer?

Louis. "I was master at that time to order the troops to march; but I never had an intention of shedding blood."

Prof. "After these events, and in spite of the promises which you made on the 15th in the constituent assembly, and on the 17th in the town-hall of Paris, you have persisted in your projects against national liberty. You long eluded the execution of the decrees of the articles; you ordered the Thuilleries to favour that act on the 28th of February, April; and you were busy in supporting the caufe of the

Prof. "But the resistance of the citizens made you sensible that their distrust was great; you endeavoured to disprove it by communicating to the constituent assembly a letter, which you addressed to the agents of the nation near foreign powers, to announce to them that you had freely accepted the constitutional articles, which had been presented to you; and, notwithstanding, on the 21st you took flight with a false passport. You left behind a protest against these self-same constitutional articles; you ordered the ministers to sign none of the acts issued by the National Assembly; and you forbade the ministers of justice to deliver up the seals of state. The public money was lavished to infure the success of this treachery, and the public force was to protect it, under the orders of Bouillé, who shortly before had been charged with the massacre of Nancy, and to whom you wrote on this head, "to take care of his popularity, because it would be of service to you." These facts are proved by the memorial of the 23d of February, with marginal comments in your own handwriting; by your declaration of the 20th of June, wholly in your own handwriting; by your letter of the 4th of September 1790 to Bouillé; and by a letter that you wrote on the 14th of September; your speeches announced an absolute monarchy, and you were silent upon this convention till the moment when it was known by all Europe.—What have you to answer?"

Louis. "I have no knowledge whatever of the memorial of the 23d of February. As to what relates to my journey to Varennes, I appeal to my declaration to the commissioners of the constituent assembly at that period."

Prof. "After your detention at Varennes, the exercise of the executive power was for a moment suspended in your hands, and you again formed a conspiracy. On the 17th of July the blood of citizens was shed in the Champ de Mars. A letter, in your own handwriting, written in 1790 to La Fayette, by your order, was adressed to the agents of the revolution; and to counter-revolutionary purposes than you had addressed to Mr. de Lafayette, to whom you promised a criminal coalition subsisted between you and La Fayette, to which Mirabeau acceded. The revision began under these cruel auspices; all kinds of corruptions were made use of. You have paid for libels, pamphlets, and newspapers, designed to corrupt the public opinion, to discredit the assignats, and to support the cause of the emigrants. The regiments of Septembre threw what immense sums have been made use of in these libellicide manoeuvres.—What have you to answer?"

Louis. "What happened on the 17 of July has nothing at all to do with me. I know nothing of it."

Prof. "You seemed to accept the constitution on the 14th of September; your speeches announced an intention of supporting it; you were busy in counterturning it, even before it was completed. A convention was entered into at Phlitz on the 24th of July, between Leopold of Austria and Frederic-William of Brandenburg, who pledged themselves to erect in France the throne of absolute monarchy, and you were silent upon this convention till the moment when it was known by all Europe.—What have you to answer?"

Louis. "I made it known as soon as it came to my knowledge; besides, every thing that refers to this subject concerns the minister."

Prof.
REV [ 182 ]

Prof. "Arles had hoisted the standard of rebellion; you favoured it by sending three civil commissaries, who made its business not to repress the counter-revolutionists, but to justify their proceedings.—What have you to answer?"

Louis. "The instructions which were given to the commissaries must prove what was their mission; and I knew none of them when the ministers proposed them to me."

Prof. "Avignon, and the county of Venaisin, had been united with France; you caused the decree to be executed; but a month after that time civil war desolated that country. The commissaries you sent thither helped to ravage it.—What have you to answer?"

Louis. "I do not remember what delay has been caused in the execution of the decree; besides, this occurrence has no personal reference to me; it only concerns throes that have been sent, not those that sent them."

Prof. "Nimes, Montauban, Mende, Jales, felt great shocks during the first days of freedom. You did nothing to still those gems of counter-revolution till the moment when Saillant's conspiracy became manifestly notorious.—What have you to answer?"

Louis. "I gave, in this respect, all the orders which were proposed to me by the ministers."

Prof. "You sent 22 battalions against the Marfellais, who marched to reduce the counter-revolutionists of Arles.—What have you to answer?"

Louis. "I ought to have the papers referring to this matter, to give a just answer."

Prof. "You gave the southern command to Witgenstein, who wrote to you on the 21st of April 1792, after he had been recalled: 'A few infidels more, and I shall call around the throne of your Majesty thousands of French, who again become worthy of the wishes you form for their happiness.'—What have you to answer?"

Louis. "This letter is dated since his recall; he has not employed since. I do not recollect this letter."

Prof. "You paid your late life-guards at Coblenz; the regiments of Septeuil attest this; and general orders signed by you prove that you conferred considerable remittances to Bouille, Rochefort, Vauguyon, Choiseul, Beaupre, Hamilton, and the wife of Polignac.—What have you to answer?"

Louis. "When I first learned that my life-guards assembled beyond the Rhine, I dropped their pay: as to the rest, I do not remember."

Prof. "Your brothers, enemies to the state, caused the emigrants to rally under their banners: they raised regiments, took up loans, and concluded alliances in your name; you did not disclaim them; but at the moment when you were fully certain that you could no longer cross their projects, your intelligence with them by a note, written by Louis Stanislaus Xavier, signed by your two brothers, was conceived in these words: 'I wrote to you, but it was by post, and I could say nothing. We are two here, who make but one; one in sentiments, one in principles, one in zeal of serving you. We keep silence; because, were we to break it too soon, it would injure you; but we shall speak as soon as we shall be certain of general support, and that moment is near. If we are spoken to on the part of those people, we shall hear nothing; but if on your part, we will listen: we shall pursue our road straight. It is therefore desired that you will enable us to say something. Do not stand on ceremonials. Be easy about your safety: we only exist to serve you; we are eagerly occupied with this point, and all goes on well; even our enemies feel themselves too much interested in your preservation to commit an useless crime which would terminate in their own destruction. Adieu.'

L. S. Xavier and Charles Philippe."

"What have you to answer?"

Louis. "I disowned all the proceedings of my brothers, according as the constitution prescribed me to do, and from the moment they came to my knowledge. Of this note I know nothing."

Prof. "The soldiers of the line, who were to be put on the war establishment, consisted but of 100,000 men at the end of December, you therefore neglected to provide for the safety of the state from abroad. Narbonne required a levy of 50,000 men, but he stopped the recruiting at 26,000, in giving assurances that all was ready; yet there was no truth in these assurances. Servan proposed after him to form a camp of 20,000 men near Paris; it was decreed by the legislative assembly; you refused your sanction.—What have you to answer?"

Louis. "I had given to the ministers all the orders for expediting the augmentation of the army; in the month of December last, the returns were laid before the Assembly. If they deceived themselves, it is not my fault."

Prof. "A flight of patriotism made the citizens repair to Paris from all quarters. You issued a proclamation, tending to stop their march; at the same time our camps were without soldiers. Dumourier, the successor of Servan, declared that the nation had neither arms, ammunition, nor provisions, and that the poifs were left defenceless. You waited to be urged by a request made to the minister Lagard, when the legislative assembly wished to point out the means of providing for the external safety of the state, by proposing the levy of 42 battalions. You gave commission to the commanders of the troops to disband the army, to force whole regiments to desert, and to make them pass the Rhine, to put them at the disposal of your brothers, and of Leopold of Aultria, with whom you had intelligence. This fact is proved by the letter of Toulougeon, governor of Franche Comte.—What have you to answer?"

Louis. "I know nothing of this circumstance; there is not a word of truth in this charge."

Prof. "You charged your diplomatical agents to favour this coalition of foreign powers and your brothers against France, and especially to cement the peace between Turkey and Aultria, and to procure thereby a larger number of troops against France from the latter. A letter of Choiseul-Gouffier, ambassador at Constantinople verifies the fact.—What have you to answer?"

Louis. "M. Choiseul did not speak the truth: no such thing has ever been."

Prof. "The Prussians advanced against our frontiers: your minister was summoned on the 8th of July to give an account of the state of our political relations with
REV

REV

French Revolution

with Prussia; you answered, on the 10th, that 50,000
Prussians were marching against us, and that you gave
notice to the legislative body of the formal acts of the
pending hostilities, in conformity to the constitution.
—What have you to answer?

Louis. “It was only at that period I had know-
ledge of it; all the correspondence passed with the
ministers.”

Prof. “You entrusted Dabancourt, the nephew of
Calonne, with the department of war; and such has
been the success of your conspiracy, that the posts of
Longwy and Verdun were surrendered to the enemy at
the moment of their appearance.—What have you to
answer?”

Louis. “I did not know that Dabancourt was M.
Calonne’s nephew. I have not divulged the posts. I
would not have permitted myself such a thing. I know
nothing of it, if it has been so.”

Prof. “You have destroyed our navy—a vast num-
ber of officers belonging to that corps, had emigrated;
there scarcely remained any to do duty in the harbours;
meanwhile Bertrand was granting passports every day;
and when the legislative body reprefented to you his
criminal conduct on the 8th of March, you answered,
that you were satisfied with his services.—What have
you to answer?”

Louis. “I have done all I could to retain the of-
cers. As to M. Bertrand, since the legislative assem-
bly presented no complaint against him that might have
put him in a state of accusation, I did not think proper
to turn him out of office.”

Prof. “You have favoured the maintenance of an-
olute government in the colonies; your agents fomented
troubles and counter-revolutions throughout them,
which took place at the same epoch when it was to
have been brought about in France, which indicates
plainly that your hand laid this plot.—What have you
to answer?”

Louis. “If there are any of my agents in the co-
lonies, they have not spoken the truth; I had nothing
to do with what you have just mentioned.”

Prof. “The interior of the state was convulsed by
fanaticism; you avowed yourself their protector, in mani-
festing your evident intention of recovering by them
your ancient power.—What have you to answer?”

Louis. “I cannot answer to this; I know nothing
of such a project.”

Prof. “The legislative body had passed a decree
on the 29th of January against the traitous priests;
you suspended its execution.—What have you to an-
swer?”

Louis. “The constitution referred me the free
right to refuse my sanction of the decrees.”

Prof. “The troubles had increased; the minister
declared, that he knew no means in the laws, extant to
arrest the guilty. The legislative body enacted a fresh
decree, which you likewise suspended.—What have you
to say to this?”

[Louis replied in the same manner as in the preced-
ing charge.]

Prof. “The citizen-like conduct of the guards
whom the constitution had granted, you had rendered it
necessary to disband them. The day after, you sent
them a letter expressive of your satisfaction, and con-
tinued their pay. This fact is proved by the trea-
furer of the civil list.—What have you to answer?”

Louis. “I only continued them in pay till fresh
ones could be raised, according to the tenor of the de-
cree.”

Prof. “You kept near your person the Swiss
guards; the constitution forbade you this, and the legi-

dative body had expressly ordained their departure.—
What have you to answer?”

Louis. “I have executed all the decrees that have
been enrolled in this respect.”

Prof. “You had private companies at Paris, charg-
ed to operate movements useful to your projects of a
counter-revolution. Dangremont and Gilles were two
of your agents, who had salaries from the civil list.
The receipts of Gilles, who was ordered to raise a com-
pany of 60 men, shall be presented to you.—What
have you to answer?”

Louis. “I have no knowledge whatever of the pro-
jects laid to their charge: the idea of a counter-revolu-
tion never entered into my mind.”

Prof. “You wished to foment, with considerable
fums, several members of the legislative and con-
stituent assemblies. Letters from St Leon and others evince
the reality of these deeds.—What have you to an-
swer?”

Louis. “Several persons presented themselves with
similar decrees, but I have waved them.”

Prof. “Who are they that presented you with
those projects?”

Louis. “The plans were so vague that I do not
recollect them now.”

Prof. “Who are those to whom you gave money?”

Louis. “I gave money to nobody.”

Prof. “You suffered the French name to be re-

dicted in Germany, Italy, and Spain, since you omitted
to demand satisfaction for the bad treatment which the
French suffered in those countries.—What have you to
answer?”

Louis. “The diplomatical correspondence will prove
the contrary; besides, this was a concern of the mini-
sters.”

Prof. “You reviewed the Swiss on the 10 of Aug-
ust at five o’clock in the morning; and the Swiss
were the first who fired upon the citizens.”

Louis. “I went on that day to review all the troops
that were assembled about me: the constituted authori-
ties were with me, the department, the mayor, and mu-
icipality; I had even invited thither a deputation of the
national assembly, and I afterwards repaired into the
midst of them with my family.”

Prof. “Why did you draw troops to the castle?”

Louis. “All the constituted authorities saw that
the castle was threatened; and as I was a constituted
authority, I had a right to defend myself.”

Prof. “Why did you summon the mayor of Paris
in the night between the 9th and 10th of August to the
castle?”

Louis. “On account of the reports that were cir-
culated.”

Prof. “You have canvassed the blood of the French
to be shed.”

Louis. “No, Sir, not I.”

Prof. “You authorized Septeuil to carry on a
con-

French Revolution
1792

considerable trade in corn, sugar, and coffee, at Hamburg. This fact is proved by a letter of Septeul.

Louis. "I know nothing of what you say."

Prlt. "Why did you affix a veto on the decree which ordained the formation of a camp of 20,000 men?"

Louis. "The constitution left me the free right of refusing my sanction of the decrees; and even from that period I had demanded the assembling of a camp at Soissons."

Presidential, addressing the convention. "The questions are done with."—(To Louis) "Louis, is there anything that you wish to add?"

Louis. "I request a communication of the charges which I have heard, and of the pieces relating thereto, and the liberty of choosing counsel for my defence.

Valazé, who sat near the bar, presented and read to Louis Capet the pieces, viz. The memoir of Laporte and Mirabeau, and some others, containing plans of a counter-revolution.

Louis. "I disown them."

Valazé next presented several other papers, on which the act of acclamation was founded, and asked the king if he recognized them. These papers were the following :

Valazé. "Letter of Louis Capet, dated June 29th 1790, settling his connections with Mirabeau and Lafayette to effect a revolution in the constitution.""—(Valazé read the letter).—"It's only a plan, in which there is no question about a counter-revolution; the letter was not to be sent."

Valazé. "Letter of Louis Capet, of the 22d of April, relative to conversations about the Jacobins, about the president of the committee of finances, and the committee of domains; it is dated by the hand of Louis Capet."

Louis. "I disown it."

Valazé. "Letter of Laporte, of Thursday morning, March 5th, marked in the margin in the handwriting of Louis Capet with March 5th 1791, implying a pretended rupture between Mirabeau and the Jacobins."

Louis. "I disown it."

Valazé. "Letter of Laporte without date, in his handwriting, but marked in the margin by the hand of Louis Capet, containing particulars respecting the last moments of Mirabeau, and expressing the care that had been taken to conceal from the knowledge of men some papers of great concern which had been deposited with Mirabeau."

Louis. "I disown it as well as the rest."—(Valazé). "Plan of a constitution, or revision of the constitution, signed Lafayette, addressed to Louis Capet, April 6th 1790, marked in the margin with a line in his own handwriting."

Louis. "These things have been blotted out by the constitution."

Valazé. "Do you know this writing?"

Louis. "I do not."

Valazé. "Your marginal comments?"

Louis. "I do not."

Valazé. "Letter of Laporte of the 19th of April, marked in the margin by Louis Capet April 19. 1791, mentioning a conversation with Rivarol."

Louis. "I disown it."

Valazé. "Letter of Laporte, marked April 16. 1791, in which it seems complaints are made of Mirabeau, the abbé Perigord, André, and Beaumetz, who do not seem to acknowledge sacrifices made for their sake."

Louis. "I disown it likewise."

Valazé. "Letter of Laporte of the 23d of February 1791, marked and dated in the handwriting of Louis Capet; a memorial annexed to it, respecting the means of his gaining popularity."

Louis. "I know neither of these pieces."

Valazé. "Several pieces without signature, found in the castle of the Tuilleries, in the gap which was shut in the walls of the palace, relating to the expenses to gain that popularity."

Presidential. "Previous to an examination on this subject, I wish to ask a preliminary question: Have you caused a press with an iron door to be constructed in the castle of the Tuilleries, and had you your papers locked up in that press?"

Louis. "I have no knowledge of it whatever."

Valazé. "Here is a day-book written by Louis Capet himself, containing the pensions he has granted out of his coffers from 1776 till 1792, in which are observed some douzants granted to Acoluce."

Louis. "This I own, but it consists of charitable donations which I have made."

Valazé. "Different lists of sums paid to the Scotch companies of Noailles, Gramont, Montmorency, and Luxembourg, on the 6th of July 1791."

Louis. "This is prior to the epoch when I forbade them to be paid."

Presidential. "Louis where had you deposited those pieces which you own?"

Louis. "With my treasurer."

Valazé. "Do you know these pension-lists of the life-guards, the one hundred Swifs, and the king's guards for 1792?"

Louis. "I do not."

Valazé. "Several pieces relative to the conspiracy of the camp of Jales, the originals of which are deposited among the records of the department of l'Ardcche."

Louis. "I have not the smallest knowledge of them."

Valazé. "Letter of Bouillé, dated Mentz, bearing an account of 995,600 livres received of Louis Capet."

Louis. "I disown it."

Valazé. "An order for payment of 168,000 livres, signed Louis, indorsed Le Bonneirs, with a letter and billet of the same."

Louis. "I disown it."

Valazé. "Two pieces relative to a present made to the wife of Polignac, and to Lavauguyon and Choiseul."

Louis. "I disown them as well as the others."

Valazé. "Here is a note signed by the two brothers of the late king, mentioned in the declaratory act."

Louis. "I know nothing of it."

Valazé. "Here are pieces relating to the affair of Choiseul-Gouffier at Constantinople."

Louis. "I have no knowledge of them."
When the revolution of 1789 was going on, the king was no longer allowed to nominate his own counsel.

He was first interrogated; but on the 16th of April 1791, he was condemned to death by a small majority of the assembly. The discussion was carried on till the 16th of January. After a sitting of near 34 hours, the punishment of death was pronounced against the detested monarch. Do not affect to refer their sentence to the tribunal of the people. You have either forgotten or destroyed (said the celebrated M. Tronchet) the unity which the law allows to criminals, of requiring at least two-thirds of the voices to constitute a definitive judgment.

The sentence was ordered to be executed in twenty-four hours. The king and his family had been for some time kept separate from each other; but he was now allowed to see them, and to choose an ecclesiastic to attend him. The meeting, and, above all, the separation from his family, was tender in the extreme. On Monday the 21st January, at eight o'clock in the morning, the unfortunate monarch was summoned to his fate. He attended the scaffold with a firm air and step. Raising his voice, he said, "Frenchmen, I die innocent; I pardon all my enemies; and may France"—at this instant the inhuman Santerre ordered the drums to beat, and the executioners to perform their office. When they offered to bind his hands, he started back as if about to resist; but recollected himself in a moment, and submitted. While the instruments of death defended, the priest exclaimed, "Son of St Louis, ascend to the throne of your ancestors." The bleeding head was held up, and a few of the populace shouted Vive la Republique. His body was interred in a grave that was filled up with quicklime, and a guard placed around it till it should be confounded.

Thus fell Louis XVI. He possessed from nature a good understanding, which, however, was blunted by the early indulgences of a court. He had a strong sense of justice, and his humanity, was perhaps extreme. One deed rendered his virtues of little value, which was the composition of an irreproachable and unoffending character. Unambitious and easily advised, he was without difficulty induced to change his purposes, especially by his queen, whose connection with the house of Austria had always tended to render his counsellors unpopular. Whether he was or was not connected with the foreign invaders of his country, popularity must decide; but all men of sense and moderation must be convinced that he was murdered by a band of ruffians. Indeed a sentence so infamous, and in all respects unjust, is not to be found in the records of history. The greater part of the charges brought against him were frivolous. Those which seem to be of importance relate to conduct authorised by the constitution under which he acted; and that constitution declared his person inviolable. The severest punishment that he could incur by law, was not death, but deposition; and there is no doubt, that in putting him to death the French nation broke the social compact which their representatives made with him. In a political view, this tragic event was injurious to the republican cause throughout Europe. Few men out of France ventured to justify it; and in all countries it excited the most violent indignation against the rulers of the new republic.

New enemies were now hallowing to join the general league against France. We do not mean here to enter into a detail of the political struggles that occurred in any other country, than that in the narrative of whose revolution we are now engaged. It will therefore only be necessary to remark in general, that the British government at this time thought itself endangered by the propagation of those speculative opinions which had overturned
of the 10th of August 1792 from giving to the French nation proofs of his attachment to the concert of crowned heads; that he had drawn into the same league the stadtholder of the United Provinces; that, contrary to the treaty of 1783, the English ministry had granted protection to the emigrants and others who have openly appeared in arms against France; that they have committed an outrage against the French republic, by ordering the ambassador of France to quit Great Britain; that the English have stopped divers boats and vessels laden with corn for France, whilst, at the same time, contrary to the treaty of 1786, they continue the exportation of it to other foreign countries; that to thwart more efficaciously the commercial transactions of the republic with England, they have by an act of parliament prohibited the circulation of assignats. The convention therefore declares, that in consequence of these acts of hostility and aggression, the French republic is at war with the king of England and the stadtholder of the United Provinces.

The absurdity of pretending that any treaty with France made in 1783 could be violated by protecting the emigrants who fled from the fury of the convention, must be obvious to every reader. The convention considered a rebellious usurpation of the government with which such a treaty was made. The prohibition of assignats was certainly contrary to no law, and was sanctioned by every motive of expediency, unless the convention could prove that all nations were bound by the law of nature to risk their own credit upon the credit of the French republic.

About a fortnight after this declaration against And Britain, war was likewise declared against Spain; and against in the course of the summer France was at war with all Europe, excepting only Switzerland, Sweden, Denmark, and Turkey.

In the mean time General Dumourier, who was proceeding agreeably to his orders, made an attack upon Holland; but in doing this he dispersed his troops in rier, such a manner as to expose them much to any attack on the side of Germany. He commanded General Miranda to invade Maastricht, while he advanced to block up Breda and Bergen-op-Zoom. The first of these places, viz. Breda, surrendered on the 24th of February; Kinnert was taken on the 26th; and Gertruydenberg on the 4th of March. But here the triumphs of Dumourier ended. The sieges of Williamstadt and Bergen-op-Zoom were vigorously but unsuccessfully pressed. On the 1st of March General Clairfait having passed the Scheldt, Roer, attacked the French posts, and compelled them to retreat with the loss of 4000 men.

The following day the archduke attacked them anew with considerable success. On the 3d the French were driven from Aix-la-Chapelle, with the loss of 4000 men killed and 1600 taken prisoners.

The siege of Maastricht was now raised, and the French retreated to Tongres, where they were also attacked and forced to retreat to St. Tron. Dumourier here joined them, but did not bring his army along with him from the attack upon Holland. After some skirmishes a general engagement took place at Neerwinden. It was fought on the part of the French with great obstinacy; but they were at length overpowered by the number of their enemies, and perhaps also by the treachery of their commander. This defeat was fatal. The French lost 3000 men, and 6000 immediately
About the middle of March they advanced against Nantes to the amount of 40,000. In the beginning of April they defeated the republicans in two pitched battles, and possessed themselves of 50 leagues of country. They even threatened by their own efforts to shake the new republic to its foundation. On the 8th of April a congress of the combined powers assembled at Antwerp. It was attended by the prince of Orange and his two sons, with his excellency Vander Spiegel, on the part of Holland; by the duke of York and Lord Auckland on the part of Great Britain; by the prince of Saxe Cobourg, Counts Metterinch, Sarenberg, and Mercy Dargentault, with the Prussian, Spanish, and Neapolitan envoys. It was here determined to commence active operations against France. The prince of Cobourg's proclamation was recalled, and a scheme of conquest announced.

Commissioners from the convention now set up the standard of the republic anew, and the scattered battalions flocked around it. General Dampierre was appointed commissioner, and on the 13th he was able to refit a general attack upon his advanced posts. On the 14th, his advanced guard yielded to superior numbers, but on the 15th was victorious in a long and well-fought battle. On the 23d the Austrians were again repulsed, and on the 1st of May General Dampierre was himself repulsed in an attack upon the enemy. On the 8th another engagement took place, in which the French general was killed by a cannon ball. On the 23d a very determined attack was made by the allies upon the French fortified camp of Farniers, which covered the town of Valenciennes. The French were overcome, and in the night abandoned their camp. In consequence of this the allies were enabled to commence the siege of Valenciennes; for Condé had been blockaded from the 1st of April.

About the same time General Cufine on the Rhine made a violent but unsuccessful attack upon the Prussians, in consequence of which they were soon enabled to lay siege to Mentz. The Corfican General Paoli revolted at this period; and the new republic, insulted from without by the whole strength of Europe, was undermined by treachery and faction within.

While the country was in a state verging upon utter ruin, parties in the convention were gradually waxing more fierce in their animosity; and regarding what was passing at a distance, they seemed only anxious for the extermination of each other. In the month of March, the celebrated Revolutionary Tribunal was established for the purpose of trying crimes committed against the state and the Girondists party, the misdness of whose administration had contributed not a little to increase the evils of their country, began to feel the necessity of adopting measures of severity. But the public calamities, which now rapidly followed each other in succession, were ascribed by their countrymen to their imbecility or perfidy. This gave to the party of the Mountain a fatal advantage. On the 15th of April the communities of the 48 sections of Paris presented a petition, requiring that the chiefs of the Girondists therein named should be impeached and expelled from the convention. This was followed up on the 15th of May by another petition from the suburbs of St Antoine. The Girondists party in the mean time impeached Marat, but he was acquitted by the jury at his trial.
Mountain, by the assistance of the Jacobin club, had now acquired a complete ascendency over the city of Paris. The Girondists or Briffotines proposed therefore to remove the convention from the capital; and to prevent this, the Mountain resolved to make the same use of the people of the capital against the Girondist party that they had formerly done against the monarch on the 10th of August. It is unnecessary to relate in detail all the tumults that occurred either in Paris or in the convention during the remaining part of the month of May. On the 18th, at four o'clock in the morning, the tocsin was sounded, the general alarm gave fire, all commotion and terror. The citizens flew to arms, and assembled around the convention. Some deputations demanded a decree of accusation against 35 of its members. The day, however, was spent without a decision. On the afternoon of the 18th of June an armed force made the same demand. On the 19th of June this was repeated, the tocsin again sounded, and an hundred pieces of cannon surrounded the national hall. At half Barrere mounted the tribune. He was considered as a moderate man, and respected by both parties; but he now artfully deserted the Girondists. He invited the denounced members voluntarily to resign their character of representatives. Some of them complied, and the president attempted to dissolve the sitting; but the members were now imprisoned in their own hall. Henriot, commander of the armed force, compelled them to remain, and the obnoxious deputies, amounting to upwards of 90 in number, were put under arrest, and a decree of denunciation against them signed.

It is obvious, that on this occasion the liberties of France were trodden under foot. The minority of the national representatives, by the assistance of an armed force raised in the capital, compelled the majority to submit to their measures, and took the leading members prisoners. Thus the city of Paris assumed to itself the whole powers of the French republic; and the nation was no longer governed by representatives freely chosen, but by a minority of their members, whose sentiments the city of Paris and the Jacobin club had thought fit to approve of. Human history is a mass of contradictions. The Mountain party came into power by preaching liberty, and by violating its fundamental principles. How far the plea of political necessity may excuse their conduct, we shall not venture to decide explicitly. Certain it is, however, that they soon commenced a career of the most terrible energy both at home and abroad that is to be found in the annals of nations.

The first result of their victory in the capital was calamitous to the republic at large. Breffot and me other deputies escaped, and endeavoured to kindle the flames of civil war. In general, however, the influence of the Jacobin club, and of its various branches, was such, that the north of France adhered to the convention as it stood; but the southern departments were speedily in a state of rebellion. The department of Lyons declared the Mountain party outlawed. Marfellins and Toulon followed the example of Lyons, and entered into a confederacy, which has since been known by the appellation of Federalism. The departments of La Gironde and Calvados broke out into open revolt. In short, the whole of France was in a state of violent convulsion. Still, however, the enthusiastic garrions of Mentz and Valenciennes protected it against the immediate entrance of a foreign force, and allowed leisure for one of its internal factions to gain an ascendency, and thereafter to protect its independence.

In the mean time, the political enthusiasm of all orders of persons was such, that even the female sex did not escape its contagion. A young woman of the name of Charlotte Cordette, in the beginning of July, came from the department of Calvados to devote her life for what she thought the cause of freedom and of her country. She requested an interview with Marat, the most obnoxious of the Mountain party. Having obtained it, and conversed with him calmly for some time, she suddenly plunged a dagger in his breast, and walked carelessly out of the house. She was immediately seized and condemned. At the place of execution, the beholders with infinite consternation, shouting Vive la républice. The remains of Marat were interred with great splendor, and the convention attended his funeral. His party perhaps derived advantage from the manner of his death, as it seemed to take the odious charge of assassination upon their antagonists, and gave them the appearance of suffering in the cause of liberty. The truth is, that assassination was sanctioned by both parties under pretence of defending the liberties of the republic.

One of the first acts of the Mountain junta after the republic's triumph was to finish the republican constitution. Previous to their fall, the Girondists had brought forward the plan of a constitution, chiefly the work of Condorcet; but it never was sanctioned by the convention, and was too intricate to be practically useful.

The new constitution now framed, which was afterwards sanctioned by the nation, but has never yet been put in practice, abolishes the former mode of electing the representatives of the people through the medium of electoral assemblies, and appoints them to be chosen immediately by the primary assemblies, which are made up of electors from 200 to 600 citizens, each man voting by ballot or open vote at his option. There is one deputy for every 40,000 individuals, and population is the sole basis of representation. The elections take place every year on the 18th of May. Electoral assemblies are still retained for one purpose. Every 200 citizens in the primary assemblies name one elector; and an assembly of all the electors of the department is afterwards held, which elects candidates for the executive council, or ministry of the republic. The legislative body chooses out of this list of candidates the members of the executive council. One half of this council is renewed by each legislature in the last month of the session. Every law, after it is passed by the legislative body, is sent to the department. If in more than half of the departments the tenth of the primary assemblies of each have not objected to it, it becomes effectual. Trial by jury is established. National conventions may be called for altering the constitution, and must be called, if required by the tenth of the primary assemblies of each department in a majority of the departments.

The publication of this constitution procured no small degree of applause to the convention and the Mountain party. The rapidity with which it was formed (being only a fortnight) seemed to cast a just reproach upon the feows of its antagonists, and it was regarded as a proof of their being decidedly fe-
Prince Cobourg and General Clairfait in the mean
time unsuccessfully attempted to besiege Cambray
and Bouchain. One day was, however, taken by General
Clairfait on the 14th of September; and here finally
terminated for the present campaign the successes of
the allies in the Netherlands.

A considerable part of the French army of the
north took a strong position near Maubeuge, where
they were blocked by Prince Cobourg; but upon the
15th and 16th of October he was repeatedly at­
tacked by the French troops under General Jourdan,
who succeeded Houchard. The French had now re­
covered their vigour. They brought into the field a
formidable train of artillery, in which were many 24
pounders. Commissioners from the convention in­
tranced the soldiers, threatened the fearful, and
applied the brave. Crowds of women, without confi­
ence, went through the ranks, distributing spirited li­
quors in abundance, and carrying off the wounded.
The attacks were repeated and terrible on both sides;  
but the Austrians had considerably the disadvantage,
and Prince Cobourg retired during the night. The
French now menaced maritime Flanders. They took
Furnes and besieged Nieuport. A detachment of
British troops ready to fail to the West Indies were
hastily sent to Ostend, and prevented for the present
the farther progress of the French.

Such was the multiplicity of the events that now oc­
curred in France, that it is difficult to state the out­
lines of them with any tolerable perspicuity. We have
already mentioned the extensive diffusions which oc­
curred throughout the republic in consequence of the tri­
umph of the Mountain party on the 31st of May. The
department of Calvados was first in arms against the
convention under the command of General Felix Wimp­
fen; but before the end of July the insurrection was
quelled, after a few light skirmishes. But the federal
body of the cities of Marseille, Lyons, and Toulon, fell
besieged by the convention troops. Several actions followed,
which were attended with great loss both on the part of
the assailants and of the besieged. While the city was
reduced to ruins; but it held out during the whole month of September. The besieging General
Kellerman was removed from his command, on account
of his incapacity; and the city surrendered on the 8th of October to General Doppet, a man who had
lately been a physician. Such was the rage of party
Unadvent­
seal at this time, that the walls and public buildings of the character of
Lyons were ordered to be demolished, and its name
of the
ter of the
changed to that of Ville-Joffre-a-la-Neige. Many hundreds
of its citizens were dragged to the scaffold on account
of their alleged treasonable resistance to the convention.
The insurrection, wanted by the low operation of the guilty, at last brought their perpetrators in multi­
plities of the scaffold, and in their turn were
persecuted by the same means.

In the end of July General Custos was sent against
Marille. In the beginning of August he gained follow­
some successes over the advanced federalist troops. On
the 24th he took the town of Aix, and the Marille
fell.
Who is at length obliged to evacuate it.

Proceedings of the royalists in La Vendée.

The ardour of the leading people of the important town and harbour of Toulon entered into a negociation, and submitted to the British admiral Lord Hood, under condition that he should preserve as a depot the town and shipping for Louis XVII, and under the stipulation that he should affil in reforcing the confiuction of 1789. The siege of Toulon was commenced by General Cartaux in the beginning of September. It continued without much vigour during that and the whole of the succeeding month. Neapolitan, Spanish, and English troops had the command of the town, under a commiffion from the British majesty. On the 3oth of November, the garrifon made a powerful rally to defend some batteries that were erecting upon heights which commanded the city. The French were surprised, and the allies succeeded completely in their object; but, elated by the facility of their conquest, the allied troops rushed forward in pursuit of the flying enemy, contrary to their orders, and were unexpectedly met by a strong French force that was drawn out to protect the fugitives. General O'Hara now came from the city to endeavour to bring off his troops with regularity. He was wounded in the arm and taken prisoner. The total loss of the allies in this affair was estimated at nearly one thousand men. The French had now murdered in full force around Toulon, and prepared for the attack. It was begun on the 10th of December in the morning, and was chiefly directed against Fort Mulgrave, defended by the British. This fort was protected by an entrenched camp, 13 pieces of cannon, 36 and 24 pounders, &c. 5 mortars, and 3000 troops. Such was the arduous of affault, that it was carried in an hour, and the whole garrifon was destroyed or taken. The allies now found it impossible to defend the place; and in the course of the day embarked their troops, after having fent on fire the arsenal and ships. A scene of confusion here ensued, such as has not been known in the history of modern wars. Crowds of people of every rank, age, and fex, hurried on board the ships, to avoid the vengeance of their enraged countrymen. Some of the inhabitants began to fire upon their late allies; others in despair were seen pluming into the sea, making a vain effort to reach the ships; or putting an end at once to their own existence upon the shore. Thirty-one ships of the line were found by the British at Toulon; thirteen were left behind; ten were burnt; four had been previously fent to the French ports of Brest and Rochefort, with 5000 republicans who could not be trusted; and Great Britain finally obtained by this expedition three ships of the line and five frigates.

On the fide of Spain the war produced nothing of importance; and in the mountainous country of Piedmont it went on slowly. Nice and Chambery were still retained by the French; but more terrible scenes were acting in other quarters. In La Vendée a most bloody war was perfifed in by the royalists. In that quarter of the country the language of the refl of France is little understood. The people were superstitious, and had acquired little idea of the new opinions that had lately been propagated in the refl of the empire. They were chiefly headed by priests, and regarded their cause as a religious one. Their mode of warfare usually was, to go on in their ordinary occupations as peaceable citizens, and suddenly to assemble in immense bands, informuch that at one time they were said to amount to 150,000 men. They besieged Nantes and the city of Orleans, and even Paris itself was not thought safe from their enterprises. The war was inconceivably bloody. Neither party gave quarter; and La Vendée proved a dreadful drain to the population of France. On the 28th of June, the conventional general Biron drove the royalists from Lucon; and Nantes was relieved by general Beyfier. After some successes, general Westerman was surprifed by them, and compelled to retreat to Parthenay. In the beginning of August the royalists were defeated by general Rollignol; but on the 1oth of that month, under Charette their commander in chief, they again attacked Nantes, but suffered a repulf. It would be tedious to give a minute detail of this obscure but cruel war. The royalists were often defeated and seemingly dispersed, but as often arose in crowds around the aifonified republicans. At laft, however, about the middle of October, they were completely defeated, driven from La Vendée, and forced to divide into separate bodies. One of these threw itself into the island of Noirmoutier, where they were subduèd; another took the road of Maine and Brittany, where they struggled for some time against their enemies, and were at laft cut to pieces or dispersed.

The royalists had long expected affordance from England; and an armament under the earl of Moira was actually fitted out for that service, but it did not arrive till too late, and returned home without attempting a landing.

The Mountain party always disgraced their successes by dreadful cruelties. Humanity is shocked, and history would almost cease to obtain credit, were we to relate in detail the unrelenting cruelties which were exercised against the unfortunate royalists, chiefly by Carrier, a deputy from the convention, fent into this quarter with unlimited powers. Multitudes of prisoners were crowded on board vessels in the Loire, after which the vessels were sunk. No age nor fex was spared; and these executions were performed with every circumstance of wanton barbarity and infulat.

On the fide of the Rhine a great variety of events occurred during the months of August and September. Several engagements at first took place, in which the French were, upon the whole, successful. In September, however, Landau was invested by the combined powers; and it was resolved to make every possible effort to drive the French from the strong lines of Weilfembourg, on the river Lauter. On the 13th of October, the Austrian general Wurmer made a grand attack upon these lines. The French say that their generals betrayed them, and suffered the lines to be taken almost without resistance. The general of the allies confessed that the lines might have held out for several days. The French retreated to Hagenau, from which they were driven on the 18th; and suffered two other defeats on the 25th and 27th. Some of the principal citizens of Strasbourg now sent a private deputation to general Wurmer, offering to surrender the town, to be preserved as a deposit to be restored to Louis.
In this quarter was immense, and unparalleled in the history of modern war. It is even said that it might amount to more than 70,000 or 80,000 men.

Thus far we have attended to the military affairs of the republic for some time past. Very violent efforts were in the mean time made at Paris by the new administration, established under the auspices of the Jacobin club, and of the party called the Mountain. The new republican constitution had been presented to the people in the primary assemblies, and accepted. The business, therefore, for which the convention was called together, that of forming a constitution for France, was at an end; and it was proposed that they should dissolve themselves, and order a new legislative body to assemble, according to the rules prescribed by that constitution. This was, no doubt, the regular mode of procedure; but the ruling party considered it as hazardous to convene a new assembly, poising only limited powers, in the present distracted state of the country. It was indeed obvious, that France at this time needed a dictatorship, or of a government possessed of more absolute authority than can be enjoyed by one that acts, or even pretends to act, upon the moderate principles of freedom. It was therefore determined that the convention should remain undissolved till the end of the war; and that a revolutionary government, to be conducted by its members, should be established, with uncontrolled powers. Committees of its own body were selected for the purpose of conducting every department of business. The chief of these committees was called the committee of public safety. It superintended all the rest, and gave to the administration of France all the secrecy and dispatch which have been accounted peculiar to a military government, together with a combination of skill and energy hitherto unknown among mankind. A correspondence was kept up with all the Jacobin clubs throughout the kingdom. Commissioners from the convention were sent into all quarters, with unlimited authority over every order of persons. Thus a government possessed of infinite vigilance, and more absolute and tyrannical than that of any single despot, was established; and the whole transcriptions and resources of the state were known to the rulers.

On the 23d of August, Barrere, in name of the committee of public safety, procured the celebrated decree to be passed for placing the whole French nation in a state of requisition for the public service. "From this moment," says the decree, "till that when all enemies shall have been driven from the territory of the republic, all Frenchmen shall be in permanent readiness for the service of the army. The young men shall march to the combat; the married men shall form arms, and transport the provisions; the women shall make tents and clothes, and attend in the hospitals; the children shall make lint of old linen; the old men shall cause themselves to be carried to the public squares, to excite the courage of the warriors, to preach hatred against the enemies of the republic; the collars shall be washed to procure fuel; and the saddle-horses shall be given up to complete the cavalry; the unmarried citizens, from the age of 18 to 25, shall march first, and none shall send a substitute; every battalion shall have a banner, with this inscription, The French nation riven against tyrants." The decree also regulated the mode of organizing this mass. A decree more tyrannical
In the end of July, general Cuffin was brought to trial, and executed, in consequence of a variety of accusations of infidelity to his trust and disrepute to the convention. The queen was next brought to trial before the revolutionary tribunal, on the 15th of October. The charges against her were very various; but the chief tendency of them was to prove that she had always been hostile to the revolution, and had excited all the efforts that had been made by the court against it. On the 16th of October, this beautiful woman, whom fortune once placed to high, ended her days on a scaffold, after a mock trial, in which no regard was paid either to justice or decency. She behaved with much dignity and composure, and appeared deeply impressed with a sense of religion. The members of the convention who had been at the head of the Girondist party, and had either been detained in prison since the 31st of May, or seized in the departments to which they had retired, were afterwards brought to trial. On the 30th of October, 21 of them were executed, viz. Brilhot, Vergniard, Genêvois, Duport, Lehardy, Ducos, Fonfrecé, Boileau, Gardien, Duchatel, Sillery, Fauchet, Dufriche, Duperret, La Sonce, Carra, Beauvais, Mainville, Antoine, Viégas, and Lacaze. Seven of them were still detained in confinement. The duke of Orleans was afterwards condemned, on a charge of having aspired to the sovereignty from the beginning of the revolution. His execution gave satisfaction to all parties. His vote for the punishment of death upon the late king had done him little honour even in the opinion of the Mountain, and had rendered him odious to all the rest mankind.

The executions of persons of all ranks, particularly of priests and nobles, became now so common, that it would be in vain to attempt to give any detail of them. Every person brought before the revolutionary tribunal was condemned as a matter of course. The Jacobins seemed infatuated in their thirst after blood, and the people at large appeared to regard their conduct with unaccountable indifference.

When the human mind is once roused, its activity extends to every object. At this time a new table of weights and measures was established by the convention, in which the decimal arithmetic alone is employed. The court of Spain had the liberty, notwithstanding the war, to suffer M. Mechain to proceed in his operations for measuring a degree of the meridian in that country. He carried on his series of triangles from Barcelona to Perpignan; and from this place the menuation was continued to Paris. M. de Lambre, and his pupil M. le Francois, also measured a degree of latitude in the vicinity of the Metropolis. In all, 12 degrees of the meridian were measured; of which the mean is 573027 toises, and by this the universal standard of measure is calculated. M. M. de Borde and Caffini determined the length of a pendulum that swings 1 second, in vacuo and in a mean temperature at Paris, to be 9 feet and 8.66 line. M. M. Lavoisier and Hauy found that a cubic foot of distilled water at the freezing point weighs in vacuo 70 pounds and 68 gross French weight. We shall insert a table of the measures and weights now established.

A new table of weights and measures established.
A piece of silver coin weighing a *enigma*, and a franc of silver, according to the former standard will be worth 40 fols 10c deniers. The *milliare* or thousand *metres*, is suffixed for the mile; and the are, for the arpent in land-measure. The latter two are to each other as 49 to 25. The astronomical circles with which M. M. de Borda and Caffini made the observations, are divided according to this plan. The quadrant contains 100 degrees, and each degree 100 minutes. Hence the minute of a great circle on our globe is equal to a *milliare*, or new French mile. If, for the reduction of this measure, we estimate the Paris toile, according to the comparison made with the standard kept in the Royal Society of London, at 6.3925 English feet, the *milliare* or minute will be equal to 1093.633 yards, and the *mètre* 3.280899 feet.

At the same period a new calendar was formed. By it the year is made to begin with the autumn equinox, and is divided into 12 months. These are called Vendémiaire, Brumaire, Frimaire, Nivois, Ventôse, Pluviose, Germinal, Floraire, Prairial, Mardi, Férard, and Fructidor. The months consist of 30 days each, and are divided into three decades. The days of each decade are known as the *Prima* to the *Septima*. The day (which begins at midnight) is distributed into ten parts, and these are successively divided and subdivided. Five supernumerary days are added every year after the 35th of Fructidor. To these is given the absurd appellation of "Sève Calendrée," a word borrowed from a term of reproach ("fane culottelle"), which had often been beloathed on the republic party from the meanest of their rank and fortune; but which that party now attempted to render honourable and popular.

The religion of France had been gradually losing its influence; and on the 7th of November, Gobet bishop of Paris, along with a great multitude of other ecclesiastics, came into the hall of the convention, and solemnly renounced their functions and renounced the Christian religion. All the clergy, whether Protestant or Catholic, that were members of the convention, followed this example, except only Gregoire, whom we formerly mentioned as having been one of the first priests that joined the *Tiers État* after the meeting of the States General. He had the courage to profess himself a Chelitian although he said that the emoluments of his bishopric were at the service of the republic. With the acclamations of the convention, it was decreed that the only French deities hereafter should be Liberty, Equality, Reason, &c. and they would seem to have consecrated them as a kind of new objects of worship.

What political purpose the leaders in the convention intended to serve by this proceeding does not clearly appear; unless, perhaps, their object was to render the French manners and modes of thinking so completely new, that it should never be in their power to return to the state from which they had just emerged, or to unite in intercourse with the other nations of Europe. The populace, however, could not at once relinquish entirely the religion of their fathers. The Commune of Paris ordered the churches to be shut up, but the Convention found it necessary to annul this order; and Robespierre gained no small degree of popularity by supporting the liberty of religious worship on this occasion. Hebert and Fabre d'Eglantine, who led the opposite party, hastened their fall by this ill-judged contempt of popular opinion.

For, now that the republic saw itself successful in all quarters, when the Mountain party and the Jacobins had no rival at home, and accounted themselves in no immediate danger from abroad, they began to split into factions, and the fiercest jealousies arose. The Jacobin Club was the usual place in which their contests were carried on; and at this time Robespierre added the part of a mediator between all parties. He attempted with great art to turn their attention from private animosities to public affairs. He declared Great Britain was speedily to take place. He therefore proposed that the Jacobin Club should set themselves to work to discover the vulnerable parts of the British constitution and government. They did so: They made speeches, and wrote essays without number. And in this war the most fierce and turbulent band of men that ever perhaps existed in any country occupied and amused for a very considerable time. What is no less singular, a great number of British subjects favoured the plans of these reforming Atheists; the conduct of the government giving ample scope for censure.

The winter passed away in tolerable quietness, and no military enterprise was undertaken either by the allies or by the French. On the 1st of February, Barrère, the friend of the convention, proposed to the government giving ample scope for censure.

The management of the revolutionary government was gradually becoming more vigorous. Thirty committees of the Convention managed the whole business of the state, without having much of the direct executive government, which rested in the committee of public safety. These different committees were engaged in the utmost variety of objects. The ruling party had no competitors for power. Without collusion or opposition, therefore, the most extensive plans were rapidly carried into effect. The Convention was little more than a court in which every project was solemnly registered. In the same session 30 decrees would sometimes be passed upon objects the most widely different. The finances were under only one committee, at the head of which was Cambon.

This committee, found resources for the most lavish expenditure. The assignats were received as money everywhere throughout the state; and thus a paper mill was said to have become more valuable than a mine of gold. Their unlimited credit was supported by an arbitrary law regulating the *maximum* or highest price of all provisions, and by the immense mass of wealth which had come into the hands of the Convention by seizing the church lands, and by confiscating the property of royalists, emigrants, and per sons
French Revolution

1794

persons condemned by the revolutionary tribunal. So unequally had property been divided under the ancient government, that by means of these confiscations about seven-tenths of the national territory was supposed to be in the hands of the public. To this was added the plunder of the churches, consisting of gold and silver lambs, and utensils employed in divine worship, along with other articles of less value; among which may be mentioned the innumerable church bells, which were regarded as sufficient for the manufacture of 15,000 pieces of cannon. These resources formed a mass of property such as never was possessed by any government.

Other committees were engaged in very different objects. Highways were constructed, and canals planned and cut throughout the country. Immense manufactories of arms were everywhere established. At Paris alone 1,100 muskets were daily fabricated, and 100 pieces of cannon cast every month. Public schools were assiduously instituted, and the French language taught in its purity from the Pyrenees to the Rhine. The French Convention possessed immense resources, and they did not hesitate to lavish them upon their schemes. Every science and every art was called upon for aid; and the most accomplished men in every profession were employed in giving splendour to their country. The chemists, in particular, gave essential aid by the facility with which they supplied materials for the manufacture of gun-powder; and in return for their services, Lavoisier, the greatest of them, suffered death by a most iniquitous sentence. Not fewer than 200 new dramatic performances were produced in less than two years; the object of which was to attach the people to the present order of things. The vigour with which the committees of subordination exerted themselves is particularly to be remarked. As all Europe was at war with France, and as England, Holland, and Spain, the three maritime powers, were engaged in the contest, it had been thought not impossible to reduce France to great distress by famine, especially as it was imagined that the country had not resources to supply its immense population. But the present leaders of that country acted with the policy of a besieged garrison. They feized upon the whole provisions in the country, and carried them to public granaries. They registered the cattle, and made their owners responsible for them. They provided the armies abundantly, and, as the people were accurately numbered, they dealt out in every district, on stated occasions, what was absolutely necessary for subsistence, and no more. To all this the people submitted; and indeed, throughout the whole of the mixed scenes of this revolution, the calm judgment of the historian is not a little perplexed. We cannot avoid admiring the patience with which the people at large endured every hardship that was represented as necessary to the common cause, and the enthusiastic energy with which they justified their blood in defence of the independence of their country. At the same time, we must regard with indignation and disgust the worthless intrigues by means of which the fanquinary factions in the Convention and the capital alternately mancfraced each other.

During the winter the diffusions of the Jacobins still increased. They were divided into two clubs, of which the new one assembled at a hall which once belonged to the Cordeliers. The leaders of it wereBERT, Ronfin, Vincent, and others; but the old society retained its ascendency, and Robespierre was now decidedly its leader. This extraordinary man had gradually accumulated in his own person the confidence of the people and the direction of the government. As the committees were above the Convention, which was become little more than a silent court of record, to the committee of public safety was above the other committees. Robespierre was the leader of this ruling committee. Barrere, St Jut, Counthou, and others of its members, only acted a secondary part. They laboured in the business of the state, but the radical power was with Robespierre. He surrounded the members of the Convention with spies. He was jealous and implacable, and set no bounds to the shedding of blood. On the 25th of March he brought to trial the following active Jacobins, who were condemned and executed on the following day: Hebert, Ronfin, Momoro, Vincent, Du Croquet, Koecq, Col. Launum, M. M. Bourgeois, Mazuel, La Bourrole, Ancard, Le Clerc, Proly, Defieux, Anacharis Cloots, Pereira, Florent Armand, Descombes, and Debuifon. Not satisfied with this, on the 2d of April he brought to trial nine of those who had once been his most vigorous associates, Danton, Fabre d’Eglantine, Bazire, Chabot, Philippeaus, Camille Defmoulins, Lacroix, Daunay d’Anges, Herault de Sechelles, who, along with Westerman, were executed on the evening of the 5th.

Still, however, the preparations for the ensuing campaign were proceeding with unabated vigour. The committee for military affairs, at the head of which were Carnot, La Fitte, d’Amiiff, and others, was busy in arranging along the frontiers the immense force which the requisition had called forth. Plans of attack and defence were made out by this committee; and when approved by the committee of public safety they were sent to the generals to be executed. On the other side, the allies were making powerful preparations for another attempt to subjugate France. The Emperor himself took the field at the head of the armies in the Netherlands. The plan of the campaign is said to have been formed by the Austrian Colonel Mack. With Flanders was to be protected by a strong body of men; the main army was to penetrate to Landrecies, and getting within the line of French frontier towns, it was to cut them off from the interior by covering the country from Maubeuge to the sea. The plan was bold. It belongs to military men to judge whether this was not its only merit. When attempting to put it in execution, the allies must have been ill-informed of the immense force which the French were collecting against them. Even the town of Lille alone, which is capable of containing a numerous army within its walls, and which was to be left in their rear, should have seemed an insurmountable objection to the plan.

On the 16th of April the Austrians, British, and Dutch armies assembled on the heights above Cateau, and were reviewed by the emperor. On the following day they advanced in eight columns against the French, drove in their whole polis, and penetrated beyond Landrecies; which place the French attempted to relieve, but without success. The allied army now amounted to 187,000 men, who were disposed in the following manner: 15,000 Dutch and 15,000 Austrians, under the prince of Orange and general Latour, formed the...
...in Flanders. Pichegru...

On the morning of the 26th of April they attacked the duke of York near Cateau in great force. After a severe conflict they were repulsed, and their general Chapuy was taken prisoner. At the same time they attacked the troops under his Imperial majesty, but were repulsed in a similar manner; losing in all 57 pieces of cannon. On the same day, however, general Pichegru advanced from Lille, attacked and defeated general Clairfait, took 32 pieces of cannon; and, in the course of a few days, made himself master of Maubeuge, and, in the course of a few days, made himself master of...
of Betignies, now advanced with fifth strength upon
Charleroi in the ealt that its immediate fall was feared.
As this would have enabled the two French armies to encircle the whole of Flanders, the prince of Cobourg advanced to its relief. Charleroi surrendered at discretion on the 25th. This circumstance was not known by the prince of Cobourg when he advanced on the 26th to attack in their entrenchments the army that covered the siege near Fleurus: but the covering army being by this time reinforced by the accession of the besieging army, the allies were repulsed. Jourdan then drew his men out of their entrenchment; and, in his turn, attacked the Austrians. He was three times repulsed, but was at last successful: the loss of the vanquished army is said to have been prodigious; but no regular accounts of it have been published. The French unquestionably exaggerated their own success, when they said that it amounted to 15,000 men.

The allies now retreated in all quarters. Nieuport, Oltend, and Bruges, were taken; and Tournay, Mons, Oudenarde, and Bruffel, opened their gates. At this last place the French armies of East and West Flanders united. Landrecies, Valenciennes, Condé, and Querchy, were fruitless left with garrisons in them. The allied troops, evacuating Namur, formed a line from Antwerp to Liege to protect the country behind. The Dutch advanced in full force, and attacked general Clairfait, cut to pieces half of the troops that now remained under him, and broke the line. The allies retreated before them. The duke of York was joined by some troops under the earl of Marlborough that with much difficulty had made their way to him. Oltend and the Dutch troops he retired to the neighbourhood of Bergen-op-zoom and Breda for the protection of Holland. The prince of Cobourg evacuated Liege, crossed the Meuse, and placed a garrison in Maafbracht. He then, however, sent back a part of his troops to the neighbourhood of Tongres; for here, to the astonishment of all Europe, the French armies made a voluntary pacifie in their career of victory, and ceased to pursue their retiring foes. Sluys in Dutch Flanders was the only foreign post that they continued to attack, and it surrendered after a siege of 21 days.

On the Rhine the war was equally successful on the part of the French. On the 12th, 13th, and 14th of July, repeated engagements were fought, in which the French enjoyed their usual success. They had numerous armies in every quarter. Their mode of fighting was to make full preparation for accomplishing their object, and to fight in great bodies day after day till it was obtained. The Palatinate was thus overrun, and Traross taken by general Michaud. Flanders and the Palatinate have always been the granaries of Germany; and both of them, at the commencement of the harvest, now fell into the hands of the French.

During the course of this summer Corsica was subdued by Great Britain; and the whole of the French expedition of the West India Islands, excepting a part of Guadalupe, yielded to the British troops under the command of Sir Charles Grey and Sir John Jarvis. On the first of June the British fleet, under the command of Earl Howe, gained a most splendid victory over the French fleet to the westward of Ushant. The French committee of state were known to have purchased in America immense quantities of grain and other stores. These were embarked on board 160 sail of merchantmen, conveyed by fix sail of the line. Lord Howe failed to intercept this valuable convoy. The French fleet failed at the same time to protect it. On the morning of the 28th of May the fleets came in fight of each other. The British admiral had previously dispatched six ships of the line under admiral Montague to intercept the French convoy, while he should engage and detain the Howe's grand fleet. The French dispatched eight sail to defeat this attempt. In the course of the 29th Lord Howe got to windward of the French fleet. His force was 25, and theirs was 26, sail of the line. The following day he bore down upon them, and broke their line. The engagement was one of the feareft ever fought. The French admiral, in less than an hour after the close action commenced in the centre, crowded off with 12 of his ships. The British fleet was so much disabled, or separated, that several of the French dismantled ships got away under sails raised on the stump of their fore-masts. Seven sail of the line, however, remained in possession of the British, and two were unquestionably sunk. In the mean time, admiral Montague fell in with the French convoy, but it was now guarded by 14 sail of the line. As he could not encounter such a force, he returned home, and it was safely conveyed into port. Thus, by one of those contradictions which so often occur in human affairs, the British fleet was victorious, and the French were left in some measure masters of the sea. As this engagement however testified that the British fleet had not lost their ancient superiority on their own element, the nation regarded the present victory as a pledge of its independence, and very general rejoicings took place in consequence of it.

In the mean time, the revolutionary system of government in the hands of committees of the convention at Paris, and of committees of the popular societies throughout the country, was arrived at its highest perfection, and proceeded without opposition in its fever and fanguinary measures.

On the 10th of May Madame Elizabeth, sister of the late king, was sacrificed by it in consequence of a decree of the revolutionary tribunal. Multitudes of others of every rank and sex were daily sacrificed in a similar manner; the rich in particular were the great objects of persecution, because the confiscation of their property added to the strength of the ruling powers. But neither were the poor safe from the bloody vigilance of this new and singular government. By the different executions Robespierre had contrived to destroy every opposition and rival. All the collected authorities confirled wholly of persons nominated with his approbation; and as the committees which conducted the business of the state were at his disposal, his will was irresistible throughout the republic. He met with no opposition in the convention; for that body was no longer the turbulent popular assembly which it had once appeared; it was little more than a name employed to give some form of respectability to such schemes as were proposed to it.

Amidst this accumulation, however, of seemingly irresistible authority, Robespierre was at the brink of ruin. The whole of the old Girondist party was indeed subdued and silent; but many members of the convention still remained attached to it. The party of the Mountain,
The fall of Robespierre, the convention exhibited no small change of appearance. Instead of that silence which formerly prevailed, all was bustle and noise; all accused each other. There was no longer any leader, and there was no formed party. The former false system of terror was declared to be at an end, and a new system of moderate firmness succeeded. This was carried to as great a height as the system of terror had formerly been; and all means were taken to render popular the fall of their late tyrant. The committees were organized anew, and their members ordered to be frequently changed. The correspondence between the affiliated Jacobin clubs was prohibited, and at last the Jacobin club itself was abolished. This last event was accomplished with ease; and that society which had been the great engine of the revolution, was itself without resistance overturned. Seventy-one deputies of the Girondist party, who had been imprisoned since the 5th of May 1793, were set at liberty. The name of Lyons was restored to it. Some of the agents of Robespierre were punished, particularly the infamous Carrier, whose cruelties in La Vendée we formerly mentioned. Still, however, the convention appeared so little united and so little decided with regard to objects of the first importance, that in all probability they would not have conducted the important struggle against the nations of Europe with more success than the Girondist party had formerly done, if the revolutionary government and the late system of terror had not already accumulated in their hands such vast resources, and traced out such a plan of procedure, as rendered it an easy matter to preserve their numerous armies in the train of success to which they were now accustomed.

Revolution

French

Mountain, by means of whom Robespierre had risen to power, with little satisfaction now found themselves not only disregarded, but ready at every instant to fall a sacrifice to that tyram of terror which they had contributed to erect. Even the Jacobins themselves, though neither timid nor cautious in the shedding of blood, began to murmur when they saw that awful privilege confined exclusively within a few hands, or rather monopolized by an individual. In this state things remained for some time; and it appeared how possible it is for an individual to murmur against the nation is sacrifice to ambition, and thus to his interests, not only disregarded, but ready at every moment of weakness.

The speech Robespierre defended his throne with, and enumerated the crimes, and proclaimed the tyranny of Robespierre. The speech was received with shouts of applause. Robespierre in vain attempted to defend himself; he was silenced by shouts of execration from every part of the hall. Tallien seconded the former speaker in his accusation. The firing was declared permanent, and a decree of arrest was passed against Robespierre and his younger brother of his, along with St. Jauf, Counton, and Lebas. These men left the convention, and found security in the hall of the commune of Paris; where the municipal officers agreed to protect and stand by them. The tocsin was sounded; the armed force was under their command; an insurrection was therefore attempted against the convention; but the factions of Paris refused their support. Very few of the troops could be collected, and those were not firm; the late tyranny had become odious. The hall of the commune was therefore speedily surrounded; and about three o'clock in the morning of the 28th Robespierre and his associates were made prisoners. They had been outlawed by the convention on account of their resistance. They were not therefore tried, unless for the purpose of identifying their persons; and, in the course of that day, they were executed: 60 of the municipal officers were also executed for joining in their rebellion; and in this way a form passed over, which at one time threatened to involve the French capital in ruin, and filled all Europe with astonishment. Thus also terminated the career of the most extraordinary man that the French revolution had brought forward. His talents were undoubtedly considerable, and his ambition knew no bounds, bidding defiance to the ordinary feelings of humanity. Had Dumas pollenfield his counsels and caution, or had he possessed the military talents of Dumas, the convention would certainly have been overthrown, and we should have seen a second Cromwell on the throne of his murdered sovereign.

The fall of Robespierre, the convention exhibited no small change of appearance. Instead of that silence which formerly prevailed, all was bustle and noise; all accused each other. There was no longer any leader, and there was no formed party. The former false system of terror was declared to be at an end, and a new system of moderate firmness succeeded. This was carried to as great a height as the system of terror had formerly been; and all means were taken to render popular the fall of their late tyrant. The committees were organized anew, and their members ordered to be frequently changed. The correspondence between the affiliated Jacobin clubs was prohibited, and at last the Jacobin club itself was abolished. This last event was accomplished with ease; and that society which had been the great engine of the revolution, was itself without resistance overturned. Seventy-one deputies of the Girondist party, who had been imprisoned since the 5th of May 1793, were set at liberty. The name of Lyons was restored to it. Some of the agents of Robespierre were punished, particularly the infamous Carrier, whose cruelties in La Vendée we formerly mentioned. Still, however, the convention appeared so little united and so little decided with regard to objects of the first importance, that in all probability they would not have conducted the important struggle against the nations of Europe with more success than the Girondist party had formerly done, if the revolutionary government and the late system of terror had not already accumulated in their hands such vast resources, and traced out such a plan of procedure, as rendered it an easy matter to preserve their numerous armies in the train of success to which they were now accustomed.

The allies in their retreat had left strong garrisons in the French towns which had surrendered to them. These were Condé, Valenciennes, Quenioux, and Landrecies. They now surrendered to the republican armies with so little resistance, that the conduct of the emperor began to be considered as ambiguous, and he was suspected of having entered into some kind of compact with the French. This idea proved erroneous; and as soon as the army which had besieged these towns was able to join the grand army under Pichegru and Jourdan, the operations of the campaign were resumed after a suspension of almost two months. The French army divided itself into two bodies. One of these under Jourdan advanced against General Clairfait, who had succeeded the prince of Cobourg in the command
The French, on the contrary, well received, abounding in every thing, and proud of fighting in a popular cause, now acted with much order, and submitted to the strictest discipline. In addition to all these advantages, the French leaders had the dexterity to persuade the world that new and unknown arts were employed to give aid to their cause. At this period the **telegraph** was first used for conveying intelligence from the frontiers to the capital, and from the capital to the frontiers. (See nis.

**Telegraph**. Balloons were also used by the French during this campaign to procure knowledge of the position of the enemy. An engineer ascended with the balloon, which was furnished to rise to a great height, but prevented from flying away by a long cord. He made plans of the enemy's encampment; and during an attack he sent down notice of every hostile movement. In the affairs of men, and more especially in military transactions, opinion is of more importance than reality. The French soldiers confided in their own officers as men possessed of a kind of omniscience, while the allied troops, no doubt, beheld with anxiety a new contrivance employed against them, whose importance would be readily magnified by credulity and ignorance. With all these advantages, however, after the capture of Niméguen, they once more made a halt in their career, and abstained from the attack of Holland, which now seemed almost prostrate before them.

While these events occurred in the north, the French arms were fiercely lefs successful on the side of Spain. Bellegarde was taken; in the Western Pyrenees, Fontarabia surrendered, and also St. Sebastien; the whole kingdom of Spain seemed panic-struck. That feeble government, with an officer imperiled, his fortune, and the most powerful fortresses, could make little resistance; and the difficult nature of their country was their only protection. The history of this war is only a history of victories on the part of the French. In the Eastern Pyrenees, on the 17th of November, the French general Dugommier was killed in an engagement, in which his army was successful. On the 20th of that month the French again attacked the Spaniards, and routed them by means of the bayonet, without firing a single musket-shot. Tents, baggage, and cannon, for an army of 50,000 men, fell into the hands of the conquerors, along with a great part of the province of Navarre. Towards the end of the year, an army of 40,000 Spaniards, entrenched behind 80 redoubts, the labour of six months, suffered themselves to be completely routed; their general count de La Union was found dead on the field of battle, and the whole Spanish artillery was taken. In three days thereafter, the fort Fernando de Figueres, containing a garrison of 9107 men, surrendered, although it mounted 171 pieces of cannon, and possessed abundance of provisions. The French continued their conquests; Rosas was taken, and the whole province of Catalonia was left at the mercy of the invaders.

The successes of this wonderful campaign were not yet terminated; and the last part of them is perhaps the most important, although no great effort was necessary to its execution. The winter now set in with uncommon severity. For some years past the feasons of Europe had been uncommonly mild; there had been little frost in winter, and no intense heat in summer. But during the late season the weather had long been remarkably
markedly dry till the latter part of harvest, when there fell a considerable, though by no means unusual, quantity of rain. Towards the end of December a few frosts bound up the whole of the rivers and lakes of Holland. The Waal was frozen over in the beginning of January; a circumstance which had not occurred for 14 years past. Taking advantage of this, the French crossed that river, and with little opposition seized the important paı̈s of Bommel, which at other seasons is fo strong by its inundations. The allied army had been joined by 17,000 Austrians, and had received orders to defend Holland to the last. They did so, and were successful in repulsing the French for some days between the Waal and the Leck; but the republican army, amounting to 70,000 men, having at last advanced in full force, the allied troops were compelled to retire across the Yssel into Westphalia. In the course of their march through this defert country, in the midst of severe frost and a deep snow, they are said to have suffered incredible hardships, and to have lost a very great number of men. The French, in the mean time, having crossed rapidly across the country to the Zuyder sea, to prevent the inhabitants from flying, and carrying off their property. On the 16th of January 1795, a party of horse, without resistance, took possession of Amsterdam. The other towns surrendered at discretion. In consequence of an order from the Sates General, the strong fortresses of Bergen-op-Zoom, Williamstads, Breda, &c. opened their gates to the French. The fleet and the shipping were fixed by the intense frost in their stations, and fell a prey to the enemy; who thus, with little effort, made a complete conquest of this populous and once powerful country. The French were well received by the people at large. The power of the Stadholder had been supported among them merely by the influence of Prussia and England. Through hatred to this office, which had now become odious chiefly to the mercantile aristocracy of Holland, they were little attached to their allies, and gave them, during the present war, as little support as possible. The Stadholder and his family now fled to England. The French declared, that they did not mean to make subjects but allies of the Dutch, and invited them to call together popular assemblies for settling their own government, under the protection of the French republic.

Thus terminated a campaign, the most astounding perhaps, that has been known in the history of mankind. In the course of it, even before the conquest of Holland, the French had taken 2,000 pieces of cannon and 60,000 prisoners. After that event, the conquered territories added to them a population of nearly 14 millions of people. Luxembourg and Mentz were the only places on this side of the Rhine that resisted them. The former was closely blockaded, for the purpose of compelling it to surrender; the latter was several times attaı̈cked, but successfully held out.

Europe was now weary of this bloody strife. The German Diet of Ratisbon declared its resolution to take measures for procuring peace. The Grand Duke of Tuscany concluded a treaty with the French republic. France itself, exhausted by massacres, emigrations and the terrible efforts which it had made, wished for tranquillity; and the Convention found it necessary to declare that they were willing to treat for peace with any of the powers of Europe, upon honourable terms.

The frequent changes, however, which have with astonishing rapidity taken place in the mode of conducting French affairs, and the different principles displayed by the different factions as they successively got into power, had produced in Great Britain and Austria a very general persuasion that no peace concluded with the present Convention could either be honourable or permanent; and therefore these two mighty nations have resolved to continue the war with redoubled vigour.

In support of the wisdom of this resolution, it has been observed, that the hatred of the Mountain to the Girondists was such, that it would have violated any treaty which had been concluded with them; that when Robespierre became all powerful, and terror was the order of the day, all former measures were changed, and peace or war made wholly subservient to the ambitious views of that relentless tyrant; that Talleyrand, having originally belonged to the Mountain, introduced the present system of moderation, not from principle, but only to reconcile the people to his usurped authority, and that in the fall of his bloody predecessor; that he may suddenly change his measures, or be denounced and executed by the influence of some more daring demagogue, who would again introduce the system of terror; and that in such a state of uncertainty, the only consequence to be expected from making peace at present is, that it would furnish the next faction which may gain the ascendancy in France with an opportunity of attacking the allies when least prepared to receive them. Such reasoning as this has been admitted in the British parliament, where a loan of six millions Sterling has been voted to the Emperor, to enable him to begin the ensuing campaign with an army of 200,000 men. In what manner the war ought to be conducted, it is not for us to say. The British nation seems to reit its hopes on its superiority at sea; and the greatest exertions are making to augment and man the navy. But we are here under the necessity of dropping this subject, without being able completely to fulfil the promise which we made to our readers at the end of the article France; there is as little appearance at present of peace, and a steady government being soon restored to that distracted country, as there was at the beginning of the troubles; and there is not the smallest probability that the republican constitution, framed by the Convention, will last one year after the dissolution of that assembly.

In tracing the origin and progress of this wonderful revolution, we have consulted every work from which we had reason to look for information, and we have confined ourselves to a simple narration of facts, seldom giving way to the reflections which they suggested. Our facts, too, have been generally stated from writers who are supposed to be not unfriendly to democracy, that they may gain the higher credit with other reformers; for in the most favourable point of view in which those facts can be placed, they furnish strong objections to precipitate innovations in moderate governments. If the horrible deeds of dark ages which have been acted on the theatre of France cannot make us contented with the government under which we live, and which has been brought to its present state of perfection, not by the metaphysical speculations of recluse philosophers, but by observation and the practical experience of other nations we shall be considered by posterity as a people...
people incapable of instruction, and ripe for the greatest militories in which we may be involved.

REVULSION, in medicine, turning a flux of humours from one part to another by bleeding, cupping, fribbing, flapsipins, blisters, fomentations, batheings, fufes, fetses, strong purging of the bowels, &c.

REYN (Jan de), an eminent history and portrait painter, born at Dunkirk in 1610. He had the good fortune to be a disciple of Vandyke, was the first performer in his school, and was attached to his master that he followed him to London, where it is thought he continued as long as he lived. In these kingdoms he is mostly known by the name of Lang Jan. He died in 1678: and it is imagined that the scarcity of his works is occasioned by so many of them being imputed to Vandyke; a circumstance which, if true, is beyond any thing that could be said in his praise.

REYNOLDS (Sir Joshua), the celebrated painter, was, on July the 16th, 1723, born at Plympton, a small town in Devonshire. His father was minister of the parish, and also master of the grammar school, and being a man of learning and philanthropy, he was beloved and respected by all to whom he was known. Such a man, it will naturally be supposed, was affiduous in the cultivation of the minds of his children, among whom his son Joshua shone conspicuous, by displaying at a very early period a superiority of genius, and the rudiments of a correct taste. Unlike other boys, who generally content themselves with giving a literal explanation of their author, regardless of his beauties or his faults, young Reynolds attended to both these, displaying a happy knowledge of what he read, and entering with ardour into the spirit of his author. He discovered likewise talents for composition, and a natural propensity to drawing, in which his friends and intimates thought him qualified to excel. Emulation was a disfiguring feature in his mind, which his father perceived with the delight natural to a parent; and designing him for the church, in which he hoped that his talents might raise him to eminence, he sent him to one of the universities.

Soon after this period he grew passionately fond of painting; and, by the perusal of Richardson's theory of that art, was determined to make it his profession through life. At his own earnest request, therefore, he was removed to London; and about the year 1733 became a pupil to Mr Hudson, who, though not himself an eminent painter was preceptor to several who afterwards excelled in the art. One of the first advices which he gave to Mr Reynolds was to copy carefully Guerino's drawings. This was done with such skill, that many of the copies are said to be now preferred in the cabinets of the curious as the originals of that very great master.

About the year 1740, Mr Reynolds went to Italy under the auspices, and in the company, of the late Lord (then Commodore) Keppel, who was appointed to the command of the British squadron in the Mediterranean. In this garden of the world, this magic feat of the arts, he failed not to visit the schools of the great masters, to study the productions of different ages, and to contemplate with unwearied attention the various beauties which are characteristic of each. His labour here, as has been observed of another painter, was "the labour of love, not the talk of the hirpling," and how much he profited by it is known to all Europe.

Having remained about two years in Italy, and studied the language as well as the arts of the country with great success, he returned to England, improved by travel and refined by education. On the road to London from the port where he landed, he accidentally found in the inn where he lodged Johnson's life of Stages; and was so taken with the charms of composition, and the masterly delineation of character displayed in that performance, that having begun to read it while leaning with his arm on the chimney-piece, he continued in that attitude insensible of pain till he was hardly able to raise his hand to his head. The admiration of the work naturally led him to seek the acquaintance of its author, who continued one of his sincerest admirers and warmest friends, till 1784, when they were separated by the stroke of death.

The first thing that distinguished him after his return to his native country, was a full length portrait of Commodore Keppel; which in the polite circles was spoken of in terms of the highest encomium, and testified to what a degree of eminence he had arrived in his profession. This was followed by a portrait of Lord Edgecombe, and a few others, which at once introduced him to the first business in portrait painting; and that branch of the art he cultivated with such success as will ever establish his fame with all descriptions of refined society. Having painted some of the first-rate beauties of the age, the polite world flocked to see the graces and the charms of his pencil; and he soon became the most fashionable painter, not only in England, but in all Europe. He has indeed preferred the resemblance of so many illustrious characters, that we feel the least regret for his having left behind him so few historical paintings; though what he has done in that way shows (a) him to have been qualified to excel in both departments. The only landscape, perhaps, which he

(a) As the lovers of painting may wish to have a catalogue of this great master's historical pieces, we subjoin the following from the European Magazine, which we have good reason to believe accurate, as the editors of that miscellany grudge neither trouble nor expense to procure authentic information. Sir Joshua's principal historical pieces, then, are the following: Hope nursing Love; Venus caressing Cupid for having learned to cast accounts; Count Ugolino in the dungeon; the calling of Samuel; Ariadne; a Captain of banditti; Beggar Boy; a Lady in the character of St Agnes; Thais; Dionylus the Areopagite; an infant Jupiter; Mallet Crewe in the character of Henry VIII.; the death of Dido; a Child asleep; Cupid sleeping; Covent Garden Cupid; Cupid in the Clouds; Cupids painting; Boy laughing; Mallet Hebert in the character of Bacchus; Hebe; Miss Meyer in the character of Hebe; Madona, a head; the Black-guards Mercury; a little boy (Samuel) praying; and old Man reading; Love losing the zone of Beauty; the Children in the Wood; Cleopatra.
he ever painted, except those beautiful and chaste ones which compose the back grounds of many of his portraits, is "A View on the Thames from Richmond," which in 1734 was exhibited by the Society for Promoting Painting and Design in Liverpool.

In 1764 Mr Reynolds had the merit of being the first promoter of that club, which, having long existed without a name, became at last distinguished by the appellation of the Literary Club. Upon the foundation of the Royal Academy of Painting, Sculpture, and Architecture, he was appointed president; and his acknowledged excellence in his profession made the appointment acceptable to all the lovers of art. To add to the dignity of this new institution, his majesty conferred on the president the honour of knighthood; and Sir Joshua delivered his first discourse at the opening of the Academy on January 2, 1769. The merit of that discourse has been universally admitted among painters; but it contains some directions respecting the proper mode of prosecuting their studies, to which every student of every art would do well to pay attention. "I would chiefly recommend (says he), that an implicit confidence be placed in his teachers, for without this, the practice of the arts becomes a dead letter, and cripples the body which is to concern due to the talents and the spirit." Finding a disease of the liver, Sir Joshua gave up painting for a better reason. The picture of the portrait of the Death of Beaufort, which, at the opening of the future president on account of bodily infirmities, which disabled him from executing the duties of it to his own satisfaction. The academicians received this intelligence with the respectful concern due to the talents and virtues of their president; and either then did enter, or delayed to enter, into a resolution, honourable to all parties, namely, that a deputation from the whole body of the academy should wait upon him, and inform him of their wishes. The authority and privileges of the office of president might be his during his life; declaring their willingness to permit the performance of any of its duties which might be irksome to him by a deputy.

From this period Sir Joshua never painted more. The last effort of his pencil was the portrait of the Honourable Charles James Fox, which was executed in his Cc

patra dissolving the pearl; Garrick in the character of Kitley; Garrick between Tragedy and Comedy; Mrs Abington in the character of Comedy; a Child surrounded by Guardian Angels; Miss Beaulcerc in the character of Spenfer's Una; Reformation; the Duchess of Manchester in the character of Diana; Lady Blake in the character of June; Mrs Sheridan in the character of St Cecilia; Edwin, from Beatle's Minstrel; the Nativity, Four Cardinal Virtues, and Faith, Hope, and Charity, for the window of New College Chapel, Oxford; the Stuclous Boy; a Bacchant; a daughter of Lord W. Gordon as an Angel; the Holy Family; the Crucifixion by J. Thorpe; the Vocal; the Careful Shepherdess; a Gypsy telling Fortunes; the Infant Hercules slaying the Serpent; the Mount-trap Girl; Venus; Cornelia and her Children; the Bird; Melancholy; Mrs Siddons in Tragedy; Head of Lear; Mrs Talma in the character of Miranda, with Prospero and Caliban; Robin Goodfellow; Death of Cardinal Beaufort; Macbeth, with the Caldon of the Witches.
On Thursday February the 23d 1792, the world was deprived of this amiable man and excellent artist at the age of 68 years; a man than whom no one, according to Johnson, had passed through life with more observation of men and manners. The following character of him is said to be the production of Mr Burke:—

"His illness was long, but borne with a mild and cheerful fortitude, without the least mixture of any thing irritable or querulous, agreeably to the placid and even tenor of his whole life. He had from the beginning of his malady a distinct view of his dissolution, which he contemplated with that entire composure which nothing but the innocence, integrity, and usefulness of his life, and an unaffected submission to the will of Providence, could befool. In this situation he had every consolation from family tenderness, which his tenderness to his family had always merited.

Sir Joshua Reynolds, was, on very many accounts, one of the most memorable men of his time: He was the first Englishman who added the praise of the elegant arts to the other glories of his country. In taste, in grace, in facility, in happy invention, and in the dignity, harmony and harmony of colouring, he was equal to the great masters of the renowned ages. In portrait he went beyond them; for he communicated to that art, in which English artists, were the most engaged, a variety, a fancy, and a dignity, derived from the higher branches, which even those who professed them in a superior manner did not always preferve when they delineated individual nature. His portraits remind the spectator of the invention of hisfory and the amenity of landscape. In painting portraits, he appears not to be raised upon that platform, but to descend to it from a higher sphere. His paintings illustrate his lessons, and his lessons seem to be derived from his paintings.

He professed the theory as perfectly as the practice of his art. To be such a painter, he was a profound and penetrating philosopher.

In full happiness of foreign and domestic fame, admired by the expert in art, and by the learned in science, courted by the great, careful of sovereign powers, and celebrated by distinguished poets, his native humility, modesty, and candour, never forsook him, even on surplice or provocation; nor was the least degree of arrogance or assumption visible to the most scrutinizing eye in any part of his conduct or discourse.

His talents of every kind—powerful from nature, and not meanly cultivated in letters—his facial virtues in all the relations and all the habits of life, rendered him the centre of a very great and unparalleled variety of agreeable societies, which will be disinterred by his death. He had too much merit not to excite some jealously, too much innocence to provoke any enmity. The loss of no man of his time can be felt with more fincere, general, and unmixed sorrow."

REZAN, or REZANSKOI, an ancient town of Russia, and capital of a duchy of the same name, with an archbishop's see. It was formerly considerable for its extent and riches; but it was almost ruined by the Tartars in 1569. The country is populous, and was formerly governed by its own princes. E. Long. 42. 37. N. Lat. 54. 54. E.

RHADAMANTHUS, a severe judge, and king of Lydia; the poets make him one of the three judges of hell.

RHAGADES, in medicine, denotes chaps or clefs in any part of the body. If seated in the anus, and recent, the patient must sit still, and fit over the fteam of warm water. The epulotic cerafe may also be applied. If the lips of these fissures are callous, they must be cut or otherwise treated as to become new ulcerations.

RHAMA, or RAMA, an incarnate deity of the first rank, in Indian mythology. Sir William Jones believes he was the Dionysus (A) of the Greeks, whom they named Bromius, without knowing why; and Bugenes, when they represented him borned, as well as Lyatos and Eleuterios the deliverer, and Triambos or Dybyrambos the triumphant. Most of these titles (says Sir William) were adopted by the Romans, by whom he was called Bruma, fearless, Tauriformis, Lilio, and Triambus; and both nations had records or traditionary accounts of his giving laws to men and deciding their contests, of his improving navigation and commerce, and what may appear yet more observable, of his conquering India and other countries with an army of satyrs, commanded by no less a personage than Pan; whom Lilius Giraldisus, on what authority I know not, afferts to have resided in Iberia when he had returned, says the learned mythologist, from the Indian war, in which he accompanied Bacchus. It were superfluous in a mere essay to run any length in the parallel between this European god and the fore­ reign of Ayodhya, whom the Hindoos believe to have been an appearance on earth of the preferring power; to have been a conqueror of the highest renown, and the deliverer of nations from tyrants, as well as of his comfort Siva from the giant Ravan king of Lanka; and to have commanded in chief a numerous and intrepid race of those large monkeys, which our naturalists, or some of them, have denominated Indian satyrs; his general, the prince of satyrs, was named Hanumat; or with high cheek bones; and, with workmen of such agility, he soon raised a bridge of rocks over the sea, part of which, say the Hindoos, yet remain; and it is probable the feries of rocks to which the Mussulmans or the Portuguefe have given the foolish name of Adam's (it should be called Rama's) bridge. Might not this army

---

(A) The learned president, whose death will be lamented by every scholar, by the Orientalists and the divine especially, imagines, that this would fully appear from comparing together the Dionyfaca of Nonus and the Ramayan of Valme, the first poet of the Hindoos. He adds, that, in his opinion, Rham was the son of Cuth, and that he might have established the first regular government in that part of Asia, in which his exploits are said to have been performed.
The buckthorn, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 43d order, *Dumfie*. The calyx is tubulous, with five minute scales surrounding the flaminia; there is no corolla; the fruit is a berry. There are 27 species; of which the most remarkable are:

1. The catharticus, or common purging buckthorn, growing naturally in some parts of Britain. This grows to the height of 12 or 14 feet, with many irregular branches at the extremities. The leaves are oval-lanceolate, finely ferrated on the edges, their nerves converging together. The flowers grow in clusters, one on each footstalk, white, and in this species divided into four segments: the fruit is a round black berry, containing four seeds. The juice of the berries is a strong purgative, and is made use of for making the common syrup of buckthorn kept in the shops. The bark is emetic; the juice of the unripe berries, with alum and dry yellow; the ripe ones a fine green; the bark also dyes yellow. The green colour yielded by the berries, called by the French *vert-de-coffe*, is much esteemed by miniature painters.

Of this species there are two varieties, viz. the dwarf buckthorn, a shrub of about a yard high, of a greenish colour but little show; and the long-leaved dwarf buckthorn, which is a larger shrub, with leaves somewhat larger, but in other respects very similar to the dwarf buckthorn.

2. The *zizyphus* is the species in which the lac is taken, its cells, and produces the wax called *gum-cus*. See Coc-loc. See Laca.

3. The *lotus* has the leaves, prickles, flowers, and fruit, of the *zizyphus* or jubej; only with this difference, that the fruit is here round, smaller, and more lucious, and at the same time the branches, like those of the paliurus, are neither so much jointed nor crooked. The fruit is in great abundance, takes something like gingerbread, and is sold in the markets all over the southern districts of Great Britain. The Arabs call it *anab enta el fedra*, or the *jubej of the fedra*; which Olavus Celsum had so high an opinion of, that he describes it as the dux of the scriptures. This species is very common in the Jereede and other parts of Bombay; and has been supposed by some to be the same plant with that celebrated by Homer for its enchanting property; though the latter is more generally supposed to have been a *species of Diospyros* (which see). It is proper, however, to distinguish between both these shrubs and an herb often mentioned by the ancients under the name of *lotus*, which Homer mentions as being fed upon by the horses of Achilles, and Virgil as proper to increase the milk of sheep (see Lotus). They are also different from the Egyptian *lotus* described by Herodotus; for which see Nymphe.

4. The frangula, or berry-bearing alder, is a deciduous shrub, a native of England and most of the northern parts of Europe, and affords several varieties.

5. The Alpine, rough-leaved frangula, or berry-bearing alder, is also a deciduous shrub, and native of the Alps. It differs in no respect from the common alder, except that it has no thorns, and that it will grow to be rather taller, with tough, large, and doubly laciniate leaves. The smooth-leaved alpine frangula is a variety of this species, with smooth leaves and of a lower growth.

6. The paliurus, or thorn of Chrift, is a deciduous shrub or tree, a native of Palestine, Spain, Portugal, and Italy. It will grow to nearly the height of 14 feet,
feet, and is armed with sharp thorns, two of which are at each joint, one of which is about half an inch long, straight, and upright; the other is scarcely half that length, and bent backward; and between them is the bud for next year's shoot. June is the time of flowering, and the flowers are succeeded by a small fruit, surrounded by a membrane. This plant (says Hanbury) is undoubtedly the sort of which the crown of thorns for our Blest Saviour was composed. The branches are very plant, and the spines of it are at every joint strong and sharp. It grows naturally about Jerusalem, as well as in many parts of Judæa; and there is no doubt that the barbarous Jews would make choice of it for their cruel purpose. But what farther confirms the truth of these thorns being then used, are the ancient pictures of our Blest Saviour's crucifixion. The thorns of the crown on his head exactly answer to those of this tree; and there is great reason to suppose these were taken from the earliest paintings of the Lord of Life; and even now our modern painters copy from them, and represent the crown as composed of these thorns. These plants, therefore, should principally have a share in those parts of the plantation that are more peculiarly designed for religious retirement; for they will prove excellent monitors, and conduci
d to due reflection on and gratitude to Him who hath loved us, and has washed us from our sins." &c.

7. The common alaternus is an evergreen tree, and native of the south of Europe. There are several varieties of this species; the most remarkable of which are the broad-leaved and the jagged-leaved alaternus, which have all been confounded with the phillyrea.

8. The infectiorius, or narrow-leaved buckthorn, is an evergreen shrub or tree, and native of Spain. It grows to the height of 10 or 12 feet, and sends forth several branches from the bottom to the top. They are covered with a blackish or dark-coloured bark, and each of them is terminated by a long sharp thorn. The fruit continues on the trees all winter, making a beautiful appearance among the narrow-cluttered leaves at that season.

9. The oleoides, or olive-leaved buckthorn, is an evergreen shrub, and native of Spain, and grows to the height of 8 or 10 feet. It sends forth numerous branches, each of which is terminated by a long sharp spine. The flowers are small, of a whitish green colour, and are succeeded by round black berries.

RHAMPHASTOS, in ornithology, a genus belonging to the order of picae. The bill is very large, and ferrated outwardly. The nostrils are situated behind the base of the beak; and in most of the species the feet are toed, and placed two forwards and two backwards. The tongue is long, narrow, and feathered on the edge. Mr Latham enumerates 15 different species; of which the toucans are the most remarkable, and were formerly divided into four or five varieties, though Mr Latham makes them different species, of which we shall only describe that called the red-beaked toucan.

This bird is about the size of a jackdaw, and of a familiar shape, with a large head to support its monstrous bill: this bill, from the angles of the mouth to its point, is six inches and an half; and its breadth in the thickest part is a little more than two. Its thickness near the head is one inch and a quarter; and it is a little rounded along the top of the upper chap, the under side being round also; the whole of the bill extremely light, and a little thicker than parchment. The upper chap is of a bright yellow, except on each side, which is of a fine scarlet colour; as is also the lower chap, except at the base, which is purple. Between the head and the bill there is a black line of separation all round the base of the bill; in the upper part of which the nostrils are placed, and are almost covered with feathers; which has occasioned some writers to say that the toucan has no nostrils. Round the eyes, on each side of the head, is a space of bluish skin, void of feathers; above which the head is black, except a white spot on each side joined to the base of the upper chap. The hinder part of the neck, the back, wings, tail, belly, and thighs, are black. The under side of the head, throat, and the beginning of the breast, are white. Between the white on the breast, and the black on the belly, is a space of red feathers, in the form of a new moon, with its horns upwards. The legs, feet, and claws, are of an ash-colour; and the toes stand like those of parrots, two before and two behind.

It is reported by travellers, that this bird, though furnished with so formidable a beak, is harmless and gentle, being so easily made tame as to sit and hatch its young in houses. It feeds chiefly upon peppers, which it devours very greedily, gorging itself in such a manner that it voids it crude and unconiected. This, however, is no objection to the natives from using it again; they even prefer it before that pepper which is fresh gathered from the tree; and seem persuaded that the strength and heat of the pepper is qualified by the bird, and that all its noxious qualities are thus exhausted.

Whatever be the truth of this report, nothing is more certain than that the toucan lives only upon a vegetable diet; and, in a domestic state, to which it is frequently brought in the warm countries where it is bred, it is seen to prefer such food to all other. Pozzo, who bred one tame, afferts, that it leaped up and down, wagged the tail, and cried with a voice resembling that of a magpie. It fed upon the same things that parrots do; but was most greedy of grapes, which, being pulped off one by one, and thrown in the air, it would most dexterously catch before they fell to the ground. Its bill, he adds, was hollow, and upon that account very light, so that it had but little strength in so apparently formidable a weapon; nor could it peck or strike smartly therewith. But its tongue seemed to afford the efforts of this unwieldy machine: it was long, thin, and flat, not unlike one of the feathers on the neck of a dunghill cock; this it moved up and down, and often extended five or six inches from the bill. It was of a flesh colour, and remarkably fringed on each side with very small filaments exactly resembling a feather.

It is probable that this long tongue has greater strength than the thin hollow beak that contains it. It is likely that the beak is only a kind of sheath for this peculiar instrument, used by the toucan, not only in making itself a nest, but also in obtaining its provision. Nothing is more certain, than that this bird builds its nest in holes of trees, which have been previously
Rha
d o

viously flooped out for this purpose; and it is not very likely that fo feeble a bill could be very serviceable in working upon such hard materials.

Be this as it will, there is no bird secures its young better from external injury than the toucan. It has not only birds, men, and serpents, to guard against; but a numerous tribe of monkeys, sill more praying, malicious, and hungry, than all the rest. The toucan, however, scoops out its nest into the hollow of some tree, leaving only a hole large enough to go in and out at. There it sits, with its great beak, guarding the entrance; and if the monkey ventures to offer a visit of curiosity, the toucan gives him such a welcome, that he presently thinks proper to pack off, and is glad to escape with safety.

This bird is only found in the warm climates of South America, where it is in great request, both for the delicacy of its flesh, which is tender and nourishing, and for the beauty of its plumage, particularly the feathers of the crown. The tips of these are plucked off, and when dry glue to their cheeks; and this they consider as an irreducible addition to their beauty.

Rhapis, in botany: A genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking under the first order, Palma. The calyx is a monoplyelfth trifid spatha; the corolla monopetalous and trisiphid. There are two species, viz. 1. Flabilliformis, or ground-ratan, a native of China; 2. Arundinacea, simple leaved rhapis, a native of Carolina.

Rhapsody, Rhapsodists, in antiquity, persons who made a business of singing Homer's poems. Caspar informs us, that the Rhapsodists were clothed in red when they sung the Iliad, and in blue when they sung the Odyssey. They performed on the theatres, and sometimes strove for prizes in contests of poetry, singing, &c. After the two antagonists had finished their parts, the two papers or papers they were written in were joined together again: whence the name, viz. from ἐροτεῖς, ἐροτεῖς, and ἀπὸ κανίτως: but there seem to have been other Rhapsodists of more antiquity than these people, who composed heroic poems or fongs in praise of heroes and great men, and sung their own compositions from town to town for a livelihood: of which profession Homer himself is said to have been.

See Bard

Rhapsodomancy, an ancient kind of divination performed by pitching on a passage of a poet at hazard, and reckoning on it as a prediction of what was to come to pass. There were various ways of practising this rhapsodomancy. Sometimes they wrote several papers or sentences of a poet on so many pieces of wood, paper, or the like, shook them together in an urn, and drew out one which was accounted the lot: sometimes they cast dice on a table whereon veres were written, and that whereon the die lodged contained the prediction. A third manner was by opening a book, and pitching on some verse at first sight. This method they particularly called the Fortes Præstætes; and afterwards, according to the poet, made use of, Fortes Hœmeriae, Fortes Virgilianæ, &c. See Sortes.

Rhapsody, in antiquity, a discourse in verse sung or rehearsed by a rhapsodist. Others will have rhapsody to signify a collection of verses, especially those of Homer, which having been a long time dispersed in pieces and fragments, were at length by Pilippatus's order digested into books called rhapsodies, from ἐροτεῖς and κανίτως. Hence, among moderns, rhapsody is also used for an assemblage of passages, thoughts, and authorities, raked together from divers authors, to compose some new piece.

RHE, or Reese, a little island in the Bay of Biscay, near the coast of Annis in France. It was taken during the war with France which ended in 1763, in the expedition commanded by Hawke and Mordaunt.

Rhea americana. The American ostrich of authors has been frequently mentioned, but till of late years very imperfectly known; being blended by some with other genera, although forming of itself a distinct one, differing in many things from all others. The older writers, however, have kept it separate. It does not occur to us whether any author has figured this bird except Nieremberg, whose representation conveys no such idea, which is written, as is to be met with, in sufficient plenty in various parts of South America; nor has the bird itself made its appearance in the cabinets of collectors, until the one now in the Leverian museum.

M. Bajon, in his Mem. fur Cayenne, gives a figure and description of the jabirus, and seems clear that this bird is no other than the ostrich of America. From this affirmation, Mr Latham, in his Synopis, leaves the matter undecided; but this author, in his Index Ornith., from having met with the species above alluded to, and supported in an account of its manners given by Molina in his Hif. Nat. du Chili, treats this matter on more certain grounds, so as to enable us to give the following description.

In size the American ostrich is very little inferior to the common one; the bill is not unlike that of a goose, being flat on the top and rounded at the end; the eyes are black, and the lids furnished with hairs; the head is rounded, and covered with downy feathers; the neck is two feet eight inches long, and feathered also: from the tip of one wing to that of the other extended, the length is eight feet; but from the want of continuity of the webs of the feathers, and their laxity of texture, the bird is unable to raise itself from the ground; it is, however, capable of greatly affisting itself by their motion in running, which it does very swiftly: the legs are stout, bare of feathers above the knees, and furnished with three toes, all placed forwards, each having a straight and stout claw as in the callowary; on the heel is a callous knob, serving in place of a back toe: the general colour of plumage is dull grey mixed with white, inclining to the latter on the under parts: the tail is very short, and not conspicuous, being entirely covered with long loose and floating feathers, having origin from the lower part of the back and rump, and entirely covering it: the bill and legs are brown.

Molina observes that this bird varies; the body in some being white, in others black. In respect to manners, it is said to be a general feeder, but more fond of flies, which it catches with great dexterity, and will also, like the common ostrich, swallow bits of iron and any other trash offered to it. In common with the ostrich of the old world, it lays a number of eggs, from 40 to 60, in the sand, each of them holding a quart; but
RHEEDIA, in botany: A genus of the monogynia order, belonging to the polyandria clafs of plants; and in the natural method ranking with those of which the order is doubtful. The corolla is tetrapetalous; there is no calyx; and the fruit is a triperಮous berry.

RHEGIUM (anc. geog.), so very ancient a city as to be supposed to take its name from the violent bursting of the coast of Italy from Sicily; thought to have been formerly conjoined (Mela, Virgil). A city of the Brituli, a colony of Chalcidians from Euboea (Strabo); mentioned by Luke; furnished Tulium (Polemy), from a fresh supply of inhabitants sent thither by Augustus, after driving Sextus Pompeius out of Sicily (Strabo); and thus was in part a colony, retaining the right of a municipium (Inscription). The city is now called Reggio, in the farther Calabria.

RHEIMS, a city of France in Champagne, and capital of Rhemois. It is one of the most ancient, celebrated, and largest places in the republic, had an archbishop's see, whose archbishop was duke and peer of France. It is about four miles in circumference, and contains several fine squares, well-built houses, and magnificent churches. It had a mint, an university, and five abbeys, the most famous of which was that of St Remy. There are also several triumphal arches and other monuments of the Romans. It is seated on the river Vesle, on a plain surrounded by hills, which produce excellent wine. E. Long. 4. 8. N. Lat. 49. 14.

RHENISH WINE, that produced on the hills about Rheims. This wine, is much used in medicine as a solvent of iron, for which it is well calculated on account of its acidity. Dr Percival observes, that it is the best solvent of the Peruvian bark; in which, however, he thinks its acidity has no share, because an addition of vinegar to water does not augment its solvent power.

RHETORES, among the Athenians, were ten in number, elected by lot to plead public causes in the senate-house or assembly. For every cause in which they were retained, they received a drachm out of the public money. They were sometimes called Συνήθεις, and their fees Συνήθεια. No man was admitted to this office before he was 40 years of age, though others say 30. Valour in war, piety to their parents, prudence in their affairs, frugality, and temperance, were necessary qualifications for this office, and every candidate underwent an examination concerning these virtues previous to the election. The orators at Rome were not unlike the Athenian rhetores. See Or. Rhetorians Tor.

RHETORIAN, a sect of heretics in Egypt, so denominated from Rhetorius their leader. The distinguishing tenets of this heresiarcl, as represented by Philostratus, was, that he approved of all the heresies before him, and taught that they were all in the right.

RHETORIC, the art of speaking copiously on any subject, with all the advantages of beauty and force. See Oratory.

RHEUM, a thin ferrous humor, occasionally oozing out of the glands about the mouth and throat.

RHEUM, Rhubarb: A genus of the monogynia order, belonging to the euneandria clafs of plants; and in the natural method ranking under the 12th order, Holocarce. There is no calyx; the corolla is fexfid and persistent; and there is one triquetrous seed. There are five species, viz. 1. The rhaponticum, or common rhubarb, hath a large, thick, fleshy, branching, deeply-frieking root, yellowish within; crowned by very large, roundish, heart-shaped smooth leaves, on thick, slightly-furred foot-stalks; and an upright long-stemmed, two or three feet high, adorned with leaves finely, and terminated by thick close spikes of white flowers. It grows in Thrace and Scythia, but has been long in the English gardens. Its root affords a gentle purge. It is however of inferior quality to some of the following sorts; but the plant being astringent, its young stalks in spring, being cut and peeled, are used for tarts.

2. The palmatum, palmated-leafed true Chinese rhubarb, hath a thick fleshy root, yellow within; crowded with very large palmed leaves, being deeply divided into acuminate segments, expanded like an open hand; upright ftem, five or six feet high or more, terminated by large spikes of flowers *. This is now proved to be the true foreign rhubarb, the purgative quality of which is well known.

3. The compositum, or Tartarian rhubarb, hath a large, fleshy, branched root, yellow within; crowned by very large, heart-shaped somewhat lobated, sharply indented, smooth leaves, and an upright long ftem, five or six feet high, garnished with leaves finely, and branching above; having all the branches terminated by nodding panicles of white flowers. This has been supposed to be the true rhubarb; which, however, though of inferior quality to some sorts, is accounted inferior to the rhum palmatum.

4. The undulatum, undulated, or waved-leafed Chinese rhubarb, hath a thick, branchy, deep-frieking root, yellow within; crowned with large, oblong, undulate, somewhat hairy leaves, having equal foot-stalks, and an upright firm ftem, four feet high; garnished with leaves finely, and terminated by long loose spikes of white flowers.

5. The Arabian ribes, or currant rhubarb of Mount Libanus, hath a thick fleshy root, very broad leaves, full of granulated protuberances, and with equal foot-stalks, and upright firm ftem, three or four feet high, terminated by spikes of flowers, succeeded by berry-like seeds, being surrounded by a purple pulp. All these plants are perennial in root, and the leaves and stalks are annual. The roots being thick, fleshy, generally divided, strike deep into the ground; of a brownish colour without and yellow within; the leaves rise in the spring, generally come up in a large head folded together,
RHE [ 207 ]

Rheum, together, gradually expanding themselves, having thick foot-stalks; and grow from one to two feet high, or more, in length and breadth, spreading all round; amidst them rise the flower-stems, which are garnished at each joint by one leaf, and are of strong and expeditious growth, attaining their full height in June, when they flower; and are fertilized by large triangular seeds, ripening in August. Some plants of each sort merit culture in gardens for variety; they will effect a singularity with their luxuriant foliage, spikes, and flowers; and as medical plants, they demand culture both for private and public use.

They are generally propagated by seeds sowed in autumn soon after they are ripe, or early in the spring, in any open bed of light deep earth, in any open bed of light deep earth, remarking, that some intended for medical use should generally be sowed where they are to remain, that the roots, being not disturbed by removal, may grow large. Scatter the seeds thinly, either bybroadcast all over the surface, and raked well in, or in small drills at a foot and half distance, covering them near an inch deep. The plants will rise in the spring, but not flower till the second or third year: when they, however, are come up two or three inches high, thin them to eight or ten inches, and clear out all weeds; though these designed always to stand should afterwards be led out to a foot and a half or two feet distance: observing, if any are required for the pleasure ground, &c. for variety, they should be transplanted where they are to remain in autumn, when their leaves decay, or early in spring, before they shoot: the others remaining where sowed, must have the ground kept clear between them; and in autumn, when the leaves and stalks decay, cut them down, and lightly dig the ground between the rows of plants, repeating the same work every year. The roots remaining, they increase in fine annually; and in the second or third year many of them will shoot up stalks, flower, and perfect seeds; and in three or four years the roots will be arrived to a large size; though older roots are generally preferable for medical use.

In Mr Bell's Travels we have an account of some curious particulars relating to the culture of rhubarb. He tells us, that the best rhubarb grows in that part of Eastern Tartary called Mongolia, which now serves as a boundary between Russia and China. The marmots of the country, in the culture of the rhubarb. Wherever you see ten or 20 plants growing, you are sure of finding several burrows under the thistles of their broad-leaved leaves. Perhaps they sometimes eat the leaves and roots of this plant; however, it is probable the manner they leave about the roots contributes not a little to its increase; and their casting up the earth, makes it shoot out young buds, and multiply. This plant does not run, and spread itself, like docks and others of the same species; but grows in tufts, at certain distances, as if the seeds had been dropped with design.

It appears that the Monguls never accustom it worth cultivating; but that the world is obliged to the marmots for the quantities gathered, at random, in many parts of this country; for wherever part of the ripe seed happens to be blown among the thick grass, can very seldom reach the ground, but must there wither and die; whereas, should it fall among the loose earth thrown up by the marmots, it immediately takes root, and produces a new plant.

After digging and gathering the rhubarb, the Monguls cut the large roots into small pieces, in order to make them dry more readily. In the middle of every piece they scoop a hole, through which a card is drawn, in order to suspend them in any convenient place. They hang them for the most part about their tents, and sometimes on the horns of their sheep. This is a most pernicious custom, as it destroys some of the most part of the root: for all about the hole is rotten and useless; whereas, were people rightly informed how to dig and dry this plant, there would not be one pound of refuse in an hundred; which would have a great deal of trouble and expense, that much diminish the profits on this commodity. At present, the dealers in this article think these improvements not worthy of their attention, as their gains are more considerable on this than on any other branch of trade. Perhaps the government may hereafter think it proper to make some regulations with regard to this matter.

Two sorts of rhubarb are meet with in the shops. The first is imported from Turkey and Russia, in roundish pieces freed from the bars, with a hole through the middle of each: they are externally of a yellowish colour, and on cutting appear variegated with lively reddish streaks. The other, which is less esteemed, comes immediately from the East Indies, in longish pieces, harder, heavier, and more compact than the foregoing. The first sort, unless kept very dry, is apt to grow mouldy and worm-eaten; the second is less subject to these inconveniences. Some of the more indolent artists are tid to fill up the worm-holes with certain mixtures, and to colour the outside of the damaged pieces with powder of the finer parts of rhubarb, and sometimes with cheaper materials: this is often so nicely done, as effectually to impose upon the buyer, unless he very carefully examines each piece. The marks of good rhubarb are, that it be firm and solid, but not flinty; that it be easily pulverizable, and appear, when powdered, of a fine bright yellow colour: that, upon being chewed, it impart to the spirit a fine tinge, without proving slimy or mucusinous in the mouth. Its taste is faradic, bittersih, and somewhat astringent: the smell highly aromatic.

Rhubarb is a mild astringent, which operates without violence or irritation, and may be given with safety even to pregnant women and children. Besides its purgative quality, it is celebrated for an astringent one, by which it strengthens the tone of the stomach and intestines, and proves useful in diarrhœa and disorders proceeding from a laxity of the fibres. Rhubarb in salubrity operates more powerfully as a cathartic than any of the preparations of it. Watery tinctures purge more than the lightest ones; whilst the latter contain in greater perfection the aromatic, astringent, and corroborating virtues of the rhubarb. The most, when intended as a purgative, is from a strong to a weak dose. The Turkey rhubarb is, among us, universally preferred to the East Indian; and the best is for some purposes at least equal to the other; it is materially more astringent, but has somewhat less of an aromatic flavour. Tinctures drawn from both with rectified spirit have nearly the same taste: on distilling off
Rheum.

Rhubarb has been cultivated of late in Britain with considerable success, and for medical purposes is found to equal that of foreign growth, as is proved by the Transactions of the London Society for encouraging Arts, Manufactures, and Commerce, who have rewarded several perfons both for cultivating and curing it. In the Transactions for 1792, the gold medal was adjudged to Sir William Fordyce, for raising from seed in the year 1791 upwards of 300 plants of the true rhubarb or rheum palmatum of the London Pharmacopoeia 1788, which in the second and third weeks of October were transplanted into a deep loam, at four feet distance from each other, according to rules laid down by the society. In 1793 it was judged to Mr Thomas Jones, from whose papers we derive the following information.

After giving an accurate account of his experiments and observations, he concludes, that the feaon for sowing is the spring about March or April, or in autumn about August and September; that those plants which are raised in the spring should be transplanted in autumn, and vice versa; that they cannot have too much room; that room and time are essentially necessary to their being large, of a good appearance, and perhaps to the increase of their purgative qualities; that to effect these purposes, the foil must be light, loamy, and rich, but not too much so, lest the roots should be too fibrous; that their situation can scarcely be too dry, as more evils are to be expected from a superabundance of moisture than any actual want of it; and lastly, we may conclude, that in particular the injuries which they are subject to are principally during their infancy, and to be imputed to insects and inattention to the planting season; afterwards, from too great an exposure to frost: but that none can be dreaded from heat; and that in general they are hardy and easy of cultivation, when arrived beyond a certain term.

The method of curing rhubarb, as proposed by Dr Tiirnuell of Stockholm, is as follows: “No roots should be taken up till they have been planted ten years: they should be taken out of the ground either in winter, before the frost sets in, or in the beginning of spring, and immediately cut into pieces, and carefully barked; let them be piled upon a table for three or four days, and be frequently turned, that the juices may thicken or congeal within the roots. After this process, make a hole in each piece, and put a thread through it; by which let them hang separately, either within doors, or in some sheltered shady shed. Some persons dry them in a different way: they inclose the roots in clay, and make a hole in the clay, about the thickness of a goose quill, and in this manner hang up each piece to dry separately, that the moisture may not evaporate, nor the strength of the root be weakened. But the methods which the Tartars follow is a bad one: they dig the roots out of the deferts where they grow, bark them, and immediately firing them, and hang them round the necks of their camels, that they may dry as they travel; but this greatly lessens the medicinal virtue of the root.”

Mr Thomas Halley of Pontefract in Yorkshire, to whom the London Society voted the silver medal in 1793, informs us, that his father tried various experiments for curing rhubarb, as washing, bruising, barking, and peeling, and he dried them in the sun, on a kiln, in a flore, or in a warm kitchen. But of the success of all or either of these methods we have no account, owing to the death of Mr Halley’s father. His tent, however, to them, five different specimens, which the society acknowledges to be superior to any rhubarb hitherto cured in England, and produced to them. The roots tent, Mr Halley says, were planted: about the year 1781 in a light sandy loam, but were much neglected. They were taken up in the spring of 1792, and being thoroughly divested of the adhering earth, were placed for some weeks on the floor of a cool warehouse: the fibres were then taken off, cut up, and dried on the flue of a green-house; but, from mismanagement, were entirely spoiled. The prime roots were severed in small pieces, peeled clean, and thoroughly cleared of every particle of ungroundness. Part was separately laid in fieves, and the remainder perforated, fortified, and suspended in felafoons from the cieling of a warm kitchen. The manner of dressing consists in paining off the external coat with a sharp knife, as thin and clean as possible, and then finishing it off by a piece of fish-kin, with its own powder; which powder may be procured from the chips and small pieces, either by grinding or pounding it in a large mortar.

In the year 1794 the Society adjudged the gold medal to Mr William Hayward of Hambury, Oxfordshire, for propagating rhubarb by offsets taken from the crowns of large plants, instead of seeds, for the purpose of bringing it to perfection in a shorter time, which fully answered his expectations. Mr Hayward was a candidate in the year 1789 for the gold medal; but having misunderstood their rules, he was not entitled to it, though with great propriety they voted to him the silver medal; in consequence of which he sent them his method of culture and cure. His method of cultivating Turkey rhubarb from seed is thus explained to the Society: “I have usually sown the seeds about the beginning of February, on a bed of good soil (if rather sandy the better), exposed to an east or west aspect, in preference to the south; observing a full sun to be prejudicial to the vegetation of the seeds, and to the plants whilst young. The seeds are best sown moderately thick (broad-cast), treading them regularly in, as is usual with parsnips and other light seeds, and then raising the ground smooth. I have sometimes, when the season has been wet, made a bed for sowing the rhubarb seeds upon, about two feet thick, with new dung from the stable, covering it near one foot thick with good foil. The intent of this bed is not for the sake of warmth, but solely to prevent the rising of earth-worms, which, in a moist season, will frequently destroy the young crop. If the seed is good, the plants often rise too thick; if so, when they have attained six leaves they should be taken carefully up (where too close), leaving the standing crop eight or ten inches apart: those taken up may be planted at the same distance, in a fresh spot of ground, in order to furnish other plantations. When the plants in general are grown to the size that cabbage-plants are usually set out for a standing crop, they are best planted where they are to remain, in beds four feet wide, one row along the middle of the bed, leaving two yards distance between the plants,
RHEUM plants, allowing an alley between the beds about a foot wide, for convenience of weeding the plants. In the autumn, when the decayed leaves are removed, if the 
shoveling of the alley are thrown over the crowns of the plants, it will be found of service.

His mode of cultivating the same plant by offsets is thus given: "On taking up these plants in the last spring, I 
offered several offsets from the bases of large plants; these I set with a dibble about a foot apart, in 
order, if I found them thrive, to remove them into other beds. On examining them in the autumn, I was 
surprised to see the progress they had made, and pleased to be able to furnish my beds with 40 plants in the most 
thriving state. Though this was my first experiment of its kind, I do not mean to arrogate the discovery to 
myself, having known it recently tried by others, but without being informed of their success. I have rea-
tion to think this valuable drug will, by this method, be brought much sooner to perfection than from seed."

His method of curing rhubarb is thus described: "The plants may be taken up either in the spring, 
or in autumn, when the leaves are decayed, in dry wea-
ter if possible, when the roots are to be cleared from 
dirt (without washing); let them be cut into pieces, 
and with a sharp knife freed from the outer coat, and 
exposed to the sun and air for a few days, to render the 
outside a little dry. In order to accelerate the curing 
of the largest pieces, a hole may be scooped out with a 
penknife; these and the smaller parts are then to be 
covered with packthread, and hung up in a warm room (I 
have always had the convenience of such a one over 
a baker’s oven), where it is to remain till perfectly dry. 
Each piece may be rendered more firmly by a common 
file, fixing it in a small vice during that operation: af-
terwards rub over it a very fine powder, which the 
small roots furnish in beautiful perfection, for this and 
ever other purpose where rhubarb is required."

In the year 1794, too, the Society adjudged the gold 
medal to Mr Ball for his method of curing the true 
rhubarb, which is as follows: "I take the roots up 
when I find the stalks withering or dying away, clean 
them from the earth with a dry brush; cut them in small 
pieces of about four or five inches in breadth, and about 
two in depth, taking away all the bark, and make a hole 
in the middle, and firing them on packthread, keeping 
every piece apart; and every morning, if the weather is 
clear and fine, I place them in the open part of the 
garden, on flages, eroded by fixing small poles about 
six feet high in the ground, and fix feet adiner, into 
which I fix horizontal pegs, about a foot apart, begin-
ning at the top; and the rhubarb being strung cross-
wise on small poles, I place them on these pegs; so that 
if it should rain, I could easily remove each pole with the 
spunped pieces, into any covered place. I never 
without them to be cut at night, as the damps at this sea-
sion would be apt to mould them; and if at any time I 
perceive the least mark of mould, I rub it off with a dry 
cloth.

In some of the pieces of rhubarb which I have 
cured this year, I have made holes about half an inch 
diameter in the middle, for the free passage of air, and 
have found that every one of these pieces dried better 
than the others where no such holes were made; and 
have therefore hung several strings in the kitchen, and 
ever exposed them in the open air, and found them to 
dry exceedingly well, and much better than in the 
open air.

Some years since I dried a quantity of rhu-
barb on a malt-kiln, keeping up the heat near 
degree, which answered well, but I think rather 
dried too quick: the roots which I have cured this 
year are a part of the plantations of 1789, and for 
which the Society was so kind as to give me a me-
dal (a)."

RHEXIA, in botany: A genus of the monogynia 
order, belonging to the octandria class of plants; and 
in the natural method ranking with that of the 17th 
order, CaCyonthema. The calyx is quadridif, with four 
petals inserted into it; the anthers are declining; the 
capule is quadrilocular, within the belly of the calyx.

RHINANTHUS, in botany: A genus of the angio-
permia order, belonging to the didynamia class of 
plants; and in the natural method ranking under 
the 40th order, Peronatae. The calyx is quadridif, 
and ventricose; the capule bilocular, obtuse, and compref-
ted.

RHINE, a large river of Germany, famous both 
in ancient and modern history. It rises among the 
Alps Lepontice, or Grifons; and first traversing the 
Lacus Acronius, divides the Rheti and Vindelici from 
the Helvetii, and then the Germans from the Gauls 
and Belgae; and running from south to north for the 
greatest part of its way, and at length bending its 
course west, it empties itself at several mouths (Cæsar); 
at three mouths into the German ocean, (Pliny); viz. 
the western, or Helius; the northern, or Pienus; and 
the middle between both these, which retains the original 
name, Rhenus; and in this Ptolemy agrees.— 
Mela and Tacitus mention two channels, and as many 
mouths, the right and left; the former running by 
Germany, and the latter by Gallia Belgica; and thus 
also Alfinus Pollio, and Virgil; the cut or trench of 
Druus not being made in their time, whereby the 
middle channel was much drained and reduced, and 
therefore overlooked by Tacitus and Mela; and which 
Pliny calls the Scanty. To account for Cæsar’s sev-
eral mouths, is a matter of no small difficulty with the 
commentators; and they do it no otherwise than by 
admitting that the Rhine naturally formed small drains 
or rivulets from itself; the cut of Druus being long 
posterior to him; in whose time Alfinus Pollio, quoted 
by Strabo, who agrees with him therein, affirmed 
that there were but two mouths, finding fault with those 
who made them more; and he must mean the larger 
mouths, which emitted larger streams. The Romans, 
especially the poets, used the term Rhenus for Ger-
many, (Martial).—At present, the river, after enter-
ing the Netherlands at Schenkinhaus, is divided into 
several channels, the two largest of which obtain the 
names of the Lech and the Waal, which running thro’ 
the United Provinces, falls into the German ocean be-
low Rotterdam.

Vol. XVI.

(a) The Society also adjudged to Mr Ball the medal in 1790, for cultivating rhubarb.
RHINE, [210] RHINE

Lower Circle of the Rhine, consists of the palatinate of the Rhine, and the three ecclesiastical electorates, viz. those of Cologne, Mentz, and Trier.

Upper Circle of the Rhine, consists of the landgravies of Alten and Hesse, comprehending the Waterau; but now only Hesse can be accounted a part of Germany, Alten being long ago united to France.

RHINEBERG, a town of Germany, in the circle of the Lower Rhine, and diocese of Cologne. It was in the possession of the French, but restored to the archbishop of Cologne by the treaty of Utrecht. It is seated on the Rhine, in E. Long. 6. 39. N. Lat. 51. 30.

RHINECK, a town of Germany, in the archbishopric of Cologne, seated on the Rhine, E. Long. 7. 53. N. Lat. 50. 27.—There is another town of the same name in Switzerland, capital of Rhinhalt, seated on the Rhine, near the lake of Constance, with a good castle. E. Long. 9. 53. N. Lat. 47. 38.

RHINEFELD, a small but strong town of Germany, in the circle of Swabia, and the heart of the four forest-towns belonging to the house of Auftilia. It has been often taken and retaken in the German wars; and is seated on the Rhine, over which there is a handsome bridge. E. Long. 7. 53. N. Lat. 47. 40.

RHINEGAU, a beautiful district of the electorate of Mentz, is situated on the Rhine, about three miles from the city of Mentz, and is so populous that it looks like one entire town intermixed with gardens and vineyards. The Rhine here grows astonishingly wide, and forms a kind of bow, near a mile broad, in which are several well wooded little islands. The Rhinegaus forms an amphitheatre, the beauties of which are beyond all description. At Waldb, the very high hills come nearly down to the river side; from thence they recede again into the country, forming a kind of half circle, the other end of which is 15 miles off at Rudesheim, on the banks of the Rhine. The banks of the river, the hills which form the circles, and the slopes of the great mountains, are thick covered with villages and hamlets. The whole appearance of the buildings, and the fine blue slanted roofs of the houses playing amidst the green of the landscape, have an admirable effect. In the space of every mile, as you fall down the river, you meet with a village which in any other place would pass for a town. Many of the villages contain from 300 to 400 families; and there are 36 of them in a space of 15 miles long and fix miles broad, which is the width of this beautiful amphitheatre. The declivities of all the hills and mountains are planted thick with vineyards and fruit trees, and the thick wooded tops of the hills cast a gloomy horror over the otherwise cheerful landscape. Every now and then a row of rugged hills run directly down to the river, and dominate majestically over the leffer hills beneath them. On one of these great mountains, just about the middle of the Rhineland, you meet with Johannisberg, a village which produces some of the best Rhenish. Before this village is a pretty little river, and near the banks of the river there is a very fine old castle, which gives unlookable majesty to the whole landscape. Indeed, in every village, you meet with some or other large building, which contributes very much to the decoration of the whole. This country is indebted for its riches to this semicircular hill, which protects it from the cold winds of the east and north; at the same time that it leaves room enough for the sun to exercise his benign influences. The groves and higher slopes of the hills make excellent pastures, and produce large quantities of dung, which, in a country of this sort, is of inestimable value.

The bank of the Rhine, opposite to the Rhinegaus, is exceedingly barren, and heightens the beauty of the prospect on the other side by the contrast it exhibits; on this side, you hardly meet above three or four villages, and these are far distant from each other. The great interval between them is occupied by heaths and meadows, only here and there a thick bush affords some shade, and a few corn fields among the villages enliven the gloomy landscape. The back ground of this country is the most picturesque part of it. It is formed by a narrow gullet of mountains, which diminish in perspective between Rudesheim and Bing. Perpendicular mountains and rocks hang over the Rhine in this place, and seem to make it the dominion of eternal night. At a distance, the Rhine seems to come out of this landscape through a hole under ground; and appears to be run tediously, in order to enjoy its course through a pleasant country the longer. Amidst the darkens that covers this back ground, the celebrated Moule tower seems to sway upon the river. In a word, there is not any thing in this whole tract that does not contribute something to the beauty and magnificence of the whole; or, if I may be permitted the expression, to make the paradise more welcome. As you sail along the Rhine, between Mentz and Bingen, the banks of the river form an oval amphitheatre, which makes one of the richest and most picturesque landscapes to be seen in Europe. The inhabitants of these regions are some of them extremely rich, and some extremely poor. The happy middle state is not for countries the chief product of which is wine; for, besides that the cultivation of the vineyard is infinitely more troublesome and expensive than agriculture, it is subjected to revolting, which in an infall reduce the holder of land to the condition of a day-labourer. It is a great misfortune for this country, that, though restrained by law, the nobility are, through connivance of the Elector, allowed to purchase as much land as they please. The peasant generally begins by running in debt for his vineyard; so that if it does not turn out well, he is reduced to day-labour, and the rich man extends his possessions to the great detriment of the country. There are several peasants here, who having incomes of 30, 50, or 100,000 guilders a-year, have laid aside the peasant, and assumed the wine-merchant; but, splendid as their situation is, it does not compensate, in the eyes of the humane man, for the sight of so many poor people with which the villages swarm. In order to render a country of this kind prosperous, the State should appropriate a fund to the purpose of maintaining the peasant in bad years, and giving him the salary which his necessities, and his want of ready money, may from time to time make convenient.

The inhabitants of the Rhinegaus are a handiome and uncommonly strong race of men. You see at the very first aspect that their wine gives them merry hearts and found bodies. They have a great deal of natural wit, and a vivacity and jocoseness, which distinguishes them...
Rhinoceros very much from their neighbours. You need only compare them with some of these, to be convinced that the drinker of wine excels the drinker of beer and water, both in body and mind, and that the inhabitant of the fourth is much flouter than he who lives in the north; for though the wine drinker may not have quite as much flesh as he who drinks only beer, he has better blood, and can bear much more work. Tacitus had already observed this, in his treatise De moribus Germanorum. "The large and corpulent bodies of the Germans (says he) have a great appearance, but are not made to lull." At that time almost all the Germans drank only water, but the more drinking of wine has effectuated a revolution in several parts of Germany, which makes the present inhabitants of these countries very different from those described by Tacitus. Black and brown hair is much commoner here than the white,

made to visit the prelate of Erbach. These lordly monkeys, for so in every respect they are, have an excellent hunt, rooms magnificently furnished, billiard tables, half a dozen beautiful fingling women, and a splendid wine cellar, the well ranged batteries of which made me shudder. A monk, who saw my astonishment at the number of the caffes, assured me, that, without the benign influence which flowed from them, it would be totally impossible for the cloister to subsist in so damp a situation.

RHINFELS, a castle of Germany, in the circle of the Lower Rhine, in a county of the same name. It is looked upon as one of the most important places feated on the Rhein, as well in regard to its strength as situation. It is near St. Goar, and built on a craggly rock. This fortress commands the whole breadth of the Rhine, and those who pass are always obliged to pay a considerable toll. In the time of war it is of great importance to be masters of this place. E. Long. 7° 43'. N. Lat. 50° 3'.

RHINLANDE, a name given to a part of South Holland, which lies on both sides the Rhine, and of which Leyden is the capital town.

RHINOCEROS, in zoology, a genus of quadrupeds belonging to the order of Bovidae. The name is entirely Greek; but these animals were totally unknown to the ancient Greeks. Aristeotles takes no notice of them, nor any other Greek writer till Strabo, nor Roman till Pliny. It is probable they did not frequent that part of India into which Alexander had penetrated, since it was near 300 years after that Pompey brought them to Europe. From this time till the days of Pliny and others, the rhinoceros was frequently exhibited in the Roman fasti, and he has often been transported into Europe in more modern times; but they were long very ill represented, and very imperfectly described, till those that arrived in London in 1739 and 1741 were inspected, by which the errors and caprices of former writers were detected.

There are two species of rhinoceros, the first of which is the unicorn, the length of which, Buffon tells us, from the extremity of the muzzle to the origin of the tail, is at least 12 feet, and the circumstance of the body is nearly the same. "The rhinoceros, which came to London in the year 1739 was sent from Bengal. Though not above two years of age, the expense of his food and journey am uncle to near £ 1000 Sterling. He was fed with rice, sugar, and hay. He had daily seven pounds of rice, mixed with three pounds of sugar, and divided into three portions. He had likewise hay and green herbs, which he preferred to hay. His drink was water, of which he took large quantities at a time. He was of a peaceable disposition, and allowed all parts of his body to be touched. When hungry, or struck by any person, he became mischief, and in both cases nothing appealed to him but food. When enraged, he sprang forward, and nimbly raised himself to a great height, pushing at the same time his head furiously against the walls, which he performed with amazing quickness, notwithstanding his heavy and unwieldy mass. I often observed, says Dr. Parsons, these movements produced by rage or impatience, especially in the mornings before his rice and sugar were brought to him. The vivacity and promptitude of his movements, Dr. Parsons adds, led me to think, that he was altogether unconquerable, and that he could easily overtake any man who should offend him.

This rhinoceros, at the age of two years, was not taller than a young cow that has never produced. But his body was very long and very thick. His head was disproportionately large. From the ears to the horn there is a concavity, the two extremities of which, namely the upper end of the muzzle, and the part near the ears, are considerably raised. The horn, which was not yet above an inch high, was black, smooth at the top, but full of wrinkles directed backward at the base. The nostrils are situated very low, being not above an inch distant from the opening of the mouth. The under lip is pretty similar to that of the ox; but the upper lip has a greater resemblance to that of the horse, with this advantageous difference, that the rhinoceros can lengthen this lip, move it from side to side, roll it about a staff, and seize with it any object he wishes to carry to his mouth. The tongue of this young rhinoceros was soft, like that of a calf. His eyes had no vivacity; In figure they resembled those of the hog, and were situated lower, or nearer the nostrils, than in any other quadruped. His ears are large, thin at the extremities, and contracted at their origin by a kind of annular rugosity. The neck is very short, and surrounded with two large folds of skin. The shoulders are very thick, and at their juncture there is another fold of skin, which depends upon the fore legs. The body of this young rhinoceros was very thick, and pretty much resembled that of a cow about to bring forth. Between the body and crupper there is another fold, which depends upon the hind legs. Lastly, another fold transversely surrounds the inferior part of the crupper, at some distance from the tail. The belly was large, and hung near the ground, particularly its middle part. The legs are round, thick, strong, and their food in a state of nature is the grosser herbs, as thistles and thorny shrubs, which they prefer to the soft pastures of the belt meadows; they are fond of the figuar cane, and eat all kinds of grain, but for flesh they have no appetite."
Rhinoceroses, when the animal lies, is covered with a remarkable fold of the skin, appears when he stands. The tail is thin, and proportionally short; that of the rhinoceros is often mentioned, exceeded not 16 or 17 inches in length. It turns a little thicker at the extremity, which is garnished with some short, thick, hard hairs. The form of the penis is very extraordinary. It is contained in a prepuce, or sheath like that of the horse; and the first thing that appears in the time of erection is a second prepuce, of a flesh-colour, from which there issue a hollow tube, in the form of a funnel cut and bordered somewhat like a flower-de-luce, and constitutes the glands and extensity of the penis. This anomalous glans is of a paler flesh-colour than the second prepuce. In the most vigorous erection, the penis extends not above eight inches out of the body; and it is easily procured by rubbing the animal with a handful of straw when he lies at his ease. The direction of this organ is not straight, but bent backward. Hence he throws out his urine behind; and from this circumstance, it may be inferred that the male covers not the female, but that they unite with their crupper to each other. The female organs are situated like those of the cow; and the exactly resembles the male in figure and grossness of body. The skin is so thick and impenetrable, that when a man lays hold of any of the folds, he would imagine he is touching a wooden plank of half an inch thick (a). When tanned, Dr. Grew remarks, it is excessively hard, and thicker than the hide of any other terrestrial animal. It is everywhere covered more or less with indurations in the form of galls or tuberousities, which are pretty small on the top of the neck and back, but become larger on the sides. The largest are on the shoulders and crupper, are still pretty large on the thighs and legs, upon which they are spread all round, and even on the feet. But between the folds the skin is penetrable, delicate, and as soft to the touch as silk; and this is a proof of what the surgeon of the Shafterbury observed in a rhinoceros, newly taken after having watered in the mud, several insects concealed under the skin. This carries with it every appearance of probability; for as the creature welter in mud, it is impossible for it to do so without bringing up with it some of the insects which live in that mud; and when this is the case, it surely cannot be unnatural to suppose that they would shelter themselves under the plaits of the skin. Mr. Bruce had an opportunity of examining the skin of a rhinoceros before his muddy covering had been scraped off, and saw under it several very large worms, but not of the carnivorous kind. He saw likewise several smaller animals resembling ear-wigs, which he took to be young scolopendras; and, though he searched no further, we must certainly consider this as a proof of what the surgeon of the Shafterbury related. Mr. Bruce supposes, too, that they wadder in the mire, partly in order to screen themselves by a cavel of mud from the attacks of that mischievous fly which infects the animals of Abyssinia to such a degree. "The time of the fly (says he) being in the rainy season, the whole black earth turns into mire. In the night, when the fly is at rest, the rhinoceros chooses a convenient place, and lies, rolling himself in the mud, to clothes himself with a kind of cloak, which defends him against his enemy the following day. The wrinkles and plaits of his skin serve to keep this muddy platter firm upon him, all but about his hips, shoulders, and legs, where it cracks and falls off by motion, and leaves him exposed in those places to the attacks of the fly. The itching and pain which follow occasion him to rub himself in those parts against the roughest tree; and this is at least one cause of the puttures or tuberousities which we see upon these places, both on the elephant and rhinoceros." They bring forth only one young at a time, about which they are very solicitous. They are said to congregate in troops like elephants. Being of a more solitarious and savage disposition, they are more difficult to hunt and to overcome. They never attack men, however, except when they are provoked, when they are very furious and formidable; but as they live only before them, and not very sharply, and as they turn with great difficulty, they may be easily avoided. The skin of these animals is so extremely hard as to resist fabrics, lances, javelins, and even musket balls, the only penetrable parts being the belly, the eyes, and about the ears. Hence the hunters generally attack them when they lay down to sleep. Their flesh is considered as excellent by the Indians and Africans, but especially by the Hottentots; and if they were trained when young, they might be rendered domestic, in which case they would multiply more easily than the elephant. They inhabit Bengal, Siam, China, Chirripo in China, the islands of Java and Sumatra, Congo, Angola, Ethiopia, and the country as low as the Cape. They love shady forests, the neighbourhood of rivers, and marly places. They swallow in the mire like hogs, and are said by that means to give shelter in the folds of their skins to scorpions, centipedes, and other insects. This is denied by Buffon and Edwards, though the surgeon of the Shafterbury had observed in a rhinoceros, newly taken after having watered in the mud, several insects concealed under the skin. This carries with it every appearance of probability; for as the creature welter in mud, it is impossible for it to do so without bringing up with it some of the insects which live in that mud; and when this is the case, it surely cannot be unnatural to suppose that they would shelter themselves under the plaits of the skin. Mr. Bruce had an opportunity of examining the skin of a rhinoceros before his muddy covering had been scraped off, and saw under it several very large worms, but not of the carnivorous kind. He saw likewise several smaller animals resembling ear-wigs, which he took to be young scolopendras; and, though he searched no further, we must certainly consider this as a proof of what the surgeon of the Shafterbury related. Mr. Bruce supposes, too, that they wadder in the mire, partly in order to screen themselves by a cavel of mud from the attacks of that mischievous fly which infects the animals of Abyssinia to such a degree. "The time of the fly (says he) being in the rainy season, the whole black earth turns into mire. In the night, when the fly is at rest, the rhinoceros chooses a convenient place, and lies, rolling himself in the mud, to clothes himself with a kind of cloak, which defends him against his enemy the following day. The wrinkles and plaits of his skin serve to keep this muddy platter firm upon him, all but about his hips, shoulders, and legs, where it cracks and falls off by motion, and leaves him exposed in those places to the attacks of the fly. The itching and pain which follow occasion him to rub himself in those parts against the roughest tree; and this is at least one cause of the puttures or tuberousities which we see upon these places, both on the elephant and rhinoceros." They bring forth only one young at a time, about which they are very solicitous. They are said to congregate in troops like elephants. Being of a more solitarious and savage disposition, they are more difficult to hunt and to overcome. They never attack men, however, except when they are provoked, when they are very furious and formidable; but as they live only before them, and not very sharply, and as they turn with great difficulty, they may be easily avoided. The skin of these animals is so extremely hard as to resist fabrics, lances, javelins, and even musket balls, the only penetrable parts being the belly, the eyes, and about the ears. Being of a more solitarious and savage disposition, they are more difficult to hunt and to overcome. They never attack men, however, except when they are provoked, when they are very furious and formidable; but as they live only before them, and
Rhinoceroses

The horn, however, has not this property; some of them fell ing very cheap, while others are extremely dear.

Some writers are of opinion, that the rhinoceros is the unicorn of holy writ and of the ancients, and that the as by the Indian or Persian legends of Aesop, who says it has a but one horn, was the same, his informers comparing the human and hog-like tail. The unicorn of Scripture is considered as having all the properties of the rhinoceros, as rage, untameable, great swiftness, and vault strength. This opinion is most ably supported by Mr Bruce. "The derivation of the Hebrew word rem (fays he, which in our version is translated unicorn, both in the Hebrew and the Ethiopic, seems to be from eredness, or standing straight. This is certainly no particular quality in the animal itself, who is not more or even so much erect as many other quadrupeds, for in its knees it is rather coked; but it is from the circumstance of its in which its horn is placed. The horns of all other animals are inclined to some degree of parallelism with his nose or snout. The horn of the rhinoceros is erect and perpendicular to this bone, on which it stands at right angles, whereby poffessing a greater purchase or power, as a lever, than an horn could possibly have in any other position. The situation of the horn is very happily alluded to in Scripture; 'My horn shalt thou exalt like the horn of an unicorn.' And the horn here alluded to is not wholly figurative, but was really an ornament worn by great men in the days of victory, preferment, or rejoicing, when they were anointed with new, sweet, or fresh oil; a circumstance which David joins with that of exalting the horn. Some authors, for what reason I know not, have made the rem, or unicorn, to be of the deer or antelope kind; that is, of a genus whose very character is fear and weakness, directly opposite to the qualities by which the rem is described in Scripture: besides, it is plain that the rem is not of the class of class quadrupeds; and a late modern traveller very whimsically applied him for the leviathan, which certainly a whale. Balaam, a priest of Midian, and fohn in the neighborhood of the haunts of the rhinoceros, and intimately connected with Ethiopia, (for they themselves were shepherds of that country,) in a transport, from contemplating the strength of Israel, whom he was brought to curie, says, they had, as it were, the strength of the rem. Job makes frequent allusion to his great strength, ferocity, and duplicity. He asks, 'Will the rem be willing to serve thee, or abide by thy crib? that is, Will he willingly come into thy stable, and eat at thy manger? And again, 'Canst thou bind the rem with a hand in the furrow? and wilt thou bow the valleys for thee?' In other words, Canst thou make him go to the plough or harrows?" "The rhinoceros, in Cree, is called Arwe-Harich, and in the Amhara Aaurasa; both which names signify 'a large wild beast with a horn.' This would form as if applied to the species with one horn. On the other hand, in the country of the Shangalla and in Nubia he is called Gisangur, or a horn upon horn; and this would seem to denote that he had two. The Ethiopic text renders the word rem, 'Arwe-Harich;' and this the Septuagint translates monoceros, or unicorn. The principal reason of translating the word unicorn rather than rhinoceros, is from a prejudice that he must have had but one horn. But this is by no means so well founded as to be admitted the only argument for establishing the existence of an animal, which never has appeared after the search of so many ages. Scripture speaks of the horns of the unicorn; so that even from this circumstance the rem may be the rhinoceros, as the Asiatic, and part of the African rhinoceros, may be the unicorn." "The rhinoceros bicornis was long known in Europe merely by the double horns which were preferred in various cabinets; and its existence, though now past all doubt, has been frequently questioned. Dr Sparman, in his voyage to the Cape of Good Hope, killed two of these animals, which he dissected, and very minutely describes them. The horns, he says, in the live animal, are so mobile and loose, that when it walks carelessly along, one may see them waggle about, and hear them clash and clatter against each other. In the Phil. Trans. for 1793, we have a description of the double-horned rhinoceros of Sumatra, by Mr Bell, surgeon in the service of the East India Company at Bencoolen; and this account, though it differs considerably from that of Sparman in some particulars, we shall insert here. "The animal fays Mr Bell) herein described was shot with a leaden ball from a musket about ten miles from Fort Marlborough. I saw it the day after; it was then not in the leaf putrid, and I put it into the position from which the accompanying drawing was made. (See Plate cccccc.) It was a male; the height at the shoulder was 4 feet 4 inches; at the facrum nearly the same; from the tip of the nose to the end of the tail eight feet five inches. From the appearance of its teeth and bones it was but young, and probably not near its full size. The shape of the animal was much like that of the hog. The general colour was a brownish ash; under the belly, between the legs and folds of the skin, a dirty flesh-colour. The head much resembled that of the single horned rhinoceros; the eyes were small, of a brown colour; the stomatitis thick and strong; the skin surrounding the eyes was wrinkled; the nostrils were wide; the upper lip was pointed, and hanging over the under. There were six molars or grinders, on each side of the upper and lower jaw, becoming gradually larger backwards, particularly in the upper; two teeth in the front of each jaw; the tongue was quite smooth; the ears were small and pointed, lined and edged with short black hair, and blunted like those of the single-horned rhinoceros. The horns were black, the larger was placed immediately above the nose, pointing upwards, and was bent a little back; it was about nine inches long. The small horn was four inches long, of a pyramidal shape, flattened a little, and placed above the eyes, rather a little more forward, standing in a line with the larger horn, immediately above it. They were both firmly attached to the skull, nor was there any appearance of joint or muscles to move them (c). The neck was thick and short, the skin on the under side thrown in-

(c) Mr Bruce, however, says, that in the living animal the horns are extremely sensible. He informs us, that
RHI

Rhinoceros. Bird. See Buceros.

RHOZOBOALUS, in botany: A genus of the teraynia order, belonging to the polyandria class of plants; and in the natural method ranking under the 23d order, Tribilatæ. The calyx monophyllous, fleshy, and downy; the corolla consists of five petals, which are round, concave, fleshy, and much larger than the calyx; the stamens are very numerous, filiform, and longer than the corolla; the style is four, filiform, and of the length of the calyx; the pericarpium has four drupes, kidney-shaped, composed with a fleshy substance inside, and in the middle a flat large nut containing a kidney-shaped kernel. Of this there is only one species, viz. Pekia. The nut is sold in the shops as American nuts; they are flat, tuberculated, and kidney-shaped, containing a kernel of the same shape, which is sweet and agreeable. Clusius gives a good figure of the nut, and Aublet has one of the whole plant.

RHIYMPA. See Rhynchos.

RHIZOPHORA, the mangrove, or Mangle, in botany: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 12th order, Holoboeæ. The calyx is quadrirpartite, the corolla partite; there is one seed, very long, and carnous at the base. These plants are natives of the East and West Indies, and often grow 40 or 50 feet high. They grow only in water and on the banks of rivers, where the tide flows up twice a day. They prefer the verdure of their leaves throughout the year. From the lowest branches issue long roots, which hang down to the water, and penetrate into the earth. In this position they resemble so many arcades, from five to ten feet high, which serve to support the body of the tree, and even to advance it daily into the bed of the water. These arcades are so closely interwoven one with another, that they form a kind of natural and transparent terrace, railed with such solidity over the water, that one might walk upon them, were it not that the branches are too much encumbered with leaves. The most natural way of propagating these trees, is to suffer the several slender small filaments which issue from the main branches to take root in the earth. The most common method, however, is that of laying the small lower branches in baskets of mould or earth till they have taken root.

The description just given pertains chiefly to a particular species of mangrove, termed by the West Indians that once at a hunting match he saw the point of a rhinoceros’s horn broken off by a musket-shot; the consequence of which was, that the creature was for a moment deprived of all appearance of life.
Rhodes.

Rhodians, black mangrove, on account of the brown dusty colour of the wood. The bark is very brown, smooth, plant when green, and generally used in the West Indies for tanning of leather. Below this bark lies a cuticle, or skin, which is lighter, thinner, and more tender. The wood is nearly of the same colour as the bark; hard, plant, and very heavy. It is frequently used for fuel, for which purpose it is said to be remarkably proper: the fires which are made of this wood being both clearer, more ardent and durable than those made of any other materials whatever.—The wood is compact; almost incorruptible; never splinters; is easily worked; and were it not for its enormous weight, would be commodiously employed in almost all kinds of work, as it polishes every property of good timber. To the roots and branches of mangroves that are immersed in the water, oysters frequently attach themselves; so that wherever this curious plant is found growing on the sea-shore, oyster-shells are very easy; as in such cases these shells may be literally said to be planted upon trees.

The red mangrove or mangrove grows on the sea-shore, and at the mouth of large rivers; but it does not advance, like the former, into the water. It generally rises to the height of 20 or 30 feet, with crooked, knotty branches, which proceed from all parts of the trunk. The bark is slender, of a brown colour, and, when young, is smooth, and adheres very closely to the wood; but when old, appears quite cracked, and is easily detached from it. Under this bark is a skin as thick as parchment, red, and adhering closely to the wood, from which it cannot be detached till the tree is felled and dry. The wood is hard, compact, heavy, of a deep red, with a very fine grain. The pith or heart of the wood being cut into small pieces, and boiled in water, imparts a beautiful red to the liquid, which communicates the same colour to wool to admit of this tree, which, when ripe, is of a vivid red; the leaves being detached from it. From the fruit of this tree, which, when ripe, is of a vivid colour, and resembles some grapes in tints, is prepared an agreeable liquor, much esteemed by the inhabitants of the Caribbeen islands.

White mangrove, so termed from the colour of its wood, grows, like the two former, upon the banks of rivers, but is seldom found near the sea. The bark is grey; the wood, as we have said, white, and when green, supple; but it dries as soon as cut down, and becomes very light and brittle. This species is generally called *rope-mangrove*, from the use to which the bark is applied by the inhabitants of the West Indies. This bark, which, by reason of the great abundance of sap, is easily detached when green from the wood, is beaten or bruised between two stones, until the hard and woody part is totally separated from that which is soft and tender. This latex, which is the true cortical substance, is twisted into ropes of all sizes, which are exceedingly strong, and not apt to rot in the water.

RHODES, a celebrated island in the Archipelago, the largest and most easterly of the Cyclades, was known in ancient times by the names of *Aetolia, Ophionius, Leucosia, Thracian, Cerynia, Pseuus, Amybaria, Arcosia, Ojentia, Stadis, Teubia, Pelopis*, and *Rhodes*. In later ages, the name of *Rhodes*, or *Rhode*, prevailed, from the Greek word *rhodon*, as is commonly sup-posed, signifying a *rose*; the island abounding very much with these flowers. Others, however, give different etymologies, among which it is difficult to find one preferable to another. It is about 20 miles distant from the coasts of Lycia and Caria, and about 120 miles in compass.

Several ancient authors assert, that Rhodes was formerly covered by the sea, but gradually raised its head above the waves, and became an island. Delos and Rhodes (says Pliny), islands which have long been celebrated, sprang at first from the sea. The fame fact is supported by a variety of other evidence as rendered indubitable. Philo* attributes the event to the decrease of the waters of the ocean. If his conjecture be not without foundation, most of the isles of the Archipelago, being lower than Rhodes, much have had a similar origin. But it is much more probable that the volcanic fires, which in the fourth year of the 135th Olympiad, raised Theria and Thera, known at present by the name of Santorin, from the depths of the sea, and in our days thrown out several small islands adjacent, also produced in some ancient era Rhodes and Delos.

The first inhabitants of Rhodes, according to Dio, were called the *Teuchines*, who came originally from the island of Crete. These, by their skill in astrologoy, perceiving that the island was soon to be drowned with water, left their habitations, and made room for the Heliaides, or grandsons of Phæbus, who took possession of the island after that god had cleared it from the water and mud with which it was overwhelmed. These Heliaides, it seems, excelled all other men in learning, and especially in astrology; invented navigation, &c. In after ages, however, being infested with great serpents which bred in the island, they had recourse to an oracle in Delos, which advised them to admit Phorbas, a Thracian, with his followers, into Rhodes. This was accordingly done; and Phorbas having destroyed the serpents, was, after his death, honoured as a demigod. Afterwards a colony of Cretans settled in some part of the island, and a little before the Trojan war, Telephus, the son of Hercules, who was made king of the whole island, and governed with great justice and moderation.

After the Trojan war, all the ancient inhabitants were driven out by the Dorian, who continued to be masters of the island for many ages. The government was at first monarchical; but a little before the expedition of Jason into Greece, a republican form of government was introduced; during which the Rhodians applied themselves to navigation, and became very powerful by sea, planting several colonies in distant countries. In the time of the Peloponnesian war, the republic of Rhodes was rent in two factions, one of which favoured the Athenians, and another the Spartans; but at length the latter prevailing, democracy was abolished, and an aristocracy introduced. About 351 B.C. we find the Rhodians oppressed by Mausolus, king of Caria, and at last reduced by Artaxerxes, his widow. In this emergency, they applied to the Athenians; by whose assistance, probably, they regained their liberty.

For this time to that of Alexander the Great, the Rhodians enjoyed an uninterrupted tranquillity. To him they voluntarily submitted; and were on that account exempt from taxation.

*Driven out by the Dori.*
count highly favoured by him: but no sooner did they hear of his death, than they drove out the Macedonian garrisons, and once more became a free people. About this time happened a dreadful inundation at Rhodes; which, being accompanied with violent torrents of rain, and hailstones of an extraordinary bigness, beat down many houses, and killed great numbers of the inhabitants. As the city was built in the form of an amphitheatre, and no care had been taken to clear the pipes and conduits which conveyed the water into the sea, the lower parts of the city were in an instant laid under water, several houses quite covered, and the inhabitants drowned before they could get to the higher places. As the deluge increased, and the violent showers continued, some of the inhabitants made to their ships, and abandoned the place, while others miserably perished in the waters. But while the city was thus threatened with utter destruction, the wall on a sudden burst asunder, and the water discharging itself by a violent current into the sea, unexpectedly delivered the inhabitants from all danger. The Rhodians suffered greatly by this unexpected accident, but soon retrieved their losses by a close application to trade. During the wars which took place among the successors of Alexander, the Rhodians observed a strict neutrality; by which means they enriched themselves so much, that Rhodes became one of the most opulent states of that age; infomuch that, for the common good of Greece, they undertook the piratical war, and, at their own charge, cleared the sea of the pirates who had for many years infested the coasts of Europe and Asia. However, notwithstanding the neutrality they preserved, as the most advantageous branches of their commerce lay toward the land toward Egypt, they were more attached to Ptolemy, king of that country, than to any of the neighbouring princes. When therefore Antigonus, having engaged in a war with Ptolemy about the island of Cyprus, demanded succours of them, they earnestly intreated him not to compel them to declare war against their ancient friend and ally. But this answer, prudent as it was, drew upon them the displeasure of Antigonus, who immediately ordered one of his admirals to sail with his fleet to Rhodes, and seize all the ships that came out of the harbour for Egypt. The Rhodians, finding their harbour blocked up by the fleet of Antigonus, equipped a good number of galleys, fell upon the enemy, and obliged him, with the loss of many ships, to quit his station. Hereupon Antigonus, charging them as aggressors, and beginners of an unjust war, threatened to besiege their city with the strength of his whole army. The Rhodians endeavoured by frequent embassies to appease his wrath; but all their remonstrances served rather to provoke than allay this resentment; and the only accommodation upon which he would hearken to any accommodation were, that the Rhodians should declare war against Ptolemy, that they should admit his fleet into their harbour, and that an hundred of the chief citizens should be delivered up to him as hostages for the performance of these articles. The Rhodians sent embassadors to all their allies, and to Ptolemy in particular, imploiring their affittance, and representing to the latter, that their attachment to his interest had drawn upon them the danger to which they were exposed. The preparations on both sides were therefore made. As Antigonus was near fourscore years of age at that time, he committed the whole management of the war to his son Demetrius, who appeared before the city of Rhodes with 200 ships of war, 170 transports having on board 40,000 men, and 1000 other ships laden with provisions and all sorts of warlike engines. As Rhodes had enjoyed for many years a profound tranquility, and been free from all devastations, the expectation of booty, in the plunder of so wealthy a city, allure multitudes of pirates and mercenaries to join Demetrius in this expedition; inomuch that the whole sea between the continent and the island was covered with vessels; which struck the Rhodians, who had a prospect of this mighty armament from the walls, with great terror and alarm. So Demetrius, having landed his troops without the reach of the enemy's machines, detached several small bodies to lay waste the country round the city, and cut down the trees and groves, employing the timber, and materials of the houses without the walls, to fortify his camp with strong ramparts and a treble palisade; which work, as many hands were employed was finished in a few days. The Rhodians, on their part, prepared for a vigorous defence. Many great commanders, who had signaled themselves on other occasions, threw themselves into the city, being desirous to try their skill in military affairs against Demetrius, who was reputed one of the most experienced captains in the conduct of sieges that antiquity had produced. The besieged began with dimming from the city all such persons as were useless; and then taking an account of those who were capable of bearing arms, they found that the citizens amounted to 6000, and the foreigners to 1000. Liberty was promised to all the slaves who would distinguish themselves in any glorious action, and the public engaged to pay their rations, and give their sons, when they were grown up, should be crowned and presented with a complete suit of armour at the great solemnity of Bacchus; which decree kindled an incredible ardour in all ranks of men.

Demetrius, having planted all his engines, began to batter with incredible fury the walls on the side of the harbour; but was for eight days successively repulsed by the besieged, who set fire to most of his warlike engines, and thereby obliged him to allow them some reprieve, which they made good use of in repairing the breaches, and building new walls where the old ones were either weak or low. When Demetrius had repaired his engines, he ordered a general assault to be made, and caused his troops to execute all their arts, thinking by this means to strike terror into the enemy. But the besieged were so far from being intimidated, that they repulsed the aggressors with great slaughter, and performed the most astonishing feats of bravery. Demetrius returned to the assault next day; but was in the same manner forced to retire, after having lost a great number of men, and some officers of distinction. He had seized, at his first landing, an eminence at a small distance from the city; and, having fortified this advantageous post, he caused several batteries to be erected there, with engines, which incessantly discharged
Demetrius now ordered a scalade by sea and land to be thrown down from the ladders, and the besieged defended themselves with the greatest intrepidity. Such of the enemy as advanced first were thrown down from the ladders, and miserably bruised. Several of the chief officers, having mounted the walls to encourage the soldiers by their example, were there either killed or taken prisoners. After the combat had lasted many hours, with great slaughter on both sides, Demetrius, notwithstanding all his valour, thought it necessary to retire, in order to repair his engines, and give his men some days rest.

Demetrius being sensible that he could not reduce the city till he was master of the port, after having refreshed his men, he returned with new vigour against the fortifications which defended the entry into the harbour. When he came within the caft of a dart, he caused a vast quantity of burning torches and firebrands to be thrown into the Rhodian ships, which were riding there; and at the same time galled, with dreadful showers of darts, arrows, and stones, such as offered to extinguish the flames. However, in spite of their utmost efforts, the Rhodians put a stop to the fire; and, having with great expedition manned three of their strongest ships, drove with such violence against the vessels on which the enemy's machines were planted, that they were shattered in pieces, and the engines dismounted and thrown into the sea. Excelius the Rhodian admiral, being encouraged by this success, attacked the enemy's fleet with his three ships, and sunk a great many vessels; but was himself at last taken prisoner; the other two vessels made their escape, and regained the port.

As unfortunate as this last attack had proved to Demetrius, he determined to undertake another; and, in order to succeed in his attempt, he ordered a machine of a new invention to be built, which was twice the height and breadth of those he had lately lost. When the work was finished, he caused the engine to be placed near the port, which he was resolved, at all adventures, to force. But as it was upon the point of entering the harbour, a dreadful storm arising, drove it against the shore, with the vessels on which it had been reared. The besieged, who were attentive to improve all favourable conjunctures, while the tempest was still raging, made a rally against those who defended the eminence mentioned above; and, though repulsed several times, carried it at last, obliging the Demetrians, to the number of 400, to throw down their arms and submit. After this victory gained by the Rhodians, there arrived to their aid 150 Grecians, and 500 men sent by Ptolemy from Egypt, most of them being natives of Rhodes, who had served among the king's troops.

Demetrius being extremely mortified to see all his batteries against the harbour rendered ineffectual, resolved to employ them by land, in hopes of carrying the city by assault, or at least reducing it to the necessity of capitulating. With this view, having got together a vast quantity of timber and other materials, he framed the famous engine called helipolis which was by many degrees larger than any that had ever been invented before. Its base was square, each side being in length near 50 cubits, and made up of square pieces of timber, bound together with plates of iron. In the middle part he placed thick planks, about a cubit distant from each other; and on these the men were to stand who forced the engine forward. The whole was moved upon eight strong and large wheels whose fellos were strengthened with strong iron plates. In order to facilitate and vary the movements of the helipolis, calliers were placed under it, whereby it was turned in an instant to what side the workmen and engineers pleased. From each of the four angles a large pillar of wood was carried to about the height of 100 cubits, and inclining to each other; the whole machine consisting of nine stories, whose dimensions gradually increased in the ascent. The first story was supported by 43 beams, and the loft by no more than nine. Three sides of the machine were plated over with iron, to prevent its being damaged by the fire that might be thrown from the city. In the front of each story were windows of the same size and shape as the engines that were to be discharged from thence. To each window were shutters, to draw up for the defence of those who managed the machines, and to deaden the force of the stones thrown by the enemy, the shutters being covered with skins stuffed with wool. Every story was furnished with two large staircases, that whatever was necessary might be brought up by one, while others were going down by the other, and so every thing might be dispatched without tumult or confusion. This huge machine was moved forwards by 3000 of the strongest men of the whole army; but the art with which it was built greatly facilitated the motion. Demetrius caused likewise to be made several rafledoors or pent-houses, to cover his men while they advanced to fill up the trenches and ditches; and invented a new fort of galleries, through which those who were employed at the siege might pass and repass at their pleasure, without the least danger. He employed all his seamen in levelling the ground over which the machines were to be brought up to the space of four furlongs. The number of workmen who were employed on this occasion amounted to 60,000.

In the mean time, the Rhodians, observing these formidable preparations, were busy in raising a new wall within which the enemy intended to batter with the helipolis. In order to accomplish this work, they pulled down the wall which surrounded the theatre, and some buildings contiguous, and even some temples, after having solemnly promised to build more magnificent structures in honour of the gods, if the city were preferred. At the same time, they sent out nine of their best ships to seize such of the enemy's vessels as they could meet with, and thereby disperse them for the...
want of provisions. As these ships were commanded by their bravest sea-officers, they fobn returned with an immense booty, and a great many prisoners. Among other vessels they took a galley richly laden, on board of which they found a great variety of valuable furniture, and a royal robe, which Phila herself had wrought and sent as a present to her husband Demetrius, accompanied with a letter written with her own hand. The Rhodians sent the furniture, the royal robe, and even the letter, to Ptolemy; which exasperated Demetrius to a great degree.

While Demetrius was preparing to attack the city, the Rhodians having assembled the people and magistrates to consult about the measures they should take, some proposed in the assembly the pulling down of the statues of Antigonus and his son Demetrius, which till then had been held in the utmost veneration. But this proposal was generally rejected with indignation, and their prudent conduct greatly averted the wrath both of Antigonus and Demetrius. However, the latter continued to carry on the siege with the utmost vigour, thinking it would reflect no small dishonour on him were he obliged to quit the place without making himself master of it. He caused the walls to be secretly undermined; but, when they were ready to fall, a defender very opportunely gave notice of the whole to the townsfolk; who having, with all expedition, drawn a deep trench all along the wall, began to countermine, and, meeting the enemy under ground, obliged them to abandon the work. While both parties guarded the mines, one Athenagoras a Milefian, who had been sent to the assistance of the Rhodians by Ptolemy with a body of mercenaries, promised to betray the city to the Demetrians, and let them in through the mines in the night-time. But this was only in order to enfranchise them; for Alexander, a noble Macedonian, whom Demetrius had sent with a choice body of troops to take possession of a port agreed on, no sooner appeared, but he was taken prisoner by the Rhodians, who were waiting for him under arms.—Athenagoras was crowned by the senate with a crown of gold, and presented with five talents of silver.

Demetrius now gave over all thoughts of undermining the walls, and placed all his hopes of reducing the city in the battering-engines which he had contrived. Having therefore levelled the ground under the walls, he brought up his heliopolis, with four teduades on each side of it. Two other teduades of an extraordinary size, bearing battering-rams, were likewise moved forwards by 1000 men. Every story of the heliopolis was filled with all sorts of engines for discharging of stones, arrows, and darts. When all things were ready, Demetrius ordered the signal to be given; when his men, setting up a shout, assaulted the city on all sides both by sea and land. But, in the heat of the attack, when the walls were ready to fall by the repeated strokes of the battering-rams, embassadours arrived from Cnidus, earnestly soliciting Demetrius to suspend all further hostilities, and at the same time giving him hopes that they should prevail upon the Rhodians to submit to an honourable capitulation. A sufficient of arms was accordingly agreed on, and embassadours sent from both sides. But the Rhodians refusing to capitulate on the conditions offered them, the attack was renewed with so much fury, and the machines played off in so brisk a manner, that a large tower built with square stones, and the wall that flanked it, were battered down. The besieged, nevertheless, fought in the breach with so much courage and resolution, that the enemy, after various unsuccessful attempts, were forced to abandon the enterprise, and retire.

In this conjuncture, a fleet which Ptolemy had freighted with 300,000 measures of corn, and received very seasonably in the port, notwithstanding the vigilance of the enemy's ships, which cruized on the coasts of the island to surprize them. A few days after came in safe two other fleets, one sent by Car fander, with 100,000 bushels of barley; the other by Lythmachus, with 400,000 bushels of corn and as many of barley. This seasonable and plentiful supply arriving when the city began to suffer for want of provisions, inspired the besieged with new courage, and raised their drooping spirits. Being thus animated they formed a design of setting the enemy's engines on fire; and with this view ordered a body of men to fall out the night ensuing, about the second watch, with torches and firebrands, having first placed on the walls an incredible number of engines, to discharge stones, arrows, darts, and fire-balls, against those who should attempt to oppose their detachment. The Rhodian troops, pursuant to their orders, all on a sudden fell out, and advancing, in spite of all opposition, to the batteries, set them on fire, while the engines from the walls played incessantly on those who endeavoured to extinguish the flames. The Demetrians on this occasion fell in great numbers, being incapable, in the darkness of the night, either to see the engines that continually discharged showers of stones and arrows upon them, or to join in one body and repulse the enemy. The confusion was so great, that several plates of iron falling from the heliopolis, that vast engine would have been entirely consumed, had not the troops that were stationed in it with all possible speed quenched the fire with water, before prepared, and ready in the apartments of the engine against such accidents. Demetrius, fearing lest all his machines should be consumed, called together, by sound of trumpet, those whole province it was to move them; and, by their help, brought them off before they were entirely destroyed. When it was day, he commanded all the darts and arrows that had been shot by the Rhodians to be carefully gathered, that he might from their number form some judgment of the number of machines in the city. Above 800 firebrands were found on the spot, and no fewer than 1500 darts, all discharged in a very small portion of the night. This struck the prince himself with no small terror; for he never imagined that they would have been able to bear the charges of such formidable preparations. However, after having caused the slain to be buried, and given directions for the curing of the wounded, he applied himself to the repairing of his machines, which had been dismantled and rendered quite unserviceable.

In the mean time, the besieged, improving the respite allowed them by the removal of the machines, built a third wall in the form of a crescent, which took in all that part that was most exposed to the enemy's batteries; and, besides, drew a deep trench behind the breach.
Rhodes. gaining the advantageous conjuncture, Timocrates the chief of the pirates, and several other officers of distinction belonging to the fleet of Demetrius. On their return, they fell in with several vessels laden with corn for the enemy's camp, which they likewise took, and brought into the port. These were soon followed by a numerous fleet of small vessels loaded with corn and provisions sent them by Ptolemy, together with 1500 men, commanded by Antigonus a Macedonian of great experience in military affairs—Demetrius, in the mean time, having repaired his machines, brought them up anew to the walls; which he incessantly battered till he opened a great breach and threw down several towers. But when he came to the assault, the Rhodians, under the command of Aminias, defended themselves with such resolution and intrepidity, that he was in three successive attacks repulsed with great slaughter, and at last forced to retire. The Rhodians likewise, on this occasion, lost several officers; and amongst others, the brave Aminias their commander.

While the Rhodians were thus signallizing themselves in the defence of their country, a second embassoy arrived at the camp of Demetrius from Athens and the other cities of Greece, soliciting Demetrius to compose matters, and strike up a peace with the Rhodians. At the request of the ambassadors, who were in all above 50, a cessation of arms was agreed upon; but the terms offered by Demetrius being anew rejected by the Rhodians, the ambassadors returned home without being able to bring the contending parties to an agreement. Hostilities were therefore renewed; and Demetrius, who had previously taken several breaches to prevent the enemy succeeding, threw down several towers. This caused Demetrius to resume his operations and to proceed against the theatre. This was done with great signal success, but the commanding officers dispatched orders to the soldiers on the ramparts not to quit their posts, nor fire from their respective stations. Having thus secured the walls, they put themselves at the head of a chosen body of their own troops, and of those who were lately come from Egypt, and with these charged the enemy's detachment. But the darkness of the night prevented them from dislodging the enemy and regaining the advantageous posts they had seized. Day, however, no sooner appeared, than they renewed their attack with wonderful bravery. The Demetrians without the walls, with loud shouts endeavored to animate those who had entered the place, and inspire them with resolution to maintain their ground till they were relieved with fresh troops. The Rhodians being sensible that their fortunes, liberties, and all that was dear to them in the world, lay at stake, fought like men to the utmost despair, the enemy defending their posts for several hours without giving ground in the least.

At length the Rhodians, encouraging each other to exert themselves in defence of their country, and animated by the example of their leaders, made a last effort, and, breaking into the very heart of the enemy's battalion, there killed both their commanders. After their death the rest were easily put in disorder, and all to a man either killed or taken prisoners. The Rhodians likewise, on this occasion lost many of their own commanders; and among the rest Damoteles, their chief magistrate, a man of extraordinary valour, who had signalized himself during the whole time of the siege.

Demetrius, not at all discouraged by this check, was making the necessary preparations for a new assault, when he received letters from his father Antigonus, enjoining him to conclude a peace with the Rhodians upon the best terms he could get, lest he should lose his whole army in the siege of a single town. From this time Demetrius wanted only some plausible pretence for breaking up the siege. The Rhodians likewise were now more inclined to come to an agreement than formerly; Ptolemy having acquainted them that he intended to send a great quantity of corn, and 5000 men to their assistance, but that he would first have them try whether they could make up matters with Demetrius upon reasonable terms. At the same time ambassadors arrived from the Eotolian republic, soliciting the contending parties to put an end to the war which might involve all the east in endless calamities.

An accident which happened to Demetrius in this conjuncture, did not a little contribute towards the wished-for pacification. This prince was preparing to advance his heilepolis against the city, when a Rhodian engineer found means to render it quite useless. He undermined the track of ground over which the heilepolis was to pass the next day in order to approach the walls. Demetrius, not suspecting any stratagem of this nature, caused the engine to be moved forward, which drawing to the place that was undermined, sunk so deep into the ground that it was impossible to draw it out again. This misfortune, if we believe Vegetius and Vitruvius, determined Demetrius to bearken to the Eotolian ambassadors, and at last to strike up a peace upon the following conditions: That the republic of Rhodes should be maintained in the full enjoyment of their ancient rights, privileges, and liberties, without any foreign garrison; that they should renew their ancient alliance with
with Antigonus, and afflict him in his wars against all
states and princes except Ptolemy king of Egypt; and
that, for the effectual performance of the articles stipu-
lated between them, they should deliver 100 hostages,
such as Demetrius should make choice of, except those
who bore any public employment.

Thus was the siege raised, after it had continued a
whole year; and the Rhodians amply rewarded all
those who had distinguished themselves in the service
of their country. They also set up statues to Ptolemy,
Cassander, and Lyﬁmacus; to all of whom they paid
the highest honours, especially to the ﬁrst, whom they
worshipped as a god. Demetrius at his departure pre-
ented them with the heliopolis, and all the other ma-
hines which he had employed in battering the city;
from the sale of which, with some additional sums of
their own, they erected the famous Colossus. After this
they applied themselves entirely to trade and naviga-
tion; by which means they became quite masters of the
sea, and much more opulent than any of the neigh-
brouring nations.

As far as lay in their power, they endeavoured to pre-
serve a neutrality with regard to the jarring nations of the east.

However, they could not avoid a war with the Byzantines, the occasion of which
was as follows: The Byzantines being obliged to pay
a yearly tribute of 80 talents to the Gauls, in order to
raise this sum, they came to a resolution of laying a toll
on all ships, that traded to the Pontic sea. This resolu-
tion provoked the Rhodians, who were a trading na-
tion, above all the rest. For this reason they immedi-
ately dispatched ambassadors to the Byzantines, com-
plaining of the new tax; but as the Byzantines had no
other method of satisfying the Gauls, they perﬁlled in
their resolution. The Rhodians now declared war,
and prevailed upon Prusias king of Bithynia, and At-
talus king of Pergamus, to afﬁl them; by which
confraternity the Byzantines were so intimidated, that
they agreed to exact no toll from ships trading to the
Pontic sea, the demand which had been the occasion of
the war.

About this time happened a dreadful earthquake,
which threw down the colossus, the arsenal, and a great
part of the city-walls of Rhodes; which calamity the
Rhodians improved to their advantage, sending ambas-
dadors to all the Grecian princes and states to whom
their losses were so much exaggerated, that their conn-
trymen obtained immense sums of money under pretence
of repairing them. Hiero king of Syracuse presented
them with 100 talents; and, besides, exempted from all
tolls and duties such as traded to Rhodes. Ptolemy
king of Egypt gave them 100 talents, a million of mea-
ures of wheat, materials for building 20 quinqueremes
and the like number of triremes; and, besides, sent
them 100 architects, 302 workmen, and materials for
repairing their public buildings, to a great value, pay-
ing them moreover 24 talents a-year for the mainte-
nance of the workmen whom he sent them. Antig-
onus gave them 100 talents of silver, with 10,000 pieces
of timber, each piece being 16 cubits long; 7000
planks; 3000 pounds of iron, as many of pitch and re-
ﬁn, and 1000 measures of tar. Chryseis, a woman
of diﬁnition, sent them 100,000 measures of wheat, and
3000 pounds of lead. Antiochus exempted from all
taxes and duties the Rhodian ships trading to his do-
minions; presented them with 10 galleys, and 200,000
measures of corn, with many other things of great va-
late. Prusias, Mithridates, and all the princes then
reigning in Asia, made them proportionable, preface:

It has been noted for the short, all the Greek towns and nations, all the princes
of Europe and Asia, contributed, according to their
ability, to the relief of the Rhodians on that oc-
casion; insomuch that their city not only soon rose from
its ruins, but attained to an higher pitch of splendor
than ever.

In the year 203 B.C. the Rhodians engaged in a
war with Philip of Macedon. This monarch had in-
vaed the territories of Attalus king of Pergamus; and
because the Rhodians seemed to favour their ancient
friend, sent one Heraclides, by birth a Tarentine, to
afﬁl to their fleet; at the same time that he dispatched
ambassadors into Crete, in order to stir up the Cre-
tans against the Rhodians, and prevent them from fend-
ing any assistance to Attalus. Upon this war was im-
mediately proclaimed. Philip at ﬁrst gained an incon-
siderable advantage in a naval engagement; but the
next year was defeated with the loss of 11,000 men,
while the Rhodians lost but 60 men and Attalus 70.

After this he carefully avoided coming to an engage-
ment at sea either with Attalus or the Rhodians. The
combined fleet, in the mean time, sailed towards the
island of Ægina in hopes of intercepting him: but hav-
ing failed in their purpose, they failed to Athens,
where they concluded a treaty with that people; and,
on their return, drew all the Cyclades into a confedera-
ty against Philip. But while the allies were thus
waiting their time in negotiations, Philip, having di-
vided his forces into two bodies, sent one, under the
command of Philocele, to ravage the Athenian territo-
ries; and put the other aboard his fleet, with orders to fail
to Meronea, a city on the north side of Thrace. He
then marched towards that city himself with a body of
forces, took it by assault, and reduced a great many
others; so that the confederates, in all proba-
bility, had had little reason to boast of their suc-
cess, had not the Romans come to their assistance, by
whose help the war was soon terminated to their ad-
vantage. In the war which took place between the
Romans and Antiochus the Great king of Syria, the
Rhodians were very useful allies to the former.

The best part of their fleet was indeed detroyed by a trea-
cherous contrivance of Polyxeniades the Syrian admi-
rall; but they soon ﬁtted out another, and defeated a
Syrian squadron commanded by the celebrated Hanni-
bal, the Carthaginian commander; after which, in con-
junction with the Romans, they utterly defeated the
whole Syrian fleet commanded by Polyxeniades; which,
together with the loss of the battle of Magnesia, fo dis-
spirited Antiochus, that he submitted to whatever con-
ditions the Romans pleased.

For these services the Rhodians were rewarded with
the provinces of Lycia and Caria; but tyrannizing
over the people in a terrible manner, the Lycians ap-
plied to the Romans for protection. This was readily
granted: but the Rhodians were so much displeased
with their interfering in this matter, that they secretly
favoured Peres in the war which broke out between
him and the Roman republic. For this offence the
two provinces abovementioned were taken from them;
but the Rhodians, having banished or put to death those
who had favoured Peres, were again admitted into fa-
Rhodes besieged by Mithridates without success.  

The Rhodians dis commander Caius; which drew upon them the rev enment of C. Cassius, who advanced to the islands of Rhodes with a powerful fleet, after having reduced the greatest part of the continent. The Rhodians, terrified at his approach, sent ambassadors intreating him to make up matters in an amicable manner, and promising to stand neutral, and recall the ships which they had sent to the assistance of the triumvirs. Cassius insisted upon their delivering up their fleet to him, and putting him in possession both of their harbour and city. This demand the Rhodians would by no means comply with, and therefore began to put themselves in a condition to fland a siege; but first sent Archelaus, who had taught Cassius the Greek tongue while he studied at Rhodes, to intercede with his disciple in their behalf. Archelaus could not, with all his authority, prevail upon him to moderate his demands; wherefore the Rhodians, having created one Alexander a bold and enterprising man, his praetor or prytanes, equipped a fleet of 33 sail, and sent it out under the command of Mnæus, an experienced sea-officer, to offer Cassius battle. Both fleets fought with incredible bravery, and the victory was long doubtful: but the Rhodians, being at length overpowered by numbers, were forced to return with their fleet to Rhodes; two of their ships being sunk, and the rest very much damaged by the heavy ships of the Romans. This was the first time, as our author observes, that the Rhodians were fairly overcome in a sea-fight.

Cassius, who had beheld this fight from a neighbouring hill, having rested his fleet, which had been so few ships as damaged than that of the Rhodians, repaired to Loryma, a strong hold on the continent belonging to the Rhodians. This castle he took by assault; and from hence conveyed his land-forces, under the conduct of Tannius and Lentulus, over into the island. His fleet consisted of 80 ships of war and above 200 transports. The Rhodians no sooner saw this mighty fleet appear, but they went out again to meet the enemy. The second engagement was far more bloody than the first; many ships were sunk, and great numbers of men killed on both sides. But victory now declared for the Romans; who immediately blocked up the city of Rhodes both by sea and land. As the Rhodians had not time to furnish the city with sufficient stores of provis ions, some of the inhabitants, fearing that if it were taken either by assault or by famine, Cassius would put all the inhabitants to the sword, Brutas had lately done at Xanthus, privately opened the gate to him, and put him in possession of the town, which he nevertheless treated as if it had been taken by assault. He commanded 50 of the chief citizens, who were suffraged to favour the adverse party, to be brought before him, and sentenced them all to die; others, to the number of 25, who had commanded the fleet or army because they did not appear when summoned, he proscribed. Having thus punished such as had either acted or spoken against him or his party, he commanded the Rhodians to deliver up to him all their ships, and whatever money they had in the public treasury. He then plundered the temples; stripping them of all their valuable furniture, vases, and statues. He is said not to have left one statue in the whole city, except that of the Sun; bragging at his departure, that he had stripped the Rhodians of all they had, leaving them nothing but the fun. As to private persons, he commanded them, under severe penalties, to bring to him all the gold and silver they had, promising by a public crier, a tenth part to such as should discover any hidden treasures. The Rhodians at first conceived some part of their wealth, imagining that Cassius intended by this proclamation only to terrify them; but when they found he was in earnest, and several wealthy citizens put to death for concealing only a small portion of their riches, they desired that the time prefixed for the bringing in their gold and silver might be prolonged. Cassius willingly granted them this request; and then through fear they dug up what they had hid under ground, and laid at all the feet they all were worth in the world. By this means he extorted from private persons besides 8000 talents. He then fined the city in 500 more; and leaving L. Varus there with a strong garrison to exact the fine without any abatement, he returned to the continent.

After the death of Cassius, Marc Antony restored the Rhodians to their ancient rights and privileges; bequeathing upon them the islands of Andros, Naxos, Tenos, and the city of Myndus. But these the Rhodians so oppressed and loaded with taxes, that the same Antony, though a great friend to the Rhodian republic, was obliged to deliver her of the sovereignty over those places, which he had a little before so liberally bestowed upon her. From this time till the reign of Emperor Claudius we find no mention made of the Rhodians. That prince, as Dion informs us, deprived them of their liberty for having crucified some Roman citizens. However, he soon restored them to their former condition, as we read in Suetonius and Tacitus. The latter adds, that they had been as often deprived of, as restored to, their liberty by way of punishment or reward for their different behaviour, as they had prolonged the Romans with their assistance in foreign wars, or provoked them with their seditions at home. Pliny, who wrote in the beginning of Vespasian's reign, styles Rhodes a beautiful and free town. But this liberty they did not long enjoy, the island being soon after restored by the same Vespasian to a Roman province, and obliged to pay a yearly tribute to their new masters. This province was called the province of the islands. The Roman prefect who governed it resided at Rhodes, as the chief city under his jurisdiction; and Rome, notwithstanding the eminent services rendered her by this republic, thenceforth treated the Rhodians not as allies, but vassals.

The island of Rhodes continued subject to the Romans till the reign of the emperor Andronicus; when Villaret, grand-master of the knights of Jerusalem, then residing in Cyprus, finding himself much exposed to the attacks of the Saracens in that island, resolved to exchange it for that of Rhodes. The island too was almost
almost entirely occupied by the Saracens; Andronicus, the eastern emperor possessing little more in it than a castle. Nevertheless he refused to grant the investiture of the island to Villaret. The latter, without spending time in fruitless negotiations, failed directly for Rhodes, where he landed his troops, provisions, and warlike stores, in spite of the opposition made by the Saracens, who then united against the common enemy. As Villaret foresaw that the capital must be taken before he could reduce the island, he instantly laid siege to it. The inhabitants defended themselves obstinately, upon which the grand-master thought proper to turn the siege into a blockade; but he soon found himself so closely surrounded by the Greeks and Saracens, that he could get no supply either of forage or provisions for his army. But having at length obtained a supply of provisions by means of large sums borrowed of the Florentines, he came out of his trenches and attacked the Saracens, with a full resolution either to conquer or die. A bloody fight ensued, in which a great number of the bravest knights were killed; but at length the Saracens gave way, and fled to their ships; upon which the city was immediately assaulted and taken. The Greeks and other Christians had their lives and liberties given them, but the Saracens were all cut to pieces. The reduction of the capital was followed by that of all the other places of inferior strength throughout the island; and in four years after their landing, the whole was subjugated, and the conquerors took the title of the Knights of Rhodes. For many years those knights continued the terror of the Saracens and Turks, and sustained a severe siege from Mohammed II. who was compelled to abandon the entrenchments; but at length the Turkish sultan Solyman resolved at all events to drive them from it. Before he undertook the expedition, he sent a message commanding them to depart the island without delay; in which case he promised that neither they nor the inhabitants should suffer any injury, but threatened them with his utmost vengeance if they refused his offer. The knights, however, proving obstinate, Solyman attacked the city with a fleet of 400 ships and an army of 140,000 men.

The trenches were soon brought close to the town, and a strong battery raised against the town; which, however, did but little damage, till the sultan being informed by a spy of this particular, and that he was in danger of receiving some fatal shot from the tower of St John which overlooked his camp, he planted a battery against that tower, and quickly brought it down. Solyman, however, finding the whole place in some measure covered with strong fortifications of such height as to command all his batteries, ordered an immense quantity of stones and earth to be brought in which 50,000 men were employed night and day by turns, that they quickly raised a couple of hillocks high enough to overtop the city-wall. They piled them accordingly with such a continual fire, that the grand-master was obliged to cause them to be strongly propped within with earth and timber. All this while the besieged, who, from the top of the grand-master’s palace, could discover how their batteries were planted, demolished them with their cannon almost as fast as they raised them.

Here the enemy thought proper to alter their measures, and to plant a strong battery against the tower of St Nicholas, which, in the former siege by Mohammed, had resisted all the efforts of the then grand-vizier. This the bashaw of Romania caused to be battered with 12 large pieces of brass cannon, but had the mortification to see them all dismantled by the fire of the tower; to prevent which in future, he ordered them to be fired only in the night, and in the day had them covered with gabions and earth. This had such success, that, after 500 cannon-shot, the well began to shake and tumble into the ditch; but he was surprised to find another wall behind it, well terraced, and bordered with artillery, and himself obliged either to begin afresh or give up the enterprise; and yet this was what Solyman preferred, when he was told of its being built on a hard rock, incapable of being tapped, and how firmly it had held out against all the efforts of Mohammed’s vizier. The next attack was therefore ordered by him to be made against the bastions of the town, and that with a vast number of the largest artillery, which continued firing during a whole month; so that the new wall of the bastion of England was quite demolished, though the old one stood firm against all their shot. That of Italy, which was battered by 17 large pieces of cannon, was still worse damaged; upon which Martinengo the engineer advised the grand-master to cause a sally to be made on the trenches of the enemy out of the breach, whist he was making fresh entrenchments behind it. His advice succeeded; and the 200 men that filled out fword in hand having surprized the Turks in the trench, cut most of them in pieces. At the same time a new detachment, which was sent to repulse them, being obliged, as that engineer rightly judged, to pass by a spot which lay open to their artillery, were likewise mostly destroyed by the continual fire that came from it, whilst the assailants were employed in filling up severall fathoms of the trench before they retired. By that time the breach had been repaired with such new works, that all the efforts to mount it by assault proved equally ineffectual and disastrous.

Unfortunately for the besieged, the continual fire that had made such a consumption of their powder, that they began to feel the want of it; the pernicious, and d’Anmara, whose province it had been to visit the magazines of it, having asumed the council with a false report, that there was more than sufficient to maintain the siege, though it should last a whole twelve month. But here the grand-master found means to supply in some measure that unexpected defect, by the cautious provision he had made of a large quantity of saltpetre, which was immediately ground and made into gunpowder, though he was at the same time obliged to order the engineers to be more sparing of it for the future, and to make use of it only in the defence of such breaches as the enemy should make.

All this while the Turks had not gained an inch of Delicate ground; and the breaches they had made were so sudden either repaired or defended by new entrenchments, in mine, that the very rubbish of them must be mounted by assault. Solyman, therefore, thought it now advisable to set his numerous pioneers at work, in five different parts, in digging of mines, each of which led to the bastion opposite to it. Some of these were countermined by a new invented method of Martinengo; who, by the help of braced shins, or drums, could discover where
where the miners were at work. Some of these he perceived, which he caused to be opened, and the miners to be driven out by hand grenades; others to be smothered, or burned, by setting fire to gunpowder. Yet did not this hinder two considerable ones to be sprung, which did a vast deal of damage to the balion of England, by throwing down about six fathoms of the wall, and filling up the ditch with its rubbish: whereupon the Turks immediately climbed up sword in hand to the top of it, and planted seven of their standards upon the parapet; but being stopped by a traverse, the knights, recovering from their surprize, fell upon them with such fury, that they were obliged to abandon it with great loss. The grand master, who was then at church, quickly came to the place with his short pike in his hand, attended by his knights, encouraging all he met with,burghers, footiers, and others, to fight bravely in defence of their religion and country, and arrived time enough to assist in the taking down their standards, and driving down the enemy by the way they came up. In vain did the vizier Mustapha endeavour to prevent their flight by killing some of the foremoft with his sword, and driving the rest back; they were obliged to abandon the balion, and, which was still worse, met with that death in their flight, which they had strove to shun from the fire-arms which were discharged upon them from the ramparts. Three footiers lost their lives in this attack, besides some thousands of the Turks; the grand master, on his side, lost some of his bravest knights, particularly his standard-bearer.

The attacks were almost daily renewed with the same ill success and loss of men, every general striving to dignify himself in the sight of his emperor. At length the old general Peri, or Pyrrus, having harried the troops which guarded the balion of Italy for several days successively without intermission, caused a strong detachment, which he had kept concealed behind a cavalier, to mount the place by break of day, on the 13th of September; where, finding them overcome with sleep and fatigue, they cut the throats of the fentinels, and, sliding through the breach, were just going to fall upon them. The Italians, however, quickly recovered themselves and their arms, and gave them an obftinate repulse. The contest was fierce and bloody on both sides; and the balion still supplying his own with new reinforcements, would hardly have failed of overpowering the other, had not the grand master, whom the alarm had quickly reached, timely intervened, and, by his presence, as well as example, revived his Rhodians, and threw a sudden panic among the enemy. Pyrrus, desirous to do something to wipe of the disgrace of this repulse, tried his fortune next on an adjoining work, lately railed by the grand master Caretta; but here his soldiers met with a little worse treatment, being almost overwhelmed with the hand-grenadoes, melted pitch, and boiling oil, which came pouring upon them, whilst the forces which were on the adjacent flanks made such a slaughter of those that fled; in formuch that the janizaries began to refuse their old murmuring tone, and cry out that they were brought thither only to be slaughtered.

The grand vizier Mustapha, afraid left their complaints should reach his master, agreed at length, as the last resort, to make a fresh attempt on the balion of England, while, to cause a diversion, the basileus Ahmed sprung some fresh mines at an opposite part of the city. This was according executed on the 17th of September; when the former, at the head of five battalions, resolutely mounted or rather crept up the breach, and, in spite of the fire of the English, advanced so far as to pitch some standards on the top; when, on a sudden, a crowd of English knights, commanded by one Bouk, or Burk, fell out of their entrenchments, and, affiicted by some other officers of distinction, obliged them to retire, though in good order. Mustapha, provoked at it, led them back, and killed several knights with his own hand; and had his men supported him as they ought, the place must have been yielded to him; but the fire which was made from the adjacent batteries and musketry disconcerted them to such a degree, that neither threats nor entreaties could prevent their abandoning the enterprise, and dragging him away with them by main force. The Rhodians lost in that action several brave knights, both English and German; and, in particular, John Burk, their valiant commander: but the Turks lost above 2000 men, besides many officers of distinction. Much the same ill success having attended Ahmed with his mines, one of which had been opened, and the other only bringing some fathoms of the wall down, he was also obliged to retreat; his troops, though some of the very best, being forced to disperse themselves, after having borne the fire and fury of the Spaniards and Auvergnian knights as long as they were able.

By this time Solyman, amazed and exasperated at his ill success, called a general council; in which he made some striking reflections on his vizier, for having represented the reduction of Rhodes as a very easy enterprise. To avoid the effects of the sultan's resentment, the noble Mustapha declared, that hitherto they had fought the enemy as it were upon equal terms, as if they had been afraid of taking an ungenerous advantage of their superiority, by which, said he, we have given them an opportunity of expiring with their united force wherever we attacked them. But let us now resolve upon a general assault on several sides of the town; and see what a poor defence their strength, thus divided, will be able to make against our united force. The advice was immediately approved by all, and the time appointed for the execution of it was on the 24th of that month, and every thing was ordered to be got ready against that day. Accordingly the town was actually assaulted at four different parts, after having suffered a continual fire for some time from their united artillery in order to widen the breaches; by which the grand master easily understood their design, and that once

An assault in four different parts, after having suffered a continual fire for some time from their united artillery, widened the breaches by which the grand master easily understood their design, and that once

The morning was no sooner come, than each party mounted their respective breach with an undaunted bravery, the young sultan, to animate them the more, having ordered his throne to be reared on an eminence, whence he could see all that was done. The Rhodians, on the other hand, were no less diligent in repulsing them with their cannon and other fire-arms, with their melted lead, boiling oil, flint-pots, and other usual expedients. The one side ascend the scaling ladders, fearless of all that opposed them; the other overthrew their
their ladders and send them tumbling down headlong into the ditches, where they were overwhelmed with stones, darts, and other missile weapons. The battering of England proves the scene of the greatest slaughter and bloodshed; and the grand-master makes that his proof of honour, and, by his presence and example, inspires his men with fresh vigour and bravery, whilst the continual thunder of his artillery makes such horrid work among the assailants as chills all their courage, and forces them to give way: the lieutenant-general, who commands the attack, leads them back with fresh vigour, and mounts the breach at the head of all; immediately after comes a cannon-ball from the Spanish battalion, which overthrows him dead into the ditch. This disaster, instead of fear and dread, fills them with a furious desire of revenging his death: but all their obstinacy cannot make the Rhodians go one step back, whilst the priests, monks, young men and old, and even women of every rank and age, assist them with an uncommon ardour and firmness; some in overwhelming them with their ladders and sending them tumbling down headlong; others in destroying them with melted lead, sulphur, and other combustibles; and a third in supplying the combatants with bread, wine, and other refreshments.

The assault was no less desperate and bloody on the battalion of Spain, where the knights, who guarded it, not expecting to be so soon attacked, and ashamed to stand idle, were affilling the battalion of Italy; which gave the Turks an opportunity to mount the breach and penetrate as far as their entrenchments, where they planted no less than 30 of their standards on them. The grand-master was quickly apprised of it, and ordered the battalion of Auvergne to play against them; which was done with such diligence, and such continual fire, whilst the Rhodians enter the battalion by the help of their camarates, and, sword in hand, fall upon them with equal fury, that the Turks alike befet by the fire of the artillery and the arms of the Rhodian knights, were forced to abandon the place with a considerable loss. The aga with great bravery rallies them asfresh, and brings them back, by which time the grand-marshal likewise appeared. The fight was renewed with greater feracities; and such slaughter was made on both sides that the grand-master was obliged to draw 202 men out of St. Nicholas tower to his assistance; these were commanded by some Roman knights, who led them on with such speed and bravery, that their very appearance on the battalion made the janissaries draw back; which Solyman observing from his eminence, caused a retreat to be founded, to conceal the disgrace of their flight. In these attacks there fell about 15,000 of his best troops, besides several officers of distinction. The loss of the besieged was no less considerible, if we judge from the small number of their forces; the greatest of all to them was that of some of their bravest and most distinguished knights and commanders, many of whom were killed, and scarce any escaped unscathed. But the most dreadful fate of all had like to have fallen on the favourite vizier Mustapha, who had proposed this general assault: the ill success of which had so enraged the proud sultan, that he condemned him to be shot with arrows at the head of his army, which dreadful sentence was just ready to be executed, when the old bashaw, by his intrigues, obtained a full pardon of it, in hopes that when his fury was abated, he should also obtain his pardon.

Solyman, however, was so discouraged by his ill success, that he was on the point of raising the siege, and would have actually done so, had he not been diverted from it by the advice which he received from an Albanian deserter, some of a letter from the traitor D’Amarald, that the far greater part of the knights were either killed or wounded, and those that remained altogether incapable of sustaining a fresh assault. This having determined him to try his fortune once more, the command of his forces was turned over to the bashaw Achmed; and, to shew that he designed not to stir till he was master of the place, he ordered a house to be built on the adjacent mount Philerno for his winter-quarters. Achmed marched directly against the battalion of Spain, which had suffered the most; where, before he could open the trenches, his men fell-thick and threefold by the contant fire both of small and great guns from the battalion of Auvergne. Achmed filled a much greater number in forming a rampart of earth to cover the attack, and give him an opportunity of sapping the wall; and, as soon as he saw a large piece fall, ordered his men to mount the breach. They were no sooner come to the top, than they found a new work and entrenchments which Martinengo had reared; and there they were welcomed with such a brisk fire from the artillery, that they were glad to recover their trenches with the utmost precipitation, after having lost the much greater part of their men. The attack was renewed, and a reciprocal fire continued with great obstinacy, till a musquet-shot deprived that indefatigable engineer of one of his eyes, and the order of his abiduous services for some time. The grand-master, having ordered him to be carried to his palace took his place, and kept it till he was quite cured, which was not till 34 days after; and continued all the time in the entrenchments with his handful of knights, fearfully allowing himself rest night or day, and ever ready to expose himself to the greatest dangers, with an ardour more becoming a junior officer than an old worn-out sovereign; which made his knights more lavish of their own lives than their prudence and present circumstances could well admit of.

Soon after this, the treason of D’Amarald was discovered, and he was condemned to death and executed; but by this time the city was reduced to the last extremity. The pope, emperor, and other crowned heads, had been long and often importuned by the grand-master for speedy assistance, without success, and, as an addition to all the other disasters, those which were felt to him from France and England perished at sea. The new supply which he had sent for of provisions from Candia had the same fatal fate; so that the winds, seas, and every thing, seemed combined to bring on the destruction of that city and order. The only resource which could be thought of, under so dismal a situation, was, to send for the few remaining knights and forces which were left to guard the other islands, to come to the defence of their capital, in hopes that, if they could save this, the others might in time be recovered, in short the Turks should seize upon them. On the other hand, Solyman, grown impatient at the small ground his general had gained, gave him express orders to renew the attack with all imaginable speed
and vigour, before the succours which he apprehended were coming from Europe, obliged him to raise the siege. Ahmet instantly obeyed, raised a battery of 17 large cannon against the balion of Italy, and quickly after made himself master of it, obliging the garrison to retire farther into the city. Here the grand master was forced to demolish two of the churches, to prevent the enemy's seeing on them; and, with their materials, caused some new works and entrenchments to be made to hinder their proceeding farther.

The Turks, however, gained ground every day, though they still lost vast numbers of their men: at length the 30th of November came, when the grand master, and both the besiegers and besieged, thought the last assault was to be given. The bailaw Pyrrus, who commanded it, led his men directly to the entrenchments; upon which the bells of all the churches founded the alarm. The grand master, and his few knights, troops, and citizens ran in crowds, and in a confused disorderly manner, to the entrenchments, each fighting in his own way, or rather as his fear directed him. This attack would have proved one of the most desperate that had yet been felt, had not a most vehement rain intervened, which carried away all the earth which the enemy had reared to serve them as a rampart against the artillery of the balion of Auvergne; so that being now quite exposed to their continual fire, they fell in such great numbers, that the bailaw could no longer make them stand their ground, but all precipitately fled towards their camp. This last repulse threw the proud sultan into such a fury, that none of his officers dared to come near him; and the flame of his having now spent near six whole months with such a numerous army before the place, and having lost such myriads of his brave troops with so little advantage, had made him quite desperate, and they all dreaded the consequences of his7

Pyrrus at length, having given it time to cool, ventured to approach him, and propose a new project to him, which, if approved, could hardly fail of success; which was, to offer the town a generous capitulation: and he observed, that in case the stubborn knights should reject it, yet being now reduced to so small a number, as well as their forces and fortifications almost destroyed, the citizens, who were most of them Greeks, and least ambitious of glory than solicitous for their own preservation, would undoubtedly accept of any composition that should secure to them their lives and effects.

This proposal being replied to by the sultan, letters were immediately dispatched about the city, in his name, exhorting them to submit to his government, and threatening them at the same time with the most dreadful effects of his retribution if they persisted in their obstinacy. Pyrrus like wise dispatched a Genoese to approach as near as he could to the balion of Auvergne, and to treat the knights to take pity of so many of their Christian brethren, and not expose them to the dreadful effects which must follow their refusal of a capitulation; so generally offered them at their last extremity. Other agents were likewise employed in other places; to all of whom the grand master ordered some of his men to return this answer. That his order never treated with infidels but with sword in hand. An Albanian was sent next with a letter from the sultan to him, who met with the same repulse; after which he ordered his men to fire upon any that should present themselves upon the same pretence; which was actually done. But this did not prevent the Rhodians from listening to the terms offered by the Turks, and holding frequent cabals upon that subject; in which the general massacre of a town taken by assault, the dreadful slavery of those that escaped, the rape of their wives and daughters, the destruction of their churches, the profanation of their holy relics and sacred utensils, and other dire consequences of an obstinate refusal, being duly weighed against the sultan's offers, quickly determined them which party to take. The grand master, however, proving inexorable to all their intreaties, they applied to their Greek metropolitan, who readily went and represented all these things to him in the most pathetic terms: Yet he met with no better reception; but was told, that and his knights were determined to be buried under the ruins of the city if the sultan could no longer defend it, and he hoped their example would not permit them to show less courage on that occasion. This answer produced a quite contrary effect; and, as the citizens thought delays dangerous at such a juncture, they came in a body to him by the very next morning, and plainly told him, that if he paid no greater regard to their preservation, they would not fail of taking the most proper measures to preserve the lives and chastity of their wives and children.

This resolution could not but greatly alarm the grand master; who thereupon called a council of all the knights, and informed them himself of the condition of the place. These all agreed, particularly the engineer Martinengo, that it was no longer defensible, and no other resource left but to accept the sultan's offers; adding, at the same time, that though they were all ready, according to the obligations of their order, to fight to the last drop of their blood, yet it was no less their duty to provide for the safety of the inhabitants, who, not being bound by the same obligations, ought not to be made a sacrifice to their glory. It was therefore agreed, with the grand master's consent, to accept of the next offers the sultan should make. He did not let them wait long: for the fear he was in of a fresh succour from Europe, the intrepidity of the knights, and the flame of being forced to raise the siege, prevailed upon him to hang out his pacific flag, which was quickly answered by another on the Rhodian side; upon which the Turks, coming out of their trenches, delivered up the sultan's letter for the grand master, to the grand-prior of St Giles, and the engineer Martinengo. The terms offered in it by Solyman appeared so advantageous, that they immediately exchanged hostages; and the knights that were sent to him had the honour to be introduced to him, and to hear him confirmed by his own mouth, though not without threats of putting all to fire and sword in case of refusal, or even delay. Two ambassadours were forthwith sent to him, to demand a truce of three days to settle the capitulation and interests of the inhabitants, who were part Greeks and part Latins; but this was absolutely refused by the impatient monarch, out of a suspicion of the rumoured succour being near, and that the truce was only to gain time till it was come.

He therefore ordered the hostilities to be renewed.
with fresh fury; in which the Rhodians made a most noble defence, considering their small number, and that they had now only the barbaric or falfe Bray of the bation of Spain left to defend themselves, and once more repulsed the enemy: at which the sultan was so enraged, that he resolved to overpower them by numbers on the next day; which was, after a stout defence, so effectually done, that they were forced to abandon that outworks, and retire into the city. In the meantime, the bargers, who had but a day or two before raised a fresh uproar against the grand-matter, under pretence that he was going to give them up a prey to an infidel who regarded neither oaths nor solemn treaties, perceiving their own danger, came now to desire him to renew the negotiations, and only begged the liberty of sending one of their deputies along with his, to secure their interests in the capitulation. He readily consented to it; but gave them a charge to shew the bashaw Achmed the treaty formerly concluded between Bajazet and his predecessor d'Aubignon, in which the former had entailed a dreadful curse on any of his successors that should infringe it. This was done, in hopes that the showing it to his master, who valued himself so much upon his strict observance of his law, might produce some qualm in him which so much in hopes of a succour from Europe as he was and dry unduged soil. The fragrance of the RHO DIOLA, ROSE-WORT, not thrive in gardens, and for want of their usual co-

ditches, and is looked upon to be impregnable. It is Rhoi.

habited by Turks and Jews; the Christians being obli-
ged to occupy the suburbs, as not being allowed to stay in the town during the night. The town is situ-
ed in E. Long. 28. 25. N. Lat. 36. 54.

RHODIOLA, ROSE-WORT, in botany: A genus of the oecandria order, belonging to the dicot clas.

of plants; and in the natural method ranking under the 17th order, Succulentae. The male calyx is quadrilat-

eral, the corolla tetraverticillate. The female calyx is

quadripartite, and there is no corolla; the nectar are four; the pistils four; and there are four polysperma-
capules. There are two species, the rofea and the mini-

ta: the firft grows naturally in the clefts of the rocks

and rugged mountains of Wales, Yorkshire, and Well-

tmoreland. It has a very thick fleshy root, which when cut or bruifed emits an odour like rofes. It has thick fucculent stalks, like thofe of orpine, about nine inches long, clofely garnifhed with thick fucculent leaves indented at the top. The falk is terminated by a clus-
ter of yellowifh herbageous flowers, which have an agreeable fcent, but are of short continuance. The fi-
ccond fort is a native of the Alps, and has purplifh flowers which come out later than the former; it is al-

do of a smaller fize. Both species are easily propagated

by parting their roots; and require a fandy fition, and dry undunged foil. The fragrance of the flirt

fpecies, however, is greatly diminished by cultivation.

OIL OF RHODIUM. See Asphalatus.

RHODODENDRON, DWARF ROSE-BAY, in bot-

any: A genus of the monogynia order, belonging to

the decandria clas of plants; and in the natural me-

thod ranking under the 18th order, Biornae. The cal-

yx is quinquepetal; the corolla funnel-shaped; the flan-

ma a deftrict; the capule quinquelocular. There are fe-

ten species: the moft remarkable of which are,

1. The birsutum, with naked hairy leaves, grows natu-

rally on the Alps and feveral mountains of Italy. It is

a low shrub, which seldom rifes two feet high, fending

out many ligneous branches covered with a light-

brown bark, garnifhed clofely with oval fpear-shaped

leaves, fitting pretty clofe to the branches. They are

entire, having a great number of fine iron-coloured hairs

on their edges and underfide. The flowers are produ-

ced in bunches at the end of the branches in May, ha-

ving one funnel-shaped petal cut into five obfute seg-

ments, and of a pale-red colour. They make a good

fhow, and are fucceeded by oval capules, containing

ripe feds in Auguft. 2. The ferrugineum, with smooth

leaves, hairy on their underfide, is a native of the Alps

and Apennines. It rifes with a shrubby falk near

three feet high, fending out many irregular branches

covered with a purplifh bark, and clofely garnifhed with

smooth fpear-shaped entire leaves, whose borders are re-

flexed backward; the upper fide is of a light lucid

green, their under fide of an iron colour. The flowers

are produced at the ends of the branches, are funnel-

shaped, cut into five segments, and of a pale rofe colour.

These plants are propagated by feds, but, being natives

of barren rocky foils and cold fitions, they do not thrive in gardens, and for want of their usual co-

ferv of fnow in the winter are often killed by

warmier climates. 3. The chamazel, or ciliate-leaved

dwarf rofe-bay, is a low deciduous shrub, native of

Mount Baldus, and near Salzburg in Germany. It

Rhododendron. See Asphalatus.

...shaped, large, and of a beautiful rofe-colour... They

...ear in May, and are succeded by oval capsules full of feeds, which in England do not always ripen.

4. The Dauricum, or Daurian dwarf rofe-bay, is a low deciduous shrub, and native of Dauria. Its branches are numerous, and covered with a purplish bark.

The flowers are produced at the end of the branches in bunches, are of a wheel-shaped figure, pretty large, of a fine crimson colour, and handsome appearance. They appear in June, and are succeded by oval capsules containing ripe feeds in September.

The Dauricum, or Daurian dwarf rofe-bay, is a low deciduous shrub, and native of Dauria. Its branches are numerous, and covered with a purplish bark. The flowers are wheel-shaped, large, and of a beautiful rofe-colour; they appear in May, and are succeded by oval capsules full of feeds, which in England do not always ripen.

5. The maximum, or American mountain laurel, is an evergreen shrub, and native of Virginia, where it grows naturally on the highest mountains, and on the edges of cliffs, precipices, &c. where it reaches the size of a moderate tree, though in England it seldom rises higher than six feet. The flowers continue by succession sometimes more than two months, and are succeded by oval capsules full of feeds.

6. The Ponticum, or Pontic dwarf rofe-bay, is an evergreen shrub, native of the caft, and of moist shady places near Gibraltar. It grows to the height of four or five feet. The leaves are speared-shaped, glossy on both sides, acute, and placed on short foot-stalks on the branches; the flowers, which are produced in clusters, are bell-shaped, and of a fine purple colour. They appear in July, and are succeded by oval capsules containing feeds, which in England seldom attain to maturity.

In Siberia, a species of this plant is used with great success in gouty and rheumatic affections; of which the following account is given in the 5th volume of the Medical commentaries, p. 454, in a letter from Dr Guthrie of Peterburgh to Dr Duncan of Edinburgh. "It is the rhododendrum chrysanthemeum, nova species, belonging to the clafs of decandria, difcovered by Profcor Pallas in his tour through Siberia. This Alpine shrub grows near the tops of the high mountains named Sayan, in the neighbourhood of the river Jenife in Siberia; and delights in the skirts of the snow-covered summits, above the region that produces trees.

When the inhabitants of that country mean to exhibit it in arthritis or rheumatic disorders, they take about two drams of the dried shrub, infalp and leaves, with nine or ten ounces of boiling water, and putting them into an earthen pot, they lute on the head, and place them in an oven during the night. This infusion (for it is not allowed to boil) the fick man drinks next morning for a dofe. It occasions heat, together with a degree of intoxication, resembling the effects of spirituous liquors, and a singular kind of uneasy fentation in the parts affected, accompanied with a fent of vermifolatia, which is likewise confined to the difeafed parts. The patient is not permitted to quench the thirft which this medicine occasions; as fluids, particularly cold water, produce vomiting, which lefens the power of the specific.

In a few hours, however, all the disagreeable effects of the dofe difappear, commonly with two or three folows. The patient then finds himself greatly relieved of his disorder; and has feldom occasion to repeat the medicine above two or three times to complete a cure.

The inhabitants of Siberia call this shrub 

ceti or 

tea, from their drinking, in common, a weak infusion of it, as we do the Chinefe plant of that name. This practice fows that the plant, ufed in small quantities, must be innocent. Profcor Pallas informs me, that he fent fome time ago fome of this shrub dried to Profcor Koelpin at Stetin; and he showed me a letter from that gentleman, where he fays, that he has given it with fuccefs in feveral cafes, particularly in what he calls the arthritis venerea, with a tophus arthritisus on the corpus, and it produced a complete cure. It must be remarked, that the dofe which hefe hardy Siberians take, who are alfo in the habit of drinking it as tea, would, in all probability, be too strong for our countrymen; however, it is a medicine which we may certainly give with safety, beginning with small doses."

RHEDAE. See RHEA.

RHEDAEAE (rheas, Linneus's name, after Diocorides, for the roed poppy), the name, of the 27th order in Linneus's fragments of a natural method, consisting of poppy and a few genera which refeemble it in habit and structure. See BONATY, p. 462.

RHOMBOIDES, in geometry, a quadrilateral figure whose opposite fides and angles are equal, but is neither equilateral nor equiangular.

RHOMBOIDES, in anatomy, a thin, broad, and obliquely square flethy mucle, situated between the fasis of the fcapula and the fpinia dorsi; fo called from its figure. Its general ufe is to draw backward and upward the fubfipinal portion of the fasis fcapule.

RHOMBUS, in geometry, an oblique-angled parallelogram, or quadrilateral figure whose fides are equal and parallel, but the angles unequal, two of the opposite ones being obtuse and two acute.

RHONE, one of the largeft rivers in France, which, rifing among the Alps of Switzerland, paffes through the lake of Geneva, visits that city, and then runs mouthward to Lyons; where, joining the river Soane, it continues its course due fouth, paffing by Orange, Avignon, and Arles, and falls into the Mediterranean a little above Mafelles.

RHOPHULIUM, in botany: A genus of the triandria order, belonging to the gymandria clafs of plants; and in the natural method ranking with thofe that are doubtfuL The calyx is monophyllous and fexpartite; there is no corolla nor any flamina; the three antheres are each attached to one of the filylis; the capsule is tricoccos and fexlocular, each containing two feeds.

There is only one species, viz. the meborea, a native of Guiana. This is a shrub rifing about three or four feet in height. The flowers grow in the form of a corymbus; they are of a yellowwhif green colour; the fcapsules are black.

RHOPOLIA, in botany: A genus of the moneynia order, belonging to the tetranapia clafs of plants; and in the natural method ranking with thofe that are doubtfuL There is no calyx; the petals are four, oblong, obtuse, and narrowing at the base; the flamina are four, inferted in the corolla, and have large antheres; the feed-velles unilocular, and contains one feed. There is only one species, viz. the montana. This is a fhrubby plant growing in Guiana, and remarkable for the great number of branches fent off from its trunk in every direction, and for the fetid fmmel of the wood and bark of this plant.
RHUBARB. See Rheum.

RHUMB, in navigation, a vertical circle of any given place, or intersection of such a circle with the horizon; in which last sense rhumb is the same with a point of the compass.

Rhumb-line is also used for the line which a ship describes when falling in the same collateral point of the compass, or oblique to the meridians.

Rhus, sumach, in botany: A genus of the tri-division order, belonging to the pentandria class of plants; and in the natural method ranking under the 43d order, Dumaidea. The calyx is quinquepartite; the petals five; the berry monoecious. There are 24 species, of which the most remarkable are,

1. The coriaria, or elm-leaved sumach, grows naturally in Italy, Spain, Turkey, Syria, and Palestine. The branches of this tree are used instead of oak-bark for tanning of leather; and it is said that the Turkey leather is all tanned with this shrub. It has a ligneous stalk, which divides at bottom into many irregular branches, rising to the height of eight or ten feet; the bark is hairy, of an herbaceous brown colour; the leaves are winged, composed of seven or eight pair of lobes, terminated by an odd one, bluntly sawed on their edges, hairy on their under side, of a yellowish-green colour, and placed alternately on the branches; the flowers grow in loose panicles on the end of the branches, which are of a whitish herbaceous colour, each panicle being composed of several spikes of flowers fitting close to the footstalks. The leaves and feeds of this sort are used in medicine, and are esteemed very reftirgent and debilitant.

2. The typhina, virginianum sumach, or vinegar plant, grows naturally in almost every part of North America. This hath a woody stem, with many irregular branches, which are generally crooked and deformed. The young branches are covered with a soft velvet-like down, resembling greatly that of a young flag's horn, both in colour and texture, from whence the common people have given it the appellation of flag's horn; the leaves are winged, composed of six or seven pair of oblong heart-shaped lobes, terminated by an odd one, ending in acute points, hairy on their underside, as is also the midrib. The flowers are produced in close tufts at the end of the branches, and are succeeded by seeds, included in purple woolly succulent covers; so that the brenches are of a beautiful purple colour in autumn; and the leaves, before they fall in autumn, change to a purplish colour at first, and before they fall to a feuille-mort. This plant, originally a native of North America, has been long cultivated in the north of Germany, and is lately introduced into Russia. It has got the name of the vinegar plant from the double reason of the young germen of its fruit, when fermented, producing either new or adding to the strength of old weak vinegar, whilst its ripe berries afford an agreeable acid, which might supply the place when necessary of the citric acid. The powerful astringency of this plant in all its parts recommends it as useful in several of the arts. As for example, the ripe berries boiled with alum make a good dye for hats. The plant in all its parts may be used as a succedaneum for oak-bark in tanning, especially the white gowle leather. It will likewise answer to prepare a dye for black, green, and yellow colours; and with martial vitriol it makes a good ink. The milky juice that flows from incisions made in the trunk or branches, makes when dried the basis of a warmth little inferior to the Chiness. Bees are remarkably fond of its flowers; and it affords more honey than any of the flowering shrubs, so that it may prove a useful branch of economy, where rearing these insects is an object. The natives of America use the dried leaves as tobacco.

3. The glabrum, with winged leaves, grows naturally in many parts of North America; this is commonly titled by the gardeners New England sumach. The stem of this is stronger and rises higher than that of the former; the branches spread more horizontally; they are not quite so downy as those of the last, and the down is of a brownish colour; the leaves are composed of many more pair of lobes, which are smooth on both sides; the flowers are disposed in loose panicles, which are of an herbaceous colour.

4. The Carolinianum, with sawed winged leaves, grows naturally in Carolina; the seeds of this were taken thence by the late Mr. Catesby, who has given a figure of the plant in his Natural History of Carolina. This is by the gardeners called the scarlet Carolina sumach; it rises commonly to the height of seven or eight feet, dividing into many irregular branches, which are smooth, of a purple colour, and pounced over with a greyish powder, as are also the footstalks of the leaves. The leaves are composed of seven or eight pair of lobes, terminated by an odd one; these are not always placed exactly opposite on the midrib, but are sometimes alternate. The upper side of the lobes are of a dark green, and their under hoary but smooth. The flowers are produced at the end of the branches in very close panicles, which are large, and of a bright red colour.

5. The Canadensis, with winged spear-shaped leaves, grows naturally in Canada, Maryland, and several other parts of North America. This hath smooth branches of a purple colour, covered with a grey pounce. The leaves are composed of seven or eight pair of lobes, terminated by an odd one; the lobes are spear-shaped, sawed on their edges, of a lucid green on their upper surface, but hoary on their under, and are smooth. The flowers are produced at the end of the branches in large panicles, which are composed of several smaller, each standing upon separate footstalks; they are of a deep red colour, and the whole panicle is covered with a grey pounce, as if it had been scattered over them.

6. The copallinum, or narrow-leaved sumach, grows naturally in most parts of North America, where it is known by the title of beach sumach, probably from the place where it grows. This is of humbler growth than either of the former; seldom rising more than four or five feet high in Britain, dividing into many spreading branches, which are smooth, of a light brown colour, closely garnished with winged leaves, composed of four or five pair of narrow lobes, terminated by an odd one; they are of a light green on both sides, and in autumn change purplish. The midrib, which sustains the lobes, has on each side a winged or leafy border, which runs from one pair of lobes to another, ending in joints at each pair, by which it is easily distinguished from the other sorts. The flowers are produced in loose panicles at the end of the branches, of a yellowish herbaceous colour.

These
These six farts are hardy plants, and will thrive in the open air. The first and fourth farts are not quite so hardy as the others, so must have a better situation, otherwise their branches will be injured by severe frosts in the winter. They are easily propagated by seeds, which if sown in autumn the plants will come up the following spring; but if they are sown in spring, they will not come up till the next spring; they may be either sown in pots, or the full ground. If they are sown in pots in autumn, the pots should be placed under a common frame in winter, where the seeds may be protected from hard frost; and in the spring, if the pots are plunged into a very moderate hot-bed, the plants will soon rise, and have thereby gained strength before winter. When the plants come up, they must be gradually hardened to bear the open air, into which they should be removed as soon as the weather is favourable, placing them where they may have the morning sun; in the summer, they must be kept clean from weeds, and in dry weather watered. Toward autumn it will be proper to thin their growth by keeping them dry; for if the extremity of their shoots may harden; for if they are replete with moisture, the early frosts in autumn will pinch them, which will cause their shoots to decay almost at the bottom, if the plants are not screened from them. If the pots are put under a common frame in autumn, it will secure the plants from injury; for while they are young and the shoots soft, they will be in danger of suffering, if the winter proves very severe; but in mild weather they must always enjoy the open air, therefore should never be covered but in frost. The spring following, just before the plants begin to shoot, they should be shaken out of the pots, and carefully separated, that not to tear the roots; get transplanted into a nursery, in rows three feet asunder, and one foot distant in the rows. In this nursery they may stand two years to get strength, and then may be transplanted where they are to remain.

7. Besides these, Linnæus has included in this genus the toxicodendron or poison-tree, under the name of rhhu vernix or pofern-qf. This grows naturally in Virginia, Pennsylvania, New England, Carolina, and Japan, rising with a strong woody stalk to the height of 20 feet and upwards; though in Britain it is seldom seen above 12, by reason of the plants being extremely tender. The bark is brown, inclining to grey; the branches are garnished with winged leaves composed of three or four pair of lobes terminated by an odd one. The leaves vary greatly in their shape, but for the most part they are oval and heart-shaped. The footstalks become of a bright purple towards the latter part of summer, and in autumn all the leaves are of a beautiful purple before they fall off.

All the species of sumach abound with an acid milky juice, which is reckoned poisonous; but this property is most remarkable in the vernix. The most distinct account of it is to be found in Professor Kalm's Travels in North America. "An incision (says he) being made into the tree, a whitish yellow juice, which has a nauseous smell, comes out between the bark and the wood. This tree is not known for its good qualities, but greatly so for the effect of its poison; which, tho' it is noxious to some people, yet does not in the least affect others. And therefore one person can handle the tree as he pleases, cut it up, peel off its bark, rub it or the wood upon his hands, smell at it, spread the juice upon his skin, and make more experiments, with no inconvenience to himself: another person, on the contrary, dares not meddle with the tree while its wood is fresh; nor can he venture to touch a hand which has handled it, nor even to expose himself to the smoke of a fire which is made with this wood, without soon feeling its bad effects; for the face, the hands, and frequently the whole body, swell excessively, and is affected with a very acute pain. Sometimes bladders or blisters arise in great plenty, and make the sick person look as if he was infected by a leprous. In some people the external thin skin, or cuticle, peels off in a few days; and it is the case when a person has scalded or burnt any part of his body. Nay, the nature of some persons will not even allow them to approach the place where the tree grows, or to expose themselves to the wind which carries the effluvia or exhalations of this tree with it, without letting them feel the inconvenience of the swelling which I have just now described. Their eyes are sometimes shut up for one, or two, or more days together, by the swelling. I know two brothers, one of whom could without danger handle this tree in what manner he pleased, whereas the other could not come near it without swelling. A person sometimes does not know that he has touched this poisonous plant, or that he has been near it, before his face and hands show it by their swelling. I have known old people who were more afraid of this tree than of a viper; and I was acquainted with a person who, merely by the noxious exhalations of it, was fwellen to such a degree, that he was as stiff as a log of wood, and could only be turned about in his bed. I have tried experiments of every kind with the poison-tree on myself. I have spread its juice upon my hands, cut and broke its branches, peeled off its bark, and rubbed my hands with it, smelt at it, carried pieces of it in my bare hands, and repeated all this frequently, without feeling the baneful effects so commonly annexed to it; but I, however, once experienced, that the poison of the sumach was not entirely without effect upon me. On a hot day in summer, as I was in some degree of perspiration, I cut a branch of the tree, and carried it in my hand for about half an hour together, and smelt at it now and then. I felt no effects from it in the evening. But next morning I awoke with a violent itching on my eye-lids and the parts thereabouts; and this was so painful, that I could hardly keep my hands from it. It ceased after I had washed my eyes for a while with very cold water. But my eye-lids were very full all that day. At night the itching returned; and in the morning when I awoke, I felt it as ill as the morning before, and I used the same remedy against it. However, it continued almost for a whole week together; and my eyes were very red, and my eye-lids were with difficulty moved during all that time. My pain ceased entirely afterwards. About the same time I had spread the juice of the tree very thick upon my hand. Three days after, they occasioned blisters, which soon went off without affecting me much. I have not experienced any thing more of the effects of this plant, nor had I any desire to do so. However, I found that it could not exert its power upon me when I was not perspiring. 'I have never heard that the poison of this sumach has
Rhyme
Rh商品

has been mental, but the pains seizes after a few days duration. The natives formerly made their flutes of this tree, because it has a great deal of pith. Some people admired me, that a person suffering from its noisome exhalations, would easily recover by spreading a mixture of the wood burnt to charcoal, and hog's lard, upon the swelled parts. Some asserted, that they had really tried this remedy. In some places this tree is rooted out, on purpose that its poison may not affect the workmen. 2. The natives are said to distinguish this tree in the dark by its extreme coldness to the touch. The juice of some kinds of fumach, when exposed to the heat of the sun, becomes so thick and clammy, that it is used for bird-lime, and the inflattled juice of the poison-ash is said to be the fine varnish of Japan. A cataplasm made with the fresh juice of the poison-ash, applied to the feet, is said by Hubbe, in his Natural History of Barbadoes, to kill the vermin called by the West Indian ebiers. Very good vinegar is made from an infusion of the fruit of an American fumach, which for that reason is called the vinegar-tree. The resin called gum copal is from the rhus copallinum. See Copal.

RHYME, Rhyme, Rymer, or Rhyme, in poetry, the similar sound or cadence and termination of two words which end in two verbs, &c. Or rhyme is a similitude of sound between the last syllable or syllables of a verse, succeeding either immediately or at a distance of two or three lines. See Poetry, n°. 177, &c.

RHYMER (Thomas the), was a native of the parish of Earlstown, in the county of Berwick. His real name and title was Sir Thomas Lermont. He lived at the west end of Earlstown, where part of his house is now standing, called Rhymers Tower; and there is a stone built in the fore wall of the church with this inscription on it;

Auld Rhymers race lies in this place.

He lived in the 14th century, and was contemporary with one of the earls of March, who lived in the same place.

RHYTHM, in music, the variety in the movement, as to the quickness or slowness, length or shortness, of the notes. Or it may be defined more generally, the proportion which the parts of the motion have to each other.

RIAL, or Royal, a Spanish coin. See Money-Table.

RIAL, or Royal, is also the name of a piece of gold formerly current in Britain for 10s.

RIBAN, or Riband, in heraldry, the eighth part of a bend. See Heraldry, p. 447.

RIBAND, or Ribbon, a narrow sort of silk, chiefly used for head-ornaments, badges of chivalry, &c.

In order to give our readers an idea of the manner in which this curious and valuable branch of manufactures is managed, a view of the ribbon weaver at his loom is represented in Plate CCCCXXXV. where

1. Is the frame of the loom. 2. The castle, containing 48 pulleys. 3. The branches, on which the pulleys turn. 4. The tires, or the riding cords, which run on the pulleys, and pull up the high-lifles. 5. The lift-flicks, to which the high-lifles are tied. 6. The high-lifles, or lills, are a number of long threads, with platines, or plate-leads, at the bottom; and ringlets, or loops, about their middle, through which the cords or crofs-threads of the ground-harness ride. 7. The plate-leads, or platines, are flat pieces of lead, of about six inches long, and three or four inches broad at the top, but round at the bottom; some use black plates instead of them: their use is to pull down those lilies which the workman had raised by the tredtle, after his foot is taken off. 8. The branches or cords of the ground-harness, which go thro' the loops in the middle of the high-lifles; on the well-ordering of these cords chiefly depends the art of ribbon-weaving, because it is by means of this contrivance that the weaver draws the tooth or silk that makes the flower, and rejects or excludes the ref. 9. The batton: this is the wooden frame that holds the reed or shuttle, and beats or clofes the work where, observe, that the ribbon- weaver does not beat his work; but as soon as the shuttle is passed, and his hand is taken away, the batton is forced, by a spring from the top, to beat the work clofe. 10. The shuttle, or reed. 11. The spring of the batton, by which it is made to clofe the work. 12. The long-harnesses are the front-reeds, by which the figure is raised. 13. The linguas are the long pieces of round or square lead, tied to the end of each thread of the long-harnesses to keep them tight. 14. The broad piece of wood, about a foot square, leaning somewhat forward, intended to cafe the weaver as he floops to his shuttle; it is fixed in the middle of the braid-beam. Some weavers, instead of this, have a contrivance of a cord or rope that is fastened to the front-frame, and comes across his breast: this is called a flopfall. 15. The feat-bench; this leans forward very much. 16. The foot-rip to the tredtles. 17. The braid-beam, being a crofs- bar that paffes from one of the flames to the other, fo as to front the workmans breast; to this braff-bar is fixed a roll, upon which the ribbon paffes in its way to be rolled upon the roller, that turns a little below. 18. The clamps, or pieces of wood, in which the broaches that confine the tredtles reft. 19. The tredtles are long narrow pieces of wood, to the ends of which the cords that move the liffes are faftened. 20. The tredtle-cords are only distinguished from the riding-cords by a board full of holes, which divide them, in order to prevent the plate-leads, which are tied to the high-lifles, from pulling them too high when the workman's foot is off the treddle; which stop is made by a knot in the tredtle-cord, too big to be forced through that hole in the board. 21. The lames are two pieces of thin narrow boards, only used in plain works, and then to supply the place of the long-harnesses. 22. The knee-roll, by which the weaver rolls up his ribbon as he paffes proper, or by bit and bit as it is finifhed. 23. The back-rolls, on which the warp is rolled. It is to be observed, that there are always as many rolls as colours in the work to be wrought. 24. The clamps, which support the rollers. 25. The return-rolls, or, as others call them, the return, or the rumble, or pulleys, to which the tiers are tied, to clear the course of cords through the high-lifles. 26. The catch-board for the tumblers. 27. The tire-board. 28. The buttons for the knee-rolls and tredtle-board, described in number 20.

Ribbons of all sorts are prohibited from being imported into Britain.

RIBANDS (from rid and bend), in naval architecture,
Ribands, long narrow flexible pieces of timber, nailed up on the outside of the ribs, from the stem to the flern-pott, so as to envelope the ship lengthwise, and appear on her side and bottom like the meridians on the surface of the globe. The ribands being judiciously arranged with regard to their height and distance from each other, and forming regular sweeps about the ship's body, will compose a kind of frame, whose interior surface will determine the curve of all the intermediate or filling-timbers which are stationed between the principal ones. As the figure of the ship's bottom approaches that of a conoid, and the ribands have a limited breadth, it is apparent that they cannot be applied to this convex surface without forming a double curve, which will be partly vertical and partly horizontal; so that the vertical curve will increase by approaching the stem, and still more by drawing near the stern-pott. It is also evident, that by deviating from the middle line of the ship's length, as they approach the extreme breadth at the midship-frame, the ribands will also form an horizontal curve. The lowest of these, which is terminated upon the stem and stern-pott, at the height of the rising-line of the floor, and answers to the upper part of the floor-timmer upon the midship-frame, is termed the floor-riband. That which coincides with the wing-tramunt, at the height of the lower-deck upon the midship-frame, is termed the breadth-riband; all the rest, which are placed between these two, are called intermediate ribs. See Ship-building.

Ribes, the Currant and Gooseberry-bush: A genus of the monogyna order, belonging to the pentandria class of plants; and in the natural method ranking under the 36th order, Pomacea. There are five petals, and flavina inserted into the calyx; the style is bifid; the berry polysemiferous, inferior.

The currant and the gooseberry were long considered each as a separate genus; ribes the currant, and groesfularia the gooseberry, but now they are commonly included together, the groesfularia being made a species of ribes, all the currant kinds having inermous or thornless branches, and racemose clusters of flowers and fruit, and the gooseberry, have spinous branches, and flowers and fruit for the most part fingly.

There are three species of the currant-tree, two of which, and their varieties, merit culture for their fruit; the other as a plant of variety for observation: all of which are thorned or unarmed, having no thorns on the branches.

1. Rubrum, common red-currant tree, &c. hath a shrunby stem, dividing low into many branches, forming a bushy head, five or six feet high or more, without thorns; broad trilobate leaves, and smooth pendulous clusters of plane greenish flowers, succeeded by small clusters of berries. It grows naturally in woods and the hedges, in most parts of Europe, and comprires all sorts of red and white currants; as, common small red currant—large bunched red currant—Champaigne pale-red currant—common small white currant—large white Dutch currant—yellow blotched-leaved currant—silver striped leaved—gold striped leaved—gooseberry-leaved. All these sorts are varieties of one species, ribes rubrum, or common red currant; it being the parent from which all the others were first obtained from the seed, and improved by culture. They all flower in the spring, and the fruit ripens in June and July; and by having the trees in different situations and modes of training, such as plantations of standards in the open quarters for the general supply, others trained against walls or pales of different kinds, the fruit may be continued ripe in good perfection from about the middle of June until November, provided the later crops are defended with mats or nets from the birds.

2. The nigrom, or black currant tree, hath a shrunby stem, dividing low into many branches, forming a bushy head five or six feet high; broad trilobate leaves of a rank odour, and having racemose clusters of oblong greenish flowers, succeeded by thin clusters of black berries. The fruit of this species being of a strong flavour, and somewhat physical relish, is not generally liked; it, however, is accounted very wholesome: there is also made of it a syrup of high estimation for sore throats and quinsies; hence the fruit is often called feijunancy berries. There is a variety called the Pennsylvania black currant, having smaller flowers and leaves, not strong leaved, and small fruit but of little value; to the shrub is esteemed only for variety and shrubbberies. The mode of bearing of all the varieties of currants is both in the old and young wood all along the sides of the branches and shoots, often upon a fort of small sprigs and fronds, producing the fruit in numerous long pendulous clusters.

The groesfularia, or common gooseberry bush, rives, with a low shrubby stem, dividing low into a very bushy head, armed with spines; trilobate smallish leaves, having hairy ciliated footstalks; and small greenish flowers, succeeded by hairy berries. It consists of many varieties, of different sizes and colours.

3. The reclusatum, or reclined broad-leaved gooseberry-bush, rives, with a low shrubby stem, and reclinaed somewhat prickly branches, trilobate broadish leaves, and small greenish flowers, having the pedunculi furnished with thryphyllous bractea.

5. The oxyacanthoideae, or oxyacantha-leaved gooseberry, hath a shrubby stem, and branches armed on all fides with spines, and largish trilobate hawthorn leaves.

6. The uva crispa, or smooth gooseberry, hath a shrubby stem, and branches armed with spines; trilobate leaves; pedicles having monophyllous bractea; and smooth fruit.

7. The eumohina, or prickly-fruitied gooseberry bush, hath a shrubby stem, and branches armed with spines, mostly at the axills, and prickly fruit in clusters.

All the above seven species of ribs, both currants and gooseberry kinds, and their respective varieties, are very hardy shrubs, that prosper almost anywhere, both in open and shady situations, and in any common soil; bearing plentifully in any exposure, though in open sunny situations they produce the largest and fairest fruit, ripening to a richer vinous flavour; but it is eligible to plant them in different situations and aspects, in order to have the fruit as early and late as possible.

They are commonly planted in the kitchen-garden, mostly as dwarf standards, in the open quarters, for the general supply; being disposed sometimes in continued plantations in rows, eight or ten feet by fix aunder, where great quantities of the fruit are required for market or other large supplies; and are sometimes disposed in single ranges round the outward edge.
edge of the quarters, eight feet asunder; frequently in single rows, in order to divide the ground into separate wide plots or beds, of from 20 to 30 or 40 feet wide, which also serves to shelter the ground a little and to make them as standards; they should be generally trained up to a single stem about a foot high, then suffered to branch out every way all around into bulky heads, keeping the middle, however, open, and the branches moderately thin, to admit the sun and free air; though if some are fanned, that is, trimmed on two sides oppositely, so as to make the other branches range in a line like an epalp, they will take up much less of the ground, and, by admitting the sun and air more freely, they will produce large fair fruit. They are likewise trained against walls or paitings, like other wall-trees, but principally some of the large red and white Dutch currants, in which they will produce fine large fruit, and those against any south fence will ripen earlier, and be high flavoured; but it is proper to plant a few both against south, north, east, and west walls, in order to obtain the fruit ripe both early and late, in a long succession. It is also proper to plant a few of the finest sorts of gooseberries against a warm fence, both to have early green gooseberries for tarts, &c., as well as to ripen early; and they will grow very large and fine. Sometimes both currants and gooseberries are also trained in low epalps for variety, and they produce very fine fruit.

The fruits both of the currant and gooseberry are of an acid and cooling nature, and as such are sometimes used in medicine, especially the juice reduced to a jelly by boiling with sugar. From the juice of currants also a very agreeable wine is made.

RICAUT, or RICAUT (Sir Paul), an eminent English traveller, of the time of whose birth we find no account; but in 1661, he was appointed secretary to the earl of Winchelsea, who was sent ambassador extraordinary to the Ottoman Porte. During his continuance in that station, he wrote, "The present State of the Ottoman Empire, in three books, containing the maxims of the Turkish policy, their religion, and military disciplines," London, folio, 1670. He afterwards resided 11 years as consul at Smyrna, where, at the command of Charles II. he composed "The present state of the Greek and Armenian Churches, anno Chifii 1678." On his return, Lord Clarendon being appointed lord-lieutenant of Ireland, made him his principal secretary for Leinster and Connaught: king James II. knighted him; and made him one of the privy council in Ireland, and judge of the court of admiralty; all which he held till the Revolution. He was employed by King William as resident at the Hanse-towns in Lower Saxony, where he continued for ten years; but being worn out with age and infirmities, he obtained leave to return in 1700, and died the same year. Ricaut continued "Knolles's History of the Turks, and Plutarch's Lives of the Popes" besides which, there are some other productions under his name.

RICCIA, in botany: A genus of the natural order of algae, belonging to the cryptogamia class of plants. There is no calyx, but a vescular cavity within the substance of the leaf. There is no corolla; the anthers are cylindrical, and fertile, placed on the stem, which is turbinated; the style is filiform, perforating the anther; and the seed-case is spherical, crowned with the withered anthera; the seeds are hemispherical and pedicellated.

RICE. See ORYZA. "Rice bras" (says Mr Martin), which in the huku, is in India called padder, and assumes a different name in each of its other various states. We observe no distinction of this kind in Europe, where our grain retains through all its stages, till it becomes flour, its original name of barley, wheat, or oats. The following, besides many others, are names applied to rice, in its different stages of growth and preparation: padder, original name of the seed; ossey, grain of last season; bummer, the plants before removed to the sawows: bras or brag, rice, the huku of the padder being taken off: charroop, rice cleaned for boiling; suffer, boiled rice: poorang, yellow rice: jumbar, a service of rice, &c.

Among people whose general objects of contemplation are few, those which do of necessity engage their attention, are often more nicely discriminated than the same objects among more enlightened people, whose ideas ranging over the extensive field of art and science, disdain to fix long on obvious and common matters. Padder, on Sumatra and the Malay islands, is distinguished into two sorts; Laddang or up-land padder, and Sawoor or low-land, which are always kept separate, and will not grow reciprocally. Of these the former bears the higher price, being a whiter, heartier, and better flavoured grain, and having the advantage in point of keeping. The latter is much more prolific from the seed, and liable to less risk in the culture, but is of a watery substance, produces less increase in boiling, and is subject to a swifter decay. It is, however, in more common use than the former. Beside this general distinction, the padder of each sort, particularly the Laddang, presents a variety of species, which, as far as my information extends, I shall enumerate, and endeavour to describe. The common kind of dry ground padder: colour, light brown: the rice rather large, and very little crooked at the extremity. Padder andillong dry ground: short round grain: grows in whirls or bunches round the stalk. Paddeebahai dry ground: large grain: common. Padder gaiton dry ground: light coloured: fascie. Paddeefonner dry ground: deep coloured: small grain: fascie. Padder ejors dry ground: light coloured. Padder kooning: dry ground: deep yellow: fine rice: crooked, and pointed. Padder coocor ballum: dry ground: much esteemed: light coloured: small, and very much crooked, resembling a dove's nail, from whence its name. Padder pefang dry ground: outer coat light brown: inner red: longer, smaller, and less crooked than the coocor ballum. Padder santong: the finest sort that is planted in wet ground: small, straight, and light coloured. In general it may be observed that the larger grained rice is the least esteemed, and the smaller and whiter the most prized. In the Lampoon country they make a distinction of padder crowong and padder jeroog: the former of which is a month earlier in growth than the latter.

Rice-Bird. See ORYZIYERA.

Rice-Bunising. See EMBERIZA.

RICHARD I. II. and III. kings of England. See ENGLAND

RICHARDIA, in botany: A genus of the monogamia order, belonging to the hexandria class of plants: and
Richardson and in the natural method ranking under the 47th order, Stellata. The calyx is sestarpart; the corolla monopetalous, and subhyaline; and there are three seeds.

Richardson (Samuel), a celebrated English sentimental novel-writer, born in 1688, was bred to Johnfon, in his business of a printer, which he exercised all his life with eminence. Though he is said to have understood no language but his own, yet he acquired great reputation by his three epistolary novels, intituled Pamela, Clarissa, and Sir Charles Grandison; which show an uncommon knowledge of human nature. His purpose being to promote virtue, his pictures of moral excellence are by much too highly coloured; and he has described his favourite characters such rather as we might with them to be, than as they are to be found in reality. It is also objected by some, that his writings have not always the good effect intended: for that, instead of improving natural characters, they have fashioned many artificial ones; and have taught delicate and refined ladies and gentlemen to despise everyone but their own self-exalted persons. But after all that can be urged of the ill effects of Mr Richardson's novels on weak minds, eager to adopt such models of perfection, than of those nearer to the natural standard of human frailty, and where those frailties are artfully exaggerated so as to fix and misemploy the attention on them. A stroke of the palsy carried off Mr Richardson, after a few days illness, upon the 4th of July 1761. He was a man of fine parts, and a lover of virtue; which, for aught we have ever heard to the contrary, he showed in his life and conversation as well as in his writings. Besides the works abovementioned, he is the author of an Aesop's Fables, a Tour through Britain, 4 vols. and a volume of Familiar Letters upon business and other subjects. He is said from his childhood to have delighted in letter-writing; and therefore was the more easily led to throw his romances into that form; which, if it enlivens the history in some respects, yet lengthens it with uninterseting prate, and formalities that make their effect, and on that account is sometimes found little tedious and fatiguing.

The most eminent writers of his own country, and even of foreign parts, have paid their tribute to the transcendantal talents of Mr Richardson, whose works have been published in almost every language and country of Europe. They have been greatly admired, notwithstanding every diffimillitude of manners, or every disadvantage of translation. M. Diderot, a late celebrated French author, speaking of the means employed to move the passions, in his Essay on Dramatic Poetry, mentions Richardson as a perfect master of that art: "How striking (says he), how pathetic, are his descriptions! His personages, though silent, are alive before me; and those who speak, the actions are still more affecting than the words."—The famous John James Rousseau, speaking, in his letter to M. d'Alembert, of the novels of Richardson, afferts, "that nothing was ever written equal to, or even approaching them, in any language."—Mr Aaron Hill calls his Pamela a "delightful surfey of virtue."—Dr Warton speaks thus of Clementina: "Of all representations of madness, that of Clementina, in the History of Sir Charles Grandison, Vol. XVI, is the most deeply interesting. I know not whether even the madness of Lear is wrought up, and express'd, by so many little strokes of nature and passion. It is absolute pedantry to prefer and compare the madness of Orestes in Euripides to this of Clementina."—Dr Johnson, in his Introduction to the 97th number of the Rambler, which was written by Mr Richardson, observes, that the reader was indebted for that day's entertainment to an author, "from whom the age has received greater favours, who has enlarged the knowledge of human nature, and taught the passions to move at the command of virtue;" and, in his Life of Rowe, he says, "The character of Lovelace seems to have been expanded by Richardson into that of Lovelace; but he has excelled his original in the moral effect of the fiction. Lovelace, with gaiety which cannot be hated, and bravery which cannot be despised, retains too much of the spectator's kindnss. It was in the power of Richardson alone to teach us at once esteem and detestation; to make virtuous resentment overpower all the benevolence which wit, and elegance, and courage, naturally excite; and to lose at last the hero in the villain."—Dr Young very pertinently observed, that Mr Richardson, with the mere advantages of nature, improved by a very moderate progress in education, stuck out at once, and of his own accord, into a new province of writing, in which he succeeded to admiration. And what is more remarkable, that he not only began, but finished, the plan on which he set out, leaving no room for any one after him to render it more complete: and that not one of the various writers that have ever since attempted to imitate him, have in any respect equalled, or at all approached near him. This kind of romance is peculiarly his own; and "I consider him (continues the Doctor) as a truly great natural genius; as great and supereminent in his way as Shakespeare and Milton were in theirs."

Richardson (Jonathan), a celebrated painter of Walpole's Anecdotes of Painting in England, was born about the year 1665, and against his inclination was placed by his father-in-law apprentice to a scrivener, with whom he lived six years; when obtaining his freedom by the death of his master, he followed the bent of his disposition, and at 20 years old became the disciple of Riley; with whom he lived four years, whose niece he married, and of whose manner he acquired enough to maintain a solid and lafiting reputation, even during the lives of Kneller and Dahl; and to remain at the head of the profession when they went off the stage.

There is strength, roundness, and boldness in his colouring; but his men want dignity, and his women grace. The good sense of the nation is characterised in his portraits. You see he lived in an age when neither enthusiasm nor fertility were predominant. Yet with a pencil so firm, possess'd of a numerous and excellent collection of drawings, full of the theory, and profound in reflections on his art, he draw nothing well below the head, and was void of imagination. His attitudes, draperies, and back-grounds, are totally infipid and unmeaning; so ill did he apply to his own practice the flagious rules and hints he bestowed on others. Though he wrote with fire and judgment, his paintings owed little to either. No man dived deeper into the inexhaustible stores of Raphael, or was more intimate with the native sublire of Vandyke. Yet though capable...
Richardson, life of painting the elevation of the one and the elegance of the other, he could never contrive to see with their eyes, when he was to copy nature himself. One wonders that he could comment their works so well, and imitate them so little.

He quitted business himself some years before his death; but his temperance and virtue contributed to protract his life to a great length in the full enjoyment of his understanding, and in the felicity of domestic friendship. He had had a paralytic stroke that affected his arm, yet never disabled him from his exercise and walks. He had been in St. James's Park, and died suddenly at his house in his 80th year of age. He left a son and four daughters, one of whom was married to his disciple Mr. Hudson, and another to Mr. Grignon an attorney. The tale and learning of the son, and the harmony in which he lived with his father, are visible in the joint works they composed. The father in 1719 published two discourses: 1. An Essay on the whole Art of Criticism as it relates to Painting; 2. An Argument in behalf of Painting.

The sale of his pictures, in February 1747, lasted 18 days, and produced about 2000 l. His pictures about 700 l. Hudson his son-in-law bought many of the drawings.

Richelet (Cesar Peter), a French writer, born in 1671 at Chemin in Champagne. He was the friend of Racine and Ablancourt; and like them applied himself to the study of the French language with success. He compiled a dictionary of that language, full of new and useful remarks; but exceptionable, as containing many factitious reflections and obscurities. The best edition is that of Lyons, 3 vols folio, 1728. He also collected a small dictionary of rhymes, and composed some other pieces in the grammatical and critical way. He died in 1698.

Riches, a word used always in the plural number, means wealth, money, possession, or a splendid sumptuous appearance. When used to express the fortune of private persons, whether patrimonial or acquired, it signifies opulentia; terms which express not the enjoyment, but the possession, of numerous superfluities. The riches of a state or kingdom expresses the produce of industry, of commerce, of different incorporated bodies, of the internal and external administration of the principal members of which the society is composed.

Our Saviour says that it is more easy for a camel to go through the eye of a needle, than for a rich man to enter the kingdom of heaven; and we find, in fact, that riches frequently bring along with them a degree of inattention, lukewarmness, and irreligion, such as sufficiently confirms the divine assertion; which is merely a general truth, and which by no means afferts the absolute impossibility of being virtuous and rich at the same time. For as the ancient philosophers wisely taught, riches, confidered in themselves, and abstracted from the bad purposes to which they may be applied, are not necessarily incompatible with virtue and widom. They are indeed absolutely indifferent; in good hands they will be useful, and promote the cause of truth, virtue, and humanity; and in bad hands they are the source of much mischief; on the one hand they confer the power of doing much good, and on the other they are equally powerful in doing ill.

To men, however, whose principles of virtue are not sufficiently founded, riches are unquestionably a dangerous and seducing bait; and as the ancients rightly taught, they are to the greatest number of men, in an infinite
infinite variety of circumstances, a powerful obstacle to the practice of moral virtues, to the progress of truth, and a weight which prevents them from rising to that degree of knowledge and perfection of which human nature is capable. They multiply without ceasing the occasions of vice, by the facility which they give to satisfy a multitude of irregular passions, and to turn at length those who are attached to them from the road of virtue, and from the desire of enquiring after truth.

It is this which Seneca means to express, when he says, "that riches in a vast number of cafes have been a great obstacle to philosophy; and that, to enjoy freedom of mind necessary for study, a man must live in poverty, or as if he were poor. Every man (adds he) who wishes to lead a pleasant, tranquil, and secure life, must avoid, as much as possible, the deceitfulness of riches, which are a bait with which we allow ourselves to be taken as in a snare, without afterwards having the power to extricate ourselves, being so much the more unhappy, that we believe we possess them, while, on the contrary, they tyrannize over us." Senec. Epist. 17, and Epist. 8.

"The wise man (says the same author in another place) does not love riches to excess, but he would not choose wholly to divest himself of them; he does not receive them into his soul, but into his house; he is careful of them, and employs them for the purpose of opening a wide field for virtue, and of making it appear in all its splendor. Who can doubt that a wise man has not more occasions of displaying the elevation and greatness of his mind when he is possessed of riches than when he labours under indigence, since, in the last condition, he can exercise only one virtue, namely, resignation; whereas, riches give him an opportunity of displaying, in their greatest lustre, the virtues of temperance, liberality, diligence, regularity, and magnificence. There is no occasion, then, to prohibit philosophers from the use of wealth, or to condemn wisdom to poverty. The philosopher may possess the greatest riches, provided he has not employed force or shed blood in acquiring them; provided he has not gained them by unjust or illegal means; in a word, provided the use which he makes of them be as pure as the source from which they were derived, and no pernicious (the envious excepted) regretting his possession; he will not refuse the kindness of fortune, and will enjoy, without shame or pride, the wealth acquired by honest means; he will have more reason to glory, if, after exhausting his riches to the view of the whole world, he can defray any person to carry away the reward of treachery or the fruits of oppression. If, after these words, his riches continue undiminished, this man is truly great, and worthy to be rich. If he has not allowed to enter into his possession the smallest piece of money gained by unwarrantable means, neither will he refuse the greatest riches, which are the blessings of fortune, and the fruit of virtue: if he can be rich, he will choose to be so, and he shall have riches; but he will regard them as blessings of uncertain possession, and of which he may be every moment deprived; he will not permit them to be a load to himself or to others; he will give them to the good, or to them whom he would make good; but he will give them with the nicest wisdom, taking care always to distribute them to the most worthy, and to those who remember that they must give an account, as well of the wealth which they receive from heaven, as of the purposes to which it is applied." Senec. de Vita Beata, cap. 21, 22, & 23.

RICHELIEU (John Armand du Pléaux de), cardinal of Richelieu and Froniat, bishop of Lucan, &c. was born at Paris in 1585. He was of excellent parts; and at the age of 22 had the address to obtain a dispensation to enjoy the bishopric of Lucan in 1657. Entering into France, he applied himself in a particular manner to the foundation of preaching; and his reputation this way procured him the effect of an almoner to the queen Mary de Medicis. His abilities and management of affairs advanced him to be secretary of state in 1616; and the king soon gave him the preference to all his other secretaries. The death of the marquis d'Ancre having produced a revolution in state affairs, Richelieu retired to Avignon; where he employed himself in composing books of controversy and piety. The king having recalled him to court, he was made cardinal in 1622; and, three years after, first minister of state, and grand master of the navigation. In 1626, the isle of Rhéa was preferred by his care, and Rochelle taken, having flopped up the haven by that famous dyke which he ordered to be made there. He accompanied the king to the siege of Caër, and contributed not a little to the raising of it in 1629. He also obliged the Huguenots to the peace at Alets, which proved the ruin of that party; he took Pamerol, and succoured Caër besieged by Spinola. In the mean time the nobles found fault with his conduct, and persuaded the king to dismiss him. The cardinal, for his part, was unmoved with it; and by his reasonings overthrew what was thought to be determined against him; so that, instead of being disgraced, he from that moment became more powerful than ever. He punished all his enemies in the same manner as they would have had him suffer; and the day which produced this event, so glorious to cardinal Richelieu, was called the day of dupes. This able minister had from thenceforward an ascendancy over the king's mind; and he now resolved to humble the exeeptive pride of the house of Austria. For that purpose he concluded a treaty with Guilielms Adolphus king of Sweden, for carrying the war into the heart of Germany. He also entered into a league with the duke of Bavaria; secured Lorrain; raised a part of the princes of the empire against the emperor; treated with the Dutch to continue the war against Spain; favoured the Catalans and Portuguese till they shook off the Spanish yoke; and, in short, took so many different measures, that he accomplished his design; and after having carried on the war with success, was thinking of concluding it by a peace, when he died at Paris on the 9th of December 1642, aged 58. He was interred in the Sorbonne, where a magnificent mausoleum is erected to his memory. This great politician made the arts and sciences flourish; formed the botanical garden at Paris, called the king's garden; founded the French academy; established the royal printing-house; erected the palace; afterwards called Le Palais Royal, which he presented to the king; and rebuilt the Sorbonne with a magnificence that appears truly royal. Besides his books of controversy and piety, there go under the name of this minister, A Journal, in 2 vols 12mo; and a Political Testament, in 12mo; all treating of politics and state affairs. Cardi-
Ricinus

The ricinus Americanus grows as tall as a little tree, and is so beautiful that Millar says it deserves a place in every curious garden, and he planted it himself at Chelsea. It expands into many branches; the leaves are sometimes two feet in diameter, and the stem as large as a middle-sized broom staff; towards the top of the branch it has a cluster of flowers, something resembling a bunch of grapes; the flowers are small and flaminous, but on the body of the plant grow bunches of rough triangular hulks, each containing three speckled seeds, generally somewhat less than horse beans; the shell is brittle, and contains white kernels of a sweet, oily, and nauseous taffle. From this kernel the oil is extracted, and if the medicine should become officinal, the seeds may be imported at a reasonable rate, as the plant grows wild and in great plenty in all the British and French American islands. See Olism Palma Christi.

Of the ricinus communis there are a great many varieties; all of them fine majestic plants, annual, or at most biennial, in Britain; but in their native soil they are said to be perennial both in root and stem. They are propagated by seeds sown on a hot-bed, and require the same treatment as other tender exotics.

Ricketts, in medicine. See there, No. 347.

Ricocchet, in gynnery, is when guns, howitzers, or mortars, are loaded with small charges, and elevated from 5 to 12 degrees, so as to fire over the parapet, and the shot or shell rolls along the opposite rampart; it is called ricocchet-firing, and the batteries are likewise called ricocchet-batteries. This method of firing was first invented by M. Behlod, and first used at the siege of Ath in 1697. This mode of firing out of mortars was first tried in 1723 at the military school at Strauburg, and with success. At the battle of Rolfbach, in 1757, the king of Prussia had several 6-inch mortars made with trunnions, and mounted on traveling-carriages, which fired obliquely on the enemy’s lines, and amongst their horses, loaded with 8 ounces of powder, and at an elevation of one degree, 15 minutes, which did great execution; for the shells rolling along the lines, with burning fuses, made the stoutest of the enemy not wait for their burial.

Ricota, in botany: A genus of the filiquofa order, belonging to the tetradyanamia class of plants; and in the natural method ranking under the 39th order, Silvica. The filiaca is unilocular, oblong, and compressed with plain valves.

Rid, RIDGEL, or RIDGE, in agriculture, a long piece of rising land between two furrows. See Agriculture, No. 111.

Ridgeling, or Ridgel, among farriers, &c. the male of any beast that has been but half-gaited.

Ridicule, in matters of literature, is that species of writing which excites contempt with laughter.

The ridiculous, however, differs from the risible, (see Risible.) A risible object produces an emotion of laughter merely; a ridiculous object is improper as well as risible; and produces a mixed emotion, which is vented by a laugh of derision or scorn.

Burlesque, though a great engine of ridicule, is not confined to that subject; for it is clearly distinguishable into burlesque that excites laughter merely, and
Ridicule is a burlesque poem of the other sort, laying hold of a low and trifling incident, to expose the luxury, indolence, and contentious spirit of the subject, by dressing it in the heroic style, and affecting to consider it as of the utmost dignity and importance. In a composition of this kind, no image professedly ludicrous ought to find quarter, because such images destroy the contrariety; and accordingly the author shows always the grave face, and never once betrays a smile.

Though the burlesque that aims at ridicule produces its effects by elevating the style far above the subject, yet it has limits beyond which the elevation ought not to be carried: the poet, confounding the imagination of his readers, ought to confine himself to such images as are lively and readily apprehended: a burlesque poem without having ridicule for its chief aim; giving way, however, to ridicule where it arises naturally from a trifling incident, to expose the luxury, indolence, and contentious spirit of the subject, by dressing it in the heroic style, and affecting to consider it as of the utmost dignity and importance. In a composition of this kind, no image professedly ludicrous ought to find quarter, because such images destroy the contrariety; and accordingly the author shows always the grave face, and never once betrays a smile.

The Rape of the Lock is of a character clearly distinguishable from those now mentioned; it is not properly a burlesque performance, but what may rather be termed an heroico-comical poem: it treats a gay and familiar subject with piafancy, and with a moderate degree of dignity: the author puts not on a mask like Boileau, nor professes to make us laugh like Tasso. The Rape of the Lock is a genteel species of writing, less strained than that of Boileau, and is pleasant or ludicrous without having ridicule for its chief aim; giving way, however, to ridicule where it arises naturally from a particular character, such as that of Sir Plume. Addison's Spectator, upon the exercise of the fan, is extremely gay and ludicrous, resembling in its subject the Rape of the Lock.

There remains to show, by examples, the manner of treating subjechts so as to give them a ridiculous appearance.

Il ne dit jamais, je vous donne, mais, je vous prête au bon jour.

Molière.

Orlans. I know him to be valiant.

Contestable. I was told that by one that knows him better than you.

Orlans. What's he?

Contestable. Marry, he told me so himself; and he said, he car'd not who knew it.

Henry V. Shakespeare.

He never broke any man's head but his own, and that was against a poet when he was drunk.

Molière. Sententious Mirabel! prithee don't look with that violent and inflexible wife face, like Solomon at the dividing of the child in an old tapestry-hanging.

Way of the World. A true critic, in the perusal of a book, is like a dog at a feast, whose thoughts and stomach are wholly fe from what the guests fling away, and consequently is apt to sniff moli when there are the fewest bones.

Tale of a Tub. In the following instances, the ridicule arises from absurd conceptions in the persons introduced.

Mascarille. Te souviens-tu, vicomte, de cette demi-lune, que nous emportames par les enfans au fide d'Airas?

Molière, les Précieuses Ridicules, ft. 11. Fodelet. Que veux-tu dire avec ta demi-lune? c'est bien une lune tout entiere.

Molière, les Précieuses Ridicules, fe. 11.

Slander. I came yonder at Eaton to marry Mrs Anne Page; and she's a great burlesquely boy.

Page. Upon my life then you took the wrong—

Slander. What need you tell me that? I think so when I took a boy for a girl: if I had been married to him, for all he was in woman's apparel, I would not have had him.

Merry Wives of Windsor.

Valentine. Your blessing, Sir.

Sir Sampfon. You've had it already, Sir: I think so:

sent it you to-day in a bill for four thousand pound; a great deal of money, brother Forethought.

Forethought. Ay, indeed, Sir Sampfon, a great deal of money for a young man: I wonder what he can do with it.

Love for Love, act 2. ft. 7.

Millament. I nauseate walking; 'tis a country diversion; I lothe the country, and every thing that relates to it.

SIR WIFULL. Indeed, hah! looke ye, looke ye, you do? nay, 'tis like you may—here are choice of pastimes here in town, as plays and the like; that must be confesse'd, indeed.

Millament. Ah l'etourdie! I hate the town too.

SIR WIFULL. Dear heart, that's much—hah! that you should hate 'em both! hah! 'tis like you may; there are some can't relife the town, and others can't away with the country—'tis like you may be one of thefe, Cousin.

Lord Froth. I affure you, Sir Paul, I laugh at nobody's jefts but my own, or a lady's: I affure you, Sir Paul.

Brisk. How? how, my Lord? what, affront my wit? Let me perifh, do I never fay any thing worthy to be laugh'd at?

Lord Froth. O foy, don't misapprehend me, I don't say fo, for I often fmile at your conceptions. But there is nothing more unbecoming a man of quality than to laugh; 'tis fuch a vulgar exrefion of the paffions! every body can laugh. Then especially to laugh at the jefl of an inferior perfon, or when any body el's of the fame quality does not laugh with one; ridiculous! To be pleas'd with what pleafes the crowd! Now, when I laugh I always laugh alone.

Double Dealers, act 1. ft. 4.
RID [238] RID

RIDICULE. So sharp-fought is pride in blemishes, and so willing to be gratified, that it takes up with the very slightest improprieties: such as a blunder by a foreigner in speaking our language, especially if the blunder can bear a face that reflects on the speaker:

 Quickly. The young man is an honest man.

Caius. What shall I do? He is in my closet? There is no honest man that shall come in my closet.

Merry Wives of Windsor.

Love speeches are finely ridiculed in the following passage.

Quoth he, My faith as adamantine,
As chains of destiny, I’ll maintain;
True as Apollo ever spoke,
Or oracle from heart of oak;
And if you’ll give my flame but vent,
Now in cloak hugger-mugger pent,
And thine upon me but benignly,
With that one and that other pigney,
The fun and day shall fooner part
Than love, or you, shake off my heart;
The fun, that shall no more dispence
His own, but your bright influence:
I’ll carve your name on barks of trees,
With true love-knots and flourishes;
That shall infuse eternal spring,
And everlasting flourishing:
Drink every letter on’t in fum,
And make it brisk campaign become.
Where’er you tread, your foot shall fet
The primrose and the violet;
All spices, perfumes, and sweet powders,
Shall borrow from your breath their odours;
Nature her charter fhall renew
And take all lives of things from you;
The world depend upon your eye,
And, when you frown upon it, die.
Only our loves shall still survive,
New worlds and natures to out-live;
And, like to herald’s moons, remain
All crefcents, without change or wane.

Hudibras, part 2. can. 1.

Those who have a talent for ridicule, which is seldom united with a taste for delicate and refined beauties, are quick-fought in improprieties; and these they eagerly grasp, in order to gratify their favourite propensity. Perons galled are provoked to maintain that ridicule is improper for grave subjects. Subjects really grave are by no means fit for ridicule; but then it is urged against them, that, when called in question whether a certain subject be really grave, ridicule is the only means of determining the controversy. Hence a celebrated question, Whether ridicule be or be not a test of truth?

On one side, it is observed, that the objects of ridicule are falsehood, incongruity, impropriety, or turpitude of certain kinds: but as the object of every excited passion must be examined by reason, before we can determine whether it be proper or improper; so ridicule must, apparently at least, establish the truth of the improprieties designed to excite the passion of contempt. Hence it comes in to the aid of argument and reason, when its impressions on the imagination are consistent with the nature of things; but when it strikes the fancy and affections with fallacious images, it becomes the instrument of deceit. But however ridicule may impress the idea of apparent turpitude or falsehood in the imagination, yet still reason remains the supreme judge; and thus ridicule can never be the final test or touchstone of truth and falsehood.

On the other side, it is contended that ridicule is not a subject of reasoning, but of sense or taste; (see and compare the articles Risible and Congruity.) Stating the question, then, in more accurate terms, Whether the sense of ridicule be the proper test for distinguishing ridiculous objects from what are not so? they proceed thus: No person doubts that our sense of beauty is the true test of what is beautiful; and our sense of grandeur, of what is great or sublime. Is it more doubtful whether our sense of ridicule be the true test of what is ridiculous? It is not only the true test, but indeed the only test; for this subject comes not, more than beauty or grandeur, under the province of reason. If any subject, by the influence of fashion or custom, have acquired a degree of reverence, to which naturally it is not intitled, what are the proper means for wiping off the artificial colouring, and displaying the subject in its true light? A man of true taste sees the subject without difficulty; but if he hesitate, let him apply the test of ridicule, which separates it from its artificial connections, and exposes it naked with all its innate improprieties. But it is urged, that the grave and most serious matters may be set in a ridiculous light. Hardly so; for where an object is neither ribile nor improper, it lies not open in any quarter to an attack from ridicule.

RIDING, in general, signifies the being carried along on any vehicle.

Riding on horseback. See Horsemanship.

Riding, in medicine. During this exercise all the viscera are shaken, and pressed against each other; at the same time the pure air acts with a greater force on the lungs. Weakly persons, or those whose stomachs are in firm, should, however, be cautious of riding before their meals are somewhat digested.

Riding, in naval affairs. The state of a ship’s being retained in a particular station, by means of one or more cables with their anchors, which are for this purpose sunk into the bottom of the sea, &c.

Riding Abroad, the position of a ship which lies across the direction of the wind and tide, when the former is so strong as to prevent her from falling into the current of the latter.

Riding between the Wind and Tide, the situation of a vessel at anchor, when the wind and tide are upon her in direct opposition, in such a manner as to destroy the effort of each other upon her hull; so that she is in a manner balanced between their reciprocal force, and rides without the least strain on her cables. When a ship does not labour heavily, or feel a great strain when anchored in an open road or bay, she is said to ride easy. On the contrary, when she pitches violently into the sea, so as to strain her cables, masts, or hull, it is called riding hard, and the vessel is termed a bad reader.
Riding.

A digit is rarely said to ride when the is tattened at both the ends in a harbour or river, that situation being comprehended in the article Mooring.

Riding, a district visited by an officer.—Yorkshire is divided into three ridings or, viz. the east, west, and north ridings. In all districts in that county, both the town and riding must be expressed.

Riding, as connected with gardening and susceptible of embellishment. See Gardening.

Observations on Modern Gardening, p. 247, &c.

1 Decorations of a riding.

A riding, though in extent differing so widely from a garden, yet agrees with it in many particulars: for, exclusive of that community of character which results from their being both improvements, and both defined to pleasure, a closer relation arises from the property of a riding, to extend the idea of a feat, and appropriate a whole country to the mansion; for which purpose it must be distinguished from common roads, and the marks of distinction must be borrowed from a garden. Those which a farm or a park can supply are faint and few; but whenever circumstances belonging to a garden occur, they are immediately received as evidence of the domain. The species of the trees will often be decisive: plantations of firs, whether placed on the sides of the way, or in clumps or woods in the view, denote the neighbourhood of a feat; even limes and horse-chefs-nuts are not indifferent; for they have always been frequent in improvements, and rare in the ordinary scenes of cultivated nature. If the riding be carried through a wood, the shrubs, which for their beauty or their fragrance have been transplanted from the country into gardens, such as the sweet-brier, the viburnum, the euonymus, and the wood-bine, should be encouraged in the underwood; and to these may be added several which are still peculiar to shrubberies, but which might equally excel in a riding, except in a park or a garden; it has an elegance in the disposition which cannot be attributed to accident, and it seems to require a degree of preservation beyond the care of mere husbandry. A neat railing on the edge of a steep which commands a prospect, alone distinguishes that from other points of view. A building is still more strongly characteristic: it may be only ornamental, or it may be accommodated to the reception of company; for though a place to alight at interrupts the range of a riding, yet, as the object of an airing, it may often be acceptable. A small spot which may be kept by the labour of one man, enclosed from the fields, and converted into a shrubbery or any other scene of a garden, will sometimes be a pleasing end to a short excursion from home: nothing so effectually extends the idea of a feat to a distance; and not being constantly visited, it will always retain the charms of novelty and variety.

When a riding is carried along a high road, a kind of property may in appearance be claimed even there; by planting on both sides, except in a park or other, to give it the air of an approach: regularity intimates the neighbourhood of a mansion. A village therefore seems to be within the domain, if any of the inlets to it are avenues; other formed plantations about it, and still more trivial circumstances, when they are evidently ornamental, sometimes produce and always corroborate such an effect; but even without raising this idea, if the village be remarkable for its beauty, or only for its singularity, a passage through it may be an agreeable incident in a riding.

The fame ground which in the fields is no more than rough, often seems to be romantic when it is the site of a village; the buildings and other circumstances mark and aggravate the irregularity. To strengthen this appearance, one cottage may be placed on the edge of a steep, and some winding steps of unhewn stone lead up to the door; another in a hollow, with all its little appendances hanging above it. The position of a few trees will sometimes answer the same purpose; a footbridge here and there for a communication between the sides of a narrow dip, will add to the character; and if there are any rills, they may be conducted so as greatly to improve it.

A village which has not these advantages of ground, may, however, be beautiful; it is distinguished by its elegance, when the larger intervals between the houses are filled with open groves, and little clumps are introduced upon other occasions. The church often is, it generally may be, made a picturesque object. Even the cottages may be neat and sometimes grouped with

which may be very acceptable in a riding: a green lane is always delightful; a passage winding between thickets of brambles and briers, sometimes with, sometimes without a little spring-wood rising amongst them, or a cut in a continued sweep through the furze of a down or the fern of a heath, is generally pleasant. Nor will the character be absolutely lost in the interruption, it will soon be resumed, and never forgotten; when it has been once strongly impressed, very slight means will preserve the idea.

Simplicity may prevail the whole length of the way when the way is all naturally pleasant, but especially if it be a communication between several spots, which in character are raised above the rest of the country: a fine open grove is useful, except in a park or a garden; it has an elegance in the disposition which cannot be attributed to accident, and it seems to require a degree of preservation beyond the care of mere husbandry. A neat railing on the edge of a steep which commands a prospect, alone distinguishes that from other points of view. A building is still more strongly characteristic: it may be only ornamental, or it may be accommodated to the reception of company; for though a place to alight at interrupts the range of a riding, yet, as the object of an airing, it may often be acceptable. A small spot which may be kept by the labour of one man, enclosed from the fields, and converted into a shrubbery or any other scene of a garden, will sometimes be a pleasing end to a short excursion from home: nothing so effectually extends the idea of a feat to a distance; and not being constantly visited, it will always retain the charms of novelty and variety.

When a riding is carried along a high road, a kind of property may in appearance be claimed even there; by planting on both sides, except in a park or other, to give it the air of an approach: regularity intimates the neighbourhood of a mansion. A village therefore seems to be within the domain, if any of the inlets to it are avenues; other formed plantations about it, and still more trivial circumstances, when they are evidently ornamental, sometimes produce and always corroborate such an effect; but even without raising this idea, if the village be remarkable for its beauty, or only for its singularity, a passage through it may be an agreeable incident in a riding.

The same ground which in the fields is no more than rough, often seems to be romantic when it is the site of a village; the buildings and other circumstances mark and aggravate the irregularity. To strengthen this appearance, one cottage may be placed on the edge of a steep, and some winding steps of unhewn stone lead up to the door; another in a hollow, with all its little appendances hanging above it. The position of a few trees will sometimes answer the same purpose; a footbridge here and there for a communication between the sides of a narrow dip, will add to the character; and if there are any rills, they may be conducted so as greatly to improve it.

A village which has not these advantages of ground, may, however, be beautiful; it is distinguished by its elegance, when the larger intervals between the houses are filled with open groves, and little clumps are introduced upon other occasions. The church often is, it generally may be, made a picturesque object. Even the cottages may be neat and sometimes grouped with
Riding.

with thickets. If the place be watered by a stream, the crollings may be in a variety of pleasing designs; and if a spring rise, or only a well for common use be sunk by the side of the way, a little covering over it may be contrived which shall at the same time be simple and pretty.

There are few villages which may not easily be rendered agreeable. A small alteration in a house will sometimes occasion a great difference in the appearance. By the help of a few trifling plantations, the objects which have a good effect may be shown to advantage, those which have not may be concealed, and such as are similar be disguised. And any form which offends the eye, whether of ground, of trees, or of buildings, may sometimes be broken by the slightest circumstances, by an advanced paling, or only by a bench. Variety and beauty, in such a subject, are rather the effects of attention than expense.

But if the passage through the village cannot be pleasant; if the buildings are all alike, or stand in unmeaning rows and similar situations; if the place furnishes no opportunities to contrast the forms of dwellings with those of out-houses; to introduce trees and thickets; to interpose fields and meadows; to mix farms with cottages; and to place the several objects in different positions: yet on the outside even of such a village there certainly is room for wood; and by that alone the whole may be grouped into a matrix, which shall be agreeable when skirted by a riding; and still more so when seen from a distance. The separate farms in the fields, also, by planting some trees about them, or perhaps only by managing those already on the spot, may be made very interesting objects; or if a new one is to be built, beauty may be confulted in the form of the house, and the disposition of its appurtenances. Sometimes a character not their own, as the semblance of a castle or an abbey, may be given to them; they will thereby acquire a degree of consideration, which they cannot otherwise be entitled to; and objects to improve the views are so important to a riding, that buildings must sometimes be erected for that purpose only: but they should be such as by an actual effect adorn or dignify the scene; not those little flight deceptions which are too well known to succeed, and have no merit if they fail; for though a fallacy sometimes contributes to support a character, or fuggefts ideas to the imagination, yet in itself it may be no improvement of a scene; and a bit of turret, the tip of a spire, and the other ordinary sub jects of these frivolous attempts, are so insignificant as objects, that whether they are real or fictitious is almost a matter of indifference.

The fame means by which the prospects from a riding are improved, may be applied to those from a garden, though they are not essential to its character, they are important to its beauty; and wherever they abound, the extent only of the range which commands them, determines whether they shall be seen from a riding or a garden. If they belong to the latter, that assimiles in some degree the predominant properties of the former, and the two characters approach very near to each other: but still each has its peculiarities. Progress is a prevailing idea in a riding; and the pleasurableness of the way is, therefore, a principal consideration: but particular spots are more attended to in a garden; and to them the communications ought to be subordinate; their direction must be generally accommodated, their beauties sometimes sacrificed to the situation and the character of the scenes they lead to; an advantageous approach to these must be preferred to an agreeable line for the walk; and the circumstances which might otherwise become it misplaced, if they anticipate the openings: it should sometimes be contrived to them; be retired and dark if they are splendid or gay, and simple if they are richly adorned. At other times it may burst unexpectedly out upon them; not on account of the surprize, which can have its effect only once; but the impressions are stronger by being sudden; and the contrariety is enforced by the quickness of the transition.

In a riding, the scenes are only the amusements of the way, through which it proceeds without stopping; in a garden they are principal; and the subordination of the walk raises their importance. Every art, therefore, should be exerted to make them form parts of the place. Distant prospects cannot be so; and the alienation does not offend us; we are familiarized to it; the extent forbids every thought of a closer connexion; and if a continuation be preferred between them and the points which command them, we are satisfied. But home-view suggests other ideas; they appear to be within our reach: they are not only beautiful in prospect, and we can perceive that the spots are delightful; but we wish to examine, to inhabit, and to enjoy them. Every apparent impediment to that gratification is a disappointment; and when the scenes begin beyond the opening, the consequence of the place is lowered; nothing within it engages our notice; it is an exhibition only of beauties, the property of which does not belong to it; and that idea, though indifferent in a riding, which is but a passage, is very disadvantageous to such a residence as a garden. To obviate such an idea, the points of view should be made important; the objects within be appendages to those without; the separations be removed or concealed; and large portions of the garden be annexed to the spots which are contiguous to it. The ideal boundary of the place is then carried beyond the scenes which are thus appropriated to it; and the wide circuit in which they lie, and the different positions in which they may be thrown, afford a greater variety than can generally be found in any garden, the scenery of which is confined to the enclosure.

Persfield (a) is not a large place; the park contains about 500 acres; and the house stands in the midst of it. On the side of the approach, the inequalities of Persfield, the ground are gentle, and the plantations pretty; but nothing there is great. On the other side, a beautiful lawn falls precipitately every way into a deep vale which shelves down the middle; the declivities are diversified with clumps and with groves; and a number of large trees straggle along the bottom. This lawn is encompassed

(a) The seat of Mr Morris, near Chepstowe, in Monmouthshire.
passed with wood; and through the wood are walks, which open beyond it upon those romantic scenes which surround the park, and which are the glory of Persfield. The Wye runs immediately below the wood; the river is of a dirty colour; but the shape of its course is very various; winding first in the form of a horse-shoe, then proceeding in a large sweep to the town of Chepilowe, and afterwards to the Severn. The banks are high hills; in different places steep, bulging out, or hollow on the sides; rounded, flattened, or irregular at top; and covered with wood, or broken by rocks. They are sometimes seen in front; sometimes in perspective; falling back for the passage, or closing behind the bend of the river; appearing to meet, rising above, or shooting out beyond one another.

The wood which incloses the lawn crowns an extensive range of these hills, which overlooking all those on the opposite shore, with the country which appears above or between them; and winding themselves as the river winds, their sides, all rich and beautiful, are alternately exhibited; and the point of view in one spot becomes an object to the next.

In many places the principal feature is a continued rock in length a quarter of a mile, perpendicular, high, and placed in a height. This resembles some rocks: but no ruin of any single structure was ever equal to this enormous pile; it seems to be the remains of a city, and other smaller heaps scattered about appear to be fainter traces of the former extent, and strengthen the similitude. It stretches along the brow which terminates the forest of Dean; the face of it is composed of immense blocks of stone, but not rugged; the top is bare and uneven, but not craggy; and from the foot of it, a declivity, covered with thicket, slopes gently towards the Wye; but in one part is abruptly broken off by a ledge of rocks, of a different hue, and in a different direction. From the groton it seems to rise immediately over a thick wood, which extends down a hill below the point of view, across the valley, through which the Wye flows, and up the opposite banks, hides the river, and continues without interruption to the bottom of the rock: from another feat it is seen by itself without even its base; it faces another, with all its appendages about it; and sometimes the sight of it is partially intercepted by trees, beyond which, at a distance, its long line continues on through all the openings between them.

Another capital object is the castle of Chepilowe, a noble ruin of great extent; advanced to the very edge of a perpendicular rock, and so immediately riveted into it, that from the top of the battlements down to the river feems but one precipice: the fame ivy which over spreads the face of the one, twines and clusters among the fragments of the other; many towers, much of the walls, and large remains of the chapel, are standing. Close to it is a most romantic wooden bridge, very ancient, very grotesque, at an extraordinary height above the river, and seeming to abut against the ruins at one end, and some rocky hills at the other. The cattle is so near to the above at Persfield, that little circumstances in it may be discerned; from other spots more distant, even from the lawn, and from a shrubbery on the side of the lawn, it is distinctly visible, and always beautiful, whether it is seen alone, or with the bridge, with the town, with more or with less of the rich meadows which lie along the banks of the Wye, to its junction three miles off with the Severn. A long sweep of that river also, its red cliffs, and the fine rising country in the counties of Somerset and Gloucester generally terminate the prospect.

Most of the hills about Persfield are full of rocks; some are intermixed with hanging woods, and either advance a little before them, or retire within them, and are backed, or overhung, or separated by trees. In the walk to the cave, a long succession of them is frequently seen in perspective, all of a dark colour, and with wood in the intervals between them. In other parts the rocks are more wild and uncouth; and sometimes they stand on the tops of the highest hills; at other times down as low as the river; they are homely objects in one spot, and appear only in the back-ground of another.

The woods concur with the rocks to render the scenes of Persfield romantic: the place everywhere abounds with them; they cover the tops of the hills; they hang on the steep; or they fill the depths of the valleys. In one place they front, in another they rise above, in another they sink below the bank, or they are seen sometimes retiring beyond each other, and darkening as they recede; and sometimes art opening between two is closed by a third at a distance beyond them. A point, called the Lover’s Leap, commands a continued surface of the thickest foliage, which overspreads a vast hollow immediately underneath. Below the Chineses feat the course of the Wye is in the shape of a horse-shoe: it is on one side included by a semicircular hanging wood; the direct heaps of a table-hilllint it in on the other; and the great rock fills the interval between them: in the midst of this rude scene lies the peninsula formed by the river, a mile at the least in length, and in the highest state of cultivation: near the isthmus the ground rises considerably, and thence descends in a broken surface; till it flattens to the water’s edge at the other extremity. The whole is divided into cornfields and pastures; they are separated by hedges-rows, copses, and thickets: open clumps and fine trees stand out in the meadows; and houses and other buildings, which belong to the farms, are scattered amongst them: nature so cultivated, surrounded by nature so wild, compose a most lovely landscape together.

The communications between these several points are generally by close walks; but the covert ends near the Chineses feat; and a path is afterwards conducted through the upper park to a rustic temple, which overlooks on one side some of the romantic views which have been described, and on the other the cultivated hills and valleys of Monmouthshire. To the rude and magnificent scenes of nature now succeeds a pleasant, fertile, and beautiful country, divided into inclosures, not covered with woods, nor broken by rocks and precipices, but only varied by csey swells and gentle declivities. Yet the prospect is not tame: the hills in it are high; and it is bounded by a vast sweep of the Severn, which is here visible for many miles together, and receives in its course the Wye and the Avon.

From the temple a road leads to the Windcliff, an eminence much above the reef, and commanding the whole in one view. The Wye runs at the foot of the hill; the peninsula lies just below; the deep bosom of the

RIGA, a large, strong, populous, and rich town of the Russian empire, and capital of Livonia. It is a large trading place, and has a very considerable fores; the trade is chiefly in corn, flax, leather, and naval fores. It was taken by the Russians in 1710, after they had blockaded it up a long while, during which the inhabitants were afflicted with the plague. The castle is square, and defended by four towers and six bastions; besides which, it has a fine arsenal. The Protestants have still a handsome college here. It is seated on a large plain on the river Dvina. E. Long. 24° 25'. N. Lat. 57° 0'.

RIGADOON, a gay and brisk dance, borrowed originally from Provence in France, and performed in figure by a man and woman.

RIGGING of a SHIP, a general name given to all the ropes employed to fasten the masts, and to extend or reduce the sails, or arrange them to the disposition of the wind. The former, which are used to fasten the mast, remain usually in a fixed position, and are called standing rigging; such are the shrouds, stays, and back-stays. The latter, whose office is to manage the sails, by communicating with various blocks or pulleys, situated in different places of the masts, yards, shrouds, &c. are comprehended in the general term of running rigging; such are the braces, sheets, halliards, stays, &c.

In rigging a mast, the first thing usually fixed upon its head is a circular wreath or rope, called the gromet, or collar, which is firmly beat down upon the top of the hounds. The intent of this is to prevent the shrouds from being fretted or worn by the trelle-trees, or shoulders of the mast; after this are laid on the two pendents, from whose lower ends the main or fore tackles are suspended; and next, the shrouds of the starboard and larboard side, in pairs, alternately. The whole: is covered by the stays, which are the largest ropes of the rigging. When a yard is to be rigged, a gromet is also driven first on each of its extremities; next to this are fitted on the horsetail or top-sail sheets.

In rigging a ship, appear to resemble, convenience, and simplicity; or, the properties of affording sufficient security to the masts, yards, and falls; of arranging the whole machinery in the most advantageous manner, to fasten the masts, and facilitate the management of the falls; and of avoiding perplexity, and rejecting whatever is superfluous or unnecessary. The perfection of this art, then, consists in retaining all those qualities, and in preserving a judicious medium between them. See SHIP-BUILDING.

Right.

RIG [ 243 ] RIG

1. The term Right explained.

Right is a word which, in the propriety of the English language, is used sometimes as an adjective and sometimes as a substantivate. As an adjective, it is nearly of the same import with fit, suitableness, propriety, and whilst it expresses a quality, it indicates a relation. Thus when we say that an action is right, we must not only know the nature of the action, but, if we speak intelligibly, must also perceive its relation to the end for which it was performed; for an action may be right with one end in view which would be wrong with another. The conduct of that general would be right, who, to have an army that could not be otherwise and would place a small detachment in a nation where he knew they would all be inevitably cut out; but his conduct would be wrong were he to throw away the life of a single individual for any purpose, however important, which he knew how to accomplish without such a sacrifice.

Many philosophers have talked of actions being right and wrong in the abstract without regard to their natural consequences; and converting the word into a substantive they have fancied an eternal rule of right, by which the morality of human conduct is in every particular case to be tried. But in these phrases we can discover no meaning. Whatever is right must be so on some account or other; and whatever is fit, must be fit for some purpose. When he who befriends the foundation of virtue on the moral sense, speaks of an action being right, he must mean that it is such as, through the medium of that sense, will excite complacency in the mind of the agent, and gain to him the general approbation of mankind. When he befriends moral obligation on the will of God, speaks of some actions as right and of others as wrong, he must mean that the former are agreeable to the divine will, however made known to men, and the latter disagreeable to it; and the man who deduces the laws of virtue from what he calls the fitness of things, must have some end in view, for which things are fit, and denominate actions right or wrong as they tend to promote or counteract that end.

But the word right, used as a substantive, has in common as well as in philosophical language a signification which at first view appears to be very different from this. It denotes a just thing or an honest proceeding. Thus we say, a father has a right to reverence from his children, a husband to the love and fidelity of his wife, and a king to the allegiance of his subjects. When we trace these rights to their source, we shall find that they are all laws of moral obligation, and that they are called rights only because it is agreeable to the will of God, to the infinite dictates of the moral sense, or to the fitness of things, if such a phrase has any meaning, that children reverence their parents, that wives love their husbands, and that subjects pay allegiance to their sovereign. This will be apparent to any man who shall put to himself such questions as these: "Why have parents a right to reverence from their children, husbands to the love of their wives, and sovereigns to the allegiance of their subjects?" As these questions contain in them nothing absurd, it is obvious that they are each capable of a precise answer; but it is impossible to give to any of them an answer which shall have any meaning, and not imply that right and obligation are reciprocal, or, in other words, that wherever there is a right in one person, there is a corresponding obligation upon another. Thus to the question, "Why have parents a right to reverence from their children?" it may be answered, "because, under God, they were the authors of their children's being, and protected them from danger, and furnished them with necessaries, when they were in a state to help, lest that they could do nothing for themselves." This answer conveys no other meaning than that there is an obligation upon children, in return for benefits received, to reverence their parents. But what is the source of this obligation? It can only be the will of God, the moral sense, or the fitness of things.

This view of the nature of right will enable us to form a proper judgment of the assertion of a late writer, that man has no rights. The arguments by which this apparent paradox is maintained, are not merely inadmissible, but glaringly absurd.

2 Rights of man.

God's rights.

Political society is founded on the principles of morality and justice. It is impossible for intellectual beings to be brought into coalition and intercourse without a certain mode of conduct, adapted to their nature and connexion, immediately becoming a duty incumbent on the parties concerned. Men would never have associated if they had not imagined that, in consequence of that association, they would mutually conduct to the advantage and happiness of each other. This is the real purpose, the genuine ends, of their intercourse; and, as far as this purpose is answered, so far does society answer the end of its institution. There is only one politiculate more that is necessary to bring us to a conclusive mode of regarding upon this subject: Whatever is meant by the term right, there can neither be opposite rights, nor rights and duties hostile to each other. The rights of one man cannot clash with or be detrimental to the rights of another; for this, instead of rendering the subject an important branch of truth and morality as the advocates of the rights of man certainly.
Ly underhand it to be, would be to reduce it to a heap of unintelligible jargon and inconsistency. If one man have a right to be free, another man cannot have a right to make him a slave; if one man have a right to inflict chastisement upon me, I cannot have a right to withdraw myself from chastisement; if my neighbour have a right to a sum of money in my possession, I cannot have a right to retain it in my pocket. It cannot be left incontrovertible, that I have no right to omit what my duty prefers. From hence it inevitably follows that men have no rights.

It is commonly said, 'that a man has a right to the disposal of his fortune, a right to the employment of his time, a right to the uncontrolled choice of his profession or pursuits.' But this can never be confidently affirmed till it can be shown that he has no duties prescribing and limiting his mode of proceeding in all these respects.

In reality, nothing can appear more wonderful to a careful inquirer, than that two ideas so incompatible as man and right should ever have been associated together. Certain it is, than one of them must be utterly exclusive and annihilatory of the other. Before we ascribe rights to man, we must conceive of him as a being endowed with intellect, and capable of discerning the differences and tendencies of things. But a being endowed with intellect, and capable of discerning the differences and tendencies of things, infinitely becomes a moral being, and has duties incumbent on him to discharge: and duties and rights, as has already been shown, are absolutely exclusive of each other.

It has been affirmed by the zealous advocates of liberty, 'that princes and magistrates have no rights;' and no position can be more incontrovertible. There is no situation of their lives that has not its correlative duties. There is no power intrusted to them that they are not bound to exercise exclusively for the public good. It is strange, that persons adopting this principle did not go a step farther, and perceive that the same restrictions were applicable to subjects and citizens.

This reasoning is unanswerable; but it militates not against the rights of man in the usual acceptation of the words, which are never employed to denote disinterested power, but a just claim on the one hand, implying a corresponding obligation on the other. Whether the phrase be absolutely proper is not worth the debating; it is authorized by custom—the jus et norma legum—and is universally understood except by such as the demons of faction, in the form of paradoxical writers on political justice, have been able to mislead by sophistical reasonings.

Rights, in the common acceptation of the word, are of various kinds: they are natural or adventitious; exalted or deprecatable, perfect or imperfect, particular or general. See the article Liberty. Natural rights are those which a man has to his life, limbs, and liberty; to the produce of his personal labour; to the use, in common with others, of air, light, and water, &c. That every man has a natural right or just claim to these things, is evident from their being absolutely necessary to enable him to answer that purpose, whatever it may be, for which he was made a living and a rational being. This shows undeniably, that the Author of his nature designed that he should have the use of them, and that the man who should wantonly deprive him of any one of them, would be guilty of a breach of the divine law, as well as act inconsistently with the fitness things in every sense in which that phrase can possibly be understood.

Adventitious rights are those which a king has over his subjects, a general over his soldiers, a husband to the person and affections of his wife, and which every man has to the greater part of his property. That the right of the king and the general are adventitious, is universally admitted. The rights of property have been considered elsewhere (see Property); and though the human constitution shows sufficiently that men and women have a natural right to the use of each other, yet it is evident that the exclusive right of any one man to any one woman, and vice versa must be an adventitious right: But the important question is, How are adventitious rights acquired?

In answer to this question, the moralist who deduces the laws of virtue from the will of God, observes, that as God appears from his works to be a benevolent Being, who wills the happiness of all his creatures (see Metaphysics, n. 312.), he must of course will every thing which naturally tends to promote that happiness. But the existence of civil society evidently contributes in a great degree to promote the sum of human happiness (See Society); and therefore whatever is necessary for the support of civil society in general, or for the conduct of particular societies already established, must be agreeable to the will of God: But the allegiance of subjects to their sovereign, the obedience of soldiers to their leader, the protection of private property, and the fulfilling of contracts, are all absolutely necessary to the support of society; and hence the rights of kings, generals, husbands, and wives, &c., though adventitious, and immediately derived from human agency, are not left facetious natural rights since they may all be ultimately traced to the same source. The same conclusion may easily be drawn by the philosopher, who refers moral obligation on the fitness of things or on a moral sense; only it must in each of these cases partake of the instability of its foundation.

To the sacredness of the rights of marriage, an author already quoted has lately urged some declamatory objections. "It is absurd (says he) to expect, that the inclinations and wishes of two human beings should coincide through any long period of time. To oblige them to act and to live together, is to subject them to some inevitable portion of thwarting, bickering, and unhappiness. This cannot be otherwise, a long as man has failed to reach the standard of absolute perfection. The supposition that I must have a companion for life, is the result of a complication of vices. It is the dictate of cowardice, and not of fortitude. It flows from the desire of being loved and esteemed for something that is not dear." "But the evil of marriage, as it is practised in European countries, lies deeper than this. The habit is, for a thoughtless and romantic youth of each sex to come together, to see each other for a few times, and under circumstances full of delusion, and then to vow to each other eternal attachment. What is the consequence of this? In almost every instance they find themselves deceived. They are reduced to make the best of an irretrievable mistake. They are permitted with the strongest imaginable temptation to become the dupes of
R.~.

Obviated.

of falsehood. They are led to conceive it their wisest policy to shut their eyes upon realities; happy if by any perversion of in effect they can persuade themselves that they were right in their first crude opinion of their companion.

So long as two human beings are forbidden by positive inclination to follow the dictates of their own mind, prejudice is alive and vigorous. So long as I seek to engross one woman to myself, and to prohibit her to engage one woman to my self, and to prohibit her to engage

peculative reformation, his already positive tion, perversion of mind. prejudice is alive and its continuance will continue with one woman, but in the reason and

will be impossible for me to live in the world without finding one man of a worth superior to that of any other whom I have an opportunity of observing. To this man I shall feel a kindness in exact proportion to my apprehension of his worth. The case will be precisely the same with respect to the female sex; I shall addiduously cultivate the intercourse of that woman whose accomplishments shall strike me in the most powerful manner. But it may happen that other men will feel for her the same preference that I do.' This will create no difficulty. We may all enjoy her conversation; and we shall all be wise enough to consider the sensuous intercourse as a very trivial object. This, like every other affair in which two persons are concerned, must be regulated in each successive inforcement by the unforced consent of either party. It is a mark of the extreme depravity of our present habits, that we are inclined to suppose the sensuous intercourse anywise material to the advantages arising from the pure affection. Reasonable men now eat and drink, not from the love of pleasure, but because eating and drinking are essential to our healthful existence. Reasonable men then will propagate their species, not because a certain sensible pleasure is annexed to this action, but because it is right the species should be propagated and the manner in which they exercise this function will be regulated by the dictates of reason and duty.'

It is right: then, according to this political innovator, that the species should be propagated, and reasonable men in his Utopian commonwealth would be incited by reason and duty to propagate them: but the way to fulfill this duty, experience, which is seldom at one with speculative reformation, his already demonstrated, not to conflict in the promiscuous intercourse of several men with one woman, but in the fidelity of individuals of the two sexes to each other. Common prostitutes among us seldom prove with child; and the society of Arrows in Otaheite, who have completely diverted themselves of what our author calls prejudice, and are by no means guilty of his most odious of all monopolies, are for the most part childless (See Otaheitee). He seems to think that a state of equal property would necessarily destroy our relish for luxury, decrease our indiscriminate appetites of every kind, and lead us universally to prefer the pleasures of intellect to the pleasures of sense. But here again experience is against him. The Arrows, who have a property in their women perfectly equal, are the most luxurious and sensuous women on the face of the earth; sensuous inclined to a degree of which the most licentious European can hardly form a conception.

By admitting it to be a duty to propagate the species, our author must necessarily grant that every thing which is right which is requisite to the fulfilling of that duty, and the contrary wrong. If so, promiscuous concubinage is wrong, since we have seen, that by a law of nature it is incompatible with the duty; whence it follows on his own principles, that the sexual union by pairs must be right. The only question therefore to be decided between him and his opponents is, 'Whether should that union be temporary or permanent?' And we may think the following observations by Mr. Paley sufficient to decide it to the conviction of every person not blinded by the rage of innovation.

'A lawyer, whose counsels were directed by views of general utility, and obviated by no local impediments, would make the marriage-contract indissoluble during the joint lives of the parties, for the sake of the following advantages: Such a union tends to preserve peace and concord between married persons, by perpetuating their common interest, and by inducing a necessity of mutual compliance. An earlier termination of it would produce a separate interest. The wife would naturally look forward to the dissolution of the partnership, and endeavor to draw to herself a fund against the time when she was no longer to have access to the same resources. This would beget speculation on one side, and misfortune on the other; evils which at present are not so easily disturb the confidence of married life. The second effect of making the union determinable only by death, is not less beneficial. It necessarily happens, the adverse tempers, habits, and tastes, oftentimes meet, in marriage. In which case each party must take pains to give up what offends, and practice what may gratify, the other. A man and woman in love with each other do this insensibly: but love is neither general nor durable; and where this is wanting, no leasons of duty, no delicacy of sentiment, will go half so far with the generality of mankind and woman-kind as this one intelligible reflection, that they must each make the best of their bargain; and that feeling they must either both be miserable or both share in the same happiness. Neither can find their own comfort but in promoting the pleasure of the other. Their compliances, though at first exerted by necessity, become in time easy and mutual; and though less enduring than affections which take their rise from affection, generally procure to the married pair a repose and satisfaction sufficient for their happiness.'

So differently from our author does this judicious writer reason concerning the effects of a permanent union on the tempers of the married pair. Instead of subjecting them to some inevitable portion of thwarting, bickering, and unhappiness, it lays them, in his opinion, under the necessity of curbing their unruly passions, and acquiring habits of gentleness, forbearance, and peace. To this we may add, that both believing the
Right.

the children propagated during their marriage to be
their own (a belief unattainable by the father in
a state of promiscuous concubining), they come by a na-
tural process of the human passions (see Passion) to
love each other through the medium of their offspring.
But if it be the duty of man to acquire a spirit first
pure, then peaceable, gentle, and easy to be intreated,
it must be agreeable to the will of God, and a branch
of the fitness of things, that the sexual union last
during the joint lives of the parties; and therefore the ex-
clusive right of marriage, though adventitious, must be
equally facred with those which are natural.

But to return from this digression, into which the
importance of the subject led us, rights, besides be-
ing natural or adventitious, are likewise alienable or un-
alienable. Every man, when he becomes the member of
a civil community, alienates a part of his natural rights.
In a state of nature, no man has a superior on earth;
and each has a right to defend his life, liberty, and prop-
erty, by all the means which nature has put in his
power. In civil society, however, these rights are all
transferred to the laws and the magistrate, except in
cases of such extreme urgency as leave not time for le-
gal interposition. This single consideration is suffi-
cient to shew, that the right to civil liberty is alien-
able; though, in the vehemence of men's zeal for it,
and in the language of some political remonstrances,
it has often been pronounced to be an unalienable right.

The true reason (says Mr Paley) why mankind hold
in detestation the memory of those who have fold their
wealth to a tyrant, is, that, together with their own,
they fold commonly or endangered the liberty of others;
of which they had certainly no right to dispose.

The rights of a prince over his people, and of a husband over
his wife, are generally and naturally unalienable.

Another division of rights is into those which are per-
fect and those which are imperfect. Perfect rights are
such as may be precisely ascertained and ascertained by
force, or in civil society by the course of law. To im-
perfect rights neither force nor law is applicable to
man's rights to his life, person, and property, are all
perfect; for if any of these be attacked, he may repel
the attack by instant violence, punish the aggressor by
the course of law, or compel the author of the injury
to make restitution or satisfaction. A woman's right
to her honour is likewise perfect; for if she cannot
otherwise escape, the may kill the ravisher. Every
poor man has undoubted right to relief from the rich;
but his right is imperfect, for if the relief be not volun-
tarily given, he cannot compel it either by law or by
violence. There is no duty upon which the Christian
religion puts a greater value than alms-giving; and every
preacher of the gospel has an undoubted right to in-
culcate the practice of it upon his audience; but even
this right is imperfect, for he cannot refuse the com-
munication to a man merely on account of his self-interest
to the poor, as he can to another for the neglect of any
duty comprehended under the term justice. In elec-
tions or appointments to offices, where the qualifica-
tions are prescribed, the best qualified candidate has un-
questionably a right to succeed; yet if he be rejected,
he can neither seize the office by force, nor obtain re-
course at law. His right, therefore, is imperfect.

Here a question naturally offers itself to our considera-
tion: How comes a person to have a right to a thing,
of ten Newtons to be equal to that of one Godwin, we are warranted to say, that however great his merits may be, they are not infinite, and that the addition of those of one Newton to them would undoubtedly increase their sum.

Rights, are particular or general. Particular rights are such as belong to certain individuals or orders of men, and not to others. The rights of kings, of masters, of husbands, of wives, and, in short, all the rights which originate in society, are particular. General rights are those which belong to the species collectively. Such are our rights to the vegetable produce of the earth, and to the flesh of animals for food, though about the origin of this latter right there has been much diversity of opinion, which we have noticed in another place. (See Theology, Part I. Sect. 2d.) If the vegetable produce of the earth be included under the general rights of mankind, it is plain that he is guilty of wrongful leaves any considerable portion of land waste merely for his own amusement; he is lessening the common flock of provision which Providence intended to distribute among the species. On this principle it would not be easy to vindicate certain regulations respecting game, as well as some other monopolies which are protected by the municipal laws of most countries. Mr Paley, by just reasoning, has established this conclusion, "that nothing ought to be made exclusive property which can be conveniently enjoyed in common."

An equal division of land, however, the dream of some visionary reformers, would be injurious to the general rights of mankind, as it may be demonstrated, that it would lessen the common flock of provisions, by laying every man under the necessity of being his own weaver, tailor, shoemaker, smith, and carpenter, as well as ploughman, miller, and baker. Among the general rights of mankind, is the right of necessity; by which a man may use or destroy his neighbour's property when it is absolutely necessary for his own preservation. It is on this principle that goods are thrown overboard to save the ship, and houses pulled down to stop the progress of a fire. In such cases, however, at least in the last, restitution ought to be made when it is in our power; but this restitution will not extend to the original value of the property destroyed, but only to what it was worth at the time of destroying it, which, considering its danger, might be very little.

Righteousness, means justice, honesty, virtue, goodnes, and amongst Christians is of exactly the same import with holiness, without which, we are told, no man shall see the Lord. The doctrine of the fall, and of redemption through Jesus Christ, has occasioned much disputation, and has given rise to many singular notions in the world. The haughty philosopher, dissatisfied with mysteries, and with the humiliating doctrine of atonement by a crucified Saviour, has made a religion for himself, which he calls rational Christianity; and the enthusiast, by extracting doctrines from Scripture which are not contained in it, and which are repugnant to its spirit, has given too much countenance to this presumption. The doctrine of imputed righteousness, by which the merit of Christ is said to be imputed to us, appears to be of this number; and though it has been held by many good, and by some learned men, it is certainly in general unfriendly to virtue as will be readily allowed by all who have conversed with the more ignorant sort of Methodists in England or Scotland. That it does not follow from the doctrine of the atonement, and consequently that it has no foundation in Scripture, will appear elsewhere. See Theology.

Bill of Rights, in law, is a declaration delivered by the lords and commons to the prince of Orange, 13th February 1688; and afterwards enacted in parliament, when they became king and queen. It sets forth, that king James did, by the assistance of divers evil counsellors, endeavour to subvert the laws and liberties of this kingdom, by exercising a power of dispensing with and suspending of laws; by levying money for the use of the crown by pretence of prerogative without consent of parliament; by pronouncing those who petitioned the king, and discouraging petitions; by raising and keeping a standing army in time of peace; by violating the freedom of election of members to serve in parliament; by violent prosecutions in the court of king's bench; and causing partial and corrupt jurors to be returned on trials, excessive and unreasonable fines to be imposed; cruel punishments inflicted; all which were declared to be illegal. And the declaration concludes in these remarkable words: "And they do claim, demand, and insist upon, all and singular the premises, as their undisputed rights and liberties." And the act of parliament itself (1 W. & M. Stat. 2. cap. 2.) recognizes all and singular the rights and liberties, and the act of parliament itself (1 W. & M. Stat. 2. cap. 2.) recognizes all and singular the rights and liberties, as in the said declaration, to be the true, ancient, indubitable rights of the people of this kingdom. See Liberty.

RIGIDITY, in physics, denotes a brittle hardness. It is opposed to ductility, malleability, and softness.

RIGOLL, or REGALS, a kind of musical instrument, consisting of several fitches bound together, only separated by beads. It is tolerably harmonious, being well struck with a ball at the end of a fllick. Such is the account which Graffineau gives of this instrument. Skinner, upon the authority of an old English dictionary, represents it as a clavichord, or clarsich; possibly founding his opinion on the nature of the office of the tuner of the regals, who fill subfits in the establishment of the king's chapel at St James's, and whose business is to keep the organ of the chapel royal in tune; and not knowing that such wind instruments as the organ need frequent tuning, as well as the clavichord and other strung instruments. Sir Henry Spelman derives the word rigoll from the Italian rigatello, a musical instrument, anciently used in churches instead of the organ. Walther, in his description of the regal, makes it to be a reed-work in an organ, with metal and also wooden pipes and bellows adapted to it. And he adds, that the name of it is supposed to be owing to its having been presented by the inventor to some king.

From an account of the regal used in Germany, and other parts of Europe, it appears to consist of pipes and keys on one side, and the bellows and wind-chest on the other. We may add, that Lord Bacon (Nat. Hist. cent. ii. §. 102.) distinguishes between the regal and organ, in a manner which shew them to be instruments of the same class. Upon the whole, there is reason to conclude, that the regal or rigoll was a pneumatic, and not a strung instrument.

Merfennus relates, that the Flemings invented an instrument, les regales de los, consisting of 17 cylindrical pieces
produce a succession of tones and semitones in the diatonic series, which had keys, and was played on as a spinet; the hint of which, he says, was taken from an instrument in use among the Turks, consisting of 12 wooden cylinders, of different lengths, strung together, which being suspended and struck with a stick, having a ball at the end, produced music. Hawkins's Hist. Mus. vol. ii. p. 449.

RIGOR, in medicine, a convulsive shuddering from severe cold, an ague fit, or other disorder.

RIMINI, an ancient, populous, and handsome town of Italy, in Romagna, which is partly the territory of the church, with a bishop's see, an old castle, and a strong tower; as also many remains of antiquity, and very fine buildings. It is famous for a council in 1359, confounding of 400 bishops, who were all Arians except 20. It is seated in a fertile plain, at the mouth of the river Marecchia, on the gulf of Venice. E. Long. 12. 39 N. Lat. 44. 6.

RING, the skin of any fruit that may be cut off or passed. Ring is also used for the inner bark of trees, or that whitish soft substance which adheres immediately to the wood. See Plant.

RING, an ornament of gold and silver, of a circular figure, and usually worn on the finger.

The episcopal ring (which makes a part of the pontifical apparatus, and is esteemed a pledge of the spiritual marriage between the bishop and his church) is of very ancient standing. The fourth council of Toledo, held in 633, appoints, that a bishop condemned by one council, and found afterwards innocent by a second, shall be restored, by giving him the ring, staff, &c. From bishops, the custom of the ring has passed to cardinals, who are to pay a very great sum pro jure annulii cardinalis.

RINGS. The antiquity of rings is known from Scripture and profane authors. Judith left his ring or signet with Tamar (Gen. xxxviii. 18). When Pharaoh committed the government of all Egypt to Joseph, he took his ring from his finger, and gave it to Joseph (Gen. xli. 42). After the victory that the Israelites obtained over the Midianites, they offered to the Lord the rings, the bracelets, and the golden necklaces, and the ear-rings, that they had taken from the enemy (Numb. xxx. 50). The Israelitish women wore rings not only on their fingers, but also in their nostrils and their ears. St James distinguishes a man of wealth and dignity by the ring of gold that he wore on his finger (James ii. 2). At the return of the prodigal son, his father orders him to be dressed in a new suit of clothes, and to have a ring put upon his finger (Luke xv. 22). When the Lord threatened King Jeconiah with the utmost effects of his anger, he tells him, that though he were the signet or ring upon his finger, yet he should be torn off (Jer. xxii. 24.)

The ring was used chiefly to seal with: and the Scripture generally puts it in the hands of princes and great persons; as the king of Egypt, Joseph; Ahaz, Jezebel, King Ahaz'rus, his favourite Hanan, Mordecai, who succeeded Haman in his dignity, King Darius (1 Kings xxii. 8; Esther iii. 10, &c.; Dan. vi. 17). The patrons and orders of these princes were sealed with their rings or signets; and it was this that secured them to their authority and respect. See the article Seal.
RIP

[249]

RIP

hindered from the reading of it, such oppressors and hinderers are felons without benefit of clergy; and all persons to whom such proclamation ought to have been made, and knowing of such hindrance, and not delivering, are felons without benefit of clergy. There is the like indemnifying clause, in case any of the mob be unfortunately killed in the endeavour to disperse them, being copied from the act of queen Mary. And by a falsifiable clause of the new act, if any pervert, fo riotously assembled, begin even before proclamation to pull down any church, chapel, meeting-house, dwelling-house, or out-houses, they shall be felons without benefit of clergy.

Riots, routs, and unlawful assemblies, must have three persons at least to constitute them. An unlawful assembly is, when three, or more, do assemble themselves together to do an unlawful act, as to pull down inclosures, to destroy a warren or the game therein; and part without doing it, or making any motion towards it. A rout is where three or more meet to do an unlawful act upon a common quarrel, as forcibly breaking down fences upon a right claimed of common, or of way, and make some advances towards it. A riot is where three or more actually do an unlawful act of violence, either with or without a common cause or quarrel; as if they beat a man; or hunt and kill game in another's park, chase, warren, or liberty; or do any other unlawful act with force and violence; or even do a lawful act, as removing a nuisance, in a violent and tumultuous manner. The punishment of unlawful assembly, if to the number of 12, we have just now seen, may be capital, according to the circumstances that attend it; but, from the number of three to eleven, is by fine and imprisonment only. The same is the case in riots and routs by the common law; to which the pillory in very enormous cafes has been sometimes superadded. And by the statute 13 Hen. IV. c. 7, any two justices, together with the sheriff or under-sheriff of the county, may come with the palfre comitatus, if need be, and suppres any such riot, assembly, or rout, arrest the rioters, and record upon the spot the nature and circumstances of the whole transaction; which record, alone shall be a sufficient conviction of the offenders. In the interpretation of which statute it hath been held, that all persons, noblemen and others, except women, clergymen, persons decrepil, and infants under 12, are bound to attend the justices in suppressing a riot, upon pain of fine and imprisonment; and that any battery, wounding, or killing the rioters, that may happen in suppressing the riot, is justifiable. So that our ancient law, previous to the modern riot Act, seems pretty well to have guarded against all violent breach of the public peace; especially as any rioters assembling on a public or general account, as to redress grievances or pull down all inclosures, and also retaliating the king's forces if sent to keep the peace, may amount to overt acts of high treason, by levying war against the king.

RIPEN, a town of Denmark, in north Jutland, and capital of a diocese of the same name, with a bishop's see, a good harbour, a castle, two colleges, and a public library. The tombs of several of the kings of Denmark are in the cathedral church, which is a very handsome structure. The harbour, which has contributed greatly to the prosperity of this place, is at a small distance, being seated at the mouth of the river Niptia, in a country which supplies the belt beeches in Denmark. It is 45 miles north-west of Slesvick and 25 south-west of Wirburg. E. Long. 8. 94. N. Lat. 55. 25. The diocese is bounded on the north by those of Wirburg and Athery, on the south by the duchy of Slesvick, and on the east and west by the sea.

RIPENING OF Grains, means its arriving to maturity. The following paper, which appeared in the last volume of the Transactions of the Royal Society in Edinburgh, is worthy the attention of farmers in cold countries; where it frequently happens, from continued rains, that the corn is quite green when the frost sets in; in consequence of which, the farmers cut it down, without thinking it can possibly arrive at further maturity.

"Summer 1782 having been remarkably cold and unfavourable, the harvest was very late, and much of the grain, especially oats, was green even in October. In the beginning of October the cold was so great, that, in one night, there was produced on ponds near Kinneill, in the neighbourhood of Borrowstounness, ice three quarters of an inch thick. It was apprehended by many farmers, that such a degree of cold would effectually prevent the further filling and ripening of their corn. In order to ascertain this point, Dr. Roebuck selected several stalks of oats, of nearly equal fulness, and immediately cut those which, on the most attentive comparison, appeared the best, and marked the others, but allowed them to remain in the field 14 days longer; at the end of which time they, too, were cut, and kept in a dry room for 10 days. The grains of each parcel were then weighed; when 11 of the grains which had been left standing in the field were found to be equal in weight to 30 of the grains which had been cut a fortnight sooner, though even the best of the grains were far from being ripe. During that fortnight (viz. from October 7th to October 21st) the average heat, according to Fahrenheit's thermometer, which was observed every day at eight o'clock in the morning and in the evening, was a little above 43. Dr. Roebuck observes, that this ripening and filling of corn in so low a temperature should be the less surprising to us, when we reflect, that feed-corn will vegetate in the same degree of heat; and he draws an important inference from his observations, viz. That farmers should be cautious of cutting down their unripe corn, on the supposition that in a cold autumn it could fill no more."

A writer in the Scots Magazine for June 1792, under the signature of Agricola, when speaking on this subject, adds the following piece of information, viz. "That grain cut down before it is quite ripe will grow or spring equally well as ripe and plump grain, provided it is properly preferred. I relate this from a fact, and also on the authority of one of the most judicious and experienced farmers in this island, William Craik of Arbigland, Esq. near Dumfries, who was taught by such a reason as this threatens to prove. This being the case, every wise economical farmer will prefer his ripe and plump grain for bread, and low the green and seemingly shrivelled grain, with a perfect conviction that the plate proceeding from such feed will yield as strong and thriving corn as what grows from plump feed. By this means the farmer will enjoy the double advantage of having the corn most productive in flour for bread, and
RIPHEAN his light shrivelled grain will go much farther in seed than the plump grain would do. I saw the experiment made on wheat which was so shrivelled that it was thought scarcely worth giving to fowls, and yet produced heavy large ears.

RIPHEAN MOUNTAINS, are a chain of high mountains in Rullia, to the north-east of the river Oby. where there are said to be the finest tables of the whole empire.

RIPHATH, or RIPHAT, second son of Gomer, and grandson of Japhet (Gen. x. 3. 5 in Riphath). In most copies he is called Dipath in the Chronicles (1 Chr. i. 6, 5 in Dipath). The resemblance of the two Hebrew letters ר and ד is so much, that they are very often confounded. But, to the credit of the translators of our English version be it said, that in this instance, as well as in many others, they have restored the original reading, and rendered it Ripath. The learned are not agreed about the country that was peopled by the descendants of Riphat. The Chaldees and Arabic take it for France; Eusebius for the country of the Sauromates; the Chronicus Alexandria for that of the Garamantes; Josephus for Paphlagonia. Mela affirms us, that anciendy the people of this province were called Riphataei, or Riphaces; and in Bithynia, bordering upon Paphlagonia, may be found the river Rhebus, a people called Rhebantes, and a canton of the same name. These reasons have prevailed with Bochart to believe, that Riphat peopled Paphlagonia. Others think he peopled the Montes Riphei; and this opinion seems the most reasonable to us, because the other sons of Gomer peopled the northern countries towards Scythia, and beyond the Euxine sea.

RISIBLE, anything capable of exciting laughter.

Lucidus is a general term, signifying, as may appear from its derivation, what's playforme, sportive, or jocular. Lucidus therefore seems the genus of which risible is a species, limited as above to what makes us laugh.

However easy it may be, concerning any particular object, to say whether it be risible or not, it seems difficult, if at all practicable, to establish any general character, by which objects of that kind may be distinguished from others. Nor is that a singular case; for, upon a review, we find the same difficulty in most of the articles already handled. There is nothing more easy, viewing a particular object, than to pronounce that it is beautiful or ugly, grand or little; but were we to attempt general rules for ranging objects under different classes according to these qualities, we should be much perplexed. A separate case increases the difficulty of distinguishing risible objects by a general character: all men are not equally affected by risible objects, nor the same man at all times; for in high spirits a thing will make him laugh outright, which will scarce provoke a smile in a grave mood. Risible objects, however, are circumcised within certain limits. No object is risible but what appears slight, little, or trivial; for we laugh at nothing that is of importance to our own interest or that of others. A real instance raises pity, and therefore cannot be risible; but a sight or imaginary instance, which moves not pity, is risible. The adventure of the fulling-mills in Don Quixote, is extremely risible; so is the scene where Sancho, in a dark night tumbling into a pit, and touching himself to the side by hand and foot, hangs there in terrible dismay till the morning, when he discovers himself to be within a foot of the bottom. A note remarkably long or short, is risible; but to want it altogether, so far from provoking laughter, raises horror in the spectator. With respect to works both of nature and of art, none of them are risible but what are out of rule; some remarkable defect or excess, a very long vifage, for example, or a very short one. Hence nothing just, proper, decent, beautiful, proportioned, or grand, is risible.

Even from this slight sketch it will be readily conjectured, that the emotion raised by a risible object is of a nature so singular, as scarce to find place while the mind is occupied with any other passion or emotion; and the conjecture is verified by experience; for we scarce ever find that emotion blended with any other. One emotion we must except; and that is, contempt raised by certain improprieties: every improper act inspires us with some degree of contempt for the author; and if an improper act be at the same time risible to provoke laughter, of which blunders and absurdities are noted instances, the two emotions of contempt and of laughter unite intimately in the mind, and produce externally what is termed a laugh of derision or of scorn. Hence objects that cause laughter may be distinguished into two kinds: they are either risible or ridiculous. A risible object is mirthful only; a ridiculous object is both mirthful and contemptible. The first raises an emotion of laughter that is altogether pleasant: the pleasurable emotion of laughter raised by the other, is blended with the painful emotion of contempt; and the mixed emotion is termed the emotion of ridicule. The pain of a ridiculous object is of disproportion. The following examples are of flight or imaginary misfortunes.

Falstaff. Go fetch me a quart of sack, put a toast in't. Have I lived to be carried in a basket, like a barrow of butcher's offal, and to be thrown into the Thames! Well, if I be served such another trick I'll have my brains taken out and butter'd, and give them to a dog for a new-year's gift. The rogues flighted me into the river with as little remorse as they would have drown'd a bitch's blind puppies, fifteen 17th litter; and you may know by my size that I have a kind of alacrity in finking; if the bottom were as deep as hell, I should down. I had been drowned, but that the thre was shelvy and shallow; a death that I abhor: for the water swells a man; and what a thing should I have been when I had been swelled? I should have been a mountain of mummy.

Merry Wives of Windsor, act 2, sc. 15. Falstaff.
River

Definition.

A current of fresh water, flowing in a bed or channel from its source to the sea.

The term is appropriated to a considerable collection of waters, formed by the conflux of two or more Brooks, which deliver into its channel the united streams of several Rivulets, which have collected the supplies of many Rills trickling down from numberless springs, and the torrents which carry off from the sloping grounds the surplus of every flofier.

Rivers form one of the chief features of the surface of this globe, serving as venders of all that is immediately redundant in our rains and springs, and also as boundaries and barriers, and even as highways, and in many countries as plentiful thoroughfares. They also fertilize our soil by laying upon our warm fields the richest mould, brought from the high mountains, where it would have remained useless for want of genial heat.

Being such interesting objects of attention, every branch acquires a proper name, and the whole acquires a sort of personal identity, of which it is frequently difficult to find the principle; for the name of the great body of waters which discharges itself into the sea is traced backwards to one of the sources, while all the contributing streams are lost, although their waters form the chief part of the collection. And sometimes the feeder in which the name is preferred is smaller than others which are united to the current, and which like a rich but ignoble alliance left their name in that of the more illustrious family. Some rivers indeed are respectable even at their birth, coming at once in force from some great lake. Such is the Rio de la Plata, the river St. Lawrence, and the mighty streams which issue in all directions from the Baltic lake. But, like the sons of Adam, they are all of equal descent, and should take their name from one the feeders of these lakes. This is indeed the case with a few, such as the Rhone, the Rhine, the Nile. These, after having mixed their waters with those of the lake, return their appearance and their name at its outlet.

But in general their origin and progress, even Origin and progress, is as well known as the life of man. The river springs from the earth; but its origin is in heaven. Its beginnings are insignificant, and its infancy is frivolous; it plays among the flowers of a meadow; it waters a garden, or turns a little mill. Gathering strength in its youth, it becomes wild and impetuous. Impatient of the restraints which it still meets with in the hollows among the mountains, it is refracts and fretful; quick in its turnings, and unfeated in its course. Now it is a roaring cataract, tearing up and overturning whatever opposes its progress, and it foams headlong down from a rock; then it becomes a full and glossy pool, buried in the bottom of a glen. Recovering breath by repose, it again dafhes along, till tired of the uproar and mischief, it quits all that it has swept along, and leaves the opening of the valley strewed with the rejected waftes. Now, quitting its retirement, it comes abroad into the world, journeying with more prudence and discretion through cultivated fields, yielding to circumstances, and winding round what would trouble it to overwhelm or remove. It passes through the populous cities and all the busy haunts of man, tendering its services on every hand, and becomes the support and ornament of the country. Now increased by numerous alliances, and advanced
in its course of existence, it becomes grave and stately in its motions, loves peace and quiet; and in majestic silence rolls on its mighty waters, till it is laid to rest in the vast abyss.

The philosopher, the real lover of wisdom, fees much to admire in the economy and mechanism of running waters; and their few operations of nature which give him more opportunities of remarking the nice adjustment of the most simple means for attaining many purposes of most extensive beneficence. All mankind seem to have felt this. The heart of man is ever open (unless perverted by the habits of selfish indulgence and arrogant self-sufficiency) to impressions of gratitude and love. He who ascribes the religious principle (debated, though it be by the humbling abuses of superstition) to the workings of fear alone, may betray the flavius meanness of his own mind, but gives a very unfair and a false picture of the hearts of his neighbours. Lucretius was but half a philosopher when he penned his oft-quoted apophthegm. Indeed his own nation's invention has been the subject of much ridicule, but every inhabitant of the adjacent or ruins, might I not wash in them, the rivers seem to couple their kalendars. And, if we see the inhabitants of the country, the river-gods are theomacuses, more showered than all the waters of Judaea? Might I not wash in them and be clean? So he went away wrought.

In those countries particularly, where the rural labours, and the hopes of the shepherd and the husbandman, were not so immediately connected with the approach and recession of the sun, and depended rather on what happened in a far distant country by the falls of periodical rains or the melting of collected snows, the Nile, the Ganges, the Indus, the river of Pegu, were the fertile agents of nature in procuring to the inhabitants of their banks all their abundance, and they became the objects of grateful veneration. Their sources were fought out with anxious care even by conquering princes; and when found, were universally worshipped with the most affectionate devotion. These remarkable rivers, so eminently and so palpably beneficial, preferve to this day, amidst every change of habit, and every increase of civilization and improvement, the fond adoration of the inhabitants of those fruitful countries through which they hold their flately course, and their waters are still held sacred. No progress of artificial refinement, not all the corruption of luxurious sensuality, has been able to eradicate this plant of native growth from the heart of man. The sentiment is congenial to his nature, and therefore it is universal; and we could almost appeal to the feelings of every reader, whether he does not perceive it in his own breast.

Perhaps we may be mistaken in our opinion in the cafe of the corrupted inhabitants' of the populous and busy cities, who are habituated to the fond contemplation of their own individual exertions as the sources of all their hopes. Give the fioomaker but leather and a few tools, and he defies the powers of nature to dis-appoint him; but the simpler inhabitants of the country, the most worthy and the most respectable part of every nation, after equal, perhaps greater exertion both of skill and of industry, are more accustomed to resign themselves to the great munition of Providence, and to look up to heaven for the "early and the latter rains," without which all their labours are fruitless.

**Extremus per illos**

Numerus excedens terrae nulli a factis.

And among the husbandmen and the shepherds of all nations and ages, we find the same fond attachment to their springs and rivulets. Fortunate genus, hic inter fluminum nota

Et fontes sacros frigus captatis opacum,

was the mournful ejaculation of poor Melibæus. We hardly know a river of any note in our own country whose source is not looked on with some respect.

We repeat our assertion, that this worthy was the offspring of affection and gratitude, and that it is giving a very unfair and false picture of the human mind to ascribe these superfluities to the working of fear alone. Their would have represented the river-gods as seated on ruins, brandishing rooted-up trees, with angry looks, pouring out their weeping torrents. But no such thing. The lively imagination of the Greeks felt, and expressed with an energy unknown to all other nations, every emotion of the human soul. They figured the Naiads as beautiful nymphs, patterns of gentleness and of elegance. They are represented as partially attached to the children of men; and their interference in human affairs is always in acts of kind affluence and protection. They reemisce, in this respect, the rural deities of the northern nations, the fairies, but without their caprices and resentments. And, if we attend to the descriptions and representations of their River-Gods, beings armed with power, an attribute which flavius fear never fails to couple with cruelty and vengeance, we find the same expression of affectionate fruit and confidence in their kind dispositions. They are generally called by the respectable but enduring name of father. "Da Tyberi pater," says Virgil. Mr Bruce says that the Nile at its source is called the abay or "father."—We observe this word, or its radices, blended with many names of rivers of the east, and think it probable that when our traveller goes by this name from the inhabitants of the neighbourhood, they applied to the stream what is meant to express the tutelar or preening spirit. The river-gods are always represented as venerable old men, to indicate their being coeval with the world. But it is always a cruda viridissima fenectus, and they are never represented as oppressed with age and decrepitude. Their beards are long and flowing, their looks placid, their attitude easy, reclined on a bank, covered, as they are crowned, with never-fading fedges and bulrushes, and leaning on their urns, from which they pour out their plentiful and fertilizing streams.

Mr
RIVER.

Mr Bruce's description of the sources of the Nile, and of the respect paid to the sacred waters, has not a frowning feature; and the hospitable old man, with his fair daughter Irepone, and the gentle priesthood which peopled the little village of Geh, forms a contrast with the neighbouring Galli (among whom a military leader was called the ‘labar, because he did not murder pregnant women), which very diffently points the inspiring principle of this superstition. Pliny says (VIII. 8.) that at the source of the Clitumnus there is an ancient temple highly respected. The presence and the power of the divinity are expressed by the fates which fland in the vestibule.—Around this temple are several little chapels, each of which covers a sacred fountain; for the Clitumnus is the father of several little rivers which unite their streams with him. At some distance below the temple is a bridge which divides the sacred waters from those which are open to common use. No one must presume to set his foot in the streams above this bridge; and to step over any of them is an indignity which renders a person infamous. They can only be visited in a consecrated boat. Below the bridge we are permitted to bathe, and the place is inefentially occupied by the neighbouring villagers. (See also Vitii. Sequefr. Ortelius. p. 101—103. and 221—223. also Sax. Caligula, c. 43. Virg. Georg. II. 146.)

What is the cause of all this? The Clitumnus flows (near its source) through the richest pastures, through which it was carefully distributed by numberless springs; and these nourished cattle of such spotless whiteness and extraordinary beauty, that they were fought for with eagerness over all Italy, as the most acceptable victims in their sacrifices. Is not this superstition then an effusion of gratitude?

Such are the dictates of kind-hearted nature in our breafly, before it has been vitiated by vanity and selfishness, and we should not be ashamed of feeling the impression. We hardly think of making any apology for dwelling a little on this incidental circumstance of the superfluous veneration paid to rivers. We cannot think that our readers will be displeased at having agreeable ideas excited in their minds, being always of opinion that the torch of true philosophy will not only enlighten the understanding, but also warm and cherish the affections of the heart.

With respect to the origin of rivers, we have very little to offer in this place. It is obvious to every person, that besides the torrents which carry down into the rivers what part of the rains and melted snows is not absorbed by the soil or taken up by the plants which cover the earth, they are fed either immediately or remotely by the springs. A few remarkable streams rush at once out of the earth in force, and must be considered as the continuation of subterraneous rivers, whose origin we are therefore to seek out; and we do not know any circumstance in which their first beginnings differ from those of other rivers, which are formed by the union of little streams and rivulets, each of which has its own source in a spring or fountain. This question, therefore, What is the proceed of nature, and how the fupplies which fill our springs? will be treated of under the word Spring.

Whatever be the source of rivers, it is to be met with in almost every part of the globe. The crust of earth with which the rocky framing of this globe is covered is generally stratified. Some of these strata are extremely pervious to water, having but small attraction for its particles, and being very porous. Such is the quality of gravelly strata in an eminent degree. Other strata are much more firm, or attract water more strongly, and refuse it a passage. This is the case with firm rock and with clay. When a stratum of the first kind has one of the other immediately under it, the water remains in the upper stratum, and burfts out wherever the sloping sides of the hills cut off the strata, and this will be in the form of a trickling spring, because the water in the porous stratum is greatly obstructed in its passage towards the outlet. As this irregular formation of the earth is very general, we must have springs, and of course rivers or rivulets, in every corner where there are high grounds.

Rivers flow from the higher to the lower grounds, It is the arrangement of this elevation which distributes them over the surface of the earth. And this appears to be accomplished with considerable regularity; and, except the great defect of Kobi on the confines of China, and Tartary, we do not remember any very extensive track of ground that is deprived of those channels for voiding the superfluous waters; and even there they are far from being redundant.

The course of rivers gives us the best general method for judging of the elevation of a country. Thus the rivers appear that Savoy and Switzerland are the highest grounds of Europe, from whence the ground slopes in every direction. From the Alps proceed the Danube and the Rhine, whose courses mark the two great valleys, into which many lateral streams descend. The Po also and the Rhone come from the same head, and with a steeper and shorter course find their way to the sea through valleys of less breadth and length. On the west side of the valleys of the Rhine and the Rhone the ground rises pretty fast, so that few tributary streams come into them from that side; and from this gentle elevation France slopes to the westward. If a line, nearly straight, but bending a little to the northward, be drawn from the head of Savoy and Switzerland all the way to Solikamkoy in Siberia, it will nearly pass through the most elevated part of Europe; for in this track most of the rivers have their rise. On the left go off the various feeders of the Elbe, the Oder, the Wesel, the Niemen, the Duna, the Neva, the Dwina, the Petzora. On the right, after passing the feeders of the Danube, we see the sources of the Sereth and Pruth, the Dnieaper, the Bog, the Dnieper, the Don, and the mighty Volga. The elevation, however, is extremely moderate; and it appears from the levels taken with the barometer by the Abbé Chaffe d'Autechere, that the head of the Volga is not more than 470 feet above the surface of the ocean. And we may observe here that the bay, that its mouth, where it discharges its waters into the Caspian sea, is undoubtedly lower, by many feet, than the surface of the ocean. See Pneumatics, p. 277. China and Finland, with Lapland, Norway, and Sweden, form two detached parts, which have little symmetry with the rest of Europe.

A chain of mountains begins in Nova Zembla, and stretches due south to near the Caspian Sea, dividing Europe from Asia. About three or four degrees north
River.

of the Caspian sea it bends to the south-east, traverses western Tartary, and passing between the Tengis and Zaizan lakes, it then branches to the east and south. The western branch runs to the shores of Korea and Kamchatka. The southern branch traverses Turkestan and Thibet, separating them from India, and at the head of the kingdom of Ava joins an arm stretching from the great eastern branch, and here forms the centre of a very singular radiation. Chains of mountains strike from it in every direction. Three or four of them keep very close together, dividing the continent into narrow slips, which have each a great river flowing in the middle, and reaching to the extreme points of Malacca, Cambodiam, and Cochin-China. From the same central point proceeds another great river due east, and passes a little north of Canton in China. We called this a singular centre: for though it sends off so many branches, it is by no means the most elevated part of the continent.

In the triangle which is included between the first southern ridge (which comes from between the lakes Tengis and Zaizan), the great eastern ridge, and its branch which almost unites with the southern ridge, lies the Bouthan, and part of Thibet, and the many little rivers which occupy its surface, flow southward and eastward, uniting a little to the north of the centre often mentioned, and then pass through a gorge eastward into China. And it is farther to be observed, that these great ridges do not appear to be seated on the highest parts of the country; for the rivers which correspond to them are at no great distance from them, and receive their chief supplies from the other sides. This is remarkably the case with the great Ob, which runs almost parallel to the ridge from the lakes to Nova Zembla. It receives its supplies from the east, and indeed it has its source far east. The highest grounds (except the ridges of mountains which are the boundaries) of the continent seem to be in the country of the Calmecs, about 45° east from London, and latitude 45° or 45° north. It is represented as a fine though sandy country, having many little rivers which lose themselves in the sand, or end in little salt lakes. This elevation stretches north-east to a great distance; and in this track we find the heads of the Irrith, Selenga, and Tuengukaia (the great feeders of the Ob), the Olenitz, the Lena, the Yana, and some other rivers which all go off to the north. On the other side we have the great river Amur, and many smaller rivers, whose names are not familiar. The Hoangho, the great river of China, rises on the south side of the great eastern ridge we have so often mentioned. This elevation, which is a continuation of the former, is somewhat of the same complexion, being very sandy, and at present is a desert of prodigious extent. It is described, however, as intersected with vast tracks of rich pasturage; and we know that it was formerly the most fertile country, and is now given by the name of Turkestan and possessed itself of most of the richest kingdoms of Asia. In the south-western extremity of this country are found remains not only of barbaric magnificence, but even of cultivation and elegance. It was a profitable privilege granted by Peter the Great to some adventurers to search these sandy deserts for remains of former opulence, and many pieces of delicate workmanship (though not in a style which we should admire) in gold and silver were found. Vaults were found buried in the sand filled with written papers, in a character wholly unknown; and a wall was discovered extending several miles, built with hewn stones and ornamented with niches and battlements. But we are forgetting ourselves, and return to the consideration of the distribution of the rivers on the surface of the earth. A great ridge of mountains begins at the south-east corner of the Euxine Sea, and proceeds eastward, ranging along the south side of the Caspian, and still advancing unites with the mountains first mentioned in Thibet, sending off some branches to the south, which divide Persia, India, and Thibet. From the south side of this ridge flow the Euphrates, Tigris, Indus, Ganges, &c. and from the north the ancient Oxus and many unknown streams.

There is a remarkable circumstance in this quarter of the globe. Although it seems to be nearest to the greatest elevations, it seems also to have places of the greatest depression. We have already said that the Caspian Sea is lower than the ocean. There is in its neighbourhood another great basin of salt water, the lake Aral, which receives the waters of the Oxus or Gion, which were said to have formerly run into the Caspian Sea. There cannot therefore be a great difference in the level of these two basins; neither have they any outlet, tho' they receive great rivers. There is another great lake in the middle of Persia, the Zare or Zara, which receives the river Hindemond, of near 250 miles length, besides other streams. There is another such in Asia Minor. The sea of Sodom and Gomorrah is another inaccuracy. And in the high countries we mentioned, there are many small salt lakes, which receive little rivers, and have no outlet. The lake Zara in Persia, however, is the only one which indicates a considerable hollow of the country: It is now ascertained by actual survey, that the sea of Sodom is considerably higher than the Mediterranean. This feature is not, however, peculiar to Asia. It obtains all over Africa, whose rivers we now proceed to mention.

Of them, however, we know very little. The Nile indeed is perhaps better known than any river out of Europe; and of its source and progress we have given a full account in a separate article. See Nile.

By the register of the weather kept by Mr Bruce at Gondar in 1770 and 1771, it appears that the greatest rains are about the beginning of July. He says that at an average each month after June it doubles its rains. The calix or canal is opened at Cairo about the 9th of August, when the river has risen 14 pikes (each 21 inches), and the waters begin to decrease about the 10th of

Sep.
History.

September, we must conclude that the water then flow-
ing past Cairo had left Abyssinia when the rains had
greatly abated. Judging in this way, we must still al-
low the stream a velocity of more than six feet. Had
the first swell at Cairo been noticed in 1770 or 1771,
we might have guessed better. The year that Thvenot
was in Egypt, the first swell of 8 peeks was observed
Jan. 28. The calath was opened for 14 peeks on Au-
gust 14th, and the waters began to decrease on Septem-
ber 23d, having risen to 215 peeks. We may suppose
a similar progress at Cairo corresponding to Mr Bruce's
observations at Gondar, and date every thing five days
earlier.

We understand that some of our gentlemen station-
ed far up the Ganges have had the curiosity to take
notes of the swellings of that river, and compare them
with the overflows at Calcutta, and that their obser-
vations are about to be made public. Such accounts are
valuable additions to our practical knowledge, and
we shall not neglect to insert the information in some
kindred article of this work.

The same mountains which attract the tropical va-
pours, and produce the fertilizing inundations of the
Nile, perform the same office to the famous Niger,
whose excellence has often been accounted fabulous,
and with whose water we have very little acquaintance.
The researches of the gentlemen of the African associa-
tion render its existence no longer doubtful, and have
greatly excited the public curiosity. For a farther ac-
count of its track, see Nig)c.

From the great number, and the very moderate size,
of the rivers which fall into the Atlantic Ocean all the
way south of the Gambia, we conclude that the western
shore is the most elevated, and that the mountains are at
no great distance inland. On the other hand, the ri-
vcrs at Melinda and Sofala are of a magnitude which in-
dicate a much longer course. But of all this we speak
with much uncertainty.

The frame-work (to call it) of America is better
known, and is singular.

A chain of mountains begins, or at least is found, in
latitude 10° north of London, and latitude 40° north,
on the northern confines of the kingdom of Mexico,
and stretching southward through that kingdom, forms
the ridge of the neck of land which separates North from
South America, and keeps almost close to the shore,
ranges along the whole western coast of South Ameri-
ca, terminating at Cape Horn. In its course it sends
off branches, which after separating from it for a few
leagues, rejoin it again, inclosing valleys of great extent
from north to south, and of prodigious elevation. In
one of these, under the equatorial sun, flants the city
of Quito, in the midst of extensive fields of barley, oats,
Wheat, and gardens, containing apples, pears, and goose-
berries, and in short all the grains and fruits of the
cooler parts of Europe; and although the vine is also
there in perfection, the olive is wanting. Not a dozen
miles from it in the low countries, the sugar-cane, the
indigo, and all the fruits of the torrid zone, find their
genial heat, and the inhabitants swelter under a burning
sun. At as small a distance on the other hand tower
alas the pinacles of Pichincha, Corambourou, and
Chemb-raco, crowned with never melting snows.

The individu 1 mountains of this tremendous range
not only exceed in height all others in the world (if
we except the peak of Teneriffe, Mount Jëfina, and
Mount Blanc); but they are set down on a base incom-
parably more elevated than any other country. They
cut off therefore all communication between the Pacific
Ocean and the inland continent; and no rivers are to be
found on the west coast of South America which have
any considerable length of course or body of water. The
country is drained, like Africa, in the opposite direc-
tion. Not 100 miles from the city of Lima, the capi-
tal of Peru, which lies almost on the sea shore, and just
at the foot of the high Cordilleras, arises out of a small
lake the Maragon or Amazon's river, which, after run-
ing northward for about 100 miles, takes an easterly
direction, and crosses nearly the broadest part of South
America, and falls into the great western ocean at Para,
after a course of not less than 3500 miles. In the first
half of its descent it receives a few middle-sized rivers
from the north, and from the south it receives the great
river Combus, springing from another little lake not 50
miles distant from the head of the Maragon, and inco-
figuring between them a wide extent of country. Then it
receives the Yuta, the Yuerva, the Cuchivaera, and
Pana Mire, each of which is equal to the Rhine; and
then the Madeira, which has flowed above 1300 miles.
At their junction the breadth is so great, that neither
shore can be seen by a person standing up in a canoe
that the united stream must be about 6 miles broad.
In this majestic form it rolls along at a prodigious rate
through a flat country, covered with impenetrable for-
ets, and most of it as yet untrodden by human feet.
Mr Condamine, who came down the stream, says, that
all is silent as the desert, and the wild beasts and num-
nerless birds crowd round the boat, eyeing it as some
animal of which they did not seem afraid. The bed
was cut deep through an equal and yielding soil, which
seemed rich in every part, if he could judge by the ve-
etation, which was rank in the extreme. What an
addition this to the possible population of this globe!
A narrow slip along each bank of this mighty river
would equal in surface the whole of Europe, and would
probably exceed it in general fertility: and although
the velocity in the main stream was great, he observed
that it was extremely moderate, near almost still, at the
fords; so that in those parts this country was inhabited by
men, the Indians paddled up the river with perfect ease.
Boats could go from Para to near the Mouth of the Madeira in 38 days, which is near
1200 miles.

Mr Condamine made an observation during his passage
down the Maragon, which is extremely curious and
instructive, although it puzzled him very much. He
observed that the tide was sensible at a vast distance
from the mouth: it was very considerable at the junc-
tion of the Madeira; and he supposes that it might have
been observed much farther up. This appeared to him
very surprising, because there could be no doubt but
that the surface of the water there was higher by a
great many feet than the surface of the flood of the At-
tantic ocean at the mouth of the river. It was there-
fore very natural for him to attribute the tide in the Ma-
ragon to the immediate action of the moon on its wa-
ters; and this explanation was the more reasonable, be-
cause the river extends in the direction of territorial
longitude, which by the Newtonian theory is most fa-
vourable to the production of a tide. Journeying as he
did
did in an Indian canoe, we cannot suppose that he had much leisure or convenience for calculations, and therefore are not surprised that he did not see that even this circumstance was of little avail in so small or shallow a body of water. He carefully noted, however, the times of high and low water as he paddled along. When arrived at Para, he found not only that the high water was later and later as we are farther from the mouth, but he found that at one and the same instant there were several points of high water between Para and the confluence of the Madeira, with points of low water intervening. This conclusion was easily drawn from his own observations, although he could not see at one instance the high waters in different places. He had only to compute the time of high water at a particular spot, on the day he observed it at another; allowing, as usual, for the moon's change of position. The result of his observations therefore was, that the surface of the river was not an inclined plane whose slope was lessened by the tide of flood at the mouth of the river, but that it was a wavy line, and that the propagation of the tide up the river was nothing different from the propagation of any other wave. We may conceive it clearly, though imperfectly, in this way. Let the place be noted where the tide happens 12 hours later than at the mouth of the river. It is evident that there is also a tide at the mouth of the same instant; and, since the ocean tide had withdrawn itself during the time that the former tide had proceeded so far up the river, and the tide of ebbs is successively felt above as well as below the tide of flood, there must be a low water between these two high waters.

Newton had pointed out this curious fact, and observed that the tide at London-Bridge, which is 43 feet above the sea, is not the same with that at Gravesend, but the preceding tide. (See Phil. Trans. 67.) This will be more particularly insisted on in another place.

Not far from the head of the Maragnon, the Cordilleras tend off a branch to the north-east, which reaches and ranges along the shore of the Mexican Gulf, and the Rio Grande de Sta Martha occupies the angle between the ridges.

Another ridge ranges with interruptions along the coast of Terra Firma, so that the whole waters of this country are collected into the Oronoko. In like manner the north and east of Brazil are hemmed in by mountainous ridges, through which there is no considerable passage; and the ground sloping backwards, all the waters of this immense tract are collected from both sides by many considerable rivers into the great river Paraguay, or Rio de la Plata, which runs down the middle of this country for more than 1400 miles, and falls into the sea through a vast mouth in latitude 35°.

Thus the whole of South America seems as if it had been formerly surrounded by a mound, and been a great basin. The ground in the middle, where the Parana, the Madeira, and the Plata, take their rise, is an immense marsh, uninhabitable for its exhalations, and quite impervious in its present state.

The manner in which the continent of North America is watered, or rather drained, has also some peculiarities. By looking at the map, one will observe first of all a general division of the whole of the left known part into two, by the valleys in which the beds of the river St. Lawrence and Mississippi are situated. The head of this is occupied by a singular series of fresh water lakes or lakes, viz. the lake Superior and Michigan, which empty themselves into lake Huron by two cataracts. This again runs into lake Erie by the river Detroit, and the Erie pours its waters into the Ontario by the famous fall of Niagara, and from the Ontario proceeds the great river St. Lawrence.

The ground to the south west of the lakes Superior and Erie is somewhat lower, and the middle of the valley is occupied by the Mississippi and the Missouri, which receives on both sides a number of smaller streams, and having joined, proceeds to the south, under the name Missouri. In latitude 37°, this river receives into its bed the Ohio, a river of equal magnitude, and the Cherokee river, which drains all the country lying at the back of the United States, separated from them by the ranges of the Appalachian mountains. The Mississippi is now one of the chief rivers on the globe, and proceeds due south, till it falls into the Mexican bay through several shalley mouths, which greatly resemble those of the Danube and the Nile, having run above 1200 miles.

The elevated country between this bed of the Mississippi and St. Lawrence and the Atlantic ocean is drained on the east side by a great number of rivers, some of which are very considerable, and of long course; because instead of being nearly at right angles to the coast, as in other countries, they are in a great measure parallel to it. This is more remarkably the case with Hudson's river, the Delaware, Patomack, Rapahanoc, &c. Indeed the whole of North America seems to consist of ribs or beams laid nearly parallel to each other from north to south, and the rivers occupy the interstices. All those which empty themselves into the bay of Mexico are parallel and almost perfectly straight, unlike what are seen in other parts of the world. The westernmost of them all, the North River, as it is named by the Spaniards, as nearly as long as the Mississippi.

We are very little informed as yet of the distribution of rivers on the north-west coast of America, or the course of those which run into Hudson's and Baffin's bay.

The Maragnon is undoubtedly the greatest river in the world, both as to length of run and the vast body of water which it rolls along. The other great rivers succeed nearly in the following order.

Maragnon, Senegal, Nile, St. Lawrence, Hoangho, Rio de la Plata, Yenisey, Mississippi, Volga, Ob, Amur, Oronoko, Ganges, Euphrates, Danube, Don, Indus, Dnieper, Duna, &c.

We have been much assisted in this account of the course of rivers, and their distribution over the globe, by a beautiful planisphere or map of the world published by Mr. Bode astronomer royal at Berlin. The ranges of mountains are there laid down with philosophical discernment and precision; and we recommend it to the notice
PART I. THEORY OF THE MOTION OF RIVERS AND CANALS.

The importance of this subject needs no commentary. Every nation, every country, every city, is interested in it. Neither our wants, our comforts, nor our pleasures, can dispense with an ignorance of it. We must conduct their waters to the centre of our dwellings; we must secure ourselves against their ravages; we must employ them to drive those machines which, by compensating for our personal weaknesses, make a few able to perform the work of thousands; we employ them to water and fertilize our fields, to decorate our mansions, to cleanse and embellish our cities, to preserve or extend our domains, to transport from country to country every thing which necessity, convenience, or luxury, has rendered precious to man: for these purposes we must confine and govern the mighty rivers, we must preserve or change the beds of the smaller streams, draw off from them what shall water our fields, drive our machines, or supply our houses. We must keep up their waters for the purposes of navigation, or supply their places by canals; we must drain our fens, and defend them when drained; we must understand their motions, and their mode of secret, flow, but unceasing action, that our bridges, our wharfs, our dikes, may not become heaps of ruins. Ignorant how to proceed in their daily recurring cafes, how often do we see projects of high expectation and heavy expense fail of their object, leaving the state burdened with works not only useless but frequently hurtful.

This has long been a most interesting subject of study in Italy, where the fertility of their fields is not more indebted to their rich soil and happy climate, than to their numerous derivations from the rivers which traverse them: and in Holland and Flanders, where their very existence requires unceasing attention to the waters, which are every moment ready to swallowing up the inhabitants; and where the inhabitants, having once subdued this formidable enemy, have made those very waters their indefatigable drudges, transporting through every corner of the country the materials of the most extensive commerce on the face of this globe.

Such having been our incessant operations with moving waters, we should expect that while the operative arts are continually furnishing facts and experiments, the men of speculative and scientific curiosity, excited by the importance of the subject, would ere now have made considerable progress in the science; and that the professional engineer would be daily acting from established principle, and be seldom disappointed in his expectations. Unfortunately the reverse of this is nearly the true state of the case; each engineer is obliged to collect the greatest part of his knowledge from his own experience, and by many dear-bought lessons, to direct his future operations, in which he still proceeds with anxiety and hesitation: for we have not yet acquired principles of theory, and experiments have not yet been collected and published, by which an empirical practice might be safely formed. Many experiments of inestimable value are daily made; but they remain with their authors, who seldom have either leisure, ability, or generosity, to add them to the public flock.

The motion of waters has been really so little investigated as yet, that hydraulics may still be called a new study. We have merely skimmer over a few common notions concerning the motions of water; and the mathematicians of the first order seem to have contented themselves with such views as allowed them to entertain themselves with elegant applications of calculus. This, however, has not been their fault. They rarely had any opportunity of doing more, for want of a knowledge of facts. They have made excellent use of the few which have been given them; but it required much labour, great variety of opportunity, and great expenditure, to learn the multiplicity of things which are combined even in the simplest cafes of water in motion. These are seldom the lot of the mathematician; and he is without blame when he enjoys the pleasures within his reach, and cultivates the science of geometry in its most abstracted form. Here he makes a progress which is the boast of human reason, being almost unfurms from error by the intellectual simplicity of his subject. But when we turn our attention to material objects, and begin knowing either the size and shape of the elementary particles, or the laws which nature has prescribed for their action, presume to foretell their effects, calculate their exertions, direct their actions, what must be the consequence? Nature sheds her independence with respect to our notions, and, always faithful to the laws which are enjoined, and of which we are ignorant, she never fails to thwart our views, to disconcert our projects, and render useless all our efforts.

To with to know the nature of the elements is vain, Proper mode of investigation and our gross organs are insufficient for the study. To suppose what we do not know, and to fancy shapes and sizes at will; this is to raise phantoms, and produce a system, but will not prove a foundation for any science. But to interrogate Nature herself, study the laws which she so faithfully observes, catch her, as we say, in the fact, and thus wrench from her the secret; this is only way to become her master, and it is the only procedure consistent with good faith. And we see, that after Kepler detected the laws of the planetary motions, when Galileo discovered the uniform acceleration of gravity, when Pafchall discovered the pressure of the atmosphere, and Newton discovered the laws of attraction and the track of a ray of light; astronomy, mechanics, hydrostatics, chemistry, optics, quickly be...
River.

Theory.

It happened that some bodies of sound doctrine; and the deductions from their respective theories were found fair representations of the phenomena of nature. Whenever a man has discovered a law of nature, he has laid the foundation of a science, and he has given us a new mean of subjugating to our service some element hitherto independent; and so long as groups of natural operations follow a route which appears to us whimsical, and will not admit our calculations, we may be assured that we are ignorant of the principle which connects them all, and regulates their procedure.

This is remarkably the case with several phenomena in the motions of fluids, and particularly in the motion of water in a bed or conduit of any kind. Although the first geniuses of Europe have for this century past turned much of their attention to this subject, we are almost ignorant of the general law which may be observed in their motions. We have been able to select very few points of resemblance, and every cafe remains nearly an individual. About 150 years ago we discovered, by experience only, the quantity and velocity of water issuing from a small orifice, and, after much labour, have extended this to any orifice; and this is almost the whole of our confidential knowledge. But as to the uniform course of the streams which water the earth, and the maxims which will certainly regulate this agreeably to our wishes, we are in a manner totally ignorant. Who can pretend to say what is the velocity of a river of which you tell him the breadth, a heavy body would fall in a second) is the distance of the principle.

Our ignorance of the general laws of this motion.

The velocity of any particle R, in any part of a river of which you tell him the breadth, and the depth; the declivity and the distance of the principle.

The velocity of each filament will be that which is acquired by falling from the surface AB. The fluid is then drawn with its velocity which it would have acquired by falling through the height OF, the point O being in the horizontal plane AB produced. The same may be said of its velocity when it arrives at H or K. The filament immediately above C will also have its velocity which is the subduplicate ratio of its depth, and will then glide down above the first filament. The same may be affirmed of all the filaments; and of the superficial filament, which will occupy the surface of the descending stream.

The velocity of any particle R, in any part of the stream, is that acquired by falling from the horizontal plane AN.

1. The velocity at the bottom of the stream is everywhere greater than anywhere above it, and is least of all at the surface.

2. The velocity of the stream increases continually as the stream recedes from its source.
Part I.

RIVER.

Theory. 4. The depths EF, GH, &c. in different parts of the stream, will be nearly in the inverse subduplicate ratio of the depths under the surface AN: for since the same quantity of water is running through every section EF and GH, and the channel is supplied of uniform breadth, the depth of each section must be inversely as the velocity of the water passing through it. This velocity is indeed different in different filaments of the section; but the mean velocity in each section is in the subduplicate ratio of the depth of the filament under the surface AB. Therefore the stream becomes more shallow as it recedes from the source; and in consequence of this the difference between LH and MG continually diminishes, and the velocities at the bottom and surface of the stream continually approach to equality, and at a great distance from the source they differ insensibly.

5. If the breadth of the stream be contracted in any part, the depth of the running water will be increased in that part, because the same quantity must still pass through; but the velocity at the bottom will remain the same, and that at the surface will be less than it was before; and the area of the section will be increased on the whole.

6. Should a sluice be put across the stream, dipping a little into the water, the water must immediately rise on the upper side of the sluice till it rises above the level of the reservoir, and the smallest immersion of the sluice will produce this effect. For by lowering the sluice, the area of the section is diminished, and the velocity cannot be increased till the water heap up to a greater height than the surface of the reservoir, and this acquires a pressure which will produce a greater velocity of efflux through the orifice left below the sluice.

An additional quantity of water coming into this channel will increase the depth of the stream, and the quantity of water which it conveys; but it will not increase the velocity of the bottom filaments, unless it comes from a higher source.

All these consequences are contrary to experience, and show the imperfection, at least, of the explanation.

The third consequence is of all the most contrary to experience. If any one will but take the trouble of following a single brook from its source to the sea, he will find it most rapid in its beginnings among the mountains, gradually slackening its pace as it winds among the hills and gentle declivities, and at last creeping slowly along through the flat grounds, till it is checked and brought to rest by the tides of the ocean.

Nor is the second consequence more agreeable to observation. It is universally found, that the velocity of the surface in the middle of the stream is the greatest of all, and that it gradually diminishes from thence to the bottom and sides.

And the first consequence, if true, would render the running waters on the surface of this earth the instruments of immediate ruin and devastation. If the waters of our rivers, in the cultivated parts of a country, which are two, three, and four hundred feet lower than their sources, run with the velocity due to that height, they would in a few minutes lay the earth bare to the very bases.

The velocities of our rivers, brooks, and rills, being so greatly inferior to what this theory assigns to them, the other consequences are equally contrary to experience. When a stream has its section diminished by narrowing the channel, the current increases in depth, and this is always accompanied by an increase of velocity through the whole of the section, and most of all at the surface; and the area of the section does not increase, but diminishes, all the phenomena, thus contradicting in every circumstance the deduction from the theory; and when the section has been diminished by a sluice let down into the stream, the water gradually heaps up on the upper side of the sluice, and, by its pressure, produces an acceleration of the stream below the sluice, in the same way as if it were the beginning of a stream, as explained in the theory. The velocity now is composed of the velocity preferred from the source and the velocity produced by this subordinate accumulation; and this accumulation and velocity continually increase, till they become such that the whole supply is again discharged through this contracted section: any additional water not only increases the quantity carried along the stream, but also increases the velocity, and therefore the section does not increase in the proportion of the quantity.

It is surprising that a theory really founded on a concept, and which in every most familiar and obvious circumstance is contradicted by facts, should have met with so much attention. That Varignon should immediately catch at this notion of Guglielmini, and make it the subject of many elaborate analytical memoirs, is not to be wondered at. This author only wanted donner prêle au calcul; and it was a usual joke among the academicians of Paris, when any new theorem was invented, donner le à Varignon à généralet. But his numerous theorems and corollaries were adopted by all, and still make the substance of the present systems of hydraulics. Guglielmini was, however, not altogether the dupe of his own ingenuity. He was not only a pretty good mathematician, but an adulatory and factious observer. He had applied his theory to some important cafes which occurred in the course of his profession as inspector of the rivers and canals in the Milanese, and to attempt the course of the Danube; and could not but perceive that great corrections were necessary for making the theory quadrate in some tolerable manner with observation; and he immediately saw that the motion was greatly obstructed by inequalities of the channel, which gave to the contiguous filaments of the stream transverse motions, which thwarted and confused the regular progress of the rest of the stream, and thus checked its general progress. These obstructions, he observed, were most effectual in the beginning of its course, while yet a small till, running among stones, and in a very unequal bed; while the stream being small, the inequalities bore a great proportion to it, and thus the general effect was great. He also saw that the same causes (these transverse motions produced by the unequal bottom) chiefly affected the contiguous filaments, and were the reasons why the velocity at the sides and bottom was so much diminished as to be left in the superficial velocity, and that even this might come to be diminished.
diminished by the same cause. For he observed, that the general stream of a river is frequently composed of a part of boiling or tumbling motion, by which masses of water are brought up to the surface and again descend. Every person must recollect such appearances in the freshes of a muddy river; and in this way Guglielmini was enabled to account in some measure for the disagreement of his theory with observation.

Mariotte had observed the same obstructions even in the smoothest glass pipes. Here it could not be ascribed to the checks occasioned by transverse motions. He therefore ascribed it to friction, which he supposed to diminish the motion of fluid bodies in the same manner as of solids; and he thence concludes, that the filaments which immediately rub on the sides of the tube have their velocity gradually diminished; and that the filaments immediately adjoining to these, being thus obliged to pass over them or outstrip them, rub upon them, and have their own velocity diminished in like manner, but in a smaller degree; and that the succeeding filaments towards the axis of the tube suffer similar but smaller diminutions. By this means the whole stream may come to have a smaller velocity; and at any rate the motion of the particles which are moving more rapidly have their motions diminished by those in their neighbourhood which move slower, but that the filaments also which would have moved more slowly are accelerated by their more active neighbours; and that in this manner the superficial and inferior velocities are brought nearer to an equality. But this will never account for the universal fact, that the superficial particles are the swiftest of all. The superficial particles, says he, acquire by this means a greater velocity than the parabolic law allows them; the medium velocity is often in the middle of the depth; the numerous obstacles, continually multiplied and repeated, cause the current to lose the velocity acquired by the fall; the slope of the bottom then diminishes, and often becomes very small, so that the force remaining is hardly able to overcome the obstacles which are still repeated, and the river is reduced almost to a state of stagnation. He observes, that the Rhine, a river of the Milanese, has near its mouth a slope of no more than 50°, which he considers as quite inadequate to the task; and here he introduces another principle, which he considers as an essential part of the theory of open currents. This is, that there arises from the very depth of the stream a propelling force which restores a part of the lost velocity. He offers nothing in proof of this principle, but uses it to account for and explain the motion of waters in horizontal canals. The principle has been adopted by the numerous Italian writers on hydraulics, and, by various contrivances, interwoven with the parabolical theory, as it is called, of Guglielmini. Our reader may see it in various modifications in the *Idrofìlatìa Idraulica* of P. Lecchi, and in the *Sopra il movimento* of Michelotti. It is by no means distinct either in its origin or in the manner of its application to the explanation of phenomena, and seems only to serve for giving something like consistency to the vague and obscure discussions which have been published on this subject in Italy. We have already remarked, that in that country the subject is particularly interesting, and has been much commented upon. But the writers of England, France, and Germany, have not paid so much attention to it, and have more generally occupied themselves with the motion of water in close conduits, which seem to admit of a more precise application of mathematical reasoning.

Some of these have considered with more attention the effects of friction and viscosity. Sir Isaac Newton, with his usual penetration, had seen the difficulty of the matter in which it believed these circumstances to operate. He had occasion, in his researches into the mechanism of the celestial motions, to examine the famous hypothesis of Descartes, that the planets were carried round the sun by fluid vortices, and saw that there would be no end to uncertainty and dispute till the *modus operandi* of the vortices was mechanically considered. He therefore employed himself in the investigation of the matter in which the acknowledged powers of natural bodies, acting according to the received laws of mechanics, could produce and preserve these vortices, and restore that motion which was expended in carrying the planets round the sun. He therefore, in the second book of the Principles of Natural Philosophy, gives a series of beautiful propositions, viz. 51, 52, &c. with their corollaries, showing how the rotation of a cylinder or sphere round its axis in the midit of a fluid will excite a vortical motion in this fluid; and he afterwards with mathematical precision the motion of every filament of this vortex.

He sets out from the supposition that this motion is excited in the surrounding stratum of fluid in consequence of a want of perfect lubribility, and afterwards by an hypothesis, that the initial resistance (or diminution of the motion of the cylinder) which arises from this want of lubribility, is proportional to the velocity with which the surface of the cylinder is separated from the contiguous surface of the surrounding fluid, and that the whole resistance is proportional to the velocity with which the parts of the fluid are mutually separated from each other. From this, and the equality of action and reaction, it evidently follows, that the velocity of any stratum of the vortex is the arithmetical medium between the velocities of the strata immediately within and without it. For the intermediate stratum cannot be in equilibrium, unless it is as much pressed forward by the superior motion of the stratum within it, as it is kept back by the lower motion of the stratum without it.

This beautiful investigation applies in the most perfect manner to every change produced in the motion of a fluid filament, in consequence of the viscosity and friction of the adjoining filaments; and a filament proceeding along a tube at some small distance from the sides has, in like manner, a velocity which is the medium between those of the filaments immediately surrounding
It is therefore a problem of no very difficult solution to assign the law by which the velocity will gradually diminish as the filament recedes from the axis of a cylindrical tube. It is somewhat surprizing that so near a problem has never occupied the attention of the mathematicians during the time that these subjects were so abduly studied; but so it is, that nothing specific has been published on the subject. The only approach to a diffusion of this kind, is a Memoire of Mr. P.ots, read to the academy of Paris in 1797, where he considers the velocity of efflux through a pipe. Here, by attending to the comparative superiority of the quantity of motion in large pipes, he affirms, that the total diminution arising from friction will be \(c\) (ceteris paribus) in the inverse ratio of the diameters. This was thankfully received by other writers, and is now a part of our hydraulic theories. It has not, however, been attended to by those who write on the motion of rivers, though it is evident that it is applicable to thee with equal propriety; and had it been introduced, it would at once have solved all their difficulties, and particularly would have shewn how an almost imperceptible decay would produce the gentle motion of a great river, without having recourse to the unimpealible principle of Guglielmini.

Mr. Couplet made some experiments on the motion of the water in the great main pipes of Verailles, in order to obtain some notions of the retardations occasioned by friction. They were found prodigious; but were so irregular, and unappeasable to any general principle, (and the experiments were indeed so few that they were unsuit for this reduction), that he could establish no theory. What Mr. Belidor established on them, and makes a sort of subject to direct future engineers, is quite unworthy of attention.

Upon the whole, this branch of hydraulics, although of much greater practical importance than the conduct of water in pipes, has never yet obtained more than a vague, and, we may call it, slovenly attention from the mathematicians; and we ascribe it to their not having taken the pains to settle its first principles with the same precision as had been done in the other branch. They were, from the beginning, satisfied with a sort of applicability of mathematical principles, without ever making the application. Were it not that some would accuse us of national partiality, we would ascribe it to this, that Newton had not pointed out the way in this as in the other branch. For any intelligent reader of the performances on the motions of fluids in closed vessels; will see that there has not a principle, may hardly a flimp of investigation, been added to those which were used or pointed out by Sir Isaac Newton. He has nowhere touched this question, the motion of water in an open canal. In his theories of the tides, and of the propagation of waves, he had an excellent opportunity for giving at once the fundamental principles of motion in a free fluid whose surface was not horizontal. But, by means of some of those happy and shrewd squabbles, in which, as Daniel Bernoulli says, he excelled all men, he saw the unsted consequences of some palpable phenomenon which would answer all his present purposes, and therefore entered no farther into the investigation.

The original theory of Guglielmini, or the principle adopted by him, that each particle of the vertical section of a running stream has a tendency to move as if it were issuing from an orifice at that depth under the surface, is false; and that it really does so in the face of a dam when the flood-gate is taken away, is no less so; and if it did, the subsequent motions would hardly have any reference to those which he assigns them. Were this the case, the exterior form of the cascade would be something like what is sketched in fig. 2, with an abrupt angle at B, and a concave surface BEG. This will be evident to every one who combines the greater velocity of the lower filaments with the motion of those which must slide down above them. But this greater advance of the lower filaments cannot take place without an expenditure of the water under the surface AB. The surface therefore sinks, and B instantly ceases to retain its place in the horizontal plane. The water does not successively flow forward from A to B, and then tumble over the precipice; but immediately upon opening the flood-gate, the water wails from the space immediately behind it, and the whole puts on the form represented in fig. 4, conflating the curve A a P c E G, convex from A to c, and concave from thence forward. The superficial water begins to accelerate all the way from A; and the particles may be supposed (for the present) to have acquired the velocity corresponding to their depth under the horizontal surface. This must be understood as nothing more than a vague sketch of the motions. It requires a very critical and intricate investigation to determine either the form of the upper curve or the motions of the different filaments. The place A, where the curvature begins, is of equally difficult determination, and is various according to the differences of depth and of inclination of the preceding canal.

We have given this sort of history of the progress which had been made in this part of hydraulics, that our readers might form some opinion of the many dissertations which have been written on the motion of rivers, and of the state of the arts depending on it. Much of the business of the civil engineer is intimately connected with it; and we may therefore believe, that since there was so little principle in the theories, there could be but very little certainty in the practical operations. The fact has been, that no engineer could pretend to say, with any precision, what would be the effect of his operations. One whose business had given him many opportunities, and who kept accurate and judicious registers of his own works, could pronounce, with some probability, how much water would be brought off by a drain of certain dimensions and a given slope, when the circumstances of the case happened to tally with some former work in which he had succeeded or failed; but out of the pale of his own experience he could only make a hazardous guess. A remarkable instance of this occurred not long ago. A small aqueduct was lately carried into Paris. It had been conducted on a plan presented to the academy, who had corrected it, and gave a report of what its performance would be. When executed in the most accurate manner, it was deficient in the proportion of five to nine. When the celebrated Desaguliers was employed by the city of Edinburgh to superintend the bringing in of the water for the supply of the city, he gave a report on the plan which was to be followed. It was executed to his complete satisfaction; and the quantity of water...
Part I. Theory.

The theory of rivers.

It is certain that the motion of open streams must be studied in some respects, remarkable that of bodies sliding down inclined planes perfectly polished; and that they would accelerate continually, were they not obstructed; but they are obstructed, and frequently move uniformly.

This law is as old as the formation of rivers, and should be the key of hydraulic science. Its evidence is clear; and it is, at any rate, the basis of all uniform motion. And since it is so, there must be some considerable analogy between the motion in pipes and the motion in open channels. Both owe their origin to an inequality of pressure; both would accelerate continually, if nothing hindered; and both are reduced to uniformity by the viscosity of the fluid and the friction of the channel.

It will therefore be convenient to examine the phenomena of water moving in pipes by the action of its weight only along the sloping channel. But previous to this, we must take some notice of the obstructions to the entry of water into a channel of any kind, arising from the deflection of the many different filaments which pass into the channel from the reservoir from every side. Then we shall be able to separate this diminution of motion from the sum total that is observed, and ascertain what part remains as produced by the subsequent obstructions.

We shall then consider the principle of uniform motion, the equilibrium between the force of the resistance. The power is the relative height of the column of fluid which tends to move along the inclined plane of its bed; the resistance is the friction of
the bed, the viscosity of the fluid, and its adhesion to the sides. Here are necessarily combined a number of circumstances which must be gradually detached that we may see the effect of each, viz. the extent of the bed, its perimeter, and its slope. By examining the effects produced by variations of each of these separately, we discover what share each has in the general effect; and having thus analysed the complicated phenomenon, we shall be able to combine those elements, and frame a formula which shall comprehend every circumstance, from the greatest velocity to the extinction of all motion, and from the extent of a river to the narrow dimensions of a quill. We shall compare this formula with a series of experiments in all this variety of circumstances, partly made by Mr Buat, and partly collected from other authors; and we shall leave the reader to judge of the agreement.

Confident that this agreement will be found most satisfactory, we shall then proceed to consider very curiously the chief varieties which nature or art may introduce into these beds, the different velocities of the same stream, the intensity of the resistance produced by the materials of the channel, and the force of the current by which it continually acts on this channel, tending to change either its dimensions or its form. We shall endeavour to trace the origin of these great rivers which spread like the branches of a vigorous tree, and occupy the surface even of a continent. We shall follow them in their course, and therefore consider the consequences which a heavy body would acquire by falling to the orifice from the horizontal surface of the flagrant cataract. This we shall call its Natural Velocity. Therefore if we multiply the area of the orifice by this velocity, the product will be the bulk or quantity of the water which is discharged. This we may call the Natural Expanse of water, or the Natural Discharge.

Let O represent the area or section of the orifice expressed in some known measure, and b its depth under the surface. Let g express the velocity acquired by a heavy body during a second by falling. Let V be the medium velocity of the water's motion, Q the quantity of water discharged during a second, and N the natural exponent.

We know that V is equal to \( \sqrt{2gh} \). Therefore \( N = O \cdot \sqrt{2gh} \).

If these dimensions be all taken in English feet, we have \( \sqrt{2g} \) very nearly equal to 8; and therefore \( V = 8\sqrt{b} \), and \( N = 0.27\sqrt{b} \).

But in our present business it is much more convenient to measure every thing by inches. Therefore since a body acquires the velocity of 32 feet 2 inches in a second, we have \( 2g = 04 \text{ feet 4 inches or } 772 \text{ inches} \), and \( \sqrt{2g} = 27.78 \) inches nearly 27\frac{1}{2} inches.

Therefore \( V = \sqrt{772}\sqrt{b} = 27.78\sqrt{b} \), and \( N = O \cdot 27.78\sqrt{b} \).

But it is also well known, that if we were to calculate the expanse or discharge for every orifice by this simple rule, we should in every instance find it much greater than nature really gives us.

When water issues through a hole in a thin plate, the lateral columns, pressing into the hole from all sides, cause the issues to converge to the axis of the jet, and contract its dimensions at a little distance from the hole. And it is in this place of greatest contraction that the water acquires that velocity which we observe in our experiments, and which we assume as equal to that acquired by falling from the surface. Therefore, that our computed discharge may be agreed with observation, it must be calculated on the supposition that the orifice is diminished to the size of this smallest section. But the contraction is subject to variations, and the dimensions of this smallest section...
We mentioned an observation of Mr Buat to this effect, when he saw a gooseberry rise up from the bottom of the canal along the face of the bar, and then rapidly fly over its top. We have attempted to represent this motion of the filaments in these different situations. Fig. 5. A shows the motion through a thin plate. B shows the motion when a tube of about two diameters long is added, and when the water flows with a full mouth. This does not always happen in so short a pipe (and never in one that is shorter), but the water frequently detaches itself from the sides of the pipe, and flows with a contracted jet. C shows the motion when the pipe projects into the inside of the vessel. In this case it is difficult to make it flow full. D represents a mouth-piece fitted to the hole, and formed agreeably to that shape which a jet would assume of itself. In this case all contraction is avoided, because the mouth of this pipe may be considered as the real orifice, and nothing now diminishes the discharge but a trifling friction of the sides. E shows the motion of water over a dam or weir, where the fall is free or unobstructed; the surface of the lower stream being lower than the edge or sole of the waile-board. F is a similar representation of the motion of water over what we would call a bar or keep. It was one great aim of the experiments of Michelotti and Boffut to determine the effects of contraction in these cases. Michelotti, after carefully observing the form and dimensions of the natural jet, made various mouth-pieces resembling it, till he obtained one which produced the smallest diminution of the computed discharge, or till the discharge computed for the area of its smaller end approached the nearest to the effective discharge. And he at last obtained one which gave a discharge of 983, when the natural discharge would have been 1000. This piece was formed by the revolution of a trochoid round the axis of the jet, and the dimensions were as follow:

- Diameter of the outer orifice = 36
- Diameter of the inner orifice = 46
- Length of the axis = 96

The results of the experiments of the Abbé Boffut and of Michelotti scarcely differ, and they are expressed in the following table:

<table>
<thead>
<tr>
<th>Diameter of the outer orifice</th>
<th>Diameter of the inner orifice</th>
<th>Length of the axis</th>
</tr>

</table>

The numbers in the last column of this little table are the cubic inches of water discharged in a second when the height is one inch.

It must be observed that the discharges assigned here for the weir and bar relate only to the contractions occasioned by the passage over the edge of the board. The weir may also suffer a diminution by the contractions at its two ends, if it be not as easily passed as the stream, which is generally the case, because the two ends are commonly of square masonry or woodwork. The contraction is near the same with that at the edge of a thin plate. But this could not be introduced into this table, because its effect on the expence is the same in quantity whatever is the length of the waile-board of the weir.

In like manner, the diminution of discharge through a sluice could not be expressed here. When a sluice is drawn up, but its lower edge still remains under water, the discharge is contracted both above and at the edges, and the diminution of discharge by each is in proportion to its extent. It is not easy to reduce either of these contructions to computation, but they may be very easily observed. We frequently can observe the water, at coming out of a sluice into a mill-courte, quite the edge of the aperture, and show a part of the bottom quite dry. This is always the case when the velocity of efflux is considerable. When it is very moderate, this place is occupied by an eddy water almost stagnant. When the head of the water is 8 or 10 inches, and runs off freely, the space left between it and the edges is about 1/4 inches. If the edges of the entry have a slope, this void space can never appear; but there is always this tendency to convergence, which diminishes the quantity of the discharge.

It will frequently abridge computation very much to consider the water discharged in these different situations as moving with a common velocity, which we conceive as produced n.t. by a fall from the surface of the fluid (which is exact only when the expence is equal to the natural expence), but by a fall accommodated to the discharge; or it is convenient to know the height which would produce that very velocity which the water issues with in these situations.

And also, when the water is observed to be actually moving with a velocity \( V_1 \), and we know whether it is coming through a thin plate, through a tube, over a dam, &c. it is necessary to know the pressure of head of water \( b \) which has actually produced this velocity. It is convenient therefore to have the following numbers in readiness.

\( b \) for
The motion

It was necessary to premise these facts in hydraulics, that we may be able in every case to distinguish between the force expended in the entry of the water into the conduit or canal, and the force employed in overcoming the refusines along the canal, and in preserving or accelerating its motion in it.

The motion of running water is produced by two causes; 1. The action of gravity; and 2. The mobility of the particles, which makes them assume a level in confined vessels, or determines them to move to that side where there is a defect of pressure. When the surface is level, every particle is at rest, equally prefixed in all directions; but if the surface is not level, not only does a particle on the very surface tend by its own weight towards the lower side, as a body would slide along an inclined plane, but there is a force, external to itself, arising from a superiority of pressure on the upper end of the surface, which pushes this superficial particle towards the lower end; and this is not peculiar to the superficial particles, but affects every particle within the mass of water. In the vessel ACDE (fig. 6.), containing water with an inclined surface AE, if we suppose all frozen but the extreme columns AKHB, FGLE, and a connecting portion HKCDLG, it is evident, from hydrostatical laws, that the water on this connecting part will be pushed in the direction CD; and if the frozen mass BHGF were moveable, it would also be pushed along. Giving it fluidity will make no change in this respect; and it is indifferent what is the situation and shape of the connecting column or columns. The propelling force (MNF being horizontal) is the weight of the column AMNB. The same thing will obtain wherever we select the vertical columns. There will always be a force tending to push every particle of water in the direction of the declivity. The consequence will be, that the water will sink at one end and rise at the other, and its surface will rest in the horizontal position of OA, cutting the former in its middle O. This cannot be unsafe that be not only a motion of perpendicular descent and ascent of the vertical columns, but also a real motion of translation from K towards L. It perhaps exceeds our mathematical skill to tell what will be the motion of each particle. Newton did not attempt it in his investigation of the motion of waves, nor is it at all necessary here. We may, however, acquire a very distinct notion of its general effect.

Let OPQ be a vertical plane passing through the middle point O. It is evident that every particle in PQ, such as P, is prefixed in the direction QD, with a force equal to the weight of a single row of particles, whose length is the difference between the columns BH and FG. The force acting on the particle Q is, in like manner, the weight of a row of particles = AC-ED. Now if OQ, OA, OE, be divided in the same ratio, so that all the figures ACDE, BHGF, &c. may be similar, we see that the force arising solely from the declivity and acting on each particle of the plane OQ is proportional to its depth under the surface, and that the row of particles ACDE, BHGF, &c. which is to be moved by it, is in the same proportion. Hence it unquestionably follows, that the accelerating force on each particle of the row is the same in all. Therefore the whole plane OQ tends to advance forward together with the same velocity; and in the instant immediately succeeding, all these particles would be found again in a vertical plain indefinitely near to OQ; and if we sum up the forces, we shall find them the same as if OQ were the opening of a sluice, having the water on the side of D (and level with O), and the water on the other side standing at the height AC. This result is extremely different from that of the hasty theory of Guglielmini. He confiders each particle in OQ as urged by an accelerating force proportional to its depth, it is true; but he makes it equal to the weight of the row OP, and never recollects that the greatest part of it is balanced by an opposite pressure, nor perceives that the force which is not balanced must be distributed among a row of particles which varies in the same proportion with itself. When these two circumstances are neglected, the result must be incompatible with observation. When the balanced forces are taken into the account of pressure, it is evident that the surface may be tipped horizontal, and that motion should obtain in this case as well as in the case of a sloping surface; and indeed this is Guglielmini’s professed theory, and what he highly values himself on. He announces this discovery of a new principle, which he calls the energy of deep waters, as an important addition to hydraulics. It is owing to this, says he, that the great rivers are not stagnant at their mouths, where they have no perceptible declivity of surface, but, on the contrary, have greater energy and velocity than farther up, where they are shallower. This principle is the basis of his improved theory of rivers, and is insinuated at great length by all the subsequent writers. Buffon, in his theory of the earth makes much use of it. We cannot but wonder that it has been allowed a place in the theory of rivers given in the great Encyclopædie of Paris, and in an article having the signature (O) of D’Alembert. We have been very anxious to show the fallacy of this principle, because we consider it as a mere subterfuge of Guglielmini, by which he was able to patch up the mathematical theory which he had so hastily taken from Newton or Galileo; and we think that we have enabled our readers from being misled by it, when we show that this energy must be equally operative when the surface is on a dead level. The absurdity of this is evident. We shall fee by and by, that deep waters, when in actual motion, have an energy not to be found in shallow running waters, by which they are enabled to continue that motion; but this is not a moving principle; and it will be fully explained, as an immediate result of principles, not vaguely conceived and indifferently expressed, like this of Guglielmini, but easily understood, and appreciable with the greatest precision. It is an energy common to all great bodies. Although they lose as much momentum in surmounting any obstacle as small ones, they lose but a small portion of their velocity. At present, employed only in considering
The progressive motion of an open stream, whose surface is not level, it is quite enough that we see that such a motion must obtain, and that we see that there are propelling forces; and that those forces arise solely from the want of a level surface, or from the slope of the surface; and that, with respect to any one particle, the force acting on it is proportional to the difference of level between each of the two columns (one on each side of the particle) which produce it. Were the surface level, there would be no motion; if it is not level there will be motion; and this motion will be proportional to the want of level or the declivity of the surface: it is of no consequence whether the bottom be level or not, or what is its shape.

Hence we draw a fundamental principle, that the motion of rivers depends entirely on the slope of the surface.

The slope or declivity of any inclined plane is not properly expressed by the difference of height alone of its extremities; we must also consider its length: and the measure of the slope must be such that it may be the fame while the declivity is the same. It must therefore be the same over the whole of any one inclined plane. We shall answer these conditions exactly, if we take for the measure of a slope the fraction which expresses the elevation of one extremity above the other divided by the length of the plane. Thus \( \frac{AM}{AF} \) will express the declivity of the plane AF.

If the water met with no resistance from the bed in which it runs, if it had no adhesion to its sides and bottom, and if its fluidity were perfect, its gravity would accelerate its course continually, and the earth and its inhabitants would be deprived of all the advantages which they derive from its numberless streams. They would run off so quickly, that our fields, dried up as soon as watered, would be barren and useless. No fall could arrest the impetuosity of the torrents; and their accelerating force would render them a destroying scourge, were it not that, by kind Providence, the resistance of the bed, and the viscosity of the fluid, become a check which reins them in and sets bounds to their rapidity. In this manner the friction on the sides, which, by the viscosity of the water, is communicated to the whole mass, and the very adhesion of the particles to each other, and to the sides of the channel, are the causes which make the resistances bear a relation to the velocity; so that the resistances augmenting with the velocities, come at last to balance the accelerating force. Then the velocity now acquired is preserved, and the motion becomes uniform, without being able to acquire new increase, unless some change succeeds either in the slope or in the capacity of the channel. Hence arises the second maxim in the motion of rivers, that when a stream moves uniformly, the resistance is equal to the accelerating force.

As in the efflux of water through orifices, we pass over the very beginnings of the accelerated motion, which is a matter of speculative curiosity, and consider the motion in a state of permanency, depending on the head of water, the area of the orifice, the velocity, and the expense; so, in the theory of the uniform motion of rivers, we consider the slope, the transverse section or area of the stream, the uniform velocity, and the expense. It will be convenient to affix precise meanings to the terms which we shall employ.

The section of a stream is the area of a plane perpendicular to the direction of the general motion. The resistances arise ultimately from the action of the water on the internal surface of the channel, and must be proportional (ceteris paribus) to the extent of the action. Therefore if we unfold the whole edge of this section, which is rubbed as it were by the passing water, we shall have a measure of the extent of this action. In a pipe, circular or prismatical, the whole circumference is acted on; but in a river or canal ACDQ (fig. 6.) the horizontal line AO, which makes the upper boundary of the section A CD, is free from all action. The action is confined to the three lines AC, CD, DA. We shall call this line AC DE the border of the section.

The mean velocity is that with which the whole section, moving equally, would generate a fluid equal to the expense of the stream. This velocity is to be found perhaps but in one filament of the stream, and we do not know in which filament it is to be found.

Since we are attempting to establish an empirical theory of the motion of rivers, founded entirely on experiments and palpable deductions from them; and since it is extremely difficult to make experiments on open streams which shall have a precision sufficient for such an important purpose—it would be a most desirable thing to demonstrate an exact analogy between the mutual balancing of the acceleration and resistance in pipes and rivers; for in these we can only make experiments with all the desired accuracy, and admit only precise measures, but we can make them in a number of cases that are almost impracticable in rivers. We can increase the slope of a pipe from nothing to the vertical position, and we can employ every desired degree of preasure, so as to ascertain its effect on the velocity in degrees which open streams will not admit. The Chevalier de Buset has most happily succeeded in this demonstration; and it is here that his good fortune and his penetration have done so much service to practical science.

Let AB (fig. 7.) be a horizontal tube, through which the water is impelled by the preasure, or head DA. This head is the moving power; and it may be conceived as confining of two parts, performing two distinct offices. One of them is employed in impelling the water on the water that velocity with which it actually moves in the tube. Were there no obstructions to this motion, no greater head would be wanted; but there are obstructions arising from friction, adhesion, and viscosity. This requires force. Let this be the office of the reft of the head of water in the reverbior. There is but one allotment, appropriation, or repartition, of the whole head which will answer. Suppose E to be the point of partition, so that DE is the head necessary for impelling the actual velocity on the water (a head or preasure which has a relation to the form or circumstance of the entry, and the contraction which takes place there). The reft EA is wholly employed in overcoming the simulaneous resistances which take place along the whole tube AB, and is in equilibrio with this resistance. Therefore if we apply at E a tube EC of the same length and diameter with AB, and
and having the same degree of polish or roughness; and if this tube be inclined in such a manner that the axis of its extremity may coincide with the axis of AB in the point C— we affirm that the velocity will be the same in both pipes, and that they will have the same expence; for the moving force in the sloping pipe EC is composed of the whole weight of the column DE and the relative weight of the column EC; but this relative weight, by which alone it descends along the inclined pipe EC, is precisely equal to the weight of a vertical column EA of the same diameter. Every thing therefore is equal in the two pipes, viz. the lengths, the diameters, the moving forces, and the resistances; therefore the velocities and discharges will also be equal.

This is not only the case on the whole, but also in every part of it. The relative weight of any part of it EK is precisely in equilibrio with the resistances along that part of the pipe; for it has the same proportion to the whole relative weight that the resistance has to the whole resistance. Therefore (and this is the most important circumstance, and the basis of the whole theory) the pipe EC may be cut shorter, or may be lengthened to infinity, without making any change in the velocity or expence, so long as the propelling head DE remains the same.

Leaving the whole head DA as it is, if we lengthen the horizontal pipe AB to G, it is evident that we increase the resistance without any addition of force to overcome it. The velocity must therefore be diminished; and it will now be a velocity which is produced by a smaller head than DE; therefore if we were to put in a pipe of equal length at E, terminating in the horizontal line AG, the water will not run equally in both pipes. In order that it may, we must discover the diminished velocity with which the water now actually runs along AG, and we must make a head DI capable of impelling this velocity at the entry of the pipe, and then insert at A a pipe IH of the same length with AG. The expence and velocity of both pipes will now be the same (A).

What has now been said of a horizontal pipe AB would have been equally true of any inclined pipe AB, A'B (fig. 8.) Drawing the horizontal line CB, we see that DC is the whole head or propelling pressure for either pipe AB or A'B; and if DE is the head necessary for the actual velocity, EC is the head necessary for balancing the resistances; and the pipe EF of the same length with AB, and terminating in the same horizontal line, will have the same velocity; and its inclination being thus determined, it will have the same velocity and expence whatever be its length.

Thus we see that the motion in any pipe, horizontal or sloping, may be referred to or substituted for the motion in another inclined pipe, whose head of water, these pipes and rivers above the place of entry, is that productive of the actual velocity of the water in the pipe. Now, in this case, the accelerating force is equal to the resistance: we may therefore consider this half pipe as a river, of which the bed and the slope are uniform or constant, and the current in a state of permanency; and we now may clearly draw this important conclusion, that pipes and open streams, when in a state of permanency, perfectly resemble each other in the circumstances which are the immediate causes of this permanency. The equilibrium between the accelerating force and the resistance obtains not only in general, but takes place through the whole length of the pipe or stream, and is predictable of every individual transverse section of either. To make this more palpably evident if possible, let us consider a sloping cylindrical pipe, the current of which is in a state of permanency. We can conceive it as consisting of two half cylinders, an upper and a lower. These are running together at an equal pace; and the filaments of each immediately contiguous to the separating plane and to each other, are not rubbing on each other, nor affecting each other's motions in the smallest degree. It is true that the upper half is preying on the lower, but in a direction perpendicular to the motion, and therefore not affecting the velocity; and we shall see presently, that although the lower side of the pipe bears somewhat more pressure than the other, the resistances are not changed. (Indeed this odds of pressure is accompanied with a difference of motion, which need not be considered at present; and we may suppose the pipe so small or so far below the surface, that this shall be insensible). Now let us suppose, that in an instant the upper half cylinder is annihilated: We then have an open stream; and every circumstance of accelerating force and of resistance remains precisely as it was. The motion must therefore continue as it did; and in this state the only accelerating force is the slope of the surface. The demonstration therefore is complete.

From these observations and reasonings we draw a Conclusive and important conclusion, "That the same quiescent pipe will be susceptible of different velocities, which it will preserve uniform at any distance, according as it has different inclinations: and each inclination of a pipe of given diameter has a certain velocity peculiar to itself, which will be maintained uniform at any distance whatever.'
When the velocity increases continually, according to some law, to be discovered by theory or experiment, as the position of the pipe changes, from being horizontal till it becomes vertical; in which position it has the greatest uniform velocity possible relative to its inclination, or depending on inclination alone.

Let this velocity be called the "train," or the rate of each pipe.

It is evident that this principle is of the utmost consequence in the theory of capillaries; for by experiment we can find the train of any pipe. It is in train when an increase of length makes no change in the velocity. If lengthening the pipe increases the velocity, the slope of the pipe is too great, and vice versa. And having discovered the train of the pipe, and observed its velocity, and computed the head productive of this velocity with the contraction at the entry, the remainder of the head, that is, the slope (for this is equivalent to $\theta$), is the measure of the resistance. Thus we obtain the measure of the resistance to the motion with a given velocity.

Measurement of the resistance to the motion with a given velocity.

It is supposed that the pressure on any part of the pipe is equal to the pressure on another part, and that there is no diminution of the velocity in the parts urged or pressed by the external force, and are proportional to these external pressures by the principles of hydrostatics. Therefore the pressures or forces necessary for keeping up the velocities are as the squares of the velocities; but these deflating forces are pressures, propagated from the parts urged or pressed by the external force, and are proportional to these external pressures by the principles of hydrostatics. Therefore the pressures or forces necessary for keeping up the velocities are as the squares of the velocities; and they are our only measures of the resistances which must be considered as following the same ratio. Whatever view therefore we take of the nature of these resistances, we are led to consider them as proportional to the squares of the velocities.

We may therefore express the resistances by the symbol $V^m$, $m$ being some number to be discovered by experiment. Thus, in a particular pipe, the diminution of the motion or the resistance may be the 100th part of the square of the velocity, and $R = \frac{V^m}{1000}$.

Now if $g$ be the accelerating power of gravity on any particle, $m$ will be its accelerating power, by which it would urge it down the pipe whose slope is $\theta$. Therefore, by the principle of uniform motion, the equality of the accelerating force, and the resistance, we shall have $\frac{V^m}{m} = g$, and $V \sqrt{s} = \sqrt{mg}$; that is, the product of the velocity, and the reciprocal of the square root of the slope, or the quotient of the velocity divided by the slope, is a constant quantity $\sqrt{mg}$ for any given pipe; and the primary formula for all the uniform velocities of one pipe is $V = \frac{\sqrt{mg}}{\sqrt{\theta}}$.
Mr Buat therefore examined this by experiment, but found, that even with respect to a pipe or channel which was uniform throughout, the water did not tend to give at once the final formula which he found to express the velocity in every case whatever; but this would be too empirical. The chief steps of his very ingenious investigation are instructive. We shall therefore mention them briefly, at least as far as they tend to give us any collateral information; and let it always be noted, that the induction which they convey is not abstract speculation, but experimental truth, which must ever remain as an addition to our stock of knowledge, although Mr Buat's deductions from them should prove false.

He found, in the first place, that in the same channel the product of V and \( \sqrt{r} \) or \( \sqrt{v} \) increased as \( \sqrt{r} \) increased: that is, the velocities increased faster than the square roots of the slope, or the resistances did not increase as fast as the squares of the velocities. We beg leave to refer our readers to what we said on the subject of the squares of the velocities.

Mr Buat, after many trials and reflections, the chief of which will be mentioned by and by, found a value for the constant quantity \( \sqrt{m^2 g} \), or \( \sqrt{m} g \) a constant quantity. Let X be this function of \( \sqrt{r} \), so that we shall always have VX equal to the constant quantity \( \sqrt{m^2 g} \), or \( \sqrt{m} g \) equal to the actual velocity V of a pipe or channel which is in train.

Mr Buat, in a cylindrical pipe, the whole width \( b \), and height \( h \), the mean depth is \( \frac{ab}{b + 2b} \) &c. In general, if \( q \) represent the proportion of the breadth of a rectangular canal to its depth, that is, if \( q \) be made \( \frac{ab}{b} \), we shall have

\[
d = \frac{q b}{q + 2},
\]

Now, since the resistances must augment as the proportion of the border to the section increases, m in the formula \( V = \frac{r}{m} \), and \( V \sqrt{r} = \sqrt{m^2 g} \), must follow the proportions of \( d \), and the quantity \( \sqrt{m^2 g} \) must be proportional to \( \sqrt{d} \) for different channels, and

\[
\frac{\sqrt{m^2 g}}{\sqrt{d}}
\]

should be a constant quantity in every case.

Our author was aware, however, of a very specious objection to the close dependence of the resistances on the extent of the border; and that it might be said that a double border did not occasion a double resistance, unless the preface on all the parts was the same. For it may be naturally (and it is generally) supposed, that the resistance will be greater when the preface is greater. The friction or resistance analogous to friction may therefore be greater on an inch of the bottom than on an inch of the side; but Mr D'Alembert and many others have demonstrated, that the paths of the filaments will be the same whatever be the preface.
Theory.

Obviated by an experiment on the oscillation of water in syphons, we were about to publish this result is very agreeable to the experimenter. The oscillation of the surrounding water was susceptible of much greater precision, and of more extensive and important application.

The two vessels ABCD, abcd (fig. 9.) were connected by the syphon EFG, g, f, which turned round in the short tubes E and e, without allowing any water to escape; the axes of these tubes being in one straight line. The vessels were about 10 inches deep, and the base of the syphon was about 5 feet long. The vessels were set on two tables of equal height, and (the holes being stopped) the vessel ABCD, with the whole syphon, was filled with water, and water was poured into the vessel abcd till it stood at a certain height. The syphon was then turned into a horizontal position, and the plug drawn out of g, and the time carefully noted which the water employed in rising to the level HK k b in both vessels. The whole apparatus was now inclined, so that the water run back into ABCD. The syphon was then put in a vertical position, and the experiment was repeated.

No sensible or regular difference was observed in the time. Yet in this experiment the effusion on the part G g of the syphon was more than 100 times greater than before. As it was thought that the friction on this small part was too small a portion of the whole obstructions, various additional obstructions were put into this part of the syphon, and it was still lengthened to nine feet; but still no remarkable difference was observed. It was even thought that the times were less when the syphon was vertical.

Thus Mr De Buat's opinion is completely justified; and he may be allowed to assert, that the resistance depends chiefly on the relation between the syphon and its border and that \( \frac{\sqrt{m g}}{\sqrt{d}} \) should be a constant quantity.

To ascertain this point was the object of the next series of experiments; to see whether this quantity was really constant, and, if not, to discover the law of its variation, and the physical circumstances which accompanied the variations, and may therefore be considered as their causes. A careful comparison of a very great number of experiments, made with the same syphon, and with very different channels and velocities, showed that \( \sqrt{m g} \) did not follow the proportion of \( \sqrt{d} \), nor of any power of \( \sqrt{d} \) of this quantity \( \sqrt{m g} \) increased by smaller degrees in proportion as \( \sqrt{d} \) was greater. In very great beds \( \sqrt{m g} \) was nearly proportional to \( \sqrt{d} \), but in smaller channels, the velocities diminished much more than \( \sqrt{d} \) did. Calling about for some way of accommodation, Mr Buat considered, that some approximation at least would be had by taking off from \( \sqrt{d} \) some constant small quantity. This is evident: For such a diminution will have but a trifling effect when \( \sqrt{d} \) is great, and its effect will increase rapidly when \( \sqrt{d} \) is very small.

He therefore tried various values for this subtraction, and compared the results with the former experiments; and he found, that if in every cafe \( \sqrt{d} \) be diminished by one-tenth of an inch, the calculated discharges would agree very exactly with the experiment. Therefore, instead of \( \sqrt{d} \), he makes use of \( \sqrt{d} - 0.1 \), and finds this quantity always proportional to \( \sqrt{m g} \), or that \( \frac{\sqrt{m g}}{\sqrt{d} - 0.1} \) is a constant quantity, or very nearly so. It varied from 297 to 287 in all sections from that of a very small pipe to that of a little canal. In the large sections of canals and rivers it diminished still more, but never was less than 23.66.

This result is very agreeable to the most distinct notions that we can form of the mutual actions of the water and its bed. We see, that when the motion of our discharging water is obstructed by a solid body, which reflects the passing filament, the disturbance does not extend to any considerable distance on the two sides of the body. In like manner, the small disturbances, and imperceptible curvilinear motions, which are occasioned by the infinitesimal inequalities of the channel, must extend to a very small distance indeed from the sides and bottom of the channel. We know, too, that the mutual adhesion or attraction of water for the solid bodies which are moistened by it, extends to a very small distance; which is probably the same, or nearly so, in all canals.

Mr Buat observed, that a surface of 23 square inches, applied to the surface of flagrant water, lifted 1651 grains; another of 5\( \frac{1}{2} \) square inches lifted 365; this was at the rate of 65 grains per inch nearly, making a coefficient of about one fifth of an inch high. Now this effect is very much analogous to a real contraction of the capacity of the channel. The water may be conceived as nearly flagrant to this small distance from the border of the section. Or, to speak more accurately, the diminution of the progressive velocity occasioned by the friction and adhesion of the sides, decreases very rapidly as we recede from the sides, and ceases to be sensible at a very small distance.

The writer of this article verified this by a very simple and instructive experiment. He was making experiments framed by Sir Isaac Newton, by whirling a very accurate and smooth polished cylinder in water; and he found that the rapid motion of the surrounding water was confined to an exceedingly small distance from the cylinder, and it was not till after many revolutions that it was sensible even at the distance of half an inch. We may, by the way, suggest this as the best form of experiments for examining the resistances of pipes. The motion excited by the whirling cylinder in the flagrant water is equal and opposite to the motion lost by water passing along a surface equal to that of the cylinder with the same velocity. Be this as it may, we are justified in confiding, with Mr Buat, the section of the stream as thus diminished by cutting off a narrow border all round the touching parts, and supposing that the motion and discharge is the same as if the root of the mean depth of the section were diminished by a small quantity, nearly constant. We see, too, that the effect of this must be sensible in great canals and rivers; so that, fortunately, its quantity is felt best ascertained by experiments made with small pipes. This is attended with another convenience, in the opinion of Mr Buat, namely, that the effect
Part I.

River.

Theory.

The effect of viscosity is most sensible in great masses of water in flow motion, and is almost insensible in small pipes, so as not to disturb these experiments. We may therefore assume 297 as the general value of \( \frac{\sqrt{m g}}{\sqrt{d - o_1}} \).

Since we have \( \frac{\sqrt{m g}}{\sqrt{d - o_1}} = 297 \), we have also

\[ n = \frac{297}{\sqrt{d - o_1}}, \]

\[ g = 362 \left( \sqrt{d - o_1} \right)^3, \]

\[ 243.7 \left( \sqrt{d - o_1} \right)^3. \]

This may express by \( n \left( \sqrt{d - o_1} \right)^3 \). And thus, when we have expressed the effect of friction by \( \frac{V}{m} \), the quantity \( m \) is variable, and its general value is \( \frac{V^3}{n \left( \sqrt{d - o_1} \right)^3} \), in which \( \kappa \) is an invariable abstract number equal to 243.7 given by the nature of the resistance which water sustains from its bed, and which indicates its intensity.

And, lastly, since \( m = n \left( \sqrt{d - o_1} \right)^3 \), we have \( \sqrt{m g} = \sqrt{n g} \left( \sqrt{d - o_1} \right) \), and the expression of the velocity \( V \), which water acquires and maintains along any channel whatever, now becomes \( V = \frac{\sqrt{n g} \left( \sqrt{d - o_1} \right)}{X} \), or \( 297 \left( \sqrt{d - o_1} \right) \), in which \( X \) is also a variable quantity, depending on the slope of the surface of the channel, and expressing the accelerating force which, in the case of water in train, is in equilibrium with the resistances expressed by the numerator of the fraction.

Having so happily succeeded in ascertaining the variations of resistance, let us accompany Mr. Buat in his investigation of the law of acceleration, expressed by the value of \( X \).

Experience, in perfect agreement with any distinct opinions that we can form on this subject, had already showed him, that the resistances increased in a flower ratio than that of the squares of the velocities, or that the velocities increased slower than \( \sqrt{v} \). Therefore, in the formula \( V = \frac{\sqrt{n g} \left( \sqrt{d - o_1} \right)}{X} \), which, for one channel, we may express thus, \( V = \frac{A}{X} \), we must admit that \( X \) is sensibly equal to \( \sqrt{v} \), when the slope is very small or \( v \) very great. But, that we may accurately express the velocity in proportion as the slope augments, we must have \( X \) greater than \( \sqrt{v} \); and moreover, \( \sqrt{v} \) must increase as \( \sqrt{v} \) diminishes. These conditions are necessary, that our values of \( V \), deduced from the formula \( V = \frac{A}{X} \), may agree with the experiment.

In order to comprehend every degree of slope, we must particularly attend to the motion through pipes, because open canals will not furnish us with influences of exact trains with great slopes and velocities. We can make pipes vertical. In this case \( \frac{1}{s} \) is \( \frac{1}{t} \) and the velocity is the greatest possible for a train by the action of gravity: But we can give greater velocities than this by increasing the head of water beyond what produces the velocity of the train.

Let \( AB \) (fig. 10.) be a vertical tube, and let \( CA \) be the head competent to the velocity in the tube, which we suppose to be in train. The slope is \( t \), and the full weight of the column in motion is the precise measure of the resistance. The value of \( t \), considered as a slope, is now a maximum; but, considered as expressing the proportion of the weight of the column in motion to the weight which is in equilibrium with the resistance, it may not be a maximum; it may surpass unity, and \( s \) may be less than \( t \). For if the vessel be filled to \( E \), the head of water increased, and will produce a greater velocity, and this will produce a greater resistance. The velocity being now greater, the head \( EF \) which imparts it must be greater than \( CA \). But it will not be equal to \( EA \), because the uniform velocities are found to increase faster than the square roots of the pressures. This is the general fact.

The forces above \( A \), and the weight of the column \( FB \), now employed to overcome the resistance, is greater than the weight of the column \( AB \) in motion.

In such cases, therefore, \( \frac{1}{t} \) greater than unity, is a sort of fictitious slope, and only represents the proportion of the resistance to the weight of the moving column. This proportion may surpass unity.

But it cannot be infinite: for supposing the head of water infinite; if this produce a finite velocity, and we deduct from the whole height the height corresponding to this finite velocity, there will remain an infinite head, the measure of an infinite resistance produced by a finite velocity. This does not accord with the observed law of the velocities, where the resistances actually do not increase as fast as the squares of the velocities. Therefore an infinite head would have produced an infinite velocity, in opposition to the resistances; taking off the head of the tube, competent to this velocity, at the entry of the tube, which head would also be infinite, the remainder would in all probability be infinite, balancing a finite resistance.

Therefore the value of \( t \) may remain finite, although the velocity be infinite; and this is agreeable to all our clearest notions of the resistances.

Adopting this principle, we must find a value of \( X \) which will answer all these conditions.

1. It must be sensibly proportional to \( \sqrt{v} \), while \( s \) is great. It must always be less than \( \sqrt{v} \).

2. It must deviate from the proportion of \( \sqrt{v} \), so much as \( \sqrt{v} \) is smaller.

3. It must not vanish when the velocity is infinite.

4. It must be in agreement with a range of experiments with every variety of channel and of slope.

We shall understand the nature of this quantity \( X \) better by representing by lines the quantities concerned in forming it.

If the velocities were exactly as the square roots of the slopes, the equilateral hyperbola \( NKS \) (fig. 10. n 2) between its asymptotes \( MA, AB \), would represent the equation \( V = \frac{A}{\sqrt{t}} \). The values of \( \sqrt{v} \) would be represented by the abscissae, and the velocities by the ordinates, and \( V \sqrt{t} = A \) would be the power of the hyperbola. But since these velocities are not sensibly equal
equal to $\frac{A}{\sqrt{J}}$ except when $\sqrt{J}$ is very great, and deviate the more from this quantity as $\sqrt{J}$ is smaller; we may represent the velocities by the ordinates of another curve PGT, which approaches very near to the hyperbola, at a great distance from A along AB; but separates from it when the abscissas are greater than unity, which corresponds to an infinite velocity, the line QO may be the asymptote of the new curve. Its ordinates are equal to $\frac{A}{\sqrt{J}}$ while those of the hyperbola are equal to $\frac{A}{\sqrt{J}}$. Therefore the ratio of these ordinates or $\frac{\sqrt{J}}{X}$ should be such that it shall be so much nearer to unity as $\sqrt{J}$ is greater, and shall surpass it so much the more as $\sqrt{J}$ is smaller.

To express $X$ therefore as some function of $\sqrt{J}$ so as to answer these conditions, we see in general that $X$ must be less than $\sqrt{J}$. And it must not be equal to any power of $\sqrt{J}$ whose index is less than unity, because then $\frac{\sqrt{J}}{X}$ would differ so much the more from unity as $\sqrt{J}$ is greater. Nor must it be any multiple of $\sqrt{J}$ such as $q \sqrt{J}$, for the same reason. If we make $X = \sqrt{J} - K$, $K$ being a constant quantity, we may answer the first condition pretty well. But $K$ must be very small, that $X$ may not become equal to nothing, except in some exceedingly small value of $\sqrt{J}$. Now the experiments will not admit of this, because the ratio $\frac{\sqrt{J}}{X}$ does not increase sufficiently to correspond with the velocities we observe in certain slopes, unless we make $K$ greater than unity, which again is inconsistent with other experiments. We learn from such canvassing that it will not do to make $K$ a constant quantity. If we should make it any fractional power of $\sqrt{J}$, it would make $X = \infty$, that is, nothing, when $s = \infty$, which is also contrary to experience. It would seem, therefore, that nothing will answer for $K$ but some power of $\sqrt{J}$ which has a variable index. The logarithm of $\sqrt{J}$ has this property. We may therefore try to make $X = \sqrt{J} - \log \sqrt{J}$. According if we try the equation $V = \frac{A}{\sqrt{J}} - \text{hyp. log. } \sqrt{J}$ we shall find a very great agreement with the experiments till the declivity becomes considerable, or about $\frac{1}{10}$, which is much greater than any river. But it will not agree with the velocities observed in some mill courses, and in pipes of a still greater declivity, and gives a velocity that is too small; and in vertical pipes the velocity is not above one half of the true one. We shall get rid of most of these incongruities if we make $K$ confit of the hyperbolic logarithm of $\sqrt{J}$ augmented by a small constant quantity, and by trying various values for this constant quantity, and comparing the results with experiment, we may hit on one sufficiently exact for all practical purposes.

Mr De Burt, after repeated trials, found that he would have a very great conformity with experiment by making $K = \log \sqrt{J} - 1$.6, and that the velocities exhibited in his experiments would be very well represented by the formula $V = \frac{297}{2} \frac{\sqrt{J}}{\sqrt{I}} - 1.6$. Therefore, the ratio of the velocities, which represents the velocities by the ordinates of another curve, may represent the velocities by the ordinates of another curve.

There is a circumstance which our author seems to have overlooked on this occasion, and which is undoubtedly of great effect in these motions, viz. the mutual adhesion of the particles of water. This causes the water which is descending (in a vertical pipe for example) to drag more water after it, and thus greatly increases its velocity. We have seen an experiment in which the water issued from the bottom of a revolver through a long vertical pipe having a very gentle taper. It was 15 feet long, one inch diameter at the upper end, and two inches at the lower. The depth of the water in the reveller was exactly one foot; in a minute there were discharged 2-88 cubic feet of water. It must therefore have issued through the hole in the bottom of the revolver with the velocity of 8.82 feet per second. And yet we know that this head of water could not make it pass through the hole with a velocity greater than 6.56 feet per second. This increase must therefore have arisen from the cause we have mentioned, and it is a proof of the great intensity of this force. We doubt not but that the discharge might have been much more increased by proper contrivances; and we know many influences in water pipes where this effect is produced in a very great degree.

The following cafe is very different: water is brought into the town of Dunbar in the county of East Lothian, from a spring at the distance of about 3200 yards. It Scotland is conveyed along the first 1100 yards in a pipe of two inches diameter, and the declivity is 12 feet nine inches; from thence the water flows in a pipe of 1 ½ diameter, with a declivity of 34 feet 3 inches; in all 57 feet. When the work was carried as far as the two-inch pipe reached, the discharge was found to be 27 Scotch pints, 103½ cubic inches each in a minute. When it was brought into the town, the declivity was 28. Here it is plain that the detention along the second stretch of the pipe could derive no impulsion from the first. This was only able to supply 27 pints, and to deliver it into a pipe of equal bore. It was not equivalent to the forcing it into a smaller pipe, and almost doubling its velocity. It must therefore have been dragged into this smaller pipe by the weight of what was descending along it, and this water was exerting a force equivalent to a head of 16 inches, increasing the velocity from 14 to about 28.

It must be observed, that if this formula be just, there can be no declivity so small that a current of water the smallest will not take place in it. And accordingly none declivity has been observed in the surface of a stream when this did not happen. But it also should happen with reverse a current to any declivity of bottom. Yet we know that water will hang on the sloping surface of a board without proceeding further. The cause of this seems to be the adhesion of the water combined with its viscosity. The viscosity of a fluid presents a certain force which must be overcome before any current can take place.

A series of important experiments were made by our author in order to ascertain the relation between the velocity at the surface of any stream and that at the bottom.
Part I.

The velocity (in inches per second) which a heavy body acquires by falling during one second.

A constant part of the accelerating force employed in overcoming the viscosity, &c.

We think, with our ingenious author, that on a review of these circumstances, there is a constant or invariable proportion of the accelerating force employed in overcoming this viscosity and producing this mutual separation of the adjoining filaments. We may express this part of the accelerating force by a part \( \frac{1}{8} \) of that slope which constitutes the whole of it. If it were not employed in overcoming this resistance, it would produce a velocity which (on account of this resistance) is not produced, or is lost. This would be

\[
\sqrt{\frac{g}{S-L}} \cdot \sqrt{S}.
\]

This must therefore be taken from the velocity exhibited by our general formula. When thus corrected, it would become

\[
V = (\sqrt{d} - 1) \left( \sqrt{\frac{g}{S-L}} \cdot \sqrt{S} \right).
\]

But as the term \( \sqrt{\frac{g}{S-L}} \cdot \sqrt{S} \) is compounded only of constant quantities, we may express it by a single number. This has been collected from a scrupulous attention to the experiments (especially in canals and great bodies of water moving with very small velocities; in which case the effects of viscosity must become more remarkable), and it appears that it may be valued at \( \sqrt{\frac{1}{\text{inch}}} \) or 0.3 inches very nearly.

From the whole of the foregoing considerations, drawn from nature, supported by such reasoning as our intellect permits of the internal motions of water, and authorized by a very extensive comparison with experiment, we are now in a condition to conclude a complete formula, expressive of the uniform motion of water, and involving every circumstance which appears to have any share in the operation.

Therefore

\[
V = \sqrt{\frac{g}{S-L}} \cdot \sqrt{S}.
\]

The velocity (in inches per second) which a heavy body acquires by falling during one second.

An abstract constant number, determined by experiment to be 2437.

The hyperbolic logarithm of the quantity to which it is prefixed, and is had by multiplying the common logarithm of that quantity by 2.3026.

We shall have in every instance

\[
V = \sqrt{\frac{S}{S-L}} \cdot \sqrt{S} - 0.3 (\sqrt{d} - 1).
\]

This, in numbers, and English measure, is

\[
V = 307 (\sqrt{d} - 1) \sqrt{\frac{S}{S-L}} \cdot \sqrt{S} - 0.3 (\sqrt{d} - 1).
\]

And in French measure

\[
V = 297 (\sqrt{d} - 1) \sqrt{\frac{S}{S-L}} \cdot \sqrt{S} - 0.3 (\sqrt{d} - 1).
\]

The following table contains the real experiments from which this formula was deduced, and the comparison of the real velocities with the velocities computed by the formula. It consists of two principal sets of experiments. The first are those made on the motion of water in pipes. The second are experiments made on open canals and rivers. In the first set, column 1 contains the number of the experiments; 2d, the length of the tube; 3d, the height of the reservoir; 4th, the values of \( S \), deduced from column second and third; 5th gives the observed velocities; and 6th the velocities calculated by the formula.

In the second set, column 2d gives the area of the section of the channel; 3d, the border of the canal or circumference of the section, deducing the horizontal width, which sustains no friction; 4th, the square root of the hydraulic mean depth; 5th, the denominator \( S \) of the slope; 6th, the observed mean velocities; and 7th, the mean velocities by the formula. In the last ten experiments on large canals and a natural river the 6th column gives the observed velocities at the surface.

This comparison must be acknowledged to be most satisfactory, and shows the great cooperation and addresse of the author, in the successful setting and appreciating the figure which each cooperating circumstance has had in producing the very intricate and complicated effect. It adds some weight i the principles on which he has proceeded in this analysis of the mechanism of hydraulic motion, and must give us great confidence in that theory so thoroughly established on a very copious induction. The author offers it only as a rational and well-founded probability. To this character the author is certainly entitling; for the suppositions made in it are reasonable to the most distinct notions we can form of these internal motions. And it much always be remembered that the investigation of the formula, although it be rendered somewhat more periphrastic by thus having recourse to those notions, has no dependence on the truth of the principles. For it is, in fact, nothing but a classification of experiments, which are grouped together by one of these conclusions of slope, velocity, form of section, &c. in order to discover the laws of the changes which are induced by a variation of the circumstances which do not resemble. The proposition was clearly similar to that of the astronomer when he deduces the elements of an orbit from a multitude of observations. This was the task of Mr de Buat and he candidly and modestly informs us, that the finding out analytical forms of expression which would exhibit these changes was the work of Mr Benezech de St Honoré, a young officer of engineers, and his colleague in the experimental course. It does honour to his skill and address; and we think the whole both a pretty and instructive specimen of the method of discovering the laws of nature in the midst of complicated phenomena. Daniel Bernouilli first gave the rules of this method, and they have been greatly improved by Lambert, Condorcet, and De la Grange. Mr Coulomb has given some excellent examples of their application to the discovery of the laws of friction, of magnetic and electrical attraction, &c. But this present work is the most periphrastic and familiar of them all. It is the empirical method of generalizing natural phenomena, and of deducing general rules, of which we can give no other demonstration but that they are faithful representations of matters of fact. We hope that others, encouraged by the success of Mr de Buat, will follow this example, where public utility is preferred to a display of mathematical knowledge.

Although the author may not have hit upon the precise modus operandi, we agree with him in thinking that nature seems to act in a way not unlike what is here supposed. At any rate, the range of experiments is so extensive, and so multifarious, that few cases can occur which are not included among them. The experiments will always retain their value (as we presume that they are faithfully narrated), whatever may become of the theory; and we are confident that the formula will give an answer to any question to which it may be applicable infinitely preferable to the vague guesses of the most sagacious and experienced engineer.

We must however observe, that as the experiments on pipes were all made with scrupulous care in the contrivance and execution of the apparatus, excepting only those of Mr Couple on the main pipes at Verailles, we...
Let us compare these velocities with the velocities calculated by Buat's formula.

The hydraulic mean depths $d$ and $D$ of the Rheno and Po in the great freshes deduced from the above measurements, are 98.6 and 344 inches; and their slopes $r$ and $S$ are $\frac{307}{\sqrt{D - 0.1} - 0.3 (\sqrt{D} - 0.1)} = 52,176$ inches

and $\frac{307}{\sqrt{D - 0.1} - 0.3 (\sqrt{D} - 0.1)} = 46,277$ inches.

These results differ very little from the velocities abovementioned. And if the velocity corresponding to a depth of 31 feet be deduced from that observed by Montanari in the Po Magra 10 feet deep, on the supposition that they are in the proportion of $\sqrt{d}$, it will be found to be about 53.5 inches per second.

This comparison is therefore highly to the credit of highly to the theory, and would have been very agreeable to the credit of M. de Buat, had he known it, as we hope it is to our readers.

We have collected many accounts of water pipes, and made the comparisons, and we flatter ourselves that these have enabled us to improve the theory. They shall appear in their proper place; and we may just observe here, that the two-inch pipe, which we formerly spoke of as conveying the water to Dunbar, should have yielded only 25 ½ Scotch pints per minute by the formula, instead of 27; a small error.

We have, therefore, no hesitation in saying that this single formula of the uniform motion of water is one of the most valuable precepts which natural science and the arts have received during the course of this century.

We hoped to have made this fortunate investigation of the chevalier de Buat still more acceptable to our readers by another table, which should contain the values of $\frac{307}{\sqrt{D - 0.1} - 0.3 (\sqrt{D} - 0.1)}$ ready calculated for every declivity that can occur in water pipes, canals, or rivers. Aided by this, which supercedes the only difficult part of the computation, a perfon could calculate the velocity for any proposed case in less than two minutes. But we have not been able to get it ready for its appearance in this article, but we shall not fail to give it when we resume the subject in the article Works; and we hope even to give its results on a scale which may be carried in the pocket, and will enable the unlearned practitioner to solve any question with accuracy in half a minute.

We have now established in some measure a Theory of Hydraulics, by exhibiting a general theorem which expresses the relation of the chief circumstances of all such motions as have attained a state of permanency, in so far as this depends on the magnitude, form, and slope of the channel. This permanency we have expressed by the term stream, signifying that the stream is in train.

We proceed to consider the subordinate circumstances contained in this theorem; such as, $\frac{1}{h}$. The forms which nature or art may give to the bed of a running stream, and the manner of expressing this form in our theorem, $2d$. The gradations of the velocity, by which
it decreases in the different filaments, from the axis or the most rapid filament to the border; and the connection of this with the mean velocity, which is expressed by our formula. 30. Having acquired some distinct notions of this, we shall be able to see the manner in which undisturbed nature works in forming the beds of our rivers, the forms which the affects, and which we must imitate in all their local modifications, if we would secure that permanency which is the evident aim of all her operations. We shall here learn the mutual action of the current and its bed, and the circumstances which ensure the stability of both. These we may call the regimen or the conservation of the stream, and may say that it is in regimen, or in conservation. This has a relation, not to the dimensions and the slope alone, or to the accelerating force and the resistance arising from mere inertia; it respects immediately the tenacity of the bed, and is different from the train.

II. These pieces of information will explain the deviation of rivers from the rectilinear course; the regimen occasioned by these deviations; and the circumstances on which the regimen of a winding stream depends.

§ 1. Of the Forms of the Channel.

The numerator of the fraction which expresses the velocity of a river in train has \( \sqrt{A} \) for one of its factors. That form, therefore, is most favourable to motion which gives the greatest value to what we have called the hydraulic mean depth \( d \). This is the prerogative of the semicircle, and here \( d \) is equal to half the radius; and all other figures of the same area are the more favourable, as they approach nearer to a semicircle. This is the form, therefore, of all conduit pipes, and should be taken for aqueducts which are built of masonry. Ease and accuracy of execution, however, have made engineers prefer a rectangular form; but neither of these will do for a channel formed out of the ground. We shall soon see that the semicircle is incompatible with a regimen; and, if we proceed through the regular polygons, we shall find that the half-hexagon is the only one which has any pretensions to a regimen; yet experience shows us, that even its banks are too steep for almost any foil. A dry earthen bank, not bound together by grass roots, will hardly stand with a slope of 45 degrees; and a canal which conveys running waters will not stand with this slope. Banks whose base is to their height as 4 to 3 will stand very well in mossy soils, and this is a slope very usually given. This form is even affected in the spontaneous operations of nature, in the channels which the hills for the rills and rivulets in the higher and steeper grounds.

This form has some mathematical and mechanical properties which intitle it to some further notice. Let \( ABEC \) (fig. 11.) be such a trapezium, and \( AHGC \) the rectangle of width and depth. Bisect \( HB \) and \( EG \) by the verticals \( FD \) and \( KL \), and draw the verticals \( bB, Ee \). Because \( AH : HB = 3 : 4 \), we have \( AB = 5 \), and \( BD = 3 \), and \( BD + DF = BA \). From these premises it follows that the trapezium \( ABEC \) has the same area with the rectangle; for \( HB \) being bisected in \( D \), the triangles \( ACF, BCD \) are equal. Also the border \( ABEC \), which is touched by the pafing stream, is equal to \( FDIK \). Therefore the mean depth, which is the quotient of the area divided by the border, is the same in both; and this is the cafe, whatever is the width \( BE \) at the bottom, or even though there be no rectangle such as \( bBEE \) interposed between the falt sides.

Of all rectangles, that whose breadth is twice the \( b-B \) form height, or which is half of a square, gives the greatfet of a channel.

In this cafe, we have \( AC = 10, AH = 3 \), and \( BE = 2 \). Or we may say that the form is a trapezium, whose bottom width is \( \frac{1}{4} \) of the depth, and whose extreme width is \( \frac{1}{4} \). This form approaches very near to that width the torrents in the hills naturally dig for themselves in uniform ground, where their action is not checked by stones which they lay bare, or which they deposit in their course. This shows us, and it will be fully confirmed by and by, that the channel of a river is not a fortuitous thing, but has a relation to the confiency of the soil and velocity of the stream.

A rectangle, whose breadth is \( \frac{1}{4} \) of the depth of water, will therefore have the same mean depth with a triangle whose surface width is \( \frac{1}{4} \) of its vertical depth; for this is the dimensions when the rectangle \( bBEE \) is taken away.

Let \( A \) be the area of the section of any channel, \( w \) its width (when rectangular), and \( d \) its depth of water. Then what we have called its mean depth, or \( d \), will be

\[
\frac{A}{w+2d} = \frac{w}{w+2d}.
\]

Or if \( q \) expresses the ratio of the width to the depth of a rectangular bed; that is, if \( q = \frac{b}{d} \), we have a very simple and ready expression for the mean depth, either from the width or depth.

\[
d = \frac{w}{q+2}, \quad \text{or} \quad d = \frac{q}{q+2}.
\]

Therefore, if the depth were infinite, and the width finite, we should have \( d = \frac{w}{2} \); or if the width be infinite, and the depth finite, we have \( d = b \). And these are the limits of the values of \( d \); and therefore, in rivers whose width is always great in comparison of the depth, we may without much error take their real depth for their hydraulic mean depth. Hence we derive a rule of easy recollection, and which will at all times give us a very near estimate of the velocity and expence of a running stream, viz. that the velocities are nearly as the squares of the depths. We find this confirmed by many experiments of Michelotti.

Also, when we are allowed to suppose this ratio of the velocities and depths, that is, in a rectangular canal of great breadth and small depth, we shall have the quantities \( d \) discharged nearly in the proportion of the cubes of the velocities. For the quantity discharged \( d \) is as the velocity and area jointly, that is, as the height and velocity jointly, because when the width is the same the area is as the height. Therefore, we have \( d = \frac{w}{v} \). But, by the above remark, \( b = \frac{v^2}{v} \). Therefore, \( d = \frac{w}{v} \); and this is confirmed by the experiments of Bosetti, vol. ii. 236. Also, because \( d \) is as \( w b \), when \( w \) is constant, and by the above remark (allowable when \( w \) is very great in proportion to \( b \) ) \( v \) is as \( \sqrt{b} \), we have \( d \) as \( b \sqrt{b} \), or \( b^2 \), or the squares of the discharges.
River.

Part I.

Theory.

1. Knowledge the mean depth and the proportion of the width and real depth, we can determine the dimensions of the bed, and we have \( A = 4b + 2d \)

2. If we know the area and mean depth, we can in like manner find the dimensions, that is, \( A \) and \( d \); for \( A = wh \) and \( d = \frac{wh}{b} \);

3. If \( d \) be known, and one of the dimensions be given, we can find the other; for \( d = \frac{wh}{2b} \) gives

4. If the velocity \( V \) and the slope \( S \) for a river in train be given, we can find the mean depth; for \( V = \frac{2g}{\sqrt{S} - L} \)

And slope.

5. We can deduce the depth which will put in train a river whose channel has given dimensions. We make

\[ \sqrt{\frac{V}{S - L}} = \frac{2g}{\sqrt{S} - L} \]

This should be \( S \)

6. The velocity of the current is equal to that at the bottom the velocity in the axis of a inclined cylindrical tube, of which the current is in train, moves the fastest, and that all those in the same circumference round it are moving with our velocity, and that the lower or those which slide along the pipe. We may affirm the same thing of the motions in a semi-cylindrical channel conveying an open stream. But even in these we have not yet demonstrated the ratio between the extreme velocities, nor in the different circles. This must be decided experimentally.

And here we are under great obligations to Mr de Buat. He has compared the velocity in the axis of a prodigious number and variety of streams, differing in size, form, slope, and velocity, and has computed in them all the mean velocity, by measuring the quantities of water discharged in a given time. His method of measuring the bottom velocity was simple and just. He threw in a gooseberry, as nearly as possible, of the same specific gravity with the water. It was carried along the bottom almost without touching it. See Resistance of Fluids, n° 67.

He discovered the following laws: 1. In small velocities the velocity in the axis is to that at the bottom the velocity in a ratio of considerable inequality. 2. This ratio diminishes as the velocity increases, and in very great velocities approaches to the ratio of equality. 3. What was most remarkable was, that neither the magnitude of the channel, nor its slope, had any influence in changing this proportion, while the mean velocity remained the same. Nay, though the stream ran on a channel covered with pebbles or coarse sand, no difference worth noticing was to be observed from the velocity over a polished channel. 4. And if the velocity in the axis is constant, the velocity at the bottom is also constant, and is not affected by the depth of water or magnitude of the stream. In some experiments the depth was thrice the width, and in others the width was thrice the depth. This changed the proportion of the magnitude of the velocity in a year she will do in a century. The beds of our rivers have acquired some stability, because they are the labour of ages; and it is to time that we owe those deep and wide valleys which receive and confine our rivers in channels, which are now consolidated, and with slopes which have been gradually moderated, so that they no longer either ravage our habitations or confound our boundaries. Art may imitate nature, and Nature to be imitated in making artificial streams.

The knowledge of this is necessary for understanding the regimen of a river; for it is the velocity of the filaments in contact with the bed which produces any change in it, and occasions any preference of one to another, in respect of regimen or stability. Did these circumstances not operate, the waters, true to the laws of hydraulics, and confined within the bounds which have been assigned them, would neither enlarge nor diminish the area of the channel. But this is all that we can promise of waters perfectly clear, running in pipes, or hewn channels. But rivers, brooks, and smaller streams, carry along waters loaded with mud or sand, which they deposit wherever their velocity is checked; and they tear up, on the other hand, the materials of the channel wherever their velocity is sufficiently great. Nature, indeed, aims continually at an equilibrium, and works without ceasing to perpetuate her own performances, by establishing an equality of action and reaction, and proportioning the forms and direction of the motions to her agents, and to local circumstances. Her work is slow but unceasing; and what she cannot accomplish in a year she will do in a century. The beds of our rivers have acquired some stability, because they are the labour of ages; and it is to time that we owe those deep and wide valleys which receive and confine our rivers in channels, which are now consolidated, and with slopes which have been gradually moderated, so that they no longer either ravage our habitations or confound our boundaries. Art may imitate nature, and Nature to be imitated in making artificial streams.
Part I. River. 279

Theory.  

To the magnitude of the rubbing part, but made no change on the ratio of the velocities. This is a thing which no theory could point out.

Another most important fact was also the result of his observation, viz. that the mean velocity in any pipe or open stream is the arithmetical mean between the velocity in the axis and the velocity at the sides of a pipe or bottom of an open stream. We have already observed, that the ratio of the velocity in the axis to the velocity at the bottom diminished as the mean velocity increased. This variation he was enabled to express in a very simple manner, so as to be easily remembered, and to enable us to tell any one of them by observing another.

If we take unity from the square root of the superficial velocity, expressed in inches, the square of the remainder is the velocity at the bottom; and the mean velocity is the half sum of these two. Thus, if the velocity in the middle of the stream be 25 inches per second, its square root is five; from which if we take unity, there remains four. The square of this, or 16, is the velocity at the bottom, and \( \frac{25 + 16}{2} \), or 20 \( \frac{1}{2} \), is the mean velocity.

This is a very curious and most useful piece of information. The velocity in the middle of the stream is the easiest measured of all, by any light small body floating down it; and the mean velocity is the one which regulates the train, the discharge, the effect on machines, and all the most important consequences.

We may express this by a formula of most easy recollection. Let \( V \) be the mean velocity, \( v \) the velocity in the axis, and \( u \) the velocity at the bottom; we have \( u = \sqrt{v - 1} \) and \( V = \frac{v + u}{2} \).

Also \( v = (\sqrt{v - 1} + \frac{1}{2})^2 \), and \( v = (\sqrt{u + 1} + \frac{1}{2})^2 \).

\( V = (\sqrt{v - 1})^2 + \frac{1}{2} \), and \( V = (\sqrt{v + 1})^2 + \frac{1}{2} \).

Also \( v - u = 2 \sqrt{\frac{v}{p}} \) and \( v - V = V - u \).

That is, the difference between these velocities increases in the ratio of the square roots of the mean velocities diminished by a small constant quantity.

This may perhaps give the mathematicians some help in ascertaining the law of degradation from the axis to the sides. Thus, in a cylindrical pipe, we may conceive the current as consisting of an infinite number of cylindrical shells sliding within each other like the draw tubes of a spy-glass. Each of these is in equilibrium, or as much accelerated by the one within it as it is retarded by the one without; therefore as the momentum of each diminishes in the proportion of its diameter (the thickness being supposed the same in all), the velocity of separation must increase by a certain law from the sides to the axis. The magnitude of the small constant quantity here spoken of seems to fix this law.

The place of the mean velocity could not be discover ed with any precision. In moderate velocities it was not more than one-fourth or one-fifth of the depth, but distant from the bottom. In very great velocities it was sensibly higher, but never in the middle of the depth.

The knowledge of these three velocities is of great importance. The superficial velocity is easily observed; hence the mean velocity is easily computed. This multiplied by the friction gives the expense; and if we also measure the expanded border, and then obtain the mean depth (or \( \sqrt{p} \)), we can, by the formula of uniform motion, deduce the slope; or, knowing the slope, we can deduce any of the other circumstances.

The following table of these three velocities will save the trouble of calculation in one of the most frequent questions of hydraulics.
The knowledge of the velocity at the bottom is of the greatest use for enabling us to judge of the action of the stream on its bed ; and we shall now make some observations on this particular.

Every kind of soil has a certain velocity consistent with the stability of the channel. A greater velocity would enable the water to tear it up, and a smaller velocity would permit the deposition of more movable materials from above. It is not enough, then for the stability of a river, that the accelerating forces are so adjusted to the size and figure of its channel that the current may be in train; it must also be in equilibrium with the tenacity of the channel.

We learn from observation, that a velocity of three inches per second at the bottom will just begin to work upon fine clay fit for pottery, and however firm and compact it may be, it will tear it up. Yet no beds are more liable than clay when the velocities do not exceed this; for the water soon takes away the impalpable particles of the superficial clay, leaving the particles of sand sticking by their lower half in the rest of the clay, which they now protest, making a very perceptible bottom, if the stream does not bring down gravel or coarse sand, which will rub off this very thin crust, and allow another layer to be worn off; a velocity of six inches will lift fine sand; eight inches will lift sand as coarse as lintseed; 12 inches will sweep along fine gravel; 24 inches will roll along round pebbles an inch diameter; and it requires three feet per second at the bottom to sweep along shivery angular flints of the size of an egg.

The manner in which unwearied nature carries on the work of the stream on its bed, and the formation of the channel that the accelerating forces are so adjusted to the size and figure of its channel that the current may be in train; it must also be in equilibrium with the tenacity of the channel.

article lying about E are treated in the same way, and,
tumbling over the ridge B, cover the first particle, and
now project it effectually from any further disturbance.
The same operation is going on at the bottom of each
ridge. The brow or steep of the ridge gradually ad-
vances down the stream, and the whole set change their
places, as represented by the dotted line a d b s; and
after a certain time the particle which was de-
posited at F is found in an unexpected situation, as it
was in E, and it now makes another step down the
stream. The Abbé Bofflot finds, that when the velocity of
the stream was just sufficient for lifting the sand (and
a small excess hindered this operation altogether) a ridge
advanced about 20 feet in a day.

Since the current carries off the most movable mat-
ters of the channel, it leaves the bottom covered with
the remaining coarser sand, gravel, peebles, and larger
stones. To these are added many which come down the
stream while it is more rapid, and also many which
roll in from the sides as the banks wear away. All
these form a bottom much more solid and immovable
than a bottom of the medium soil would have been.
But this does not always maintain the channel in a per-
manent form; but frequently occasions great changes,
by obliging the current, in the event of any sudden fresh
or swell, to enlarge its bed, and even to change it alto-
gether, by working to the right and to the left, force
it cannot work downwards. It is generally from such
accumulation of gravel and pebbles in the bottom of the
bed of the stream which the beds of rivers change.

It remains to ascertain, in absolute measures, the force
which a current really exerts in attempting to drag
along with it the materials of its channel; and which
will produce this effect unless resisted by the inertia
of these materials. It is, therefore, of practical importance
to know this force.

Nor is it abstruse or difficult. For when a current is
in train, the accelerating force is in equilibrio with
the resistence, and is therefore its immediate measure.
Now this accelerating force is perfectly equal to the
weight of the body of water in motion multiplied by
the fraction which expresses the slope. The mean depth
being equal to the quotient of the section divided by
the border, the section is equal to the product of the
mean depth multiplied by the border. Therefore, cal-
lng the border b, and the mean depth d, we have the
section = bd. The body of water in motion is there-
fore bd (because s was the flant length of a part
whose difference of elevation is s), and the accelerating
force is \( \frac{d}{s} \times \frac{b}{s} = \frac{bd}{s} \), or \( bd \).

But if we would only con-
der this resistence as corresponding to an unit of the
length of the channel, we must divide the quantity \( \frac{bd}{s} \)
by \( s \), and the resistence is then \( \frac{bd}{s^2} \). And if we would
consider the resistence only for an unit of the border,
we must divide this expression by \( b \); and thus this res-
tenue (taking an inch for the unit) will be expressed
for one square inch of the bed by the weight of a
bulk of water which has a square inch for its base, and
\( s \) \( \frac{bd}{s} \) for its height. And lastly, if \( E \) be taken for any gi-
ven superficial extent of the channel or bed, and \( F \) the
obstrution which we consider as a sort of resistence, we
shall have \( F = \frac{Ed}{s} \).

Thus, let it be required to determine in pounds the
resisience or resistence on a square yard of a channel
whose current is in train, which is 10 feet wide, four
feet deep, and has a slope of one foot in a mile. Here
\( E \) is nine feet, 100 feet width and four feet depth give
a section of \( 400 \) feet. The border is 18 feet. There-
fore \( d = \frac{40}{18} = 2,111 \), and \( s = 1,528 \). Therefore the
resistence is the weight of a column of water whose base
is nine feet, and height \( 2,111 \) or nearly \( 3 \frac{7}{9} \) ounces
avoided.

§ 3. Settlement of the Beds of Rivers.

He who looks with a careless eye at a map of the Simplicity
world, is apt to consider the rivers which ramble over
its surface as a chance-medly disposition of the drainers
which carry off the waters. But it will afford a most
agreeable object to a considerate and contemplative
mind, to take it up in this very simple light; and having
considered the many ways in which the drenched sur-
face might have been cleared of the superfluous waters,
to attend particularly to the way which nature has
followed. In following the troubled waters of a moun-
tain torrent, or the pure streams which trickle from
their bases, till he sees them swallowed up in the ocean,
and in attending to the many varieties in their motions,
he will be delighted with observing how the simple laws
of mechanism are made fruitful in good consequences,
both by modifying the motions of the waters them-
selves, and also by inducing new forms on the surface
of the earth, fitted for re-asling on the waters, and pro-
ducing the very modifications of their motions which
render them so benefical. The permanent beds of ri-
vers are by no means fortuitous gutters hastily spoofed
out by dashing torrents; but both they and the valleys
through which they flow are the patient but unceasing
labours of nature, promptly by goodnnes and directed
by wisdom.

Whether we trace a river from the torrents which
collect the superfluous waters of heaven, or from the
springs which disperse what would otherwise be con-
demned to perpetual inactivity, each feeder is but a
little rill which could not ramble far from its scanty
source among growing plants and absorbent earth,
without being sucked up and evaporated, did it not
meet with other rills in its course. When united they
form a body of water still inconoeiderable, but much
more able, by its bulk, to overcome the little obstacles
to its motion; and the rivulet then moves with greater
speed, as we have now learned. At the same time, the
surface exposed to evaporation and absorption is dimin-
hed by the union of the rills. Four equal rills have
only the surface of two when united. Thus the por-
tion which escapes arrestment, and travels downward,
is continually increasing. This is a happy adjustment
to the other operations of nature. Were it otherwise,
the lower and more valuable countries would be loaded
with the palling waters in addition to their own sur-
plus rains, and the immediate neighbourhood of the sea
would be almost covered by the drain of the interior
countries.
RIVER.

But, fortunately, those passing waters occupy less room as they advance, and by this wise employment of the most simple means, not only are the superfuous waters drained off from our fertile fields, but the drains themselves become an useful part of the country by their magnitude. They become the habitation of a prodigious number of flies, which share the Creator's bounty; and they become the means of mutual communication of all the blessings of cultivated society.

The vague ramblings of the rivers scatter them over the face of the country, and bring them to every door. It is not even an indifferent circumstance, that they gather strength to cut out deep beds for themselves. By this means they cut open many springs. Without this, the produce of a heavy shower would make a swamp which would not dry up in many days. And it must be observed, that the same heat which is necessary for the vigorous growth of useful plants will produce a very copious evaporation. This must return in showers much too copious for immediate vegetation, and the overplus would be destructive. Is it not pleasant to contemplate this adjustment of the great operations of nature, so different from each other, that if chance alone directed the detail, it was almost an infinite odds that the earth would be uninhabitable?

But let us follow the waters in their operations, and note the face of the countries through which they flow; attending to the breadth, the depth, and the slope of the valleys, we shall be convinced that their present situation is extremely different from what it was in ancient days; and that the valleys themselves are the works of the rivers, or at least of waters which have descended from the heights, loaded with all the lighter matters which they were able to bring away with them. The rivers flow now in beds which have a considerable permanency; but this has been the work of ages. This has given stability, both by filling up and smoothing the valleys, and thus lessening the changing caufes, and also by hardening the beds themselves, which are now covered with aquatic plants, and lined with the stones, gravel, and coarser sand, out of which all the lighter matters have been washed away.

The surface of the high grounds is undergoing a continual change; and the ground on which we now walk is by no means the same which was trodden by our remote ancestors. The flowers from heaven carry down into the valleys, or sweep along by the torrents, a part of the foil which covers the heights and steeples. The torrents carry this foil into the brooks, and these deliver part of it into the great rivers, and these discharge into the sea this fertilizing fat of the earth, where it is swallowed up, and forever lost for the purposes of vegetation. Thus the hillocks left of their height, the valleys are filled up, and the mountains are laid bare, and show their naked precipices, which formerly were covered over with a fleaf and skin, but now look like the skeleton of this globe. The low countries, raised and nourished for some time by the substance of the high lands, will go in their turn to be buried in the ocean; and then the earth, reduced to a dreary flat, will become an immense uninhabitable mass.

This catastrophe is far diftant, because this globe is in its youth, but it is not the least certain; and the united labours of the human race could not long protract the term.

But, in the mean time, we can trace a beneficent purpose, and a nice adjutment of seemingly remote circumstances. The grounds near the sources of all rivers are indeed gradually stripped of their most fertile ingredients. But had they retained them for ages, the sentient inhabitants of the earth, or at least the noblest animals, with man at their head, would not have derived much advantage from it. The general laws of nature produce changes in our atmosphere which must ever render their great elevations uninfruitful, that general warmth, which is equally necessary for the useful plant as for the animal which lives on it, is confined to the lower grounds. The earth, which on the top of mount Haemus could only bring forth moss and dittany, when brought into the gardens of Spalatro, produced pot-herbs so luxuriant, that Dioclefan told his colleague Maximian that he had more pleasure in their cultivation than the Roman empire could confer. Thus nature not only provides us manure, but conveys it to our fields. She even keeps it safe for us till it shall be wanted. The tracts of country which are but newly inhabited by man, such as great part of America, and the newly discovered regions of Terra Australis, are still almost occupied by marshes and lakes, or covered with impenetrable forests; and they would remain long enough in this state, if population, continually increasing, did not increase industry, and multiply the hands of cultivators along with their necessities. The Author of Nature was alone able to form the huge ridges of the mountains, to model the hillocks and the valleys, to mark out the courses of the great rivers, and give the first trace to every rivulet; but has left to man the task of draining his own habitation and the fields which are to support him, because this is a task not beyond his powers. It was therefore of immense advantage to him that those parts of the globe into which he has not yet penetrated should remain covered with lakes, marshes, and forests, which keep in store the juice of the earth, which the influence of the air and the vivifying warmth of the sun would have expended long ere now in useless vegetation, and which the rains of heaven would have swept into the sea, had they not been thus protected by their situation or their cover.

It was therefore the business of man to open up these mines of hoarded wealth and to thank the Author of all good, who has thus husbanded them for his use, and left them as a rightful heritage for those of after days.

The earth had not in the remote ages, as in our day, those great canals, those capacious voiders, always ready to drain off the rain waters (of which only part is absorbed by the thirsty ground), and the pure waters of the springs from the foot of the hills. The rivers did not then exist, or were only torrents, whose waters, confined by the gullies and glens, are searching for a place to escape. Hence arise those numerous lakes in the interior of great continents, of which there are still remarkable relics in North America, which in progress of time will disappear, and become champaign countries. The most remote from the sea, unable to contain its waters, finds an issue through some gorge of the hills, and pours over its superfluous waters into a lower basin, which, in its turn, discharges its contents into another, and the last of the chain delivers its waters by a river into the ocean. The communication was originally begun by a simple overflowing at the lowest part of the margin. This made a torrent, which quickly...
Part I.

**R I V E R.**

*Theory.*

quickly deepened its bed: and this circumstance increasing its velocity, as we have seen, would extend this deepening backward to the lake, and draw off more of its waters. The work would go on rapidly at first, while earth and small stones only resisted the labours of nature; but these being washed away, and the channel hollowed out to the firm rock on all sides, the operation must go on very slowly, till the immense cascade shall undermine what it cannot break off, and then a new discharge will commence, and a quantity of flat ground will emerge all round the lake. The torrent, in the mean time, makes its way down the country, and digs a canal, which may be called the first sketch of a river, which will deepen and widen its bed continually. The waters of several bafins united, and running together in a great body, will (according to the principles we have established) have a much greater velocity, with the same slope, than those of the lakes in the interior parts of the continent; and the sum of them all united in the river towards the sea, after having broken through its natural mound, will make a prodigious torrent, which will dig for itself a bed so much the deeper as it has more slope and a greater body of waters.

The formation of the first valleys, by cutting open many springs which were formerly concealed under ground, will add to the mafs of running waters, and contribute to drain off the waters of these bafons. In course of time many of them will disappear, and flat valleys among the mountains and hills are the traces of their former existence.

When nature thus traces out the courses of future rivers, it is to be expected that those streams will most deeply their channels which in their approach to the sea receive into their bed the greatest quantities of rain and spring waters, and that towards the middle of the continent they will deepen their channels least. In these last situations the natural slope of the fields causes the rain-water, rills, and the little rivulets from the springs, to seek their way to the rivers. The ground can sink only by the flattening of the hills and high grounds; and this must proceed with extreme slowness, because it is only the gentle, though incessant, work of the rains and springs. But the rivers, increasing in bulk and strength, and of necessity flowing over every thing, form to themselves capacious beds in a more yielding soil, and dig them even to the level of the ocean.

The beds of rivers by no means form themselves in one inclined plane. If we should suppose a canal AB (fig. 12.) perfectly straight and horizontal at B, where it joins with the sea, this canal would really be an inclined channel of greater and greater slope as it is farther from B. This is evident; because gravity is directed towards the centre of the earth, and the angle CAB contained between the channel and the plumb-line at A is smaller than the similar angle CDB; and consequently the inclination to the horizon is greater in A than in D. Such a canal therefore would make the bed of a river; and some have thought that this was the real form of nature's work; but the supposition is a whim, and it is false. No river has a slope at all approaching to this. It would be 8 inches declivity in the mile next the ocean, 4 in the second mile, 40 inches in the third, and so on in the duplicate ratio (for the whole elevation) of the distances from the sea. Such a river would quickly tear up its bed in the mountains (were there any grounds high enough to receive it), and, except its first cascade, would soon acquire a more gentle slope. But the fact is, and it is the result of the imprescriptible laws of nature, that the continued track of a river is a succession of inclined channels, whose slope diminishes by steps as the river approaches to the sea. It is not enough to say that this results from the natural slope of the countries through which it flows, which we observe to increase in declivity as we go to the interior parts of the continent. Were it otherwise, the equilibrium to which nature aims in all her operations would still produce the gradual diminution of the slope of rivers. Without it they could not be in a permanent train.

That we may more easily form a notion of the manner in which the permanent course of a river is established, let us suppose a stream or rivulet a (fig. 13.) far up the country, make its way through a soil perfectly uniform to the sea, taking the course abcedf, and after the permanent section of the streams eg, bb, ic, kd, le, and that its velocity and slope in all its parts are so fitted to the tenacity of the soil and magnitude of its section, that neither do its waters during its annual freshes tear up its banks or deepen its bed, nor do they bring down from the high lands materials which they deposit in the channel in times of smaller velocity. Such a river may be said to be in a permanent state, to be in configuration, or to have stability.

Let us call this state of a river its regimen, denoting by the word the proper adjustment of the velocity of the stream to the tenacity of the channel. The velocity of its regimen must be the same throughout, because it is this which regulates its action on the bottom, which is the same from its head to the sea. That its bed may have stability, the mean velocity of the current must be constant, notwithstanding the inequality of discharge, through its different sections by the brooks which it receives in its course, and notwithstanding the augmentation of its section as it approaches the sea.

On the other hand, it behaved this exact regimen to commence at the mouth of the river, by the working of the whole body of the river, in concert with the waters of the ocean, which always keep within the same limits, and make the ultimate variable. This working will begin to dig the bed, giving it as little breadth as possible: for this working confisits chiefly in the efforts of falls and rapid streams, which arise of themselves in every channel which has too much slope. The bottom deepens, and the sides remain very steep, till they are undermined and crumble down; and being then diluted in the water, they are carried down the stream, and deposited where the ocean checks its speed. The banks crumble downwards, the valley or hollow forms; but the action, always confined to its bottom, cannot acquire a great breadth, and it retains a good deal of the form of the trapezium formerly mentioned. In this manner does the regimen begin to be established from f to e.

With respect to the next part de, the discharge or produce is diminished by the want of the brook le. It must take a similar form, but its area will be diminished, in order that its velocity may be the same; and its mean depth d being less than in the portion ef below, the slope must be greater. Without these conditions we could not have the uniform velocity, which the assumed

---

N 2 permanent.
permanent in an uniform foil necessarily supposes. 
Refoning after the same manner for all the portions 
cd, bc, ab, ac, we fee that the regimen will be succes-

cively establlished in them, and that the foil necessary 
for this purpose will be greater as we approach the ri-
er head. The vertical section or profile of the course 
of the river abcdef will therefore reemblle the line 
SABCDEF which is sketched below, having its dif-

tinct parts variously inclined to the horizontal line 
HF.

Such is the process of nature to be observed in every 
river on the surface of the globe. It long appeared a 
kind of puzzle to the theorists; and it was this observa-
tion of the increasing, or at least this continued velocity 
with smaller slopes, as the rivers increased by the 
addition of their tributary streams, which caused 
Guglielmini to have recourse to his new principle, the ene-

gy of deep waters. We have now seen in what this 
energy consists. It is only a great quantity of motion 
remaining in the middle of a great stream of water 
after a quantity has been retarded by the sides and 
bottom; and we see clearly, that since the addition of a 
new and perhaps an equal stream does not occupy a 
bed of double surface, the proportion of the retarda-
tions to the remaining motion must continually diminish 
as a river increases by the addition of new streams. If 
therefore the streams were not diminished, the regimen 
would be destroyed, and the river would dig up its chan-
el. We have a full confirmation of this in the many 
works which have been executed on the Po, which runs 
with rapidity through a rich and yielding soil. About 
the year 1600, the waters of the Panaro, a very con-

ciderable river, were added to the Po Grande; and al-
though it brings along with it in its freshes a vast quan-
tity of sand and mud, it has greatly deepened the whole 
Tronco di Venezia from the confluence to the sea.

This point was clearly ascertained by Manfredi about 
the 1720, when the inhabitants of the valleys adjacent 
were alarmed by the project of bringing in the waters 
of the Rheno, which then ran through the Ferrarese. 
Their fears were overcame, and the Po Grande con-
tinues to deepen its channel every day with a prodigious 
advantage to the navigations; and there are several ex-
tensive marshes which now drain off by it, after having 
been for ages under water; and it is to be particularly 
remarked, that the Rheno is the fouleat river in its 
freshes of any in that country. We infer this remark, 
because it may be of great practical utility, as pointing 
out a method of preferring and even improving the 
depth of rivers or drains in flat countries, which is not 
obvious, and rather appears improper; but it is strictly 
conformable to a true theory. and to the operations 
of nature, which never fails to adjust every thing so as to 
bring about an equilibrium. Whatever the exactness of 
the country may have been originally, the regimen be-
gins to be settled at the mouths of the rivers, and the 
streams are diminished in succession as we recede from 
the coast. The original freshes inland may have been much 
greater; but they will (when busy nature has complet-
ed her work) be left somewhat, and only so much 
greater, that the velocity may be the same notwithstanding 
the diminution of the section and mean depth.

Fresches will disturb this methodical progress relative 
only to the successive permanent additions; but their 
effects chiefly accelerate the deepening of the bed, and 
the diminution of the slope, by augmenting the veloci-
ity during their continuance. But when the regimen 
of the permanent additions is once established, the freshes 
tend chiefly to widen the bed, without greatly deepening 
it: for the aquatic plants, which have been growing 
and thriving during the peaceable state of the river, are 
now laid along, but not swept away, by the freshes 
and protect the bottom from their attacks; and the 
flame and gravel, which must have been left bare in a 
course of years, working on the soil, will also collect in 
the bottom, and greatly augment its power of resista-
ence; and even if the floods should have deepened the 
bottom some small matter, some mud will be deposited 
as the velocity of the freshes diminishes, and this will 
remain till the next flood.

We have supposed the foil uniform through the whole 
course: This seldom happens; therefore the circum-
cstances which infure permanency, or the regimen of a 
river, may be very different in its different parts and 
in different rivers. We may say in general, that the 
farther that the regimen has advanced up the stream 
in any river, the more slowly will it convey its waters to 
the sea.

There are some general circumstances in the motion 
of rivers which it will be proper to take notice of juft 
now, that they may not interrupt our more minute ex-
amination of their mechanism, and their explanations 
will then occur of themselves as corollaries of the pro-
positions which we shall endeavour to demonstrate.

In a valley of small width the river always occupies the 
in narrow 
lowest part of it; and it is observed, that this is seldom 
valleys ri-
the middle of the valley, and is nearest to that side 
on which the slope from the higher grounds is steepest 
and this without regard to the line of its course. The 
river generally adheres to the steepest hillside, whether 
they advance into the plain or retire from it. This 
general feature may be observed over the whole globe. 
It is divided into compartments by great ranges of moun-
tains; and it may be observed, that the great rivers hold 
their course not very far from them, and that their chief 
feeders come from the other side. In every compartment 
there is a swell of the low country at a distance from 
the bounding ridge of mountains; and on the summit of 
this swell the principal feeders of the great river have 
their sources.

The name valley is given with least propriety to these 
immenue regions, and is more applicable to tracks of 
champaign land which the eye can take in at one view. 
Even here we may observe a resemblance. It is not 
always in the very lowest part of this valley that the 
river has its bed; although the waters of the river flow 
in a channel below its immediate banks, these banks are 
frely higher than the grounds at the foot of the 
hills. This is very distinctly seen in Lower Egypt, by 
means of the canals which are carried backward from 
the Nile for accelerating its fertilizing inundations. 
When the canals are opened to admit the waters, it is 
always observed that the districts most remote are the 
first covered, and it is several days before the immedi-
ately adjoining fields partake of the blessing. This is a 
consequence of that general operation of nature by 
which the valleys are formed. The river in its floods 
is loaded with mud, which it retains as long as it 
rolls rapidly along its limited bed, tumbling its waters 
over and over, and taking up in every spot as much as 
in
The water of a river is generally enlarged near the sea, and this general law is broken, however, in the immediate neighbourhood of the sea; because in this situation the velocity of the water is checked by the passing flood-tides of the ocean. As the whole waters must still be discharged, they require a larger bed, and the enlargement will be chiefly in width. The sand and mud are deposited when the motion is retarded. The depth of the mouth of the channel is therefore diminished. It must therefore become wider. It must be done on a coast exposed to the force of a regular tide, which carries the waters of the ocean across the mouth of the river; this regular enlargement of the mouth will be the only consequence, and it will generally widen till it washes the foot of the adjoining hills; but if there be no tide in the sea, or a tide which does not set across the mouth of the river, the sands must be deposited at the sides of the opening, and become additions to the shore, lengthening the mouth of the channel. In this sheltered situation, every trivial circumstance will cause the river to work more on particular parts of the bottom, and deepen the channel there. This keeps the mud suspended in such parts of the channel, and it is not deposited till the stream has shot farther out into the sea. It is deposited on the sides of those deeper parts of the channel, and increases the velocity in them, and thus still farther protracts the deposition. Rivers so situated will not only lengthen their channels, but will divide them, and produce islands at their mouths. A bush, a tree torn up by the roots by a mountain torrent, and floated down the stream, will thus inevitably produce an island; and rivers in which this is common will be continually shifting their mouths.

The Adriatic is a remarkable instance of this. It has a long course through a rich soil, and diffemerges itself into the Bay of Mexico, in a place where there is no passing tide, as may be seen by comparing the hours of high water in different places. No river that we know carries down its stream such numbers of rooted-up trees: they frequently interrupt the navigation, and render it always dangerous at its mouth, that the most experienced pilots are puzzled, and it has protruded its channel above 50 miles in the short period that we have known it. The discharge of the Danube is very similar; so is that of the Nile, for it is discharged into a sill corner of the Mediterranean. It may now be said to have acquired considerable permanency; but much of this is owing to human industry, which strips it as much as possible of its fubburable matter. The Ganges too is in a situation pretty similar, and exhibits similar phenomena. The Marigua might be noticed as an exception; but it is not an exception. It has flowed very far in a level bed, and its waters come pretty clear to Para; but besides, there is a strong transverse tide, or rather current, at its mouth, setting to the south-east both during flood and ebb. The mouth of the Po is perhaps the most remarkable of any on the surface of this globe, and exhibits appearances extremely singular. Its discharge is into a lecherous corner of the Adriatic. Though there be a more remarkable tide in this gulf than in any part of the Mediterranean, it is still but trilling, and it either sets directly in upon the mouth of the river, or retires straight away from it. The river has many mouths, and they shift prodigiously. There has been a general increase of the land very remarkable. The marshes where Venice now stands were, in the Augustan age, everywhere penetrable by the fishing boats, and in the 5th century could only bear a few miserable huts; now they are covered with crowds of flately buildings. Ravenna, situated on the southernmost mouth of the Po, was, in the Augustan age, at the extremity of a swamp, and the road to it was along the top of an artificial mound, made by Augustus at immense expense. It was, however, a fine city, containing extensive docks, arsenals, and other military buildings, being the great military port of the empire, where Augustus laid up his great ships of war. In the Gothic times it became almost the capital of the Western empire, and was the seat of government and luxury. It must, therefore, be supposed to have every accommodation of opulence, and we cannot doubt of its having paved streets, harbours, &c.; for that its wealthy inhabitants were at least walking dryfooted from house to house. But now it is an Italian mile from the sea, and surrounded with vineyards and cultivated fields, and is accessible in every direction. All this must have been formed by depositions from the Po, flowing through Lombardy loaded with the spoils of the Alps, which were here arrested by the reeds and bulrushes of the marsh. These things are in common course; but when wells are dug, we come to the pavements of the ancient city, and these pavements are all on one exact level, and they are eight feet below the surface of the sea at low water. This cannot be ascribed to the subduing of the ancient city. This would be irregular, and great among the heavy buildings. The tomb of Theodoric remains, and the pavement round it is on a level with all the others. The lower story is always full of water; so is the lower story of the cathedral to the depth of three feet. The ornaments of both these buildings leave no room to doubt that they were formerly dry; and such a building as the cathedral could not sink without crumbling into pieces. It is by no means easy to account for all this. The depositions...
The rivers are convex athwart the stream, and the course of it.

54. Of the Windings of Rivers.

Rivers are seldom straight in their course. Formed by the hand of nature, they are accommodated to every change of circumstance. They wind around what they cannot get over, and work their way to either side according as the resistance of the opposite bank makes a straight course more difficult; and this seemingly fortuitous rambling distributes them more uniformly over the surface of a country, and makes them every where more at hand, to receive the numberless rills and rivulets which collect the waters of our springs and the superfluities of our flowers, and to comfort our habitations with the many advantages which cultivation and society can derive from their presence. In their feeble beginnings the smallest inequality of slope or confluence is enough to turn them aside and make them ramble through every field, giving drink to our herds and fertility to our soil. The more we follow nature into the minutiae of her operations, the more must we admire the inexhaustible fertility of her resources, and the simplicity of the means by which she produces the most important and beneficial effects. By thus twisting the course of our rivers into 10,000 shapes, she keeps them long amid the fields, and thus compensates for the declivity of the surface, which otherwise would tumble them with great rapidity into the ocean, loaded with the belt and richness of our soil. Without this, the flowers of heaven would have little influence in supplying the wants of insect life. But as things are, the rains are kept slowly trickling along the flowing rives of our hills and steepes, winding round every edd, nay every plant, which lengthens their course, diminishes their slope, checks their speed, and thus prevents them from quickly brushing off from every part of the surface the lightest and best of the soil. The flatness of our hollom lands would be too steep, and the rivers would shoot along through our finest meadows, hurrying every thing away with them, and would be unfit for the purposes of inland conveyance, if the inequalities of soil did not make them change this headlong course for the more beautiful meanders which we observe in the course of the small rivers winding through our meadows. Those rivers are in general the straightest in their course which are the most rapid, and which roll along the greatest bodies of water; such as the Rhone, the Po, the Danube. The smaller rivers continue more devious in their progress, till they approach the sea, and have gathered strength from all their tributary streams.

Every thing aims at an equilibrium, and this directly or indirectly affects even the ramblings of rivers. It is of importance to understand the relation between the force of a river and the resistance which the soil opposes to those deviations from a rectilinear course; for it may frequently happen that the general procedure of nature may be inconfisent with our local purposes. Man was set down on this globe, and the talk of cultivating it was given him by nature, and his chief enjoyment seems to be to struggle with the elements. He must not find things to his mind, but he must mould them to his own fancy. Yet even this seeming anomaly is one of nature's most beneficent laws; and his exertions must still be made in conformity with the general train of the operations of mechanical nature; and when we have any work to undertake relative to the course of rivers, we must be careful not to thwart their general rules, otherwise we shall be sooner or later punished for their infrac tion. Things will be brought back to their former state, if our operations are inconfisent with that equilibrium which is constantly aimed at, or some new state of things which is equivalent will be soon induced. If a well regulated river has been improperly deepened in some place, to answer some particular purpose of our own, or if its breadth has been improperly augmented, we shall soon see a disposition of mud or sand chock up our fancied improvements; because, as we have enlarged the section without increasing the slope or the supply, the velocity must diminish, and floating matters must be deposited.

It is true, we frequently see permanent channels where the forms are extremely different from that which the waters would dig for themselves in an uniform foil, and which approaches a good deal to the trapezium described formerly. We see a greater breadth frequently compensate for a want of depth; but all such deviations are a sort of constraint, or rather are indications of inequality of soil. Such irregular forms are the works of nature; and if they are permanent, the equilibrium is obtained. Commonly the bottom is harder than the sides, confining the coarser of the sand and of gravel; and therefore the necessary deviation can be obtained only by increasing the width. We are
are accustomed to attend chiefly to the appearances which prognosticate mischief, and we interpret the appearances of a permanent bed in the same way, and frequently form very false judgments. When we see one bank low and flat, and the other high and abrupt, we suppose that the waters are pulling along the hill in peace, and with a gentle stream, but that they are rapid on the other side, and are tearing away the bank; but it is just the contrary. The bed being permanent, things are in equilibrio, and each bank is of a form just competent to that equilibrio. If the soil on both sides be uniform, the stream is most rapid on that side where the bank is low and flat, for in no other form would it withstand the action of the stream; and it has been worn away till its flatness compensates for the greater force of the stream. The stream on the other side must be more gentle, otherwise the bank could not remain abrupt. In short, in a state of permanency, the velocity of the stream and form of the bank are just suited to each other. It is quite otherwise before the river has acquired its proper regimen.

A careful consideration therefore of the general features of rivers which have settled their regimen, is of use for informing us concerning their internal motions, and directing us to the most effectual methods of regulating their course.

We have already said that perpendicular brims are inconsistent with stability. A fimicircular fection is the form which would produce the quickest train of a river whose expence and slope are given; but the banks at B and D (fig. 14.) would crumble in, and lie at the bottom, where their horizontal surface would secure them from farther change. The bed will acquire the form G c F, of equal section, but greater width, and with brims less shelving. The proportion of the velocities at A and e may be the same with that of the velocities at A and C; but the velocity at G and F will be less than it was formerly at B, C, or D; and the velocity in any intermediate point E, being somewhat between those at F and e, must be less than it was in any intermediate point of the fimicircular bed. The velocities will therefore decrease along the border from e towards G and F, and the steepness of the border will augment at the same time, till, in every point of the new border GcF, these two circumstances will be so adjusted that the necessary equilibrio is established.

The same thing must happen in our trapezium. The slope of the brims may be exact, and will be retained; it will, however, be too great anywhere below, where the velocity is greater, and the sides will be worn away till the banks are undermined and crumble down, and the river will maintain its seotion by increasing its width. In short, no border made up of straight lines is consistent with that gradation of velocity which will take place whenever we depart from a fimicircular form. And we accordingly see, that in all natural channels the section has a curvilinear border, with the slope increasing gradually from the bottom to the brim.

These observations will enable us to understand how nature operates when the inequality of surface or of tenacity obliges the current to change its direction, and the river forms an elbow.

Supposing always that the discharge continues the same, and that the mean velocity is either preserved or restored, the following conditions are necessary for a permanent regimen.

1. The depth of water must be greater in the elbow than anywhere else.

2. The main stream, after having struck the concave bank, must be reflected in an equal angle, and must then be in the direction of the next reach of the river.

3. The angle of incidence must be proportioned to the tenacity of the foil.

4. There must be in the elbow an increase of slope, or of head of water, capable of overcoming the resistance occasioned by the elbow.

The reasonableness, at least, of these conditions will appear from the following considerations.

1. It is certain that force is expended in producing this change of direction in a channel which by supposing diminishes the current. The diminution arising from any cause which can be compared with friction must be greater when the stream is directed against one of the banks. It may be very difficult to state the proportion, and it would occupy too much of our time to attempt it; but it is sufficient that we be convinced that the retardation is greater in this case. We see no cause to increase the mean velocity in the elbow, and we must therefore conclude that it is diminished. But we are supposing that the discharge continues the same; the seotion must therefore augment, or the channel increase its transverse dimensions. The only question is, in what manner it does this, and what change of form does it affect, and what form is competent to the final equilibrio and the consequent permanency of the bed? Here there is much room for conjecture. Mr. Bute reasons as follows. If we suppose that the points B and C (fig. 13.) continue on a level, and that the points H and I at the beginning of the next reach are also on a level, it is an inevitable conseqence that the slope along CMI must be greater than along BEH, because the depression of H below B is equal to that of I below C, and BEH is longer than CMI. Therefore the velocity along the convex bank CMI must be greater than along BEH. There may even be a stagnation and an eddy in the contrary direction along the concave bank. Therefore, if the form of the seotion were the same as up the stream, the sides could not stand on the convex bank. When therefore the section has attained a permanent form, and the banks are again in equilibrio with the action of the current, the convex bank must be much flatter than the concave. If the water is really still on the concave bank, that bank will be absolutely perpendicular; nay, may overhang. Accordingly this state of things is matter of daily observation, and justifies our reasoning, and entitles us to say, that this is the nature of the internal motion of the filaments which we cannot distinctly observe. The water moves most rapidly along the convex bank, and the thread of the stream is nearest to this side. Reasoning in this way, the seotion, which we may suppose to have been originally of the form M b a E (fig. 14.) assumes the shape MBAE.

2. Without pretending to know the mechanism of the internal motions of fluids, we know that superficial waves are reflected precisely as if they were elastic bodies, making the angles of incidence and reflection equal. In as far therefore as the superficial wave is concerned in the operation, Mr. Bute's second position is just.
The permanency of the next reach requires that its axis shall be in the direction of the line EP which makes the angle GEP=FEN. If the next reach has the direction EQ, MR, the wave reflected in the line ES will work on the bank at S, and will be reflected in the line ST, and work again on the opposite bank at T. We know that the effect of the superficial motion is great, and that it is the principal agent in destroying the banks of canals. So far therefore Mr Buat is right. We cannot say with any precision or confidence how the actions of the under filaments are modified; but we know no reason for not extending to the under filaments what appears to be probable with respect to the surface water.

3. The third position is no less evident. We do not know the mode of action of the water on the bank; but our general notions on this subject, confirmed by common experience, tell us that the more obliquely a stream of water beats on any bank, the less it tends to undermine it or wash it away. A tilting and cohesive sheet therefore will suffer no more from being almost perpendicularly buffeted by a stream than a friable sand would suffer from water gliding along its face. Mr Buat thinks, from experience, that a clay bank is not sufficiently affected till the angle FEB is about 36 degrees.

4. Since there are causes of retardation, and we still suppose that the discharge is kept up, and that the mean velocity, which had been diminished by the enlargement of the section, is again restored, we must grant that there is provided, in the mechanism of these motions, an accelerating force adequate to this effect. There can be no accelerating force in an open stream but the superficial slope. In the present case it is undoubtedly so; because by the deepening of the bottom where there is an elbow in the stream, we have of necessity a counter slope. Now, all this head of water, which must produce the augmentation of velocity in that part of the stream which ranges round the convex bank, will arise from the check which the water gets from the concave bank. This occasions a gorge or swell up the stream, enlarges a little the section at BVC; and this, by the principle of uniform motion, will augment all the velocities, deepen the channel, and put every thing again into its train as soon as the water gets into the next reach. The water at the bottom of this basin has very little motion, but it defends the bottom by this very circumstance.

Such are the motions which Mr de Buat entertains of this part of the mechanism of running waters. We cannot say that they are very satisfactory, and they are very opposite to the opinions commonly entertained on the subject. Most persons think that the motion is most rapid and turbulent on the side of the concave bank, and that it is owing to this that the bank is worn away till it becomes perpendicular, and that the opposite bank is flat, because it has not been gnawed away in this manner. With respect to this general view of the matter, these persons may be in the right; and when a stream is turned into a crooked and yielding channel for the first time, this is its manner of action. But Mr Buat's aim is to investigate the circumstances which obtain in the case of a regimen; and in this view he is undoubtedly right as to the facts, though his mode of accounting for these facts may be erroneous. And as this is the only useful view to be taken of the subject, it ought chiefly to be attended to in all our attempts to procure stability to the bed of a river, without the expensive help of masonry, &c. If we attempt to secure permanency by deepening on the inside of the elbow, our bank will undoubtedly crumble down, diminish the passage, and occasion a more violent action on the hollow bank. The most effectual mean of security is to enlarge the section: and if we do this on the inside, we must do it by widening the stream very much, that we may give a very sloping bank. Our attention is commonly drawn to it when the hollow bank is giving way, and with a view to stop the ravages of the stream. Things are not now in a state of permanency, but nature is working in her own way to bring it about. This may not suit our purpose, and we must thwart her. The phenomena which we then observe are frequently very unlike those described in the preceding paragraphs. We see a violent tumbling motion in the stream towards the hollow bank. We see an evident accumulation of water on that side, and the point B is frequently higher than C. This regurgitation of the water extends to some distance, and is of itself a cause of greater velocity, and contributes, like a head of stagnant water, to force the stream through the bend, and to deepen the bottom. This is clearly the case when the velocity is excessive, and the hollow bank able to abide the shock. In this situation the water thus heaped up escapes where it befits can; and as the water, obstructed by an obstacle put in its way, escapes by the sides, and there has its velocity increased, so here the water gorged up against the hollow bank falls over towards the opposite side, and passes round the convex bank with an increased velocity. It depends much on the adjuplitude between the velocity and consequent accumulation, and the breadth of the stream and the angle of the elbow, whether this augmentation of velocity shall reach the convex bank, and we sometimes see the motion very languid in that place, and even depo­sitions of mud and sand are made there. The whole phenomena are too complicated to be accurately described in general terms, even in the case of perfect regimen: for this regimen is relative to the confidence of the channel; and when this is very great, the motions may be mild violent in every quarter. But the preceding observations are of importance, because they relate to ordinary cases and to ordinary channels.

It is evident, from Mr Buat's second position, that the proper form of an elbow depends on the breadth of the stream as well as on the radius of curvature, and that every angle of elbow will require a certain proportion between the width of the river and the radius of the sweep. Mr Buat gives rules and formulae for all these purposes, and shows that in one sweep there may be more than one reflection or rebound. It is needless to enlarge on this matter of mere geometrical diffusion. It is with the view of enabling the engineer, to trace the windings of a river in such a manner that there shall be no rebounds which shall direct the stream against the sides, but preserve it always in the axis of every reach. This is of consequence, even when the bends of the river are to be secured by masonry or piling: for we have seen the necessity of increasing the section, and the tendency which the waters have to deepen the channel on that side where the rebound is made. This tends

Refractance caused by an elbow, and mode of overcoming it.

to undermine our defences, and oblige us to give them deeper and more solid foundations in such places. But any peril acconruend to the use of the scale and com

piles will form to himself rules of practice equally sure and more expeditious than Mr de Buat's formula.

We proceed, therefore, to what is more to our purpose, the confideration of the refractance caused by an elbow, and the methods of providing a force capable of overcoming it. We have already taken notice of the various consequences arising from the rambling course of rivers, inasmuch as it more effectually spreads them over the face of a country. It is no less benefi
tial by diminishing their velocity. This it does both by lengthening their course, which diminishes the de

clivity, and by the very refractance which they meet with at every bend. We derive the chief advantages from our rivers, when they no longer shoot their way, from precipice to precipice, loaded with mud and sand, but peaceably roll along their clear waters, purified during their gentle course, and offer themselves for all the pur

poses of paffage, agriculture, and navigation. The more a river winds its way round the foot of the hills, the more is the refractance of its bed multiplied; the more obstacles it meets with in its way from its source to the sea, the more moderate is its velocity; and instead of tearing up the very bowels of the earth, and digging for itself a deep trough, while while a river winds its way round the foot of the hills, the more is the

declivity, and by the very refractance which they meet with at every bend. 102

Theory applied to inclined tubes and open streams.

The analogy which we were enabled to establish between the uniform motion or the train of pipes and of open streams, entitles us now to say, that when a river has bendings, which are regularly repeated at equal intervals, its slope is compounded of the slope which is necessary for overcoming the refractance of a straight channel of its whole expanded length, agreeably to the

bounds of 36° each. A head of water was applied to it, which gave the water a velocity of six feet per sec.

cond. Another pipe of the same diameter and length, but without any bendings, was subjected to a pre

sure of a head of water, which was increased till the velocity of efflux was also six feet per second. The additional head of water was 3/4 inches. Another of the same diameter and length, having one bend of 24° 34', and running 85 inches per second, was compared with a straight pipe having the same velocity, and the differ

ence of the heads of water was 3/5 of an inch. A computation from these two experiments will give the

above result, or in English measure, \( r = \frac{V^2}{3000} \) very nearly. It is probable that this measure of the refractance is too great; for the pipe was of uniform diameter even in the bends; whereas in a river properly formed, where the regimen is exact, the capacity of the efflux of the bend is increased.

The application of this theory to inclined tubes and to open streams is very obvious, and very legitimate and safe. Let AB (fig. 17.) be the whole height of the reservoir AIBK, and BC the horizontal length of a pipe, containing any number of rebounds equal or unequal, but all regular, that is, constructed according to the conditions formerly mentioned. The whole head of water should be conceived as performing, or as divided into portions which perform, three different offices.

One portion, AD = \( \frac{V^2}{505} \), impels the water into the entry of the pipe with the velocity with which it really moves in it; another portion EB is in equilibrio with the refractances arising from the mere length of the pipe expanded into a straight line; and the third portion DE serves to overcome the refractance of the bends. If, therefore, we draw the horizontal line BC, and, taking the pipe BC out of its place, put it in the position DH, with its mouth C in H, so that DH equal to BC, the water will have the same velocity in it that it had before. N. B. For greater simplicity of argument, we may suppose that when the pipe was inserted at B, its bends lay all in a horizontal plane, and that when it is inserted at D, the plane in which all its bends lie is perpendicular to the plane of the figure. We repeat it, the water will have the same velocity the pipes BC and DH, and the refractances will be overcome. If we now prolong the pipe DH towards L to any distance, repeating continually the same bendings in a series of lengths, each equal to DH, the motion will be continued with the velocity corresponding to the pre

sure of the column AD; because the declivity of the pipe is augmented in each length equal to DH, by a quantity precisely sufficient for overcoming all the refractances in that length; and the true slope in these cases is BE + ED, divided by the expanded length of the pipe BC or DH.

The theory which we have established is, in effect, that when a river has bendings, which are regularly repeated at equal intervals, its slope is compounded of the slope which is necessary for overcoming the refractance of a straight channel of its whole expanded length, agreeably to the

The experiment was in this form: A pipe of 1 inch diameter, and 10 feet long, was formed with 10 re

Vol. XVI.
the formula for uniform motion, and of the slope which is necessary for overcoming the resistance arising from its bendsings alone.

Thus, let there be a river which, in the expanded course of 6000 fathoms, has 10 elbows, each of which has 30° of rebound; and let its mean velocity be 20 inches in a second. If we would learn its whole slope in this 6000 fathoms, we must first find (by the formula of uniform motion) the slope, which will produce the velocity of 20 inches in a straight river of this length, section, and mean depth. Suppose this to be $\tau^{\frac{3}{2}}$, or 20 inches in this whole length. We must then find (by the formula $\sqrt{\frac{3}{2}}$) the slope necessary for overcoming the resistance of 10 rebounds of 30° each. This we shall find to be 6$\frac{1}{2}$ inches in the 6000 fathoms. Therefore the river must have a slope of 30$\frac{1}{2}$ inches in 6000 fathoms, or $\tau^{\frac{3}{2}}$; and this slope will produce the same velocity which 20 inches, or $\tau^{\frac{3}{2}}$, would do in a straight running river of the same length.

**PART II. PRACTICAL INFERENCES.**

HAVING thus established a theory of a most important part of hydraulics, which may be considered as a just representation of nature's procedure, we shall apply it to the examination of the chief results of every thing which art has contrived for limiting the operations of nature, or modifying them so as to suit our particular views. Trusting to the detail which we have given of the connecting principles, and the chief circumstances which co-operate in producing the beneficial effect; and supposing that such of our readers as are interested in this subject will not think it too much trouble to make the applications in the same detail; we shall content ourselves with merely pointing out the steps of the process, and showing their foundation in the theory itself; and frequently, in place of the direct analysis which the theory enables us to employ for the solution of the problems, we shall recommend a process of approximation by trial and correction, sufficiently accurate, and more within the reach of practical engineers. We are naturally led to consider in order the following articles.

1. The effects of permanent additions of every kind to the waters of a river, and the most effectual methods of preventing or removing inundations.
2. The effects of weirs, bars, sluices, and keeps of every kind, for raising the surface of a river; and the similar effects of bridges, piers, and every thing which contracts the section of the stream.
3. The nature of canals; how they differ from rivers in respect of origin, discharge, and regimen, and what conditions are necessary for their most perfect construction.
4. Canals for draining land, and drafts or canals of derivation from the main stream. The principles of their construction, so that they may suit their intended purposes, and the change which they produce on the main stream, both above and below the point of derivation.

Of the effects of permanent additions to the waters of a river.

From what has been said already, it appears that to every kind of full or bed there corresponds a certain velocity of current, too small to hurt it by digging it up, and too great to allow the deposition of the materials which it is carrying along. Supposing this known for any particular situation, and the quantity of water which the channel must of necessity discharge, we may with to learn the smallest slope which must be given to this stream, that the waters may run with the required velocity. This suggests problems and examples on the effects of permanent additions to the waters of a river.
Part II.

Practical References.

In the second edition of the "Practical Receipts" given, we may make \( \sqrt{d-L} \text{ or } \sqrt{d+L} = \sqrt{B} \), and the formula of mean velocity will give

\[
V = \frac{297}{\sqrt{B} - 0.3} \sqrt{d - 0.1},
\]

which we may express thus:

\[
V = \frac{297}{\sqrt{B} - 0.3} \sqrt{d - 0.1}.
\]

This gives us another value of \( b \), which will rarely exceed the truth by \( 1\% \). This serves (by the same process) for finding another, which will commonly be sufficiently exact. We shall illustrate this by an example.

Let there be a river whose channel is a rectangle 150 feet wide and fix feet deep, and which discharges 1500 cubic feet of water per second, having a velocity of 20 inches, and slope of \( \frac{1}{2000} \) or about \( \frac{1}{2000} \) of an inch in 100 fathoms. How much will it rise if it receives an addition which triples its discharge? and what will be its velocity?

If the velocity remained the same, its depth would be tripled; but we know by the general formula that its velocity will be greatly increased, and therefore its depth will not be tripled. Suppose it to be doubled, and to become 12 feet. This will give \( d = 10,34483 \), or 124,138 inches; then the equation \( \sqrt{d - 0.1} = \frac{297}{\sqrt{B} - 0.3} \) gives \( d = 12,48 \). This serves (by the same process) for finding another, which will commonly be sufficiently exact. We shall illustrate this by an example.

Let there be a river whose channel is a rectangle 150 feet wide and fix feet deep, and which discharges 1500 cubic feet of water per second, having a velocity of 20 inches, and slope of \( \frac{1}{2000} \) or about \( \frac{1}{2000} \) of an inch in 100 fathoms. How much will it rise if it receives an addition which triples its discharge? and what will be its velocity?

If the velocity remained the same, its depth would be tripled; but we know by the general formula that its velocity will be greatly increased, and therefore its depth will not be tripled. Suppose it to be doubled, and to become 12 feet. This will give \( d = 10,34483 \), or 124,138 inches; then the equation \( \sqrt{d - 0.1} = \frac{297}{\sqrt{B} - 0.3} \) gives \( d = 12,48 \). This serves (by the same process) for finding another, which will commonly be sufficiently exact. We shall illustrate this by an example.

Let there be a river whose channel is a rectangle 150 feet wide and fix feet deep, and which discharges 1500 cubic feet of water per second, having a velocity of 20 inches, and slope of \( \frac{1}{2000} \) or about \( \frac{1}{2000} \) of an inch in 100 fathoms. How much will it rise if it receives an addition which triples its discharge? and what will be its velocity?
And in making these first guesses we shall do it more exactly, by recollecting that a certain variation of the mean depth requires a greater variation of the height, and the increment will be to the height nearly as half the height to the width, as may easily be seen. Therefore, if we add to 12,48 its \( \frac{6.24}{150} \) part, or its 24th part, viz. 0.52, we have 13 for our first assumption, exceeding the truth only an inch and a half. We mention these circumstances, that those who are disposed to apply these doctrines to the solution of practical cases may be at no loss when one occurs of which the regular solution requires an intricate analysis.

It is evident that the inverse of the foregoing problems will show the effects of enlarging the section of a river, that is, will show how much its surface will be sunk by any proposed enlargement of its bed. It is therefore needless to propose such problems in this place. Common sense directs us to make these enlargements in those parts of the river where their effect will be greatest, that is, where it is shallowest when its breadth greatly exceeds its depth, or where it is narrowest (if its depth exceed the breadth, which is a very rare case), or in general, where the slope of the meander is the smallest for a short run.

The same general principles direct us in the method of embankments, for the prevention of floods, by enabling us to ascertain the heights necessary to be given to our banks. This will evidently depend, not only on the additional quantity of water which experience tells us a river brings down during its freshes, but also on the distance at which we place the banks from the natural banks of the river. This is a point where mistaken economy frequently defeats its own purpose. If we raise our embankment at some distance from the natural banks of the river, we diminish its velocity, and consequently a smaller base, which will make a saving in the duplicate proportion of the height; but our works will be so much the more durable nearly, if not exactly, in the same proportion. For by thus enlarging the additional bed which we give to the swollen river, we diminish its velocity almost in the same proportion that we enlarge its channel, and thus diminish its power of ruining our works. Except, therefore, in the case of a river whose freshes are loaded with fine sand to destroy the turf, it is always proper to place the embankment at a considerable distance from the natural banks. Placing them at half the breadth of the stream from its natural banks, will nearly double its channel; and, except in the case now mentioned, the space thus detached from our fields will afford excellent pasture.

The limits of such a work as ours will not permit us to enter into any detail on the method of embankment. It would require a volume to give instructions as to the manner of founding, raising, and securing the dykes which must be raised, and a thousand circumstances which must be attended to. But a few general observations may be made, which naturally occur while we are considering the manner in which a river works in settling or altering its channel.
Of straighting or changing the course of rivers.

We have seen, that every bending of a river requires an additional slope in order to continue its train, or enable it to convey the same quantity of water without swelling in its bed. Therefore the effect of taking away any of these bends must be to sink the waters of the river. It is proper, therefore, to have it in our power to eliminate these effects. It may be defirable to gain property, by taking away the sweeps of a very winding stream. But this may be prejudicial, by destroying the navigation on such a river. It may also hurt the proprietors below, by increasing the velocity of the stream, which will expel them to the risk of its overflowing, or of its destroying its bed, and taking a new course. Or this increase of velocity may be inconsistent with the regimen of the new channel, or at least require larger dimensions than we should have given it if ignorant of this effect.

Our principles of uniform motion enable us to answer every question of this kind which can occur; and Mr de Buat proposes several problems to this effect. The regular solutions of them are complicated and difficult; and we do not think them necessary in this place, because they may all be solved in a manner not indeed elegant, because indirect, but abundantly accurate, and easy to any person familiar with those which we have already considered.

We can take the exact level across all these sweeps, and thus obtain the whole slope. We can measure with accuracy the velocity in some part of the channel which is most remote from any bend, and where the channel itself has the greatest regularity of form. This will give us the expence or discharge of the river, and the mean depth connected with it. We can then examine whether this velocity is precisely such as is compatible with stability in the straight course. If it is, it is evident that if we cut off the bends, the greater slope which this will produce will communicate to the waters a velocity incompatible with the regimen suited to this foil, unless we enlarge the width of the stream, that is unless we make the new channel more capacious than the old one. We must now calculate the dimensions of the channel which, with this increased slope, will conduct the waters with the velocity that is necessary. All this may be done by the foregoing problems; and we may easiest accomplish this by steps. First, suppose the bed and the old one, and calculate the velocity for the increased slope by the general formula. Then change one of the dimensions of the channel, so as to produce the velocity we want, which is a very simple process. And in doing this, the object to be kept chiefly in view is not to make the new velocity such as will be incompatible with the stability of the new bed.

Having accomplished this first purpose, we learn (in the very solution) how much shallower this channel with its greater slope will be than the former, while it discharges all the waters. This diminution of depth must increase the slope and the velocity, and must diminish the depth of the river, above the place where the alteration is to be made. How far it produces these effects may be calculated by the general formula. We then see whether the navigation will be hurt, either in the old river up the stream, or in the new channel. It is plain that all these points cannot be reconciled. We may make the new channel such, that it shall have a velocity compatible with stability, and that it shall not diminish the depth of the river up the stream. But, having a greater slope, it must have a smaller mean depth, and also a smaller real depth, unless we make it of a very inconvenient form.

The same things viewed in a different light, will show us what depression of waters may be produced by rectifying the course of a river in order to prevent its overflowing. And the process which we would recommend is the same with the foregoing. We apprehend it to be quite needful to measure the angles of rebound, in order to compute the slope which is employed for sending the river through the bend, with a view to supercede this by straightening the river. It is infinitely easier and more exact to measure the levels themselves, and then we know the effect of removing them.

Nor need we follow Mr de Buat in soloving problems for diminishing the slope and velocity, and deepening the channel of a river by bending its course. The expence of this would be in every case enormous; and the practices which we are just going to enter upon afford infinitely easier methods of accomplishing all the purposes which are to be gained by these changes.

Of Bars, Weirs, and Jettys, for raising the Surface of Rivers.

We propose, under the article WATERWORKS, to consider in sufficient practical detail all that relates to the construction and mechanism of these and other erec­tions in water; and we confine ourselves, in this place, to the mere effect which they will produce on the current of the river.

We gave the name of weir or bar to a dam erected across a river for the purpose of raising its waters, whether in order to take off a draft for a mill or to deepen the channel. Before we can tell the effect which they will produce, we must have a general rule for ascertaining the relation between the height of the water above the lip of the weir or bar, and the quantity of water which will flow over.

First, then, with respect to a weir, represented in fig. 18. and fig. 18. n. § 2. The latter figure more resembles their usual form, consisting of a dam of solid masonry, or built of timber, properly braced with choirs and banks. On the top is fixed a strong plank FR, called the wasteborder, or waterer, over which the water flows. This is brought to an accurate level, of the proper height. Such weirs are frequently made in the side of a mill-course, for letting the superfluous water run off. This is properly the waste, voider: it is also called an offset. The same observations will explain all these different pieces of practice. The following questions occur in course.

Prob. I. Given the length of an offset or wasteborder, made in the face of a reservoir of flagrant water, and the depth of its lip under the horizontal surface of the water, to determine the discharge, or the quantity of water which will run over in a second?

Let AB be the horizontal surface of the still water, and C the lip of the wasteborder. Call the depth BS under the surface S, and the length of the wasteborder 1. 

V. B. The water is supposed to flow over into another basin or channel, so much lower than the surface
If the water could be supported at the height BF, DE might be considered as an orifice in the side of a vessel. In which case, the discharge would be the same as if the whole water were flowing with the velocity acquired from the height $\frac{1}{2} BF$, or $\frac{3}{4} h$. And if we suppose that there is no contraction at the orifice, the mean velocity would be $\sqrt{2} \frac{1}{2} BF = \sqrt{772} \frac{3}{4} h$, in English inches per second. The area of this orifice is $\frac{1}{4} h^2$.

Therefore the discharge would be $\frac{1}{4} h \sqrt{772} \frac{3}{4} h$, all being measured in inches. This is the usual theory; but it is not an exact representation of the manner in which the efflux really happens. The water cannot remain at the height BF; but in drawing towards the waterboard from all sides, it forms a convex surface AIL, so that the point I, where the vertical drawn from the point I has been propagated, in the opinion of Mr de Buat, to the orifice, we can determine it by an experiment, and that this determination was not by an immediate and direct measurement; he concluded it from the comparison of the quantities of water discharged under different heights of the water in the reservoir.

We cannot help thinking that this reasoning is very defective in several particulars. It cannot be inferred, from the laws of hydrostatical prejure, that the filament at I is prefled forward with all the weight of the column BI. The particle I is really at the surface, and considering it as making part of the surface of a running stream, it is subject to hardly any prejure, any more than the particles on the surface of a cup of water held in the hand, while it is carried round the axis of the earth and round the fun. Reafoning according to his own principles, and availing himself of his own discovery, he should say, that the particle at I has an accelerating force depending on its slope only; and then he should have endeavoured to acentain this slope. The motion of the particle at I has no immediate connection with the prejure of the column BI; and if it had, the motion would be extremely different from what it is: for this prejure alone would give it the velocity which Mr Buat affixes it. Now it is already passing through the point I with the velocity which it has acquired in defcending along the curve AL; and this is the real state of the cafe. The particles are passing through with a velocity already acquired by a difling current; and they are accelerated by the hydrostatical prejure of the water above them.

The internal mechanism of these motions is infinitely more complex than Mr Buat here supposes; and on this supposition, he very nearly abandons the theory which he has so ingeniously established, and adopts the theory of Guglielmimi which he had exploded. At the same time, we think, that he is not much mistaken when he afferts, that the motions are nearly the same as if a fluce had been let down from the surface to I. For the filament which passes at I has been gliding down a curved surface, and has not been exposed to any friction.

It is perhaps the very cafe of hydrostatics, where the obtructions are the smallest; and we should therefore expect that its motion will be the least retarded.

We have therefore no hesitation in saying, that the filament at I is in the very state of motion which the theory would assign to it, if it were passing under a fluce, as Mr Buat supposes. And with regard to the inferior filaments, without attempting the very difficult task of investigating their motions, we shall only say, that we do not see any reason for supposing that they will move slower than our author supposes. Therefore, though we reject his theory, we admit his experimental proposition in general; that is, we admit that the whole water which passes through the plane IF moves with the velocity (though not in the same direction) with which it would have run through a fluce of the same depth; and we may proceed with his determination of the quantity of water discharged.

If we make BC the axis of a parabola BEGH, the velocities of the filaments passing at I and F will be represented by the ordinates IE and FG, and the discharge by the area IEGF. This allows a very neat solution of the problem. Let the quantity discharged per second be $D$, and let the whole height BF be $H$. Let $2G$ be the quantity by which we may divide the square of the mean velocity, in order to have the proportion in general; that is, we admit that the whole water which passes through the plane IF moves with the velocity (though not in the same direction) with which it would have run through a fluce of the same depth; and we may proceed with his determination of the quantity of water discharged.

If we make BC the axis of a parabola BEGH, the velocities of the filaments passing at I and F will be represented by the ordinates IE and FG, and the discharge by the area IEGF. This allows a very neat solution of the problem. Let the quantity discharged per second be $D$, and let the whole height BF be $H$.

Let $G$ be the quantity by which we may divide the square of the mean velocity, in order to have the proportion in general; that is, we admit that the whole water which passes through the plane IF moves with the velocity (though not in the same direction) with which it would have run through a fluce of the same depth; and we may proceed with his determination of the quantity of water discharged.

We formerly gave for its measure 726 inches, instead of 772, and said that the inches discharged per second from an orifice of one inch were 26,49, instead of 27,78. Let $x$ be the distance of any filament from the horizontal line AB. An element of the orifice, therefore, (for we may give it this name) is $\frac{1}{2} x$. The velocity of this element is $\sqrt{2Gx}$, or $\sqrt{\frac{1}{2} G \times \frac{V}{x}}$. The discharge from it is $\int \sqrt{2Gx} \frac{1}{\sqrt{x}} dx$, and the fluent of this, or $D = \int \sqrt{2Gx} \frac{1}{\sqrt{x}} dx$, which is $\frac{1}{2} \sqrt{2G} x^2 + C$.

To determine the constant quantity $C$, observe that Mr de Buat found by experiment that BI was in all cases $\frac{1}{2} BF$. Therefore $D$ must be nothing when $x = \frac{1}{2} b$; consequently $C = -\frac{1}{2} \sqrt{2G} \left(\frac{b}{2}\right)^2$, and the complete fluent, will be $D = \frac{1}{2} \sqrt{2G} \left(\frac{x^2}{2} - \left(\frac{b}{2}\right)^2\right)$.

Now make $x = b$, and we have

$$D = \frac{1}{2} \sqrt{2G} \left(\frac{x^2}{2} - \left(\frac{b}{2}\right)^2\right) + \frac{1}{2} \sqrt{2G} \left(1 - \left(\frac{b}{2}\right)^2\right) = \frac{1}{2} \sqrt{2G} \left(1 - \left(\frac{b}{2}\right)^2\right) \frac{b}{2}.$$ But $1 - \left(\frac{b}{2}\right)^2 = 0.646455$, and $\frac{1}{2}$ of this is 0.421.

Therefore, finally,

Part II.

**TheORY and Improvements in Scotland have allotted a fum of money for making the neceffary experiments, and the refults will be published by their authority. Meanwhile, this theory of Mr de Buat is of great value to the practical engineer, who at prefent must content himfelf with a very vague conjecture, or take the calculation of the erroneous theory of Guglielmini. By that theory, the board of three feet, at the depth of four inches, fhould difcharge nearly $3/4$ cubic feet per fecound, which is almost double of what it really delivers.

We presume, therefore, that the following table will be acceptable to practical engineers, who are not familiar with fuch computations. It contains, in the firft column, the depth in English inches from the furface of the flagnant water of a reaervoir to the edge of the waffeboard. The fecound column is the cubic feet of water difcharged in a minute by every inch of the waffeboard.

</table>

When the depth does not exceed four inches, it will not be exact enough to take proportional parts for the fractions of an inch. The following method is exact.

If they be odd quarters of an inch, look in the table for as many inches as the depth contains quarters, and take the eighth part of the anfwer. Thus, for $31/4$ inches, take the eighth part of 23,419, which correponds to 15 inches. This is 2,927.

When the waffeboard is not on the face of a dam, but in a running stream, we muft augment the difcharge by multiplying the fection by the velocity of the stream. But this correction can feldom occur in practice; becaufe, in this cafe, the difcharge is previoufly known; and it is $b$ that we want; which is the objeft of the next problem.

We only beg leave to add, that the experiments which we mention as having been already made in this country, give a refult somewhat greater than this table, viz. about $1/6$. Therefore, having obtained the anfwer by this table, add to it its 16th part, and we apprehend that it will be extremely near the truth.

When, on the other hand, we know the difcharge over a waffeboard, we can tell the depth of its edge under the furface of the flagnant water of the reaervoir, because we have $b = (D/116)^{1/3}$ very nearly.
We are now in a condition to solve the problem respecting a weir across a river.

PROB. II. The discharge and section of a river being given, it is required to determine how much the water will be raised by a weir of the whole breadth of the river, discharging the water with a clear fall, that is, the surface of the water in the lower channel being below the edge of the weir?

In this case we have \( D = 746 \) nearly, because there will be no contraction at the sides when the weir is the whole breadth of the river. But further, the water is not now stagnant, but moving with the velocity \( \sqrt{\frac{2h}{g}} \). \( S \) being the section of the river.

Therefore let \( a \) be the height of the weir from the bottom of the river, and \( b \) the height of the water above the edge of the weir. We have the velocity with which the water approaches the weir \( \frac{D}{l(a+b)} \). \( l \) being the length of the weir or breadth of the river. Therefore the height producing the primary mean velocity is \( \left(\frac{D}{\sqrt{2gh}}\right)^{\frac{1}{2}} \). The equation given above the weir is stagnant. Therefore, when it is already moving with the velocity \( \frac{D}{l(a+b)} \), we shall have \( h = \left(\frac{D}{\sqrt{2gh}}\right)^{\frac{1}{2}} \) for \( D \). It

little ago will give \( h = \left(\frac{D}{\sqrt{2gh}}\right)^{\frac{1}{2}} \); when the water above the weir is stagnant. Therefore, when it is already moving with the velocity \( \frac{D}{l(a+b)} \), we shall have \( h = \left(\frac{D}{\sqrt{2gh}}\right)^{\frac{1}{2}} - \left(\frac{D}{\sqrt{2gh}}\right)^{\frac{1}{2}} \). It would be very troublesome to solve this equation regularly, because the unknown quantity \( b \) is found in the second term of the answer. But we know that the height producing the velocity above the weir is very small in comparison of \( b \) and of \( a \), and, if only estimated roughly, will make a very insensible change in the value of \( b \); and, by repeating the operation, we can correct this value, and obtain \( b \) to any degree of exactness.

To illustrate this by an example. Suppose a river, the section of whose stream is 150 feet, and that it discharges 174 cubic feet of water in a second; how much will the waters of this river be raised by a weir of the same width, and 3 feet high?

Suppose the width to be 50 feet. This will give 3 feet for the depth; and we see that the water will have a clear fall, because the lower stream will be the same as before.

The section being 150 feet, and the discharge 174, the mean velocity is \( \frac{174}{150} = 1.16 \) feet, \( = 14 \) inches nearly, which requires the height of \( \frac{4}{3} \) of an inch very nearly. This may be taken for the second term of the value of \( b \). Therefore \( b = \left(\frac{D}{\sqrt{2gh}}\right)^{\frac{1}{2}} - \frac{4}{3} \). Now \( \sqrt{2gh} \) is, in the present case, \( 27,313 \); \( l \) is 600, and \( D \) is 174 \( \times \) 172,8 = 300,672. Therefore \( b = 12,192 - \frac{4}{3} = 11,928 \). Now correct this value of \( b \), by correcting the second term, which is \( \frac{4}{3} \) of an inch, instead of \( \left(\frac{D}{\sqrt{2gh}}\right)^{\frac{1}{2}} \), or 0.141. This will give us \( b = 12,192 - 0.141 = 12,051 \), differing from the first value about \( \frac{4}{3} \) of an inch. It is needless to carry the approximation farther. Thus we see that a weir, which dams up the whole of the former current of three feet deep, will only raise the waters of this river one foot.

The same rule serves for flowing how high we ought to raise this weir in order to produce any given rise of the waters, whether for the purposes of navigation, or for raising off a draft to drive mills, or for any other service; for if the breadth of the river remain the same, the water will fill ow the weir with nearly, the same depth. A very small and hardly perceptible diminution will indeed arise from the diminution of slope occasioned by this rise, and a consequent diminution of the velocity with which the river approaches the weir. But this difference must always be a small fraction of the second term of our answer; which term is itself very small; and even this will be compensated, in some degree, by the drier fall which the water will have over the weir.

If the intended weir is not to have the whole breadth of the river (which is seldom necessary even for the purposes of navigation), the waters will be raised higher, by the same height of the waftboard. The calculation is precisely the same for this case. Only in the second term, which gives the height of water corresponding to the velocity of the river, \( l \) must still be taken for the whole breadth of the river, while in the first term \( l \) is the length of the waftboard. Also \( \sqrt{2gh} \) must be a little less, on account of the contractions at the ends of the weir, unless these be avoided by giving the ma-

fory at the ends of the waftboard a curved shape on the upper side of the waftboard. This should not be done when the sole object of the weir is to raise the surface of the waters. Its effect is but trifling at any rate, when the length of the waftboard is considerable, in proportion to the thickness of the sheet of water flowing over it.

The following comparisons of this rule with experiment will give our readers some notion of its utility.

It was found extremely difficult to measure the exact height of the water in the upper stream above the waftboard. The curvature A I extended several feet up the stream. Indeed there must be something arbitrary in this measurement, because the surface of the stream is not horizontal. The deviation should be taken, not from a horizontal plane, but from the inclined surface of the river.

It is plain that a river cannot be fitted for continued navigation by weirs. These occasion interruptions; but a few inches may sometimes be added to the waters of a river by a bar, which may still allow a flat-bottomed lighter or a raft to pass over it. This is a very frequent practice in Holland and Flanders; and a very cheap
Part II.

Practical
Inferences.

CHEAP and CERTAIN CONVEYANCE OF GOODS is THERE OBTAINED BY MEANS OF STREAMS WHICH WE WOULD THINK NO BETTER THAN BOUNDARY DITCHES, AND UNFIT FOR EVERY PURPOSE OF THIS KIND. BY MEANS OF A BAR THE WATER IS KEPT UP A VERY FEW INCHES, AND THE STREAM HAS FREE COURSE TO THE SEA. THE SHOAL OVER THE BAR IS PREVENTED BY MEANS OF ANOTHER BAR PLACED A LITTLE WAY BELOW IT, LYING FLAT IN THE BOTTOM OF THE DITCH, BUT WHICH MAY BE RAISED UP ON HINGES. THE LIGHTERMAN MAKES HIS BOAT FAST TO A FLAKE IMMEDIATELY ABOVE THE BAR, RAISES THE LOWER BAR, BRINGS OVER HIS BOAT, AGAIN MAKES IT FAST, AND, HAVING LAYED DOWN THE OTHER BAR AGAIN, PROCEEDS ON HIS JOURNEY. THIS CONTRIVANCE ANSWERS THE END OF A LOCK AT A VERY TRIFLING EXPENSE; AND THOUGH IT DOES NOT ADMIT OF WHAT WE ARE ACCUSTOMED TO CALL NAVIGATION, IT GIVES A VERY SURE CONVEYANCE, WHICH WOULD OTHERWISE BE IMPOSSIBLE.

WHEN THE WATERS CAN BE RAISED BY BAR, SO THAT THEY MAY BE DRAWN OFF FOR MACHINERY OR OTHER PURPOSES, THEY ARE PREFERABLE TO WEIRS, BECAUSE THEY DO NOT OBSTRUCT FLOATING WITH RAFTS, AND ARE NOT DESTROYED BY THE ICE.

PROB. III. GIVEN THE HEIGHT OF A BAR, THE DEPTH OF WATER BOTH ABOVE AND BELOW IT, AND THE WIDTH OF THE RIVER, TO DETERMINE THE DISCHARGE.

THIS IS BY NO MEANS SO EASILY SOLVED AS THE DISCHARGE OVER A WEIR, AND WE CANNOT DO IT WITH THE SAME DEGREE OF EVIDENCE. WE IMAGINE, HOWEVER, THAT THE FOLLOWING OBSERVATIONS WILL NOT BE VERY FAR FROM A TRUE ACCOUNT OF THE MATTER.

TO AVOID THIS COMPLICATION OF CONDITIONS, WE MAY FIRST COMPUTE THE DISCHARGE OF THE BAR IN THE MANNER NOW POINTED OUT, WITHOUT THE CONSIDERATION OF THE PREVIOUS VELOCITY OF THE STREAM. THIS DISCHARGE WILL BE A LITTLE TOO SMALL. IF WE DIVIDE IT BY THE VELOCITY FB, IT WILL GIVE A PRIMARY VELOCITY TOO SMALL, BUT NOT FAR FROM THE TRUTH. THEREFORE WE SHALL GET THE HEIGHT FE, BY MEANS OF WHICH WE SHALL BE ABLE TO DETERMINE A VELOCITY INTERMEDIATE BETWEEN DG AND CH, WHICH WOULD CORRESPOND TO A WEIR, AS ALSO THE VELOCITY CH, WHICH CORRESPONDS TO THE PART OF THE SECT CA, WHICH IS WHOLLY UNDER WATER. THEN WE CORRECT ALL THESE QUANTITIES BY REPEATING THE OPERATION WITH THEM INSTEAD OF OUR FIRST ASSUMPTIONS.

MR. BAUT FOUND THIS COMPUTATION EXTREMELY NEAR THE TRUTH, BUT IN ALL CASES A LITTLE GREATER THAN OBSERVATION EXHIBITED.

WE MAY NOW SOLVE THE PROBLEM IN THE MOST GENERAL TERMS.

PROB. IV. GIVEN THE BREATH, DEPTH, AND THE SLOPE OF A RIVER, IF WE CONFINGE ITS PASSAGE BY A BAR OR WEIR OF A KNOWN HEIGHT AND WIDTH, TO DETERMINE THE RISE OF THE WATERS ABOVE THE BAR.

FOR EXAMPLE:

LET THERE BE A RIVER WHOSE ORDINARY DEPTH IS 3 FEET, AND BREATH 40, AND WHOLE SLOPE IS 1:5 INCHES IN 100 FEET, OR 45°. SUPPOSE A WEIR ON THIS RIVER 6 FEET HIGH AND 18 FEET WIDE.

WE MUST FIRST FIND THE VELOCITY AND DISCHARGE OF THE RIVER IN ITS NATURAL STATE, WE HAVE L = 450 INCHES, B = 36, \( \frac{1}{7} \) WE . OUR FORMULA OF UNIFORM MOTION GIVES

\[ V = 23,45 \], AND D = 40516 CUBIC INCHES.

THE CONTRACTION OBTAINS HERE ON THE THREE SIDES OF THE ORIFICE. WE MAY THEREFORE TAKE \( \sqrt{2G} = 26,1 \). N. B. THIS EXAMPLE IS MR. BAUT’S, AND ALL THE MEASURES ARE FRENCH. WE HAVE ALSO A (THE HEIGHT OF THE WEIR) 72, AND 2 G = 724. THEN, THE EQUATION \( b = \left( \frac{G}{a+4314\sqrt{2G}} \right) \frac{1}{7} = \left( \frac{G}{\sqrt{2G}(a+b)} \right) \) BECOMES 30,182.

ADD THIS TO THE HEIGHT OF THE WEIR, AND THE DEPTH OF THE RIVER ABOVE THE FLUICE IS 102,182, 8 FEET AND 5,182 INCHES. FROM THIS TAKE 3 FEET, AND THERE REMAINS 5 FEET AND 5,182 INCHES FOR THE RISE OF THE WATERS.

THERE IS, HOWEVER, AN IMPORTANT CIRCUMSTANCE IN THIS RISE OF THE WATERS, WHICH MUST BE DISTINCTLY UNDERSTOOD BEFORE WE CAN SAY WHAT ARE THE INTERESTING EFFECTS OF THIS WEIR. THIS FLOW EXTENDS, AS WE ALL KNOW, TO A CONSIDERABLE DISTANCE UP THE RIVER, BUT IS LESS INFLUENTIAL AS WE GO AWAY FROM THE WEIR. WHAT IS THE DISTANCE TO WHICH THE FLOW EXTENDS, AND WHAT INCREASE DOES IT PRODUCE IN THE DEPTH AT DIFFERENT DISTANCES FROM THE WEIR?

IF THIS BE KEPT UP TO A BY A WEIR AL, THE SURFACE
Practical Inferences. 

River. Part II.

will be a curve FIA, touching the natural surface F at the beginning of the swell, and the line AD which touches it in A will have the slope S corresponding to the velocity which the waters have immediately before going over the weir. We know this slope, because we are supposed to know the discharge of the river and its slope and other circumstances before barraging it with a dam; and we know the height of the dam H, and therefore the new velocity at A, or immediately above A, and consequently the slope S. Therefore, drawing the horizontal lines DC, AG, it is plain that CB and CA will be the primary slope of the river and the slope S corresponding to the velocity in the immediate neighborhood of A, because these verticals have the same horizontal distance DC. We have therefore CB : CA = S : r very nearly, and S - r : r = CB - CA : CA, = AB (nearly) : CA. Therefore CA = \( \frac{AB \times r}{S - r} \). But DA = CA \times S, by our definition of slope; therefore DA = \( \frac{H.S.r}{S - r} \).

This is all that we can say with precision of this curve. Mr. Buat examined what would result from supposing it an arch of a circle. In this case we should have DA = DF, and AF very nearly equal to 2 AD; and as we can thus find AD, we get the whole length FIA of the swell, and also the distances of any part of the curve from the primitive surface FB of the river, for these will be very nearly in the duplicate proportion of their distances from F. Thus ID will be \( \frac{1}{2} \) of AB, &c. Therefore we should obtain the depth I d of the stream in that place. Getting the depth of the stream, and knowing the discharge, we get the velocity, and can compare this with the slope of the surface at I. This should be the slope of that part of the arch of the circle. Making this comparison, he found these circumstances to be inapplicable. He found that the section and swell at I, corresponding to an arch of a circle, gave a discharge nearly \( \frac{1}{2} \) too great (they were as 405216 to 402142). Therefore the curve is such, that AD is greater than DF, and that it is more incurved at F than at A. He found, that making DA to DF as 10 to 9, and the curve FIA an arch of an ellipse whose longer axis was vertical, would give a very nice correspondence of the sections, velocities, and slopes. The whole extent of the swell therefore can never be double of AD, and must always greatly surpass AD; and these limits will do very well for every practical question. Therefore making DF, \( \frac{3}{5} \) of AD, and drawing the chord AD, and making DI \( \frac{4}{5} \) of DI, we shall be very near the truth. Then we get the swell with sufficient precision for any point H between F and D, by making FD' : FH' = ID : Hb; and if H is between D and A, we get its distance from the tangent DA by a similar process.

It only remains to determine the swell produced in the waters of a river by the erection of a bridge or cleaning sluice which contracts the passage. This requires the solution of

PROB. V. Given the depth, breadth, and slope of a river, to determine the swell occasioned by the piers of a bridge or sides of a cleaning sluice, which contract the passage by a given quantity, for a given length of channel.

This swell depends on two circumstances.

1. The whole river must pass through a narrow space, with a velocity proportionally increased; and this requires a certain head of water above the bridge.

2. The water, in passing the length of the piers with a velocity greater than that corresponding to the primary slope of the river, will require a greater slope in order to acquire this velocity.

Let V be the velocity of the river before the erection of the bridge, and K the quotient of the width of the river divided by the sum of the widths between the piers. If the length of the piers, or their dimension in the direction of the stream, is not very great, KV will nearly express the velocity of the river under the arches; and if we suppose for a moment the contraction (in the sense hitherto used) to be nothing, the height producing this velocity will be \( \frac{K^2V^2}{2g} \). But the river will not rise so high, having already a slope and velocity before getting under the arches, and the height corresponding to this velocity is \( \frac{V^2}{2g} \); therefore the height for producing the augmentation of velocity is \( \frac{K^2V^2}{2g} - \frac{V^2}{2g} \). But if we make allowance for contraction, we must employ a 2 G less than 2 g, and we must multiply the height now found by \( \frac{2g}{2G} \). It will then become \( \frac{K^2V^2}{2g} - \frac{V^2}{2g} \left( \frac{2g}{2G} \right) = \frac{V^2}{2G} \left( K^2 - 1 \right) \). This is that part of the swell which must produce the augmentation of velocity.

With respect to what is necessary for producing the additional slope between the piers, let \( \rho \) be the natural slope of the river (or rather the difference of level in the length of the piers) before the erection of the bridge, and corresponding to the velocity \( V \); \( K^2 \rho \) will very nearly express the difference of superficial level for the length of the piers, which is necessary for maintaining the velocity \( KV \) through the same length. The increase of slope therefore is \( K^2 \rho - \rho = (K^2 - 1) \rho \). Therefore the whole swell will be \( \left( \frac{V^2}{2G} + \rho \right) K^2 - 1 \).

These are the chief questions or problems on this subject which occur in the practice of an engineer; and the solutions which we have given may in every case be recommended.
Part II.

Practical Inferences.

The encouragement of arts and manufactures could scarcely do a more important service to the public in the line of their institution, that by publishing in their Transactions a description of every work of this kind executed in the kingdom, with an account of its performance. This would be a most valuable collection of experiments and facts. The unlearned practitioner would find among them something which resembles in its chief circumstances almost any project which could occur to him in his business, and would tell him what to expect in the case under his management ; and the intelligent engineer, affliated by mathematical knowledge and the habit of classing things together, would frequently be able to frame general rules. To a gentleman qualified as was the Chevalier de Buat, such a collection would be inscrutable, and might suggest a theory as far superior to his as he has gone before all other writers.

We shall conclude this article with some observations on the methods which may be taken for rendering small rivers and brooks fit for inland navigation, or at least for floatage. We get much instruction on this subject from what has been said concerning the swell produced in a river by weirs, bars, or any diminution of its former section. Our knowledge of the form which the surface of this swell affects, will furnish rules for spacing these obstructions in such a manner, and at such distances from each other, that the swell produced by one shall extend to the one above it.

If we know the slope, the breadth, and the depth of a river, in the droughts of summer, and have determined on the height of the flood-gates, or keeps, which are to be set up in its bed, it is evident that their slations are not matters of arbitrary choice, if we would derive the greatest possible advantage from them.

Some rivers in Flanders and Italy are made navigable in some sort by simple sluices, which, being shut, form magazines of water, which, being discharged by opening the gates, raises the inferior reach enough to permit the passage of the craft which are kept on it. After this momentary rise the keeps are shut again, the water sinks in the lower reach, and the lighters which were floated though the shallows are now obliged to draw into those parts of the reach where they can lie atoio till the next supply of water from above enables them to proceed. This is a very rude and imperfect method, and unjustifiable at this day, when we know the effect of locks, or at least of double gates. We do not mean to enter on the consideration of these contrivances, and to give the methods of their construction, in this place, but refer our readers to what has been already said on this subject in the articles Canal, Lock, Navigation (Inland), and to what will be said in the article Water Works. At present we confine ourselves to the single point of husbanding the different falls in the bed of the river, in such a manner that there may be everywhere a sufficient depth of water; and, in what we have to deliver on the subject, we shall take the form of an example to illustrate the application of the foregoing rules.

Suppose then a river 40 feet wide and 3 feet deep in the droughts of summer, with a slope of 1 in 4800. This, by the formula of uniform motion, will have a velocity \( V = \frac{234}{2} \) inches per second, and its discharge will be 405216 cubic inches, or 234 feet. It is proposed to give this river a depth not less than five feet in any place, by means of flood-gates of five feet high and 18 feet wide.

We first compute the height at which this body of 234½ cubic feet of water will discharge itself over the flood-gates. This we shall find by Prob. II. to be 30½ inches, to which adding 72, the height of the gate, we have 102½ for the whole height of the water above the floor of the gate; the primitive depth of the river being 3 feet, the rise of swell 5 feet 6½ inches. In the next place, we find the range or sensible extent of this swell by Prob. I. and the obstructions which accompany it. This will be found to be nearly 9177 fathoms. Now since the primitive depth of the river is three feet, there is only wanted two feet of addition; and the question is reduced to the finding what point of the curved surface of the swell is two feet above the tangent plane at the head of the swell? or how far this point is from the gate? The whole extent being 9177 fathoms, and the deviation from the tangent plane being nearly in the duplicate ratio of the distances from the point of contact, we may institute this proportion

\[ \frac{667}{24} = 9177' \frac{5526}{9}. \]

The left term is the distance (from the head of the swell) of that part of the surface which is two feet above the primitive surface of the river. Therefore 9177—5526, or 3651 fathoms, is the distance of this part from the flood-gate; and this is the distance at which the gates could be placed from each other. No inconvenience would arise from having them nearer, if the banks be high enough to contain the waters; but if they are farther distant, the required depth of water cannot be had without increasing the height of the gates; but if reasons of convenience should induce us to place them nearer, the same depth may be secured by lower gates, and no additional height will be required for the banks. This is generally a matter of moment, because the raising the water brings along with it the chance of flooding the adjoining fields. Knowing the place where the swell ceases to be sensible, we can keep the top of the intermediate flood-gate at the precise height of the curved surface of the swell by means of the proportionality of the deviations from the tangent to the distances from the point of contact.

But this rule will not do for a gate which is at a greater distance from the one above it than the 3651 fathoms already mentioned. We know that a higher gate is required, producing a more extensive swell; and the one swell does not coincide with the other, although they may both begin from the same point A (fig. 21.) Nor will the curves even be similar, unless the thickness of the sheet of water flowing over the gate be increased in the same ratio. But this is not the case; because the produce of the river, and therefore the thickness of the sheet of water, is constant.

But we may suppose the slates similar without erring more than two or three decimals of an inch; and then we shall have \( AF : AL = f'F : DL \); from which, if we take the thickness of the sheet of water already calculated for the other gates, there will remain the height of the gate BL.

\[ P p 2 \]
By following these methods, instead of proceeding by random guesses, we shall procure the greatest depth of water at the smallest expense possible.

But there is a circumstance which must be attended to, and which, if neglected, may in a short time render all our works useless. These gates must frequently be open in the time of freshes; and as this channel then has its natural slope increased in every reach by the great contradiction of the section in the gates, and also rolls along a greater body or water, the action of the stream on its bed must be increased by the augmentation of velocity which these circumstances will produce: and although we may say that the general slope is necessarily secured by the cills of the flood-gates, which are paved with stone or covered with planks, yet this will not hinder this increased current from digging up the bottom of the gate, and undermining the banks, and lodging the mud and earth thus carried off in places where the current meets with any check. All these consequences will assuredly follow if the increased velocity is greater than what corresponds to the regimen relative to the soil in which the river holds on its course.

In order therefore to procure durability to works of this kind, which are generally of enormous expense, the local circumstances must be most scrupulously considered. It is not the ordinary hurried survey of an engineer that will free us from the risk of our navigation becoming very troublesome by the rise of the waters being diminished from their former quantity, and banks formed at a small distance below every sluice. We must attentively study the nature of the soil, and discover experimentally the velocity which is not inconsistent with the permanency of the channel. If this be not a great deal less than that of the river when accelerated by freshes, the regimen may be preferred after the establishment of the gate, and no great changes in the channel will be necessary; but if, on the other hand, the natural velocity of the river during its freshes greatly exceeds what is consistent with stability, we must enlarge the width of the channel, that we may diminish the hydraulic mean depth, and along with this the velocity. Therefore, knowing the quantity discharged during the freshes, divide it by the velocity of regimen, or rather by a velocity somewhat greater (for a reason which will appear by and by), the quotient will be the area of a new section. Then taking the natural slope of the river for the slope which it will preserve in this enlarged channel, and after the cills of the flood-gates have been fixed, we must calculate the hydraulic mean depth, and then the other dimensions of the channel.

And of local circumstances,

Illustrated by an example.

Suppose then a small river having a slope of 2 inches in 100 fathoms or \( \frac{1}{50} \) which is a very usual declivity of such small streams, and whose depth in summer is 2 feet, but subject to floods which raise it to nine feet.
Inferences.

We must now flatten the flood-gates along the new channel, at such distances that we may have the depth of water which is proper for the lighters that are to be employed in the navigation. Suppose this to be four feet. We must first of all learn how high the water will be kept in this new channel during the summer droughts. There remained in the primitive channel only 2 feet, and the flood in this case had 20 feet 8 inches in width; and the discharge corresponding to this flood and slope of \( \frac{\pi}{2} \) is, by the theorem of uniform motion, 130,849 cubic inches per second. To find the depth of water in the new channel corresponding to this discharge, and the same slope, we must take the method of approximation formerly exemplified, remembering that the discharge \( D \) is 130,849, and the breadth \( B \) 19.000 at the bottom. The data will produce a depth of water

\[ \text{depth} = \frac{130,849}{19,000} \approx 6.91 \text{ inches}. \]

To obtain four feet therefore behind any of the flood-gates, we must have a swell of 41½ inches produced by the gate below.

We must now determine the width of passage which must be given at the gates. This will regulate the thickness of the sheet of water which flows over them when shut; and this, with the height of the gate, fixes the swell at the gate. The extent of this swell, and the elevation of every point of its curved surface above the new surface of the river, requires a combination of the height of swell at the flood-gate, with the primitive slope and the new velocity. These being computed, the sections of the gates may be alligned, which will secure four feet of water behind each in summer. We need not give these computations, having already exemplified them all with relation to another river.

This example not only illustrates the method of proceeding, as to be ensured of success, but also gives us a precise instance of what must be done in a case which cannot but frequently occur. We fee what a prodigious excavation is necessary, in order to obtain permanency. We have been obliged to enlarge the primitive bed to about thrice its former size, so that the excavation is at least two-thirds of what the other method required. The expense, however, will still be vastly inferior to the other, both from the nature of the work and the quantity of ground occupied. At all events, the expense is enormous, and what could never be repaid by the navigation, except in a very rich and populous country.

There is another circumstance to be attended to.—The navigation of this river by sluices must be very defultory, unless they are extremely numerous, and of small heights. The natural surface of the swell being concave upwards, the additions made by its different parts to the primitive height of the river decrease rapidly as they approach to the place \( A \) (fig. 20), where the swell terminates; and three gates, each of which raises the water one foot, when placed at the proper distance from each other, will raise the water much more than two gates at twice this distance, each raising the water two feet. Moreover, when the elevation produced by a flood-gate is considerable, exceeding a very few inches, the fall and current produced by the opening of the gate is such, that no boat can possibly pass up the river, and it runs imminent risk of being overflown and sunk, in the attempt to go down the stream. This renders the navigation defultory. A number of lighters collect themselves at the gates, and wait their opening. They pass through as soon as the current becomes moderate. This would not, perhaps be very hurtful in a regulated navigation, if they could then proceed on their voyage. But the boats bound up the river must lay on the upper side of the gate which they have just now passed, because the channel is now too shallow for them to proceed. Those bound down the river can only go to the next gate, unless it has been opened at a time nicely adjusted to the opening of the one above it. The passage downwards may, in many cases, be continued, by very intelligent and attentive lockmen, but the passage up must be exceedingly tedious. Nay, we may say, that while the passage downwards is continuous, it is but in a very few cases that the passage upwards is practicable. If we add to these inconveniences the great danger of passage during the swells, while all the gates are open, and the immense and unavoidable accumulations of ice, on occasion even of slight frosts, we may see that this method of procuring an inland navigation is amazingly expensive, defultory, tedious, and hazardous. It did not therefore merit, on its own account, the attention we have bestowed upon it. But the discussion was absolutely necessary, in order to show what must be done in order to obtain effect and permanency, and thus to prevent us from engaging in a project which, to a person not duly and confidently informed, is so feasible and promising. Many professional engineers are ready, and with honest intentions, to undertake such tasks; and by avoiding this immense expense, and contenting themselves with a much narrower channel, they succeed, without the aid of attention lockmen, but the passage up must be exceedingly tedious. Nay, we may say, that while the passage downwards is continuous, it is but in a very few cases that the passage upwards is practicable. If we add to these inconveniences the great danger of passage during the swells, while all the gates are open, and the immense and unavoidable accumulations of ice, on occasion even of slight frosts, we may see that this method of procuring an inland navigation is amazingly expensive, defultory, tedious, and hazardous. It did not therefore merit, on its own account, the attention we have bestowed upon it. But the discussion was absolutely necessary, in order to show what must be done in order to obtain effect and permanency, and thus to prevent us from engaging in a project which, to a person not duly and confidently informed, is so feasible and promising. Many professional engineers are ready, and with honest intentions, to undertake such tasks; and by avoiding this immense expense, and contenting themselves with a much narrower channel, they succeed, without the aid of attention lockmen, but the work has no duration; and, not having been found very serviceable, its cessation is not matter of much regret. The work is not much spoken of during its continuance. It is soon forgotten, as well as its failure, and engineers are found ready to engage for such another.

It was not a very refined thought to change this imperfect mode for another free from most of its inconvenience and inconveniences. A boat was brought up the river, through locks, past a series of gates, only by raising the waters of the inferior reach, and deprest those of the upper: and it could not escape observation, that when the gates were far afiured, a vast body of water must be discharged before this could be done, and that it would be a great improvement to double each gate, with a very small distance between. Thus a very small quantity of water would fill the interval to the desired height, and allow the boat to come through; and this thought was the more obvious, from a similar practice having preceded it, viz. that of navigating a small river by means of double bars, the lowest of which lay flat in the bottom of the river, but could be raised up on hinges. We have mentioned this already; and it appears to have been an old practice, being mentioned by Stevinus in his valuable work...
on sluices, published about the beginning of the last century; yet no trace of this method is to be found of much older dates. It occurred, however, accidentally, pretty often in the flat countries of Holland and Flanders, which being the seat of frequent wars, almost every town and village was fortified with wet ditches, connected with the adjoining rivers. Stevinus mentions particularly the works of Condé, as having been long employed, with great ingenuity, for rendering navigable a very long stretch of the Scheldt. The boats were received into the lower part of the fosse, which was separated from the rest by a flat batardeau, serving to keep up the waters in the rest of the fosse about eight feet. In this was a sluice and another dam, by which the boats could be taken into the upper fosse, which communicated with a remote part of the Scheldt by a long canal. This appears to be one of the earliest locks.

In the first attempt to introduce this improvement in the navigation of rivers already kept up by weirs, which gave a partial and interrupted navigation, it was usual to avoid the great expense of the second dam and gate, by making the lock altogether detached from the river, within land, and having its bafon parallel to the river above the weir, and by the other end with the river below the weir, and having a flood-gate at each end. This was a most ingenious thought; and it was a prodigious improvement, free from all the inconveniences of currents, ice, &c. &c. It was called a Schleuse, or lock, with considerable propriety; and this was the origin of the word sluice, and of our application of its translation lock. This practice being once introduced, it was not long before engineers found that a complete separation of the navigation from the bed of the river was not only the most perfect method for obtaining a secure, easy, and uninterrupted navigation, but that it was in general the most economical in its first construction, and subject to no risk of deterioration by the action of the current, which was here entirely removed. Locked canals, therefore, have almost entirely supplantedit all attempts to improve the natural beds of rivers; and this is hardly ever attempted except in the flat countries, where they can hardly be said to differ from horizontal canals. We therefore close with these observations this article, and reserve what is yet to be said on the construction of canals and locks for the article Water-Works.

We beg leave, however, to detain the reader for a few moments. He cannot but have observed our anxiety to render this dissertation worthy of his notice, by making it practically useful. We have on every occasion appealed, from all theoretical deductions, however specious and well supported, to fact and observation of those spontaneous phenomena of nature which are continually passing in review before us in the motion of running waters. Reffing in this manner our whole doxines on experiment, on the observation of what really happens, and what happens in a way which we cannot or do not fully explain, these spontaneous operations of nature came inestimably to acquire a particular value in our imagination. It has also happened in the course of our reflections on these subjeets, that these phenomena have frequently presented themselves to our view in groups, not less remarkable for the extent and the importance of their consequences than for the simplicity, and frequently the seeming insignificance, of the means employed. Our fancy has therefore been sometimes warmed with the view of a something; an Ens agitans molem, et magno se corpori miscente.

This has sometimes made us express ourselves as a way that is susceptible of misinterpretation, and may even lead into a mistake of our meaning. We therefore find ourselves obliged to declare, that by the term nature, which we have so frequently used con amore, we do not mean that indefinable idol which the self-conceit and vanity of certain would-be philosophers have set up of late, and ostentatiously stand on tiptoe to worship. This est raiouis, this creature of the imagination, has long been the object of cool contemplation in the closet of the philosopher, and has shared his attention with many other play-things of his ever-working fancy. But the more the works of Nature are investigated by those who alone deserve the name of true philosophers, the more evidently will they be discovered to be not the chance fragments of a fatal chaos, but the beautiful productions of a wonderful Artist, and the darling objects of his care: and we persuade ourselves that many thousands are ready to rally under the banners of true religion and found philosophy, and to follow the steps of a Clarke, a Butler, a Newton, and a Boyle, who so eminently distinguished themselves in the cause of Nature's God.

By nature, then we mean that admirable system of general laws, by which the adored Author and Governor of the universe has thought fit to connect the various parts of this wonderful and goodly frame of things, and to regulate all their operations.

We are not afraid of continually appealing to the laws of nature; and as we have already observed in the article Philosophy, we consider these general laws as the most magnificent displays of Infinite Wisdom, and the contemplation of them as the most chearful employment of our understandings.

Nunc est illis vigor et celestis origo Seminibus.

At the same time we deplore the cold-hearted philosopher who stops short here and is satisfied (perhaps inwardly pleased) that he has completely accounted for everything by the laws of unchanging nature; and we suspect that this philosopher would analyse with the same frigid ingenuity, and explain by irresistible arguments, the tender attachment of her whose breast he fucked, and who by many anxious and fleecy nights preferred alive the pulsing infant. But let us rather listen to the words of him who was the most sagacious observer and the most faithful interpreter of nature's laws, the illustrious Sir Isaac Newton. He says, Elegentissima hæc rerum compages non nili, confilio et domino entis sapientissimi et potentissimi oriri potuit. Omnia, simili confrueta confrilio, suberunt animus dominio. Hic omnia regit, non ut anima mundi, sed ut universorum dominus. Propter dominium fiam dominus deus,
Our readers will probably be pleased with the following list of authors who have treated professedly of the motions of rivers: Guglielmini *De Fluviis et Castris Aquarum—Danubius Illustratus*; Grandi *De Castris*;Zendrini *De Motu Aquarum*; Friuli *De Fluviis*; Lecchi *Idrologica et Idraulica*; Michelotti *Sperinze Idrauliche*; Beldiow's *Architecture Hydrologique*; Boisut *Hydrodynamique*; Buat *Hydraulique*; Silberschlag *Theoria des Flevns*; *Letters de M. L'Epinasse au P. Frêché touchant sa Theorie des Flevns*; *Tableau des principales Riviéres du Monde* de Genette; *Stevius sur les Écluses*; *Traité de la Construction des Digues*; de Stevin *Hydrostatica*; *Tielman van der Horst Theatrum Machinarum Universale*; *De la Lande sur les Canaux de Navigation*; *Racolta di Autori che Trattano del Motu dell' Acqua*, 3 tom. 4to, Firenza 1723.—This most valuable collection contains the writings of Archimedes, Albizi, Galileo, Caffelli, Michelini, Borelli, Montanari, Viviani, Caffini, Guglielmini, Grandi, Manfredi, Picard, and Narducci; and an account of the numberless works which have been carried on in the embankment of the Po.
RIVERS (Earl). See Woodville.

RIVINIA, in botany: A genus of the monogynia order, belonging to the tetrandria class of plants. - The perianth is four-leaved, coloured, and permanent, the leaflet oblong-egg'd and obtuse; there is no corolla, unless the calyx be considered as such. There are four or eight filaments, shorter than the calyx, approaching by pairs, permanent; the anthers are small. The germ is large and roundish; the style very short; the stigma simple and obtuse. The berry is globose, fitting on the green reflected calyx, one-celled with an incurved point. There is one seed, lens-form and rugged. This plant is called Solmonides by Tournefort, and Piteros by Miller. It grows naturally in most of the islands of the West Indies. The juice of the berries of the plant will stain paper and linen of a bright red colour, and many Temple, and hospitals for marching their armies into the provinces of England are Watling-street, Ikenild-street, Fos's way, and Erminage-street. Double roads among the Romans, were roads for carriages, with two pavements, the one for those going one way, and the other for those returning the other: these were separated from each other by a caufeway raised in the middle, paved with bricks, for the convenience of foot passengers; with borders and mounting stones from space to space, and military columns to mark the distance. Subterraneous roads are those dug through a rock, and left vaulted, as at that of Puzzuoli near Naples, which is near half a league long, and is 15 feet broad and as many high.

The first law enacted respecting highways and roads in England was in the year 1505; when the lords of the foil were enjoined to enlarge those ways where bushes, woods, or ditches be, in order to prevent robberies. The next law was made by Edward III. in the year 1346; when a commissary was granted by the king to lay a toll on all sorts of carriages passing from the hospital of St Giles in the fields to the bar of the Old Temple, and also through another highway called Portpoo, (now Grey's Inn Lane) joined to the before-named highway; which roads were become almost impassable. Little further relating to this subject occurs, till the reign of Henry VIII. when the parishes were entangled with the care of the roads, and surveyors were annually elected to take care of them. But the increase of luxury and commerce introduced such a number of heavy carriages for the conveyance of goods, and lighter ones for the convenience and ease of travelling, that parish aid was found insufficient to keep the frequent roads in repair. This introduced toll-gates or turnpikes; that something might be paid towards their support by every individual who enjoyed the benefit of these improvements, by paying over the roads.

Speaking of roads, the Abbé Raynal judiciously remarks, "Let us travel over all the countries of the earth, and whether we shall find no facility of trading from a city to a town, and from a village to a hamlet, we may pronounce the people to be barbarians; and we shall only be deceived respecting the degree of barbarism."

ROAD, in navigation, a bay, or place of anchorage, at some distance from the shore, whither ships or vessels occasionally repair to receive intelligence, orders, or necessary supplies; or to wait for a fair wind, &c. The excellence of a road consists chiefly in its being protected from the reigning winds and the swell of the sea; in having a good anchoring-ground, and being at a competent distance from the shore. Tho' which are not sufficiently inclosed are termed open roads.

ROAN, in the manage: A roan horse is one of a bay,
baj, forrel, or black colour, with grey or white spots interpersed very thick. When this party-coloured coat is accompanied with a black head and black extremities, he is called a roan horse with a black-a-moor's head: and if the same mixture is predominant upon a deep forrel, he is called claret-roan.

ROANOAK, an island of North America, near the coast of North Carolina. Here the English first attempted to settle in 1585, but were obliged to leave the plantation of provisions. E. Long. 75°. O. N. Lat. 35°. 40'.

ROANOAK, a river of North America, which rises in Virginia, runs through Carolina, and at length falls into the sea, where it forms a long narrow bay called Albemarle sound.

ROASTING, in metallurgic operations, signifies the distillation of the volatile parts of an ore by heat. See Metallurgy, passim.

ROB, in pharmacy, the juices of fruits purified and impregnated still till they are of the consistence of honey.

ROBBERY, the rapina of the civilians, is the felonious and forcible taking, from the person of another, of goods or money to any value, by violence or putting him in fear. 1. There must be a taking, otherwise it is no robbery. A mere attempt to rob was indeed held to be felony so late as Henry Vth's time; but afterwards it was taken to be only a misdemeanour, and punishable with fine and imprisonment; till the statute 7 Geo. II. c. 21., which makes it a felony (transportable for seven years) unlawfully and maliciously to assault another, with any offensive weapon or instrument; or by menaces, or by other forcible or violent manner, to demand any money or goods; with a felonious intent to rob. If the thief, having once taken a purse, returns it, still it is a robbery; and so it is whether the taking be forcibly from the person of another, or in his presence only; as where a robber by menaces and violence puts a man in fear, and drives away his sheep or his cattle before his face. 2. It is immaterial of what value the thing taken is: a penny, as well as a pound thus forcibly extorted, makes a robbery. 3. Lastly, the taking must be by force, or a previous putting in fear; which makes the violation of the person more atrocious than privately stealing. For, according to the maxim of the civil law, "qui vivunt, reputatur effer viventem." This previous violence, or putting in fear, is the criterion that distinguishes robbery from other larcenies. For if one privately steals from the person of another, and afterwards keeps it by putting him in fear, this is no robbery, for the fear is subsequent; neither is it capital as privately stealing, being under the value of twelvemote. Not that it is indeed necessary, though usual, to lay in the indictment that the robbery was committed by putting in fear: it is sufficient, if laid to be done by violence. And when it is laid to be done by putting in fear, this does not imply any great degree of terror or affright in the party robbed: it is enough that so much force or threatening, by word or gesture, be used, as might create an apprehension of danger, or induce a man to part with his property without or against his consent. Thus, if a man be knocked down without previous warning, and stripped of his property while senseless, though frightfully he cannot be said to be put in fear, yet this is undoubtedly a robbery. Or, if a person with a sword drawn begs an alms, and I give it him through influence and apprehension of violence, this is a felonious robbery. So if, under a pretence of sale, a man forcibly extorts money from another, neither shall this subterfuge avail him. But it is doubted, whether the forcing a higher, or other champion, to sell his wares, and giving him the full value of them, amounts to fo heinous a crime as robbery.

This species of Law, is debared of the benefit of clergy by statute 23 Hen. VIII. c. 1. and other subsequent statutes; not indeed in general, but only when committed in a dwelling-house, or in or near the king's highway. A robbery therefore in a distant field, or footpath, was not punished with death; but was open to the benefit of clergy, till the statute 3 & 4 W. and M. c. 9. which takes away clergy from both principals and accessories before the fault, in robbery, wheresoever committed. See Law, No. cxxvii.

ROBERT BRUCE, king of Scotland, in 1306, a renowned general, and the deliverer of his country from a state of vassalage to the English. See Scotland.

ROBERT, king of France, surnamed the Wise and the Pious, came to the crown in 996, after the death of Hugh Capet his father. He was crowned at Orleans, the place of his nativity, and afterwards at Rheims, after the imprisonment of Charles of Lorraine. He married Bertha his cousin, daughter of Conrad king of Burgundy; but the marriage was declared null by Gregory V.; and the king, if we can give credit to cardinal Peter Damien, was excommunicated. This anathema made such a noise in France, that all the king's courtiers, and even his very domestics, went away from him. Only two continued with him; who were so deeply infcribed with a sense of horror at whatever the king touched, that they purified it with fire: this scruple they carried so far, as to the very plates on which he was served with his meat, and the vessels out of which he drank. The same cardinal reports, that as a punishment for this pretended incest, the queen was delivered of a monster, which had the head and neck of a duck. He adds, that Robert was so struck with astonishment at this species of prodigy, that he lived apart from the queen. He contracted a second marriage with Constance, daughter of William count of Arles and Provence; but the arrogant disposition of this princess would have totally overthrown the kingdom, and thrown it into confusion, had not the wisdom of the king prevented her from interfering with the affairs of the state. He carefully concealed from her her whatever acts of liberality he shewed to any of his domestics. "Take care (said he to them) that the queen don't perceive it!"—Henry duke of Burgundy, brother of Hugh Capet, dying in 1022, without lawful issue, left his dukedom to his nephew the king of France. Robert instigated his second son Henry with this dukedom, who afterwards coming to the crown, resigned it in favour of Robert his cadet. This duke Robert was chief of the first royal branch of the dukes of Burgundy, and flourished till 1361. This dukedom was then re-united to the crown by King John, who gave it to his fourth son Philip the Bold, chief of the second house of Burgundy, which was terminated in the person of Charles the Rash, who was slain in 1477. King Robert was so much esteemed for his wisdom and piety, that...
Robert, he was offered the empire and kingdom of Italy, which, however, he declined to accept. Hugh, called the Great, whom he had had by Contantine, being dead, he caufed his second fon Henry I. to be crowned at Rheims. He died at Melun, July 20, 1031, at the age of 60. Robert was, according to the knowledge of the times, a wife prince. Helgand, friar of Fleury, relates, in his life of him, that, to prevent his subjects from falling into the crime of perjury, and incurring the penalties which followed thereon, he made them swear upon a shrine from which the relics had been previously removed, as if intention did not constitute perjury! and long after similar reasoning was adopted. Robert built a great number of churches, and procured a restitution to the clergy of the tithes and wealth which the laylords had made themselves masters of. The depredations were such, that the laity poffeffed the ecclesiastical treasures by hereditary titles; they divided them among their children; they even gave benefices as a dowry with their daughters, or left them to their sons as lawful inheritance. Although Robert was pious, and although he respected the clergy, yet it was evident that he opposed the bishops with a firmness and resolution of which, for many ages, they had had no examples. Lutheric archbishop of Sens had introduced into his diocese the custom of proving by the eucharistical pertons accused as guilty of any crime. The king wrote to him in the following strong terms: "I swear (sayès he) by the faith I owe to God, that if you do not put a stop to the gros abuse complained of, you shall be deprived of your priesthood." The prelate was forced to comply. He punifhed in 1022, the Manichéens, canons of Orleans, by burning them at the stake. There are, however, recorded of him some fevere actions, which it is right to mention. A dangerous conspiracy against his person and government having been discovered, and the authors taken into custody, he feized the moment when their judges had met to fetence them to death, to caufe an elegant repaft to be ferved up to them. Next day they were admitted to the eucharift. Then Robert told them, that he gave them their pardon, "because none of thefe can die whom Jesus Christ came to receive at his tabule." One day when he was at prayers in the chapel, he perceived a thief, who had cut off the half of the fringe of his mantle, proceeding to take the remainder; "Friend (says he with a pleafant countenance), be content with what you have already taken, the reft will very well serve some other." Robert cultivated, and was a patronizer of the sciences. There are feveral hymns wrote by him, which fill continue to be sung in the church. His reign was happy and tranquil. According to some authors, he inftituted the order of the Star, commonly attributed to king John.

Robert of France, second fon of Louis VIII. and brother to St Louis, who erected in his faviour Artois into a royal peerage in the year 1237. It was during this time that the unlucky difference between pope Gregory IX. and the emperor Frederic II. took place. Gregory offered to St Louis the empire for Robert; but the French nobility, having met to deliberate on this proposal, were of opinion that he ought to reject it. He gave the pope for anwer: "That Count Robert esteemed himself sufficiently honoured by being the brother of a king, who farpafled in dignity, in strength, in wealth, and in birth, all other monarchs in the world." Robert accompanied St Louis into Egypt, and fought with more bravery than prudence at the battle of Maffore, on the 9th of February 1250. In his pursuit of the cowards through a certain small village, he was killed by stones, ficks, and other things which they threw at him from the windows. He was an intrepid prince, but too paffionate, dogmatical, and quarrelfome.

Robert II. Count of Artois, fon of the preceding, furnamed the Good and the Noble, was at the expedition into Africa in 1270. He drove the rebels from Navarre in 1276. He brought a very powerful affiance to Charles I. king of Naples, of which kingdom he was regent during the captivity of Charles II. He defeated the Arragonians in Sicily in 1289, the English near Bayonne in 1296, and the Flemings at Furnes in 1298. But having in 1302 imprudently attempted to force thefe lait, when encamped near Courtray, he received no lefs than 30 wounds; and in that expedition loft both his honour and his life. He was a brave, but paffionate and fierce man, and good at nothing but pugnitude encounters. Mahaud his daughter inherited the dukedom of Artois, and gave herself in marriage to Otho duke of Burgundy, by whom fhe had two daughters, Jane wife of Philip the Long, and Blanche wife of Charles the Fair. In the mean time Philip, fon of Robert II. had a fon.

Robert III. who disputed the dukedom of Artois with Mahaud his aunt; but he loft his fuit by two fentences given in againht him in 1302 and 1318. He wished to revive the procès in 1329, under Philip of Valois, by means of pretended new titles, which were found to be false. Robert was condemned the third time, and banifhed the kingdom in 1331. Having found an asylum with Edward III. king of England, he undertook to declare him king of France; which proved the caufe of thofe long and cruel wars which diftraifed that kingdom. Robert was wounded at the siege of Vannes in 1342, and died of his wound in England. John, fon to Robert, and count of Eu, was taken prisoner at the battle of Poitiers in 1356, and terminated his career in 1397. His fon Philip II. high confable of France, carried on war in Africa and Hungary, and died in 1397, being a prisoner of the Turks. He had a fon named Charles, who died in 1472, leaving no issue.

Robert of Anjou, furnamed the Wife, third fon of Charles the Lame, fucceeded his father in the kingdom of Naples in 1309, by the protection of the popes, and the will of the people, to the exclusion of Charobert fon of his eldet brother. He aided the Roman pontiffs againht the emperor Henry VII. and, after the death of that prince, was nominated in 1315 vicar of the empire in Italy, in temporal matters, unlefs a new emperor was elected. This title was given him by Clement V. in virtue of a right which he pretended to have to govern the empire during an interregnum. Robert reigned with glory 33 years, eight months, and died on the 10th of January 1343, aged 64. "This prince (says M. De Montigni) had not thofe qualities which confitute heroes, but he had thofe which make good kings. He was religious, affable, generous, kind, wise, prudent, and a zealous promoter of justice." He was called the Solomon of his age. He loved the poor,
and caused a ticket to be placed upon his palace, to give notice when he meant to distribute from the throne. He had no other passion but a very great love for learning. He used to say, that he would rather renounce his crown than his study. His court soon became the sanctuary of the sciences, which he encouraged equally by his example and his bounty. This prince was veried in theology, jurisprudence, philosophy, mathematics, and medicine. Bocace says, “that since the days of Solomon we have not seen so wise a prince upon the throne.”

For a great part of his life he had no taste for poetry; he even despised it, as, in his opinion, unworthy of a man of learning. A conversation which he had with Petrarch, however, undeceived him; he retained this poet at his court, and attempted himself to write some poems, which are still extant. He was forced to engage a little in war, for which he possessed no great talents; alluding to which, may be seen on his tomb a wolf and a lamb drinking out of the same vessel. Philip of Valois refrained from giving battle in 1339, by the repeated advice which this prince gave him, who was a great friend to France, both from inclination and interest. He detested quarrels among Christiain princes, and had studied the science of astrology, so much to know the course of the stars, as to learn by this chimerical science the hidden things of futurity. He believed that he read in the grand book of heaven a very great misfortune which would befall France if Philip hazarded a battle against the English.

ROBERT the First, called the Magnificent, duke of Normandy, second son of Richard II, succeeded in 1208 his brother Richard III, whom it is reported he poisoned. He had early in his reign to suppress frequent rebellions of several of the great vassals. He re-established in his fiefs Eustatius and Flanders, who had been unjustly stript of their possessions by his own son. He forced Canute king of Denmark, who was also king of England, to divide his possessions with his counsels Alfred and Edward. In the year 1235, he undertook barefooted a journey to the Holy Land; on his return from which he died, being poisoned at Nice in Bithynia, leaving as his successor William his natural son, afterwards king of England, whom he had caused before his departure to be publicly acknowledged in an Assembly of the states of Normandy.

ROBERT, or RUPERT, surnamed the Short and the Mild, elector Palatine, son of Robert the Niggardly, was born in 1352, and elected Emperor of Germany in 1400, after the deposition of the cruel Wenceslas. In order to gain the affections of the Germans, he wished to restore Milan to the empire, which Wenceslas had taken from it; but his attempts in this respect were unsuccessful. His attachment to the anti-pope Gregory XII. entirely alienated the affections of the German princes. To such a degree were they incensed against him, that they entered into a conspiracy to cut him off; but his death, which happened on the 18th of May 1410, being then 58 years old, put a stop to their machinations. Robert began to settle the sovereignty of the German Princes. The emperors had formerly retained in their own hands the power of life and death, within the territories of a great many of the nobles; but he yielded them this right by his letters patent. — The chief fault imputed to this prince was an excess of lenity. But, if we consider the parts which he had to detect, the conspiracies which he had to frustrate, the secret and powerful enemies he had to deal with; if we inquire also into the commotions which the wicked administration of Wenceslas had excited, the insurrections and devastations of plunderers and highway robbers, which the nobles countenanced, and the disturbed situation in which he found Germany, we must without hesitation conclude, that his lenity indicated his prudence, in restoring by degrees the empire to its original tranquility. Robert had his virtues, he loved his subjects, and governed them with wisdom. Possessed of much political knowledge for the age in which he lived, he wanted nothing but talents for war to make him an accomplished prince. He was twice married. The name and rank of his first wife is unknown; he had by her a son who died before him. His second wife was Elizabeth, daughter of Frederic burgrave of Nuremberg, by whom he had five sons and three daughters. The three daughters were, Margaret married to Charles duke of Lorlain; Agnes to Adolphus duke of Cleves; Elizabeth to Frederic duke of Austria. His sons were, Louis the first of the electoral branch, which became extinct in 1559; John father of Christophor king of Denmark; Frederic who died without issue; Otto count of Sinthin; Iaflly, Stephen, from whom descended the elector, and the other counts pataline of the Rhine, who are extant at this day.

ROBERT (of Bavaria), prince pataline of the Rhine, and duke of Cumberland, the son of Frederic, elector palatine, by Elizabeth, daughter of James I. king of England, distinguished himself by his valour as a general and admiral; first in the Dutch, and then in the English service. He was unsuccessful in the cause of his uncle Charles I. against the parliament forces; but under Charles II. he defeated the Dutch fleet, and was made lord high admiral of England in 1673. This prince was a lover of the sciences, and particularly skilful in chemistry. He died in 1682.

ROBERTSON (Dr William), one of the most celebrated historians of his age, was one of those great characters who live a life of action and not of thought, and who are often called the materials for the biographer, although his writings will be read to the latest posterity with undiminished pleasure. He was born at the manse of Borthwick in the year 1721. His father was, at the time of his death, one of the ministers of the Old Grey Friar's church in Edinburgh, which the Doctor came afterwards to supply. In 1743 he was licensed preacher, and placed in the parship of Gladsmuir in 1744; whence, in 1758, he was translated to Lady Yester's parlia in Edinburgh. In 1761, on the death of principal Golie, he was elected principal of the University of Edinburgh, and appointed one of the ministers of the Old Grey Friar's church. About this period he received the degree of Doctor of Divinity, and was appointed historiographer to his majesty for Scotland, and one of his majesty's chaplains for that kingdom.

We find it not easy to ascertain at what period were first unfolded the great and singular talents which defined Dr Robertson to be one of the first writers that refused Britain from the reproach of not having any good historians. We are, however, assured, that before the publication of any of his literary performances, even...
ROB [ 308 ]

Robertson even from his first appearance in public life, his abilities had begun to attract the notice of observing men; and to his more intimate friends he discovered marks of such high-minded ambition, as, seconded by those abilities, could not have failed to carry him to the first honours of his profession, in whatever sphere he had been placed, and whatever opposition he might have had to combat.

The first theatre that offered for the display of his talents, was the General Assembly of the Church of Scotland. It is the annual meetings of this court that produce to view men who feel themselves, for a time, on a footing of the deepest obscurity. There the humble pastor, whose lot has been cast in the remotest corner of the Highland wilds, feels himself, for a time, on a footing of the deepest obscurity. There the humble pastor, whose lot has been cast in the remotest corner of the Highland wilds, feels himself, for a time, on a footing of the deepest obscurity. There the humble pastor, whose lot has been cast in the remotest corner of the Highland wilds, feels himself, for a time, on a footing of the deepest obscurity. There the humble pastor, whose lot has been cast in the remotest corner of the Highland wilds, feels himself, for a time, on a footing of the deepest obscurity.

The first sermon preached at Edinburgh before the society for propagating Christian knowledge, and afterwards published; the subject of which was, 'The state of the world at the appearance of Jesus Christ.' The ingenuity with which a number of detached circumstances are there collected, and shown to tend to one single point, may perhaps rival the art which is so much admired in the bishop of Meaux's celebrated Universal History.

This sermon did great honour to the author; and it is probably to the reputation he gained by it, that we ought to attribute the unanimity with which he was Robertson called to be one of the ministers of Edinburgh—an event which happened not long after, viz. in the year 1754. In 1759, he published, in two volumes quarto, 'The History of Scotland, during the reigns of Queen Mary and of King James VI till his Accession to the Crown of England, with a Review of the Scotch History previous to that period.' This work in its structure is one of the most complete of all modern histories. It is not a dry jejune narrative of events, delirious in ornament; nor is it a mere frothy relation, all gloss and colouring. The historian discovers a sufficient store of imagination to engage the reader's attention, with a due proportion of judgment to check the exuberance of fancy. The arrangement of his work is admirable, and his descriptions are animated. His style is copious, nervous, and correct. He has displayed consummate skill in rendering such passages of our history as are familiar to our recollection agreeable and entertaining. He has embellished old materials with all the elegance of modern dress. He has very judiciously avoided too circumstantial a detail of trite facts. His narratives are succinct and spirited; his reflections copious, frequent, and generally pertinent. His sentiments respecting the guilt of Mary have indeed been warmly controverted by Meffrs Tyler, Stuart, and Whitaker; and the general opinion now seems to be, that their victory is complete. That victory, however, on the part of Whitaker, is filled by the acrimony with which he writes. Dr Robertson was no rancorous or malicious enemy of the unfortunate queen. While relating, what he doubtless believed, he makes every possible allowance for Mary from the circumstances in which she was placed; and his history will be read with pleasure by candid men of all parties as long as the language in which it is composed shall continue to be understood.

In 1769, Dr Robertson published, in three volumes quarto, 'The History of the Reign of the Emperor Charles V. with a View of the Progress of Society in Europe, from the Subversion of the Roman Empire to the beginning of the 16th century.'—The vast and general importance of the period which this history comprises, together with the reputation which our historian had deservedly acquired, co-operated to raise such high expectations in the public, that no work perhaps was ever more impatiently wished for, or perused with greater avidity. The first volume (which is a preliminary one, containing the progress of society in Europe, as mentioned in the title) is a very valuable part of the work; for it serves not only as a key to the pages that follow, but may be considered as a general introduction to the study of history in that period in which the several powers of Europe were formed into one great political system, in which each took a station, wherein it has since remained (till within a very few years at least) with less alterations than could have been expected, after the shocks occasioned by so many internal revolutions, and so many foreign wars. Of the history itself, it may be sufficient to observe, that it is justly ranked among the capital pieces of historical excellence. There is an elegance of expression, a depth of consideration, and a correctness of judgment, which do honour to the historian. The characters are inimitably penned. They are not contrived by a studied antithesis, but by an opposition which results from a
Robertson, very acute and penetrating insight into the real merits of each character, fairly deduced from the several circumstances of his conduct exemplified in the history. For this work, the doctor got L. 4500 Sterling.

In 1779, Dr Robertson published The History of America, in two volumes quarto. This celebrated work may be considered with great propriety as a sequel to the preceding history. From the close of the 17th century we date the most splendid era in the annals of modern times. Discoveries were then made, the influence of which descended to posterity; and events happened that gave a new direction to the spirit of nations.

To the inhabitants of Europe, America was in every respect a new world. There the face of the earth changed its appearance. The plants and trees and animals were strange; and nature seemed no longer the same. A continent opened that appeared to have recently come from the hands of the Creator, and which showed lakes, rivers, and mountains, on a grander scale, and the vegetable kingdom in greater magnificence, than in the other quarters of the globe; but the animal tribes in a state of degradation, few in number, degenerate of kind, imperfect, and unfinished. The human species in the earliest stage of its progress, vast and numerous nations in the rudest form of the savage state which philosophers have contemplated, and two great empires in the lowest degree of civilization which any records have transmitted to our review, presented to the philosophic eye at this period the most fruitful subject of speculation that was to be found in the annals of history.

The discovery of the New World, moreover, was not only a curious spectacle to the philosopher, but, by the change which it effected, an interesting spectacle to the human race. When Columbus set sail for unknown lands, he little expected that he was to make a revolution in the system of human affairs, and to form the destiny of Europe for ages to come. The importance and celebrity therefore of the subject had attracted the attention of philosophers and historians. Views and sketches of the new world had been given by able writers, and splendid portions of the American story had been treated with all the beauties of eloquence. But, prior to the appearance of Dr Robertson’s history, no author had bestowed the mature and profound investigation which such a subject required, or had finished, upon a regular plan, that complete narration and perfect whole which it is the province of the historian to transmit to posterity. And as the subject upon which our author entered was grand, his execution was masterly. The character of his former works was immediately discerned in it. They had been read with uncommon admiration. When the History of Scotland was first published, and the author altogether unknown, Lord Cheltenham pronounced it to be equal in eloquence and beauty to the productions of Livy, the purest and most critical of all the Roman Historians. His literary reputation was not confined to his own country: the testimony of Europe was soon added to the voice of Britain. It may be mentioned, indeed, as the characteristic quality of our author’s manner, that he professed in no common degree that supported elevation which is suitable to compositions of the higher class; and, in his History of America, he displayed that happy union of strength and grace which becomes the rarest faculty of the historic muse. In the fourth book of his first volume, which contains a description of America when first discovered, and a philosophical inquiry into the manners and policy of its ancient inhabitants, he displays, moreover, so much patient investigation and found philosophy, abounds in such beautiful or interesting description, and exhibits such variety and copiousness of elegant writing, that future times will probably refer to it as that part of his works which gives the best idea of his genius, and is the most finished of all his productions.

In 1787 appeared a translation of the Abbé Clavigero’s History of Mexico; in which work the author threw out various reflections, tending in several instances to impeach the credit of Dr Robertson’s History of America. This attack induced our learned historian to revive his work, and to inquire into the truth of the charges brought against it by the historian of New Spain: and this he appears to have done with a becoming attention to the importance of the facts that are controverted, and to the common interests of truth. The result he published in 1798, under the title of Additions and Corrections to the former Editions of Dr Robertson’s History of America. In many of the disputed passages, he fully answered the Abbé Clavigero, and vindicated himself; in others he candidly submitted to correction, and thus gave additional value to his own work.

The literary labours of Dr Robertson appear to have been terminated in 1791 by the publication of An Historical Disquisition concerning the Knowledge which the Ancients had of India, and the progress of Trade with that Country prior to the Discovery of the Passage to it by the Cape of Good Hope; with an Appendix, containing Observations on the Civil Polity, the Laws, and Judicial Proceedings, the Arts, the Sciences, and Religious Institutions of the Indians. The perusal of Major Rennell’s Memoir, for illustrating his Map of Hindostan, suggested to Dr Robertson the design of examining more fully than he had done, in his History of America, into the knowledge which the ancients had of India, and of considering what is certain, what is obscure, and what is fabulous, in their accounts of that remote country. Of his various performances, this is not that of which the design is the most extensive, or the execution the most elaborate; but in this historical disquisition we perceive the same patient attention in collecting his materials, the same fidelity in arranging them, the same perspicuity of narrative, and the same power of illustration, which so eminently distinguish his other writings, and which have long rendered them the delight of the British reader at home and an honour to British literature abroad.

A truly useful life Dr Robertson closed on the 11th of June 1793, at Grange-House, near Edinburgh, after a lingering illness, which he endured with exemplary fortitude and resignation. It may be truly observed of him, that no man lived more respected, or died more sincerely lamented. Indefatigable in his literary researches, and piquing from nature a found and vigorous understanding, he acquired a store of useful knowledge, which afforded him ample scope for the exertion of his extraordinary abilities, and raised him to the most distinguished eminence in the republic of letters. As a minister,
ROBIN

ROB

Robinus

Robin.

a minister of the gospel, i.e. was a faithful pastor, and
justly merited the esteem and veneration of his flock.
In a word, he may be pronounced to be one of the
most perfect characters of the age; and his name will be
a lasting honour to the island that gave him birth.
His conversation was cheerful, entertaining, and instructive;
his manners affable, pleasing, and endearing.

Dr Robertson left three sons and two daughters.
The eldest son is a minister of the church of Scot-
land, and an advocate. The other two are officers in
the army; and one of them distinguished himself under
Lord Cornwallis in such a manner as to command
that illustrious general.

ROBIGNUS and ROBIGO, a Roman god and
goddes, who joined in the preservation of corn from
moll: perfections.

His parents were Quakers, and of low condition, consequently neither able nor willing to have him much instructed in human
learning. Nevertheless his own propensity to science
procured him a recommendation to Dr Pemberton at
London; by whose assistance, while he attained the
ranks of mathematician, he commenced teacher of the mathematics. But the business of
teaching, which required confinement, not suitiug his
active disposition, he gradually declined it, and engaged
in business that required more exercise. Hence he tried
many laborious experiments in gunnery, from the persua-
sion that the resistance of the air has a much greater
influence on swift projectiles than is generally imagined.
Hence also he was led to consider the mechanical arts
that depend on mathematical principles; as the con-
struction of mills, the building of bridges, the draining
of fields, the rendering of rivers navigable, and the
making of harbours. Among other works, fortification
much engaged his attention; and he met with oppor-
tunities of perfecting himself by viewing the principal
forts of Flanders, in some tours he made abroad
with persons of distinction.

Upon his return from one of these excursions, he
found
Mr. Robins was only consulted with respect to the disposition of the drawing; and that he had left England before the book was printed. Whether this be the fact, as it is asserted to be by the widow of Mr. Walter, it is not for us to determine.

It is certain, however, that Mr. Robins acquired the fame, and he was soon after desirous to compose an apology for the unfortunate affair at Prestonpans in Scotland, which was prefixed as a preface to The Report of the Proceedings of the Board of General Officers on their Examination into the Conduct of Lieutenant-General Sir John Cope; and this preface was esteemed a masterpiece in its kind. He afterwards, through the interest of Lord Anson, contributed to the improvements made in the Royal Observatory at Greenwich. Having thus established his reputation, he was offered the choice of two considerable employments; either to go to Paris as one of themathematicians for advancing the limits of Arcadia, or to be engineer-general to the East India company. He chose the latter, and arrived in the East Indies in 1759; but the climate not agreeing with his constitution, he died there the year following.

Robinson (the most Rev. Sir Richard) archbishop of Armagh and Lord Rokeby, was immediately defended from the Robinsons of Robey in the North Riding of the county of York, and was born in 1709. He was educated at Westminster school, from whence he was elected to Christ-Church, Oxford, in 1726. After continuing his studies there the usual time, Doctor Blackburne, archbishop of York, appointed him his chaplain, and collated him first to the rectory of Elton, in the East Riding of Yorkshire; and next to the prebend of Grindal, in the cathedral of York. In 1751 he attended the Duke of Dorset, lord-lieutenant of Ireland, to that kingdom, as his first chaplain, and the same year was promoted to the bishopric of Killala. A family connection with the Earl of Holderness, who was secretary of state that year, with the Earl of Sandwich and other noblemen related to him, opened the fairest prospects of attaining to the first dignity in the Irish church. Accordingly in 1759 he was translated to the united sees of Leighlin and Ferns, and in 1761 to Kildare. The Duke of Northumberland being appointed to the lieutenant of Ireland in 1765, he was advanced to the primacy of Armagh, made lord-almoner, and vice-chancellor of the university of Dublin. When Lord Harcourt was lord-lieutenant of Ireland in 1777, the king was pleased by privy-seal at St. James's, February 6th, and by patent at Dublin the 26th of the same month, to create him Baron Rokeby of Armagh, with remainder to Matthew Robinson of West Layton, Esq; and in 1783 he was appointed prelate to the most illustrious order of St. Patrick. On the death of the Duke of Rutland lord-lieutenant of Ireland in 1787, he was nominated one of the lord-justices of that kingdom. Sir William Robinson, his brother, dying in 1788, the primacy succeeded to the title of baronet, and is the survivor in the direct male line of the Robinsons of Rokeby, being the 8th in descent from William of Kendal. His grace died at Clifton near Bristol in the end of October 1794.

No private ever sat in the see of Armagh who watched more carefully over the interest of the church of Ireland, as the statute-book evinces. The act of the
Robinson. 11th and 12th of his present majority, which secures to bishops and ecclesiastical persons representation by their successors of expenditures in purchasing glebes and houses, or building new houses, originated from this excellent man, and must ever endear his name to the clergy. The other acts for repairing churches, and facilitating the recovery of ecclesiastical dues, were among the many happy exertions of the primate.

But it was at Armagh, the ancient seat of the primate, that he displayed a princely munificence. A very elegant palace, 90 feet by 60, and 40 high, adorns that town; it is light and pleasing, without the addition of wings or other parts; which too frequently wanting a sufficient uniformity with the body of the edifice, are unconnected with it in effect, and divide the attention. Large and ample offices are conveniently placed behind a plantation at a small distance. Around the palace is a large lawn, which spreads on every side over the hills, skirted by young plantations, in one of which is a terrace, which commands a most beautiful view of cultivated hill and dale; this view from the palace is much improved by the barracks, the school, and a view to the ministry of the church of England; where he had for one of his school-fellows the lord chancellor Thurlow. When about the age of 15 or 16, he imbibed the notions of George Whitfield, on which account he was disliked by his uncle, and again exposed to poverty and want. He at first directed his thoughts towards the ministry in the year 1754, and commenced preacher in the following year at the age of 20; preaching his first sermon to a congregation of poor people at Mildenhall. He continued for a year or two as one of Mr Whitfield's preachers, and during that period he married. In the year 1758, however, he determined to separate from the Methodists: after which he settled at Norwich with a small congregation formed chiefly of his methodist friends, being at that time an Independent. In the year 1759 he was invited to Cambridge, and for two years preached on trial to a congregation consisting of no more than 30 people, and it is said that they could only raise L 3 : 6 : 0, a quarter for his subsistence. In June 1761 he settled as their pastor, and was ordained in the usual manner; at which time we are told he exercised the office of a barber. In 1774, his congregation had so much increased as to consist of 1000 souls, including children and servants.

In Cambridge Mr Robertson's talents soon attracted notice, and he quickly set up a Sunday evening lecture, which was well attended. His preaching was altogether without notes; a method in which he was peculiarly happy: not by truism to his memory entirely, nor by working himself up to a degree of warmth and passion, to which the preachers among whom he first appeared commonly owe their ready utterance; but by thoroughly studying and making himself perfectly master of his subject, and a certain facility of expression which is never at a loss for suitable and proper words. In short, his manner was admirably adapted to enlighten the understanding, and to affect and reform the heart. He had such a plainness of speech, such an easy and apparent method in dividing a discourse, and such a familiar way of reasoning, as discovered an heart filled with the tenderest concern for the meanest of his hearers; and yet there was a decency, propriety, and judiciousness, that the most judicious could not but approve. Several gentlemen of the university, eminent for character and abilities, we are told, were his constant hearers.

The circumstances which left him his uncle's patronage paved the way for the future events of his life. The incident which made him discard the common sentiments on the subject of baptism, at once marked the turn of his mind, and shows what apparently slight causes frequently determine the lot and usefulness of our lives. He was invited to the baptism of a child; the minister who was to perform the service keeping the company in long expectation of his appearance, and even then they would be deserving great praise; but we say nothing else, and he left it a well-built city of mud cabins, and he left it a well-built city of stone and slate. These are noble and spirited works, giving their name to the clergy.

MDCCLXXXIX.

Robinson (Robert), a diffenting minister of considerable note, was born on the 8th of October 1735 at Swaffham in Norfolk. His father died when he was young; and his maternal grandfather Robert Wilkin, of Mildenhall, Suffolk, gent. who had ever been dissatisfied with his daughter's marriage, deprived him of his maternal inheritance, cutting him off with half a guinea. His uncle, however, who was a substantial farmer, in some measure supplied this loss. He took Mr Robinson home, and placed him under the Rev. Joseph Brett, at Scarning school in Norfolk, with a view to the ministry of the church of England; where he had for one of his school-fellows the Lord Chancellor Thurlow. When about the age of 15 or 16, he imbibed the notions of George Whitfield, on which account he was disliked by his uncle, and again exposed to poverty and want. He at first directed his thoughts towards the ministry in the year 1754, and commenced preacher in the following year at the age of 20; preaching his first sermon to a congregation of poor people at Mildenhall. He continued for a year or two as one of Mr Whitfield's preachers, and during that period he married. In the year 1758, however, he determined to separate from the Methodists: after which he settled at Norwich with a small congregation formed chiefly of his methodist friends, being at that time an Independent. In the year 1759 he was invited to Cambridge, and for two years preached on trial to a congregation consisting of no more than 30 people, and it is said that they could only raise L 3 : 6 : 0, a quarter for his subsistence. In June 1761 he settled as their pastor, and was ordained in the usual manner; at which time we are told he exercised the office of a barber. In 1774, his congregation had so much increased as to consist of 1000 souls, including children and servants.

In Cambridge Mr Robertson's talents soon attracted notice, and he quickly set up a Sunday evening lecture, which was well attended. His preaching was altogether without notes; a method in which he was peculiarly happy: not by truism to his memory entirely, nor by working himself up to a degree of warmth and passion, to which the preachers among whom he first appeared commonly owe their ready utterance; but by thoroughly studying and making himself perfectly master of his subject, and a certain facility of expression which is never at a loss for suitable and proper words. In short, his manner was admirably adapted to enlighten the understanding, and to affect and reform the heart. He had such a plainness of speech, such an easy and apparent method in dividing a discourse, and such a familiar way of reasoning, as discovered an heart filled with the tenderest concern for the meanest of his hearers; and yet there was a decency, propriety, and judiciousness, that the most judicious could not but approve. Several gentlemen of the university, eminent for character and abilities, we are told, were his constant hearers.

The circumstances which left him his uncle's patronage paved the way for the future events of his life. The incident which made him discard the common sentiments on the subject of baptism, at once marked the turn of his mind, and shows what apparently slight causes frequently determine the lot and usefulness of our lives. He was invited to the baptism of a child; the minister who was to perform the service keeping the company in long expectation of his appearance, and even then they would be deserving great praise; but we say nothing else, and he left it a well-built city of mud cabins, and he left it a well-built city of stone and slate. These are noble and spirited works, giving their name to the clergy.

MDCCLXXXIX.
Mr Robinson, one suggested, that supposing the child were not baptized at all, he saw not how it could affect his happiness. Though the conversation was not purblind, the hint struck Mr Robinson's mind; and he immediately determined to read the New Testament with this particular view, to examine what it said concerning the baptism of infants. He accordingly began with the Gospel of Matthew; and, in succession, perused the historical and epistolary books; in expectation that he should find in every following part what he had not met with in the preceding parts of the sacred volume; namely, passages recommending and urging this rite. But observing, on the whole, a total silence about it, he thought it his duty to relinquish the practice, as without foundation in the rule of our faith; which appeared to him to speak only of the baptism of believers.

This change of his sentiments was more unfavourable than the former alterations in his religious judgment to his worldly views; and having married very early in life from pure affection, he was involved in great difficulties for near 12 years after his settlement in Cambridge; as, in that course of time, his family became numerous, and the support of an aged mother, as well as of a wife and ten children, depended upon him. But unexpected supplies, from quarters of which he was ignorant, frequently relieved his necessities, and confirmed his trust in Providence: yet the situation of his family must, it is easy to conceive, have much affected his mind. For he appears to have possessed great tendereness and sensibility, and to have regarded with peculiar endearment his domestic connections.

It may be reckoned a circumstance worthy of mention, that the sphere of Mr Robinson's ministrv was the same in which his great-grandfather Mr Shelly, of Jesus College, and vicar of All Saints, had, with others, diffused the principles of the Puritans, about the beginning of the last century. The reputation of the Difen­ters in the university and neighbourhood had for almost a century been linking into contempt, when Mr Robinson settled with the Baptist church at Stone-Yard. His abilities and affluence, however, raised their reputation. The place in which his people assembled, which was at first a barn, afterwards a stable and granary, and then a meeting-house, but still a damp, dark, and rumous place, soon became too small for the audience; and several of the new auditors being men of fortune, they purchased the site, and erected at their own expense a new house in the year 1764.

His labours as a preacher were not limited to the town of Cambridge; but soon after his coming there, he set up several lectures in the adjacent villages. His lectures were either annual or occasional, or stated on fixed days. The usual time was half an hour after six in the evening; and sometimes at five in the morning; and now and then in the summer at two in the afternoon, for the sake of those who came from a distance.

He died on the 9th of June 1790, at the house of William Ruffel, Esq; of Snowell green near Birmingham. He had laboured under an alarming disorder for some time before; but on the Sunday preceding his death he preached a charity sermon. On Monday he was feared with a fit; on Tuesday he recovered and went to bed tolerably well, and was found dead next morning.

The abilities of Mr Robinson were very considerable, as appears from his numerous works; and he possessed the quality of expressing his thoughts in an easy and forcible manner. He is said to have been of an unsteady temper, but the frequency with which he changed his religious creed is a proof rather of candour than stability. The actin by which he treated the Church of England, and his plan of Lectures on the Principles of Non-conformity, for the Instruction of Calvinists, have exposed him to much censure.

Mr Robinson's largest work, the History of Baptism and of the Baptists, was published since his death, and is written in the same style and with the same ability as his other works. Though we have heard it remarked by a learned professor of Theology in the church which he opposed, it is not a little remarkable that there is in it no argument or fact against infant baptism which was not answered by Dr Wall nearly 100 years ago, of whose arguments Mr Robinson however takes no notice.

ROBORANTS, in pharmacy, medicines which strengthen the parts, and give new vigour to the constitution.

ROCHEFORT, a handsome and considerable town of France in the territory of Anuis. It was constructed by Louis XIV. and is built in the midst of marshes expressly drained for that purpose; and time evinced the utility of the project, for as a port it soon became as necessary and important to the crown of France as Brest or Toulon. It has a department of the marine, and has large magazines of naval stores. There is also one of the finest halls of arms in the kingdom, and a great many workmen employed in making them; there are also forges for anchors, and work-houses for ship-carpenters, who are employed in every thing that relates to the fitting out of ships that come within the compass of their province. They likewise cast great guns here; and have artists, whose employment is sculpture and painting. There are also flocks for building men of war, rope-walks, magazines of provisions and powder, a manufactury of sail-cloth, an hospital for sailors, and proper places to clean the ships. Add to these, the houses of the intendant, the square of the capuchins, and the superb stables, which contains lodgings for 900 marine guards, where they are taught the business and exercises belonging to seamen and officers who go on board the men of war.

Befide the usual number of workmen which were employed at Rochefort during the monarchy, which amounted to about 900, there were about 600 galley slaves, occupied in the most painful and laborious branches of service. The town is situated on the river Charente, about five leagues from its mouth, and was fortified by Louis XIV. at the time he conquered it; but its situation is at so considerable a distance from the sea, as to render it sufficiently secure from any attack, and they have therefore closed up the battlements, and neglected the fortifications. The town is laid out with great beauty and elegance. The streets are all very broad and straight, extending through the whole place from side to side; but the buildings do not correspond with them in this respect, as they are mostly low and irregular. W. Long. o. 54. N. Lat. 46. 3.

ROCHEFOUCAULT (Francis earl of), descended of an illustrious family, next in dignity to that of
the sovereigns, was chamberlain to king Charles VII. and Louis XII. His character at court was admired as obliging, generous, upright, and sincere. In 1494 he stood godfather to Francis I., who, when he came to the throne, continued to pay great respect to that spiritual relation. He made him his chamberlain in ordinary, and erected, in 1515, the barony of Rochefoucault into an earldom; and, in his writ of erection, observes, that he did this in memory of the great, honourable, highly useful, and commendable services which the said Francis had done to his predecessors, to the crown of France, and to himself. The earl of Rochefoucault died in 1517, leaving behind him an illustrious memory, and a character universally respected. Since his time all the eldest sons of that family have taken the name of Francis.

ROCHEFOUCAULT (Francis duke de la), prince of Marillac, governor of Poitou, was born in 1603. — He was the son of Francis, the first duke of Rochefoucault, and was distinguished equally by his courage and his wit. These shining qualities endeared him to all the nobility at court, who were ambitious of decorating themselves at once with the laurels of Mars and of Apollo. He wrote two excellent works; the one a book of Maxims, which M. de Voltaire says has contributed more than any other elfe to form the taste of the French nation; and the other, Memoirs of the Regency of Queen Anne of Austria. It was partly at the instigation of the beautiful duchess de Longueville, to whom he had been long attached, that the duke de Rochefoucault engaged in the civil wars, in which he signalized himself particularly at the battle of St. Vigne, where he signalized himself particularly at the battle of St. Vigne, where he

Rochelle, a celebrated city of France, capital of the territory of Aunis, with a very commodious and safe harbour, which, though it does not admit vessels of any considerable burden, is yet well calculated for trade. It may be divided (says Mr. Wralson) into three parts; the baion, which is the innermost of these, is only a quarter of a mile in circumference; and at the entrance are two very noble Gothic towers, called the Tower of St. Nicholas, and the Tour de la Chaine. They are now in a state of decay, but were formerly designed to protect the town and harbour. Without these towers is the Avant Port, extending more than a league, and bounded by two points of land to the north and south. Beyond all is the road where the largest ships usually anchor, protected from the south-west winds by the islands of Re, Oleron, and Aix. The celebrated mound erected by Richelieu extends from side to side across the whole harbour, nearly an English mile in length, and when the sea retires is still visible. "I walked out upon it (says Mr. Wralson) above 300 feet. Its breadth is at this time more than 150 feet, and it widens continually towards the base. No effort of art or power can possibly impress the mind with so vast and sublime an idea of the genius of Richelieu, as does this bulwark against the sea. While I stood upon it, in the middle of the port, between the waves which rolled on either side, and contemplated its extent and strength, I was almost inclined to suppose this astonishing work to be superior to human power, and the production rather of a deity than of a mortal. A small opening of about 200 feet was left by Pompey Targon, the archi-
Rochester.

At the beginning of the first siege, the number of inhabitants in the city amounted to 72,000; in the second they diminished to 28,000; and they were, when Mr. Wraals was there, between 17 and 18,000, of which scarce 2000 were Huguenots. The houses of this city are fine, and supported with piazzas, under which persons may walk in all weathers; and the streets in general are as straight as a line. There are several handsome churches, and other structures, besides a remarkable pump in the square of Dompier, which throws out the water through several pipes. There are no remains of the old fortifications, except on the side of the harbour, where there are great structures, besides portes, under which the mayor and citizens hold what is called an admiralcy-court once a year for regulating the oyster-fishery in the creeks and branches of the Medway that are within their jurisdiction, and for prosecuting the cable-hangers, as they are called, who dredge and fish for oysters without being free, by having served seven years apprenticeship to a fisherman who is free of the fishery. Every licensed dredger pays 6s. 8d. a year to the support of the courts, and the fishery is now in a flourishing way. Part of the castle is kept in repair, and is used as a magazine, where a party of soldiers do constant duty. The bridge was repaired in 1744, and pulliaced with new iron rails. Rochester contains about 700 houses, and 2000 inhabitants. It consists of only one principal street which is wide, and paved with flints. The houses are generally well built with brick, and inhabited by tradesmen and inn-keepers. It has also four narrow streets; but no fort of manufacture is carried on here. Stroud is at the west end of this place, and Chatham at the east. It is 27 miles north-west by west of Canterbury, and 30 south-east by east of London. Long. ° 36. 8. Lat. 51. 23. N.

Rochester (earl of). See Wilmot.

ROCK, a large mass or block of hard stone rooted in the ground. See Mountain, Petrification, and Stone.

Rock Bif:em are cavities or artificial basins of different sizes, from six feet to a few inches diameter, cut in the surface of the rocks for the purpose, as is supposed, of collecting the dew and rain pure as it descends from the heavens, for the use of ablutions and purifications, prescribed in the druidical religion; these, especially the deep, being deemed the purest of all fluids.

The Roman Wall runs through the town from Shooters' Hill to Dover. The mayor and citizens hold what is called an admiralcy-court once a year for regulating the oyster-fishery in the creeks and branches of the Medway that are within their jurisdiction, and for prosecuting the cable-hangers, as they are called, who dredge and fish for oysters without being free, by having served seven years apprenticeship to a fisherman who is free of the fishery. Every licensed dredger pays 6s. 8d. a year to the support of the courts, and the fishery is now in a flourishing way. Part of the castle is kept in repair, and is used as a magazine, where a party of soldiers do constant duty. The bridge was repaired in 1744, and pulliaced with new iron rails. Rochester contains about 700 houses, and 2000 inhabitants. It consists of only one principal street which is wide, and paved with flints. The houses are generally well built with brick, and inhabited by tradesmen and inn-keepers. It has also four narrow streets; but no fort of manufacture is carried on here. Stroud is at the west end of this place, and Chatham at the east. It is 27 miles north-west by west of Canterbury, and 30 south-east by east of London. Long. ° 36. 3. Lat. 51. 23. N.
fluids. There are two sorts of these basins, one with lips or communications between the different basins, the other simple cavities. The lips as low as the bottom of the basins, which are horizontal, and communicate with one somewhat lower, so contrived that the contents fall by a gradual descent through a succession of basins either to the ground, or into a vessel set to receive it. The basins without lips might be intended for reservoirs to preserve the rain or dew in its original purity without touching any other vessel, and was perhaps used for the druid to drink, or wash his hands, previous to officiating at any high ceremony, or else to mix with their milletoe.

Some of these basins are so formed as to receive the head and part of the human body; one of this kind is found on a rock called Arthur's bed, in the parish of North Hall in Cornwall, where are also others, called by the country people Arthur's troughs, in which they say he used to feed his dogs.

Rock-Crystal, in natural history, otherwise called jasper-crystal, a name given to the third order of crystals, from their being affixed to a rock or other solid body. See Crystal.

Rock-Salt. See Salt.

Rock-Oil. See Petroleum.

Rock-Fish. See Gobius.

ROCKET, an artificial fire-work, consisting of a cylindrical case of paper, filled with a composition of certain combustible ingredients; which, being tied to a flick, mounts into the air, and then bursts. See Pyrotechny.

Theory of the Flight of Sky-Rockets. Mariotte takes the rise of rockets to be owing to the impulse or resistance of the air against the flame. Dr Dugasquier accounts for it otherwise.

Conceive the rocket to have no vent at the choak, and to be set on fire in the conical bore; the consequence will be, either that the rocket would burst in the weakest place, or, if all its parts were equally strong, and able to sustain the impulsion of the flame, the rocket would burst out immediately. Now, as the force of the flame is equable, supposed its action downwards, or that upwards, sufficient to lift 40 pounds. As these forces are equal, but their directions contrary, they will destroy each other's action.

Imagine then the rocket opened at the choak; by this means the action of the flame downwards is taken away, and there remains a force equal to 40 pounds acting upwards, to carry up the rocket, and the flick it is tied to. Accordingly, we find that if the composition of the rocket be very weak, so as not to give an impulse greater than the weight of the rocket and flick, it does not rise at all; or if the composition be slow, so that a small part of it only kindles at first, the rocket will not rise.

The flick serves to keep it perpendicular; for if the rocket should begin to tumble, moving round a point in the choak, as being the common centre of gravity of rocket and flick, there would be so much friction against the air by the flick between the centre and the point, and the point would beat against the air with so much velocity, that the friction of the medium would restore it to its perpendicularity.

When the composition is burnt out, and the impulse upwards is ceased, the common centre of gravity is brought lower towards the middle of the flick; by which means the velocity of the point of the flick is decreased, and that of the point of the rocket increased; so that the whole will tumble down, with the rocket-end foremost.

All the while the rocket burns, the common centre of gravity is shifting and getting downwards, and fills the faster and the lower as the flick is the lighter, so that it sometimes begins to tumble before it be burnt out; but when the flick is a little too heavy, the weight of the rocket bearing a less proportion to that of the flick, the common centre of gravity will not get so low but that the rocket will rise straight, though not so fast.

Rocket, in botany. See Brassica.

ROCKINGHAM, a town in Northamptonshire, in England, 87 miles from London, stands on the river Welland. It has a charity-school, a market on Thursday, and a fair on Sept. 8 for five days. Its forest was reckoned one of the largest and richest of the kingdom, in which William the Conqueror built a castle; it extended, in the time of the ancient Britons, almost from the Welland to the Nene, and was noted formerly for iron-works, great quantities of flags, i.e. the refuse of the iron-ore, being met with in the adjacent fields. It extended, according to a survey in 1641, near 14 miles in length, from the west end of Middleton-Woods to the town of Mansfield, and five miles in breadth, from Brigglock to the Welland; but is now dismembered into parcels, by the interposition of fields and towns, and is divided into three bailiwicks. In several of its woods a great quantity of charcoal is made of the tops of trees, of which many waggon-loads are sent every year to Peterborough. There is a spacious plain in it called Rockinghamshire, which is a common to the four towns of Cottingham, Rockingham, Corby, and Gretton.

King William Rufus called the council here of the great men of the kingdom. W. Long. o. 46. N. Lat. 52° 32'.

ROCKING-STONES. See Rocking-Stones.

ROCKOMBOLE. See Allium.

Rod, a land measure of 16 feet and a half; the same with perch and pole.

Black Rod. See Ussur of the Black Rod.

Fishing Rod, a long taper rod or wand, to which the line is fastened for angling. See Fishing-Rod.

RODNEY (George Bridges), Lord Rodney, was born in the year 1718. Of the place of his birth and the rank of his ancestors we have not been able to procure any well-authenticated account. His father was a naval officer; and commanding, at the time of his son's birth, the yacht in which the king, attended by the Duke of Chandos, was passing to or from Hanover, he asked and obtained leave to have the honour of calling his infant for George Bridges. The royal and noble godfathers advised Captain Rodney to educate his boy for his own profession, promising, as we have been told, to promote him as rapidly as the merit he should display and the regulations of the navy would permit.

Of young Rodney's early exertions in the service of his country, nothing, however, is known to the writer of this abstract, nor, indeed, any thing of sufficient importance to be inserted in articles so circumstanced as all our biographical sketches must be, till 1754; when we find him, in the rank of a Commodore, sent out to make
make accurate discoveries respecting an island which was supposed to lie about 50° N. L. and about 300 leagues W. of England; but he returned without having seen any such island as that which he was appointed to survey. In the war which soon followed this voyage of discovery, he was promoted to the rank of a rear-admiral, and was employed to bombard Havre-de-Grâce; which in 1759 and 1760 he considerably damaged, together with some shipping. In 1761 he was sent on an expedition against Martinique, which was reduced in the beginning of the year 1762, and about the same time St. Lucia surrendered to Captain Harvey. Both these islands were restored to the French at the peace of 1763.

In reward for his services, he was created a knight of the bath; but being inattentive, as many seamen are, to the rules of economy, his circumstances became so embarrassed that he was obliged to fly from his country, with very little hopes of ever being able to return. He was in France when the policy of that court induced them to take a decided part with America against Great Britain; and it is said that some men in power, no strangers to the desperate state of Sir George’s affairs, offered him a high command in the French navy, if he would carry arms against his own country. This offer he rejected with becoming indignation. Soon after this gallant behaviour, the Duke de Chartres, afterwards the infamous Orleans, told Sir George that he was to have a command in the fleet which was to be opposed to that under the command of his countryman Mr Keppel; and with an insulting air asked him what he thought would be the consequence of their meeting? “That my countryman will carry your Highness with him to learn English,” was the high-spirited reply. When the divisions, which the mutual recriminations of Admiral Keppel and Sir Hugh Palliser excited in the British navy, made it difficult for the ministry to procure experienced, and at the same time popular, commanders for their fleets, Lord Sandwich wrote to Sir George Bridges Rodney, offering him a principal command, but the difficulty was for the veteran to find money to pay his accounts in France, so that he might be permitted to leave that kingdom. The money, it has been repeatedly affirmed, was advanced to him by the courtiers whose offer he had before indignantly rejected. He arrived, therefore, in England, and was again employed in the service of his country. His first exploit after his appointment was in January 1780, when he took 19 Spanish transports bound to Cadiz from Bilboa, together with a 64 gun ship and 5 frigates, their convoy. On the 16th of the same month he fell in with the Spanish fleet, consisting of 11 sail of the line, under the command of Don Juan de Langara; of which one was blown up during the engagement, five were taken and carried into Gibraltar, among which was the admiral’s ship, and the rest were much shattered. In April the same year, he fell in with the French fleet, under the command of Admiral Guichen, at Martinico, whom he obliged to fight, and whom he completely beat; though from the shattered state of his own fleet, and the unwillingness of the enemy to risk another action, he took none of their ships. The successful efforts of this gallant admiral during the year 1780 were generally applauded through the nation. He received the thanks of both Houses of Parliament, and addresses of thanks from various parts of Great Britain, and the islands to which his victories were more particularly serviceable. In December the same year, he made an attempt, together with General Vaughan, on St. Vincent’s, but failed. In 1781, he continued his exertions, with much success, in defending the West India islands; and, along with the above named general, he conquered St. Eustatius; on which occasion his conduct to the inhabitants has been much, though perhaps unjustly, censured. The island was certainly a nest of contraband traders.

On the 14th of April 1782, he came to a close action with the French fleet under Count de Graffe; during which he sunk one ship and took five, of which the admiral’s ship, the Ville de Paris, was one. The following year brought peace; but, as a reward for his numerous services, he had a grant of L. 2000 a-year for himself and his two successors. He had long before been created a baronet, rear-admiral of Great Britain, and at length was justly promoted to the peerage, by the title of Baron Rodney of Stoke, Somerfellshire, and made vice-admiral of Great Britain. He was once also governor of Greenwich Hospital.

Lord Rodney had been twice married; first to the sister of the Earl of Northampton, and secondly to the daughter of John Clies, Esq. with whom he did not reside for several years before his death, which happened on the 24th of May 1792. He was succeeded in title and estates by his son George, who married in 1781 Martha, daughter of the Right Hon. Alderman Harley, by whom he has issue.

Of the private life of Lord Rodney we know but little. His attention to the wants of the seamen, and the warrant officers serving under him, indicated that humanity which is always allied to true courage. He has often, from the number of dishes which his rank brought to his table, selected something very plain for himself, and sent the rest to the midshipmen’s mess. His public transactions will transmit his name with honour to posterity; his bravery was unquestionable, and his successes have been seldom equaled. It has, indeed, been very generally said, that his skill in naval tactics was not great, and that he was indebted to the superior abilities of Capt. Young and Sir Charles Douglas for the manœuvres by which he was so successful against Langara and de Graffe. But, supposing this to be true, it detracts not from his merit. A weak or foolish commander could not always make choice of the ablest officers for his first captains, nor would such a man be guided by their advice.

Whatever was Lord Rodney’s skill in the science of naval war, or however much he may have been beholden to the counsels of others, he certainly possessed himself the distinguished merit of indefatigable exertion; for he never omitted anything within the compass of his power to bring the enemy to action. He therefore unquestionably deserves the respect and gratitude of his country. In the year 1783 the House of Assembly in Jamaica voted L. 1000 towards erecting a marble statue to him, as a mark of their gratitude and veneration for his gallant services, so timely and gloriously performed for the salvation of that island in particular, as well as the whole of the British West India islands and trade in general. We have not, however, heard of any such tribute being paid to him in Britain either before or since his death.
ROH

ROE, the seed or spawn of fish. That of the male fish is usually distinguished by the name of fetus roe, or milt; and that of the female, herd roe, or spawn. So inconceivably numerous are these ovula or small eggs, that M. Petit found 342,144 of them in a carp of 18 inches; but M. Lieuwenboek found in a carp no more than 211,629. This last gentleman observes, that there are four times this number in a cod; and that a common one contains 9,344,000 eggs.

ROE, in zoology. See Cervus.

ROHELLA, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and was Peter, the in pamon-week. Roga is also used for the decree of the senate. From the court, and in consequence of its deriving its origin from the first sovereigns of Brittany, and clearly admitted by the dukes of Brittany themselves in the states general of that province held in 1088. The house of Rohan had still another advantage, which was common to it with very few families, even the most distinguished among the princes, namely, that instead of having been aggrandized by the wealth procured from alliances, it had held in itself for seven centuries the largest possessions of any family in the kingdom.

ROGA, in antiquity, a prefix which the emperors made to the senators, magistrates, and even to the people; and the popes and patriarchs to their clergy. These rogues were distributed by the emperors on the first day of the year, on their birth-day, or on the natalis dies of the cities; and by the popes and patriarchs in passion-week. Roga is also used for the common pay of the soldiers.

ROGATION (ROGATION), in the Roman jurisprudence, a demand made by the confuls or tribunes of the Roman people, when a law was proposed to be passed. Rogatio is also used for the decree itself made in consequence of the people's giving their assent to this demand; to distinguish it from a fratius consultum, or decree of the senate.

ROGATION-WEEK, the week immediately succeeding Whit-Sunday; so called from the three feasts therein, viz. on Monday, Tuesday, and Wednesday.

ROGER de Hoveden, a learned man of the 13th century, was born in Yorkshire, most probably at the town of that name, now called Hoveden, some time in the reign of Henry I. After he had received the first parts of his education in his native country, he studied the civil and canon law, which were then become the most fashionable and lucrative branches of learning. He became domestic chaplain to Henry II., who employed him to transact several ecclesiastical affairs; in which he acquitted himself with honour. But his most meritorious work was, his Annals of England, from A.D. 731, when Bede's Ecclesiastical History ends, to A.D. 1202. This work, which is one of the most voluminous of our ancient histories, is more valuable for the sincerity with which it is written, and the great variety of facts which it contains, than for the beauty of its style, or the regularity of its arrangement.

ROGUE, in law, an idle sturdy beggar; who by ancient statutes is for the first offence called a rogue of the first degree, and punished by whipping, and boring through the gristle of the right ear with a hot iron; and for the second offence, is termed a rogue of the second degree, and, if above 18 years of age, ordered to be executed as a felon.

ROHAN (Peter de), Chevalier de Gé, and mar-shal of France, better known by the name of Marshal de Gé, was the son of Louis de Rohan, the first of the name, lord of Guéméné and Montauban, and descended of one of the most ancient and most illustrious families of the kingdom. The family of Rohan, before the Revolution, held the rank of prince in France in consequence of its deriving its origin from the first sovereigns of Brittany, and clearly admitted by the dukes of Brittany themselves in the states general of that province held in 1088. The house of Rohan had still another advantage, which was common to it with very few families, even the most distinguished among the princes, namely, that instead of having been aggrandized by the wealth procured from alliances, it had held in itself for seven centuries the largest possessions of any family in the kingdom.

One of the most distinguished branches of this family was Peter, the subject of the present article. Louis XI. rewarded his bravery with the staff of marshal of France in 1475. He was one of the four lords who governed the kingdom during the indisposition of that prince at Châlon in 1484. Two years afterwards he opposed the attacks of the archduke of Austria upon Picardy. He commanded the van-guard at the battle of Fornone in 1495, and signalized himself much in that engagement. His bravery procured him the countenance and confidence of Louis XII. who appointed him his prime counsellor, and general of the army in Italy; but these advantages he lost, by incurring the displeasure of Anne of Brittany the queen.

The marshal had flopped some of her equipage on the road to Nantes; for which that vindictive princes prevailed on her husband to enter into a process against him before the parliament of Toulouge, at that time the most rigorous and severe in the kingdom. He was on the 15th of February 1506 found guilty, banished from the court, and deprived of the privileges and emoluments of his office for five years. The expense of this prosecution amounted to more than 31,000 livres, and did no honour either to the king or the queen. If indeed it be true, that the queen was never so much delighted as with the humiliation of her enemies, she had good reason to be satisfied here. John of Authon, who had entered into a pretty full detail of this affair, reports that Gé, being removed to the Château de Dreux, became an object of ridicule to the witheesi who had sworn against him. He wore a long white beard, and, quite full of the thoughts of his disgrace, took it on one occasion in his hands and covered his face with it. An ape, belonging to Alain d'Albret, count of Dreux, jumped from a bed where his master was reposing himself, and attacked the beard of Gé, who, with some difficulty, extricated himself. This scene not only occasioned much laughter to the whole company who were present, but likewise became instantly the subject of the farces and mummeries which were then acting in France. Even the school-boys made a representation of it, where, alluding to the name of the queen, they said, that there was a marshal who wished to fume an ase (un ane), but that he received such a blow with the foot, as threw him over the wall into the garden. Mareschal de Gé died at Paris, the 22d April 1515, perfectly disfigured with courts and grandeur.

ROHAN (Henry duke of), peer of France, and prince of Leon, was born at the Château de Bélin in Brittany in 1579. Henry IV. under whose eyes he gave distinguished proofs of his bravery at the siege of Amiens, when only 16 years of age, loved him with as much affection as if he had been his own son. After the death of Henry, he became chief of the Calvinists...
He was interred in France; and was equally formidable for his genius as his sword. In defence of the civil and religious rights of his party, he maintained three wars against Louis XIII. The first, which terminated to the advantage of the Protestants, broke out when that prince wished to establish the Romish religion in Le Bearn: the second, because of the siege which Cardinal de Richelieu caused to be laid to Rochelle: and the third, when that place was belied a second time. The consequences of this war are sufficiently known: Rochelle surrendered; and the duke de Rohan perceiving, that after the taking of this place, the majority of his party were endeavouring to make up matters with the court, succeeded in procuring for them a general peace in 1629, upon very honourable and advantageous terms. The only sacrifice of importance which the Huguenots were obliged to make, was their fortifications; which put it out of their power to renew the war. Some factious persons, dissatisfied with seeing their fortresses fall into their enemies’ hands, were ready to accuse their general of having sold them. This great man, under the odious ingratitude, presented his breast to these enraged malcontents, and said, “Strike, strike! I wish to die by your hands, after I have hazarded my life in your service.” The peace of 1629 having extinguished the flame of civil war, the duke de Rohan, no longer of use to his party, and become disagreeable at court, retired to Venice. There is a very particular anecdote of him, extracted from the Memoirs of the duchess de Rohan, Margaret of Bethune, daughter of the famous Sully. Whilst the duke de Rohan was at Venice, a proposal was made to him from the Porte, that for 20,000 crowns, and an annual tribute of 20,000, the Grand Signior would give him the island of Cyprus, and fully invest him with the dignity and prerogatives of king. The duke was warmly inclined to comply with this proposal, and to settle in the island the Protestant families of France and Germany. He negotiated this business at the Porte by means of the intervention of the patriarch Cyril, with whom he had much correspondence; but different circumstances, and in particular the death of the patriarch, occurred to break off the treaty. The republic of Venice chose Rohan for their commander in chief against the Imperialists; but Louis XIII. took him from the Venetians, and sent him ambassadoir into Switzerland, and into the Grisons. He wished to allay these people in bringing back La Valteline under their obedience, the revolt of which the Spaniards and Imperialists encouraged. Rohan, being declared general of the Grisons, after many victories, drove the German and Spanish troops entirely from La Valteline in 1633. He defeated the Spanish again in 1636 at the banks of the lake of Constance. Rohan, not thinking it proper to withdraw her troops, the Grisons rode up in arms, and the duke de Rohan, not satisfied with the conduct of the court, entered into a special treaty with them the 25th March 1637. This hero, fearing the resentments of cardinal de Richelieu, retired to Geneva, with a view to join his friend the duke of Saxe-Weimar, who wished him to undertake the command of his army, then ready to engage the Imperialists near Rhinfield. Although he declined this honour, yet he took the command of the regiment of Nafian, with which he threw the enemy into confusion; but was himself wounded, February 28, 1633; and died of his wounds the 15th of April following, at the age of 59. He was interred May 27th, in the church of St Pierre in Geneva, where there is a magnificent monument of marble erected to his memory, having on it the most illustrious actions of his life. The duke de Rohan was one of the greatest generals of his time, equal to the princes of Orange, and capable, like them, of letting a comm nuance; but more zealous than they for religion, or at least appearing to be so. He was vigilant and indefatigable, not allowing himself any pleasures which might take off his attention from his necessary employment, and well qualified for being the head of a party; a pull very difficult to retain, and in which he had to fear equally from his enemies and his friends. It is in this light that Voltaire has viewed this illustrious character, when he composed the following verses:

*Avec tous les talans le Ciel ne voit nul:'

Il a été en Italie, et Sainz il crut.

Il fut même grand homme en combattant son Maître,

Et plus grand lorsqu’il le servit.

His military virtues were much heightened by the sweetness of his disposition, his affable and courteous manners, and by a generosity which had but few examples. Neither ambition, pride, nor a view of gain, could ever be traced in his character. He was wont to say, that “true glory and a zeal for the public good never dwelt where selfish intereSt reigned.” Rohan had always a particular regard for Henry the Fourth: “Truly (said he, sometimes after the death of that prince) when I think of him, my heart is ready to break. A wound received in his presence would have afforded me more satisfaction than now to gain a battle. I would have valued an encomium from him in this art, of which he was the greatest master of his time, more than the united praises of all the commanders now living.” He wrote several interesting performances: 1. The Interests of Princes, printed at Cologne in 1666, in 12mo: in which work he fully examines the public interests of all the princes of Europe. 2. The Perfect General, or an abridgment of the wars from Caesar’s Commentaries, in 12mo. In this he makes it appear, that a knowledge of the tactics of the ancients might be of much use to the moderns. 3. A Treatise on the Corruption of the ancient Militia. 4. A Treatise on the Government of the Thirteen Provinces. 5. Memoirs; the full edition of which is in 2 vols. 12mo. They contain the history of France from 1610 to 1629. 6. A Collection of some Political Discourses on state Affairs, from 1612 to 1629, 8vo, Paris, 1644, 1693, 1755; with the Memoirs and Letters of Henri duc de Rohan relative to the war of La Valteline, 3 vol, 12mo, Geneva, 1757. This was the first edition which appeared of these curious memoirs: We owe it to the great attention and diligence of M. le Baron de Zuriachen, who published them from different authentic manuscripts. He likewise ornamented this edition with geographical, historical, and genealogical notes, and a preface, which contains an abridged, but highly interesting life, of the duke de Rohan, author of the memoirs. The abbé Péne has also written a life of him, which occupies the 21st and 22d volumes of the History of the Illustrious Men of France. Some want of spirit might be excused in the detail of wars finished upwards of 140 years.
years ago; yet the memoirs of the duke de Rohan still
afford considerable pleasure in the perusal. He tells his
story with humour, with sufficient exactness, and in
such a style as procures the confidence of the reader.

ROHAULT (James), a celebrated Cartesian phil-
osopher, was the son of an merchant of Amiens, where
he was born in 1620. He became well skilled in the
mathematics, and taught them at Paris, where he be-
came acquainted with M. Clerfeller, an advocate, who
married his daughter in Marriage. Rohault also
taught philosophy in the same city with uncommon
aptitude. He there improved the arts, and gave ex-
cellent lectures to the artists and workmen. He died
at Paris in 1675. He wrote, in French, 1. A Treatie
on Natural Philosophy. 2. The Elements of the
Mathematics. 3. A Treatise on Mechanics, which is
very curious. 4. Philosophical Conversations; and
other works. His Physics have been translated into
Latin, by Dr Samuel Clarke, with notes, in which
the Cartesian errors are corrected upon the Newtonian
system.

ROLLANDRA, in botany; A genus of the polyga-
nia segregata order, belonging to the syngeneia clas.
ss of plants; and in the natural method ranking under
the 49th order, Compipia. The common calyx con-
sists of distinct floras, between each of which is a short
squamis, the whole forming a round head. The partial calyx
is bivalved. The corolla is small and funnel-shaped, the
tube small as a thread, the lucina short and acute. The
flaminea are five; the style bifid. It has no other seed
vesel except the partial calyx, which contains a long
three-sided seed. Of this there is only one species, viz.
the Argentea; a native of the West Indies, and found in
copies and waste lands.

ROLL, in manufactories, something wound and fold-
ed up in a cylindrical form.

Few stuffs are made up in rolls, except satins, gau-
se, and crapes; which are apt to break, and take
prints not easy to be got out, if folded otherwise. Rib-
bons, laces, gallons, and padus of all kinds, are also
thus rolled.

A roll of tobacco, is tobacco in the leaf, twisted on
the mill, and wound twit over twit about a flick or
roller. A great deal of tobacco is fold in America in
rolls of various weights; and it is not till its arrival in
England, Spain, France, and Holland, that it is cut.

A roll of parchment, properly denotes the quantity of
60 skins.

The ancients made all their books up in the form of
rolls; and in Cicerio's time the libraries consisted wholly
of such rolls.

ROLL, in law, signifies a schedule or parchment
which may be rolled up by the hand into the form of
a pipe.

In these schedules of parchment all the pleadings,
memorials, and acts of court, are entered and filed by
the proper officer; which being done, they become rec-
ords of the court. Of these there are in the exchequer
several kinds, as the great wardrobe roll, the cofferer's
roll, the subfidy-roll, &c.

Roll is also used for a list of the names of persons of
the same condition, or of those who have entered into
the same engagement. Thus a court-roll of a manor, is
that in which the names, rents, and services, of each
tenant are copied and enrolled.

Calves-head Roll, a roll in the two temples, in
which every bencher is taxed yearly at 2 s. every barri-
er at 1 s. 6 d. and every gentleman under the bar at
1 s. to the cook and other officers of the house, in
consideration of a dinner of calves-heads provided in
Easter-term.

Master-Roll, that in which are entered the soldiers
of every troop, company, regiment, &c. As soon as a
soldier's name is written down on the roll, it is death
for him to desert.

Rolls-Office, is an office in Chancery-lane, London,
appointed for the custody of the rolls and records in
chancery.

Master of the Rolls. See Master of the Rolls.

Rider-Roll, a schedule of parchment frequently few-
od or added to some part of a roll or record.

Rolls of Parliament, are the manuscript registers
or rolls of the proceedings of the ancient parliaments,
which before the invention of printing were all engraved
on parchment, and proclaimed openly in every
county. In these rolls are also contained a great many
decisions of difficult points of law, which were fre-
cently in former times referred to the decision of that
high court.

Roll, or Roller, is also a piece of wood, iron, brafs,
&c. of a cylindrical form, used in the construction of
several machines, and in several works and manufac-
tories.

Thus in the glass manufacture they have a running-
roll, which is a thick cylinder of cast brass, which
serves to conduct the melted glass to the end of the
table on which large looking-glasses, &c. are cast.

Founders also use a roll to work the sand which they
use in making their moulds.

The prefixes called calendars, as serving to calendar
stuff withal, consist, among other essential parts, of two
rollers. It is also between the two rollers that the
waves are given to silks, mohairs, and other stuffs pro-
table to be tabbied.

Impreisions from copper-plates are also taken by
passing the plate and paper between two rollers. See
Rolling-press, Printing.

Rolls, in flating-mills, &c. are two iron instruments
of a cylindrical form, which serve to draw out stretch
plates of gold, silver, and other metals.

Rolls, in sugar-works, are two large iron barrels
which serve to bruise the canes, and to express the
juice. These are cast hollow, and their cavities are
filled up with wood, the cylinders of which are pro-
tably the rollers.

ROLLER, in surgery, a long and broad bandage,
usually of linen-cloth, rolled round any part of the
body, to keep it in, or dress it to a state of health.

ROLLO (Paul), was born at Rome in 1687. He
was the son of an architect, and a pupils of the celebra-
ted Gravina, who inspired him with a taste for learning
and poetry. An intelligent and learned English lord
having brought him to London, introduced him to the
royal family as a master of the Tuscan language. Rolli
remained in England till the death of queen Caroline
his protector, and the patroness of literature in general.
He returned to Italy in 1747, where he died in 1757,
in the 80th year of his age, leaving behind him a very
curious collection in natural history, &c. and a valuable
and well chosen library. His principal works first ap-
peared
ROLLIN.

...they consist of odes in blank verse, elegies, songs, and other things, after the manner of Catullus. There is likewise, by him a Collection of Epigrams, printed at Florence in 1776, in 8vo, and preceded with his life by the Abbé Fondini. What Martial said of his own Collection may be said of this, "That there are few good, but many indifferent or bad, pieces in it." Rollin, however, bore the character of one of the best Italian poets of his age. During his stay in London, he procured editions of several authors of his own country. The principal of these were, the Satires of Ariost, the Burlesque Works of Berni, Varchi, &c. 2 vols, in 8vo, which possefs considerable merit. The Decameron of Boccace, 1727, in 4to and folio; in which he has faithfully copied the celebrated and valuable edition published by the *Juntas* in 1527: and, lastly, of the elegant Lucretia of Marchetti, which, after the manuscript was revised, was printed at London in 1717, in 8vo, through the influence and attention of Rollin. This edition is beautiful; but the work is thought of pernicious tendency. There are likewise, by him, translations into Italian verse of the Parodist Loft of Milton, printed at London in folio in 1735; and of the Odes of Anacreon, London 1739, in 8vo.

ROLLIN (Charles), a justly celebrated French writer, was the son of a cutler at Paris, and was born there on the 30th of January 1661. He studied at the college Du Plessis, in which he obtained a burying through the interest of a Benedictine monk of the White Mantle, whom he had served at table, and who discovered in him some marks of genius. Here he acquired the regard of M. Gobinet, principal of that college, who had a particular esteem for him. After having studied humanity and philosophy at the college of Du Plessis, he applied to divinity three years at the Sorbonne; but he did not prosecute this study, and never rose in the church higher than to the rank of a tonsured priest. He afterwards became professor of rhetoric in the same college; and, in 1688, he was made Rector of the college. No man ever exercised the functions of it with greater elan: he often made Latin orations, to celebrate the memorable events of the times; and frequently accompanied them with poems, which were read and esteemed by every body. In 1694, he was chosen Rector of the university; and continued in that office two years, which was then a great mark of distinction. By virtue of his office, he spoke the annual panegyric upon Louis XIV. He made many very useful regulations in the university; and particularly revived the study of the Greek language, which was then much neglected. He substituted academical exercises in the place of tragedies; and introduced the practice which had been formerly observed, of causing the students to get by heart passages of Scripture. He was a man of indefatigable attention; and trained innumerable persons, who did honour to the church, the state, and the army. The first President Porte-gal was pleased one day to reproach Rollin in a jocular strain, as if he exceeded even himself in doing business: to whom Rollin replied, with that plainness and sincerity which was natural to him, "It becomes you well, Sir, to reproach me with this; it is this habit of labour in me which has distinguished you in the place of advocate-general, which has raised you to that of first president: you owe the greatness of your fortune to me."

Upon the expiration of the rectorship, Cardinal de Noailles engaged him to superintend the studies of his nephews, who were in the college of Laon; and in this office he was agreeably employed, when, in 1699, he was with great reluctance made coadjutor to the principal of the college of Beauvais. This college was then a kind of desert, inhabited by very few students, and without any manner of discipline: but Rollin's great reputation and industry soon re-peopled it, and made it that flourishing society it has ever since continued. In this situation he continued till 1712: when the war between the Jesuits and the Jansenists drawing towards a crisis, he fell a sacrifice to the prevalence of the former. Father le Tellier, the king's confessor, a furious agent of the Jesuits, infifted into his matter prejudices against Rollin, whose connections with cardinal de Noailles would alone have sufficed to have made him a Jansenist; and on this account he lost his share in the principality of Beauvais. No man, however, could have lost less in this than Rollin, who had everything left him that was necessary to make him happy; retirement, books, and enough to live on. He now began to be employed upon Quinellian; an author he justly valued, and saw neglected not without uneasiness. He retracted in him whatever he thought rather curious than useful for the instruction of youth; he placed summaries or contents at the head of each chapter; and he accompanied the text with short foot-notes. His edition appeared in 1715, in 2 vols, 12mo, with an elegant preface, setting forth his method and views.

In 1710, the university of Paris, willing to have a head suitable to the importance of their interests in the then critical conjuncture of affairs, chose Rollin again rector: but he was displaced in about two months by a letter de cachet. The university had preferred to the parliament a petition, in which it protested against taking any part in the adjournment of the late disputes; and their being congratulated in a public oration by Rollin on this step, occasioned the letter which ordered them to choose a rector of more moderation. Whatever the university might suffer by the removal of Rollin, the public was probably a gainer; for he now applied himself to compose his treatise upon the Manner of Studying and Teaching the Belles Lettres, which was published, two volumes in 1726, and two more in 1728, 8vo.

This work has been justly esteemed for the sentiments of religion which animate its author, whose zeal for the public good prompted him to felect the choicest passages of Greek and Latin authors. The style is sufficiently elegant, but the language on some occasions is not remarkable for delicacy; and in the book altogether there is neither much order nor depth. The author has indeed spoken of common things agreeably, and has spoken as an orator on subjects which demanded the investigation of the philosopher. One can scarcely reduce any thing in him to principles.—For example, the three species of eloquence; the simple, the temperate, and the sublime, can scarcely be understood from him when we read that the one resembles a frugal table; the second a beautiful ruin, with green wood growing...
on its banks; and the third thunder and an impetuous river which overflows every thing that opposes it.

The work, however, has been exceedingly successful, and justly so; and its success encouraged its author to undertake another work of equal use and entertainment; his Histoire Ancienne, &c. or “Ancient History of the Egyptians, Carthaginians, Assyrians, Babylonians, Medes and Persians, Macedonians, and Greeks,” which he finished in 13 vols 8vo. and published between 1730 and 1738. M. Voltaire, after having observed that Rollin was “the first member of the university of Paris who wrote French with dignity and correctness,” says of this work, that “though the past volumes, which were written in too great a hurry, are not equal to the first, it is nevertheless the best compilation which has yet appeared in any language; because it is seldom that compilers are eloquent, and Rollin was remarkably so.” This is perhaps saying too much. There are indeed in this work some passages written with much elegance; but they are only such as he had taken from the ancient authors, agreeable images. Full of the reading of the ancients, the reader will easily discover in this work the same attachment to religion, the same desire for the public good, and the same love of virtue, which appears in that on the Belles Lettres. But it is to be lamented that his chronology is neither uniform nor correct; that he states facts inaccurately; that he has not sufficiently examined the exaggerations of ancient historians; that he often interrupts the most solemn narrations with mere trifles; that his style is not uniform; and this want of uniformity arises from his borrowing from writers of a modern date 40 or 50 pages at a time. Nothing can be more noble and more refined than his reflections; but they are cowardly with too sparing a hand, and want that depth which moderate than Rollin’s temper. He has been so much of an admirable composition; very ingenious, and much after the Ciceronian style, and embellished with most judicious thoughts and agreeable images. Full of the reading of the ancients, from which he brought quotations with as much propriety as plenty, he expressed himself with much spirit and excellence. His Latin poems deserve the same eulogium.

This excellent person died in 1741. He had been named by the king a member of the academy of inscriptions and belles lettres in 1701; but as he had not then brought the college of Beauvais into repute, and found he had more business upon his hands than was consistent with a decent attendance upon the functions of an academician, he begged the privileges of a veteran, which were honourably granted him. Nevertheless, he maintained his connections with the academy, attended their assemblies as often as he could, and demanded an academician for his censor. Rollin was a man of an admirable composition; very ingenious, consummate in polite learning, of rigid morals, and eminently pious. He was rather too religious; his religion carrying him into the territories of superstition; and he wanted nothing but a mixture of the philosophic in his nature to make him a very perfect character. Nothing could be more benign, more pacific, more sweet, more moderate than Rollin’s temper. He showed, it must be owned, some zeal for the cause of Jansenism; but in all other respects he was exceedingly moderate. The celebrated poet Rousseau conceived such a veneration for him, that he came out of banishment incognito to Paris, on purpose to visit him and pay his respects to him. He looked upon his histories, not only as the best models of the historic kind, but as a complete fylem of politics and morals, and a most instructive school for princes as well as subjects to learn all their duties in.

Instead of blushing at the lowness of his birth, Rollin on no occasion hesitated to speak of it. “It is from the Cyclops’s shop (says he, in a Latin epigram to one of his friends, to whom he had sent a small sword) that I have taken my flight to Paris. Parnassus. He was not, however, without some share of vanity, especially at hearing mention made of his writings, of which he took a great pride. His best pieces of his adherents had given him a very high opinion. He spoke without any dissimulation what he thought; and his opinions were less the effect of presumption than of openness of heart. He was one of those men who are vain without any mixture of pride.
Rolling, the motion by which a ship rocks from side to side like a cradle, occasioned by the agitation of the waves.

Rolling, therefore, is a sort of revolution about an imaginary axis passing through the centre of gravity of a ship; so that the nearer the centre of gravity is to the keel, the more violent will be the rolling motion; because the centre about which the vibrations are made is placed so low in the bottom, that the reflexion made by the keel to the volume of water which it displaces in rolling, bears very little proportion to the force of the vibration above the centre of gravity, the radius of which extends as high as the main-headers.

But if the centre of gravity is placed higher above the keel, the radius of vibration will not only be diminished, but an additional force to oppose the motion of rolling will be communicated to that part of the ship's bottom which is below the centre of gravity.

So far as relates to the effect of rolling, when produced by the quality of the ballast, and to the manner by which it may be prevented, viz., a change of the quantity or disposition of the ballast, we shall endeavour to explain under the article Trim. It may, however, be necessary to remark, that the construction of the ship's bottom may also contribute to diminish this movement considerably.

Many fatal disasters have happened to ships arising from a violent rolling; as the loss of the masts, loosening of the cannon, and straining violently on the decks and sides, so as to weaken the ship to a great degree. See Pitching.

Rolling-Precaution. See Rolling-Pass.

Rolling-Tackle, a pulley or purchase fastened to that part of a sail-yard which is to the windward of the mast, in order to confine the yard close down to the leeward when the sail is furled.

It is used to prevent the yard from having a great friction against the mast in a high sea, which would be equally pernicious to both.

Rollo, the conqueror of Normandy, was a Norwegian duke, banished from his country by Harold Harfagre, who conquered Norway in 870, on account of the pirates he exercised. He first retired with his fleet among the islands of the Hebrides to the north-west of Scotland, whither the flower of the Norwegian nobility had fled for refuge ever since Harold had become master of the whole kingdom. He was there received with open arms by those warriors, who, eager for conquest and revenge, waited only for a chief to undertake some glorious enterprise. Rollo feeting himself at their head, and seeing his power formidable, Lilled towards England, which had been long as it were a field open on all sides to the violence of the northern nations. But the great Alfred had some years before establisht such order in his part of the island, that Rollo, after several fruitless attempts, despaired of forming there such a settlement as should make him amends for the loss of his own country. He pretended, therefore to have had a supernatural dream, which promised him a glorious fortune in France, and which pressed at least to support the ardour of his followers. The weakness of the government in that kingdom, and the confusion in which it was involved, were still more persuasive reasons to induce them of success. Having therefore failed up the Seine to Rouen, he immediately took that capital of the province, then called Neufiria, and making it his magazine of arms, he advanced up to Paris, to which he laid siege in form. This war at length ended in the entire cession of Neufiria, which Charles the Simple was obliged to give up to Rollo and his Normans in order to purchase a peace. Rollo received it in perpetuity to himself and his posterity, as a feudal duty dependent on the crown of France. A description of the interview between Charles and this new duke gives us a curious picture of the manners of those Normans (as they were called by foreigners); for the latter would not take the oath of fealty to his sovereign lord any other way than by placing his hands within those of the king; and absolutely refused to kiss his feet, as custom then required. It was with great difficulty he was prevailed on to let one of his warriors perform this ceremony in his stead; but the officer to whom Rollo deputed this service, suddenly raised the king's foot so high, that he overturned him on his back; a piece of rudeness which was only laughed at: to such a degree were the Normans feared, and Charles dejected.

Soon after, Rollo was persuaded to embrace Christianity, and he was baptized with much ceremony by the archbishop of Rouen in the cathedral of that city. As soon as he saw himself in full possession of Normandy, he exhibited such virtues as rendered the province happy, and desired to make his former outrages forgotten. Religious, wise, and liberal, this captain of pirates became, after Alfred, the greatest and most humane prince of his time.

ROMAN, in general, something belonging to the city of Rome. See Rome.

King of the Romans, in modern history is a prince elected to be successor to the reigning emperor of Germany.

ROMANCE in matters of literature, a fabulous relation of certain adventures designed for the entertainment and instruction of the readers, and differing from the novel as it always exhibits actions great, dangerous, and generally extravagant. Many authors of the first name have written on the ancient Romance. It has exercised the pen of Hurd, of Warburton, and of some ladies, who have not thought it any derogation to the fertility of their muse to unite antiquarian research with the cultivation of the belles lettres. We have not, however, seen any where so concise, just, and elegant an account of the origin and progress of romances as in D'Irseil's Curiosities of Literature. "Romance (says this writer) has been elegantly defined the offspring of fiction and love. Men of learning have amused themselves with tracing the epochs of romances. In this
ment; and some have fancied that it may have existed as far back as the time of Aristotle; Dearchus, one of his disciples, having written several works of this amusing species.

Let us, however, be satisfied in deriving it from the Theagenes and Chariclea of Heliodorus, a bishop who lived in the 4th century, and whose work has been lately translated. This elegant prelate was the Grecian Feneleon (A). Beautiful as these compositions are when the imagination of the writer is sufficiently floried with accurate observations on human nature, in their birth, like many of the fine arts, they found in the zealots of religion men who opposed their progress. However Heliodorus may have delighted those who were not insensible to the felicities of a fine imagination, and to the enchanting eveligies of style, he raised himself, among his brother ecclesiastics, enemies; who at length so far prevailed, that it was declared by a synod, that his performance was dangerous to young persons, and that if the author did not suppress it, he must resign his bishopric. We are told he preferred his romance to his bishopric. Even so late as in Racine’s time, it was held a crime to peruse these unhallowed pages. He informs us, that the first effusions of his muse were in consequence of studying that ancient romance, which his master observing him to devour with the keenness of a famished man, he caught it from his hands and flung it in the fire; a second copy, experienced the same fate. What could Racine do? He bought a third, and took the precaution of devouring it secretly till he got it by heart; after which he offered it to his master with a smile to burn, if he chose, like the others.

The decision of these bigots was founded in their opinion of the immorality of such works. They alleged, that the writers paint too warmly to the imagination; and in general, by the freedom of their representations, hover on the borders of indecency. This century is certainly well-founded. Many of the old romances, and even of the dramas, acted in Europe two centuries ago, are such as common prostitutes would in this age think indecent. But we are at present concerned with the origin of romance.

The learned Fleury thinks that they were not known till the 12th century, and gives as their original the history of the dukes of Normandy. Verdier, whose opinion is of no great weight, says the invention of romance was owing to the Normans of France; and that these fictions being originally written in the old Norman language, they were entitled Normances; the name was afterwards altered to that of Romances. The Spaniards, who borrowed them from the French, called them Romances, which also did the Italians.

Dom Rivet, one of the learned associates of the congregation of St. Maur, authors of the Literary History of France, fixes their origin in the 10th century. He says, that the most ancient romance known was one which appeared in the middle of that century, under the title of Philomena, or the Beloved. This romance contains the pretended exploits of Charlemagne before Narbonne. At Touloupe, he tells us, they have preserved a copy of the Philomena in its original language; that is to say, the Romanz or polished; such as was then spoken at court. They preferred this language to the Latin, which was then that of the common people, but vitiated with their corruptions.

So far have we travelled on the road of conjecture: we shall now turn into the path of fact. It is certain that these compositions derive their name from the language in which they were first written. Abbé Irald has given us the character of the earliest romances, which we shall transcribe; for to add to what is well expressed, however it may please the vanity of a writer, seldom tends to the gratification of the reader.

The first romances were a monitorious assemblage of histories, in which truth and fiction were equally blended, but all without probability; a composition of amorous adventures, and all the extravagant ideas of chivalry. The incidents are infinitely multiplied; defect of imitation, of order, and art. These are the ancient and miserable romances which Cervantes, in his celebrated satirical romance of Don Quixote, has covered with an eternal ridicule.

It is, however, from these productions rather in their improved state, that poets of all nations have drawn their richest inventions. The agreeable wildness of that fancy which characterized the eastern nations was caught by the crusaders. When they returned home, they mingled in their own the customs of each country. The Saracens, who were men like themselves, because they were of another religion, and were therefore their enemies, were pictured under the tremendous form of Paynim Giants. The credulous reader of that day followed with trembling anxiety the Red-cross Knight. It was then that fiction embellished religion, and religion invigorated fiction. Such incidents have enlivened the cantos of Ariosto, and adorned the epic of Tasso. Spenser is the child of their creation; and it is certain that we are indebted to them for some of the bold and strong touches of Milton.

Other circumstances however have been assigned as the sources of these extravagant fictions. Castles were erected to repulse the vagrant attacks of the Normans, and in France (from the year 768 to 987) these places became fatal to the public repose. The petty despots, who raised these castles, pillaged whoever passed, and carried off the females who pleased them. Rapine, of every kind, was the privilege of Lords! Mezeray observes, that it is from these circumstances romances have
"We must now turn our contemplation to the French romances of the 15th century. They were then carried to a point of perfection, which as romances they cannot exceed. To this the Atriola of D’Urfe greatly contributed. It was followed by the illustrious Bassi, the great Cyrus, Clelia, &c., which, though not adapted to the present age, gave celebrity to their authors. Their style, as well as that of the Atriola, is diffuse and insipid. Zaide (attributed by some to Segrais, but by Huet to Madame La Fayette) and the princess of Cleves are translated, and though they are masterpieces of the kind, were never popular in our country, and are little adapted to its genius.

"It is not surprising that romances have been regarded as pernicious to good sense, morals, taste, and literature. It was in this light that they were considered by Boileau; because a few had succeeded, a crowd imitated their examples. Gomberville and Scudery, and a few more were admired; but the satirist disdained the illusion. This he did most effectually by a dialogue, in which he ridicules those citizens of a certain district, whose characters were concealed in these romances, under the names of Bruns, Horace Coles, Lucretius, and Clelia. This dialogue he only read to his friends, and did not give it for a long time to the public, as he esteemed mademoiselle de Scudery; but when at length it was published, it united all the romance writers against our satirist.

"From romances, which had now exhausted the patience of the public, sprung novels. They attempted to allure attention by this inviting title, and reducing their works from ten to two volumes. The name of romance disgusted; and they substituted those of histories, lives, memoirs, and adventures. In these works (observes Frail) they quitted the unnatural incidents, the heroic projects, the complicated and endless intrigues, and the exertion of noble passions; heroes were not now taken from the throne, they were fought for even amongst the lowest ranks of the people. On this subject, I shall only observe, that a novel is a very dangerous poison in the hand of a libertine; it may be a fruitfull medicine in that of a virtuous writer." See Novel.

ROMAGNA, a province of Italy, in the pope’s territories, bounded on the north by the Ferraresi, on the south by Tuscany and the duchy of Urbino, on the east by the Gulf of Venice, and on the west by the Bolognesi and a part of Tuscany. It is fertile in corn, wine, oil, fine fruits, and pastures. It has also mines, mineral waters, and salt-works, which make its principal revenue. Ravenna is the capital town.

ROMANO (Giulia), a famous painter, was the diciple of Raphael, who had such an affectation for him, that he appointed him, with John Francis, Penzi, his heir. His conceptions were more extraordinary and more elevated than even those of his master, but not fo natural. He was wonderful in the choice of attitudes; but did not perfectly understand the lights and shades, and is frequently harsh and ungraceful. The folds of his draperies, says Du Fresnoy, are neither beautiful nor great, easy nor natural, but all extravagant, like the fantastic habits of comedians. He was, however, superior to most painters, by his profound knowledge of antiquity; and, by converting with the works of the most excellent poets, particularly Homer, he made himself master of the qualifications necessarily required in a great designer. Julio Romano was also well skilled in architecture. He was employed by cardinal de Medicis, who was afterwards pope under the name of Clement VII.; and afterwards went to Mantua, whither he was invited by Frederic Gonzaga, marquis of that city, in order to avoid his being justly punished for his having drawn at Rome the deligns of 20 obfecn plates, engraved by Mark Antony, to which Aretine added the fame number of sonnets. Julio Romano embellifhed the city of Mantua with many of his performances both in painting and architecture; and died in that city in 1545, at 54 years of age, much regretted by the marquis, who had an extraordinary friendship for him.

ROME, a very ancient and celebrated city of Italy, situated on the river Tiber, in E. Long. 13°. N. Lat. 41° 45′; the capital of the empire of the Latins, and famous in modern history for being the centre of an ecclesiastical tyranny, by which for many ages the greatest part of the world was held in subjection.

The ancient Romans derived their origin from Æneas the Trojan hero; and though some historians pretend to treat his voyage into Italy as a mere fable, yet no sufficient reasons for rejecting this account have been offered, nor has any more probable history of the origin of the Roman name been given; so that, without entering into the dispute, we shall proceed to the history of Æneas and his successors as they are recorded by the generality of Latin writers.

When the Greeks, by the treachery of the sons of Antenor, or by whatever other means it happened, were become masters of Troy, Æneas with the forces under his command retired into the forrests of the city, and defended it bravely for some time; but yielding at length to necessity, he conveyed away his gods, his father, wife, and children, with every thing he had that was valuable, and, followed by a numerous crowd of Trojans, fled to the strong places of Mount Ida. His master those of his countrymen, who were more anxious than the rest to preserve their liberty, flocked to him from the several towns of Troas. His army thus augmented and advantageously posted, he continued quiet, waiting for the departure of the Greeks, who, it was imagined, would return home as soon as they had pillaged the country. But there, after they had enriched themselves with the spoils of Troy and of the neighbouring towns, turned their arms against the fugitives, resolving to attack them in their strong-holds upon the mountain. Æneas, to avoid the hazard of being forced in his last refuge, had recourse to negociation; and, by his heralds, intreated the enemy not to constring him to a battle. Peace was granted him on condition that he with his followers quitted the Trojan territories; and th.e Greeks, on their part, promised not to molest him in his retreat, but to let him safely pass through any country within the extent of their domination.

Upon this assurance Æneas equipped a fleet, in order to seek a settlement in some foreign land. We are told, that at his departure he left his eldest son Anchises with the Daedalites, a people of Salamis, of whom it is decreted to have him for their king; but that the young prince did not remain long with them: for when Scamandrius (Asfanax), with the rest of the Hecatomorphæ whom Neoptolemus permitted to return home from Greece, repaired to him, he put himself at their head, and led them back to their native country.

The Trojan having crossed the Hellespont, arrived in the peninsula of Pallene, where he built a city, called from him Ænida, and left in it a part of that multitude which had followed him. From thence he sailed to Delos: and thence to Cythera, where he erected a temple to Venus. He built another to the same goddesses in Zycnthus, in which island he likewise inflated games, called the races of Æneas and Venus: the statues of both, says Dionylius, are standing to this day. In Leucas, where the Trojans landed, was to be seen, in the fame author's time, a temple erected to Venus the mother of Æneas. Nor were Archimedes and Amphitryon, without monuments that testified his arrival in those places. At Dodona were found, among the trees, upon which the name of the Trojan hero, who had made an offering of them to Jupiter, was engraved in old characters. Not far from Butthoros, in Epirus, a Trojan camp which had escaped the injuries of time, retained the name of Troja. All these antiquities, still subsisting in the reign of Augustus, were then looked upon as indubitable proofs of Æneas's voyage to Epirus: "and that he came into Italy (adds the fame Dionylius) we have the concurrent testimony of all the Romans; the ceremonies they observe in their sacrifices and festivities bear witness to it, as also the Sibylline books, the Python oracles, and many other things which nobody can reasonably reject as invented merely for ornament."

The first land of Italy which Æneas made, after crossing the Ionian sea, was cape Minerva, in Iapygia; and here he went on shore. Sailing afterwards from hence, and coasting along the south-east of Italy and the east and south sides of Sicily, he arrived with his fleet either by choice or by force of necessity at the port of Drepanum in that island. Elymus and Egeus, who had escaped from Troy a little before him, had brought a Trojan colony to this place. Æneas augmented it by a good number of his followers, whom, pleased to have found a safe resting place after many dangers and fatiguing voyages, he willingly left behind him at their request; though certain authors pretend that he was constrained to it by the difficulty of transporting them, because some Trojan women, weary of the sea, had burnt a considerable part of his ships.

Æneas, leaving Drepanum, steered his course for Italy.
Italy across the Tyrrenian sea. To the cape where he first landed, he gave the name Palinurus, from one of his pilots who died there. The little island of Leucadia, not far distant, whither he sailed next, got its name in like manner from a daughter of Æneas' father, who there ended her days. The port of Misenum, the island of Procynthia, and the promontory of Cajaia where he successively arrived were so called from being the burial places, the first of a noble Trojan his companion, the second of his kinswoman, and the third of his nurse. At length the Trojan prince and his chosen bands finished their tedious and painful voyages on the coast of the once famous Latium. This was a small territory on the east side of the river Tiber, containing a part of the present Campagna di Roma; Latinius was the king of it; its capital town, Laurentum; his subjects, a people who, till his time called Aborigines, had from him taken the name of Latins. Here, far removed from their implacable enemies the Greeks, Æneas and his followers undertook to raise a second Troy: they fortified a camp near the mouth of the Tiber, gave it the name of Troy, and settled themselves with the hopes of a quiet settlement, and a period to all their unhappy adventures.

When Æneas arrived in Italy, Latinus was engaged in a war with the Rutuli, a neighbouring people, in which he was attended but with very indifferent success, when news was brought him that a foreign army had made a defeat on his coasts, pilaged the maritime part of his dominions, and were fortifying themselves in a camp at a small distance from the sea. Hereupon he marched against them with all his forces, hoping to oblige them to repulse and abandon his dominions, without meeting with any great resistance from a band of vagabonds, as he supposed, or pirates, come only to seek for plunder; but finding them, as he drew near, well-armed, and regularly drawn up, he thought it advisable to forbear engaging troops that appeared so well disciplined; and, instead of venturing a battle, to desire a parley. In this conference Latinus understanding who they were, and being at the same time struck with terror, and touched with compassion for those brave but unfortunate men, entered into a treaty with them, and assigned them a tract of land for a settlement, on condition that they should employ their arms and exert their valour in defence of his dominions, and look upon the Rutuli as a common enemy. This condition Æneas readily accepted; and complied with his engagement faithfully, that Latinus came at length to repose an entire confidence in the trojan; and in proof of it gave him Lavinia, his daughter and only child; in marriage, fecuring to him by that means the succeffion to the throne of Latium. Æneas, to testify his gratitude to Latinus, and affection for Lavinia, gave her name to the camp he had pitched; and instead of Troy called it Lavium. The Trojans followed the example of their leader; and by making alliances with Latini families, became, in a short time, one and the same people with the Latins.

In the mean time Turnus, the queen's nephew, who had been brought up in the palace under the eye of Latinus, and entertained hopes of marrying Lavinia and succeeding to the throne, seeing the prince belov'd on a stranger, and all his views defeated, went over to the Rutuli; and by stirring them up, brought on a battle between them and the Latins, in which both he and Latinus were killed. Thus Æneas, by the death of his father-in-law, and by that of a troublesome rival, came into the quiet possession of the kingdom of Latium, which he governed with great wisdom, and transmitted to his posterity.

Æneas is said to have reigned three years; during which time he established the worship of the gods of his own country, and to the religion of the Latins added that of Troy. The two Palladiums, which had been the protectors of that city, became the tutelary deities of Lavinium, and, in after ages, of the whole Roman empire. The worship of Vesta was likewise introduced by Æneas; and virgins, from her called Vestals, were appointed to keep a fire continually burning in honour of that goddess. Jupiter, Venus, and many other deities who had been revered in Troy, became, in all likelihood, known to the Latins by means of Æneas; which gave occasion to the poets of representing him under the character of a pious hero.

While Æneas was thus employed, the Rutuli, ancient enemies of the Latin name, entering into an alliance with Mezentius king of the Tyrrenians, took the field with a design to drive out those new-comers, of whom power they began to conceive no small jealousy. Æneas Marched out against them at the head of his Trojans and Latins. Hereupon a battle ensued, which lasted till night; when Æneas being brought to the banks of the Numicus, which ran close by Lavinium, and forced into that river, was there drowned. The Trojans concealed his body; and pretending that he had vanished away on a sudden, made him pass for a deity among his credulous subjects, who accordingly erected a temple to him under the title of Jupiter Indiges.

Upon the death of Æneas, his son Euryoleon, called also Ascanius and Iulus, ascended the throne; but as by his son, the young king did not think it advisable to venture a battle in the very beginning of his reign, with a formidable enemy, who promised himself great success from the death of Æneas, he had the prudence to confine himself within the walls of Lavinium, and to try whether he could, by an honourable treaty, put an end to so dangerous war. But the haughty Mezentius demanding of the Latins, as one of the conditions of a peace, that they should pay him yearly, by way of tribute, all the wine produced in the territory of Latium, Ascanius rejected the proposal with the utmost indignation; and having caused all the vines throughout his dominions to be consecrated to Jupiter, and by that means put it out of his power to comply with the enemy's request, he resolved to make a vigorous sally, and try whether he could, by force of arms, bring the insulting Tyrrenian to more reasonable terms. The main body of the enemy's army was encamped at a small distance from Lavinium; but Lausus, the son of Mezentius, with the flower of their youth under his command, lay entrenched at the very gates of the city. The Trojans, who had been long accustomed to make vigorous sallies, marching out at night, attacked the post where Lausus commanded, forced his encampments, and obliged the troops he had with him to save themselves by flying to the main body of the army encamped on the plain; but the unexpected arrival and overthrow
overthrow of their advance-guard struck them with such terror, that, instead of stopping the flight of their companions, they fled with them, in great disorder, to the neighbouring mountains. The Latins pursu’d them, and in the pursuit Laboüs was killed; whose death fo discouraged Mercurius, that he immediately sued for peace; which was granted him, upon condition, that for the future the Tiber should be the boundary between the Latin and Etrurian territories.

In the mean time Lavinia, who had been left with her child by Aeneas, entertaining a strong jealousy of the ambition of her son-in-law, retired to the woods, and was there peaceably delivered of a son, who, from his father, was named Aeneas, and, from the place of his birth, had the surname of Sylvia; but as the queen’s flight, who had disappeared on a sudden, raised suspicions at Lavinium prejudical to the reputation of Acanthus, he used all possible means to remove them, caused diligent search to be made after Lavinia, calmed her fears, and prevailed upon her to return to the town with her son whom he ever after treated as a brother. Lavinium grew every day more populous; but as it was in reality the patrimony of Lavinia, and the inheritance of her son Sylvius, Acanthus resolved to resign it to them, and build elsewhere another city for himself. This he made the place of his residence, and the capital of his new kingdom, calling it Alba Longa; Alba, from a white fow, which we are told Lavinia had found in the place where it was built; and Longa, to distinguish it from another town of the same name in the country of the Marfis; or rather, because it extended, without having much breadth, the whole length of a lake near which it was built. It was 30 years after the building of Lavinium that Acanthus fixed his abode at Alba; and there he died, after a reign of about 38 years, 12 of which he had reﬁded at his new settlement. He left a son called Iulus; so that between him and Sylvius lay the right of succession to the Latin throne; the latter being the fom, and the former the grandson of Aeneas.

The Latins not thinking it their interest to continue divided, as it were, into two states, resolved to unite Alba and Lavinium into one sovereignty; and as Sylvius was born of Lavinia the daughter of Latins, and had there an undisputed title to the kingdom of his grandfather, whereas the other was but the fom of a stranger, the Latins deposed the crown on Sylvius; and, to make Iulus some amends, decreed to him the sovereign power in affairs of religion; a power which thenceforth continued in his family. Sylvius was succeeded by 13 kings of the same race, who for near 500 years reigned at Alba: but we scarce know any thing of them besides their names, and the years of their respective reigns. Aeneas Sylvius died, after a reign of 29 years. His fon, called also Aeneas Sylvius, governed Latium 31 years. Latium Sylvius, who succeeded him, sware the fepulture for the space of 15 years—Alba reigned 39; Capetus, by Livy named Alfi, 26; Capis, 28; and Capetus, 13. Tiberinus, who succeeded him, engaged in a war which proved fatal to him: for in a battle which was fought on the banks of the Alburnus, he was forced into that river and drowned. From him the river took the name of Tiber, which it has borne ever since. Agrrippa succeeded Tiberinus after a reign of eight years; and left the throne, which he had held 43 years, to Alladius; who reigned 19, and was succeeded by Aventinus, who left his name to the hill Aventinus, where he was interred. Procas, who succeeded him, and reigned 23 years, was the father of Numitor and Amulius; and at his death bequeathed the throne to his elder son Numitor. But Amulius, who surpafted his brother in courage and understanding, drove him from the throne; and to secure it to himself, murdered Agenus, Numitor’s only fon, and confiscated his daughter Rhea Sylvia to the worship of Vesta, by which she was obliged to perpetual virginity. But this precaution proved ineffectual; for as the Vestal was going to a neighbouring spring to fetch water for the performance of a sacrifice to Mars, she was met and ravished by a man in a military habit, like that in which the god Mars is represented. Some authors think that this counterfeit Mars was a lover come thither by her appointment; others charge Amulius himself with using this violence to his niece, not so much to gratify his lust, as to have a pretence to destroy her. For ever after he cauféd her to be carefully watched, till she was delivered of two sons; and then exaggerating her crime in an assembly of the people, he prevailed upon them to sentence her to death, and to condemn the fruit of her criminal amour to be thrown into the Tiber. The sentence against Rhea was, according to some authors, changed by Amulius, at the request of Lys and Re- his daughter Anthe, into perpetual confinement, but executed against the twins; who being laid in a wooden trough, and carried to the foot of Mount Palatine, were there turned adrift on the Tiber, which at that time overﬂowed its banks. But the wind and stream proved both so favourable, that at the fall of the water the two infants were left safe on the land, and were there happily found by Faulitus, the chief of the king’s shepherds, and suckled by his wife Acca Laurentia, who for her disorderly life was called Lupus; and this probably gave rise to the fabulous miracle of their being nurfed by a wolf.

As Faulitus was probably well acquainted with the birth of the twins, he took more than ordinary care of their education, and lent them to Gabinus to be inured there in Greek literature. As they grew up, they appeared to have something great in their men and air which commanded respect; and the attendant which they assumed over the other shepherds made them dreaded in the forests, where they exercised a sort of empire. A quarrel happening between the herdmen of Amulius and those of Numitor, the two brothers took the part of the former against the latter; and some blood being shed in the fray, the adverse party, to be revenged on Romulus and Remus (for so the twins were called), on the festival of Lupercalia, surpriz’d Remus, and carried him before Numitor, to be punished according to his deserts. But Numitor feeling himself touched in the prisoner’s favour asked him where he was born, and who were his parents. His answer immediately fructed Numitor with a lively remembrance of his two grand¬ sons: their age, which was about 18 years, agreed with the time when the two infants were exposed upon the Tiber; and there needed no more to change his anger into tenderness.

In the mean time Romulus, eager to rescue his brother, and pursue those who had carried him off, was preparing to be revenged on them; but Faulitus diffused
flued him from it; and on that occasion, disfacing to
him his birth, awakened in his breast sentiments worthy
of his extraction. He resolved, at all adventures, to at-
temp the delivering of his mother and grandmother from
oppression. With this view he acquainted the country
people, over whom he had assumed a kind of over-eign-
ty, and engaged them to come to the city on an ap-
pointed day, and enter it by different gates, prefided
with arms, which they were to conceal. While Romu-
lus was thus disposing everything for the execution of
his design, Numitor made the same discovery to Re-
mus, among his parents, and the oppressions they
groaned under; which & fired him, that he was ready
to embark in any enterprise. But Numitor took care
to moderate the transports of his grandson, and only
directed him to acquaint his brother with what he had
heard from him, and to send him to his house. Romu-
lus soon came, and was followed by Fautilius, who
took with him the trough or skiff in which the twins had
been exposed, to shew it to Numitor: but, as the shep-
der betrayed an air of concern and earnestness in his
looks, he was stopped at the gate of the city, led before
Amulus, and examined concerning his burden. It
was easily known by its make and inscription, which
was still legible; and therefore Fautilius owned what it
was, and confed that the twins were living; but, in
order to gain time, pretended that they were feeding
flocks in a remote defert. In the mean time, the
usurper's death being resolved on, Remus undertook to
raise the city, and Romulus to invict the king's palace.
The country people came at the time appointed; and
formed themselves into companies each containing of 150
men. They had no other ensigns but bundles of hay
hanging upon long poles, which the Latins at that time
called manipuli; and hence came the name of manipu-
lates, originally given to troops raised in the country.
With this tumultuous army Romulus befet the avenues
of the palace, forced the guard, and having killed the
tyant, after he had reigned 42 years, restored his
grandfather to the throne.

Affairs being thus settled at Alba, the two bro-
thers, by the advice of Numitor, undertook the found-
ing of a new colony. The king bestowed on them
those lands near the Tiber where they had been
brought up, supplied them with all manner of instru-
ments for breaking up ground, with flaxes, and beaks
of burden, and granted full liberty to his subjects
to join them. Hereupon most of the Trojans of whom
there still remained 50 families in Augustus's time,
chose to follow the fortune of Romulus and Remus, as
did also the inhabitants of Palantium and Saturnia,
two small towns. For the more speedy carrying on of
the work, it was thought proper to divide those who
were to be employed in the building of the city into
two companies, one under the command of Romulus,
the other of Remus; but this division, which was des-
dsigned purely with a view to the public welfare, and
that the two parties might work by way of emulation,
gave birth to two factions, and produced a jealousy be-
tween the two brothers, which broke out when they
came to choose a place for the building of their new
city; for Remus was for the Aventine, and Romulus for
the Palantine mount. Upon which, the matter be-
going referred to their grandfather, he advised the con-
tending parties to have recourse to the gods, and to
put an end to the dispute by augury, to which he was
himself greatly addicted. The day appointed for the
ceremony being come, the brothers placed themselves
each upon his hill; and it was agreed, that whoever
should be the first light, or the greatest number of
vultures should gain his cause. After the two rivals
had waited some time for the appearance of a favourable
omen, Romulus, before any had appeared, sent to acqi-
unt his brother that he had seen some vultures; but
Remus, having already fixed, told him that the rest of
the messengers were yet on their way, heightened, on their
arrival, to mount Palatine, to examine the truth of what
they had told him. He had no sooner got thither, than
by an unexpected good fortune twelve vultures ap-
peared to Romulus. These he immediately showed to his
brother; and, transported with joy, desired him to
judge himself of the truth of what his messengers had
told him. However, Remus discovered the deceit,
and, being told that Romulus had not seen the twelve
vultures till after he had seen fix, he inficted on the time
of his seeing them, and the other on the number of
birds he had seen. This widened the breach between
the two brothers; and, their parties being divided,
while each man espoused the cause of his leader, the
dispute grew so warm, that, from words they came at
length to blows. The shepherd Fautulus, who was
equally dear to both the brothers, endeavouring to
part the combatants, was by an unknown hand laid
dead on the spot. Some writers tell us, that Remus
likewise left his life in the fray; but the greater num-
ber place his death later, and say that he was killed by
one Fabius, for having, in defence, leaped over the
wall of the new city: but Livy says, the more com-
mon report was, that Remus fell by the hand of his
brother.

Romulus, being now head of the colony, by hav-
...
As to the exact year of the foundation of Rome, there is a great disagreement among historians and chroniclers. Fabius Pictor, the most ancient of all the Roman writers, places it in the end of the Seventh Olympiad; this is, according to the computation of Ulfher, in the year 3256, of the flood 1600, and 748 before the Christian æra. The Romans, if we may so call them, began to build, as Plutarch and others inform us, on the 21st of April; which day was then consecrated to Pales, goddess of the shepherds; whence the festival of Pales, and that of the foundation of the city, were afterwards jointly celebrated at Rome.

When Rome had received the utmost perfection which its poor and rude founder could give it, it consisted of about 1000 houses, or rather huts; and was properly speaking a beggarly village, whereof the principal inhabitants followed the plough, being obliged to cultivate with their own hands the ungrateful soil of a barren country which they had shared among themselves. Even the walls of Romulus's palace were made of rushes, and covered with thatch. As every one had chosen his ground to build upon, without any regard to the regularity and beauty of the whole, the streets, if we may so call them, were both crooked and narrow. In short, Rome, till it was rebuilt after the burning of it by the Gauls, was rather a disorderly heap of huts, than a city built with any regularity or order.

As soon as the building of the city was finished, Romulus assembled the people, and desired them to choose what kind of government they would obey. At that time monarchy was the unanimous voice of the Romans, and Romulus was elected king. Before he ascended the throne, however, he consulted the will of the gods by augury; and having received a favourable answer, it thence became an established custom to have recourse to augury before the raising any one to the dignity of king, priest, or any public employment. After this he applied himself to the establishment of good order and subordination among his subjects. He put on a habit of distinction for himself, appointed 12 lictors to attend him as guards, divided his subjects, who at this time consisted only of 33,000 men, into curiae, decuriae, patricians, plebeians, patres, clients, &c. for an account of which, see these articles as they occur in the order of the alphabet. After this he formed a senate consisting of 100 persons, chosen from among the patricians; and a guard of 300 young men called curiae, who attended the king, and fought either on foot or on horseback as occasion required. The king's office at home was to take care of religious affairs, to be the guardian of laws and customs; to decide the weightier causes between man and man, referring those of smaller moment to the senate; to call together the senators, and assemble the people, first delivering his own opinion concerning the affair he proposed, and then ratifying by his consent what was agreed on by the majority. Abroad, and in the time of war, he was to command the army with absolute authority, and to take care of the public money. The senate were not only to be judges in matters of small importance, but to debate and resolve upon such public affairs as the king proposed, and to determine them by a plurality of voices. The people were allowed to create magistrates, enact laws, and resolve upon any war which the king proposed; but in all these things the content of the senate was necessary.

Romulus next proceeded to settle the religious affairs of his people. Many of the Trojan and Phrygian duties were added to those whom the Aborigines or Italian natives already worshipped. He chose priests, instituted festivals, and laid the foundation of a regular system of religion; after which, as his colony was still thinly peopled, he opened an asylum for fugitive slaves, homicides, outlaws, and debtors. Thence, however, he did not at first receive within the walls, but appointed for their habitation the hill Saturnius called afterwards Capitolinus, on which he erected a temple to a divinity of his own invention, whom he named the Asylan god, under whose protection all criminals were to live securely. But afterwards, when the city was enlarged, the asylum was inclosed within the walls, and those who dwelt in it included among the citizens of Rome.

When Romulus had thus settled every thing relating to his new colony, it was found that a supply of women was wanting to perpetuate its duration. This occasioned some difficulty; for the neighbouring nations refused to give their daughters in marriage to such a crew of vagabonds as had settled in Rome; wherefore Romulus at last resolved upon the following expedition. By the advice of his grandfather Numitor, and with the consent of the senate, he proclaimed a solemn feast and public games in honour of the Equestrian Neptune called Conus. This occasioned a great concourse of people, who flocked from the adjacent parts to behold these pompous shows. Together with the new city. But, in the midst of the solemnity, the Romans, rushing in with their swords drawn, seized all the young women, to the number of 683, for whom Romulus chose husbands. Among all those who were thus seized, only one married woman, named Herflia, was found; and Romulus is said to have kept her for himself.

This violence soon brought on a war with the neighbouring nations. Acron king of Cænea, a city on war with the confines of Latium, having entered into a league with the inhabitants of Cæna and Antemnes, invaded the Roman territories. Romulus marched against them without delay, defeated the confederate army, killed their king in single combat, decreed himself a triumph, and consecrated the spoils of Acron to Jupiter Feretrius, under the name of Opima Spolia. The city of Cænea was razed to the ground, and the inhabitants transplanted to Rome, where they were admitted to the privileges of citizens. The king then marched with one legion (conspicuous at this time of 3000 foot and 300 horse) against the Cæna and Antemnes, both of whom he defeated in battle, and transplanted the inhabitants to Rome; which being incapable of holding such a number, Romulus took in the hill Saturnius abovementioned, on the top of which he built a citadel, committing the care of it to a noble Roman named Tarpeius. The citadel was surrounded on all sides with ramparts and towers, which equally commanded the city and country. From the foot of this hill Saturnius a wall was carried on quite to the Tiber, and a gate opened
Invasion of their king Titus Tatius. Romulus, having received the deputation to Romulus, demanding restitution of the young women who had been carried off; and, upon his refusal, marched to Rome with an army of 25,000 foot and 1,000 horse, under the command of their king Titus Tatius. Romulus, having received supplies from Numitor and from Hetruria, likewise took the field, with 20,000 foot and 800 horse, with whom he seized an advantageous post, and fortified himself so strongly, that he could not be attacked. The Sabine monarch, perceiving the military skill of Romulus, began to be apprehensive of the event; but was extricated out of his difficulties by the treachery of Tarpeia daughter to the governor of the citadel, who agreed to betray that important fortress to the enemy, on condition of being rewarded with the bracelets which the Sabines wore on their left arms. But when once they became masters of this important place, they are said to have crucified Tarpeia under the weight of their bucklers, pretending that thus they discharged their promise, as they wore their bucklers also on their left arms. The possession of the citadel enabled the Sabines to carry on the war with more success; but, at last, in a general engagement, they had the misfortune to be driven back into the citadel, whither they were pursued by the Romans, who expected to have retaken that important post; but the enemy, rolling down great stones from the top of the hill, wounded Romulus on the head, so that he was carried insensible out of the field of battle, while, in the mean time, his troops were repulsed, and pursued to the gates of Rome. However, the king soon recovering himself, encouraged his routed troops, and drove the enemy back into the citadel. But while the two nations were thus fiercely contending, the women, for whose cause the war had been commenced, undertook the office of mediators; and having obtained leave from the senate, marched in a body to the camp of the Sabines, where they pleaded the cause of their husbands so effectually, that a treaty of union between the two nations was fet on foot, and a peace was at last concluded, on the following terms. 1. That the two kings should reign jointly at Rome. 2. That the city should still, from Romulus, be called Rome; but the inhabitants QUiTIES, a name till then peculiar to the Sabines. 3. That the two nations should become one; and that the Sabines should be made free in Rome, and enjoy all the privileges of Roman citizens. As Rome was chiefly indebted for this incease of her power and splendor to the Sabine women, honourable privileges and marks of distinction were allowed them. Every one was commanded to give way to them; in capital causes they were exempted from the jurisdiction of the ordinary judges; and their children were allowed to wear a golden ball hanging from their necks, and a particular kind of robe called prestita, to distinguish them from the vulgar.

The two kings reigned with great harmony for the space of five years; during which time the only military exploit they accomplished was the reduction of the city of Cameria at a small distance from Rome. Four thousand of the Camerini were transplanted to Rome, and a Roman colony sent to peoplene Cameria; soon after which the Sabine king was murdered by the Livians, on account of his granting protection to some of his friends who had ravaged their territories. The Livians, wearing the sentiment of Romulus, delivered up the affaillants into his hands; but he sent them back unpunished, which gave occasion to suspect that he was not displeased with the death of his colleague.

Soon after the death of Tatius, Rome was afflicted with famine and pestilence, which encouraged the Camerini to revolt; but Romulus, marching against them suddenly, defeated them with the loss of 6,000 men. After which he attacked the Fidenates, whose city stood about five miles from Rome, took their capital, and made it a Roman colony. This drew upon him the resentment of the Veientes, a powerful nation in the neighbourhood, who claimed Fidenza as within their jurisdiction; but their forces were defeated in two engagements, and a great number of them taken prisoners, they were obliged to sue for peace. Romulus granted them a truce for 100 years, on condition that they delivered to him seven small towns on the Tiber, together with some salt-ponds near the mouth of that river, and sent 50 of their chief citizens as hostages to Rome. The prisoners taken in this war were all sold for slaves.

The remaining part of the life of Romulus was spent in making laws for the good of his people; but towards the latter end of his reign, being elated with success, he began to enlarge the bounds formerly set to his prerogative, and to behave in an arbitrary manner. He paid no longer any regard to the voice of the senate, but assembled them only for form's sake to ratify his commands. The senate therefore conpired to destroy him, and accomplished their purpose while he was reviewing his troops, and drove the enemy back into the citadel. But while the two nations were thus fiercely contending, the women, for whose cause the war had been commenced, undertook the office of mediators; and having obtained leave from the senate, marched in a body to the camp of the Sabines, where they pleaded the cause of their husbands so effectually, that a treaty of union between the two nations was set on foot, and a peace was at last concluded, on the following terms. 1. That the two kings should reign jointly at Rome. 2. That the city should still, from Romulus, be called Rome; but the inhabitants QuiTIES, a name till then peculiar to the Sabines. 3. That the two nations should become one; and that the Sabines should be made free in Rome, and enjoy all the privileges of Roman citizens. As Rome was chiefly indebted for this increase of her power and splendor to the Sabine women, honourable privileges and marks of distinction were allowed them. Every one was commanded to give way to them; in capital causes they were exempted from the jurisdiction of the ordinary judges; and their children were allowed to wear a golden ball hanging from their necks, and a particular kind of robe called prestita, to distinguish them from the vulgar.

Rome. [332]

His death followed by an interregnum.

Romulus had divided his reign into ten months, which, according to Plutarch, had no certain or equal number of days; some consisting of 20, some of 35, &c. However, by other historians, we are informed that he allotted to March, May, Quintilis, and October, 31 days; to April, June, Sextilis, November, and December 30; making in all 354 days. But Numa being better acquainted with the celestial motions, added to these the two months of January and February. To compose these two months he added 50 days to the 294; and thus made the year as it will, as it was reckoned in time to be kept at a festival quite opposite to what it had been formerly.

There are all the remarkable transactions of the succeeding reign of Numa, which is said to have continued 43 years; though some think that its duration could not be above 15 or 16. His death was followed by a short interregnum; after which Tullus Hostilius, the son or grandson of the famous Herline, was unanimously chosen king. Being of a bold and fiery temper, he did not long continue to imitate his peaceful predecessor. The Albans, indeed, soon gave him an opportunity of exercising his martial disposition. Celicus, or, as he is called by Livy, Claudia, who was at the head of the Alban republic, jealous of the growing greatness of Rome, privately commissioned some of the most indigent of his subjects to wafte the Roman territory; in consequence of which a Roman army entered the territories of Alba, engaged the robbers, killed many, and took a great number prisoners. A war soon commenced, in consequence of this, between the two nations; but when the armies came in sight of each other, their ardour cooled, neither of them seeming inclined to come to an engagement. This inaction raised a great discontent in the Alban army against Claudia; insomuch that it came to a resolution of giving battle to the Romans next morning, or of forming their trenches if they should decline it. Next morning, however, he was found dead in his bed; after which the Alban chose in his stead one Mettius Fulvius, a man remarkable for his hatred to the Roman name, as Claudia had been before him. Fulvius, however, continued in the same state.
state of inactivity as his predecessor, until he received certain intelligence that the Veientes and Fidenates had resolved to destroy both Romans and Albans when they should be weakened by a battle. Fufetus then resolved to come to an accommodation with the Romans; and, having obtained a conference with Tullus, both seemed equally desirous of avoiding the calamities of war. But, in order to establish the peace on the most perfect foundation, Tullus proposed that all, or at least the chief families in Alba, should remove to Rome; or, in case they were unwilling to leave their native city, that one common council should be established to govern both cities, under the direction of one of the two sovereigns. Fufetus took aside those who attended him, to consult with them about this proposal; but they, though willing to come to an accommodation with Rome, absolutely refused to leave Alba. The only difficulty remaining, then, was to settle which city should have the superiority; and, as this could not be determined by argument, Tullus proposed to determine it by single combat between himself and Fufetus. This proposal, however, the Alban general thought proper to decline; and it was at last agreed, that three champions should be chosen out of each camp to decide the difference. This produced the famous combat between the Horatii and Curatii, by which the sovereignty was decided in favour of Rome. See Horatii.

Tullus now resolved to call the Fidenates to an account for their treacherous behaviour during the war with Alba, and therefore cited them to appear before Rome. They, however, had disdained, and the Romans obtained the victory. They, though willing to come to an accommodation with Rome, absolutely refused to leave Alba. The only difficulty remaining, then, was to settle which city should have the superiority; and, as this could not be determined by argument, Tullus proposed to determine it by single combat between himself and Fufetus. This proposal, however, the Alban general thought proper to decline; and it was at last agreed, that three champions should be chosen out of each camp to decide the difference. This produced the famous combat between the Horatii and Curatii, by which the sovereignty was decided in favour of Rome. See Horatii.

They, however, had disdained, and the Romans obtained the victory. They, though willing to come to an accommodation with Rome, absolutely refused to leave Alba. The only difficulty remaining, then, was to settle which city should have the superiority; and, as this could not be determined by argument, Tullus proposed to determine it by single combat between himself and Fufetus. This proposal, however, the Alban general thought proper to decline; and it was at last agreed, that three champions should be chosen out of each camp to decide the difference. This produced the famous combat between the Horatii and Curatii, by which the sovereignty was decided in favour of Rome. See Horatii.

Tullus now resolved to call the Fidenates to an account for their treacherous behaviour during the war with Alba, and therefore cited them to appear before Rome. They, however, had disdained, and the Romans obtained the victory. They, though willing to come to an accommodation with Rome, absolutely refused to leave Alba. The only difficulty remaining, then, was to settle which city should have the superiority; and, as this could not be determined by argument, Tullus proposed to determine it by single combat between himself and Fufetus. to take care to strengthen his party in the senate by adding another hundred to that body. These were called senatores minorum gentium, because they were chosen out of the plebeians; however, they had the same authority in the senate as the others, and their children were called patricians.

Tarquin was not inferior to any of his predecessors either in his inclination or abilities to carry on a war. As soon as he ascended the throne, he recommenced hostilities with the Latins; from whom he took the cities of Apiole, Cruculum, Nomentum, and Collatia. The inhabitants of Apiole were sold for slaves; but those of Cruculum and Nomentum, who had submitted after their revolt, were treated with great clemency. The inhabitants of Collatia were disarmed, and obliged to pay a large sum of money; the sovereignty of it, in the mean time, being given to Egerius, the son of Arunx, Tarquin's brother; from whence he took the name of Collatina, which he transmitted to his posterity.

Corniculum, another city of Latium, was taken by form, and reduced to ashes. This progress having greatly alarmed the Latins, several of them joined their forces in order to oppose such a formidable enemy; but being defeated in a bloody battle near Fidenae, they were obliged to enter into an alliance with Rome; upon which the Latins having held a national conference, entered into a league with the Hetrurians, and again took the field with a very numerous army.

But Tarquin, having defeated the confederate armies in two very bloody battles, obliged the Latin cities to submit to a kind of dependence on Rome; and, having entered the city in triumph, built the circus maximus with the spoils which he had taken from the enemy.

The war with the Latins was scarce ended, when another commenced with Hetruria. This was accounted the most powerful nation in Italy, and was at that time divided into 12 tribes or lucomonies. These appointed a national assemblie, in which it was decreed that the whole force of Hetruria should be employed against Tarquin; and if any city presumed only to stand neutral, it should be for ever cut off from the national alliance. Thus a great army was raised, with which they ravaged the Roman territory, and took Fidenae by the treachery of some of its inhabitants. Tarquin, not being in a condition to oppose them at first, was obliged to submit to the loss occasioned by their ravages for a whole year; after which he took the field with all the forces he could raise. The Roman army was divided into two bodies, one under the king himself, the other commanded by his nephew Collatinaus. The latter, having divided his forces in order to plunder the country, was defeated; but Tarquin, in two engagements, vanquished the army which opposed him.

He then marched against Fidenae, where he gained a third battle; after which he took the city. Such of the citizens as were suspected to have been concerned in betraying it to the enemy were whipped to death; the rest were sent into banishment, and their lands divided by lot among the Roman soldiers. Tarquin now hastened to oppose the new army of the Hetrurians before their forces could be properly collected; and having come up with them at Eretum, a place about 10 miles from Rome, defeated them with great slaughter, for which victory he was decreed a triumph by the senate; while the enemy, disheartened by so many misfortunes, were glad to sue for peace; which Tarquin readily granted, upon the sole condition of their owning his superiority over them. In Ensigns of royalty which were in use among them, viz. a crown of gold, a throne of ivory, a sceptre with an eagle on the top of it, a tunic embroidered with gold, and adorned with figures of palm-branches, together with a purple robe enriched with flowers of several colours. Tarquin, however, would not wear these magnificnt ornaments till such time as the senate and people had consented to it by an express law. He then applied the regalia to the decoration of his triumph, and never afterwards laid them aside. In this triumph he appeared in a gilt chariot, drawn by four horses, clothed in a purple robe, and a tunic embroidered with gold, a crown on his head, and a sceptre in his hand, attended by 12 dictors with their axes and fasces.

Tarquin, having now obtained some respite from war, applied himself to the beautifying and ornamenting the city. He built the walls of Rome with hewn stone, and erected those famous common fountains which have dexterously been accounted one of the wonders of the world. Rome at this time contained four miles within its compafs, viz. the Palatinus, Tarpeius, Quirinalis, and Caelius. In the valleys between these hills, the rain-water and springs unifying, formed great pools which lay under water the streets and public places.

The mud likewise made the way impassable, infected the air, and rendered the city unhealthy. Tarquin built the common sewerage of the city, by conveying off these waters by subterraneous channels into the Tiber. In doing this, it was necessary to cut through hills and rocks a channel large enough for a navigable stream, and covered with arches strong enough to bear the weight of houses, which were frequently built upon them, and flood as firm as on the most solid foundations. All these arches were made of hard stone, and neither trouble nor expense were spared to make the work durable. Their height and breadth were so considerable, that a cart loaded with hay could easily pass through them under ground. The expense of constructing these fewers was never so thoroughly understood as when it became necessary to repair them; for then the cenfors gave no less than 1000 talents to the person appointed for this purpose.

Besides these great works, Tarquin adorned the forum, surrounding it with galleries in which were shops for tradesmen, and building temples in it for the youth of both sexes, and halls for the administration of public justice. He next engaged in a war with the Sabines, on pretence that they had affifted the Hetrurians. Both armies took the field, and came to an engagement on the confines of Sabinia, without any considerable advantage on either side; neither was any thing of consequence done during the whole campaign. Tarquin then, considering with himself that the Roman forces were very deficient in cavalry, resolved to add some new bodies of knights to those already instituted by Romulus. But this project met with great opposition from the superflitious augurs, as the original division of horse into three bodies had been determined by auguries; and Actius Nepius, the chief of the
the diviners at that time, violently opposed the king's will. On this Tarquin, dextrous to expulse the dectic of these people, summoned Nervius before an assembly of the people, and directed him to show a specimen of his art, by telling the king if what he thought of at that time could be done or not. The augur replied, after confusing his birds, that the thing was very possible. On which Tarquin told him, that he had thought whether it was possible to cut a flint with a razor, pulling at the same time a razor and flint from below his robe. This set the people a-laughing; but Nervius gravely defiring the king to try it, he was surprised to find that the flint yielded to the razor; and that with no much ease as to draw blood from his hand. These people testified their surprize by loud acclamations, and Tarquin himself continued to have a great reverence for augurs ever after. A statute of brafs was erected to the memory of Nervius, which continued till the time of Augustus; the razor and flint were buried near it, under an altar, at which witness were afterwards sworn in civil causes.

This adventure, whatever was the truth of it, caused Tarquin to abandon his design of increasing the number of bodies of horse, and content himself with counting the number in each body. He then renewed the war with the Sabines, ravaged their country defeated them in three pitched battles, obliging them at last to submit to him and put him in possession of their country. In the decline of life he employed himself further decorating the city, building temples, &c. He was affifted in his palace, in the 80th year of his age, by the sons of Ancus Martius, whom he had formerly deprived of the kingdom.

After the death of Tarquin I. his wife Tanaquil preferred the kingdom to her fon-in-law Servius Tullius, by artfully giving out that the king was only stunned, and would soon recover; upon which the sons of Ancus went voluntarily into banishment. The second day after his decease, Servius Tullus heard caufes from the throne in the royal robe, and attended by the lictors; but as he pretended only to supply the king's place till he should recover, and thought it incumbent on him to revenge the wicked attempt upon his life, he summoned the sons of Ancus to appear before his tribunal; and on their non-appearance, caufed them to be declared infamous, and their elates to be confiscatated. After he had thus managed matters for some time in such a manner as to engage the affections of the people, the death of Tarquin was published as a thing that had newly happened, and Servius Tullius assumed the ensigns of royalty, having none to dispute the honour with him.

The new king showed himself every way worthy of the throne. No sooner were the Hetrurians informed of Tarquin's death, than they shook off the yoke; but Servius quickly reduced them to obedience, depriving them of their lands, which he shared among the poor Roman citizens who had none. For this he was decreed a triumph by the people, in spite of the opposition of the senate, who could never be brought to approve of his election to the kingdom, though he was soon after legally chosen by the tribes.

After Servius had obtained the sanction of the popular voice, he marched a second time against the revolted Hetrurians; and having again vanquished them, was decreed another triumph. He then applied himself to the enlarging and adorning the city. To the hills Palatins, Tarpeius, Quirinalis, Coelius, and Aventinianus, he added the Equilinus and Viminalis, fixing his own palace on the Equilinus, in order to draw in habitants thither. He likewise added a fourth tribe, which he called Tribus Equejflue, to those inhabited already in the city, and added a fourth temple, commanding that each of them should have their peculiar temple, tutelary god, and magistrates. Each of them had likewise their peculiar festival, called paga-nalia; when every perfon was to pay into the hands of those who preceded at the sacrifices a piece of money, the men of one kind, the women of another, and the children of a third. By this means an exact computation was made of the men, women, and children, in each tribe.

In the mean time, his two wards, Lucius Tarquinius and Arunx, the grandchildren of Tarquin, being grown up, in order to secure their fidelity, he married them to his two daughters. And though the elder of these daughters, who was of a mild and tractable disposition, resembled in character the younger of his pupils, as the elder of his pupils did the younger of his daughters, who was of a violent and vicious temper, yet he thought it advisable to give his elder daughter to Tarquin, and the younger to Arunx; for by that means he matched them according to their ages, and at the same time hoped that the elder Tullia's sweet disposition would temper Tarquin's impetuosity, and the younger Tullia's vivacity refute the indolence of Arunx.

During the public rejoicing for this double marriage, the twelve lucumonies of Hetruria uniting their forces, attempted to shake off the Roman yoke; but were in several battles defeated by Servius, and obliged to submit to him on the fame conditions on which they had submitted to his predecessor. For this success Servius was honoured with a third triumph.

The king being thus disengaged from a troublesome war, returned to the pursuit of his political schemes; and put in execution that masterpiece of policy which Rome made use of ever after, and which established a perpetual order and regularity in all the members of the state, with respect to wars, to the public revenues, and the suffrages of the comitia. The public supplies had hitherto been raised upon the people at so much an head, without any distinction of rich and poor; whence it likewise followed, that when levies were made for the war, the rich and poor were equally obliged to take the field, according to the order of their tribe; and as they all served at their own expense, the poorer fort could hardly bear the charges of a campaign. Besides, as the most indigent of the people, few themselves burdened with the same taxes as the rich, they pretended to an equal authority in the comitia; so that the election of kings and magistrates, the making of peace or war, and the judging of criminals, were given up into the hands of a populace who were easily corrupted, and had nothing to lose. Servius formed a project to remed...
To this end, he divided the Roman people into five classes; the first class consisted of those whose estates and effects amounted to the value of 10,000 drachmas, or 100,000 ases of brasis; the first way of computing being used by the Greeks, and the latter by the Latins.

This class was subdivided into 80 centuries, or companies of foot. To these Servius joined 18 centuries of Roman knights, who fought on horseback; and appointed fifty considerable bodies of horsemen to be at the head of the first class, because the estates of these knights, without all doubt, exceeded the six necessary to be admitted into it. However, the public supplied them with horses; for which a tax was laid upon widows, who were exempt from all other tributes. This first class, including infantry and cavalry, consisted of 98 centuries. The second class comprehended those whose estates were valued at 5700 drachmas, or 57,000 ases of brasis. It was subdivided into 20 centuries, all foot. To these were added two centuries of carpenters, smiths, and other artificers. In the third class were those who were esteemed worth 5000 drachmas, or 50,000 ases. This class was subdivided into 20 centuries. The fourth class was that of whose estates were rated at the value of 3300 drachmas, or 33,000 ases, and was divided into 20 centuries; to which were added two other centuries of lumpers, and horsemen. The whole army was supplied the whole army with this martial music. The fifth class included those whose estates were worth 1250 drachmas, or 12,500 ases; and this class was divided into 30 centuries. The sixth class comprehended all those who were not worth so much as those of the fifth class: they exceeded in number any other class, but nevertheless were reckoned but as one century.

The king drew from these regulations all the advantages he had expected. Levies for the army were now no longer raised by tribes, nor were taxes laid at so much a head as formerly, but all was levied by centuries. When, for instance, an army of 20,000 men, or a large supply of money, was wanted for the war, each century furnished its quota both of men and money: so that the first class, which contained more centuries, though fewer men, than all the others together, furnished more men and more money for the public service than the whole Roman state besides. And by this means the Roman armies consisted for the most part of the rich citizens of Rome; who, as they had lands and effects to defend, fought with more resolution, while their riches enabled them to bear the expense of a campaign. As it was but just the king should make the first class amends for the weight laid on it, he gave it almost the whole authority in public affairs; changing the comitia by curse, in which every man gave his vote into comitia by centuries in which the majority was not reckoned by single persons, but by centuries, how few ever there might be in a century. Hence the first class, which contained more centuries than the other five together, had every thing at its disposal. The votes of this class were first taken; and if the 98 centuries happened to agree, or only 97 of them, the affair was determined; because these made the majority of the 193 centuries which composed the five classes. If they disagreed, then the second, the third, and the other classes in their order, were called to vote, though there was very seldom any occasion to go lower as the fourth class for a majority of vote: so that by this good order Servius brought the affairs of the state to be determined by the judgment of the most considerable citizens, who undertook the public interest much better than the blind multitude, liable to be imposed upon, and easily corrupted.

And now the people being thus divided into several orders, according to the census or valuation of their estates, Servius resolved to compleat the invention by some public act of religion, that it might be the more respected and the more lasting. Accordingly, all the citizens were commanded to appear, on a day appointed, in the Campus Martius, which was a large plain, lying between the city and the Tiber, formerly consecrated by Romulus to the god Mars. Here the centuries being drawn up in battle, a solemn lustration or expiatory sacrifice was performed in the name of all the people. The sacrifice consisted of a fow, a sheep, and a bull, whence it took the name of suovetaurilia. The whole ceremony was called lustrum, a lustrum: that is, from paying, expiating, clearing, or perhaps from the goddess Luwa, who presided over expiations, and to whom Servius had dedicated a temple.

This wise king considering, that in the space of five years there might be such alterations in the fortunes of private persons as to entitle some to be raised to an higher class, and reduce others to a lower, enjoined that the census should be renewed every five years. As the census was usually closed by the lustrum, the Romans henceforth began to compute time by lustrums, each lustrum containing the space of five years. However, the lustrums were not always regularly observed, but often put off, though the census had been made in the fifth year. Some writers are of opinion, that Servius at this time coined the first money that had ever appeared at Rome; and add, that the circumstances of the issuance probably led him to stamp the figures of the animals there plain on pieces of brass of a certain weight.

The government of the city being thus established, the freedmen in regular a manner, Servius, touched with compas-
and though they were distinguished from the plebeians by their old name of liberti or freemen, yet they enjoyed all the privileges of free citizens. The senate took offence at the regard which the king showed to such mean people, who had but lately flaken off their fetters; but Servius, by a most humane and judicious discourse, entirely appeased the fathers, who passed his institution into a law, which subsisted ever after.

The wife king, having thus established order among the people, undertook at first to reform the royal power itself; his equity, which was the main spring of all his resolutions, leading him to act contrary to his own interest, and to sacrifice one half of the royal authority to the public good. His predecessors had referred to themselves the cognizance of all causes both public and private; but Servius, finding the duties of his office too much for one man to discharge well, committed the cognizance of ordinary suits to the senate, and referred that only of state-crimes to himself.

A bill being now regulated at home, both in the city and country, Servius turned his thoughts abroad, and formed a scheme for attaching the Sabines and Latins to the Romans, by such social ties as should be strengthened by religion. He summoned the Latin and Sabine cities to send their deputies to Rome, to consult about an affair of great importance. When they were come, he proposed to them the building of a temple in honour of Diana, where the Latins and Sabines should meet once a year, and join with the Romans in offering sacrifices to that goddess; that this festival should be followed by a council, in which all disputes between the cities should be amicably determined; that there proper measures should be taken to pursue their common interest; and, lastly, in order to draw the common people thither, a fair should be kept, at which every one might furnish himself with what he wanted. The king's design met with no opposition; the deputies only added to it, that the temple should be an inviolable asylum for the united nations; and that all the cities should contribute toward the expense of building it. It being left to the king to choose a proper place for it, he pitched upon the Aventine hill, where the temple was built, and assemblies annually held in it. The laws which were to be observed in these general meetings were engraved on a pillar of brafs, and were to be seen in Augustus's time, in the Latin tongue, but in Greek characters.

But now Servius was grown old; and the ambition of his fon-in-law Aegus, who placed all his happiness in a private life, to the most villainous enterprise; while her younger fister was ever intriguing Arus, who placed all his happiness in a private life, to the most villainous attempts. She was continually lamenting her fate in being tied to such an indolent husband, and willing the had either continued unmarried, or were become a widow. Similitude of temper and manners, formed, by degrees, a great intimacy between her and Tarquin. At length the propoited nothing left to him but the murdering of her father, fitter, and husband, that they two might meet and ascend the throne together. Soon after, they paved their way to an incestuous marriage, he by poisoning his wife, and she her husband; and then had the affurance to ask the king's and queen's consent to their marriage. Servius and Tarquinia, though they did not give it, were silent, through too much indulgence to a daughter in whom now was their only hope of posterity. But these criminal nuptials were only the first step towards a yet greater iniquity. The wicked ambition of the new-married couple first showed itself against the king: for they publicly declared, that the crown belonged to them; that Servius was an usurer, who, being appointed tutor to Tarquin's grandchildren, had deprived his pupils of their inheritance; that it was high time for an old man, who was but little able to support the weight of public affairs, to give place to a prince who was of a mature age; &c.

The patricians, whom Servius had taken great pleasure in humbling during the whole time of his reign, were easily gained over to Tarquin's party; and, by the help of money, many of the poorer citizens were also brought over to his interest. The king, being informed of their treasonable practices, endeavoured to diffuse his daughter and fon-in-law from such proceedings, which might end in ruin; and exhorted them to wait for the kingdom till his death. But they, despising his counsels and paternal admonitions, resolved to lay their claim before the senate, which Servius was obliged to summon; so that the affair came to a formal process. Tarquin reproached his father-in-law with having ascended the throne without a previous interregnum; and with having bought the votes of the people, and defpised the suffrages of the senate. He then urged his own right of inheritance to the crown, and injustice of Servius, who, being only his guardian, had kept possession of it, when he himself was of an age to govern. Servius answered, that he had been lawfully elected by the people; and that, if there could be any hereditary right to the kingdom, the sons of Aeneas had a much better one than the grandsons of the late king, who must himself have been an usurer. He then referred the whole to an assembly of the people; which being immediately proclaimed all over the city, the forum was soon filled; and Servius harangued the multitude in such a manner as gained all their affections. They all cried out with one voice, Let Servius reign; let him continue to make the Romans happy. Amidst their confused clamours, these words were likewise heard: Let Tarquin perish; let him die; let us kill him. This language frightened him so, that he retired to his house in great haste; while the king was conducted back to his palace with the acclamations of the people.

The ill success of this attempt cooled Tarquin's ardent desire of reigning; but this ambition made him act a new part. He undertook to regain the favour of his father-in-law by carelessness, submissions, and prostitutions of a sincere regard and affection for him; informing that the king, who judged of the policy of others from his own, was sincerely reconciled to him, and tranquillity re-established in the royal family. But it was not long ere Tarquin, roused by the continual reproaches of his wife, began to renew his intrigues among the senators; of whom he had no sooner gained a considerable party, than he clothed himself in the royal robes, and caused the faclces to be carried before him by some of his domestics, crossed the Roman forum, entered the temple where the senate used to meet, and seated himself.

Vol. XVI.
[338]

Tarquin II: a cruel tyrant; receiving, in the very beginning of his reign, the surname of *praedictum*, on account of his capricious humour and haughty behaviour. All controversies whatever were decided by himself and his friends; and he banished, fined, and even executed, whom he pleased. The cenus and lustrum, the division of citizens into classes and centuries, were abolished; and all kinds of assemblies, even those for amusements and marriage, were prohibited, both in town and country. Nay, to such a height did Tarquin carry his incontinence and tyranny, that the most virtuous of the senators went out of their houses, and even the clothes of the inhuman daughter, whence the title and surname of *Tullia* were derived, were cut off on various pretences, that the king might enjoy their estates.

In consequence of this monstrous treachery, Tarquin was looked upon by the Latins as their deliverer, and declared general of the Latin armies; soon after which, the Hernici and two tribes of the Volsci entered into an alliance with him on the same terms. In order to keep these confederates together, Tarquin, with their consent, erected a temple to Jupiter Latiaris on an hill near the ruins of Alba, where he appointed certain feasts called *Feria Latina* to be held on the 27th of April, where the several nations were to sacrifice together, and on no account to commit any hostility against each other during their continuance. The king then proceeded to make war on the rest of the Volsci who had refused to enter into an alliance with him. Some depredations which they had committed in the territo-
ries of the Latins serv'd for a pretence to begin the war; but as Tarquin had no confidence in the Romans, his army was composed only of a small body of them who were incorporated among the Latin auxiliaries. However, he defeated the enemy, took one of their cities by storm, and gave the booty to his followers. He next turned his arms against the Sabines, whom he entirely defeated in two engagements, and made the whole nation tributary; for which exploits he decreed himself two triumphs, and on his return to Rome he employed the populace in finishing the fewers and circus which had been begun by his grandfather Tarquin I.

In the mean time, the perfecutions of Tarquin against his own subjects daily drove some of the most respectable and influential into banishment. A great number of patricians took refuge in Gabii, a city of Latium about 13 miles from Rome; where the inhabitants, touched with compassion for their misfortunes, not only received them with kindness, but began a war with Tarquin on their account. The Gabini seem to have been the most formidable enemies whom the Romans had hitherto met with; since Tarquin was obliged to raise a prodigious bulwark to cover the city on the side of Gabii. The war lasted seven years; during which time, by the mutual devastations committed by the two armies, a great scarcity of provilions took place in Rome. The people soon grew clamorous; and Tarquin being unable either to appease them, or to reduce the Gabini, fell upon the following dishonourable and treacherous expedient. His son Sextus Tarquinius pretended to be on very bad terms with his father, and openly inveighed against him as a tyrant; on which he was proclaimed a rebel, and publicly beaten in the forum. This being reported at the court, and the suspicions of Tarquin, was one M. Junius, who was shewn to the people. The princes took Brutus and Titus to begin the war; both of whom were ever afterwards held in high estimation at Rome, and Tarquin appointed two persons of distinction to take care of them. These were called Duumviri: but their number was afterwards increased to 10, when they were called Decemviri; and then to 15, when they were termed Quindecemviri. At this time also the written civil law had its origin among the Romans; all the statutes enacted by the kings being collected into one body; which, from Papirius the name of the collector, was called the Papirian law. The temple of the Capitol was also finished; for which purpose the most skilful architects and workmen were brought from Hetruria, the populace being obliged to serve them in the most laborious parts.

We now come to the important revolution which put an end to the regal power at Rome, and introduced a new form of government, to which this city is allowed to owe the greatest part of her grandeur. Tarquin, as we have already seen, had left himself no friends among the rich citizens, by reason of the oppression under which he made them labour; and the populace were equally dissatisfied on account of their being obliged to labour in his public works. Among the many persons of distinction who had been sacrificed to the avarice or frugality of Tarquin, was one M. Junius, who had married the daughter of Tarquin I. This nobleman had a son named L. Junius Brutus, who escaped the cruelty of the tyrant by pretending to be an idiot, which part he had ever since continued to act. Soon after the finishing of the works abovementioned, a violent plague happening to break out at Rome, Tarquin sent his sons Titus and Arunx to consult the oracle of Delphi; and the princes took Brutus along with them, to divert themselves with his pretended folly by the aduertures of the Aitolian stock, a flock of elders, which occupied much laughter. However, he had the precaution to infuse into the gold winder within the flock; and to this probably it was owing that the priests gave the princes the following riddle, that he who should find the king's mother should succeed Tarquin in the government of Rome. This answer had been given to their inquiries concerning the succession; upon which the two brothers either drew lots which of them should kis her mother at their return, or agreed to do it at once, that both might reign jointly: but Brutus, imagining the oracle had another meaning, fell down and killed the earth, the common mother of all living. This, in all probability, the priests had meant; and had given the answer on purpose to have another proof of Brutus's ingenuity, which had already disdovered itself, by his offering the elder son a treaty of alliance with them.

On the return of the princes to Rome, they found their father engaged in a war with the Rutuli. The treasury being exhausted by the sums which Tarquin had expended in his public works, he had marched to

U b 2
Arden, the capital of that nation, which lay about 20 miles from Rome, in hopes of taking it without opposition. Contrary to his expedition, however, he was obliged to besiege it in form; and this constrained him to lay a heavy tax upon his subjects, which increased the number of malcontents, and disposed every thing for a revolt. As the siege was carried on very slowly, the general officers frequently made entertainments for one another in their quarters. One day, when Sextus Tarquinius was entertaining his brothers, the conversation happened to turn upon their wives: every one extolled the good qualities of his own; but Collatinus bellowed such extravagant praises on his Lucretia, that the dispute ended in a kind of quarrel. It was then resolved that they should mount their horses and surprize their wives by their unexpected return. The king's daughters-in-law were employed in feasting and diversion, and seemed much disconcerted by the appearance of their husbands; but Lucretia, though the night was far advanced, was found, with her maids about her, spinning and working in wool. She was not aware of her husband's return, but, as Sextus had brought with him, and they were all pleased with the reception she gave them. As Lucretia was very beautiful, Sextus Tarquinius conceived a passion for her, which resolv'd to satisfy at all events, he soon returned to Collatia in the absence of Lucretia's husband, and was entertained by her with great civility and respect. In the night-time he entered Lucretia's apartment, and threatened her with immediate death if she did not yield to his desires. But finding her not to be intimidated with this menace, he told her, that, if she still resisted in her refusal, she would kill one of her male slaves, and lay him naked by her when she was dead, and then declare to all the world that he had only revenged the injury of Collatinus. On this the virtuous Lucretia (who, it seems, dreaded prostitution more than revenging the injury of Collatinus), said that the dispute ended in a kind of quarrel. It was chlorine, and seemed much disconcerted by the disturbance. If Brutus had concealed under her robe, having previously wrote to her husband to meet her at her father Lucretius's house, where the refu'd to discover the cause of her grief except in a full assembly of her friends and relations. Here, addressing herself to her husband Collatinus, she acquainted him with the whole affair; exhorted them to revenge the injury; and protested that she would not outlive the loss of her honour. Every one present gave her a solemn promise that they would revenge her quarrel; but while they endeavoured to comfort her, the suddenly flung herself to the heart with the dagger which she had concealed under her robe. See CHASTITY.

This extravagant act inflamed beyond measure the minds of all present. Brutus, laying aside his pretended folly, drew the bloody dagger out of Lucretia's body; and, showing it to the assembly, swore by the blood upon it that he would pursue Tarquin and his family with fire and sword: nor would he ever suffer that or any other family to reign in Rome. The same oath was taken by all the company, who were so much surprised at the apparent transition of Brutus from folly to wisdom, that they did whatever he defined them. By his advice the gates of the city were shut, that nobody might go out of it to inform Tarquin of what was going forward; which, as Lucretius had been left governor of the city by Tarquin, was put in execution without difficulty. The corpse of Lucretia was then exposed to public view; and Brutus having made a speech to the people, in which he explained the mystery of his conduct in counterfeiting folly for many years past, proceeded to tell them that the patriots were come to a resolution of deposing the tyrant, and exhorted them to concur in the same design. The people testified their approbation, and called out for arms; but Brutus did not think proper to truct them with arms till he had first obtained a decree of the senate in favour of the design. This was easily procured: the senate enacted that Tarquin had forfeited all the prerogatives belonging to the regal authority, condemned him and all his posterity to perpetual banishment, and devoted to the gods of hell every Roman who should hereafter, by word or deed, endeavour his restoration; and this decree was unanimously confirmed by the curia.

Tarquin being thus deposed, the form of government became the next object. Lucretius was for the present of government declared Interrex; but Brutus being again consulted, declared, that though it was by no means proper for the state to be without supreme magistrates, yet it was equally necessary that the power should not be centered in one man, and that it should not be perpetual. For this reason he proposed, that two magistrates, called consuls, should be elected annually; that the state should thenceforth have the name of republie; that the ensigns of royalty should be abolished; and that the only ensigns of consular dignity should be an ivory chair, a white robe, and 12 lictors for their attendants. However, that he might not utterly abdicate the name of king, he proposed that this title should be given to him who had the superintendency of religious matters, who should thenceforth be called rex facrorum, or king of sacred things.

This scheme of Brutus being approved of, Brutus and Tullius Collatinus were proposed by Lucretius as the two first leaves consuls, and unanimously accepted by the people, who thought it was impossible to find more implacable enemies to the Tarquins. They entered on their office in the year 508 B.C.; and Tullia, perceiving that now all was lost, thought proper to leave the city, and retire to her husband at Ardea. She was suffered to depart without molestation, though the populace hooted at her, and cursed her as she went along. Tarquin, in the mean time, being informed by some who had got out of Rome before the gates were shut, that Brutus was raising commotions to his prejudice, returned in haste to the city, attended only by his sons and a few friends; but, finding the gates shut, and the people in arms on the walls, he returned again to the camp: but here again, to his surprize, he found that the consuls had taken the opportunity of gaining over the army to their interest; so that, being refused admittance into the camp also, he was forced to fly for refuge, at the age of 76, with his wife and three sons, to Gabii, where Sextus had been made king. Here he continued for some time: but not finding the Latins very forward to revenge his caufe, he retired into Hetruria; where, being the country of his mother's family, he hoped to find more friends, and a readier assistance for attempting the recovery of his throne.

The
The Romans now congratulated themselves on their happy deliverance from tyranny. However, as Tarquin had by his policy procured himself many friends abroad, these now became enemies to the Roman name; and, by the defection of their allies, the Roman dominions were left in much the same state as they had been in the time of Romulus. The territory of Rome had always been confined to a very narrow compass. Though almost constantly victorious in war for 243 years, they had not yet gained land enough to supply their city with provisions. The main strength of the state lay in the number of the citizens of Rome; which the custom of transplanting the inhabitants of the conquered cities thither had so prodigiously increased, that it put the Romans in a condition of usurping the authority over other nations, the most inconsiderable of which had an extent of territory far exceeding theirs. By frequent depredations and incursions they so harassed the petty states of Latium and Etruria, that many of them were constrained to enter into treaties with Rome, by which they obliged themselves to furnish her with auxiliaries whenever she should be pleased to invade and pillage the lands of her other neighbours. Submissions of this kind the Romans called making alliances with them, and the useful alliances supplied the want of a larger territory; but now, upon the change of her government, all the allies of Rome forsook her at once, and either stood neutral, or espoused the cause of the banished king; so that she was now obliged to maintain her liberties as she best might.

The new consuls in the mean time took the most effectual methods they could for securing the liberties of the republic. The army which had been employed in the siege of Ardea marched home under the conduct of Herminius and Hortensius, who concluded a truce with the Ardeates for 15 years. The consuls then again assembled the people by centuries, and had the decree of Tarquin’s banishment confirmed; a rex falerium was elected to preside at the sacrifices, and many of the laws of Servius Tullius were revived to the great joy of the people, who were thus restored to their ancient right of voting in all important affairs. Tarquin, however, resolved not to part with his kingdom on such easy terms. Having wandered from city to city in order to move compassion, he at length made Tarquinii the seat of his residence; where he engaged the inhabitants to send an embassy to Rome, with a modest, submissive letter from himself, directed to the Roman people. The ambassadors represented in such strong terms to the senate how reasonable it was to let the king be heard before he was condemned, and the danger which threatened the state from the neighbouring powers if that common justice were refused, that the consuls inclined to bring these agents before the people, and to leave the decision thereof to the curiae; but Valerius, who had been very active in the revolution, strenuously opposed this, and by his influence in the senate got it prevented. As that illustrious body had been greatly thinned by the murders committed by Tarquin, new members were elected from among the knights, and the ancient number of 300 again completed. The old senators had been called patres or “fathers;” and as the names of the new ones were now written on the small roll, the whole body received the name of patres confessi.

The old king was not to be feigned by a single attempt. He prevailed on the inhabitants of Tarquinii to send a second embassy to Rome, under pretence of demanding the estates of the exiles, but with the private instructions to get the confuls affainted. The restoration of the estates of the exiles was approved by Brutus, but Collatinus was so far complying with it; whereas upon Brutus acceded his colleague of treachery, and of a design to bring back the tyrant. The matter was then referred to the people, where it was carried by one vote in favour of the Tarquins. But whilst the people were employed in loading carriages with the effects of the exiles, and in selling what could not be carried off, the ambassadors found means to draw some of the nearest relations of the confuls into a plot with them. There were three young noblemen of the Aquilian family (the sons of Collatinus’s sister), and two of the Vitii (whole sister Brutus had married); and these last engaged Titus and Tiberius, the two sons of Brutus, in the same conspiracy. They all bound themselves by solemn oaths, with the dreadful ceremony of drinking the blood of a murdered man and touching his entrails. They met at the house of the Aquilii, where they wrote letters to Tarquin and gave them to the ambassadors. But though they used all imaginable precaution, their proceedings were overheard by one Vindicius a slave, who immediately communicated the whole to Valerius; upon which all the criminals were apprehended. Brutus froid judge over his own sons; and, notwithstanding the intercession of the whole assembly, and the tears and lamentations of his children, commanded them to be beheaded; nor would he depart till he saw the execution of the sentence. Having performed this piece of heroic barbarity, he quit the tribunal, and left Collatinus to perform the rest. Collatinus, however, being inclined to spare his nephews, allowed them a day to clear themselves; and caused Vindicius, the only witness against them, to be delivered up to his murtherers. This roused the indignation of the people in general, especially of Valerius, who had promised to protect the witnesses; and therefore he refused to deliver him up to the executioners. The multitude called aloud for Brutus to return; which when he had done, he told them that he had executed his two sons in consequence of his own paternal authority over them, but that it belonged to the people to determine the fate of the rest. Accordingly, by a decree of the curiae, all the delinquents suffered as traitors except the ambassadors, who were spared out of respect to their character. The slave Vindicius had his liberty granted him; and was presented with 25,000 asses of brass, in value above 350 Spanish dollars. The decree for refusing the estates of the exiled Tarquins was annulled, their palaces were destroyed, and their lands divided among the ingenuous people. The public only retained a piece of ground near the Campus Martius, which the king had usurped. This they consecrated to Mars, and it afterwards became a common field where the Roman youth exercised themselves in running and wrestling. But after this consecration, the superstitious Romans scrupled to use the corn which they found there ready reaped to their hands; so that, with some trees, it was thrown into the Tiber; and the water being low, it floated in the middle of the river, and began to form a fine island named afterwards Isola Sacra.

The behaviour of Brutus towards his two sons struck such
such a terror into the Romans, that scarce any person dared oppose him; and therefore, as he hated Collatinus, he openly accused him before the people, and without ceremony deposed him from the consulship, banishing him at the same time from Rome. The multitude ac-
quiesced in every thing he said, and refused to hear Collatinus speak in his own defence; so that the con-
ful was on the point of being driven out with ignominy and disgrace, when Lucertius interposed, and prevailed upon Brutus to allow his colleague quietly to resign the fasces, and retire of his own accord from the city. Brutus then, to remove all suspicions of personal en-
mity, preserved a profent of 20 talents out of the public treasury, to which he added five of his own. Collatinus then retired to Lavinium, where he lived in peace, and at last died of old age.

After the abdication of Collatinus, Valerius was chosen in his room; and as his temper agreed much better with Brutus than that of Collatinus, the two consuls li-
ved in great harmony. Nothing, however, could make the de
throned king forego the hope of recovering his king-
dom by force. He at first engaged the Volsci and Tar-
quinienses to join their forces in order to support his rights. The consuls marched out without delay to meet them. Brutus commanded the horfe and Valerius the foot, drawn up in a square battalion. The two armies being in fight of each other, Brutus advanced with no lefs speed; and as both soon discovered Brutus, than he made towards him.

The Volsci were defeated by the Romans conquerors; and the Volsci, being broken, they retired; and of the greater part of the Volsci, found that the Volsci were driven out with ignominy and disgrace, and that they were hated by everyone.

While the Romans were making the most vigorous And vigorous preparations for defence, Porfena, assisted by his son, exerts their army. Arunx and the exiles, marched towards the city at the head of a formidable army, which was quickly joined by a considerable body of Latins under Mamilius, the son-in-law of Tarquin. The consuls and the senate took all imaginable care to supply the common people with provisions, lest famine should induce them to open the gates to Tarquin; and they desired the country people to lodge their effects in the fort Janiculum, which overlooked the city, and which was the only fortified place possessed by the Romans on that side the Tiber. Porfena, however, soon drove the Romans out of this for; upon which the consuls made all their troops pass the river, and drew them up in order of battle to defend the bridge, while Porfena advanced to engage them. The victory was a long time doubtful, but at last the Romans fled. Horatius Coles, nephew of Tarquin, and the con-
ful, with Sp. Lartius and T. Herminius, who had commanded the right-wing, posted themselves at the entrance of the bridge, and for a long time bravely defended it; but at last, the defensive arms of Lartius and Herminius being broken, they retired; and then Horatius desiring them to advise the consuls from him to cut the bridge at the other end, he for a while sustained the attack of the enemy alone. At last, being wounded in the thigh, and the signal given that the bridge was almost broken down, he leaped into the river, and swam across it through a shower of darts.

The Romans, in token of gratitude for this eminent service, erected a statue to him in the temple of Vulcan, gave him as much land as he himself with one yoke of oxen could plough in one day; and each of the inhab-

bitants, to the number of 300,000, gave him the value of as much food as each consumed in a day. But notwithstanding all this, as he had lost one eye, and from his wounds continued lame throughout the remainder of his life, these defects prevented his ever being raised to the consulature, or invested with any military command.

The city was not yet fully invested; but as it was very difficult to find provisions for such a multitude, the inhabitants soon began to be in want. Porfena Rome had no to the consulate, very difficult to find would supply them with provisions if they would take to the camp from whence they had being informed of their difficulties, told them that he women; and

1. Attempt of Mutius Cordus to affiifinate Porfena. He got access to the Hetrurian camp, disguised like a servant, magnificently him for Porfena, instantly leaped upon the tribunal and killed him. But being seized and brought back, he owned his charged with, that he immediately ordered them to bandons rage and disappointment,

2. Treachery of the Tarquins. This notorious piece of treachery in the Tarquins gave Porfena strong suspicions of the badness of their cause. He therefore assembled the chief commanders of the Hetrurians; and having heard in their presence the complaints of the Romans, and the justification of their proceedings against the Tarquins, he was so struck with horror at the recital of the crimes the Tarquins were charged with, that he immediately ordered them to leave his camp; declaring, that he renounced his alliance with them, and would no longer continue the hospitality he had shown them. He then commanded the ten young virgins to be brought before him and inquired who was the first author and chief manager of the enterprise. They all kept silence, till Clelia herself, with an air of intrepidity, confessed, that she alone was guilty, and that she had encouraged the others by her advice. Upon this the king, extolling her resolution above the bravery of Horatius and the intrepidity of Mutius, made her a present of a fine horse, with sumptuous furniture. After this he concluded a peace with the Romans, and restored to them all their hostages; declaring, that their bare word was to him a sufficient security for the performance of the articles.

And now Porfena being about to return to Clusium, gave, before his departure, a further testimony of his respect and friendship for the Romans. He knew that Rome was greatly distressed for want of provisions; but being afraid to offend the inhabitants by relieving them in a direct manner, he ordered his soldiers to leave behind them their tents and provisions, and to carry nothing with them but their arms. As his camp abounded with all sorts of provisions, Rome was hereby much relieved in her wants. The moveables and corn of the Hetrurians were sold by auction to private persons; and on this occasion the Romans took up the custom of making a proclamation by an herald, whenever any effects belonging to the public were to be sold, in the following words, These are Porfena's goods. The design of this was to preserve the memory of that prince's kindness. The senate, not satisfied with this, erected a statue of the king near the comitium, and sent an embasssy

3. Adventure of Clelia.
embassy to him with a present of a throne adorned with ivory, a sceptre, a crown of gold, and a triumphal robe.

Thus the Romans escaped the greatest danger they had hitherto been in. However, they did not yet enjoy tranquillity. The Sabines revolted, and continued the war for some time with great obstinacy; but being defeated in several engagements, they were at last obliged to submit; and fear a was this war ended, when another began with the Latin, who now declared for king Tarquin. Before they began this war, however, an embassy was sent to Rome, the purpose of which was, that the Romans should raise the siege of Fidenae which had revoked, and receive the Tarquins; who, on their part, should grant a general amnesty. The ambassadors were to allow the Romans a whole year to consider on those overtures; and to threaten them with a war if they refused to comply with them. The chief view of Tarquin and his partisans in promoting this embassy was, to lay hold of that opportunity to raise a sedition in the city. To the ambassadors, therefore, of the Latins, he joined some of his own emissaries, who, on their arrival in the city, found two forts of people disposed to enter into their measures; to wit, the slaves, and the meaner citizens.

The slaves had formed a conspiracy the year before to seize the Capitol, and set fire to the city in several quarters at the same time. But the plot being discovered, those who were concerned in it had been all crucified, and this execution had highly provoked the whole body of slaves. As to the meaner citizens, who were for the most part overwhelmed with debt, and cruelly sued by their creditors, they were all apprized that there could happen no change in the government but to their advantage. These were the conspirators pitched upon, and to them were given the following parts to act: the citizens were to make themselves masters of the ramparts and gates of the city, at an appointed hour of the night; and then to raise a great shout as a signal to the slaves, who had engaged to make their masters at the same instant; the gates of the city were then to be opened to the Tarquins, who were to enter Rome while it was yet reeking with the blood of the senators. The conspiracy was ripe for execution, when Tarquin's principal agent, Publius and Marcus, both of his own name and family, being terrified with frightful dreams, had not courage enough to proceed in their design till they had consulted a diviner. However, they did not discover to him the conspiracy; but only asked him in general terms, what success they might expect in a project they had formed? The soothsayer, without the least hesitation, returned the following answer: Your project will end in your ruin; disburden yourselves of this heavy load. Hereupon the Tarquins, leaving left some of the other conspirators should be before hand with them in informing, went immediately to S. Sulpius, the only confid, then at Rome, and discovered the whole matter to him. The confid greatly recommended them, and detained them in his house, till, by private enquiries, he was assured of the truth of their depositions. Then he assembled the senate, and gave the Latin ambassadors their audience of leave, with an answer to their proposals; which was, that the Romans would neither receive the Tarquins, nor raise the siege of Fidenae, being all to a man ready to sacrifice their lives in defence of their liberties, and willing to undergo any dangers rather than submit to the government of a tyrant.

The ambassadors being dismissed with this answer, and conducted out of the city, Sulpius laid open to the fathers the dreadful conspiracy. It struck them with horror; but they were all at a loss in what manner they should apprehend and punish the guilty; since, by the law of Poplicola, there was an appeal to the people in all capital cases; and the two witnesses, who were strangers, might be excused against by Roman citizens. In this perplexity they left the whole conduct of this critical affair to Sulpius; who took a method which he thought would equally serve to prove the guilt and punish the guilty. He engaged the two informers to assemble the conspirators, and to appoint a rendezvous at midnight in the forum, as if they designed to take the tail measure for the execution of the enterprise. In the mean time he used all proper means to secure the city, and ordered the Roman knights to hold themselves ready, in the houses adjoining to the forum, to execute the orders they should receive. The conspirators met at the time and place appointed by the two Tarquins; and the knights, upon a signal agreed on beforehand, invaded the forum, and blocked up all the avenues to it so closely, that it was impossible for any of the conspirators to make their escape. As soon as it was light, the two consuls appeared with a strong guard on the tribunal; for Sulpius had sent to his colleague Manius, who was besieging Fidenae, informing him to hasten to the city with a chosen body of troops. The people were convened by curiae, and accustomed with the conspiracy which had been formed, against the common liberty. The accused were allowed to make their defence, if they had any thing to offer against the evidence: but not one of them denying the fact, the consuls repaired to the senate, where sentence of death was pronounced against the conspirators, in case the people approved it.

This decree of the senate being read to and approved by the assembly, the people were ordered to retire; the conspirators were delivered up to the soldiery, who stoned and cast them all to the sword. The peace of Rome was thought sufficiently secured by this stroke, without any further inquiries. The two informers were rewarded with all the privileges of Roman citizens, 100,000 acres, and 20 acres of land. Three festival days were appointed for expiations, sacrifices, and public games, by the way of thanksgiving to the gods. But the general joy was disturbed by a melancholy accident: as the people were conducting Manius Tullius the consul from the circus to his house, he fell from his chariot, and died three days after.

The city of Fidenae was not yet reduced; it held out during the following consulship of T. Erebatus and P. Veturius; but was taken the next year by T. Latius, who, together with Q. Cloelius, was raised to the consul dignity. The Latins, enraged at the loss of this town, began to complain of their leading men; which opportunity Tarquin and Mamilus improved so far, as to make all the Latin cities enter into an alliance against Rome, and to bind themselves by oath never to violate their engagements. The Latins
Rome.

The Latin nation was much superior to them in strength, they sent deputies to solicit succours from the several states with which they were surrounded: but their negotiations proved everywhere unsuccessful; and, what was worse than all, the republic had rebellious sons in her own bosom, who refused to lend their aid in defence of their country. The poorer sort of people, and the debtors, refused to take the military oaths, or to serve; alleging their poverty, and the fruitless hazards they ran in fighting for the defence of a city, where they were oppressed and enslaved by their creditors. This spirit of mutiny spread among the inferior classes, most of them refusing to lift themselves, unless their debts were all remitted by a decree of the senate; nay, they began to talk of leaving the city, and settling elsewhere.

The senate, apprehending a general insurrection, assembled to deliberate on the means of quieting those rebellious spirits, unless their debts were forgiven. This spirit of mutiny spread among the lower classes, and the fruitless attempts they made to raise up a rebellion, unless their debts were forgiven, alarmed the consuls, who resolved to send a force of 24 lictors, to seize those who refused to obey. But this expedient was unsuccessful; and, what was worse than all, the republic disarmed.

The senate therefore, to elude the consuls, resolved to make an assembly of the people, and, by this means, acquire the power which they were obstinately refusing to grant them. But this plan was not executed; and, unless their debts were forgiven, the people refused to assemble. Several other expedients were proposed: but at length this prevailed; to wit, that all actions for debts should be suspended till the conclusion of the war with the Latins. munity that reigned between them and the people, thought it expedient to create a dictator. The two consuls were therefore impowered to name one of themselves to that dignity; whereupon Virginius readily yielded it to his colleague Pollihuans, as the more able commander. The new dictator, having created Æbutius Elva his general of the horse, and divided his army into four bodies, left one of them, under the command of Sempronius, to guard the city; and with the other three, commanded by himself, Virginius, and Æbutius, marched out against the Latins, who, with an army of 45,000 foot and 3000 horse, under the command of Sextus Tarquinius, Titus Tarquinius, and Mamilius, had already made themselves masters of Corbio, a stronghold belonging to the republic, and put the garrison to the sword. Pollihuans encamped in the night on a steep hill near the lake Regillus, and Virginius on another hill over-against him. Æbutius was ordered to march silently in the night, with the cavalry and light-armed infantry, to take possession of a third hill upon the road, by which provisions must be brought to the Latins.

Before Æbutius had fortified his new camp, he was vigorously attacked by Lucius Tarquinius, whom he repulsed three times with great loss, the dictator having sent him a timely reinforcement. After this, Æbutius intercepted two couriers sent by the Volsci to the Latin generals, and, by letters found upon them, discovered, that a considerable army of the Volsci and Hernici were to join the Latin forces in three days. Upon this intelligence, Pollihuans drew his three bodies of troops together, which amounted in all to no more than 24,000 foot and 1000 horse, with a design to engage the enemy before the arrival of the succours they expected. Accordingly he encouraged his men, and, with his army in battle-array, advanced to the place where the enemy was encamped. The Latins, who were much superior to the Romans in numbers, and before began to want provisions, did not decline the engagement. Titus Tarquinius, at the head of the Roman horse, was in the centre, Mamilius in the right wing, and Sextus Tarquinius in the left. In the Roman army the dictator commanded in the centre, Æbutius in the left wing, and Virginius in the right.

The first body which advanced was that of the dictator; and, as soon as it began to march, T. Tarquinius, singling out the dictator, ran full speed against him. The dictator did not decline the encounter, but, flying at his adversary, wounded him with a javelin in the right side. Upon this, the first line of the Latins advanced to cover their general; but he being carried out of the field, they made but a faint resistance when charged by the troops of the dictator. They were deficient of a leader; and therefore began to retire, when Sextus Tarquinius, taking the place of his brother, brought them back to the charge, and renewed the fight with such vigour, that the victory in the centre was still doubtful. On the side of Mamilius and Æbutius, both parties, encouraged by the example of their leaders, fought with incredible bravery and resolution. After a long and bloody contest, the two generals agreed to determine the doubtful victory by a single encounter. Accordingly the champions pulled on their horses against each other. Æbutius with his lance wounded Mamilius in the breast; and Mamilius with his sword Æbutius in the right arm. Neither of the wounds were mortal; but, both generals falling from their horses put an end to the combat. Marcus Valerius, the brother of Poplicola, supplying the place of Æbutius, endeavoured, at the head of the Roman horse, to break the enemy's battalions; but was repulsed by the cavalry of the Roman royalists. At the same time Mamilius appeared again in the van, with a considerable body of horse and light-armed infantry. Valerius, with the affittance of his two nephews, the sons of Poplicola, and a chosen troop of volunteers, attempted to break through the Latin battalions, in order to engage Mamilius; but, being surrounded by the Roman exiles, he received a mortal wound in his side, fell from his horse, and died. The dead body was carried off by the two sons of Poplicola, in spite of the utmost efforts of the exiles, and delivered to Valerius' servants, who conveyed it to the Roman camp; but the young heroes being afterwards invited on all sides, and overpowered by numbers, were both killed on the spot. Upon their death, the left wing of the Romans began to give ground, but were soon brought back by Pollihuans; who, with a body of Roman knights, flying to their assistance, charged the royalists with such fury, that they were, after an obstinate resistance obliged to give way, and retire in the utmost confusion. In the mean time Titus Horinius, one of the dictator's lieutenants, having rallied those who had fled, fell upon some close battalions of the enemy's right wing, which still kept their ground under the command of Mamilius, killed him with his own hand, and put that body to flight. But while he was busy in stripping the body of his enemy, he received himself a wound, of which he died soon after.

Sextus Tarquinius in the mean time maintained the fight with great bravery, at the head of the left wing, against the confid Virginius; and had even broke through the right wing of the Roman army, when the dictator surprised him unexpectedly with his victorious squadrons. Then Sextus, having discovered all hopes of victory, threw himself, like one in despair, into the midst of the Roman knights, and there sunk under a multitude of wounds, after he had distinguished himself in most eminent manner. The death of the three Latin generals was followed by the entire defeat of the Latin army. Their camp was taken and plundered, and most of their troops cut in pieces; for, of the 43,000 men who came into the field, scarcely 10,000 returned home. The next morning the Volsci and Hernici came, according to their agreement, to affilt the Latins; but finding, upon their arrival, how matters had gone, some of them were for falling upon the Romans before they could recover from the fatigue of the preceding day; but others thought it more safe to send ambassadors to the dictator, to congratulate him on his victory, and assure him that they had left their own country with no other design than to affilt Rome in so dangerous a war. Pollihuans, by producing their couriers and letters, gave them to understand that he was well apprised of their designs and treacherous proceedings. However, out of regard to the law of nations, he sent them back unhurt, with a challenge to their generals to fight the next day; but the Volsci and their confederates, not caring to engage a victorious army, de-
The Romans were no sooner freed from these dangerous wars, than they began to oppress one another; and those domestic feuds took place which continued more or less during the whole time of the republic. The first disturbances were occasioned by the oppression of the plebeians who were debtors to the patricians. The senate, who were at the head of the patricians, chose to the consuls one Appius Claudius, who violently opposed the pretensions of the plebeians; but gave him for his colleague one P. Servilius, who was of a quite contrary opinion and disposition. The consequence of this was, that the consuls disagreed; the senate did not know what to determine, and the people were ready to revolt. In the midst of these disturbances, an army of the Volsci advanced towards Rome; the people refused to serve; and had not Servilius procured some troops who served out of a personal affection to himself, the city would have been in great danger.

But though the Volsci were for this time driven back, they had no intention of dropping their designs; they engaged in an alliance with them the Hernici and Sabinens. In the mean time, the disputes at Rome continued with as much violence as ever. Nay, though they were expressly told that the Volscian army was on its way to besiege the city, the plebeians absolutely refused to march against them, saying that it was the same thing whether they were chained by their own countrymen or by the enemy. In this extremity Servilius promised, that when the enemy were repulsed the senate would remit all the debts of the plebeians. This having engaged them to serve, the consuls marched out at their head, defeated the enemy in a pitched battle, and took their capital, giving it up to be plundered by his soldiers, without referring any part for the public treasury.

Whatever might have been the reasons of Servilius for this step, it furnished Appius with a pretence for refusing him a triumph, as a man of a sedition disposition who aimed at popularity by an excessive indulgence and profusion to his soldiers. Servilius, incensed at this injustice, and encouraged by the acclamations of the people, decreed himself a triumph in spite of Appius and the senate. After this he marched against the Aurunci, who had entered Latium; and, in conjunction with Pomptinus Regillens, he utterly defeated them, and obliged them to retire into their own country. But neither the services of the general nor his soldiers could mollify the senate and patrician party. Appius even doubled the severity of his judgments, and imprisoned all those who had been set at liberty during the war. The prisoners cried for relief to Servilius; but he could not obtain the accomplishment of those promises which the senate never had meant to perform; neither did he choose to quarrel openly with the whole patrician body; so that, striving to preserve the friendship of both parties, he incurred the hatred of the one and the contempt of the other. Perceiving therefore that he had lost all his interest with the plebeians, he joined with the patricians against them; but the plebeians rushing tumultuously into the forum, made such a noise, that no sentence pronounced by the judges could be heard, and the utmost confusion prevailed through the whole city. Several proposals were made to accommodate matters; but through the obstinacy of Appius and the majority of the senators, they all came to nothing. In the mean time it was necessary to raise an army against the Sabinens, who had invaded the territories of the republic; but the people refused to serve. Manius Valerius, however, brother to the celebrated Poplicola, once more prevailed upon the people to march out against the common enemy; having previously obtained assurance from the senate that their grievances should be redressed. But no sooner had victory declared in favour of the Romans, than the senate, apprehending that the soldiers at their return would challenge Valerius, who had been nominated dictator, for the performance of their promises, desired him and the two consuls to detain them still in the field, under pretence that the war was not quite finished. The consuls obeyed; but the dictator, whose authority did not depend on the senate, disbanded his army, and declared his soldiers free from the oath which they had taken; and as a further proof of his attachment to the plebeians, he chose out of that order whom he invested with the dignity of knights. After this he claimed the accomplishment of the promises made by the senate; but instead of performing them, he had the mortification to hear himself loaded with reproaches; on which he resigned his office as dictator, and acquainted the people with his inability to fulfill his engagements to them. No sooner were these transactions known in the army, than the soldiers, to a resolution, created tribunes of the people, to avenge the injury they had received with the dignity of knights. After this they claimed the accomplishment of the promises made by the senate; but instead of performing them, he had the mortification to hear himself loaded with reproaches; on which he resigned his office as dictator, and acquainted the people with his inability to fulfill his engagements to them. No sooner were these transactions known in the army, than the soldiers, to a resolution, created tribunes of the people, to avenge the injury they had received with the dignity of knights. After this they claimed the accomplishment of the promises made by the senate; but instead of performing them, he had the mortification to hear himself loaded with reproaches; on which he resigned his office as dictator, and acquainted the people with his inability to fulfill his engagements to them. No sooner were these transactions known in the army, than the soldiers, to a resolution, created tribunes of the people, to avenge the injury they had received with the dignity of knights.
ed sacrifices to the god, and consecrated the place of their retreat, they returned to Rome, led by their new magistrates and the deputies of the senate.

Thus the Roman constitution, which had originally been monarchic, and from thence had passed into an aristocracy, began now to verge towards a democracy. The tribunes immediately after their election obtained permission from the senate to elect two persons as their ministrants or assistants, who should eafe them a little in the great multiplicity of their affairs. These were called plebeian aediles; and afterwards came to have the inspection of the public baths, aquæduces, with many other offices originally belonging to the confuls, after which they were called simply aediles.

All opposition to the making of regular levies being now at an end, the conful Cominius led an army against the Volsci. He defeated them in battle, and took from them Longula and Polulate; after which he besieged Corioli, a city strongly fortified, and which had never been called their capital. He invested this place, and gained a victory over the Antiates, the same day; but Caius Marcius, an eminent patrician, had all the glory of both actions. The troops detached by the conful to scale the walls of Corioli being repulsed in their first assault, Marcius rallied the runaways, led them on afreth to the charge, drove back the enemy within their walls, and, entering the city with them, made himself master of it. This exploit achieved, he with all expedition put himself in the foremost ranks of the conful's main army, that was just going to engage with the Antiates, who were come to the relief of the place; and there he behaved with equal bravery, and had equal successes.

The next day the conful, having erected his tribunal before his tent, called the soldiers together. His whole speech to them was little more than a panegyric upon Marcius. He put a crown upon his head; assigned him the surname of Coriolanus, transferring thereby from himself to Marcius all the honour of the conquest of Corioli. Cominius, at his return to Rome, disbanded his army; and war was succeeded by works of religion, public games, and treaties of peace. A cenus and a lustrum closed the events of this memorable confufion. There appeared to be in Rome at this time no more than 110,000 men fit to bear arms; a number by many thousands less than at the last enrollment. Doubtless great numbers had run away to avoid being flaves to their creditors.

Under the following administration of T. Geganianus and P. Minucius, Rome was terribly afflicted by a famine, occasioned chiefly by the neglect of ploughing and sowing during the late troubles; for the sedition had happened after the autumnal equinox, about sowing-time, and the accommodation was not made till just before the winter solstice. The senate dispatched agents into Etruria, Campania, the country of the Volsci, and even into Sicily, to buy corn. Those who embarked for Sicily met with a tempest which retarded their arrival at Syracuse; where they were constrained to pass the winter. At Cumea, the tyrant Aristedemus seized the money brought by the commissaries; and they themselves with difficulty saved their lives by flight. The Volsci, far from being disjouected, had marched against them, if a sudden and most destructive peiilience had not defeated their purpose. In Hetruria alone the Roman commissaries met with success. They sent a considerable quantity of grain from thence to Rome in barks; but this was in a short time consumed, and the misery became excessive: the people were reduced to eat any thing they could get; and nature in so great extremity loathed nothing.

During this distress a deputation came from Velitri, a Volscian city, where the Romans had formerly planted a colony, representing that nine parts in ten of its inhabitants had been swept away by a plague, and praying the Romans to send a new colony to re-peopie it. The confcript fathers without much hesitation granted the request, prefied the departure of the colony; and without delay named three leaders to conduct it.

The people at first were very well pleased with the proposal, as it gave them a prospect of relief in their hunger; but when they reflected on the terrible havoc the plague had made among the old inhabitants of Velitri, they began to fear that the place might be still infected; and this apprehension became so universal, that not one of them would consent to go thither. Nevertheless the Senate at length published a decree that all the citizens should draw lots; and that those to whose lot it fell to be of the colony should instantly march for Velitri, or suffer the severest punishments for their disobedience: fear and hunger made the people comply; and the fathers, a few days after, sent away a second colony to Norba, a considerable city of Latium. But the patricians were disappointed as to the benefit they expected from these measures. The plebeians who remained in Rome being now more and more preyed on by hunger and want, grew daily more angry with the Senate. At first they assembled in small companies to vent their wrath in abusive complaints; and at length, in one great body, rushed all together into the forum, calling out upon their tribunes for succour.

The tribunes made it their business to heighten the general discontent. Having convened the people, Spurius Ficilius, chief of the college of tribunes, inveighed against the Senate, which retarded the making of regular levies; and at the same time, exhorting others to speak freely their thoughts; particularly, and by name, calling upon Brutus and Sicinius, the ringleaders of the former sedition, and now aediles. These men, far from attempting to extinguish the fire, added fresh fuel to it: And more to inflame the spirits of the multitude, they enumerated all the past insults which the people had suffered from the nobles. Brutus concluded his harangue with loudly threatening, that if the plebeians would follow his advice, he would soon oblige those men who had caus'd the present calamity to find a remedy for it; after which the assembly was dismissed.

The next day the conful, greatly alarmed at this commotion, and apprehending from the menaces of Brutus some very mischievous event, thought it advisable...
The power of the people increases.

The disputation grew warm, and both parties were ready to come to blows; when Brutus having put some questions to the confuls, ended it for that time. Next day he proposed a law which was carried, that no person whatever should interrupt a tribune when speaking in an assemble of the people; by which means the influence and power of the popular party was considerably increased, and the tribunes became formidable opponents to the confuls and patricians. An opportunity soon offered for both parties to try their strength. A great fleet of ships laden with corn from Sicily, a great part of which was a present from Geron the king of that country, was sent to Rome, and the rest purchased by the senate with the public money, raised the spirits of the people once more.

But Coriolanus incurred their resentment, by infiting that it should not be distributed till the grievances of the senate were removed. For this, the tribunes summoned him to a trial before the people, under pretence that he aspired at the sovereignty. When the appointed day was come, all persons were filled with the greatest expectation, and a vast concourse from the adjacent country assembled and filled up the forum. Coriolanus, upon this, presented himself before the people with a degree of intrepidity that merited better fortune. His graceful presence, his persuasive eloquence, the cries of those whom he had favored from the enemy, inclined the auditors to relent. But being confounded with a new charge which he did not expect, of having embezzled the plunder of Antium, the tribunes immediately took the votes, and Coriolanus was condemned to perpetual exile. This sentence against their bravest defender struck the whole body of the nation with sorrow, consternation, and regret. Coriolanus alone, in the midst of the tumult, seemed an unconcerned spectator. He returned home, followed by the lamentations of hundreds of the most respectable senators and citizens of Rome, to take a lasting leave of his wife, his children and his mother Veturia. Thus recommending his little children to their care, he left the city, without followers or fortune, to take refuge with Tullus Atius, a man of great power among the Volscians, who took him under his protection, and epoused his quarrel.

The first thing to be done, was to induce the Volscians to break the league which had been made with Rome; and for this purpose Tullus sent many of his citizens thither, in order to see some games at that time celebrating; but at the same time gave the senate private information, that the strangers had dangerous intentions of burning the city. This had the desired effect; the senate issued an order that all strangers, wherever they were, should depart from Rome before sunset. This order Tullus represented to his countrymen as an infliction of the treaty, and procured an embassage to Rome, complaining of the breach, and demanding back all the territories belonging to the Volscians, of which they had been violently dispossessed; declaring war in case of a refusal; but this message was treated by the senate with contempt.

War being thus declared on both sides, Coriolanus and Tullus were made generals of the Volscians; and accordingly invaded the Roman territories, ravaging and laying waste all such lands as belonged to the plebeians, but letting those of the senators remain untouched. In the mean time, the levies went on very slowly at Rome; the two confuls, who were re-elected by the people, seemed but little skilled in war, and even feared to encounter a general whom they knew to be their superior in the field. The allies also showed their fears, and slowly brought in their succours; so that Coriolanus continued to take their towns one after the other. Fortune followed him in every expedition; and he was now so famous for his victories, that the Volsci left their towns defenceless to follow him into the field. The very soldiers of his colleague's army came over to him, and would acknowledge no other general. Thus finding himself with a numerous army, he at length invaded the city of Rome itself, fully resolved to besiege it. It was then levies to the senate and the people unanimously agreed to send deputies to him, with proposals of restoration, in case he should return off his army. Coriolanus received their proposals at the head of his principal officers, and, with the threaten of a general that was to give the law, refused their offers.

Another embassy was now sent forth, conjuring him not to exact from his native city what became Romans to grant. Coriolanus, however, still persisted in his former demands, and granted them but three days in which to finish their deliberations. In this exigence, all that was left was another deputation still more solemn than either of the former, composed of the pontiffs, the priests, and the augurs. Their, clothed in their habits of ceremony, and with a grave and mournful deportment, issued from the city, and entered the camp of the conqueror; but all in vain; they found him so fierce and intractable as to make no terms.

When the people saw them return ineffectually, they began to give up the commonwealth as lost. Their temples were filled with old men, with women and children, who, prostrate at their altars, put up their ardent prayers for the preservation of their country. Nothing was to be heard but anguish and lamentation, nothing to be seen but scenes of anguish and distress. At length,
it was suggested to them, that what could not be effected by the interference of the senate or the adjuration of the priests, might be brought about by the tears of his wife, or the commands of his mother. This deputation seemed to be relished by all; and even the senate itself gave it the sanction of their authority. Veturia, the mother of Coriolanus, at first made some hesitation to undertake so pious a work: however, she at last undertook the embassy, and set forward from the city, accompanied by many of the principal matrons of Rome, with Volumnia his wife, and his two children. Coriolanus, who at a distance discovered this mournful train of females, was resolved to give them a denial, and called his officers round him to be witness of his resolution; but, when told that his mother and his wife were among the number, he faintly came down from his tribunal to meet and embrace them. At first, the women's tears and embraces took away the power of words; and the rough soldier himself, hard as he was, could not refrain from shaking in their distress. Coriolanus now seemed much agitated by contending passions; while his mother, who saw him moved, seconded his resolution; but, when told that his mother and his wife were among the number, he faintly came down from his tribunal to meet and embrace them. At first, the women's tears and embraces took away the power of words; and the rough soldier himself, hard as he was, could not refrain from shaking in their distress. Volumnia, the mother of Coriolanus, now seemed much agitated by contending passions; while his mother, who saw him moved, seconded his resolution; but, when t
the vanquished were to march. Their captains and generals he made prisoners of war, being referred to adorn his triumph. As for the plunder of the enemy's camp, that he gave entirely up to his own soldiers, without referring any part for himself, or permitting those of the delivered army to have a share. Thus, having refused a Roman army from inevitable destruction, having defeated a powerful enemy, having taken and fortified their city, and, still more, having refused any part of the spoil, he resigned his dictatorship, after having enjoyed it but 14 days. The Senate would have enriched him; but he declined their proffer, choosing to retire once more to his farm and his cottage, content with temperance and fame.

But this repose from foreign invasion did not lessen the tumults of the city within. The clamours for the Agrarian law still continued, and still more fiercely, when Sicinius Dentatus, a plebeian, advanced in years, but of an admirable person and military deportment, came forward, to enumerate his hardships and his merits. This old folder made no scruple of extolling the various merits of his youth; but indeed his achievements supported ostentation. He had served his country in the wars 40 years; he had been an officer 30, first a centurion, and then a tribune: he had fought 120 battles, in which, by the force of his single arm, he had saved a multitude of lives: he had gained 14 civic, three mural, and eight golden crowns, besides 83 chains, 60 bracelets, 18 gilt spears, and 23 horse-trappings, whereof nine were for killing the enemy in single combat: moreover, he had received 45 wounds, all before, and none behind. These were his honours: yet, notwithstanding all this, he had never received any share of those lands which were won from the enemy, but continued to drag on a life of poverty and contempt; while others were possessed of those very territories which his valour had won, without any merit to deserve them, or ever having contributed to the conquest. A cafe of so much hardship had a strong effect upon the multitude: they unanimously demanded that the law might be passed, and that such men as had not gone unrewarded. It was in vain that some of the senators rose up to speak against it; their voices were drowned by the cries of the people. When reason, therefore, could no longer be heard, passion, as usual, succeeded; and the young patricians, running, furiously into the throng, broke the balloting urns, and dispersed the multitude that offered to oppose them. For this they were some time after fined by the tribunes; but their resolution, nevertheless, for the present, put off the Agrarian law.

The commonwealth of Rome had now for near 60 years been fluctuating between the contending orders that composed it, till at length, each side, as it were, weary of the strife, was willing to desist from the mutual exertions of their claims. The citizens, now, therefore, of every rank, began to complain of the arbitrary decisions of their magistrates, and wished to be governed by a written body of laws, which being known might prevent wrongs as well as punish them. In this state the Senate and the people concurred, as hoping that such laws would put an end to the commotions that so long had harassed the state. It was thereupon agreed, that ambassadors should be sent to the Greek cities in Italy, and to Athens, to bring home such laws from thence as by experience had been found most equitable and useful. For this purpose, three senators, Pothisium, Sulpicius, and Manlius, were fixed upon, and galleys assigned to convey them, agreeable to the majesty of the Roman people. While they were upon this commission abroad, a dreadful plague depopulated the city at home, and supplied the interval of their absence with other anxiety than that of wishes for their return. In about a year the plague ceased, and the ambassadors returned, bringing home a body of laws, collected from the most civilized states of Greece and Italy, which being afterwards formed into ten tables, and two more being added, made that celebrated code called the Laws of the Twelve Tables, many fragments of which remain to this day.

The ambassadors were no sooner returned, than the Decemviri were elected, and the tribunes required that a body of men should be chosen to digress their new laws into proper form, and to give weight to the execution of them. After long debates whether this choice should not be partly made from the people as well as the patricians, it was at last agreed that 10 of the principal senators should be elected, whose power, continuing for a year, should be equal to that of kings and consuls, and that without any appeal. The persons chosen were Appius and Genitius, who had been elected consuls for the ensuing year; Pothisium, Sulpicius, and Manlius, the three ambassadors; Sextus and Romulus, former consuls; with Julius Veturius, and Horatius, senators of the first consideration.

The decemviri being now invested with absolute power, agreed to take the reins of government by turns, and that each should dispense justice for a day. These magistrates, for the first year, wrought with extreme application: and their work being finisht, it was expected that they would be contented to give up their offices; but having known the charms of power, they were now unwilling to resign it: they therefore pretended that some laws were yet wanting to complete their design, and intreated the Senate for theaggregate of their offices; to which that body assented.
