## R A N

Rana.

RANA, the frog, in zoology; a genus belonging to the order of amphibia reptilia. The body is naked, furnifhed with four feet, and without any tail. There are 17 fpecies. The moft remarkable are,

1. The temporaria, or common frog. This is an animal fo well known, that it needs no defcription; but fome of its properties are very fingular.

Its fpring, or power of taking large leaps, is remarkably great, and it is the beft fwimmer of all fourfooted animals. Nature hath finely adapted its parts for thofe ends, the fore members of the body being very lightly made, the hind legs and thighs very long, and furnifhed with very frong mufcles.

While in a tadpole flate, it is entirely a water animal ; the work of generation is performed in that element, as may be feen in every pond during fpring, when the female remains oppreffed by the male for a number of days.
The work of propagation is extremely fingular, it being certain that the frog has not a penis intrans. There appears a ftrong analogy in this cafe between a certain clafs of the vegetable kingdom and thofe animals; for it is well known, that when the female frog depofits its fpawn, the male inflantaneoufly impregnates it with what we may call a farina facundans, in the fame manner as the palm.tree conveys fructification to the flowers of the female, which would otherwife be barren.

As foon as the frogs are releafed from their tadpole ftate, they immediately take to land; and if the weather has been hot, and there fall any refrefhing thowers, you may fee the ground for a confiderable fpace perfeetly blackened by myriads of thefe animalcules, feeking for fome fecure lurking places. Some philofophers, not giving themfelves time to examine into this phenomenon, imagined them to have been generated in the clouds, and fhowered on the earth; but had they, like Derham, but traced them to the next pool, they would have found a better folution of the difficulty. See Preternatural Rains.

As frogs adhere clofely to the backs of their own fpecies, fo we know they will do the fame by fifh.Walton mentions a ftrange fory of their deftroying pike; but that they will injare, if not entirely kill carp, is a fact indifputable, from the following relation. Not many years ago, on fifhing a pond belonging to Mr Pitt of Encomb, Dorfethire, great numbers of the carp were found each with a frog mounted on it, the hind legs clinging to the back, and the fore legs fised in the corner of each eye of the fifh, which were thin and greatly wafted, teized by carrying fo difagreeVoL. XVI.

R A N
able a load. Thefe frogs Mr Pennant fuppofes to have been males difappointed of a mate.
The croaking of frogs is well known; and from that in fenny countries they are diftinguifhed by ludicrous tities: thus they are Ayled in England Dutch nigbtingales, and Bofon waites.

Yet there is a time of the year when they become mute, neither croaking nor opening their mouths for a whole month : this happens in the hot feafon, and that is in many places known to the country people by the name of the paddock moon. It is faid, that during that period their mouths are fo clofed, that no force (without killing the animal) will be capable of opening them.

Thefe, as well as other reptiles, feed but a fmall fpace of the year. The food of this genus is flies, infeets, and fnails. Toads are faid to feed alfo on bees, and to do great injury to thofe ufeful infects.
During winter, frogs and toads remain in a torpid fate : the laft of which will dig into the earth, and cover themfelves with almoft the fame agility as the mole. See Physiology, $\mathrm{n}^{\circ} 4^{8}$ and note ( B ), and $\mathrm{n}^{\circ} 5^{2}$.
2. The efculenta, or edible frog, differs from the former, in having a high protuberance in the middle of the back, forming a very fharp angle. Its colours are alfo more vivid, and its marks more difinet ; the ground colour being a pale or yellowifh green, marked with rows of black fpots from the head to the rump.This, and (Mr Pennant thinks) the former, are eaten. He has feen in the markets at Paris whole hampers full, which the venders were preparing for the table, by fkinning and cutting off the fore-parts, the loins and legs only being kept; but his flrong diflike to thefe reptiles prevented a clofe examination into the fpecies.
3. In the ftate of Pennfylvania, and fome other parts of North America, there is a very large fpecies of frogs called the bull-frog, or rana ocellata. Their irides are of a dulky red, furrounded with a yellow ring. The anticles are covered with a thin circular fkin, which forms a fpot behind each eye. They have four toes on the fore-feet, and five palmated toes behind. Their colour is a dufky brown, mixed with yellowifh green, and fpotted with black. The belly is yellowifl, and faintly fpotted. Thefe make a monftrous roaring noife like a bull, only fomewhat more hoarfe. Their fize is fuperior to that of any other of the genus, and they can fpring forward three yards at a leap. By this means they will equal in fpeed a very good horfe in its fwifteft courfe. Their places of abode are ponds, or bogs with ftagnant water; but they never frequent freams. When many A

Rana: $\underbrace{\text { Ran: }}$

## R A N

of them are together, they make fuch a horrid noife, that two people cannot underftand each other's fpeech. They croak all together, and then ftop for a little and begin again. It feems as if they had a captain among them : for when he begins to croak, all the others follow ; and when he ftops, they alfo become filent. When this captain gives the fignal for ftopping, you hear a note like poop coming from him. In the day time they feldom make any great noife, unlefs the fky is covered; but in the night-time they may be heard at the diftance $r^{\frac{1}{2}}$ a mile and an half. When they croak, they are commonly near the furface of the water, under the ruhnes, and have their heads ont of the water. By going flowly, therefore, one may get up almolt quite clofe to them before they go away. As foon as they are quite under water, they think themfelves fafe, though it be ever fo thallow. Thefe creatures kill and eat young ducklings and gonlings, and fometimes carry off chickens that come too near the water ; when beaten, they cry cut almolt like little children. As foon as the air begins to grow a little cool in autumn, they hide themfelves under the mud in the bottom of fagnant waters, and lie there torpid during the winter. As foon as the weather grows mild towards fummer, they begin to get out of their holes and croak. They are fuppofed by the people of Virginia to be the purifiers of waters, and are refpected as the genii of the fountains. Some of them were taken to England alive feveral years ago.
4. To bufo, or toad, is the moft deformed and hideous of all animals. The body is broad ; the back flat, and covered with a dimply dufky hide; the belly large, fwagging, and fwelling out; the legs flort, and its pace laboured and crawling; its retreat gloomy and filthy: in fhort, its general appearance is fuch as to Itrike one with difguft and horror. Yet it it faid by thofe who have refolution to view it with attention, that its eyes are fine; to this it feems that Shakefpeare alludes, when he makes his Juliet remark,

Some fay the lark and loathed tdad change eyes :
As if they would have been better beftowed on fo charming a fongfter than on this raucous reptile.

But the hideous appearance of the toad is fuch as to make this one advantageous feature overlooked, and to have rendered it in all ages an object of horror, and the origin of molt tremendous inventions. EElian makes its venom fo potent, that bafilifk-like it conveyed death by its very look and breath ; but Juvenal is content with making the Roman ladies who were weary of their hubands form a potion from its entrails, in order to get rid of the good man. This opinion begat others of a more dreadful nature ; for in after-times fuperftition gave it preternatural powers, and made it a principal ingyedient in the incantations of nocturnal hags.

This animal was believed by fome old writers to have a ftone in its head fraught with great virtues medical and magical : it was dininguibed by the name of the reptile, and called the toad-fone, bufonites, crapaudine, krottenflein; but all its fancied powers vanithSee Anare ed on the difcovery of its being nothing but the foffiltricas.
fifh, not unfrequent in Britain as well as feveral other countries.

But thefe fables have been long exploded. And as to the notion of its being a poifonous animal, it is probable that its exceffive deformity, joined to the faculty it has of emitting a juice from its pimples, and a duky liquid from its hind parts, is the foundation of the report.

That it has any noxious qualities there feem to have been no proofs in the fmalleft degree fatisfactory, tho' we have heard many ftrange relations on that point.On the contrary, there have been many who have taken them in their naked hands, and held them long without receiving the lealt injury: it is alfo well known that quacks have eaten them, and have befides fqueezed their juices into a glafs and drank them with impunity. We may fay alfo, that thefe reptiles are a common food to many animals; to buzzards, owls, Norfolk plovers, ducks, and fnakes, who would not touch them were they in any degree noxious.

So far from having venomous qualities, they have of late been confidered as if they had beneficent ones; particularly in the cure of the moft terrible of difeafes, the cancer, by fuction: (See Britilb Zoology vol. iii. Append. p. 389, et feq.) But, from all circumftances, as Mr Pennant obferves they feem only to have rendered a horrible complaint more loathfome.

The moft full information concerning the nature and qualities of this animal is contained in the following letters from Mr Arfcott and Mr Pittfield to Dr Milles. "It would give me great pleafure (fays Mr Arfcott) to be able to inform you of any particulars worthy Mr Pennant's notice, concerning the toad who lived fo many years with us, and was fo great a favourite. The greatelt curiofity in it was its becoming fo remarkably tame. It had frequented fome fteps before the: hall-door fome years before my acquaintancecommenced with it, and had been admired by my father for its fize (which was of the largef I ever met with), who conftantly paid it a vifit every evening. I knew it myfelf above $3 \circ$ years; and by conftantly feeding it, brought it to be fo tame, that is always came to the candle, and looked up as if expecting to be taken up and brought upon the table, where I always fed it with infects of all forts; it was fondeft of flefh maggots, which I kept in bran ; it would follow them, and, when within a proper diftance, would fix its eye, and remain motionlefs for near a quarter of a minute, as if preparing for the ftroke, which was an inltantaneous throwing its tongue at a great diftance upon the infect, which ftuck to the tip by a glutinous matter: the motion is quicker then the eye can follow ( A ).
"I always imagined that the root of its tongue was. placed in the forepart of its under jaw, and the tip to wards its throat, by which the motion mult be a half circle; by which, when its tongwe recovered its fituation, the infect at the tip would be brought to the place of deglutition. I was confirmed in this by never obferving any internal motion in its mouth, excepting one fwallow the inftant its tongue returned. Poffibly I might be mittaken ; for I never diffected one, but contented
(A) This rapid capture of its prey might give occafion to the report of its faccinating powers, Linnæus fays, Jnjecta in fauces fafino revocat.

## R A N

Hana.

tented myfelf with opening its mouth, and flightly inspecting it.
"You may imagine, that a toad, generally detefted, (althnugh one of the moft inoffenfive of all animals), to much taken notice of and befriended, excited the curionity of all comers to the houfe, who all defired to fee it fed; fo that even ladies fo far conquered the horrors infilled into them by nurfes, as to defire to fee it. This produced innumerable and improbable reports, making it as large as the crown of a hat, \&c. \&c."

The following are anfwers from the fame gentleman to fome queries propofed by Mr Pennant.
"Firft, I cannot fay how long my father had been asquainted with the toad before I knew it; but when I firft was aiqquainted with it, he ufed to mention it as the old toad I've known fo many years; I can anfwer for $3^{6}$ years.
" Secondly, No toads that I ever faw appeared in the winter feafon. The old toad made its appearance as foon as the warm weather came, and I always concluded it retired to fome dry bank to repofe till the fpring. When we new-lay'd the fteps, I had two holes made in every third ftep, with a hollow of more than a yard long for it, in which I imagine it flept, as it came from thence at its firft appearance.

Thirdly, It was feldom provaked : neither that toad, nor the multitudes I have feen tormented with great cruelty, ever fhowed the leaft defire of revenge, by fpitting or emitting any juice from their pimples. Sometimes, upon taking it up, it would let out a great quantity of clear water, which, as 1 have often feen it do the fame upon the fteps when quite quiet, was certainly its urine, and no more than a natural evacuation.

Fourthly, A toad has no particular enmity for the fpider; he ufed to eat five or fix with his millepedes (which I take to be its chief food) that I generally provided for it before I found out that flefh maggots, by their continual motion, was the molt tempting bait;

## $3]$ <br> RA N

but, when offered, it cat blowing flies and humble Lees that came from the rat-tailed maggot in gutters, or in fhort any infect that moved. I imagine, if a bee was to be put before a toad, it would certainly eat it to its coft; but as bees are feldom flirring at the fame time that toads are, they can feldom come in their way, as they feldom appear after fun-rifing or before fun-fet. In the heat of the day they will come to the mouth of their hole, I believe, for air. I once from my parlour window obferved a large toad I had in the bank of a bowling-green, about 12 at noon, a very hot day, very bufy and active upon the grafs; fo uncommon an appearance made me go out to fee what it was, when I found an innumerable fwarm of winged ants had dropped round his hole, which temptation was as irrefiftible as a turtle would be to a luxurious alderman.
" Fifibly, Whether our toad ever propagated its fpecies, I know not; rather think not, as it always appeared well, and not leffened in bulk, which it mult have done, I fhould think, if it had difcharged fo large a quantity of fpawn as toads generally do. The females that are to propagate in the fpring, I imagine, inltead of retiring to dry holes, go into the bottom of ponds, and lie torpid among the weeds : for to my great furprife, in the middle of the winter, having for amulement put a long pole into my pond, and twilled it till it had gathered a large volume of weed, on taking it off I found many toads; and having cut fome afunder with my knife, by accident, to get off the weed, found them full of fpawn not thoroughly formed. I am not pofitive, but think there were a few males in March; I know there are 30 males ( B ) to one female, 12 or 14 of whom I have feen clinging round a female: I have often difengaged her, and put her to a folitary male, to fee with what eagernefs he would feize her. They impregnate the fawn as it is drawn (c) out in long ftrings, like a necklace, many yards long, not in a large quantity of jelly, like frogs fawn.

Sixtbly,
(s) Mr John Hunter has affured me, that during his refidence at Belleifle, he diffected fome hundreds of toads, jet never met with a fingle female among them.
(c) I was incredulous as to the obfetrical offices of the male toad; but fince the end is fo well accounted for ${ }^{2}$ and the fact eltablifhed by fuch good authority, belief mult take place.

Mr Demours, in the Memoirs of the French Academy, as tranllated By Dr Templeman, vol. i. p. 371, has been very particular in refpect to the male toad as acting the part of an accoucheur: His account is curious, and claims a place here.
" In the evening of one of the long days in fummer, Mr Demours, being in the king's garden, perceived two toads coupled together at the edge of an hole, which was formed in part by a great fone at the top.
"Curiofity drew him to fee what was the occafion of the motions he obferved, when two facts equally new furprifed him. The firft was the extreme difficulty the female had in laying her eggs, infomuch that fhe did not feem capable of being delivered of them without fome affiltance. The fecond was, that the male was mounted on the back of the female, and exerted all his ftrength with his hinder feet in pulling out the egzs, whilit his fore fect embraced her breatt.
"In order to apprehend the manner of his working in the delivery of the female, the reader muft obferve, that the paws of thefe animals, as well thofe of the fore-feet as of the hinder, are divided into feveral toes, which can perform the office of fingers.
" It mult be remarked likewife, that the eggs of this feecies of toads are included each in a membranous coat that is very firm, in which is contained the embryo ; and that thefe eggs, which are oblong and about two lines in length, being faftened one to another by a fhort but very ftrong cord, form a kind of chaplet, the beads of which are diftant from each other about the half of their length. It is by drawing this cord with his paw that the male performs the function of a midwife, and acquits himfelf in it with a dexterity that one would not expest from folumpilh an animal.
"The prefence of the obferver did not a little difcompofe the male : for fome time he ftopped fhort, and

## RAN [ 4 ] RAN

Rana.
"Sixthly, Infects being their food, I never faw any toad thow any liking or diffike to any plant (D).
"Seventhly, I hardly remember any perfons taking it up except my father and myfelf; I do not know whether it had any particular attachment to us.
"Eighthly, In refpect to its end, I anfwer this laft query. Had it not been for a tame raven, I make no doubt but it would have been now living; who one day deeing it at the mouth of its hole, pulled it out, and although I refcued it, pulled out one eye, and hurt it fo, that notwithftanding its living a twelvemonth it never enjoyed itfelf, and had a difficulty of taking its food, miffing the mark for want of its eye : before that accident it had all the appearance of perfect health."
6. The rubeta, or natter-jack, frequents dry and fandy places: it is found on Putney common, and alfo near Revefby abbey, Lincolnfhire. It never leaps, neither does it crawl with the flow pace of a toad, but its mution is liker to running. Several are found common. ly together, and like others of the genus they appear in the evenings. The upper part ot the body is of a dirty yellow, clouded with brown, and covered with porous pimples of unequal fizes: on the back is a yellow line. The upper fide of the body is of a paler hue, marked with black fpots, which are rather rough. On the fore-feet are four divided toes; on the hind five, a little webbed. The length of the bady is two inches and a quarter; the breadth, one and a quarter: the length of the fore-legs, one inch one-fixth; of the hind legs, two inches. We are indebted to Sir Jofeph Banks, for this account.
7. The pipal, or Surinam toad, is more ugly than even the common one. The body is flat and broad; the head fmall; the jaws, like thofe of a mole, are extended, and evidently formed for rooting in the ground: the fkin of the neck forms a fort of wrinkled collar: the colour of the head is of a dark chernut, and the eyes are fmall : the back, which is very broad, is of a lightifh grey, and feems covered over with a number of fmall eyes, which are round, and placed at nearly equal diftances. Thefe eyes are very different from what they feem : they are the animal's eggs, covered with their thells, and placed there for hatching. Thefe eggs are buried deep in the fkin, and in the beginning of incubation but jult appear; and are very vilible when the roung animal is about to burft from its confinement. They are of a reddilh, flining yellow colour; and the fpaces between them are full of fmall warts, refembling pearls.

This is their fituation previous to their coming forth; but nothing fo much demands our admiration as the
manner of their production. The eggs, when formed in the ovary, are fent, by fome internal canals, which anatomifts have not hitherto defcribed, to lie and come to maturity under the bony fubfance of the back: in this fate they are impregnated by the male, whofe feed finds its way by pores very fingularly contrived, and pierces not only the fkin but the periofteum : the fkin, however, is Atill apparently entire, and forms a very thick covering over the whole brood; but as they advance to maturity, at different intervals, one after another, the egg feems to ftart forward, and burgeons from the back, becomes more yellow, and at laft breaks; when the young one puts forth its head: it fill, however, keeps its fituation until it has acquired a proper degree of ftrength, and then it leaves the fhell, but ftill continues to keep upon the back of the parent. In this manner the pipal is feen travelling with her wonderous family on her back, in all the different ftages of maturity. Some of the Arange progeny, not yet come to fufficient perfection, appear quite torpid, and as yet without life in the egg : others feem jalt beginning to rife through the ikin; bere peeping forth from the thell, and there having entirely forfaken their prifon: fome are fporting at large upon the parent's back, and others defcending to the ground to try their own-fortune below. The male pipal is every way larger than the female, and has the fkin lefs tightly drawn round the body. The whole body is covered with puftules, refembling pearls; and the belly, which is of a bright yellow, feems as if it were fewed up from the throat to the vent, a feam being feen to run in that direation. This animal, like the reft of the frog kind, is mof probably harmlefs.
8. The water frog of Cateiby has large black eyes, yellow irides, and long limbs : the upper part of the head and body is of a dunky green, fpotted with black; and from each eye to the nofe is a white line ; and alro. a yellow line along the fides to the rump. They frequent rivulets and ditches, which they do not quit for the dry land. It is faid they will fpring five or fix yards at a leap.
9. The rana arborea, or green tree frog of Catelby, is of a flender thape and bright green colour, marked on each fide with a line of yellow: the eyes are black; the irides ycllow; they have four toes before and five behind; at the end of each toe there is a round mem brane, concave beneath, and not unlike the mouth of a leech. They lurk under the lower fides of leaves, even of the talleft trees, and adhere firmly, by means of the membranes at the ends of their toes, ficking to the fmootheft furface : a looking-glafs was held before one,

## R A N

Ranai I
at four yards diftance; it reached it at one leap, and ftuck clofely to it. At night thefe frogs make an inceffant chirping, and leap from fpray to fpray in fearch of infects. This fpecies is common to America and the warmer parts of Europe.
10. The land frog of Catefby has much the appearance of a toad: above it is grey or brown, fpotted with dufky ; below white, faintly fpotted ; the irides are red; and the legs fhort. They frequent the high-lands, and are feen molt frequently in wet weather and in the hotteft time of the day: they leap, feed on infects, particularly the fire-fly and ant. Sometimes the Americans bake and reduce this fpecies to powder, which, mixed with orrice root, is taken as a cure for a tympany.
11. The cinereous frog has a gibbous, cinereous, and fmooth back; the belly is yellow and granulated : on each fide, from the nofe to the rump, there is a white line; and there is the fame on the outfide of the thighs and legs; the toes are bullated at their ends. They inhabit Carolina.

RANAI, one of the Sandwich iflands difcovered by Captain Cooke, is about nine miles diftant from Mowee and Morotor, and is fituated to the fouth-welt of the paffage between thofe two ifles. The country towards the fouth is elevated and craggy ; but the other parts of the ifland had a better appearance, and feemed to be well inhabited. It abounds in root:, fuch as fweet potatoes, taro, and yams; but produces very few plaintains and bread-fruit trees. The fouth point of Ranai is in the latitude of $20^{\circ} 4^{6^{\prime}}$ north, and in the longitude of $203^{\circ} B^{\prime}$ eaft.

RANCID, denotes a fatty fubitance that has become rank or multy, or that has contracted an ill fmell by being kept clofe.

RANDIA, in botany : A genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. The calyx is monophyllous; the corolla falver-fhaped; the berry unilocular, with a capfular rind. There are two fpecies, viz. the mitis and aculeata.

RANDOLPH (Thomas), an eminent Englifh poet in the 17 th century, was born in Northamptonfhire 1605. He was educated at Weftminfter and Cambridge, and wery early diftinguifhed for his excellent genius; for at about nine or ten years of age he wrote the Hiftory of the Incarnation of our Saviour in verfe. His fubfequent writings eftablifhed his character, and gained him the efteem and friendihip of fome of the greateft men of that age, particularly of Ben Johnfon, who adopted him one of his fons in the mufes. He died in 1534, and was honourably interred. He wrote, I. The Mufes Looki-

ing-glafs, a comedy. 2. Amyntas, or the Impofible Dowry, a palloral, aeted before the king and queen. 3. Ariftippus, or the Jovial Philofopher. 4. The Conceited Pedlar. 5. The Jealous Lovers, a comedy. 6.
Hey for Honefy, down with Knavery, a comedy; and feveral poems.

RANDOM shot, in gunnery, is a fhot made when the muzzle of a gun is raifed above the horizontal line, and is not defigned to thoet directly or point blank.

The utmof random of any piece is about ten times as far as the bullet will go point-blank. The bullet will go fartheft when the piece is mounted to about $45^{\circ}$ above the level range. Sece Gunnery and Projectiles.

RANGE, in gunnery, the path of a bullet, or the line it defcribes from the mouth of the piece to the point where it lodges. If the piece lie in a line parallel to the honizon, it is called the rigbt or liach range : if it be mounted to $45^{\circ}$, it is faid to have the utmoft range; all others between 00 and $45^{\circ}$ are called the intermediate ranges.

RANGER, a fworn officer of a foreft, appointed by the king's letters patent ; whofe bufinefs is to walk through his charge, to drive back the deer out of the purlieus, \&c. and to prefent all trefpaffes within his jurifdiction at the next foreft-court.

RANK, the order or place alligned a perfon fuitable to his quality or merit.

Rank, is a Atraight line made by the foldiers of a battalion or fquadron, drawn up fide by fide: this orm der was eftablithed for the marches, and for regulating the different bodies of troops and officers which compofe an army.

Rank and Precedence, in the Britilh army and navy, are as follow:
Engincers RANK. Chief, as colonel; director, as lieutenant-colonel ; fub-director, as major; engineer in ordinary, as captain; engineer extraordinary, as cap-tain-lieutenant ; fub-engineer, as lieutenant; practition-er-engineer, as enfign.

Navy RANK. Admiral, or commander in chief of the Britifh flect, has the rank of a field-marfhal; admirals, with their flags on the main-top-mall-head, rank with generals of horfe and foot; vice-admirals, with lieutenant-generals; rear-admirals, as major-generals; commodores, with broad pendants, as brigadier-generals ; captains of polt-fhips, after three years from the date of their firlt commiffion, as colonels; other captains, as commanding polt-fhips, as lieutenant-colonels; captains, not taking polt, as majors; licutenante, as captains.

Rank between the Army, Navy, and Governors.

| Army. | NAvY. | Governors. |
| :--- | :--- | :--- |
| General in chief | Admiral in chief | Commander in chief of the ferces in America |
| Generals of horfe | Admiral with a flag at <br> the main-top-malt | Captain-general of provinces |
| Lieutenant-generals | Vice-Admirals | Lieutenant-generals of provinces |
| Major-generals | Rear-Admirals | Lieutenant-governors and prefidents |
| Colonels | Poft-captains of 3 years | Lieutenant-governors not commanding |
| Lieutenant-colonels | Poft-captains | Governors of charter colonies |
| Majors | Captains | Deputy-governors |
| Captains | Lieutenants | Eftablifhed by the king, 1760 |

Doubling of the RaNks, is the placing two ranks in one, frequently uled in the manceuvres of a regiment.
$R_{A N K s}$ and Files, are the horizontal and vertical lines of foldiers when drawn up for fervice.
RANSON, a fam of money paid for the redemption of a flave; or the liberty of a prifoner of war. In our law-books, ranfom is alfo ufed for a fum paid for the pardon of fome great offence, and to obtain the offender's liberty.

RANULA, a tumour under a child's tongue, which, like a ligature, binders it from fpeaking or fucking.

RANUNCULUS, crowfoot: A genus of the polygamia order, belonging to the polyandria clafs of plants; and in the natural method ranking under the 26th order, Multiffliqua. The calyx is pentaphyllous; there are five petals, each with a melliferous pore on the infide of the heel; the feeds naked.

Species. There are near 40 different fpecies of this genus, fix or eight of which claim general efteem as Howery plants for ornamenting the gardens, and a great number are common weeds in the fields, waters, and pafture ground, not having merit for garden culture. Of the garden kinds, the principal fort is the Afiatic or Turkey and Perfian ranunculus, which comprifes many hundred varieties of large, double, molt beautiful flowers of various colours: but feveral other fpecies haying varieties with fine double flowers, make a good appearance in a collection, though as thofe of each fpecies confift only of one colour, fome white, others yellow; they are inferior to the Afiatic ranunculus, which is large, and diverfified a thoufand ways ia rich colours, in different varieties. However, all the garden kinds in general effect a very agreeable diverfity in affemblage in the flower compartments, \&c. and they being all very hardy, fucceed in any open beds and borders, $\& \mathrm{c}$

- Culture. The Afiatic fpecies in all its varieties will fucceed in any light, rich, garden earth; but the florifts often prepare a particular compoft for the fine varieties; confifting of good garden-mould or paftureearth, fward and all, a fourth part of rotted cow-dung and the like portion of fea-fand; and with this they
prepare beds four feet wide and two deep: however, in default of fuch compoft, ufe beds of any good light earth of your garden; or, if neceffary, it may be made light and rich with a portion of drift-fand and rotten dung, cow-dung is moft commonly recommended ; but they will alfo thrive in beds of well-wrought kitchengarden earth, and they often profper well in the common flower-borders.
The feafon for planting the roots is both in autumn and fpring; the autumn plantings generally flower ftrongett and fooneft by a month at leaft, and are fucceeded by the fpring-planting in May and June. Perform the autumnal planting in October and early part of November, but fome plant towards the latter end of September in order to have a very early bloom; but thofe planted in that month and beginning of October often come up with rank leaves foon after, in winter, fo as to require protection in hard frofts; thofe, however, planted about the middle or latter end of October, and beginning of November, rarely fhoot up frong till towards fpring, and will not require fo much care of covering during winter; and the fpring-planting may be performed the end of January or beginning of February, or as foon as the weather is fettled; they will not require any trouble of covering, and will fucceed the antumnal plants regularly in bloom, and will flower in good perfection. Thus by two or three different plantings you may obtain! a fuccefion of thefe beautiful flowers in conftant bloom from April till the middle of June; but the autumnal plants, for the general part, not only flower ftrongeft, but the roots increafe more in fize, and furnifh the beft off-fets for propagation : it is, however, proper to plant both in fpring and autumn.

Prepare for the choicer forts four-feet beds of light earth, and rake the furface fmooth : then plant the roots in rows lengthwife the beds, either by drilling them in two inches deep, and fix inches diftance in the row, and the rows fix or eight afunder ; or you may plant them by bedding-in, or by dibble-planting, the fame depth and diffance.

Thofe defigned for the borders fhould be planted generally

## R A P

Ranuncu- nerally towards the fpring, in little clumps or patches, three, four, or five roots in each, putting them in either with a dibble or trowel, two or three inches deep, and three or four afunder in each patch, and the patches
from about three to five or ten feet diftance, placing them rather forward in the border.

Propagation. All the varieties of the Afiatic ranunculus propagate abundantly by off-fets from the roor, and new varieties are gained by feed.-1. By off-fets. The time for feparating the off-fets is in fummer when the flower is patt, and the leaves and falks are withered : then taking up all the roots in dry weather, feparate the off-fets from each main root, and after drying the whole gradually in fome fhady airy room, put them up in bags till the autumn and fpring feafons of planting ; then plant them as before, placing all the off-fets in feparate beds: many of them will blow the firlt year, but in the fecond they will all flower in good perfec-tion.-2. By feed. Save a quantity of feed from the fineft femi-double flowers, and fow it either in Auguft, or in March, or April, though, to fave trouble of win-ter-covering, fome prefer the fpring: it fhould be fowed in light rich mould, either in pots or in an eaft border; drawing very fhallow flat drills five or fix inches afunder, in which fow the feeds thinly, and cover them lightly with earth, giving frequent refrefhments of water in dry weather, and in a month or fix weeks the plants will rife with fmall leaves ; obferving to continue the light waterings in dry weather, to preferve the foil moift during their fummer's growth to increafe the fize of the roots; and in June when the leaves decay, take up the roots and preferve them till the feafon for planting, then plant them in common beds, as before directed, and they will flower the fpring following, when all the doubles of good properties fhould be marked, and the fingles thrown away.

The juice of many fpecies of ranunculus is fo acrid as to raife blifters on the fkin, and yet the roots may be eaten with fafety when boiled.

RAPACIOUS animals, are fuch as live upon prey.

RAPE, in law, the carnal knowledge of a woman forcibly and againft her will. This, by the Jewifh law, was punifhed with death, in cafe the damfel was betrothed to another man : and, in cafe fhe was not betrothed, then a heavy fine of fifty fhekels was to be paid to the damfel's father, and the was to be the wife of the ravifher all the days of his life; without that power of divorce, which was in general permitted by the Mofaic law.

The civil law punifhes the crime of ravifhment with death and confifcation of goods: under which it includes both the offence of forcible abduction, or taking away a woman from her friends; and alfo the prefent offence of forcibly difhonouring her ; either of which, without the other, is in that law fufficent to conftitute a capital crime. Alfo the ftealing away a woman from her parents or guardians, and debauching her, is equally penal by the emperor's ediet, whether fhe confent or is forced. And this, in order to take away from women. every opportunity of offending in this way; whom the Roman laws fuppofe never to go aftray without the feduction and arts of the orher fex ; and therefore, by reftraining and makiog fo highly penal the folicitations of the men, they meant to fecure effectually the honour

## 7 ] <br> R A P

of the women. But the Englihh law does not entertain quite fuch fublime ideas of the honour of either fex, as to lay the blame of a mutual fault upon one of the tranfgreffors only; and therefore makes it a neceffary ingredient in the crime of rape, that it muk be againft the woman's will.

Rape was punifhed by the Saxon laws, particularly thofe of king Athelltan, with death; which was alfo agreeable to the old Gothic or Scandinavian conftitution. But this was afterwards thought too hard : and in its ftead another fevere, but not capital, punifiment was inflicted by William the Conqueror, viz. caltration and lofs of eyes; which continued till after Bracton wrote, in the reign of Henry III. But in order to prevent malicious accufations, it was then the law (and, it feems, fill continues to be fo in appeals of rape), that the woman thould, immediately after, go tothe next town, and there make difcovery to fome credible perfons of the injury the has fuffered; and afterwards fhould acquaint the high conftable of the hundred, the coroners, and the Cheriff, with the outrage. This feems to correfpond in fome degree with the laws of Scotland and Arragon, which require that complaint mult be made within 24 hours : though afterwaris by ftatute Weftm. 1. c. 13. the time of limitation in England was extended to 40 days. At prefent there is no time of limitation fixed : for, as it is ufalally now punilhed by indictment at the fuit of the king, the maxim of law takes place, that " nullum tempus occurrit regi :" but the jury will rarely give credir to a fale complaint. During the former period alfo it was held for law, that the woman (by confent of the judge and her parents) might redeem the offender from the execution of his Sentence, by accepting him for her hufband; if he allo was willing to agree to the exchange, but not otherwife.

In the 3 Edw. I. by the ftatute Weftm. I. c. 13 . the punifhment of rape was much mitigated : the offence itfelf, of ravifhing a damfel within age, (that is, twelve years old) either with her confent or without, or of any other woman againt her will, being reduced to a trefpafs, if not profecuted by appeal within 40 days, and fubjecting the offender only to two years imprifonment, and a fine at the king's will. But this lenity being productive of the moft terrible confequences, it was in ten years afterwards, 13 Edw. I. iound neceffary to make the offence of forcible rape felony by ftatute Weftm. 2. c. 34. And by ftatule 18 Eliz. c. 7. it is made felony without benefit of clergy: as is alfo the abominable wickednefs of carnally knowing or abufing any woman-child under the age of ten years; in which cate the confent or non-confent is immaterial, as by reaton of her tender years the is incapable of judgment and ditcretion. Sir Matthew Hale is indeed of opinion, that fuch profligate actions committed on an infant un. der the age of twelve years, the age of $f \in$ male difcretion by the common law, either with or without confent ${ }_{2}$ amount to rape and felony ; as well fince as before theftatute of queen Elizabeth : but that law has in general been held only to extend to infants under ten; though it fhould feem that damfels between ten and twelve are ftill under the protection of the fatute Weftm. I. the law with refpect to their feduction not having been altered by either of the fubfequent fatutes.

A male infant, under the age of fourteen years, is

## R A P

tepe. $\cdots$ prefuned by law incapable to commit a rape, and thercfore it feems cannot be found guilty of it. For though in other felonies " malitia fupplet ætatem ;" yet, as to this particular fecies of felony, the law fuppofes an imbecility of body as well as mind.

The civil law feams to fuppofe a proftitute or common harlot incapable of any injuries of this kind: not ailowing any punifhment for violating the chaftity of her, wio hath indeed no chaftity at all, or at leaft hath no regard to it. But the law of England does not judge fo hardly of offenders, as to cut of all opportuaity of retreat even from common Itrumpets, and to treat them as never capable of amendment. It therefore holds it to be felony to force even a concubine or harlot; becaufe the woman may have forfaken that unlawful courfe of life:- for, as Bracton well obferves, " licet meretrix fuerit antea, certe tunc temporis non fuit, cum reclamando nequitiz ejus confentire noluit."

As to the material facts requifite to be given in evidence and proved upon an indictment of rape, they are of fuch a nature, that, though neceffary to be known and fettled, for the conviction of the guilty and prefervation of the innocent, and therefore are to be found in fuch criminal treatifes as difcourfe of thefe matters in detail, yet they are highly improper to be publickly difcuffed, except only in a court of juttice. We fhall therefore merely add upon this head a few remarks from Sir Matthew Hale, with regard to the competency and credibility of witneffes; which may, falvo pudore be confidered.

And, firt, the party ravifhed may give evidence upon wath, and is in law a competent witnefs; but the credibility of her teftimony, and how far forth the is to be selieved, muft be left to the jury upon the circumftances of fact that concur in that teftimony. For inftance : if the witnefs be of good fame; if the prefently difcovered the offence, and made fearch for the offender ; if the party accured fed for it; thefe and the like are concurring circumitances, which give greater probability to her evidence. But, on the other fide, if the be of evil fame, and fand unfupported by others; if fhe concealed the injury for any confiderable time after the had opportunity to complain; if the place, where the fact was alleged to be committed, was where it was poflible fhe might have been heard, and fle made no outcry : tisefe and the like circumftances carry a. Arong, but not conclufive, prefumption that her teftimony is falfe or zeigned.

Moreover, if the rape be charged to be committed on an infant under is years of age, fhe may fill be a competent witnefs, if the hath fenfe and underftanding to know the nature and obligations of an oath; and, even if fhe hath not, it is thought by Sir Mattheiv Hale, that fhe ought to be heard without oath, to give the court information ; though that alone will not be fufficient to convist the offender. And he is of this opinion, firf, Becaufe the nature of the offence being fecret, there may be no other poffible proof of the actual fact ; though afterwards there may be con'current circumftances to corroborate it, proved by other witnefles: and, fecondly, Becaufe the law allows what the child told her mother, or ottrer relations, to be given in evidence, fince the nature of the
cafe admits frequently of no better proof; and there is much more reafon for the court to hear the narration of the child herfelf, than to receive it at fecondhand from thofe who fwear they heard her fay fo. And indeed it fcems now to be fettled, that in thefe cafes infants of any age are to to be heard ; and, if they have any idea of an oath, to be alfo fworn : it being found by experience, that infants of very tender years often give the clearefl and truell teltimeny. But in any of thefe cafes, whether the child be fworn or not, it is to be wifhed, in order to render her evidence credible, that there fhould be fome concurrent teftimony of time, place, and circumflances, in order to maké out the fact; and that the conviction fhould not be grounded fingly on the unfupported accufation of an infant under years of difcretion. There may be therefore, in many cafes of this nature, witnefles who are competent, that is, who may be admitted to be heard ; and yet, after being heard, may prove not to be credible, or fach as the jury is bound to believe. For one excellence of the trial by jury is, that the jury are triers of the credit of the witneffes, as well as of the truth of the fact.
" It is true (fays this learned judge), that rape is a moft deteftable crime, and therefore ought feverely and impartially to be punifhed with death; but it mult be remembered, that it is an accufation eafy to be made, hard to be proved, but harder to be defended by the party accufed, though innocent." He then relates two very extraordinary cafes of malicious profecution for this crime that had happened within his own obfervation; and concludes thus: "I mention thefe inftances, that we may be the more cautious upon trials of offences of this nature, wherein the court and jury may with fo much eale be impofed upon, without great care and vigilance ; the heinoufnefs of the offence many times tranfporting the judge and jury with fo much indignation, that they are over-haltily carried to the conviction of the perfons accufed thereof, by the confiftert teftimony of fometimes falfe and malicious witneffes."

RAPHAEL (D'Urbino), the greatef, moft fublime, and mof excellent painter that has appeared, fince the revival of the fine arts, was the fon of an indifferent painter named Sansio, and was born at Urbino on Good Friday 1482. The popes Julius II. and Leo X. who employed him, loaded him with wealth and honour; and it is faid that cardinal De St Bibiana had fach a value for him that he offered bim his niece in marriage. His genius is admired in all his pittures ; his contours are free, his ordonnances magnificent, his defigns correct, his figures elegant, his exprefions lively, his attitudes natural, his heads graceful; in fine, every thing is beautiful, grand, fublime, juft and adorned with graces. Thefe various perfections he derived not only from his excellent abilities, but from his Itudy of antiquity and anatomy ; and from the friendfhip he contracted with Ariolto, who contributed not a little to the improvement of his talte. His pictures are piincipally to be found in Italy and Paris. That of the Transfiguration, preferved at Rome in the church of St Peter Monterio, paffes for his mafter-piece. He had a handfome perfon, was well proportioned, and had great fiweetnefs of temper ; was polite, affable, and mo-

Rape, Raphacl.

## R A P

kaphain Raphidia. of the eminent mafters of his time were ambitious of working under him; and he never went out without a crowd of artifts and others, who followed him purely through refpect. He was not only the beft painter in the world, but perhaps the beft architect too; on which account Leo $\mathbf{X}$. charged him with building $S t$ Peter's church at Rome : but he was too much addicted to pleafure, which occalioned his death at 37 years of age. He left a great number of difciples; among whom were Julio Romano and John Francis Perini, who were his heirs. Many able engravers, as Raimondi, George Mantuan, and Bloemart, engraved after lRaplael. See Painving, p. 595 and $59^{8}$.

RAPHAIM, or Rephaim, (Mores, a name fignifying Giants, as they really were, and an actual people too, Gituated in Bafan or Batanea, beyond Jordan, feparated from the Zamzummim by the river Jabbok. Al. fo a valley near Jerufalem; Johnua $x$.

RAPHANUS, radish; a genus of the filiquofa order belonging to the tetradynamia clafs of plants; and in the natural method ranking under the 39 th order, Siliquofa. The calyx is clofe; the filiqua torofe, or fwelling out in knots, fubarticulated, and round. There are two melliferous glandules between the fhorter ftamina and the piftil, and two between the longer Atamina and the calyx.

There is only one fpecies, viz. the fativus, or common garden radifh; of which there are feveral varieties. They are annual plants, which being fowed in the fpring, attain perfection in two or three months, and fhoot up foon after into falk for flower and feed, which, ripening in autumn, the whole plant, root and top, perifhes; fo that a frefh fupply mult be raifed annually from feed in the fpring, performing the fowings at feveral different times, from about Chrifmas until May, in order to continue a regular fucceffion of young tender radifhes throughout the feafon: allowing only a fortnight or three weeks interval between the fowings; for one crop will not continue good longer than that fpace of time, before they will either run to feed, or become tough, ticky, and too hot to eat.

RAPHANIDOSIS, a punifhment inflicted at Athens upon adulterers. The manner of it was this: The hair was plucked off from the privates of the offender, hot alhes laid upon the place, and a radifh or mullet thruft up his fundament, as has been mentioned under Adultery. To this Juvenal alludes, Sat. x. ver. 317. Quoflam machos et mugilis intrat. Perfons who had been thus punifhed were called sutporxtos. The word fraplianidofis is derived from pacarrs, a radifh.

RAPHIDIA, in zoology; a genas of infects, of the neuroptera order ; the characters of which are thefe: The head is of a horny fubftance, and depreffed or flattened: the mouth is armed with two teeth, and furnifhed with four palpi: the ftemmata are three in number: the wings are deflected: the antenna are filiform, as long as the thorax; the anterior part of which is lengthened out, and of a cylindrical form : the tail of the female is terminated by an appendix, refembling a flexible crooked brifle.-There are three fpecies. The molt remarkable is the ophioptis; which for its fhape is one of the moft fingular that can be

+ Plate
cecexxpr. Vol. XVI.
with its point joined to the thorax, and the broad part before. It is fmooth, black, flattened, continually fhaking, with fhort antennæ, yellowifh maxillæ, and four palpi. Towards the middle of the upper part of the head, between the eyes, are the three ftemmata, placed in a triangle. The thorax, to which this head is faftened, is narrow, long, and cylindrical. The $a b$ domen, broader, is black like the reft of the body, with the fegments margined yellow. The feet are of a yellowifh caft. The wings, which are faltigiated, are white, diaphanous, veined, and as it were covered with a very fine net-work of black. This infeet, in The figure of its head, refembles a fnake. It is found but feldom, and in woods only. Its larva, chryfolis, and habitation, are abfolutely unknown.

RAPIER, formerly fignified a long old-fafhioned fword, fuch as thofe worn by the common foldiers: but it now denotes a fmall fword, as contradiftinguifhed from a back-fword.

RAPIN (Rene), a Jefuit and eminent French writer, was born at Tours in 162 I . He taught jolite literature in the fociety of the Jefuits with great applaufe, and was juftly eiteemed one of the beft Latin poets and greateft wits of his time. He died at $\mathrm{Pa}-$ ris in 1687. He wrote, 1. A great number of Latin poems, which have rendered him famous throughout all Europe; among which are his Hortorum libri quatuor, which is reckoned his mafter-piece. 2. Reflections on Eloquence, Poetry, Hiftory, and Philofophy. 3. Comparifons between Virgil and Homer, Demofthenes and Cicero, Plato and Ariftotle, Thum cydides and Titus Livius. 4. The hifory of Janfenifm. 5. Several works on religious fubjects. The beft edition of his Latin poems is that of Paris in $17_{23}$, in 3 vols 12 mo .

Rapin de Thoyras (Paul de), a celebrated hiftorian. was the fon of James de Rapin lord of Thoyras, and was born at Caltres in 1661. He was educated at firt under a tutor in his father's houfe ; and afterwards fent to Puylaurens, and thence to Saumur. In 1679 he returned to his father, with a defign to apply himfelf to the fludy of the law, and was admitted an advocate : but fome time after, reflecting that his being a Proteftant would prevent his advancement at the bar, he refolved to quit the profeffion of the law, and apply himfelf to that of the fword; but his father would not confent to it. The revocation of the edict of Nantes in 1685 , and the death of his father, which happened two months after, made him refolve to go to England; but as he had no hopes of any fettlement there, his ftay was but fhort. He therefore foon after went to Holland, and lifted himfelf in the company of French volunteers at Utrecht, commanded by M. Rapin his coulin-german. He attended the Prince of Orange into England in 1688: and the following year the Lord Kingiton made him an enfign in his regiment, with which he went into Ircland, where he gained the efteem of his officers at the fiege of Carrickfergus, and had foon a licutenant's commiffion. He was prefent at the battle of the Boyne, and was fhot thro' the fhoulder at the fiege of Limerick. He was foon after captain of the company in which he had been enfign: but, in 1693 , religned his company to one of his brothers, in order to be tutor to the earl of Portland's

Rapier,
Kapin.

## R A S <br> 10

 marriage neither abated his care of his pupil nor prevented his accompanying him in hi, travels. Having finifhed this employment, he returned to his family, which he had fetted at the Hague; and here he continued fome years. But as he found his family increafe, he refolved to retire to fome cheap country; and accordingly removed, in 1707, to Wefel, where he wrote his Hiftory of England, and fome other pieces. Though he was of a ftrong conflitution, yet feventeen years application (for fo long was he in compofing the hiftory jult mentioned) entirely ruined his health. He died in 1725 . He wrote in French, I. A Differtation on the Whigs and Tories. 2. His Hiftory of Eng. land, printed at the Hague in 1726 and 1727 , in 9 vols 4 to, and reprinted at Trevoux in 1728 , in 10 vols 4 to. This laft edition is more complete than that of the Hague. It has been tranflated into Englifh, and improved with Notes, by the Reverend Mr Tindal, in 2 vols folio. This performance, though the work of a foreigner, is defervedly efteemed as the fulleft and moft impartial collection of Englifh political tranfactions extant. The readers of wit and vivacity, however, may be apt to complain of him for being fometimes rather tedious and dull.RAPINE, in law, the taking away another's goods stc. by violence.

RAPPERSWIL, a town of Swifferland, on the confines of the canton of Zurich, and of the territory of Gafter, with an old cafte it is ftrong by fituation, being feated on a neck of land which advances into the lake of Zurich, and over which there is a bridge 850 paces long. It is fubject to the cantons of Zurich and Berne. E. Long. 8. 57. N. Lat. 47. 20.

RAPP OLSTEIN, a town of France in Upper A1face, which, before the Revolution, had the title of a barony. All the muficians of Alface likewife depended upon this baron, and were obliged to pay him a certain tribute, without which they could not play upon their inflruments. E. Long. 7. 28. N. Lat. 48 . 15 .

RAPTURE, an ecftafy or tranfport of mind. See Extasy.

RARE, in phyfics, ftands oppofed to denfe; and demotes a body that is very porous, whofe parts are at a great diftance from one another, and which is fuppofed to contain but little matter under a large bulk. See the following article.

RAREFACTION, in phyfics, the act whereby a body is rendered rare; that is, brought to poffefs more room, or appear under a larger bulk, without acceffion of any new matter. -This is very frequently the effect of fire, as lias long been univerrally allowed. In many cafes, hovever, philofophers have attributed it to the action of a repulfive principle. However, from the many difcoveries concerning the nature and properties of the electric fluid and fire, there is the greateft reafon to believe, that this repulfive principle is no other than elementary fire. See Repulsion.

RAS.el-Feel, one of the frontier provinces of Abyflinia, of which the late celebrated traveller Mr Bruce was made governor while in that country. It is but of fmall extent, and in its moft profperous fate contained only 39 villages. The climate is extremely hot, in Mr Brace's opinion one of the hotteft in the world. He informs us, that on the firlt day of March, at three
$0^{\prime}$ clock in the afternoon, the thermometer food at $14^{\circ}$ Ras-Sem, in the fhade, and in the evening at $82^{\circ}$; though at

Rafay. funrife it had been no higher than 6 I . Notwithflanding this appearance of extreme heat, however, the fenfation was by no means intolerable; they could bunt at mid-day, and felt the evenings rather cold. The foil is a fat, loofe, black earth, which our author fays is the fame from $13^{\circ}$ to $16^{\circ}$ of north latitude; at leaft till we come to the deferts of Atbara, where the tropical rains ceafe. This country divides that of the Shangalla into two parts, nearly equal. Thefe people inhabit a belt of land about 60 miles broad, all along the northern frontier of Abyffinia, excepting two large gaps or fpaces which have been left open for the fake of commerce, and which are inhabited by frangers, to keep the Shangalla in awe. The latter trade in gold, which they pick up in the ftreams as it is wafhed down from the mountains; for there are no mines in their country, neither is there any gold in Abyffinia, excepting what is imported from this or fome other country. The Shangalla are the natural enemies of the inhabitants of Ras-el-Feel, and much blood has been fhed in the various incurfions they have made upon one another ; though of late thofe of Ras-el-Feel, by the affifance of the emperors, have been enabled to keep the Shangalla at bay.

RAS SEm, a city of Tripoli in Barbary, concerning which a number of fables were told by the Tripoline ambalfador, all of which were believed in England and other parts of Europe in the begnning of this century. (See Petrified-City). Mr Bruce informs us, that it is Gituated about five days journey fouth from Bengazi; but has no water excepting one fountain, which has a difagreeable, tafte, and feems to be impregnated with alum. Hence it has obtained the name of Ras-Sem, or the furuntain of poifon. The only remains of antiquity in this place confift of the ruins of a tower or fortification, which, in the opinion of Mr Bruce, is as late as the time of the Vandals; but he fays he cannot imagine what ufe they made of the water, and they had no ntrier within two days journey of the place.Here our traveller faw many of the animals called jerboa, a kind of mice; which, he fays, feem to partake as much of the nature of a bird as of a quadruped.

RASAY, one of the Hebrides Iflands, is about 13 miles long and 2 broad. It contains 700 inhabitants, has plenty of lime-ftone, free-ftone; and feeds great numbers of black cattle; but has neither deers, hares, nor rabbits. The only appearance of a harbour in Rafay is at Clachan Bay, where Mr Macleod the proprietor of the ifland refides. Rafdy prefents a bold fhore, which rifes to the height of mountains; and here the natives have, with incredible labour, formed many little corn fields and potato grounds. Thefe heights decreafe at the fouth end, where there are frme farms and a goodlooking country. Mr Macleod is fole porprietor of this iffand, and of Rona and Fladda at the north end of it, which are only proper for grazing.

The houfe of Rafay is pleafantly fituated near the fouth-weft end of the illand, which is the moft level part of it. It has an extenfive and excellent garden, and is furrounded with foreft trees of confiderable magnitude; another proof that trees will grow upon the edge of the fea, though it muft be allowed that the

## R A 5

Rafcians
channel here is narrow. Immediately behind the houfe of Rafay are the ruins of an ancient chapel, now ufed as the family burying-place.

Dr Joinfon, in his Tour, expreffes the higheft fati, facticn at the reception he met wih when in Rafay from Mr Macleod.

RASCIANS, a poor opprefled people who dwelt on both fides of the Datuhe, and who, tbout the year 1594, being weary of the Turkifh thraldinm, firft took 13 of their veffels upon that river; and then drawing together a body of fifteen thoufand men between Buda and Belgrade, twice defeated the pâfhâ of Temefwar with a bedy of fourteen thoufand Turks. They afterwards took Bac;kerek, four miles from Belgrade, and the cafte of Otradt; then laying fiege to that of Beche, on the Theyfia, the old patifia of Temefwar marched to relieve it wita eleven thoufand men; but the Rafcians encountering them, flew near ten thoufand, and took 18 pieces of anon. The confequence of this vietery was the reduction of Werfetza and Luts. Then, fending to the archduke for aid and gunners, they offered to put themielves and therr country under the emperor's protection.

Rasor-Fijh. Sec Sulen.
RASTALL (John), a printer and mifcellaneous writer, was born in London, probably about the end of the 15 th century, and educated at Osford. Returning from the univerity, he fettled in the metropolis, and commenced printer, "then efteemed (fays Wood) a profefion fit for any fcholar or ingenious man." He married the fifter of Sir Thomas More, with whom, we are told, he was ve-y intimate, and whofe writings he Atrenuoufly defended. From the title-page of one of his books, he appears to have lived in Cheapfide, at the fign of the mermaid. He died in the year 1536; and left two fins, William and John: the firt of whom became a judge in queen Mary's reign, and the latter a juftice of peace. This John Raftall, the fubject of the prefent article, was a zealous Papift ; but Bale fays, that he changed his religion befure his death. He wrote, 1. Natura naturata. Pits calls it a copious (prolixa) and ingenious comedy, defcribing Europe, Afia, and Africa; with cuts. What fort of a comedy this was, is not eafy to conceive. Probably it is a cofmographical defcription, written in dialogue, and therefore fityled a comedy. 2. The pattyme of the people; the cronycles of diverfe realmys, and moft efpecially of the realm of England, brevely compiled and emprinted in Cheapefyde, at the fign of the mearmaid, next Pollyfgate, cun pricilsin, fol. 3. Ecclefa Yobannis Raftall, 1542. Wis cane of the prohibited books in the reign of Henry VIII. 4. Legum Anglicanarum vocabula explicata. French and Latin. Lond. 1567, 8vo. And fome other works.

RASTADT, a town of Germany, in the circle of Suabia and merquifate of Baden, with a handfome caftle. It is remarkable for a treaty concluded here between the French and Imperialifts in 1714; and is feated on the river Merg, near the Rhine. E. Long. 9. 14. N. Lat. 48.52 .

RASTENBURG, a fine city in Pruffia, on the Guber, furrounded with a wall, and fince 1629 alfo with a rampart.

## $R$ A S

RAT, in zoology. See Mus.
The following reseipt is faid to have been found ef. feftual for the deftruction of rats. Take of the feeds of ltavefacre or lcufewort, powdered, more or lefs as the occafion requires, one part ; of oat-meal, three parts; mir them well, and make them upinto a pate with honey. Lay pieces of it in the holes, and on the places where mice and rats frequent; and it will effectually kill or rid the place of thofe kind of vermin by their eating thereof.

Some time ago, the fociety for encouraging arts propofed a premium of 50 l . for a preparation capable of alluring or fafcinating rats fo that they might be taken alive. In confequence of this, a great number of new traps, \&c. were invented; and the following methods of alluring the rats to a certain place were publifhed.

One of thofe moft eafily and efficacioufly practifed is the trailing fome pieces of their moft favourite food. which fhould be of the kind that has the frongelt fcent, fuch as toalted cheefe or broiled red herrings, from the holes or entrances of the clofet to their receffes in every part of the houfe or contiguous building. At the extremities and in different parts of the courfe of this trailed track, fmall quantities of meal, or any other kind of their food, fhould be laid, to bring the greater number into the tracks, and to encourage them to purfue it to the place where they are intended to be taken: at that place, when time admits of it, a more plentiful repaft is laid for them, and the trailing repeated for two or three nighis.

Befides this trailing and way-baiting, fome of the moft expert of the rat-catchers have a fhorter and perhaps more effectual method of bringing them together; which is the calling them, by making fuch a whitling noife as refembles their own call; and by this means, with the affiftance of the way-baits, they call them out of their holes, and lead them to the repalt prepared for them at the place defigned for taking them. But this is much more difficult to be practifed than the art of trailing; for the learning the exact notes or cries of any kind of beafts or birds, fo as to deceive them, is a peculiar talent which is feldom attained : though fome perfons have been known who could call together a great number of cats; and there was a man in London who could bring nightingales, when they were within hearing, about him, and even allure them to perch on his hand, fo as to be taken.

In practifing either of chofe methods, of trailing or calling, great caution mult be ufed by the operator to fupprefis and prevent the fcent of his feet and body from being perceived; which is done by overpowering that fcent by others of a Atronger naturc. In o-der to this, the feet are to be covered with cloths rubbed over with afafortida, or other ftrong-\{melling fubftances; and even oil of rhodium is fometimes ufed for this purpofe, but fparingly, on account of its dearnefs, though it has a very alluring as well as difguifing effect. If this caution of avoiding the feent of the operator's feet, near the track, and in the place where the rats are propofed to be collected, be not properly obferved, it will very much obltruct the faccefs of the attempt to take them; for they are very fhy of coming where the fcent of human feet lies very frefh, as it intimates to their fagacious inftinet the prefence of human creatures, whom they

## R A T

 luring by trailing, way-baiting, and calling, is added another of a very material efficacy, which is, the ufe of oil of rhodium, which, like the marum Syriacum in the rafe of cats, has a very extraordinary fafcinating power on thefe animals. This oil is extremely dear, and therefore fparingly ufed. It is exalted in a fmall quantity in the place, and at the entrance of it, where the rats are intended to be taken; particularly at the time when they are to be laft brought together, in order to their deftruction; and it is ufed alfo by fmearing it on the furface of fome of the implements ufed in taking by the method below defcribed; and the effect it has in taking off their caution and dread, by the delight they appaer to have in it, is very extraordinary.It is ufual, likewife, for the operator to difguife his figure as well as feent, which is done by putting on a fort of gown or cloak, of one colour, that hides the :atural form, and makes him appear like a polt or fome fach inanimate thing; which habit muft likewife be icented as above, to overpower the fmell of his perfon; and befides this, he is to avoid all motion till he has fecured his point of having all the rats in his power.

When the rats are thus enticed and collected, where time is afforded, and the whole in any houfe and outbuildings are intended to be cleared away, they are fuffered to regale on what they moft like, which is ready prepared for them, and then to go away quietly for two or three nights; by which means thofe that are not alJured the firf night are brought atterwards, either by their fellows, or the effects of the trailing, \&c. and will not fail to come duly again, if they are not difturbed or molefted. But many of the rat-catchers make fhorter work, and content themfelves with what can be brought together in one night or two; but this is never effectual, unlefs where the building is fmall and entire, and the rats but few in number.

The means of taking them, when they are brought together, are various. Some entice them into a very large bag, the mouth of which is fufficiently capacious to cover nearly the whole floor of the place where they are collected; which is done by fmearing fome veffel, placed in the middle of the bag, with oil of rhodium, and laying in the bag baits of food. This bag, which before lay flat on the ground with the mourh fpread open, is to be fuddenly clofed when the rats are all in. Others drive or fright them, by light noifes or motions, into a bag of a long form, the mouth of which, after all the rats are come in, is drawn up to the opening of the place by which they entered, all other ways of retreat being fecured. Others, again, intoxicate or poifon them, by mixing with the repalt prepared for them the coculus Indicus, or the nux vomica. They direct four ounces of the coculus Indicus, with twelve ounces of oatmeal, and two ounces of treacle or honey, made into a moift pafte with frong-beer: but if the nux vomica be ufed, a much lefs proportion will ferve than is here given of the coculus. Any fimilar compofition of thefe drugs,*with that kind of food the rats are moft fond of, and which has a ftrong flavour, to hide that of the drugs, will equally well anfwer the end. If indeed the coculus Indicus be well powdered, and infured in ftrong-beer fur fome time, at leaft half the quantity here directed will ferve as well as the quautity before-mentioned. When the rats appear to be thoroughly in-
toxicated with the coculus, or fick with the nux vomica, Rat-Ifanst they may be taken with the hand, and putinto a bag or cage, the door of the place being firft drawn to, left $\xrightarrow{\|}$ thofe who have ftrength and fenfe remaining efcapc.

Rat-Ifand, a fmall detached part of the ifland of Lundy, off the north coalt of Devon. Though noted in Donn's map of the county, it is not worth mention here, but as giving opportunity to fubjoin a farther notice of Lundy, which illand was purchafed a few years fince by Mr Cleveland M. P. for about 1200 guineas, who has a fmall villa on it: not more than 400 acres are cultivated: it is let altogether for 7ol. a year. The foil is good, though no trees will grow on the ifland. It has fine fprings of water: the houfes are feven : the inhabitants, men, women, and children, do not exceed 24. The bird called murr, whofe eggs are very large and fine, the Lundy parrot, and rabbits, are the chief produce; thefe abound, and are taken for the feathers, eggs, and kins, principally. 'They have now (1794) 70 bullocks and 400 fheep, but the latter do not thrive. They pay no taxes : filhing lkiffs often call with neceffaries : the fituation is very pleafant, and the rocks around, which are large, and partly granite, are wild, romantic, and novel. It had probably more inhabitants once, as human bones have been ploughed up. It has no place of worfhip, nor public-houfe; but ftrangers are always welcome. Eight cannon lie on the battlements on the top of a very fteep precipice, under which is a curious cavern. Lord Gower, Mr Benfon, and Sir J. B. Warren, K. B. have been former proprietors. See Lundy.

Rat-Tails, or Arrefts. See Farriery, $\S$ xxxvii.
RATAFIA, a fine fpirituous liquor, prepared from the kernels, \&c. of feveral kinds of fruits, particularly of cherries and apricots.

Ratafia of cherries is prepared by bruifing the cherries, and putting them into a veffel wherein brandy has been long kept; then adding to them the kernels of cherries, with ftrawberries, fugar, cinnamon, white $p \in p-$ per, nutmeg, cloves; and to 20 pound of cherries io quarts of brandy. The veffel is left open ten or twelve days, and then fopped clofe for two months before it be tapped. Ratafia of apricots is prepared two ways, viz. either by boiling the apricots in white-wine, adding to the liquor an equal quantity of brandy, with fugar, cinnamon, mace, and the kernels of apricots; infuing the whole for eight or ten days; then fraining the li'quor, and putting it up for ufe: or elfe by infufing the apricots, cut in pieces, in brandy, for a day or two, paffing it through a ftraining bag, and then putting in the ufual ingredients.

RATCH, or rash, in clock-work, a fort of wheel having twelve fangs, which ferve to lift up the detents every hour, and make the clock frike. See Clock.

RATCHETS, in a watch, are the fmall teeth at the bottom of the fufy, or barrel, which fops it in winding. up.

RATE, a ftandard or proportion, by which either the quantity or value of a thing is adjufted.

RATES, in the navy, the orders or claffes into which the fhips of war are divided, according to their force and magnitude.
The regulation, which limits the rates of men of war to the fmalleft, number poffible, feems to have been dictated by confiderations of political economy, or of that

## R A T [ I 3 ] <br> R A T

Ratcs.
of the fimplicity of the fervice in the royal dock-yards. The Britifh fleet is accordingly diftributed into fix rates, exclufive of the inferior veffels that ufually attend on naval armaments ; as floops of war, armed fhips, bombketches, fire-hips and cutters, or fchooners commanded by lieutenants.

Ships of the firf rate mount ioo cannon, having $42^{-}$ pounders on the lower deck, 24 -pounders on the middle deck, 12 -pounders on the upper deck, and 6 -pounders on the quarter-deck and fore-calle. They are manned with 850 men , including their officers, feamen, marines, and fervants.

In general, the fhips of every rate, befides the captain, have the mater, the boatfwain, the gunner, the chaplain, the purfer, the furgeon, and the carpenter ; all of whom, except the chaplain, have their mates or affiftants, in which are comprehended the fail-maker, the mafter at arms, the armourer, the captain's clerk, the gunfmich, \&c.

The number of other officers are always in proportion to the rate of the thip. Thus a firft rate has fix lieutenants, fix mafter's mates, twenty-four midfhipmen, and five furgeon's mates, who are confidered as gentlemen : befides the following petty officers; quarter-mafters and their mates, fourteen; boatfwain's mates and yeomen, eight ; gunner's mates and affiltants, fix ; quar-ter-gunners, twenty-five ; carpenter's mates, two, befides fourteen affiftants; with one Ste ward, and Iteward's mate to the purfer.

If the dimenfions of all fhips of the fame rate were equal, it would be the fimpleit and moft peripicuous method to collect them into one point of view in a table : but as there is no invariable rule for the general dimenfions. We muft content ourfelves with but a few remarks on fhips of each rate, fo as to give a general idea of the difference between them.

The Victory, one of the laft built of the Britilh firlt rates, is 222 feet 6 inches in length, from the head to the ftern ; the length of her keel, 15 I feet 3 inches; that of her gun-deck, or lower deck, i 86 feet; her extreme breadth is 51 feet 10 inches; her depth in the hole, 21 feet 6 inches; her burden, 2162 tons; and her poop reaches 6 feet before the mizen-maft.

Ships of the fecond rate carry 90 guns upon three decks, of which thofe on the lower battery are 32 . pounders; thofe on the middle, 18 -pounders ; on the upper deck, 12 -pounders; and thofe on the quarterdeck, 6 -pounders, which ufually amount to four or fix. Their complement of men is 750 , in which there are fix lieutenants, four mafter's mates, 24 midfhipmen, and four furgeon's mates, 14 quarter-mafters and their mates, eight boatfwain's mates and yeomen, fix gunner's mates and yeomen, with 22 quarter-gunners, two carpenter's mates, with 10 affiftants, and one fteward and fteward's mate.

Ships of the third rate carry from 64 to 80 cannon, which are 32,18 , and 9 -pounders. The 80 -gun hips however begin to grow out of repute, and to give way to thofe of 74, 70, \&c. which have only two whole batteries; whereas the former have three, with 28 guns planted on each, the cannon of their upper deck being the fame as thofe on the quarter-deck and fore-caftle of the latter, which are 9 -pounders. The complement in a 74 is 650 , and in a $6+500$ men; having, in peace, four lieutenants, but in war, five; and when an admial
is aboard, fix. They have three mafter's mates, 16 midfhipmen, three furgeon's mates, 10 quarter-mafters and their mates, fix boatfwain's mates and yeomen, four gunner's mates and yeomen, with 18 quarter-gunner , one carpenter's mate, with eight affilants, and one lte 1 ard and fteward's mate under the purfer.

Ships of the fourth rate mount from 60 to 50 guns, upon two decks, and the quarter-deck. The lower tier is compofed of 24 -pounders, the upper tier of 12 pounders, and the cannon on the quarter-deck and fore-caftle are 6 -pounders. The complement of a 50 gun fhip is 350 men, in which there are three lieutenants, two malter's mates, 10 midihipmen, two furgeon's mates, eight quarter-malters and their mates, four boatfwain's mates and yeomen, one gunner's mate and one yeoman, with 12 quarter-gunners, one carpenter's mate and fix affiftants, and a feward and feward's mate.

All veffels of war, under the fourth rate, are ufually comprehended under the general name of frigutes, and never appear in the line of battle. They are divided into the 5 th and 6 th rates; the former mounting from 40 to $3^{2}$ guns, and the latter from 28 to 20 . The largelt of the fifth rate have two decks of c.mnon, the lower battery being of 18 -pounders, and that of the upper deck of 9 -pounders; but thole of $3^{6}$ and $3^{2}$ guns have one complete deck of guns, mounting 12pounders, befides the quarter-deck and fore-cafle, which carry 6 -pounders. The complement of a fhip of 44 guns is 280 men; and that of a figate of 36 guns, 240 men. The firlt has three, and the fecond two, lieutenants ; and bith have two mafter's mates, fix midfhipmen, $t$ wo furgeon's mates, fix quarter-mafters and their mates, two boatfwain's mates and one yeonian, one gunner's mate and one yeoman, with io or Ir quar-ter-gunners, and one purfer's fteward.

Frigates of the 6th rate carry 9 -pounders, thofe of 28 guns having 3 -pounders on their quarter-deck, with 200 men for their complement; and thofe of 24,160 men : the former has two lieutenants, the latter, one; and both have two matter's mates, four midfhipmen, onefurgeon's mate, four quarter-matters and their matec, one boatfwain's mate and one yeoman, one gunner's mate and one yeoman, with fix or feven quarter-gunners, and one purfer's fteward.

The flocps of war carry from 18 to 8 cannon, the largelt of which have fix-pounders; and the fmalleft, viz. thofe of 8 or io guns, four-pounders. Their officers are generally the fame as in the 6th rates, with little variation ; and their complements of men are trom 120 to 60 , in proportion to their force or magnitude. $N$. B. Bomb-veffels are on the fame cftablifliment as floops ; but fire-fh'ps and hofpital-fhips are on that of fifth rates.

Nothing more evidently manifels the great improvement of the marine art, and the dearee of perfection to which it has arrived in Britain, than the facility of managing their firt rates; which were formerly elteemed incapable of goverument, unlcfs in the mof favourable weather of the fummer.

Ships of the fecond rate, and thofe of the third, which have three decks, carry their fails remarkably well, and labour very little at fea. They are excellent in a general action, or in cannonading a furtrefs. Thole of the third rate, which have two tiers, are fit for the

Rate $\underbrace{\text { Rate }=:}$
,

## R A T $\quad 14] \quad$ R A T

Ratcen line of battle, to lead the convoys and fquadrons of fhips of war in action, and in general to fuit the different exigencies of the naval fervice.

The fourth-rates may be employed on the fame occafions as the third-rates, and may be alfo deftined a. mong th the foreign colonies, or on expeditions of great diftance; fince thefe veffels are ufually excellent for keeping and fibtaining the fea.

Veffels of the fifth rate are too weak to fuffer the fhock of a line of battle; but they may be deftined to lead the convoys of merchant fhips, to protect the commerce in the colonies, to cruize in different fations, to accompany fquadrons, or to be fent exprefs with neceffary intelligence and orders. The fame may be obferved of the fixh rates.

The frigares, which mount from 28 to $3^{8}$ guns upon one deck, with the quarter-deck, are extremely preper for cruizing againft privateers, or for fhort expeditions, being light, long, and ufvally excellent failors.

RATEEN, or Ratten, in commerce, a thick woollen fuff, quilled, woven on a loom with four treddles, like ferges and other ftuffs that have the whale or quilling. There are fome rateens dreffed and prepared like cloths; others left fimply in the hair, and others where the hair or knapis frized. Rateens are chiefly manufatured in France, Holland, and Italy, and are moltiy ufed in linings. The frize is a fort of coarle rateen, and the drugget is a rateen half linen half woollen.

RATIFICATION, an ast approving of and confirming fomething done by another in our name.

RA'lIO, in atithmetic and geometry, is that relation of homogeneous things which determines the quantity of one from the quantity of another, without the intervention of a third.

Two numbers, lines, or quantities, A and B , being propofed, their relation one to another may be confidered under one of thele two heads: I. How much A exceeds $B$, or $B$ exceeds $A$ ? And this is found by taking A from $B$, or $B$ from $A$, and is called aritbmetic reafon, or ratio. 2. Or how many times, and parts of a time, A contains B, or B contains A? And this is called geometric reafon or ratio; (or, as Euclid defines it, it is the mutual babitude, or re/pect, of two magnitudes of the fame kind, according to quantity ; that is, as to how often the one contains, or is contained in, the other) ; and is found by dividing $A$ by $B$, or $B$ by A. And here note, that that quantity which is referred to another quantity is called the antecedent of the ratio: and that to which the other is referred is called the confequent of the ratio; as, in the ratio of $A$ to $B, A$ is the antecedent, and B the confequent. Therefore any quantity, as antecedent, divided by any quantity as a confequent, gives the ratio of that antecedent to the confequent.

Thus the ratio of $A$ to $B$ is $\frac{A}{B}$, but the ratio of $B$ to $A$ is $\frac{B}{A}$; and, in numbers, the ratio of 12 to 4 is $\frac{12}{4}=3$, or thiple ; but the ratio of 4 to 12 is $\frac{4}{12}=\frac{1}{3}$, or fubtriple.

And here note, that the quantities thus compared
muft be of the fame kind ; that is, fuch as by multiplication may be made to exceed one the other, or as thefe quantities are faid to have a ratio between them, which, being multiplied, may be made to exceed one another. Thus a line, how fhort foever, may be multiplied, that is, produced fo long as to exceed any given right line; and confequently thefe may be compared together, and the ratio expreffed : but as a line can never, by any multiplication whatever, be made to have breadth, that is, to be made equal to a fuperficies, how fmall foever; thefe can therefore never be compared together, and confequently have no ratio or refpect one to another, accorditg to quantity ; that is, as to how often the one contans, or is contained in, the other. See Quantity.

RATIOCIN.ITION, the act of reafuning. See

## Reasoning.

RATION, or Ratian, in the army, a fortion of ammunition, bread, drink, and forage, diltributed to each foldier in the army, for his daily fubfiltence, \&c. The horfe have rations of hay and oats when they cannot go out to forage. The rations of bread are reguJated by weight. The ordinary ration of a foot foldier is a pound and a half of bread per day. The officers have feveral rations according to their quality and the number of attendants they are obliged to keep.When the ration is augmented on occation, of rejeicing it is called a double ration. The fhip's crews have alfo their rations or a lowance of bifket, pulfe, and water, proportioned according to their ft ck.

RATIONALE, a folution or account of the principles of fome opinion, action, hypothefis, phenomenon, or the like.

RATIBOR, a town of Germany, in Silefia, and capital of a duchy of the fame name, with a caftle. It has been twice taken by the Swedes, and is feated on the river Oder, in a country fertile in corn and fruits, 15 miles north-eaft of Troppaw, and 142 eaft of Prague. E. Long. 22. 24. N. Lat. 50. I4.

RATISBON, an ancient, large, rich, hanfome, and Atrong city of Germany, in Bavaria, free and imperial, with a bifhop's fee, whofe bifhop is a prince of the empire. It is called by the Germans Regenfburg, from the river Regens, which runs under a tine fone bridge, and throws itfelf into the Danube below the city; and the rivers Luber and Nab mix with it above the city. The French call it Ratifbon, in imitation of the Latins; it hath formerly been fubject to the kings of Bavaria, who made it the place of their refidence; but it was declared free by the emperor Frederick I. which does not however, hinder the dukes of Bavariafrom dividing the toll with the citizens, according to an agreement between them. Thefe princes have alfothe criminal jurifdiction, for which the magiftrates of the city pay them homage. It is the firt city of the bench of Suabia, and contains at prefent within its walls five different free Itates of the empire; namely, the bifhop, the abbot of St Emmeran, the abbefles of the Low and High Munfter, and the city. The inhabitants of Ratifon have the privilege not to be cited before other tribunals, unlefs for actions above 400 florins. The fenate is compifed of 17 members, and there is a council of $\mathrm{IO}_{3}$ which is charged with the government of the ftate. The citzens have a right to elect a chief, who judges of the affairs of police. The catholics have the exercife of their religion in the cathedral church, and others; and

Ratlines the Iutherans in three chnrches, which they have built. The magiltrates and officers of the city are all Proteftants ; and it is to be remarked, that although there are about 22 Catholic churches, yet there are very few Catholic citizens, the magiltracy not allowing the freedom of the town to be given to Catholics living there. As this city is large, elegant, and full of magnificent houfes, it has been chofen many years for the place of holding the diet, upon account of the conveniency, to many neighbouring princes and Itates of fending their provifions by land and water, without great expence. The town-houfe, in the hall of which the Diet meets, is extremely magnificent. In the year i740, however, when there was a war in Germany, the Diet met at Frankfort on the Main, till after the death of the emperor Charles VII. Provifions are very plentiful at Ratibon in time of peace. The inhabitants have a good deal of trade; the river on which it Itands being navigable, and communicating with a great part of Germany. It is 55 miles fouth-eat of Nuremberg, 62 north of Munich, and 195 weft of Vienna. E. Long 12. 5. N. Lat. 48. 59.

RATLINES, or, as the failors call them rallins, thofe lines which make the ladder fleps to go up the fhrouds and puttocks, hence called the ratins of the Jrouds.

RATOLFZEL, a frong town of Germany, in Suabia, near the wefl end of the lake Conftance. It is feated on the part of it called Bodenfee, and belongs to the houfe of Auftria, who took it from the duke of Wirtemburg, after the battle of Nordlingen. It is 12 miles weft of the city of Conftance. It is defended by the impregnable cafte of Hohen Dwel, on an inaccef: fible hill in the middle of a plain, the rock of which is flint, fo that a few men may hold it out againft an army.

## RATTLESNAKE. See Crotalus.

Ragtiesnare Root. See Polygala.
RATZEBURG, or Ratzemburg, an ancient town of Germany, in the circle of Lower Saxony, and in the duchy of Lawenburgh, with a bifhop's fee and a caftle. Thetown depends on the duchy of Lawenburg, and the cathedral church on that of Ratzburg. It is feated on aneminence, and almolt furrounded with alake 25 miles in length and three in breadth. The Duke of Lawenburg feized and fortified it in 1689, and the king of Denmark took it in 1693 ; but it was difmantled, and reftored in 1700 to the Duke, who re-forified it. This town has been frequentiy pillaged, particularly in 1552, by Fiancis duke of Saxe Lawenburg, becaufe the canons refufed to elect his fon Maqnus their bifhop. It lies nine miles fouth of Lubec. This place is noted for its excellent beer. E. Long. 10. 58. N. Lat. 53.47.

RAVA, a town of Great Poland, and capital of a palatinate of the fame name, with a fortified catle, where they heep flate prifoncrs. The houfes are built of wood, and there is a Jefuits college. It is feated in a morafs covered with water, which proceeds from the river Rava, with which it is furrounded. It is 45 miles fouth of Bloiko, and 50 fouth-weft of Warfaw. The palatinate is bounded on the north by that of Blolko, on the ealt by that of Mazovia, on the fouth by that of Sandomer, and on the weft by that of Lencieza.

RAVELIN, in fortification, was anciently a flat
baftion placed in the middle of a curtain ; but now a detached work compofed only of two faces, which make a faliant angle without any flanks, and raifed be- fore the counterfarp of the place. See Fortification.

RAVEN, in ornithology. Sce Corvus.
Sea Rayen or corvo marino of Kongo in Africa, ia ichthyology, is about fix feet long, and big in proportion ; but the moft fingolar circumplance appertaining to this creature is the fone found in its head, to whirh the natives afcribe fome medicinal virtues, and the delicate talte of its hard soe, which is ftill much admires, when dried in the fun, and becomes as hard as a fone.

RAVENGLAS, a town of Cumberland in England, fituated between the rivers Irt , and Etk, which, with the fea, encompafs three parts of it. It is a well built place, and has a good road for fhipping, which brings it fome trade. E. Long. 0. 5. N. Lat. 54. 20 .

RAVENNA (anc. geog.), a noble city of Gallia Cif padana; a colony of Theflalians, on the Adriatic, in wathes or a boggy fituation, which proved a natural fecurity to it. The houfes were all of wood, the communication by bridges and boats, and the town kept fweet and clean by the tides carrying away the mud and foil, (Strabo). Ancenly it had a port at the mouth of the Bedelis: Auguftus added a new port, capacious to hold a fleet, for the fecurity of the Adriatic, between which and the city lay the via Cæfaris. In the lower age it was the feat of the Oltrogoths for 72 years; but being recover. ed by Narfes, Juftinian's general, it became the refidence of the exarchs, magiftrates fent by the emperor from Conftantinople, for 175 years, when it was taken by the Longobards. It is till called Ravenna, capital of Romania. The feat of the weftern or Roman Empite was by Honorius tranllated to Ravenna about the year 404, and hence the country in which it Itood was called Romania, in the p pe's territory. It had a very flourifhing trade till the fea withdrew two miles from it, which has been a great detriment. The fortifications are of little importance, and the citadel is gone to ruin. It is now mof remarkable for the excellent wine produced in its neighbcurhood. The maufoleum of Theodoric is fill to be feen, remarkable for being covered by a fingle fone 28 feet in diameter and is thick. It was at Ravenna that the duke of Nemours fell, after having gained a moft decifive victoryover the confederate army, in 15 11. See Francen ${ }^{\circ}$ 129, an:1 Modern Univerfal Hifory, vol. xx. p. 324 . \&c.

RiVENSBURG, a county of Germany, in Weft. phalia, bounded in the north by the bilhoprics of Ofnaburg and Minden, on the ealt by Lemgow, on the fouch by the bifhopric of Paderborn, and on the weft by that of Munfter. It belongs to the king of Pruffia, and has its name from the caltle of Ravenl: burg.

Ravensburg, a free and imperial town of Germany, in Algow, in the circle of Suabia. It is well built, and the public ftructures are handfome. The inhabitants are partly Proteftants and partly Papifts. It is feated on the river Chenfs, in E. Long. 9. 46. N. Lat. 47. 44-

RAVET, an infect fhaped like a may-bug; or cock chaffel, (fee Scarabeus), with which the illand of Guadaloupe is much peftered. It has a finking fmell, preys upon paper, books, and furniture, and whatever

Ruiliac. they do not gnaw is difcoloured by their ordure. Thefe nalty infects, which are very numerous, and appear chiefly by night, would be intolerable, were it mot for a large fipider, fome of them as long as a man's fift, which intangles them in its web, and otherwife furprifes them. On which account the inhabitants of the ifland are very careful of thefe fipiders.

RAVILIIAC (Francis), the infamous affafin of

Modern
Univ. Min. vol.xxi, p, 147 . note (A), $\& c$ Henry IV. of France, was a native of Angoulefme, and at the time of his execution he was about one or two and thirty years of age. See France, n ${ }^{\circ}$ 146, and Henry IV. of France. Ravilliac was the fon of parents who lived upon alms. His father was that fort of inferior retainer to the law, to which the vulgar give the name of a pettyfogger, and his fon had been bred up in the fame way. Kavilliac had fet up a claim to an eftate, but the caufe went againit him: this difappointment affected his mind deeply: he afterwards taught a fchool, and, as himfelf faid, received charitable gifts, though but of a very fmall value, from the parents of thole whom he taught; and yet his diftrefs was fo great, that he had much ado to live. When he was feized for the king's murder, he was very loofely rruarded; all were permitted to fpeak with him who pleafed; and it was thought very remarkable that a Jefinit fhould fay to him, "Friend, take care, whatever you do, that you don't charge honef people." He was removed neat day from the houfe of Efpernon to the Conciergcrie, the proper prifon of the parliament of Paris. When he was firt interrogated, he anfwered with great boldnefs, "That he had done it, and would do it, if it were to do again." When he was told that the king, though dangeroully wounded, was living, and might recover, he faid that he had fluck him home, and that he was fure he was dead. In his fubfequent examinations he owned that he had long had an intention to kill the king, becaufe he fuffered two religions in his kingdom; and that he endeavoured to obtain an andience of him, that he might admonifh him. He alfo faid that he underfood the king's great armament to be againft the pope, and that, in his opinion, to make war againlt the pope, was to make war againft God. We have no diftinct account of the three laft examinations; but he is faid to have perfifted, in the moft folemn affeverations, that he had no accomplices, and that nobody had periuaded him to the fact. He appeared furprifed at nothing fo much as at the univerial abhorrence of the people, which, it feems, he did not expeet. They were forced to guard him frictly from his fellow-prifoners, who would otherwife have murdered him. The butchers of Paris defired to have him put into their hands, affirming that they would flay him alive, and that he fhould fill live 12 days. When he was put to the torture, be broke out into horrid execrations, and always infilted that he did the fact from his own motive, and that he could accule nobody. On the day of his execution, after he had made the amende bonourable before the church of NotreDame, he was carried to the Greve; and, being brought won a fcaffold, was tied to a wooden engine in the fhape of a St Andrew's crofs. The knife with which he did the murder being tiaftened in his right hand, it was firf bumt in a flow fire; then. the flefhy parts of his body were torn with red hot pincers, and melted lead, oil, pitch, and rolin, poured inio the wounds
and through a clay funnel into his bowels by the navel. The people refufed to pray for him; and when, according to the fentence pronounced upon him, he came to be dragged to pieces by four horfes, one of thofe that were brought appearing to be but weak, one of the fpectators offered his own, with which the criminal was much moved: he is faid to have then made a confeffion, which was fo written by the greffier Voifin, that not fo much as one word of it could ever be read. He was very earneft for abfolution, which his confeffor refufed, unlefs he would reveal his accomplices; "Give it me conditionally (faid he); upon condition that I have told the truth," which they did. His body was fo robult, that it refifted the force of the horfes; and the executioner was at length obliged to cut him into quarters, which the people dragged through the Itreets. The houfe in which he was born was demolifhed, and a column of infamy erected; his father and mother were banifhed from Angoulefme, and ordered to quit the kingdom upon pain of being hanged, if they returned, without any form of procefs ; his brothers, filters, uncles, and other relations, were commanded to lay afide the name of Ravilliac, and to affume fome other. Such was the fate of this execrable moniter, who, according to his own account, fuffered himfelf to be impelled to fuch a fact by the feditious fermons and books of the Jefuits, whom Henry, rather out of fear than love, had recalled and careffed, and to whom he had bequeathed his heart.

Neither the dying words of Ravilliac, nor fo much of his procefs as was publifhed, were credited by his cotemporaries. Regalt the hiftorian fays, that there were two different opinions councerning this affallination ; one, that it was conducted by fome grandees, who facrificed that monarch to their old refentments; the other, that it was done by the emiffaries of the Spaniards. Letters from Bruffels, Antwerp, Mechlin, and other places, were received before the ${ }^{1} 5^{\text {th }}$ of $\mathrm{Ma} \mathrm{y}^{\prime}$, with a report of the king's death. Though nothing occurs in the examinations of Ravilliac that were firlt publifhed, in reference to his journeys to Naples and other places; yet as thefe are fet down as certain truths by good authors, fo there are probable grounds to believe that they were not fictitious. It appears from Sir Ralph Winwood's Memorials, that Ravilliac had been not long before at Bruffels. Amongft other circumftances that created a very great doubt, whether the affaflin fpoke truth, were the things found in his pocket at the time he was feized; amongft which was a chaplet, the figure of a heart made in cotton, in the centre of which he faid there was a bit of the true crofs, but when cut there was none, which he affirmed was given him by a canon at Angoulefme, a piece of paper with the arms of France painted upon it, another full of characters, and a third containing verfes for the meditation of a criminal going to execution. The provoft of Pluviers, or Petiviers, in Beauce, abont fix miles from Paris, had faid openly on the day that Henry IV. was murdered, "This day the king is either flain or dangeroufly wounded," After the king's death was known, he was feized and fent prifoner to Paris; but, before he was examined, he was found hanged in the ftrings of bis drawers. His body was, notwithftanding, hung up by the beels on the common gibbet on the rgth of June. What increafed the fufpicions
grounded

## RA Y

grounded on this man's end, was his having two fobs Thomas, leaving him aldo for life bol. per annam.
Ry. Jefuits, and his being a dependent on the family of Monfieur d'Entragues.

RAUN, upon the river Mia, a town of forme firength, remarkable for a bloody fkirmifh between the Prufians and Auftians, in Augult 1744. The king of Proffia, intending to get polfefion of Braun, font thither fix battalions, with eight cannon, and 800 hufffur; but General Feftitiz being there with a great party of his corps, and M. Luchefi with nco horfe, they not only repuifed the Pruffians, but attacked them in their turn, and, after a warm difpute, obliged them to retire with confuierable lops.

RAURICUM (ane. geog.), a town of the Raurici, fituated over againft Abnoba, a mountain from which the Danube takes its rife. A Roman colony led by L. Manutius Planers the fcholar and friend of Cicero: called Colonial Rauriaca (Pliny), Raurica (Infcription), Arugula Rauricarum. The town was deftroyed in Jutlan's time. It is now commonly called $A u g \mathrm{~g}$, a village greatly decayed from what it formerly was. It is fituated on the Rhine, diftant about two hours to the eat of Bafil. The country is now the canton of Bafil.

RAY (John), a celebrated botanift, was the for of Mr Roger Ray a blackfmith, and was born at Black Nobly in Effex in 1628 . He received the frit rudimeats of learning at the grammar fchool at Braintree; and in 1644 was admitted into Catharine hall in Cambridge, from whence he afterwards removed to Trinity college in that univerfity. He took the degree of matter of arts, and became at length a fenior felllow of the college; but his intenfe application to his todies having injured his health, he was obliged at his leifure hours to exercife himfelf by riding or walking in the fields, which led him to the fundy of plants. He noted from Johnfon, Parkinfon, and the Pbyiologia Britannica, the places where curious plants grew; and in 1658 rode from Cambridge to the city of Cheller, from whence he went into North Wales, vifiting many places, and among others the famous hill of Snow don; returning by Shrewbury and Gloucefter. In 1600 he publifhed his Catalogus Plantarum circa Cantabrigian nafcentiun, and the fame year was ordained deacon and prieft. In 166i he accompanied Francis Willoughby, Eq; and others in fearch of plants and other natural curiofities, in the north of England and Scotland; and the next year made a weftern tour from Chefter, and through Wales, to Cornwall, Devonshire, Dorfethire, Hampfhire, Wiltfhire, and other counties. He afterwards travelled with Mr Willoughby and other gentlemen through Holland, Germany, Italy, France, \&c. took Several tours in England, and was admitted tellow of the Royal Society. In 1672 , his intimate and beloved friend Mr Willoughby died in the 37 th year of his age, at Middleton Hall, his feat in Yorklhire; "to the infinite and unfpeakable loft and grief (fays Mr Ray) of myfelf, his friends, and all good men." There having been the clofelt and fincerelt friend hip between Mr Willoughby and Mr Ray, who were men of fimilar natures and taftes, from the time of their being fellow collegians, Mr Willoughby not only confided in Mr Ray, in his lifetime, but alfo at his death: for he made him one of the executors of his will, and charged him with the education of his for Francis and

Vol. XVI.

The eldelt of thefe young gentlemen not being four years of age, Mr Ray, as a faithful truftee, betook himself to the inftruction of them; and for their use composed his Nomenclator Cla/fius, which was publifhed this very year, 1672 . Francis the eldeft dying before he was of age, the younger became Lord Middleton. Not many months after the death of Mr Willloughby, Mr Kay loft another of his belt friends, bifop Wilkins; whom he vifited in London the $s$ th of November 1672 , and found near expiring by a total fuppreflion of urine for eight days. As it is natural for the mind, when it is hurt in one part, to lek relief from another; fo Mr Ray, having loft forme of his belt friends, and being in a manner left deftitute, conceived thoughts of marriage ; and accordingly, in June 1673, did actually marry a gentlewoman of about 20 years of age, the daughter of Mr Oakly of Launton in Oxfordihire. Towards the end of this year, came forth his "Obfervations Topographical, Moral, \&c." made in foreign countries; to which was added his Catalogus Stirfium in exteris regionibus obfervatarum: and about the fame time, his Collection of unufual or local Englifb words, which he had gathered up in his travels through the counties of England. After having publifted many books on fubjects foreign to his profeffion, he at length refolved to publifh in the character of a divine, as well as in that of a natural philosopher: in which view he publifhed his excellent demonftration of the being and attributes of God, entitled The Wifdone of God manifffed in the Works of the Creation, 8vo, 1697. The rudiments of this work were read in forme college lectures; and another collection of the fame kind he enlarged and publifhed under the title of Three $P b y$ ficotheological Difcourfes, concerning the Chaos, Deluge, and Diffolution of the World, $8 \mathrm{vo}, 1692$. He died in 1705. He was modeft, affable, and communicative; and was diltinguilhed by his probity, charity, fobriety, and piety. He wrote a great number of works; the principal of which, befides thole already mentioned, are, i. Cataloo rus Plantarum Anglia. 2. Diationariorum Trilingue fecundum locos communes. 3. Hiforia Plantarum, Species. baclenus editas, aliafque infuser multas noviter inventas et defiriptas compleciens, 3 vols. 4. Methodius Plantarum nova, cam Tabulis, 8vo, and Several other works on plants. 6. Synop/is Methodical Animalium quadrupedur et Serpentine generis, 8vo. G. Synopfis Methodical $A$ vitun et Pifcium. 7. Hiftoria Infefiorun, opus poflbumum. 8. Methodius Infeciorum. g: Philofophical Letters, \&c.

Ray, in optics, a beam of light emitted from a radiane or luminous body. See Light and Optics.

Inflected Rays, thole rays of light which, on their near approach to the edges of bodies, in palling by them, are bent out of their course, being turned either from the body or towards it. This property of the rays of light is generally termed diffraction by foreigners, and $\mathrm{Dr}_{r}$ Hooke fometimes called it deflection.

Reflected RaTs, thole rays of light which, after far. ling upon the body, do not go beyond the furface of it, but are thrown back again.

Refracted Rays, thole rays of light which, after fall. ing upon any medium, enter its furface, being bent cither towards or from a perpendicular to the point on which they fell.

COIN.

KAZOR, a well-known iaftrument, ufed by furgeons, barbers, \&e. for fhaving off the hair from vatious parts of the body.-As having to many people is a moft painful operation, cutlers in different countries have long applied their fkill to remove that inconvenience. Some have invented foaps of a peculiar kind to make the operation more eafy, and fome have invented laraps. With refpect to razors, fome artits have ficceeded rather by accident than from any fixed principle; and therefore we have found great inequality in the goodnefs of razors made by the fame artift.

A correfpondent affures us, that he has for 40 years pait been at much pains to fund ont razors made by the beft maker; both in England and Scotland, and was fortunate enough, about 22 years ago, to difcover a kind made by a Scotchman of the name of Logan, which he called magnetical razors, becaufe they were directed to be touched with an artificial magnet before ufing. Thefe, our friend affures us, are molt excellent razors, and he has ufed them for upwards of 20 years. He fays likewife that they continue in good order, without requiring to be ground ; but that the great draw-back on their being generally ufed, is the price, which is higher than moft people are able or difpofed to give for that inftrument. Our correfpondent, who refides in the vicinity of London, alfo informs us, that lately the famous furgeon's inftrument-maker, Mr Savigny in Pall Mall, after numberiefs experiments, in the courfe of above 20 years, has at length brought razors to a degree of perfection never yet equalled; and with fuch certainty, that the purchafer is in no danger of a difappointment, though the price is very moderate. By thefe, we are told, the operation of fhaving is performed with greater eafe, more perfectly, and more expeditioully, than with any other.

RE, in grammar, an infeparable particle added to the beginning of words to double or otherwife modify their meaning ; as in re-action, re-move, re-export, \&c.

RE-ACTION, in phyfiology, the refiftance made by all bodies to the action or impulfe of others that endeavour to change its ftate whether of motion or reft, \&c.

READING, the art of delivering written language with propriety, force, and elegance.
"We muft not judge fo unfavourably of eloquence or good reading (fays the illuftrious Fenelon), as to reckon it only a frivolous art, that a declaimer ufes to impore upon the weak imagination of the multitude, and to ferve his own ends. It is a very ferious art, defigned to inltruct people; to fupprefs their paffions and reform their manners; to fupport the laws, direct public councils, and to make men good and happy."
I
reading ought to be lefs animated than in interefted fpeaking. In every exercife of the faculty of fpeech, and thofe expreffions of countenance and gefture with which it is generally attended, we may be confidered to be always in one of the two following fituations : Firf, delivering our bofom fentiments on circumftances which relate to ourfelves or others, or, fecondly, repeating fomething that was fpoken on a certain occafion for the amufe-
ment or information of an auditor. Now, if we obferve Readiags the deliveries natural to thefe two fituations, we fhall find, that the firlt may be accompanied with every degree of expreffion which can manifeft itfelf in us, fr. $m$ the loweft of fympathy to the moft violent and energetic of the fuperior pafions; while the latter, from the fpeaker's chief bufinefs being to repeat what he heard with accuracy, difcovers only a faint imitation of thofe figns of the emotions which we fupp fe agitated him from whom the words were firft borrowed.-The ufe and necelfity of this difference of manner is evident; and if we are attentive to thefe natural figns of expreffion, we fhall find them conforming with the greateft nicety to the flighteft and moit minute movements of the breaft.

This repetition of another's words might be fuppofed to pafs through the mouth of a fecond or third perfon ; and in thefe cafes, fince they were not ear and eye witneffes of him who firft fpoke them, their manner of delivery would want the advantage neceffarily arifing from an immediate idea of the original one; hence, on this account, this would be aftill lefs lively reprefentation than that of the firt repeater. But as, from a daily obfervation of every variety of fpeech and its affociated figns of emotion, mankind foon became pretty well acquainted with them, and this in different degrees, according to their difcernment, fenfibility, \&cc. experience fhows us that thefe latter repeaters (as we call them) might conceive and ufe a manner of delivery which, though lefs characterific perhaps, would on the whole be no way inferior to the firft, as to the common natural expreflion proper for their fituation. It appears, therefore, that repeaters of every degree may be efteemed upon a level as to animation, and that our twofold diftinction above contains accurately enough the whole variety of ordinary delivery ;-we fay ordinary, becaufe

There is another very peculiar kind of delivery fometimes ufed in the perfon of a repeater, of which it will in this place be neceffary to take fome notice. 'What we mean here is mimicry; an accomplifhment which, when perfectly and properly difplayed, never fails of yielding a high degree of pleafure. But fince this pleafure chiefly refults from the principle of imitation: refpecting manner, and not from the purport of the matter communicated ; fince, comparatively fpeaking, it is only attainable by a few perfons, and practifed only on particular occafions;-on thefe accounts it muft be refufed a place among the modes of ufeful delivery taught us by general nature, and efteemed a qualification purely anomalous.

Thefe diftinctions with regard to a fpeaker's fituation of mind premifed, let us fee to which of them an author and his reader may moft properly be referred, and how they are circumftanced with regard to one another.

The matter of all books is, either what the author fays in his own perfon, or an acknowledged recital of the words of others : hence an author may be efteemed both an original fpeaker and a repeater, according as what he writes is of the firft or fecond kind. Now a reader mult be fuppofed either actually to perfonate the author, or one whofe office is barely to communicate what he has faid to an auditor. But in the firft of there fuppofitions he would, in the delivery of what is the author's own 2 evidently commence mimic ; which being, as
above

## R E A

Reading above obervel, a character not acknowledged by general nature in this department, ought to be rojected as generally improper. The other iuppofition therefure mult be accounted right; and then, as to the rujple matter of the book, the reader is found to be exactly in the fituation of a repeater, fave that he takes what he delivers from the page before him initead of his memo. ry. It follows then, in proof of our initial propofition, that, if we are directed by nature and propriety, the manner of our delivery in reading ought to be inferior in warmth and energy to what we fhould ufe, were the language before us the fpontaneous effufions of our own hearts in the circumitances of thofe out of whofe mouths it is fuppofed to proceed.

Evident as the purport of this reafoning is, it has not fo much as been glanced at by the writers on the fubjecl we are now entered upon, or any of its kindred ones; which has occafioned a manifelt want of accuracy in feveral of their rules and obfervations. Among the reft, this precept has been long reverberated from au. thor to author as a perfect ftandard for propriety in reading. " Deliver yourfelves in the fame manner you would do, were the matter your own original fentiments uttered directly from the heart." As all kinds of delivery muft have many things in common, the rule will in many articles be undoubtedly right ; but, from what las been faid above, it mult be as certainly faulty in refpect to feveral others; as it is certain nature never confounds by like figns two things fo very different, as a copy and an original, an emanation darted immediately from the fun, and its weaker appearance in the lunar reflection.

The precepts we have to offer for improving the abovementioned rule, fhall be delivered under the heads of accent, emphafis, modulation, expreflion, paufes, \&c.
I. Accent. In attending to the affections of the voice when we fpeak, it is eafy to obferve, that, independent of any other confideration, one part of it differs from another, in flefs, energy, or force of utterance. In words we find one fyllable differing from another with refpect to this mode; and in fentences one or more words as frequently vary from the reft in a fimilar manner. This ftrefs with regard to fyllables is called accent, and contributes greatly to the variety and harmony of language. Refpecting words, it is termed canPhofis; and its chief office is to allift che fenfe, force, or perficuity of the fentence-of which more under the next head.
"Accent (as defcribed in the Lectures on Elocution) is made by us two ways; either by dwelling longer upon one fyllable than the relt, or by giving it a fmarter percuffion of the voice in utterance. Of the firt of thefe we have inftances in the words olory, fäther, laly; of the laf in bat'tle, bab'it, lor'row. So that accent with us is not referred to tune, but to time; to quantity, not quality ; to the more equable or precipitate motion of the voice, not to the variation of the notes or inflexions."

In theatric declamation, in order to give it more pomp and folemnity, it is wiu:l to dwell longer than common upon the unaccented fyllables; and the author now quoted has endeavoured to prove (p. 51. 54.) the practice faulty, and to fhow (p. 55.) that "though it (i. e. tuue folemnity) may demand a flower utterance
thin ufual, get (it) requires that the fame proportion in point of quantity be oblerved in the fyllables, as there is in mufical notes when the fame tune is played in quicker and flower time." But that this deviation from

pace and be confiftent with the dignity of the tragic mufe, the delivery of her language fhould neceffarily be dignified ; and this it is plain from obfervation (I.) cannot be accomplifhed otherwife than by fomething different in the manner of it from that of ordinary fpeech; fince dignity is effentially different from familiarity. But how mult we difcover this different mannc:? By attending to nature : and in this cafe the tells us, that befides ufing a foover delivery, and greater difinctnefs of the words (which every thing merely grave requires, and gravity is a concomitant of dignity, though not its effence), we mult dwell a little laiger upon the unacconted fyllables than we do in common. As to what our author obferves in the above quotation, of dignity's only requiring a flower utterance than ordinary, while the proportion of the fyllables as to quantity continues the fame; it is apprehended the remark (II.) refpecting quicknefs and flozunefs of movement, will thow it to be not altogether true. For fince the delivery is not altered in form, its expreffion mult be ftill of the fame kind, and perhaps what may be rightly fuggefted by the term grave'y familiar.

Reading.
But fomething farther may be yet faid in defence of this artificial delivery, as our author calls it. Is not the movement of any thing, of whatever fpecies, when digrified or folemn, in general of an equable and deliberate nature (as in the minuet, the military ftep, \&c.) ? And in theatrical declamation, is not the propenfity to introduce this equablenefs fo ftrong, that it is almoft imfolrele to avoid it wholly, were we ever fo determined to do it ? If thefe two queries be anfwered in the affirmative (as we are perfuaded they will), while the firt fupports our argument for the propriety of the manner of defivery in queftion, the fecond difcovers a kind of neceffity for it. And that this manner may be carried a little farther in quantity on the fage than is ufual in real life, the principle (IV.) of heightening nature will jultify, provided faftion (which has ever fomething to do in thefe articles) give it a fanction; for the preci/e quantity of feveral heightenings may be varied by this great legiflator almoft at will.
II. Empbafis. As emphafis is not a thing annexed to particular words, as accent is to fyllables, but owes its rife chiefly to the meaning of a paffage, and muft therefore vary its feat according as that meaning varies, it will be neceffary to explain a little farther the general idea given of it above,

Of man's firft difobedience, and the fruit
Of that forbidden tree, whofe mortal tafte
Brought death into the world, and all our woe, \&c.
Sing heav'nly mufe, \&c.
Suppofing, in reference to the above well-known lines, that originally other beings, befides men, had difobeyed the commands of the Almighty, and that the circumftance were well known to us, there would fall an emphafis upon the word man's in the firtt line, and hence it would be read thus;

Of man's firlt difobedience, and the fruit, \&c.
But if it were a notorious truth, that mankind had tranfgreffed in a peculiar manner more than once, the amphafis would fall on firft, and the line be read,

Of man's $\operatorname{fr} / f$ difobedience, \&c.
Again, admitting death (as was really the cafe) to
have been an unheard-of and dreadful punifhment $\underbrace{\text { Reading. }}$ brought upon man in confequence of his tranfgreffion; on that fappofition the third line would be read,

Brought death into the world, \&c.
But if we were to fuppofe mankind knew there was fuch an evil as death in other regions, though the place they inhabited had been free from it till their tranfgreflion ; the line would run thus,

## Brought death into the ruor! $d$, \&c.

Now from a proper delivery of the above lines, with regard to any one of the fuppofitions we have chefen, out of feveral others that might in the fame manner have been imagined, it will appear that the emphafis they il. luftrate is effected by a manifeft delay in the pronunciation, and a tone fomething fuller and louder than is ufed in ordinary; and that its office is frlely to determine the meaning of a fentence with reference to fomething. faid before, prefuppofed by the author as general knowledge, or in order to remove an ambiguity where a paflage is capable of having more fenfes given it than one.

But, fuppofing in the above example, that none of the fenfes there pointed out were precifely the true one, and that the meaning of the lines were no other than what is obvioufly fuggefted by their fimple conftruction; in that cafe it may be anked, if in reading them there fhould be no word dignified with the emphatical accompanyments above defcribed ?-The anfwer is, Not one with an emphafis of the fame kind as that we have jult been illuftrating; yet it is neverthelefs true, that on hearing thefe lines well read, we fhall find fome words diftinguifhed from the reft by a manner of delivery bordering a little upon it ( $\Delta$ ). And thefe words will in general be fuch as feem the molt important in the fentence, or on other accounts to merit this diftinction. But as at beft it only enforces, graces, or enlivens, and not fixes the meaning of any paffage, and even caprice and fathion (в) have often a hand in determining its place and magnitude, it cannot properly be reckoned an effenial of delivery. However, it is of too much moment to be neglected by thofe who would wifh to be good readers; and, for the fake of diftinction, we may not
(A) The following lines will illufrate both thefe kinds of ftreffes: For, to convey their right meaning, the word any is evidently to be pronounced louder and fuller than thofe with the accents over them. Get wéalth and pláce, if poffible with gráce; If not, by any meáns get weálth and pláce. Pope.
This couplet is accented in the manner we find it in the Effay on Elocution by Mafon. And if, according to the judgment of this author, the words thus diftinguifhed are to have an emphatical frefs, it mult be of the inferior kind abovementioned, and which a little farther on we call emphafis of force; while the word any in a different type alone polfeffes the other fort of energy, and which is there contradiftinguifhed by the term emphafis of fenfe.
(в) Among a number of people who have had proper opportunities of learning to read in the bef manner it. is now taught, it would be difficult to find two, who, in a given inftance, would ufe the emphafis of force alike either as to place or quantity. Nay fome fcarce ufe any at all: and others will not fcruple to carry it much beyond any thing we have a precedent for in common difcourfe; and even now and then throw it upon words forery trifling in themfelves, that it is evident they do it with no other view, than for the fake of the variety it gives to the modulation.-This practice, like the introduction of difcords into mufic, may without doubt be indulged now and then ; but were it too frequent, the capital intert of thefe energies would manifeftly either be: efefroyed or rendered dubious.

## R E A

Reading. not unaptly denominate both the kinds of energies in queftion, by the terms emphafis of fenfe, and cmphafis of force ( c ).

Now from the above account of the fe two fpecies of emphafis it will appear, "that in reading, as in fpeaking; the firft of them muft be determined entirely by the fenfe of the paffage, and always made alike: But as to the other, tafle alone feems to have a right of fixing its fituation and quantity."-Farther : Since the more elfential of thefe two energies is folely the work of nature (as appears by its being confantly found in the common converfation of people of all kinds of capacities and degrees of knowledge), and the moft ignorant perfon never fails of ufing it rightly in the effutions of his own heart, it happens very luckily, and ought always to be remembered, that provided we underftand what we read, and give way to the dictates of our own feeling, the emphafis of fenfe can farce ever avoid falling fpontaneoully upon its proper place.

Here it will be neceffary to fay fomething by way of reply to a queftion which will naturally occur to the mind of every one. As the rule for the emphafis of fenfe requires we fhould underfand what we read before it can be properly ufed, is it incumbent upon us never to attempt to read what we have not previoufly ftudied for that purpofe? In anfwer to this, it mult be obferved, that though fuch a ftep will not be without its advantages; yer, as from the fairnefs of printed types, the well-known paufes of punctuation, and a long acquaintance with the phrafeology and conftruction of our language, \&c. experience tells us it is poffole to comprehend the fenfe at the firf reading, a previous perufal of what is to be read does not feem neceflary to all, though, if they would wifh to appear to advantage, it may be expedient to many; and it is this circumptance
which makes us venture upon extemporary reading, and Rearing. give it a place among our amufements.-Similar re. marks might be made with regard to modulation, exprof-
fron, \&c. did not what is here obferved naturally anticipate them.
III. Modulation (D). Every perfon mult have obler- Modulnved, that, in fpeaking, the voice is fubject to an altera-tion. tion of found, which in fome meafure refembles the movement of a tune. Thefe founds, however, are evidently nothing like fo much varied as thofe that are ftrictly mufical; and we have attempted to fhow in the preceding chapter, that, befides this, they have an effential difference in themfelves. Neverthelefs, from the general fimilitude of thefe two articles, they poffefs feveral terms in common; and the particular we have now to examine is in both of them called modulatis\%. This affection of the voice, being totally arbitrary, is differently characterized in different parts of the world; and, through the power of cultom, every place is inclined to think their own the only one natural and agreeable, and the reft affected with fome barbarous twang or unfeemly variation ( E ). It may be obferved, however, that though there is a general uniform calt or fafhion of modulation peculiar to every country, yet it by no means follows, that there is or can be any thing fixed in its application to particular paffages; and therefore we find different people will, in any given inftance, ufe modulations fomething different, and neverthelefs be each of them equally agreeable.

But, quitting thefe general remarks, we fhall (as our purpole requires it) confider the properties of modulation a little more minutely.

Firlt, then, we may obferve, that, in fpeaking, there is a particular found (or key-note, as it is often called) in which the modulation for the moft part runs, and to which
(c) The firt of thefe terms anfwers to the fimple emphafis defcribed in the Lectures on Elocution, and the fecond nearly to what is there called complex. The difference lies in this. Under complex emphafis the author feems (for he is far from being clear in this article) to include the tones fimply confidered of all the emotions of the mind; as well the tender and languid, as the forcible and exulting. Our term is intended to bee confined to fuch modes of expreffion alone as are marked with an apparent ftrefs or increafe of the voice.
(D) The author of the Introducion to the Art of Reading, not allowing that there is any variation of tone, as to bigh and low, in the delivery of a complete period or fentence, places modulation folely in the diverfification of the key-note and the variety of fyllables, as to long or flort, fwift or flow, frong or weak, and loud or foft. As we are of a different opinion, our idea of modulation is conined purely to barmonious inflexions of voice. Thefe qualities of words, it is true, add greatly both to the force and beauty of delivery; yet, fince fome of them are fixed and not arbitrary (as lon, and foort), and the others (ot fwift and fow, fironr and weak, loud and foft), may be confidered as modes of expreffion which do not affect the modulation as to tone, it will agree beft with our plan to efteem thefe properties as refpectively belonging to the eftablifhed laws of promunciation and the imitative branch of expreflion mentioned in the end of the enfuing head.
(e) From what accounts we have remaining of the modulation of the ancients, it appears to have been highly ornamented, and apparently fomething not unlike our modern recitative; particularly that of their theatric declamation was mufic in the ftrictelt fenfe, and accompanied with inftruments. In the courfe of time and the progrefs of refinement, this modulation become gradually more and more fimple, till it has now loft the genius of mufic, and is entirely regulated by talte. At home here, every one has heard the fing-fong cant, as it is called, of

Ti ti dum dum, ti ti dum ti dum de,
Ti dum ti dum, ti dum ti dum dum de;
which, though difgultul now to all but mere ruftics on account of its being out of fafhion, was very pro. bably the favourite modulation in which heroic verfes were recited by our anceftors. So floktuating are the tafte and practices of mankind! But whether the fower of language over the paftions has received any advantage from the change juft mentioned, will appear at leaft very doubtful, when we secollect the forios of its former triumphs, and the inherent charms of mufical founds.

## R E A

R.aling.

Which its occifion il inflexions, either above or below, nay in tome refpects be conce:ved to have a reference, like that which common mulic has to its key-note. Yet tibie is this difference between the two kinds of modulation, that whereas the firit always concludes in the key-note, the other frequently concludes a little below it ( F ). This key-note, in fpeaking, is generally the found given at the outfet of every complete fentence or period; and it may be obferved on fome occafions to vary its pitch through the limits of a mufical interval of a confiderable magnitude. The tones, that fuil a little lower than the key at the clofe of a fentence or period, are called cadences. Thefe cadences, if we are accurate in our diftinctions, will, with refpect to their offices, be found of ewo kinds; though they meet fo frequently together, that it may be beft to conceive them only as anfwering a double purpofe. One of thefe cffices is to affift the fenfe, and the other to decorate the modulation. An account of the firlt may be feen in the fection on Paufes; and the latter will be found so fhow itfelf pretty frequently in every thing grave and plaintive, or in poetic defcription and other highly ornamented language, where the mind is by its influence brought to feel a placid kind of dignity and fatisfaction. Thefe two cadences, therefore, may be conveniently diftinguifhed by applying to them refpectiveIy the epithets fignificant and ornamental.

We have already obferved, that reading fhould in fome things differ from fpeaking; and the particular under confideration feems to be one which ought to vary a little in thefe arts. For,

Modulation in reading ferves a twofold purpofe. At the fame time that it gives pleafure to the ear on the principles of harmony, it contributes through that medium to preferve the attention. And fince written language (when not purely dramatical) is in general more elegant in its conftruction, and mufical in its periods, than the oral one; and fince many interefting particulars are wanting in reading, which are prefent in fpeaking, that contribute greatly to $\mathrm{fin}_{2}$ the regard of the hearer; it feems reafonable, in order to do juftice to the language, and in part to fupply the incitements of attention juft alluded to, that in the former of thefe two articles a modulation hould be ufed fomething more harmonious and artificial than in the latter. Agreeably to this reafoning, it is believed, we fhall find every reader, on a narrow examination, adopt more or lefs a modulation thus ornamented : though, after all, it mult be acknowledged there are better grounds to believe, that the practice has been hitherto directed intuitively by nature, than that it was difcovered by the inductions of reafon. Wre fhall conclude this head with a rule for modulation in reading. "In every thing dramatic, colloquial, or of fimple narrative, let your modulation be the fame as in fpeaking; but when the fubject is flowery, folemn, or dignified, add fomething to its harmony,

## $22]$ <br> R E $\Lambda$

diverfify the key-note, and increale the frequency of
Reading. cadences in propoltion to the merit of the compofition."

It will readily be feen, that the precepts here drawn from a comparifon between fpeaking and reading, would be very inadequate, were they left deltitute of the affiftance of tafle, and the epportunity of frequently bearing and imitating maferly readers. And indeed, to thefe two great auxiliaries we might very properly have referred the whole matter at once, as capable of giving fufficient direstinns, had we not remembered that our plan required us to found feveral of cur rules as much on the principles of a philofophical analyis, as on thofe more familiar ones which will be found of greater efficacy in real practice.
IV. Expreffion. I. There is no compofition in mufic, Expreflion however perfect as to key and melody, buts in order as to the to do juflice to the fubject and ideas of the author, tones of the will require, in the performing, fomething more than voice. an exact adherence to tune and time. This fomething is of a nature, too, which perhaps can never be adequately pointed out by any thing graphic, and refults entirely from the tafte and feeling of the performer. It is that which chiefly gives mufic its power over the paflions, and characterifes its notes with what we mean by the words fweet, barfh, dull, lively, plaintive, joyous, \&c. for it is evident every found, confidered abftractedly, without any regard to the movement, or high and low, may be thus modified. In practical mufic, this commanding particular is called Expreffion; and as we find certain tones analogous to it frequently coalefcing with the modulation of the voice, which indicate our paffions and affections (thereby more particularly pointing out the meaning of what we fay), the term is ufually applied in the fame fenfe to fpeaking and reading.

Thefe tones are not altogether peculiar to man.Every animal, that is not dumb, has a power of making feveral of them. And from their being able, unaffited by words, to manifelt and raife their kindred emotions, they conflitute a kind of language of themfelves. In the language of the heart nan is eminently converfant; for we not only underfland it in one another, but alfo in many of the inferior creatures fubjected by providence to our fervice.

The expreffion here illuftrated is one of the mott effential articles in good reading, fince it not only gives a finifhing to the fenfe, but, on the principles of fympathy and antipathy, has alfo a peculiar efficacy in inte-. refting the heart. It is likewife an article of mof difficult attainment; as it appears from what follows, that a matterly reader ought not only to be able to incorporate it with the modulation properly as to quality, but in any degree as to quantity.

Every thing written being a proper imitation of fpeech, expreffive reading mult occafionally partake of
(F) As mufical founds have always an harmonical reference to a key or fundamental note, and to which the mind is fill fecretly attending, no piece of mufic would appear perfect, that did not clofe in it, and fo naturally put an end to expectation. But as the tones ufed in fpeech are not mufical, and therefore cannot refer harmonically to any other found, there can be no neceflity that this terminating found (and which we immediately below term the cadence) fhould either be ufed at all, or follow any particular law as to form, \&c. faxther than what is impofed by tafte and cuftom.

## R E A

Readiug. all its tones. But from what was faid above, of the difference between reading and fpeaking, it follows, that there figns of the emotions fhould be lefs frongly characterifed in the former article than in the latter. Again, as feveral of thefe tones of expreffion are in themfelves agreable to the mind, and raife in us agreeable emotions (as thofe of pity, benerolence, or whatever indicates bappinefs, and goodvefs of heart), and others difagreeable (as thofe of a boiflerous, malevolent, and depraved nature, \&c.) it farther appears, fince reading is an art improving and not imiiating nature, that, in whatever degree we abate the expreflions of the tones above alluded to in the firft caie, it would be eligible to make a greater abatement in the latter. But as to the quantities and proportional magnitudes of thefe abatements, they, like many other particulars of the fame nature, mult be left folely to the taite and judgment of the reader.

To add one more remark, which may be of fervice on more accounts than in fuggefting another reafon for the doctrine above. Let it be remembered, that tho' in order to acquit himfelf agreeably in this article of expreffion, it will be neceffary every reader thould feel his fubject as well as underfand it; yet, that he may preferve a proper eafe and malterlinefs of delivery, it is alfo neceffary he fhould guard againtt difcovering too much emotion and perturbation.

From this reafoning we deduce the following rule, for the tones which indicate the paffions and emotions.
"In reading, let all your tones of expreffion be berrowed from thofe of common fpeech, but fomething more faintly characterifed. Let thofe tones which fignify any difagreeable paffion of the mind, be fill more faint than thofe which indicate their contrary; and preferve yourfelf fo far from being affected with the fubject, as to be able to proceed through it with that peculiar kind of eafe and maferlinefs, which has its charms in this as well as every cther art."

We fhall conclude this fection with the following obfervation, which relates to fypaking as well as rending. When words fall in our way, whofe "founds feem on echo to the fenfe," as fquirr, buzz, bum, rattle, bifs, jar, \&c. we ought not to pronounce them in fuch a manner as to heighten the imitation, except in light and ludicrous fubjects. For initance, they flould not in any other cafe be founded fquir.r.r-buzz.z.z-hum.m.m, r.r.rattle, \&c. On the contrary, when the imitation lies in the movement, or flow and flucture of a ru'tele paf. fage (which frequently happens in poetry), the delivery may always be allowed to give a heightening to it with the greatef propriety; as in the following inftances, out of a number more which cvery experienced reader will quickly recollect.

In thefe deep folitudes and awful cells,
Where beav'nly-penfive Conitonplation dwellt,
And (ver-mufing Melancholy reigus-,
Pope's Eloifa to Abelard.
With eafy courfe
The veffels glide, unlefs their fpeed be ftopp'd By dead calms, that oft lie on the fef nooth facas.

Softly fweet in Lydian meafure,
Soon he footh'd bis foul to pleafiure.
Dryden's Ode on St Cccilia's day.

Still gathering force it fmokes, and, urg'd amain, $\underbrace{\text { Readinc. }}$ Whirls, leaps, and thunders down impetuous to the plain. Pope's lliad, B. 13 .
For who to dumb forgetfulnefs a prey,
This pleafing anxious being ere refign'd,
Left the warm precincts of the cheerful day,
Nor caft one longing ling'ring look bebind?
Grey's Elegy.
6
2. Befides the particular tones and modifications of Expreflion voice above defcribed, which always accompany and as to the exprefs our inward ayitations, nature has in thefe cafes face and endowed us with another language, which, inltead of gefture. the ear, addreffes itfelf to the eye, thereby giving the communications of the heart a double advantage over thofe of the undertanding, and us a double chance to preferve fo ineftimable a bleffing. This language is what arifes from the different, almon involuntary movements and configurations of the face and body in our emotions and paffions, and which, like that of tones, every one is formed to underftand by a kind of intuition.

When men are in any violent agitation of mind, this co-operating expreflion (as it is called) of face and gefture is very ftrongly marked, and totally free from the mixture of any thing which has a regard to gracefulnefs, or what appearance they may make in the eyes of others. But in ordinary converfation, and where the emotions are not fo warm, fanhionable people are perpetually infinuating, into their countenance and action, whatever they imagine will add to the eafe and elegance of their deportment, or imprefs on the fpectator an idea of their amiablenefs and breeding. Now, though the abovementioned natural organical figns of the emotions fhould accompany every thing fpoken, yet from what was obferved in the introductory part of this article (like the tones we have juft treated upon), they fhould in reading be much lefs frongly expreffed, and thofe fuffer the greateft diminution that are in themfelves the moft ungainly. And as it was in the laft fection recommended to the reader to preferve himfelf as far from being affected in all paffionate fubjects as to be able to keep a temperate command over the various affections of the voice, \&c. fo under the fanction of this fubordinate feeling he may accompany his delivery more frequently with any eafy action or change of face, which will conmibute to fet off his manner, and make it agreeable on the principles of art.

As thefe calm decorations of action (as we may call them) are not altogether natural, but have their rife from a kind of inftitution, they mult be modelled by the pratices of the polite. And though mankind differ from one another fcarce more in any particular than in that of talents for adopting the graceful actions of the body, and hence nothing determinate can be faid of their nature and frequency, yet even thofe, moft happily calculated to acquit themfelves well in their ufe, might proft by confidering that it is better greatly to abridge the difplay, than to over-do it ever fo little. For the peculiar modefty of deportment with which the moft amiable characters are endowed, makes them in common endeavour to fupprefs many figns of an agitated mind; and in fuch cafes the bodily ones in particular are very faringly ufed. They have alfo a natural and rooted dillike to any kind of afectation; and to no species,

## KEA [ 24 ] REA

reading. fpecies, that we can recollect, a greater, than to that which is feen in a perfon who pretends to mimicry ard courtly gefture, without poffeffing the advantages and talents they require; and of which not many poople, comparatively fpeahing, have any remarkable hare.

The inference of this is too obvions to need drawing out, and we would particularly recommend it to the confideration of thofe readers who think the common cocurrences of a newfpaper, \&c. cannot be properly delivered without a good de 1 of elbow-room.

Although it is impoffible to come to particulars in any directions of this kind, yet there is one article of our prefent fubject on which a ferviceable remark may be nade. In ordinary difcourfe, when we are particularly prefling and earneft in what we fay, the eye is naturally thrown upon thofe to whom we addrefs ourfelves: And in reading, a turn of this organ now and then upon the hearers, when any thing very remarktable or interefting falls in the way, has a good effect in gaining it a proper attention, \&cc. But this fhould not be too frequently ufed; for if fo, befides its having a tendency to confound the natural importance of different paflages, it may not be altogether agreeable to fome to have their own reflections broken in upon by a fignal, which might be interpreted to hint at their wanting regulation.

One obfervation more, and then we fhall attempt to recapitulate the fubftance of this fection in the form of a precept. Though it is, when ftrictly examined, inconfiftent, both in fpeaking and reading, to imitate with action what we are defcribing, yet as in any thing comic fuch a practice may fuggett ideas that will accord with thofe of the fubject, it may there be now and then indulged in either of thefe articles.
"In a manner fimilar to that directed with regard to tones, moderate your bodily expreffion of the figns of the emotions. And in order to fupply, as it were, this deficiency, introduce into your carriage fuch an eafy gracefulnefs, as may be confiftent with your acquirements in thefe particulars, and the neceffary dread which fhould ever be prefent of falling into any kind of affectation or grimace."
V. Paufes. Speech confifting of a fucceffion of diftinet words, mult naturally be liable (both from a kind of accident, and a difficulty there may be in beginning certain founds or portions of phrafes immediately on the ending of certain others) to feveral fmall intermiffions of voice; of which, as they can have no meaning, nothing farther need here be faid. There are, however, fome faufes, which the fenfe neceffarily demands ; and to thefe the fubftance of this fection is directed.

The paules are in part to diftinguifh the members anding. of fentences from one another, the terminations of complete periods, and to afford an opportunity for taking breath. Befides this, they have a very graceful effeet in the modulation, on the fame account they are fo effential in mufic.-In both articles, like blank fpaces in pictures, they fet off and render more confpicuous whatfoever they disjoin or terminate.

Were language made up of nothing but fhort colloquial fentences, thefe paufes, though they might do no harm, and would generally be graceful, would however be fuperfeded as to ufe by the completenefs and nar. rrunef, as we may fay, of the meaning. Butin more diffule language, compofed of feveral detached rer.m tences, and which require fome degree of attention in order to take in the fenfe, the intermiffions of voice under confideration are of the greateft fervice, by fignifying to the mind the progrefs and completion of the whole paffage. Now, though in extenfive and differently formed periods there may be members whofe completenefs of fenfe might be conceived of various degrees, and hence might feem to require a fet of paufes equally numerous; yet, fince the fenfe does not alto. gether depend upon thefe intermiffions, and their ratios to one another, if capable of being properly defined, could not be accurately obferved, grammarians have ventured to conceive the whole clafs of paufes as reducible to the four or five kinds now in ufe, and whofe marks and ratios are well known ( G ) ; prefuming that under the eye of tafte; and with the affirtance of a paricular to be next mentioned, they would not fail in all cafes to fuggelt intermififons of voice fuitable to the fenfe. But in many of thefe extenfive and complex periods, rounded with a kind of redundancy of matter, where the full fenfe is long fufpended, and the final words are not very important, there would be fome hazard of a mifapprehenfion of the termination, had we not more evident and infallible notice of it than that which is given by the paufe. This notice is the cadence, referred to in the fection on Modulation; which, as is there obferved, befides the ornamental variety it affords, appears from thefe remarks to be a very neceffary and ferviceable article in perfpicuous delivery.

As this cadence naturally accompanies the end of every entire fenfe, circumftanced as abovementioned, it may fometimes fall before the femicolon, but more generally before the colon, as well as the period: For thefe marks are often found to terminate a complete fenfe; and in thefe cafes, the relation what follows has to what went before, is fignified to the mind by the relative thortnef of the flop, and the form of introducing the additional matter. Nor can any bad confequence
( G ) Suppofing the comina (,) one time, the femicolon (;) will be two; the colon (:) three, and the period (.) as alfo the marks of interrogation (?) and admiration (!) four of thefe times. The blank line (- or ---), and the breaks between paragraphs, intimate ftill greater times; and by the fame analogy may be reckoned a double and quadruple period refpectively. Now and then thefe blank lines are placed immediately after the ordinary points, and then they are conceived only as feparating for the cye the different natures of the matter;-as a queftion from an anfwer,-precept from eximple,-premifes from inferences, \&c. in which cafe their import is evident. But of late fome authors have not fcrupled to confound thefe diftinctions; and to make a blank ferve for all the paufes univerfally, or the mark of an indefinite reft, the quantity of which is left to the determination of the reader's talte. A practice, it is imagined, too deftructive of the intended precifion of thefe typical notices to be mach longer adopted.

## R E A

Reading.
quence arife from thus founding diftingtions on ratios of time, which it may be faid are too nice to be often rightly hit upon: for if a confufion fhould happen between that of the colon and period, there is perhaps fo trifling a difference between the nature of the palfages they fucceed, as to make a fmall inaccuracy of no confequence. And as to the relts of the femicolon and period, it will not be eafy to miftake about them, as their ratio is that of two to one. Add to this the power which the matter and introduction of the fub. fequent paffages have to rectify any flight error here made, and we thall be fully fatisfied, that the paufes as ufually explained, with the cadence above defcribed, and a proper knowledge of the language, will convey fufficient information to the underftanding of the co:ftructive nature of the paffages after which they are found.

It may be obferved, that in natural fpeech, according to the warmth and agitation of the fpeaker, the refts are often hort and injudicioufly proportioned, and hence that every thing thus delivered cannot be fo graceful as it might have been from a proper attention to their magnitude and effects.

Paufes then, though chiefly fubjected to the fenfe, are, as was remarked at the outfet, ferviceable in beautifying the modulation, \&c.-And fince books, are often inaccurately printed as to points, and people's taltes differ fome little about their place and value, it appears, that, "although in reading great attention fhould be paid to the ftops, yet a greater thould be given to the fenfe, and their correfpondent times occafionally lengthened beyond what is ufual in common fpeech;" which obfervation contains all that we fhall pretend to lay down by way of rule for the management ef paufes in the delivery of written language.

As there are two or three fpecies of writing, which have fomething fingular in them, and with regard to the manner in which they fhould be read, a few particular remarks feem neceffarily required, we fhall conclude this article with laying them before the reader:

1. Of Plays, and fuch like conversation-pieces. Writings of this kind may be confidered as intended for two different purpofes; one to unfold fubject matter for the exercife of theatric powers; and the other to convey amufement, merely as fable replete with pleafing incidents and characteriftic manners. Hence there appears to be great latitude for the difplay of a confffent delivery of thele performances: for while, on one hand, a good reader of very inferior talents for mimicry may be heard with a tolerable degree of pleafure; on the other, if any perfon is qualified to give a higher degree of life and force to the dialogue and characters by delivering them as an actor, he muft be fully at liberty to ftart from the confinement of a chair to a pofture and area more fuited to his abilities; and, if he be not deceived in himfelf, his hearers will be confiderable gainers by the change.The next article is,
2. Sermons or other orations, which in like manner may be conceived intended for a double purpofe. Firf, as matter for the difplay of oratorical powers; and, fecondly, as perfuafive difcourfes, \&c. which may be read like any other book. Therefore it appears (for reafons fimilar to thofe above) that according as clergymen are poffeffed of the talents of elocution, they may confiftently either rehearfe their fermons, in the Vol. XVI.
$25] \quad R E A$
manner of an extemporary harangue, or deliver them in the more humble capacity of une who is content to entertain and inftruct his hearers with reading to them his own or fome other perfon's written difcourfe.

That either of thefe manners of delivery (or a mixture of them), in either of the cafes abovementioned, is agreeable, we find on a careful examination. For this will thow us how frequently they run into one another; and that we are fo far from thinking fuch tranfitions. wrong, that, without a particular attention that way, we fcarce ever perceive them at all.
3. Poetry is the next and laft object of our prefent remarks. This is a very peculiar kind of writing, and as much different from the language of ordinary difcourfe as the movements of the dance are from common walking. To ornament'and improve whatever is fubfervient to the pleafures and amufements of life, is the delight of human nature. We are alfo pleafed with a kind of excefs in any thing which has a power to amure the fancy, infpire us with enthuliafm, or awaken the foul to a confcioufnefs of its own importance and dignity. Hence one pleafure, at leaft, takes its rife, that we feel in contemplating the performances of every art ; and hence the language of poetry, confifting of a meafured rythmus, harmonious cadences, and an elevated picturefque diction, has been ftudied by the ingenious, and found to have a powerful influence over the human brealt in every age and region. There is fuch an affinity between this language and mufic, that they were in the earlier ages never feparated; and though modern refinement has in a great meafure deftroyed this union, yet it is with fome degree of difficulty in rehearfing thefe divine compolitions we can forget the finging of the mufe.

From thefe confiderations (and fome kindred ones mentioned in fect. iii.) in repeating verfes, they are generally accompanied with a modulation rather more ornamented and mufical than is ufed in any other kind of writing. And accordingly, as there feems to be the greatef propriety in the practice, the rule for this particular in the fection juft referred to, will allow any latitude in it that can gain the fanction of tafte and pleafure.
$R$ hymes in the lighter and more foothing provinces of poetry are found to have a good effect; and hence (for reafons like thofe jult fuggelted) it is certainly ablurd to endeavour to fmother them by a feeble pronunciation, and running one line precipitately into another, as is often affected to be done by many of our modern readers and fpeakers. By this method they not only deltroy one fource of pleafure intended by the compofer (which though not great is neverthelefs genuine). but even often fupply its place with what is really difigreeable, by making the rhymes, as they are interruptedly perceived, appear accidental blemithes of a different fyle, arifing from an unmeaning recurrence of fimilar founds. With regard then to reading verfes terminated with thyme, the common rule, which directs to pronounce the final words full, and to diftinguilh them by a llight paufe even where there is none required by the fenfe, feems the moft rational, and confequently molt worthy, of being followed. See Declamation, Narration, and Oratory.

Reaning, a town of Berkhire in England, pleafantly feated on the river Kennetb, near the confluence with the Thames. It had once a fine 1 ich monaftery, of which there are large ruins remaining. It had alfo a

Readings cafle built by king Henry I. but it was afterwards le-

Re-anima--anim
tion.
velled with the ground. It is a corporation, enjoys feveral privileges, and fends two members to parliament. The two navigabie rivers render it a fit place for trade. W. Long. i. O. N. Lat 5 I. 25 .

Reading, a polt-town of Pennfylvania, and capital of Berks county; fituated on the N. E. fide of the river Schuylkill. It is regularly laid out, and contains about . 600 houfes, a fone jail, court-houfe, a church for German Lutherans, one for Calvinifts, one for Quakers, and one for Roman Catholics; allo a large building for the public offices. It is chiefly inhabited by Germans. This town is remarkable for the manufacture of wool hats, which is carried on largely by individuals. Contiguous to the town is a remarkable fpring, which is one hundred feet fquare, and 140 feet deep, with a fream of water iffuing from it large enough to turn a mill, and affording an abundance of fifh: the water is clear and tranfparent. A court of quarter feffions and common pleas is held here the firl Monday in January, April, and November. It is 54 miles N. W. of Philadelphia. W. Lon. 75. 54. N. Lat. 40. 2 I.

READINGS, or Various Readings, in criticifm, are the different manner of reading the texts of authors in ancient manufcripts, where a diverfity has arifen from the corruption of time, or the ignorance of copyits. A great part of the bufinefs of critics lies in fettling the readings by confronting the various readings of the feveral manufcripts, and confidering the agreement of the words and fenfe.

Readings are alfo ufed for a fort of commentary or glofs on a law, text, paffage, or the like, to fhow the fenfe an author takes it in, and the application he conceives to be made of it.

RE-AGGRAVATION, in the Romifh ecclefiaftical law, the laft monitory, publifhed after three admonitions, and before the laft excommunication. Before they proceed to fulminate the laft excommunication, they publifh an aggravation, and a re-aggravation. Fevret obferres, that in France the minifter is not allowed to come to re-aggravation, without the permiffion of the bifhop or official, as well as that of the lay-judge. See Excommunication.

REAL (Cxfar Vichard de St), a polite French writer, fon of a counfellor to the fenate of Chamberry in Savoy. He came young to France, diftinguifhed himfelf at Paris by feveral ingenious prodnctions, and refided there a long time without title or dignity, intent upon literary purfuits. He died at Chamberry in 1692 , advanced in years, though not in circumftances. He was a man of great parts and penetration, a lover of the fciences, and particularly fond of hiftory. A complete edition of his works was printed at Paris, in 3 vols 4 to, 1745 , and another in 6 vols 12 mo .

Real Preffice. See Transubstantiation.
REALGAR. See Chemistey, ${ }^{\circ}$ i279.
REALITY, in the fchools, a diminutive of res, "thing," firft ufed by the Scotilts, to denote a thing which may exifl of itfelf; or which has a full and abfolute being of itfelf, and is not confidered as a part of any other.

REALM, a country which gives its head or governor the denomination of a king.

RE-ANIMATION means the reviving or reftoring to life thofe who are apparently dead. Sudden death is
dreaded by every human being, and it is one of thofe evils againft which the Church of England prays in her Litany. Accidents, however, cannot always be prevented; but, after they have happened, it is often poffible to prevent their effects. This, by the eftablifhment of what with great propriety has been called the Ifumane Society, has been abundantly proved: for, in the courfe of 12 years immediately after their inftitution, they were the means of faving the lives of 850 perfons, who otherwife would in all human probability have been lof to the community. Since that period, they have faved many more; and various perfons, in different countries of the world, by following their directions, have done the fame. To preferve one human being from premature death, we mult confider as of the utmoft confequence both as citizens and Chriftians; how much more the prefervation of thoufands. It appears from the writings of Doctors Mead, Winflow, Bruhier, Fothergill, Haller, Lecat, Tiffot, Van Engelen, Gummer, and others, that they had prepared the way for inftirutions fimilar to the Humane Society: for in their werks they have elucidated the principles on which they go, and furnifhed directions for the practice they favour. See Drath, Premature Interment, and Drowning.

REAR, a term frequently ufed in compofition, to denote fomething behind, or backwards, in refpect of another ; in oppofition to van.
$R_{\text {ear }}$ of an Armur $^{\text {, fignifies, in general, the hinder- }}$ moft part of an army, battalion, regiment, or fquadron; alfo the ground behind either.
$R_{E A R}$-Guard, is that body of an army which marches after the main-body; for the march of an army is always compofed of an advance-guard, a main-body, and a rear-guard: the firft and laft commanded by a general. The old grand-guards of the camp always form the rear-guard of the army, and are to fee that every thing come fafe to the new camp.

Rafr Half-fles, are the three hindmolt ranks of the battalion, when it is drawn up fix deep.
Rear-Line, of an army encamped, is always 1200 feet at leaft from the centre line; both of which run parallel to the front line, as alfo to the referve.
$R_{\text {EaR-Rank, }}$ is the laft rank of a battalion, when drawn up, and generally 16 or 18 feet from the centreline when drawn in open order.

REASON, a facuity or power of the mind, whereby it ditinguifhes good from evil, truth from falfehood. See Metaphysics.

REASONING, ratiocination, the exercife of that faculty of the mind called reafon; or it is an act or operation of the mind, deducing fome unknown profofition from other previous ones that are evident and known. See Logic, Part III.

REAUMUR (Rene Antoine Ferchault, Sieur de), a perfon diftinguifhed for his laborious refearches into natural knowledge, was born at Rochelle in 1683 , of a family belonging to the law. After having finifhed his early fudies in the place of his birth, he began a courfe of Philofophy at Poitiers, and of civil law at Bourges; but foon relinquifhed the latter, to apply himfelf, according to his tafte, to mathematics, phyfics, and natural hiftory. Being come to Paris, he was received into the Academy of Sciences in 1708 . From that hour he was wholly employed in natural hiftory, to which his inclination

## R EA <br> [ 27 ] <br> REB

 confined to any one part of it. His memoirs, his ob. fervations, his difcoveries on the formation of fhells, fpiders, mufcles, the marine flea, the berry which affords the purple colour, and on the caufe of the numbnefs of the torpedo, excited the curiofitg of the public, and early procured our author the character of an able, curious, and entertaining naturalift. Filled with \%eal for the welfare and advantage of fociety, and the progrefs and perfection of arts, he endeavoured in all his refearches to promote the public good. We were indebted to him for the difcovery of the Turquois mines in Languedoc. He alfo found out a fubftance, which is ufed to give falle flones a colour, which is obtained

- See Ee-
lon, 3 19.; and l'ennant's Zoology, vol. iii. p. 315. + See eryprinus, $n^{2} 9$. $t$ See Porelain,
from a certain filh called in the French Able or Ablete* on account of its whitenefs, and which is the Bleak or Blay of our writers $\dagger$. His experiments on the art of turning iron into fteel obtained him a penfion of 12,000 livres; and this reward has been continued to the Academy to fupport the expence which might accrue in this art.

He continued his inquiries on the art of making tin and porcelain $\ddagger$, and endeavoured to render our thermometers more ufeful than thofe of former times: he compofed a curious hiflory of rivers where gold dult is found in France; and gave fo fimple and eafy a detail of the art of gathering this duft, that perfons have been employed for that purpofe.

He alfo made curious and important obfervations on the nature of flints, on the banks of foffil fhells, from whence is obtained in Touraine an excellent manure for land ; as likewife on birds and their prefervation, on their method of building nelis; on infects; and a great number of other fubjects, not lefs curious than uffeful.

He imagined at firt, that a certain varnifh would keep eggs frefh; but the wafte of time and money, \&c. fhowed him the inconveniences of fuch a procefs. He afterwards adopted the method practifed for time immemorial in Greece and the inlands of the Archipelago, which is to fteep or immerfe eggs in oil, or melted fat; by this means, not being expofed to the air or to froft, they are well preferved, and contract no bad fmell. Another experiment fill more important, made by our auchor, was to introduce into France the art of hatching fowls and birds, as practifed in Egypt, without covering the eggs. Active, fedulous, and attentive, he was early in his ftudy, often at fix in the morning. Exast in his experiments and obfervations, he let no circumftance efcape him. His writings mult be of great ufe to future philofophers. In fociety, he was diftinguifhed through life for his modeft and agreeable behaviour. His probity, benerolence, goodnefs of heart, and other amiable qualities, as well natural as acquired, endeared him to his countrymen. He died in the $75^{\text {th }}$ year of his age, on the 18 th of October 1757, and left this world filled with fentiments of piety. His death wrs the confequence of a fall, which happened at the caltle of Barnardiere on the Maine, where he went to pafs his vacation. He bequeathed to the Academy of Sciences his manufcripts and all his natural productions. His works are, I. A very great number of memoirs and obfer vations on different parts of natural hiftory ; they are printed in the collections of the Academy of Sciences. 2. A large work printed feparately in 6 vols in 4 to, in. sitled, A Natural Hifory of Infects. This important
work contains a defcripticn of vaft numbers of caterpi.--
lars, moths, gall infects, flies with two and four wings, lady-birds, and thofe ephemeron flies which live only in
that form a few hours; and lanly, of thofe fingular and wonder ful infeets which are called $p$ plyer, which bei"g cut into feveral pieces, each piece lives, grows, and becomes an infect, and affords to our eyes a great number of prodigies*. The works of M. de Reanmur are exat, * See Pocurious, intereAing, and very ingenious. They are writ- Iypus. ten with much candour, clearneis, and elegance; but it mult be acknowledged his manner is fomewhat too diffufe. But we mult not deceive the reader; he often raifes our expectations, and does not give us all the fatisfaction we promife ourfelves from his writings. His method of raifing poultry, in paricular, rather difippoints us. He fpared neither care, time, nor expence, to render it practicable : he fattered himfelf and his countrymen with the greatef hopes; but notwith tanding his affiduous induftry, and valt charges, it prove? abortive. The late M. I'Advocat recommended him to obtain better information from Egypt on the fubject: and if poffible to procure a perfon verfed in the art to influct him in it; but his death prevented the completion of the fcheme. If the native of Egypt had arrived, fhowed M. de Reaumur a better method than his own, and pratifed it with fuccefs, as in his country, the community would have been benefited; on the other hand he would have feen, had it failed, that the climate of France was not proper for fuch experiments. M. Maillet, conful at Cairo, to whom Monfieur the regent had written to obtain the art, offered to fend over a native of Egypt, if the government would pay the expence of his voyage, and allow him a penfion of 1500 livres. M. Maillet rightly judged, when be preferred this method of proceeding. M. de Reaumur was not ignorant of the defign; but he flattered himfelf, that his efforts would be fucceffful without further aid, and thought he fhould acquire fome honour. He certainly had great talents, induftry, fagacity, and every other requifite which are neceffary in fuch attempts; but it is morally impoffble that a fingle man, in a different climate, can attain fuch knowledge in an art as thofe who live in a more favourable country, and have had the experience of many ages to profit by: however M. de Reaumur may have been unfuccefsful, poterity is indebted to him for his repeated trials. He has removed fome difficulties in the road, and thofe that travel it may difcover what he only faw at a diftance.
REAUMURIA, it botany : A genus of the pentagynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the $13^{\text {th }}$ oider, Succulenta. The calyx is hexaphyllous, and there are five petals; the capfule is unilocular, quinquevalved, and polyfpermous.

RebATE, or Rebatement, in commerce, a term much ufed at Amfterdam for an abatement in the price of feveral commodities, when the buyer, inftead of taking time, advances ready money.
Rebatement, in heraldry, a diminution or abatement, of the bearings in a coat of arms. See Abatement.
REBELLION, Rebellio, among the Romans, was where thofe who had beer formerly overcome in batthe, and yielded to their fubjection, made a fecond refiftance: but in England it is generally ufed for the taking

## R E B $\quad[28] \quad R E C$

Rebelious up of arms traiteroufly againf the king, whether by naword relel is fometimes applied to him who wilfully
breaks a law ; alfo to a villein difobeying his lord.

There is a difference between enemies and rebels. Enemies are thofe who are out of the king's allegiance: therefore fubjects of the king, either in open war, or rebellion, are not the king's enemies but traitors. And David Prince of Wales, who levied war againit Edw. I. becaufe he was within the allegiance of the king, had fentence pronounced againf him as a traitor and rebel. Private perfons may arm themielves to fuppiefs rebels, enemies, \& $c$.

REBELLiOUS assembly, is a gathering toge. ther of twelve perions or more, intending or going about to practife or put in ufe unlawfully, of their own authority, any thing to change the law or fatutes of the realm ; or to deitroy the inclofures of any ground, or banks of any filh.pond, pool, or conduit, to the intent the fame fhall lie wafte and void; or to deftroy the deer in any park, or any warren of conies, dove-houfes, or finh in ponds; or any houfe, barns, mills, or bays; or to burn Itacks of corn; or abate rents, or prices of victuals, \&c.

REBUS, an enigmatical reprefentation of fome name, sc. by ufing figures or pictures intead of words, or parts of words. Camden mentions an inftance of this :.brurd kind of wit in a gallant who expreffed his love to a woman named Rofe Hill, by painting in the border of his gown a rofe, a hill, an eye, a loaf, and a well; which, in the fyle of the rebus, reads, "Rofe Hill I love well." This kind of wit was long practifed by the great, who took the pains to find devices for their names. It was, however, happily ridiculed by Ben Johnfon, in the humourous defcription of Abel Drugger's device in the Alchemitt ; by the Spectator, in the device of Jack of Newberry; at which time the rebus, being raifed to fign-pofts, was grown out of falhion at court.

Rebus is alfo ufed by the chemical writers fometimes to fignify four milk, and fometimes for what they call the ultimate matter of which all bodies are compofed.

Rebus, in heraldry, a coat of arms which bears an allufion to the name of the perfon; as three caftes, for Cafleton; three cups, for Butler; three conies, for Coniby; a kind of bearings which are of great antiquity.

REBUTTER (from the Fr. bonter i. e. repellere, to put back or bar), is the anfwer of defendant to plaintiff's furrejoinder; and plaintiff's anfwer to the rebutter is called a furrebutter: but it is very rare the parties go fo far in pleading.

Rebutter is alfo where a man by deed or fine grants to warranty any land or hereditament to another ; and the perfon making the warranty, or his heir, fues him to whom the warranty is made, or his heir or affignee, for the fame thing; if he who is fo fued plead the deed or fine with warranty, and pray judgment, if the plaintiff fhall be received to demand the thing which he ought to warrant to the party againft the warranty in the deed, \&c. this is called a rebutter. And if I grant to a tenant to hold without impeachment of wafte, and afterwards implead him for wafte done, he may debar me of this ation by hewing my grant, which is a rebutter,

RECAPITULATION, is a fummary, or a con. Recapitu. cife and tranfient enumeration of the principal things in- Jation fifted on in the preceding difcourle, whereby the force Reciprocal. of the whole is collefted into one view. See Oratory, $\underbrace{\text { reipracal }}$ $\mathfrak{n}^{\circ} 37$ and 127.

RECEIPT, or Receit, in commerce, an acquittance, or difcharge, in writing, intimating that the party has received a certain fum of money, either in full for the whole debt, or in part, or on account.

RECEIVER, in pneumatics, a glafs veffel for containing the thing on which an experiment in the airpump is to be made.

Receiver, receptor or receptator, in Englifh law, is commonly underftood in a bad fenfe, and ufed for fuch as knowingly receive itolengoods from thieves, and conceal them. This crime is felony, and the punilhment is tranfportation for 14 years.
RECENSIO was an account taken by the cenfors, every luftrum, of all the Roman people. It was a general furvey, at which the equites as well as the reft of the people, were to appear. New names were now put upon the cenfor's lift, and old ones cancelled. The recenfio, in fhort, was a more folemn and accurate fort of probatio, ar.d anfwered the purpofe of a review, by fhowing who were fit for military fervice.

RECEPTACULUM, in botany, one of the feven parts of fructification, defined by Linnæus to be the bafe which connects or fupports the other parts.
Receptaculum Cbyli, or Pecquet's Refervatory, the refervoir or receptacle for the chyle, fituated in theleft fide of the upper vertebra of the loins, under the aorta and the veffels of the left kidney.

RECHABITES, a kind of religious order among the ancient Jews, inftituted by Jonadab the fon of Rechab, comprehending only his own family and pofterity. Their founder prefcribed them three things: firlt, not to drink any wine; fecondly, not to build any houfes, but to dwell in tents ; and thirdly, not to fow any corn, or plant vines.
The Rechabites obferved thefe rules with great frictnefs, as appears from Jer. xxxv. 6. \&c. Whence St Jerome, in his 13 th epiftle to Paulinus calls them monachi, monks, Jonadab, their founder, lived under Jehoarh, king of Judah, contemporary with Jehu king of Ifrael; his father Rechab, from whom his pofterity were denominated defcended from Raguel or Jethro, father-inlaw to Mofes, who was a Kenite, or of the race of Ken: whence Kenite and Rechabite are ufed as fynonymous in Scripture.

RECHEAT, in hunting, a leffon which the huntfman plays on the horn, when the hounds have loft their game, to call them back from purfuing a counter fcent.

RECIPE, in medicine, a prefcription, or remedy, to be taken by a patient : fo called becaufe always beginning with the word recipe, i. e. take; which is generally denoted by the abbreviature $\mathrm{B}_{3}$.

RECIPROCAL, in general, fomething that is mutual, or which is returned equally on both fides, or that affects both parties alike.

Rectrocof/L Terms, among logicians, are thofe which have the fame fignification; and confequently are convertible, or may be ufed for each other.
Reciprocal, in mathematics, is applied to quantities

## R E C $\left[\begin{array}{ll}29 & 1\end{array}\right] \quad$ R C.

Reciprocal ties which multiplied together produce unity. Thus $\underbrace{x}_{\text {Reclufe. } \frac{1}{s}}$ and $x, y$ and $\frac{r}{y}$, are reciprocal quantities. Likewife $\frac{1}{x}$ is faid to be the reciprocal of $x$, which is again the reciprocal of $\frac{1}{x}$.

Reciprocal Figures, in geometry, thofe which have the antecedents and confequents of the fame ratio in both figures.

Recirrocal Proportion, is when in four numbers the fourth is lefs than the fecond by fo much as the third is greater than the firt, and vice verfe. See Proportion and $A_{\text {rithmetic, chap. vi. Great ufe is made of this }}$ reciprocal proportion by Sir Ifaac Newton and others, in demontrating the laws of motion.

RECITAL, in law, means the rehearfal or making mention in a deed or writing of umething which has been done before.

RECITATIVO, or Recitative, in mufic, a kind of finging, that differs but little from ordinary pronunciation ; fuch as that in which the feveral parts of the liturgy are rehearfed in cathedrals; or that wherein the actors commonly deliver themfelves at the theatre or the opera, when they are to exprefs fome action or paffion; to relate fomelevent ; or reveal fome defign.

RECKENHAUSEN, a ftrong town of Cologne, in Germany, in the middle territory of that name. The abbefs of its nunnery has power of punifhing offenders with death, and the alone is obliged to the vow of chaftity.

RECKONING, or a Ship's Recroning, in navigation, is that account whereby at any time it may be known where the fhip is, and on what courfe or courfes fhe is to fteer, in order to gain her port ; and that account taken from the log-board is called the dead reckoning. See Navigation.

RECLAIMING, or Reclaming, in the ancient cuftoms, a lord's purfuing, profecuting, and recalling, his vaffal, who had gone to live in another place without his permiffion.

Reclaiming is alfo ufed for the demanding of a perfon, or thing, to be delivered up to the prince or ftate to which it properly belongs ; when, by any irregular means, it is come into another's poffeflion.

Reclaiming, in falconry, is taming a hawk, \&c. and making her gentle and tamiliar.

A partridge is faid to reclaim, when the calls her young ones together, upon their fcattering too much from her.

RECLINATION of a plane in dialling. See Dialling.

RECLUSE, among the Papifts, a perion fhut up in a fmall cell of an hermitage, or monatery, and cut off, not only from all converfation with the world but even with the houfe. This is a kind of voluntary imprifonment, from a motive either of devotion or penance.

The word is alfo applied to incontinent wives, whom their hubands procure to be thus kept in perpetual imprifonment in fome religious houfe.

Reclufes were anciently very numerous. They took an oath never to ftir out of their retreat : and having entered it, the bifhop fet his feal upon the door ; and the reclufe was to have every thing neceffary for the fupport of life conveyed to him through a window. If
he was a prieft, he was allowed a mall oratory, with a window, which looked into the chureh, through which he might make his offerings at the mafs, hear the finging, and aniwer thofe who fpoke to him; but this window had curtains before it, fo that he could not be feen. He was allowed a little garden, adjoining to his cell, in which he might plant a few herbs, and breathe a little frefh air. lf he had difciples, their cells were contiguous to his, with only a window of communication, thro' which they conveyed neceffaries to him, and received his inftructions. If a reclufe fell fick, his door might be opened for perfons to come in and affit him, but he himfelf was not to fir out.

RECOGNITION, ir law, an acknowledgement; a word particularly ufed in the law-books for the firft chapter of the ftatute I Jac. I. by which the parliament acknowledged, that, after the death of queen Elifabeth, the crown had rightfully defcended to king James.

RECOGNIZANCE, in law, is an obligation of record, which a man enters into before fome court of record or magiftrate duly authorifed, with condition to do fome particular aft; as to appear at the affizes, to keep the peace, to pay a debt, or the like. It is in molt refpects like another bond: the difference being chiefly this, that the bond is the creation of a frelh debt or obligation $d e$ norro, the recognizance is an acknowledgement of a former debt upon record; the form whereof is, " that A. B. doth acknowledge to owe to our lord the king, to the plaintiff, to C.D. or the like, the fum of ten pounds," with condition to be void on performance of the thing ftipulated: in which cafe the king, the plaintiff, C.D. \&c. is called the cognizee, is cui cognofcitur ; as he that enters into the recognizance is called the cognizor, is qui cognofit. This being certified to, or taken by the officer of fome court, is witneffed only by the record of that court, and not by the party's feal : fo that it is not in ftrict propriety a deed, though the effects of it are greater than a common obligation; being allowed a priority in point of payment, and binding the lands of the cognizor from the time of enrolment on record.

RECOIL, or Rebound, the ftarting backward of a fire-arm after an explofion. Merfennus tells us, that a cannon 12 feet in length, weighing $6_{400} \mathrm{lb}$. gives a ball of 24 lb . an uniform velocity of 640 feet per fecond. Putting, therefore, $W=6400, w=14, V=$ 640 , and $v=$ the velocity with which the cannon recoils; we fhall have (becaufe the momentums of the cannon and ball are equal) $\mathrm{W} v=w \mathrm{~V}$; and fo $v=\frac{w v}{\mathrm{~W}}=$ $\frac{24 \times 64}{6400}=2,4$; that is, it would recoil at the rate of $2 \frac{4}{1}$ feet per fecond, if free to move.

RECOLLECTION, a mode of thinking, by which ideas fought after by the mind are found and brought to view.

RECONNOITRE, in military affairs, implies to view and examine the fate of things in order to make a report thereof.

Parties ordered to reconnoitre are to obferve the country and the enemy; to remark the routes, conveniences, and inconveniences of the firit ; the pofition, march, or forces of the fecond. In either cafe, they fhould have an expert geographer, capable of taking

## Resngni-

 ticu Reconnoitre.
## REC <br> REC

Rccord flass :adily: he flould be the bef mounted of the H. jesorety. wicele in cale t:se enemy hippen to feater the ciforte, that le aray fave his works and ideas. See Wifar.
ikLCORD, an authentic teftimony in writing, contained in rolis of parchment, and preferved in a court of record. See Court.

Trial $b$ : $R_{\text {ECORD }}$, a fpecies of trial which is ufed waly in one particular infance: and that is where a mitter of record is pleaded in any action, as a fine, a judgment, or the like; and the oppofite party pleads, mil tiel wicorl, that there is no fuch matter of record exiting. Upon this, iffue is tendered and joined in the following form", "and this he prays may be inquired of by the record, and the other doth the like;" and hereupon the parcy pleading the record has a das given him to bring it in, and proclamation is made in court for him to " bring forth the record by him in pleading alliged, or elfe he fhall be condemned;" and, on his failure, his antagonift fhall have judgment to recover. The trial, therefore, of this iffue, is merely by the record: for, as Sir Edward Coke obferves, a record or enrolment is a monument of fo high a nature, and importeth in itfelf fuch abfolute verity, that if it be pleaded that there is no fuch record, it thall not receive any trial by witneifs, jury, or otherwife, but only by itfelf. Thus titles of nobility, as whether earl or not earl, baron or not baron, fhall be tried by the king's writ or patent only, which is matter of record. Alfo in cafe of an alien, whether alien friend or enemy, fhall be tried by the league or treaty between his fovereign and ours; for every league or treaty is of record. And alfo, whether a manor be held in ancient demefne or not, thall be tried by the record of domefday in the king's exchequer.

RECORDER, a perfon whom the mayor and other migititrates of a city or corporation affociate to them, for their better direction in matters of juftice and proceedings in law ; on which account this perfon is generally a counfellor, or other perfon well fxilled in the law.

The recorder of London is chofen by the lord mayor and aldermen; and as he is held to be the mouth of the city, delivers the judgment of the courts therein, and records and certifies the city-cuftoms. See London, $\mathrm{n}^{\circ} 38$.

RECOVERY, or Common Recorerr, in Englifi law, a fpecies of affurance by matter of record; concerning the original of which it muft be remarked, that common recoveries were invented by the ecclefialtics to clude the flatutes of mortmain (fee TAIL) ; and afterwards encouraged by the fineffe of the courts of law in in Edward IV. in crder to put an end to all fettered inheritances, and bar not only eftates-tail, but alfo all remainders and reverfions expectant thereon. We have here, therefore, only to conlider, firft, the nature of a common recovery; and, fecondly, its force and effect.
Wlackif. I. A common recovery is a fuit or action, either acComment, tual or fictitious: and in it the latids are recovered againf the tenant of the freehold; which recovery, being a fuppofed abjudication of the right, binds all perfons, and velts a free and abfolute fee-fimple in the recoverer. To explain this as clearly and concifely as poffible, let us, in the firt place, fuppofe David Edwards to be tenant of the freehold, and defirous to fuffer a common recovery, in order to bar all entails, remain-
ders, and reverfions, anl to convey tic fame in foc- fimple, Recovery. to Francis Golding. To effect this, Golding is to biing an action againft him for the laids; and he acecrdingly fues out a writ called a pracise $y^{\prime \prime}$ in retida, becaufe thefe were its initial ir molt opertive words when the lawproceedings were in Latin. In this wit the demandant Golding alleges, that the defendant Edvards (here called the tenant) has no legal title to the land; but that he came into poffeffion of it after one Hugh Hunt had turned the demandant out of it. The fubfequent proceedings are made up into a record or recovery roll, in which the writ and complaint of the demandant are firf recited: whereupon the tenant appears, and calls upon one Jacob Morland, who is fuppofed, at the original purchafe, to have warranted the title to the tenaut; and thereupon he prays, that the faid Jacob Morland may be called in to defend the title which he fo warranted. This is called the vousher, "vocatio," or calling of Jacob Morlard to warranty ; and Morland is called the voucbee. Upon this Jacob Morland, the vouchee, appears, is impleaded, and defends the title. Whereupon Golding the demandant defires leave of the court to imparl, or confer with the vouchee in private ; which is (as ufual) allowed him. And foon afterwards the demandant Golding returns to court ; but Morland the vouchee difappears, or makes default. Whereupon judgment is given for the demandant Golding, now called the recoverer, to recover the lands in queftion againft the tenant Edwards, who is now the recoveree : and Edwards has judgment to recover of Jacob Morland lands of equal value, in recompenfe for the lands fo warranted by him, and now lolt by his default ; which is agreeable to the doctrine of warranty mentioned in the preceding chapter. This is called the recompenfe, or recovery in value. But Jacob Morland having no lands of his own, being ufually the crier of the court, who, from being frequently thus vouched, is called the common vouchee, it is plain that Edwards has only a nomiaal recompenfe for the lands fo recovered againft him by Golding ; which lands are now abfolutely vefted in the faid recoverer by judgment of law, and feifin thereof is delivered by the fheriff of the county. So that this collufive recovery operates merely in the nature of a conveyance in fee-fimple, from Edwards the tenant in tail to Golding the purchafer.

The recovery here defrribed, is with a fingle voucher only; but fometimes it is with a double, treble, or farther voucher, as the exigency of the cafe may require. And indeed it is now ufual always to have a recovery with double voucher at the leaft : by firf conveying an eftate of freehold to any indifferent perfon, againt whom the pracipe is brought; and then he vouches the terant in tail, who vouches over the common vouchee. For, if a recovery be had immediately againft tenant in tail, it bars only fuch eftate in the premifes of which he is then actually feifed; whereas if the recovery be had againft another perfon, and the tenant in tail be vouched, it bears every latent right and intereft which he may have in the lands recovered. If Edwards therefore be tenant of the freehold in poffeffion, and John Barker be tenant in tail in remainder, here Edwards doth firft vouch Barker, and then Barker vouches Jacob Morland the common vouchee; who is always the laft perfon vouched, and alwaysmakes default; whereby the demandant Golding recovers the land againit the tenant

Edwards

## R E C $[3 \mathrm{I}] \quad \mathrm{R} \mathrm{E} \mathrm{C}$

$\underbrace{\text { Recovery. }} \begin{aligned} & \text { Edwards, and Edwards recovers a recompenfe of equal } \\ & \text { value againft Barker the firt vouchee; who recovers }\end{aligned}$ the like againft Morland the common vouchee, againft whom fuch ideal recovery in value is always ultimately awarded.

This fuppofed recompenfe in value is the reafon why the iffue in tail is held to be barred by a common recovery. For, if the recoveree fhould obtain a recompenfe in lands from the common vouchee (which there is a poffibility in contemplation of law, though a very improbable one, of his doing), thefe lands would fupply the place of thofe fo recovered from him by collufion, and would defcend to the iflue in tail. The reafon will alfo hold with equal force as to moft remaindermen and reverfioners, to whom the poffibility will remain and revert, as a fuil recompenfe for the reality which they were otherwide cutitled to: but it will not always hold ; and therefore, as Pigott fays, the judges have been ever aftuti, in inventing other reatons to maintain the authority of recoveries. And, in particular, it hath been faid, that though the eftate-tail is gone from the recoveree; yet it is not de!troyed, but only transferied, and itill fubfitis; and will ever continue to fubfift (by conftruction of law) in the recoveror, his heirs and affigns: and as the eftate-tail fo continues to fubfift for ever, the remainders or reverfions expectant on the determination of fuch eftate-tail can never take place.

To fuch aukward nlifts, fuch fubtile refinements, and fuch flange reafoning, were our anceltors obliged to have recourfe, in order to get the better of that ftubborn ftatute de donis. The defign for which thefe contrivances were fet on foot, was certainly laudable; the unrivetting the fetters of eftates-tail, which were attended with a legion of mifchiefs to the commonwealth : but, while we applaud the end, we cannot but admire the means. Our modern courts of juttice have indeed adopted a more manly way of treating the fubject ; by confidering common recoveries in no cther light than as the formal mode of conveyance by which tenant in tail is enabled to aliene his lands. But, fince the ill confequences of fettered inheritances are now generally feen and allowed, and of courfe the utility and expedience of fetting them at liberty are apparent, it hath often been wilhed that the procers of this conveyance was fhortened, and rendered lefs fubject to niceties, by either totally repealing the fatute de donis; which perhaps, by reviving the old dotrine of conditional fees, might give birth to many litigations: or by velting in evory tenant in tail, of full age, the fame abfolute fee-fimple at once, which now he may obtain whenever he pleafes, by the collulive fiction of a common recovery; though this might poflibly bear hard upon thofe in remainder or reverfion, by abridging the chances they would otherwife frequently have, as no recovery can be fuffered in the intervals between term and term, which fometimes continue for near five months together : or, laftly, by empowering the tenant in tail to bar the eftate-tail by a folemn deed, to be made in term-time, and enrolled in fome court of record; which is liable to neither of the other objections, and is warranted not only by the ufage of our American colonies, but by the precedent of the flatute 21 Jac . I. c. 19. which, in the cafe of a bankrupt tenant in tail, empowers his commiffioners to fell the eftate at any time, by doed indented and enrolled. And if, in fo national
a concern, the emoluments of the officers concerned in Recoviry, palfing recoveries are thought to be worthy attention, Recremer: thofe might be provided for in the fees to be paid upon each enrollment.
2. The force and effect of common recoveries may appear, from what has been faid, to be an ablolute bar not only of all eftates tail, but of remainders and reverfions expectant on the determination of fach effates. So that a tenant in tail may, by this method of affurance, convey the lands held in tail to the recoverer, his heirs and alfigns, abfolutely free and difcharged of all conditions and limitations in tail, and of all remainders and reverfions. But, by ftatute $34 \& 35 \mathrm{H}$. VIII. c. 20. no recovery had againft tenant in tail of the king's gift, whereof the remainder or reverfon is in the king, fhall bar fuch eftate-tail, or the remainder or reverfion of the crown. And by the flatute in H. VII. c. 20. no woman, atter her tufband's death, flall fuffer a recovery of lands fettled on her by her hufbund, or fettled on her hufoand and her by any of his anceftors. And by flatute 14 Eliz. c. 8. no tenant for life, of any fort, can fuffer a recovery fo as to bind them in remainder or reverfion. For which reafon, if there be tenant for life, with remainder in tail, and other remainders over, and the tenant for life is defirous to fuffer a valid recovery, cither he, or the tenant to the preci, e by him made, mult vouch the remainder-man in tail, otherwife the recovery is void: but if he does vouch fuch remainder-man, and he appears and vouches the common vouchee, it is then good; for if a man be vouched and appears, and fuffers the recovery to be had, it is as effectual to bar the eftate-tail as if he himfelf were the recoverce.

In all recoveries, it is neceffary that the recoveree, or tenant to the precipe, as he is ufually called, be actually feifed of the freehold, clfe the recovery is void. For all actions to recover the feifin of lands mult be brought againft the actual tenant of the freehold, elfe the fuit will lofe its effect; fince the freehold cannot be recovered of him who has it not. And, though thefe recoveries are in themfelves fabulous and fistitious, yet it is neceffary that there be actores fabule properly qualified. But the nicety thought by fome modern practitioners to be requifite in conveying the legal free. hold, in order to make a good tenant to the pracipe, is removed by the provifions of the flatute ia Geo. II. c. 20. which enacts, with a retrofpect and conformity to the antient rule of law, that, though the legal freehold be vefted in leffees, yet thofe who are entitled to the next freehold eflate in remainder, or reverfion, may make a good tenant to the precipe; and that, though the deed or fine which creates fuch tenant be fubfequent to the judgment of recovery, yet if it be in the fame term, the recovery fhall be valid in law : and that though the recovery itfelf do not appear to be entered, or be not regularly entered on record, yet the deed to make a tenant to the pracife, and declare the ufes of the recovery, fhall after a poffeffon of 20 years $b e$ fufficient evidence on behalf of a purchaicr for valuable confideration, that fuch recovery was duly fuffered.

Recovery of perfons drowned, or apparently dead. See Re-animation, and the articles there referred to.

RECREANT, Conardly, Faint-bearted; formerly a word very reproachful. See Battle.

RECREMENT, in chemittry, fome fuperfluous matter feparated from forec other that is ufeful; in

## R E C

Recrimina whicis fof it is the fame with jorric, faces, and excretion Reông. Reentry ments.

RECRIMTNATION, in law, an accufation brought by the accufed againf the accufer upon the fame fact.

RECRUITS, in military affairs, new-raifed foldiers defigned to fupply the place of thofe who have loft llisir lives in the fervice, or who are difabled by age or wounds.

RECTANGLE, in geometry, the fame with a rightangled parallelogram. See Geometry.

RECTIFICATION, in chemiftry, is nothing but the repetition of a diftillation or fublimation feveral times, in order to render the fubftance purer, finer, and freer from aqueous and earthy parts.

Rectifichatoin of Spirits. See Distillation.
RECTIFIER, in navigation, an inftrument confifting of two parts, which are two circles, either laid one upon, or let into the other, and fo faftened together in their centres, that they reprefent two compaffes, one fixed, the other moveable; eash of them divided into the 32 points of the compaifs, and $360^{\circ}$, and numbered both ways, from the north and the fouth, ending at the eall and welt, in $90^{\circ}$.

The fixed compais reprefents the horizon, in which the north and all the other points of the compafs are fixed and immoveable.

The moveable compafs reprefents the mariner's compafs; in which the north and all other points are liable to variation.

In the centre of the moveable compais is faftened a filk thread, long enough to reach the outfide of the fixed compafs. But if the inftrument be made of wood, there is an index inltead of the thread.

Its ufe is to find the variation of the compafs, to rectify the courfe at fea; having the amplitude or azimuth given.

RECTIFYING the Globe. See Geography, p. 656.

RECTILINEAR, in geometry, right-lined ; thus figures whofe perimeter confilts of right lines, are faid to be rectilinear.

RECTITUDE, in philofophy, refers either to the act of judging or of willing; and therefore whatever comes under the denomination of rectitude, is either what is true or what is good, thefe being the only objects about which the mind exercifes its two faculties of judging and willing.

Moral rectitude, or uprightnefs, is the choofing and purfing thofe things which the mind, upon due inquiry and attention, clearly perceives to be good; and avoiding thofe that are evil. See Moral Pbilofophy.

REC'FOR, a term applied to feveral perfons whore offices are very different : as, i. The rector of a parifh is a clergyman that has the charge and cure of a parifh, and poffeffes all the tithes, Sc. 2. The fame name is alio given to the chief elective officer in feveral foreign univerfities, particularly in that of Paris, and alfo in thofe of Scotland. It is alio applied to the head mafter of large fchools in Scotland, as in the high fchool of Edinburgh. 3. Rector is alfo ufed in feveral convents for the fuperior officer who governs the houfe: and the Jefuits give this name to the fuperiors of fuch of their houfes as are either feminaries or colleges.

RECTORY, a parifh church, parfonage, or firitual living, with all its rights, tithes, and glebes.

Rectory is alfo fometimes ufed for the restor's manfion or parfonage-houfe.

RECTUM, in anatomy, the third and lat of the large inteftines or guts. See Anatomy, $\mathrm{n}^{\circ} 93$.

RECTUS, in anatomy a name common to feveral pairs of mufcles, fo called on account of the fraightnefs of their fibres.

RECUPERATORES, among the Romans, were commiffioners appointed to take cognizance of private matters in difpute, between the fubjects of the flate and foreigners, and to take care that the former had juftice done them. It came at laft to be ufed for commiffioners, to whom the prator referred the determination of any affair between one fubject and another.

RECURRENTS, in anatomy, a name given to feveral large branches of nerves fent out by the par vagum from the upper part of the thorax to the larynx.

RECURVIROSTRA, in ornithology; a genus belonging to the order of grallæ of Linnæus, and that of palmipedes of Pennant and Latham. The bill is long, fubulated, bent back, fharp and flexible at the point. The feet are webbed, and furnifhed with three toes forwards, and a fhort one behind. Mr Latham notes of this genus three fpecies, viz. the Avofetta, or the one commonly known, the Americana, and the Alba. This laft, it is probable has fome affinity to the Americana. The recurviroftra avofetta is about the fize of a lapwing in body, but has very long legs. The fubftance of the bill is foft, and almolt membranous at its tip; it is thin, weak, flender, compreffed horizontal1 y , and incapable of defence or effort. Thefe birds are variegated with black and white, and during the winter are frequent on the eaftern fhores of Great Britain. They vifit alfo the Severn, and fometimes the pools of Shropfhire. They feed on worms and infects, which they froop out of the fand with their bills. They lay two eggs, white, with a greenifh hue, and large fpots of black ; thefe eggs are about the fize of a pigeon's.They are found alfo in various parts of the continent of Europe, in Ruflia, Denmark, and Sweden, but they are not numerous. They are alfo found in Siberia, but oftener about the falt lakes of the Tartarian defert, and about the Cafpian fea. They are found likewife on the coalts of Picardy in France in April and November, and at Orleans, but rarely. In breeding-time they are very plentiful on the coafts of Bas Poictou. They do not appear to wander farther fouth in Europe than Italy. Whether from timidity or addrefs, the avofet fhuns fnares, and is not eafily taken. The American avofet is rather larger and longer than the laft. The bill is fimilar, and its colour black: the forehead is dulky white: the head, neck, and upper part of the brealt, are of a deep cream-colour : the lower parts of the neck behind white: the back is black, and the under parts from the breaft pure white: the wings are partly black, partly white, and partly afh-coloured. Thefe birds inhabit North America, and were found by Dampier in Shark's Bay, on the coaft of New Holland. See Plate CCCCXXXV.

The recurviroftra, or fcolopax alba, is about 14 inches and a $\mathrm{C}_{\text {inarter }}$ long, its colour white, the inferior coverts of its wings dufkifh, its bill orange, its légs brown. Edwards remarks, that the bill of this bird is bent upwards, as in the avofet; its bill black at the tip, and orange the reft of its length; all the plumage is white,

Thackara. $\dot{\text { pr }}$.

Reculante, except a tint of ycilowifh on the great quills of the Red Sea. wing and of the tail. Edwards fuppofes, that the
whitenefs is produced by the cold climate of Hudfon's Bay, from which he received it, and that they refume their brown feathers during the fummer. It appears that feveral fpecies of this bird have fpread further into America, and have even reached the fouthern provinces: for Sloane found our thi:d pecies in Jamaica; and Fernandez feems to indicate two of them in New Spain, by the names chiquatootl and elotototl; the former being lile the woodcock, ard the latter lodging under the italks of maize.

A bird of this kind, Mr Latham fays, was fent from Hudfon's Bay, and from the figure, has every appearance of an avofet: however, in Edwards's plate, the toes hapear cloven to the bottom; a circumftance feeming to overturn the fuppofition, and only to be authenticated when other fpecimens fhall have come under the eye of the well-informed naturalift.

RECUSANTS, in England fuch perfons as acknowledge the pope to be the fupreme head of the church, and refufe to acknowledge the king's fupremacy; who are hence called Popilb recufants. The penal laws againft Papifts are now abolifhed in Britain and in Ireland; and in all probability they will quickly be allowed the ampleft privileges.

RED, one of the colours called fimple or primary. being one of the fhades into which the light naturally divides itfelf when refracted through a prifm. See Chromatics.

Red, in dyeing, fee that article.-Some reckon fix hinds or cafts of red, viz. fcarlet-red, crimfon-red, mad-der-red, half-grain red, lively orange-red, and fcarlet of cochineal: but it is eafy to fee that there can be but one proper fpecies of red ; namely, the 1 eflection of the light exactly in fuch a manner as it is refracted by the prifm; all other fhades being adulterations of that pure colour, with yellow, brown, \&c.

Red, in heraldry. See Gules.

## Red-Bird. See Muscicapa, n ${ }^{\circ} 7$.

Red-Breaf, in ornithology. See Motacilla.
$R_{E D}$. Book of the Britifh exchequer, an ancient record or manufcript volume, in the keeping of the king's remembrancer, containing divers mifcellany treatiles relating to the times before the conqueft.

Red-Lead. See Chemistry, ñiziz.
Red Precipitate of Mercury. See Chemistry, $n^{\circ}$ $-64$.

Red-Rafia, or. Litile Ruffia, a province of Poland, bounded on the welt by Upper Poland, on the north by Lithuania, on the eaft by the country of the Little Tartars, and on the fouth by Moldavia, Tranfylvania, and a part of Hungary. It comprehends Rullia properly fo called, Volhimia, and Podolia. It is about 650 miles in length, and from 150 to 250 in breadth. It conifits chiefly of large fields, but little cultivated on account of the frequent inroads of the Tartars, and becaufe there is no water carriage. It had the name of Red $R u / f_{c}$, from the colour of the hair of its inhabitants. Rulia, properly fo called, comprehends the three palatinates of Leopol or Lemburg, Belfizo, and Chelm.

Rev-Sia or Aralic Gulph, fo much celebrated in facred hiltory, feparates Arabia from Upper Ethiopia and part of Egypt. This fea is 350 leagues in length
and 40 in breadth. As no river falls into it of rom-
cient force to counteract the influence of the tide, it is more affected by the motions of the great ocean thon any of the inland feas nearly in the fame latitude. It is not much expofed to tempefs: the winds uitullj blow from north to fouth, and being periodical, I le the monfoons of India, invariably determine the featon of failing into or out of this fea. It is divided into two gulphs; that to the eaft was called the RElinitic guth, from the city Flana at the north end of it; anci tat to the weft the Heroopolitic, from the city of Heroopolis; the former of which belongs to Arabia, and the latter to Egypt.

Mr Bruce has made many obfervations on this $\mathrm{f}_{\therefore, 1}$, which are worthy of notice.-With regard to the rame, he fays it was certainly derived from Edom or Efau the fon of Jacob; though in another place he fays, le wonders that writers have not rather fuppofed it $:$ have got the epithet of $R(d$, from the colour ol the fand on its coafts, than for other reafons they have alleged. With regard to any rednefs in the water itfell, or in the bottom, which fume have afferted, our travel. ler affures us that there is no fuch thing. It is more ditficult to aflign a reafon for the Hebrew name of it, which fignities the Sea of $W_{e c d s}$; as he never faw a weed throughout the whole extent of it. "Irdeed, (fays he) upon the flighteft confideration, it will ccocir to any one, that a narrow gulph, under the immediate influence of the monfoons, blowing from contrary points fix months each year, would have too much agitation to produce fuch vegetables, feldom found but in ftagnant waters, and feldom, if ever, found in falt ones. My opinion then is, that it is from the large trees or plants of white coral, fpread everywhere over the bottom of the Red Sea, perfecaly in imitation of plants on land, that the fea has obtained this name.-I fiw one of thefe, which, from a root nearly central, threw out ramifications of an almoft circular form, meafuring 26 feet every way."

Our author has alfo made many ufeful obfervations on the navigation of this fea. "All the weftern fhore (he fays) is bold, and has more depth of water than the eaft ; but on this fide there is neither anchoring ground nor fhoals. It is rocky, with a confiderable depth of water everywhere; and there are a number of funken rocks, which, though not vifible, are fufficiently near the furface to deftroy a large fhip." The caufe of this, in Mr Bruce's opinion, is, that the monntains cn the fide of Abyffinia and Egypt are all of haxd tome, porphyry, many different kinds of marble, granite, al:bafter, and bafaltes. Thefe being all compofed of $10-$ lid materials, therefore, can part with very little dut or fand, which might otherwife be blown from them into the fea. On the oppofite coalt, viz. that of He jaz and Tahamah, on the Arabian fide, the whole ccififts of moving fands; a large quantity of which is blown from the fouthealt by the dry winter menfoons; which being lodged among the rocks on that fide, and confired there by the north-eaft or fummer monioci., which is in a contray direction, hinders them from co. ming over to the Egyptian fide. Hence the weftora coalt is full of funk rocks for want of fand to cover them, with which they would otherwife become iflands. They are naked and bare all round, with fharp points like fpears; while, on the eult-fide, every rosk become.

## RED

Red gea. an inland, and every two or three iflands become an harbour. On the ends of the principal of thefe harbours the people have piled up great heaps of ftones to ferve as fignals: "and it is in thefe (fays Mr Bruce) that the large veffels from Cairo to Jidda, equal in fize to large 74 gun-fhips (but from the cilterns of ma-fon-work built within for holding water, I fuppofe doutle their weight, after navigating their portion of the cha nnel in the day-time, come fafely and quietly to at four o'clock in the afternoon; and in thefe little harbours pafs the night, to fail into the channel again next morning."

The weftern channel of the Red Sea was chofen, in the diysof the Piolemies, for the track of the Indian and African. Thefe monarchs erected a great number of cities all along the weftern coaft ; and notwithftanding the dangers of the navigation, we do not hear that it was ever abandoned on account of them.

From the obfervations made by our author on the navigation of the Red Sea, he undertakes to point out a fafe paffage for large fhips to the gulph of Suez, fo that they may be able to judge of the propriety of their own courfe themfelves, without trufting implicity to the pilotstthey meet with, who are often very ignorant of their profeffion. This fea, according to Mr Bruce, may be divided into four parts, of which the channel occupies two, till near the latitude of $26^{\circ}$, or that of Coffair. On the weft it is deep water, with many rocks; and on the eaft it is fuil of iflands, as has been already mentioned. Between thefe inlands there are channels and harbours of deep water, where fhips may be protected in any wind; but a pilot is neceffary in failing among thefe from Mocha to Suez, and the voyage befides can be continued only during part of the day. Ships bound to Suez without the confent of the Mheriffe of Mecca, that is, without any intention of felling their cargo at Jidda, or paying cuftom there, ought to take in their frefh water at Mocha; or if there be any reafon againft this, a few hours will carry them to Azab or Saba on the Abyffinian coaft, where they may be plentifully fupplied: but it muft be remembered, "that the people here are Galla, the moft treacherous and villanous wretches on earth." Here not only water may be procured, but plenty of fheep, goats, with fome myrrl, and incenfe in the proper feafon.Great caution, however, mult be ufed in dealing with the people, as even thofe of Mocha, who are abfolutely neceftary to them in their commercial dealings, cannot truft them without furetx or hoftages. Not many years ago, the furgeon and mate of the Elgin Eaft Indiaman, with feveral other failors, were murdered by thefe Lavages as they went afhore to purchafe myrrh, though the $y$ had a letter of fafe conduct from the fhekh.

To fuch as do not want to be known, our author recommends a low black indind on the coalt of Arabia, named Camaran, in latitude $15^{\circ} 20^{\prime}$. It iş dittingniihed by a white houfe or fortrefs on the welt end of it; where water is to be had in ftill greater plenty than at Azab; but no provifions, or fuch only as are very bad, can be procured. If it is neceflary not to be feen at all on the coatt, the iflasd of Foofht is recommended by our author as having excellent water, with a faint or monk, whofe office is to keep the wells clean. This is one of the chain of iflands which ftretches almolt acrofs the gulph from Loheia to Mafual, and from ac-
tual obfervation by Mr Bruce, is found to be fituated in N. Lat. $15^{\circ} 59^{\prime} 43^{\prime \prime}$. E. Long. $42^{\circ} 47^{\prime}$. From this to Yambo there is a fafe watering place; and there is an ablolute neceffity for having a pilot before you come to Ras Mahomet; becaufe, over the Ælanitic gulph, the mountains of Aucha, and the Cape itfelf, there is often a thick haze which lafts for many days together, and a number of thips are loft by mittaking the eaftern bay or ※lanitic gulph for the entrance of the gulph of Suez; the former has a ridge of rocks nearly acrofs it. After reaching Sheduan, a large illand, about three leagues farther in a north by weft direation, there is a bare rock diftinguifhed by no particular name; but fo fituated that hips ought not to come within three leagues of it. This rock is to be left to the weftward at the diftance juft mentioned; after paffing which you meet with hoals forming a pretty broad channel, with foundings from 15 to 30 fathoms; and again, on flanding direaly for Tor, there are two other oval fands with funk rocks in the cha:nel, between which you are to fteer. Tor may be known at a diftance by two hills that ftand near the water fide; which, in clear weather, may te feen fix leagues off. Juft to the fouth-eaft of thefe is the town and harbour, where there are fome palin-trees about the houfes, the more remarkable, as being the firlt that are feen on the coaft. The fourdings in the way to Tor harbour are clean and regular; " and, by giving the beacon a fmall birth on the larboard hand, you may haul in a little to the northward, and anchor in five or fix fathom." In fpring-tides, it is high water at Tor nearly about 12 o'clock: in the middle of the gulph there is no perceptible tide, but at the fides it runs at the rate of more than two knots in the hour. Tor itfelf is but a fmall village, with a convent of monks belonging to thofe of Mount Sinai. It was taken by Don John de Caftro, and fortified foon after its difcovery by the Portuguefe; but has never fince been a place of any confideration; ferving now only for a watering place to the fhips trading to or from Suez. From this place there is a diftinct view of mounts Horeb and Sinai, which appear zbove and behind the others, with their tops frequently covered with fnow in the winter.

Mr Bruce next proceeds to confider fome queftions which may be reckoned matters of curiofity rather than any thing elfe. One of thefe is concerning the level of the water of this fea itielf, which has been fuppofed feveral feet above that of the Mediterranean. "To this (fays our author) I anfwer, that the fact has been fuppofed to be fo by antiquity, and alleged as a reafon why Ptolemy's canal was made from the bottom of the Heroopolitic gulph rather than brought due north acro's the idhmus of Suez; in which laft cafe it was feared it would fubmerge a great part of Afia Minor. But who has ever attempted to verify this by experiment? or who is capable of fettling the difference of levels, amounting, as fuppofed, to fome feet and inches, between two points 120 miles diftant from each other, over a defert that has no fettled furface, but is changing its height every day? Befides, fince all feas are in fact but one, what is it that hinders the Indian ocean to flow to its level? What is it that keeps the Indian ccean up? Till this laft branch of the queftion is refolved, I fhall take it for granted that no fuch difference

## RED

Red Sea oflevel exifts, whatever Ftolemy's ergineers might have Rcddle. pretended to him ; becaufe, to fuppofe it fact, is to fuppore the violation of one very material law of nature."

The next thing confidered by our author is the paf. fage of the Iraclites through the Ked Sea. At the place where he fuppofes the paflage to have been, the fea is not quite four leagues broad, fo that it might eafily have been croffed in one night without any miracle.
There is about 14 fathom water in the channel, and 9 at the fides, with good anchorage everywhere; the fartheit fide is a low fandy coalt, and a very cafy landing place. "The draught of the bottom of the gulph (fays he) given by Dr Pococke, is very erroneous in every part of it. It was propofed to Mr Niebuhr, when in Lgypt, to inquire upon the fpot, whether there were not fome ridges of rocks where the water was fhallow, fo that an army at particular times might pafs over ? Secondly, whether the Etefian winds, which blow Arongly all fummer from the north-welt, could not blow fo violently againtt the fea, as to keep it back on a heap, fo that the Ifraclites might have paffed without a miracle? And a copy of thefe queries was left for me to join my inquiries likewife. But I muft confefs, howevcrlearned the gentlemen were who propofed thefe doubts, I did not think they merited any attention to folve them. If the Etefian winds, blowing from the north-weft in fummer, could heap up the fea as a wall on the right or to the fouth, of 50 feet high, fill the difficulty would remain of building the wall on the left hand or to the north. Befides, water ftanding in that pofition for a day, mult have loft the nature of a fluid. Whence came that cohefion of particles that hindered that wall to efcape at the fides? This is as great a miracle as that of Mofes. If the Etefian winds had done this once, they mult have repeated it many a time before and fince, from the fame caules. Yet Diodorus Siculus fays, the Troglodytes, the indigenous inhabitants of that very fot, had a tradition from father to fon, from their very earlieft and remotelt ages, that once this divifion of the fea did happen there; and that, after leaving the bottom fome time dry, the fea again came back and covered it with great fury. The words of this author are of the moft remarkable kind. We cannot think this heathen is writing in favour of revelation. He knew not Mofes, nor fays a word about Pharoah and his hoft ; but records the miracle of the divifion of the fea in words nearly as ftrong as thofe of Mofes, from the mouths of unbiaffed undefigning pagans."

Red-Shank, in ornithology. See Scolopax.
Red-Start, a fpecies of Motacilla.
Red-Wing. Se Turdus.
REDANS, in field fortification. See the article Redens.

REDENDUM, in law, is ufed fubftantively for the claufe in a leafe wherein the rent is referved to the leffor. 'the proper place for it is next after the limita. tion of eftate.

REDDITIO, was the third part of the facrifice of the heathens, and confitted of the folemn act of putting in again the entrails of the victims, after they had been religioufy infpected. See Sacrifice.

REDDLE, a foft, heavy, red marle, of great ufe in colouring; and being walhed and freed from fand
is often fuld by the druggitts under the name of la'i Recterp armenic.

REDEMPTION, in law, a fazulty or right of $\because 2-$ entering upon lands, \&c. that have been foid and af Reduelio. figns upon lands, \&c. that have been fo.d an'1 alfigned, upon reimburfing the purchafe-money wi:h legill colts.

Rejemption, in theology, denotes the recovery of mankind from fin and death, by the obedience and facrifice of Chrilt, who on this account is called the Redeemer of the world. See Theology.

REDENS, Redans, or Redant, in fortification, a kind of work indented in form of the teeth of a far, with falient and re-entering angles ; to the end that cre part may flank or defend another. It is likewife called faw-work and insented work. The lines or faces in this flank one another.

Redens are ufed in fortifying walls, where it is net neceflary to be at the expence of building battions: as when they ftand on the fide of a river running through a garrifon town, a marfh, the fea, \&cc. But the fault of fuch fortification is, that the befiegers from one battery may ruin both the fides of the tenaille or front of a place, and make an alfault without fear of being enfiladed, fince the defences are mined. The parapet of the corridor is likewife often redented or carried ch by the way of redens. The redens was ufed before baftions were invented, and fome people think them preferable.

REDI (Francis), an Italian phyfician and polite fcholar, was born at Arezzo in Tufcany in 1626 . His ingenuity and learning recommended him to the office of firft phyfician to Ferdinand II. duke of Tufcany; and hee contributed not a little toward the compiling of the Dictionary of La Crufca. He wrote upon vipers, upon the generation of infects, and compofed a grod deal of poetry. All his writings, are in Italian ; and his language is fo fine and pure, that the authors of the Distionary of La Crufca have often cited them as Itandards of perfection. He died in 1697.

REDOUBT, in fortification, a fmall fquare fort, without any defence but in front; ufed in trenches, lines of circumvallation, contravallation, and approach; as alfo for the lodgings of corps-de-guard, and to defend paffages.

REDUCTION, in the fchools, a manner of bringing a term or propofition, which was before oppofite to fome other, to be equivalent to it.

Reduction, in arithmetic, that rule whereby num. bers of different denominations are brought into one denomination. See Arithmetic.

Reduction of Equations, in algebra, is the clearing them from all fuperfluous quantities, bringing them to their loweit terms, and feparating the known from the unknown, till at length only the unknown quantity is found on one fide, and known ones on the other. The reduction of an equation is the laft part of the refolution of the problem. See Algebra.

Reduction of a figure, defign, or draught, is the making a copy thereof, cither larger or fmaller than the original; Aill preferving the form and proportion. The great ufe of the proportional compaffes is the reduction of figures, \&c. whence they are called compafies of reduction. See the article Compass.

There are various methods of reducing figures, \&e. E 2 the

## R E D $[36] \quad \mathrm{R}$ E E

Rciuction the trote cafy is by means of the pentagraph, or paral-
\| liogram; but this hath its defects. See the article P PNRedundant tagraps.

The beit and moit ufual methods of reduction are as
Plate cccexxiv. follow : r. To reduce a figure, as ABCDE ( $\mathrm{n}^{\circ} \mathrm{I}$.), into a lefs compals. About the middle of the figure,
as $z$, pitch on a point, and from this point draw lines to its feveral angles A, B, C, \& c, then drawing the line $a b$ parallel to $\mathrm{AB}, b c$ parallel to BC , \&c. you will have the figure $a b c d e$ fimilar to ABCDE .

If the figures $a b c d e$ had been required to be enlarged, there needed nothing but to produce the lines from the point beyond the angles, as $z \mathrm{D}, z \mathrm{C}, \& \mathrm{c}$. and to draw lines, viz. $\mathrm{DC}, \mathrm{CB}, \& c$. pardllel to the fides $d c, c b$, Eic.
2. To reduce a figure by the angle of proportion, fuppofe the figure $\operatorname{ABCDE}\left(\mathrm{n}^{\circ} 2\right.$.) required to be diminithed in the proportion of the line AB to $a b$ ( $\mathrm{n}^{\circ} 3$. ), draw the indefinite line $\mathrm{GH}\left(\mathrm{n}^{\circ} 4.\right)$, and from $G$ to $H$ fet off the line $A B$. On $G$ defcribe the arch HI. Set off the line $a b$ as a chord on HI, and draw GI. Then with the angle IGH, you have all the meafures of the figure to be drawn. Thus to lay down the point $c$, take the interval BC , and upon the point G defcribe the arch KL. Alfo on the point G defribe MN ; and upon A, with the diftance MN, defcribe an arch cutting the preceding one in $c$, which will determine the fide $b c$. And after the fame manner are the other fides and angles to be defcribed. The fame procefs will alfo ferve to enlarge the figure.
3. To reduce a figure by a fcale. Meafure all the fides of the figure, as $\operatorname{ABCDE}$ ( $\mathrm{n}^{\circ}$ 2.) by a fcale, and lay down the fame meafures refpectively from a fmaller fcale in the proportion required.
4. To reduce a map, defign, or figure, by fquares. Divide the original into little fquares, and divide a frefh paper of the dimenfions required into the fame number of fquares, which are to be larger or lefs than the former, as the map is to be enlarged or diminifhed. This done in every fquare of the fecond figure, draw what you find in its correfpondent one in the firlt.
Reduction, in metallurgy, is the bringing back metalline fubftances which have been changed into fcorix or afhes, or otherwife divefted of their metallic form, into their natural and original fate of metals again. See Metallurgy, pafim; and Chemistry, ${ }^{\circ}{ }^{1} 140$. , 320.

Reduction, in furgery, denotes an operation whereby a diflocated, luxated, or fractured bone, is reftored to its former ftate or place.

REDUNDANCY, a fault in difcourfe, confifting in the cfe of a fuperfluity of words. Words perfect. ly fynonymous are redundant, and ought to be retrenched.
REDUNDANT, in mufic. What the French call w?e accord fuperflue, which we have tranflated a redunusist chord in the article Music (from D'Alembert), has by others been rendered a chord extremely harp, as in the tranlation of Ramean's Principles of Compofition. Their nature will be beft underfood by a few examples, and an account of the number of tones, femitones, or lefier intervals, contained in each.

The fecond redundant is compofed of a major tone, and a minor femitone; as from fa to fol hatp. Its propertion is as 64 to 75 .

The third redindant confifts of two tones and a femitone, as $f a$, la, fuarp. Its proportion is as 96 to $12 \%$. The fourth redundant is the fame with the tritone.
From thefe examples compared with the fame intervals in their natural fate, the reader may form a general idea of what is meant by redundant.

REE, Reis, or Res, a little Portuguefe coin. See Monkr-Table.
Reed, in botany. See Arundo and Bamboo.
There are two forts of reeds, fays Haffelquift, growing near the Nile. One of them has farce any branches; but is furnifhed with numerous leaves, which are narrow, fmooth, channelled on the upper furface; and the plant is about it feet high. The Egyptians make ropes of the leaves. They lay them in water like hemp, and then make them into good ftrong cables. Thefe, with the bark of the date-tree, form almof the only cable ufed in the Nile. The other fort is of great confequence. It is a fmall reed, about two or three feet high, full branched, with fhort, fharp, lancet-fhaped leaves. The roots, which are as thick as the fem, creep and mat themelves together to a confiderable diflance. This plant feems ufelefs in common life : but to it, continues the learned author, is the very foil of Egypt owing: for the matted roots have ftopped the earth which floated in the waters, and thus formed, out of the fea, a country that is habitable.

Fire-Reeds. See FIRe-Ship.
Remb, a term in the weft of England for the ftraw ufed by thatchers, which is wheat flaw finely combed, confifing of fiff, unbruifed, and unbroken ftalks of great length, carefully feparated from the fraw ufed tor fodder by the threfher, and bound in fheaves or nitches, each of which weighs 28 lb . and are fold from 21 s. to $3^{1}$ s. per hundred nitches, according to the feafon. This is a great improvement in the art of thatching, as it gives a finifh to the work which cannot be attained by Atraw, rough and tumbled together, without any feparation of the long and fhort: it alro is a readier mode of working.

REEF, a term in navigation. When there is a great gale of wind, they commonly roll up part of the fail below, that by this means it may become the narrower, and not draw fo much wind; which contracting or taking up the fail they call a reef, or reefing the fail: fo alfo when a top-madf is fprung, as they call it, that is, when it is cracked, or almof broken in the cap, they cut off the lower piece that was near broken off, and fetting the other part, now much fhorter, in the ftep again, they call it a leefed top-maf.

REEL, in the manufactories, a machine ferving for the office of reeling. There are various kinds of reels; fome very fimple, others very complex.

REELING, in the manufactories, the winding of filk, cotton, or the like, into a fkain, or upon a button, to prevent its entangling. It is alfo ufed for the charging or difcharging of bobbins, or quills, to ufe them in the manufacture of different ftuffs, as thread, filk, cotton, \&c. Reeling is performed in difierent ways, and on different engines.

REEVING, in the fea-language, the putting a rope through a block : hence to pull a rope out of a block is called unreeving.

RE-EXCHANGE, in commerce, a fecond payment of the price of exchange, or rather the price of

## R E F

Refection a new exchange due upona bill of exchange that comes Refiniag. to be protelted, and to be refunded the bearer by the drawer or indorfer.

REFECTION, among ecclefiaftics, a fpare meal or repait, juft fufficing for the fupport of life: hence the hall in convents, and other communities, where the monks, nuns, \&c. take their refections or meals in common, is called the refectory.

REFERENCE, in writing, \&c. a mark relative to another fimilar one in the margin, or at the bottom of the page, where fomething omitted in the text is added, and which is to be inferted either in reading or copying.

REFINING, in general, is the art of purifying a thing ; including not only the eflaying or refining of metals, but likewife the depuration or clarification of liquors. See Metallurgy, Part II. Clarification; and Pharmacy.

Gold and filver may be refined by feveral methods, which are all founded on the efiential properties of thefe metals, and acquire different names according to their kinds. Thus, for infance, gold having the property which no other metal, not even filver, has of refifing the action of fulphur, of antimony, of nitrous acid, of marine acid, may be purified by thefe agents from all other metallic fubftances, and confequently may be refined. Thefe operations are diftinguifhed by proper names, as purification of gold by an:imony, parting, concen*See Fart- trated parting, dry parling *. In a fimilar manner, as ing. filver has the property, which the imperfect metals
have not, of refifting the action of nitre, it may be refined by this falt: but the term refining is chiefly applied to the purification of gold and filver by lead in the cupel.

This is performed by the deffuction, vitrification, and fcorification, of all the extraneous and deftructible metallic fubltances with which they are allayed.

As none but the perfect metals can refift the combined action of air and fire, without lofing their inHammable principle, and being changed into earthy or vitreous matters, incapable of remaining any longer united with fubitances in a metallic flate, there is then a poffibility of purifying gold and filver from all allay of imperfect metals merely by the action of fire and air ; only by keeping them fufed till all the allay be deftroyed : but this purification would be very expenfive, from the great confumption of fuel, and would be exceedingly tedious. Silver allayed with copper has been expofed longer than 60 hours to a glafs-houfe fire without being perfectly refined: the reafon of which is, that when a fmall quantity only of imperfect metal remains united with gold or filver, it is covered and protected from the action of the air, which is neceflary for the combuftion of the imperfect metals, as of all combuftible matters.

This refining of gold and filver merely by the action of fire, which was the only method anciently known, was very long, difficult, expenfive, and imperfect; but a much fhorter and more advantageous method has been difcovered. This method confills in adding to the al. layed gold and filver a certain quantity of lead, and in expofing afterwards this mixture to the action of the fire. Lead is one of the metals which lofes moft quickly and eafily a fufficient quantity of its infammable principle to ceafe to be in a metallic ftate; but, at the
fame tinc, this metal has the remarkable property of Refaing. retaining, notwithftanding the action of the fire, enough of this fame inflammable principle to be very eatily melted into a vitrefied and powerfilly vitrifying maticr, called litharge.

The lead then which is to be added to the geld and filver to be refined, or which happens naturally to be mixed with thefe metals, produces in their refining the following asvantages: 1 . By increafing the propetmon of imperfect metals, it prevents them from being io well covered and protected by the perfect matals.2. By uniting with thefe imperfect metals, it commannicates to them a property it has of lofing very eafily a great part of its inflammable principle. 3 By its vitrifying and fufing property which it excrcifes with all its force upon the calcined and naturally refrasiory pares of the other metals, it facilitates and accelerates the fufion, the forification, and the feparation of thefe me. tals. Thefe are the advantages procured by lead in the refining of gold and filver,

The lead, which in this operation is feorified, and forifies along with it the impaffec metals, feparates from the metallic mafs, with which it is then incapable of remaining united. It floats upon the furface of the melted mats ; becaufe, by lofing part of its phlonil. ton, it lofes alfo part of its fpecific gravity, and laty it virrifies.

Thefe vitrified and melted matters accumuliting more and more upon the furface of the metal while the operation advances, would proted this furface from the contact of air which is fo abfolutely necchaty for the fenification of the reft, and would thus ttep the progrefs of the operation, which could never be finifhed, it a method had not been contrived for their removal. This removal of the vitrified matter is procured either by the nature of the velfel in which the melted matter is contained, and which being porous, abforbs and imbibe; the fcorified matter as falt as it is formed, or by a channel cut in the edge of the veffel through which the matter flows out.

The veffel in which the refining is performed is fat and fhallow, that the matter which it contains may prefent to the air the greatelt furface poffible. This form refembles that of a cup, and hence it has been called cim pel. The furnace ought to be vaulted, that the heat may be applied upon the furface of the metal during the whole time of the operation. Upon this furface a crult of dark-coloured pellicle is continually forming. In the inftant when all the imperfect metal is deftroycd, and confequently the fcorification ceafes, the furface of the perfect metals is feen, and appears clean and bri] liant. Thes forms a kind of fulguration or coruf. cation. By this mark the metal is known to be refined. If the operation be fo conducted that the metal firf tains only the precife degree of heat neccifary to keep it fufed before it be perfectly refined, we m:cy obferve that it fixes or becomes folid all at once in the very inftant of the corufcation; becaufe a greater heat is re quired to keep filver or gold in fufion when they are pure than when allayed with lead,

The operation of refining may be performed in fmall or in large quantities, upon the fame principles, but only with fome differences in the manasement. As the refining of rmall quantitie of perfcet metals is perfom ed in the fame manner as thefe metals are eflaject, the

Reflestion effay being only a very accurate refining, we refer to the article EssAr of the Value of Silver.

Large quantities of filver are thus purified, after the operations by which that metal is obtained from its ores. This filver, being always much allayed, is to be mixed with a fufficient quantity of lead to complete its purification, unlefs lead has b-en added in its firlt fufion from the ore, or unled, it has been extracted from an ore which alfo contains lead; in which latter cafe, it is allayed naturally with a fufficient quantity, or more than fufficient, for the refining of it.

REFLECTION, the return or progreflive motion of a moving body, occafioned by fome obftacle which hindered it from purfuing its former direction.

Circulsr Ingrument of Reflection an intrument for meafuring angles to a very great degree of accuracy. It was invented by the celebrated altronomer Mr Tobias Mayer of Gottingen, principally with a view to do away the errors of the divifions of the limb; and has fince been much improved by the Chevalier de Borda, and M. J. H. de Magelları. This inttrument is particularly applicable to the meafuring of the diftances of the heavenly bodies, and was ufed by the French in their part of the operation for determining the difference of meridians of Paris and Greenwich. For the defcription, rectification, and ufe of this inftrument, fee the aricle Navigation, and Mackay on the Longitude, rol. i. p. 44 .

Refifction of the Rays of Light, in catoptrics, is theic return, after approaching to near the furface of bodiss as to be thereby repelled or driven backwards. For the canfes of reflection, fee Oprics, Index at Rays of Lighi and Reflection of Light, \&c. For the application of the doctrine of reflection to mirrors, fee Oftics, p. 347 --349. See alfo Mirror, BurningGlafes, and Glafs-Grinding ; and for the coating or foliating of mirrors, fee the article Foliating of Lookingshafs, \&c. See allo Telescope.

Reflection is alfo ufed, figuratively, for an operation of the mind, whereby it turns its view backwards as it were upon itfelf, and makes itfelf and its own operations the object of its difquifition; and by contemplating the manner, order, and laws, which it obferves in perceiving ideas; comparing them together, reafoning, \&c. it frames new ideas of the relations difcovered therein. See Metaphysics.

REFLEX, in painting, means thofe places in a picture which are fuppofed to be illuminated by light reflected from fome other body in the fame piece. See Painting, Part I. fect. 2. and 5 .

REFLUX, the backward courfe of water, has the famemeaning as the ebbing of the fea, and is oppofed to flood, flux, or the flowing of the fea. See Tides.

REFORM means a change from worfe to better, a re-eftablifhment or revival of former neglected difcipline, or a correction of abufes tharein. The term is much ufed in a monaftic fenfe for the reducing an order or congregation of religious to the ancient feverity of the rule from which it had gradually fiverved, or even for improving on the ancient rule and inftitution itfelf, and voluntarily making it more fevere. In this fenfe the order of Si Bernard is faid to be only a reform of that of St Benediet. In this country it is applied both to politics and religion, and may innocently be applied to any endeavours to change an eltablifhmentfrom worfe
to better. But it appears at prefent to have been Reform. chiefly made a pretence for defigns which could not fairly or fafely be av̀owed.

A reform in religion and in parliament ( See Parliament ) has, in England been alleged to be moft loudly called for by men whofe religious notions are immenfely different from what has been generally reckoned Chriftianity, and whofe defigns, as has been fuggeited, went to the overthrow of all civil order. For inlidious purpofes like thefe, the word reform is a good cloak, efpecially if any thing can be fixed upon, either in the religion or government of the ftate, which, with the help of exaggeration and diftortion, can be reprefented to the weak and unthinking as extremely defective and erroneous.

The general error of thefe men is faid to be, that having picked up a fot of fpeculative notions which flatter their own pride and the pride of thofe who liften to them, they will allow nothing to the arguments of their opponents or the experience of mankind. They think fo often and fo much upon their ideal reforms, that while they imagine their notions are liberal and extenfive, they become contracted beyond imagination ; while their judgments, of courfe, are warped with the molt inveterate prejudices (fee Prejudice.) They fee, or think they fee, the propriety of their fchemes; but it is faid they feldom, perhaps never reflect, that that may be true in fpeculation or in theory which cannot poffibly be redu. ced to practice. They will not take the world as it is, and allow it to profit by the wifdom and experience of ages; but they will reform it according to thofe ideas of right which they have learned from their own fpeculations and airy theories; feldom confidering what may be done, they are determined to do what they think ought to be done. Liberty of confcience, and liberty of action, have been claimed by them as the unalienable rights of man; and fo we ourfelves are difpofed to think them: and it has been urged that in this country they have not been denied to any man, or fet of men, fo far as has been thought confiftent with the fafety of the fate, and that of the other individuals who compofe it. At the fame time, the very fame men hefitate not to blame, with acrimony the moft violent, and to the utmoft of their power to reltrain, the actions and opinions of thofe who with equal conviction, often on different grounds, and generally with much modefty, differ from them.

Amidft that exceffive ardour, too, with which they propagate their opinions, they forget the extreme danger of withdrawing the attention of that part of the community, who mult earn their bread by the fweat of their brow, from their proper occupations, to the tempeftuous fea of political debate, for which their education and mode of life cannot poffibly have qualified them. It requires but very little penetration, however, to be able to fee, that it can be of no real fervice either to the individuals themfelves, or to the community at large, in whatever light we look upon it. Indeed, to make thofe the judges of the law, and the reformers of the legillature, who have all their lives been employed in manual labour, is the extreme of folly; and yet it is what fome men of confiderable abilities, have judged highly proper and have more than once attempted. The effect of fuch a mode of feduction (if it deferves that name), when it fhall become general, inftead of ferving the purpofes of a real reform, mult be to annihilate all civil order. Diffa-

## R E F $\quad[39]$

## R E F

Rcform, tisfaction is the molt powerful check to honeft indultry; Reformation. and diffatistaction and idlenefs mult be the effect of the wanderings of fuch men in the labyrinths of politics;
which, for uncultivated minds efpecially, paves the way for every fpacies of vice, and gradually ripens them for any wickednefs, however atrocious. For the truth of thefe remarks, appeals are made to the hiltory of mankind from the Creation to the prefent time: however, the foler friends of reform, and many fuch, we doubt not, there are, will undoubtedly reflect, that in the prefent day we have as much to fear from licentioufnefs as from defpotifm : from reform carried to an extreme as much as from the pretended attempts of magiftrates to annihilate real liberty (See Revolution).

It may alfo be worth their while to confider, that times of public danger are not generally the belt adapted to attempt changes of government; becaufe what might fatisfy one party would probably be thought too little bs another, and divifions at fuch a period are molt dangerous. When, therefore, attempts are made for reform which appear to be inconfinent with the fafety of the ftate, reltrictions mult be uled, which may by fpeculative men be thought fevere and unnecelfary, but of which they themfelves are the caufes. Thefe reftrictions too will be patiently fubmitted to by the wifer part of the community, when in more peaceabic times they would neither have been thought of nor allowed.

Speculative reafoners may feeak as much as they will of enlightening the minds of men, and of reforming government by the dictates of a refined and difpaffionate philofophy; but when they come to apply their notions to practice, they will either find their reprefentations little better than empty founds, and thetefore ineffectual ; or, as is more generally found to be the cafe, thole fchemes which in theory appeared to be perfect, will in practice, when combined with the malignant and ambitious paffions of men, lead to ruin and diforder. The firft inftitution of government, except among the Jews, was unqueftionably the effect of paffion and interett combined; and this paffion and this interelt, reftrained within due bounds, is productive of much happinefs. That government, we believe, too, will be beft fupported and moft productive of happinef, in which the mutual paffions and interefts of the individ,als who compofe it are fo equally poifed as to fupport one another, and to promote each the ends and fuccefs of the other: and this by the ableft reafoners and the beft men has been thought to be the cafe with the Britifh conftitution. If the modern favourers of reform thould think this an untable fupport, if they will confider the world as it ever has been, and as it is, they will find it the only one we have, except religion; and they will thence be inclined to make the beft of it. If, after all, however, they fhould be difpofed to doubt the pofition, we have only further to requeft them, with the fincerity of men and of Chriftians, to confult their own breafts, and feriounty to confider the probable motives of thofe who act with them. They will then perhaps fee, and they furely ought to acknowledge, that few men have acted more according to the impulfe of paffion, intereft, and ambition, than thofe who have for fome time palt founded the toczin of reform.

REFORMATION, in general, an aft of reforming or correcting an error or abufe in religion, difci-
pline, or the like. By way of eminence the word is ufed for that great alteration and reformation in the corrupted fyftem of Chriltianity, begun by Luther in the year $15^{17}$.

Under the article History (fect. ii.), the various corruptions in religion, the oppreffions and ufurpations of the clergy, and the extreme infolence of the popes, havebeen fo fully treated of, that any further detail hore is unneceffary. It is fufficient to obferve, that, be- The pu fore the period of the Reformation, the Pope had in afiumesthe the moft audacious mannerdeclaredhimfelf the fovereign difpotai of of the whole world. All the parts of it which were inhabited by thofe who were not Chrifians, he accounted to be inhabited by no-body; and if Chriftians took it into their heads to poffefs any of thofe countries, he gave them full liberty to make war upon the inhabitants without any provocation, and to treat them with no more humanity than they would have treated wild bealts. The countries, if conquered, were to be parcelled out according to the pope's pieafure ; and dreadful was the fituation of that prince who refufed to obey the will of the holy pontiff, of which many inftances will occur to the reader in the various hiftorical article; of this work. In confequence of this extraordinary authority which the pope had affumed, he at laft granted to the king of Portugal all the countries to the ealtward of Cape Non in Africa, and to the king of Spain all the countries to the weftward of it. In this, according to the opinions of fome, was completed in his perfon the character of Antichrift fitting in the temple of God, and fuewing bimfolf as God*. He had long before, * 2 Therf. fay they, affumed the fupremacy belonging to the Dei-ii. 4. ty himfelf in fpiritual matters ; and now he affumed the fame fupremacy in wordly matters alfo, giving the extreme regions of the earth to whom he pleafed. The Reformation, therefore, they conlider as the immediate effect of divine power taking vengeance on this and all other deviations from the fyitem of tru'h; while others confider it merely as an effect of natural caufes, and which might have been forefeen and prevented, without abridging the papal power in any confiderable degree.

Be this as it will, however, the abovementioned partition was the laft piece of infolence which the pope ever had, or in all probability ever will have, in his power to exercife, in the way of parcelling out the globe to his adherents. Every thing was quiet, every heretic exterminated, and the whole Chriftian world fupinely acquiefced in the enormous abfurdities which were inculcated upon them; when, in 1517 , the empire of fuperftition began to decline, and has continued to do fo ever fince. The perfon who made the firlt attack on the Refurmaextravagant fuperfitions then prevailing was Martin tion begun Luther; the occafion of which is fully related under by Lutacr. the article Luther. By fome it is pretended, that the only motive which Luther had in begiming the Reformation was his enmity to the Dominican friars, who had excluded his order (the Auguitins) fiom all fhare in the gainful traffic of indulgences. But this does not feem at all probable, if we confider that fuch a motive would not naturally have led him to deny the virtue of indulgences, as fuch conduct could not but exclude him for ever from any chance of a fhare in the traffic, which otherwife perhaps he might have obtaired. Befides, the extreme contrariety of this traffic to the common principles of reafon and honefty was fo great, that we

K form:- cannet wonder at fading one man in the world who had tion.

5 InSwitzerhand ty Zatightus. ny, but was not long confmed either to that city or province. In 1520 the Francifcan friars, who had the care of promulgating indulgences in Switzerland, were oppofed by Zuinglius, a man not inferior in undertanding and knowledge to Luther himfelf. He procceded with the greateft rigour, even at the very beginninc, to overturn the whole fabric of Popery ; but his opinions were declared erroneous by the univerfities of Cologne and Louvain. Notwithatanding this, the magitrates of Zurich approved of his proceedings; and that whole canton, together with thofe of Bern, Bafil, and Chaffoufen, embraced his opinions.

In Germany, Luther continued to make great advances, without being in the lealt intimidated by the ecclefialtical cenfures which were thundered againtt him from all quarters, he being continually protected by the German princes either from religious or political motives, fo that his adverfaries could not accomplifh his deftruction as they had done that of others. The princes, who were upon bad terms with the court of Rome, tock advantage of the fuccefs of the new doctrines; and in their own dominions eafily overturned a church which had loft all the refpect and veneration of the inferior ranks. The court of Rome had difobliged fome of the fimaller princes in the north of Germany, whom the Pope probab'y thought too infignificant to be worth the managing, and they univerfally eftablifhed the Reformation in their own dominions. Melancthon, Carloltadius, and other men of eminence, alfo greatly forwarded the work of Luther; and in all probability the Popilh hierarchy would have foon come to an end, in

4 Onpofed in the northern parts of Europe at lealt, had not the emGurnany peror Charles V. given a fevere check to the progrefs by char. $V$ of reformation in Germany. In order to follow out the fchemes dictated by his ambition, he thought it necerfary to ingratiate himfelf with the pope; and the moft effectual method of doing this was by deltroying Luther. The Pope's legates infifted that Luther ought to be condemned by the diet of Worms without either trial or hearing; as being a moft notorious, avowed, and incortigible heretic. However, this appeared unjult to the members of the diet, and he was fummoned to appear ; which he accordingly did without hefitation*. 'There is not the lealt doubt that his appearance there had been his $1:$ it in this world, hat not the aftonifhing refpect that was paid him, and the crowds who came daily to fee him, deterred his judges from delivering the church from the author of fuch a peftilent herefy; which they were ftrongly folicited by the pope's party to do. He wis therefore permitted to depart with a fafe conduct for a certain time; after which he was in the ftate' of a profcribed criminal, to whom it was unlawful to perform any of the offices of humanity.

During the confinement of Luther in a caftle near

Warburg, the Rcformation advanced rapidiy; almolt Reformaevery city in Saxony embracing the Lutheran opinions. At this time an alteration in the eftablifhed forms of $\qquad$ worihip was firft ventured upon at Wittemberg, by abo- Form of lifhing the celebration of private mafies, and by giving worftip the cup as well as'the bread to the laity in the Lord's ed in Witfupper. In a fhort time, however, the new opinions were tembergcondemned by the univerfity of Paris, and a refutation of them was attempted by Henry VIII. of England. But Luther was not to be thus intimidated. He publifhed his animadverfions on both with as much acrimony as if he had been refuting the meanett adverfary ; and a controverfy managed by fuch illuftrious antagonits drew a general attention, and the Reformers daily gained new converts both in France and England.

6
But while the efforts of Luther were thus everywhere Difputes crowned with fuccefs, the divifions began to prevail among the which have fince fo much agitated the reformed church- Reformers. es. The firf difpute was between Luther and Zuinglius concerning the manner in which the body and blood of Chrift were prefent in the eucharift. Luther and his followers, though they had rejected the notion of tranfubftantiation, were neverthelefs of opinion that the body and blood of Chrift were really prefent in the Lord's fupper, in a way which they could not pretend to explain. Carloftadt, who was Luther's colleague, firt fuggelted another view of the fubject, which was afterwards confirmed andillultrated by Zuinglius, namely, that the body and blood of Chrift were not really prefent in the eucharift; and that the bread and wine were no more than external fymbols to excite the remembrance of Chrif's fufferings in the minds of thofe who received it. Both parties maintained their tenets with the utmoft obftinacy; and, by their divifions, firft gave their adverfaries an argument againt them, which to this day the Catholics urge with great force; namely, that the Proteftants are fo divided, that it is impoffible to know who is right or wrong; and that there cannot be a fronger proof than thefe divifions, that the whole doctrine is falfe.
To thefe inteftine divifions were added the horrors Difturtanof a civil war, occafioned by oppreffion on the one hand, ces in Gcrand enthufiafm on the other. In 1525 , a great num. many. ber of fediticus fanatics arofe on a fudden in different parts of Germany, took arms, united their forces, and made war againft the empire, laying wafte the country with fire and fword, and committing everywhere the greatelt cruelties. The greateft part of this furious mob was compofed of peafants and vaffals, whogroaned under heavy burdens, and declared that they were no longer able to bear the defpotic government of their chiefs ; and hence this fedition had the name of the ruftic war, or the war of the peafants. At firft this rabble declared, that they had no other motives than the redrefs of their grievances; but no fooner had the enthufiaf Munzer, or Munfter, the anabaptif, put himfelf at their head, than the face of things was entirely changed, and the civil commotions in Saxony and Thuringia exceedingly increafed, of which an account is given under the article Anabaptists.

In the mean time Frederic, furnamed the Wife, elector of Saxony, and Luther's great patron, departed this life, and was fucceeded by his brother John. Frederic; though he had protected and encouraged Luther, yet was at no pains to introduce the reformed religion into

## $\mathrm{REF} \quad[4 \mathrm{I}] \quad \mathrm{REF}$

Reforma- his deminions. But with his fucceflor it was othervife; tion.

Reformation eftablifhed in Saxony. for he, convinced that Luther's doctrine mult foon le totally deftrojed and fuppreffed unlefs it received a fpesdy and effecual fapport, ordered Luther and IMclan:thon to draw up a body of laws relating to the form of ecclefatical gevernment, the method of public worthir, \&c. which was to be proclaimed by heralds throughour his dominions. This example was fullowed by all the princes and ftates of Germany who renounced the papal fupremacy ; and a like form of wormip, difcipline, and government, was thus introduced into all the churches which differited from that of Rome. This open renunciation of the Romifh juriftiction foon changed the face of afiars: and the patrons of Popery foon intimated, in a manrier not at all ambigureus, that they intended to make war on the Lutheran party; which would certainly have been put in execution, had not the troubles that took place in Europe difoncerted their meafures. On the other hand, the Lutherans, apprifed of thefe hoftile intewions, began alfo to deliberate on a proper plan of defence againft that fuperftitious violence with which they were in danger of being afliuled. The diet of the empire affembled at Spire, in the year 1526; where the emperor's ambaffadors were defired to ufe arir utmol endeavours to fupprefs all difputes about religion, and to infit upon the rigorous execution of the fentence which had been pronounced againft Luther and his followers at Worms. The greatelt part of the German princes oppofed this motion with the utmoft refolution, declaring that they could not execute that fentence, nor come to any determination with regard to the doctrines by which it had been occafiored, before the whole matter was fubmitted to the decifion of a council lawfully affembled; alleging farther, that the decifion of controverfies of this nature belonged properly to it, and to it alone. This opinion, afterlong and very warm debates, was adopted by a great majority, and at length confented to by the whole affembly: for it was unanimouly agreed to prefent a folemn addrefs to the emperor, intreating him to afemble, without delay, a free and general council; whle in the mean time it was alfo agreed, that the princes of the empire fhould, in their refpective dominions, be at liberty to manage ecelefiaftical affairs in the manner they hould think moft proper ; yet fo as to be able to give to God and the emperor a proper account of their adminiltration when it thould be required of them.

Thefe refolutions proved extremely favourable to the caufe of reformation; neither had the emperor any leifure for fome time to give difturbance to the reformed. The war, which at this time enfued between him and the pope, gave the greatelt advantage to the friends of the reformed, and confiderably augmented their number. Several princes, whom the fear of perfecution and punifhment had hitherto prevented from lending their alliftance, publicly remounced the Romilh fupertition, and introduced among their fubjects the fame forms of religious worlhip, and the fame fyftem of doct:ine, that had been received in Saxony. Others, though placed in fuch circumitances as difcouraged them from acting in an open manwer againft the interelts of the Roman pontiff, were, however, far from difcovering the fmalleft oppofition to thofe who withdrew the people from his defpotic yoke; nor did they moleft the private affemblies of thofe who had feparated themfelves from the
church of Roms. And in gerceal, all the Gemmais R formawho, before thefe rahlutions of the diet of Spina, had rojected the papal difeipline and dochine, were row, in confequence of the liberty they enjoyed, wholj employ. ed in bringing their fchemes and patas to a certain degree of confifence, and in adding vigour and fimren to the caufe in which they were engaged. But this tranquility and liberty was of no long duration. Ia 1529, a new diet was affembled at the fame place by the emperor, after he had quiuted the troubles in varicus parts of his dominions, and concluded a peace w th the prpe. The power which had been granted to prip- Revokid iy ces of managing ecclefiaftical afeirs till the meeting of the eape. a gencral council, was now revoked by a majority of ror, votes; and every change declared unlawful that fhould be introduced into the doctrine, difcipline, or worthip of the eftablifhed religion, lefore the determination of the approaching council was known. This decree was confidered as iniquitous and intolerable by the clecor of Saxony, the landgrave of Hefe, and other members of the diat, who were periuaded of the necellity of a reformation. The promife of feedily affemtling a general courcil, they looked upon to be an artifice of tive church of Rome; well knowing, that a free and lawful council would be the laft thing to which the pope would confent. When, therefore, mey found that all their arguments and remonitrances made no impreffion upon Ferdinand the emperor's brother, who prelided in the diet, Charles himfelf being then at Barcelona, they entered a fulemn proteft againft this decree on the 19 th of April, and appealed to the emperor and a future council. Hence arofe the denomination of Protelants, Origin of which from this period has been given to hhofe who fe- the name parate from the communion of the church of Rome. l'rotelants The princes of the empire who entered this proteft were, John elettor of Saxiony ; George elector of Brandenburg; Ernelt and Francis dukes of Lanenburgh; the landgrave of Hefle; and the prince of Anhalt. Thefe were feconded by 13 imperial towns, viz. Strafburg, Ulm, Nuremberg, Confance, Rottingen, Wind. feim, Memingen, Nortingen, Lindaw, Kempton, Heilbron, Wiffemburg ; and St Gall.

The diffenting princes, who were the protectors and heads of the reformed churches, had no fooner entered their proteft, than they fent proper peifons to the emperor, who was then upon his paffage from Spain to Italy, to acquaint him with their proceedings in this matter. The minifters employed in this commiffion executed it with the greateft intrepidity and prefence of mind ; but the emperor, exafperated at the audacity of thofe who prefumed to differ from him, caufed the ambaffadors to be arrefted. The news of this violent fep made the Proteltant princes conclude, that their perfonal fafety, and the fuccefs of their caufe, depended entiely upon their own courage and union. They determined, therefore, to enter into a folemn confederacy : for which purpole they held feveral meetings at Rot, Nuremberg, Smalcald, and other places : but fo different were their opinions and views, that they could determine upon nothing.

One great obltacle to the intended confederacy was 12 the difnute which had arifen between Luther and 'Zuin Conference glius concerning the real prefence of Chrift in the Luther and Lord's Supper. To terminate this difpute, if pollible, Zuinglius, Philip, landgrave of $\mathrm{He} f \mathrm{fe}$, invited, in the year 1529, to

## R E F $\quad[42\rceil$ R E F

R.forma- a conference at Marpurg, Luther and Zuinglius, togetion. ther with feveral other of the more eminent doctors who adhered to the refpective parties of thefe contending chiefs : but this meafure was not attended with the falutary effects which were expected from it. The divines difputed for four days in prefence of the landgrave. Luther attacked Oecolampadius, and Zuinglius was attacked by Melarcthon. Zuinglius was accufed of leerefy, not only on account of his explanation of the nature and detign of the Lord's Supper, but alfo in confequence of the falfe notions he was fuppofed to have adopted concerning the divinity of Chrift, the efficacy of the divine word, original fin, and fome other paris of the Chritian doctrine. This illutrious reformer, however, cleared bimfelf from the greatelt part of thefe charges with the molt triumphant evidence, and in fuch a manner as appeared fatistactory even to Luther himfelf: but their diffenfion concernins the manner of Chrilt's prefence in the eucharilt itill remained; nor could either of the contending parties be perfuaded to abandon, or even to modify, their opinions on that matter. The only advantage, theretore, which refulied from the meeting was, that the jarring doctors formed a kind of trine, by agreeing to a mutual toleration of their fentiments, and leaving to the diffofal of Providence the cure ot their divifions.

In the mean time news were received that the emperor defigned to come into Germany, with a view to terminate all religious differences at the approaching diet of Augburg. Having forefeen fome of the confequences of thofe difputes, and, befides, taken the advice of men of wifdom, fagacity, and experience, he became at certain times more cool in his proceedings, and more impartial in his opinions both of the contending parties and the merits of the caufe. He , therefore, in an interview with the pope at Bologna, infilted, in the moft ferious and urgent manner on the neceffity of a general council. His remonftrances and expoftulations, however, could not move the pontiff; who maintained with zeal the papal prerogatives, reproached the emperor with an ill-judged clemency, and alleged that it was the duty of that prince to fupport the church, and to execute fpeedy vengeance upon that obitinate heretical faction who dared to call in queftion the authority of Rome and its pontiff. To this difcourfe the empernr paid no regard; looking upon it as a moft iniquitous thing, and a meafure directly oppofite to the laws of the empire, to condemn unbeard a fet of men who had always approved themfelves good citizens, and deferved well of their country in feveral refpects. Hitherto indeed it was not eafy for the emperor to form a clear idea of the matters in debate, fince there was no regular fyftem as yet compofed, by which it might be known with certainiy what were the true caufes of Luther's oppofition to the pope. The elector of Saxony, therefore, ordered Luther, and other eminent divines, to commit to writing the chief articles of their religious fyltem, and the principal points in which they differed from the church of Rome. Luther, in compliance with this order, delivered to the elector at Torgaw in articles which had been agrecd upon in a conference at Sultzbach in 1529; from whence thefe received the name of the art:cles of Targaz. But though thele were deemed by Luther a fufficient declaration of the fentiments of the refurmers, yet it was judged proper to en-
large them, in order to give perfpicuity to their argu. Reformaments, and itrength to their caufe. In this w rkM: lancthon was employed; in which he fhowed a proper deference to the councils of Luther, and expreffed his fentiments and doctrine with the greateft elegance and perfpicuity; and thus came forth to view the famous Confsfion of Augsburg.

On the 15 th of June 1530, Charles arrived at Augeburg, and the diet was opened five days after. The Proteltants received a formal permiffion to prefent an account of their tenets to the diet on the 25 th of the fame month ; in confequence of which, at the time appointed, Chriftian Bayer, chancellor of Saxony, read, in the German language, before the emperor and the princes. affembled, the confeffion of Augfburg abovementioned. It contained 28 chapters, of which 21 were employed in reprefenting the religious opinions of the Proteltants, and the other feven in pointing out the errors and fuperftitions of the church of Rome. The princes heard it with the deepeft attertion and recollec. tion of mind: it confirmed fome in the principles they had embraced; furprifed others; and many, who before this time had little or no idea of the religious fentiments of Luther, were now not only convinced of their innocence, but delighted with their purity and fimplicity. The copies of this Confeffion, which after It is pre being read were delivered to the ewperor, were figned fented to by John elector of Saxony, George marquis of Branv the empedenburg, Erneft duke of Lunenburg, Philip landgrave ror, of Heffe, Wolfgang prince of Anhalt, and by the Imperial cities of Nuremberg and Reutlingen.

The creatures of the church of Rome who were pre- A refutafent at this diet employed John Faber, afterwards bifiop tion of it, of Vienna, together with Eckius, and another doctor in which named Cockleus, to draw up a refutation of the Proteftant confeflion : which refutation having been publicly read, the emperor required the Proteftant members to acquiefce in it, and put an end to the religious difputes by an unlimited fubmiffion to the opinions and doctrines contained in this anfwrer. But this demand was far from being complied with. The Proteftants declared on the contrary, that they were by no means fatisfied with the reply of their adverfaries; and earneftly defired a copy of it, that they might more fully demonftrate its extreme infufficiency and weaknefs. But this reafonable requeft was refufed by the emperor ; who interpofed his fupreme authoriiy to prevent any farther proceedings in this matter, and folemnly prohibited the publication of any mew writings or declarations that might contribute to lengthen out thefe religious debates. This, however, did not reduce the Proteftants to filence. The divines of that communion, who had been prefent at the diet, endeavoured to recollect the arguments and objections employed by Faber, and had again recourfe to the pen of Melancthon, who refuted them in an ample and fatisfactory manner in a piece which was prefented to the emperor on the 22 d of September, but which Charles refufed to receive. This anfwer was afterwards enlarged by Melancthon, when he had obtained a copy of Faber's reply; and was publifhed in the year 153 I , with the o:her pieces that related to the doctrine and difcipline of the Lutheran chuich, under the title of $A$ Defence of the Confeflion of Augsburg.

Matters now began to draw towards a crifis. There were only three ways of bringing to a conclufion thefe religious.

## R E F [ 43$]$ R E F

Heforma- religious differences. I. To grant the proteftants a tion. $\rightarrow$ - Severe de-perial edicts, and the force of the fecular arm. On the
cref againt 1 gth of November, a fevere decree was iffued out by the Protefrants. 1gth of November, a fevere decree was iffued out by the exprefs order of the emperor (during the abfence of the Heffian and Saxon princes, who were the chief toleration and privilege of ferving God as they thought proper: 2. To compel them to return to the church of Rome by the violent methods of perfecution: or, 3. That a reconciliation hould be made, upon fair, candid, and equitable terms, by engaging each of the parties to temper their zeal with moderation, to abate reciprocally the rigour of their pretenfions, and remit fomething of their refpective claims. The third expedient was moft generally approved of, being pecu'iarly agrecable to all who had at heart the welfare of the enmpire; nor did the pope feem to look upon it either with avertien or contempt. Various conferences therefore were held between perfons eminent for piety and learting on both fides; and nothing was omitted that might have the leaft tendency to calm the animofities and heal the divitions which reigned between the contending parties. But the differences were too great to admit of a reconciliation; and therefore the votariss of Rome had recourfe to the powerful arguments of imfupporters of the proteftant caufe), in which every thing was manifefty adapted to deject the friends of religious liberty, excepting only a faint and dubious promife of engaging the pope to affemble a general council about fix months after the feparation of the diet. In this decree the dignity and excellence of the Popilh religion were extolled beyond meafure, a new degree of feverity and force was added to that which had been publifhed at Worms againt Luther and his adherents, the changes which had been introduced into the doctrine and difcipline of the Proteltant churches were feverely cenfured, and a folemnorder wasaddrefied to the princes, cities, and ftates, who had thrown off the Papal yoke, to return to their allegiance to Rome, en pain of incurring the indig. nation and vengeance of the emperor as the patron and protector of the church. Of this formidable decree the elector of Saxeny and confederated princes were no fooner informed, than they affembled in order to deliberate on

17
The league of Smalcald,
the meafures proper to be taken in fuch a crifis. In the years 1530 and 1531 they met, firft at Smalcald, and afterwaids at Francfort, where they formed a folemn alliance and confederacy, with the intention of defending vigoroully their religion and liberties againft the dangers and encroachments with which they were threatened by the edict of Aughburg, without attempting, however, any thing offenfive againf the votaries of Rome; and into this confederacy they invited the kings of England, France, Denmark, \&rc. leaving no means unemployed that mi_ht corroborate and cement this important alliance.

This confederacy was at firft oppofed by Luther, from an apprehenfion of the calamities and troubles which it might produce; bat at latt, perceiving the neceflity of it, he confented; though he uncharitably, as well as imprudently, refufed to comprehend in it the followers of Zuinglius among the Swifs, together tith the Girman ftates and cities who had adopted the fentiments and confeffion of Bucer. In the invitation addreffed to Henry VIII, of Enpland, whom the confederate princes were willin:s to declare the head and protector of their lagre, the following things, among
others, were exprefsly Aipulated: That the king ifoild Reforatencourage, promote, and maintain, the true doctrine of tion. Chrilt as it was contained in the confeffion of Aupf. burg, and defend the fame at the next general councii: that he fhould not agree to any council fummoned by the bifhop of Rome, but protelt agimft it; and neither fubmit to its decrees, nor fuffer them to be refpected in his dominions: that he fhould never allow the Roman pontiff to have any pre-emincnce or juriddition in his dominions; that he fhould advance 1 co, oco crowns. for the ufe of the confederacy, and double that fum in it became neceffary: all which articles the coufederati princes were equally obliged to oblerve on their part. To thefe demands the king replied, he would maintain and promote the true doctrine of Chift; but, at the fime time, as the true ground of that doetrine lay only in the holy Scriptures, he would not accept ar any one's hand what fhould be his ourn faith, or that of his kingdom; and therefore defited that they would fend over two learned men to confer with him, in order to promote a religious union between him and the confcderates. However, he declared himielf of their opinion with regard to the meeting of a free general council, and promifed to join with them in all luch councils for the defence of the true doctrine ; but thought the regrulation of the ceremonial part of religion, being : matter of indifference, ought to be left to the choice of each fovereign for his own dominions. After this the king gave them a fecond anfwer more full and fatisfactory; but after the execution of queen Anne, this negociation came to nothing. On the one hand, the king grew cold when he perceived that the confederates were no longer of ufe to lim in fupporting the validity ot his marriage ; and, on the other hand, the German princes became fenfible that they could never fucceed with Hen.ry unlefs they allowed him an abfolute dictatorfhip in matters of religion.

While every thing thus tended to an open war between the two oppofite parties, the elector Palatine, and the elector of Mentz, offered their mediation, and endeavoured to procure a reconciliation. The emperor himfelf, for various reafons, was at this time inclined to peace: for, on the one hand, he food in need of fuccours againft the Turks, which the Proteftant princes refufed to grant as long as the edicts of Wcrms and Au; furg remained, in force; and, on the other, the election of his brother Ferdinand to the dignity of king of the Romans, which had been cariied by a majority of votes at the cirt of Cologne in 1531 , was by the fame princes contelted, as being contrary to the fundamental laws of the empire. In confequence of all this, after many negociations and projects of reconciliation, a treaty of peace was comeluded Nuremberg ination, Nurema treaty of peace was concluded at Nuremberg in 5532 , berg con-
between the emperor and the proteitant princes, on the cluded. following conditions; viz. That the latter fhould furnifh a fubfidy for carrying on the war againft the Turks, and acknowledge Ferdinand ldwful king of the Romans; and that the emperor on his part hould abrogate and aunul the edicts of Worms and Augtburg, and allow the Lutherans the free and undifurbed exercife of their seligious doctrine and difcipline, until a rule of faith was fixed either in the free general council that was to be affembled in the face of fix months, or in a diet of the empire.

Soon after the conclufin of the peace at Nuremberg
$\mathrm{F}_{2}$

## R E F

Reforms- died John elestor of Saxony, who was fucceeded by his tion. fon John Frederic, a prince of invincible fortitude and magnanimity, but whofe reign was little better than one continued train of difappointments and calamities. The religious truce, however, gave new vigour to the reformation. Thofe who had hitherto been only fecret enemies to the Roman puntiff, now publicly threw off his yoke; and various cities and provinces of Germany enlifted themfelves under the religious ftandards of Luther. On the other hand, as the emperor had now no other hope of terminating the religious difputes but by the meeting of a general councl, he repeated his requefts to the pope for that purpofe. The pontiff (Clement VII.), whom the hifory of palt coun-
20 cil; filled with the greateft uneafinefs, endeavoured to A general retard what he could not with decency refure. At laft, council in 1533, he made a propofd by his legate to affemble propofed. a council at Mantua, Placentia, or Bologna; but the Proteftants refufed their confent to the nomination of an Italian council, and infifted that a controverfy which had its rife in the heart of Germany, fhould be determined within the limits of the empire. The pope, by his ufual artifices, eluded the performance of his own promife; and, in 1534, was cut of by death, in the midt of his tratagems. His fucceffor Paul III. feemed to fhow lefs reluctance to the affembling a general council, and in the year 1535 expreffed his inclination to convoke one at Mantua; and, the year following, actually fent circular letters for that purpofe through all the fates and kingdoms under his jurifdiction. This council was fummoned by a bull iffued out on the 2 d of June 1536 , to meet at Mantua the following year: but feveral obitacles prevented its meeting; one of the moft material of which was, that Frederic duke of Mantua had no inclination to receive at once fo many guefts, fome of them very turbulent, into the place of his refidence. On the other hand, the Proteflants were firmly perfuaded that, as the council was affembled in Italy, and by the authority of the pope alone, the latter mult have had an undue influence in that affembly; of confequence, that all things mult have been carried by the votaries of Rome. For this reafon they affem-
21 bled at Smalcald in the year 1537, where they folemn-Protela- ly proteted againt this partial and corrupt council, tion againf and, at the fame time, had a new fummary of their it. doctrine drawn up by Luther, in order to prefent it to the affembled bilhops if it fhould be required of them. This fummary, which had the tirle of The Arthizes of Smaticl:, is commonly joined with the creeds. and confeffions of the Lutheran church.
${ }_{\text {ruitlefs }}^{22}$ After the meeting of the general council in Manfrhemes of twa was thus preventel, many fchemes of accommo. asconnc- dation were propofed both by the emperor and the dation:
the meeting of fuch a council fhould be prevented, to the next German diet.

This relolution was rendered ineffectual by a variety of incidents, which widened the breach, and put off to a farther day the deliberations which were defigned to heal it. The pope ordered his legate to declare to the diet of Spire, affembled in 1542, that he would, according to the promife he had already Council made, affemble a general council, and that Trent Trent profhould be the place of its meating, if the diet had no pofed. objection to that city. Ferdinand, and the princes who adhered to the canfe of the pope, gave their confent to this propotal; but it was vehemently objected to by the Proteftants, both becaufe the council was fummoned by the authority of the pope only, and :1fo becaule the place was within the jurifdiction of the Pope; whereas they defired a free council, which fhould not be biaffed by the dictates, nor awed by the proximity, of the pratiff. But this proteftation produced no effect. Paul III. perfifted in his purpofe, and iffued out his circular letters for the convocation of the council, with the approbation of the emper r. In juftice to this pontiff, however, it muft be obferved, that he fhowed himfelf not to be averfe to every. refor- pormation mat propored. mation. He appointed four cardinals, and three other by the perfons eminent for their learning, to draw up a plan pope. for the reformation of the church in general, and of the church of Rome in particular. The reformation propofed in this plan was indeed extremely fupericial and partial, yet it contained fome particulars which could ficarcely have been expected from thofe who compofed it. They complained of the pride and ignorance of the bilhops, and propofed that none fhould receive orders but learned and pious men; and that therefore care fhould be taken to have proper mafters for the inftruction of youth. They condemned tranlations from one benefice to another, grants of refervation, non-refidence, and pluralities. They propofed that fome convents fhould be abolifhed; that the liberty of the prefs fhould be reAtrained and limited; that the colloquies of Erafmus fhould be fupprefled: that no ecclefiaftic hould enjoy a benefice out of his own country; that no cardinal fhould have a bilhopric; that the queftors of St Anthony and feveral other faints fheuld be abolifhed; and, which was the beft of all their propofals, that the effects and perfonal eitates of ecclefiaftics frould be gi$\mathrm{v}=\mathrm{n}$ to the poor. They concluded with complaining: of the prodigious number of indigent and ragged priefts. who frequented St Peter's church; and declared, that it was a great fcandal to fee the whores lodged fo magnificently at Rome, and riding through the ftreets on fine mules, while the cardinals and other ecclefiaftics. accompanied them in the moft courteous manner.This plan of reformation was turned into ridicule by Luther and Sturmius; and indeed it left wiredreffed the moft intolerable grievances of which the Proteftants complained.
All this time the emperor had been labouring to War beperfuade the Proteltants to confent to the meeting of tween thethe council at Trent; but when he f sund them fixed and the in their oppofition to this meafure, he began to liften and the to the fanguinary meafures of the pope, and refulved to ternainate the difputes by force of arms. The elector of Saxony and landgrave of Heffe, who were the chief fugporters of the Proteftant caufe, upon this took

## REF <br> RE E

Reforma- proper meafures to prevent their being furprifed and tion. overwhelmed by a fuperior force ; but, before the horrors of war commenced, the great reformer Luther died in peace at Ayfelben, the place of his nativity, in 1546. The emperor and the pope had mutually refolved on the deftruction of all who fhould dare to oppofe the council of Trent. The meeting of it was to ferve as a fignal for taking up arms; and accordingly its deliberations were fcarcely begun in 1546 , when the Proteftants perceived undoubted figns of the approaching form, and a formidable union betwixt the emperor and pope, which threatened to crulh and overwhelm them at once. This year indeed there had heen a new conference at Ratifon upon the old fubject of accommodating differences in religion; but from the manner in which the debates were carried on, it plainly appeared that thefe differences could only be decided in the field of battle. The council of Trent, in the mean time, promulgated their decrees; while the reformed princes, in the diet of Ratifbon, protefted againft their authority, and were on that account proferibed by the emperor, who raifed an army to reduce them to obedience. See Father Paul's Hiffory of the Council of Trent, and our articles Paul (Father), and Trent.

The elector of Saxony and the landgrave of Hefle led their forces into Bavaria againft the emperor, and cannonaded his camp at Ingoldltalt. It was fuppoied that this would bring on an engagement, which would probably have been advantageous to the caufe of the reformed; but this was prevented, chiefly by the perfidy of Maurice duke of Saxony, who invaded the dominions of his uncle. Divifions were alfo fomented among the confederate princes, by the diffimulation of the emperor ; and France tailed in paying the fubfidy which had been promifed by its monarch: all which fo difcouraged the heads of the Proteltant party that their army foon difperfed, and the elector of sazony
was obliged to direct his march homewards. But he
26
Elector of Saxony demarches, with a view to deltroy his enemy before he ad and fhould have time to recover his vigour. The two artaken prifoner. fhould have time to recover his vigour. The two ar-
mies met near Muhlberg, on the Elbe, on the 24 th of April 1547; and, after a bloody action, the elector was obliged to direa his mareh homewaras. But he was purfued by the emperor, who mase feveral forced
was entirely defeated, and himfelf taken prifoner.Maurice, who had fo bafely betrayed him, was now declared elector of Saxony; and by his intreanes Philip landgrave of Heffe, the other chief of the ProteItants, was perfuaded $\omega$ throw himfelf on the mercy of
the emperor, and to implore his pardon. To this he Itants, was perfuaded w throw himfelf on the mercy of
the emperor, and to implore his pardon. 'To this he confented, reljing on the promife of Charles for obtaining forgivenefs, and being refored to liberty; but, not-
withitanding thefe expectations, he was unjufly detaining forgivenefs, and being reftored to liberty; but, not-
withftanding thefe expectations, he was unjuftly detained prifoner, by a fcandalous violation of the moft fo-
lemn convention. It is faid that the emperor ratracted prioner, by a fcandalous violation of the mont foed his promife, and deluded this unhappy prince by the ambiguity of two German words. Hitory indeed can fcarce afford a parallel to the perfidious,
mean-fpirited, and defpotic behaviour of the emperor deed can fcarce afford a parallel to the perfidious,
mean-fpirited, and defpotic behaviour of the emperor in the prefent cafe. After having received in pub-
lic the humble fubmiffion of the prince on his knees, in the prefent cafe. After having received in pub-
lic the humble fubmiffion of the prince on his knecs, and after having fet him at liberty by a folemn treaty, he had him arrelted ancw without any reafon, nay, without any pretence, and lept him clofe prifoner for feveral years. When Maurice remonllated againf this new confinement, the emperor anfwered,
that he lad never promifed that the landgrave fould not be imprifoned anew, but only that he fhould be exempted from perpetual imprifonment ; and, to fupport this affertion, he produced the treaty, in which his minifters had perfidioully foilted ewiger gefangnis, which fignifies a "perpetual prifon," intlead of einiger gefangnis, which fignifies "any prifon." This, however, is contefted by fome hiftorians.

The affair of the Proteltants now feemed to be defperate. In the diet of Augfburg, which was foon after called, the emperor required the Proteltants to leave the decifion of thefe religious difputes to the wifdom of the council which was to meet at Trent. The greatelt part of the members confented to this propofal, being convinced by the powerful argument of an imperial army, which was at hand to difeel the darknefs from the eyes of fuch as might otherwife have been blind to the force of Charles's reafoning. However this general fubmifion did not produce the effect which was expected from it. A plague which broke out, or was faid to do fo, in the city, caufed the greateft part of the bifhops to retire to Bologna; by which means the council was in effet difiolved, nor could all the intreaties and remonftrances of the emperor prevail upon the pope to re-affemble it rithout delay. During this interval therefore, the empoior judged it neceffary to fall upon fome method of accommodating the religious differences, and maintaining peace until the council fo long expected fhould be finally obtained. With this view he ordered Julius Pelugius bihop of Naumberg, Michael Sidonius, a creature of the pope, and a drawn fare of the pope, and jun Agricula, a native up by the of Ayfelben, to draw up a formulay which might enperus: ferve as 1 rule of faith and wormip, till the council thould be alfembled : but as this was onity a temporary expedient, and had not the force of a permanent or perpetual inftitution, it thence obtained the name of the Interim.

This project of Charles was formed partly with a defign to vent his refenment againf the pope, and partly to anfwer other political purpofes. It contained all the uffential doctrines of the church of Rome, though confiderably foftened by the artful terms which were employed, and which were quite different from thofe employed before and after this period by the council of Trent. There was even an affected ambiguity in many of the expreflions, which made them fuiceptible of different fenfes, and applicable to the fentiments of both communions. The confequence of all this was, that the imperial creed was reprobated Difpleafes. both parby b th parties. Eowever, it was promulgated with ties. great folemnity by the emperor at Aughurg. The elector of Mentz, without even afking the cpinion of the princes, prefent, gave a fanction to this formula, as if he had been commiffioned to reprefeat the whole diet. Many kept filence through fear, and that filence was interpreted as a tacit confent. Some had the courage to oppofe it, and thefe were reduced by force of arms; and the moft deplorable feenes of bloodfhed. and violence were acted throughout the whole empire. Maurice, electer of Saxony, who had hitherto kept neutral, now affembled the whole of his nobiity and clergy, in order to deliberate on this critical affair. At the head of the latter was Melancthon, whofe word

ficherite of recorciliation by Thelancthen.
the cfore on all occafions ready to make conceflions, and to prepore ichemes of accommodation. In the prefent cafe, therefore, he gave it as his opinion, that the whole of the book called Interim could not by any menns be adopted by the proteftants; but at the fame time he declated, that he faw no reafon why this book might not be approved, adopted, and received, as an authoritative rule in things that did not relate to the effential parts of religion, and which he accounted indifferent. But this fcheme, inftead of cementing the differences, made them much worfe than ever ; and produced a divifion among the Proteltants themfelves, which might have overthrown the Reformation entir ly, if the emperor and pope had feized the opportunity.

In the year 1549, the pope (Paul III.) died; and was fucceeded by Julius III. who, at the repeated folicitations of the emperor, confented to the reaffembling of a council at Trent. A diet was again held at Augfburg under the cannon of an imperial army, and Charles laid the matter before the princes of the empirs. Moft of thofe prefent gave their confent to it, and among the relt Maurice elector of Saxony; who confented on the following conditions: 1. That the points of doctrine which had already been decided there, fhould be re-examined. 2. That this examination hould be made in prefence of the Proteftant divines. 3. That the Saxon Proteftants fhould have a liberty of voting as well as of deliberating in the council. 4. That the pope fhould not pretend to prefide in that affembly, either in perfon or by his legates. This declaration of Maurice was read in the diet, and his deputies infifted upon its being entered into the regifters which the archbithop of Mentz obftinately refufed. The diet was concluded in the year 1551; and, at its breaking up, the emperor defired the affembled princes and fates to prepare all things for the approaching council, and promifed to ufe his utmof endeavours to procure moderation and harmony, impartiality and charity, in the tranfactions of that afsembly.

On the breaking up of the diet, the Proteltants took uch fteps as they thought moft proper for their own fafety. The Saxons employed Melancthon, and the Wurtembergers Brengins, to draw up Confeffions of Taith to be laid before the new council. The Saxon divines, however, proceeded no farther than Nuremberg, having received fecret ordsrs from. Maurice to ftop there: For the elector, perceiving that Charles had formed defigns againlt the liberties of the German princes, refolved to take the moft effectual meafures for crufhing his ambition at once. He therefore entered with the utmolt fecrecy and expedition into an alliance

32
was agreed, that Maurice and the confederates fhould lay down their arms, and lend their troops to Ferdinand to affilt him againt the Turks; and that the landgrave of Hefle fhould be fet at liberty. By the fourth it was agreed, that the Rule of Paith called the Interim fhould be confidered as null and void : that the contending parties fhould enjoy the free and undifturbed exercife of their religion, until a diet fhould be affembled to determine amicably the prefent difputes (which diet was to meet in the fpace of fix months) ; and that this religious liberty fhould continue always, in cafe it fhould be found impoflible to come to an uniformity in doctrine and worhip. It was allo determined, that all thofe who had fuffered banifhment, or any other calamity, on account of their having been concerned in the league or war of Smalcald, fhould be reinftated in their privileges, poffeffions, and employments; that the imperial chamber at Spire fhould be open to the Proteftants as well as to the Catholics ; and that there fhould always be a certain number of Lutherans in that high court.-To this peace Albert, marquis of Brandenburg, refufed to fubfcribe; and continued the war againt the Roman-catholics, committing fuch ravages in the empire, that a confederacy was at laft formed againt him. At the head of this confederacy was Maurice elector of Saxony, who died of a wound he received in a battle fought on the occafion in 1553.

The affembling of the diet promifed by Charles was prevented by various incidents; howerer it met at Augfburg in 1555, where it was opened by Ferdinand in name of the emperor; and terminated thofe deplorable calamities which had fo long defolated the empire. After various debates, the following acts were paffed, on the 25th of September: That the Prote- Treaty of ftants who followed the Confeffion of Augfourg fhould Augfburg. be for the future confidered as entirely free from the jurifdiction of the Roman pontiff, and from the authority and fuperintendance of the bifhops; that they were left at perfect liberty to enact laws for themfelves relating to their religious fentiments, difcipline, and worthip; that all the inhabitants of the German empire fhould be allowed to judge for themfelves in religious matters, and to join themfelves to that church whofe doctrine and workhip they thought the moft pure and confonant to the fpirit of true Chriftianity; and that all thofe who fhould injure or perfecute any perfon under religious pretences, and on account of their opinions, thould be declared and proceeded againt as public enemies of the empire, invaders of its liberty, and difturbers of its peace.

Thus was the Reformation eftablifhed in many parts of the German empire, where it continues to this day ; nor have the efforts of the Popifh powers at any time been able to fupprefs it, or even to prevent it from gaining ground. It was not, however, in Germany Accu4 gaining ground. It was not, however, in Germany Account of
alone that a reformation of religion tcok place. Al- the R formoft all the kingdoms of Europe began to open their mation in eyes to the truth abont the fame time. The reformed Sweden. religion was propagated in Sweden, foon after Luther's rupture with the church of Rome, by one of his difciples named Olaus Petri. The zealous efforts of this miffionary were feconded by Guftavus Vafa, whom the Swedes had raifed to the throne in place of Chrifiern king of Denmark, whofe horrid barbarity lof him the crown. This prince, however, was as

## R E F

Reforma- prudent as he was zealous; and, as the minds of the tion. Swedes were in a fluctuating fate, he wifely avoided all kind of vehemence and precipitation in fpreading the new doctrine. Accordingly, the firft object of his attertion was the infruction of his people in the facred doctrines of the Holy Scriptures: for which purpofe he invited into his dominions feveral learned Germans, and fpread abroad through the kingdom the Swedifh tranflation of the Bible that had been made by Olaus Petri. Some time after this, in 1526, he appointed a confercace at Upfal, between this reformer and Peter Gallius, a zealous defender of the ancient fiu. perftition, in which each of the champions was to bring forth his arguments, that it might be feen on which fide the truth lay. In this difpute Olaus obtained a fignal victory; which contributed much to confirm Guftavus in his perfuation of the trath of Luther's doctrine, and to promote its progrefs in Sweden. The following year another event gave the finifhing ftroke to its propagation and fuccefs. This was the affembly of the ftates at Wefteraas, where Guftavus recommended the doctrine of the reformers with fuch zeal, that, after warm debates fomented by the clergy in general, it was unanimoufly refolved that the reformation introduced by Luther fhould have place in Sweden. This refolution was principally owing to the firmnefs and magnanimity of Gultavus, who declared publicly, that he would lay down the fceptre and retire from the kingdom, rather than rule a people enflaved by the orders and authority of the pope, and more controuled by the tyranny of their bifhops than by the laws of their monarch. From this time the papal empire in Sweden was entirely overthrown, and Guftavius declared head of the church.

In Denmark, the reformation was introduced as early as the year 1521 , in confequence of the ardent defire difcovered by Chriftiern IL. of having his fubjects in. Atructed in the doctrines of Luther. This monarch, notwithftanding his cruelty, for which his name has been rendered odious, was neverthelefs defirous of delivering his dominions from the tyranny of the church of Rome. For this purpofe, in the year 1520 , he fent for Martin Reinard, one of the difciples of Carloltadt, out of Saxony, and appointed him profeffor of divinity at Hafnia; and after his death, which happened in 1521 , he invited Carloftadt himfelf to fill that important place. Carloftadt accepted of this office indeed, but in a fhort time returned to Germany; upon which Chriftiern ufed his utmoft endeavours to engage Luther to vifit his dominions, but in vain. However, the progrefs of Chriftiern, in reforming the religion of his fubjects, or rather of advancing bis own power above that of the church, was checked, in the year 1523 , by a confpiracy, by which he was depofed and banifh. ed; his uncle Frederic, duke of Holftein and Slefwic, being appointed his fucceffor.

Frederic conducted the reformation with much greater prudence than his predeceffor. He permitted the Protellant dcetors to preach publicly the fentiments of Lather, but did not venture to change the eftablifhed government and difcipline of the chutch. Huwever, he contributed greatly to the progrefs of the reformatim, by his fuccefsful attempts in favour of religious liberty in an affembly of the ttates held at Odenfee in 1527. Here he procured the publication of a famous

## 47 ] <br> R E

edict, by which every fubject of Denmark was decla. Reformared free either to adhere to the tenets of the cburch of tion. Rome, or to the doctrine of Luther. 'The papal tyranny was totally deftroyed by his fucceffor Chriftiern III. He began by fuppreffing the defpotic authority of the bifhops, and refloring to their lawful owners a great part of the wealth and polfellions which the church had acquired by various flratagems. This was followed by a plan of religious doctrine, worfhip, and dilcipline, laid down by Bugenhagius, whom the king had fent for from Wittemberg for that purpofe; and in 1539 an affembly of the fates at Odenfee gave a folemn fanction to all thefe traulactions. -

In France alfo, the reformation began to make fome In France. progrefs very early. Margaret queen of Navarre, filter to Francis I. the perpetual rival of Charles V. was a great friend to the new doctrine; and it appears that, as early as the year 1523 , thene were in feveral of the provinces of France great numbers of people who had conceived the greateft averfion both to the doctrine and tyranny of the church of Rome; among whom were many of the firt rank and dignity, and even fome of the epifcopal order. But as their number increafed daily, and troubles and commotions were excited in feveral places on account of the religious ditferences, the authority of the king intcrvened, and many perfons eminent for their virtue and piety were put to death in the molt barbarous manner. Indeed Francis, who had either no religion at all, or, at beft, no fixed and confiftent fyltem of religious principles, conducted himfelf towards the Proteftints in fuch a. manner as belt anfwered his private views. Sometimes he refolved to invite Melancthon into Frince, probably with a view to pleafe his fifter the queen of Navarre, whom he loved tenderly, and who had ftrongly imbibed the Protettant principles. At other times he exercifed the molt infernal cruelty towards the reformed; and once made the following mad declaration, That if he thought the blood in his arm was tainted by the Lutheran herefy, he would have it cut off; and that: he would not fpare even his own children, if they entertained fentiments contrary to thofe of the Catholic church.

About this time the famous Calvin began to draw the attention of the public, but more efpecially of the queen of Navarre. His zeal expofed him to danger; and the friends of the reformation, whom Francis was daily committing to the flames, placed him more than once in the moft perilous fituation, from which he was delivered by the interpofition of the queen of Navarre. He therefore retired out of France to Bafil in Swiffer. land; where he publifhed his Chriftian Inftitutions, and. became afterwards fo famous.

Thofe among the French who firft renounced the jurifdiston of the Romifh church, are commonly called Lutherans by the writers of thofe early times. Hence it has been fuppofed that they had all imbibed the peculiar fentiments of Luther. But this appears by no means to have been the cafe: for the vicinity of the cities of Geneva, Laufannc, \&c. which had adopted the doctrines of Calvin, produced a remarkable effect upon the French Protellant churches; infomuch that, about the middle of this century, they all entered into communion with the church of Geneva. The Freach Proteftants ware called Hurucrots* by their ad-* See Plu . vafaries, sucnots.

ferere，being peciecuted with unparalleled fury；and though many princes of the bloud，and of the firf no－ bility，had embraced their fentiments，yet in no part of the wond wid the refomers fuTer fo much $\dagger$ ．At lat all commotions were quelled by the fortitude and mag． ranimity of Henry IV．who in the year 1598 granted all bis fubjects full liberty of confcience by the famous Edict of Nantes，and feemed to have thoroughly elta－ blifhed the reformation throughout his dominions．Dit sing the minority of Luis XIV．however，this edict was revoked by Cardinal Mazarine，fince which time the Proteflants ha：e often been cruelly perfecuted；nor was the profeffion of the reformed religion in France at any time fo fafe as in moft other countries of Europe． ぶe Revolution．

In the other parts of Europe the oppofition to the church of Rome was bat faint and ambiguous bafore the diet of Augfburg．Before that period，hewever， it appears from undoubted teflimony，that the doctrine of Luther had made a confiderable，though probably fecret，progrefs through Spain，Hungary，Bohemia， Britain，Poland，and the Netherlands；and had in all thefe countries many friends，of whom feveral repaired to Wittemberg，in order to enlarge their knowledge by means of Luther＇s converfaticn．Some of thefe countries threw off the Romifh yoke enticly，and in others a prodigious number of families embraced the principles of the reformed religion．It is certair in－ deed，and the Roman－catbolics themfelves acknowledge it without hefitation，that the Papal doctrines and au－ thority would have fallen into ruin in all parts of the vinnld at once，had not the force of the fecular arm hesn employed to fupport the rottering edifice．In the Netherlands particularly，the moft grievous perfecutions took place，fo that by the emperor Charles V．upwards． of 100,000 were deftroyed，while fill greater cruelties vere exercifed upon the people by his fon Philip II． The revolt of the United Provinces，however，and mo－ tives of real policy，at haft pat a fop to thefe furious proceedings；and，though in many provinces of the Netherlands，the eftablifhment of the Popifh religion was ftill continued，the Proteftants have been long free of the danger of perfecution on account of their principles．
The reformation made a confiderable progrefs in Spain and Italy foon after the rupture between Lu－ ther and the Roman pontiff．In all the provinces of Italy，but more efpecially in the territories of Venice， Tufcany，and Naples，the fuperfition of Rome loft ground，and great numbers of people of all ranks ex． preffed an averfion to the Papal yoke．This occafion－ ed violent and dangerous commations in，the kingd $m$ of Naples in the year 5546 ；which，however，veere at laft quelled by the united efforts of Charles V．and his viceroy Don Pedro di Toledo．In feveral places the pope put a flop to the progrefs of the reformation，by letting loofe the inquifitors；who fpread dreadiul marks of their barbarity through the greateft．part of Italy． Thefe formidable minilters of fuperition put fo many to death，and perpetrated fuch horrid acts of cruelty and oppreffion，that moft of the reformed confulted their fafety by a voluntary exile，while others returned to the religion of Rome，at leaft in external appearance． But the inquifition，which fighted into the profeffion of Popery feveral Proteftants in other parts of Italy，
could never make its way into the kingdom of Napler；Reforma－ nor could either the authority or intraties of the tins． pope engage the Neapolitans to admit even vifiting in－ quifitors．
$\qquad$

In Spain，feveral people embraced the Proteftant In Spain． religion，not only from the controverfies of Luther，but． even from thofe divines whom Charles V．had brought with him into Germany in order to refute the doc－ trines of Luther．For thefe doctors imbibed the prem tended herefy infead of revuting it，and propagated it more or lefs on their return home．But the inqui－ fition，which could obtain no footing in Naples，reign－ ed triumphant in Spain，and by the molt dreadful me－ thods frightened the people back into Popery，and fuppreffed the defire of exchanging their fuperftition for a more rational plan of religion．It was indeed prefumed that Charles himfelf died a proteftant；and it feems to be certain，that，when the approach of death had diffipated thofe fohemes of ambition and grandeur which had fo long blinded．him，his fentiments became much more rational and agreeable to Chrifianity than they had ever been．A．ll the ecclefiatics who had at－ tended him，as foon as he expired，were fent to the inquifition，and committed to the flames，or put to death by fome other method equally terrible．Such was the fate of Auguftine Cafal，the emperor＇s preach－ er；of Conftantine Pontius，his confeffor；of Egidius， whom he had named to the biflopric of Tortofa；of Bar－ tholomew de Caranza，a Dominican，who had been con－ feffor to King Philip and Queen Mary；with 20 others of lefs note．

In England，the principles of the reformation be－In Eng－ gan to be adopted as foon as an account of Luther＇s land． doctrines could be conveyed thither．In that kingdom there were fill great remains of the fest called Lol－ lurds，whofe doctrine refembled that of Luther；and among whom，of confequence，the fentiments of our reformer gained great credit．Henry VIII．king of England at that time was a violent partifan of the church of Rome，and had a particular veneration for the writings of Thomas Aquints．Being informed． that Luther fpoke of his favourite author with cori－ tempt，he conceived a violent prejudice againt the re－ former，and even wrote againft him，as we have already obferved．Luther did not hefitate at writing againlt his majefty，overcame him in argument，and treared him with very little ceremony．The firlt fep towards public reformation，however，was not taken till the year 1529．Great complaints had been made is Eng－ land，and of a very ancient date，of the ufurpations of the clergy；and by the prevalence of the Lutheran opinions，thefe complaints were now become more ge． neral than before．The Houfe of Commons，finding the occafion favourable，paffed feveral bills，reftraining the impefitions of the clergy：but what threatened the ecclefiafical order with the greateft danger were the fevere reproaches thrown out almof without oppofition in the houfe againft the diffolute lives，ambition，and avarice of the priefts，and their continual encroach－ ments on the privileges of the laity．The bills for re－ gulating the clergy met with oppofition in the Houfe of Lords；and bifhop Fifher imputed them to want of faith in the Commons，and to a formed defign，pro－ ceeding from heretical and Lutheran principles，of rob－ bing the chunch of her patrimony，and overturning the national religion．The Commons，however，complain－

## REF

\&.furma- ed to the king, by their fpeaker Sir Thomas Audley, tion. of thefe reflections thrown out againit them; and the
bifhop was obliged to retraet his words.

Though Henry had not the lealt idea of rejecting any, even of the moft abfurd Romifh luperfitions, yet as the opprefions of the clergy fuited very ill with the violence of his own temper, he was pleafed with every opportunity of leffening their power. In the parliament of 1531, he fhowed his dehgn of humbling the clergy in the mon effectual manner. An obfolete ftatute was revived, from which it was pretended that it wis criminal to fubmit to the legatine power which had been exercifed by cardinal Wolfey. By this ftroke the whole body of clergy was declared guilty at once. They were to, well acquainted with Henry's difpofi. tion, however, to reply, that their ruin would have been the certain confequence of their not fuomitting to Wulfey's commiffion which had been given by royal authority. Inftead of making any defence of this kind, they chofe to throw themfelves on the mercy of their fovereign; which, however, it coll them I18,840l. to procure. A confeffion was likewife extorted from them, that the king was protector and fupreme head of the church of England; though fome of them had the dexterity to get a claufe inferted, which inyalidated the whole fubmilfion, viz. in fo fur as is permitted by the law of Chrill.

The king, having thus begun to reduce the power of the clergy, kept no bounds with them atter wards. He did notindeed attempt any reformation in religious matters; nay, he perfecuted moft violently fuch as did attempt this in the leaft. Indeed, the molt effential article of his creed feems to have been his own lupremacy; for whoever denied this, was fure to fuffer the moft fevere penalties, whether Proteftant or Papift. But an account of the ablurd and cruel conduct of this prince, and of his final quarrel with the pope on account of his refufing a difpenfation to marry Anne Boleyn, is given under the article England, $n^{\circ}$ 253292.

Fe died in 1547 , and was fucceeded by bis only fon Edward VI. This amiable prince, whore early youth was crowned with that wifdom, iagacity, and viriue, that would have done honour to advanced years, gave new lpirit and vigcur to the Proteitant caufe, and was its brigheft ornament, as well as its moft effectual fupport. He encouraged learned and pious men of foreign countries to fettle in England, and addreffed a particular invitation to Martin Bucer and Paul Fagius, whofe moderation added a luftre to their other virtucs, that, by the miniftry and labours of thefe eminent rien, in concert with phole of the friends of the Reformation in England, he might purge his dominions from the fordid tictions of popery, and eftabliih the pure cootrines of Chritianity in their place. For this purpofe, he iffued out the wifeft orders for the rettoration of tue religion; but his reign was too fhort to acromplifh fully fuch a glarious purpofe. In the year $155^{3}$, he was taken from his loving and afficted fubjects, whole !orrow was inexpreflible, and filited to their lofs. His fifter Mary (the daughter of Catharine of Arragon, from whom Henry had been reparated by the famous divorcc), a furious bigot to the church of Rome, and a princels whofe natural character, like the fipirt of her religion, was defpotic and cruel, fucceeded him on the Eiritifh throne, and impofed anew the a:biVol. XVI.
trary laws and the tyrannical yoke of incme thon the people of England. Nor were the methods the employed in the caufe of faperfition better than the caule ilielf, or tempered by any fentiments of equity or compaffion. Barbarous tortures and dealh, in the m.lt fhocking forms, awaited thote who oppofed ber will, or made the lealt fland againt the reftoration of Popers. And among raany other vidims, the learned and pious Crammer, archbifhop of Canterbury, who had been one of the molt illultrious inftruments of the Reformation in Lingland, fell a facrifice to her fury. This odious fcene of perfecution was happily concluded in the year 1558 , by the death of the queen, who left no iflue; and, as foon as her fucceffor the lady Elizabeth afcended the throne, all things affumed a new and a pleafing aspect. This illuftrious princefs, whofe fentiments, counfels, and projects, breathed a fpirit fuperior to the natural foftrofs and delicacy of her fex, exerted this vigorous and manly fpirit in the defence of opprefied confcience and expiring liberty, brcke anew the dcfpotic yoke of Papal authority and fuperitition, and, delivering her people from the bondage of Rome, cla, blifhed that form of religious doctrine and eccleffaftical government which Atill fubfints in England. This religious oftablifhment differs, in fome refpects, from the plan that had been formed by thofe whom Edward VI. had employed tor promoting the caufe of the Reformation, and approaches nearer to the rites and dificipline
in former times; though it is widely different, and, in tion, and approaches nearer to the rites and difcipline
in former times; though it is widely different, and, in the molt important points, entirely oppofite to the prin-
ciples of the Roman hierarchy. See ENGLAND, $\mathrm{n}^{\circ}{ }^{293}$, the molt important points, entirely opponte to the prin-
ciples of the Roman hierarchy. See ENGLAND, $\mathrm{n}^{\circ}$ 293, \&c.

The caufe of the reformation underwent in Ireland In Irelanda the fame vicifitudes and revolutions that had attended it in England. When Henry VIII. after the abolition of the Papal authority, was declared.fupreme head upon earth of the church of England, George Brown, a na. tive of England, and a monk of the Auguline order, whom that monarch had created, in the year 1535 ,
archbithop of Dublin, began to aft with the utmoft whom that monarch had created, in the year 1535 ,
archbiChop of Dublin, began to act with the utmolt vigour in confequence of this change in the hierarchy.
He purged the churches of his diocefe from fuperftivigour in confequence of this change in the hierarchy.
He purged the churches of his diocefe fram fuperftition in all its various forms, pulled down images, deAtroyed relics, abolifhed abfurd and idolatrous rites, and, by the influence as well as authority he had in Ireland, caufed the king's fupremacy to be acknowledged in that nation. Henry howed, foon after, that this futhat nation. Henry thowed, foon after, that this fu-
premacy was not a vain title; for he banilhed the monks out of that kingdom, confifcated their revenues, and deftroyed their convents. In the reign of Edward and deftroyed their convents. In the reign of Edward
VI. Aill farther progrefs was made in the removal of Popifh fupertitions, by the zealous labours of bilhop Brown, and the aufpicious encouragement he granted Brown, and the aufpicious encouragement he granted
to all who exerted themfelves in the caufe of the Reformation. But the death of this excellent prince, formation. But the death of this excellent prince,
and the acceffion of queen Mary, had like to have changed the face of affairs in Hieland a"s much as in England ; but her defigns were difappointed by a very curious adventure, of which the following account has been copied from the papers of Richard earl of Corke. "Queen Mary having dealt feverely with the Protefants in England, about the latter end of her reign Curious Gign Engand, about the latter end of her reign difappointfigned a commiffion for to take the fame courfe with ment of a them in Ireland; and to execute the fame with greater "opiindocforce, fhe nominates Dr Cole one of the commifioneis. torin lesThis Doctor coming, with the cominifione to Cheiter Jand

$\qquad$ - Dostor coming, whe connimion, to Cheiter

Rcio:m:- on his journey, the mayor of that city hearing that her tion. majefty was fending a meffenger into Ireland, and he
being a churchman, waited on the Doctor, who in difcourfe with the mayor taketh out of a cloke-bag a leather box, faying unto him, Here is a commiffon that Thall la/b the Heretics of Ireland, calling the Proteltants by that title. The good woman of the houfe being well affected to the Proteftant religion, and alfo having a brother named $\mathfrak{F}$ obn Edmonds of the fame, then a ciiizen in Dublin, was much troubled at the Doctor's words; but watching her convenient time while the mayor took his leave, and the Doctor complimented him down the flairs, fhe openis the box, takes the commiffion out, and places in lieu thereof a fheet of paper with a pack of cards wrapt up therein, the knave of clubs being faced uppermoft. The doctor coming up to his chamber fufpecting nothing of what had been done put up the box as formerly. The next day going to the water-fide, wind and weather ferving him, he fails towards Ireland and landed on the 7 th of October 1558 at Dublin. Then coming to the caftle, the Lord Fitz.Walters being lord-deputy, fent for him to come before him and the privy-council; who, coming in, after he had made a fpeech relating upon what account he came over, he prefents the box unto the lord-deputy; who caufing it to be opened, that the fecretary might read the commiffion, there was nothing fave a pack of cards with the knave of clubs uppermolt ; which not only ftartled the lord-deputy and council, but the Doctor, who affured them he had a commiffion, but knew not how it was gone. Then the lord-deputy made anfwer : Let us have another commiffion, and we hall fhuffle the cards in the meanwhile. The Doctor being troubled in his mind, went away, and returned into England, and coming to the court obtained another commiffion; but flaying for a wind on the water-fide, news came to him that the queen was dead : and thus God preferved the Proteftants of Ireland." Queen Elizabeth was fo delighted with this fory, which was related to her by lord Fitz-Walter on his return to England, that fhe fent for Elizabeth Edmonds, whofe hufband's name was Matterfhad, and gave her a penfion of 40 l. during her life.
d'Augsbourg depuis 1517-1530, in 4 vois 8vo, Berlin Refraction 1785, and Motheim's Ecclefiaftical Hiftory. See alfo Sleidan De Statu Religionis $\mathcal{J}$ Republica Carolo V.; C@faris Commentarii; and father Paul's hiftory of the Council of Trent.

REFRACTION, in general, is the deviation of a moving body from its direct courfe, nccafioned by the different denfity of the medium in which it moves; or it is a change of direction occafioned by a body's falling obliquely out of one medium into another. The word is chiefly made ufe of with regard to the rays of light. See Optics (Index) at Refraction.

REFRANGIBILITY of Light, the difpofition of rays to be refracted. The term is chiefly applied to the difpofition of rays to produce different colours, according to their different degrees of refrangibility. See Chromatics and Oprics paflem.

REFRIGERATIVE, in medicine, a remedy which refrelhes the inward parts by cooling them; as clyfters, ptifans, \& c.

REFRIGERATORY, in chemiftry, a veffel filled with cold water, through which the worm paffes in diftillation.; the ufe of which is to condenfe the vapours as they pafs'through the worm.

Cities of REFUGE, were places provided as Afyla, for fuch as againft their will fhould happen to kill a man. Of thefe cities there were three on each fide Jordan : on this fide were Kedefh of Naphtali, Hebron, and Schechem; beyond Jordan were Bezer, Golan, and Ramoth-Gilead. When any of the Hebrews, or ftrangers that dwelt in their country, happened to fpill the blood of a man, they might retire thither to be out of the reach of the violent attempts of the relations of the deceafed, and to prepare for their defence and juflification before the judges. The manllayer underwent two trials: firft before the judges of the city of refuge to which he had fled; and fecondly before the judges of his own city. If found guilty, he was put to death with all the feverity of the law. If he was acquitted, he was not immediately fet at liberty; but, to infpire a degree of horror againft even involuntary homicide, he was reconducted to the place of refuge, and obliged to coninue there in a fort of banifhment till the death of the high-prieft. If, before this time, he ventured our, the revenger of blood might freely kill him ; but after the high-prieft's death he was at liberty to go where he pleafed without moleftation. It was neceflary that the perfon who fled to any of the cilies of refuge fhould underftand fome trade or calling that he might not be burthenfome to the inhabitants. The cities of refuge were required to be well fupplied with water and neceffary provifions. They were alfo to be of eafy accefs to have good roads leading to them, with commodious bridges where there was occafion. The vidth of the roads was to be 32 cubits or 48 feet at leaft. It was further required, that at all crofs-ways direction-pofts fhould be erested, with an infcription pointing out the road to the cities of refuge. The $15^{\text {th }}$ of Adar, which anfwers to our February moon, was appointed for the city magiftrates to fee that the roads were in good condition. No perfon in any of thefe cities was allowed to make weapons, left the relations of the deceafed fhould be furnifhed with the means of gratifying their revenge. Deut. xix. 3. iv. 41. 43.; Jofh. xx. 7. Three other cities of refuge were conditionally promifed, but never granted. See Asyuum. REGU.

## REG 「 5 I 1 REG

Refugees REFUGEES, a term at firt applied to the French Proteftants, who, by the revocation of the edict of Nantz, were confrained to fly from perfecution, and take refuge in foreign countries. Since that time, however, it has been extended to all fuch as leave their country in times of danger or diftrefs; and hence, fince the American Revolution, the Englifh fiequently heard of Anerican refityees.
REGALE, a magnificent entertainment or treat, given to ambaffadors and other perfons of diftinction, to entertain or do them henour.

It is ufual in Italy, at the arrival of a traveller of eminence, to fend him a regale, that is, a prefent of fweetmeats, fruits, \&c. by way of refrefliment.

REGALIA, in law, the rights and prerogatives of a king. See Prerogative.

Regalia is allo ufed for the apparatus of a coronation; as the crown, the fceptre with the crofs, that with the dove, St Edward's ftaff, the globe, and the orb with the crofs, four feveral fwords, \&c.-The regalia of Scotland were depofited in the cattle of Edinburgh in the year 1707, in what is called the Fewel Office. This room was lately opened by fome commiffioners appointed by the king, when the large cheft in which it is fuppofed they were placed was found; but as it has not, that we have heard of, been opened, it is impoffible to fay whether they be there or not. It is very generally thought they were carried to the Tower of London in the reign of Queen Anne; and a crown is there fhewn which is called the Scotch crown. We do not believe, however, that that is the real crown of Scotland ; and think it probable that the Scotch regalia are in the cheft which was lately found. If they are not there, they mult have been taken away by fealth, and either deftroyed or melted down, fcr we do not believe that they are in the Tower of London.

Lord of REGALITY, in Scots law. See Law, $n^{\circ}$ clviii. 4.

Court of REGARD. See Forest-Courts.
REGARDANT, in heraldry, fignifies looking behind; and it is ufed for a lion, or other bealt, with his face turned towards his tail.

REGARDER, an ancient officer of the king's foreft, fworn to make the regard of the foreft every year ; that is, to take a view of its limits, to inquire into all offences and defaults committed by the forefters within the foreft, and to obferve whether all the officers executed their refpective duties. See ForestLaws.

REGATA, or Regatta, a fpecies of amufement peculiar to the republic of Verice. This fpectacle has the power of exciting the greatef emotions of the heart, admiration, enthufiafm, and fenfe of glory, and the whole train of our belt feelings. The grand regata is only exhibited on particular occafions, as the vifits of foreign princes and kings at Venice.

It is difficult to give a jult idea of the ardour that the notice of a regata fpreads among all claffes of the inhabitants of Venice. Proud of the exclufive privilege of giving fuch a fpectacle, through the wonderful local circumftances of their city, they are highly delighted with making preparations a long time before, in order to conribute all they can towards the perfection and enjoy ment oi the fpectacle. A thoufand interefts are formed and augmented every day; parties in favour of the different competitors who are known; the protection of young
noblemen given to the gondoliers in their fervice; the defire of honours and rewards in the afpirants; and, in the midlt of all this, that ingenious national indulty, which awakes the Venetians from their habitual intolence, to derive advantage from the bufinefs and agitation of the moment : all thefe circumftances united give to the numerous inhabitants of this lively city a degree of fpirit and animation which render it during that time a delightful abode in the eyes of the philofopher and the ftranger. Crowds of people flock from the adjacent parts, and travellers joyfully repair to this feene of gaiety and pleafure.

Although it is allowable for any man to go and infcribe his name in the lift of combatants until the fixed number is complete, it will not be amifs to remark one thing, which has relation to more antient times. The flate of a gondolier* is of much confideration among* See Gon. the people; which is very natural, that having been the cola. primitive condition of the inhabitants of this courtry. But, befides this general confideration, there are among them fome families truly diftinguifhed and refpeeted br their equals, whofe antiquity is acknowledged, and who, on account of a fucceffion of virtuous men, able in their profeflion, and honoured for the prizes they have carried off in thefe contefts, form the body of nolle gondoliers; often more worthy of that title than the higher order of nobility, who only derive their honours from the meit of their anceftors, or from their own riches. The confideration for thofe families is carried fo far, that, in the difputes frequently arifing among the gondoliers in their ordinary paffage of the canals, we fometimes fee a quarrel inftantly made up by the fimple interpofition of a third perfon, who has chanced to be of this reverend body. They are rigid with refpect to mifalliances in their families, and they endeavour reciprocally to give and take their wives among thofe of their own sank. But we mult remark here, with pleafure. that thefe diftinctions infer no inequality of condition, nor admit any oppreffion of inferiors, being founded folely on laudable and virtuous opinions. Diftinctions derived from fortune only, are thofe which always outrage nature, and often virtue.

In general, the competitors at the great regatas are chofen from among thefe families of reputation. As foon as they are fixed upon for this exploit, they fpend the intermediate time in preparing themfelves for it, by a daily affiduous and fatiguing exercife. If they are in fervice, their mafters during that time not only give them their liberty, but alfo augment their wages. This cultom would feem to indicate, that they look upen them as perfons confecrated to the honour of the nation, and under a fort of obligation to contribute to its glory.

At laft the great day arrives. Their relations afiem. ble together : they encourage the heroes, by calling to their minds the records of their families; the women prefent the oar, befeeching them, in an epic tone, to remember that they are the fons of famous men, whofe fteps they will be expected to follow : this they do with as much folemnity as the Spartan women prefented the fhield to their fons, bidding them either return with or upon it. Religion, as practifed ameng the Jower claf; of people, has its fhare in the preparations for this enterprize. They caufe maffes to be faid; they make vows to fome particular church; and they arm their boats for the conteft with the images of thofe faint: who are moft in vogue. Sorcerers are not forgotten

## R E G

Regat. upan this occafion. For gondoliers who have lof the race often declare, that witchcraft had been practifed arainft them, or certainly they mult have won the day. Such a fuppofition prevents a poor fellow from thinking ill of himfelf; an opinion that might be favourable to him another time.

The courfe is abcut four miles. The boats ftart from a certain place, run through the great winding canal, which divides the town into two parts, turn round a picket, and, coming back the fame way, go and feize the prize, which is fixed at the acutelt angle of the great canal, on the convex fide, fo that the point of fight may be the more extended, and the prize feized in the fight of the fpectators ori both fides.

According to the number of competitors, different races are performed in different forts of boats; fome with one oar and others with two. The prizes propofed are four, indicated by four flags of different colours, with the different value of the prizes marked upon them.Thefe flags, public and gloriows monuments, are the prizes to which the competitors particularly afpire. But the government always-adds to each a genteel fum of money; befides that the conquerors, immediately after the vistory, are furrounded by all the beau monde, who congratulate and make them prefents: after which they go, bearing their honotrable trophy in their hand, down the whole length of the canal, and receive the applaufe of innumerable fpectators.

This gran'd canal, ever ftriking by the fingularity and beauty of the baildings which border it, is, upon thefe occafions, covered with an infinity of fpectators, in all forts of barges, boats, and gondolas. The element on which they move is fcarcely feen; but the noife of oars, the agitation of arms and bodies in perpetual motion, indicate the fpectacle to be upon the water. At certain diftances, on each fide of the hore, are erected little amphitheatres and fcaffoldings, where are placed bands of mufic ; the harmonious fouind of which predominates now and then over the buzzing noife of the people. Some days before a regata, one may fee on the great canal many boats for pleafure and entertainment. The young noble, the citizen, the rich artizan, mounts a long boat of fix or eight oars; his gondoliers decorated with rich and fingular dreffes, and the veffel itfelf adorned with various ftuffs. Among the nobles there are always a number who are at a confiderable expence in thefe decorations; and at the regata itfelf exhibit on the water perfonages of mythologic ftory, with the heroes of antiquity in their train, or amufe themfelves with reprefenting the coftumi of different nations: in fhort, people contribute with a mad fort of magnificence, from all quarters, to this mafqueTade, the favoorite diverfion of the Venetians. But thefe great machines, not being the lefs in motion on account of their ornaments, are not merely deftined to grace the fhow: they are employed at the regata, at every momert, to range the people, to protect the courfe, and to keep the avenue open and clear to the goal. The nobility, kneeling upon cuhhions at the prow of their veffels, are attentive to thefe matters, and announce their orders to the mofr reftive, by darting at them little gided or filvered balls, by means of certain bows, with which they are furnified on this occafon. And this is the only appearance of coertion in the Venetian police on thefe days of the greatef tumult: nor is there to be feen, in any part of the city, a body of
!
g
guards or patrol, nor even a gun or a halbert. The
mildnefs of the nation, fits gaiety, its education in the mildnefs of the nation, its gaiety, its education in the habit of believing that the government is ever awake, that it knows and fees every thing; its refpectful attachment to the body of paricians; the fole afpect of certain officers of the police in their robes, difperfed in different places, at once operate and explain that tranquillity, that fecurity, which we fee in the midft of the greateft confution, and that furprifing docility in fo lively and fiery a people. Regattas have been attempted on the river Thames, but they were but humble imitations of the Venetian amufement.

REGEL, of Riget, a fixed ftar of the firf magnitude, in Orion's left foot.

REGENERATION, in the logy, the act of being born again by a firitual birth, or the change of heart and life experienced by a perfon who fortakes a courle of vice, and fincerely embraces a life of virtue and piety.

REGENSBURG, or Ratisbon. See Ratisbon.
REGENT, one who governs a kingdom during the minority or abfence of the king.

In France, the queen-mother had the regency of the kingdom during the minoity of the king, under the title of queen-regeht.

In England, the methods of appointing this guardian or regent have been fo various, and the duration of his power fo uncertain, that from hence alone it may be collected that his office is unknown to the com. mon law; and therefore (as sir Edward Coke fays, $4 \mathrm{Inft} .5^{8}$.) the fureft way is to have him made by autherity of the great council in parliament. The earl of Pembroke by lis own authe rity affomed in very troubicfome times the regency of Henry MI. who was then only rine years old; but was declared of full age by the pope at 17 , confirmed the great charter at 18 , and took upon him the adminiftration of the government at 20. A guardian and councils of regency were named for Edward III. by the parliament, which depofed his father; the young king being then 15 , and not affuming the government till three years after. When Richard II. fucceeded at the age of 11, the duke of Lancafter took upon him the management of the kingdom till the parliament met, which appointed a nominal council to affift him. Herry V. on his death-bed named a regent and a guardian for his infänt fon Herry VI. then nine months. old : but the parliament altered his difpofition, and appointed a protector and council, with a fpecial limited authority. Both thefe.princes remained in a flate of pupil. age till the age of 23. Edward V. at the age of 13, was recommended by his father to the care of the duke of Gloucefter; who was declared protector by the privycouncil. The flatutes 25 Flen . VIII. c. 12. and 28. Hen. VIII. c. 7. provided, that the fucceffor, if a male and under 18 , or if a female and under 16 , fhould be till fuch age in the governance of his or her na. tural mother, (if approved by the king), and fach other c uncellors as his uajefty thould by will or otherwife appoint: and he accordingly appointed his 16 executors to have the government of his Ion Edward VI. and the king dom, which executers elealed the eapl of Hartford protector. The ftatutes 24 Geo . II. c. 24 . in cafe the crotyn fhould defend'to any of the children of Frederic late prince of Wales under the age of 18 , appointed the princefs dowager; -and that of 5 Geo . III. $\mathrm{c}_{\text {. }}$. 27. in cafe of a like deffent to any of his prefent majefty's children, empowers the king to name either the

Travels in
the Two
Sicilies.
queen or princefs dowager, or any defcendant of king George II. refiding in England; - to be guardian and regent till the fucceffor attains fuch age, affifted by a council of regency; the powers of them all being exprefsly defined and fet down in the feveral acts.

Regent alfo fignifies a profefor of arts and fciences in a college, having pupils under his care; but it is generally reftrained to the lower claffes, as to rhetoric, logic, \&rc. thofe of philofophy Eeing called profeffors. In the Englifh univerfities it is applied to Mafters of Arts under five years ftanding, and to Doctors under two, as non-regent is to thole above that itanding.

REGGIO, an ancient and confiderable town of Italy, in the kingdom of Naples, and in the Farther Calabria, with an archbifhop's fee, and a woollen manufactory. It is feated in a delightful country, which produces plenty of oranges, and all their kindred fruits. The olives are exquifite, ard high-flavoured. The town, however, cail boalt o neither beautiful buildings nor ftrong fortifications. Of its edifices the Gothic cathedral is the only Itriking one, but it affords noihing curious in architecture. The citadel is far from formidable, according to the prefent fyftem of tactics; nor could the city walis make a long refiftance ag $t i \cdots$, any enemy but Barbary corfairs; and even thefe they have not always been able to repel, for in 1543 it was laid in afhes by Barbaroffa. Multapha facked it 15 years aiter, and the defolation was renewed in 1593 by another fet of Turks. Its expofed fituation, on the very threfhold of Italy, and fronting Sicily, has frem the earlieft period rendered it liaule to attacks and devaftations. The Chal. cidians feized upon it, or, according to the ufual Greek phrafe, founded it, and called the colony Rhegion, from a word that means a break or crack, alluding to its pofition on the point where Sicily broke off from the continent. Anaxilas oppreffed its liberties. Dionyfius the Elder took it, and put many of the principal citizens to death, in revenge for their having refufed his alliance. The Campanian legion, fent to protect the Rhegians, turned its fword againft them, maffacred many inhabitants, and tyrannized over the remainder, till the Roman fenate thouglit proper to punifh thefe traitors with exemplary feverity, though at the fame time it entered into league with the revolved garrifon of Meffina. This union with a fet of villains, guilty of the fame crime, proved that no love of juftice, but political reafons alone, drew down its vengeance on the Campanians. It is about 12 miles $S$. E of Meffina, and igo 'S. by E. of Naples. E. Long. 16. o. N. Lat. 38. 4.

Reggio, an ancient, handfome, and ftrong town of Italy, in the duchy of Modena, with a ftrong citadel, and a bifhop's lee. It has been ruined feveral times by the Got ${ }^{2} 1 \mathrm{~s}$, and other nations. In the cathedral are paintings by the greateft mafters; and in the fquare is the fatue of Brennus, chief of the Ganls. The inhabitants are about 22,000, who carry on a great trade in filk. It was taken by prince Eugene in 1706 , and by the king of Sardinia in 1742 . It is feated in a fettile country to the fouth of the Apennines, and to the north of a fpacious plain, 15 miles north-weft of Modena, and 80 fouth eaft of Milan. E. Long. 11. 5. N. Lat. 44. 43. -The duchy of this name is bounded on the welt by that of Modena, and produces a great deal of filk, and belongs to the duke of Modena, except the marquifate of St Martin, which belongs to a prinie of that name.

REGIAM majestatem. See Lav, in clv. $3 \cdot$
REGICIDE, king-killer, a word chiefly ufed in England in fpeaking of the perfons concerned in the trial, condemnation, and execution, of king Charles I.

REGIFUGIUM was a feaft celebrated at Rome on the 24 th of February, in commemoration of the expulfion of Tarquinius Superbus, and the abolition of regal power. It was alfo performed on the 26th of May, when the king of the facrifices, or Rce Sacrorum, offered bean flour and bacon, in the place where the aflem... blies were held. The facrifice being over, the people hafted away with all fpeed, to denote the precipitats flight of King Tarquin.

REGIMEN, the regulation of diet, and, in a more general fenfe, of all the non-naturals, with a view to. preferve or reftore bealth. See Abstinence, Aliment, Food, Diet, Drink, and Medicine.

The viciflitude of exercife and reft forms alfo a neceffary part of regimen. See Exercise.

It is beneficial to be at reft now and then, but more fo frequently to ufe exercife ; becaufe inaction renders the body weak and liltefs, and labour itrengthens it. But a medium is to be obferved in all things, and too much fatigue is to be avoided : for frequent and violent exercife overpowers the natural ftrength, and wattes the body; but moderate exercife ought always to be ufed before meals. Now, of all kinds of exercife, riding on horleback is the mof convenient : or if the perfon be too weak to bear it, riding in a coach, or at lealt in a litter : next follow fencing, playing at ball, runing, walking. Bat it is one of the inconveniences of old age, that there is feldom fufficient frength for ufing bodily exercife, though it be extremely requifite for heallh: wherefore frictions with the flefh-brufh are neceffary at this time of life; which hould be performed by the perfon himfelf, if poflible; if not, by his fervants.

Sleep is the ixcet focther of cares, and rettorer of ftrength; as it repairs and replaces the waltes that are made by the labours and exercifes of the day. But exceffive'fleep has its inconveniences; for it blunts the fenfes, and renders them lefs fit for the duties of life。 The proper time for fleep is the night, when darkneis. and filence invite and bring it on: day-fleep is lefs refrething; which rule if it be proper for the multitude to obferve, much more is the obfervance of it neceffary for perfons addicted to literary ftudies, whofe minds and bodies are more fufceptible of injuries.

Regimen in grammar, that part of fyntax, or con. Aruction, which regulates the dependency of words, and the alterations which one occafions in another.

## Regimen for Searnen. See Seamen.

REGIMENT, is a body of men, either horfe, foot ${ }_{2}$ or artillery, commanded by a colonel, lieutenant-colonel, and major. Each regiment of foot is divided into companies; but the number of companies differs: though in Britain the regiments are generally 10 companies, $^{2}$ one of which is always grenadiers, exclufive of the two independent companies. Regiments of horfe are coma monly fix troops, but there are fome of nine. Dragoon resiments are generally in war-time 8 troofs, and in time of peace but 6 . Each regiment has a chaplain, quarter-mafter, adjutant, and furgeon. Some German regiments confilt of 2000 foot; and the regiment of Ticardy in France confifted of 6000 , being 120 ccm . panies $_{2}$ of 50 men in each company.

## R E G

## R E G

Repiomortanus ! Regifter.

Regiments wer e firlt formed in France in the year 1558 , and in England in the year 1660.

REGIOMONTANUS. See Muller.
REGION, in geugraphy, a large extent of land, in. habiced by many people of the fame nation, and inclofed within certain limits or bounds.

The modern aftronomers divide the moon into feveral regions, or large tracts of land, to each of which they give its proper name.

Region, in phyfiology, is taken for a divifion of our atmofphere, which is divided into the upper, middle, and lower regions.

The upper region commences from the tops of the mountains, and reaches to the utmof limits of the atmofphere. In this region reign a perpetual, equable, calmnefs, clearnefs, and ferenity. The middle region is that in which the clouds refide, and where meteors are formed, extending from the extremity of the lowelt to the tops of the higheft mountains. The loweft region is that in which we breathe, which is bounded by the reflection of the fun's rays; or by the height to which they rebound from the earth. See Atmosphere and Air.

Ethereal Region, in cofmography, is the whole extent of the univerfe, in which is included all the heavanly bodies, and even the orb of the fixed fars.

Elementary Region, according to the Aritotelians, is a filure terminated by the concavity of the moon's orb, comprehending the atmofphere of the earth.

Region, in anatomy a divifion of the human body, otherwife called savity, of which anatomilts reckon three, viz. the upper region, or that of the head; the middle region, that of the thorax or breait; and the lower, the ablomen, or belly. See Anatomy.

Regron, in ancient Rome, was a part or divifion of the city. The regions were only four in number, till Augultus Cæfar's time, who divided the city into fourteen; over"each of which he fettled two furveyors, called curatores viarum, who were appointed annually, and took their divifions by lot. Thefe fourteen regions contained four hundred and twenty four freets, thirtyone of which were called greater or royal ftreets, which began at the gilt pillar that ftood at the entry of the open place in the middle of the city. The extent of thefe divifions vaiied greatly, fome being from 12000 or 13000 to 33000 feet or upwards in circumference. Authors, however, are not agreed as to the exact limits of each. The curatores viarum wore the purple, had each two liftors in their proper divifions, had flaves under them to take care of fires, that happened to break out. They had alfo two officers, called denunciatores, in each region to give account of any diforders. Four vico-magifit alfo were appointed in each freet, who took care of the freets allotted them, and carried the orders of the city to each citizen.

REGISTER, a public book, in which are entered and recorded memoirs, acts, and minutes, to be had recourle to occafionally for knowing and proving matters of fact. Of thefe there are feveral kinds; as,
I. Regifter of deeds in Yorkhire and Middlefex, in which are regiftered all deeds, conveyances, wills, \&c. that affes any lands or tenements in thofe counties, which are otherwife void againt any fubfequent purchafers or mortgagees, \&c. but this does not extend to ans copyhold eftate, nor to leafes at a rack-rent, or
where they do not exceed 2 I years. The regitered Rigifers memorials mult be ingroffed on parchment, under the hand and leal of fome of the granters or grantees, attelted by witnefles who are to prove the figning or feal. ing of them and the execution of the deed. But thefe regifters, which are confined to two counties, are in Scotland general, by which the laws of North Britain are rendered very ealy and regular. Of thefe there are two kinds; the one general, fixed at Edinburgh, under the direction of the lord-regilter; and the other is kept in the feveral thires, itewartries, and regalities, the clerks of which are obliged to tranfmit the regifters of their refpective courts to the general regifter.
2. Parifh-regifters are books in which are regiftered the baptifms, marriages, and burials, of each parifh.

Registers were kept both at Athens and Rome, in which were inferted the names of fuch children as were to be brought up, as foon as they were born. Marcus Aurelius required all free perfons to give in accounts of their cliildren, within 30 days after the birth, to the treafurer of the empire, in order to their being depofited in the terople of Saturn, where the public acts were kept. Officers were alfo appointed as public regifters in the provinces, that re urfe might be had to their lifts of names, for fettling difputes, or proving any perfon's freedom.

ReGISTER Ships, in commerce, are veffels which obtain a permiffion either from the king of Spain, or the council of the Indies, to traffic in the ports of the Spanifh Weft Indies ; which are thus called, from their being regiftered before they fet fail from Cadiz for Buenos Ayres.

REGISTERS, in chemiftry, are holes, or chinks with ftopples, contrived in the fees of furnaces, to regulate the fire ; that is, to make the heat more intenfe or remifs, by opening them to let in the air, or keeping them clofe to exclude it. There are alfo regifters in the fteam-engine. See STEAM-Engine.

REGISTRAR, an officer in the Englifh univerfities, who has the keeping of all the public records.

REGIUM, Legrum Lepidi, Regium Lepidum, (anc. geog.) ; a town of Cifalpine Gaul, on the Via Emilia fo called from Emilius Lepidus, who was conful with C. Flaminius; but whence it was furnamed Regium is altogether uncertain. Tacitus, relates, that at the battle of Bedriacum, a bird of an unufual fize was feen perching in a famous grove near Regium Lepidum. Now called Reggio, a city of Modena. E. Long. 11. O. N. Lat. 44- 45. See Reggio.

REGNARD (John Francis), one of the beft French comic writers after Moliere, was born at Paris in 1647. He had fcarcely finifhed his ftudies, when an ardent paffion for travelling carried him over the greateft part of Europe. When he fettled in his own country, he was made a treafurer of France, and lieutenant of the waters and forefts: he wrote a great many comedies; and, though naturally of a gay genius, died of chagrin in the 52 d year of his age. His works, confilting of comedies and travels, were printed at Rouen, in 5 vols $12 \mathrm{mo}, 1732$.

REGNIER (Mathurin), the firlt French poet who fucceeded in fatire, was born at Chartres in 1573 . He was brought up to the church, a place for which his debaucheries rendered him very unfuitable ; and thefe by his own confeffion were fo exceffive, that at 30 he had

## REG

Regnum all the infirmities of age. Yet he obtained a canonry $\underset{\text { Regul- }}{\|}$ hium. in the church of Chartres, with other benefices; and died in 1613 . There is a neat Elzevir edition of his works, $122 n 0,1652$, Leyden ; but the moft elegant is that with notes by M. Broffette, 4 to, ${ }^{\text {1 }} 729$, London.

Regnier des Marets (Seraphin), a French poet, born at Paris in 1632 . He dittinguithed himfelf early by his poetical talents, and in 1684 was made perpetual fecretary to the French academy on the death of Mezeray: it was he who drew up all thofe papers in the name of the academy againlt Furetiere : the king gave him the priory of Grammont, and he had alfo an abbey. He died in 1713 , and his works are, French, Italian, Spanifh, and Latin poems, 2 vols; a French grammar; and an Italiantranflation of Anacreon's odes, with fome other tranflations.

REGNUM (anc. geog.), a town of the Regni, a people in Britain, next the Cantii, now Surry, Suffex, and the coalt of Hamplhire, (Camden) ; a town fituated, by the Itinerary numbers, on the confines of the Belgx, in a place now called Ringwood, in Hampfhire, on the rivulet Avon, running down from Salifbury, and about ten miles or more diftant from the fea.

REGRATOR, fignifies him who buys and fells any wares or victuals in the fome market or fair : and regrators are particulariy defer ted to be thofe who buy, or get into their hands, in fairs or markets, any grain, fifh, butter, cheefe, Theep, lambs, calves, fwine, pigs, geefe, capons, hens, chickens, pigeons, conies, or other dead victuals whatfoever, brought to a fair or market to be fold there, and do fell the fame again in the fame fair, market, or place, or in fome other within four miles thereof.

Regrating is a king of buckfry, by which victuals are made deazer; for every feller will gain fomething, which muft of confequence enhance the price. And, in ancient times, both the engroffer and regrator were comprehended under the word foreftaller. Regrators are punifhable by lofs and forfeiture of goods, and im. prifonment, according to the firft, fecond, or third offence, \&c.

REGENSBERG, a handfome, though fmall town of Swifferland, in the canton of Zurich, and capital of a bailiwirk of the fame name, with a frong caftle; feated on a hill, which is part of Meunt Jura. There is a well funk through a rock, 36 fathi ms deep.

REGULAR, denotes any thing that is agreeable to the rules of art: thus we fay, a regular building, verb, \&c.

A fegular figure, ir geometry, is one whofe fides, and confequently angles, are equal; and a regular figure with three or four lides is commonly termed an equilateral triangle or fquare, as all others with more fides are called regular polygons.

Regular, in a monaftery, a perfon who has taken the vows; becaufe he is bound to obferve the rules of the order he has embraced

REGULATION, a ruie or order prefcribed by a fuperior, for the proper management of fome affair.

REGULATOR of a Watch, the fmall fpring belonging to the balance; ferving to adjult its motions, and make it go falter or flower. See Watch.

REGULBIUM, or Regulvium. (Notitia Imperii) ; mentioned nowhere elfe more early: a town of the Cantii, in Britain. Now Reculver, a village on the
coalt, near the ifland Thanet, towards the Thames, to the north of Canterbury, (Camden).

REGULUS (M. Attilius), a conful during the Girf Punic war. He reduced Brundufium, and in his fecond confulfhip he took 64 and funk 30 galleys of the Carthaginian fleet, on the cualts of Sicily. Afterwards he landed in Africa; and fo rapid was his fu ceefs, that in a fhort time he made himfelf mafter of abcut 200 places of confequence on the coaft. The Carthaginians fued for peace, but the conqueror refuled to grant it; and foon after he was defeated in a battle by Xanthippus, and 30,000 of his men were left on the field of battle, and 15,000 taken prifoners. Regulus was in the number of the captives, and he was carried in triumph to Carthage. He was fent by the enemy to $R$ : me, to propofe an accommodation and an exchange ot prifoners ; and if his commifion was unfucceffful, he was bound by the moft folemn oaths to return to Carm thage without delay. When he came to Rome, Regulus difluaded his countrymen from accepting the terrns which the enemy propofed; and when his opinion had had due influence on the fenate, Regulus retired to Carthage agreeable to his engagements. The Carthaginians were told that their offers of peace had been rejectedat $R$ me by the means of Regulus; and therefore they prepared to punifh him with the greateft feverity. His eyebrows were cut, and he was expofed for fome days to the excelfive heat of the meridian fun, and afterwa is contined in a barrel, whofe fides were everywhere find with large iron fpikes, till he died in the greateftagonies. His fufferings were heard of at Rome ; and th? fenate permitted his widow to inflict whatever punithment the pleafed on fome of the moft illuftrious captives of Carthage which were in their hands. She confined them alfo in prefles filled with fharp iron points; and was fo exquifite in her cruelty, that the fenate interfered, and ftopped the barbarity of her punifhment. Regulus died about 251 years before Chrift.-Memmius, a Roman, made governor of Greece by Caligula. While Regulus was in his province, the emperor wifhed to bring the celebrated fatue of Jupiter Olympius by Phidias to Rome, but this was fupernaturally prevented; and according to ancient authors, the fbip which was to convey it was deftroyed by lightning, and the workmen who attempted to remove the fatue were terrified away by fudden noifes.- A man who condemned Sejanus.-Rofcius, a man who held the confulfhip but for one day, in the reign of Vitellius.

Regulus, in chemitry, an imperfect metallic fub. ftance that falls to the bottom of the crucible, in the melting of ores or impure metallic fubltances. It is. the fineft or pureft part of the metal ; and, according to the alchemifts, is denominated regulus, or lit tle king, as being the firft-born of the royal metallic blood. Ac. cording to them, it is really a fon, but not a perfect man; i.e. not yet a perfect metal, for want of time and proper nourifhment. To procure the regulus or mercurial parts of metals, \&c. flux powders are commonly ufed; as nitre, tartar, \&c. which purge the fulphureous part adhering to the metal, by attracting and abforbing it to themfelves.

Regulus of Antimony. See Chemistry, no 1252 -1257; and fee Indicx there, at Antimony.

Regulus of Arfenic. See Chemistriy, $\mathrm{n}^{0}$ 12.67, \&c. and 1285-1294. The ancient procefs for making re-

## R E G

$\underbrace{\text { Requlus. gulus of arferic confifted in mixing four parts of arfenic }}$ with two parts of black flux, one part of borax, and one part of filings of iron or of copper, and quickiy fufing the mixture in a cracible. After the operation is finith. ed, a regulus of arfenic will be found at the bottom of the crucible of a white livid colour, and of confiderable folidity. The iron and copper employed in this procefs are not intended, as in the operation for the martial regulus of antimeny, to precipitate the arfenic, and to feparate it from fulphur or any other fubtance; for the white arfenic is pure, and nothing is to be taken from it ; but, on the contrary, the inflammable principle is to be added to reduce it to a regulus. The true ufe of thefe merals in the prefent operation is to unite with the regulus of arfenic, to give it more body, and to prevent its entire diffipation in vapours. Hence the addition of iron, while it procures thefe advantages, has the inconveniency of altering the purity of the regulus: for the metallic fubftance obtained is a regulus of arfenic allayed with iron. It may, however, be purified from the iron by fublimation in a clofe veffel; by which operation the regulifed arfenical part, which is very volatile, is fublimed to the top of the veffel, and is feparated from the iron, which being of a fixed nature remains at the bottom. We are not, however, very certain, that in this kind of reatification the regulus of arfenic does not carry along with it a certain quantity of iron; for, in general, a volatile fubftance raifes along with it, in fublimation, a part of any fixed matter wich which it happened to be united.

Mr Brandt propofes another method, which we believe is preferable to that defcribed. He directs that white arfenic lhould be mixed with foap. Inftead of the foap, olive-oil may be ufed, which has been found to fucceed well. The mixture is to be put into a retort or glafs matrafs, and to be diftilled or fublimed with fire, at fift very moderate, and only fufficient to raife the oil. As the oils, which are not volatile, cannot be diltilled but by a heat fufficient to burn and decompofe them, the oil therefure which is mixed with the at fenic undergoes thefe alterations, and after having penetrated the arfenic thoroughly is reduced to a coal. When no more oily vapours rife, we may then know that the oil is reduced to coal. Then the fire mult be increafed, and the metallifed arfenic will be foon fublimed to the upper part of the veffel, in the infide of which it will form a metallic cruft. When no more fublimes, the veffel is to be broken, and the adhering cruit of regulus of arfenic is to be feparated. The reguilus obtained by this firft operation is not generally perfect, or not entirely $f a$, as a part of it is always overcharged with fuliginous matter, and another part has not enough of phlogifton; which latter part adheres to the inner furface of the crult, and forms grey or brown crytals. This fublimate mult then be mixed with a lefs quantity of oil, and fublimed a fecond time like the firtt ; and even, to obtain as good regulus as may be made, a third fublimation in a clofe veffel, and without oil, is necelfary. During this operation, the oil which rifes is more fetid than any other empyreumatic oil, and is almoft infupportable. This fmell certairly proceeds from the arienic ; the fmell of which is exceedingly frong and difagreeable when heated.

Reguius of arfenic made by the method we have deferibed, and which we confider as the only one which
is pure, has all the properties of a femimetal. Ii has metaliic gravity, opacity, and luftre. Its colour is white and livid, it tarnifhes in the air, is very brittle, but much more volatile than any other femimetal. It eafily lefes its inflammable principle, when fublimed in veffels into which the air has accefs; the fublimate having the appearance of grey flowers, which by repeated fublimations become entircly white, and fimilar to white cryftalline arfenic. When regulus of arfenic is heated quickly and Arongly in open air, as under a muffe, it burns with a white or bluifh flame, and diffipates in a thick fume, which has a very fetid fmell, like that of garlic.

Regulus of arfenic may be combined with acids and moft metals. See Arsenic, $\mathrm{n}^{\circ}{ }^{17}$. We fall only farther obferve here, that, according to Mr Brandt, in the Swedifh Memoirs, the regulus of arfenic cannot be united with mercury. Although the phenomena exhibited by white arfenic and regulus of arfenic in folutions and allays are probably the fame, yet an accurate comparifon of thefe would deferve notice, efpecially if the regulus employed were well made ; for fome difference mult proceed from the greater or lefs quantity of what in the old chemiftry is called phlogifon with which it is united. See Chemistry, ${ }^{\circ}{ }^{\circ}$ 1288, \&c.

Regozus of Cobaft , is a femimetal lately difcovered, and not yet perfectly well known. It receives its name from cobalt, becaufe it can only be extracted from the mineral properly fo called. The procefs by which this femimetal is obtained, is fimilar to thafe generally ufed for the extraction of metals from their ores. The cobalt muft be thoroughly torrified, to deprive it of all the fulphur and arfenic it contains; and the unmetallic earthy and fony matters muft be feparated by wafhing. The cobalt thus prepared is then to be mixed with double or triple its quantity of black flax, and a little decrepitated fea-falt; and muft be fufed either in a forge or in a hot furnace, for this ore is very difficult of fufion. When the fufion has been well made, we find upon breaking the crucible, after it has cooled, a metallic regulus covered with a fcoria of a deep blue colour. The regulus is of a white metallic colour. The furface of its fracture is clofe and fmall-grained. The femimetal is hard, but brittle. When the fufion has been well made, its furface appeans to be carved with many convex threads, which crofs each other diverfely. As almoft all cobolts contain alfo bifmuth, and even as much as of the regulus itfelf, this bifmuth is reduced by the fame operation, and precipitated in the fame manner, as the ragulus of cobalt; for although thefe two metals are frequently mixed in the fame mineral, that is, in cobalt, they are incapable of uniting together, and are always found diftinct and feparate from one another when they are melted tagether. At the bottom of the crucible then we find both regulus of cobalt and bifmuth. The latter, having a greater fpecific gravity, is found underthe former. They may be feparated from each ather by the blow of a bammer. Bifmuth may be eafily diftinguifhed from the regulus of cobalt, not only from its fituation in the crucible, but alfo by the large fhining facets which appear in its fracture, and which are very different from the clofe afhccloured grain of regulus of cobalt.

This femimental is more difficult of fufion than any

## R E I <br> [ 57.$]$ <br> REL

Regulus other; is lefseafily calcinable, and much lefs volatle. Reichenberg.

Its calx is grey and more or lefs brown; and when fufed with virifiable matters, it changes into a beautiful blue glats called fmatt. This calx, then, is one ut thole which preferve always a part of their inflammable pinciphe. It is foluble in acids, as the regulus is. This regulus is foluble in vitriolic, marine, nitrous aci's, and in aqua regia, to all which it c mmunicates colerrs. The folution in vitriolic acid is reddifh; the folution in manine acid is of a fine bluth-green whin hot, and is colour is almolt totally effaced whan cold, but is eaflly recoverable by heating it, without being obliged to une rik the botle containing $i$. This folution of the calx of rezulus of cobalt is the bafis of the fympathetic ink; for without marice acid this ink cannot be made. sill the folutions of regulus of cobalt may be precipitated by alkais; ; and thefe precipitates are blue, which colour they retain when vitrified with the Atrongeft fire.

Not only fympathetic ink, but alfo regulus of cobalt, may be made from the zaffre commonly fold; which is nothing elfe than the calx of regulus of cobalt mixed with more or lefs pulverifed flints. For this purpofe we mult feparate as well as we can the powder of flints from it, by walhing, as M. Beaume does, and then reduce it with black flux and fea-falt. Regulus of cobalt feems incapable of uniting with fulphur : but it eally unites with liver of fulphur ; and the union it forms is fo intimate, that M. Beaumé could not feparate thefe two fublances otherwife than by precipitation with an acid.

Many curious and interefting remarks are ftill to be difcovered concerning this fingular femimetal, and we may hope to receive further information from the cn deavours of chemifts who have undertaken the examination of it. M. Beaumé particularly has made confiderable experiments on this fubject, part of which he communicates to the public in his Courfe of Chemiltiy, and from whom we have borrowed the moft of the above obfervations. See Chemistry, no 1294 , \&c.

REHEARSAL, in mufic and the drama, an effay or experiment of fome compofition, generally made in private, previous to its reprefentation or performance in public, in order to render the actors and performers more perfect in their parts.

REICHENBERG, in Bohemia, 95 miles weft of Prague, 205 north welt of Vienna, Lat. 50. 2. E. Long. 12.25. is only remarkable as the place where the Prullian army defeated the Auftrians on the 2 ift of April 1757. The Auftrian army, commanded by Count Konigfeck, was poited near Reichenberg, and was attacked by the Pruffians under the command of the prince of Brunfwick Bevern. The Pruffians were 20,000, and the Auftrians 28,000: the action began at half after fix in the morring, when the Pruflian lines wele formed, and attacked the Auttrian cavalry, which was ranged in three lines of 30 fquadrons, and their two wings fultained by the infantry, which was pofted among felled trees and entrenchments. The Aultrians had a village on their right, and a wood on their left, where they were intrenched. The Pruffian dragoons and grenadiers cleared the intrenchment and wood, and entirely routed the Autrian cavalry; at the fame time, the redoubts that covered Reichenberg were taken by General Leftewitz; and the Auftrians were entirely Vol. XVI.
defeated. The Promans had feren oneors and ro kin-jex men killed; 14. chicers and 150 men woundod. The Aultrims had 1000 men klled and wounded; 20 of B. leafe. thair officers and 400 mon taken prifoners. The action andid at eleven.

REMNeEer, on Terandus. See Cervus, ne 4.
REINS, in aratomy, the fame with Kidames. Sec Anatonip, ${ }^{\circ}$ ici.

Reins of a Brille, are two long fips of leather, fa ftened on each fide a curb or fante, which the the: holds in his band, to keep the horfe in fubjection.

There is alfo what is called falfe rims whith is a lath of lea'her, paffed fomstimes through the atch of the binquet, to bend the horfe's neck.

REJOINDER, in law, is the dofucma's anfver to the plaintiff's replication or repl:. Thus, in the courr of chancery, the defendant pats in as andire: to the plaintiff's bill, which is fometimes alfo called an exception; the plaincif's anfwer to that is called a $\%$ plication, and the defendun's anfwer to that a rosime.

RELAND (Adrian), an eminent Orientalut, born at Rgp, in North Holland, in 1676 . During there years itudy under Surenhufius, he made an uncommon: progrefs in the Hebrew, Syriac, Chaldee, and Arabic languages; and thefe languages were always his favounite ltudy. In 1701, he was, by the recommenda. tion of King William, appointed profeflior of Orienta? languages and ecclefialtical antiquities in the univenits of Utrecht; and died of the fmall-pox in 1718 . Fie was diftinguifhed by his modelty, humanity, and leatiing; and carried on a correfpondence with the molt eminent fcholars of his time. His principal worls are, I. An excellent defcription of Paleftine. 2. Five differtations on the Medals of the ancient Hebrews, and feveral other diflirtations on different fubjects. 3. An Introduction to the Hebrew Grammar. 4. The Ar:tiquities of the ancient Hebrews. 5. On the Mahometan Religion. Thefe works are all written in Latin.

RELATION, the mutual refpect of two things, or what each is with regard to the other. See Metaphysics, $\mathrm{n}^{\circ} 93$, \&c. and $\mathrm{I} 2 \mathrm{~S}, 8 \mathrm{sc}$.

Relation, in geometry. See Ratio.
Relition, is alfo ufed for anaiogy. See Ana. logy, and Metaphysics, p. 529, \&c.

RELATIVE, fomething relating to or refpeaing another.

Relative, in mufic. See Mode.
Relatift-Terms, in logic, are words which imply relation: fuch are mafter and fervant, hufband and wife, \&c.

In grammar, relative words are thofe which anfwer to fome cther word forgoing, called the antecedtent; fuch are the relative pronouns qiii, que, quod, axc. and in Englifh, welo, whom, which, \&c. The werd anfwering to thele relatives is often underitood, as, "I know whom you mean," for "I know the perfon whom you mean."

RELAXATION, in medicine, the af of loofening or flackening ; or the lowenefs or fachefs of the fibres, nerves, mufcles, \&c.

RELAY, a fupply of horfes, placed on the road, and appointed to be ready for a traveller to charge, in order to make the greater expedition.

RELEASE, in law, is a difcharge or conveyance of a man's right in lands or tenements, to another that H
lauh
lath fome former eftate in poffeffion. The words generally ufed therein are "c remifed, releafed and for cver quit-claimed." And thefe releafes may enure, either, 1. By way of enlarging an eflate, or enlarger l'cfate: as, if there be tenant for life or years, remainder to another in fee, and he in remainder releafes all his right to the particular tenant and his heins, this gives him the ettate in fee. But in this cafe the relefiee muft be in poffefion of fome eftate, for the releafe to work upon; tor if there be leffee for yeirs, and, before he enters and is in poffeffion, the leffor releafes to him all his right in the reverfion, fuch releafe is void for want of poffeflion in the releffee. 2. By way of parintr an eftate, or mitter l'gfats: as, when one of two coparceners releafeth all his right to the other, this pafieth the fee-fimple of the whole. And, in beth thefe cafes, there mull be a privity of eitate between the releflor and relefiee; that is, one of their eftates mult be fo related to the other, as to make but one and the fame eftate in law. 3. By way of pafling a rigbt, or mitter le droit: as if a man be diffeifed, and releafeth to his diffeifor all his right; hereby the diffeifor acquires a new right, which changes the quality of his eftate, and renders that lawful which before was tortious. 4. By way of extinguifloment: as if my tenant for life makes a leafe to A for life, remainder to $B$ and his heirs, and I releafe to $A$; this extinguifhes my right to the reverfion, and thall enure to the advantage of B's remainder as well as of A's particular eftate. 5. By way of entry and feoffment: as if there be two joint difieifors, and the diffifee releafes to one of them, he thall be fole feifed, and thall keep out his former companion; which is the fame in effect as if the diffeifee had entered, and thereby put an end to the diffeifin, and afterwards had enfeoffed one of the diffeifors in fee. And hereupon we may obferve, that when a man has in himfelf the poffeffion of lands, he mult at the common law convey the freehold by feoffment and livery; which makes a notoriety in the country: but if a man has only a right or a future interelt, he may convey that right or intereft by a mere releafe to him that is in poffeffion of the land : for the occupancy of the releffee is a matter of fufficient notoriety already.

RELEVANCY, in Scots. law. See Law, No clexxvi. 48.

RELICS, in the Romifh church, the remains of the bodies or clothes of faints or martyrs, and the infruments by which they were put to death, devoutly preferved, in honour to their memory; kifed, revered, and carried in proceflion.

The refpect which was jufly due to the martyrs and. teachers of the Chriftian faith, in a few ages increafed almoft to adoration ; and at length adoration was really paid both to departed faints and to relics of holy men or holy things. The abufes of the church of Rome, with refpect to relics, are very flagrant ind notorious. For fuch was the rage for them at one time, that, as F. Mabillon a Benedictine jultly complains, the altars were loaded with fufpected relics; numerous fpurious ones being everywhere offered to the piety and devotion of the faithful. He adds, too, that bones are often. confecrated, which, fo far from belonging to faints, probably do not belong to Chriftians. From the catawoms numerous relics have been taken, and yet it is
not known who were the perfons interred therein. In the irth century, relics were tried by fire, and thofe which did not confume were reckoned genuine, and the re 7ot. Relics were, and ftill are, preferved on the altars whereon mafs is celebrated; a fquare hole being made in the middle of the altar, big enough to receive the hand, and herein is the relce depolited, being firft wrapped in red filk, and inclofed in a leaden box.

The Romanifts plead antiquity in behalf of relics: For the Manichees, out of hatred to the flelh, which they confidered as an evil principle refufed to honour the relics of faints; which is reckoned a kind of proof that the Catholics did it in the firlt ages.

We know, indeed, that the touching of linen cloths. on relics, from an opinion of fome extraordinary virtue. derived therefrom, was as ancient as the firlt ages, there being a hole made in the coffins of the 40 martyrs at Conftantinople exprefsly for this purpofe. The ho-, nouring the relics of faints, on which the church of Rome afterwards founded her fupertitions and lucrative ufe of them, as objects of devotion, as a kind of charms or amulets, and as infruments of pretended miracles, appears to have originated in a very ancient cuftom, that prevailed among Chritians, of aficmbling at the cemeteries or burying-places of the martyrs, for the purpofe of commemorating them, and of performing divine worfhip. When the profeffion of Chrifianity obtained the protection of the civil government, under Conftantine the Great, Atately churches were erected over their fepulchres, and their names and memories. were treated with every poflible token of affection and refpect. This reverence, however, gradually exceeded all reafonable bounds; and thofe prayers and religious. fervices were thought to have a peculiar fanctity and virtue, which were performed over their tombs. Hencethe practice which afterwards obtained, of depofitingrelics of faints and martyrs; under the altars in all churches. This practice was then thought of fuch. importance, that St Ambrofe would not confecrate a church becaufe it had no relics; and the council of Conftantinople in Trullo ordained, that thofe altars. fhould be demolifhed under which there were found no. relics. The rage of procuring relics for this and other purpofes of a fimilar nature, became fo exceffive, that in 386 the emperor Theodofius the Great was obliged to pais a law, forbidding the people to dig up the bodies of the martyrs, and to traffic in their, relics.

Such was the origin of that refpect for facred relics, which afterwards was perverted into a formal worfhip of them, and became the occafion of innumerable proceffions, pilgrimages, and miracles, from which the church of Rome hath derived incredible advantage.In the end of the ninth century, it was not fufficient to reverence departed faints, and to confide in their interceffions and fuccours, to clothe them with an imaginary: power of healing difeafes, working miracles and delivering from all forts of calamities and dangers; their bones, their clothes, the apparel and furniture they had poffeffed during their lives, the very ground which they had touched, or in which their putrefied carcafes were laid, were treated with a ftupid veneration, and fuppofed to retain the marvellous virtue of healing all diforders. both of body and mind, and of defending fuch as poffeffed them againft all the affaults and devices of the de-.

Relics.

## ,

vil. The confecuence of all this ras, that every one which, vicu found, are to be defaced and bu:nt, \& . was eager to provide himielf with thefe falutary remedies; confequeritly great numbers undertook fatiguing and perilous veyages, and fubjected themfelves to all forts of hardfips; while others made ufe of this delufion to accumulate their riches, and to impofe upon the mife.able multitude by the moft impious and fhocking inventions. As the demand for relics was prodigious and univerfal, the clergy employed the utmof dexterity to fatisfy all demands, and were far from being nice in the methods they ufed for that end. The bodies of the faints were fought by falling and prayer, inAlituted by the prieft in order to obtain a divine anfwer and an infallible direction, and this pretended direction never failed to accomplifh their defires; the holy carcale was always found, and that always in confequence, as they impioully gave out, of the fuggeftion and infpiration of God himfelf. Each difcovery of this kind was attended with excelfive demonftrations of joy, and animated the zeal of thefe devout feekers to enrich the church fill more and more with this new kind of treafure. Many travelled with this view into the Eaftern provinces, and frequented the places whioh Chrift and his difciples had honoured with their prefence, that, with the bones and other facred remains of the firt heralds of the gofpel, they might comfort dejeqted minds, calm trembling confciences, fave finking fates, and defend their inhabitants from all forts of calamities. Nor did thefe pious travellers return home empty; the craft, dexterity, and knavery of the Greeks, found a rich prey in the ftupid credulity of the Latin relic-hunters, and made a profitable commerce of this new devotion. The latter paid confiderable fums for legs and arms, fkulls and jaw-bones (feveral of which were Pagan, and fome not human), and other things that were fuppofed to have belunged to the primitive worthies of the Chriftian church; and thus the Latin churches came to the poffeflion of thofe celebrated relics of St Mark, St James, St Bartholomew, Cyprian, Pantaleon, and others, which they fhow at this day with fo much oftentation. But there were many who, unable to procure for themfelves thefe firitual treafures by voyages and prayers, had recourfe to violence and theft ; for all forts of means, and all forts of attempts in a caufe of this nature, were confidered, when fuccefsful, as pious and acceptable to the Supreme Being.Belides the arguments from antiquity to which the Papilts refer, in vindication of their worlhip of relics, of which the reader may form fome judgment from this article, Bellarmine appeals to Scripture in fupport of it, and cites the following paffages, viz. Exod. xiii. 19.; Deut. xxiv. 6.; 2 Kings xiii. 21.; 2 Kings xxiii. 16, 17, 18. ; Ifaiah xi. 10. ; Mathew xi. 20, 2 I, 22.; Acts v. 12-if.; Acts xix. if, i2. See Popery.

The Roman Cetholics in Great Britain do not acknowledge any worhhip to be due to relics, but merely a high veneration and refpect, by which means they think they honour God, who, they fay, has often wrought very extraordinary miracles by them. But, however proper this veneration and refpect may be, its abufe has been fo great and fo general, as fully to warrant the rejection of them altogether.

Relics are forbiden to be ufed or brought into England by feveral ftatutes; and juftices of peace are empowered to fearch houfes for popilh books and relics,

## 3 Jac. I. cap. 26.

RELICT, in law, the fame wilh Widow.

RELIEF (Relevamen; but, in Domerday, Relerotin. Ru $l_{c}$ :um $)$, fignifies a certain fum of moner, which the tenant, holding by knight's fervice, grand ferjeanty, or other tenure, (for which homage or legal fervice is due), and being at full age at the death of his arceltor, paid unto his lord at his entrance. See Primer.

Though reliefs had their original while feuds wer: only life-eftates, yet they continued after feads became hereditary; and were therefore looked upon, very juftly, as one of the greatelt grievances of tenure: efpecially when, at the firlt, they were merely arbitrary and at the will of the lord; fo that, if he pleafed to demand an exorbitant relief, it was in effect to difinherit the heir. The Englifh ill broosed this confequence of their new-adopted policy, and there. fore William the Conqueror by his laws cffort.ined the relief, by drecting (in imitation of the Danifh he. riots), that a certain quantity of arms, and hatmi. ments of war, fhould be paid by the earls, barons, and vavafours refpectively; and, if the latter had no arms, they fhould pay roos. William Rufus broke through this compofition, and again demanded arbitrary un. certain reliefs, as due by the feodal laws; thereby in effect obliging every heir to new-purchafe or ratico:? his land: but his brother Henry I. by the charter be-fore-mentioned, reftored his father's law ; and ordained, that the relief to be paid fhould be according to the law fo eftablithed, and not an arbitrary redemption. But afterwards, when, by an ordinance in 27 Hen. II. called the affife of arms, it was provided, that every man's armour hould defcend to his heir, for defence of the realm, and it thereby became impracticable to pay thefe acknowledgments in arms according to the laws of the Conquetor, the compofition was univerfally accepted of 100 s , for every knight's fee, as we find it ever after eftablifhed. Bur it mult be remem. bered, that this relief was only then payable, if the heir at the death of his anceftor had attained his full age of 21 years.

To RELIEVE the Gurd, is to put freth men upon guard, which is generally every 24 hours.

To Relieve the Trenches, is to relieve the guard of the trenches, by appointing thofe for that duty who have been there before.

To R RLIAVE the Sentries, is to put frefh men upon that duty from the guard, which is generally done every two hours, by a corporal who attends the relief, to fee that the proper orders are delivered to the foldie: who relieves.

RELIEVO, or Relief, in iculpture, $s c$, is the projecture or ftanding out of a figure which arifes preminent from the ground or plane on which it is forred; whether that figure be cut with the chiffel, moulded, or calt.

There are three kinds or degrees of relievo, viz. alto, baffo, and demi-r elievo. The alto-relievo, called alfo, baut-clief, or bigh-relievo, is when the figure is formed after nature, and projects as much as the life. Bafiorelievo, bafs-relief, or low-relievo, is when the work is raifed a litcle from the ground, as in medals, and the frontifpieces of buildings ; and particularly in the hiftoH 2

## REL $\quad[60] \quad \mathrm{REL}$

Relicu, ries, fe:torns, foliages, and other ornaments of friezes. Religizu. Demi-reliero is when one half of the figure rifes from the plane. When, in a baffo-relievo, there are parts that Hand clear out, detached from the reft, the work is called a demi-baff.

In architecture, the relievo or projecture of the orna. ments ought slways to be proportioned to the magni$\mathfrak{t u d}$ of the building it adorns, and to the diftance at which it is to be viewed.

Relievo, or Relief, in painting, is the degree of boldnefs with which the figures feem, at a due diftance, to tand out from the ground of the painting.

The relievo depends much upon the depth of the fhadow, and the Atrength of the light; or on the height of the diferent colours, bordering on one another; and particularly on the difference of the colour of the figure from that of the ground: thus, when the light is fo difpofed as to make the neareft parts of the figure advance, and is well diffufed on the maffes, ye: imfenfibly diminifhing, and terminating in a large tpacious faradow, brought off infenfibly, the relievo is fail to be bold, and the clair obfcure well underftood.

- De Natu- ReLigion (Religio), is a Latin word derived, ra Deorum according to Cicero *, from religere, "to re-confider ;" lib. 2. § 28 , but according to Servius and molt modern grammariReligion ans, from religare, " to bind falf." The reafon affligned by defined; guinhed from theology.
${ }^{2}$ obligation which we feel on our minds from the relation the Roman orator for deducing religio from relego, is in thefe words, " qui autem omnia, qux ad cultum deorum pertinerent, diligenter retractarent, et tanquam relegerent, funt dicti religiofi ex relegendo." The reafon given by Servius for his derivation of the word is, "quod mentem religio religet." If the Ciceronian etymology be the true one, the word religion will denote the diligent fudy of whatever pertains to the worlhip of the gods; but according to the other derivation, which we are inclined to prefer, it denotes that in which we fland to fome fuperior power. In either cafe, the import of the word religion is different from that of theology, as the former fignifies a number of practical duties, and the latter a fyttem of fpeculative truths. Theolozy is therefore the foundation of religion, or the fcience from which it fprings; for no man can tudy what pertains to the worflip of fuperior powers till he believe that fuch powers exift, or feel any obligation on his mind from a relation of which he knows nothing.

This idea of religion, as diftinguilhed from theology, compreherds the duties not orily of thofe more rezined and complicated fytems of theifm or polytheifm which have prevailed among civilized and enlightened nations, fuch as the polyblelim of the Greeks and Romans, and the theifm of the Jew's, the Mahometans, and the Chrilians; it comprehends every lentiment of obligation which human beings have ever conceived themelves under to fuperior powers, as well, as all the forms of worthip which have ever been practifed th:ougla the woill, however fantaftic, immoral, or abfurd.
When we turn our eyes to this feature of the human ctaracter, we find it peculiarly interenting. Mankind are dilinguifled from the brutal tribes, and elevated to an higher rark, by the mational and moral faculties with which they are endowed; but they are fill more widely difinguified from the inferion creation, and more high-
ly exalted above them, by being made capable of religi- Religion. ous notions and religious fentiments. The flighteft knowledze of hiftory is fufficient to inform us, that reJigion has ever had a powerful influence in moulding the fentiments and manners of men. It has fometimes dignified, and fometimes degraded, the human character. In one region or age it has been favourable to civilization and refinement; in another, it has occalionally cramped the genius, depraved the morals, and deformed the manners of men. The varieties of religion are innumerable; and the members of every diftinct fert mult view all who differ from them as more or lefs miftaken with refpect to the moft important concerns of man. Religion feems to be congenial to the heart of man ; for wherever human fociety fubfifts, there we are certain of finding religious opinions and fentiments.
It muft, therefore, be an important fubject of fectu- Three ${ }^{4}$ lation to the man and the philofopher to confider the queftions origin of religion; to inquire, How far religion in gene- concerning ral has a tendency to promote or to injure the order and happinefs of fociety ? and, above all, to examine, What particular religion is beft calculated to produce an happy influence on human life?

We fhall endeavour to give a fatisfactory anfwer to each of thefe queftions, referving to the article Theology the confideration of the dogmas of that particular religion which, from our prefent inquiries, fhall appear to be true, and to have the happieft influence on human life and manners.
I. The foundation of all religion refts on the belief of the ${ }^{5}$ of the exiftence of one or more fuperior beings, who fource or govern the world, and upon whom the happinefs or mi. foundation fery of mankind ultimately depends. Of this belief, as of religion. it may be faid to have been univerfal, there feem to be but three fources that can be conceived. Either the image of Deity mult be ftamped on the mind of every human being, the favage as well as the fage ; or the founders of focieties, and other eminent perfons, tracing by the efforts of their own reafon vifible effects to invifible caufes, mult have difcovered the exiftence of fuperior powers, and communicated the difcovery to their affociates and followers ; or, lafly, the univerfal belief in fuch powers muft have been derived by tradition from a primæval revelation, communicated to the progenitors of the human race.

One or other of thefe hypothefes mult be true, be- It does not caufe a fourth cannot be framed. But we have elfe- arife from where (Polytheism, no 2.) examined the reafoning an original which has been employed to eltablith the firt, and fhewn flamp on that it proceeds upon falfe notions of human nature. We fhould likewife pronource it contrary to fact, could we believe, on the authority of fome of its patrons, who are not afhamed to contradict one another, that the Kamtfchatkans, and other tribes, in the loweft ftate of reafoning and morals, have no ideas whatever of Deity. We proceed, therefore, to confider the fecond hypothefis, which is much more plaufible, and will bear a Atricter fcrutiny.

That the exifience and many of the attributes of the $\frac{7}{7}$ Deity are capable of rigid demonftration, is a truth reafouing; which cannot be controverted either by the philofopher or the Chriftian ; for "the invifible things of Him from the creation of the world are clearly feen, being underflood by the things that are made, even His eternal power and Godhead," (fee Metarhysics, Part III.

adequate ideas and noticns of evcry object in which rendered them carable of exerting their natural facul. Religion. they were intureltos, brought all their organs, external and juternal, at once to their utmot poffible fate of perfectica : taught them infantaneoully the laws of reatoning; and, in one word, fored their minds with every branch of ufeful knowledge? This is indeed our own opinion; and it is perfectly agreeable to what we are taught by the Hebrew lawgiver. When God had formed Adam and Eve, Moles does not fay that he left them to acquire by flow degrees the ufe of their fenfes and reafoning powers, and to diftinguifh as they could iruits that were falutary from thofe that were poifonous. No: he placed them in a garden where every tree but one bore fruit fit for food; he warned them particularly againd the fruit of that tree; he brought before them the various animals which roamed through the garden; he arranged there animals into their proper genera and fpecies; and by teaching Adam to give them names, he communicated to the firft pair the elements of language. This condefcenfion appears in every refpect worthy of perfect benevolence; and indeed without it the helplefs man and woman could not have lived one whole week. But it cannot be fuppofed, that amidft fo much ufeful inftruction the gracious Creator would neglect to communicate to his rational creatures the knowledge of himfelf; to inform them of their own origin, and the relation in which they ftood to him ; and to thate in the plaineft terms the duties incumbent on them in return for fo much goodnefs.

To of conmur nication notcertainly knowin.

In what minner all this knowledge was communicated, cannot be certainly known. It may have been in either of the fullowing ways conceivable by us, or in others of which we can form no conception. God may have miraculoufly ftored the minds of the firft pair with adequate ideas and notions of fenfible and intellectual objects; and then by an internal operation of his own Spirit have enabled them to exert at once their rational faculties fo as to difcover his exittence and attributes, together vith the relation in which as creatures they ftood to him their Almighty Creator. Or, after rendering them capable of diftinguifhing objects by means of their lenfes, of comparing their ideas, and underftanding a language, he may have exhibited himfelf under fome fenfible emblem, and conducted them by degrees from one branch of knowledge to another, as a fchoolmalter conducts his pupils, till they were fufficiently acquainted with every thing relating to their own happinefs and duty as rational, moral, and religious, creatures. In determining the queftion before us, it is of no importance whether infinite wifdom adopted either of thefe methods, or fome cther different from them both which we cannot conceive. The ordinary procels in which men acquire knowledge is, by the laws of their nature, extremely tedious. They cannot reafon before their minds be ftored with ideas and notions; and they cannot acquire thefe but through the medium of their

II
But whether inter* nal or exter: , it was equally a revela tion. fenfes long exercifed on external objects.

The progenitors of the human race, left to inform themfelves by this procefs, muft have inevitably perifhed before they had acquired one ditinct notion; and it is the fame thing with refpes to the origin of religion, whether God preferved them from deltruction by an internal or external revelation. If he fored their minds at once with the rudiments of all ufeful knowledge, and
ties, fo as, by tracing effects to their caures, to difcover his being and attributes, he revealed himfelf to them as certainly as he did afterwards to Mofes, when to him he condefcended to fpeak face to face.

If this reafoning be admitted as fair and conclufive, Such a reand we apprehend that the principles on which it pro- velation ceeds cannot be confidered as ill-founded, we have ad- muft natuvanced fo far as to prove that mankind. muft have been originally enlightened by a revelation. But it is farce neceffary to obferve, that this revelation mult have been handed down through fucceeding generations. It could not fail to reach the era of the deluge. It is not abfurd to fuppofe, that he who fpake from heaven to Adam, fpake alfo to Noab. And both the revelation which had been handed down to the poitdeluvian patriarch by tradition, and that which was communicated immediately to himfelf, would be by him made known to his defcendants. Thus it appears almof impoffible that fome part of the religious fentiments of mankind fhould not have been derived from revelation; and that not of the religious fentiments of one particular family or tribe, but of almolt all the nations of the earth. rally be handed to pofterity.

This conclufion, which we have deduced by fair rea-Th 13 foning from the benevolence of God and the nature of rity of the man, is confirmed by the authority of the Jewifh and Jewifh and Chriftian Scriptures, which are entitled to more im- Chriftian plicit credit than all the other records of ancient hif- \&cr. tory.

When we review the internal and external evidence of the authenticity of thefe facred books, we cannot for a moment hefitate to receive them as the genuine zord of God. If we examine their internal character, they every where appear to be indeed the voice of Heaven. The creation of the world-the manner in which this globe was firt peopled-the deluge which fwept away its inhabitants-the fucceeding views of the flate of mankind in the next ages after the deluge-the calling of Abraham-the legiflation of Mofes-the whole feries of events which befel the Jewilh nation-the pro-phecies-the aprearance of Jefus Chritt, and the promulgation of his gofpel, as explained to us in the Scrip-tures-form one feries, which is, in the higheft degree, illuftrative of the power, wifdom, and goodnefs of the Supreme Being.

While it muft be allowed that the human mind is ever prone to debafe the fublime principles of true religion by enthufiafm and fupertition, rearon and can. dour will not for a moment hefitate to acknowledge, that the whole fyftem of revelation reprefents the Supreme Being in the moft fublime and amiable light: that, in it, religion appears effentially connected with morality: that the legiflative code of Mofes was fuch as no legiflator ever formed and eftablifhed among a people equally rude and uncultivated: that the manners and morals of the Jews, vicious and favage as they may in fome inftances appear, yet merit a much higher character than thofe either of their neighbours, or of almoft any other nation, whofe circumftances and character were in orher refpects fimilar to theirs: that there is an infinite difference between the Scripture prophecies and the oracles and predictions which prevailed among heathen nations: and that the miracles recorded in thofe writings which we efteem facred were attended with circumfances which entitle them to be ranked in a very different

Religion.

I 4
The five books of Mofes proved to be divine. ture have fabricated among other nations. See Miracle and Prophecy.

But as the evidence of the divine origin of the primæval religion refts particularly on the authority of the firt five books of the Oid Teftament, it may be thought incumbent on us to fupport our reanoning on this fubject, by proving, that the author of thofe books was indeed infpired by God. This we fhall endeavour to do by one decifive argument ; for the nature of the article, and the limits preicribed us, admit not of our entering into a minute detail of all that has been written on the divine legation of Mofes.

If the miracles recorded in the book of Exodus, and the other writings of the Hebrew lawgiver, were really performed; if the firlt-born of the Egyptians were all cut off in one night, as is there related; and if the children of Ifrael paffed through the Red fea, the waters being divided, and forming a wall on their right hand and on their left-it muft neceffarily be granted, that Mofes was fent by God; becaufe nothing lefs than a divine power was fufficient to perform fuch wonderfal works. But he who fuppofes that thofe works were never periormed, mult affirm that the books recording them were forged, either at the era in which the miracles are faid to have been wrought, or at fome fubfequent era: There is no other alternative.

That they could not be forged at the era in which they affirm the miracles to have been wrought, a very few reflections will make incontrovertibly evident. Thefe books inform the people for whofe ufe they were written that their author, after having inflicted various plagues upon Pharaoh and his fubjects, brought them, to the number of 600,000, out of Egypt with a high hand; that they were led by a pillar of cloud through the day, and by a pillar of fire through the night, to the brink of the Red fea, where they were almolt overtaken $b y$ the Egyptians, who had purfued them with chariots and horfes; that, to make a way for their efcape, Mofes ftretched out his rod over the fea, which was immediateIy divided, and permitted them to pafs through on dry ground, between two walls of water ; and that the $E$ gyptians, purfuing and going in after them to the midft of the fea, were all drowned by the return of the waters to their ufual fate, as foon as the Hebrews arrived at the further fhore. Is it poflible now that Mofes or any other man could have perfuaded 600,000 perfons, how. ever barbarous and illiterate wefuppofe them, that they had been witneffes of all thefe wonderful works, if no fuch works had been performed? Could any art or eloquence perfuade all the inhabitants of Philadelphias that they had yefterday walked on dry ground through a fea twenty or thirty miles wide, the waters being divided and forming a wall on their right hand and on their left? If this queftion mult be anfwered in the negative, it is abfolutely impoffible that the books of Mofes, fuppoling them to have been forged, could have been received by the people who were alive when thofe wonders are faid to have been wrought.
period.

- Deưt. xxxi. 24 87.
ark which, upon this fuppofition, had no exiftence prior Keligion. to the forgery. They fipeak of themfelves likewife, not only as a hiftory of miracles wrought by their author, but as the Itatutes or municipal law of the nation, of which a copy was to be always in the poffefion of the priefts, and another in that of the fupreme magiftrate $\dagger$. $\dagger$ Deut. Now, in whatever age we fuppofe thefe books to have xviii. 19. been forged, they could not poffibly be received as autthentic; becaufe no copy of them could then be found either with the king, with the priefts, or in the ark, though, as they contain the fatute law of the land, it is not conceivable that, if they had exifted, they could have been kept fecret. Could any man, at this day, forge a book of flatutes for England or America and make it pafs upon thefe nations for the only book of fatutes which they had ever known? Was there eve: fince the world began abook of fham flatutes, and theie, too, multifarious and burdenfome, impofed upon any people as the only fatutes by which they and their fathers had been governed for ages? Such a forgery is evidently imporfible.

But the books of Mofes have internal proofs of authenticity, which no other books of a ncient fatutes ever had They not only contain che laws, but f al give an hiltorical account of their enactment, and the reafons upon which they were founded. Thus they tell uss, that \$ Gen. xy:\%. the rite of circumcifion was inflituted as a mart of the cavenant between God and the founder of the Jewift nation, and that the practice of it was enforced by the declaration of the Almighty, that every uncircumcifed man-child fhould be cut off from his people. They inform us that the annual folemnity of the pafiover was inftituted in commemoration of their deliverance when God flew, in one night, all the firt-born of the Egyptians; that the firt-born of Ifrael, boih of men and bealt, were on the fame occafion dedicated for ever to God, who took the Levites infead of the filt-born of the men $\ddagger$; that this tribe was confecrated as priefts, by $\ddagger$ Exod. xii, whofe hands alone the facrifices of the people were to and Numb.. be offered ; that it was death for any perfon of a differ-vii. ent tribe to approach the altar, or even to touch the ark of the covenant; and that Aaron's budding rod was kept in the ark in $m$ mory of the wonderful deftruction of Korah, Dathan, and Abiram, for their rebellion againt the priefthood.
ls it poffible now, if all thefe things had not been practifed among the Hebrews fromthe era of Mofes, with a retrofpect to the fignal mercies which they are faid to commemorate, that any man or body of men could have perfuaded a whole nation, by means of forged books, that they had always religioufy obferved fuch inftitutions? Could it have been pofifle, as any period pofterior to the Exodus, to perflude the Ifraelites that they and their fathers had all been circumcifed on the sighth day from their birth, if they had been confcions themfelves that they had nevar been ci:cumcifed at all ? or that he paffover was kept in memory of their deliverance in Egyptian bondage, if no fuch feftival was known among them?

But let us fuppofe that circumcifion had been practifed, and all their other rites and ceremonies obferved from time immemorial, without their knowing any reafon of fuch inftitutions; fill it mult be confefled that the forger of thefe books, if they were forged, conftructed lis narrative in fuch a manner as that no man.
af

## R EL

Religin. n . n of common fenfe could receive it as authentic. He fays never heard or before, and as the ritual he was endeavouring to make them elleem facred was oppreffively multifarious ; furely fome daring fpirit would have ventured to pu: his veracity to the teft by moving the ark and even offering facrifices; and fuch a teft would at once have expofed the impolture. The budding rod, too, and the pot of manna, which, though long preferved, were never before heard of, mult have produced inquiries that could not fail to end in detection. Thefe books fpeak likewife of weekly fabbaths, daily facrifices, a yearly expiation, and monthly feftivals, all to be kept in remembrance of great things particularly fpecilied as cone for the nation at an early perind of its exiftence. If this was not the cafe, could the forger of the books have perfuaded the people that it really was fo? The culightened reafoners of this nation would be offended were we to compare them with the ancient Ifraelites; but furely they will not fay that we are partial to that people, it we bring them to a level with the mol favage tribes of the Ruffian empire, who profefs Chriftianity? Now, were a book to be foiged containing an account of many ftrange things done a thoufand years ago in Siberia by an Apollonius, or any other philofopher or hero, numbers of the barbarians inhabiting that country would, we doubt not, give implicit credit to the legend: But were the author, in confirmation of his narrative, to affirm, that all the Siberians had from that day to this kept facred the firft day of the week in memory of his hero; that they had all been baptized or circumafed in his name; that in their public judicatories they had fworn by his name, and upon that very book which they had never feen before; and that the very fame book was their law and their gofpel, by which for a thoufand years back the actions of the whole people had been regulated-furely the groffeft favage among them would reject with contempt and indignation a forgery fo palpable.

If this reafoning be conclufive, the books of Mores mult indubitably be authentic, and he himfelf molt have been infpired by the fpirit of God. But this point being eftablifhed, the queftion refpecting the origin of the primeval religion is completely anfwered. The writer of the book of Genefis informs us, that Adam and Noah received many revelations from the Author of their being, and that their religion was founded on the principles of the pureft theifm. How it degenerated among the greater part of their defcendants into the grofelt idolatry, has been fhown at large in another focicty. religious fentiments have a tendency to injure or to promote the welfare of fociety? This is a fubject of the umoft importance; and if we prove fuccefsful in our inquiries, we fhall be enabled to determine whether the grvernors of mankind ought carefaily to fupport religious eftablifhments, or whether the philofopher who callo himfelf a citizen of the world, and profeffes to feel the molt eager defire to promote the interefts of his fpecies, acts confiftently when he labours to exterminate religion from among men.

* M. Necker.

A celebrated French financier*, a man of abilities
of religious opinions, labours to thow that religious eftablifhments are indifpenfably neceffary for the maintenance of civil order, and demontrates how weak the infuence of political infitutions is on the morals of mankind; but he refufes to review the hiftory of paft ages in order to difcover how far religious opinions have actually been injurious or beneficial to the welfare of fociety; choofing rather to content himfelf with the refult of a feries of metaphyfical difquifitions.

We admire the pirit which induced a man who had fpent a confiderable part of his life amid the hurry of public bufinefs, to become the ftrenuous advocate of religion ; but we cannot help thinking that, notwithltanding the eloquence, the acuteneis, and the knowledge of mankind which he has difplayed, his refufing to admit the evidence of facts concerning the influence of religion on fociety may poflibly be regarded by its enemies as a tacit acknowledgement that the evidence of facts would be unfavourable to the caufe which he wifhes to defend. The fallacy of general reafonings, and the inutility of metaphyfics for the purpofes of life, are fo univerfally acknowledged, that they have long been the theme of declamation. Though the abufes of religion, as well as the abufes of reafon, the perverfina of any of the principles of the human mind, and the mifapplication of the gifts of providence, may have often produced effects hurtful to the virtue and the happinefs of mankind ; yet, after tracing religion to a divine origin, we cannot, for a moment, allow ourfelves to think that the primary tendency of religion mult be holtile to the interefts of fociety, or that it is neceflary to view it abftractly in order that we may not behold it in an odious light. Often has the fceptic attacked religion with artful malice; but perhaps none of his attacks has been fo fkilfully directed as that which has firft ridiculed the abfurdity of the molt abfurd fuperfitions, and afterwards laboured to prove that the molt abfurd fyftem of polytheifm is more favourable to the interefts of fociety than the pureft and molt fublime theirm. Inftances in which the abufe of religion had tended to deprave the human heart, and had led to the moft fhocking crimes, have been affiduoully collected, and difplayed in all the aggravating colours in which eloquence could array them, till at length even the friends of true religion have been abalhed; and it has become a fafhionable opinion, that nothing but felf-interef or bigotry can prompt men to reprefent religion as the friend of civil order. But let us try if, by a candid confideration of what effects have refulted to fociety from religious principles, in general, without comparing thefe with regard to truth or falfehood, we can advance any thing to vindicate the character of religion.

Notions of Deity in general, of various orders of divinities, of their moral character, of their influence on human life, of a future ftate, and of the immortality of the human foul, conttitute the leading articles of religion. Let us view thefe together with the rites to which they have given rife; and we may perhaps be enabled to form fome well-grounded notions on this important point.

1. Having proved that the firf religious principles entertained by men were derived from revelation, it is impoffible to fuppofe that they could produce effects in-

18 Triumphs tic on fepcount of the abufes of religion,

## REL $\left.\mid \sigma_{S}\right] \quad$ REL

$\underbrace{\text { Religing. }}$ jurious to focies. If religion of any kind has ever leffened the virtue or diftubsad the peace of men, it mult have been that religien which fprings from a belief in a multitude of fuperior powers actuated by farfions, and of whom fome were conceived as benevolent and ochers as malicious baings. That fuch fentiments

20
The effect of atheifm on the, mamners of nation.

21
Would be more malignant than that of the moft abfurd paganifm, fhould have produced vices unknown in focieties where pure theilm is profeffed, will be readily admitied. Even the few atheifs who live in Chriltian or Mahometan countries are reltrained by the laves, by a defire to promote the honour of the fect, and by many oher confiderations, from indulging in practices which the example of the falle gods of antiquity fanctioned in their voturies. But in determining the prefent queftion, we mult not compare the virtues of the pazan world with thofe of individual atheifts in modern Europe, but with thofe of nations profeffing atheifm; and fuch nations are nowh re to be found. We can however ealily craceive, that in a fociety unawed by any notions of God or a future fate, no fuch laws would be enacted as thofe which reftrain the fenfual appetites; of which the criminal indulgence was one of the greatell Atigmas on the pagan worthip of antiquity. In fuch focieties, therefore, thofe vices would be practifed conftantly to which paganim gave only an occafonal fantion ; and many others, in fite of the utmoft vigilance of human laws, would be perperrated in fecret, which the moft profligate pagans viewed with horrcr. Confcience, though acting with all her energy, would not be able to command any regard to the laws of morality: No virtue would be known; focial order would be nowhere obferved; the midnight affatin would every where be found; and in the general fcramble mankind would be exterminated from the face of the earth.

The worlt fpecies of paganifm, even that which prevails among favages who worthip evil fpirits, affords greater fecurity than this. It is indeed thocking to think that demons fhould be worfhipped, while deities, who are regarded as being all benevolence, are treated with contempt: And it has been atked, If the influence of fuch religious fentiments on the moral pratice of the idolaters muft not naturally be, to caufe them to treat their friends and benefactors with ingratitude, and to humble themfelves with mean fubmilion before a powerful enemy ?

They do not appear to have produced fuch effects on the morality of the favages by whom they were entertained. The benevolent deitics were neglected, only becaufe their benevolence was neceffiry. A voluntary favour merits a grateful return : a defigned injury provokes refentment. But when you become, by accident, the inftrument of any man's good fortune, the world will fearce confider him as owing you any obligation: the fone which bruifes your foot escites only a momentary emotion of refentment. Thofe gods who could not avoid doing good to men might not receive a profution of thanks for their fervices; and yet a favour conferned by an human benefactor commands the warmeft gratitude. But thofe rude tribes appear to have had fo much wifdom as to confer a lefs abfolute malice on thicir malevolent deitie:, than the benevolence which they attributed to their more amiable order of fuperior - beings: though the latter could not poffibly do them any thing but good, and that conftantly; yet the former were not under an eciually indifpenfable neceffity of Vol. XVI.
perfevering in depreffing them under calamities. On Relirin. their malevolent deities they conferred a frodom of agency which they denied to the benevo'cnt. To wonder, then, that they were more affiduous in paying their court to the one than to the other. They might witis as much proprieis have thought of being grateful to the boar or Hag whofe flefh fupperted them, as to dei. ties who were always benevolent, becaufe they could not poffibly be cticrwife. Thoush negligent of fuch deites, this can farce be thought to have had any iendency to render them ungrateful to benefactors like themfelves. And $y \in t$, it mult not be diffembled, that the American Indians, among whom fuch 1 eligions fentiments have been found to prevail, are faid to be very litile fenfible to the emotions of gratitude. Ar Indian receives a prefent without thinking of makisg any grateful acknowledgments to the beltower. He pleales his fancy or gratifies his appetite with what ycu have given, without feeming to confider himfelf as under the fmalleft obligation to you for the gift.

It may be doubted, however, whether this fpirit of ingratitude originates from, or is only collateral with, that indifference which refufes adoration and worfhip to the benevolent divinities. If the former be actually the cafe, we nult acknowledge that thofe religious notions which we now confider, though preferable to general atheifm, are in this refpect unfieiendly to virtue. Bat if the Indians may be thought to owe the ingratitude for which they ale diftinguithed to the opinion which they entertain of the exiftence of a benevolent order of deities, whofe benevolence is neceffary and involuntary, their ideas of the nature of their malevolent demons do not appear to have produced equal effects on their mo. ral fentiments. However fubmiflive to thofe dreaded beings, they are far from fhowing the fame tame and cowardly fubmiflion to their human enemies: towards them they feem rather to adopt the fentiments of their demons. Inveterate rancour and brutal fury, inhuman cruelty and inconceivable cunning, are difplayed in the hoftilities of tribes at war ; and we know not, after all, if even thefe fentiments do not owe fomewhat of their force to the influence of religion.

Yet let us remember that thefe fame Indians have not been always reprefented in fo unamiable a light; or, at leatt, other qualities have been afcibed to them which feem to be inconfitent with thofe barbarous difpofitions. They have been defcribed as peculiarly furceptible of conjugal and parental love; and he who is fo cannot be deftitute of virtue.
2. But leaving the religion of favages, of which very The inf little is known with certainty, let us proceed to exa- ence of mine what is the natural influence of that mixed fyftem Greek and of theology which reprefents to the imagination of men Roman poa number of fuperior and inferior divinitiss, actuated lytheifm. by the fame pafions and feelings with themfelves, and nften making ufe of their fuperior power and knowledge for no other purpofe but to enable them to violate the laws of moral order with impunity. This is the celebrated polytheifm of the Greeks and Romans, and molt other nations of antiquity (fee Polytheism). Could its influence be favourabie to virtue?

At a firf view every perfon will readily declare, that Apparentfuch a fyftem muft have been friendly to protligacy. If ly friendly you commit the government of the univerfe, and the to profligainfpection of human fociety, to a fet of beings who are cy; I
oiten

Religion. often difpofed to regard vice with a no lefs favourable eye than virtue, and who, though there be an eftablifh ed order by which virtue is difcriminated from vice, and right from wrong, yet feruple not to viclate that order in their own conduct ; you cannot expect them to require in you a degree of rectitude of which they themfelves appear incapable. A Mercury will not difcourage the thievifh arts of the trader; a Bacchus and a Venus cannot frown upon debauchery; Mars will behold with favage delight all the cruelties of war. The Thracians indeed, one of the mof barbarous nations of antiquity, whofe ferocity was little if at all inferior to that of the Indians who had been diftinguifhed as canibals, was the favourite nation of Mars; among whom flood his palace, to which he repaired when about to mount his chariot, and arm himfelf for battle. Even Jupiter, who had been guilty of fo many acts of tyrannical caprice, had been engaged in fuch a multitude of amorous intrigues, and feemed to owe his elevated ftation as monarch of the fky, not to fuperior goodnefs or wifdom, but merely to a fuperior degree of brutal force, could not be feared as the avenger of crimes, or revered as the impartial rewarder of virtues.

That this fyftem had a pernicious effect on morals,

23
Put when contrafted with atheifm its heifm its effects. It was fo conneited with the order of fociety, cre that, without its fupport, that order could farce have favourable: been maintained. The young rake might perhaps juftify himfelf by the example of Jupiter, or Apollo, or fome other amorous divinity; the frail virgin or matron might complain of Cupid, or boaft of imitating Venus ; and the thief might practife his craft under the patronage of Mercury: But if we take the whole fyftem together, if we confider with what views thofe deities were publicly worfhipped, what temples were raifed, what rites infituted, what facrifices offered, and what feria confectated; we thall perhaps find it neceffary to acknowledge that the general effects even of that mixed and incoherent fyftem of polytheifm which prevailed among the Greeks and Romans were favourable to fociety. To ftate a particular inftance; the ancilia of Mars and the fire of Vefta were thought to fecure the perpetuity of the Roman empire. As long as the facred ancile, which had been dropped from heaven for that benevolent purpofe, was fafely preferved in thofe boly archives in which it had been depofited; and as long as the facred fire of Vefta was kept burning, without being once extinguifhed, or at leaft fuffered to remain for an inftant in that fate ; fo long was Rome to fubfift and flourifh. And, however fimple and abfurd the idea which connected the profperity of a nation with the prefervation of a piece of wood in a certain place, or with the conftant blazing of a flame upon an hearth; yet no fact can be more certain, than that the patriotifm and enthufiaftic valour of the Romans, which we fo much extol and admire, were, in many infatces, owing in no inconfiderable degree to the veneration which they entertained for the ansilia and the and that, as compared with pure theifm, it was injurious to fociety, cannot be denied ; but yet, when contrafted with atheifm, it was not without its favourable , and the hearts of the people knit together ; and when perfuaded, that by propitiating the gods they bad removed the caufe of their diftrefs, they acquired fuch calmnefs and ftrength of mind as enabled them to take more direct and proper meafures for the fafety of the fate.

Could we view the ancient Greeks and Romans act. ing in public or in private life under the influence of that fy ftem of fuperfition which prevailed among them; could we pexceive how much it contributed to the maintenance of civil order ; could we behold Numa and Lycurgus eftablifhing their laws, which would otherwife have met with a very different reception under the fanction of divinities; could we obferve all the be. neficial effects which arofe to communities from the celebration of religious ceremonies-we fhould no longer hefitate to acknowledge, that thofe principles in the human heart by which we are fufceptible of religious feritiments, are fo eminently calculated to promote the happinefs of mankind, that even when perverted and abufed, their influence is fill favourable.

The ideas which prevailed among the nations of the 25 heathen world concerning a future flate of retribution tion of a were, it muft be confeffed, not very correct. Some of future flate the poets, we believe, have reprefented them in no un- of retribufair light: both Homer and Virgil have conducted their tion incorheroes through the realms of Pluto, and have taken ic rccit ; cafion to unfold to us the fecrets of thofe dreary abodes. 'The feenes are wild and fanciful; the rewards of the jult and virtuous are of no very refined or dignified nature : and of the punifhments inflicted on the guilty, it is often hard to fay for what ends they could be inflifed; whether to correct and improve, or for the gratification of revenge or whim: they are often fo whimfical and unfuitable, that they cannot with any degree of propriety be afcribed to any caufe but blind chance or wanton caprice. A great dog with three tongues, a peevifh old boatman with a leaky ferry-boat, de-

## REI

Rcligion. manding his freight in a furly tone, and an uxorious monarch, are objects too familiar and ludicrous not to degrade the dignity of thofe awful fcenes which are reprefented as the manfions of the dead, and to prevent them from making a deep enough imprefion on the imagination. The actions and qualities, too, for which departed fpirits were admitted into Elyfium, or doomed to the regions of fuffering, were not always of fuch a nature as under a well-regulated government on earth would have been thought to merit reward, or to be worthy of punifhment. It was not always virtue or wifdom which conducted to the Elyfian fields, or gained admiffion into the fociety of the immortal gods.Ganimede was for a very different reafon promoted to be the cup-bearer of Jove; and Hercules and Bacchus could not furely plead that any merits of that kind entitled them to feats in the council, and at the banquets of the immortals. That doctrine, likewife, which reprefented mortals as hurried by fate to the commiffion of crimes, which they could no more abftain from committing than the fword can avoid to obey the impulfe of a powerful and furious arm plunging it into the breaft of an unrefifting antagonift, could not but produce effects unfavourable to virtue; and it afforded a

26
Fut neverchelefs fa-? vourable to virtue and moral oreler. ready excufe for the moft extravagant crimes.

Yet, after all, he who attentively confiders the ideas of the Greeks and Romans concerning the moral government of the world and a future tate of rewards and punifhments, will probably acknowledge, that their general influencemult have been favourable to virtue and moral order. Allow them to have been incorreat and dafhed with abfurdity; fill they reprefent punifhments prepared for fuch qualities and actions as were injurious to the welfare of fociety ; whillf, for thofe qualities which rendered men eminently ufeful in the world, they hold forth a reward. Though incorrect, their ideas concerning a future ftate were exceedingly diftinct; they were not vague or general, but fuch as might be readily conceived by the imagination, in all their circumftances, as really exifting. When a man is told that for fuch a deed he will be put to death, he may fhudder and be alarmed, and think of the deed as what he mult by no means commit; but place before him the fcene and the apparatus for his execution, call him to behold fome other criminal mounting the fcaffold, addreffing his laft words in a wild fream of defpair to the furrounding fpectators, and then launching into eternity-his horror of the crime, and his dread of the pun:hment, will now be much more powerfully excited. In the fame manner, to encourage the foldier marching out to battle, or the mariner fetting fail under the profpect of a form, promife not, merely in general terms, a liberal reward; be fure to fpecify the nature of the reward which you mean to beftow ; defribe it fo as that it may take hold on the imagination, and may rife in oppofition to the images of death and danger with which his coura e is to be afiales.

If thete phenomena of the human mind are fairly ftated, if it be true that general ideas produce no very powerful effects on the fentiments and difpofitions of the human heart, it mult then be granted, that though the ficenes of fucure reward and punifhment, which the heathens confidered as propared for the righteous and the wicked, wicre of a fomewhat motley complexion; yet fill, as they were ditinct and even minute drapgh,
they mull have been favourable to virtue, and contribu- Reitipi-\% ted in no inconfiderable degree to the fupport of civil order.

27
Another hing of which we may take notice under The notios. th:s head, is the vaft multiplicity of deitics with which of disitio the Greek and Roman mytholory peopled all the re- peoplin!, gions of nature, Flocks and fields, and woods and of a uficit oaks, and flowers, and many much more minute objects, tendency had all their guardian deities. Thefe were fomewhat when co.... capricious at times, it is true, and expected to have at- pared with tention paid them. But yet the faithful fhepherd, and atheifm. the induftrious farmer, knew generally how to acquire their friendilhip; and in the idea of deities enjoying the fame fimple pleafures, partaking in the fame labours, protecting their poffeffions, and bringing forward the fruits of the year, there could not but be fomething of a very pleafing nature, highly favourable to indultry, which would animate the labours, and cheer the fettivals, of the good people who entertained fuch a notion: nay, would diffufe a new charm over all the fenes. of the country, even in the gayelt months of the year.

From all of thefe particular obfervations, we think ourfelves warranted to conclude, that notwithftanding the mixed characters of the deities who were adored by the celebrated nations of antiquity; though they are in many inftances reprefented as confpicuous for vices and frolics; howevervain, abfurd, and morally criminal, fome of the rites by which they were worfhipped may have been, and however incorrect the notions of the heathens concerning the moral government of the univerfe and a future flate of retribution; yet ftill, after making a juft allowance for all thefe imperfections, the general influence of their religious fyftem was rather favourable than unfavourable to virtue and to the order and happinefs of fociety.
It was not without good reafon that the earlieft legif. Theadvanlators generally endeavoured to eftablifh their laws and tage of conftitutions on the bafis of religion; government needs eftablifhing the fupport of opinion; the governed mult be impreffed with a belief that the particular eftablifhment ${ }^{\text {ol }}$ the bato which they are required to fubmit is the bof calcu- fis of relilated for their fecurity and happinefs, or is fupported on fome fuch folid foundation, that it mult prove im. poffible for them to overturn it, or is connected with fome awful fanction, which it would be the mof heinous impiety to oppofe. Of thefe feveral notions, the laft will ever operate on moft men with the moft feady influence. We are frequently blind to our own interelt; even when eager for the attainmentof happinefs, we often refufe to take the wifett meafures for that end. The great bulk of the people in every community are fo little capable of reafoning and forefight, that the public minitter who fhall molt fleadily direct his views to the public good will often be the moft unpopular. Thofe laws, and that fyltem of government, which are the moft beneficial, will often excite the frongeft popular difcontents. A gain, it is not always eafy to perfuade people that your power is fuperior to theirs, when it is not really fo. No one man will ever be able to perfuad: a thowfand that he is flronger than they all together: and therefore, in order to perfuade one part of his fubjects $c$ r army that it is abfolutely neceffary for them to fubmit to him, becaufe any attempts to refift his power would prove ineffectual, a monarch or general muft take care firf to perfuade another part that it is for their in-

## R E L

Religion. tereft to iobmit to him ; or to imprefs the whole will a belief that, weak and pitiful as he himfelf may appear, when viewed fingly in oppofition to them all, yet by the afiftance of fome awful invifible beings, his friends and protectors, he is fo powerful, that any attempts to refirt his authority mult prove prefumptuous folly. Here, then, the aid of religion becomes requifite. Religious thtiments are the mof happily calculated to ferve this purpofe. Scarce ever was there a fociery formed, a mode of government eftablified, or a code of laws framed and enacted, without having the religious fentim:ents of mankini, their notions of the eriftence of fuperior invifitle beings, and their hopes and fears from thofe beings, as its fundamental principle. Now, we believe, it is :lnunt unive:fally agreed, that even the rudelf form of fociety is more favourable to the happinets of mankind, and the dignity of the human character, than a folitary and favage flate. And if this, with what we have alterted concerning religion as the bafis of civil government, be both granted, it will follow, that even the mof imperfect religious notions, the moof foolifh and abfurd rites, and the wildeft ideas that have been entertained concerning the moral government of the univerfe by fuperior biings, and a future flate of retribution, have been more advantagenus than atheifm to the happinefs and virtue of human life. We have already grauted, nor can it be denied, indeed, that many of the religious opinions which prevailed among the ancient heathens, did contribute, in fome degree, to the depravation of their morals : and all that we argue for is, that on a comparative view of the evil and the good which refulted from them, the latter muft appear more than adequate to counterbalance the effects of the former.

But if fuch be the natural tendency of thofe princi- ples by which the humat heart is made fufceptible of religious fentiments, that even enthufiafm and abfurd fuperftition are productive of beneficial effects more than fufficient to counterbalance whatever is malignant in their influence on fociety-furely a pare rational religion, the doctrines of which are founded in undeniable trath, and all the obfervances which it enjoins, calculated to promote by their direst and immediate effects Some ufful purpofes, mult be in a very high degree conducive to the dignity and the happinefs of human nature. Indeed one collateral procf of the truth of any religion, which muft have very confiderable weight with all who are not of opinion that the fyltem of the uiniverfe bas been produced and hitherto maintained in orker and exiftence by blind chance, will be its having a Atronger and more direct tendency than others to promote the interefts of moral virtue and the happinefs of mankind in the perent life. Even the teftimony of thoufands, even miracles, frophecies, and the fancion of remote antiquity, will fcarce have fufficient weight to perfuade us, that a religion is of divine origin, if its seneral tendency appear to be rather unfavourable than advantagegus to moral vistue:
III. We fhall therefore, in the next place, endeavour to determine, from a comparative view of the effects produced on the charater and circumftances of fociety by the moft eminent of thefe various fyftems of religion which have been in different ages or in diffesent countries eftablifhed in the world, how far any one of them has in this refpect the advantage over the yef: and, if the utility of a fyttem of religion were to
be received asa teft of its truth, what particular fyltem $\underbrace{\text { Religiont. }}$ might, with the beft reafon, be received as true, while the reft were rejected.

Ift, The principle upon which we here fet out is, that all, or almoft all, fytems of religion with which we are acquainted, whether true or falie, contribute more or lefs to the welfare of fociety. But as one field is more fruitful, and one garden lefs overgrown with weeds than another; fo, in the fame manner, one fyftem of religious opinions and ceremonies may be more happily calculated than others to promote the truer interefts of mankind. In uppofition to thofe philofophers who are fo vehement in their declamations againft the inequality of ranks, we have ever been of opinion, that refinement and civilization contribute to the hap. pinefs of human life. The character of the folitary favage is, we are told, more dignified and refpectable than that of the philofopher and the hero, in proportion as he is more inderendent. He is indeed more independent; but his independence is that of a ftone, which receives no nourifment from the earth or air, and communicates none to animals or. vegetables around it. In point of happinefs, and in point of refpectability, we cannot hefitate a moment, let philofophers fay what they will, to prefer a virtuous, enlightened, and polifhed citizen to any of the rudeft favages, the leaft acquainted with the reftraints and the fympathies of focial life, that wander through the wild forefts of the weftern world. But if we pre. And $3^{32}$ fer civilization to barbarifm, we mult admit, that in fore of this view Chritianity has the advantage over every Chriftiaother religious fyitem which has in any age or country prevailed among men; for nowhere has civilization and ufeful fcience been carried to fuch a height as among Chrittians.

It is not, indeed, in any confiderable degree that the vicw of abfurd fupertitions of thofe rude tribes, who can fcarce the various be faid to be formed into any regular fociety, can con- religinus tribute to their happinefs. Among them the faculty notions of of reafon is but in a very low ftate; and the moral prin- Pagan naciple ufually follows the improvement or the deprefion tions. of the reafoning faculty. Their appetites and merely animal paffions are almoft their only principles of action : their firlt religious notions, if we fuppofe them not to be derived from revelation or tradition, are produced by the operation of gratitude, or grief, or hope, or fear, upon their imaginations. And to thefe, however wild and fanciful, it is not improbale that they may owe fome of their earlieft moral notions. The idea of fuperior powers naturally leads to the thought that thofe powers have fome influence on human life. From this they will moft probably proceed to fancy ore fet of aftions agreeable, another offenfive, to thofe beings to whom they believe themfelves fubject. And this, perhaps, is the firt diftinction that favages can be fupFofed to form between actions, as right or wrong, to be performed or to be avoited. Bur if this be the cafe, we muit acknowledge that the religious notions of the favage, however abfurd, contribute to elevate his character, and to improve his happinefs, when they call forth the moral principle implanted in his breall.
But if the focial ftate be preferable to a fate of wild and folitary independence, even the rude fuperftitions of unenlightened tribes of favages are in another refpect beneficial to thofe among whom they prevail. They

## R E L

$\underbrace{\text { Religion. }}$ ufually form, as has been already obferved under this article, the bafis of civil order. Reli, ;ious opinions may lead the great body of the community to reverence fome particular fet of inftitutions, fome individual, or fome family, which are repiefented to them as peculiarly connected with the gods whom they adore. Under this fanction fome form of goverument is eftablifhed; they are tanght to porform focial duties, and rendered capable of iecial enjoyments. Not only Nut ma and Lycurgus, but almoft every legiflator who has fought to civilize a rude people, and reduce them under the reftraints of legal government, have endeavoured to imprefs their people with an idea that they acted with the approbation, and under the immediate direction, of fuperior powers. We cannot but allow that the rude fupertitions of early ages are productive of thefe advantages to fociety; but we have already acknowledged, and it cannot be denied, that they are alfo attended with many unhappy effects. When we view the abfurdities intermixed with the fyftems of religion which prevailed among melt of the nations of antiquity, we camot help limenting that fo noble a principle of human nature as our religious fentiments flould be liable to fuch grofs perverfion; and when we view the effects which they produce on the morals of mankind, and the forms of fociety, thougl we allow them to have been upon the whole rather beneficial than hurtful, yet we cannot but obferve, that their unfavourable effects are by far more numerous than if they had been better directed. What unhappy effects, for inftance, have been produced by falfe notions concerning the condition of human fouls in a future fate. Various nations lave imagined that the fcenes and objefts of the world of firits are only a fhadowy reprefentation of the things of the prefent world. Not only the fouls of men, according to them, indabit thofe regions; all the inferior animals and vegetables, and evenimanimate bodies that are killed or deftroyed here, are fuppofed to pafi into that vifionary world; and, exifting there in unfubftantial forms, to execute the fame functions, or ferve the fame purpores, as on earch. Such are the ideas of futurity that were entertained by the inhabitants of Guinea. And by thefe ideas they were induced, when a king or great man died among them, to provide for his comfortable accommodation in the world of firits, by burying with him meat and drink for his fubfiftence, flaves to attend and ferve him, and wives with whom he might ftill enjoy the plealures of love. His faithful fubjects vied wilh each other in offering, one a fervant, another a wife, a third a fon or diaghter, to be fent to the other world in company with the monarch, that they might there be employed in lis fervice. In New Spain, in the ifland of Java, i: the kingdom of Benin, and among the inhabitants of In. doftan, fimilar practices on the fame occation, owing no doubt to fimilar notions ef futurity, have been prevalent. But fuch practices as thefe cannot be viewed with greater contempt on account of the opinions which have given rife to them, than horror on account of their unhappy effects on the condition of thofe among whom they prevail. A lively imprefion of the enjoyments to be obtained in a future itate, together with fome very falfe or incorrect notions concerning the qualities or actions which were to entitle the departing foul to admiffion into the feene of thofe enjor-
ments, is faid to have produced equally unhappy ef. Retivier. fects among the Japanefe. They not only bribed their priefts to folicit for them ; but looking upon the enjoyments of the prefent life with difguft or contempt, they ufed to dafh themfelves from precipices, or cut their throats, in order to get to paradife as foon as polmbie. Various other fuperfitions fubfifting among rude nations might here be enumerated, as inftarces of the perverfion of the religions principles of the humart heart, which render them injurious to virtue and happinels. The aulterities which have been practiled, chiefly among rude mations, as means of propitiating fuperior powers, are efpecially wortiny of notice.When the favourite idol of the Banians is carried in folemn proceffion, fome devotees proftrate themfelves on the ground, that the chariot in which the idol is carried may run over them; others, with equal enthuflafm, dafl themfelves on fikes faltened on purpofe to the car. Innumerable are the ways of torture which have been invented and practifed on themfelves by men ignorantly friving to recommend themfelves to the favour of heaven. Thefe we lament as inllances in which religious fentiments have been fo ill directed by the influence of imagination, and unenlighened erriseg reafon, as to produce unfavourable effects on the human character, and oppofe the happinefs of focial life.Thnough we have argued, that even the molt abfurd fyftems of reigion that have prevailed in the vorld, have been upon the whole rather bencficial than i: jurious to the dignity and happinefs of human nature; yet if it fhall not appear, as we proceed farther in ou: comparative view of the effects of religion on focicty, th. t others have been attended with hapier effects than thete fuperfitions which belong to the rude ages of fociety, we may farce venture to brand the infidel with the appellation of fool, for refufing to give his affent to religious dectrines, or to act under their infuence.

2 d . The polytheifm of the Greeks and Romans, and other heathen nations in a fimilar flate of civilization, we have already confidered as being, upon the whole, rather favourable than unfavourable to virtue: but we mult not parially conceal its defects. The vicious characters of the deities which they wormipped, the incorrect notions which they entertained concerning the moral gove:nment of the univerfe and a future retribution, the abfurdities of their rites and ceremonies, and the criminal practices which were intermixed with them, muft have altogether had a tendency to pervert both the radoning and the moral principles of the human mind. The debaucheties of the monarch of the gods, and the fidelity with which his example in that repect was fillowed by the whele crowd of the infuriordeities, did, we know, difpofe the devout heathen, when he felt the fame paffions which had afferted their power. over the gods, to gratify them without fcruple. It is a truth, however, and we will not attempt to deny or conceal it, that the genius of the polytheifm of the Greeks and Romans was fritndly to the arts; to fuch of them efpecially as are raifed to exccllence by the vigorous exertion of a fine imagination; mufic, poetry, fculpure, architecture, and panting; all of thefe arte appear to have been confiderably indebted for that perfection to which they attained, efpecially among the Greeks, to the fplendid and fancifill fyttem of mythogy which was received among that ingerious people.-

Relinion. But we cannce give an equally faronable account of its infucace on the fciences. There was little in that fytem that could contribute to call firth reaion. We may soant inded, that if reafon can be fo fhocked with abfurdty as to be roufed to a more vigorous exertion of her powors, and a more determined affertion of her rights in confequence of furveying it; in that cafe this iytem of my thology might le favourable to the exercife and improvemert of reafon; not otherwife.

The connection of paganifon with morality was too imperfect for it to produce any very important effects on the morals of its votaries. Sacrifices and prayers, and temples and feftivals, not purity of heart and integrity of life, were the means prefcrived for propitiabing the favour of the deities adored by the Pagans. 'lhere were other means, too, befides true heroifm and patriotifm, of gaining admifion into the Elyfian fields, or obtaining a feat in the council of the gods. Xenophon, in one of the mof beautiful parts of his Memoirs of Socrates, reprefents Hercules wooed by Virtue and Peafure in two fair female forms, and deliberating with much anxiety which of the two he fhould prefer. But this is the fiction of a philofopher defirous to improve the fables of antiquity in fuch a way as to render them truly ufeful. Hercules does not appear, from the tales which are told us of his adventures, to have been at any fuch pains in choofing his way of life. He was received into the palace of Jove, without having occafion to plead that he had through life been the faithful follower of that godedef to whom the philofopher makes him give the preference; his being the fon of Jove, and his wild adventures, were fufficient without any other merits to gain him that honour. The fame may be faid concerning many of the other demi-gods and heroes who were advanced to heaven, or conveyed to the blefsful fields of Elyfium. And whatever might be the good effects of the religion of Greace and Rome ir, general upon the civil and political eftablifhments, and in fome few inftances on the manners of the people, yet ftill it mult be acknowledged to have been but ill calculated to imprefs the heart with fuch principles as might in all circumitances direct to a firm, uniform, tenor of virtuous conduct.

But after what has been faid on the character of this religion elfewhere (fee Polytheism), and in the fecond part of this article, we cannot without repetition enlarge farther on it here. Of the Jewifh religion, however, we have as yet faid little, having on purpofe referved to this place whatever we mean to introduce under the article, concerning its influence on fociety.

3 d, When we take a general view of the circumfances in which the Jewifh religion was eftablifhed, the effects which it produced on the character and fortune of the nation, the rites and ceremonies which it enjoined, and the fingular political inftitutions to which it gave a fanction, it may perhaps appear hard to determine, whether it were upon the whole more or lefs beneficial to fociety than the polytheifm of the Egyp. tians, Greeks, and Romans. But if fuch be the judgement which preconceived prejudices, or an halty and carelefs view, have induced fome to form of this celebrated fyftem; there are others who, with equal keennefs, and founder reafoning, maintain, that it was happily calculated, not only to accomplifh the great defign of
preparing the way for the promulgation of the Gofpel, Reipion. but likewile to render the Jews a more refined and virtuous people, and a better regulated community, than any neighb uring nation. In the firf place, the attributes of the Deity were very clearly exhibited to the Jews in the eftablifhment of their religion. The miracles by which he delivered them from fervitude, and conducted them out of Egypt, were Ariking demonftrations of his power ; that condefcenfion with which he forgave their repeated acts of perverfenefs and rebellion, was a moft convincing proof of his benevolence; and the impartiality with which the obfervance and the violation of his laws were rewarded and punifhed, evea in the prefent life, might well convince them of his juftice. A part of the laws which he dictated to Mofes are of eternal and univerfal obligation ; others of them were local and particular, fuited to the character of the Jews, and their circumftances in the land of Ca naan. The Jewifh code, taken altogether, is not to be confidered as a complete fyftem of religion, or laws calculated for all countries and all ages of fociety. When we confider the expediency of this fyftem, we mult take care not to overlook the defign for which the Jews are faid to have been feparated from other nations, the circumitances in which they had lived in Egypt, the cufoms and manners which they had contracted by their intercourfe wiih the natives of that country, the manner in which they were to acquire to themfelves fettlements by extirpating the nations of Canaan, the rank which they were to hold among the nations of Syria and the adjacent countries, together with the difficulty of reftraining a people fo little civilized and enlightened from the idolatrous worlhip which prevailed among their neigbours: All thefe circumftances were certainly to be taken into account; and had the legiflator of the Jews not attended to them, his inflitutions muft have remained in force only for a fhort period; nor could they have produced any lafing effects on the character of the nation. With a due attention to thefe circumflances, let us defcend to an examination of particulars.

Although in every religion or fuperftition that has The Sab. prevailed through the world, we find one part of its in- bath, ftitutions to conffit in the enjoining of certain feftivals to be celebrated by relaxation from labour, and the performance of certain ceremonies in honour of the geds; yet in none, or almoft none befides the Jewih, do we find every feventh day ordained to be regularly kept holy. One great end which the legiflator of the Jewis had in view in the inftitution of the Sabbath was, to imprefs them with a belief that God was the maker of the univerfe. In the early ages of the world a great part of mankind imagined the ftars, the fun, the moon, and the other planets, to be eternal, and confequently objects highly worthy of adoration.. To convince the Ifraelites of the abfurdity of this belief, and prevent them from adopting that idolatry, Mofes taught them, that thofe confpicuous objeets which the Gentile nations regarded as eternal, and endowed with divine power and intelligence, were created by the hand of God; who, after bringing all things out of nothing, and giving them form, order, and harmony, in the fpace of fix days, refted on the feventh from all his works. Varions paffages in the Old Teftament concur to fhow, that this was one great end of the inftitution of the

Sabbath.

R EL
Religion. Sabbath. The obfervance of the Sabbath, and deteftation of idolatrous worthip, are frequently inculcated together ; and, again, the breach of the Sabbath, and the worthip of idols, are ufually reprobated at the fame time. Another good realon for the infitution of a Sabbath migh be, to remind the Jews of their deliverance from bondage, to infpire them with humanity to frangers and domeftics, and to nitigate the rigours of

The purpofes for which the other feftivals of the Jewifh religion were inflituted appear alfo of fufficient importance. The great miracle, which, after a feries of other miracles, all direceed to the fame end, finally effected the deliverance of the Jews out of Egypt; and their actual departure from that land of fervitude, might well be commemorated in the fe:rlt of the paffover. To recal to the minds of pofterity the hiftory of their anceftors, to imprefs them with an awful and grateful fenfe of the goodnefs and greatnefs of God, and to make them think of the purpofes for which his almighty power had been fo fignally exerted, were furely good reafons for the infitution of fuch a feftival. The feaft of Pentecolt celebrated the firlt declaration of the law by Mofes, in the fpace of fifty days after the fealt of the paffover. It ferved alfo as a day of folemn thankfgiving for the bleffings of a plenteous harveft. On the feaft of tabernacles, they remembered the wandering of their anceftors through the wildernefs, and expreffed their gratitude to heaven for the more comfortable circumftances in which they found themfelves placed. The fealt of new moons ferved to fix their kalen lar, and determine the times at which the other feltivals were to be celebrated; on it trumpets were lunaded, to give public notice of the event which was the caufe of the feftival; no fervile works were performed, divine fervice was carefully attended, and the sirt fruits of the month were offered to the Lord. The Jewilh legiflator limited his feftivals to a very fmall number, while the heathens devoted a confiderable part of the year to the celebration of theirs. But we perceive the occafions upon which the Jewifh fertivals were celebrated to have been of fuitable importance; whereas thofe of the heathens were often celebrated on trifling or ridiculous occafions. Piety and innocent recreation fhared the Jewifh fetival; the feftivals of the heathens were chiefly devoted to debauchery and idlenefs.

The Hebrews had other folemn feafons of devotion befides the weekly Sabbath and thefe annual feltivals. Every feventh year they refted from labour: they were then neither to plough, to fow, nor to prune ; and whatever the earth produced fontaneoully that year belonsed rather to fraegers, orphans, and the poor, thin to the proprietors of the ground. On this year infolvent debtors were difcharged from all debts contracted by purchafing the neceflaries of life: ard the great end of this releaie from debts contrafed daring the erceding fix years, appears to have been to prevent the Hebrew from flying to the Gentiles and forfaking his religion when embarrafled in his circumftances. None but native Ifraelites and profelyics of righteonfiefs were admitted to this pisilege; it was refufed to frangers, and even to profelytes of the gate. The jubilee was a feftival to be celebrated every fiftieth year. It produced the fame effects with the fabbatical year as to reft from labour and the wiflarge of debts: with inis
addition, that on the year of the jubilec flaves obt:ined Religim their freedom, and the lands reverted to the o'd proprietors. On the year of the jubilee, as on the fabbatical gear, the lands were to reft uncultivated, and lawfuits were now to terminate. The chief delign of this inflitution appears to have been, to preferve the order of ranks and property originally eftabliflied in the Hebrew itate. None but Ifraelites or circumcifed converts could enjoy the benefit of this inflitution; nor could even thefe hope to regain their efates on the year of the Jubilee, if they fold them for any other purpofe but to fupply their neceflities. The law relative to ufury was evidently founded on the fame plan of polity with refpect to property. To almof any other nation fuch a law, it mult be confeffed, would have been unfuitable and unjuf: but as the Jews were not defigned for a tradiag nation, they could have little occafion to borrow, unlefs to relieve diftrefs; and as an indulgence to people in fuch circumftances, the Jew was forbidden to exact ufury from his brother to whom he had lent mones.
The Jewifh legiflator, we may well think, would be difpoied to adopt every proper method to prevent his nation from falling away into the idolatry of heathen nations. Probably onc reafon of the diftinctions vetween clean beafts which they were permitted to eat, and unclean beats, the eating of whith they were taught to confider as pollution, was to prevent them from convivial intercourfe with profane nations, by which they might be feduced to idolatry. We do nor readily fit down at table with people who are fond of dilhes which we regard with abhorrence. And if the Jews were taught to loathe the flefh of forme of thofe animals which were among the greateft delicacies of the Gentiles, they would naturally of confequence avoid fitting de wriat meat with them, either at their ordinary meals or at thofe entertainments which they prepared in honour of their deities; and this we may with good reafon confider as one happy mean to preferve them from idolatry. Befides, the Jews were permitted, or rather injoined, to eat animals whict the Gentiles reverenced as facred, and from which they religiounly with-held all violence. Goats, fheep, and oxen, wore worfhipped in Egypt (fee Polytheism and $P_{\text {an }}$ ); and feveral learned writers are of opinion, that Mofes directed his pecple to facrifice and eat certain of the favourite antmals of the Egyptians, in order to remove from their minds any opinions which they might have otherwife entertained of the fancticy of thrife pretended deities. Many of the obfervances wich Mofes injoined with regard tis food, appear to have been intended to infpire the Ifraviitcs with contempt for the fiperftitions of the people among whom they had fo long fajourned. They were to kill the animal which the Egyptians worfhipped; to roaft the fleth which that people ate raw ; to eat the head, which they never ate; and to drefs the entrails, which they fet apart for divination. Thefe difinetions concurred with the peculiarities of their drefs, language, government, cultom", places, and times cit worfhip, and even the natural fituation of their country, by which they we:e in a maner tconfined and fortified on all fides, to feparate them in fuch a manner from neighbouring nations, that they might efcape the infection of their idolatry. And if we reflect both on the defign for which Prcvidence feparated the Ifraelites from other
tanas, a a on tie probability that, in the fate of fociety in which mankind were during the canier period of we Jowidnem, the Jews, by mixing with other aton, would rather bave been themflyes converted to idolity tina lave ennverted idolatrous nations to the wormip of the true God; we cannot but be fatisfied, that even this, however it may at firlt appear, was a bereft, not a difadrantage; and in the author of ther legilation wifdom, not caprice.

But not only in the dilinations of meats, and between clean and unclean animals, does the legillator of the Juers appear to have laboured to fix a barrier tetween them and other nations whith might preferve them from the contagion of idolatry-we thall not err, perhaps, if we afcribe many particulars of their worfhip to this defign in the intitutor. The leathens had gods who prefided over woods, rivers, mountains, and valleys, and to each of thefe hey offered facrifices, and p :rformed other rites of worlhip in a fuitahle place. Sometimes the grove, fomelimes the mountain top, at other times the bank of the river or the brink of the ppring, was the feene of their devotions, But as the unity of the divine nature was the truth the moft earnefty inculcated on the children of Ifrael; fo in order to imprefs that truth on their minds with the more powerful efficacy, they viere taught to offer their facrifices and other offerings only in one place, the place chofen by the Lord; and death was threatened to thofe who dared to difobey the command. To confirm this i.ea, one of the prophets intimates, that when idolatry thould be ab. lifhed, the worfhip of God thould not be confined to Jerufalem, but it would then be lawful to worfhip him anywhere.

The whole inftitutions and obfervances of the Jewifh religinn appear to have been defigned and happily calculated to imprefs the minds of the people with veneration and refpect for the Deity. A!1 the fellivals wbich either commemorated fone gracious difpenfation of his providence towards their anceftors, or terved as days of thankfgiving for the conflant returns of his goodnefs to thote who celcbrated them, and all the other rites defignel to fortify them againf idolatry, furved at the fame time to imprefs their hearts with awful reverence for the God of Jacob. Various other particulars in the inflitu:ions of the Jewifh economy appear to have been directed folely to that end. Into the molt facred place, the Holy of Holies, none but the bigh prieft was admitied, and he only once a year. No iire was ufed in facrifice but what was taken from the altar. Severe punifhments were on various occafions inflicted on fuch as prefumed to intermeddle in the fervice of the fancuary in a manner contrary to what the law had directed. All the laws refpecting the character, the circumftances, and the fervices, of the priefts and the Levites, appear plainly to have a fimilar tendency.

In compliance with the notions of Deity which naturally prevailed among a grofs and rude people, though no vifible objet of worfhip was granted to the Jews, yet they were allowed in their wanderings through the wilderne's to have a tabernacle or porta le temple, in which the fovereigu of the univerfe fometimes dcigned to difplay fome rays of his glory. Incapable as they were of conceiving aright concerning the finitual nature and the omuiprefence of the Deity, they might
 about tion, had they been at no tinefavoured with a vifble demonfration of his prefence.
The facrifies in tife among the Centiles in their Sacrifices worfhip of idols were permitted by the Jewifh lemifla- and lutrator ; but he direfod them to be offered with views ve- tions. ry different from thofe with which the Gentiles facrificed to their idois. Some of the ficrifees of the Jewith ritua! were defigned to avert the indignation of the Deity; fime to expiate offences and purify the heart ; and all of them to abolith or remove ichatry. Lultrations or ablutions entered likewife into the Jewifh ritual; but thefe were recommended and enjoined by Mofes for purpiles widely different from thole which induced the heatiens to place fo high a vilue upoa them. The huathens practifed them with magical and fuperititious ceremonies ; bui in the Jewifh ritual they were intented fimply for the cleuting away of impurities and pollutions.

The theocratical form of government to which the Tendency Jews were fubject, the rewards which they were fure of of the receiving, and the punifhments which they were equally theocracy liable to futfer in the prefent lifs, had a powerful effect ral fancto remove fuperfition and preferve them from idolatry, tions. as well as to fupport all the focial virtues among them. They were promifed a numerous ofispring, a land flowing with milk and honey, long life, and victory over their enemies, on the condition of their paying a faithful obedience to the will of their heavenly Sovereign; plague, famine, dfeafe, defeats, and death, were threatened as the punithments to be inflicted on thofe who violated his laws: and thefe fanctions, it mutt be allowed, were happily accommodated to the genius of a rude and carnal-minded people, attentive only to prefent objects, and not like! $y$ to be influenced by remote and firitual confiderations.

There were other rites and prohibitions in the Mo. Rices ${ }^{43}$ faic law, which appear to have had but little connection prohib:with religion, morals, or policy. Thefe may be more tions of liable to be objetted againt, as adding an unneceflary lefs appaweight to a burden which, though heavy, might yet rentutility. have been otherwife borne in confideration of the advantages connected with it. Even thefe, however, may perhaps admit of being viewed in a light in which they. thall appear to have been in no way unfavourable to the happinefs of thofe to whom they were enjoined. They appear to have had none of them an immoral tendency: all of them had, in all probability, a te: idency to remove or prevent idolatry, or to fupport, in fome way or other, the religious and the civil eltablifhment to which they belonged.
From thefe views of the firit and tendency of the Jewifh religion, we may fairly conclude it to have been happ ly calculated to promote the welfare of admirably In comparing it with other relioco it refeed on the peculi that its two principal obje:As were to preferve the Jews intended. a feparate people, and to guard them againt the contagion of the furrounding idolatry. When thefe chings are taken into conlideration, every candid mind acquainted with the hiftory of ancient nations will readily acknowledge that the whele fyfem, though calculatedindeed in a peculiar manner for them, was as happily adapted for the purpofes for which it had been wifly and gracioufly intended, as it is poffible to imagine any

$\underbrace{\text { Religion, fuch a fyltem to be. It would be unhappy, indeed, if, der every dificulty and trial. Chaitianity lepricients kulizion: }}$ on a comparifon of pure theifm with polytheifm, the latter, with all its abfurdities, fhould be found more beneficial to mankind than the former. The theifm of the Jews was not formed to be diffeminated through the earth ; that would have been inconfiltent with the purpofes for which it is faid to have been defigned. But while the Jews were feparated by their religion from all other nations, and perhaps, in forme degree, fixed and rendered ftationary in their progrefs towards refinement, they were placed in circumttances, in refpect to laws, and government, and religion, and moral light, which might with good reafon render them the envy

45
IV. The Chriltian religion next demands our atten. tion. It is to be confidered as an improvement of the Jewifh, or a new fuperftructure raifed on the fame bafis. If the effects of the Jewifh religion were beneficial to thofe among whom it was eftablifhed, they were confined almott to them alone. But is the fpirit of Chrifianity equally pure and bengriant? Is its influence equally beneficial and more diffufive than that of Judaifm? Does it really merit to have triumphed over buth the theifm of the Jews and the polytheifm of the
46 heathens?
The doc- If we confider the doctrines and precepts of the Chritrines pure ftian religion, nothing can be more happily calculated and rites fimple.
all men as children of the fame God, and heirs of tie fame falvation, and levels all diftinctions of rich and poor, as accidental and infignificant in the fight of hinn who rewards or punifhes with impartiality according to the merits or demerits of his creatures. This doctrine is highly favourable to virtue, as it tends to humble the proud, and to communicate dignity of fentiment to the lowly; to render princes and inferior magiltrates moderate and jult, gentle and condefcending, to their inferiors. It tarther requires hafbands to be affectionate and indulgent to their wives, wives to be faithful and refpectful to their hufbands, and both to be true and conftant to each other. Such is the purity of the Gofpel, that it forbids us even to harbour impure thoughts; it requires us, to abandon our vices, however dear to us; and to the cautious wifdom of the ferpent it directs us to join the innocent fimplicity of the dove. The Chrifitan difpenfation, to prevent a perfeverance in immorality, offers pardon for the paft, provided the offender forlake his vicious practices, with a firm refolu. tion to act differently in future. The fanctions of the Gofpel have a natural tendency to exalt the mind above the paltry purfuits of this world, and to render the Chriftian incorruptible by wealth, honours, or pleafures. The true Chriftian not only ablains from injuftice towards others, but even forgives thofe injuries which he himfelf fuffers, knowing that he cannot otherwife hope for forgivenefs from God. Such are the precepts, fuch the fipit, and fuch the general tendencyof the Gofpel. Even thofe who refufed to give credit to its doctrines and hitory have yet acknowledged the excellence of its precepts. They have acknowledged, that "no religion ever yet appeared in the world of which the natural tendency was fo much dirested to promote the peace and happinefs of mankind as the Chriftian; and that the Gofpel of Chrift is one conti-. nued leffon of the ftricteft morality, of juftice, benevo. lence, and univerfal charity." Thefe are the words of Bolingbroke, one of its keeneft and moft infidious opponents. Without examining the effects of this religion on focieiy, we might almoft venture to pronounce with confidence, that a religion, the precepts of which are fo happily formed to promote all that is juft and excellent, cannot but be in the highelt degree beneficial to mankind. By reviewing the effects which it has actually produced, the favourable opinion which we naturally conceive of it, after confidering its precepts, cannot but be confirmed.

One circumtance we mutt take notice of as rather The ${ }^{47}$ unfavourable to this review. It is really impoflible to tues it redo juftice to Chrifianity by fuch a difcuffion of its me- commends rits. The virtues which it has a natural tendency to unoftenproduce and cherifh in the human heart, are not of a tatious. noify oftentatious kind; they often efcape the obfervation of the world. Temperance, gentlenefs, patience, benevolence, juftice, and general purity of manners, are not the qualities which moft readily attract the admiration and obtain the applaufe of men. The man of Rofs, whom Mr Pope has fo juftly celebrated, was a private character ; his name is now likely to live, and his virtues to be known to the lateft pofterity : and yet, however difinterefted his virtues, however beneficial his influence to all around him, had his character not attracted the notice of that eminent poet, his name K would

## R E L [ 74$]$ R E L

$\underbrace{\text { Religion. would perhaps ere this time have been lof in oblivion. }}$ Individuals in private life feldom engage the attention of the hiftorian ; his object is to record the actions of princes, warriors, and fatefmen. Had not the profeffors of Chriftianity in the earlier ages of its exiftence been expofed to perfecutions, and unjuft accufations from which they were called on to vindicate themfelves, we fhould be ftrangers to the names and virtues of faints and martyrs, and to the learning and endowments of the firtt apologills for Criftianity. We can therefore only trace the general influence of the inftitutions of Chriftianity on fociety. We cannot hope to make an accurate enumeration of particulars. In many of the countries in which it has been eftablifhed, it has produced a very favourable change on the circumftances of domettic life. Polygamy, a praftice repugnant to the will of our Creator (fee Polygamy), who has declared his intentions in this irftance in the plainelt manner, by caufing nearly equal numbers of males and females to be brought into the world, was never completely abolifhed but by Chriltianity.

The practice of divorce, too, though in fome cafes proper and even neceffary, had been fo much abufed at the time of our Saviour's appearance in the world, that he found reafon to declare it unlawful, unlefs in the cale of adultery. The propriety and reafonablenels of this prohibition will fufficiently appear, if we confider, that when divorces are eaflly obtained, both parties will often have nothing elfe in view at the period of marriage than the diffolution of their nuptial engagements after a fhort cohabitation ; the interefts of the hufband and the wife will almolt always be feparate; and the children of fuch a marriage are fcarce likely to enjoy the cordial affection and tender watchful care of either parent. The huband in fuch a cafe will naturally be to his wife, not a friend and protector, but a tyrant; fear and deceit, not love, gratitude, or a fenfe of duty, will be the principles of the wife's obedience.

In another inftance, likewife, Chriftianity has produced an happy change on the circumitances of domeftic life; it muft be acknowledged to have contributed greatly to the abolition of flavery, or at lealt to the mitigation of the rigour of fervitude. The cuftoms and laws of the Romans in relation to flaves were cruel and fevere. Mafters were often fo inhuman as to remove aged, fick, or infirm flaves, into an infand in the Tiber, where they fuffered them to perifh without pity or affiltance. The greater part of the fubjects of many of thofe republics which enjoyed the molt liberty, groaned under tyrannical oppreffion; they were condemned to drag out a miferable exiffence in hard labour, under inhuman ufage, and to be transferred like bealts from one mafter to another. The hardihips of flavery were eafed, not by any particular precept of the Gofpel but by the gentle and humane fpirit which breathed through the general tenor of the whole fyltem of doctrines and precepts of which the Gofpel confifts. It mult indeed be allowed, that a trade in haves is at prefent carried on by people who prefume to call themfelves Chrifians, and protected by the legiflature of Chritian ftates: but the fpirit of the Chriftian code condemns the practice, and the true Chritian will not engage in it.

Partly by the direat and confpicuous, partly by the fecret and unfeen, influence of Chrifianity fince its prozulgation in the world, the hearts of men have been
gradually foftened; even barbarians have been formed to mildnefs and humanity ; the influence of felfifhnefs has been checked and reftrained; and even war, amid all the pernicious improvements by which men have fought to render it more terrible, has affumed much more of the fpirit of mildnefs and peace than ever entered into it during the reign of heathenifm.

If we review the hiltory of mankind with a view to their political circumftances, we fhall find, that by fome means or other, it has happened, fince the time when the Gofpel vias firft preached, that both fytems of legiflature and forms of governmenthave been raifed to much greater perfection, at leaft in thofe parts of the world into which the religion of Jefus has made its way, and obtained an eftablifhment.

The popular government of the Romans, notwith1tanding the multiplicity of their laws, and the imperfections of their political conflitution, was, no doubt, happily enough adapted to promote the increafe of the power and the extenfion of the empire of Rome. In Greece there were various republics, the wifdom and impartiality of whofe laws have been highly celebrated. But we apprehend that there is a fufficient number of well authenticated facts to warrant us to affirm, that fince Chriftianity has been propagated, and has had fufficient time to produce its full effect on arts, manners, and literature, even under governments the form of which might appear lefs favourable than the celebrated models of antiquity to the liberty and happinefs of the people in general, thefe actually have been much better provided for than under the laws of Athens or Sparta, or even of Rome in the days of the confuls. It is a jult and happy obfervation of Montefquieu, who has attributed fo much to the influence of climate and local circumftances, that " the mildnefs fo frequently recommended in the Gofpel is incompatible with the defpotic rage with which an arbitrary tyrant punifhes his fubjects, and exercifes himfelf in cruelty. It is the Chriftian religion (fays he) which, in fpite of the extent of empire, and the influence of climate, has hindered defpotifm from being eftablifhed in Ethiopia, and has carried into Africa the manners of Europe. The heir to the empire of Ethiopia enjoys a principality, and gives to other fubjects an example of love and obedienceNot far from hence may be feen the Mahometan fhutting up the children of the king of Sennaar, at whofe death the council fends to murder them in favour of the prince who afcends the throne. Let us fet before our eyes (continues that eloquent writer), in the third chapter of the 24 th book of his Spirit of Laws, on one hand the continual maffacres of the kings and generals of the Greeks and Romans, and on the other the deftruction of people and cities by the famous conquerors Timur Beg and Jenghiz Kan, who ravaged Afia, and we thall perceive, that we owe to Chriftianity in government a certain political law, and in war a certain law of nations, which allows to the conquered the great advantages of liberty, laws, wealth, and always religion, when the conqueror is not blind to his own intereft."

Thefe are the reflections of no common judge in this matter, but one who had long fudied the hiftory of nations, and obferved the phenomena of the various forms of fociety, with fuch fuccefs as few others have attained.

## REL [ 75 ] REL

Teliginft. But on no occafion has the mild influence of Chrifti49 Its effects in foftening and humanizing barbarians, anity been more eminently difflayed, or more happily exerted, than in foftening and humanizing the barbarians who overturned the Roman empire. The idolatrous religion which prevailed among thofe tribes before their converfion to Chriftianity; inftead of difpofing them to cultivate humanity and mildnefs of manners, contributed ftrongly to render them fierce and blood- thirlty, and eager to diftinguilh themfelves by deeds of favage valour. But no fooner had they fettled in the dominions of Rome, and embraced the principles of Chritianity, than they became a mild and generous people.

We are informed by Mofheim, who was at pains to collect his materials from the moft authentic fources, that in the 10 th century Chriftian princes exerted themfelves in the converfion of nations whofe fiercenefs they had experienced, in order to foften and render them more gentle. The mutual humanity with which nations at war treat each other in modern times, is certainly owing, in a great meafure, to the influence of the mild precepts of the Gofpel. It is a fact worthy of notice too, that during the barbarous ages, the fpiritual courts of juftice were more rational and impartial in their decifions than civil tribunals.

How many criminal practices which prevailed among heathen nations have been abolifhed by their converfion to Chriftianity! Chriftians of all nations have been obferved to retain the virtues, and reject the vicious practices of their refpective countries. In Parthia, where polygamy prevailed, they are not polygamilts; in Perfia, the Chrittian father does not marry his own daughter. By the laws of Zoroafter the Perfians committed inceft until theyembraced the Gofpel; after which period they abftained from that crime, and obferved the duties of chaftity and temperance, as enjoined by its precepts. Even the polifhed and enlightened Romans were cruel and blood-thirfty before the propagation of the Gofpel. The breaking of a glafs, or fome fuch trifling offence, was fufficient to provoke Vidius Pollio to calt his flaves into fifh-ponds to be devoured by lam. preys. The effufion of human blood was their favourite entertainment ; they delighted to fee men combating with bealts, or with one another; and we are informed on refpectable authority, that no wars ever made fuch havock on mankind as the fights of gladiators, which fometimes deprived Europe of 20,000 lives in one month. Not the humanity of Titus, nor the wifdom and virtue of Trajan, could abolith the barbarous fpectacle. However humane and wife in other inftances, in this practice thofe princes complied with the cuftom of their country, and exhibited fplendid hows of gladialors, in which the combatants were matched by pairs; who, though they had never injured nor offended each other, yet were obliged to maim and murder one another in cold blood. Chriftian divines foon exercifed their pens agraint thefe horrid practices; the Chriftian emperor Conftantine reftrained them by edicts, and Honorius finally abolifhed them. It would be tecious to proced through an enumeration of particulars; but wherever Chritianity has been propagated, it has conftantly operated to the civilization of the manners of mankind, and to the abolition of abfurd and criminal practices. The Irifh, the Scotch, and all the ancient inhabitants of the $\mathrm{B}_{1}$ :iilh :17s, were, notwithotanding
their intercourfe with the Romans, rude barbarians, till Relifion. fuch time as they were converted to Chriftianity. The $\underbrace{\text { resow }}$ inhuman practice of expofing infants, which once prevailed fo generally over the world, and fill prevails among fome Pagan nations, even under very humane and enlightened legiflatures, yielded to the influence of Chriftianity.

Let us likewife remember, in honour of Chritianity, Learning that it has contributed eminently to the diffufion of is much knowledge, the prefervation and the advancement of indebted te learning. When the barbarians overfpread Europe, Chriftiwhat muit have become of the precious remains of polifhed, enligbtened antiquity, had there been no other depolitaries to preferve them but the heathen priefts? We allow that even the Romilh clergy during the dark ages did not ftudy the celebrated models of ancienc times with much advantage themfelves, and did not labour with much affiduity to made the laity acquainted with them. It mult even be acknowledged, that they did not always preferve thofe monuments of gem nius with fufficient care, as they were often ignoranc of their real value. Yet, after all, it will be granted, it cannot be denied, that had it not been for the clergy of the Chritian church, the lamp of learning would, 1 n all probability, have been entirely extinguifhed, during that night of ignorance and barbarity in which all Europe were buried for a long feries of centuries, after the irruption of the barbarians into the Roman empire.

Such is the excellence of the Chriftian fytem, and The benefuch its tendency to meliorate the human character, ficial influthat its beneficial influence has not been confined to ence of thofe who have received its doctrines and precepts, and Chriftiahave profeffed themfelves Chriftians; it has even produ- nity hasex ced many happy effects on the circumptances and the evended to characters of Pagans, and infidels, who have had oppor- thofe who tunities of beholding the virtues of Chriftians, and have not learning the excellence of the morality of the Gofpel. embraced Thofe virtues which diftinguifhed the character of the ${ }^{\text {it. }}$ apoftate Julian were furely owing in no inconfiderable degree to his acquaintance with Chriftianity; and it is an undeniable fact, that after the propagation of Chriftianity through the Roman empire, even while the purity of that holy religion was gradually debafed, the manners of thofe Pagans who remained unconverted became more puse, and their religious doctrines and worthip lefs immoral and abfurd.-We might here ad. duce a tedious feries of facts to the fame purpofe. Whenever Chriftians have had any intercourfe with Pagan idolaters, and have not concealed the laws of the Gufpel, nor fhown by their conduct that they difregarded them, even thofe who have not been converted to Chrillianity have, however, been improved in their difpolitions and manners by its influence. The emperor, whofe virtues we have mentioned as arifing, in a certain degree, from his acquaintance with Chriftanity, in a lecter to an Heathen pontif, defires him to turn his eyes to the means by which the fuperftition of Chrifians was propagated : by kindnefs to frangers, by fanctity of life, and by the attention which they paid to the burial of the dead. He recommends an imitation of their virtues, exhorts him to caufe the priefts of Galatia to be attentive to the worfhip of their gods, and authorifes him to frip them of the facerdotal function, unlefs they obliged their wives, children, and fervants,

Religion. to pay atention to the fame duties. He likewife en joins works of beneficence, defires the priett to relieve the diftreffed, and to build houfes for the accommodation of Arangers of whatever religion; and fays, it is a difgrace for Pagans to difregard thofe of their own religion, whide Chriftians do kind offices to ftrangers and enemies. This is indeed an eminent inftance of the happy influence of Chrittianity even on the fentiments and manners of thofe who regarded the Chriftian name

5:
Chrifia-
nity to be preferred te all other religions.

Upon the whole then, may we not, from the particulars here exhibited concerning the influence of this religion on the manners and happinefs of men in fociety, conclude that Chriftianity is infinitely fuperior to the fuperfitions of Paganifm? as being in its tendency uniformly favourable to the virtue and the happinefs of mankind, and even to the fytem of religion and laws delivered by Mofes to the children of Ifrael: becaufe, while the religion of the Jews was calculated only for one particular nation, and it may almoft be faid for one particular ftage in the progrefs of fociety, Chrittianity is an univerfal religion, formed to exert its happy influence in all ages and among all nations; and has a tendency to difpel the fhades of barbarifm and ignorance, to promote the cultivation of the powers of the human underftarding, and to encourage every virtuous refinement of manners.
V. Another religion, which has made and fill makes a confpicuous figure in the world remains yet to be examined. The religion of Mahomet is that which we here allude to. Whether we confider through what an extenfive part of the globe that religion prevails, the political importance of the nations among whom it is profeffed, or the friking peculiarity of character by which it is diftinguifhed from all other religious fytems-it is for all thefe reafons well worthy of particular notice. Like the Jewifh religion, it is not barely a fyltem of religious doctrines and general moral precepts; it forms both the civil legillature and the religious fyftem of thofe nations among whom it is profeffed; and, like it too, it would appear to be calculated rather for one particular period in the progrefs of mankind from rudenefs to refinement, than for all ages and all fates of fociety.

The hiftory of its origin is pretty well known, and we have had occafion to enlarge upon it under a former article (fee Mahomet and Mahometanism). We are not here to trace the impoftures of the prophet, or to confider the arts by which he fo fuccefffully accompl:fhed his defigns ; but merely to confider the morality of his religion, and its influence on civil order and the happinets of fociety.
If we view the ftate of the nations among whom it is eftablifhed, we cannot hefitate a moment to declare it friendly to ignorance, to defpotifm, and to impurity of manners. The Turks, the Perfians, and the Malays, are all Mahometans ; and in reviewing their hiftory and conlidering their prefent flate, we might fund a fuffcient number of facts to jutify the above affertion: and we mult not neglect to obferve, that, as thofe nations are not known to have ever been fince their converfion to Mahometanifm under a much happier government, or in a much more civilized fate than at prefent, it cannot be, with any degree of fairnefs, argued, with $\because$ Feft to Mahometanifm as with refpect to Chrifiani-
ty, that it is only when its influence is fo oppofed by
other caufes as to prevent it from producing its full effects, that it does not conduct thofe focieties among which it is eftablifhed to an high fate of civilization and refinement.

One, and that by no means an inconfiderable, part of Remaths the Koran, was occafionally invented to folve fome dif- on the Koficulty with which the prophet found himfelf at the ran, $\&<$. time perplexed, or to help him to the gratification of his ruling pdffions, luft and ambition. When he and his followers were, at any time, unfuccetsful in thofe wars by which he fought to propagate his religion, to prevent them from falling away into unbelief, or finking into defpondency, he took care to infurm them that God fuffered fuch misfortunes to befal believers, as a punifhment for their fins, and to try their faitl. The doctrine of predeftination, which he affiduoufly inculcated, had an happy effect to perfuade his followers to rufh boldly into the midft of death and danger at his command. He prevailed with Zeyd to pat away his wife, married her himfelf, and pretended that his crime had the approbation of heaven ; and, in the Koran, he introduces the Deity approving of this marriage. Being repulfed from the fiege of Mecca, he made a league with the inhabitants; but on the very next year, finding it convenient to furprife the city, by violating this treaty, he juftified his perfidy by teaching his followers to difregard promifes or leagues made with infidels. In fome inftances again, we find abfurd prohibitions enjoined for fimilar reafons: his officers, having on fome occafion drunk to excefs, excited much riot and confufion in the camp, he prohibited the ufe of wine and other inebriating liquors among his followers in future. Now, though it muft be acknowledged that many evils arife from the ufe of thefe liquors, yet we cannot but think that, when ufed in moderation, they are in many cafes beneficial to men; and certainly as much allowed by God as opium, which the Mahometans have fubftituted in their place.

Mahomet is allowed to have copied from the Chri- Mahome- ${ }^{56}$ ftian and the Jewifh religions, as well as from the ido- tanifm a latrous fuperftitions which prevailed through Arabia, misture of and thus to have formed a motley mixture of reafon and Chritiabfurdity, of pure theifm and wild fuperfition. He anity, Juconfidered alfo the circumfances of his country, and daifm, and the prejudices of his countrymen. When he attended fitions of to the former, he was generally judicions enough to Arabiafuit his doftrines and decifions to them with fufficient fkill; the latter he alfo managed with the greateft art: but he entered into accommodation with them in inftances when a true prophet or a wie and upright legiflator would furely have oppofed them with decifive vigour. Where the prophet indulges his own fancy, or borrows from the fuperfitions of his countrymen, nothing can be more ridiculous than that rhaprody of Jies, contradiations, and extrivagant fabies, wlich he delivers to his followers. Amazing are the abfurdities which he relates concerning the patriarchs, concerning Solomon, and concerning the animals that were affembled in Noalis ark.

Bat in the whole tiffue of abfurdities of which his $\frac{57}{5}$ fyltem confifts, there is nothing more abfurd, or more heave of happily calculated to promote impurity of manners, than hell. his defcriptions of heaven and hell; the ideat of future rewards and punifhments, which he fought to imprefs

Religion. on the minds of his followers. Paradife was to abound with rivers, trees, fruits, and fady groves; wine which would not intoxicate was to be there plentifully ferved up to believers; the inlabitants of that happy region were all to enjoy perpetual yourh; and their powers of enjoyment were to be enlarged and iuvigorated, in order that fo many fine things might not be thrown away upon them. "Inftead of inipiring the bleffed inhabitants of paradife with a liberal tafte for harmony and fcience, converfation, and friendihip (fays Mr Gibbon), Mahomet idly celebrates the pearls and diamonds, the robes of filk, palaces of marble, dithes of gold, rich wines, artificial dainties, numerous attendants, and the whole train of fenfual luxury.-Seventy two houris, or black-eyed girls of refplendent beanty, blooming youth, virgin purity, and exquifite fenfibility, will be created for the ufe of the meaneft believer; a moment of pleafure will be prolonged for 1000 years, and his faculties will be increafed 100 fold, to render him worthy of his felicity." It mult be acknowledged that he allows believers other more refined enjoyments than thefe; thus they are to fee the face of God morning and evening; a pleafure which is far to exceed all the other pleafures of paradife. The following is his defcription of the punilhments of hell : The wicked are there to drink nothing but boiling ftinking water; breathe nothing but hot winds; dwell for ever in continual burning fire and fmoke; eat nothing but briars and thorns, and the fruit of a tree that rifeth out of the bottom of bell, whofe branches refemble the heads of devils, and whofe fruits thall be in their bellies like burning pitch.

All that we can conclude from a general view of the religion of Mahomet, from confidering the charater of the prophet, or from reviewing the hiftory of the nations among whom it has been eftablifhed, is, that it is one tiffue of abfurdities, with a few truths, however, and valuable precepts incongruoufly intermixed; that a great part of it is unfavourable to virtuous man. ners, to wife :and equal laws, and to the progrefs of knowledge and refinement. It often inculcates in a dired minner fentiments that are highly immoral; it fubilitutes trifing, fupertitious obfervances in the room of genuine piety and moral virrue; and it gives fuch views of futurity as render purity of heart no neceflary qualification fer feeing God.

Surely, therefore, even the deift, who rejects all but natural religion, would not hefitate to prefer Chriftianity, and even Judaifm, to the religion of Sahomet. Judaifm, calculated for a peculiar people, was undoubtedly much more fublime and much more happily fram- ed to render that people virtuous and lappy in the circumfances in which they were placed; and Chrintianity we find to be an univerfal religion, fuited to ath circumflances and to all the flages of fociety, and acting, wherever it is received, with more or lefs force to the fupport of civil order, virtuous manners, improvement of arts, and the advancement of fcience. However, as Mahometanifm forms in fome meafure a regular fyftem, as it has borrowed many of the precepts and duc. trines of Judaifm and Chriftianity, not indeed without corrupting and degrading them; and as it has contributed confiderably to the fupport of civil government, althwugh in a very imperfect form, in thofe coun ries in which it has obtained an efabilhment; for ill thefe
reafons we cannot but give it the preference to the fu-
perfitions of Paganifm.
THE whole refult of our inquiries under this article, therefore, is, 1 . That as man, by the confitution of Conclution. his mind, is naturally fitted for acquiring certain notions concerning the exillence of invifible, fuperior beings, and their influence on human life; fo the religious ideas which we find to have in all ages of the world, and in all the different flages of the progrefs of fociety, prevailed among mankind, appear to have originated partly from the natural exertions of the human imagination, underftanding, and paffions, in various circumftances, and partly from fupernatural revelation.
2. That though religious opinions, together with the moral precepts, and the rites of worfhip connected witls them, may appear to have been in numerous inftances injurious to the virtue and happinefs of fociety; yet, as they have often contributed to lead the mind to form moral ditinctions, when it would otherwife in all pro. bability have been an entire ftranger to fuch diftinctions; and as they have always contributed in an effential manner to the eftablifhment and the fupport of civil government-it muft therefore be acknowledged that , they have always, even in their humbleft ttate, been more beneficial than hurtful to mankind.
3. That when the different fyftems of religion that have prevailed in the world are comparatively viewed with refpect to their influence on the welfare of fociety, we find reafon, to prefer the polytheifm of the Greeks and Romans to the ruder, wilder, religious ideas and ceremonies thit have prevailed among iavages; Mahomotanifm, pernaps in fome reipects, to the polytheifm of the Greeks and Romans; Judaifm however to Mahometanim; and Chritianity to all of them.

RELIGIOUS, in a general fenfe, fomething that relates to religion.-We fay, a religious life, religious fociety, \&c.-Churches and church-yards are religious places.-A religious war is alfo called a croifade. See Croisade.

Religious, is alfo ufed fubitantially for a perfon engaged by folemn vows to the monallic life; or a perfon thut up in a monaitery to lead a life of devotion and aufterity, under fome rule or inftitution. The male religious we popularly call monks and friars; the female, naias and canoneffes.

REMBRANDT (Van Rhin), a Flemifh painter and engraver of great eminence, was born in 1606 , in a mill upon the banks of the Rhine, from whence he derived his name of Van Rhin. This matter was born with a creative genius, which never attained perfection. It was faid of him, that he would have invented painting, if he had not found it already difcovered. Without Rudy, without the affitance of any matter, but by his own inftinet, he formed rules, and a certain pracical method for colouring ; and the mixtare produced the defigned effect. Nature is not fet (ff to the greatef advantage in his pictures; but there is fuch a triking truth and fimplicity in them, that his heads, particularly his portraits, feem animated, and rifing from the canvas. He was fond of Atong contralts of licht and hade. The light entered in bis working-room only by a hole, in the manner of a camera obfcura, by which he judged with greater certainty of his productior.s. This attit conflered painting like the ftage

Wherz

## REM [ 78 1 REM

Remband where ide charaters do not frike unlef they are ex argeratei. He did not purfue the method of the Flemiff painters of finifhing his pieces. He fometimes gave his licht lach thick touches, that it feemed more like modelling than painting. A head of his has been fhown, the nofe of which was as thick of paint, as that which he copied from nature. He was told one day, that by his peculiar method of employing colnurs, his pieces appeared rugged and uneven-he replied, he was a painter, and not a dyer. He took a pleafure in dreffing his figures in an extraordinary manner: with this view he had collected a great number of ealtern caps, ancient armour, and drapery long fince out of fathion. When he was advifed to confult antiquity to attain a better tafte in drawing, as his was ufually heavy and uneven, he took his counfellor to the clofet where thefe old veltments were depofited, faying, by way of derifion, thofe were his antiques.

Rembrandt, like moft men of genius, had many caprices. Being one day at work; painting a whole family in a fingle picture, word being brought him that his monkey was dead, he was fo affected at the lofs of this animal, that, without paying any attention to the perfons who were fitting for their pictures, he painted the monkey upon the fame canvas. This whim could not fail of difpleafing thofe the piece was defigned for : but he would not efface it, choofing rather to lofe the fale of his picture:

This freak will appear fill more extraordinary in Rembrandt, when it is confidered that he was extremely avaricious; which vice daily grew upon him. He practifed various ftratagems to fell his prints at a high price. The public were very defirous of purchafing them, and not without reafor. In his prints the fame tafte prevails as in his pictures; they are rough and irregular, but picturefque. In order to heighten the value of his prints, and increafe their price, he made his fon fell them as if he had purloined them from his father ; others he expofed at public fales, and went thither himfelf in difguife to bid for them, fometimes he gave out that he was going to leave Holland, and fettle in another country. Thefe ftratagems were fuccefsful and he got his own price for his prints. At other times he would print his plates half finifhed, and expofe them to fale; he afterwards finifhed them, and they became frefh plates. When they wanted retouching, he made fome alterations in them, which promoted the fale of his prints a third time, though they differed but little from the firft imprefions.

His pupils, who were not ignorant of his avarice, one day painted fome pieces of money upon cards; and Rembrandt no fooner faw them, than he was going to take them up. He was not angry at the pleafantry, but his avarice fill prevailed. He died in 1674.

REMEMBRANCE, is when the idea of fomething formerly known recurs again to the mind without the operation of a like object on the external fenfory. See Memory and Reminiscence.

REMEMBRANCERS, in England, anciently called clerks of the remembrance, certain officers in the exchequer, whereof three are diftinguifhed by the names of the king's remembrancer, the lord ireafurer's remembrancer, and the remembrancer of the firft fruits. The king's remembrancer enters in his office all recognizances taken before the barons for any of the king's debts, for appearances or obferving
of orders; he allo takes all bonds for the king's debis; \&c. and makes out proceffes thereon. He likewife if. fues proceffes againtt the collectors of the cultoms, excife; and others, for their accounts; and informations upon penal ftatutes are entered and fued in his office, where all proceedings in matters upon Englifh bills in the ex-chequer-chamber remain. His duty further is to make out the bills of compofitions upon penal laws, to take the ftatement of debts; and into his office are delivered all kinds of indentures and other evidences which concern the affuring any lands to the crown. He every year in craftino animarum, reads in open court the ftatute for election of fheriffs; and likewife openly reads in court the oaths of all the officers, when they are admitted

The lord treafurer's remembrancer is charged to make out procefs againt all fheriffs, efcheators, receivers, and bailiffs, for their accounts. He alfo makes out writs of feri facias, and extent for debts due to the king, either in the pipe or with the auditors; and procefs for all fuch revenue as is due to the king on account of his tenures. He takes the account of fheriffs; and alfo keeps a record, by which it appears whether the fheriffs or other accountants pay their proffers due at Eafter and Michaelmas; and at the fame time he makes a record, whereby the heriffs or other accountants keep their prefixed days: there are likewife brought into his office all the accounts of cultomers, comptrollers, and accounts, in order to make entry thereof on records ; alfo all eftreats and amercements are certified here, \&c.

The remembracer of the firt-fruits takes all compofitions and bonds for the payment of firft-fruits and tenths; and makes out procefs againft fuch as do not pay the fame.

REMINISCENCE, that power of the human mind, whereby it recollects itfelf, or calls again into its remembrance fuch ideas or notions as it had really forgotten : in which it differs from memory, which is a treafuring up of things in the mind, and keeping them there, without forgetting them.

REMISSION, in phyfics, the abatement of the power or efficacy of any quality; in oppofition to the increafe of the fame, which is called intenfion.

Remission, in law, \&c. denotes the pardon of a crime, or the giving up the punifhment due thereto.

Remission, in medicine, is when a diftemperabates for a time, but does not go quite off.

REMITTANCE, in commerce, the traffick or return of money from one place to another, by bills of exchange, orders, or the like.

REMONSTRANCE, an expotulation or fupplication, addreffed to the chief magiftrate, or other fuperior, befeeching him to reflect on the inconveniences or ill confequences of fome order, edict, or the like. This word is alfo ufed for an expoftulatory counfel, or advice ; or a gentle and handfome reproof, made either in general, or particular, to apprize of or correct fome fault, \&c.

REMORA, or Sucking-fish, a fpecies of Ecmeneis. Many incredible things are related of this animal by the ancients; as that it had the power of fopping the largeft and fwifteft veffel in its courfe : and even to this day it is afferted by the fifhermen in the Mediterranean, that it has a power of retarding the motion of their boats by attaching itfelf to them, for

 ! Remora. Remora.
## R E M

Remorfe, which reafon they kill it whenever they perceive this $\underbrace{\text { Remphan. retardation. But in what manner the remora performs }}$ this, we have no account.

REMORSE, in its worf fenfe, means that pain or anguifh which one feels after having committed fome bad action. It alfo means tendernefs, pity, or fympathetic forrow. It is mof generally ufed in a bad fenfe, and is applied to perfons who feel compunction for fome great crime, as murder and fuch like. Murders which have been committed with the utmoft circumfpection and fecrecy, and the authors of which could never have been difcovered by any human inveftigation have been frequently unfolded by the remorfe and confeffion of the perpetrators, and that too, many years afterwards. Of this there are numerous infances, which are well authenticated, and which are fo generally known that it is needlefs to relate them here. See $\mathrm{R}_{\mathrm{E}}$ pentance.

REMPHAN, an idol or Pagan god whom St Stephen fays the Ifraelites worfhipped in the wildernefs as they paffed from Egypt to the land of Promife : "Yea, ye took up the tabernacle of Moloch, and the Itar of your god Remphan ; figures which ye made to worlhip them." That the martyr here quotes the following words of the prophet Amos, all commentators are agreed : "Ye have borne the tabernacle of your Moloch, and Chiun your images, the far of your god, which ye made to yourfelves." But if this coincidence between the Chrifian preacher and the Jewifh prophet be admitted, it follows, thac Cbiun and Remphan are two names of one and the fame deity. This is indeed farther evident from the LXX. tranflators having fubfituted in their verfion the word $\mathrm{Pas}_{\mathrm{a}}^{\mathrm{o}} \mathrm{a}$ inftead of Cbiun, which we read in the Hebrew and Englith Bibles. But the queftion which fill remains to be anfwered is, what god was worlhipped by the name of Remphan, Raiphan, or Cbiun? for about the other divinity here mentioned there is no difpute. See Moloch.

That Cbiun or Fenlf bon was an Egyptian divinity, cannot be queftioned; for at the era of the Exodus the Hebrews muit have been ftrangers to the idolatrous worThip of all other nations; nor are they ever accufed of any other than Egyptian idolatries during their 40 years wanderings in the wildernefs, till towards the end of that period that they became infected by the Moabites with the wormip of Baal-peor. That Moloch, Moleck, Melek, or Milcom, in its original acceptation denotcs a king or chief, is known to every oriental fcholar; and therefore when it is ufed as the name of a god, it undoubtedly fignifies the fun, and is the fame divinity with the Egyptian Offris. Reafoning in this way many critics, and we believe Seldon is in the number, have concluded that Cliun, and of courfe Rempban, is the planet Saturn; becaufe Cbiun is written Cian, Cenan, Ceuan Chevvin; all of which are modern oriental names of that planet.

But againt this hypothefis infurmountable objections prefent themfelves to our minds. It is univerfal ly allowed (fee Polytheism), that the firf objects of idolatrous worlhip were the $\int n n$ and moon, confidered
as the king and queen of heaven. The fixed fars, in- R mplan, deed, and the planets, were afterwards gradually admitted into the Pagan rubric ; but we may be fure that thofe would be firft affociated with the two prime luminaries which moft refembled them in brightnefs, and were fuppofed to be moft benignant to man. But the planet Saturn appears to the naked eye with fo feeble a luftre, that, in the infancy of aftronomy, it could not make fuch an impreffion on the mind as to excite that admiration which we mult conceive to have always preceded planetary worthip. It is to be obferved, too, that by the Pagan writers of antiquity Saturn is conftantly reprefented as a ftar of baleful influence. He is termed the leaden planet; the planet of malevolent afpea; the difmal, the ixhumane far. That the Egyptians, at fo early a period as that under confideration, fhould have adored as one of their greatelt gods a planet obfcure in its appearance, diftant in its fituation, and baleful in its influence, is wholly incredible.

There is, however, another ftar which they might naturally adore, and which we know they actually did adore, as one of their moft beneficent gods, at a very early period. This is the astpaxcail or arpios of the Greeks, the canis or fella canicularis of the Romans, and the dog-far of modern Europe, By the Egyptians it was called Sothis or Soti, which fignifies fafety, beneficence, fecundity; and it received this name, becaufe making its appearance in the heavens at the very time when the Nile overflowed the country, it was fuppored to regulate the inundation. On this account Plutarch (If. et Ofir. ) tells us, they believed the foul of their illuftrious benefactrefs $I f$ is to have tranfmigrated into the far Sothis, which they therefore worfhipped as the divinity which rendered their country fruitful. It made its appearance, too, on the firt day of the month Thoth ( A ), which was the beginning of the Egyptian year, and as fuch celebrated with fealting and feltivity; and being by much the brighteft far in the heavens, Horopollo (cap. 3.) informs us it was confidered as fovereign over the reft. A combination of fo many important circumitances might have induced a people lcis fuperfitious, than the Egyptians to pay divine homageto that glorious luminary, which was confounded with Ifis, who had been long regarded with the higheft veneration; and as Ifis was the wife and fifter of Ofiris and always affociated with him, the ftar of Ifis or Remphan was naturally afociated with Moloch, the fame with Olinis.

But it will be alked, how the far which by the E. gyptians was called Soth or Sothis came to be worfhipped by the Hebrews under the appellation of Gbiun or Remphan? This is a very pertinent queftion, and we fhall endeavour to anfwer it.

Every one knows that the pronunciation of oriental words is very uncertain; and that as the vowels were often omitted in writing, it is of very little importance to the meaning how they be fupplied, provided we retain the radical confenants. The word Cbiun may with equal propriety be written Kiun, Kion, or even $K_{y o n}$,
(A) This was the cafe at a very remote period; but it is otherwife at prefent, owing to the Paforsices of the Equizoxes. See that article.
$\underbrace{\text { Rempr. Whe Heberw jod being convertible into the Greek } u \text { or }}$ the Roman y; bat the werds Cans, Ckan, Kan, or Kban, which are often diverffied ints $K_{s n} K_{y} n$, Coben, Caban, figuifitag Hial, Chief, Prince, King, \&c. are diffufed through a great part of Aria and Europe., In the Chinefe language Q $_{2}, \boldsymbol{\prime}$, which fignifies a King, is fo fimilar to the word Cbizn or Khiun under confideration, that no etymologif will hefitate to pronounce them of the fame original and the fame import. The word Kan or Khan is univerfally known to be an honorary title in Tartary ; and Kaian or Kaiz, which is manifeftly cognare of the word Cbiun or Kiun, is, in the Plhevi or old Perfian language, the epithet applied to the dynaty of princes which fucceeded Cyrus the Great. Anong the Scythiars or ancient Tartars, Chiun fignifies the Sun and likewife the day; and Kung, Kinung, Kun, runs through all the dialects of the Gothic tongue, every where denoling a chief or fovereign. In the Syrian dialect, Kon fignifies a prince; and hence the Almighty is Ryled (Gen. xiv. 19.) Konah, which is tranflated poff fjr, but might have, with perhaps more propriety, been rendered Sovereign of heaven and earth. In Hebrew, the word Kaban or Kaben, which is the very fame with Kban or Kan, fignifies either a prief or a prince; and in Egypt Kon was the name of the firft Hercules or the fun. Hence the fame word in compofition denotes greatuefs, as Can-obus the great ferpent; Can-athoth, the great Thoth or Mercury; Canoffis, the great Ofiris.

From this deduction we would conclude, that the word, which is found in fo many tongues, and always denotes Cbief, Prince, Sovercign, is the very word Cbiun which the Egyptians and Hebrews applied to Sotbis, as being, in their conceptions, the chief or fovereign of all the fars. This will appear fill more probable, when we have afcertained the import of the word Rempham, or, as the LXX have it, Raiphan.
$P b a n$, the latter part of this word, is unqueftionably the fame with Pan, the molt ancient of the Egyptian gods (fee $P_{\text {an }}$ ). It is likewife a cognate of the Hebrew Pbanab, confpexit, fpectavit, vidit; and the radical word feems to be $P H A H$, which fignifies fometimes the countenance, and fometimes light. Hence Phacthon, which is compounded of pha light, eth or efh fire, and on ftrength, came to be one of the names of the an. Rai, which we commonly write Rajab, has long fignified, among the Indians, a fubordinate prince; and we know, that between India and Egypt there was a very early intercourfe. Raipban, therefore, may be either the royal light or the bright prince, fabordinate to Ofiris; and in either fenfe, it was a very proper epithet of Sotbis in the Egyptian kalendar. The word Rem or Rom, again (for it is fometimes written Remphan, and fometimes Rompha), is no other than the Hebrew Din Rum "high, exalted." Hence Remphan is the high or e:xalte.t light, which Sothis certainly was.

For this etymological difquifition we are indebted to Dr Doig, the learned author of Letters on the Savage Slate, who has written a differtation on Chiun and Remphan, of fuch value that we hope it will not be much longer with-held from the public. The afcertaining the identity of thofe names, and the god to which they belonged, is the leaft of its merit; for it will be found to throw much ligh upon many pallages in the Old 'Teftament. What confirms his interpretation is, that the
idol confecrated by the Egyptians to Sothis or the dng- Removing ftar, was a female figure with a llar on her head; and hence the prophet upbraids his councrymen with having borne the Star of tireir deity.

Regfyew fhire.

Paction of KEMOVING, in Scots law. See Law, $\mathrm{N}^{0}$ clxvii. 18.

REMURIA, feftivals eftablifhed at Rome by Romulus to appeafe the manes of his brother Remus. They were afteruards called Lemuria, and celebrated jearly,

RENIUS, the brother of Romulus, was expored together with his brother by the cruelty of his grandfather. In the contelt which happened between the two brothers about building a city, Romulus obtained the preference, and Remus, for ridiculing the rifing walls, was put to death by his brother's orders, or by Romulus himfelf (fee Romulus). The Romans were afflicted with a plague after this murder; upon which the oracle was confulted, and the manes of Remus appeafed by the inftitution of the Remuria.

RENAL, fomething belonging to the reins or KibN.EYS.

RENCOUNTER, in the military art, the encounter of two little bodies or parties of forces. In which fenfe rencounter is ufed in oppofition to a pitched battle.

Rencounter, in fingle combats, is ufed by way of contradiftinction to duel.-When two perfons fall out and fight on the fot without having premeditated the combat, it is called a rencounter.

RENDEZVOUS, or Rendevous, a place appointed to meet in at a certain day and hour.

RENEALMIA, in botany; a genus of the monegynia order, belonging to the monandria clafs of plants. The corolla is trifid; the neftarium oblong; the calyx monophyllous; the anthera feflile, oppofite to the nectarium ; the berry is flefhy. There is only one fpecies, which is a native of Surinam.

RENEGADE, or Renegado, a perfon who has apoltatized or renounced the Chriftian faith, to embrace fome other religion, particularly Mahometanifm.

RENFREW, the county-town of Renfrewfhire, flanding on the fmall river Cathcart, which flows into the Clyde at the diftance of five miles from Glafgow, is a fmall but ancient royal borough, the feat of the fheriff's court and of a prefbytery. The town is neatly built, and the inhabitants enjoy a tolerable fhare of commerce--Renfrew was originally joined to Lanerk, but was made an independent fheriffdom by Robert II. who had a palace here. W. Long. 4. 26. N. Lat. 55.51 .

RENFREWSHIRE, a county of Scotland, liyled by way of eminence the barony, becaufe it was the ancient inheritance of the Stewarts, is a fmall county, extending about 20 miles from north to fouth, and 13 from eaft to weft, parted from Dumbartonfhire by the river Clyde on the weft, bordering on the eaft with Lanerkihire, and on the north with Cunningbam. The face of the country is varied with hill and vale, wood and ftream; crowded with populous villages, and adorned with the feats of gentlemen. The foil is in general fertile, producing rye, barley, oats, peafe, beans, flax, and fome wheat: it likewife yields plenty of coal, and turf for fuel : and affords abundance of pafturage for fheep and cattle. The inhabitants are Lowlanders and Prefbyterians; wealthy and induftrious, addicted to traffic, and particularly expert in the linen manufacture.
REP [ 8i ] REP

Rennes Their genius is Aimulated to commerce, by the example II $\underbrace{\text { Repeating. }}$ of their neighbours of Glafgow, as well as the conve nience of the river and frith of Clyde, along the courfe of which they are fituated.
RENNES, a town of France, in Bretagne, and capital of that province. Defore the revolution it had a bifhop's fee, two abbeys, a parliament, and a mint. It is very $p$ pulous; the houfes are fix or feven fories high, and the fuburbs of larger extent than the town ittelf. The cathedral church is large, an:d the parlia-ment-houfe a handfome fructure. The great fquare belonging to it is furrounded with handfome houfes. There is a tower, formerly a pagan temple, which now contains the town-clock. It is feated on the river Villaine, which divides it into two parts, and was anciently fortified, but the walls are now in ruins, and the ditch nearly filled up. The fiege of the city by Edward III. king of England, is very celebrated in hiftory. The Englifh and Breton army confifed of 40,000 men; and neverthelefs, after having remained before it fix months, were obliged to retire without fuccefs. E. Long. o. 23. N. Lat. 48. 7.

Rennet. See Runnet.
RENT, in law, a fum of money, or other confideration, iffuing yearly out of lands or tenements.

RENTERING, in the manufactoties, the fame with fine-drawing. It confifts in fewing two pieces of cloth edge to edge, without doubling them, fo that the feam fcarce appears; and hence it is denominated fine-drawing. It is a French word meaning the fame thing, and is derived from the Latin retrabere, or re, in, and trabere,

* Lettres Edifiantes et CuricuTes. becaufe the feam is drawn in or covered. We are told *, that in the Eaf Indies, if a piece of fine mullin be torn and afterwards mended by the fine-drawers, it will be impofible to difcover where the rent was. In Britain the dexterity of the fine-drawers is not fo great as that of thofe in the ealt ; but it is fill fuch as to enable them to defraud the revenue, by fewing a head or flip of Englifh cloth on a piece of Dutch, Spanifh, or other foreign cloth: or a nlip of foreign cloth on a piece of Englifh, fo as to pafs the whole as of a piece; and by that means avoid the duties, penalties, \&c. The trick was firft difcovered in France by M. Savary.

Remtering, in tapeftry, is the working new warp into a piece of damaged Tapeftry, whether eaten by the rats or otherwife deftroyed, and on this warp to reftore the ancient pattern or defign. The warp is to be of woollen, not linen. Among the titles of the French tapeftry makers is included that of renterers. Finedrawing is particularly ufed for a rent or hole, which lappens in dreffing or preparing a piece of cloth artfully fewed up or mended with filk. All fine-drawings are reckoned defects or blemilhes; and thould be allowed for in the price of the piece.

RENVERSE, inverted, in heraldry, is when any thing is fet with the head downwards, or contrary to its natur.l way of fanding. Thus, a chevron renverfé, is a chevron with the point downwards. They ufe alfo the fame term when a beaft is laid on its back.

RENUNCIATION, the act of renouncing, abdicating, or relinquifhing, any right, real or pretended.

REPARTEE, a fmart, ready reply, efpecially in maters of wit, humour, or raillery. See Raillery.

REPEALING, in law, the revoking or annulling of a flatute or the like.

Vol. XVI.

No act of parliament in England fhall be zcpealed the Rep. Lieots: fame feffion in which it was made. A deed or will may be repe:iled in part, and ftand good for the relt. It is Replevi: held that a pardon of felony may be repealed on difproving the fuggetion thereof.

REPELLEN IS, in medicine, remedies which drive back a morbid humour into the mals of blood, from whence it was undoly fecreted.

REPENTANCE, in general, means forrow for any thing patt. In theology it means fuch a forrow for fin as produces newnefs of life, or fuch a conviction of the evil and danger of a linful courfe as is fufficient to promduce fhame and forrow in the review of it, and effectual refolutions of amendment. In this fenfe the evangelical
 Theology.

REPERCUSSION, in mufic, a frequent repetitic: of the fame found.

REPERTORY, a place wherein things are orderly difpofed, fo as to be eafily found when wanted. The indices of books are repertories, fhowing where the matters fought for are treated of. Commion-place books are alfo kinds of repertcries.

REPETITION, the reiterating of an action.
Repetition, in mufic, denotes a reiterating or playiug over again the fame part of a compofition, whether it be a whole ftrain, part of a frain, or double frain, \&e.

When the fong ends with a repetition of the firf
Atrain, or part of it, the repetition is denoted by $d a$ capo, or D. C. i.e. "from the beginning."

Repetition, in rhetoric, a figure which gracefully and emphatically repeats either the fame word, or the fame fenfe in different words. See Oratory, no ${ }^{\circ} 67$ -80.

The nature and defign of this figure is to make deep impreffions on thofe we addrefs. It expreffes anger and indignation, full affurance of what we affirm, and a vehement concern for what we have efpoufed.

REPHIDIM (anc. geog.), a ftation of the Ifraelites near mount Horeb, where they murmured for want of water; when Mofes was ordered to fmite the rock Horeb, upon which it yielded water. Here Jofhua difcomfited the Amalekites. This rock, out of which Mofes brought water, is a tone of a prodigious height and thicknefs, rifing out of the ground; on two fides of which are feveral holes, by which the water ran. (Thevenot.)

REPLEGIARE, in law, fignifies to redeem a thing taken or detained by another, by putting in legal fureties.

De homine Replegiando. See Homine.
REPLEVIN, in law, a remedy granted on a diftrefs, by which the firft poffeffor has his goods reftored to him again, on his giving. fecurity to the fheriff that he will purfue his action againft the party diftraining. and return the goods or cattle if the taking them fhall be adjudged lawful.

In a replevio the perfon diftrained becomes plaintiff; and the perfon diftraining is called the defendant or avowant, and his jultification an avowry.
At the conimon law replevins are by writ, either out of the king's.bench or common-pleas; but by ftatute, they are by plaint in the fheriff's court, and court-baron, for a perfon's more fpeedily obtaining the goods diftrained.

## REP $\quad[82] \quad \mathrm{REP}$

Replevy If a plaint in replevin be removed into the court of Reprieve. king's-bench, \&c. and the plaintiff makes default and becomes non-fuit, or judgment is given againft him, the defendant in replevin thall have the writ of retorno babendo of the goods taken in diftrefs. See the next article.

REPLEVY, in Englifh law, is a tenant's bringing a writ of replevin, or replegiari facias, where his goods are taken by diftrefs for rent; which mult be done with. in five days after the diftrefs, otherwife at the five days end they are to be appraifed and fold.

This word is allo ufed for bailing a perfon, as in the cale of a bomine replegiando.

REPORT, the relation made upon oath, by officers or perfons appointed to vifit, examine, or eftimate the ftate, expences, \&c. of any thing.

Report, in Englifh law, is a public relation of cafes judiciounly argued, debated, refolved, or adjudged in any of the king's courts of juftice, with the caufes and reafons of the fame, as delivered by the judges. Alfo when the court of chancery, or any other court, refers the fating of a cafe, or the comparing of an account, to a mafter of chancery, or other referee, his certificate thereon is called a report.

REPOSE, in poetry, \&c. the fame with reft and paufe. See Rest, \&c.

Repose, in painting, certain maffes or large affemblages of light and hade, which being well conducted, prevent the confufion of objects and figures, by engaging and fixing the eye fo as it cannot attend to the other parts of the painting for fome cime; and thus leading it to confider the feveral groups gradually, proceeding as it were from tage to flage.

REPRESENTATION, in the drama, the exhibition of a theatrical piece, together with the fcenes, machinery, \&c.

REPRESENTATIVE, one who perfonates or fupplies the place of another, and is invefted with his right and authority. Such, for inftance, are the ReprefenEatives of the United States in Congrefs.

REPRIEVE, in criminal law (from reprendre, " to take back'), is the withdrawing of a fentence for an interval of time; whereby the execution is fufpended. See Judgment.
Blackf.
Comment.
This may be, firf, ex arbitrio judicis, either before or after judgment: as, where the judge is not fatisfied with the verdict, or the evidence is fufpicious, or the indictment is infufficient, or he is doubtful whether the offence be within clergy; or fometimes if it be a fmall felony, or any favourable circumftances appear in the criminal's character, in order to give room to apply to the crown for either an abfolute or conditional pardon. Thefe arbitrary reprieves may be granted or taken off by the juftices of gaol-delivery, although their feffron be finifhed, and their commiffion expired: but this rather by common ufage than of ftrict right.

Reprieves may alfo be ex neceflitate legis: as where a woman is capitally convicted, and pleads her pregnancy. Though this is no caufe to ftay judgment, yet it is to refpite the execution till the be delivered. This is a mercy dictated by the law of nature, in' favorem prolis ; and therefore no part of the bloody proceedings in the reign of Queen Mary hath been more juftly detefted, than the cruelty that was exercifed in the inland of Gaernfey, of burning a woman big with child; and,
hen through the violence of the flames the infant Reprieve, fprang forth at the fake, and was preferved by the by- Reprifuls. ftanders, after fome deliberations of the priefts who affifed at the facrifice, they calt it into the fire as a young heretic. A barbarity which they never learned from the laws of ancient Rome; which direct, with the fame humanity as our own quod prognantis mulieris dafnnate pena differatur, quoad pariat: which doctrine has alio prevailed in England, as early as the firt memorials of their law will reach. In cafe this plea be made in ftay of execution, the judge mult direct a jury of twelve matrons or difcreet women to inquire into the fact: and if they bring in their verdich quick with, cbild (for bare. ly with child, unlefs it be alive in the womb, is not fuf. ficient), execution fhall be faid generally till the next feffion; and fo from feffion to feffon, till either the is delivered, or proves by the courfe of nature not to have been with child at all. But if fhe once hath had the benefit of this reprieve, and been delivered, and afterwards becomes pregnant again, fhe fhall not be intitled to the benefit of a fatther refpite for that caufe. For the may now be executed before the child is quick in the womb; and fhall not, by her own incontinence, evade the fentence of juftice.

Another caufe of regular reprieve is, if the offender become non compos between the judgment and the award of execution: for regularly, though a man be compos when he commits a capital crime, yet if he becomes non compos after, he thall not be indiced; if after indictment, he thall not be convicted; if after conviction, he thall not receive judgment; if after judgment, he Shall not be ordered for execution: for furiofus folo furore punitur ; and the law knows not but be might have offered fome reafon, if in his fenfes, to have flayed thefe refpective proceedings. It is therefore an invariable rule, when any time intervenes between the attainder and the award of execution, to demand of the prifoner what he hath to allege why execution fhould not be awarded againft him; and, if be appears to be infane, the judge in his difcretion may and outht to reprieve him. Or, the party may plead in bar of execution; which plea may be either pregnancy, the king's pardon, an aft of grace, or diverfity of perfon, viz. that he is not the fame that was attainted, and the like. In this laft cafe a jury fall be impanelled to try this collateral ifue, namely, the identity of his perfon; and not whether guilty or innocent, for that has been decided before. And in thefe collateral iffues the trial thall be inftanter; and no time allowed the prifoner to make his defence or produce his witneffes, unlefs he will make oath that he is not the perfon attainted: neither fhall any peremptory challenges of the jury be allowed the prifoner, though formerly fuch challenges were held to be allowable whenever a man's life was in queftion. If neither pregnancy, infaity, non-identity, nor other plea, will avail to avoid the judgment, and fay the execution confequent thereupon, the laft and furef refort is in the king's molt, gracious pardon; the granting of which is the moft amiable prerogative of the crown. See the article Pardon.

REPRISALS, a right which governments claim of taking from their enemies any thing equivalent to what they unjuftly detain from them or their citizens. For as the delay of making war may fometimes be detrimental to individuals who have fuffered by depredations froma

## R E P $\quad\left[\begin{array}{ll}8_{3}\end{array}\right]$

Reprifals. from foreign potentates, our laws have in fome refpects Slackit. Commest. armed the fubject with powers to impel the prerogative; by directing the minifters of the crown to iffue
letters of marque and reprifal upon due demand: the prergative of granting which is nearly related to, and plainly derived from, that other of making war ; this being indeed only an incomplete fate of hoitilities, and generally ending in a formal denunciation of war. Thefe letters are grantable by the law of nations, whenever the iubjeets of one fate are oppreffed and injured by thofe of another ; and juftice is denied by that fate to which the oppreffor belongs. In this cafe letters of marque and reprifal (words ufed as fynonymous; and fignifying, the latter a taking in return, the former the paffing the frontiers in order to fuch taking) may be obtained, in order to leize the bodies or goods of the fubjects of the offending flate, until fatisfaction be made, whereever they happen to be found. And indeed this cuftom of reprifals feems diftated by nature herfelf; fur which reafon we find in the molt ancient times very notable initances of it. But here the neceffity is obvious of calling in the fovereign power, to determine when reprifals may be made; elfe every private fufferer would be a judge in his own caufe. In purfuance of which principle, it is with us declared by the Rlat. 4 Hen. V. c. 7. that, if any fubjects of the realm are oppreffed in time of truce by any foreigners, the king will grant marque in due form, to all that feel themfelves grieved. Which form is thus directed to be otferved: the fuf. fere' muft firlt apply to the lord privy-feal, and he fhall make out letters of requeft under the privy.feal ; and it after fuch requeft of fatisfaction made, the party required do not within convenient time make due fatisfaction or reflitution to the party grieved, the lord-chancellor flall make him out letters of marque under the great feal; and by virtue of thefe he may attack and feize the property of the aggreffor nation, without hazard of being condemned as a robber or pirate.

Reprisal, or Recaption, is a feecies of remedy allowed to an injured perfon. This happens when any one hath deprived anothcr of his property in goods or chattels perfonal, or wrong fully detains one's wife, child, or fervant: in which cafe the owner of the goods, and the hufband, parent, or matter, may lawfully claim and retake them, wherever he happens to find them; fo it be not in a riotous manner, or attended with a breach of the peace. The reafon for this is obvious; fince it may frequently happen that the owner may have this only opportunity of doing himfelf jultice : his goods may be afterwards conveyed away and deftroyed; and his wife, children, or fervants, concealed or carried out of his reach; if he had no fpeedier remedy than the ordinary procefs of law. If therefore he cim fo contrive it as to gain poffeffion of his property again, without force or terror, the law favours and will jultify his proceeding. But, as the public peace is a fuperior confideration to any one man's private property; and as, if individuals were once allowed to ufe private force as a remedy for private imjuries, all focial juftice muft ceafe, the ftrong would give law to the weak, and every man would revert to a fate of nature; for thefe reafons it is provided, that this natural right of recaption hall never be exerted, where fuch exertion mult occafion trife ard bodily contention, or endanger the peace of fuciety. If, for inflance, my horfe is taken
away, and I find him in a common, a fair, or a public inn, I may lawfully feize him to my own ufe: but I cannot juftify breaking open a private ftable, or entering on the grounds of a third perfon, to take him, except he be telonioully ftolen; but mult have recourfe to an action at law.
REPROBATION, in theology, means the act of abandoning, or flate of being abandoned, to eternal deftruction, and is applied to that decree or refolve which God has taken from all eternity to punifh fimers who flall die in impenitence; in which fenfe it is directly oppofed to election. When a finner is fo hardened as to feel no remorfe or mifgiving of confcience, it is confidered as a fign of reprobation; which by the cafuifts has been diftinguifhed into pofitive and negative. The firt is that whereby God is fuppofed to create men with a pofitive and abfolute refllution to darm them eternally. This opinion is countenanced by St Augultine and other Chriftian fathers, and is a peculiar tenet of Calvin and molt of his followers. The church of England, in The thirty-nine Articles, teaches fomething like it ; and the church of Scotland, in the Confefion of Faith, maintains it in the flrongeft terms. But the notion is generally exploded, and is believed by no rational divine in either church, being totally injurious to the juftice of the Deity. Negative or conditional reprobation is that whereby God, though he has a fincere defire to fave men, and furnifhes them with the neceffary means, fo that all if they will may be faved, yet fees that there are many who will not be faved by the means, however powerful, that are afforded them ; tho' by other means which the Deity fees, but will not afford them, they might be faved. Reprobation refpects angels as well as men, and refpects the latter either fallen or unfallen. See Prebestination.

REPRODUCTION, is ufually undertood to mean the reftoration of a thing before exifting, and fince deftroyed. It is very well known that trees and plants may be raifed from flips and cuttings; and fome late obfervations have fhown, that there are fome animals which have the fame property. The polype * was the * See Pofirft inftance we had of this; but we had farce time lypus. to wonder at the difcovery Mr Trembley had made, when Mr Bonett difcovered the fame property in a fpecies of water-worm. Amongtt the plants which may be raifed from cuttings, there are fome which feem to poffefs this quality in fo eminent a degree, that the fmalleft portion of them will become a complete tree again.

It deferves inquisy, whether or not the great Author of nature, when he ordained that certain infects, as thefe polypes and worms, fhould refemble thofe plants in that paricular, allowed them this power of being reproduced in the fame degree? or, which is the fame thing, whether this reproduction will or will not take place in whatever part the worm is cat? In order to try this, MIr Bonett entered on a courfe of many experiments on the water-worms which have this property. Thefe are, at their common growh, from two to three inches long, and of a brownilh colour, with a catt of reddifh. From one of thefe worms he cut off the head and tail, taking from each extremity only a fmall piece of a twelfth of an inch in length; but neither of thefe pieces were able to reproduce what was wanting. They both perifhed in about 24 hours; the tail firlt,

# R E P 

## R E P

Reproduc- and afterwards the head. As to the body of the worm tion. from which thefe pieces were feparated, it lived as well as before, and feemed indeed to fuffer nothing by the lofs, the head-part being immediately ufed as if the head was thereon, boring the creature's way into the mud. There are, belides this, two other points in which the reproduction will not take place; the one of thefe is about the fitth or fixth ring from the head, and the other at the fame diltance from the tail; and in all probability the condition of the great artery in thefe parts is the caufe of this.

What is faid of the want of the reproductive power of thefe parts relates only to the head and tail ends; for as to the body, it feels very little inconvenience from the lofs of what is taken off, and very fpeedily reproduces thofe parts. Where then does the principle of life refide in fuch worms, which, after having their heads cut off, will have not only the fame motions, but even the inclinations, that they had before? and yet this difficulty is very fmall, compared to feveral others which at the fame time offer themfelves to our reafon. Is this wonderful reproduction of parts only a natural confequence of the laws of motion ? or is there lodged in the body of the creature a chain of minute buds or fhoots, a fort of little embryos, already formed and placed in fuch parts where the reproductions are to begin? Are thefe worms only mere machines ? or are they, like more perfect animals, a fort of compound, the fprings of whofe motions are actuated or regulated by a fort of foul? And if they have themfelves fuch a principle, how is it that this principle is multiplied, and is found in every feparate piece? Is it to be granted, that there are in thefe worms, not a fingle foul (ifit is to be fo called) in each, but that each contains a3 many fouls as there are pieces capable of reproducing perfect animals? Are we to believe with Malpighi, that thefe forts of worms are all heart and brain from one end to the other! This may be; but yet if we knew that it was fo, we flould know in reality but very little the more for knowing it : and it feems, after all, that in cafes of this kind we are only to admire the works of the great Creator, and fit down in filence.
The nice fenfe of feeling in fpiders has been much talked of by naturalifts; but it appears that thefe worms have yet fomewhat more furpifing in them in regard to this particular. If a piece of ftick, or any other fubfance, be brought near them, they do not fay for its touching them, but begin to leap and frikk about as foon as it comes towards them. There want, however, fome farther experiments to afcertain whether this be really owing to feeling or to fight; for though we can difcover no ditinct organs of fight in thefe creatures, yet they feem affected by the light of the fun or a candle, and always frifk about in the fame manner at the approach of either; nay, even the moon-light has fome effect upen them.

A twig of willow, poplar, or many other trees, being planted in the earth, takes root, and becomes a tree, every piece of which will in the fame manner produce other trees. The cafe is the fame with theie worms: they are cut to pieces, and thefe feveral pieces become perfect animals; and each of thefe may be again cut into a number of pieces, each of which will in the fame manner produce an animal. It had been fuppofed by fome that thefe worms were oviparous: but Mr Bo.
nett, on cutting one of them to pieces, having obferved Reproduca flender fubftance, refembling a fmall filament, to move at the end of one of the pieces, feparated it; and on examining is with glaffes, found it to be a perfect worm, of the fame form with its parent, which lived and grew larger in a veffel of water into which he put it. Thefe fmall bodies are eafily divided, and very readily complete themfelves again, a day ufually ferving for the production of a head to the part that wants one; and, in gcneral, the fmaller and flenderer the worms are, the fooner they complete themfelves after this operation. When the bodies of the large worms are examined by the microfcope, it is very eafy to fee the appearance of the young worms alive, and moving about within them: but it requires great precifinn and exaAnefs to be certain of this ; fince the ramifications of the great artery have very much the appearance of young worms, and they are kept in a fort of continual motion by the fyftoles and diaftoles of the feveral portions of the artery, which ferve as fo many hearts. It is very certain, that what we force in regard to thefe animals by our operations, is done alfo naturally every day in the brooks and ditches where they live. A curious obferver will find in thefe places many of them without heads or tails, and fome without either ; as alfo other fragments of various kinds, all which are then in the act of completing themfelves: but whether accidents have reduced them to this fate, or they thus purpofely throw of parts of their cwn body for the reproduction of more animals, it is not eafy to determine. They are plainly liable to many accidents, by which they lofe the feveral parts of their body, and muft perifh very early if they had not a power of reproducing what was lof: they often are broken into two pieces, by the refiftance of fome hard piece of mud which they enter; and they are fubject to a difeafe, a kind of gangrene, roting off the feveral parts of their bodies, and muft inevitably periih by it, had they not this furprifing property.

This worm was a fecond intance, after the polype, of the furprifing power in an animal of recovering its molt effential parts when loft. But Nature does not feem to have limited her bereficence in this refpect to thefe two creatures. Mr Bonett tried the fame experiments on another fpecies of water-worm, differing from the former in being much thicker. This kind of worm, when divided in the fummer-feafon, very otten flows the fame property: for if it be cut into three or four pieces, the pieces will lie like dead for a long time, but afterwards will move about again; and will be found in this ftate of reft to have recovered a head, or a tail, or both. After recovering their parts, they move very little; and, according to this gentleman's experiments, feldom live more than a month.

It hould feem, that the more difficult fuccefs of this laft kind of worm, afer cutting, and the long time it takes to recover the lof parts, if it do recover them at all, is owing to its thicknefs; fince we always find in that fpecies of worms which fucceeds beft of all, that thofe which are thinneft always recover their parts much fooner than the others.

The water-infects alfo are not the only creatures which have this power of recovering their lof parts. The earth affords us fome already difovered to grow in this manner from their cuttings, and thefe not lefs deferving our admiration than thofe of the water: the
common

## R E P

Reproduc- common earth-worms are of this kind. Some of thefe tion. worms have been divided into two, others into three or four pieces; and fome of thefe pieces, after having paffed two or three months without any appearance of life or motion, have then begun to reproduce a head or tail or both. The reproduction of the anus, after fuch a ftate of reft, is no long work; a few days do it : but it is otherwife with the head, that does not feem to perform its functions in the divided pieccs till about feven months after the feparation. It is to be obferved, that in all thefe operations both on earth and water-worms, the hinder part fuffers greatly more than the fore part in the cutting; for ic always twilts itfelf about a long time, as if actuated by frong convultions; whereas the head ufually crawls away without the appearance of any great uncafinefs.

The reproduction of leveral parts of lobtters, crabs, \&c. makes alfo one of the great curiofities in natural hiltory. That, in lieu of an organical part of an animal broken off, another fhall rife perfectly like it, may feem inconfiftent with the modern fyftem of generation, where the animal is fuppofed to be wholly fermed in the egg. Yet has the matter of fact been well attefted by the fifhermen, and even by feveral virtuofi who have taken the point into examination, particularly M. de Reaumur and M. Perrault, whofe fiill and exactnefs in things of this nature will hardly be queftioned. The legs of lobiters, \&c. confift each of five articulations: now, when any of the legs happen to break by any accident, as in walking, \&c. which frequently happens, the fracture is always found to be in a part near the fourth articulation; and what they thus lofe is precifely reproduced fome time afterwards; that is, a part of a leg fhoots out, confifting of four articulations, the firt whereof has two claws as before; fo that the lofs is entirely repaired.
If a lubiter's leg be broken off by defign at the fourth or fifth articulation, what is thus broken of always comes again; but it is not fo if the fracture be made in the firlt, fecond, or third articulation. In thofe cafes, the reproduction is very rare if things continue as they are. But what is exceedingly furpriing is, that they do not; for, upon vifiting the lobfter maimed in thefe barren and unhappy articulations, at the end of two or three days, all the other articulations are found broken off to the fourth; and it is fufpected they have performed the operation on themfelves, to make the reproduction of a leg certain.

The part reproduced is not only perfestly like that retrenched, but alfo, in a certain face of time, grow's equal to it. Hence it is that we frequently fee lobfers, which have their two big legs unequal, and that in all proportions. This fhows the fmaller leg to be a new one.

A part thus reproduced being broken, there is a fecond reproduction. The fummer, which is the only feafon of the year when the lobfters eat, is the molt favourable time for the reprodustion. It is then performed in four or five weeks; wherensit takes up eight or nine months in any other feafon. The fmell legs are fometimes reproduced; but more rarely, as will as more nowly, than the great ones: the horns do tie fame. The experiment is moft eafily tried on the common crab. See Metaphysics, p. 5:4. to:e (f); and Prysiology, $\mathrm{n}^{\circ} 26$ I.

REPTILES, in natural hiftory, a kind of animals denominated from their creeping or advancing on the belly. Or reptiles are a genus of animals and infects, which, infead of feet, relt on one part of the body, while they advance forward with the reft. Such are earthworms, fnakes, caterpillars, \&c. Indeed, moit of the clafs of reptiles have feet; only thofe very fmall, and the legs remarkably fhort in proportion to the bulk of the body.

Naturailits obferve a world of artful contrivance for the motion of reptiles. Thus, particularly in the earthworm, Dr Willis tells us, the whole body is only a chain of annular mufcles; or, as Dr Derham fays, it is only one coutinued fpiral mufcle, the orbicular fibres whereof being contracted, render each ring narrower and longer than before ; by which means it is enabled, like the worm of an augre, to bore its paflage into the earth. Its reptile motion might allo be explained by a wire wound on a cylinder, which when flipped off, and one end extended and held fall, will bring the other near to it. So the earthworm having fhot ous or extended his body (which is with a wreathing), it takes hold by thefe fmall feet it hath, and fo contracts the hinder part of its body. Dr ${ }^{\text {'Tyfon adds }}$ that when the forepart of the body is ftretched out, and applied to a plane at a diftance, the hind part relaxing and fhortening is eafly drawn towards it as a centre.

Its feet are difpofed in a quadruple row the whole length of the worm, wi h which, as witi fo many hooks, it fatens down fometimes this and fometimes that part of the body to the plane, and at the fame time flretches out or drags after it another.

The creeping of ferpents is effected after a fomewhat different manter; there being a diffecnce in lieir ftructure, in that thefe laf have a compages of bones articulated together.

The body here is not drawn together, but as it were complicated; part of it being applied on the :01th ground, and the ret ejaculated and fhut from it, which being fet on the grouad in its turn, brings the other after it. The fpine of the back varioufly wreathed has the fame effect in leaping, as the joints in the feet of other animals; they make their leaps by means of mufcles, and extend the plicx or folds. See ZooloGy.

REBUBLIC, or commonwealth, a popular ftate or goverument; or a nation where the people have the government in their own hands. See Government, Aristocracy, Democracy, and Monarchy.

Repubile of Letters, a phrafe ufed collectively of the whole body of the ftudious and learned penple.
REPUDIATION, in the civillaw, the aft of divorcing. See Divorce.

REPULSION, in phyfics, that property of bodies whereby they recede from each other, and, on certain occafions, mutually avoid coming ieto contact.
Repulsion, as well as attraction, has of late been confidered as one of the primsry qualities of all matter, and has beeia much ufed in explaining the phenomena of nature : thes the particles of ar, tre, fleam, electric fluid, \&c. are all haid to have a repulive power with reffer to one another.-That this is the caie with the air, and vapcur of all kinds, is certain; becaufe when they aie compreficd into a foall fpace, they expand

## R.E Q

Reputa- with great force: but as to fire, light, and electricity, tion, 1: greft. orr experimenti fail ; nay, the fuppolition of a repullive power among the paticles of the electric fluid is incon-
fiftent with the phenomena, as has been demonftrated wider the aiticle Elfctricity, Sect. V. and VI. Even in thofe fiuid, dir and feam, where a repulfive pwer molt mandelity exifts, it is demonitrable that the repulfion camot be a primary quainty, fince it can be increafed to a great degree by heat, and diminifhed by cold: but it is impolible that a primary quality of matter can be increafed or diminifhed by any external circumitances whatever; for whatever property depends upon external circumblances, is not a primary but a fecondary one. -The repulfion of electrified bodies is explained under the article. Electricity: that of others is lefs fubject to invelligation; and the moft that can be faid concerning it is, that in many cafes it feems to be the confequence of a modification of fire, and in others of electricity.

REPUTATION means credit, honour, or the character of good; and fince we are deftined to live in fociety, is neceffary and ufeful more or lefs to every human being. There is no man, except one who is cvergrown with pride and felf-conceit, or whofe actions are bad, but pays attention to his reputation, and wifhes to poffefs the good opinion of his neighbours or the world. The love of reputation and of fame are molt powerful fprings of action; but though they proceed from the fame principle, the means of attaining them, and the effects of them, are not altogether the fame.

Many means indeed ferve equally to fupport the reputation and to increafe the fame, differing only in degrees; others, however, belong peculiarly either to the one or to the other. An honeft reputation is within the reach of the bulk of mankind ; it is obtained by the focial virtues and the conftant practice of the common duties of life. This kind of reputation indeed is neither extendive nor brilliant, but it is often the moft ufeful in point of happinefs. Wit, talents, and genius, are the necelfary requilites for fame; but thofe advantages are perhaps lef's real in their confequences than thofe arifing from a good reputation. What is of real ufe cofts little; things rare and fplended require the greateft labour to procure, and yield perhaps a more ideal happinefs.

Fame can be poffeffed, comparatively fpeaking, but by few individuals; as it requires either very fuperior abilities, fupported by great efforts, or very fortunate circumftances. It is conftituted by the applaufe of mankind, or at lealt by that of a fingle nation; whilit reputation is of much lefs extent, and arifes from different circumtances. That reputation which is founded on deceit and artifice is never fulid; and the moft honourable will always be found to be the moft ufeful. Every one may fafely, and indeed ought to, afpire to the confideration and praife due to his condition and merit ; but he who afpires to more, or who feeks it by difhoneft means, will at length meet with contempt.

REQUEST, in law, a fupplication or petition preferred to a prince, or to a court of jutice; begging relief in fome confcionable cafes where the common law grants ne immediate redrefs.

Court of Requests (curia requifitionum) was a court of equity, of the fame nature with the court of chancery, but inferior to it; principally inftituted for the relief of fuch petitioners as in confcionable cafes addref-
fed themfelves by fupplication to his majefty. Of this Requef. court the lord privy-ieal was chief judge, affifted by the Blackit. mafters of requelts; and it had beginning about the 9 comment. Hen. VII. according to Sir Julius Cæfar's tractate upon this fubject: though Mr Gwyn, in his preface to his Readings, faith it began from a commiffion firt granted by king Henry VIII.-This court, having afumed great power to itfelf, fo that it became burchenfome, Wich. anno 40 and 41 Eliz. in the court of com-mon-pleas it was adjudged upon folemn argument, that the court of requelts was no court of judicature, \&c. and by ftat. 16 \& 17 Car. I. c. Io. it was taken away.

There are fill courts of requeft, or courts of confcience, confituted in London and other trading and populous diftricts for the recovery of fmall debts. The firt of thefe was eftablifhed in Lonsion fo early as the reign of Henry VIII. by an act of their common council; which however was certainly infufficient for that purpofe, and illegal, till confirmed by fatute 3 Jac . I. c. 15 . which has fince been explained and amended by ftatute 14 Geo. II. c. Io. The conftitution is this: two aldermen and four commoners fit twice a week to hear all caufes of debt not exceeding the value of forty fhillings; which they examine in a fummary way, by the oath of the parties or other witneffes, and make fuch order therein as is confifent to equity and good confcience. The time and expence of obtaining this fummary redrefs are very inconfiderable, which make it a great benefit to trade ; and thereupon divers trading. towns and other diftricts have obtained acts of parliament for eitablufhing in them courts of confcience upon nearly the fame plan as that in the city of London.

By 25 Geo. III. c. 45 . (which is confined to profecutions in courts of confcience in London, Middlefex, aud the borough of Southwark), and by 26 Geo. III. c. $3^{8 \text {. (which extends the provifions of the former act }}$ to all other courts inftituted for the recovery of fmall debts), it is enaifed, that after the firft day of September i 786 , no perfon whofoever, being a debtor or defendant, and who has been or hall be committed to any gaol or prifon by order of any court or commiffioners authorifed by any act or acts of parliament for conftituting or regulating any court or courts for the recovery of fmall debts, where the debt does not exceed twenty fhillings, fhall be kept or continued in cultody, on any pretence whatfoever, more than twenty days from the commencement of the laft mentioned aft; or from the time of his, her, or their commitment to prifon: and where the original debt does not amount to or exceed the fum of forty fhillings, more than forty days from the commencement of the faid act, or from the time of his, her, or their commitment as aforefaid ; and all gaolers are thereby required to difcharge fuch perfons accordingly. And by fect. 2. if it thall be proved to the fatisfaction of the court, that any fuch debtor has money or goods which he has wilfully and fraudulently concealed : in that cafe the court fhall have power to enlarge the aforefaid times of imprifonment for debts under twenty fhillings, to any time not exceeding thirty days, and for cebts under forty fuillings, to any time not exceeding fixty days; which faid ground of farther detention thall be fpecified in the faid commitment. And that (by fect. 5.) at the expiration of the faid refpective times of imprifonment, every fuch perfon thall immediately be difcharged, without paying any fum of

## R E S

Requiem money, or other reward or gratuity whatfoever, to the a very large produce upon an acre. The crop being,

gaoler of fuch gaol on any pretence whatfoever; and every gaoler demanding or receiving any fee for the difcharge of any fuch perfon, or keeping any fuch perfon prifuner after the faid refpective times limited by the faid act, fhall forfeit five pounds, to be recovered in a fummary way before two juftices of the peace, one moiety thereof to te paid to the overfeers of the poor of the parifh where the offence fhall be committed, and the other $t$ o the informer.

REQUIEM, in the Romifh hitory, a mafs fung for the reft of the foul of a perfon deceafed.

RESCISSION, in the civil law, an action intended for the annulling or fetting afide any contract, deed, \&c.

RESCRIPT, an anfwer delivered by an emperor, or a pope, when confulted by particular perfons on fome difficult quefion or point of law, to ferve as a decifion thereof.

RESEDA, dyer's-weed, rcllow-weed, Weld, or Wild-woad: A genus of the order of trigynia, belonging to the dodecandria clafs of plants; and in the natural method ranking under the 54 th order, Mifcellanea. The calyx is monophyllous and partite; the petals lanciniated; the capfule unilocular, and opening at the mouth. There are in fpecies; of which the moft remarkable is the luteola or cummon dyer's weed, growing naturally in wafte places in many parts of Britain. The young leaves are often undulated; the ftalk is a yard high, or more, terminated with a long naked fike of yellowifh.green flowers: the plant is cultivated and muck ufed for dyeing filk and wool of a yellow colour. The great recommendation of the plant is, that it will grow with very little trouble, witheut durg, and on the very worlt fils. For this re fon it is commonly fown with, or immediately after, barley or oats, without any additioual care, except dawing a bufh over it to harrow it in. The reaping of the corn does it littie or no hurt, as it grows but little the firft gear; and the next fummer it is pulled and drie like flax. Much care and nicety, however, is requifite, io as not to injure either the feed or ftalk; or, which fometimes happens, damaging both, by letting it fand too long, or puling it too green. To avoid thefe inconveniences, a better method of culture has been devifed. This new method is to plough and harrow the ground very fine, without dung, as equaily as poflible, and then fowing about a gillon of feed, which is very fmall, upon an acre, fome time in the month of Augult. In about two months it will be high enough to hoe, which muit be carefully done, and the plants left about fix inches afunder. In March it is to be hoed again, and this labour is to be repeated a third time in May. About the clofe of June, when the flower is in full vigour, and the ftalk is become of a greenilli-yellow, it thould be pulled; a dufficient quantity of ftems being leit growing for feed till September. By this means the Hower and ftalk, both of them being carefully dried, will fell at a good price to the dyers, who employ it confantly, and in large quantities; add to this, that the feed being ripe and in perfect order, will yield a very confiderable profit. In a tolerable year, when the feafons have not been unfavourable, the advantages derived from this vegetable will arfuer very well; but if the fummer fhould be remarkably fine, and proper care is taken in getting it in, there will te
as has been fhown, fo early removed, the ground may be conveniently prepared for growing wheat the next year. Upon the whole, weld is in its nature a very valuable commodity in many refpects, as it ferves equally for woollen, linen, or filk; dyeing not only a rich and lafting yellow, but all,, properly managed, all the different fhades of yellow with brightnefs and beauty; and if there be previoully dipped blue, they are by the weld changed into a very pleafing green, which the artifs can alfo diverfify into a great variety of flades.

RESEMBLANCE, and Dissimilitude, the relations of likencfs and difference among objects. See Comparison.

The connection that man hath with the beings around Elem. of him, requires fome acquaintance with their nature, their Criticifnt, powers, and their qualities, for regulating his conduct. For acquiring a branch of knowledge fo effential to our well-being, motives alone of reafon and intereft are not fufficient : nature hath providentially fuperadded curio. fity, a vigorous propenfity, which never is at reft. This propenlity alone attaches us to every new obect $\dagger$; and $\dagger$ Sce Noincites us to compare objects, in order to difcuver their velty. differences and refemblances.

Refemblance among objects of the fame kind, and diflimilitude among objects of different kinds, are too obvious and familiar to gratify our curiofity in any degree: its gratification lies in difcovering differences among things where refemblance prevails, and refemblances where difference prevail. Thus a difference in individuals of the fame kind of plants or animals, is. deemed a difcovery, while the many particulars in which they agree are neglected; and in different kinds, any refemblance is generally remarked, without attending to the many particulars iu which they differ.

A comparifon of the former neither tends to gratify our curiofity, nor to fet the objects compared in a ftronger light: two apartments in a palace, fimilar in thape, fize, and furniture, make feparately as good a figure as when compared; and the fame oblervation is $a_{1}$ plicable to two fimilar compartments in a garden: on the other hand, oppofe a regular building to a fall of water, or a good picture to a towering hill, or even a litt'e dog tu a large horfe, and the contraft will produce no effeet. But a refemblance between objects of different kinds, and a difference between objents of the fame kind, have remarkally an colivening effect. The poets, fuch of them as have a juft tafte, draw all their fimiles from things that in the main differ widely from the principal lubject; and they never atiempt a contialt, but where the things have a common genus, and a refemblance in the capital circumftances : place together a large and a fmall-fized animal of the fame fpecies, the one will appear greater, the other lefs, thin when viewed fepardtely : when we oppofebeauty to defurmity, each makes a rrater figure by the comparion. We compare the drefs of different nations with curioficy, but without furprife; becalie they have no fuch refemblance in the capital parts as to pleafe us by contrafting the fmaller parts. But it new cut of a fleeve, or of a pocket, enchants by its novelty; and, in oppofition to the former fallhion, raifes fome degree of furprife.

That :ufemblace and difimilitude have an enliven-

R fes:-
banse.
ince effect upon obe?s of fight, is made fufficiently evidint: aras that they have the fame effet upon objess of the other fentes, is alfo certain. Nor is thit haw conted to the external fenfes; for charafters conratted make a greater figure by the oppolition: Iago, in the tragety of Othello, fayc,

He hath a daily beauty in his life
'Hiat makes me ugly.
The charater of a $f$, and of a rough warrior, are nowhere more fuccefsfully contrafted than in Shakefpeace:

Hotftur. My liege, I did deny no prifoners; But I remember, when the fight was done, When I was dry with rage, and extreme toil, Breathlefs and faint, leaning upon my fword, Came there a certain lord, neat, trimly drefs'd, Erefh as a bridegroom; and his chin, new reap'd, Show'd like a ftubble-!and at harveft-home. He was perfumed like a milliner; Aad 'twixt his finger and his thumb he held A pouncet-box, which ever and anon He gave his nofe :-and Itill he fmil'd and talk'd; And as the foldiers bare dead bodies by, He call'd them untaught knaves, unmannerly, To bring a flovenly, unhandforne corfe Betwist the wind and his nobility. With many holiday and lady terms He queftion'd me: among the reft, demanded My pris'ners in your majelty's behalf,
It then, all fmarting with my wounds; being gall'd
'To be to pelter'd with a popinjay,
Out of my gricf, and my impatience,
Anfwer'd, neglectingly, I know not what:
He flould, or thould not; for he made me mad,
'Io fee him thine fo brik, and frell fo fweet,
And fo talk like a waiting gentlewoman,
Of guns, and drums, and wounds, (God fave the mark!)
And telling me, the fovereign'f thing on earth
Wias parmacity for an inward bruife;
And that it was great pity, fo it was,
This villanous faltpetre fhould be digg'd
Out of the bowels of the harmlefs earth,
Which many a good, tall fellow had deftroy'd
So cowardly : and but for thefe vile gans,
He would himfelf have been a foldier.- -
Firft part, Henry IV. act 1. fc. 4.
Paffions and emotions are alfo enflamed by comparifon. A man of high rank humbles the byftanders even to annihilate them in their own opinion: Cæfar, beholding the ftatue of Alexander, was greatly mortified, that now, at the age of 33 , when Alexander died, he had not performed one menorable action.

Our opitiors alfo are much influenced by comparifon. A man whofe opulence exceeds the ordinary ftandard is reputed richer than he is in reality; and wildom or weaknefs, if at all remarkable in an individual, is generally carried beyond the truth.

The opinion a man forms of his prefent diftrefs is heightened by contrafting it with his former happinefs :

> What I have been, I might the better bear What I'm deftin'd to. I'm not the fittit

That have been wretched: but to think how much I have been happier.

Southern's Invocent Adultery, aft 2.

The diftrefs of a long journey makes even an indifferent inn agreeable : and, in travelling, when the road is good, and the horfeman well covered, a bad day may be agreeable, by making him fenfible how fnug he is.

The fame effect is equally remarkable, when a man oppofes his condition to that of others. A fhip toffed about in a ftorm, makes the fpectator reflect upon his own eafe and fecurity, and puts thefe in the ftrongeft light.

A man in grief canmot bear mirth; it gives bim a more, lively notion of his unhappinefs, and of courfe makes him more unhappy. Satan, contemplating the beauties of the terrellial paradife, has the folluwing exclamation :
With what delight could I have walk'd thee round, If I could joy in aught, fweet interchange Of hill and valley, livers, woods, and plains, Now land, now fea, and thores with foreft crown'd, Rocks, dens, and caves! but I in none of thefe Find place or refuge ; and the more I fee Pleafures about me, fo much more I feel
'Torment within me, as from the hateful fiege Of contraries: all good to me becomes
Bane, and in heav'n much worle would be my fate.
Paradife Loft, book 9. l. II4.
The appearance of danger gives fometimes pleafure, fometimes pain. A timorous perfors upon the battlements of a high tower, is feized with fear, which even the confcioufnefs of fecurity cannot diffipate. But upon one of a firm head, this fituation has a contrary effect : the appearance of danger heightens, by oppofition, the confcioufnefs of fecurity, and confequently the fatisfaction that arifes from fecurity : here the feeling refembles that abovementioned, occafioned by a fip labouring in a florm.

The effect of magnifying or leffening objects by means of comparifon is to be attributed to the influence of paffion over our opinions. This will evidently appear by reflecting in what manner a fpectator is, affected, when a very large animal is for the firt time placed befide a very fmall one of the fame fpecies. The firft thing that ftrikes the mind is the difference between the two animals, which is fo great as to occafion furprife; and this, like other emotions, magnifyng its object, makes us conceive the difference to be the greateft that can be: we fee, or feem to fee, the one atsimal extremely little, and the other extremely large. The emotion of furprife arifing from any unufual re. fembance, ferves equally to explain, why at firt view we are apt to think fuch refemblance more entire than it is in reality. And it muft be obferved, that the circumftances of more and lefs, which are the proper fubjects of comparifon, raife a perception fo indiftinct and vague as to facilitate the effect defcribed; we have no mental ftandard of great and little, nor of the feveral degrees of any attribute; and the mind, thus unreltrained, is naturally difpofed to indulge its furprife to the utmolt extent.

In exploring the operations of the mind, fome of which are extremely nice and llippery, it is neceffary

## R E S

Riferblance.
to proceed with the utmof circumfpestion: and after Luckily, in the prefat kind our feculitions are fipported by facts and folid arris. ment. lirt, a fmall object of one fpecies oppoied ts a great object of another, produces not, in any degree, thit deception which is fo remarkable when both objects are of the fame feries. The greatelt difparity beiween obiects of different kinds, is fo common as to be obferved with perfect indifference; but fuch difparity between the objects of the frme kind being uncommon, never fails to produce furprife: and may we not fairly conclude, that furprife, in the latter cafe, is what occafions the dereption, when we find no deception in the former? In the next place, it furprife be the fole caufe of the deception, it follows neceffarily that the deception will vanifh as foon as the objecis compared become familiar. This holds fo unerri.: gly, as to leave no reafonabie doubt that furprife is the prime mover: sur furprife is great, the firft time a fmall lapdog is feen with a large maltiff; but when two fuch animals are conftintly together, there is no furprife, and it makes no difference whether they be viewed feparately or in company. We fet no bounds to the riches of a man who has recently made his fortune ; the furprifing difproportion between his prefent and bis palt fituation being carried to an extreme : but with regard to a family that for many generations hath enjoyed great weath, the fame falfe reckoning is not made. It is equally remarkable, that a trite fimile has no effect : a lover compared to a moth fcorching itfelf at the flame of a candle, originally a fprightly fimile, has by frequent ufe loft all force; love cannot now be compared to fire, without fome degree of difgult. It has been juftly obferved againt Homer, that the lion is too often introduced into his fimiles; all the variety he is able to throw into them not being fufficient to keep alive the reader's furprife.

To explain the influence of comparifon upon the mind, we have chofen the fimpleft cafe, viz. the firft fight of two animals of the tame kind, differing in fize only; but to complete the theory, other circumfances mult be taken in. And the next fuppofition we make, is where both animals, feparately familiar to the fpectator, are brought together for the firlt time. In that cafe, the effect of magnifying and diminifhing is found remarkably greater than in that firft mentioned; and the reafon will appear upon analyfing the operation: the firft feeling we have is of furprife at the uncommon difference of two creatures of the fame fpecies; we are next fenfible, that the one appears lefs, the other larger, than they did formerly; and that new circumftance increaling our furprife, makes us imagine a fill greater oppofition between the animals, than if we had formed no notion of them beforehand.

Let us make ole other fuppofition, thit the fpecta. tor was acquainted beforehand with one of the animals only; the lapdog, for example. This new circumfance will vary the effect; for, intead of widening the natural differeace, by enlarging in appearance the one animal, and diminifhing the other in proporto:, the whole apparent alteration will reft upon the lap og: the furprite to find it lefs than it appeared formerly, directs to it our whole attention, and makes us con scive it to be a mof diminutive creature: the maftiff Vol. XVI.
in the mean time is quite overlooked. To illuftats R,fomthis efies by a familiar examnle. ' Take a piece of faper or of linen tolerally white, and compare it with a pure white of the famekind: the judgment we frome! of the firlt object is inftantly varicd; and the furpric occafioned ty finding it lefs white than was thought, produced a hafy conviction that it is much lefs white than it is in reali:y: withdrawing now the pure white. and putting in its place a deep black, the furprife $o c$ caficned by that new circumitance carries us to the other cxtreme, and makes us conceive the object fint mentioned to be a pure white : and thus experience compels us to acknowledge, that our emotions lave an influence even upon our eje-fight. This experiment leads to a general obfervation, that whatever is foun.' more Arange and beauliful than was expected, is judged to be more Arange and beautiful than it is in realit:Hence a common artifice, to depreciate beforehand what we wifh to make a figure in the opininn of others.

The comparifons employed by poets and orators are of the kind laft mentioned $; f$ fit is always a known object that is to be magnified or leffened. The former is effected by likening it to fome grand cbject, or by contralting it with one of an oppefite character. To effectuate the latter, the method muft be reverfed: the object mult be contrafted with fomethirg fuperior to it, or likened to fomething inferior. The whole effect is produced upon the principal object; which by that means is elevated above its rank, or depreffed below it.

In accounting for the effect that any unufual refemblance or diflimilitude hath upon the mind, no caufe has been mentioned but furprife ; and to prevent con. furion, it was proper to difcufs that caufe firft. But furprife is not the only caufe of the effect defcribed: another occurs, which operates perhaps not lefs powcrfullv, viz. a principle in human nature that lies fill in oblcurity, not having been unfolded by any writer, though its effects are extenfive : and as it is not diltinguifhed by a proper name, the reader mult be fatisfied with the following defcription. Every man who fu. dies himelif or others, muft be fenfible of a tendency or propenfity in the mind to complete every work that is begun, and to carry things to their fall perfection. There is little opportunity to difplay that propenfity upon natural operations, which are feldom left imperfeet ; but in the operations of art it hath great fcope: it impels us to perfevere in cur own work, and to wilh for the completion of what another is doing: we feel a fenfible pleafure when the work is brought to perfection; and our pain is not lefs fenfible when we are difappointed. Hence our uneafinefs when an interefting fory is broken off in the middle, when a piece (f mufic ends without a clofe, cr when a building or garden is left unfinifhed. The fame propenfity operates in making collections; fuch as the whole works, good and bad, of any author. A certain perfon attempted to collect prints of all the capital paintings, and fucceeded except as to a few. La Bruyere remarks, that an anxious fearch was made for thefe; not for their value, but to complete the fet.

The final caufe of the propenfity is an additional proof of its exiftence. Human works are of no fignificancy till they be completed; and reafon is not always a fufficient counterbalance to indolence : fome prinM ciple
blave:
-

## R E S

R.cemblance. ciphe over and above is neceffary to excite our induftry, and to prevent our flopping fhort in the middle of the courfe.

We need not lofe time to defcribe the co-operation of the foregoing propenfity with furprife, in producing the effect that follows any unufual refemblance or diffimilitude. Surprife firl operates, and carries our opinion of the refemblance or diffimilitude beyond truth. The propenfity we have been defcribing carries us ftill farther ; for it forces upon the mind a conviction, that the refemblance or diffimilitude is complete. We need no better illuftration, than the refemblance that is fancied in fome pebbles to a tree or an infeet; which refemblance, however faint in reality, is conceived to be wonderfully perfect. The tendency to complete a refemblance acting jointly with furprife, carries the mind fometimes fo far, as even to prefume upon future events. In the Greek tragedy entitled Pbineides, thofe unhappy women feeing the place where it was intended they Aritt Poet. fhould be flain, cried out with anguifh, "They now cap. 17.
faw their cruel deftiny had condemned them to die in that place, being the fame where they had been expofed in their infancy."

The propenfity to advance every thing to its perfection, not only co-operates with furprife to deceive the mind, but of itfelf is able to produce that effect. Of this we fee many inftances where there is no place for furprife; and the firlt we fhall give is of refemblance. Unumquodque codem modo diffolvitur quo colligatum eff, is a maxim in the Roman law that has no foundation in truth; for tying and loofing, building and demolifhing, are atts oppofite to each other, and are performed by oppofite means: but when thefe acts are connected by their relation to the fame fubject, their connection leads us to imagine a fort of refemblance between them, which by the foregoing propenfity is conceived to be as complete as poflible. The next inftance fhall be of contraft. Addifon obferves, "That the paleft features look the moft agreeable in white; that a face which is overflufhed appears to advantage in the deepeft fcarlet; and that a dark complexion is not a little alleviated by a black hood." The foregoing propenfity ferves to account for thefe appearances; to make this evident, one of the cafes thall fuffice. A complexion, however dark, never approaches to black: when the fe colours appear together, their oppofition ftrikes us; and the propenfity we have to complete the oppofition, makes the darknefs of complexion vanifh out of fight.

The operation of this propenfity, even where there is no ground for furprife, is not confined to opinion or conviction: fo powerful it is, as to make us fometimes proceed to action, in order to complete a refemblance or diffimilitule. If this appear obfcure, it will be made clear by the following inftance. Upon what principle is the lex tal onis founded, other than to make the puniflment refemble the mifchief? Reafon dictates, that there cught to be a conformity or refemblance between a crime and its punifhment; and the fregoing propenfity impels us to make the refemblance as complete as poffible. Titus Livius $\|$, under the influence of that propenfity, accounts for a certain punifhment by a refemblance between it and the crime, tow fubtile for comrion apprehenfion. Speaking of

Mettus Fuffetius, the Alban general, who, for treacliery to the Romans his allies, was fentenced to be torn to pieces by hories, he puts the following fpeech in the mouth of Tullus Hoftilius, who decreed the punifhment. "Mette Fuffeti, inquit, fi ipfe difcere priflis fidem ac fredera fervare, vivo tibi ea difciplina a me adhibita effet. Nunc, quonium tuum infanauile ingenium off, at lis tuo fupplicio doce bumanum genus ea fancla cicitcre, gase a te violata funt. Ut igitur failo ante animum inler Fidenatem Romanamque rem ancipitem geffli, ita jam capp's pafim diftrabendum dabis" By the fame influence, the fentence is often executed upon the very fot where the crime was committed. In the Eleitra of Sophocles, Egitheus is dragged from the theatre into an inner room of the fuppofed palace, to fuffer death where he murdered Agamemnon. Shakefpeare, whofe know. ledge of nature is not lefs profound than extenfive, has not overlooked this propenfity.
"Othello. Get me fome poifon, Iagn, this night. I'll not expoftulate with her, left her body and her beauty unprovide my mind again. This night, Iago."
"Iago. Do it not with poifon; Atrangle her in her bed, even in the bed the hath contaminated."
"Othello. Good, good: the juftice of it pleafes: very good."

Othelio, act 4.fc. 5.
Perfons in their laft momentsare generally feized with an anxiety to be buried with their relations. In the Amynta of Taflo, the lover, hearing that his mittrefs was torn to pieces by a wolf, expreffes a defire to die the fame death.

Upon the fubject in general we have two remaths to add. The firf concerns refemblance, which, when too entire, hath no effect, however different in kind the things compared may be. The remark is applicable to works of art only ; for natural objects of different kinds have fcarce ever an entire refemblance. To give an example in a work of art: Marble is a fort of matter very different from what compores an animal ; and marble cut into a human figure, produces great pleafure by the refemblance: but if a marble ftatue be coloured like a picture, the refemblance is fo entire as at a diftance to make the ftatue appear a real perfon: we difcover the miftake when we approach; and no other emotion is raifed, but furprife occafioned by the deception: the figure fill appears a real pirfon, rather than an imitation; and we mult ufe reflection to correct the miftake. This cannot happen in a picture ; for the refemblance can never be fo entire as to difguife the imitation.

The other remark belongs to contraft. Emotions make the greateff figure when contrafted in fucceffion; but then the fucceffion ought neither to be rapid, nor immoderately flow : if too flow, the effect of contraft becomes faint by the diftance of the emotions; and if rapid, no fingle emotion has room to expand itfelf to its full fize, but is flifled, as it were, in the birth by a fucceeding emotion. The funeral oration of the bifhop of Meaux upon the duchefs of Orleans, is a perfect hodge-podge of cheerful and melancholy reprefentations, following each other in the quickeft fucceffion: oppofite emotions are beft felt in fucceffion; but each emotion feparately fhould be raifed to its due pitch, before another be introduced.

What

Refem-
blanct.

## R ES

What is above laid down, will enable us to deter. blatice. hatice. mine a very important queftion concerning emotions
raifed by the fine arts, viz. Whether ought fimilar emotions to fucceed each other, or diffimilar? The emotions raifed by the fine arts are for the molt part too nearly related to make a figure by refemblance; and for that reafon their fucceffion ought to be regulated as much as poffible by contraft. This hoids confeffedly in epic and dramatic compofitions; and the betl writers, led perhaps by talte more than by reafoning, have generally aimed at that beauty. It holds equally in mulic: in the fame cantata all the variety of emotions that are within the power of mufic, may not only be indulged, but, to make the greatef figure, ought to be contralted. In gardening, there is an additional reafon for the rule: the emotions raifed by that art, are at beft to faint, that every artifice fhould be employed to give them their utmoit vigour : a field may be laid out in grand, fweet, gay, neat, wild, melancholy feenes; and when thefe are viewed in fucceffion, grandeur ought to be contraited with neatnefs, regularity with wildnefs, and gaiety with melancholy, fo as that each emotion may fucceed its cppofite : nay, it is an improvement to intermix in the fucceffion rude uncultivated fpots as well as unbounded views, which in themfelves are difagreeable, but in fucceflion heighten the feeling of the agreeable object; and we have nature for our guide, which in her moft beautiful landfeapes often intermixes rugged rocks, dirty marfhes, and barren flony heaths. The greateft mafters of mufic have the fame view in their compofitions: the fecond part of an Italian fong feldom conveys any fentiment : and, by its harfhnefs, feems purpofely contrived to give a greater relifh for the interetting parts of the compofition.

A fmall garden, comprehended under a fingle view, affords litile opportunity for that embellifhment. Diflimilar emotions require different tones of mind; and therefore in conjunction can never be pleafint: gaiety and fweetnefs may be combined, or wildnefs and gloominefs; but a compofition of gaiety and gloominefs is diftafteful. The rude uncultivated compartment of furze and broom in Richmond garden, hath a good effect in the fuccelfion of objects; but a fpot of that nature would be infufferable in the midlt of a polifhed parterre or flower-pot. A garden, therefore, if not of great extent, admits not difimilat emotions; and in ornamenting a fmall garden, the fafelt courfe is to confine it to a fingle expreffion. Fer the fame reaton, a landfape ought alfo to be confined to a Engle ex. preffion; and accordingly it is a rule in painting, that if the fubject be gay, every figure ought to contribuic to that emotion.

It follows from the foregoing train of reafoning, that I garden near a great city ought to have an air of folitude. The folitarinefs, again, of a walte country ought :o be contrafted in forming a garden ; no temples, no obfcure wallss but jots d'eay, cafcades, cojefis active, say, and fplendid. Nay, fuch a garden fhould in fome meafure avoid imitating nature, by taking on an extraordinary anpearance of regularity and art, to thow the bufy hand of man, which in a wafte country has a fine effect by contralt.

Wit and ridicule make not à: agreeab'e mixture

911 K ES
with grandeur. Difimilar emotions have a fanc cone Refer. in a flow fucceffion; but in a rapid fuccetion, uhich approaches to co-exiltence, they will not be relithed. In the midla of a laboured and clevated defcription of battle, Virgil introduces a ludicrous image, which is R.f1v:... $\underbrace{\text { tior. }}$ $\underbrace{\text { tior. }}$

Obvias ambuttum torrem Chorineeus ab ara
Corripit, et venienti Ebufo plagamque ferenti
Occupat os flammis : illi ingens barba reluxit,
Nidoremque ambulta dedit. Eiv, xii. 298,
E qual tauro ferito, il fuo dolore
Verfo mugghiando e fofpirando fuore.
Gierufal. cant. 4.'A. I.
It would however be too auttere to banifh altogether ludicrous images from an epic poem. This poeris doth not always foar above the clouds : it admits graz variety; and upon occafion can defcend even to the ground without finking. In its more familiar tones, a ludicrous fcene may be introduced without impropricty. This is done by Virgil * in a foot-race : the cir- * Enca, cumfances of which, not excepting the ludicrous part, lit. v. are copied from Homer $\dagger$. After a fit of merriment, $\dagger$ iliad, we are, it is true, the lets difpofed to the ferious and xxiii. 579 . fublime : but then, a ludicrous fcene, by unbending the mind from fevere application to more interelting fubjecto, may prevent fatigue, and preferve our relith entire.

RESEN, (Mofes) ; a town on the Tigris, built by Nimrod; thought to be the Larifla of Xenophon.; which fee. But as Larifa is a name in imitation of a Greek city; and as there were no Greek cities, confequently no Lariffa in Alfyria, before Alexander the Great; it is probable that the Greeks afking of what city thofe were the ruins they faw, the Affrians might anfwer, Larefin, "Of Refen;" which word Xenophon expreffed by Larifa, a more familiar found to a Greek ear, (Wells).

RESENTMENT, means a ftrong perception of good or ill, generally a deep fenfe of injury, and may be diftinguifhed into anger and reveng:. "By anger (fays Archdeacon Paley), I mean the pain we fuffer upon the receipt of an injury or affront, with the ufual effects of that pain upon ourfelves. By revenge, the inflicting of pain upon the ferfon who has injured or offended uc, farther than the juft ends of punilhment or reparation require. Anger prompts to revenge; but it is poffible to fufpend the effect when we cannot altogether quell the principle. We are bound alfo to endeavour to qualify and correct the principle itfelf. So that our duty requires two different applications of the mind : and for that reafon anger and revenge fhould be confidered feparately." See Revenge.

RESERVATION, in law, an action or claufe whereby femething is referved, or fecured to one's felf.

Minial Resfrvaqion, a propofition which, ftrifly taken, and according to the natural import of the terms, is falfe; but, if qualified by fomething concealed in the mind, becomes true.

Mental refervations are the great refuge of relipion; hypocrites, who ufe them to accommodate their confciences with their interelts: the Jefuits are zealous advocates for mental refervations; yet are they real lies, as including an inteation to deceive.

## K E S

KESERVE, in law, the fame with refervation. Reservation.

Body of Reserve, or Corps de Reserde, in military affairs, the third or laf line of an army, drawn up for battle; fo called becaufe they are referved to fuitain the selt as occafion requires, and not to engage but in cafe of neceflity.

RESERVOIR, a place where water is collected and referved, in order to be conveyed to diftant places through pipes, or fupply a fountain or jet d'eau.

RESET, in law, the receiving or harbouring an outlawed perfon. See Outlawry.

Reset of Theft, in Scots law. See Law, no clxxxvi. 29.

RESIDENCE, in the canon or common law, the abode of a perfon or incumbent upon his benefice; and his affiduity in attending on the fame.

RESIDENT, a public miniter, who manages the affairs of a kingdom or ttate, at a foreign court:

They are a clats of public minifters inferior to ambaffidors or envoys; but, like them, are under the pritection of the law of nations.

RESIDUE, the remainder cr balance of an account, debt, or obligation.

RESIGNATION, in general, fignifies the implicit fubmifion of ourfelves, or of fomething we poffefs, to the will of another. In a religious fenfe it fignifies a perfect fubmiffion, without difcontent, to the will of God. See Moral Philosophy, no itg.

RESIN, in natural hifory, a vifcid juice oozing either fpontaneoufly, or by incifion, from feveral trees, as the pine, fir, \&c.-A premium for feveral years has been offered by the London Society for Encouraging Arts, \&c. for difcovering a mode of reducing the inflammable quality of refin, fo as to adapt it to the purpofes of making candles; but no fuch difcovery has yet been made.

Elafic Resin. See Caoutchouc.
Gum Resin, a misture of gum and refin. See Phar$\mathrm{MACY}, \mathrm{n}^{\mathrm{C}} 38$.

Red Gum Resin, is procured from the red gum tree, or eucalyptus refinifera; a tree fo large and lofty as to exceed in fize the Englifh oak. The wood of the tree is brittle, and of little ufe but for fire-wood, from the large quantity of refinous gum it contains. The tree is diftinguifhed by having pedunculated flowers, and an acute or pointed conical calyptra. To obtain the juice from this tree incifions are made in the trunk of it, and fometimes upwards of 60 gallons of red refinous

White's
Voyage, Appendix. juice have been obtained from one of them. "When this juice is dried, it becomes a very puwerful aftringent gum-refin, of a red colour, much refembling that known in the fhops by the name of kino, and, for all medical purpofes, fully as efficacious. Mr White adminiftered it to a great number of patients in the dyfentery, which prevailed much, foon after the landing of the conviets, and in no one initance found it to fail. This gum-refin diffolves almoft entirely in fpirit of wine, to which it gives a blood-red tincture. Water diffolves about one fixth parionly, and the watery folntien is of a bright red. Both thefe folutions are powerfully aftringent.

Cellow Gum Resin, is procured from the yellow refin tree, which is as large as the Englifh walnut tree. The properties of this refin are equal to thofe of the
ee molt fragrant balfams
It exudes from the bark foon- Refineus, taneoully, but more readily if incifions are made. The Reffitance. colour of it is yellow, and at firf it is fluid; but after being infpiffated in the fun, it becomes folid. When burnt on hot coals, it fmells like a mixture of balfam of Tolu and benzoin, approaching fomewhat to ftorax. " It is perfectly foluble in fpirit of wine, but not in wa- Ibid.
ter, nor even in effential oil of turpentine, unlefs it $b$ ? digefted in a frong heat. The varnifh which it makes with either is very weak, and of little ufe. With refpect to its medicinal qualities, $\mathbf{M r}$ - White has found it, in many cafes, a good pectoral medicine, and very balfamic. It is not obtainable in fo great abundance as the red gum produced by the eucalyptus refinifera. The plant which produces the yellow gum feems to be perfectly unknown to botanifts, but Mr White has com. municated no fpecimens by which its genus or even clafs could be determined."
'RESINOUS electricity, is that kind of electricity which is produced by exciting bodies of the refinous kind, and which is generally negative. See

## Electricity paffm.

RESISTANCE, or Resisting Force, in philofophy, denotes, in general, any power which acts in an oppofite direction to another, fo as to deftroy or diminifh its effect. See Mechanics, Hydrostatics, and Pieumatice.

I
Of all the refiftances of bodies to each, there is un- Importance doubtedly none of greater importance than the re- of the fubfiftance or reaction of fluids. It is here that we je:t. mult look for a theory of naval architecture, for the impulfe of the air is our moving power, and this mulk be modified fo as to produce every motion we want by the form and difpofition of our fails; and it is the refiftance of the water which mult be overcome, that the fhip may proceed in her courfe ; and this mult alfo be modified to our purpofe, that the fhip may noc drive like a log to leeward, but on the contrary may ply to windward, that the may anfwer her helm brifkly, and that the may be eafy in all her motions on the furface of the troubled ocean. The impulfe of wind and water makes them ready and indefatigable fervants in a thoufand fhapes for driving our machines; and we thould lofe much of their fervice did we remain ignorant of the laws of their action: they would fometimes become terrible mafters, if we did not fall upon methods of eluding or foftening their attacks.

We cannot refufe the ancients a confrderable know- The anciledge of this fubject. It was equally interefting to them ents were as to us; and we cannot read the accounts of the naval tolerably exertions of Phœnicia, Carthage, and of Rome, exertions which have not been furpafled by any thing of modern date, without believing that they poffeffed much practical and experimental knowledge of this fubject. It was not, perhaps, poffeffed by them in a itrict and fyftematic form, as it is now taught by our mathematicians; but the mafter-builders, in their dockyards, did undoubtedly exercife their genius in comparing the forms of their fineft hips, and in marking thofe circumftances of form and dimenfion which were in fath accompanied with the defirable properties of a thip, and thus framing to themfelves maxims of naval architecture in the fame manner as we do now. For we believe

## R E S

Refifance. believe that our naval architects are not difpofed to grant that they have profited much by all the labours of the mathematicians. But tie ancients had not made any great progrefs in the phyficomathematical fionces, which conlift chiefly in the application of calculus to the phenomena of nature. In this branch they could make none, becaufe they had not the means of inveltigation. A knowledge of the motions and actions of Huids is acceffible only to thofe who are familiarly

3
But even now it is not perfectly underftood. acquainted with the fluxionary mathematics ; and without this key there is no admittance. Even when poffeffed of this guide, our progrefs has been very flow, hefitating, and devious; and we have not yet been able to eftablifh any fet of doctrines which are fufceptible of an eafy and confident application to the arts of life. If we have advansed farther than the ancients, it is becaufe we have come after them, and have profited by their labours, and even by their mitakes.

Sir Iface Newton was the firft (as far as we can reton firt ap- collect) who attempted to make the motions and acplied ma- tions of fluids the fubject of mathematical difcullion. thematics He had invented the method of fluxions long before to it.
he engaged in his phyfical refearches; and he proceeded in thefe fual mathef facem praferente. Yet even with this guide he was often obliged to grope his way, and to try various bye-paths, in the hopes of obtaining a legitimate thecry. Having exerted all his powers in eltablilhing a theory of the lunar motions, he was obliged to reit contented with an approximation inftead of a perfect folution of the problem which afcertains the motions of three bodies mutually acting on to to upect an accurate invenigation of he motions and actuns of fluids, where millions of unfeen particles combine their influence. He threfore cal about to find fome particular cafe of the problen which sonld admit of an accurate determination, and at ra: fome time furnifh circumfta ses of analory or comblance fufficiently numerus for giving tming afes, which fhould include between inten iksos ofer cafes that did not admit of this accurse inveiligation. And thers, by knowing the limit to which the cafe propofed did approximate, and the circumftauces which egulated the approximation, many uleful propofitions might be deduced for directing us in the application of thefe doctrines to the arts of life.

He therefore figured to himfelf a hypothetical col. lection of matter which poffeffed the chamateriftic property of fuidity, viz. the gualquatverfum propagation of preflure, and the moft perfect inte:mobility (pardon the uncouth term) of parts, and which formed a phyfical whole cr aggregate, whofe parts were conneded by mechanical forces, determined both in degree and in direction, and fuch as rendered the determination of certain important circumftances of their m tion fufceptible of precife inveftigation. And he concluded, that the laws which he hould difcover in thefe motions mer have a great analogy with the laws of the motions of real fluids: And from this hypothefis he deduced a feries of propofitions, which form tioe bals of almolt all the theories of the impulfe and refiltance of fuids which have been offered to the public fince his time.

It muft be acknowledged, that the refults of this theory agres but ill with experiment, and that, in the way in whieb it bas been acalou? frofernad by fuljequat
mathematicians, it proceeds on principles or aflumphors Refilance. which are not only gratuitous, but even falfe. But it affords fuch a beautiful application of geometry and calculus, that mathematicians have been as it were fa:cinated by it, and have publimed fyftems fo elegant and fo exteifively applicable, that cone cannot help i.menting that the foundation is fo flimfy. John Bernoulli's theory, in his differtation on the communic:tion of motion, and Bouguer's in his Traité du Navir, and in his Theorie du ATavicuvie et de ha Mature des Vai;feaux, muft ever be confidered as among the fincit fpecimens of phyficomathematical frience which the world has feen. And, with all its imperestions, this theory put its utir ftill furnifhes (as was expected by its illuftrious athor) $h^{1+} y$ is fill many propofitions of immenfe practical ufe, they te very confiing the limits to which the real phenomena of the impulfe and refiftance of fluids really approximate. So that when the law by which the phenomena deviate from the theory is once determined by a wall chofen feries of experiments, this hypothetical theory becomes almolt as valuable as a true one. And we may add, that although Mr d'Alembert, by treading warily in the fteps of Sir Sfac Newton in ancther routc, has difoovered a genuine and unexceptionable theory, the procefs of inveftigation is fo intricate, requiring every fineffe of the molt ablrufe analyfis, and the final equations are fo complicated, that even their moft expert author has not been able to deduce mone thom one fimple propofition (which too was difcovered by Di.niel Bernoulli by a more fimple procefs) which can be applied to any ufe. The hypothetical theory of Newion, therefore, continues to be the groundwork of all our practical knerledge of the fubject.
We fhall therfore lay before our readers a very flort view of the the. ${ }^{\prime}$, and the manner of applying it. W'e fhali then thens its defects (all of which were pointed ont be its ur ant ant and geve an hiforical account of the nuiy nitempes whith it ve been ma e to amend it or to finftitute anether: in all which we hink it our duty to fiow, tha: Sir hiac Newton took the lead, and pointed out every path which wthers have taken, if we except Daniel Bernoulli and d'Alembert ; and wie hall give an account of the chief fets o! experiments which have been made on this ineportant fubject, in the h. pes of etablifhing an empirical theny, which may be efisployed with confidence in the arts of life.

We know by experience that force mult be applied The rerm to a body in order that it may move through a fluid, refinence, fuch as air or water; and that a body projeted with as here apm any velocity is gradually retarded in its motion, and pied, exa generally broupht to reit. The analogy of nature makes us imatine that there is a force antirg in the oppofite direcion, or oppofing the motion, and that this force refides in, $r$ is exerted $b y$, the flid. And the phenomena refemble thofe which accompany the known reffance of active beings, fuch as animals. Therefore we give to this fuppoled force the metaphorical name of Resistance. We alfo know that a fluid in motion will hurry a folid body along with the fream, and that it requires force to maintain it in its place. A fimilar analogy makes us fuppofe that the fluid exerts force, in the fame manner as when an active being impels the body before him; therefore we call this the Impolsion of a Fluil. And as our knowledge of nature informs as that tie mutual actions of bodies are in
every

## $R E S \quad[94] \quad R E S$

 change of motion is ha only indication, characteriltic, and metare, of the changing force, the forces are the fire (whether we call them impultions or refiftances) vhen the relative motions are the fame, and therefore depend entirely on thele relative metions. The force, therefore, which is nectlury for keeping a body immoveable in a ftream of water, flowing with a certain velocity, is the fame with what is required for moving Lhis body with this velocity through fagnant water. Tho any one who admits the motion of the earth round the fun, it is evident that we can neither obferve nor reaton from a cafc of a body moving through fill waier, nor of a fream of water preffing upon or impelling a guiefeent body.

A body in motion appears to be refifted by a ftagnant fluid, becaufe it is a law of mechanical nature that force mult be employed in order to put any body in motion. Now the body camot move forward without putting the contiguous fluid in motion, and force muft be employed for producing this motion. In like manner, a quiefcent body is impelled by a flream of flaid, becaufe the motion of the contiguous fluid is diminifhed by this fulid obftacle; the refift nnce, therefore, or impulfe, no way differs from the ordinary communications of motion among folid bodies.

Sir Ifaac Newton, therefore, begins his theory of the isfiftance and impulfe of fluids, by felecting a cafe where, although he cannot pretend to afcertain the motions themelelves which are produced in the particles of a contiguous fluid, he can tell precifely their mutual ratios.

He fuppofes two fyttems of bodies fuch, that each body c the firlt is fimilar to a corrfponding body of the ferma, and that each is to each in a conftant ratio. He alfo fuppofes them to be fimilarly fituated, that is, at the angles of fimilar figures, and that the homologous Ines of thefe figures are in the fame ratio with the diameters of the bodies. He farther fuppofes, that they attract or repel each other in fimilar directions, and that the accelerating connecting forces are alfo proportional ; that is, the forces in the one fyltem are to the corre'ponding furces in the other fyltern in a conftant ratio, and that, in each fyltem taken apart, the forces are as the fquares of the velocities directly, and as the diameters of the correfponding bodies, or their diftances, invertely. parts being tions, in any given inflant, they will continue to move pant in mo- fimilarly, each correfpondent body defcribing fimilar tion.
will have the fame ratio with the diliances of the particles. The curves defribed by the correfponding bodies will therefore be fimilar, the velocities will be proportional, and the bodies will be fimilarly fituated at the end of the firlt moment, and expofed to the action of fimilar and fimilarly fituated centripetal or centrifugal forces; and this will again produce fimilar motions during the next moment, and fo on for ever. All this is evident to any perfon acquainted with the elementary doctrines of curvilineal motions, as delivered in the theory of phyfical altronomy.

From this fundamental propofition, it clearl 5 follows, Comfe. that if two fimilar bodies, having their homologous quelice lines proportional to thofe of the two fytems, be timi- deduced larly projected among the bodies of thofe two fyiterns with any velocities, they will produce fimilar motions in the two fyltems, and will themfelves continue to move fimilarly; and therefore will, in every fubfequent moment, fuffer fimilar diminutions or retardations. If the initial velocities of projection be the fame, but the denfities of the two fyftems, that is, the quantities of matter contained in an equal bulk or extent, be different, it is evident that the quantities of motion produced in the two fyftems in the fame time will be proportional to the denfities; and if the denfities are the fame, and uniform in each fyftem, the quantities of motion produced will be as the fquares of the velocities, becaufe the motion communicated to each correfponding body will be proportional to the velocity communicated, that is, to the relocity of the impelling body; and the number of fimilarly fituated particles which will be agitated will alfo be proportional to this velocity. Therefce, the whole quantities of motion produced in the fame moment of time will be proportional to the fquares of the velocities. And lafly, if the denfities of the two fyftems are uniform, or the fame chrough the whole extent of the fytems, the number of particles impelled by fimilar bodies will be as the furfaces of thefe bodies.

Now the diminutions of the motions of the projected bodies are (by Newton's third law of motion) equal to the motions produced in the fyftems; and thefe diminutions are the meafures of what are called the refiftances oppofed to the motions of the projected bodies. Therefore, combining all there circumftances, the refiftances are proportional to the fimilar furfaces of the moving bodies, to the denfities of the fyltems through which the motions are performed, and to the fquares of the velocities, jointly.

We cannot form to ourflves any diftina notion of a fluid a fluid, otherwife than as a fy ftem of fmal: bodies, or a confidered collection of parti:les, fimilarly or fymmetrically arran. as a fyitem ged, the centres of each being fitiated in the angles of regular folids. We muft form this notion of it, whether we fuppofe, with the vulgar, that the particles are milarly arlittle globules in mutual contact, or, with the partifans of corpufcular attractions and repulfions, we fuppofe the particles kept at a diftance from each other by means of thefe attractions and repulions mutually balancing each other. In this laft cafe, no other arrangement is confiftent with a quiefcent equilibrium: and in this cafe, it is evident, from the theory of curvilineal motions, that the agitations of the particles will always be fuch, that the connecting forces, in actual exertion,

## R E S

Refifance. will be proportional to the fquares of the velocities directly, and to the chords of curvature having the directiun of the forces inveriely.

From thefe premifes, therefore, we deduce, in the fricteft manner, the demonftration of the leading theorem of the refiftance and impulic of fuids; namely,
14 Prop. I. The refiltances, and (by the third law of mothe refift tion), the impulfions of fluids on fimilar bodies, are ance, \&s. proportionil to the furfaces of the folid bodies, to the of fuids. denfities of the fluids, and to the fquares of the velocities, jointly.
We mult now obferve, that when we fuppofe the particles of the fluid to be in mutual contact, we may either fuppofe them elaftic or unelaftic. The mution communicated to the collection of elaftic particles mult be double of what the fame body, moving in the fame manner, would communicate to the particles of an unelaftic fluid. The impulfe and relitance of elaft:c fluids mult therefore be double of thofe of unelaftic fluids.But we mult caution our readers not to judge of the elaficity of fluids by their fenfible comprefliblity. A diamond is incomparably more elaftic than the fineff foot-
ball, though not compreffible in any fenfible degree. It remains to be decided, by well chofen experiments, whether water be not as elatic as air. If we fuppofe, with Bofcovich, the particles of perfert fluids to be at a diftance from each other, we fhall find it difficult to conceive a fluid void of elafticity. We hope that the theory of their impulfe and refiftance will fuggeft experiments which will decide"this quefion, by pointing out what ought to be the abfolute impulfe or refiftance in either cafe. And thus the fundamental propofition of the impul:e and refiftance of fluids, taken in its proper meaning, is fufceptible of a rigid demonftration, relative to the only diftine notion that we can form of the internal conftitution of a fluid. We fay, taken ir its profer meaning ; namely, that the impulfe or refilitance of fluids is a prefiure, oppofed and meafured by another preflure, fuch as a pound weight, the force of a fpring, the preffure of the atmorphere, and the like. And we apprehend that it would be very difficult to find any legitimate demonflration of this leading propofition different from this, which we have now borrowed from Sir Ifaac Newton, Prop. 23. B. II. Priatip. We achowledge that it is prolix and even circuitous: but in all the attempts made by lis commentators and thair copyifts to limplify it, we fee great defects of logical arcument, or affumption of principles, which are not only gratuitou;, but inadmilifible. We thill have occafion, as we proceed, to point out fome of the:e defects; and doubt not but the illuftrious author of this demo:itration had exercifedhisuncommon patience and fagacity in fimilar attempts, and was diffatisfied with then ail.

Before we proceed further, it will be perfer to make a general remark, which will fave a great dell of difcution. Since it is a matter of univerfal expritace, that every ataion of a body on others is acconanied by an equal and contrary reation : and fince all that we can demonftrate concerning the reffitace of bocies during their motions through fluids proceeds on this rap. pofition, (the refiftance of the body being affored as equal and oppofite to the fum of motions commamicated to the particles of the fluid, cilimates in the diretion of the body's motion), we a.e imitica in prored in the
contrary order, and to confider the impulaons with hefitance. each of the particles of fluid exerts on the body at ren, as equal and oppofite to the motion which the bedy would communicate to that particle if the fluid were at reft, and the body were moving equally fis it in the op. pofite direction. And therefore the whole impulfion of the fluid mult be conccived as the meature of the whole motion which the body would thus communicate to the fluid. It muft therefore be alfo confidered as the meaft:e of the refiftance which the body, moving wish the fime velocity, would fultain from the fuid. When, thervfore, we fhall demonftrate any thing concerning the impulion of a fluid, eltimated in the direction of its motion, we muft confider it as demonftrated concerning the refift. ance of a quiefcent fluid to the motion of that body, having the fame velocity in the oppofice direction. The determination of thefe impulfions being much cafice: than the determination of the motions communicated by the body to the paricles of the fuid, this method will be followed in moft of the fublequent difculfions.
The general propofition already delivered is by no means fufficient for explaining the various importants phenomear obferved in the mutual actions of folids and fluids. In particular, it gives us no affiftance in afcertaining the modifications of this refiftance or impulf, which depend on the fhape of the body and the inclination of its impelled or refifted fur $f_{\text {ace }}$ to the direstion of the motion. Sir Ifaac Newton found another hypothefis neceifary ; namely, that the fluid flould be to extremely rare that the diffance of the particles may be incomparably greater than their diameters. This additional condition is neceffary for confidering their actions as fo many feparate collifions or impulfions on the folid body. Each particle muft be fuppofed to have abrindant room to rebound, or otherwife efcape, after having made its froke, without fenfibly affecting the fiturtions and motions of the particles which have not yet made their Atroke : and the morion mult be fo fwift as not to give time for the fenfible exertion of their mutual forces of attractions and repulions.

Keeping there conditions in mind, we may proceed to determine the impultions made by a fluid on furfaces of every kind: And the moft convenient method to. purfue in this determination, is to compare them all either with the impulfe which the fanne firface would receive frum the fluid impinging on it erpendicularly, or with the impulfe which the forme fircan of finill wrull mate whea coming perpendicularly on a furface (If fuch extent as to occopy the whole itream.
It will greatly abbreviate lenguage, if we make ufe Terns of a fow terass in an appropriated fonfe.

By a hee.m, we ha.ll mean a quantity of fuid mowing in one ciirction, that is, each part.cle moving in paral. lel lines; and the $l$ radth of the Itream is a ine perpendicular to ail thefe parallels.
A filament means a portion of this fream of very frall breadh, and it confifts of an indefnite number of particles following one another in the fame direation, and fucceeflively impinging on, cy gliding along, the furface of the folla body.

The bafe of any furface expofed to a hiream of fluid, is that portion of a mane feryendicu'ar to the fiream, which is covered or rote ed from the a ation of the ftrean by the furface cerpofed to its impuife. Thus the bife cif a phure expofer to a frem of fuld is it great
circle,

## $\left.\mathrm{T} E \mathrm{~S} \quad \Gamma^{-} 96\right] \quad$ RES

Yeirape whe, whofe phane is perpendicutan to the fream. If thate DC (fy. I.) be a plane turfice expofed to the ation
 BR , or SE , perp ndicular to DC , is its bafe.

Dies ime thall exprefs the energy or action of the purtivic or flument, or ftream of fuid, when meeting the futace perpendicularly, or when the furface is perpendicular to the direction of the fream.

Abjotro inpulfe means the actual preffure on the impiled furfice, arifing from the action of the fluid, whether friking the furface perpendicularly or obliquely; $n$ it is the force imprefied on the furface, or tendency to motion which it acquires, and which muft be oppofed by an equal force in the oppofite direction, in order that the furace may be maintaired in its place. It is of importance to keep in mind, that this prellure is always perpendicular to the fuiface. It is a propofition founded on univerffl and uncontradicted experience, that the mutual a aions of bodies on each other are always exerted in a direction perpendicular to the touching furfaces. Thus, it is obferved, that when a billia d ball $\therefore$ is ftruck by another B, moving in any direction whatever, the ball $A$ always moves offin the direction perpendicular to the plane which touches the two balls in the yoint of mutual contact, or point of impulf.. This induetive propofition is fupported by every argument which cin be drawn from what we know concerning the forces which connect the particles of matter together, and are the immediate caufes of the communication of motion. It would employ much time and room to ftase them here; and we apprehend that it is unneceftary : fir no reafon can be afligned why the preflure fhould be in any particular oblique direction. It any one fhould fay that the impulfe will be in the direction of the ftream, we have only to defire him to take no-- tice of the effect of the rudder of a thip. This hows that the impulfe is not in the dirction of the fiream, and is therefore in fome direction tranfiverfe to the lleam. He will alfo find, that when a plane furface is impelled obliquely by a fluid, there is no direction in which it can be fupported but the direction perpendicular to itfelf. It is quite fafe, in the mean time, to take it as an experimental truch. We may, perhaps, in fome other part of this work, give what will be received as a rigorous demonftration. \&
Relative or effecive impulfe means the preffure on the furface eftimated in fome particular direction. Thus $B C$ (fig. I.) may reprefent the fail of a fhip, impelled by the wind blowing in the direction DC. GO may be the direction of the fhip's keel, or the line of her courfe. The wind ftrikes the fail in the direction GH parallel to DC ; the fail is urged or preffed in the direation GI, perpendicular to BC. But we are interefted to know what tendency this will give the hip to move in the direction GO. This is the effective or relative impulfe. Or BC may be the tranfverfe fection of the fail of a common wind-mill. This, by the conitruction of the machme, can move only in the direction GP, perpendicular to the direction of the wind; and it is only in this direction that the impulfe produces the defired cffect. Or BC may be half of the prow of a punt or lighter, riding at anchor by means of the cable DC , attached to the prow C. In this cafe, GQ, parallel to DC , is that part of the abfolute impulfe which is employed in Itraining the cabie.

The angt of inctionce is the angle FGC comianed $\underbrace{\text { R-finance. }}$ betwecn the direstion of the fircam FG and the plane BC.

The angle of oblqzity is the angle OCC contained between tise plane and the direction GO , in which we wifh to eflimate the impulfe.
Prop. II. The dircet impulfe of a fuid on a piane furface, is to its abflute olliquc impule on the fame furface, as the fquare of the radius to the fquare of the fine of the angle of incicence.
Let a ftream of fluid, moving in the direction DC , (fig. . .), act on the plane BC. With the radius CB deferibe the quadrant $\therefore B E$; daw $C A$ perpe dicular to CE, and diaw MNBS parallel to CE. Let the particle F , moving in the direction FG , meet the flane in G, and in FG protuced take GH to reprefe t the magnitude of the direat impulfe, or the impulfe which the particie would exert on the plane AC , by mesting the particie would exert on the plane $A C$, by mexting
it in $V$. Draw GI and HK perpendicular to $B C$, and HI perpendicular to GI. Alfo draw $B R$ perpendice. lar to DC.
The force GH is equivalent to the two forces GI and GK; and GK being in the direction of the plane bas no thare in the impulfe. The abfolute impulfe, therefore, is reprefented by GI ; the angle GHI is equal to FGC, the argle of incidence; and therefore GH is to GI as radias to the fine of the angle of incidence: Therefore the direct impulfe of each particle or filament is to its abfolute cblique impulfe as radius to the fine of the angle of incidence. But further, the number of particles or filaments which ftrike the furface $\hat{A C}$, is to the number of thofe which ftrike the furface $B C$ as $A C$ to NC: for all the filament between LA and MB go patt the oblique furfac: BC without ltriking it. But $\mathrm{BC}: \mathrm{NC}=$ furfac BC without ltriking it. But $\mathrm{BC}: \mathrm{NC}=$
rad. $:$ fin. $\mathrm{NDC},=$ rad. : fin. FGC, $=$ rad. : fin. incidence. Now the whole impulfe is as the impulfe of each filament, and as the number of filaments exerting equal impulfes jointly ; therefore the whole direct impulfe on AC is to the whole abfolute impulfe on BC ,
as the fquare of radius to the fquare of the fine of the pulfe on AC is to the whole abfolute impulfe on BC ,
as the fquare of tadius to the fquare of tie fine of the anyle of incidence.
1.et $S$ exprefs the extent of the furface, $i$ the angle of incidence, o the angle of obliquity, $v$ the velocity
of the fluid, and $d$ its denfity. Let $F$ reprefent the of incidence, o the angle of obliquity, $v$ the velocity
of the fluid, and $d$ its denfity. Let $F$ reprefent the direct impulfe, $f$ the abfolute oblique impulfe, and $\phi$ direst impulfe, $f$ the abfolute oblique impulfe, and $\varphi$
the relative or effective impulfe : and lit the tabalar fines and cofines be confidered as decimal fractions of the radius unity:
This propofition gives us $F: f=\mathrm{R}^{2}: \operatorname{Sin} .^{2},=1$ :
Sin. ${ }^{2} i$, and therefore $f=F \times \sin .{ }^{2} i$. Alfc, beraufe impulfes are in the proportion of the extent of furface impulfes are in the proportion of the extent of furface
fimilarly impelled, we have, in general, $f=\mathrm{FS} \times$ Sin. ${ }^{2}, i$.
The firt who publifhed this theorem was Pardies, in
is Ocuvres de Mathematique, in 1673 . We know that
The firt who publifhed this theorem was Pardies, in
his Ocuves de Mathematigue, in 1673 . We know that Newton had invefligated the chief propofitions of the Principia before 1670.
Prop. III، The direat impulfe on any furface is to the Third law. effective oblique impulfe on the fame furface, as the effective oblique impulfe on the fame furface, zs the
cube of radius to the folid, which has for its bafe the fquare of the fine of incidence, and the fine of obliquity for its height.

\end{aligned}
$$

19 $\quad$ 二 $=\mathrm{P} \times \operatorname{Sin}^{2}{ }^{2} i \times \operatorname{Sin} . \mathrm{O}$.

Proportion of the direct impulfe to the effective oblique impulfe.

Cor.-The direct impulfe on any furface is to the effective oblique impulfe in the direction of the fream, as the cube of radius to the cube of the fine of incidence. For draw I Q and G P perpendicular to GH, and IP perpendicular to GP; then the abfolute impulfe $G I$ is equivalent to the impulfe $G Q$ in the direction of the ftream, and GP, which may be called the tranfverfe impulfe. The angle $G$ I $Q$ is evidently equal to the angle GH , or FGC , the angle of incidence.

$$
\begin{array}{ll}
\text { Therefore } f: \varphi=\mathrm{GI}: \mathrm{GQ},=\mathrm{R}: \operatorname{Sin} . i \\
\text { But } \mathrm{F}: f= & \mathrm{R}^{3}: \operatorname{Sin}^{2} i . \\
\text { Therefore } \mathrm{F}: \varphi= & \mathrm{R}^{3}: \operatorname{Sin} .{ }^{3} i .
\end{array}
$$

20
Impulfeon a furface in motion.

$$
\text { And } \varphi=\mathrm{F} \times \operatorname{Sin} .3 i
$$

Before we proceed further, we fhall confider the impulfe on a furface which is alfo in motion. This is evidently a frequent and an important cafe. It is perhaps the molt frequent and important: It is the cafe of a thip under fail, and of a wind or water-mill at work.

Therefore, let a fream of fluid, moving with the di-
Plate rection and velocity DE, meet a plane BC, (fig. I. sccexxyvr. $n^{\circ}{ }^{2}$.), which is moving parallel to itfelf in the direction and with the velocity DF: It is required to determine the impulfe?
Nothing is more cafy: The mutual actions of bodies depend on their relative motions only. The motion $D E$ of the fluid relative to $B C$, which is a $r_{0}$ in motion, is compounded of the real motion of the guid and the oppofite to the real motion of the body. Therefore produce FD till $\mathrm{D} f=\mathrm{DF}$, and complete the parallelogram $\mathrm{D} f e \mathrm{E}$, and draw the diagonal $\mathrm{D} e$. The impulfe on the plane is the fame as if the plane were at reft, and every particle of the fluid impelled it in the direction and with the velocity $\mathrm{D}_{e}$; and may therefore be determined by the foregoing propofition. This propofition applies to every polfible cafe; and we thall not beftow more time on it, but referve the important modification of the general propofition for the cafes which fhall occur in the prastical applications of the whole doctrine of the impulfe and refiftance of fluids.
21
Proportion Prop. IV. The direct impulfe of a ftream of fluid, of the dired impulfe of a given
flream to
the effec-
tive ob-
liqueim-
pulfe in
the fame
direction. whofe breadth is given, is to its oblique effective impulfe in the direction of the ftream, as the fquare of radius to the fquare of the fine of the angle of incidence.
For the number of filaments which occupy the oblique plane BC, would occupy the portion NC of a perpendicular plane, and therefore we have only to compare the perpendicular impulfe on any point $V$ with the effective impulfe made by the fame filament FVon the oblique plane at $G$. Now $G H$ reprefents the impulfe which this filament would make at $V$; and GQ is the effective impulfe of the fame filament at G, eftimated in the direction G H of the tream; and GH is to GQ as $\mathrm{GH}^{2}$ to $\mathrm{GI}^{2}$, that is, as rad. ${ }^{2}$ to fin. ${ }^{3}$.

Vol. XVI.

## RES

Cor. 1. The effective impulife in the direction of the Reffance. fream on any plane furface $B C$, is to the 山irect impulfe on its bafe $B R$ or $S E$, as the fquare of the fine of the angle of incidence to the fquare of the radius.
2. If an ilofceles wedge $\lambda \mathrm{CB}$ (fig. 2.) be expofed to a ftream of fluid moving in the direct c n of its height $C D$, the impulfe on the fides is to the direct impalfe on the bafe as the fquare of half the bafe $A D$ to the fquare of the fide $A C$; or as the fquare of the fine of half the angle of the wedge to the fquare of the radius, For it is evident, that in this cafe the two tranfverfe impulies, fuch as GP in fig. I, balance each other, and the only impulfe which can be obferved is the fum of the two impulfes, fuch as GQ of fig. i, which are to be compared with the impulfes on the two halves AD, $D B$ of the bafe. Now $A C: A B=$ rad. : fin. $A C D$, and $A C D$ is equal to the angle of incidence.

Thereiore, if the angle $A C B$ is a right angle, and $A C D$ is half a right angle, the fquare of $A C$ is twice the fquare of $A D$, and the impulie on the fides of a rectangular wedge is half the impulfe on its bafe.

Alfo, if a cube ACBE (fig. 3.) be expofed to a ftream moving in a direction perpendicular to one of its fides, and then to a fream moving in a direction perpendicular to one of its diagonal planes, the impulfe in the firft cafe will be to the impulfe in the fecond as $\sqrt{2}$ to $x$. Call the perpendicular impulfe on a fide $F$, and the perpendicular impulfe on its diagonal plane $f$, and the effective oblique impulfe on its fides $\Phi$;-we have

$$
\begin{aligned}
& \mathrm{F}: f=\mathrm{AC}: A B=1: \sqrt{2}, \text { and } \\
& f: \phi=\mathrm{AC}^{2}: A D^{2}=2: 1 . \text { Therefore } \\
& \mathrm{F}: \Phi= \\
& 2: \sqrt{2}=\sqrt{2}: 1, \text { or }
\end{aligned}
$$

very nearly as 10 to 7.
The fame reafoning will apply to a pyramid whofe bafe is a regular polygon, and whofe axis is perpendicular to the bafe. If fuch a pyramid is expofed to a fream of tuid moving in the direction of the axis, the direct impulfe on the bafe is to the effective impulfe on the pyramid, as the fquare of the radius to the fquare of the fine of the angle which the axis makes with the fides of the pyramid.

And, in like manner, the direct impulion on the bafe of a right cone is to the effective impulfion on the conical furface, as the fquare of the radius to the fquare of the fine of half the angle at the vertex of the cone. This is demonltrated, by fuppofing the cone to be a pyramid of a number of fides.

We may in this manner compare the impulfe on any polygonal furface with the impulfe on its bafe, by comparing apart the impulfes on each plane with thofe in their correfponding bafes, and taking their fum.

And we may compare the impulfe on a curved furface with that on its bafe, by refolving the curved furface into elementary planes, each of which is impelled by an elementary filament of the fream.

The following beautiful propofition, given by Le Seur and Jaquier, in their Commentary on the fecond Book of Newton's Principia, with a few examples of its application, will fuffice for any further account of this theory.
pulfe on a Pr. Let ADB (fg. 4.) be the rection of a curved furfurface of fimple curvature, fuch as is the furface of face coma cylinder. Let this be expofed to the action of a pared with fluid moving in the direction AC. Let BC be the that on its
fection of the plane (which we have called its bafe), perpendicular to the direction of the fream. In AC produced, take any length CG; and on CG defcribe the femicircle CHG, and complete the rectangle BCGO. Through any point D of the curve draw ED parallel to $A C$, and meeting $B C$ and $O G$ in $Q$ and P. Let DF touch the curve in D, and draw the chord GH parallel to DF , and HKM perpendicular to CG, meeting ED in M. Suppofe this to be done for every point of the curve ADB, and let LMN be the curve which paffes through all the points of interfection of the parallels EDP and the correfponding perpendiculars HKM.

The effective impulfe on the curve furface ADB in the direction of the fream, is to its direct impulfe on the bafe BC as the area of BCNL is to the rectangle BCGO.

Draw e a $q$ mp parallel to EP and extremely near it. The arch $\mathrm{D} d$ of the curve may be conceived as the fection of an elementary plane, having the pofition of the tangent DF. The angle EDF is the angle of incidence of the filament ED de. This is equal to CGH , becaufe ED, DF, are parallel to CG, GH; and (becaufe CHG is a femicircle) CH is perpendicular to GH . Alfo $\mathrm{CG}: \mathrm{CH}=\mathrm{CH}: \mathrm{CK}$, and $\mathrm{CG}: \mathrm{CK}=$ $\mathrm{CG}^{2}$ : $\mathrm{CH}^{2},=$ rad. $^{2}:$ fin. $^{2}, \mathrm{CGH},=\mathrm{rad}^{2}:$ fin. $^{2}$ in. cid. Therefore if CG , or its equal DP, reprefent the direct impulfe on the point $Q$ of the bafe, CK, or its equal QM , will reprefent the effective impulfe on the point D of the carve. And thus, $\mathrm{Q}_{q \rho} \mathrm{P}$ will reprefent the direct impulfe of the filament on the element $\mathrm{Q} q$ of the bafe, and Qqm M will reprefent the effective impulfe of the fame filament on the element $\mathrm{D} d$ of the curve. And, as this is true of the whole curve ADB, the effective impulfe on the whole curve will be reprefented by the area BCNML; and the dirett impulfe on the bafe will be reprefented by the $r=c$ tangle BCGO ; and therefore the impulfe on the curvefurface is to the impulfe on the bafe as the area BLMNC is to the rectangle BOGC.

It is plain, from the conftruction, that if the tangent to the curve at A is perpendicular to AC , the point N will coincide with G. Alfo, if the tangent to the eurve at $B$ is parallel to $A C$, the point $L$ will coincide with B.

Whenever, therefure, the curve ADB is fuch that an equation can be had to exhibit the general relation between the abrififa $A R$ and the ordinate DR , we thall deduce an equation which exhibits the relation between the abfcifs CK and the ordinate KM of the curve LMN; and this will give us the ratio of BLNC to BOGC.

Thus, if the furface is that of a cylinder, fo that the curve BDA $b$ (fig. 5.), which receives the impulfe of the fluid, is a femicircle, make CG equal to AC, and conftruct the figure as before. The curve BMG is a parabola, whofe axis is CG, whofe vertex is G, and whore parameter is equal to CG. For it is plain, that $\mathrm{CG}=\mathrm{DC}$, and $\mathrm{GH}=\mathrm{CQ},=\mathrm{MK}$. And $\mathrm{CG} \times \mathrm{GK}$ $=\mathrm{GH}^{2}=\mathrm{KM}^{3}$. That is, the curve is fuch, that the fquare of the ordinate $K M$ is equal to the rectangle of the abfiffa GK and a conftant line GC ; and it is therefore a parabola whofe vertex is G. Now it is well
known, that the parabolic area BMGC is two thirds Refilance, of the parallelogram BCGO. Therefore the impulfe on the quadrani $A D B$ is two thirds of the impulfe on the bafe BC. The fame may be faid of the quadrant A $d b$ and its bafe $c b$. Therefore, The impulfe on $a c y$-The ${ }^{23}$ linder or balf cylinder is two thirds of the direct impulfe on pulfe on a its traverfe plane through the axis; or it is two this ds cylinder, of the direct impulfe on one fide of a parallelopiped of the fame breadth and height.
Prop. VI.-If the body be a folid generated by the revolution of the figure BDAC (fig. 4.) round the axis AC; and if it be expofed to the action of a ftream of fluid moving in the direction of the axis $A C$; then the effective impulfe in the direction of the Aream is to the direct impulfe on its bafe, as the folid generated by the revolution of the figure BLMNC, round the axis CN to the cylinder generated by the revolution of the rectangle BOGC.
This fcarcely needs a demonftration. The figure ADBLMNA is a fection of thefe folids by a plane pafing through the axis; and what has been demonflrated of this fection is true of every other, becaufe they are all equal and fimilar. It is therefore true of the whole folids, and (their bafe) the circle generated by the revolution of BC round the axis AC.

Hence we eafily deduce, that Tbe impulfe on a fphere On a ${ }^{2}$ is one balf of the direct impulfe on its great circle, or on the fphere, bafe of a cylinder of equal dianneter.
For in this cafe the curve BMN (fig. 5.) which generates the folid expreffing the impulie on the fphere is a parabola, and the folid is a parabolic conoid. Now this conoid is the cylinder generated by the revolution of the rectangle BOGC round the axis CG, as the fum of all the circles generated by the revolution of ordinates to the parobala fuch as KM, to the fum of as many circles generated by the ordinates to the rectangle fuch as KT ; or as the fum of all the fquares defcribed on the ordinates KM to the fum of as many fquares defribed on the ordinates KT. Draw BG cutting MK in S . The fquare on MK is to the fquare on BC or TK as the abfaiffa GK to the abfciffa GC (by the nature of the parabula), or as SK to BC; becaufe SK and BC are refpectively equal to GK and GC. Therefore the fum of all the fquares on ordinates, fuch as MK, is to the fum of as many fquares on ordinates, fuch as TK, as the fum of all the lines SK to the fum of as many lines TK; that is, as the triangle BGC to the rectangle BOGC ; that is, as one to two: and therefore the impulfe on the fphere is one half of the direct impulfe on its great ciccle.

From the fame conftruction we may very eafily de- o ${ }^{25}$ duce a very curious and feemingly ufeful truth, that of frufum of all conical bodies having the circle whofe diameter is a cone. AB (fig. 2.) for its bafe, and FD for its height, the one which fuftains the fmallef impulfe or reeets with the fmalleft refiftance is the fruftum AGHB of a cone ACB fo conftructed, that EF being taken equal to ED, EA is equal to EC. This fruftum, though more capacious than the cone AFB of the fame height, will be lefs refifted.

Alfo, if the folid generated by the revolution of BDAC (fig. 4.) have its anterior part covered with a fruftum of a cone generated by the lines $\mathrm{D} a, a \mathrm{~A}$, forming

## R E S

$\underbrace{\text { Refinance. forming the angle at } a \text { of } 135 \text { degrees; this folid, }, ~}$ though more capacious than the included folid, will be leis refilted.

And, from the fame principles, Sir Ifaac Newton determined the form of the curve $A D B$ which would generate the folid which, of all others of the fame length and bafe, hould have the leaft refiftance.

Thefe are curious and importart deductions, but are not introduced here, for reafons which will foon appear.

The reader cannot fail to obferve, that all that we have hitherto delivered on this fubject, relates to the comparifon of different impulfes or refiftances. We have always compared the oblique impulfions with the direct, and by their intervention we compare the oblique impulfions with each other. But it remains to give abfolute meafures of fome individual impulfion ; to which, as to an unit, we may refer every other. And as it is by their preffure that they become ufeful or huriful, and they mult be oppofed by other preffures, it becomes extremely convenient to compare them all with that preffure with which we are molt familiarly acquainted, the preffure of gravity.

The manner in which the comparifon is made, is this. When a body advances in a fluid with a known velocity, it puts a known quantity of the fluid into motion (as is fuppofed) with this velocity; and this is done in a known time. We have only to examine what weight will put this quantity of fluid into the fame motion, by acting on it during the fame time. This weight is conceived as equal to the refiftance. Thus, let us fuppofe that a ftream of water, moving at the rate of eight feet per fecond, is perpendicularly obftructed by a fquare foot of folid furface held faft in its place. Conceiving water to act in the manner of the hypothetical fluid now defcribed, and to be without elafticity, the whole effect is the gradual annihilation of the motion of eight cubic feet of water moying eight feet in a fecond. And this is done in a fecond of time. It is equivalent to the gradually putting eight cubic feet of water into motion with this velocity; and doing this by acting uniformly during a fecond. What weight is able to produce this effect? The weight of eight feet of water, acting during a fecond on it, will, as is well known, give it the velocity of thirty two feet per fecond; that is, four times greater. Therefore, the weight of the fourth part of eight cubic feet, that is, the weight of two cubic feet, acting during a fecond, will do the fame thing, or the weight of column of water whofe bafe is a fquare foot, and whofe height is two feet. This will not only produce this effect in the fame time with the impulfion of the folid body, but it will alfo do it by the tame degrees, as any one will clearly perceive, by attending to the gradual acceleration of the mafs of wacer urged by $\frac{x}{4}$ of its weight, and comparing this with the gradual production or extinction of motion in the tuid by the progrefs of the refilted furface.
$N_{\circ}$ w it is well known that 8 cubic feet of water, by' falling one foot, which it will do in one-fourth of a fecond, will acquire the velocity of eight feet per fecond by its weight; therefore the force which produces the fame effect in a whole fecond is one-fourth of this. This force is therefore equal to the weight of a column of
water, whofe bafe is a fquare foot, and whofe height is R.fifance. two feet ; that is, twice the height neceffary for acquiring the velocity of the motion by gravity. The conclufion is the fame whatever be the furface that is refitted, whatever be the fluid that relifs, and whatever be the velocity of the motion. In this inductive and familiar manner we le:mn, that the direa impulfe or reffitance of an unelaffic fluid on any plane furface, is equal to the weight of a column of the fluid baving the furface for its bafe, and trwice the fall nectfary for acquiring the velocity of the motion fur its beight: and if the fluid is confidered as elaftic, the impulfe or refiftance is twice as great. See Newt. Prinip. B. II. prop. 35. and 38.

It now remains to compare this theory with experi- Thistheory ment. Many have been made, both by Sir Ifaac New- tried by ton and by fublequent writers. It is much to be 12 - different mented, that in a matter of fuch importance, both to experithe philofopher and to the artift, there is fuch a difagreement in the refults with each other. We fhall mention the experiments which feem to have been made with the greateft judgment and care. Thofe of Sir Iface Newton were chiefly made by the ofcillations of pendulums in water, and by the defeent of balls both in water and in air. Many have been made by Mariotte (Traitéde Mouvement des Eaux). Gravefande has publiifhed, in his Syfem of Natural Pbilofophy, experiments made on the refiftance or impulfions on folids in the midit of a pipe or canal. They are extremely well contrived, but are on fo fmall a fcale that they are of very little ufe. Daniel Bernoulli, and his pupil Profeflur Krafft, have publifhed, in the Comment. Acad. Petropol. experiments on the impulfe of a Aream or vein of water from an orifice or tube: Thefe are of great value. The Abbé Boffut has publifhed others of the fame kind in his Hydrodynamique. Mr Robins has publifhed, in his New principles of Gunnery, many valuable experiments on the impulfe and refiftance of air. The Chev. de Borda, in the Mem. Acad. Paris, 1763 and 1767 , has given experiments on the refiftance of air and alfo of water, which are very interefting. The molt complete collection of experiments on the refiftance of water are thofe made at the public expence by a committee of the academy of fciences, confifting of the marquis de Condorcet, Mr d'Alembert, Abbé Boffur, and others. The Chev. de Buat, in his Hydraulique, has publifhed fome moft curious and valuable experiments, where many important circumftances are taken notice of, which had never been attended to before, and which give a view of the fubject totally different from what is ufually taken of it. Don George d'Ulloa, in his Examine Maritimo, has alfo given fome important experiments, fimilar to thofe adduced by Bougeur in his Manouvre des $V a i f f a u x$, but leading to very different conclufions. All thefe fhould be confulted by fuch as would acquire a practical knowledge of this fubject. We muft content ourfelves with giving their moft general and fteady refults. Such as,
I. It is very confonant to experiment that the refif. ances are proportional to the fquares of the velocities. When the velocities of water do not exceed a few feet per fecond, no fenfible deviation is obferved. In very fmall velocities the refiftances are fenfibly greater than in this proportion, and this excefs is plainly owing to the vifcidity or imperfect fluidity of water. Sir Ifaac

RES [ 100
Refifance. Newton has flown that the refiftance anifing from this caufe is conftant, or the fame in every velocity; and when he has taken off a certain pant of the total refiftance, he found the remainder was very exactly proportionable to the fquare of the velocity. His experiments to this purpofe were made with balls a very little heavier than water, fo as to defcend very flowly; and they were made with his ufual care and accuracy, and may be depended on.

In the experiments made with bodies floating on the furface of water, there is an addition to the refiftance arifing from the inertia of the water. The water heaps up a little on the anterior furface of the floating body, and is depreffed behind it. Hence arifes a hydroftatical preflure, acting in concert with the true refiftance. A fimilar thing is obferved in the refiftance of air, which is condenfed before the body and rarefied behind it, and thus an additional refiftance is produced by the unbalanced elafticity of the air; and alfo becaufe the air, which is attually difplaced, is denfer than common air. Thefe circumflances caufe the refiftances to increafe fafter than the fquares of the velocities: but, even independent of this, there is an additional refiftance arifing from the tendency to rarefaction behind a very fwift body; becaufe the preffure of the furrounding fluid can only make the fluid fill the fpace left with a determined velocity.

We have had occafion to fpeak of this circumRance more particularly under Gunnery and Pneumatics, when confidering very rapid motions. Mr Robins had remarked that the velocity at which the obferved refiltance of the air began to increafe fo prodigioully, was that of about 1100 or 1200 feet per fecond, and that this was the velocity with which air would rufh into a void. He concluded, that when the velocity was greater than this, the ball was expofed to the additional refifance arifing from the unbalanced itatical preflure of the air, and that this conftant quantity behoved to be added to the refiftance ariing from the air's inertia in all greater velocities. This is very reafonable: But he imagined that in fmaller velocities there was no fuch unbalanced preffure. But this cannot be the cafe: for although in fmaller velocities the air will fill fill up the fpace behind the body, it will not fill it up with air of the fame denfity. This would be to fuppofe the motion of the air into the deferted place to be inftantaneous. There muft therefore be a rarefaction behind the body, and a preflure hackward; arifing from unbalan. ced elaficicty, independent of the condenfation on the antericr part. The condenfation and rarefaction are caufed by the fame thing, viz. the limited elafticity of the air. Were this infinitely great, the fmatleft condenfation befcre the body would be inflantly diffufed over the whole air, and fo would the rarefaction, fo that no preffure of ur balanced elafticity would be obferved ; but the elafticity is fuch as to-propagate the condenfation with the velocity of found only, i.e. the velocity of 1142 feet per feeond. Therefore this additional refiffance does not commence precifely at this velocity, but is fenfible in all frualler velocities, as is very jufly wherved by Euler. But we are not yet able to afcertain the lav of its increafe, although it is a problem which feems fufceptible of a tolerably accurate folunon.

Precifely fimilar to this is the refiffance to the mo- Refifance. tion of floating bodies, arifing from the accumulation or gorging up of the water on their anterior furface, and its depreffion behind them. Were the gravity of the water infinite, while its inertia remains the fame, the wave raifed up at the prow of a fhip would be inflantly diffufed over the whole ocean, and it would therefore be infinitely fmall, as alfo the depreffion behind the poop. But this wave requires time for its diffufion ; and while it is not diffufed, it acts by hydroftatical preffure. We are equally unable to afcertain the law of variation of this part of the refiftance, the mechanifm of waves being but very imperfectly underftood. The height of the wave in the experiments of the French academy could not be meafured with fufficient precifion (being only obferved en paffant) for afcertaining its relation to the velocity. The Chev. Buat attempted it in his esperiments, but without fuccefs. This muft evidently make a part of the refiftance in all velocities: and it fill remains an undecided queftion, "What relation it bears to the velocities?" When the folid body is wholly buried in the fluid, this accumulation does not take place, or ar leaft not in the fame way: It may, however, be obferved. Every perfon may recollect, that in a very fwift running frearn a large ftone at the bottom will produce a fmall fwell above it ; unlefs it lies very deep, a nice eye may till obferve it. The water, on arriving at the obftacle, glides paft it in every direction, and is deflected on all hands; and therefore what paffes over it is alfo deflected upwards, and caufes the water over it to rife above its level. The nearer that the body is to the furface, the greater will be the perpendicular rife of the water, but it will be lefs diffufed; and it is uncertain whether the whole ele. vation will be greater or lefs. By the whole elevation we mean the area of a perpendicular fection of the elevation by a plane perpendicular to the direction of the fream. We aie rather difpofed to think that this area will be greatelt when the body is near the furface. D'Ulloa has attempted to confider this fubject fcientifically; and is of a very different opinion, which he confirms by the fungle experiment to be mentioned by and by. Mean time, it is evident, that if the water which glides paft the body cannot fall in behind it with fnfficient velocity for filling up the face behind, there muft be a void there; and thus a hydroftatical preffure mult be fuperadded to the refiftance arifing from the inertia of the water. All muft have obferved, that if the end of a ftick held in the hand be drawn flowly through the water, the water will fill the place left by the ttick, and there will be no curled wave: but if the motion be very rapid, a hollow trough or gutter is left behind, and is not filled up till at fome diftance from the ftick, and the wave which fornis its fides is verymuch broken and curled. The writer of this article has often looked into the water from the poop of a fecond rate man of war when the was failing is miles per hour, which is a velocity of 16 feet per fecond nearly; and he not only obferved that the back of the rudder was naked for about two feet below the load water-line, but alfo that the trough of wake made by the flip was filled up with water which was broken and foaming to a confiderable depth, and to a confiderable diftance from the veffel: There muft therefore have been

## R E S

## 101

## R E S

$\underbrace{\text { Refifance. a void. He never faw the wake perfectly tranfparen }}$ (and therefore completely filled with water) when the velocity exceeded 9 or 10 feet per fecond. While this broken water is obferved, there can be no doubt that there is a void and an additional refiftance. But even when the fpace left by the body, or the fpace behind a ftill body expofed to a ftream, is completely filled, it may not be filled fufficiently faft, and there may be (and certainly is, as we fhall fee afterwards) a quantity of water behind the body, which is moving more flowly away than the relt, and therefore hangs in fome fhape by the body, and is dragged by it, increafing the refiltance. The quantity of this mult depend partily on the velocity of the body or Itream, and partly on the rapidity with which the furrounding water comes in behind. This laft muft depend on the preffure of the furrounding water. It would appear, that when this adjoining preffure is very great, as mult happen when the depth is great, the augmentation of refiltance now fpoken of would be lefs. Accordingly this appears in Newton's experiments, where the balls were lefs retard. ed as they were deeper under water.

Thefe experiments are fo fimple in their nature, and were made with fach care, and by a perfon fo able to detect and appreciate every circumftance, that they deferve great credit, and the conclufions legitimately drawn from them deferve to be confidered as phyfical laws. We think that the prefent deduction is unexceptionable : for in the motion of balls, which hardly deficended, their preponderancy being hardly fenfible, the effect of depth mult have borne a very great proportion to the whole refiftance, and mult have greatly influenced their motions; yet they were obferved to fall as if the refiltance had no way depended on the depth.

The fame thing appears in Borda's experiments, where a fphere which was deeply immerfed in the water was lefs refifted than one that moved with the fame velocity near the furface; and this was very conlant
and regular in a courfe of expriments. D'Ulloa, however, affirms the contrary: He fays that the refifance of a board, which was a foot broad, immerfed one foot in a fream moving two feet per fecond, was $15^{\frac{x}{2}}$ lbs. and the refiftance to the fame board, when immerfed 2 feet in a Aream muving $1 \frac{1}{3}$ feet per fecond (in which cafe the furface was 2 feet), was $26 \frac{1}{4}$ pounds (a).

We are very forry that we cannor give a proper account of this theory of reilitance by Don George Juan D'Ulloa, an author of great mathematical reputation, and the infpector of the marine academies in Spain. We have not been able to procure either the original or the French tranflation, and judge of it only by an extract by Mr Prony in his Architecture Hydraulique, $\oint 868$. \&c. The theory is enveloped (according to Mr Prony's cultom) in the molt complicated expretlions, fo that the phyfical principles are kept almoft out of fight. When accommodated to the fimpleft pollible cafe, it is nearly as follows.
let $b$ be its depth under the horizontal furface of the fluid. Let of be the denfity of the fluid, and $\varphi$ the ac-
celerative power of gravity, $=32$ feet velocity acqui- Reffance. red in a fecond.

It is known, fays he, that the water would flow out at this hole with the velocity $u=\sqrt{2 \phi b}$, and $u^{2}=2 \phi b$ and $b=\frac{a^{2}}{2 \phi}$. It is alfo known that the preffure $p$ on the orifice $o$ is $\phi \circ \delta h,=\phi \circ \delta \frac{u^{2}}{2 \phi},=\frac{x}{2} \& 0 u^{2}$.

Now let this little furface o be fuppofed to move with the velocity $v$. The fluid would meet it with the velocity $u+v$, or $u-v$, according as it moved in the oppofite or in the fame direction with the efflux. In the equation $p=\frac{1}{2} \delta \circ u^{2}$, fubltitute $u \doteq v$ for $u$, and we have the preffure on $o=p=\frac{\delta 0}{2}(u \neq v)^{2},=\frac{\delta \theta}{2}$ $\left(\sqrt{2 \phi b}=v^{2}\right)$.

This prefure is a weight, that is, a mafs of matter $m$ actuated by gravity $\phi$, or $p=\phi m$, and $m=\AA$ 。 $\left(\sqrt{h}=\frac{v}{\sqrt{2 \phi}}\right)^{2}$.
This elementary furface being immerfed in a fagnant fluid, and moved with the velocity $v$, will fultain on one fide a preffure to $\left(\sqrt{b}+\frac{v}{\sqrt{2} \phi}\right)^{2}$ and on the other fide a preffure $s \circ\left(\sqrt{ } b-\frac{v}{\sqrt{2 \phi}}\right)^{2}$; and the fenfible refiftance will be the difference of thefe two preffures, which is so $4 \sqrt{ } h \frac{v}{\sqrt{ } 2 \phi}$, or $804 \sqrt{ } b \frac{v}{8}$, that is, $\frac{80 \sqrt{ } b v}{2}$, becaufe $\sqrt{2 \varphi}=8$; a quantity which is in the fubduplicate ratio of the depth under the furface of the fluid, and the fimple ratio of the velocity of the refifted furface jointly.

There is nothing in experimental philofophy more certain than that the refiftances are very nearly in the duplicate ratio of the velocities; and we cannot conceive by what experiments the ingenious author has fupported this conclufion.

But there is, befides, what appears to us to be an Defect in effential defect in this inveftigation. The equation ex-his inveftihibits no refiltance in the cafe of a fluid without weight. gation. Now a theory of the refiftance of fluids fhould exhibit the retardation arifing from inertia alone, and fhould diftinguith it from that arifing from any other caufe : and moreover, while it affigns an ultimate fenfible refittance proportional (cateris paribus) to the fimple velocity, it afumes as a firl principle that the preffure $p$ is as $u v^{2}$. It allo gives a falfe meafure of the ftatical prellures: for thele (in the cafe of bodies immerfed in our waters at lealt) are made up of the preffure of the incumbent water, which is meafured by $b$, and the preflure of the atmolph ere, a conltant quantity.

Whatever reafon can be given for fetting out with the principle that the preffure on the litule furface $o$, moving with the velocity $u$, is equal to $\frac{5}{2} \delta 0(u=v)^{2}$, makes it indifpenfably neceffary to take for the velocity
(A) There is fomething very unaccountable in thefe experiments. The refiltances are much greater than any other author has obferved.

## R E S <br> 102 <br> R E S

Rffance. $u$, not that with which water would iffue from a hole whofe depth under the furface is $h$, but the velocity with which it will iffue from a hole whofe depth is $b+33$ feet. Becaufe the preffure of the atmofphere is equal to that of a column of water 33 feet high : for this is the acknowledged velocity wiih which is would rufh in to the void left by the body. If therefore this velocity (which does not exif) has any flare in the effort, we mult have for the fluxion of preffure not $\frac{4 \sqrt{ } b v}{\sqrt{2 \phi}}$ but $\frac{4 \sqrt{b}+33 \mid v}{\sqrt{2 \phi}}$. This would not only give preflure or reffitances many times exceeding thofe that have been obferved in our experiments, but would alfo totally change the proportions which this theory determines. It was at any rate improper to embarrafs an inveftigation, already very intricate, with the preflure of gravity, and with two motions of efflux, which do not exilt, and are neceffary for making the preflures in the ratio of $\overline{u+} \overline{v^{2}}$ and $\bar{u}=v^{2}$.

Mr Prony has been at no pains to inform his readers of his reafons for adopting this theory of refiftance, fo contrary to all received opinions, and to the moft dittinct experiments. Thofe of the French academy, made under greater preflures, gave a much fmaller refiftance; and the very experiments adduced in fupport of this theory are extremely deficient, wanting fully $\frac{x}{\top} \mathrm{~d}$ of what the theory requires. The refiftances by experiment were $1 \frac{i}{4}$ and $26 \frac{1}{3}$, and the theory required $20 \frac{1}{2}$ and 39 . The equation, however, deduced from the theory is greatly deficient in the expreffion of the preflures caufed by the accumulation and depreffion, flating the heights of them as $=\frac{v^{2}}{2 \phi}$. They can never be fo high, becaufe the heaped up water flows off at the fides, and it alfo comes in behind by the fides ; fo that the preflure is much lefs than half the weight of a column whofe height is $\frac{v^{2}}{2 \boldsymbol{\psi}}$; both becaufe the accumulation and depreffion are lefs at the fides than in the middle, and becaufe, when the body is wholly immerfed, the accumulation is greatly diminifhed. Indeed in this cafe the final equation does not include their effects, though as real in this cafe as when part of the body is above water.

Upon the whole, we are fomewhat furprifed that an author of D'Ulloa's eminence fhould have adopted a theory fo unneceffarily and fo improperly embarraffed with foreign circumftances; and that Mr Prony fhould have inferted it with the explanation by which he was to abide, in a work deftined for practical ufe.

This point, or the effect of deep immerfion, is fill much contefted; and it is a received opinion, by many not accultomed to mathematical refearches, that the refiftance is greater in greater depths. This is affumed as an important principle by Mr Gordon, author of $A$ theory of Naval Arcbitelure; but on very vague and flight grounds; and the author feems unacquainted with the manner of reafoning on fuch fubjects. It fhall be confiderel afterwards.

With thefe corrections, it may be afferted that theory and experiment agree very well in this refpect, and that the refiftance may be afferted to be in the duplicate ratio of the velocity.

We have been more minute on this fubject, becaufe it is the leading propofition in the theory of the ac-
tion of fluids. Newton's demonftration of it takes no Refifanoe, notice of the manner in which the various particles of the fluid are put into motion, or the motion which each in particular acquires. He only fhows, that if there be nothing concerned in the communication but pure inertia, the fum total of the motions of the particles, eftimated in the direction of the body's motion, or that of the ftream, will be in the duplicate ratio of the velocity. It was therefore of importance to how that this part of the theory was jult. To do this, we had to confider the effect of every circumftance which could be combined with the inertia of the fluid. All thefe had been forefeen by that great man, and are moft briefly, though perfpicuoully, mentioned in the laft fcholium to prop. 36. B. II.
2. It appears from a comparifon of all the experiments, that the impulfes and refiftances are very nearly in the proportion of the furfaces. They appear, however, to increafe fomewhat fatter than the furfaces. The Chevalier Borda found that the refiftance, with the fame velocity, to a furface of

The deviation in thefe experiments from the theory increafes with the furface, and is probably much greater in the extenfive furfaces of the fails of fhips and windmills, and the hulls of fhips.
3. The refiftances do by no means vary in the duplicate ratio of the fines of the angles of incidence.
As this is the moft interefting circumftance, having a chief influence on all the particular modifications of the refiftance of fluids, and as on this depends the whole theory of the conftruction and working of fhips, and the action of water on our moft important machines, and feems moft immediately conneled with the mechanifm of fluids, it merits a very particular confideration. We cannot do a greater fervice than by rendering more generally known the excellent experiments of the French academy.

Fifteen boxes or veffels were confructed, which were two feet wide, and two feet deep, and four feet long. One of them was a parallelopiped of thefe dimenfions; the others had prows of a wedge-form, the angle ACB (fig. 7.) varying by $12^{\circ}$ degrees from $12^{\circ}$ to $180^{\circ}$; fo that the angle of incidence increafed by $6^{\circ}$ from one to another. Thefe boxes were dragged acrofs a very large bafon of fmooth water (in which they were immerfed two feet) by means of a line paffing over a wheel connected with a cylinder, from which the actuating weight was fufpended. The motion became perfectly uniform after a very little way; and the time of paffing over 96 French feet with this uniform motion was very carefully noted. The refiftance was meafured by the weight employed, after deducting a certain quantity (properly eftimated) for friction, and for the accumulation of the water againft the anterior furface. The refults of the many experiments are given in the following table; where column Ift contains the angle of the prow, column 2d contains the refiftance as given by the preceding theory, column 3 d contains the refiftance exhibited in the experiments, and column 4th contains the deviation of the experiment from the theory.

The Chevalier Borda found the refiftance of fea-water to the face of a cubic foot, moving againt the water one foot per fecond, to be 21 ounces nearly. But
this experiment is complicated : the wave was not de- Refiflance. ducted; and it was not a plane, but a cube.

Don George D'Ulloa found the impulfe of a Aream of fea-water, running two feet per fecond on a foot fquare, to be $15 \frac{1}{4}$ pounds Englifh meafure. This greatly exceeds all the values given by others.
Trom thefe experiments we learn, in the firlt place, Conicthe direct refifance to motion of a plane furface from theme column of water having that furface for its bafe, and for its height the fall producing the velocity of the motion. This is but one half of the refiltance determined by the preceding theory. It agreen, however, very whe wer the by or fluid ; and fufficiently fhows, that there mult be fome fallacy in the principles or reafoning by which this refult of the theory is fuppofed to be deduced. We fhall But we fee that the effects of the obliquity of incidence deviate enormoully from the theory, and that thow 1 in rapidy as the acuten nearly equal to the whole refitance pointed out by the theory, and in the prow of $12^{\circ}$ it is nearly 40 times greater than the theoretical refiftance.

The refiftance of the prow of $90^{\circ}$ fhould be one half the refiftance of the bafe. We have not fuch a prow; but the medium between the refiltance of the prow of

Thefe experiments are very conformable to thofe of other aithors on plane furfaces. Mr Robins found the refiftance of the air to a pyramid of $45^{\circ}$, with its apex foremoft, was to that of its bafe as 1000 to 1411 , inBorda found the re. of the fide was to the oblique it was moved in the direction of the diagonal, in the proportion of $5 \frac{1}{3}$ to 7 ; whereas it Chould have been of 2 to 1 , or of 10 to 7 nearly. He alro found, that a wedge whofe angle was $90^{\circ}$, moving in air, gave for the proportion of the refiftances of the edge and whe 1000, inked of $5000: 10000$. Alfa of the edge and bafe were 52 and 100 , inftead of 25 and 100 .

In fhort, in all the cafes of oblique plane furfaces, the refiltances were greater than thofe which are affigaed by the theory. The theoretical law agrees tolerably with oblervation in large angles of incidence, that is, cular; but in difeng very far for the perpends more to their fquares.

The academicians deduced from thefe experiments an exprefion of the general value of the refiatance, which correlponds tolerably well with obfervation. Thus let $x$ be the complement of the half angle of the prow, and $P$ be the diret preffure or refitance, with an then $p=\mathrm{P} \times$ coline $\times x+3,153\left(\frac{x^{\circ}}{6^{0}}\right)^{3.25}$. Ihis gives for a prow of $12^{\circ}$ an error in defezt a'ont $\frac{x}{1002}$ and in larger angles it is much nearer the truth ; and this is exact enough for any pratice.

Refinaref. This is an abundantly fimple formula; but if we in- every obliquity. They therefore put it in our power Refiftance. troduce it in our calculations of the refiftances of curvilineal prows, it renders them io complicated as to be almot ufeief ; and what is wore, when the calculation is completed for a curvilineal prow, the refiftance which refults is found to differ vide'y from experiment. This Shows that the motion of the fluid is fo modified by the action of the molt prominent part of the prow, that its impulfe on what fucceeds is greatly affected, fo that we are not allowed to confider the prow as compofed of a number of parts, each of which is affected as if it were detached from all the reff.
As the very nature of naval architecture feems to require curvilineal forms, in order to give the neceffary flrength, it feemed of importance to examine more particularly the deviations of the refiftances of fuch prows from the refiftances affigned by the theory. The academicians therefore made veffels with prows of a cylindrical fhape; one of thefe was a half cylinder, and the other was one-third of a cylinder, both having the fame breadth, viz. two feet, the fame depth, alfo two feet, and the fame length, four feet. The refiftance of the half cylinder was to the refiftance of the perpendicular prow in the proportion of 13 to 25 , inftead of being as 13 to 19,5 . The Chevalier Borda found nearly the fame ratio of the refiftances of the half cylinder, and its diametrical plane wher moved in air. He alfo compared the refiftances of two prifms or wedges, of the fame breadth and height. The firft had its fides plane, inclined to the bafe in angles of $60^{\circ}$ : the fecond had its fides portions of cylinders, of which the planes were the chords, that is, their fections were arches of circles of $60^{\circ}$. Their refiftances were as 133 to 100, inftead of being as $\mathbf{r} 33$ to 220 , as required by the theory; and as the refiftance of the firft was greater in proportion to that of the bafe than the theory allows, the refiftance of the laft was lefs.

Mr Robins found the refiftance of a fphere moving in air to be to the refiftance of its great circle as $\mathbf{I}$ to 2,27; whereas theory requires them to be as I to 2. He found, at the fame time, that the abfolute refiftance was greater than the weight of a cylinder of air of the fame diameter, and having the height neceffary for acquiring the velocity. It was greater in the proportion of 49 to 40 nearly:

Borda found the refiftance of the fphere moving in water to be to that of its great circle as 1000 to 2508 , and it was one-ninth greater than the weight of the column of water whofe height was that neceffary for producing the velocity. He alfo found the refiftance of air to the fphere was to its refiffance to its great 36 circle as I to 2,45 .
The theory It appears, on the whole, that the theory gives the gives fome refiftance of oblique plane furfaces too fmall, and that reffitances too fmall and others too great. of curved furfaces too great ; and that it is quite unfit for afcertaining the modifications of refiftance arifing from the figure of the body. The molt prominent part of the prow changes the action of the fluid on the fucceeding parts, rendering it totally different from what it would be were that part detached from the reft, and expofed to the ftream with the fame obliquity. It is of no confequence, therefore, to deduce any formula from the valuable experiments of the French academy. The experiments themfelves are of great importance, becaufe they give us the impulfes on plane furfaces with
to felect the moit proper obliquity in a thoufand important cafes. By appealing to them, we can tell what is the proper angle of the fail for producing the greateft impulfe in the direction of the fhip's courfe; or the beft inclination of the fail of a wind-mill, or the beft inclination of the float of a water-wheel, \&c. \&c. Thefe deductions will be made in their proper places in the courfe of this work. We fee alfo, that the deviation from the fimple theory is not very confiderable till the obliquity is great; and that, in the inclinations which other circumitances would induce us to give to the floats of water-wheels, the fails of wind-mills, and the like, the refults of the theory are fufficiently agreeable to experiment, for rendering this theory of very great ufe in the conftruction of machines. Its great defect is in the impulfions on curved furfaces, which puts a ftop to our improvement of the fcience of naval architecture, and the working of fhips.

But it is not enough to detect the faults of this theo. ry : we fhould try to amend it, or to fubflitute, another. It is a pity that fo much ingenuity fhould have been thrown away in the application of a theory fo defective. Mathematicians were feduced, as has been already obferved, by the opportunity which it gave for exercifing their calculus, which was a new thing at the time of publifhing this theory. Newton faw clearly the defeets of it, and makes no ufe of any part of it in his fubfequent difcuffions, and plainly has ufed it merely as an introduction, in order to give fome general notions in a fubject quite new, and to give a demon. ftration of one leading truth, viz. the proportionality of the impulfions to the fquares of the velocities. While we profefs the higheft refpect for the talents and labours of the great mathematicians who have followed Newton in this moft difficult refearch, we cannot help being forry that fome of the greateft of them continued to attach themfelves to a theory which he neglected, merely becaufe it afforded an opportunity of difplaying their profound knowledge of the new calculus, of which they were willing to alcribe the difcovery to Leibnitz. It has been in a great meafure owing to this that we have been fo late in difcovering our ignorance of the fub. ject. Newton had himfelf pointed out all the defects Its defeas of this theory; and he fet himfelf to work to difcover pointed out another which fhould be more conformable to the na, by Newture of things, retaining only fuch deductions from the ton. other as his great fagacity affured him would fand the teft of experiment. Even in this he feems to have been mittaken by his followers. He retained the proportionality of the refiftance to the fquare of the velocity: This they have endeavoured to demonfrate in a manner conformable to Newton's determination of the oblique impulfes of fuids; and under the cover of the. agreement of this propofition with experiment, they introduced into mechanics a mode of expreffion, and even of conception, which is inconfifent with all accurate notions on thefe fubjects. Newton's propofition was, that the motions communicated to the fluid, and therefore the motions lott by the body, in equal times, were as the fquares of the velocities; and he conceived thefe as proper meafures of the refiftances. It is a matter of experience, that the forces or preffures by which a body mult be fupported in oppofition to the impulfes of fluids, are in this very proportion. In determining the
proportion

## RES [ 105 ] RES

Refifance. proportion of the direct and oblique refitances of plane furfaces, he confiders the refiftances to arife from mutual collifions of the furface and fluid, repeated at intervals of time too fmall to be perceived. Bet in making this comparifon, he has no accafion whatever to confider this repetition; and when he affigns the proportion between the refiltance of a cone and of its bafe, he, in fact, affigns the proportion between two fimultelneous and initantaneous impulfes. But the mathematicians who followed him have confidered this repetition as equivalent to an augmentation of the initial or firt impulie; and in this way have attempted to demonftrate that the refiltances are as the fquares of the velocities. When the velocity is double, each impulfe is double, and the number in a given time is double; therefore, fay they, the refiftance, and the force which will withftand it, is quadruple; and obfervation confirms their deduction: yet nothing is more gratuitous and illogical. It is very true, that the refiftance, conceived as Newton conceives it, the lofs of motion fultained by a body moving in the fluid, is quadruple ; but the inftantaneous impulfe, and the force which can withtand it, is, by all the laws of mechanics, only double. What is the force which can withltand a double impulfe? Nothing but a double impulfe. Nothing but impulfe can be oppofed to impulfe; and it is a grofs mifconception to think of fating any kind of comparifon between impulfe and preffure. It is this which has given rife to
much jargon and falfe reafoning about the force of percuffion. This is ftated as infinitely greater than any preffure, and as equivalent to a preffure infinitely repeated. It forced the abettors of thefe doctrines at laf to deny the exiftence of all preffures whatever, and to affert that all motion, and tendency to motion, was the refult of impulfe. The celebrated Euler, perhaps the firlt mathematician, and the loweft philofopher, of this century, fays, "fince motion and impulfe are feen to exift, and fince we fee that by means of motion preffure may be produced, as when a body in motion Itrikes another, or as when a body moving in a curved chamnel prefes upon it, merely in confequence of its curvilineal motion, and the exertion of a centrifugal force; and fince Nature is moft wifely economical in all her operations; it is abfurd to fuppofe that preffure, or tendency to motion, has any other origin; and it is the bufinefs of a philofopher to difcover by what motions any obferved preffure is produced." Whenever any prefure is obinved, fuch as the preffure of gravity, of magnetifm, of electricity, of condenfed air, nay, of a fpring, and of elafticity and cohefion themfelves, however defperate, nay, oppofite, the philofopher muft immediately calt about, and contrive a fet of motions (creating pro re nat.. the movers) which will produce a preffure like the one obferved. Having pleafed his fancy with this, he crie; out 'supnex "this will produce the preflure ;" et frultra fit fer plura quod fieri poteft per pauciora, "therefore in ulis way the preifure is produced." Thus the vortices of Defeartes are brought back in triumph, and have produced vortices without number, which fill the univerfe with motion and preffure.

Such bold attempts to overturn long-received doctrines in mechanics, could not be received without much criticifm and oppoition; and mary able difertations appeared from time to time in defence of the common doctrines. In confequence of the many objections to Vox. XVI.
the comparifon of pure preffure with pure perculion Refitarce. or impulie, John Bernoulli and others were at laft obliged to affert that there were no perfently hard bodies in nature, nor could be, but that all bodies were elaftic; and that in the communication of motion by percufion, the velocities of both bodies were gradually changed by their mutual elafticity acting during the finite but im. perceptible time of the collifion. This was, in fact, giving up the whole argument, and banifhing percuffion, while their aim was to get rid of preffure. For what is elafticity but a preffure? and how fhall it be produced ? To act in this inftance, mult it arife from a ftill fmaller impulfe? But this will require ancther elafticity, and fo on without end.

Thefe are all legitimate confequences of this attempt to ttate a comparifon between percuffion and preffure. Numberlefs experiments have been made to confirm the ftatement; and there is hardly an itinerant-lecturing fhowman who does not exhibit among his apparatus Gravefand's machine (Vol. I. plate xxxv. fig. 4). But nothing affords fo fpecious an argument as the experimented proportionality of the impulfe of fluids to the fquare of the velocity. Here is every appearance of the accumulation of an infinity of minute impulfes, in the known ratio of the velocity, each to each, producing preffures which are in the ratio of the fquares of the velocitics.
The preffures are obferved; but the impulfes or percuffions, whofe accumulation produces thefe preffures, are only fuppofed. The rare fluid, introduced by New. ton for the purpofe already mentioned, either does not exift in nature, or does not act in the manner we have faid, the particles making their impulfe, and then efcaping through among the reft without affecting their motion. We cannot indeed fay what may be the proportion between the diameter and the diftance of the particles. The firt may be incomparably fmaller than the fecond, even in mercury, the denfelt fluid which we are familiarly acquainted with; but although they do not touch each other, they act nearly as if they did, in confequence of their mutual attractions and repulfions. We have feen air a thoufand times rarer in fome experiments than in others, and therefore the diftance of the particles at leaft ten times greater than their diameters; and yet, in this rare ftate, it propagates all preffures or impulfes made on any part of it to a great diftance, almoft in an inftant. It cannot be, therefore, that fluids act on bodies by impulfe. It is very pofible to conceive a fluid advancing with a flat furface againlt the flat furface of a folid. The very firit and fuperficial particles may make an impulfe; and if they were annihilated, the next might do the fame : and if the velocity were double, thefe impulfes would be double, and would be withfood by a double force, and not a quadruple, as is obferved : and this very circumitance, thati a quadruple force is neceffary, fhould have made us conclude that it was not to impulfe that this force was oppofed. The firft particles having made their ftroke, and not being annihilated, mult eicape literally. In their efcaping, they effectually prevent every farther impulfe becaufe they come in the way of thofe filaments which fmall part would her would have flruck the body. The whole procefs feems to be fomewhat as follows:

When the flat furface of the fuid has come into contact with the plane furface AD (fig. 6.), perpendicular can make any impuife on a urface.
to cccexszus,

## RES

Refifance. to the direction DC of their motion, they mult deflect to both fides equally, and in equal portions, becaufe no reafon can be affigned why more fhould go to either fide. By this means the filament EF, which would have ftruck the furface in G, is deflected before it arrives at the furface, and defcribes a curved path EFIHK, continuing its rectilineal motion to I , where it is intercepted by a frlament immediately adjoining to EF, on the fide of the middle filament DC. The different particles of DC may be fuppofed to impinge in fucceffion at C , and to be deflected at right angles; and gliding along CB , to efcape at B . Each filament in fucceffion, outwards from DC, is deflected in its turn; and being hindered from even touching the furface CB , it glides off in a direction parallel to it; and thus EF is deflected in I, moves parallel to CB from I to H , and is again defected at right angles, and defcribes HK parallel to DC. The fame thing may be fuppofed to happen on the other fide of DC.

And thus it would appear that except two filaments immediately adjoining to the line DC , which bifects the furface at right angles, no part of the fluid makes any impulfe on the furface $A B$. All the other filaments are merely preffed againft it by the lateral filaments without them, which they turn afide, and prevent from ftriking the furface.
In like manner, when the fuid frikes the edge of a eccexxxur. 40 No impulfe prifm or wedge ACB (fig. 7.), it cannot be faid that on the edge any real impulfe is made. Nothing hinders us from of a prim, fuppofing C a mathematical angle or indivifible point, not fufceptible of any impulfe, and ferving merely to divide the flream. Each filament EF is effectually provented from impinging at $G$ in the line of its direction, and with the obliquity of incidence EGC, by the filaments between EF and $\mathrm{DC}_{2}$ which glide along the furface CA; and it may be fuppofed to be deflected when it comes to the line CF which bifects the angle DCA, and again deflected and rendered parallel to DC at I. The fame thing happens on the other fide of DC; and we cannot in this cafe affert that there is any impulfe.

We now fee plainly how the ordinary theory mult be totally unfit for furnifhing principles of naval architecture even although a fermula could be deduced from fuch a feries of experiments as thofe of the French Academy. Although we flould know precifely the impulfe, or, to fpeak now more cautioufly, the action of the fluid on a furface GL (fig. 8.) of any obliquity, when it is alone, detached from all others, we cannot in the fmalleft degree tell what will be the action of part of a ftream of fluid advancing towards it, with the fame obliquity, when it is preceded by an adjoining furface CG, having a different inclination; for the fluid will not glide along GL in the fame manner as if it made part of a more extenfive furface having the fame inclination. The previous deflections are extremely different in thefe two cafes; and the previous deflections are the only changes which we can obferve in the motions of the fluid, and the only caufes of that preffure which we obferve the body to fuftain, and which we call the impulfe on it. This theory muft, therefore, be quite unfit for afcertaining the action on a curved forface, which may be confidered as made up of an indefinite number of fucceffive planes.

We now fee with equal evidence how it happens that
the action of fluids on folid bodies may and mult be op- Refiftance. pofed by preffires, and may be compared with and meafured by the preffure of gravity. We are not compa- Preffure, ring forces of different kinds', percuffions with preffures, the action but preffures with each other. Let us fee whether of fluids, this view of the fubject will afford us any method of comparifon or abfolute meafurement.

When a filament of fluid, that is, a row of corpufcles, are turned out of their courfe EF (fig. 6.), and forced to take another courfe $I H$, force is required to produce this change of direction. The filament is prevented from proceeding by other filaments which lie between it and the body, and which deflect it in the fame manner as if it were contained in a bended tube, and it will prefs on the concave filament next to it as it would prefs on the concave fide of the tube. Suppofe fuch a bended tube ABE (fig. 9.), and that a ball $A$ is projected along it with any velocity, and moves in it without friction : it is demonfrated, in elementary mechanics, that the ball will move with undiminifhed velocity, and will prefs on every point, fuch as $B$, of the concave fide of the tube, in a direction $B F$ perpendicular to the plane CBD, which touches the tube in the point $B$. This preffure on the adjoining filament, on the coscave fide of its path, mult be withfood by that filament which deflects it ; and it mult be propagated acrofs that filament to the next, and thus augment the preffure upon the next filament already preffed by the deflection of that intermediate filament; and thus there is a preffure towards the middle filament, and towards the body, arifing from the deflection of all the outer filaments; and their accumulated fum mult be conceived as immediately exerted on the middle filaments and on the body, becaufe a perfect fluid tranfmits every preffure undiminifhed.

The preffure BF is equivalent to the two $\mathrm{BH}, \mathrm{BG}$ one of which is perpendicular, and the other parallel, to the direction of the original motion. By the firft, (taken in any point of the curvilineal motion of any filament), the two halves of the ftream are preffed together ; and in the cafe of fig. 6. and 7. exactly balance each other. But the preffures, fuch as BG, mult be ultimately withftood by the furface ACB ; and it is by thefe accumulated preffures that the folid body is urged down the flream ; and it is thefe accumulated preffures which we obferve and meafure in our experiments. We fhall anticipate a little, and fay that it is molt eafily demonflated, that when a ball A (fig. 9.) moves with undiminifhed velocity in a tube foincurvated that its axis at $E$ is at right angles to its axis at $A$, the accumulated action of the preffures, fuch as BG, taken for every point of the path, is precifely equal to the force which would produce or extinguifh the original motion.

This being the cafe, it follows moft obvioully, that if the two motions of the filaments are fuch as we have defcribed and reprefented by fig. 6 . the whole preffure in the direction of the ftream, that is, the whole preffure which Whether can be obferved on the furface, is equal to the weight of a they be column of fluid having the furface for its bafe, and twice elafic or the fall productive of the velocity for its height, pre- not. cifely as Newton deduced it from other confiderations; and it feems to make no odds whether the fluid be elaf, tic or unelaftic, if the deflections and velocities are the fame. Now it is a fact, that no difference in this refect

## RES [ 107$] \quad$ RES

Refiftance. fpect can be obferved in the actions of air and water and this had always appeared a great defect in Newton's theory : but it was only a defect of the theory attributed to him. But it is alfo true, that the obferved action is but one-half of what is juft now deduced from this improved view of the fubject. Whence anifes this difference? The reafon is this: We have given a very er roneous account of the motions of the filaments. A filament EF does not move as reprefented in fig. 6. with two rectangular inflections at $I$ and at $H$, and a path IH between them parallel to CB. The procefs of nature is more like what is reprefented in fig. 10. It is obferved, that at the anterior part of the body AB, there remains a quantity of fluid ADB , almoft, if not altogether, ftagnant, of a fingular hlape, having two curved concave fides $\mathrm{A} a \mathrm{D}, \mathrm{B} b \mathrm{D}$, along which the middle filaments glide. This fluid is very flowly changed.The late Sir Charles Knowles, an officer of the Britifh navy, equally eminent for his fcientific profeffional Knowles. knowledge and for his military talents; made many beautiful experiments for afcertaining the paths of the filaments of water. At a diftance up the fream, he
allowed fmall jets of a coloured fluid, which did not mix with water, to make part of the ftream; and the experiments were made in troughs with fides and bottom of plate-glafs. A fmall taper was placed at a confiderable heigtt above, by which the fhadows of the coloured filaments were moft ditinctly projected on a white plane held below the trough, fo that they were accurately drawn with a pencil. A few important particulars may be here mentioned.

The fill water ADC latted for a long while before it was renewed; and it feemed to be gradually walted by abrafion, by the adhefion of the furrounding water, which gradually licked away the outer parts from $D$ to $A$ and $B$; and it feemed to renew itfelf in the direction $C D$, oppofite to the motion of the ftream.

There was, however, a confiderable intricacy and eddy in this motion. Some (feemingly fuperficial) water was continually, but flowly, flowing outward from the line DC, while other water was feen within and below it, coming inwards and going backwards.

The coloured lateral filaments were moft conftant in their form, while the body was the fame, although the velocity was in fome cafes quadrupled. Any change which this produced feemed confined to the fuperficial filaments. As the filaments were deflected, they were alfo conAtipated, that is, the curved parts of the filaments were nearer each other than the parallel ttraight filaments up the ftream ; and this conftipation was more confiderable as the prow was more obtufe and the deflection greater.

The inner filaments were ultimately more deflected than thofe without them; that is, if a line be drawn touching the curve EFIH in the point $H$ of contrary flexure, where the concavity begins to be on the fide next the body, the angle HKC, contained between the axis and this tangent line, is fo much the greater as the filament is nearer the axis.

When the body expofed to the fream was a box of upright fides, flat bottom, and angular prow, like a wedge, having its edge alfo upright, the filaments were not all deflected laterally, as theory would make us expect ; but the flaments near the bottom were alfo detheeted downwards as well as laterally, and glided along
at fome ditance under the bottom, forming lines of Refinance. double curvature.

The breadth of the fream that was deflected was much greater than that of the body; and the fenfible deflection begun at a confiderable diftance up the ftream, efpecially in the outer filaments.

Laftly, the form of the curves was greatly influenced by the proportion between the width of the trough and that of the body. The curvature was always lefs when the trough was very wide in proportion to the body.

Great varieties were alfo obferved in the motion or velocity of the filaments. In general, the filaments increafed in velocity outwards from the body to a certain fmall diftance, which was nearly the fame in all cafes, and then diminifhed all the way outward. Thio was obferved by inequalities in the colour of the filaments, by which one could be obferved to outitrip another. The retardation of thofe next the body feemed to proceed from friction; and it was imagined that vithout this the velocity there would always have been greatelt.

Thefe obfervations give us confiderable information with ${ }^{43}$ refpecting the mechanifm of thefe motions, and the ac-rencesfrone tion of fluids upon folids. The preflure in the duplicate them. ratio of the velocities comes here again into view. We found, that although the velocities were very different, the curves were precifely the fame. Now the obferved preffures arife from the tranfverfe forces by which each particle of a filament is retained in its curvilineal path; and we know that the force by which a body is retained in any curve is directly as the fquare of the velocity, and inverfely as the radius of curvature. The curvature, therefore, remaining the fame, the tranfverfe forces, and confequently the preffure on the body, muft be as the fquare of the velocity: and, on the other hand, we can fee pretty clearly (indeed it is rigoroully demonftrated by D'Alembert), that whateverbe the velocities, the curves will be the fame. For it is known in hydraulics, that it requires a fourfold or ninefold preffure to produce a double or triple velocity. And as all preffures are propagated through a perfect fluid without diminution, this fourfold preffure, while it produces a double velocity, produces alfo fourfold tranfverfe preffures, which will retain the particles, moving twice as faft, in the fame curvilineal paths. And thus we fee that the impulfes, as they are called, and refiftances of fluids, have a certain relation to the weight of a column of fluid, whofe height is the height neceffary for producing the velocity. How it happens that a plane furface, immerfed in an extended fluid, fultains juit half the preffure which it would have fuftained had the motions been fuch as are fketched in figure 6 th, is a matter of more curious and difficult inveftigation. But we fee evidently that the preffure muft be lefs than what is there affigned; for the ftagnant water a-head of the body greatly diminifhes the ultimate deflections of the filaments: And it may be demonfrated, that when the part BE of the canal, fig. 9. is inclined to the part $A B$ in an angle lefs than $90^{\circ}$, the preffures $B G$ along the whole canal are as the verfed fine of the ultimate angle of deflection, or the verfed fine of the angle which the part BE makes with the part AB . Therefore, fince the defections re. femble more the fketch given in fig. 10 . the accumulated fum of all thefe forces BG of fig. 9 . mult be lefs than the fimilar fum correfonding to fig. 6. thit is, lefs than

# RES 

$\underbrace{\text { Refllauce. the weight of the column of fluid, having twice the }}$ productive height for its height. How it is jult onehalf, fhall be our next inquiry.

And here we mult return to the labours of Sir Ifaac Newton. After many beautiful obfervations on the nature and mechanifm of continued fluids, he fays, that the refiftance which they occafion is but one-half of that occafioned by the rare fluid which had been the fubject of his former propofition; "which truth," (fays he, with his ufual caution and modelty), "I fhall endeavour

46
Inveftigations of Newton. to fhow."

He then enters into another, as novel and as difficult an invettigation, viz. the laws of hydraulics, and endeavours to afcertain the motion of fluids through orifices when urged by preffures of any kind. He endeavours to afcertain the velocity with which a fluid efcapes through a horizontal orifice in the bottom of a veffel, by the action of its weight, and the preffure which this vein of fluid will exert on a little circle which occupies part of the orifice. To obtain this, he employs a kind of approximation and trial, of which it would be extremely difficult to give an extract ; and then, by increafing the diameter of the veffel and of the hole to infinity, he accommodates his reafoning to the cafe of a plane furface expofed to an indefinitely extended fream of fluid; and laftly, giving to the little circular furface the motion which he had before afcribed to the fluid, he fays, that the refiftance to a plane furface moving through an unelaftic continuous fluid, is equal to the weight of a column of the fluid whofe height is onehalf of that neceffary for acquiring the velocity; and he fays, that the refiftance of a globe is, in this cafe, the fame with that of a cylinder of the fame diameter. The refifiance, therefore, of the cylinder or circle is four times lefs, and that of the globe is twice lefs than their refiftances on a rare elaftic medium.

But this determination, though founded on principles or affumptions, which are much nearer to the real ftate of things, is liable to great objections. It depends on his method for afcertaining the velocity of the iffuing fluid; a method extremely ingenious, but defeßive. The cataract, which he fuppofes, cannot exift as he fuppofes, defcending by the full action of gravity, and furrounded by a funnel of ftagnant fluid. For, in fuch circumftances, there is nothing to balance the hydroftatical preffure of this furrounding fuid; be. caufe the whole preffure of the central catarad is employed in producing its own defcent. In the next place, the preffure which he determines is beyond all doubt only half of what is obferved on a plane furface in all our experiments. And, in the third place, it is repugnant to all our experience, that the refiftance of a globe or of a pointed body is as great as that of its circular bafe. His reafons are by no means convincing. He fuppofes them placed in a tube or canal ; and fince they are fuppofed of the fame diameter, and therefore leave equal fpaces at their fides, he concludes, that becaufe tie water efcapes by their fides with the fame velocity, they will have the fame refifance. But this is by no means a neceffary confequence. Even if the water fhould be allowed to exert equal preffures on them, the preffures being perpendicular to their furfaces, and tibefe furfaces being inclined to the axis, while in the cafe of the bafe of a cylinder it is in the direction of the axis, there mult be a difference in
the accumulated or compound preffure in the direction Refifance. of the axis. He indeed fays, that in the cafe of the cylinder or the circle obffructing the canal, a quantity of water remains ftagnant on its upper furface; viz. all the water whofe motion would not contribute to the moft ready paffage of the fluid between the cyJinder and the fides of the canal or tube; and that this water may be confidered as frozen. If this be the cafe, it is indifferent what is the form of the body that is covered with this mafs of frozen or ftagnant water. It may be a hemifphere or a cone; the refiftance will be the fame.-But Newton by no means affigns, either with precifion or with diftinct evidence, the form and magnitude of this flagnant water, fo as to give confidence in the refults. He contents himfelf with faying, that it is that water whofe motion is not neceffary or cannot contribute to the moft ealy paffage of the water.
There remains, therefore, many imperfections in this Though ${ }^{48}$ theory. But notwithitanding thefe defects, we cannot difplaying but admire the efforts and fagacity of this great phi- great fagalofopher, who, after having dificovered fo many fublime city. truths of mechanical nature, ventured to trace out a path for the folution of a problem which no perfon had yet attempted to bring within the range of mathematical inveftigation. And his folution, theugh inaccurate, fhines throughout with that inventive genius and that fertility of refource, which no man ever poffeffed in fo eminent a degree.
Thofe who have attacked the folution of Sir Ifaac Newton have not been more fuccefsful. Moft of them, inftead of principles, have given a great deal of calculns; and the chief merit which any of them can claim, is that of having deduced fome fingle propofition which happens to quadrate with fome fingle cafe of experiment, while their general theories are either inapplicable, from difficulty, and obfcurity, or are difcordant with more general obfervation.
We muft, however, except from this number Daniel Bernoulli, who was not only a great geometer, but one of the firt philofophers of the age. He poffeffed all the talents, and was free from the faults of that celebrated family; and while he was the mathematician of Europe who penetrated fartheft in the inveftigation of this great problem, he was the only perfon who felt, or at leaft who acknowledged, its great difficulty.
In the 2 d volume of the Comment. Petropol. 1727, Berne 49 he propofes a formula for the refitance of fuids, de- gencral duced from confiderations quite different from thofe on fornula which Newton founded his folution. But he delivers founded on it with modeft diffidence; becaufe he found that it gave hypotheis. a refiffance four times greater than experiment. In the fame differtation he determines the refiftance of a fphere to be one half of that of its great circle. But in his. fubfequent theory of Hydrcdynamics (a work which mult ever rank among the firt productions of the age, and is equally eminent for refined and elegant mathematics, and ingenious and original thoughts in dynamics), he calls this determination in queftion. It is indeed founded on the fame hypothetical principles which have been unfkilfully detached from the reft of Newton's phyfics, and made the ground-work of all the fubfequent theories on this fubject.

In 17.4. Mr Daniel Bernoulli publifhed another dif. fertation

R E S
Refifance. fertation (in the 8th volume of the Com. Pctropol.)

50 He treats the fubject in a particular cafe with great precifion. on the action and reliftance of fluids, limited to a very particular cafe; namely, to the impulfe of a vein of fluid falling perpendicularly on an infinitely extended plane furface. This he demonitrates to be equal to the weight of a column of the fluid whofe bafe is the area of the vein, and whofe height is twice the fall producing the velocity. This demonllration is drawn from the true principles of mechanics and the acknowledged laws of hydraulics, and may be received as a Atrict phyfical demonitration. As it is the only propolition in the whole theory that has as yet received a demonftration acceflible to readers not verfant in all the refinement of modern analyfis; and as the principles on which it proceeds will undoubtedly lead to a folution of every problem which can be propofed, once that our mathematical knowledge fhall enable us to apply them-we think it our duty to give it in this place, although we mult acknowledge, that this problem is fo very limited, that it will bardly bear an application to any cafe that differs but a little from the exprefs conditions of the pro. blem. There do occur cafes however in practice, where it may be applied to very great adiantage.

Daniel Bernoulli gives two demonfrations; one of which may be called a popular one, and the other is more fcientific and introductory to further inveftigation. We fhall give both.

Bernovlii firt determines the whole action exerted Determines the adtion exerted in the efflux of a vein of fluid. in the efflux of the vein of fluid. Suppofe the velocity of efflux $v$ is that which would be acquired by faling through the height $b$. It is well known that a body moving during the time of this fall with the velocity $v$ would defcribe a fpace $2 h$. The effect, therefore, of the hydrauiic action is, that in the time $t$ of the fall $b$, there iffues a cylinder or pritim of water whofe bafe is the crofs fection for area of the vein, and wofe length is $2 h$. And this quantity of matter is now moving with the velocity $v$. The quanaty of motion, therefc:e, which is thus produced is $2 s h v$; and this quantity of motion is produced in the time $t$. And this is the accumulated effect of all the expelling forces, eftimated in the direction of the efflux. Now, to compare this with the exertion of fime preffing power with which we are familiarly acquainted, let us fuppofe this pillar $2 s b$ to be frozen, and, being held in the hand, to be dropped. It is well known, that in the time $t$ it will fall through the height $h$, and will acquine the velocity $v$, and now poffeffes the quantity of motion $2 s b v$ and all this is the effect of its weight. The weight, therefore, of the pillar $2 s b$ produces the lame effect, and in the fame time, and (as may eafily be feen) in the fame gradual manner, with the expelling forces of the fluid in the veffel, which expelling fotces arife from the preffure of all the fluid in the veffel. Therefore the accumulated hydraulic preffure, by which a vein of a heavy fluid is forced out through an orifice in the bottom or fide of a veffel, is equal (when eft: mated in the direction of the efflux) to the weight of a column of the fluid, having for its bate the fec. tion of the vein, and twice the fall productive of the velocity of efflux for its height.
Plate acecxuxvi

Now let ABDC (fig. II.) be a quadrangular veffel with upright plane fides, in one of which is an orifice EF. From every point of the circumference of this

109 ]

## R E S

orifice, fuppofe horizontal lines Ee, Ff, scc. which uillReffance mark a fimilar furface on the oppofite fide of the vefiel. Suppofe the orifice EF to be thut. There can be no doubt but that the furfaces EF and ef will be equally preffed in oppofite directions. Now open the orifce EF; the water will rufh out, and the preffure on EF is now removed. There will therefore be a tendency in the veffel to move back in the direction Ee. And this tendency muft be precifely equal and oppofite to the whole effort of the expeling forces. This is a conclufion as evident as any propofition in mechanics. It is thus that a gun recoils and a rocket rifes in the air ; and on this is founded the operation of Mr Parents or Dr Barker's mill, defcribed in all treatifes of mechanics, and molt learnedly treated by Euler in the Berlin Memoirs.

Now, let this ftream of water be received on a circular plane MiJ, perpendicular to its axis, and let this circular plane be of fuch extent, that the vein efcapes from its fides in an infinitely thin fheet, the water flowing off in a direction parallel to the plane. The vein by this means will expand into a trumpet-like fhape, having curved fides, EKG, FLH. We abftract at prefent the action of grayity, which would caufe the vein to bend downwards, and occalion a greater velocity at $H$ than at $G$; and we fuppofe the velocity equal in every point of the circumierence. It is plain, that if the action of gravity be neglected after the water has iflued through the orifice EF, the velocity in every point of the circumference of the plane MN will be that of the eflux through EF.

Now, becaufe EKG is the natural fhape affumed by the vein, it is plain, that if the whole vein were co. vered by a tube or mouth piece, fitted to its thape, and perfect:y poilifed, fo that the water fhall ylide along it, without any friftion (a thing which we may always. fuppore), the water vill exert no preffure whatever on this trumper mouth picce. Lafly, let us fuppofe that the plane MN is attached to the mouth-piece by fome bits of wire, fo as to allow the water to efcape all round by the narrow chink between the mouth-piece and the plane: We have now a veffel confifing of the upright part ABDO, the trumpet GKEFLH, and the plane MN ; and the water is efcaping from every point of the circumference of the chink GHNM with the velocity v. If any part of this chink were fhut up, there would be a preffure on that part equivalent to the force of efflux from the oppofite part. Therefore, when all is open, thefe efforts of eflitiz balance each other all round. There is not therefore any tendency in this compound veffel to move to any fide. But take away the plane MN, and there wculd immediately arife a preffure in the direction $\mathrm{E} e$ equal to the weight of the column $2 s h$. This is therefore balanced by the preffure on the circular plane LIN, which is therefore equal to this weight, and the propofition is demonftrated.

A number of experiments were made by Profeffor Krait at ist Peterburg, by receiving the vein on a plane MN (fig. ir.) which was fatened to the arm of a balance OPQ, having a fcale $R$ hanging on the oppofite arm. The refiftance or preffure on the plane was meafured by wights put into the fale R ; and the velocityof the jet was meafured by means of the diftance $\mathrm{KH}_{n}$ to which it fouted on a horizontal plane.

## RES

Refitanor.
54
Difference between this theory and exper: ments accounted for.

The refults of thefe experiments were as conformable to the theory as could be wilhed. The refiftance was always a little lefs than what the theory required, but greatly exceeded its half; the refult of the general received theories. This defect fhould be expected; for the demonftration fuppofes the plane MN to be infinitely extended, fo that the film of water which iffues through the chink may be accurately parallel to the plane. This never can be completely effected. Alfo it was fuppofed, that the velocity was juftly meafured by the amplitude of the parabola EGK. But it is well known that the very putting the plane MN in the way of the jet, though at the diftance of an inch from the orifice, will diminifh the velocity of the efflux through this orifice. This is eafily verified by experiment. Obferve the time in which the veffel will be emptied when there is no plane in the way. Repeat the experiment with the plane in its place; and more time will be neceffary. The following is a note of a courfe of experiments, taken as they ftand, without any felection.

In orderto demonitrate this propofition in fuchamanner as to furnifh the means of inveftigating the whole mechanifm and action of moving fluids, it is neceffary to premife an elementary theorem of curvilineal motions.

If a particle of matter defcribes a curve line $A B C E$
Plate ececxuxvi.
(fig. 13.) by the continual action of deflecting forces, which vary in any manner, both with refpect to intenfity and direction, and if the action of thefe forces, in every point of the curve, be refolved into two directions, perpendicular and parallel to the initial direction AK; then,
I. The accumulated effect of the deflecting forces, eftimated in a direction AD perpendicular to AK, is to the final quantity of motion as the fine of the final change of direction is to radius.

Let us firf fuppofe that the accelerating forces act by ftarts, at equal intervals of time, when the body is in the points $A, B, C, E$. And let $A N$ be the deflecting force, which, acting at $A$, changes the original direction $A K$ to $A B$. Produce $A B$ till $B H=$ AB , and complete the parallelogram BFCH. Then FB is the force which, by acting at B , changed the motion BH (the continuation of AB ) to BC. In like manner make $C b$ (in $B C$ produced) equal to $B C$, and complete the parallelogram $\mathrm{C} f \mathrm{E} b . \mathrm{C} f$ is the deflecting force at C, \&c. Draw BO parallel to $A N$, and GBK perpendicular to $A K$. Alfo draw lines through C and E perpendicular to AK , and draw through B and C lines parallel to AK. Draw allo HL, bi perpendicular, and FG, HI, $b i$, parallel to AK.

It is plain that $B K$ is $B O$ or $A N$ eftimated in the direction perpendicular to $A K$, and that $B G$ is $B F$ eftimated in the fame way. And fince $B H=A B, H L$ or IM is equal to B K . Alfo CI is equal to BG . Therefore CM is equal to $A P+B G$. By fimilar reafoning it appears that $\mathrm{Em}=\mathrm{E} i+b l,=\mathrm{C} g+\mathrm{CM},=$ $\mathrm{C} g+\mathrm{B},+\mathrm{AP}$.

Therefore ii CE be taken for the meafure of the final vel city or quantity of motion, Em will be the accumulated effect of the deflecting forces eftimated in the dirction AD perpendicular to AK . But $\mathrm{E} m$ is
to CE as the fine of $m \mathrm{CE}$ is to radius; and the angle Refiftatice. $m \mathrm{CE}$ is the angle contained between the initial and final directions, becaufe $\mathrm{C}_{m}$ is parallel to AK. Now let the intervals of time diminifh continually and the frequency of the impulies increafe. The deflection becomes ultimately continuous, and the motion curvilineal, and the propofition is demonfrated.

We fee that the initial velocity and its fublequent changes do not affect the conclufion, which depends entirely on the final quantity of motion.
2. The accumulated effect of the accelerating forces; when eftimated in the direction AK of the original motion, or in the oppofite direction, is equal to the difference between the initial quantity of motion and the product of the final quantity of motion by the cofine of the change of direction.

$$
\begin{aligned}
\text { For } \mathrm{C} m & =\mathrm{C} l-m l, \\
\mathrm{BM} & =\mathrm{BL}-\mathrm{BL}-\mathrm{ML}, \\
\mathrm{AK} & =\mathrm{AO}-\mathrm{AK} \\
\mathrm{AK}, & =\mathrm{AO}-\mathrm{PN} .
\end{aligned}
$$

Therefore $\mathrm{PN}+\mathrm{FG}+f \mathrm{Q}$ (the accumulated impulfe in the direstion $O A=A O-C M,=A O-C \overline{E \times c}=$ fine of ECM.

Cor. 1. The fame action, in the direction oppofite to that of the original motion, is neceffary for caufing a body to move at right angles to its former direction as for fropping its motion. For in this cafe, the cofine of the change of direction is $=0$, and $A O-C E$ $x$ cofine $\mathrm{ECM}=\mathrm{AO}-\mathrm{O}, \mathrm{AO},=$ the original motion.

Cor. 2. If the initial and final velocities are the fame, the accumulated action of the accelerating forces, eftimated in the drection OA, is equal to the product of the original quantity of motion by the verfed fine of the change of direction.

The application of thefe theorems, particularly the fecond, to our prefent purpofe is very obvious. All the filaments of the jet were originally moving in the direction of its axis, and they are finally moving along the refifting plane, or perpendicular to their former motion. Therefore their tranfverfe forces in the direction of the axis are (in cumulo) equal to to the force which would ftop the motion. For the aggregate of the fimultaneous forces of every particle in the whole filament is the fame with that of the fucceffive forces of one particle, as it arrives at different points of its curvilineal path. All the tranfverfe forces, eftimated in a direction perpendicular to the axis of the vein, precifely balance and fuftain each other; and the only forces which can pro. duce a fenfible effect are thofe in a direction parallel to the axis. By thefe all the inner filaments are preffed towards the plane MN, and muft be withtood by it. It is highly probable, nay certain, that there is a quantity of ftagnant water in the middle of the vein which fuftains the preffures of the moving filaments without it, and tranfmits it to the folid plane. But this does nut alter the cafe. And, fortunately, it is of no confequence what changes happen in the velocities of the particles while each is defcribing its own curve. And it is from this circumftance, peculiar to this particular cafe i,f per. pendicular impulfe, that we are able to draw the conclufion. It is by no means difficult to demonftrate that the velocity of the external furface of this jet is conftant, and indeed of every jet which is not acted on by external forces after it has quitted the orifice: but this difcuffion is quite unneceffary here. It is however exn tremely difficult to afcertain, even in this moft fimple

## R E S

Refifance. cafe, what is the velocity of the internal filaments in $\underbrace{}_{\text {the differen! points of their progrefs. }}$

Such is the demonftration which Mr Bernoulli has given of this propofition. Limited as it is, it is highly valuable, becaule derived from the true principles of hydraulics.

He hoped to render it more extenfive and applicable to oblique impulfes, when the awis AC of the vein (fig. I 3. n ${ }^{\circ}$ 2.) is inclined to the plane in an angle ACN. But here all the fimplicity of the cafe is gone, and we are now obliged to afcertain the motion of each filament. It might not perhaps be impotible to determine what muft happen in the plane of the figure, that is, in a plane paffing through the axis of the vein, and perpendicular to the plane MN. But even in this cafe it would be extremely difficult to determine how
much of the fluid will go in the direction EKG, and what will go in the path FLH, and to afcertain the form of each filament, and the velocity in its different prints. But in the reil itate of the cafe. the water will diflipate from the centre C on every fide; and we cannot tell in what proportions. Let us however confider a little what happens in the plane of the figure, and fuppofe that all the water goes either in the courfe EKG, or in the courfe FLH. Let the quantities of water which take thefe two courfes have the proportions of $p$ and $\Pi$. Let $\sqrt{2 a}$ be the velocity at $A$, $\sqrt{2 \bar{b}}$ be the velocity at $G$, and $\sqrt{2 \beta}$ be the velocity at H. ACG and ACH are the two changes of direation, of which let $c$ and $-c$ be the cotines. Then, adopting the former reafoning, we have the preffure of the watery plate GKEACM on the plane in the direstion $A C=\frac{p}{p+11} \overline{\times 2 a-2 c b}$, and the preffure of the plate HLFACN $=\frac{\pi}{p+n} \times \overline{2 a+2 c \beta}$, and their fum $=\frac{p \times \overline{2 a-2 c b}+\Pi \times \overline{2 a+2 c \beta}}{p+\Pi}$; which being multiplied by the fine of ACM or $\sqrt{1-c^{2}}$, gives the preflure perpendicular to the plane MN $=\frac{x^{2 a-2} c b+\pi \times 2 a}{p+\pi}$

$$
\overline{ \pm 2 c \bar{B}} \sqrt{1-c^{2}} .
$$

But there remains a preffure in the direction perpendicular to the axis of the vein, which is not balanced, as in the former cafe, by the equality on oppofite fides of the axis. The preflare arifing from the water which efcapes at $G$ has an effect oppofite to that produced by the water which efcapes at H. When this is taken into account, we fhall find that their joint efforts perpendicular to ACare $\frac{p-11}{p+\pi} \times 2 a \sqrt{1-c^{2}}$, which, being multiplied by the cofine of $A C M$, gives the action perpendicular to $M N=\frac{p-\pi}{p+\pi} \times z a c \sqrt{1-c^{2}}$.
The fum or joint effort of all thefe preffures is $\frac{p \times \overline{2 a-2 c b}+\pi \times \overline{2 a+2 c \beta}}{p+\Pi} \sqrt{1-c^{2}}+\frac{p-\Pi}{p+\pi} \times 2 a c \sqrt{1-c^{2}}$.

Thus, from this cafe, which is much fimpler than can happen in nature, feeing that there will always be a lateral eflux, the determination of the impulfe is as uncertain and vague as it was fure and precife in the former cafe.

## III] RES

It is therefore without proper authority that the Reffance, abfolute impulfe of a vein of fluid on a plane which receives it wholly, is afferted to be proportional to the fine of incidence. If indeed we fuppofe the velocity in $G$ and $H$ are equal to that at $A$, then $b=\beta,=a$, and the whole impulfe is $2 a \sqrt{1-c^{2}}$, as is commonly fuppofed. But this cannot be. Both the velocity and quantity at H are lefs than thofe at G . Nay, frequently there is no eflux on the fide H when the obliquity is very great. We may conclude in general, that the oblique impulfe will always bear to the direct impulfe a greater proportion than that of the fine of incidence to radius. If the whole water efcapes at G, and none goes off laterally, the preflure will be $\overline{2 a+2 a c-2 b c x}$ $\sqrt{1-c^{2}}$. The experiments of the Abbe Boffut fhow in the plaineft manner that the preflure of a vein, friking obliquely on a plane which receives it wholly, diminifhes fafter than in the ratio of the fquare of the fine of incidence; whereas, when the oblique plane is wholly immeried in the ffream, the impulfe is much greater than in this proportion, and in great obliquities is nearly as the fine.

Nor will this propofition determine the impulfe of a fluid on a plane wholly immerfed in it, even when the impulfe is perpendicular to the plane. The circumftance is now wanting on which we can eftablifh a calculation, namely, the angle of final deflection. Could this be afcertained for each filament, and the velocity of the filament, the principles are completely adequate to an accurate folution of the problem. In the experiments which we mentioned to have been made under the infpection of Sir Charles Knowles, a cylinder of fix inches diameter was expofed to the action of a ftream moving precifely one foot per fecond; and when certain deductions were made for the water which was held adhering to the pofterior bafe (as will be noticed afterwards), the impulfe was found equal to $3 \frac{\text { ª }}{8}$ ounces avoirdupois. There were 36 coloured filaments diftributed on the ftream, in fuch fituations as to give the mof uffeful indications of their curvature. It was found neceffary to have fome which paffed under the body and fome above it ; for the form of thefe filaments, at the fame diftance from the axis of the cylinder, was confiderably different : and thofe filaments which were fituated in planes neither horizontal nor vertical took a double curvature. In fhort, the curves were all traced with great eare, and the deflecting forces were computed for each, and reduced to the direction of the axis; and they were fummed up in fuch a manner as to give the impulfe of the whole ftream. The deflections were marked as far a-head of the cylinder as they conld be affuredly obferved. By this method the impulfe was computed to be $\frac{255}{15}$ ounces, differing from obfervation $\frac{3}{x}$ 3 of an nunce, or about $\frac{1}{T} \sigma$ of the whole; a difference which may mof reafonably be afcribed to the adhefion of the water, which mult be mof fenfible in fuch fmall velocities. Thefe experiments may therefore be confidered as giving all the confirmation thit can be defired of the jultnefs of the principles. This indeed hardly admits of a doubt: but, alas! it gives us but fmall affilance; for all this is empirical, in as far as it leaves us in every cafe the tafk of obferving the form of the curves and the velocities in their different points. To derive fervice from this mof judicious method of Daniel Bersoculli, we murdifocver time method of determining
a priori,

## R E S <br> R E S

$\underbrace{P_{c} \text { ifarce e afrisi, what will be the motion of the fluid whofe }}$ courle is obtrusted by a body of any form. And here we cannot omit taking notice of the cafual obfervation of Sir Iface Newton when attempting to determine the refiftance of the plane furface or cylinder, or fphere expofed to a flream moving in a canal. He fays that the form of the refinting furface is of lefs confequence, becaure there is always a quantity of water ftagnant upon it, and which may therefore be confidered as frozen ; and he therefore confiders that water only whofe motion is neceffary for the moft expeditious dicharge of the water in the veffel. He endeavours to difriminate that water from the reft; and alchough it muft be acknowledged that the principle which he affumes for this purpofe is very gratuitous, becaufe it only fhows that if certain portions of the wa$t e r$, which he determines very ingeniouly, were really frozen, the reft will iffue as he fays, and will exert the preffure which he affigns; fill we mult. admire his fertility of sefource, and his fagacity in thus forfeeing what fubfequent obfervation has completely confirmed. We are even difpofed to think, that in this cafual obfervation Sir Ifaac Newton has pointed out the only method of arriving at a folution of the problem; and that if we could difcover what motions are not neceffary for the moft expeditious pafage af the rwater, and could thus determine the form and magnitude of the fagnant water which adheres to the body, we fhould much more eafily afcertain the real motions which occafion the obferved refiftance. We are here difpofed to have recourfe to the economy of nature, the improper ufe of which we have fometimes taken the liberty of reprehending. Mr Manpertius publifhed as a great difcovery his principle of fmalleft action, where he fhowed that in all the mutual actions of bodies, the quantity of action was a minimum; and he applied this to the folution of many difficult problems with great fuccefs, imagining that he was really reafoning from a contingent law of nature, felected by its infinitely wife Author, viz. that in all occafions there is the fmalleft poffible exertion of natural powers. Mr.D'Alembert has, however, fhown (vid. Encyclopedié Frangoife, Action) that this was but a whim, and that the minimum obferved by Maupertius is merely a minimum of calculus, peculiar to a formula which happens to exprefs a combination of mathematical quantities which frequently occurs in our way of confidering the phenomena of nature, but which is no natural meafure of action.
A nuethod But the chevalier D'Arcy has fhown, that in the recommens trains of natural operations which terminate in the proded for oh- duction of motion in a particular disection, the intermetaining a general theory.
the velocity for its height, and the fmall excefs is mof Refifance. probably owing to adhefion, and the meafure of the real refiftance is probably precifely this weight. The velocity of a focuting fluid was found, in tact, to be that acquired by falling from the furface of the fluid; and it was by looking at this, as at a pole ftar, that Newton, Bernoulli, and others, have with great fagacity and ingenuity difcovered much of the laws of hydraulics, by fearching for principles which would give this refult. We may hope for fimilar fuccefs.

In the mean time, we may receive this as a phyfical truth, that the perpendicular impulfe or refiftance of a plane furface, wholly immerfed in the fluid, is equal to the weight of the column having the ferface for its bafe, and the fall producing the velocity for its height.

This is the medium refult of all experiments made in thefe precife circumitances. And it is confirmed by a fet of experiments of a kind wholly different, and which feem to point it out more certainly as an immediate confequence of hydraulic principles.

If Mr Pitot's tube be expofed to a flream of fluid Exper:iffuing from a refervoir or veffel, as reprefented in ment by fig. 14. with the open mouth I printed directly againft Mr Pitot's the flream, the fluid is obferved to fland at $K$ in the tube. upright tube, precifely on a level with the fuid $A B$ in ccccaxavv. the refervoir. Here is a moft unexceptionable experiment, in which the impulfe of the ftream is actually oppofed to the hydroftatical preffure of the fluid on the tube. Preffure is in this cafe oppofed to preffure, becaufe the iffuing fluid is deflected by what flays in the mouth of the tube, in the fame way in which it would be deflected by a firm furface. We fhall have occafion by and by to mention fome mot valuable and inftructive experiments made with this tube.

57
It was this which fuggefted to the great mathema-Eu'er's tician Euler another theory of the impulfe and refit- theory. ance of fluids, which muft not be omitted, as it is applied in his elaborate performance On the Theory of the Conftruction and working of Ships, in two volumes 4 to, which was afterwards abridged and ufed as a text-book in fome marine academies. . He fuppofes a fream of fluid ABCD (fig. 15.), moving with any velocity, to ftrike the plane BD perpendicularly, and that part of it goes through a hole EF, forming a jet EGHF. Mr Euler fays, that the velocity of this jet. will be the fame with the velocity of the ftream. Now compare this with an equal ftream iffuing from a hole in the fide of a veffel with the fame velocity. The one Atream is urged out by the preffure occafioned by the impulfe of the fluid; the other is urged out by the. preflure of gravity. The effects are equal, and the modifying circumftances are the fame. The caufes are therefore equal, and the preffure occafioned by the impulfe of a fream of fluid, moving with any velocity, is equal to the weight of a column of fluid whole height is productive of this velocity, \&c. He then determizes the oblique impulfe by the refolution of motion, and deduces the common rules of refiftance, \&c.

But all this is without juit grounds. This gentleman was always fatisfied with the flightef analogies which would give him an opportunity of exhibiting his great dexterity in algebraic analy fis, and was not afterwards ftartled by any difcordancy with obfervation. Analyf: magis fidendum is a frequent affertion. with him.

Though

Refiftance.

Though he wrote a large volume, contaiaing a theory of light and colours totally oppofite to Newton's he has publithed many differtations on optical phenomena on the Newtonian principles, exprefsly becaufe his own principles non ideo facile anfam probebat analy $\sqrt{2}$ iuftru-

Not a fhadow of argument is given for the leading principle in this theory, viz. that the velocity of the jet
is the fame with the velocity of the flream. None can be given, but faying that the preffure is equivalent to its production; and this is affuming the very thing he labours to prove. The matter of fact is, that the velocity of the jet is greater than that of the ftream, and may be greater almot in any proportion. Which curions circumftance was difcovered and ingenioufly explained long ago by Daniel Bernoulli in his Hydrodynamica. It is evident that the velocity mult be greater. Were a fream of fand to come againft the plane, what goes through would indeed preterve its velocity unchanged: but when a real fluid frikes the plane, all that does not pafs through is deflected on all fides; and by thefe deflections forces are excited, by which the filaments which furround the cylinder immediately fronting the hole are made to prefs this cylinder on all fides, and as it were fqueeze it between them: and thus the particles at the hole mult of neceffity be accelerated, and the velocity of the jet mult be greater than that of the ftream. We are difpofed to think that, in a fluid perfectly incompreffible, the velocity will be doubled, or at leaft increafed in the proportion of I to $\sqrt{\overline{2}}$. If the fluid is in the fmalleft degree compreffible, even in the very fmall degree that water is, the velocity at the firft impulfe may be much greater. D. Bernoulli found that a column of water moving 5 feet per fecond, in a tube fome hundred feet long, produced a velocity of ${ }_{136}$ feet per fecontl, in the firt moment.

There being this radical defect in the theory of Mr Euler, it is needlefs to take notice of its total infuticiency for explaining oblique impulfes and the refiftance of curvilineal prows.
Ingenious We are extremely forry that our readers are deriving folution of fo little advantage from all that we have faid ; and that d'Alem- having taken then by the hand, we are thus obliged to

II3 ]
R E S
fuch motion will produce an inequanity of penture, Refinorce. which will determine the fucceeding motions. He there. fore endeavoured to reduce all to the difcovery of thofe diturbing preflures, and thus to the laws of hydroftatics. He had long before this hit on a very refined and ingenious view of the action of bodies on each other, which had enabled him to folve many of the muf difficult problems concerning the motions of bodies, fucl: as the centre of ofcillation, of fpontaneous converfion, the precefion of the equinoxes, 8 cc . \&c, with great $\mathrm{f}_{\mathrm{d}}$ cility and elegance. He faw that the fame principle would apply to the action of fluid bodies. The principle is this.
"In whiatever matacr any number of bolies are fuppofed to act o:z each other, and by thefe actions come to change thair prefent motions, if we conceive that the motion wbicis each body rould bave in the following infant (if it lesare free), is refolved into two other motions; one of which is the motion wobich it really takes in the following inftant; the other wuill be fuch, that if eack body bad no other motion but this fecond, th: wobole bidies would have remained in equilibrio." We here obferve, that "the motion which each body would have in the following inftant, if it became free," is a continuation of the motion which it has in the firft inftant. If may therefore perhaps be better expreffed thus:

If the motions of bodies, anybow acting on cach other, be confidered in two confecutive inftants, and if we conceive the motion which it has in the firft inflant as compounded of two others, one of which is the motion which it actually takes in the fecond inflant, the other is fuch, that if each body bad only thofe fecond motions, the whole fytem would bave renuained in equilibrio.

The propofition itfelf is evident. For if thefe fecond motions be not fuch as that an equilibrium of the whole fyftem would refult from them, the other component motions would not be thofe which the bodies really have after the change; for they would neceffarily be altered by thefe unbalanced motions. See D'Alembert Efui de Dy'namique.

Affifted by this inconteftible principle, Mr d'Alembert demonftrates, in a manner equally new and fimple, thofe propofitions which Newton had fo cautioufly deduced from his hypothetical fluid, flowing that they were not limited to this hypothefis, viz. that the motions produced by fimilar bodies, fimilarly projected in them, would be fimilar; that whatever were the preffures, the curves defcribed by the particles would be the fame; and that the refiftances would be proportional to the fquares of the velocities. He then comes to confider the fluid as having ite motions conltrained by the
form of the cand or by folid obtacles interpofed.

We flall here give a fummary account of his fundamental propofition.
It is evident, that if the body ADCE (fig. 16.) did his funda not form an obfruction to the motion of the water, the particles would defcribe parallel lines TF, OK, PS, \&c. propofiBut while yet at a ditance from the luat while yet at a diftance from the body in $\mathrm{F}, \mathrm{K}, \mathrm{S}$, Plate they gradually change their directions, and defcribe the ccccx\&xy. curves $\mathrm{FM}, \mathrm{K} m, \mathrm{~S} n$, fo much more incurvated as they are nearer to the body. At a certain diftance $Z Y$ this curvature will be infenfibie, and the fluid included in the fpace ZYHQ will move uniformly as if the folid body were not there. The motions on the other fide of the axis AC will bs the fame; and we need only

his funda mental the confequences, but the caufes, of thefe curvilineal motions. No internal motion can happen in a fluid but in confequence of an unbalanced preffure; and every Vol, XVI.

## RES

Refiftance. attend to one half, and we fhall confider thefe as in a fate of permanency.

No body changes either its direction or velocity otherwife than by infenfible degrees: therefore the particle which is moving in the axis will not reach the vertex A of the body, where it behoved to deflect inftantaneoully at right angles. It will therefore begin to be deflected at fome point $F$ a-head of the body, and will deforbe a curve FM, touching the axis in $F$, and the body in M ; and then, gliding along the body, will quit it at fome point $L$, defcribing a tangent curve, which will join the axis again (touching it) in $R$; and thus there will be a quantity of flagnant water FAM before or a-hecid of the body, and another LCR behind or aftern of it.

Let $a$ be the velocity of a particle of the fluid in any intant, and $a^{\prime}$ its velocity in the next inttant. The velocity $a$ may be confidered as compounded of $a^{\prime}$ and $a^{\prime \prime}$. If the particles tended to move with the velocities $a^{\prime \prime}$ only, the whole fluid would be in equilibrio (general principle), and the preffure of the fluid would be the fame as if all were flagnant, and each particle were urged by a force $\frac{a^{\prime \prime}}{t^{\prime}}, t$. expreffing an indefinitely fmall moment of time. (N.B. $\frac{a^{\prime \prime}}{t^{\prime}}$ is the proper expreffion of the accelerating force, which, by acting during the moment $t$, would generate the velocity $a^{\prime \prime}$; and $a^{\prime \prime}$ is fuppofed an indeterminate quantity, different perhaps for each particle). Now let a be fuppofed conftant, or $a=a^{\prime}$. In this cafe $a^{\prime \prime}=0$. That is to fay, no preffure whatever will be exerted on the folid body unlefs there happen changes in the velocities or directions of the particles.

Let $a$ and $a^{\prime}$ then be the motions of the particles in two confecutive inftants. They would be in equilibrio if urged only by the forces $\frac{a^{\prime \prime}}{t^{\prime}}$. Therefore if $\gamma$ be the point where the particles which defcribe the curve FM begin to change their velocity, the preffure in D would be equal to the preffure which the fluid contained in the canal $\gamma$ FMD would exert, if each particle were folicited by its force $\frac{a^{\prime \prime}}{t}$. The quetion is therefore reduced to the finding the curvature in the canal $\gamma \mathrm{FMD}$, and the accelerating forces $\frac{a^{\prime \prime}}{t^{\prime}}$ in its different parts.

It appears, in the firft place, that no preffure is exerted by any of the particles along the curve FM: for fuppofe that the particle a (fig. 17.) defcribes the indefinitely fmall fraight line $a b$ in the firf inftant, and $b c$ in the fecond inftant ; produce $a b$ till $b d=a b_{2}$ and joining $d c$, the motion $a b$ or $b d$ may be confidered as compofed of $b c$, which the particle really takes in the next inftant, and a motion $d c$ which fhould be deftroyed. Draw $b i$ parallel to $d c$, and $i e$ perpendicular to $b c$. It is plain that the particle $b$, folicited by the forces $b_{e} e, i$ (equivalent to $d c$ ) hould be in equilibrio. This being eftablifhed, $b e$ muft be $=0$, that is, there will be no accelerating or retarding force at $b$; for if there be, draw $b m$ (fig. 18.) perpendicular to $b \mathrm{~F}$, and the parallel $n q$ infinitely near it. The part $b n$ of the fluid sontained in the canal $b n q m$ would fuftain fome pref-
fure from $b$ towards $n$, or from $n$ towards $b$. Therefore Refinance; fince the fluid in this flagnant canal fhould be in equilibrio, there mult alfo be fome action, at leatt in one of the parts $b m, m q, q n$, to counterbalance the action on the part $b n$. But the fluid is ftagnant in the fpace FAM (in confequence of the law of continuity). Therefore there is no force which can act on $b m, m q$, $q n$; and the preffure in the canal in the direction $b n$ or $n b$ is nothing, or the force $b e=0$, and the force $i e$ is perpendicular to the canal; and there is therefore no preflure in the canal FM, except what prozeeds from the part ${ }_{2} \mathrm{~F}$, or from the force $e i$; which $l_{\mathrm{a}}$ t being perpendicular to the canal, there can be no force exerted on the point $M$, but what is propagated from the part $\gamma F$.

The velocity therefore in the canal FM is conftant if finite, or infinitely fmall if variable: for, in the firit cafe, the force $b e$ would be abfolutely nothing; and in the fecond cafe, it would be an infinitefimal of the fecond order, and may be confidered as nothing in comparifon with the velocity, which $i=$ of the firft order. We fhall fee by and by that the laft is the real ftate of the cafe. Therefore the fluid, before it begins to change its direction in $F$, begins to change its velocity in fome point $\gamma$ a-head of $F$, and by the time that it reaches F its velocity is as it were annihilated.

Cor. 1. Therefore the preffure in any point D arifes both from the retardations in the part $\gamma F$, and from the particles which are in the canal MD: as thefe laft move along the furface of the body, the force $\frac{a^{\prime \prime}}{t}$, defroyed in every particle, is compounded of two others, one in the direction of the furface, and the other perpendicular to it ; call thefe $p$ and $p^{\prime}$. The point D is preffed perpendicularly to the furface MD ; Ift, by all the forces $p$ in the curve MD; 2d, by the force $p^{\prime}$ acting on the fingle point $D$. This may be neglected in comparifon of the indefinite number of the others: therefore taking in the arch MD , an infinitely fmall portion $\mathrm{N} m,=\dot{s}$, the preffure on $D$, perpendicular tothe furface of the body, will be $=f_{p} \dot{s}$; and this fluent muft be fo taken as to $\mathrm{be}=0$ in the point M .

Cor. 2. Therefore, to find the preffure on D , we mult find the force $p$ on any point N . Let $u$ be the velocity of the particle N , in the direction $\mathrm{N} m$ in any inftant, and $u+\dot{u}$ its velocity in the following inftant; we mult have $p=\frac{-u}{t^{\cdot}}$. Therefore the whole queftion is reduced to finding the velocity $u$ in every point N , in the direction $\mathrm{N} m$.

And this is the aim of a feries of propofitions which follow, in which the author difplays the moft accurate and precife conception of the fubject, and reat addreis truay folv and elegance in his mathematical analyfis. He at length the probrings out an equation which expreffes the preffure on the body in the moft general and unexceptionable manner. We cannot give an abftract, becaufe the train of reafoning is already concife in the extreme: nor can we even exhibit the final equation; for it is conceived in the moft refined and abftrufe form of indeterminate functions, in order to embrace every poffible circumfance. But we can affure our readers, that it truly expreffes the folution of the problem. But, alas! it is of

His final equation the pro-
blem; Eut

## RES [115] RES

63
From the imperfect ftate of mathematics it is aiclefy.
that even $\mathrm{Mr} \mathrm{d}^{\mathrm{A}}$ Alembert has not been able to exemplify the application of the equation to the fimpleft cafe which can be propofed, fuch as the direct impulfe on a plane furface wholly immerfed in the fluid. All that he is enabled to do, is to apply it (by fome modifications and fublitutions which take it out of its ftate of extreme generality) to the direct impulfe of a vein of fluid on a plane which deflects it wholly, and thus to Thov its conformity to the folution given by Daniel Bernoulli, and to obfervation and experience. He fhows, that this impulfe (independent of the deficiency arifing from the plane's not being of infinite extent) is fomewhat lefs than the weight of a column whofe bafe is, the fection of the vein, and whofe height is twice the fall neceffary for communicating the velocity. This great philofopher and ge:metcr comcludes by faying, that he does not believe that any method can be found for folving this problem that is more direct and fimple; and imagines, that if the deductions from it fhall be found not to agree with experiment, we mult give up all hopes of determining the refiftance of fluids by theory and analytical calculus. He fays analytical calculus; for all the phyfical principles on which the calculus proceeds are rigoroufly demonltrated, and will not admit of a doubt. There i ouly one hyfothefis introduced in his inveltigation, and this is not a phyfical hypothefis, but a hypothefis of calculation. It is, that the quantities which determine the ratios of the fecond fluxions of the velocities, eftimated in the directions parallel and perpendicular to the axis AC (fig. 16.) are functions of the abfciffa AP, and ordinate PM of the curve. Any perfon, in the leaft acquanted with mathematical analyfis, will fee, that without this fuppofition no analyfis or calculus whatever can be inftituted. But let us fee what is the phyfical meaning of this hypothefis. It is fimply this, that the motion of the particle $M$ depends on its fituation only. It appears impoffible to form any other opinion; and if we could form fuch an opinion, it is as clear as day-light that the cafe is defperate, and that we muft renounce all hopes.

We are forry to bring our labours to this conclufion;

## fimple

 cafes;but we are of opinion, that the only thing that remains is, for mathematicians to attach themfelves with firmnefs and vigour to fome fimple cafes; ard, without aiming at generality, to apply Mr d'Alenbert's or Bernoulli's mode of procedure to the particular circumfances of the cafie. It is not improbable but that, in the folutions which may be obtained of thefe particular cafes, circumftances may occur which are of a more general nature. Thefe will be fo many laws of hydraulics to be added to our prefent very fanty ftock; and thefe may have points of refemblance, which will give birth to laws of ftill greater generality. And we repeit our expreffion of hopes of tome fuccefs, by endeavouring to determine, in fome fimple cafes, the minimum poffibile of motion. The attempts of the Jefuit commentators on the Principia to afcertain this on the Newtonian hypothelis do them honour, and have really piven us great amfifance in the particular cafe which came
64 through their hands.
And multi- And we fhould mu'tip'y experiments on the refiftply experi- ance of bodies. Thofe of the French academy are unments.
pealed to. But there are circumftances in thofe experi. Renfarier. ments which render them more complicated than is proper for a general theory, and which therefore limit the conclufions which we wifh to draw from them. The bodies were floating on the furface. This greatly mierdifies the deflections of the filaments of water, caufing fome to deflect laterally, which would otherwife have remained in one vertical plane; and this circumfance alfo neceffarily produced what the academicians called the remou, or accumulation on the anterior part of the body, and depreffion behindit. This produced an additional refiftance, which was meafured with great difficulty and uncertainty. The effect of adhefion mult alfo have been very confiderable, and very different in the different cafes; and it is of difficult calculation. It cannot perhaps be totally removed in any experiment, and it is neceffary to confider it as making part of the refifance in the mof important practical cafes, viz. the motion of hips. Here we fee that its effect is very great. Every feamen knows that the fpeed, even of a copper-fheathed hip, is greatly increafed by greafing her bottom. The difference is too remarkabie to admit of a doubt: nor fhould we be furprifed at this, when we attend to the dimirution of the motion of water in long pipes. A fmooth pipe four and an half inches diameter, and 500 yards long, yields but one-fifth of the quantity which it ought to do independent of frictior. But adhefion does a great deal which cannot be compared with friction. We fee that water flowing thro' a hole in a thin plate will be increafed in quantity fully one-third, by adding a little tube whofe length is about twice the diameter of the hole. The adhefion therefore will greatly modify the action of the filaments both on the folid body and on each other, and will change both the forms of the curves and the velocities in different points; and this is a fort of objection to the only hypothefis introduced by d'Alembert. Yet it is only a fort of objection; for the effect of this adhefion, too, muft undoubtedly depend on the fituation of the particle.
The form of thefe experiments of the academy is ill. fuited to the examination of the refifance of bodies, wholly immerfed in the fluid. The form of expe riment adopted by Robins for the reffitance of air and afterwards by the Chevalier Borda for water, is free from thefe inconveniences, and is furceptible of rable accuequal accuracy. The great advantage of both is the racy. exact knowledge which they give us of the velocity of the motion ; a circumftance effentially neceffary, and but imperfecily known in the experiments of Mariotte and others, who examined quiefcent bodies expofed to the action of a fream. It is extremely difficult to meafure the velucity of a Atream. It is very different in its different parts. It is fwiftelt of all in the middle fuperfi. cial filament, and diminifhes as we recede from this towards the fides or bottom, and the rate of diminution is not precifely known. Could this be afcertained with the neceffary precifion, we fhould recommend the following form of experiment as the molt fimple, ealy, economical, and accurate.

Let $c, b, c, d$, (fig. 19.) be four hooks placed in a horizontal plane at the corners of a rectangular parallelogram, the fides $a c, b d$ being parallel to the direction of the fream ABCD , and the fides $a b, c d$ being perpendicular to it. Let the body $G$ be faftened t

## 65

Plate cccexxxvi. 66 Simple experiment
for meafuriug the velocity of an a frcall

Refitince. an axis $e f$ of ftiff-tempered Aeel-wire, fo that the furface on which the fluid is to act may be inclined to the ftream in the precife angle we defire. Let this axis have hooks at its extremities, which are hitched into the loops of four equal threads, fufpended from the hooks $a, \dot{b}, c, d$; and let $\mathrm{H}_{e}$ be a fifth thread fufpended from the middle of the line joining the points of fufpenfion $a, b$. Let HIK be a graduated arch, whofe centre is H , and whofe plane is in the direction of the ftream. It is evident that the impulfe on the body $G$ will be meafured (by a procefs well known to every mathematician) by the deviation of the thread $\mathrm{H} e$ from the vertical line HI ; and this will be done without any intricacy of calculation, or any attention to the centres of gravity, of ofcillation, or of percufion. Thefe muft be accurately afcertained with refpect to that form in which the pendulum has always been employed for meafuring the impuife or velocity of a ftream. Thefe advantages arife from the circumftance, that the axis ef remains always parallel to the horizon. We may be allowed to obferve, by the by, that this would have. been a great improvement of the beautiful experiments of Mr Robins and Dr Hutton on the velocities of cannon-fhot, and would haye faved much intricate calculation, and been attended with many important advantages.

The great difficulty is, as we have obferved, to meafure the velocity of the fream. Even this may be done in this way with fome precifion. Let two floating bodies be dragged along the furface, as in the experiments of the academy, at forme diftance from each other laterally, fo that the water between them may not be fen. fibly difturbed. Let a horizontal bar be attached to them, tranfverfe to the direction of their motion, at a proper height above the furface, and let a fpherical pendulum be fufpended from this, or let it be fufpended from four points, as here defcribed. Now let the deviation of this pendulum be noted in a variety of velocities. This will give us the law of relation between the velocity and the deviation of the pendulum. Now, in making experiments on the refiftance of bodies, let the velocity of the fream, in the very filament in which the refiltance is meafured, be deter. mined by the deviation of this pendulum.

It were greatly to be wifhed that fome more palpable argument could be found for the exiftence of a quantity of ftagnant fluid at the anterior and pofterior parts of the body. The one already given, derived from the confideration that ne motion changes either its velocity or direction by finite quantities in an inftant, is unexceptionable, But it gives us little information. The fmalleft conceivable extent of the curve FM in fig, 16. will anfwer this condition, provided only that it touches the axis in fome point $F$, and the body in fome point M, fo as not to make a finite angle with either. Put furely there are circumftances which rigoroully determine the extent of this ftagnant luid. And it appears without doubt, that if there were no cohefion or friction, this face will have a determined ratio to the fize of the body (the figures of the bodies being fuppofed fimilar). Suppofe a flane furface $A B$, as in fig. 10 . there can be no doubt but that the figure $A a D b B$ will in every cafe be fimilar. But if we fuppofe an adhefion or tenacity which is conftant, this may make a. change both in its extent and in its form : for its con-
ftancy of form depends on the difturbing forces being Rcfatane. always as the fquares of the velocity; and this ratio of the difturbing forces is preferved, while the inertia of the fluid is the only agent and patient in the procefs. But when we add to this the conitant (that is, invariable) difturbing force of tenacity, a change of form and dimenfions muft happen. In like manner, the friction, or fomethiag analogous to friction, which produces an effect proportional to the velocity, mult alter this ne-. ceffary ratio of the whole difturbing forces. We may conclude, that the effect of both thefe circumftances will be to diminifh the quantity of this fagnant Huid, by licking it away externally; and to this we muft afcribe the fact, that the part FAM is never perfeetly ftagnant, but is generally difturbed with a whirling motion. We may alfo conclude, that this flaynant fluid will be more incurvated between $F$ and $M$ than it would have been, independent of tenacity and friction; and that the arch LR will, on the contrary, be lefs incur-vated.-And, lafty, we may conclude, that there will be fomething oppofite to preffure, or fomething which we may call abflraction, exerted on the pofierior part of the body which móves in a tenacious fluid, or is expofed to the ftream of fuch a fluid; for the ftagnant fluid LCR adheres to the furface LC; and the paf. fing fluid tends to draw it away both by its temacity and by its friction. This mult augmer: the apparent impulfe of the fream un fuch a bocy; and it mult greatly augment the refiftance, that is, the motion loft by this body in its progrefs through the tenacious fluid : for the body muft drag along with it this ftagnant fluid, and drag it in oppofition to the tenacity and friction of the furrounding fluit. The effect of this is moft remarkably feen in the refifances to the motion of pendulums; and the chevalier Buat, in his examination of Newton's experiments, clearly fhows that this conftitutes the greatef part of the refiltance.

This moft ingenious writer has paid great attention to this part of the procefs of nature, and has laid the foundation of a theory of refiftance entirely diferent from all the preceding. We cannot abridge it, and it is too imperfect in its prefent condition to be offered as a body of doctrine : but we hope that the ingenious auther will profecute the fubject.

We cannot conclude this difertation (which we acknowledge to be very unfatisfactory and imperfect) Account of better, than by giving an account of fome experiments licr Buat's. of the chevalier Buat, which feem of immenfe confe- experiquence, and tend to give us very new views of the fub- ments. ject. Mr Buat oblerved the motion of water iffuing from a glafs cylinder through a narrow ring formed by a bottom of fmaller diameter; that is, the cylinder was open at both ends, and there was placed at its lower end a circle of fmaller diameter, by way of bottom, which left a ring all around. He threw fome powdered fealing wax into the water, and obferved with great attention the motion of its fmall particles. He faw thofe which happened to be in the very axis cf the cylinder defcend along the axis with a motion pretty uniform, till they came very near the bottom; from this they continued to defcend very flowh, till they were almolt in contact with the bottom; they then cieviated from the centre, and approached the orifice in itraighs

## RES [ 117$]$, RES

Refifance. Atraight lines and with an accelerated motion, and at ter flows off laterally; and if the horizontal dimenfions Refinatice. laft darted into the orifice with great rapidity. He had obferved a thing fimilar to this in a horizontal canal, in which he had fet up a fmall board like a dam or bar, over which the water flowed. He had thrown a goofeberry into the water, in order to meafure the velocity at the bottom, the goofeberry being a fmall matter heavier than water. It approached the dam uniformly till about three inches from it. Here it almoft thood ftill, but it continued to advance till almoft in contact. It then rofe from the bottom along the infide of the dam with an accelerated motion, and quickly efcaped over the top.

Hence be concluded, that the water which covers the anterior part of the body expofed to the Aream is not perfectly ftagnant, and that the filaments recede from the axis in curves, which converge to the furface of the body as different hyperbolas converge to the fame affymptote, and that they move with a velocity continualiy increafing till they efcape round the fides of the body.

He had eftablifhed (by a pretty reafonable theory, confirmed by experiment) a propofition concerning the preflure which water in motion exerts on the firface along which it glides, viz. that the preffure is equal to that qubich it would exert if at reft minus the evcight of the column wwof. beight would produce the velocity of the paffing Aream. Coniequently the preffure which the Aream exerts on the furface perpendicularly expofed to it will depend on the velocity with which it glides along it, and will diminif from the ceatre to the circumference. This, fays he, may be the reafon why the impulfe on a plane wholly immerfed is bat one half of that on he contri- 20). was pierced with a great number of holes, and fixed ved for ex-
in the front of a hallow box repreicited edgewife in fis: 2 I . The back of this box was pierced with a hole $c$, in which was inferted the tabe of glais CDE, bunt fquare at $D$. This intrumant was expofed to a itream of water, which beat on the buars plate. The water having filled the box throngi in. holes, food at an equai height in the glafs tube when the furrounding water was ftagnant ; but when it was in motion, it always ftood in the tube above the level of the fmonth watir without, and thas indicated the preffure occafioned by the action of the flream.

When the inftrument wat not wholly immerfod, there was always a confiderable accumulation againf the front of the box, and a deprefion behindit. The water before it was by no means itaguant: indeed it thould not be, as Mr Buat obferves; for ic confifts of the water which was elcaping on all fides, and therefore upwards from the axis of the fream, which meets the plate ferpendicularly in $c$ confiderably under the furface. It eicapes upwards; and if the body were fufficiontly immerfed, it would efcape in this direction almox as edfily as laterally. But in the preient circumfances, it heafs up, till the elevation occafions it to tall off fievice as frit as it is renewed. When the inftrument was immer. fed more than its imidiameter ander the furface, the water ltill rofe above the level, and the:e was a great depreflim immediately behind this elevation. In conequence of this difficulty of efcaping upwards, the wa
of the furface is great, this lateral efllux becomes more difficult, and acquires a greater accumulation. From this it happens, that the refiftance of broad furfaces equally immerfed is greater than in the proportion of ${ }^{\circ}$ the breadth. A plane of two feet wide and one foot deep, when it is not completely immerfed, will be more refilted than a plane two feet deep and one foot wide; for there will be an accumulation againf both: and even if the fe were equal in height, the additional furface will be greateft in the wideft body; and the elevation will be greater, becaufe the lateral efcape is more difficult.
The circumftances chiefly to be attended to are Circumthefe. flances
The preffure on the centre was much greater than to- chicfly to wards the border, and, in general, the height of the wa- ed to in ter in the tube DE was more than $\frac{4}{3}$ of the height ne-ufing this ceffary for producing the velocity when only the cen-inftrutral hole was open. When various holes were opened ment. at different diftances from the centre, the beight of the water in DH continually diminifhed as the hole was nearer the border. At a certain diftance from the border the water at $E$ was level with the furrounding water, fo that no preffure was exerted on that hole. But Remarkthe moft unexpected and remarkable circumftance was, able cirthat, in great velocities, the holes at the very border, cumfance. ${ }^{\text {i }}$ and even to a fmall dittance from it, not only fuftained no preffure, but even gave out water; for the water in the tube was lower than the furrounding water. Mr Buct calls this a non-preffion. In a cafe in which the velocity of the fream was three feet, and the preffure on the central hole cauted the water in the veitical tube to ftand 33 lines or $\frac{3}{x} \frac{3}{2}$ of an inch above the level of the farrounding fmooth water, the action on a hole at the lower corner of the fquare caufed it to fand 12 lines lower than the furounding water. Now the velocity of the ftrearn in $\mathrm{t}^{\text {a }}$ is cxperiment was $3^{6}$ inches per fecond. This : equires $2 x \frac{x}{2}$ lines for its productive fall; whereas the preflure o: the centa al lole was 33. This approaches to the preffure on a ferface which dethers it wholly. The intcrmediate holes gave every variation of preffure, and the diminution was more rapid as the holes were nearer the edge; but the law of diminution could not be oblerved.

This is quite a now and mon unexaced circum- $7 \mathbf{r}$ fance in the ation of flids on fid budies, ftent with ders the fuibjed more intricate than ever; yet it is by the princino means inconliftent with the genuine principles of ples of hybydroftatics or hydraulics. In as far as Mr Buat'; droftatics propotition concerning the prefure of moving fluids lics is truc, it is very 1 eafonable to fay, that when the lateral velocity with which the fluid tends to edcape exceeds the voinciry of percuffion, the heiglit neceffary for producing this relocity mul exceed that which would produce the other, and a non-preffion mult be obierved. And if we confider the forms of the lateral filaments near the edge of the bodr, we fee that the concavity of the curve is turncd towards the bo. dy, and that the contrifagal fores tend to diminifk their preffure on the body. If the middle alone were flruck with a confidera'le veiocity, the water might even rebonnd, as is frequently obferved. This actual rebounding is here prevented by the furrounding water, which is noving with the frme velocity: bu:

Refikane. the preffire may be almoft annihilated by the tendency ne to rebound of the inner filaments.

Part (and ferhaps a confiderable part) of this apparent non-prefiion is undonbtedly produced by the tenacity of the water, which licks off with it the water lying in the hole. But, at any rate, this is an im-

72 Enbitance of Buat's wiaecry.
portant fact, and gives great value to thefe experiments. It gives a key to many curious phenomena in the refiftance of fuids; and the thecry of Mr Buat deferves a very ferious confideration. It is all contained in the two following propofitions.

1. "If, by any caufe wbatever, a column of Juid, whether making part of an indefinite fuid, or contained in folid canals, comes to move with a given velocity, the preflure subich it exerted laterally before its motion, either on the adjoining fuid or on the fides of the canal, is diminibed by the weight of a column baving the beight neceffary for communirating the velocity of the motion.
2. "The preflure on the centre of a plane furface perperdicular to the fiream and wobolly immerfed in it, is $\frac{3}{2}$ of the rueight of a culumn baving the beight ne efary for communicating the velocity. For $33 i, \frac{3}{2}$ of $21 \frac{1}{2}$," "

He attempted to afcerta in the medium preffire on the whole furface, by opening 625 holes difperfed all over it. With the fame velocity of current, he found the height in the tube to be 29 lines, or $7^{\frac{1}{2}}$ more than the height neceffary for producing the velocity. But he juftly coneluded this to be too great a meafure, becaufe the holes were $\frac{x}{4}$ of an inch from the edge : had there been holes at the very edge, they would have furtained a non-preffion, which would have diminithed the height in the tube very confiderably. He expofed to the fame Aream.a conical funnel, which raifed the water to 34 lines. But this could not be confidered as a meafure of the preflure on a plane folid furface; for the central water was undoubtedly fcooped out, as it were, and the filaments much more deflected than they weuld have been by a plane furface. Perhaps fomething of this happened even in every fmall hole in the former experiments. And this fuggefts fome doubt as to the accuracy of the meafurement of the preffure and of the velocity of a current by Mr Pitot's tube. It furely renders fome corrections abfolutely neceffary. It is a fact, that when expofed to a vein of fluid coming through a fhort paffage, the water in the tube ftands on a level with that in the refervoir. Now we know that the velocity of this fream des not exceed what would be produced by a fall equal to $\frac{82}{100}$ of the head of waler in the refervoir. Mr Buat made many valuable obfervations and improvements on this moft ufeful inftrument, which will be taken notice of in the articles $\mathrm{R}_{1}-$ vers and Water IVorks.

Mr Buat by a fcrupulous attention to all the circum. flances, concludes, that the medium of preffure on the whole furface is eriual to $\frac{25,5}{21,5}$ of the weight of a column, having the furface for is bafe, and the productive fall for its height. But we think that there is an uncertainty in this conclufion; becaufe the height of the water in the vertical tube was undoubtedly augmented by an hydroftatical preffure arifing from the accumulation of water above the body which was expofed to the ftream.

Since the preffures are as the fquares of the veluci-
ties, or as the heights $b$ which produce the velocitics, Reffeatree, we may exprefs this preffure by the fymbol $\frac{25,5}{21,5}$, or 1,186h, or $m b$, the value of $m$ being $\mathbf{1}, \mathbf{1 8 6}$. This exceeds confiderably the refult of the experiments of the French academy. In thefe it does not appear that $m$ fenfibly exceeds unity. Note, that in thefe experiments the body was moved through fill water; here it is expofed to a ftream. Thefe are generally fuppofed to be equivalent, on the authority of the third law of motion, which makes every action depend on the relative motions. We fhall by and by fee fome caufes of difference.

The writers on this fubject feem to think their tafk The action completed when they have confidered the action of the on the hinfluid on the anterior part of the body, or that part of der part of it which is before the broadefl fection, and have paid a body or little or no attention to the hinder part. Yet thofe who ly y imporare moft interefted in the fubjeft, the naval architels, tant with feem convinced that it is of no lefs importance to at- that on the tend to the form of the hinder part of a fhip. And fore-part. the univerfal practice of all nations has been to make the hinder part more acute than the fore part. This has undoubtedly been deduced from experience; for it is in direct oppofition to any notions which a perfon would naturally form on this fubject. Mr Buat therefore thought it very neceffary to examine the action of the water on the hinder part of a body by the fame method. And, previous to this examination, in order to acquire fome fcientific notions of the fubject, he made the following very curious and inftructive experiment.
Two little conical pipes AB (fig. 22.) were inferted into the upright fide of a prifatic vefiel They wate an inch long, and their diameters at the inner and outer ends were five and four lines. A was 57 lines under the furface, and B was 73. A glafs fyphon was made of the fhape reprefented in the figure, and its internal diameter was $1 \frac{1}{4}$ lines. It was placed with its mouth in the axis, and even with the bafe of the conical pipe. The pipes being fhut, the veffel was filled with water, and it was made to ftand on a level in the two legs of the fyphon, the upper part being full of ain. When this fyphon was applied to the pipe A, and the water rumning freely, it rofe 32 lines in the fhort leg, and funk as much in the other. When it was applied to the pipe B, the water rofe 41 lines in the one leg of the fyphon, and funk as much in the other.

He reafons in this manner from the experiment. The And his ring comprehended between the end of the fyphon and reafoning the fides of the conical tube being the narrowelt part upon it, of the orifice, the water iffued with the velocity correfponding to the height of the water in the veffel above the orifice, diminifhed for the contraction. If therefore the cylinder of water immediately b fore the mouth of the fyphon iffued with the fame velucity, the tube would be émptied through a height equal to this head or water (charge). If, on the contrary, this cylinder of water, immediately before mouth of the fyphon, were ftagnant, the water in it would exert its full preffure on the msuth of the fyphon, and the water in the fyghon would be level with the water in the veffel. Between thefe extremes we malt find the real fate of the cafe, and we mult meafure the force of non-preffure by the rife of the water in the fyphon.

We fee that in both experiments it bears an accurate

## RES [ II9] KES

Refiftance. proportion to the depth under the furface. For 57: 73=32: 41 very nearly. He therefore eftimates the non-prefluie to be $\frac{5 \sigma}{100}$ of the height of the water above 77 the orifice.
Seemiugly We are difpofed to think that the ingenious author inaccurate, has not reafoned accurately from the experiment. In the firlt place, the force indicated by the experiment, whatever be its origin, is certainly double of what he fuppofes ; for it mult be meafured by the fum of the rife of the water in one leg, and its depreffion in the other, the weight of the air in tre bend of the fyphon being neglected. It is precifely analogous to the force acting on the water ofcillating in a fyphon, which is acknowledged to be the fum of the elevation and depreflion. The force indicated by the experiment therefore is $\frac{1}{1} \frac{2}{0} 00$ of the height of the water above the orifice. The force exhibited in this experiment bears a fill greater propercion to the productive height ; for it is certain that the water did not iffue with the velocity acquired by the fall from the furface, and pro. bably did not exceed $\frac{2}{3}$ of it. The effect of contraction muft have been confiderable and uncertain. The velocity fhould have been meafured both by the amplitude of the jet and by the quantity of water difcharged. In the next place, we apprehend that much of the effect is produced by the tenacity of the water, which drags along with it the water which would have flowly iffued from the fyphon, and the other end not dipped into the water of the veffel. We know, that if the horizontal part of the fyphon had been continued far sough, and if no retardation were occafioned by friction, the column of water in the upright leg would have accelerated like any heavy body; and when the laft of it had arrived at the bottom of that leg, the whole in the horizontal part would be moving with the velocity acquired by falling from the furface. The water of the veffel which iflues through the furrounding ring very quickly acquires a much greater velocity than what the water defcending in the fyphon would acquire in the fame time, and it drags this laft water along with it both by tenacity and friction, and it drags it out till its action is is oppofed by want of equilibrium produced in the fyphon, by the elevation in the one leg and the depreffion in the other. We imagine that little can be concluded from the experiment with refpect to the real non-preffure. Nay, if the fides of the f? phon be fuppofed infinitely thin, fo that there would be no curvature of the filaments of the furrounding water at the mouth of the fyphon, we do not very diftinctly fee any fource of nonpreffure: For we are not altogether fatisfied with the proof which Mr Buat offers for this meafure of the preffure of a Aream of fluid gliding along a furface, and obftructed by frition or any other caufe. We imagine that the palling water in the prefent experiment would be a little retarded by accelerating continually the water defcending in the fyphon, and renewed a-top, fuppofing the upper end open; becaufe this water would not of itfelf acquire more than half this velocity. It however drags it out, till it not only refifs with a force equal to the weight of the whole verrical column, but even exceeds it by $\frac{12}{480}$. This it is able to do, becaufe the whole preflure by which the water iffues from an orifice has been fhown (by Daniel Bernoulli) to be equal to twice this weight. We therefore confider this beautiful experiment as chiefly valuable, by giving us a mea-
fure of the tenacity of the water; and we uilh that it Refinance. were repeated in a variety of depths, in order to difcover what relation the force exerted bears to the depth. It would feem that the tenacity, being a certain determinate thing, the proportion of 100 to 112 would nct be conftant; and that the obferved ratio would be made $u_{p}$ of two parts, one of them conftant, and the other proportional to the depth under the furface.

But fill this experiment is intimately connected with the matter in hand; and this apparent non-preffure on the hinder part of a body expofed to a Aream, from whatever caufes it proceeds, does operate in the action of water on this hinder part, and mutt be taken into the account.

We mult thercfore follow the Chevalier de Buat in Further his difcuffions on this fubject. A prifmatic body, having its prow and poop equal and parallel furfaces, and plunged horizontally into a flad, will require a force to keep it firm in the direction of its axis precifely equal to the difference between the real preflures exerted on its prow and poop. If the fluid is at reft, this difference will be nothing, becaufe the oppofite dead preffures of the fluid will be equal: but in a fream, there is fuperadded to the dead preffure on the prow the active preffure arifing from the deflections of the filaments of this fluid.

If the dead preffure on the poop remained in its full intenfity by the perfect ftagnation of the water behind it, the whole fenfible preffure on the body would be the active preffure only on the prow, reprefented by $m b$. If, on the other hand, we could fuppofe that the water behind the body moved centinually away from it (beirg renewed laterally) with the velocity of the ftream, the dead preffure would be entirely removed from its poop, and the whole fenfible preffure, or what muft be oppofed by fome extemal force, would be $m b+b$. Neither of thefe can happen; and the real ftate of the cafe muft be between thefe extremes.

The following experiments were tried: The perfo. Expcrirated box with its vertical tube was expofed to the mentso ftream, the brafs plate being turned down the ftream. The velocity was again 36 inches per fecond.

The central hole A alone being opened, gave a nonpreflure of - - 13 lines.
A hole $B, \frac{5}{6}$ of an inch from the edge, gave
A hole C, near the furface - $\quad 15,7$
A hole D , at the lower angle $\quad$ - $\quad 15,7$
Here it appears that there is a very confiderable: non.preffure, increafing from the centre to the border. This increafe undoubtedly proceeds from the gruater lateral velocity with which the water is gliding in from the fides. The water behind was by no means flagnant, although moving off with a much fmaller velocity than that of the paffing ftream, and it was vifibly removed from the fides, and gradually licked away at its further extremity.

Another box, having a great number of holes, all open, indicated a medium of non-preffure equal to 13 , $\frac{5}{5}$ hes.

Another of larger dimenfions, but having fewer holes, irsicated a non-preffure of $12^{\frac{1}{6}}$.

But the moft remarkable, and the moft importank phenomena, were the following:

The firf box was fixed to the fide of another box,

Ventance. fo that, when all was made fmooth, it made a perfest cube, of which the perforated brafs plate made the poon.

Tlie apparatus being now expofed to the ftream, 4r: h the perforated plate looking down the ftream,

The hole $A$ indicated a non-prefion $-=7,2$

| B | - | - | - | 8 |
| :--- | :--- | :--- | :--- | :--- |
| C | - | - | - | 6 |

Were was a great diminution of the non-preflions produced by the diltance between the prow and the poop.

This box was then fitted in the fame manner, fo as to make the poop of a box three feet long. In this titu'tion the non-preffures were as follow :

Hole A

$$
\begin{array}{llll}
\mathrm{A} & - & - & - \\
\mathrm{B} & - & - & -
\end{array}
$$

The non-preffions were ftill farther diminifhed by this increafe of length.

The box was then expofed with all the holes open, in three different fituations:
ift, Single, giving a noin-preflure - 13,1
2 d , Making the poop of a cube $\quad$ - 5,3
3d, Making the poop of a box three feet long
Another larger box:
Ift, Single - - 12,2
2d, Poop of a cube . - 5,
3 d , Poop of the long box - $\quad$ 3,2
thefe are mof valuable experiments. They plainly fhow how important it is to confider the action on the hinder part of the body. For the whole impulfe or refiftance, which mult be withfood or overcome by the external force, is the fum of the active preffure on the fore-part, and of the non-preflure on the hinder-part; and they fhow that this does not depend folely on the form of the prow and poop, but alfo, and perhaps chiefly, on the length of the body. We fee that the nonpreffure on the hinder-part was prodigioufly diminifhed (reduced to one-fourth) by making the length of the body triple of the breadth. And hence it appears, that merely lengthening a hip, without making any change in the form either of her prow on her poop, will greatly diminifh the refiftance to her motion through the water; and this increafe of length may be made by continuing the form of the midfhip frame in feveral timbers along the keel, by which the capacity of the fhip, and her power of carrying fail, will be greatly increafed, and her other qualities improved, while her fpeed is augmented.

It is furely of importance to confider a little the phyfical caufe of this change. The motions are ex. tremely complicated, and we muit be contented if we can but perceive a few leading circumftances.

The water is turned afide by the anterior part of the body, and the velocity of the filaments is increafed, and they acquire a divergent motion, by which they alfo pufl afide the furrounding water. On each fide of the body, therefore, they are moving in a divergent direction, and with an increafed velocity. But as they are on all fides preffed by the fluid without them, their motions gradually approach to parallelifm, and their velocities to an equality with the ftream. The progreffive velocity, or that in the direction of the fream, is checked, at leaft at firf. But fince we obferve the filaments conitipated round the body, and that they are not deflected at right angles to their former direction,
it is plain that the real velocity of a fimment in its ob- Rafrauce. lique path is augmented. We always oblerve, thit a fone lying in the fand, and expored to the wath of the fea, is la. 1 bare at the bottom, and the fand is generally wafhed away to fome diftance all round. This is owing to the increafed velocity of the water which comes into cintaft with the flone. It takes up more fand than it can keep floating, and it depofits it at a little diftance all around, forming a litile bank, which furrounds the fone at a fmall diftance. When the filaments of water have paffed the body, they are preffed by the ambient fluid into the place which it has quit. ted, and they glide rousd its ftern, and fill up the fpace behind. The more divergent, and the more rapid they are, when about to fall in behind, the more of the cir. cumambient preffure mut be employed to turn them into the trough behind the body, and lefs of it will remain to prefs them to the body itfelf. The extreme of this mult obtain when the ftream is obitrueted by a thin plane only. But when there is fome diftance between the prow and the poop, the divergency of the filaments which had been turned afide by the prow, is diminifhed by the time that they have come abreaft of the ftern, and fhould turn in behind it. They are therefore more readily made to converge behind the body, and a more confiderable part of the furrounding preffure remains unexpended, and therefore preffes the water againt the flern; and it is evident that this advantage mult be fo much the greater as the body is longer. But the advantage will foon be furceptible of no very confiderable increafe : for the lateral and divergent, and accelerated filaments, will foon become fo nearly parallel and equally rapid with the reft of the ftream, that a great increafe of length will not make any confiderable change in thefe particulars; and it muft be accompanied with an increafe of friction.

Thefe are very obvious reflections. And if we attend minutely to the way in which the almof ftagnant fluid behind the body is expended and renewed, we fhall fee all there effects confirmed and augmented. But as we cannot fay any thing on this fubject that is precife, or that can be made the fubject of computation, it is needlefs to enter into a more minute difcuflion. The diminution of the non-preffure towards the centre moft probably arifes from the fmaller force which is neceffary to be expended in the inflection of the lateral filaments, already inffected in fome degree, and having their velocity diminifhed. But it is a fubject highly deferving the attention of the mathematicians; and we prefume to invite them to the ftady of the motions of thefe lateral filaments, paffing the body, and preffed into its wake by forces which are fufceptible of no difficult inveftigation. It feems highly prabable that if a prifmatic box, with a fquare ftern, were fitted with an addition precifely fhaped like the water which would (abftracting tenacity and friction) have been ftagnant behind it, the quantity of non-prefion would be the fmalleft poffible. The mathematician would furely difcover circumftances which would furnifh fome maxims of conftruction for the hinder part as well as for the prow. And as his feculations on this laft have not been wholly fruitlefs, we may expect advantages from his attention to this part, fr much neglected.

In the mean time, let us attend to the deductions which Mr de Buat has made from his few experiments.

## RES $[121]$ RES

Refiance. When the velocity is three feet per fecond, requi-
 reiponding to the non preffure on the $p: o_{i}$ of a thin plane is 14,4 l lines (taking in feveral circumitances of judicious correction, which we have not mentioned), that of a foot cube is 5,83 , and that of a box of triple length is $3,3 \mathrm{r}$.

Let $q$ exprefs the variable ratio of thefe to the haight prociucing the velocity, to that $q$ is may exprefis the nonprefiure in every cale; we bave,

For a thin pline - $\quad . \quad q=0,67$
t a cube - - 0,271

$$
\text { a box }=3 \text { cubes } \quad-\quad, \quad 0,153
$$

It is evident that the value of $q$ has a dependence on the proportion of the length, and the tranfvenfe fection of the body: A feries of experiments on prifmatic bodies fhowed Mr de Buat that the devation of the filaments was fimilar in nimilar bodies, and that this obtained even in diflimilar prims, when the le:gths ware as the fuate-roots of the armiverie fections. Alihough thereore the experiments were not fufficiently nume. rous for deducing the precife law, it feemed not imporfible to detive trom them a very ufelul approsimation. By a deatercus comparion he found, that if $l$ expreffs the length ot the prim, and $s$ the area of the traufvor, fection, and $L$ exprefles the common loganithm of the quantity to which it is prefixed, we thall exprefs the non-preffure pretty accurately by the formula $\frac{1}{q}=$ $\mathrm{L}\left(1,42 \frac{l}{\sqrt{ } s}\right)$.

Hence arifes an important remark, that when the height correfponding to the nun pieflion is greater than $\checkmark \cdot s$, and th: body is little immeried in the fluid, there will be a void behind it. Thus a furface of a fquare inch, juft immerfed in a current of three feet per fecond, will have a void behind it. A foot fquare will be in a fimilar condition when the velocity is 12 feet.

We mult be careful to diftinguifh this nen-ptetfure from the other caules of refiftance, which are always neceffarily combined with it. It is fuperadditive to the active impreffion on the prov, to the faitcal preffare of the accumulation a-head of the body, the It.tical preflure arifing from the depreffion behind $i$, the effeets of friction, and the cffects of tenacity. It is indecd next to impoffible to eftimate them feparately, no many of them are actually combined in the meafures now given. Nothing can determire the pure non-prefluis till we can afcertain the motions of the flaments.

Mr de Buat here takes occafion to controvert the univerfally adopted maxim, that the prefli:e occafioned by a ltre $m$ of fluid on a tixed body is the fame with that on a body moving with equal velocity in a quiefcent fluid. He repeated all thefe experiments with the perforated box in till wa er. The general ditinction was, that $b$ th the preflures and the $n \cdot n$ preflure in this cate was lef, and that the odds wis chiefly to be obferved near the edges of the farface. The general factor of the prefliv e of a fream on the anterior furface was $m=1,186$; but that on a body moving through a thill fluid is inly $m=1$. He oblerved no non-prelfur: even at the very edge of the prow, but even a fen bie perficre. The preffure, therof re, or refittance, is mire ectad. difinect oner the funface of the prow than the mathe is. -He alto found that the refilt ne uminimed in a lets ruto than the quares of the vel cinier, $a_{1}$ ccollly in fmall velocities.

Vol. XVI.

The ner-juefures increafed in agreater yetio than tha Fenene fquares of the velocities. The ratio of the $v$ dectics to a friall velucity of $2^{\frac{x}{5}}$ inches fer fecond increafed geameticaly, the value of $q$ increafed anthme:ically; and we nay determine $q$ for any velocity $V$ by this proportion
$\mathrm{L} \frac{55}{2,2}: \mathrm{L} \frac{\mathrm{V}}{22}=0,5: q$, and $q=\frac{\mathrm{L} \frac{V}{2,2}}{2,8}$. Tinatis, let the cummon logarithm of the velocity, civided by $2_{5}^{\frac{1}{5}}$, be contidered as a common number; divide this common number by $23^{\frac{8}{5}}$, the quotient is $q$, vicis mult be multiplied by the productive height. The no. duct is the prelfure.

When Piot's tube was expored to the fream, we had $n=1$; but when it is caried through filil water, $m$ is $=1,22$. When it was tumed from the fheam, we had $q=0,157$; but when carried through ftill water, $q$ is $=0,133$. A remarkable experiment.

Whe.. the tube was moved late aliy through the wa- And fip. ter, fo that the motion was in the direction of the plane perts his of its mouth, the $n=n$-preflure was $=1$. This is one crinion by of his chief arguments for his theory of non-pretion. a remainHe does not give the detail of the experiment, able expeonly inferts the refult in his table.

As a body expofed to a ftream deflects the fluid, he cps i. up, and increafes its velocity; fo a body moved through a ltill fluid turns it afide, cataes it to fwell up $b=$ fore it, and gives it a real motion alongfide of it in the oppofite dircetion. And as the budy expofed to a Itream has a quantity of fuid almoft fagnant both before and behind; fo a body moved thrugh a ftill fluid carries before it and drags after it a ciuantity of fluid, which accompanies it with nearly an equal velocity. This addition to the quantity of matter in motion mult make a diminution of its velocity ; and this forms a very coniderable part of the obferved retiftance.

We cann $r$, however, help remarking that it would The objecrequire very diftinct and ftrong proof indeed to ever-tion rot turn the common opinion, which is founded on our molt well foundcertain and fimple cunceptions of motion, and on a law ${ }^{\text {ed }}$.
o nature to which we have never oberved an exception. Mr de Buat's experiments, tho' molt judiciouily contrived, and executed with icrupuous care, are by no means of this kinc. They were, of abfolute neceffity, very complicated; and many circumftances, impomble to avoid or to appreciate, rendered the obfervation, or atlealt the comparibn, of the velocities, very uncertain.

We can fee but two circumitances $\because$ hich do not ad. Remarks mit of an ealy or immediate compaifon in the two and expeftates of the problom. When a body is expofed to a riments on fream in our txpainents, in order to have an impulfe the mocion made on it, there is a force tending to move the body of bodies bickwards, independent of the real impulfe or preffure or fill wa. occationed by the defiestion of the ftream. Vive cann $t$ ter. have a ftream except in confequence of a floping furface. Suppofe a body floating en this fiream. It wil not only fail dosin alows abib the freaty, buc is will iail doun the fr con, and will therefore (g) fater along the canal than the fteam does: for it is floating on an inclined plane; and if we examine it by the laws of hydroltatics, we hall find, that befides its own tenden:y to /ial down this inclined plane, there is an odds of hyaroutatical preflure, which pulkes it down this plane. It will theref ie go along the canal fater than the ltream. For this asceicuatin depends on the difference of prenure at the $t w$ : ends, and will be more re-

## R E S <br> [ 122 ] <br> RES

Refiftance. markable as the body is larger, and efpecially as it is longer. This may be diftinctly obferved. All floating bodies go into the fream of the river, becaufe there they find the fmalleft obftruction to the acquifition of this motion along the inclined plane; and when a number of bodies are thus floating down the ftream, the largeft and longeft outtrip the reft, A $\log$ of wood floating down in this manner may be obferved to make its way very faft among the chips and faw-duft which float alongfide of it.

Now when, in the courfe of our experiments, a body is fupported againft the action of a fream, and the impulfe is meafured by the force employed to fupport it, it is plain that part of this force is employed to act againf that tendency which the body has to outfrip the ftream. This does not appear in our experiment, when we move a body with the velocity of this ftream through fill water having a horizontal farface.

The other difinguifing circumftance is, that the retardations of a fream arifing from friction are found to be nearly as the velocities. When, therefore, a flream moving in a limited canal is checked by a body put in its way, the diminution of velocity occafioued by the friction of the Atream having already produced its et. fect, the impulfe is not affected by it ; but when the body puts the fill water in motion, the friction of the bottom produces fome effeet, by retarding the recefs of the water. This, however, mult be next to nothing.
The chief difference will arife from its being almoft impoffible to make an exact comparifon of the velocities: for when a body is moved againft the ftream, the relative velocity is the fame in all the filaments. But when we expole a body to a fream, the velocity of the different flaments is not the fame; becaufe it decreafes from the middle of the fream to the fides.

Mr Buat found the total fenfible refiftance of a plate 12 inches fquare, and meafured, not by the height of water in the tube of the perforated box, but by weights acting on the arm of a balance, having its centre 15 inches under the furface of a fream moving three feet per fecond, to be 19,46 pounds; that of a cube of the fame dimenfions was 15,22 ; and that of a prifm three feet long was 13,87 ; that of a prifm fix feet long was $\mathrm{I} 4,27$. The three firt agree extremely well with the determination of $m$ and $q$, by the experiments with the perforated box. The total refiftance of the latt was undoubtedly much increafed by friction, and by the retrograde force of fo long a prifm floating in an inclined fream. This laft by computation is 0,223 pounds; this added to $b(m+q)$, which is 13,59 , gives $\mathrm{I}_{3}, 8 \mathrm{I}$, leaving 0,46 for the effect of friction.
If the fame refiftances be computed on the fuppofition that the body moves in fill water, in which cafe we have $m=1$, and $q$ for a thin plate $=0,433$; and if $q$ be computed for the lengths of the other two bodies by the formula $\frac{1}{q}=\mathrm{L}_{1,42}+\frac{l}{\sqrt{s}}$; we fhall get for 88
And of the the refiftances 14,$94 ; \mathbf{1 2 , 2 2}$; and $11,49 \cdot$
quantity of
Hence Mr Buat concludes, that the refiftances in quantity of thefe two ftates are nearly in the ratio of 13 to 10 . hering to a This, he thinks, will account for the difference obferbody mov- ved in the experiments of different authors. jug in ftill water, \&c.
body which is carried along thro' fill water, or which Reffifance. remains nearly flagnant in the midft of a ftream. He takes the fum of the motions in the direction of the fream, viz. the fum of the actual motions of all thofe particles which have lof part of their motion, and he divides this fum by the general velocity of the fream. The quotient is equivalent to a certain quantity of water perfectly flagnant round the body. Without being able to determine this with precifion, he obferves, that it augments as the refiftance diminifhes; for in the cafe of a longer body, the filiments are obferved to converge to a greater diftance behind the body. The ftagnant mafs a-head of the body is more conftant ; for the deflection and refiftance at the prow are oblerved not to be affected by the length of the body. Mr Buat, by a very nice analyfis of many circumftances, comes to this conclufion, that the whole quantity of fluid which in this manner accompanies the folid body, remains the fame whatever is the velocity. He might have deduced it at once, from the confideration that the curves defcribed by the filaments are the fame in all velocities.

He then relates a nomber of experiments made to afcertain the abfolute quantity thus made to acce mpany the body: There were made by caufing pendulums to ofcillate in fluids. Newton bad determined the refiftances to fuch of cillation by the diminution of the arches of vibration. Mr Buat determines the quantity of dragged fluid by the increafe of their duration; for this ftagnation or dragging is in fact adding a quantity of matter to be moved, without any addition to the moving force. It was ingenioufly obferved by Newton, that the time of ofcillation was not fenfibly affected by the refiftance of the fluid: a compenfation, almoft complete, being made by the diminution of the arches of vibration ; and experiment confirmed this. If, therefore, a great augmentation of the time of vibration be obferved, it mult be afcribed to the additional quantity of matter which is thus dragged into motion, and it may be employed for its meafurement. Thus, let $a$ be the length of a pendulum fwinging feconds in vacuo, and $l$ the length of a fecond's pendulum fwinging in a fluid. Let $p$ be the weight of the body in the fluid, and P the weight of the fluid difplaced by it; $\mathrm{P}+p$ will exprefs its weight in vacuo, and $\frac{P+p}{p}$ will be the ratio of thefe weights. We fhall therefore have $\frac{P+p}{P}=$ $\frac{a}{l}$ and $l=\frac{a p}{\mathrm{P}+\not p}$.

Let $n \mathrm{P}$ exprefs the fum of the fluid difplaced, and the fluid dragged along, $n$ being a number greater than unity, to be determined by experiment. The mafs in motion is no longer $\mathrm{P}+p$, but $\mathrm{P}+n \mathrm{P}$, while its weight in the fluid is fill $p$. Therefore we muft have

$$
l=\frac{a p}{n \mathrm{P}+p}=\frac{a}{\frac{n \mathrm{P}}{p}+1} \text {, and } n=\frac{p}{\mathrm{P}}\left(\frac{a}{l}-1\right) .
$$

A prodigious number of experiments made by $\mathrm{M} r$ Buat on fpheres vibrating in water gave values of $n$, which were very conftant, namely, from 1,5 to 1,7 ; and by confidering the circumftances which accompanied the variations of $n$ (which he found to arife chiefly from the curvature of the path defcribed by the

## R E S <br> $\left[\begin{array}{ll}{[23}\end{array}\right]$ <br> R E S

Refifance. ball), he fates the mean value of the number $n$ at 1,583. So that a fphere in motion drags along with it about $\frac{6}{6} \sigma$ of its own bulk of fuid with a velocity equal to its own.

He made fimilar experiments with prifms, pyramids, and other bodies, and found a complete confirmation of his affertion, that prifins of equal lengths and fections, though diffimilar, dragged equal quantities of fluid; that fimilar prifms and prifms not fimilar, but whofe length were as the fquare-root of their fections, drarged quantities proportional to their bulks.

He found a general value of $n$ for prilmatic bodies, which alone may be confidered as a valuable truth; namely, that $n=0,705 \frac{\sqrt{ } s}{l}+1,13$.

From all thefe circumftances, we fee an intimate connection between the preffures, non-preffures, and the Hu.d dragged along with the body. Indeed this is immediately deducible from the firlt principles ; for wiat Mir Buat calls the dragged fuild is in fact a certain portion of the whole change of motion produced in the direction of the body's motion.
It was tound, that with refpect to thin planes, fpheres, and pyramidal bodies of equal bafes, the refiftances were inverfely as the quantities of fluid dragged along.

The intelligent reader will readily obierv $\epsilon$, that thefe views of the Chevalier Buat are not fo much difcoveries of new principles as they are claffifications of confequences, which may all be deduced from the general principles employed by D'Alembert and other mathematicians. But they greatly affift us in forming notions of different parts of the procedure of nature in the mutual action of fuids and folids on each other. This muft be very acceptable in a fubject which it is by no means probable that we fhall be able to invelligate with mathematical precifion. We have given an account of thefe laft obfervations, that we may omit nothing of confequence that has been written on the fubject ; and we take this opportunity of recommending the Hydrazlique of Mr Buat as a moft ingenious work, containing more original, ingenious, and practcally ufeful thoughts, than all the performances we have met with. His doctrine of the principle of uniform motion of fuids in pipes and open canals, will be of immenfe fervice to all engineers, and enable them to determine with fufficient precifion the moft important quellions in their profeffion; quefions which at prefent they are hardly able to guefs at. See Rivers and Water-Works.

The only circumftance which we have not noticed in detail, is the change of refiftance produced by the void, or tendency to a void, which obtains behind the body; and we omitted a particular difcuffion, me:ely becaufe we could fay nothing fufficiently precife on tize fubject. Perfons not accutomed to the difcufions in the phyficomathematical fciences, are apt to entertain doubts or falfe notions connected with this circumftance, which we fhall attempt to remove; and with this we fhall conclude this long and unfatisfactory dificitation.

If a fluid were perfectly incompreffible, and were contained in a veffel incapable of extenfion, it is impolible that any void could be formed behind the body; and in this cafe it is not very eafy to fee how motion could be petformed in it. A fphere moved in fuch a medium could not advance the fmallef diftance, unlefs fome particles of the fluid, in filling up the fpace left by it, moved with a velocity next to infinite. Some
degree of comprefibility, however fmall, feems necer. R:finaree. firy. If this be infenfible, it may be rigidly demonItrated, that an external force of comprefiion will make no fenfible change in the internal motions, or in the refiftances. This indeed is not obvious, but is an immediate confequence of the quaquaverfum preffure of fluids. As much as the preffure is augmented by the external comprefions on one fide of a body, fo much it is augmented on the other fide; and the fame mult be faid of every particle. Nothing more is neceffary for fecuring the fame motions by the fame partial and internal forces; and this is fully verified by experiment. Water remains equally fluid under any compreffions. In fome of Sir Ifaac Newton's experiments balls of four inches diameter were made fo light as to preponderate in water only three grains. Thefe balls defcended in the fame manner as they would have defcended in a fluid where the refiftance was equal in every part; yet, when they were near the bottom of a veffel nine feet deep, the compreffion round them was at laft 2400 times the moving force; whereas, when near the top of the veffel, it was not above 50 or 60 times.
But on a fluid fenfibly compreffible, or which is $n t$ confined, a void may be left behind the body. Its motion may be fo fwift that the furrounding preflure may not fuffice for filling up the deferted ipace; and, in this cafe, a fatical preffure will be added to the refiftance. This may be the cafe in a veffel or pond of water having an open furface expofed to the finite or limited preffure of the atmolphere. The queftion now is, whether the refiftance will be increafed by an increafe of external preffure? Suppofing a fphere moving near the furface of water, and another moving equally faft at four times the depth. If the motion be fo fwift that a void is formed in both cafes, there is no doubt but that the fphere which moves at the greatel depth is moft refifted by the preffure of the water. If there is no void in either cafe, then, becaufe the quadruple depth would caufe the water to flow in with only a double velocity, it would feem that the refiftance would be greater; and indeed the water flowing in la erally with a double velocity produces a quadruple non-preflure.But, on the other hand, the preffure at a fmall depth may be infufficient fur preventing a void, while that below effectually prevents it ; and this was obferved in fome experiments of Chevalier de Borda. The effect, therefore, of greater immerfion, or of greater compreffion, in an elaftic fluid, does not follow a precife ratio of the preffure, but depends partly on abfolute quantities. It cannot, therefore, be ftated by any very fimple formula what increafe or diminution of refiftance will refult from a greater depth; and it is chicfly on this account that experiments made with models of fhips and mills are not conclufive with refpect to the performance of a large machine of the fame proportions, without corrections, femetimes pretty intricate. We affert, however, with great confidence, that this is of all methocis the moll exact, and infinitely more certain than any thing that can be deduced from the molt elaborate catculation from theory. If the refiftances at all depths be equal, the proportionality of the total refitence to the budy is exact, and perfectly conformable to obfervation. It is only in great velocities where the depth has any material influence, and the influence is not near fo confiderable as we flould, at firf fight, fuppofe; for, in eftimating the effect of immertion, which has a rch.tion

## R ES <br> 124 ] <br> RES

Refifance. to the difference of preffure, we mult always take in the preffure of the atmofphere; and thus the preffure at 33 feet deep is not 33 times the preflure at one foot deef, but only double, or twice as great. The atmo$\mathrm{f}_{\mathrm{p}}$ heric preffure is omitted only when the refifted plane is at the very furface. D'Ulloa, in his Examino Mariitino, has introduced an equation expreffing this relation; but, except with very limited conditions, it will millead us prodigioully. To give a general notion of its foundation, let AB (fig. 23.) be the fection of a plane moving through a fluid in the direction CD , with a known velocity. The fluid will be heaped up before it above its natural level CD, becaufe the water will not be pufhed before it like a folid body, but will be pufhed afide. And it cannot acquire a lateral motion any other way than by an accumulation, which will diffufe itfelf in all direstions by the law of undulatory motion. The water will alfo be left lower behind the plane, becaufe time mu/t elapfe before the preflure of the water behind can make it fill the fpace. We may acquire fome notion of the extent of both the accumulation and depreffion in this way. There is a certain depth CF $\left(=\frac{v^{2}}{2 \phi}\right.$, where $\sigma$ is the velocity, and $\varphi$ the accelerating powier of gravity) under the furface, fuch that water would fow through a hole at $F$ with the velocity of the plane's motion. Draw a horizontal line FG. The water will certainly touch the plane in $G$, and we may fuppofe that it touches it no hgher up. Therefore there will be a hollcow, fuch as CGE. The elevation HE will be regulated by confiderations nearly fimilar. ED muft be equal to the velocit "f the plane, and HE mult be its productive height. Thus, if the velocity of the plane be one foot per fecond, HE and EG will be $\mathrm{T}^{\frac{3}{6}}$ of an inch. This is fufficient (though $n$ t exace) for giving us a notion of the thing. We fee that from this muit arife a preffure in the direction DC , viz. the preffure of the whole column HG.

Something of the fame kind will happen although the plane $A B$ be wholly immerged, and this even to iome depth. We fee fuch alleviations in a fwift running Itream, where there are large fones at the bottom.This occafions an excefs of preffure in the direction opvofite to the plane's motion; and we fee that there muit, in every cafe, be a relation between the velocity and this excefs of preffure. This D'Ulloa expreffes by an equation. But it is very esceptionable, not taking prepe:ly into the account the comparative facility with which the water can heap up and diffufe itfel. It mult niways heap up till it acquires a fufficient head of water to produce a lateral and progreffive diffution fufficient for the purpofe. It is evident, that a firaller elevation will fuffice when the body is more immerfed, becaufe the check or impulfe given by the body below is propagated, not vertically orily, but in every direction; and Gerefore the elevation is not confined to that part of the furface which is immediately above the moving body, bot extends fo much farther laterally as the ces tre of nitation is deeper: Thus, the elevation neceffary for Wraflage of the body is fo much fmaller; and it is the buigh only of this accumulation or wave which determines the backward preffure on the body. D'Ulloa's equation may happen to quadrate with two experiments at different depths, without being nearly juft; for any :- wo pents may be in a curve, without exhibiting its

4*
equation. Three points will do it with fome approach Reffanae. to precifion; but four, at leaft, are neceffary for giving any notion of its nature. D'Ull a has only given two experiments, which we mentioned in another place.

We may here obferve, that it is this circumftance which immediately produces the great refifance to the motion of a body through a fluid in a narrow canal The fluid cannot pafs the body, unlefs the area of the fection be fufficiently extenfive. A narrow canal prevents the extenfion fidewife. The water muft therefore heap up, till the fection and velocity of diffution are fufficiently enlarged, and thus a great backward preffure is produced. (See the fecond feries of Exferiments by the French Academicians ; fee alfo Franklin's Effays.) It is important, and will be confidered in another place.

Thus have we attempted to give our readers fome account of one of the moft interefting problems in the wh,le of mechanical philofophy. We are foriy that fo little advantage can be derived from the united efforts of the filt matl ematicans of Europe, and that there is fo litle hope of geatly improving our fcient fic knowledge of the fubject. What we have delivered will, however, enable our readers to perufe the writings of thofe who have applied the theories to frattical purpofes. Such, for inftance, are the treat fes of J)hn Bernoulli, of Bouguer, and of Ev ler, on the conitruc- Impulfe of tion and working of thips, and the occafional differta-water on tions of working of hips, ain the occafional differta- water applif differe t auth rs on water-mills. In this laft mills. application the ordinary theory is not without its value, for the impulfes are nearly perpendicular; in which cafe they do not materially deviate from the duplicate proportion of the fine of incidence. But even here this theory, applied as it communly is, mifleads us exceedingly. The impulfe on one float may be accurately enough fated by $1 t$; but the authors have not been at. tentive to the motion of the wa-er after it has made its impulfe; and the impulfe on the next float is flated the fame as if the parallel filaments of water, which were not $f$ topped by the preceding float, did impinge on the oppofite part of the fecond, in the fame manner, and with the fame obliquity and energy, as if it were detached from the reft. But this does not in the lealt refemble the real procefs of nature.

Suppofe the floats B, C, D, H (fig. 24.) of a wheel immerfed in a ftream whofe furface moves in the direction AK, and that this furface meets the float B in E. The part BE alone is fuppofed to be impelled; whereas the water, checked by the float, heaps up on it to e.Thea drawing the horizontal line BF, the part CF of the next float is fuppofed to be all that is impelled by the parallel filaments of the ftream; whereas tie water bends round the lower edge of the float L by the furrounding preffire, and rifes on the float $c$ all the way to $f$. In like manner, the float D , inftead of receiving an impulfe on the very fmall portion DG, is impelled all the way from D to $g$, not much below the fiariace of the fream. The furfaces impelled at once, therefore, greatly exceed what this flovenly arplication of the theory fuppofes, and the whole impulfe is much greater; but this is a fault in the a plication, and not in the theory. It will not be a very difficult thing to acquire a knowledge of the motion of the water which has paffed the preceding float, which, though not accurate, will yet approximate confiderably to the truth; and

attempted in its proper place; and we fhall endeavour, in our treatment of all the practical queltions, to derive nefful infurmation from all that has been delivered on the prefent occainon.
ReSOLUTION of Ideas. Sce Logic, Part I. ch. 3.
Resolution, in mufic. To refolve a difiord or diffonance, fiys Roudean, is to carry it according to rule into a conionance in the fublequent chord. There is for that purpofe a procedure prefuribed, both for the fundamental bafs of the difficnant chord, and for the part by which the diffonance is torme.

There is no poffible manner of refolving a difionance which is not derivèd from an operation ot cadence: it is then by the kind of cadence which we wilh to form, that the motion of the fundamental bafs is determined, (fee Cadence). With re.pect to the part by which the diffonance is formed, it ought neither to continue in its place, nor to move by disjointed gradations; but to rite or defeend diaionically, according to the nature of the cinfonance. Theorits fay, that major diffonances ought to rife, and minor to defcend; which is not however without exception, fince in parricular chords of harmony, a feventh, although major, ought not to rile, but to defcend, unlefs in that chord which is, very incorrectly, called tije chord of the feventh redundant. It is better then to fay, that the feventh and all its derivative diffonances ought to defeend ; and that the fixth fuperadded, and all its de. rivat ve diffonances, fhould rife. This is a rule truly general, and without any exception. It is the fame cafe with the rule of refolving diflonances. There are fome difforances which cannct be prepared ; but there is by no means one which ought not to be refolved.

With refpect to the ferifible note, improperly called a major diffonance, if it ought to afcend, this is lelis on account if the rule for reclving diffonances, than on account of that which prefuibes a diatonic procedure, and prefers the fhorteft road; and in reality, there are cafes, as that of the interrupted cadence, in which this fenfible note does n't afcen.l.
In chords by fuppofition, one fingle chord often produces two diffonance; ; as the feventh and nith, the ninth and fourth, \&c. Then theete two dilfonances ought to have been prepared, and both mult 1 kewife be refolved; it is becaule regard fhould be pitid to every thing which is difcordant, not only in tive fundamental, but even in the $c$ nntinued bais.

Resolution, in chemiltry, the reduction of a mixed body into its component parts or firlt princiflos, as far as can be done by a proper analy:s.

RESPIRATION, the at of relpiring or brealling the air. See Ayatomy, no 118. Plood, no 29. Ah.
dicine, $\mathrm{n}^{0}$ ro4. Physiology, Seft. I. and Putripaction fafim.
Respiration of Fijhes. See Ichthyology, $\mathrm{n}^{\circ} 7,8,9$. RESPITE, in law, fignifies a delay, forbearance, or prolongation of time, granted to any one for the payment of a debt, or the like. See Reprieve.

RESPONDENT, in the fihools, one who maintains a thefis in any art or fcience ; who is thus called from his being to anfwer all the objections propofed by the opponent.

RESPONDENTLA. See Botromry.
RESPONSE, an anfwer or reply. A word chiefly ufed in fpeaking of the anfwers made by the people to the prieft, in the litany, the pfalms, \&c.

RESSORT', a French word, fometimes ufed by Englifh authors to fignify the jurifdiction of a court, and particularly one from which there is no appeal.-Thus it is faid, that the Britifh houfe of lords judge e:z dernicirefort, or in the laft reflort.

REST, the continuance of a body in the fame place, or its continual application or contiguity to the fame parts of the ambient or contiguous bodies; and therefore is oppofed to motion. See the article Moт10:.

Rest, in poetry, is a fhort paufe of the voice in reading, being the fame with t.e cafura, which, in Alexandrine verfes, falls on the fixth fyllable; but in verifes of 10 or 11 fyllables, on the fourth. See Por. try, Part III.

REST-HARROW, or Cammock, the Ononis Arvenfis. A decoction of this plant has been much recommended to horfes labouring under a ftoppage of urine. It is the pelt of fome corn-fields; but in its younger ftate, before the plant has acquired its thorns, it is a moft acceptable food to theep.

RESTAURATION, the act of re-eftablifhing or fetting a thing or perfon in its former good thate.

RESTIO, in botany; a genus of the triandria order, belonging to the diecia clafs of plants. The male calyx is an ovate fpike of membranaceous fcales; the corolla is proper, hexapetalous, and perfiftent. The female calyx and corolla are as in the mole; the germen is roundilh, and fee-fulcated; there are three erect and perfiftent fyles; the capfule is roundifh, with fix plait:, and is roftrated and trilocular ; the feeds are oblong and cylindrical.

RESTITUTION, in a miral and legal fenfe, is reftoring a perfon to his right, or returning fomething unjuily taken or detained from him.

Restitition of Meluls, or Rasitited Medals, is a term u.ed by untiquaries for fuch medals as were fruck by the emperors, to renieve the memory of their predeceffors.

Hence, in feveral medals, we find the letters rest. This praftice was firt begua by Claudius, by his thiking afrefh feveral mejals of Augultu;. Nere did the fame; and Titus, ater his father's example, itrack re ftitutions of moft of his predecefiors. Gallienus truck a general reflituti $n$ of all the preceding emperors on two melals; the ore bearing an allur, the other an eagle, without the rest.

RESTIVE, or Resty, in the mincere, a ftubborn, unruly, ill brokea ly,fe, that fips, cr runs buck, inflead of adansing forward.

RESTO.

Refteration

Definition. 29th of Hray is kept as an anniveriary feftival, in commemoration of that event, by which the regal and epifcopal government was reltored.

RESTORATIVE, in medicine, a remedy proper for reftoring and retrieving the ftrength and vigour both of the body and arima pirits.

All under this clafs, fuys Quincy, are rather nutrimental than medicinal; and are more adminiftered to repair the waftes of the conflitution, than to alter and rectify its diforders.

RESTRICTION, among logicians, is limiting a term, fo as to make i f fignify lefs than it ufually does.

RESTRINGENT, in medicine, the fame with allringent. See Astringents.

RESULT, what is gathered from a conference, inquiry, meditation, or the like ; or the conclution and effect thereof.

RESURRECTION, in theology, is a rifing again from the fate of the dead; and is that event, the belief of which conftitutes one of the principal articles in the Chriftian creed.
In treating of this object of our faith, it has been ufual to mention, firlt, the refurrection of our Bleffed Lord, with the character of the witneffes, and the authenticity of the gofpel hiftory by which it has been proved, and from which, as a confequence, ours is inferred. But as moft of the arguments for his refurrection are contained in the gofpels, and as merely to repeat them would afford, we hope, but little information to moft of our readers, we mean here to take a view of the feveral grounds on which the belief of a future exiftence is fuppofed to be founded; to collect together fome of the fentiments of authors and nations concerning the place where departed firits refide ; concerning the nature of their prefent flate; concerning the kinds of their future deftination; that we may af. terwards fee how far their notions differ and agree 3 with what we confider as the doctrines of Scripture.

Of a future flate, there have fometimes been found a few wandering and obfcure tribes who feemed to entertain no notion at all; though it fhould be remarked, that fome of thefe were likewife obferved in fo low a degree of favage barbarity as not to be acquainted with the ufe of the bow, the dart, or the fling, and as not knowing how to wield a club, or to throw a fone, as a weapon of defence ${ }^{k}$.

Wherever the human mind has been cultivated, or properly feaking, begun to be cultivated, the opinion has likewife generally prevailed that human exifence is not confined to the prefent fcene; nay, fo very gencral has this notion been found among mankind, that many are puzzed how to account for what they fuppofe to be almof next to its univerfality.

- See Rohertion's Hift. of America.

The origin of this notion dx:ved by
fome from primeval revelation.

RESTORATION, the fame with reftauration. See Restavratios:

In England, the return of king Charles II. in 1660, ter to interting to his pafterity. They fuppore, Refurrectoo, that the hiftory of the tranfation of Encch muft have made a great noife in the world, and that the remembrance of it mult have been long retained and widely diffufed ; and they find in the bonk of Job plain intimations of a refurrection from the dead, which, from the manner in which they are introduced, they think that very ancient patriarch muft have received through this chanal.

It is not thought to be any objection to thefe fuppo- The ufual fitions, that the Molt High, when delivering his laws objections from the top of Mount Sinai, did not enforce them by the awful fanctions of a future itate. The intelligent reader of the Scriptures knows that the fanctions of a future flate belong to a different and more univerfal dif. penfation than was that of Mofes; that the primeval revelation related to that difpenfation; and that the Jewifh law, with its temporal fanctions, was introduced only to preferve the knowledge and worthip of the true God among a people too grofs in their conceptions to have been properly influenced by the viev of future rewards and punilhments, of fuch a nature as eye hath not feen, nor eas heard, neither hath it entered into the heart of man to conceive. He fees at the fame time, everywhere fcattered through the Old Teftament, plain indications of the Mofaic economy, being no more than preparatory to the bringing in of a better hope; and he thinks it evident, that fuch Jews as underfood any thing of the nature of that better hope, uult have been convinced, that, however the ceremonial rites of their religion might be fufficiently guarded by temporal fanctions, the fundamental principles of all religion and virtue are fupported by rewards and punifhments to be difpenfed in a fate beyond the grave. See Prophecy and Theology.

That the progenitors of the human race mult have Reafons been infpired by their Creator with the knowledge of fupport of their immortality, and of every thing neceffary to their the cpieverlating welfare, cannot, we fhould think, be quef nion. tioned by any one who believes that the world had a beginning, and that it is under the government of goodnefs and jutice. The progrefs from fenfe to fcience is fo flow, that however capable we may fuppofe the ear. lieft ithabitants of this earth to have been of making philofophical difcoveries, we cannot believe that the Father of mercies left his heiplefs creature to difcover for himfelf his future exifence. Death, when firt prefented to him, muft have been a ghafly object; and had he been left without any hope of redemption from it, he would undoubtedly have funk into liftlefs defpondency.

But a profpest of immortality is fo pleating to the human mind, that if it was communicated to the firlt man; it would of courfe be cherifhed by his pofterity; and there is no difficulty in conceiving how it might be lianded down $b$, tradition to very remote ages, amolg fuch of his defcendents as were not fcattered over ti.e face of the earth in fmall and $\mathrm{f}_{\text {a }}$ vage tribes.In the courfe of its progrefs, it would frequently be newymodelled by the ever cetive imagination; and at laft many abfurd and fantaftic circumftances would doublefs be combined with the original truth, that death puts not an end to human exittence.

Eut theugh we are firmly convinced that the firt principles of ufeful knowledge, and among them the dodrine of a future flate, were communicated to man

## R E S <br> 127 ] <br> RES

Refarrec- by his Maker; and though this doctrine, in large and $\underbrace{\text { tion. }}$ permanent focieties, might certainly be conveyed more or lefs pure to late polterity through the channel of tra-dition-we are far from attributing fo much to tradition as fome writers are difpofed to do, or thinking it the only fource from which mankind could derive the belief of their exiftence beyond the grave. In fmall tribes of favazes fuch a tradition could hardly be preferved; and yet fome indiftinct notions of a future fate have been found among tribes who are faid to have loft all traditionary notions even of the being of a God.

Others, therefore, are inclined to believe that, independent of any traditions, mankind might be led by certain phenomena to form fome conjectures of a future ftate. They obferve, that although a few individuals perhaps may, yet it feldom happens that the whole individuals of any nation are exempted from dreaming: They obferve, too, and this obfervation is founded on experience, that the images of the dead are from the remainng impreffions of memory frequently fummoned up in the fancy; and that it appears from all the languages of rude nations, who pay the greatelt attention to their dreams, and who fpeak of fecing the dead in their vifions, that thefe images (A) have always been taken by them for realities; nay, fome of the learned, and the celebrated Baxter is of the number, are difpofed to doubt whether thefe appearances be nut fomething more than illufions of the brain: But whether they really be fo or not, one thing is certain, that all nations in all countries, in the darkelt ages and the rudeft periods, are accuftomed to dream; and whether fleeping or waking, in the ftillnefs of the night, in the gloom of tolitude, in the fondnefs of friendihip, in the rovings of love, the delirium of fever, and the anguifh of remorfe, to fee and converfe with the fhades of the

* Lucret.
lib. 4.
tion; and it is on this general principle that necro- Refurrecmancers and dreamers have in all ages eftablifhed their trade, that the fories of goblins have at all times fo very eafily procured belief, and that

The village matron, round the blazing hearth, Sufpends the infant audience with her tales, Breathing aftonifhment! Of witching rbymes
And evil fpirits; of the deathbed call
Of him who robb'd the widow and devour'd
The orphan's portion ; of unquiet fouls
Ris'n from the grave to eafe the heavy guilt
Of deeds in life conceal'd; of thapes that walk
At dead of right, and clank their chains, and wave The torch of hell around the murderer's head. Aikenside,
Mankind in general would willingly difpenfe with thefe troublefome vifits of the dead. To prevent the return of the zumbi or the ghoft, fome nations of Africa ufe many fuperftitious rites*; and Kolben tells us, * Voygge that the frighted Hottentots leave in the hut where a to Congo perfon has died all the utenfils and furniture, left the angry ghoft, incenfed at their avarice, fhould haunt them in their dreams, and infelt them in the night. Divines and moralilts have laboured to fhow that thefe are merely imaginary terrors: but God and nature feem to have determined that they fhall produce the fame effects upon certain minds as if they were real ; and that while there is any fenfibility in the heart, while there is any remembrance of the palt, and any conjuring power in the fancy; the ignorant, the benighted, the timid, thall ofren meet with the goblins of darknefs, the fpectres of the tomb, the apparitions that hover round the grave, and the forms of the dead in the midnight dream. See Spectre.

From thefe phenomena, which have been fo common Probable in all countries and in all ages, what would mankind inferences naturally infer? Would they not infer, that there is from fomething in the nature of man that furvives death, and that there is a future fate of exiftence bcyond the grave? Are not fill many fpecimens of this reafoning preferved in the ancient poets? and is it not thus that Achilles $\dagger$ reafons alter imagining that he faw the ghoft $\dagger$ Hom. of his friend Patroclus?
'Tis true, 'tis certain, man, though dead, retains
Part of himfelf; the immortal mind remains :
The form finbfints without the body's aid,
Aerial femblance, and an empty fhade.
This night my friend, fo late in battle loft,
Stood at my fide a penfive plaintive ghoft ;
Ev'n now familiar as in life he came,
Alas! how diff'rent, yet how like the fame. Pope.
Lucretius *, a Atudious obferver of nature, though * Lib. 3. no friend to the foul's immortality, acknowledges frank. ly that thefe phantoms often terrify the mind, haunt us in our fleep, and meet us while awake. He confeffes, too, that by fuch appearances mankind have been led
(A) Thefe images were called by the Greeks eidonx ©ayoytay; and among the Romans they had various names, as umbra, lemures, manes, larve, and were fometimes called occurfacula nodium, buftorum formidamina, fepulsbrim sum terriculanenta, anina errantes, which are all comprehended under the fpieies mortworum,

Refurrec- to believe the future exitence of the foul; but, aware tion. of the confequence

Creech.
We here fee how the belief of the foul's immartalisy aame to be general among mankind. But for this information we are much more indebted to the poets, who have given us faithful tranicripts of nature, than to the philifophers who have wifhed to enter tain us with their own thzories, or to thofe laborious men of erudition, who have dreaded as much to examine the

II lowing to much to bradition. fource of an ancient report as the friends of Ulyffes to them tradition is the ultimate boundary of refarch and as gorgons, chimeras, and hydras, have come down to us by traditon; fo they, with great fagacity, fur pect, that tradition mult likewife be at the bottem of the foul's immortality, and occafion the vifions and phantoms of the dead.

To tradition we have allowed all that it can jufty: claim; bat we cannot allow it to be the only fnurce of this opinion : and we have felt the highent indign tion upon hearing men of learning and genius affirm, from. a falle zeal for the bonour of revelation, that mankind, without this intruction, could never have acquired the art of building huts to fereen them from the cold, or have learned the method of propagating their fpecies! 'The reader muft not here fuppofe that we allude to Polydore Virgil (в). We have in our eye perfons.nowf alive, wi h whom we have converfed on the fubject, and who (terrified at the length to which fome philsfophers have carried the doctine of infincts, and others the reafoning powers of the mind) have contended, with the utmoft earneftnefs, that we know nothing-not even the functions of our animal nature-but by tradition or written revelation.

Having now feen the fource of the opinion concerning the future exittence of the foul, and pointed out the natural phenomena by which mankind were led to embrace it, we come next to review the arguments by which the philofophers attempted to confirm it.

Pythagoras believed, with the ret of his country, that Refurrece annihilation was never the end, and that onnentity was never the beginning, of any thing that is. His general doctrine upon this fubject was fhortly exprefled in very few words, Omnia mutantur, $n$ :bil incerit. He afterwards learned from Egyptian priefts that the foul migrates into new bodies; and being, it feems, a perfon of a moft extraordinary and aftonifing memory, he found there was fome truth in the fory: for after mufing, he began to remember that he was Euphorbus, the ion of Pantheus, that was flain by Meneldus in the Trojan war: and upon a jaunt to Peloponnefuc, recollected the hield which he had worn at the time of the fiege, in que of the temples of Juno at Argos! That none might quertion the truth of his affertion, his followers prefently removed all doubts by the famous, argument, the ipse. mixir of Egyptian origin.

As Py thagoras taught that human fuuls are frequently thrult into brute fapes, and, as fome imagined, by way of punifhment; it occurred to Plato, that all bodies, even the human, are a fort of prifons; and that, in confequence of this confinement, the foul was fubjected to the rage of defire, appetite, and pafion, and to all the wretched miferies of a jail. 'To explain this, myftery, he fuppofed that defires, and, appetites belang ta a foul that is purely animal refiding in the body. But he was perplexed with another difficulty; for as he thought highly of the goodnefs of Deity, he could not imagire how the fhould imprifon us without a crime. He fippofed, therefore, that prior to its, union with the prefent body, the foul had exilted in one of ether, which it ftill retains; but that even in this etherial body it had felt tomething of impure defire ; and happening. to indulge the vicious appetite, had contracted fome: ftains of pollution, for which it was, confued in its pre-fent body as a houle of corpention to do, penance and. improveits morals.

To prove this ideal preexitence of the fonl, Plato And niode availed himfelf of an opinion that was general in his of protime, that coincided with the-dectines of Pythagoras, and that was partly founded on a fort of realoning and obfervation. He thought that matter and intelligente are coeternal (fee Platonism) ; that there are various arders af. fouls; that thofe of both the man and the brute are parts or emanations (c) of the anima mundi, or foul of the world; that all are ultimately parts or emanations of Deity itfelf; and that all their faculties are more or lefs reftricted and confined, according to thofe organifed fyltems with which they are conneded. Know firtt (faysone delivering his docerines),

Know firf, that heav'n and earth's compacted frame, And flowing waters, and the ftarry flame,
And both the radiant lights, one common foul
Infpires, and feeds, and animates, the whole.
(B) This writer allots part of a chapter to fhow, "Quis primum infituerit artem meretriciam," as being, in his opinion, a traditionary practice. See Lib. iii. cap. i7. De Rerum Inventoribus.
(c) The Deity was conceived by the ancients fometimes as a folid, when inferior fouls were called arcor*arر.aтa, i. e. fragme ts or paris broken off from him; and fonsetimes as a fluid, when they were conlidered as aroppora: or emavation : but fom nnne of thefe hypothefes did they reafon confequanially, Their armoracofata were often afie death reuni ed to the Deity; and their areppo:a often remained feparate and diftinct for a long: while, without flowing back as they ought to have done, and mingling with the great ocean of firit.

R E S
Hefurect tion.

T"his afive mind, infus'd through all the fpace,
Unites and mingles with the mighty mars :

Hence men and bealts the breath of life obtain, And birds of air, and monfters of the main ; The ethereal vigour is in all the fame, And every foul is fill'd with equal flame; As much as earthy limbs, and grafs allay Of mortal members, fubject to decay, Blunt not the beams of heav'n and edge of day (D). $\int$

Dryden.
Befides this hypothefis, that in fome meafure was common to others, Plato had an argument peculiarly his own. Happening to peep into the region of metaphyfics, he was fomewhat furprifed on obferving the ideas which we derive from reflection and conicioufnefs; and fuppoing that they could not have entered by the fenfes, he naturally, though not very juftly, concluded, that we mult have received them in fome ftate of prior exiftence.

As, according to him, the foul was eternal, as well as the matter which compofed the body, and as their union was only temporary and accidental, he might have been fatisfied that the death of the foul was not to be the confequence of their feparation. But, fome how or other, fatisfied he was not. He had recourfe to a new argument. As the foul, he faid, was an active principle, and a felf-moving, it did not depend for its life on another; and therefore would always continue to exif, though the body were reduced to the general mafs out of which it was formed. See Metaphysics, Part III. chap. iv.

Whether Plato had borrowed any of his doctrines from the eaftern magi, we pretend not to fay. We only obferve a Ariking fimilarity, in fome refpects, between his and theirs. In Plato's philofophy, the fun, moon, and ftars, were animated beings, and a fort of divinities that originally had fprung from the great fountain of heat and light, and our earthly bodies a fort of dungeons in which our miferable fouls are benighted and debafed by defires, appetites, and paffions. In the magian philofophy, the Supreme Being was called Oromafdes ; was the god of light, or was light itfelf, and reprefented by Mithras, a fubordinate divinity, and the fame with the fun. Another deity of very great power was Arimanes, the god of darknefs, who prefided over matter, and was the origin of all evil (fee Polytheism). Vol. XVI.
$[29]$
R E S
The ancient Gnoltics, who derived their tenets from Refur. : this fource, believed, with Pythagoras and Plato, in a tion. great number of fubordinate genii ; and faid, that Demiurgus, the god of matter and the foul or fpirit of this world, had contrived the bodies of men and brutes; and in the former particularly, as in fo many prifons, had confined a number of celeftial fpirits, that by expofing hem to the low defires of appetite and paffion, he might feduce them from their allegiance to the God of light, and render them more fubmiffive to himfelf. From thefe prifons the Supreme Being was continually making attempts to refcue them; and in the mean time was frequently fending divine meffengers to enlighten and inftruct them, and to render them capable of returning to the regions of light and happinefs, to which they had belonged ( E ).

The Stoics attempted to implify this fyftem, which appears anciently to have pervaded Egypt and the ealt, and which would feem to be no more than varioully modified by Orpheus, Pythagoras, Plato, and others of the more northerly and weftern nations. None of them allowed a creation out of nothing; and the haping and modelling of matter into forms was varioufly explained, according as they happened to be moll addicied to fuperftition, to morals, or to phyfics. Some afcribed thefe operations to ancient Time, Chaos, and Darknefs, and explained the future changes in nature by the genealogies of thefe deities; fome obferving attraction and repulfion, or at leaft a fort of agreement and difcordance among bodies, were inclined to afcribe them to Friendfhip and Hatred, or Love and Antipathy ; fome obferving, that while one body rofe another defcended, made Levity and Gravity primary agents; and fome taking notice that living bodies fprung from corruption, were difpofed to confer the fame powers on Moifure and Heat.

The phyfical hypothefes were what had moft charms of the ${ }^{1 / 7}$ for the Stoics. From their fyftem immaterial beings Stoics. were openly excluded; all things were regulated by phyfical laws or inezorable fate; and all things originated in the To 'En or the Firfl One, which was probably fuggefted by the Movas of Pythagoras. This To 'Ev appears to have been a materia prima devoid of all the qualities of body. In their language it was an $A_{p \chi^{n}}$ or firft principle, not fubject to change. When it was invelted with the properties of body, it then became R
(D) The general doctrine, as delivered here in thefe verfes of Virgil, is the fame with that not only of Pythagoras, but of the Stoics.
( E ) Plato made the ftars the native refidence of inferior fouls; and when thefe were thoroughly purified bedow, returned them home again: and therefore, fays Virgil, alluding to his doctrine,
-_-Some have taught
That bees have portions of ethereal thought,
Endu'd with particles of heav'nly fires;
For God the whole created mafs infpires :
Thro' heav'n, and earth, and ocean's depth, he throws
His influence round, and kindles as he goes.
Hence flocks, and herds, and men, and beafts, and fowls,
With breath'are quicken'd, and attract their fouls :
Hence take the forms his prefcience did ordain,
And into bim at length refolve again.
No room is left for death, they mount the fky ,
And to their own congenial planetsfly. Drydran

## RES

Refurrec- a zrosxetcy or an element; and then, fo far as refpected tion. of their creed. Some thought that the foul was a fpark
nother opinion of very old date was that of the principle refides in the blood. This opinion, which is mentioned by Mofes, was adopted by Critias and others of the ancients. Harvey likewife embraced it. But Mr Hunter, who always wilhed to be thought an original, Hunter, who always wilhed to be thought an original,
inclines to ftand at the head of the opinion, and fupports it by experiments fimilar to thofe of the famed ports it by experiments fimilar to thofe of the famed
Taliacotius in mending nofes. Should any of our readers wifh to extract the foul's immortality from fuch an opinion, we mult refer them to the many refources of ingenuity, fophiftry, and logic.

Among the Jews, the belief of a future and feparate exiftence for a long time was deemed no effential article ges almoft perpetual. The gods themfelves and the fouls of men were in this fyftem only modifications of matter ( $\boldsymbol{r}$ ). Man was compofed of their four elements, Fire, Air, Water, and Earth; and upon diffolution, every part returned to the element from which it had come, as the water of a veffel fwimming in the fea unites with the ocean when the veffel is broken. This fyftem, it is plain, cannot poffibly admit of any feparate confcioufnefs of exiftence ( $G$ ). The fame may be faid of the fyftems of Democrates and Epicurus, and all thofe who undertook to explain things upon phyfical principles (н). The chief merit of the phyfical fyitems appears to be this: Abfurd as they were, it would feem from the whimfical and the almott childifh reafoning of Lucretius, that they had a tendency to lead mankind from extravagant hypothefes to fomething that was fimilar to obfervation.

What Ariftetle thought of the feparate exiftence of the foul after death is not very certain. The foul he calls an EvTens $\chi$ efa ; and if the reader can divine the meaning of the word, he perhaps can divine the meaning of the Stagyrite, and will then be a better diviner than we. At other times he fays, that the foul is fomething divine ; that it refembles the element of the ftars; that it is fomedhing of a fiery nature ; that it is the vicegerent of God in the body; and that the acutenefs of the fenfes, the powers of the intellect, with the various kinds of appetites and paffiens, depend entirely on the qualities of the blood (I).
and others. late ingenious Mr Hunter. According to him, the living
in the moving of the heart ; fome imagined that it was the breath, and that upon the diffolution of the body it naturally vanifhed into foft air. The Sadducees denied the exiftence of either angel or fpirit. Many believed the doctrine of gholts, and were accultomed to invoke them at the grave. It is hence that we hear the prophets complaining that they were feeking from the living God unto dead men. Some imagined that there was a pre-exiftence of fouls; and, in the cafe of a blind man, afked our Saviour, whether the man or his parents had finned that he was bora blind? Others inclined to a revolution of foul and body, and thought that our Saviour was either Elias or one of the old prophets returned; and a great many new-modelled their opinion of the foul's immortality according to certain paffages in Scripture. The infpired mother of Samuel had faid, "The Lord killeth and maketh alive : he bringeth down to the grave, and bringeth up." Ifaiah had exclaimed, "Thy dead fhall live; together with my dead body fhall they arife: A wake, and fing, ye that dwell in the dult ; for thy dew is as the dew of herbs, and the earth fhall caft out the dead." Daniel had declared, that many of them that fleep in the duft of the earth fhall awake to everlafting life, and fome to thame and everlalting contempt. In the vifion of the valley of dry bones, Ezekiel had feen that "at the word of the Lord" the bones came together, bone to his bone, the finews and the flefh came upon them, and the fkin covered them above, and the breath came into the bodies, and they lived and flood upon their feet. And a paffage of Job led them to fuppofe, that at fome diftant and future period a particular time, which was called the laft or the latter day, was appointed by heaven for the general refurrection of all thofe who are fleeping in their graves. "I know (fays Job) my Redeemer liveth, and that he fhall fand at the latter day upon the earth; and though after my kin worms deftroy this body, yet in my flefh fhall I fee God."

Whether thefe paffages were fairly interpreted agreeably to their true and original meaning, it is not here our bulinefs to inquire. It is fufficient for us to obferve, that from them many of the Jews inferred the reality of a general refurrection ( $k$ ). In this perfuafion, Martha, fpeaking of her brother Lazarus, fays to our Lord, "I know that he fhall rife again in the refurrection at the laft day." This refurrection appears

## RES [13I] R ES

Refurrec- to have been a general opinion among the Pharifees; tion. for although it was a notion of the fect of the Sadducees that there was no refurrection, neither angel nor fpirit, yet the Pharifees, we are told, confeffed both. And this affertion is plainly confirmed by St Paul himfelf when his countrymen accufed him before Felix," I confefs unto thee (fays this eminent apoftle), that after the way which they call berefy fo worfhip I the God of my fathers, believing all things which are written in the law and in the prophets, and having hope toward God, which they themfelves alfo allow, that there fhall be a refurrection of the dead, both of the jult and unjuft."
This refurrection of the dead to judgment, though not perhaps in the fame fenfe in which the old Phari- fees conceived it, is now generally and almoft univerfally ( L ) maintained by Chriftians ( m ). Yet the Cbriftians differ confiderably with refpect to the nature of the human foul. Some imagine, that this firit is naturally mortal, and that it is propagated along with the body from the loins of the parent. In fupport of this opinion, it has been obferved that a great number of infects and plants transfer their lives to their pofterity, and die foon after the act of propagation; that after this act the vital principle is in the mof vigorous of plants and animals always found to be much exhaufted; and that Tertullian a father of the church, in attempting fome experiments of the kind, became fubject to a momentary blindnefs, and felt a portion of his foul going out of him ( N ).
Thefe imagine that immortality was only conditionally promifed to man ; that Adam forfeited this immortality by his difobedience ; and that Chrift has reftored us to the hopes of it again by his fufferings and death: for as in Adam we have all died, fo in Chrift, they fay, we fhall all be made alive; and that now the fling is taken from death, and the victory over our fouls from the grave.

Others have conceived the human foul as naturally immortal, and as fetting death and the grave at defiance. Adam, they fay, died only in a figure; and only from the confequences of this figure, which means
fin, has our Lord faved us. In this fenfe Adam died Refurret. on the very day in which he had finned; or he died li. terally in 1000 years, which with the Lord are as one day. To thefe arguments their opponents reply, What then is the victory over death and the grave? You mult Aill have recourfe to a new figure, and betake yourfelves to the fecond death; though, after all, where is your grave? To this it is anfwered, that the foul of itfelf is naturally immortal, and that it depends not either for its exiftence or the exercife of its faculties upon the body; that the properties of matter, as figure, magnitude, and motion, can produce nothing that is like to perception, memory, and confcioufnefs. This is true, rejoin their opponents; but befides thefe few properties of matter, which are only the objects of that philofophy whith has lately and properly been termed mechanical, the chemical philofophy has difcovered other properties of matter ; has found that matter is of various kinds; that it very often does not act mechanically ; that it acquires many new properties by combination; and that ne man, till farther experiment and obfervation, fhould venture to affert how far the foul is or is not dependent on its prefent organifed fyftem. The others, proceeding on their hypothefis, maintain that the foul, as being immaterial, is not divifible; and though the body of a frog may live without the head for a whole day ; though the body of a tortoife may live without the head for a whole month ; th ugh a human limb may for fome minutes after amputation continue to perform a vical motion, independent of a brain, a ftomach, or a heart; and though the parts of a plant, a polype, or a worm, may furvive their feparation and become living wholes*, *See Folyyet the foul, they obferve, is not to be compared with pusand Re... the vital principles of plants and animals, nor ought to production. be divided on reafons fo flender as thofe of analogy. Even granting, they fay, that the foul were not naturally immortal of itfelf; yet the juftice of God, which is not remarkable for its equal diftribution of rewards and punilhmeats in the prefent world, is bound to make fome amends in the next. And to this again their opponents anfwer, as to the equal diftribution of juftice in a future world, of that we are alfured on much betR 2
dee paraphraf of the Canticles, afferting that the prophet Solomon had faid, "When the dead fhall revive, it fhall come to pafs that the Mount of Olives fhall be cleft, and all the dead of Ifrael fhall come out from thence; and the juft too that died in captivity fhall come through the way of the caverns under the earth, and fhall come forth out of the Mount of Olives." He has likewife quoted Saunderfon's Voyage to the Holy Land, in which, we are told that many of the Jews, by their own account, are to rife up in the valley of Jehofaphat; and that in the rowling or devolution of the caverns, thofe at a diflance muft fcrape their way thither with their nails.
(L) The fect of the Quakers explain it figuratively.
(M) The laft quoted author * (Refurrection of the fame Body, afferted from the traditions of the Heathens, $\dagger$ How, the ancient Ferus, and the primitive Church) has endeavoured to flow that this doctrine, in the fame fenfe as we undertand it, has been afferted by the ancient magi, and by the prefent heathen gaurs of Perfia, the relics of the ancient magi; by fome of the ancient Arabians; by fome of the banians of India; by the prefent inhabitants of the inland of Ceylon, of Java, of Pegu, of Tranfiana; by fome amongीt the Chinefe; by the Arderians in Guinea ; and by the ancient Pruffians. The proofs which he beings, it muft be confeffed, are not however always very fatisfactory. It appears, even from his own account, that fome of thefe had derived their notions from certain Chritians, Mahometans, or Jews. But the reader may judge of the great accuracy of his ideas from his bringing old Pythagoras and the Stoics, and even Democritus and Epcurus, in fupport of the fame or a fimilar opinion.
( N ) In illo ipfo voluptatis ultimæ aftu quo genitale virus expellitur, nonne aliquid de anima quoqe fentimue cxire, atque adeo marceffimus et devigefcimes cum lucis detrimento.

## R ES <br> $[132]$ <br> R E S

Refurrec- ter grounds than any of your's: our Lord has declared tion.
it in exprefs terms ; and whether the foul be immortal or not, we can eafily believe what he faid is true, as we know him whom we have trufted.

Thefe, with Plato, fuppofe, that the foul is here as in prifon ; though how or at what time it fhould firf have come into this dungeon they have not determined. They have only agreed, that upon its enlargement all its faculties are to receive an increafe of power; and " liaving already equipped it fo exquifitely with confcioufnefs, activity, and perception in and of itfelf, and pur it into fo complete a capacity for happinefs and mifery in a feparate flate," their hypothefis does not require them to admit the leaft occalion for a refurrection; which accordingly is faid to have been an article of Baxter's creed (o).

A third opinion, which extends likewife to every fpecies of plant and animal, is, that all fouls were created at once with bodies of ether; that thefe bodies, occupying only a very fmall Space, were packed up in their firt progenitors, and there left to be afterwards evolved and clothed with matter of a groffer kind by acts of generation and confequent nutrition. For the froof of this theory we are referred to the fmall animals feen through the microfcope; and likewife to thofe which are fuppofed to efcape even microfcopic obfervation; but, above all, to the eggs of infects, which, though fcarcely perceptible, yet contain in embryo a future caterpillar and all its coats, and within thefe a future butterfly with its leg's and wings. Thefe philofophers can perhaps account for the general taint of original fin in fome other way than has hitherto been done. We have only to add', that on their fcheme the refurrection is not a matter that feems to be indifferent.

The next thing that falls to be confidered is the place of the dead. From a natural enough affociation of ideas, an opinion had very early prevailed, that the fpirit continued near to the body; and the offerings therefore intended for the dead were by moft nations prefented at the grave; and that on which the departed fpirit is fuppofed to reft is always placed near the grave in China.

From the dreams of the night and the natural tendency of the fancy. to work and to fummon up fpectres when the world around us is involved in darknefs, it has alfor been imagined, that thefe fpirits delight in the night and fhadow of death ( P ), or have been prohibited from enjoying the exhilatating beams of day. And hence we are told,

That in the difmal regions of the dead
Th' infernal king once rais'd his horrid head;
Leap'd from his throne, leit Neptune's arm fhould lay His dark dominions open to the day,
And pour in light.
The nations, therefore; who have fancied a general recaptacle for the dead, have thus been induced to
place it in the weft $(Q)$, where the night begins and Refurrecthe day ends. That part of the world which, in the divifion of his father's dominions, fell to Pluto the in$\underbrace{\text { tion. }}$ fernal god, and where, according to Lactantius, Satan In the 24 holds the empire of darknefs, the Friendly Iflanders weft. have placed to the weftward of a certain inland which they call Tejec; fome tribes of American Indians, in a country beyond the weftern mountains; and Homer, fomewhere to the weltward of Greece at the boundaries of the ocean,

Where in a lonely land and gloomy cells
The dulky nation of Cimmeria dwells;
The fun ne'er views th' uncomfortable feats
When radiant he advances nor retreats.
Unhappy race! whom endlefs night invades,
Clouds the dull air, and wraps them round in fhades.
Another opinion entertained by the Greeks and fome Under the other nations was, that the place of departed firits is earth. under the earth. This opinion is frequently mentioned in Homer, in Virgil, and alluded to by the Jewifh prophets. As for the prophets, we know the circumftance from which they burrowed it: it was borrowed from thofe fubterraneous vaults where their chiefs were buried, and which have been defcribed by modern travellers. In the fides of theie caverns there is ranged a great number of cells; and in thefe cells the mighty lay in a fort of ftate, with their weapons of war and their fwords at their head. To thefe kinds of Egyptian cemeteries Ezekiel alludes, when he fays, "that they fhall" not lie with the mighty that are fallen of the uacircumcifed, who are gone down to hell with their weapons of war, and they have laid their fwords under their head." And Ifaiah, when thus fpeaking of the prince of Babylon, "Thou fhalt be brought down to hell, to the fides of the pit. Hell from beneath is moved for thee, to meet thee at thy coming ; it firreth up the dead for thee, even all the chief ones of the earth; it hath raifed up from their thrones all the kings of the nations. All the kings of the nations, even all of them, lie in glory, every one in his own houfe."

Many of the ancient fathers of the church afferted in hideen only, that the dead are now in abditus receptaculis, or in receptacertain hidden and concealed-places. cles.

Orpheus, Origen, and fome others of the fathers, 27 with the ancient Caledonian bard Oflian, and the learn. In the air. ed 'Dodwell among the moderns, imagined that the' foul, when it left the body; went into the air, and refided fomewhere between the furface of the earth and the moon.

Thofe who believed in a tranfmigration catufed the In new bo foul at death only to enter a new body, and kept the dies. departed always with the living. This creed has been found in Ithia, in Egypt, in Mexico, and in all thofe conntries where picture-writing has been much ufed: In this fpecies of writing, the fame picture is on fancied analogy transferred by metaphor to fignify either
(o) An Hifforical View of the Controverfy concerning an Intermediate State, and the Separate Exifence of ibe Soul.
(P) Some Turkifh ghofts are an exception, who ufe lamps or candles in their tombs, when their friends choofe to fupply them with thefe luxuries.
 "O my friends! which is the weft or which is the eaft, the place of darknefs, or that of the moring ; ye canent learn,"

Refurrec- ther a god or a man, a brute or a plant; and in thofe $\underbrace{\text { tion. }}$
countries where it was practifed, men had ufually their names from animals, and were reprefented by their figure in writing ( R ). From this laft fage of the procefs, a tranfmigration was eally fuppofed : and hence we hear of the gods of Egypt wandering about like fo many vagrants in brute fhapes, and of princes being tranflated into ftars, becaufe a ftar was their emblem in hieroglyphic, or ftood for their name in figurative language. And, in like manner, we fee, from the fpecimen of this character which is ftill preferved on celeftial globes, how the heavens at firt came to be filled with bears, fcorpions, and dragons, and with a variety of other animals.

The opinions concerning the ftate of the dead are ftill more numerous than thofe concerning the place where they refide. Rude nations have generally thought that the future ftate is fimilar to the prefent ; that plants, animals, and inanimate things there, have their fhades; and that thefe contribute as much to the pleafures and conveniences of the dead as their realities do to the living; that hufbands have their wives (s), lovers their miffreffes, warriors their battles, huntfmen their fport ; and that all their paffions, amutements, and bulinefs, are the fame as formerly. For this reafon, that the dead may not appear unprovided in the next world, like the ancient Gauls, fome tribes of India, America, and Africa, bury with them in the fame grave their wives, their arms, their favourite animals, and their neceffary utenfils.

The ancient Egyptians, who believed in tranfmigration, fuppofed that the foul was after death obliged to animate every fpecies of bird and quadruped, of reptile and infect, and was not to return to a human form till after a period of 3500 years. Others have confined their tranfmigrations to particular animals, as the foul of man to the human form, and the foul of the brute to the bodies of the fpecies to which it belonged. Some have changed the brute into man, and man into the brute, that man might fuffer injuries fimilar to what he bad inflicted, and the brute retakiate what he had fuffered. Others have confined the human foul in plants and in flones; and Bell of Antermony mentions an Indian who fuppofed that his anceltors might be in fifhes.

The notions of Hemer were probably thefe of many of his time. But thefe notions were difmal indeed. When his hero Ulyffes vifited the fhades, many of the ghofts feemed to retain the mangled and ghaftly appearance
which they had at death; and, what is worfe, feemed Refu"tect to be all ftarving with hunger, innumerable multitudes, with loud fhrieks, flocking to the fteams of his flain victim as to a moft fumptuous and delicious banquet.
For fcarcely had the purple torrent flow'd, And all the caverns fmok'd with freaming blood, When, lo! appear'd along the dufky coalts Thin airy fhoals of vifionary gholts;
Fair penfive youths, and foft enamour'd maids, And wither'd elders, pale and wrinkl'd fhades.
Ghaftly with wounds, the forms of warriors flain;
Stalk'd with majeftic port, a martial train.
Thefe, and a thoufand more, fwarm'd o'er the ground,
And all the dire affembly fhriek'd around.
Ulyffes faw, as ghoft by gholt arofe,
All wailing with unutterable woes.
Alone, apart, in difcontented mood,
A gloomy hade, the fullen $A_{j a x}$ ftood;
For ever fad, with proud difdain he pin'd,
And the loft arms for ever ftung his mind.
Upon Ulyfes faying to Acbilles,
Alive', we hail'd thee with our guardian gods;
And, dead, thou rul'ft a king in thefe abodes;
The flade reply'd:
'Lalk not of ruling in this dol'rous gloom,
Nor think vain words (he cry'd) can eafe my doom;
Rather I choofe laborioufly to bear
A weight of woes, and breathe the vital air,
A slate to some poor hindthat toilsfor bread,
Than livena scepter'd monarch of the dead.
In this gloomy region no one is rewarded for his virtue, nor is punifhed for his crimes, unlefs committed, like thofe of Sifyphus, Tantalus, and Ixion, againit the gods. All indeed are claffed into groups, from a certain analogy of age, fex, fate, and difpofition; but all appear to be equally unhappy, having their whole heart and affections concentrated in a world to which they are fated never to return.
The Elyfium of Homer is allotted only for the relations and defcendants of the gods; and Menalaus goes to this country of perpetual fpring ( T ), not as a perfon of fuperior merit, but becaufe he had married the daughter of Jove.

Even long after a future ftate had become the feene Bccomes a of rewards and punifhments, thefe for the moft part place of rewere diffributed, not according to moral, but phyfical wards and diftinctions. With the Greeks and Romans, the foul punifhwas condemned to many calamities for a number of ments.

years,
(R) A military gentleman who refided at Penobfot during the late American war, affured us that the Indians, when defired to fubfribe a written argreement, drew always the pisture of the objeck or animal whofe name they bore. But for fuller information on this fubject, fee Clavigero's Hift. of Mexico.
(s) The queftion which the Sadducees put to our Saviour about the wife of the feven brothers, is a proof that the Pharifees thought there was marriage and giving in marriage in the future flate, and that it was fomewhat fimilar to the preifent.
( r ) Homer fends the ghof of Hercules to the fhades, while Hercules himfelf is quaffing nectar with Hebe in the fkies. One foul of the hero is therefore repining with the ghofts of motals in the regions below, while the other is enjoying all the happinefs of the gods abjve. (See ODxssey, B. II. near the enit). Philofophers fince have improved on this hint of the poet; and men have now got vational, animal, and vegetable fouls, to which fometimes a fourth one is added, as properly belonging to matter in general. Homer infinuates, that Menelaus was to be tranflated to Elyfum wichout taitiny death. This Elyfum is the habitation of men, and
 1, 43. in the Greek.

## R E S <br> RES

Refurrcu- years, if the body was not honoured with funeral rites tion. Among the Scandinavians, a natural death was attended with infamy, while a violent death, particularly in battle, gave a title to fit in the halls of Odin, and to quaff beer from the ikulls of enemies. Among the Tlafcalans, it was only the great that were permitted to animate birds and the nobler quadrupeds; the lower

33 There at firf diftributed according to phyfical diftinctions;
ranks were transformed into weafels, into paultry beetles, and fuch mean animals. Among the Mexicans, thofe who were drowned, who died of a droply, tumors, or wounds, or fuch like difeafes, went along with the children that had been facrificed to the god of water, and in a cool and delightful place were allowed to indulge in delicious repafts and varieties of pleafures: thofe who died of other difeafes, were fent to the north or centre of the earth, and were under the dominion of the gods of darknefs. "The foldiers who died in battle, or in captivity among their enemies, and the women who died in labour, went to the houfe of the fun, who was confidered as the prince of glory. In his manfions they led a life of endlefs delight. Every day the foldiers, on the firt appearance of his rays, hailed his birth with rejoicings and with dancings, and the mufic of inftruments ard voices. At his meridian they met with the women, and in like feltivity accompanied him to his fetting. After four years of this glorious life, they went to animate clouds, and birds of beautiful feathers and of fweet fong; but always at liberty to rife again, if they pleafed, to heaven, or defcend to the *Clavige- earth, to warble their fongs, and to fuck flowers*."

Thefe fentiments of a future ftate, conceived in a favage and a rude period, could not long prevail among an enlightened and civilized people. When the times of rapine and violence therefore began to ceafe; when focieties regulated by certain laws began to be eftablifh ed; when martial prowefs was lefs requifite, and the qualities of the heart had begun to give an importance to the character, the future fate was allo modelled on a different plan. In the Aneid of Virgil, an author of a highly cultivated mind, and of polifhed manners, it becomes a place of the moft impartial and unerring juftice; every one now receives a fentence fuited to the actions of his palt life, and a god is made to prefide in judgment;

Who hears and judges each committed crime,
Inquires into the manner, place, and time.
The confcious wretch mult all his acts reveal,
Loth to confefs, unable to conceal,
From the firt moment of his vital breath,
To the laft hour of unrepenting death.
The fpirits of the dead no longer mingle together as in the lefs enlightened period of Homer; the vicious are difmiffed to a place of torments, the virtuous fent to regions of blifs : indifferent characters are con* Or para- fined to a limbus*; and thofe who are too virtuous for enter heaven without preparation, are for fome time detained in a purgatory.

[^0]When thus purified, they become fitted to receive Refurrecthe rewards of their pait virtues, and now enter into thofe regions of happinefs and joy.

With ether vefted, and a purple fiky, The blifsful feats of happy fouls below, Stars of their own, and their own funs they know; Where patriots live, who, for their country's good, In fighting fields were prodigal of blood. Priefts of unblemilh'd lives here make abode, And poets worthy their infpiring god; And fearching wits, of more mechanic parts, Who grac'd their age with new-invented arts: Thofe who to worth their bounty did extend; And thofe who knew that bounty to commend.
Thefe good men are engaged in various amufement, according to the tafte and genins of each. Orpheus is Atill playing on his harp, and the warriors are fill delighted with their chariots, their horfes, and their arms.

The place of torment is at fome diftance.
A gaping gulph, which to the centre lies,
And twice as deep as earth is diftant from the fkies;
From hence are heard the groans of ghofts, the pains
Of founding lathes, and of dragging chains.
Here, thofe who brother's better claim difown,
Expel their parents, and ufurp the throne;
Defraud their clients, and, to lucre fold,
Sit brooding on unprofitable gold.
Who dare not give, and even refufe to lend,
To their poor kindred, or a wanting friend.
Vaft is the throng of thefe; nor lefs the train Of lufful youths for foul adult'ry flain.
Hofts of deferters, who their honour fold, And bafely broke their faith for bribes of gold:
All thefe within the dungeon's depth remain,
Defpairing pardon, and expecting pain.
The fouls of babes, of unhappy lovers, and fome ${ }^{38}$ others, feem to be placed in a paradife of fools re- His para fiding in a quarter diftinct from Elyfian Tartarus and fools. Purgatory.

It is curious to obferve, how much thefe ideas of a future fate differ from the wague and fimple conjectures of rude nations; and yet from their fimple and rude conjectures, we can eafily trace the fucceffive changes in the writings of Homer, Plato, and Virgil ; and may eafily fhow, that thofe laws which different nations have prefcibed for their dead, have always borne the frongeft analogy to their flate of improvement, their fyftem of opinions, and their moral attainments. Some nations, as thofe of India, have fancied a number of heavens and hells, correfponding to fome of their principal fhades in virtue and vice; and have filled each of thefe places refpectively with all the fcenes of happinefs and mifery, which friendfhip and hatred, admiration, con. tempt, or rancour, could fuggelt. But having already obferved the progrefs of the human mind in forming the grand and leading ideas of a future ftate, we mean not to defcend to the modifications which may have occurred to particular nations, fects, or individuals.

The belief of Chritians refpecting futurity demands The ftate our attention, as being founded on a different principle, of the dead namely, on exprefs revelation from heaven. From as revealed many exprefs declarations in Scripture, all Chrifians in Scripfeem to be agreed, that there is a heaven appointed for ture.

## R E S

Refurrec- the good and a hell for the wicked. In this heaven tion.

40
The uature
of heaven,
the faints dwell in the prefence of God and the uninterrupted fiplendors of day. Thofe who have been wife fhine as the firmament, and thofe who have converted many to righteoufnefs as the ftars. Their bodies are glorious, immortal, incorruptible, not fubject to difeate, to pain, or to death. Their minds are ftrangers to forrow, to crying, to difappointment; all their defires are pretencly iatistied; while they are calling, they are anfwered; while they are fpeaking, they are heard. Their mental faculties are alfo enlarged; they no more fee things obfcurely, and as through a cloud, but continually beholding new wonders and beauties in creation, are conitantly exclaiming, "Holy, holy, holy! is the Lord of Hotts, worthy is he to receive glory, and honour, and thankfgiving; and to him be afcribed wifdom, and power, and migbt; for great and marvellous are his works, and the whole univerfe is filled with his glory."

Their notions of heil differ confiderably. Some underitanding the Scriptures literally, have plunged the wicked into an abyfo without an:y bottom; have made this gulph darker than nighr; have filled it with rancorous and malignant fpirits, that are worfe than furies; and have decciibed it as full of fulphur, burning for ever. This frightiul gulph his by fome been placed in the bowels, of the earth; by fome in the fun; by fome in the moon; and by fome in a comet: but as the Scriptures have determined nothing on the fubject, all fuch conjectures are idle and groundlefs.

Others imagine, that the fire and fulphur are here to be taken in a figurative fenfe. Thefe fuppofe the torments of hell to be troubles of mind and remorfes of confcience; and fupport their opinion by obferving, that mattor cannot act upon fpirit; forgetting, perhaps, that at the refurrection the fpirit is to be cloched with a body, and, at any rate, that it is not for man vainly to prefcribe bounds to Omnipotence.
What feems to have tortured the genius of divines much more than heaven or hell, is a middle itate. On this fubject there being little revealed in Scripture, many have thought in incumbent upon them to fupply the defect ; which they feem to have done in different ways. From the Scriptures fpeaking frequently of the dead as lleeping in their graves, thofe who imagine that the powers of the mind are dependent on the body, fuppofe that they fleep till the refurrection, when they are to be awakened by the trump of God, reunited to their bodies, have their faculties reftored, and their fentence awarded.

This opinion they fupport by what St Peter fays in the Aets, that David is not afcended into heaven; and that this patriarch could not poflibly be fpeaking of himfelf when he faid, "Thou wilt not leave my foul in hell, i.e. the place of the dead." They obferve, too, that the victory of Chrift over death and the grave feems to imply, that our fouls are fubject to their power; that accordingly the Scripture fpeaks frequently of the foul's drawing near to, of its being redeemed from, and of its defcending into, the grave ; that the Pfalmift, however, declares plainly, that when the breath of man goeth forth, he returneth to his earth, and that very day his thoughts perifh. And hhould any one choofe to con. fult Ecclefialtes, he will find, that the living know that they thall dic, but that the dead know not any thing : that their love, and their hatred, and their envy, are $f$ erifhed; and that there is no work, nor device, nor

1351 R E S
widdom, nor knowledge, in the grave, whither they Refurrec are gone.

Thofe who believe that the foul is not for the exer. $\underbrace{\text { curn }}_{44}$ cife of its faculties dependent on the body, are upon its According feparation at death obliged to difpofe of it fome other to others, a way. In eftablifhing their theory, they ufazlly begin flate of with attempting to prove, from Scripture or tradi- confcious tion, both its active and feparate exiftence; but with proofs from tradition we intend not to meddle. Their arguments from Scripture being of more value, deferve our derious confideration; and are nearly as follow.

Abraham, they fay, Ifaac, and Jacob, are Aill living, becaule Jehovah is their God, and he, it is allowed, is not the God of the dead, but of the living. But their opponents reply, That this is the argument which our Saviour brought from the writings of Mofes to prove a future refurrection of the dead; and that any perfon who looks into the context, will fee it was not meant of a middle ftate. From the dead living unto God, our Saviour infers nothing more than that they fhall live at the refurrection; and that thefe gentlemen would do well in future to make a diftinction between fimply living and living unto God : For though Abranam, Ifaac, and Jacob, be living unto God, our Saviour has alfured us that Abraham is dead, and the prophets dead.

A fecond argument is that glimpfe which St Paul had of paradife about 14 years before he had written his Second Epiftle to the Corinthians. To this argument their opponents reply, That as St Paul could not tell whether, on that occafion, he was out of the body or in the body, it is more than probable that the whole was a vifion; and, at any rate, it is no proof of a feparate exiltence.

A third argument is, St Paul's wilhing to be abfent from the body, and prefent with the Lord. But, fay their opponents, St Paul defired not to be unclothed, but to be clothed upon: and as fome of thofe who maintain a feparate exiltence, bring Scripture to prove that the body || continues united to Chrift till the refurrection; in that cafe, St Paul, if he wifhed to be prefent with the Lord, lhuuld have rather remained with his body than left it.

A fourth argument is, the appearance of Mofes and Elias upon the mount of transfiguration. To which their opponents reply, that thefe faints appeared in their bodies; that Elias was never divefted of his body; and that the account which we have of the burial of Mofes, has led fome of the ableft critics and foundelt divioes to conciude, that he was likewife trandated to heaven without talting death. At any rate, fay they, he might have been raifed from the dead for the very purpole of being prefent at the transfiguration, as the bodies of other faints certainly were, to bear teltimony to our Lord's refurrection and victory over the grave.

A fifth argument is, what our Saviour faid to the thief, "Verily I fay unto thee, to-day thou thalt be with me in paradife." The objection ufually made here is, that the expreffion is evidently ambiguous, and that the fenfe depends entirely on the punctuation: for if the point be placed after ta-day, the meaning will be "Verily, even now, I tell thee, thou fhalr be with me in paradife." But the impart of paradife in this place, fay the opponents, is likewife doubtful. We learn from St Peter's explanation of the 1 6th Plalm, that our $S_{3}$.

that the
foul after death entersa flate of rewards and punifhments in a certain degree.
that on the day of his crucifixion he went not to heaven : for after he had rifen from the place of the dead, he forbade one of the winmen to touch him, as he had not yet afcended to the Father. Hell, therefore, and paradife, continue they, feem to be in this paffage the very fame thing, the place of the dead; and our Saviour's intention, they add, was not to go to heaven at that time, but to fhow his victory over death and the grave, to whofe power all mankind had become fubjectrby the difobedience of their firl parents.

Without pretending to enter into the merits of this difpute, the ingenious Burnet, in his Theory of the Earth, endeavours to prove, upon the authority of the ancient fathers, that paradife lies between the earth and the moon; and the learned Dodwell, on the fame authority, has made it the common receptacle of fouls till the refurrection; but has not told us. whether or not they are to be accountable for the actions of this feparate exiftence at the latter day, or are only to be judged according to the deeds that were done in their bodias.

This notion of a common receptacle has difpleafed many. The fate of purgation, obfcurely hinted in the doctrines of Pythagoras, and openly avowed by Plato and Virgil, has been adópted by the Romilh divines, who fupport their opinion on certain obfcure paffages of fcripture, which are always of a yielding and a waxen nature, may eafily be twifted to any hypothefis, and like general lovers efpoufe rather from intereft than merit.

It has difpleafed others, becaufe they are anxious that the righteous flould have a fore-tafte of their joys, and the wicked of their törments, immediattely after death, which they infer to be certainly the cafe from the parable of the rich man and Lazarus (v). But to this it is objected, that the rich man is fuppofed to be in hell, the place of torments, and that this punifhment ought not to take place on their own hypothefis till after the fentence at the refurrection.

Another argument ufed for the intermediate ftate is the vifion of St John in the Apocalypre. In this vifion the Evangelift faw under the altar the fouls of thofe that were flain for the word of God and for the teftimony which they held. Their opponents doubt whether thefe vifible fouls, were immaterial, as St John heard them cry with a loud voice, and faw white robes given unto every one of them. If they had bodies, that circumftance might chance to prove a refurrection immediately after death, and fo fuperfede the general refurrection at the laft day.

While fuch conclufions as are here drawn from the parable and vifion, fay the oppofers of an intermediate confcious exiftence, imply that the dead are already raifed, and are now receiving the refpective rewards of their virtues and their crimes; thofe who maintain an intermediate feparate exiftence, who fpeak of the body as a prifon, and of the foul as receiving an increafe of power when freed from the body, are certainly not more than conifitent with themfelves, when they think that this foul would derive an advantage from its after union with either a new fyftem of matter or the old one, however much altered. Baxter, they fay, who faw the in-
conffetency, was difpofed to reafon fomewhat like R. Refirrecr neas,

## O, Father! can it be that fous fublime

Return to vifit our terreftrial clime?
Or that the gen'rous mind, releas'd at death, Should covet lazy limbs and mortal breath ?
In no one inftance, they continue, have Chriftians perhaps more apparently than in this argument wrefted the Scriptures to their own hurt: by thus rafhly attempting to accommodate the facred doctrines of religion to a preconceived philofophical hypothefis, they have laid themfelves open to the ridicule of deifts, and have been obliged, for the fake of confiltency, either to deny or to feak flightingly of the refurrection; which is certainly the fureft foundation of their hope, feeing St Paul hath affured us, that if there be no refurrection of the dead, then they which are fallen afleep in Chrift are perifhed, and thofe who furvive may eat and dink, and act as they pleafe, for to-morrow they die; and die, too, never tơ live again.

Though this reproof may be rather fevere, we are forry to obferve that there feems to have be been fometimes too much reafon for it. A certain divine $\dagger$, whofe + DrWatts. piety was eminent, and whofe memory we refpect, having written "An Effay toward the proof of a feparate Sate of Souls between Death and the Refurrection, and the Commencement of the Rewards of Virtue and yice immediately after death," has taken this molto, "Becaufe fentence againft an evil work is not executed fpeedily; therefore the heart of the fons of men is fully fet in them to do evil." "The doctrine, he fays, of the refurrection of the body and the confequent fates of heaven and of hell, is a guard and motive of divine force, bat it is renounced by the enemies of our holy Chriftianity ; and Jhould we give up the recompenfes of feparate fouls, while the deif denies the refurrection of the body, I fear, between both we fhould fadly enfeeble and expofe the caufe of virtue, and leave it too naked and defencelefs."

This author, who wifhes much that the punifhment of crimes thould follow immediately after death, is of opinion, that if heaven intended to check vice ard impiety in the world, it has acted unwifely, if it really has deferred the punifment of the wicked to fo late a period as the refurrection. "For fuch, he obferves, is the weaknefs and folly of our natures, that men will not be fo much influenced and alarmed by ditant profpects, nor fo folicitous to prepare for an event which they fuppofe to be fo very far off, as they would for the fame event if it commences as foon as ever this mortal life expires. The vicious man will indulge his fenfualities, and lie down to fleep in death with this comfort, I fhall take my reft here for 100 or 1000 years, and perhaps in all that face my offences may be forgotten; or let the worlt come that can come, I fhall have a long fweet nap before my forrows begin: and thus the force of divine terrors is greatly enervated by this delay of punifhment."

Thus far our author, who thinks that his bypothefis, if not true, is at leaft expedient, and that from motives of expediency it ought to be inculcated as a doctrine
(u) Whitby fhows that this parable was conformable to the notions of the Jews at that time ; and even the Mahometans, who believe in the refurrection of the dead, fuppofe likewife a fate of rewards and punifiments in the grave.

## RES $\left[\begin{array}{ll}137\end{array}\right] \quad$ RES

Refurrec trine of Scripture; but how far his reafors can be tion. here jultified we mean not to determine; we fhall leave that to be fettled by others, reminding them only that the diftance of future rewards and punifhments is not greater on the fuppofition of the fleep of the foul than on the contrary hypothefis. Every man who has but dipt into the fcience of metaphyfics knows, and no man ever knew better than he who is believed to have been the author of the work before us, that time unperceived paffes away as in an inttant ; and that if the foul be in a ftate void of confcioufnefs between death and the refurrection, the man who has lain in his grave 1000 years will appear to himfelf to have died in one moment and been raifed in the next. We would likewife recommend to thofe who may henceforth be inclined to inculcate any thing as a doctrine of Scripture merely on account of its fuppofed expediency, always to remember that God is above, that they are below, that he is omnifcient, that they are of yefterday and know little, that their words therefore fhould be wary and few, and that they fhould always fpeak with re$f_{\text {peet }}$ of whatever concerns the Sovereign of the univerfe, or relates to his government either in the natural or moral world. For wilt thou, fays the Higheft, difannul my judgment? Wilt thou condemn me that thou mayeft be righteous? Shall he that contendeth with the Almighty inftruct him? He that reproveth God let him anfwer it.

If , in ltating thefe oppofite opinions, we may feem to have favuured what has been called the fleep of the foul, it is not from any conviction of its truth, for there are particular texts of Scripture which appear to us to militate againft it. We are fatisfied, however, that it is a very harmlefs opinion, neither injurious to the reft of the articles of the Chriftian faith nor to virtuous practice; and that thofe who have poured forth torrents of obloquy upon fuch as may have held it in fimplicity and godly fincerity, have either miltaken the doctrine which they condemned, or been poffeffed by peatedly - in tands on a different bafis. It is repeatedly af parety Scripture.
that the dofrice of a refurrection wis one of thore trutiss which he came to announce. Bo llan that fuch an event was poffible, he reftored to life the daughter of Jairus, a ruler of the fynagogue, a young mata of Nain, who was carried out con his bier to be buried, and his friend Lazarus, whofe bcdy at the time was theught to have become the prey of corruption. Though the two firf of thefe miracles were wrought in the prefence of a number of witneffes, yet the latt, owing to particular circumitances, produced a much greater noife among the Jews. It was performed on a perfon feemingly of fome note, in the village of Bethany, not far from Jerufalem, and in the prefence of a great many perfons who from the metropolis had come to condole with Mary and Martha. No doubts were entertai:.ed of the reality of Lazarus's death. Our Lord was at a diftance when he expired, and his body had already been lying for fome days in the grave. When he came forth at the voice of our Lord, all were altonifhed. Thofe from Jerufalem, on returning home, are impatient to relate what they had feen; thofe who heard of fo memorable an event cannot conceal it ; the report reaches the ears of the Pharifees and chief priefts. They are foon made acquainted with every circumftance; and dreading the iffue, they think it neceffary to call a council upon the occafion, and concert the meafures that ought to be purfued in a matter which was likely to be attended with fo many and important confequences. In this council, it feemed to be agreed that our Lord had performed, and was atill continuing to perform, many miracles: That this laft miracle, as being of an extraordinary kind, would make many converts; and that if meafures were not fpeedily taken to prevent thefe uncommon difplays of his power, all would believe on him : the jealoufy of the Romans would be excited, the rulers depofed, and the nation of the Jews deprived of its few remaining privileges. Yet, notwithftanding thefe private conceffions made in the council, the members who dreaded to let their fentiments be known to the people, affect in public to treat our Saviour as an impoltor. But he who already had demonltrated the abfurdity of their opinion, who fuppofed that his miracles were wrought by Beelzebub prince of the devils, is again ready to confute the ridiculous affertion of thofe who pretended to fay that they were a deception. His friend Lazarus was fill living at the diftance of only a few miles, and many of the Jews who had gone to fee him were ready to atteft the truth of the report. If the rulers, apprehending the confequences of the truth, be afraid to know it, and if they are unwilling to go to Bethany, or to fend for Lazarus and thofe who wele prefent at his refurreft:on, our Lord gives them a fair opportunity of detesting his fraud, if there was any fuch to be found in him. To preferve their power, and remove the jealous fufficion of the Romans, it had been already determined in council to put him to death; and S
(x) Perhaps no man has been more culpable in this refpect than the celebrated Warburtnn, who feems at firlt to have himfelf denied an intermediate flate of confcious exiftence. He afterwards imagined that fuch a Itate is fuppofed, though not exprefsly afferted, in Scripture; and it lait he maintained it with all the 7 ,eal and warmth of a profelyte. To prove the fincerity of his converion, he treated his adverfaries with icurrilous nicknames, banter, and abufe; a feecies of reafoning which feldnm fucceeds in recommonding a bad caufe, and which wever coufers credit on one that is good.

Referre:- our Lord foretels that the third day after his death he tion. Ghall rife from the grave. Here no place was referved for deception. The fect of the Pharifees and the chief pricfls are openly warned and put upon their guard; and, very fortunately for the caufe of Chriftianity, this fingular prediction was not heard with fcorn, or indeed, if with fion, it was only affected. We know from the fentiments expreffed in the courci!, that our Lord was fecretly doeaded by the rulers; that his miracles were far from being difcredited; and that his predictions in their private opinion, were not to be flighted. The means accordingly which they employed toprevent, even in the very appearance, the completion of his prophecy, were admirably calculated to remove the fcruples of the molt waryand feeptical inquirers, if their object was only to fearch after truth. At the next feftival of the paffover, when the fcheme of Caiaphas was put in execution, and when it was deemed expedient by the council that he fhould die, to fave the nation from the jealoufy of the Romans; as a proof of their fteady loyalty to Rome he was apprehended, was tried as an enemy to her government, was at laft condemned upon falfe evidence, and fufpended on a crofs until they were fully fatisfied of his death. Even after his death, the fpear of a foldier was thruft into his fide; and the water that gufhed out with the blood is a proof to thofe who are acquainted with the ftructure and economy of living bodies, that he muft have been fome time dead.

## And above

 all by His own refurrection.After he was taken down from the crofs, a feal was put on the door of the fepulchre in which he was laid, as the beft check againft fecret fraud; and a guard of foldiers was ftationed around it, as the beft fecurity againft open violence. In fite, however, of all thefe precautions, the prediction was accomplifhed; the angel of God, defcending from heaven with a countenance like lightning, and with raiment white as fnow; the warch fhake, and become as dead men; the earth quakes; the ftone is rolled $f_{i}$ om the mouth of the fepulchre; the angel fits on it, and our Lord comes forth.

It was in vain for the Jews to allege that his difcifles came in the night, and fole him away, while the watch were afleep. One muft fmile at thefe puerile af fertions. How came the difciples to know that the watch were theep; or what excufe had the watch for neeping, and incurring a punifhment which they knew to be capiral in the Roman law? and how came they, in the name of wonder, to be brought as an evidence for thofe tranfactions that happened at the time when they were alleep?

Whatever credit may be given by modern infidels to this ill-framed fory, it is palt difpute that it had none among the Jewilh rulers at the time that it was current. Not long after our Saviour's refurrection, the apoftles were called before the council, and threatened with death for teaching in the name of Jcfus. Their boldnef upon that occafion was fo provoking to the rulers, that the threat would have been initantly put in execution, had not Gamaliel, a doctor of the law of high reputation, put them in mind of other impontors who had perifhed in their attempts to milead the people; and concluded a very fenfible feech with thefe remarkable wo:ds: "And now, I fay unto you, refrain from thefe tion, and let them alone; for it this counfel, or this work, be of men, it will come to nought; but if it be
of God, ye cannot overthrow it, left haply ye be found Refurrec. even to fight againft God." This advice the council
tion. followed. But is it poffible that Gamaliel could have given it, or the council paid the leaft regard to it, had the fory of the difciples ftealing the body been then credited? Surely fome among them would have obferved, that a wrork or counfel, founded on impolture and fraud, could not be fuppofed to be of God, and they would unqueltionably have flain the apoftes.

The ftory of ftealing the body is indeed one of the moft fenfelefs fictions that ever was invented in fupport of a bad caufe. Our Lord was on earth 40 days after he arofe. He appeared frequently to his difciples. He ate and drank in their prefence; and when fome of them doubted, he bade them handle him and fee that he was not a fpectre, fhowed the mark of the fpear in his fide, and the prints of the nails in his feet and hands. Befides thus appearing to his difciples, he was feen by more than 500 brethren at one time; all of whom, as well as his difciples, mult neceffarily have known him previous to his fuffering, and could therefore atteft that he was the perfon who was once dead but was then alive. Yet for Atrangers in general, who had not feen him previous to his death, and could nor therefore identify his perfon after he arofe, our Lord referved many other proofs that were equally donvincing. Before his afcenfion, he bade his difciples wait till they received power, by the Holy Ghof defcending upon them : That then they fhould be witneffes with him, both in Jerufalem, and in all Judea, and in Samaria, and unto the uttermoft ends of the earth; in order that the people of all thefe nations, obferving the miracles, wrought in his name, might themfelves become ocular witneffes that thofe who preached his refurrection were warranted to do fo by his authority; and that this authority, on which fo numerous miracles attended, muft be divine.

We intend not here to examine the minute ubjections Minuteob and cavils that have been advanced refpecting the truth jections of this important fact. The kinds, however, we fhall and trifing mention in general. Some have doubted of our Lord's cavila refurrection, as being an event which is not confirmed by general experience, becaufe they imagine that what happens once thould happen again, and even repeatedly, in order to be true. Some, taking their own to be preferable fchemes, have objected to the way in which it happened, and to the manner in which it is narrated.Some have imagined, that poffibly the gofpel hiftory may be falfe; that poffibly the difciples were very ignorant, and might be deceived; that poffibly, too, they were deep politicians, and a fet of impontors; and that poffibly the writings which detected their fallehoods may have been deftroyed. It is difficult to reafon, and worfe to convince, againt this evidence of polfibilities : bot we flatter ourfelves, that to the candid reader it will appear fufficiently overturned in our article Miracle; where it is fhown that neither clowns nor politicians could have acted the part that was acted by the aponles, had not the refurrection been an undoubted fact.

Some of the objectors to it have alfo maintained, that poffibly there is nothing material without us, that there is nothing mental within us, and that poffibly the whole world is ideas. This mode of arguing we pretend not to explain ; it is thonght by fome to proceed entirely from a perverfenels of mind or difpofition, while in books.

## R E S

Refurrection.

52 Importance of the doctrine of a refurrection.
of medicine it is always confidered as a fymptom of difeafe, and the patient recommended to be treated in the hofpital, and not in the academy.
By his raifing others, and particulary by rifing him-
felf, from the dead, our Saviour demonftrited that a re. furrection from the dead is poflible. And on that authority, which by his miracles he proved to be divine, he declared to his followers, that there is to be a general refurrection both of the jult and of the unjult, inftructing his difciples to propagate this doctrine through all nations; Sr Paul confeffing, that if there be no refurrection of the dead, preaching is vain, and our faith is vain.

As to the order of fucceffion in which the dead are to be raifed, the Scriptures are almoft filent. St Paul fays, that every man is to rife in his own order, and that the dead in Chrift are to rife firlt: and St Jolin obferved in his vifion, that the fouls of them which were beheaded for the witnefs of Jefus, and for the word of God, and which had not worfhipped the beaft, neither his image, neither had received his mark upontheir ftreheads, or in their hands, lived and reigned with Chrift a thoufand years; but the reft of the dead lived not again until the thoufand years ( v ) were finifhed.
A queftion that has much oftener agitated the minds of men is, with what firt of bodies are the dead to be raifed? St Paul has anfwered, with incorruptible and immortal bodies $(z)$. And to filence the difputatious caviller of his day, he illuftrated his doctrine by the growth of grain. " Thou fool (faid he), that which thou foweft, thou foweft not that body that fhall be, but bare grain, it may chance of wheat or of fome other grain." To us it appears very furprifing, that any one who reads this paffage with the flighteft attention, fhould perplex himfelf, or difturb the church with idle attempts to prove the identity of the bodies with which we fhall die and rife again at the laft day. The apoftle exprefsly affirms, that "flefh and blood cannot inherit the kingdom of God; that we fhall all be changed, in a moment, in the twinking of an eye, at the laft trump ; that there are celeftial bodies and bodies terreftrial ; and that the glory of the celeltial is one, and the glory of the terreftrial another."

That this implies a total change of qualities, will admit of no difpute; but itill it has been confidered as an article of the Chriltian faith, that we are to rife with the fame bodies in refpect of fubtance. What is meant by the identity of fubltance, with qualities wholly different, it is not very eafy to conceive. Perhaps the meaning may be, that our incorruptible bodies thall confit of the fame material particles with our mortal bodies, though thefe particles will be differently arranged to produce the different qualities. But as the particles of our prefent bodies are conitantly changing, and as different particles compofe the body at diferent times, a queftion has been put, With what fet of particles thall we rife? Here a fingular variety of opinions have been held. - Leibnitz. Some * contend, that we thall rife with the original

## 139 J <br> RES

famina of our bodies derived from our parents; $\lceil$ ine $R$-furrc. are for vifing with that fet of particles which thes lisd tum. at birth; fome with the fet which they are to have at death; and fome with the particles which remain at $e \mathrm{er}$ maceration in waterf; though, Gid knows, that ir h.s maveration be corinued lores, thefe may arile with :ew or no particles at al!. Another query has given rauch alarm. What if any of theie particles thould enter a vezetable, compore its fruit, and be eaten by a man, woman, ir a child ? Will not a difpute, limilar to that apprehended by the Sadducees about the wife of the feven brothers, neceffarily follow, whofe particles are they to be at the refurrection? A gainft this confufion they trult that the goodnefs and wifdom of heaven will take all the proper and neceffary meafures; and they even venture to point out a way in which that may be done. A foot deep of earth, they obferve, in two or three of the counties of England, fuppofing each perfon to weigh on an average about feven flones and a few pounds, would amply fupply with material bodies $600,000,000$ of fouls for no lefs a fpace than 20,000 years §; and therefore there feems to be no necellity for § See Ho. the vamping up of their old materials to lodge and ac. dy's Refurcommodate new fouls.

But, unluckily bere, the queftion is not about the poffibility of keeping the particles of different bodies ed. ieparate and diftinct. The queftion is rather, What have the Scriptures determined on the fubject? Now the Scriptures fay, that the fpirit returns unto God who gave it. And thould it be alked, in what place does he referve it till the refurrection? the Scriptures reply, in the place of the dead; becaule the foul defcends into the pit, is redeemed from the grave; and the fting of death, the lalt enemy that is to be deftroyed, thall be taken away when the trumpet of God fhall found : at which time the dead that lleep in their graves flall awake, fhall hear the voice, and fhall come forth. There is not here fo much as a word concerning the body; and therefore it was afked with what bodies are the dead to be raifed ? To which it was anfwered, the vile body is to be changed. The body which is, is not the body which thall be ; for the corruptible mult put on incorruption, and that which is mortal, put on immortality.

This curious difcovery of the fentiments of Scripture we owe to a layman, the celebrated Locke; who, in one of his controverfies with the bifhop of Worcelter, came to underftand what he knew not before, namely, that nowhere have the Scriptures fpoken of the refurrection of the fame body in the fenfe in which it is ufually conceived. The refurrection of the fame perfon is indeed promifed ; and how that promife may be fulfilled, notwithftanding the conftant change of the particles of the body, has been hown in another place. Sce Metaphysics, Part III. Chap. iii.

The advocates, therefore, for the refurrection of the mortal body, have again been obliged to betake themfelves to the fhifts of reafoning. It is proper, fay they, S 2
that:
(y) Thefe thoufand years formed the happy millenium fo often mentioned in the ancient fathers; and the learned Burnet, in his Theory of the Earth, has endeavoured to prove, that a fimilar notion prevailed among the Jevis. See Milienium.
(z) Our Saviour rofe with the fame body, both as to fubftance and qualities; becaufe it was neseffary that his perfon fhould be known and identified after his refurrection.

55
State after the refurrection,

Refrec- that the fame bodies which have been accomplices in tion $\|$
Retardation.
$\qquad$
our vices and virtues, fhould alfo fhare in our rewards. and punifhments. Now, granting they will, fhall one fet of particles be bound for the crimes, or be entitled to receive the rewards, of the animal fyltem, from its firt commencement to its diffolution ? or flall every particle rife up fucceffively, and receive its dividend of rewards and punifhments for the vices and virtues that belonged to the fyfem during the time that they were in union with the fentient principle? and is the hand that fell in defending the father to be (as is fuppofed in fome of the eaftern countries) rewarded in heaven; while the other that ftruck him when the fon became vicious, is difmiffed into torments?

Finding this hypothefis fupported by neither Scripture nor reafon, they next appeal to the ancient fathers. And they, it is confeffed, are for the refurrestion of the rery fame flefh. But this notion is directly contrary to the Scriptures, which have faid, that Aefh and blood are not to inherit the kingdom of God.

But whatever be the bodies with which the dead are to be raifed at the general refurrection, all mankind muft appear in judgment, and receive fentence according to the deeds done in the body, without regard, fo far as we know, to their attions and conduct in the middle ftate. After this fentence, the righteous are to enter into celeftial and eternal joys, and the wicked to fuffer the punifhments of hell. Thefe punifhments fome have fuppofed to be everlalting; others think, that after fome temporary punifhment, the fouls of the wicked are to be annililated ; and others imagine, that after doing purgatorial penance for a while in hell, they are to be again received into favour; inclining to ex. plain the denunciations of the Almighty as a child would do the threatenings of his mother, or a lover the affected chidings of his miltrefs (a).

RESUSCITATION, the fame with refurrection and revivification. See the preceding article and $\mathrm{Re}_{\mathrm{E}}-$ animation.

The term refufcitation, however, is more particularly ufed by chemilts for the reproducing a mixed body from its afhes; an art to which many have pretended, as to repioduce plants, \&c. from their afhes.

RETAII, in commerce, is the felling of goods in fmall parcels, in oppofition to viholeíale. See Сомmerce.

RETAINER, a fervant who does not continually dwell in the houfe of his mafter, but oaly attends upon fpecial occafions.

RETALNING fee, the firft fee given to a ferjeant or counfellor at law, in order to make him fure, and prevent his pleading on the contrary fide.

RETALIATION, among civilians, the act of returning like for like.

RETARDATION, in phyfics, the act of dimi. rifhing the velocity of a moving body. See Gunnery, Mechanics, Pneumatics, and Projectiles.

RETE mirabile, in anatomy, a fmall piexus or network of velfels in the brain, furrounding the pituitary gland.

RETENTION is defined by Mr Locke to be, a faculty of the mind, whereby it keeps or retains thofe fimple ideas it has once received, by fenfation or reflection. See Metaphysics, Part I. Chap. ii.

Retention is alfo ufed, in medicine, \&c. for the ftate of contraction in the folids or vafcular parts of the body; which makes them hold fatt their proper contents. In this fenfe, retention is oppofed to evacua. tion and excretion.

RETICULAR BoDy (corpus reliculare), in anato. my, a very fine membrane, perforated, in the manner of a net, with a multitude of foramina. It is placed immediately under the cuticle; and when that is feparated from the cutis, whether by art or accident, this adheres firmly, to it, and is fcarce poffible to be parted from it, feeming rather to be its inner fuperficies than a ditinct fubtance. In regard to this, we are to obferve, firf, the places in which it is found, being all thofe in which the fenfe of feeling is meft acute, as in the palms of the hands, the extremities of the fingers, and on the foles of the feet. 'The tongue, however, is the part where it is moft accurately to be obferved: it is more eafily diftinguifhable there than anywhere elfe, and its, nature and ftructure are moft evidently feen there.

Its colour in the Europeans is white; but in the negroes and other black nations it is black; in the tawny it is yellowith : the flin itfelf in both is white; and the blacknefs and yellownefs depend altogether on the colour of this membrane.

The ufes of the corpus reticulare are to preferve the fructure of the other parts of the integuments, and keep them in their determinate form and fituation. Its apertures give paffage to the hairs and fweat through the papillæ and excretory ducts of the fkin: it retains thefe in a certain and determinate order, that they cannot be removed out of their places, and has fome fhare in preferving the foftnefs of the papilla, which renders them fit for the fenfe of feeling. See Anato$\mathrm{My}, \mathrm{n}^{\circ} 83$.

Reticulum, is a Latin word, fignifying a little or cafing net. It was applied by the Romans to a particular mode of conitructing their buildings. In the city of Salino (fee Salino) are fill to be feen remains of fome walls, evidently of Roman origin from the reticulam. This ftructure confits of fmall pieces of baked earth cut lozengewife, and difpofed with great regularity on the angles, fo as to exhibit to the eye the appearance of cut diamonds; and was called reticular, from its refemblance to fifhing-nets. The Romans always concealed it under a regular coating of other matter ; and Mr Houel informs us, that this was the only fpecimen of it which he faw in all his travels through Sicily, Malta, and Lipari. It appears to be the remains of fome baths, which
(A) 1 French convencion, fome on whofe principles are equally new, daing, and deftructive of all that is decent or of good report, have decided this queftion in a very fummary way, by decreeing death to be an eternal fleep, a decree equally abfurd in itfelf and fatal in its confequences. Since this article went to the prefs, however, we have learned, from the molt refpectable authority, that wild and abfurd as the opinion is, it has been indultrioufy propagated in this country, and that in fome it has gained ground. The confequences of this, were it to become general, muft indeed be baneful beyond all conception; and we thall afterwards take occafion to expofe the opinion and its nefarious confequenc sat greater length than it is now poflible to do in this place. See Theology.

## RET T $\quad$ I4I ] R E T

Retimo which bave been built for the convenience of fea-bath\| Retirement ing

RETIMO, the ancient Rbitymnia of Stephen the geographer, and called by Ptolemy Rbitymna, is a fine city, lying at one end of a rich and fertile plain, on the north coaft of the ifland of Candia. It is but a fmall place, containing fearce 6000 inhabitants; but it is a bifhop's fee, and the harbour is defended by a citadel, where a bafhaw refides. It was taken by the Turks in 1647, and has been in their hands ever fince. It is about 45 miles from Candia. E. Long. 24.45. N. Lat. 35.22.
The citadel, which ftands on a rock jutting out into the fea, would be fufficient for the defence of the city, where it not fituated at the foot of an high hill, from which it might be cannonaded with great advantage. The harbour is now almoft filled with fand, and is no longer acceffible to flipping; nor do the Turks in any meafure oppofe the ravages of time, but behold with a carelefs eye the moft valuable works in a fate of ruin. The French had formerly a vice-conful at Retimo, to which thips ufed to repair for cargoes of oil ; bat they have been long unable to get into the harbour: to repair which, however, and to revive the commerce of Retimo, would be a moft ufeful attempt. The plains around the city abound in a variety of productions. Great quantities of oil, cotton, faffron, and wax, are produced here; and they would be produced in ftill greater quantities if the inhabitants could export their commodities. The gardens of Retimo bear the beft fruits in the inland; excellent pomegranates, almonds, piftacho nuts, and oranges. The apricot-tree, bearing the michmich, the juice of which is fo delicious, and its flavour fo exquifite, is found here. It is a kind of early peach, but fmaller and more juicy than thofe of France.
RETINA, in anatomy, the expanfion of the optic nerves over the bottom of the eye, where the ienfe of vifion is firtt received. See Anatrony, $n^{\circ}$ 142. and Optics (Index) at Eye and $V_{i j o n}$.
KETINUE, the attendants or followers of a prince or perfon of quality, chiefy in a journey.
RETIRADE, in fortification, a kind of retrenchment made in the body of a baftion, or other work, which is to be difputed, inch by inch, after the defences are difmantled. It ufually confifts of two faces, which make a re-entering angle. When a breach is made in a baftion, the enemy may alfo make a retirade or new fortification behind it.

RETIREMENT, means a private way of life or a fecret habitation. "Few (fars an elegant writer) are able to bear folitude ; and though retirement is the of tenfible object of the greater part, yet, when they are enabled by fuccefs to retire, they feel themfelves unhappy. Peculiar powers and elegance of mind are neceflary to enable us to draw all our refources from ourfelvés. In a remote and folitary village the mind muft be internally active in a great degree, or it will be miferable for want of employment. But in great and populous cities, even while it is paffive, it yill be confantly amofed. It is impofible to walk the ftreets without finding the attention powerfully folicited on every fide. No exertion is neceflary. Objects pour themfelves into the fenfes, and it would be dificult to prevent their admittarice. But, in retirement, there mult be a fpirit of philoforty and a fore of learning,
or elfe the fancied fcenes of blifs will vanifh like the co- Retort, lours of the rainbow. Poor Cowley might be faid to Retra $\mathrm{s}_{\mathrm{s}}$. be melancholy mad. He languithed for folitude, and wifhed to hide himfelf in the wilds of America. Bua, alas! he was not able to fupport the folitude of a country village within a few miles of the metropolis!
" With a virtuous and cheerful family, with a few faithful and good-humoured friends, with a well-felected collection of elegant books, and with a competency, one may enjoy comforts even in the deferted village, which the city, with all its diverfions, cannot fupply."

RETORT, in chemiftry, an oblong or globular vef. fel with its neck bent, proper for diftillation. See Chemistry, $n^{\circ} 576$.

In the fifth volume of the Tranfactions of the London Society for the Eucouragenent of Arts, p. 96. we find a paper containing a method for preventing ftone retorts from breaking; or ftopping them when cracked, during any chemical operation, without lofing any of the contained fubject. "I have always found it neceflary (fays the writer) to ufe a previous coating for filling up the interfices of the earth or tone, which is made by diffolving two ounces of borax in a pint of boiling water, and adding to the folution as much flaked lime as will make it into a thin pafte; this, with a common painter's bruth, may be fpread over feveral re1orts, which when dry are then ready for the proper preferving coating. The intention of this firf conting is, that the fubtances thus fpread over, readily vitrifying in the fire, prevent any of the diftilling matters from pervading the retort, but does in nowife prevent it from cracking.
" Whenever I want to ufe any of the above coated retorts; after I have charged them with the fubftance to be diftilled, I prepare a thin pafte, made with common linfeed oil and flaked lime well mixed, and perfectly plafic, that it may be eafily fpread : with this lot the retorts be covered all over except that part of the neck which is to be inferted into the receiver; this is readily done with a painter's brufh : the coating will be fufficiently dry in a day or two, and they will then be fit for ufe. With this coating 1 have for feveral years worked my fone retorts, without any danger of their breaking, and have frequently ufed the fame retort four or five times; ebferving particularly to coat it over with the laft mentioned compofition every time it is charged with frefh materials: Before I made ufe of this expedient, it was an even chance, in conducting operations in fone and earthen retorts, whether they did not crack every time; by which means great lofs has been fultained. If at any time during the operation the retorts fhould crack, fpread fome of the oil compofition thick on the part, and fprinkle fome pow der of flacked lime on it, and it immediately fops the fik fure, and prevents any of the difilling matter from pervading; even that fubtile penetrating fubftance the folid phofphorus will not penetrate through it. It may be applied without any danger, even when the retort is red hot; and when it is made a little fitfer, is more proper for luting veffels than any other I ever have tried; becaufe if properly mixed it will never crack, nor will it indurate fo as to endanger the breaking the necks i. the veffels when taken off.,

RETRACTS, among horfemen, pricks in a horfe's fcet, arifing from the fault of the farrier in driving nails

Retrat that are weak, or in driving them ill-pointed, or otherwife amifs.

RETREAT, in a military fenfe. An army or body of men ar= faid to retreat when they turn their backs upon the enemy, or are retiving from the ground they occupied : hence every march in withdrawing from the enemy is called a retreat.

That which is done in fight of an ative enemy, who purfues with a fuperior force, is the moft important part of the fubject ; and is, with reafon, looked upon as the glory of the profeffion. It is a mancuvre themoft delicate, and the properef to difplay the prudence, genius, coumase, and addrefs, of an officer who commands: the hiftorians of all ages teltify it; and hiftorians have never been fo lavifh of eulogiums as on the fubject of the brilliant retreats of our heroes. If it is important, it is no lefs difficult to regulate, on account of the variety of circumftances, each of which demands different principles, and an almott endlefs detail. Hence a good retreat is efteemed, by experienced officers, the mafterpiece of a general. He thould therefore be well acquainted with the fituation of the country through which he intends to make it, and careful that nothing is omitted to make it fafe and honourable. See War.

Retreat, is alfo a beat of the drum, at the firing of the evening gun; at which the drum-major, with all the drums of the battalion, except fuch as are upon ducy, beats from the camp-colours on the right to thofe on the left, on the parade of encampment: the drums of all the guards beat allo; the trumpets at the fame time founding at the head of their refpective troops, This is to warn the foldiers to forbear firing, and the centinels to challenge, till the break of day that the reveille is beat. The retreat is likewife called fetting the watch.

RETRENCHMENT literally fignifies fomething cut off or taken from a thing; in which fenfe it is the fame with fubtraction, diminution, \&c.

Retrenchment, in the art of war, any kind of work raifed to cover a poit, and fortify it againit the enemy, fuch as fafcines loaded with earth, gabions, barrels of earth, fand-bags, and generally all things that can cover the men and itop the enemy. See Fortification and War.

RETRIBUTION, a handfome prefent, gratuity, or acknowledgment, given inftead of a formal falary or hire, to perfons employed in affairs that do not foimmediately fall under eftimation, nor within the ordinary commerce in money.

RETROMINGENTS, in natural hiftory, a clafs or divifion of animals, whofe characterific is, that they ftale or make water backwards, both male and female.

RETURN (returna or retorna), in law, is ued in divers fenfes. I. Return of writs by theriffs and bailiffs is a certificate made by them to the court, of what they have done in relation to the execution of the writ directed to them. This is wrote on the back of the writ by the officer, who thus fends the writ back to the court from whence it iffued, in order that it may be filed. 2. Return of a commiffion, is a certificate or anfwer fent to the court from whence the commiffion iffues, concerning what has been done by the commiffioners. 3. Returns, or days in bank, are certain days in each term, appointed for the return of writs, \&c. Thus Hillary term has four returns, viz, in the king's
bench, on the day next after the oftave, or eighth day after Hillary day : on the day next after the fifteenth day from St Hillary; on the day after Purification; and on the next after the octave of the Puritication. In the common pleas, in eight days of St Hillary: from the day of St Hillary, in fitteen days: on the day after the purification : in eight days of the Purification. Eafter term has five returns, viz. in the king's-bench, on the day next after the fifteenth day from Eafter: on the day next after the three weeksfrom Ealter: on the day next after one month from Eafter: on the day next after five weeks from Eafter : and on the day next after the day following Afcenfion-day. It the common pleas, in fifteen days from the fealt of Eafter: in three weeks from the fealt of Eafter: in one month from Ealter day: in five wheeks from Eafter day : on the day after the Afcenfion-day. Trinity term has four returns, viz. on the day following the fecond day after Trinity : on the day following the eighth day after 'Irinity : on the day next after the fifteenth day from Trinity : on the day next after three weeks from Trinity. In the common pleas, on the day after Trinity: in eight days of Trinity : in fifteen days from Trinity: in three weeks from Trinity. Michaelmas term has fir returns, viz. on the day next after three weeks from St Michael : on the day next after one month of St Michael : on the day following the fecond day after All-fouls: on the day next after the fecond day dfter St Martin : on the day following the octave of St Martin : on the day next after fifteen days of St Martin. In the common pleas, in three weeks from S r Michael : in one month from St Michael : on the day after All-fouls: on the day after St Martin : on the octave of St Martin: in fifteen days from St Martin. It is to be obferved, that, as in the king's-bench, all returns are to be made on fome parcicular day of the week in each term, care mult be taken not to make the writs out of that court returnable on a non-judical day; fuch as Sunday, and All-faints, in Michaelmas term, the Purification in Hillary, the Afcenfion in Eafter, and Midfummer-day, except it fhould fall on the firf day of Trinity term.

Returns, in a military fenfe, are of various forts, but all tending to explain the flate of the army, regiment, or company ; namely, how many capable of doing duty, on duty, fick in quarters, barracks, infirmary, or hofpital ; prifoners, abfent with or without leave; total effective; wanting to complete the eftablifhment, \&c.

RETUSARI, an ifland in Ruflia, in a long flip of Coze's land, or rather fand, through the middle of which runs Travels a ridge of granite. It is 20 miles from Peterfburg by iuto Ruffia. water, four from the thore of Ingria, and nine from the coaft of Carelia. It is about ro miles in circumfe. rence, and was overfpread with firs and pines when Pe ter firft conquered it from the Swedes. It contains at prefent about 30,000 inhabitants, including the failors and garrifon, the former of whom amount to about 12,000 , the latter to 1500 men. The ifland affords a fmall quantity of palture, produces vegetables, and a few fruits, fuch as apples, currants, goofeberries, and ftrawberries, which thrive in this northern climate,

RETZ, (Cardinal de). See Gondi.

## R E V

Reutingen to the 29th natural order, Campanacee. The capfule is bilocular, the corolla cylindrical, and villous without ; the figma bifid.

REUTLINGEN, a handfome, free, and imperial town of Germany, in the circle of Suabia, and duchy of Wirtemberg; feated in a plain on the river Eichez, near the Nerkar, adorned with handfome public buildings, and has a well frequented college. E. Long. 9 . Io. N. Lat. 48. $3^{1}$.
Reve, Reeve, or Greve, the bailiff of a franchife, or manor, thus called, efpecially in the weft of England. Hence fhire-reeve, fheriff, port-greve, \&c.

REVEILLE, a beat of drum about break of day, to give notice that it is time for the foldiers to arife, and that the fentries are to forbear challenging.

REVEL, a port town of Livonia, ficuated at the fouth entrance of the gulph of Finland, partly in a plain and partly on a mountain; 133 miles fouth-weft of $\mathrm{Pe}-$ terfburg, and 85 fouth-eaft of Abo. It is a place of great trade, and holds two fairs yearly, which are vifited by merchants from all countries, but particularly by thofe of England and Holland. It is a ftrong and a rich place, with a capital harbour. It is furrounded with high walls and deep ditches, and defended by a cafle and Itout baftions. It was confirmed to the Swedes at the peace of Oliva, conquered by Peter the Great in 1710 , and ceded to Ruffia in 1727 . The conqueft of it was again attempted by the Swedes in 1790. The duke of Sudermania, with the Swedifh fleet, attempted to carry the harbour; but after an obftinate engagement with the Ruffian fleet, he was obliged to give it up; but it was but for a very flort while. He retired about 20 leagues from the harbour, to repair the damage his fleet had fuftained, and to prepare for a fecond attrack before any relief could be afforded to the Ruffian fleet. As foon as he had refitted, he failed for the harbour, at a league diftant from which the Ruffian fleet was difcovered, ready to difpute with the Swedes the entrance. Upon a council being held by the Duke, it was refolved to attack the Ruf. fians; and the fignals being given, the fleet bore down for the attack, which was maintained for near fix hours with the utmoft fury: at length the Swedes broke the Ruffian line, which threw them into much confufion; when the Swedes, taking the advantage of the general confufion into which the Ruflians were thrown, followed them with their whole force into the harbour, where the confliet and carnage were dreaiful on both fides, though the Swedes certainly had the worf of it; at the fame time that their fkill and bravery is indifputable.

This valuable place was again confirmed to Ruffia by the peace. The government of Revel or EAThonia is one of the divifions of the Ruffian empire, containing five diltricts. I. Revel, on the Bultic fea. 2. Bultic-port, about 40 verts weltward from Revel 3. Habfal, or Hipfal, a maritime tuwn. 4. IVeifienftein, on the rivulet Saida, about 80 verfts from Revel. 5. Wefenberg, about 100 verfts from Revel, at about an equal diftance from that town and Narva.

REVELATION, the act of revealing, or marking a thing public that was before unknown; it is alfo ufed for the difcoveries made by God to his prophets, and by them to the world; and more particularly for the books of the Oid and New Teitament. See Bible,

Christianiti, Miracle, Religion, and Theolo-Revelatichiq gy.
The principal telts of the truth of any revelation, are the tendency of its practical doctrines; its confinency with itfelf, and with the known attributes of Gud; and iome fatisfactory evidence that it cannot have been derived from a human fource.

Before any man can receive a written book as a revelation from God, he mult be convinced that God exifts, and that he is poffeffed of almighty power, ininite wifdom, and prefes jultice. Now fhould a book teaching abfurd or immoral doGrines (as many chapters of the Koran do, and as all the traditionary fyftems of Paganifm did), pretend to be revealed by a God of wifdom and jultice, we may fafely reject its pretenfions without farther examination than what is neceffary to fatisfy us that we have not mifunderfood its doctrine. Should a book claiming this high origin, enjoin in one part of it, and forbid in another, the fame thing to be done under the fame circumftances, we may reject it with contempt and indignation ; becaufe a being of infinite wifdom can never act capricioully or abfárdly. Still, however, as it is impoffible for us to know how far the powers of men may reach in the inveftigation or difcovery of ufeful truth, fome farther evidence is neceffary to prove a doctrine of divine origin, than its mere confiftency with itfelf, and with the principles of morality; and this evidence can be nothing but the power of working miracles exhibited by him by whom it was originally revealed. In every revelation confirmed by this evidence, many doctrines are to be looked for which human reafon cannot fully comprehend; and thefe are to be believed on the teftimony of God, and fuffered to produce their practical confequences. At this kind of belief the fhallow infidel may fmile contemptuoully; but it has place in arts and fciences as well as in religion. Whoever avails himfelf of the demonfrations of Newton, Bernoulli, and others, refpecting the refiftance of fluids, and applies their conclufions to the art of thip-building, is as implicit a believer, if he underftand not the principles of fluxions, as any ChriAtian; and yet no man will fay that his faith is not productive of important practical confequences. He believes, however, in man, while the Chriltian believes in God; and thercfore he cannot pretend that his faith refts on a furer foundation.

Mr Locke, in laying down the difinct provinces of reafon and faith, obferves, I. That the fame truths may be difcovered by revelation which are difcoverable to us by rection. 2. That no revelation can be admitted againf the clear evidence of reafon. 4. That there are many things of which we have but irmperfect notions, or none at all; and others, of whofe paft, prefent, or future exiftence, by the natural ufe of our facuities we cannot have the leaft knowledge : and thefe, being beyond the difcovery of cur faculties, and above reafon, when revealed, become the proper object of our faith. He then adds, that our reafon is not injured or difurbed, but affifted and improved by new difct,veries of truth coming from the fountain of knowledge. Whatever God has revealed is certainly true ; but whether it be a divine revelation or not, reafon mat judge, which can never permit the mind to reject a greater evidence to embrace what is lefs evi-

## REV [144] R E V

Revelution dent. There can be no evidence that any traditional II Revenue. $\underbrace{\text { Revenue. }}$ revelation is of divine original, in the words we receive it, and the fenfe we undertand it, fo clear and fo cer- tain as that of the principles of reafon: and, therefore, nothing that is contrary to the clear and felfevident dictaces of reafon, has a right to be urged or affented to as a matter of faith, wherein reafon has nothing to do.

Reyelation of Sq fohn. See Apocalypse.
REVELS, entertainments of dancing, mafking, acting comedies, farces, \&c. anciently very frequent in the inns of court and in noblemen's houfes, but now much difufed. The officer who has the direction of the revels at court is called the $M_{A s T E R}$ of the Revels.

REVENGE, means the return of injury for injury, and differs materially from that fudden refentment which rifes in the mind immediately on being injured; which, fo far from being culpable when reftrained within due bounds, is abfolutely neceffary for felf-prefervation. Revenge, on the contrary, is a cool and deliberate wickednefs, and is often executed years after the offence was given ; and the defire of it is generally the effect of littlenefs, weaknefs, and vice ; while, to do right, and to fuffer wrong, is an argument of a great foul, that fcorns to foop to fuggefted revenges.

> Revenge is but a frailty incident
> To craz'd and fickly minds; the poor content
> Of little fouls, unable to furmount
> An injury, too weak to bear affront.

Dryden.
Revenge is generally the concomitant of favage minds, of minds implacable, and capable of the mort horrid barbarities; unable to fet any limits to their dif. pleafure, they can confine their anger within no bounds of reafon.

Cruel revenge, which fill we find
The weakeft frailty of a feeble mind.
Degenerous paffion, and for man too bafe,
It feats its empire in the favage race.

## Fuvenal.

The inflitution of law prevents the execution of private revenge, and the growth of civilization thows its impropriety. Though in modern times a flpecies of revenge is fanctioned by what is called the law of honour, which evades the law of the land indeed, but which is equally mean and difgraceful as the other kinds, and is of confequences equally baneful. See $A_{\text {nger, }}$ Duelling, and Resentment.

REVENUE, the annual income a perfon receives from the rent of his lands, houfes, interelt of money in the focks, \&c.

Royal ReVENUE, that which the Britifh conflitution hath vefted in the royal perfon, in order to fupport his dignity and maintain his power; being a portion which each fubject contributes of his property, in or. der to fecure the remainder. This revenue is either ordiurary or extraordinary.
I. The king's ordinary revenue is fuch as has either fubfifted time out of mind in the crown; or elfe has been granted by parliament, by way of purchafe or exchange for fuch of the king's inherent hereditary revenues as were found inconvenient to the fubject.In faying that it has fubfifted time out of mind in the crown, we do not mean that the king is at pre-
fent in the actual pofieflion of the whole of his reve.
nue. Much (nay the greatelt part) of it is at this day in the hands of fubjects; to whom it has been granted out from time to time by the lings of England: which has rendered the crown in fome meafure dependent on the people for its ordinary fupport and fubfiftence. So that we muft be obliged to recount, as Blackft. part of the royal revenue, what lords of maners and Comment. other fubjects frequently look upon to be their own abfolute rights; becaufe they and their anceftors are and have been vefted in them for ages, though in reality originally derived from the grants of our ancient princes.

1. The firft of the king's ordinary revenues, which may be taken notice of, is of an ecclefiatical kind (as are alfo the three fucceeding ones), viz. the cultody of the temporalities of bifhops. See Temporalities.
2. The king is entitled to a corody, as the law calls it, out of every bifhopric ; that is, to fend one of his chaplains to be maintained by the biflop, or to have a penfion allowed him till the bifhop promotes him to a benefice. This is alfo in the nature of an acknowledgement to the king, as founder of the fee, fince he had formerly the fame corody or penfion from every abbey or priory of royal foundation. It is fuppofed to be now fallen inco total difufe; though Sir Matthew Hale fays, that it is due of common right, and that no prefription will difcharge it.
3. The king alfo is entitled to all the tithes arifing in extraparochial places: though perhaps it may be doubted how far this article, as well as the laft, can be properly reckoned a part of the king's own royal revenue ; fince a corody fupports only his chaplains, and thefe extraparochial tithes are held under an im. plied truft that the king will diftribute them for the good of the clergy in general.
4. The next branch confifts in the firt-fruits and tenths of all fpiritual preferments in the kingdom. See Tenths.
5. The next branch of the king's ordinary revenue (which, as well as the fubfequent branches, is of a lay or temporal nature) confifts in the rents and profits of the demefne lands of the crown. Thefe demefne lands, terra dominicales regis, being either the fhare referved to the crown at the original diftribution of landed property, or fuch as came to it afterwards by forfeitures or other means, were anciently very large and extenfive; comprifing divers manors, honours, and lordfhips; the tenants of which had very peculiar privileges, when we fpeak of the tenure in ancient demefne. At prefent they are contracted within a very narrow compafs, having been almoft entirely granted away to private fubjects. This has occafioned the parliament frequently to interpofe; and particularly after King William III. had greatly impoverifled the crown, an act paffed, whereby all future grants or leafes from the crown for any longer term than 31 years or three lives, are declared to be void; except witin regard to houfes, which may be granted for 50 years. And no reverfionary leafe can be made, fo as to exceed, together with the eftate in being, the fame term of three lives or 31 years; that is, when there is a fubfifting leafe, of which there are 20 years ftill to come, the king cannot grant a future intereft, to commence after the expiration of the former, for any longer term than if
years

## R E V

## 145 ] R E V

Revenue. punifhed for cornmitting wafte; and the ufual tont muft be referved, cr, where there has ufually been no rent, one-third of the clear yearly value. The misiortune is, that this act was made too late, after almolt every valuable poffeffion of the crown had been granted away for ever, or elfe upon very long leafes; but may be of benefit to polterity, when thofe leafes come to expire.
6. Hi her might have been referred the advantages which were ufed to arife to the king from the profits of his military tenures, to which moft lands in the kingdom were fubject, till the flatute 12 Car. II. c. 24 . which in great meature abolifhed them all. Hither alfo might have been referred the profitable prerogative of purveyance and preemption : which was a right enjoyed by the crown of buying up provifions and other neceflaries, by the intervention of the king's purveyors, for the ufe of his royal houfehold, at an appraifed valuation, in preference to all others, and even without confent of the owner: and alfo of forcibly impreffing the carriages and horfes of the fubject, to do the king's bufinefs on the public roads, in the conveyance of timber, baggage, and the like, however inconvenient to the proprietor, upon paying lim a fettled price. A prerogative which prevailed pietty generally throughout Europe during the fearcity of gold and filver, and the high valuation of money confequential thereupon. In thofe early times, the king's houfehold (as well as thofe of inferior lords), were fupported by fpecific renders of corn, and other victuals, from the tenants of the refpective demefnes; and there was alfo a continual market kept at the palace-gate to furnifh viands for the royal ufe. And this anfwered all purpofes, in thofe ages of fimplicity, fo long as the king's court continued in any certain place. But when it removed from one part of the kingdom to another (as was formerly very frequently done), it was found neceffary to iend purveyors beforehand, to get together a fufficient quantity of provitions and other neceffaries for the houfehold: and, left unufual demands fhould raife them to an exhorbitant price, the powers beforementioned were vefted in thefe purveyors; who in proccfs of time very greatly abufed their authority, and became a great oppreflion to the fubject, though of little advantage to the crown; ready money in open market (when the toyal refidence was more permanent, and feecie began to be plenty) being found upon experience to be the beft proveditor of any. Wherefore, by degress, the powers of purveyance have declined, in forcign comntries as well as our own : and particularly were abolithed in Sweden by Guftavus Adolpinas, towards the begiming of the laft century- And, with us, in England, having falien into difure during the jufpenfion of monarchy, King Charles at his reftoration, confented, by the fame flatute, to refign entirely thofe branches of his revenue and power: and the parliament, in part of recompenfe, fettled on him, his heirs, and fuccelfors, for ever, the here itary excife of 15 d . per barrel on all beer and ale fold in the kingdom, sud a proportionable fum for certain other liquors. So that this hereditary excife now forms the fixth branch of his majefty's ordinary revenue.
7. A feventh branch might alio be computed to have

Voz. XVI.
arifen from wine-ficences; or the rents payabie to the $B$
Reven:crown by fuch perfons as are licenfed to fell wine by retail throughout Britain, except in a few privileged places. Thefe were firft fettled on the crown by the thatute 12 Car. II. c. 25. and together with the he. reditary excife, made up the equivalent in value for the lofs fuftained by the prerogative in the abolition of the military tenures, and the right of pre-emption and purveyance: but this revenue was abolifhed by the fatute 30 Geo . II. c. 19. and an annual fum of upwards of L .7000 per anmum, ifluing out of the new flampduties impoted on wine-licences, was fettled on the crown in its fead.
8. An eighth branch of the king's ordinary revenue is ufually reckoned to confift in the profirs arifing from his forelts. See Forest. Thefe confitt principaily in the amercements or fines levied for offences againit the foreft-laws. But as few, if any, courts of this kind for levying amercements have been held fince 1632 , 8 Char. I. and as, from the accounts given of the proceedings in that court by our hiftories and law-books, nobody would wifh to fee them again revived, it is needlefs to purfue this inquiry any farther.
9. The profits ariifing from the king's ordinary courts of juftice make a ninth branch of his revenue. And thefe confift not only in fines impofed upon offenders, forfeitures of recognizances, and amercements levied upon defaulters; but alfo in certain fees due to the crown in a variety of legal matters, as, for fetting the great feal to charters, original writs, and other forenfic. proceedings, and for permitting fines to be levied of lands in order to bar entails, or otberwife to infure their title. As none of thefe can be done without the immediate intervention of the king, by himfelf or his officers, the law allows him certain perquifites and profits, as a recompenfe for the trouble he undertakes for the public. Thefe, in procefs of time, have been almolt all granted out to private perfons, or elfe appropriated to certain particular ufes: fo that, though our law proceedings are fill loaded with their payment, very littlc of them is now returned into the king's exchequer; for a part of whofe royal maintenauce they werc originally intended. All future grants of them, however, by the ftatute I Ann. f. 2. c. 7 . are to endure for no longer time than the prince's life who grants them.
10. A tenth branch of the king's ordinary revenue, faid to be grounded on the confideration of his guarding and protecting the feds from pirates and robbers, is the right to royal ffis, which are whale and Aurgeon: and thefe, when either thrown afhore, or caught near the coafts, are the property of the king, on account of their fuperior excellence. Indeed, our anceftors feem to have entertained a very high notion of the importance of this right; it being the prerogative of the kings of Denmark and the dukes of Normandy; and from one of thefe it was probably derived to our princes.
II. Another maritime revenue, and founded partly upon the fame reafon, is that of shipwrecks. Sce Wreck.
12. A twelfih branch of the royal revenue, the right to mines, has its original from the king's prerogative of coinage, in order to fupply him with materials; and there-

## Revenue.

## -

therefore thofe mines which are properly royal, and to which the king is entitled when found, are only thofe of filver and gold. See Mine.
13. To the fame original may in part be referred the revenue of treafure-trove. See Treasure-Tr rove.
14. Waifs. See Waif.
15. Efrays. See Estray.

Befides the particular reafons, given in the different articles, why the king fhould have the feveral revenues of royal fifh, hipwrecks, treafure-trove, waifs, and eflrays, there is alfo one general reafon which holds for them all; and that is, becaufe they are bona vacantia, or goods in which no one elfe can claim a property. And, therefore, by the law of nature, they belonged to the firft occupant or finder ; and fo continued under the imperial law. But, in fettling the modern conflitutions of moft of the governments in Europe, it was thought proper (to prevent that ftrife and contention which the mere title of occupancy is apt to create and continue, and to provide for the fupport of public authority in a manner the leaft burdenfome to indi. viduals) that thefe rights fhould be annexed to the fupreme power by the pofitive laws of the flate. And fo it came to pars, that, as Bracton expreffes it, " hæc, "quæ nullius in bonis funt, et olim fuerunt inventoris " de jure naturali, jam efficiuntur principis de jure gen"t tium."
16. The next branch of the king's ordinary revenue confifts in forfeitures of lands and goods for offences; bona conffcata, as they are called by the civilians, becaufe they belonged to the ffrus or imperial treafury; or, as our lawy ers term them, foris facta, that is, fuch whereof the property is gone away or departed from the owner. The true reafon and only fubitantial ground of any forfeiture for crimes, confift in this; that all property is derived from fociety, being one of thofe civil rights which are conferred upon individuals, in exchange for that degree of natural freedom which every man muft facrifice when he enters into focial communities. If, therefore, a member of any national community violates the fundamental contract of his affociation, by tranfgreffing the municipal law, he forfeits his right to fuch privileges as he claims by that contract ; and the fate may very jufly refume that portion of property, or any part of it, which the laws have before affigned him. Hence, in every offence of an atrocious kind, the laws of England have exacted a total confifcation of the moveables or perfonal eftate; and, in many cafes, a perpetual, in others only a temporary, lofs of the offender's immoveables or landed property; and have vefted them boch in the king, who is the perfon fuppofed to be offended, being the one vifible magiftrate in whom the majefty of the public refides. See Forfeiture and Deodand.
17. Another branch of the king's ordinary revenue arifes from efcheats of lands, which happen upon the defect of heirs to fucceed to the inheritance; where. upon they in general revert to and veft in the king, who is efteemed, in the eye of the law, the original proprietor of all lands in the kingdom.
18. The laft branch of the king's ordinary revenue, confifts in the cuftody of idiots, from whence we fhall be naturally led to confider alfo the cuftody of lunatics. See Idiot and Lunatic.
This may fuffice for a fhort view of the king's ordi-
nary reanue, or the proper patrimony of the crown; which was very large formerly, and capable of being increafed to a magnitude truly formidable: for there are very few eftates in the kingdom that have not, at fome period or other fince the Norman conqueft, been vefted in the hands of the king, by forfeiture, efcheat, or oherwife. But, fortunately for the liberty of the fubjee, this hereditary landed revenue, by a feries of improvident managemeit, is funk almolt to nothing; and the cafual profits, aring from the other branches of the cenfus regalis, are likewife almoft all of them alienated from the crown. In order to fupply the deficiencies of which, we are now obliged to have recourfe to new methods of raifing money, unknown to our early anceltors; which methods conititute.
II. The king's extraordinary revenue. For, the public patrimony being got into the hands of private fubjects, it is but reafonable that private contributions fhould fupply the public fervice. Which, though it may perhaps fall harder upon fome individuals, whofe anceltors have had no flare in the general plunder, than upon others, yet, taking the nation throughout, it amounts to nearly the fame; provided the gain by the extraordinary fhould appear to be no greater thar the lofs by the ordinary revenue. And perhaps, if every gentleman in the kingdom was to be ftripped of fuch of his lands as were formerly the property of the crown, was to be again fubject to the inconveniences of purveyance and pre-emption, the oppreffion of fo-reft-laws, and the flavery of feodal-tenures; and was to refign into the king's hands all his royal franchifes of waits, wrecks, eftrays, treafure-trove, mines, deodands, forfeitures, and the like; he would find himfelf a greater lofer than by paying his quota to fuch taxes as are neceffary to the fupport of government. The thing, therefore, to be wifhed and aimed at in a land of liberty, is by no means the total abolition of taxes, which wouid draw after it very pernicious confequences, and the very fuppofition of which is the height of political abfurdity. For as the true idea of government and magiftracy will be found to confift in this, that fome few men are deputed by many others to prefide over public affairs, fo that individuals may the better be enabled to attend their private concerns; it is neceflary that thofe individuals fhould be bound to contribute a portion of their private gains, in ories to $f$ pport that government, and reward that magifracy, which protects them in the enjoyment of their refpective properties. But the things to be aimed at are wifdom and moderation, not only in granting, but alfo in the method of raifing, the neceffary fupplies; by contriving to do both in fuch a manner as may be moft conducive to the national welfare, and at the fame time moft confiftent with economy and the liberty of the fubject; who, when properly taxed, contributes only, as was before obferved, fome part of his property in order to enjoy the reft.

Thefe extraordinary grants are ufually called by the fynonymous names of aids, fubblidies, and fupplies; and are granted by the commons of Great Britain, in parliament affembled. See Parliament and Tax.

The clear nett produce of the feveral branches of the revenue, after all charges of collecting and management paid, amounted in the year 1786 to about L. $15,397,000$ Sterling, while the expenditure was found

## R E V $\left[\begin{array}{l}147]\end{array}\right] \quad$ R E V

Revenuc. found to be about L. $14,477,000$. How thefe immenfe fums are appropriated, is next to be confidered. And this is, firlt and principally, to the payment of the intereft of the national debt. See Nafioval Debt and Fuxds.

The refpective produces of the feveral taxes vere originally feparate and diltinct funds; being fecurities for the fums advanced on each feveral tax, and for them only. But at laft it became neceffary, in order to avoid confufion, as they multiplied yearly, to reduce the number of thefe feparate funds, by uniting and blending them together; fuperadding the faith of parliament for the general fecurity of the whole. So that there are now only three capital funids of any acccunt, the aggregate fund, and the general fund, fo called from fuch union and addition; and the Soutb-Sea fund, being the produce of the taxes appropriated to pay the intereft of fuch part of the national debt as was advanced by that company and its annuitants. Whereby the feparate funds, which were thus united, are become mutual fecurities for each other; and the whole produce of them, thus aggregated, liable to pay fuch intereft or annuities as were formerly charged upon each ditinct fund: the faith of the legiflature being moreover engaged to fupply any cafual deficiencies.

The cuftoms, excifes, and other taxes, which are to fupport thefe funds, depending on contingencies, upon exports, imports, and confumptions, muft neceffarily be of a very uncertain amcunt; but they have always been confiderably more than was fufficient to anfwer the charge upon them. The furpluffes, therefore, of the three great national funds, the aggregate, general, and South-Sea funds, over and above the intereft and annuities charged upon them, are directed by flatute 3 Geo. I. c. 7 . to be carried together, and to attend the difpofition of parliament ; and are ufually denominated the finking fund, becaufe originally deftined to fink and lower the national debt. To this have been lince added many other entire duties, granted in fubfequent years; and the annual intereft of the fums borrowed on their refpective credits is charged on, and payable out of, the produce of the finking fund. However, the nett furpluffes and favings, after all deductions paid, amount annually to a very confiderable fum. For as the interelk on the national debt has been at feveral times reduced (by the confent of the proprietors, who had their option either to lower their intereft or be paid their principal), the favings from the appropriated revenues muft needs be extremely large.

But, before any part of the aggregate fund (the furpluffes whereof are one of the chief ingrailents that form the finking fund) can be applied to diminifh the principal of the public debi, it fands mortgaged by parliament to ruife an annull furn for the maintenance of the king's houfehold and the civil lift. For tiais purpofe, in the late reigns, the produce of certain branches of the excife and cuftoms, the poft-office, the duty on wine licunces, the revenues of the remaining crown-lands, the profits arifing from courts of jultice, (which articles :achude all the hereditary revenues of the crown), and alfo a clear annuity of L. 120,000 in money, were fet!ed on the king for life, for the fupport of his majefiy's houfehold, and the henour and cignity of the crown. And, as the amount of thefe feveral branches was uncertain, (though in the lat reign they were compued to have inmetmes aifer anden a
million), if they did rot arife annually to $L$. 800,000, the parliament engaged to make up the deficiency. Fin: his prefent majelty having, foon after his acceffion, fpos. taneoufly fignified his confent that his own herefism revenues might be fo difpofed of as might beft condice to the utility and fatisfaction of the public, and hav:ng: graciouly accepted a limited fum, the faid heredtury and other revenues are now carried into, and made a purt of, the aggregate fund; and the aggregate fund is charsed with the payment of the whole annuity to the crown. The limited annuity accepted by his prefent majefty was at firft L. 800,000, but it has been fince augmented to L. 900,000 . Th:e expences themfelver, being put under the fame care and management as the other branches of the public patrimony, produce more, and are better collected than herctofore; and the public is a gainer of upwards of $L$. 100,000 per cunputt by this difinterefted bounty of his majefy.

The finking fund, though long talked of as the latt refource of the nation, proved very inadequate to the purpofe for which it was eftablifhed. Minifters found pretences for diverting it into other channels; and the diminution of the national debt proceeded flowly during the intervals of peace, whilft each fucceeding war increafed it wih great rapidity. To remedy this evil, and refore the public credit, to which the late war had given a confiderable fhock, Mr Pitt conceived a plan for diminifhing the debt by a fund, which fhould be renderea unalienable to any other purpofe. In the feffion r 786 , he moved that the annual furplus of the revenue above the expenditure fhould be raifed, by additional taxee, from L. 900,000 to one million Sterling, and that certain commiffioners fhould be vefted with the full power of difpofing of this fum in the purchafe of ftock (fee Funds), for the public, in their own names. Thefe commiffioners fhould receive the amual million by quarterly payments of L. 250,000, to be iffued out of the exchequer before any other money, except the intereft of the national debt itfelf; by thefe provifions, the fund would be fecured, and no deficiencies in the national revenues could affect it, but fuch muft be feparately provided for by parliament.

The accumulated compound intereft on a million yearly, together with the annuities that would fall into that fund, would, he raid, in 28 years amount to fuch a fum as would leave a furplus of four millions annually, to be applied, if necelfary, to the exigencies of the ftate. In appointing the commilifioners, he fhould, he faid, endeavour to chocfe perfons of fuch weight and $c^{l}$ laracter as correfponded with the importance of the commiffion they were to execute. The fpeaker of the houre of commons, the chancellor of the exchequer, the mafter of the rol:, the governor and deputy governor of the bank rif England, and the accountant-general of the bigh court of chancery, were perions who, from their feverd hituations, he fhould think highly proper to be of the number.

To the prirciple of this bill no objection was made, though feveral fpeciou: but ill-founded ones wer: urged againf the feffisiency of the mode vich the churcellor of the exchecurer had adopted for the accompllithment of fo great and fo dofrabie an ens.. He had made it a claufe in his bill, hat the accumalating millim thould never be applied bat to the purchafe of thock. To this

Revenue
i

## Reveri. <br> $\underbrace{\text { Reveri. }}$

fioners therein named floould be empowered to accept fo much of any future loan as they mould have calh belonging to the public to pay for. This, he faid, would relieve that diftrefs the country would otherwife be under, when, on account of a war, it might be neceffary to raife a new loan : whenever that foould be the care, his opinion was, that the minifter fhould not only raife taxes fufficiently productive to pay the intereft of the loan, but alfo fufficient to make good to the finking fund whatioever had been taken from it.

If, therefore, for inftance, at any future period a loan of fix millions was propofed, and there was at that time one million in the hands of the commilioners, in fuch cafe they foould take a million of the loan, and the lonus or diucour thereupon fhould be received by them for the public. Thus government would only have five millions to borrow inftead of fix; and from fuch a mode of proceeding, he faid, it was evident great benefit would arife to the public.

This claufe was received by Mr Pitt with the ftrongent marks of approbation, as was likewife another, moved by Mr Pulteney, enabling the commiffoners named in the bill to continue purchafing flock for the public when it is above par, unlefs otherwife directed by parliament. With thefe additional claufes the bill was read a third time on the 15 th of May, and carried up to the Lords, where it alfo paffed without meeting with any material oppofition, and afterwards received the royal affent.

The operation of this bill furpaffed perhaps the minifter's moft fanguine expectation. The fund was ably managed, and judicioufly applied; and in 1793 the commiffioners had extinguifhed fome millions of the public debt. The war, however, into which the nation was that year involved, and of which there is yet no certain profpect of a near end, has made it neceffary to borrow additional fums, fo large, that many years of peace muft elapie before the operation of the fund can contribute fenfibly to the relief of the people. The clear produce of the taxes raifed on the people of this country was, in the year 1792, very near L. 17,000,000; and it mult henceforth, from the accumulation of the debt, and the enormous expence of the prefent war, be neceffarily rendered greater.

Revenue, in liunting, a flefhy lump formed chiefly by a clufter of whitifh worms on the head of the deer, fuppofed to occafion the calting of their horns by gnawing them at the root.

REVERBERATION, in phyfics, the act of a body repelling or rellecting another after its impinging thereon.

Reverberation, in chemifty, denotes a kind of circulation of the flame by means of a reverberatory furnace.

REVERBERATORY, or Reverberating Furmate. See Chemistry-Index at Furnace, and Furnace.

REVEREND, a tille of refpect given to eccle-fiafics.-The religious abroad are called reverend fawers, and abbefies, prioreffes, \&c. r.verend motbers. In England, bithops are right riverend, and archbifhop's mylt roverez. In France, before the Revolution, their bithops, archbifhops, and abbots, were all alike moft reqerend. In Scotland the clergy individually are reve'enc', a fynod is very reverend, and the geueral affembly is rener able.

REVERIE, the fame with delirium, raving, or diftraction. It is ufed alfo for any ridiculous, extra.
or vifion. But the moft ordinary ufe of the word among Englfh writers, is for a deep diforderly mufing or meditation.

REVERSAL of Judgment, in law. A judgment may be falfified, reverfed, or voided, in the firft place, without a writ of error, for matters foreign to or dehors the record, that is, not apparent upon the face of it; fo that they cannot be affigned for error in the fuperior court, which can only judge from what appears in the record itfelf; and therefore, if the whole record be not certified, or not truly certified, by the inferior court, the party injured thereby (in both civil and criminal cales) may allege a diminution of the record, and caufe it to be rectified. Thus, if any judgment whatever be given by perfons who had no good commiffion to proceed againtt the perf $n$ condemned, it is void ; and may be falfified by hewing the fpccial mutter, without writ of error. As, where a commiffion iffues to $A$ and $B$, and twelve others, or any two of th $\in m$, of which $A$ or B fhall be one, to take and try indictments; and any of the other twelve proceed without the interpofition or prefence of either $A$ or $B$ : in this cafe all proceediags, trials, convictions, and judgmente, are void for want of a proper authority in the commiffioners, and may be falfified upon bare infpection, without the trouble of a writ of error; it being a high middemeanour in the judges fo proceeding, and little (if any thing) thort of murder in them ail, in cafe the perion 10 attainted be executed and fuffer death. So likewite if a man purchafes land of another; and afterwards the vender is, either by outlawry or his own confeffion, convicted and attainted of treafon or felony previous to the fale or alienation ; whereby fuch land becomes liable to forfeiture or efcheat: now, upon any trial, the purchafer is at liberty, without bringing any writ of error, to falfify not only the time of the felony or treafon fuppofed, but the very point of the felony or treaf $n$ itfelf; and is not concluded by the confeffion or the outlawry of the vender, though the vender himfelf is concluded, and not fuffered now to deny the fact, which he has by confeffion or fight acknowledged. But if fuch attainder of the vender was by verdict, on the oath of his peers, the alienee cannot be received to fallify or contradict the fact of the crime committed; though he is at liberty to prove a mitake in time, or that the offence was committed after the alienation, and not before.

Secondly, a judgment may be reverfed, by writ of error, which lies from all inferior criminal jurifdictions to the court of king's-bench, and from the king'sbench to the houfe of feers; and may be brought for nctorious miftakes in the judgment or other farts of the record : as where a man is found guilty of perjury, and reccives the judgment of felony, or for other lefs palpable errors ; fuch as any irregularity, omifion, or want of form in the procels of outlawry, or proclamations; the want of a proper addition to the defendant's name, according to the ftatute of additions; for not properly naming the fheriff or cther officer of the court, or not duly defcribing where his county-court was held: for laying an offence, committed in the time of the late: king, to be done againit the peace of the prefent-; and for many other fimilar caufes, which (though allowed out of tendernefs to life and liberty) are not much to the credit or advancement of the national juftice.Thefe writs of error, to reverfe judgments in cafe of mif.

Reverfal mifdemeanours, are not to be allowed of courfe, but on Il fufficient probable caufe fhown to the atorney-general ; Reverfion. and then they are underftood to be grantable of common right, and ex debito juftitia. But writs of error to reverfe attainders in capital cafes are only allowed $e x$ gratia; and not without exprefs warrant under the king's fign-manual, or at lealt by the confent of the at-torney-general. Thefe therefore can rarely be brought by the party himfelf, efpecially where he is attainted for an offence againf tile itate: but they may be brought by his heir or executor after his death, in more favourabletimes; which may be fome confolation to his family. But the elier and more effectual way is,

Laftly, to reverie the attainder by act of parliament. This may be and hath been frequently done upon motives of compaffion, or perhaps the zcal of the times, after a fudden revolution in the government, without examining too clofe into the truth or validity of the errors affigned. And fometimes, though the crime be univerfally acknowledged and confeffed, yei the merits of the criminal', family thall after his death obtain a reftitution in blood, honours, and eftate, or fome or one of them, by ..ct of parliament ; which (fo far as it extends) has all :he effect of reverfing the attaiuder, without catting any reflections upon the juftice of the preceding fentence. Sce Artainder.

The effect of fallifying or reverfing an outlawry is, that the party flall be in the fame plight as if he had appeared upon the capias: and, it it be before plea pleaded, he thall be put to plead to the indietment; if, atcer conviction, he thall recesve the fentence of the law ; for all the other proceedings, except only the procefs of outlawry tor his non-appearance, remain good and effectual as before. But when judgment, pronounced upon conviction, is fa fified or reverled, all former proceedings are abfolutely let afide, and the party ftands as if he had never been at all acculed; reftored in his credit, his capacity, his blood, and his eftates: with regard to which laft, though they be granted away by the crown, yet the owner may enter upun the grantee, with as little ceremony as he might enter upon a dif-feifor.- But he ltill remains liable to another profecution for the fame offence : for, the firlt being erroneous, he never was in jeopardy thereby.

REVERSE of a medal, coin, \&c. denotes the fecond or back fide, in oppofition to the head or principal figure.

REVERSION, in Scots law. See Law, No clxix. 1 - 3 .

Reversion, in the law of England has two fignifications; the one of which is an eltate left, which cuntinues during a particular eftate in being; and the other is the returning of the land, \&c. after the particular eftate is ended; and it is further faid to be an interet in lands, when the poffeffion of it fails, or where the eftaie which was for a time parted with, returns to the granters, or their heirs. But, according to the ufual definition of a reverfion, it is the refidue of an eftate left in the granter, after a particular eftate granted away ceafes, continuing in the granter of fuch an eftate.
The diference between a remainder and a reverfion confitts in this, that the remainder may belong to any man except the granter; whereas the reverfion returns to him who conveyed the lands, \&c.

In order to render the doctrine of reverfions eafy, we Revcrinu. fhall give the following table; which fhows the prefent value of one pound, to be received at the end of ar: number of years not exceeding 40 ; difcounting at thic rate of 5,4 , and 3 per cent. compound intereft.

REVERSION of Series, in algebra, a kind of reverfed operation of an infinite feries. See Series.

REVIVIFICATION, in chemiftry, a term generally applied to the diftillation of quickfilver from cinnabar.

Commission of REVIEW, is a commiffion fometimes granted, in extraordinary cafes, to revife the fentence of the court of delegates, when it is apprehended they have been led into a material error. This commifion the king may grant, although the fatutes 14 and 25 Hen. VIII. declare the fentence of the delegates definite : becaufe the pope, as fupreme head by the canon law, ufed to grant fuch commiffion of review; and fuch authority as the pope heretofore exerted is now annexed to the crown by flatutes 26 Hen . VIII. c. 1. and I Eliz. c. 1. But it is not matter of right, which the fubject may demand ex debito jufitios; but merely a matter of fuvour, and which therefore is often denied.

Review, is the drawing out all or part of the army in line of battle, to be viewed by a governor, or a general, that they may know the condition of the troops.

At all reviews, the officers fhould be properly armed, ready in their exercife, falute well, in good time, and with a good air ; their uniform genteel, \&c. The men fhould be clean and well dreffed ; their accoutrements well put on ; very well fized in their ranks; the ferjeants expert in their duty, drummers periect in their beatings, and the fifers play correct. The manual exercife mult be performed in good time, and with life; and the men carry their arms well; march, wheel, and form with exactnefs. All manœuvres mult be performed with the utmolt regularity, both in quick and flow time. The firings are generally 36 rounds; viz. by companies; by grand divifions; by fub-divifions; obliquely, advancing, retreating; by files; in the fquare; ftreet firings, advancing, and retreating; and laftly, a volley. The intention of a review is, to know the condition of the troops, fee that they are complete and perform their exercifes and evolutions well.

Review is alfo applied to Literary Journals, which give a periodical view of the ftate of literature;-as the Monthly Review, the Critical Review, the Britifh Critic, and Analytical Review, \&c.

RE-UNION island, an ifland in the South Sea, difcovered by the French on the 16 th December 1773 ; lying, according to M . de Pages, in latitude $48^{\circ} 2 \mathbf{I}^{\prime \prime}$ and longitude $66^{\circ} 47^{\prime \prime}$, the variation of the needle being $30^{\circ}$ always towards north-weft. The road and harbour are extremely good, and the latter from 16 to 8 fathoms deep at the very hore. The coaft on each fide is lofty, but green, with an abrupt defcent, and fwarms with a fpecies of buftards. The penguins and fea-lions, which fwarmed on the fands, were nowife alarmed at the approach of thofe who landed; from whence $M$. de Pages crncladed that the country was wholly uninhabited. The foll produces a kind of grafs, about five inches long, with a bruad black leaf, and feemingly of a rioh quality-but there was no vefige of a tree or
human habitation. See Travels riund the World by M. Revolution de Pages, Vol. III. chap. viii. and ix.

REVOLUTION, in politics, fignifies a change in Defirition. the conftitution of a ftate; and is a word of different import from revolt, with which it is fometimes conlounded. When a people withdraw their obedience from their governors for any particular rearn, without overturning the government, or waging an offenfive war againlt it, they are in a fate of revoit; wisen mey overturn the government and form a new one row hemfelves, they effect a revolution.

That which is termed the revolution in Britain is the Britifh ${ }_{2}^{2} \mathrm{Re}$ change which, in 1688 , took place in confequence of rolutic. $n$, the forced abdication of king James 11. when the Pro. teftant fucceffion was eftablifhed, and the conftitution reftored to its primitive purity. Oi this important tranfaction, which confirmed the rights and liberties of Britons, we have endeavoured to give an impartial account under another article (fee Britain $n^{\circ}$ 28I, \&cc.). Of the rife and progrefs of the American revolution, Amerian. which is ftill freth in the memory of our readers, a large detail is given under the article America: But there are two other revolutions yet pending, of whid fome account will be expected in this place.

The Polifh revolution, which, in all its circunatances, was perhaps the lealt exceptionable of any in the records of hiftory, we have alreads traced to the perios when the amiable king, overawed by the arms of Ruifia, was obliged to undo his patriotic work, and gire his fanction to the reftoration of the old and wretched government (fee Poland). Since that period, Kofciulko's army has been completely defeated, himfolf made a prifoner, Warfaw taken, and the whole kingdum fubdued by the powers combined againtt it. What will be the confequences of this fuccefs may pertaps be conceived, but the rumours of the day are various. At one time we are told, that Poland is to be no longer an independent fate, but to be divided among the three great powers which formerly wrefted from it fome of its molt valuable provinces. At another time, we hear of the difinterefted intention of the Emprefs, to reftore the king to his original authority; although fhe has, in the mean time, driven him from his capital, where fhe herfelf exercifes fovereign power. And a third report fays, that Staniflaus is to retire with a large penfion, and a Ruffian prince to tep into his throne. The firft of thefe rumours we think much more probable than the other two: efpecially as it feems confirmed by the following letter fent from Grodno, on the 18th of January, by the unfortunatic king to the Britifh ambaffador.
"My dear Gardiner-The charasters with which you and 1 have been invefted feem to be now almoft at an end. I do not expect to fee you again, but it is of importance to me to bid you fatewell; and this I do from the bottom of my heant. You will preferve a place in my heart till death; and I hope that at laft we fhall meet again, in a place where upright minds, according to my opinion, will be for ever united.
"Every thing belonging to the ufual etiqueite has been fo much de:anged and interrupted by my fad fate, that molt probably neither you nor I will be able to fulfil the diplomatic cultoms.
"But be affured, that I love and honour your king

## $\mathrm{K} \mathrm{EV} \quad[\mathrm{I} 5 \mathrm{I}] \quad \mathrm{REVV}$

Revolution and nation. This you will apprize them of. Be affured alio, that I wifh you hould preferve an affection towäds your friend. If I am able to fpeak to you no rore, niy picture will fpeak to you for me! (Signed) Stanislaus Augustus, King."

This fhows, at leaft, the fate of the king; and luaving that of the kingum to be afcertained by time, we procoed to fulfil a promife which we made refpecting anoller revolution, to which all the nations of Europe are

When treating of France under a former article, we ftated a few of the more ftriking hiftorical facts which led to the commencement of the revolution ; and we now come to trace the feries of tranfactions which have marked its terrible career. In doing this, we fhall comprefs our ideas as much as poffible; and cut of the endlefs variety of materials of which the public are in poffefion, we fhall endeavour to extract a thort and, if poffible, a tolerably clear detail. For this purpofe, however, it will be neceffary that we begin, by ftating the internal fituation of France at the period immediately preceding the revolution, along with the more obvious political circumftances which contributed to the production of that event. The moral hiftory of man is always more important than the mere recital of any phyfical occurrences that may take place in his lot. It is not the fall of a mighty monarch and the difperfion of his family; it is not the convulfion of empires, :n : the oceans of human blood which have been fhed, that render the French revolution peculiarly intereltios, Such events, however deplorable, are far from being without example in the hiftory of mankind. In: the populous regions of the eaft, where fuperfition and favery have always prevailed, they are regarded as furm. mg a part of the ordinary courfe of human affairs ; becaufe an intrepid and ikilful ufurper finds it eafy to intimidate or enfnare millions of weak and credulous men. In Europe the cafe is very different; no adventurer can advance far without encountering thoufands as artful and as daring as himfelf. Events are not the rfult either of blind hazard or of individual kill; confpiraciss or plots produce little effect. Like other arts, the art of government has been brought to much perfection; and an eftablifhed conftitution can only be fhaken by the ftrong convulfion produced by national paffions and efforts. The wonderful fpectacle which we are now to contemplate, is that of a mild and polifhed people becoming in an inftant fanguinary and fierce; a well eftablifhed government, celebrated for its dextetity and A:ill, overturned almoit without a ftruggle; a whole ation apparently uniting to deftroy every inftitution which anticulity had hallowed or education taught them to refpect ; a fuperltitious people treating the reagion of their dathets with contempt; a long enflaved people, whole very chains had become dear to them, occupied in their public counfels in the difcuffion of refined, and cuen vifionary fchemes of freedom: in fhort, $25,000,000$ of perfons fuddenly treading under foot cvery featiment and every prejudice that they themfelves 6 had once regarded as facred and venerable.
France was Like the cther nations of Europe, France was anunder a barbarcus ariffoctacy
formerly cientiy go.erned by a barbarous arifocracy, whofe different members were feebly united by the authority of a fucceffion of kings deftitute of power or influence. The nobles, within their own territories, enjoyed privi-
leges entirely royal: they made peace and war; they Revolution coined money; they were judges in the latt refort; their valfals were their flaves, whom they bought and fold along with the lands; the inhabitants of cities, although freemen, were depreffed and poor, depending for protedion upon fome tyrannical baron in their n -ighbourbond. At length, however, by the progrefs of the arts, the cities rofe into confiderable importance, and their inhabitants, along with fuch freemen of low rank as reflded in tle country, were confidered as entitled to a reprefentation in the Aates-general of the kingdom, under the appellation of tiers elat, or third eftate; the clergy and the nobles forming the two firt eltates. But the fovereign, having figethly become defpotic, the meetings of the ilates general were lad afide. This abfolute authority, on the part of the crown, was not acquired, as it was in England by the houfe of Tudor, by abolifhing the perincious privileges of the nobles and elevating the commons; but by ikilful encroachments, by daring exertions of prerogative, and the ufe of a powerful military force. In France, therefore, the monarch was abiolute, yei the nobles retained all their feudal privileges, and the ecclefialtical hierarchy did the fame. The following was, in a few words, the itate of that country during theie two laft centuries.

The kingdom of France, previous to the revolution, was never reduced to one homogeneous mafs. It con- reduced fifted of a variety of feparate provinces acquired by dif. ints one ferent means; fome by marriage, fome by legacy, and ohers by conqueit. Each prorince retained its ancent laws and privileges, wheiner political or civil, as exprells in their capitularies or conditions by which they vere originally acestired. In one part of his dominions the French monarch was a count, in another he was a duac, and in others he was a king ; the only bond which taited his vaft empire being the itrong military force by which it vas overaterd. Each province had its barriers; and the intercoure betwint one province and another was ofren mure ratisaired by lacal ufages than the intercculfe of either with a foreign country. Sume of the provinces. fich as Bretagne and Dauphiné, even retained the right of affembing periodically their provincial ftates; but thate formed no barrier againft the power of the court.

The clergy formed the firlt eltate of the kingdom in The clergy point of precedence. They amounted to 130,000 . formed the The higher orders of them enjoyed immenfe revenues; firf eftate but the curés or great body of acting clergy feldom inthekingpoffeffed more than about $L .=8$ Sterling a-year, and dom, their vicaires about half that fum. A few of their dig. nified clergy were men of great piety, who refided conftantly in their diocefes, and attended to the duties of their office; but by far the greater number of them paffed their lives at Paris and Verfailles, immerfed in all the intrigues and diflipation of a gay and corrupted court and capital. They were almof exclufively felected from among the younger branches of the families of the moft powerful nobility, and accounted it a kind of difhonour to the order of bifhops for any perfon of low rank to be admitted into it. The lower clergy, on the contrary, were perfons of mean birth, and had litile chance of preferment. At the fame time, we find feveral refpectable exceptions to this laft rule. The clergy, as a body, independent of the tithes, polfeffed :a revenue ariling from their property in land, amounting

The parli-

## ancut the

 third,time they were cxempt from havation. The croven had of late years attempted to break through this privilege. 'Io avoid the danger, the elergy prefented to the court a frce gift of a fim of moner fomewhat thort of a mildion Sterling every five years.

The nobility was nominally the fecond order of the nate, but it was in reality the firf. The nobles amounted to no lefs than 200,000 in number. The title and rank defeended to all the children of the family, but the property to the eldefl alone : lience valt multitudes of them were dependent upon the bounty of the court. They regarded the ufeful and commercial arts as difhonourable, and even the liberal profeftions of the law and phyfic as in a great meafure beneath their dignity, difdaining to intermarry with the families of their proferfors. The feudal fyfem in its purity was extremely favourabie to the production of refpectable qualities in the minds of thoie who belonged to the order of the nobles; but the introduction of commerce has rendered its decline equally unfavourable to that clafs of men. Intead of the ancient patriarchal attachment between the feudal chieftain and his valfals, the nobility had become greedy landlords in the provinces, that they might appear in fplendor at court and in the capital. There, loft in intrigue, fenfuality, and vanity, their charafters hecame frivolous and contemptible. Such of the Freacls noble $f$ e, however, as remained in the provinces, regarded with indignation this degradation of their order, and ttill retained a proud fenfe of honour and of comrage, which has always rendered them refpectable. The order of the nobles was exempted from the payment of taxes, although the property of fome of them was immenfe. The eltates of the prince of Conde, for example, were worth L. 200,000 a year, and thofe of the dake of Orleans nearly twice as much. The crown had indeed impofed fome trifling taxes upon the nobleffe, which; however, they in a great meafure contrived to elude.

Next to the nobles, and as a privileged order pofferfing a fecondary kind of nobility of their own, we may mention the parliaments. Thefe were large bodies of men, in different provinces, appointed as courts of law for the adminiftration of juftice. In confequence of the corruption of the officers of ftate, the members purchaied their places, which they held for life; but the fon was ufually preterred when he offered to purchafe his father's place. In confequence of this laft circumitance, the practifing lawyers had little chance of evar becoming judges. Courts thus conflituted confifted of a modey mixture of old and young, learned and ignorant, men. Juitice was ill adminiltered. The judges allowed their votes in depending caufes to be openly folicited by the parties or their friends. No wife man ever entcred into a litigation againt a member of one of thefe parliaments; no lawyer would undertake to plead his caufe; it never came to a faccefstul iflue, and uftually never came to any illue at all. After the ftatesgeneral had fallen into difufe, the parliaments acquired a certain degree of political confequence, and formed the only check upon the abfolute power of the crown. The laws, or royal edies, before being put in force, were always fent to be regiftered in the books of the parliaments. ' $a k i n g$ advantage of this, in favourable times and circumitances, they often delayed or refuled to regiter the royal ediets, and prelented remon\&trances
againf them. This was done under a kind of legad Revulution ficiion: for they pretended that the obnoxious edict being injurious to the public happinefs, could not be the will of the king, but mutt either be a forgery or an impolition by the ninilters. Thefe objections were got the better of, either by a pafitive order from the king, or by his coming in perfon and ordering the ediat to be regiltered. The parliaments, however, often carried their oppofition very far, even to che ruin of themfelves and their families as individuals. This rendered them extremely popular with the nation, and enabled them to embarrals a weak adminiftration. After all, however, the oppofition of the parliaments was fo feeble, that it was never thought worth while to abolifh them entirely till towards the end of the reign of Louis XV. but they were rettored as a popular meafure at the beginning of the reign of Louis XVI.

The tiens elat, or commons, tormed the loweft order And the of the tate in France, and they were deprefled and mi- commone ferable in the extreme. To form a conception of their or tiersetat fituation it is neceffary to obferve that they bore the the lowelt whole pecupiary burdens of the tate: They alone were hable to taxation. An expenfive and ambitious oppreffive court ; an army of 200,000 men in time of peace, and the coms of twice that number in war ; a confiderable marine elta- mons. blifhment, public roads and works, were all fupported exclufively by the loweft of the people. To add to the evil, the revenues were ill collected. They were let out to farmers-general at a certain fum, over and above which they not only acquired immenfe fortunes to them. felves, but were enabled to advance enormous prefents to thofe fayourites or miflrefles of the king or the minifter, by means of whom they procured their placesTo raile all this money from the people, they were guilty of the cruelleft oppreffion, having it in their power to obtain whatever revenue laws they pleafed, and ewecuting them in the fevereft manner. For this lalt purpofe they kept in pay an army of clerks, fulvalterns, fcouts, and ipies, amounting to 80,000 men. Thefe men were indeed detelted by the king, whom they deceived and kept in poverty; by the people, whom they oppreffed; and by the ancient nobility, as purfe-proud upitarts. But the court of France could never contrive to manage without them. The pealants could be called out by the intendants of the privinces in what they called corvées to work upon the high roads for a certain number of days in the year, which was a fource of fevere oppreffion, as the intendant had the choice of the time and place of their employment, and was not bound to accept of any commutation in moncy. They were moreover fubject to the nobles in a thoufand ways. The nobles retained all their ancient manerial or patrimonial jurifdictions. The common people being an. ciently flaves, had obtained their freedom upon different conditions. In many places they and their poftarity remained bound to pay a perpetual tribute to their feudal lords. Such tributes formed a confiderable part of the revenue of many of the provincial nobles. No man could be an officer of the army, by a late regulation, who did not produce proofs of nobility for four generations. The parliaments, although originally of the tiars ctat, attempted alfo to introduce a rule that none but the nobleffe fhould be admitted into their order. In fuch a fituation, it will not be accounted furprifing that the common people of Erance were extremely fuperfi-

Fronch tiousand ignorant. They were, however, pantonatoly Revolution devoted to their monarch, and whatever concerned him. In 1754, when Louis XV. was talien ill at Meth, the whole nation was tialy in a kind of defpair. The coutrier and his horfe that brought the news of his recovery to Paris were both almoft fuffocated by the embraces of the ceople.

I2
Defpotic power of the ling.

We have faid that the French monarch was defpotic. His power was fupported by his army and by a watchtul police, having in pay an infinite hoft of fipies and cther fervants. In France no man was fafe. The fecrets of private families were fearched into. Nothing was unknown to the jealous inquifition of the police. Men were feized by lettres de cachet when they leaft expeited $i t$, and their families had no means of difcovering their fate. The fentence of a court of law againft a nobleman was ufually reverfed by the minifter. No book was publifhed without the licence of a cenfor-general appointed by the court, and the minifter was accountable to none but the king. No account was given of the expenditure of the public money. Enormous gratifications and penfions were given as the reward of the mof infamous fervices. The fupreme power of the ftate was ufually lodged with a favourite miftrcis, and fhe was fometimes a woman taken from public proftitution. This was not indeed the cafe under Louis XVI. but it was neverthelets one of the miffortunes of his life that he was far from being abfolute in his own family. Still, however, with all its faults, the French court was the moft splendid and polifhed in Europe. It was more the refort of men of talents and literature of every kind, and there they met with more ample protection, than anywhere elfe. The court was often jealous of their productions, but they met with the moft diftinguifhed attention from men of fortune and rank; infomuch that for a century paft the French have given the law to Europe in all queftions of talte, of literature, and of every polite accomplifh. ment. The gay elegance that prevailed at ceurt diffufed itfelf through the nation; and amidft much internal mifery, gave it to a foreigner the appearance of happinefs, or at leaft of levity and vanity.

Such as it was, this government had frood for ages, and might have continaed, had not a concurrence of caufes contributed to its overthrow. The inferior or ders of clergy, excluded from all chance of preferment, regarded heir fuperiors with jeillafy and envy, and were ready to join the laity of their own ra...k in ary popular commotion. The inferior provincial nobleffe beheld with contempt and indignation the vices and the power of the courtiers, and the higher nobility wifhed to diminith the power of the crown. The pratiling lawyers, almoft eatirely excluded from the chance of becoming judges, withe eagerly for a change of affairs, not doubting that their talents and profeffional fkill would render them neceffary amidft any alterations that could occur. Accordingly, they were the firft inftruments in producing the revolution, and have been its molt active fupporters. The monisd intereft wifhed eagerly for the dow:fil of the ancient $m$ bility. As for the great miafs of the common people, they were too ignorant, too fuperilitionfly attached to old eftablifh ments, and wo much depreffed, to have any conception of the nature of political libuty, or any hope of $\dot{0}$ taining it. We have already faied the leading circumVol. XVI.
 n $n^{\circ} 184$, s.r.); but there were other circumfances whic

Prenct contributed in on equal dugree both to its commeno. ment and its progrels.
For 40 years the primiples of liberiy bad been direminated with earcracts in lance by tome men of great talents, as Rouffau, Helvetius, and Raynal, to wion the celebrated Montefquieu had led the way. Befids thefe, there was ia France a valt mulitude of whet wise called mern of letters, or perfons who gave this accoun of the manner in which they fpent their time. A1: thefe were deeply engaged on the fide of fome kind of political reform. The men of letters in Paris alone are faid to have smounted to 20,000. One of the laft acts of the adminitration of the archbifor of Thouloufe was, on the 5 th July 1788, to publifh a refolution of the king in council, inviting all his fubjects to give him their advice with regard to the Itate of affairs. This was confidered as a conceffion of an unlimited liberty of the prefs; as it is fcarcely pofible to form an idea of the infinite varicty of political publications which from that period diffufed among the penple a diflatisfaction with the order of things in which they had hitherto lived.
The eftablifhed religion of France had for fome time palt been gradually undermined. It had been folemnly affaulted by philofophers in various elaborate perform. ances; and men of wit, among whom Voltaire took the lead, and attacked it with the dangerous weapon of ridicule. The Roman Cathulic religion is much expofed in this refpect, in confequence of the multitude of falfe miracles and legendary tales with which its hiftory abounds. Without difcriminating betwixi the refpectable principles on which it refts, and the fuperfitious follies by which they had been defaced, the French nation learned th laugh at the whole, and rejected intead of reforming the religion of their fathers. Thus the firt order in the fate had already begun to be regarded as ufelefs, and the minds of men were prepared for important changes.
The immenfe population of the city of Paris, amounting to upwards of 800,000 fouls, rendered it an important engine in the hands of the condactors of the revolution. An overgrown capital has always proved dangerous to a gevernment that is or attempts to be defpotic, as appears from the hiftory of ancient Babylon and Rome, as well as of modern Conftantinople, of London under Charles I. and Paris under feveral of its kings.
We cannot here avoid mentioning a phyfical event, which aififted not a little in producing many of the convulfions attending the revolution, a general fcarcity of grain, which occurred about that period. On Sunday the 13 th of July 1788 , about nine in the morning, without any eclipfe, a dreadful darknefs fuddenly overfpead feveral parts of France. It was the prelude of fuch a tempeft as is unexampled in the temperate climates of Europe. Wind, rain, hail, and thunder, feemed to contend in impetuofity; but the hail was the great inftrument of ruin. Initead of the rich profpects of an early autumn, the face of nature in the fpace of an hour prefented the dreary afpect of univerfal winter. The foil was converted into a morafs, the fanding curn baten into the quagmire, the vines broken to pieces, the fruit tree, demolifhed, and unmelted hail ly. ing in heaps like rocks of fulid ice. Even the robut

Prench foref trees ware unable to withonad the fury of the Hevolution tempeif. The hail was compoled of enormous, folid, 1789. and angular pieces of ice, fome of them weighing from eight to ten ounces. The country people, beaten down in the fields on their way to church, amidft this concuffion of the elements, concluded that the laft day was arrived; and fcarcely attempting to extricate themfelves, lay defpairing and half fuffocated amidft the water and the mud, expecting the immediate diffolution of all things. The form was irregular in its devaltations, While feveral rich diftricts were laid entirely wafte, fome intermediate portions of country were comparatively little injuied. One of 60 fquare leagues had not a fingle ear of corn or a fruit of any kind left. . Of the 66 parihhes in the diftrict of Pontoife, 43 were entirely defolated, and of the remaining 23 fome loft two-thirds and others half their harvelt. The ifle of France, being the diftrict in which Paris is fituated, and the Orleannois, appear to have fuffered chiefly. : The damage there, upon a moderate eftimate, amounted to $80,000,000$ of livres, or between three and four millions Sterling. Such a calamity mult at any period have been feverely felt; but occuring on the eve of a great political revolution, and amidft a general fcarcity throughout Europe, it was peculiarly unfortunate, and gave more embarraffment to the government than perhaps any other event whatever. Numbers of families found it neceffary to contract their mode of living for a time, and to difmifs their fervants, who were thus left defticute of bread. Added to the public difcontent and political diffenfions, it produced fuch an effect upon the people in general, that the nation feemed to have changed its character ; and inftead of that levity by which it had ever been diftinguifhed, a fettled gloom now feemed fixed on every countenance.

The fpring of the year 1789 was a period of much Attempt to political anxiety in France. The fuperior orders wifh. power of the crown in fring 1789 .
each of the orders could eafily refift hie encroachment French of the other two. Mr Neckar has been improperly cen- Revolution fured for not deciding this laft important queftion pre- $\underbrace{\text { 1789. }}$ vious to the meeting of the fates-general : but it mult be obferved, that the very purpofe of calling that affembly was to overturn the unjuit privileges of the higher orders through its medium, and without any direct interpofition on the part of the minifters. Had the king pofitively decided in favour of three chambers, the nobles and the clergy would have retained all thofe ancient abufes eftablifhed in their own favour, of which it was his wifh to deprive them, and the crown and its prerogatives would have been the only objects of facrifice. It was therefore thought fafer to leave the ifiers etat to fight its own battle: nor was it yet imagined that the commons of France, depreffed and pocr, and difperfed by fituation over a multitude of provinces, could ever unite in enterprifes dangerous to the fovereign.

The fates had been fummoned to meet at Verfailles Statesfumon the 27th of April, and moft of the deputies arrived moned to at that time; but the elections for the city of Paris meet at not being concluded, the king deferred the commence- Verfailles. ment of their feffons till the 4 th of May. During this period, the members, left in idlenefs, began to find out and form acquaintance with each other. Among others, a few members from Brittany (Bretagne) formed themfelves into a club, into which they gradually admitted many other deputies that were found to be zealous for the popular caufe, and allo many perfons who were not deputies. This fociety, thus orizinally eftablifhed at Verfailles, was called the Comité Breton; and was one day deltined, under the appellation of the $\mathcal{F} a$ cobin Club, to give laws to France, and to diffufe terror and alarm throughout Europe. On the other fide, the ariftocratic party eltablifhed conferences at the houfe of Madame Polignac, for the purpofe, it is faid, of uniting the nobles and the clergy.

An event occurred at this time which all parties afcri- A popular bed to fome malicious motive. In the populous fuburb riet in the of St Antoine, a M. Reveillon carried on a great paper fuburb of manufactory. A falfe report was fpread that he in. Stantoine. tended to lower the wages of his workmen, and that he had declared bread was too good for them, and that they might fubfift very well on potato-flour. A commotion was raifed, he was burnt in effigy, and his houfe was thereafter burnt and pillaged by the mob, who were not difperfed till the military had been called in, and much carnage enfued. The popular party afferted that the commotion had been artiully excited by the party of the queen and the Count D'Artois, to afford a pretence for bringing great bodies of the military to the neighbourhood to overawe the fates-general, or induce the king more decifively to refolve on affembling that body at Verfailles, in preference to Paris, where they and the popular minifter M. Neckar wifhed it to be held.

On the $4^{\text {th }}$ of May the ftates-general affembled at The statcs Verfailles. They commenced bufinefs by going in a General folemn procefion, preceded by the clergy, and follow- commence ed by the king, according to ancient cuftom, to church, bufinest at to perform an act of devotion. The nobles were arrayed in a fplendid robe, and they and the higher clergy glittered in gold and jewels. The commons appeared in black, the drefs belonging to the law. The afembly

## R E V

French affembly was thereafter opened by a fhort fpeech from Revolution
the throne, in which the king congratulated himfelf upon thus meeting his people aflembled; alluded to the national debt, and the taxes, which were feverely felt becaufe unequally levied; he took notice of the general difcontent and fpirit of innovation which prevailed, but declared his confidence in the uifdom of the aflembly for remedying every evil. "May an happy union (added he) reign in this affembly; and may this epocha become ever memorable for the happinefs and profperity of the country. It is the wifh of my heart; it is the moft ardent defire of my prayers ; it is, in thort, the price which I expect from the fincerity of my intentions and my love for my people."
M. Barretin, the keeper of the feals, next addreffed the affembly in a congratulatory and uninterefting fpeech. He was followed by the popular minifter M. Neckar, who fpoke for three hours. Though much applauded on account of the clear financial details which his fpeech contained, he encountered a certain degree of cenfure from all parties, on account of the cautious ainbiguity which he obferved with regard to the future proceedings of the ftates-general.

Next day the three orders affembled feparately. The deputies of the tiers etat amounted to 600 in number, and thofe of the nobles and clergy to 300 each. During their firf fittings much time was fpent in unimportant debates about trifling points of form ; but the firf important queftion, that neceffarily became the fubject of their difcuffion, was the verification of their powers, or production of the commiffions of the members, and inveftigation of their authenticity. The commons (tiers etat) laid hold of this as a pretext for opening the grand controverfy, whether the ftates-general fhould fit in one or in three feparate chambers? They fent a deputation inviting the nobles and the clergy to meet along with them in the common hall for the purpofe of verifying their powers in one common affembly. In the chamber of the clergy in 4 members voted for the performance of this ceremony in the general affembly; and I 33 againft it. But in the more haughty order of the nobles, the refolution for the verification in their own affembly was carried by a majority of 188 againft 47. The commons paid no regard to this. They were conducted by bold and fkilful leaders, who difcerned the importance of the point in conteft, and refolved not to abandon it. Aware of the exigencies of the flate, they knew that the crown was nearly verging upon bankruptcy; and that fuch were the deficiencies of the revenue that only a fort delay was necelfary to accomplith the abfolute difolution of the government. They fuffered five weeks to pafs away therefore in tot:al inactivity. During this period propofals were made on the part of the minillry for a pacification between the three orders, and conferences were opened by com. mitioners from each. But no art could feduce the commons from their original purpofe, or prevail with Lhem to enter upon the bulinefs of the ftate.

The nation had expected much from the affembling of the flates-general, and learnt the news of their inaction with no fmall degree of concern. The tiers etat was naturally popular, and the public cenfure could not readily devolve upon that favourite order. Moreover irom the firlt period of their affembling the commons made every effort to augment their own natural popu-

## $155 \quad$ RER

larity. They admitted all perfons promifuoufly into French the galleries, and even into the body of their hall. No Revout en reliraint was attempted to be laid upon the molt velec- 1789. ment marks of popular applaufe or cenfure. Litts 0 , the voters names were publicly taken and rent to Paris upon every remarkable occafion ; and the members fud. denly found themfelves become, according to their political fentiments, the objects of general execration on applaule. The new and bold notions of liberty that were daily advanced by the leaders of the tiers etat were received with acclamation by their hearers. The cap:tal becrme interefted in the iffue of every debate; and the political fervor was eagerly imbibed by the nation with that vivacity which is fo peculiar to the French. The commons accufed the nobles of obitinately impeding the bufinefs of the ftate, by refufing to verify their powers in one common affembly. The accufation was fwallowed by the multitude, who faw not, or were unwilling to fee, that the attack was made by their own favourite order. In the mean time the nobles becam? rafidly more and more unpopular. Their perfons were infulted, new publications daily came forth, and were greedily bought up, which reviled their whole order, and reprefented them as an ufelefs or pernicious body of men, whofe exiftence ought not to be tolerated in a free flate. Whoever adhered to them was branded with the odious appellation of Arifocrate. The clergy, from the influence of the parifh curés or parfons, feemed ready to defert their caufe They were cver oppofed by a minority of their own body, which derived luftre from having at its head the duke of Orleans, the firft prince of the blood. Still, however, the majority of the nobles remained firm; well aware, that if they once confented to fit in the fame affembly, and to vote promifcuoufly, with the ambitious and more numerous body of the commons, their whole order, and all its fplendid privileges, mutt fpeedily be overthrown.

The leaders of the commons faw the change that was taking place in the minds of men; and they at length regarded the period as arrived when they ought to emerge from their inactivity, and execute the daring project of feizing the legillative authority in their country. They declared that the reprefentatives of the nobles and the clergy were only the deputies of particular incorporations whom they would allow to fit and vote along with themfelves; but who had no ritle in a collective capacity to act as the legiflators of France. For conducting bufinefs with more facility, they appointed 20 committees. In confequence of a propofal by the Abbé Sieyes, a final meffage was fent to the privileged orders requiring their attendance as individuals, and intimating that the commons, as the deputies of 96 out of every hundred of their countrymen, were about to affume the exclufive power of ligiflation. None of the nobles obeyed this fummons; but three curés, Meffrs Cefve, Ballard, and Jalot, prefented their commifions, and were received with loud acclamations. They were next day followed by five more, among whom were Meffrs Gregoire, Dillon, and Bodineau. After fome debate concerning the appellation which they ought to aflume, the commons, with fuch of the clergy as had joined them, folemnly voted themfelves the fovereign legillators of their country under the name of the National Alfembly. The refult of the vote was no fooner declared, than the hall refounded $\mathrm{U}_{2}$

Majerity of the clergy unite with them.

24
Fears of the nobles.
the king and the naidonal affembly. M. Bailly was cliofen prefident for four days only, Meffrs Camus and Pifon de Galand fecretaries, and the affembly proceeded to bufineff.

Iis firt acts were decifively expreffive of its own fovereignty. All taxes impofed without the confent of the reprefentatives of the people were declared to be null and void; but a temporary fanction was given to the prefent taxes, although illegal, till the diffolution of the affembly and no longer. It was added, that " as foon as, in concert with his majefty, the affembly thould be able to fix the principles of national regeneration, it would take into confideration the national debt, placing from the prefent moment the creditors of the ftate under the fafeguard and honour of the French nation."
The popular caufe now gained ground fo fait, that on the Igth of June a majority of the clergy voted for the verification of their powers in common with the national affembly, and they refolved to unite with them on the following day.

Affairs were now come to a crifis, and the nobles perceived that they muft inftantly make a decifive ftand, or yield up their caufe as finally loft. Such was their alarm, that M. d'Efpremenil propofed, at one of the fittings of their order, to addrefs the king, intreating him to diffolve the ftates-general. Hitherto that prince had gone along with M. Neckar in favouring the popular caufe in oppofition to the arifocracy. But every art was now ufed to alaym his mind upon the fubject of the late affumptions of power on the part of the commons, and thefe arts were at length fuccefsful, Repeated counfels were held; M. Neckar was abfent attending a dying filter, and the king was prevailed upon to act agreeably to the advice of the leaders of the nobles. But the firf meafare which they adopted was fo ill conducted as to afford little profpect of final fuccefs to their caufe. On the 2oth of June, when the prefident and members were about to enter as ufual into their own hall, they found it unexpectedly furrounded by a detachment of the guards, who refufed them admimon, while the heralds at the fame time proclamed a royal feffion. Alarmed by this nuforefeen event, the meaning of which they knew not, but apprehending that an immediate diffilution of the affembly was defigned, they infantly retired to a neighbouring icanis-court, where, in the vehemence of their enthuflafm, they took a folemn oath " never to feparate till the conftitution of their country fhould be completed."

On the 22 d a new proclamation intimated that the royal feffion, was deferred tiil the following day. It was now found that the affembly had been excluded from their hall merely becaufe the workmen were oc. capied in preparing it for the intended folemnity. This information was ill calculated to excite favourable expaiations of the meafures about to be adopted at a 2o royal feffion, ufhered in by fuch circumftances of mark-Theeifem- ed difrefpect for the reprefentatives of the people. The bly mects affembly, after wandering about in fearch of a place in the charch of St Loui:.
of meeting, at length entered the church of $S_{t}$ Louis, and were immediately joined by the majoxity of the clergy, with their prefident, the archbilhop of Vienne, at their head. Two nobles of Dauphirie, the marquis de Blaçon and the count d'Agoult, prefented their com-
miflions at the fame time. Encouraged by thefe events, French and by the applaufes of furrounding nultitudes, the Revolutian affembly now expected with firmnefs the meafures about $\underbrace{1789 .}$ to be adopted.

The royal feffion was held in the molt fplendid form, Difcourle but altogether in the ftyle of the ancient defpotifm. of the ling Soldiers furrounded the ha!1. The two fuperior orders were feated, while the reprefentatives of the people, left fanding a full hour in the rain, were in no humour, when at lalt admitted, to receive with much complacency the commands of their fovereign. The king readi a difcourfe, in which he declared null and void the refolutions of the 17 th, but at the fame time prefented the plan of a conftitution for France. It contained many good and patriotic principles, but preferved the diftinction of orders, and the exercife of lettres de cachet; it faid nothing about any active fhare in the legillative power to be pofieffed by the ftates-general, and was filent both about the refponftility of minifters and the liberty of the prefs. The king concluded by commanding the deputies immediately to retire, and to affemble again on the following day. He then withdrew, and was followed by all the nobles and a part of the clergy. The commons remained in gloomy filence on their feats. It was interrupted by the grand mafter of the ceremonies, who reminded the prefident of the intentions of the king. Infantly the vehement caunt de Mirabeau, ftarting from his feat, exclaimed with indignation, "The commons of France have determined to debate. We have heard the intentions wat have been fuggefted to the king; and you, who cannor be his agent with the ftates-general, you who have here neither feat nor voice, nor a right to fpeak, are not the perfon to remind us of his fpeech. Go tell your mafter, that we are here by the power of the people, and that nothing fhall expel us but the bayonet." The applaufe of the affembly feconded the enthufiarm of the orator, and the mafter of the ceremonies withdrew in filence.
M. Camus then rofe ; and in a violent fpeech indignantly ftigmatifed the royal feffion by the obnoxious ter the appellation of a bed of juftice; he concluded by moving king's dethat the affembly thould declare their uncqualified adhe- parture. rence to their former decrees. This motion was followed by amother, pronouncing the perfons of the de. puties inviolable. Both were fupported iy Meffrs Petion, Barnave, Glaizen, the Abbés Gregoire, Sieyes, and many others, and were unanimoufly decreed. The affembly therefore continued their fittings in the ufual form. On the following day the majority of the clergy attended as members; and on the 25 th the dake of Orleans, along with 49 of the deputies belonging to the order of nobles, joined them alfo. The remaining nobles, as well as the fmall minority of the clergy, now found themfelves aukwardly fituated. Whether on this account, or becaufe their leaders had by this time formed a plan for carrying their point not by peaceable means but by the aid of a military force, the king, on the 27 th, invited by a preffing letter both orders to join the commons. This requeft was immediately complied with, alchough many of the nobility difapproved of the meafure.

The fituation of France was now become truly alarm- Alarming ing. When the king retired from the affembly after fituation of the royal feffion, he was followed by more than 6000 France at
citizens ${ }_{6}$ this period

French citizens, from whom loud clamours and every mark of Revolution difapprobation broke forth. All Verfailles was fpeedily $\underbrace{1789 .}$ in an uproar. M. Neckar had repeatedly folicited his difmiffion, and the report of this had increafed the popular clamour. The court was in confernation. The king probably difcovered, with no great fatisfaction, that his minitter was more popular than himfelf. At fix o'clock in the evening the queen fent for M. Neckar. When he returned from the palace, he affured the crowd that waited for him that he would not abandon them ; upon which they retired fatisfied. At the fame time the news of the royal feffion had thrown the city of Paris into violent agitation. The peace of that capital was at this time endangered by a variety of caufes. A dreadful famine raged through the land, which in a great city is ufually mof feverely felt. This prepared the minds of men for receiving unfavourable impreffions of their political ftate. Every effort was moreover made to diforganize the government, and pro-
31
Numerous feditious publications. duce a diflike to the ancient order of things. The prefs poured forth innumerable publications, filled with new and feducing, though generally impracticable, theories of liberty. Thefe were diltributed gratis among the bulk of the people of Paris, and difperfed in the fame manner through the provinces. Philip duke of Orleans (prefumptive heir to the crown failing the children and brothers of the king) is with good reafon believed to have fupplied this expence out of his more than royal revenues. In the gardens of the Palais Royale at Paris, which belonged to him, an immenfe multitude was daily affembled, liftening from morning till night to orators who defcanted upon the moft violent fubjects of popular politics. Many of thefe orators were fuipected to be in his pay. It was even believed that his money found its way into the pockets of fome of the moft diftinguifhed leaders in the national affem32 bly.
Seduction
But the government was, if poffible, fill more danof the mili- geroufly affaulted by the methods now generally ufed tary.
in confinement for this offence; a crowd inftantly collected, and refcued them, the dragoons that were Revolution brought to fupprefs the tumult grounding their were $178 \%$. a deputation of the citizens folicited of the affembly the pardon of the pritoners. The affembly applied to the king, who pardoned them accordingly.

All thefe events, together with the tumultuons fate The ${ }^{33}$, of the capital, which was daily increafing, made it ne-tary called ceffary for the king to call out the military force to out. reftore, if poffible, the public peace. That his intentions were pure, the then Itate of affairs will permit of but very little doubt; but the ariftocracy, with the Count d'Artois at their head, were bringing forward other meafures, which ultimately contributed to the ruin of themfelves, the king, and the kingdom. Crowds of foldiers were collected from all parts of the kingdom around Paris and Verfailles. It was obferved, that thefe confilted chiefly of toreign mercenaries. Camps were traced out. Marfhal Broglio, a tried veteran, was fent for and placed at the head of the army. The king was fuppofed to have entirely yielded to new counfels, and every thing bore the appearance of a defperate effort to reftore the energy of the ancient government. This is the moft important period of the French revolution; yet the fpecific defigns of the leading actors have never been clearly undertood. It was rumoured at the time, that Paris was to be fubdued by a fiege and bombardment; that the affembly was to be diffolved, and its leaders put to death. Thefe are incredible exaggerations; but the crifis of French liberty was univerfally regarded as at hand, and alfo the exiftence of the national affembly as an independent body; or at leaft upon any other footing than that propofed by the king on the 23 d of Juae.

An able and eloquent addrefs to the king againft the The affemaffemblage of foreign troops in their neighbourhood was brought forward by Mirabean, and voted by the a(fembly. The king quickly replied, that the ftate of renove the capital was the caufe of alfembling the troops, and which is offered to transfer the flates.general to Noyons or Soif-refufed.
fons. " We will neither remove (exclaimed Mirabean) to Noyons nor to Soiffons; we will not place ourfelves. between two hoftile armies, that which is befieging Paris and that which may fall upon us from Flanders or Alface; we have notafked permifion to run away from the troops; we have defired that the troops fhould be removed from the capital,"

Thirty-five thoufand men were now fationed in the neighbourhood of Paris and Verfailles. The pnits were occupied which commanded the city, and camps were marked out for a greater force. The Count d'Ar tois and his party regarded their plans as ripe for execu. tion; and 1.1 . Neckar received a letter from the king, requiring him to quit the kingdom in 24 hours. That popular (a) minifter took the route of Bruffels on the following day, when his departure was made public. In his difmifion the popular, or as it was now called the democratic, party thought they $f_{1} w$ the refolution adopted to accomplifh their ruin. The affembly again They again addreffed the throne; they requefted anew the removal addrefs thr of king ;
( $\Delta$ ) Popular he certainly was ; but he either had not fortitude and talents to execute his own plans, or acted a bufe fart to his amiable mafter. From bafenefs we acquit him

Decrece of the affembly in conReyuence

## the Prince

 De Lambefq.of the troops, offering to be refponfible for the public peace, and to proceed in a body to Paris to encounter perfonally every danger that might occur. But they were coolly told, that the king was the belt judge of the mode of employing the troops, and that the prefence of the affembly was neceffary at Verfailles. From a fovereign who doubtlefs recollected the proceedings of the long parliament of England, a different reply could not in reaton be expected. On receiving it, however, it was inftantly decreed, on the motion of the marquis de la Fayette, that the late minitry had carried with them the confidence of the affembly; that the troops ought to be removed; that the minittry are and fhall be refponfible to the people for their conduct; that the affembly perfifted in all its former decrees; and that as it had taken the public debt under the protection of the nation, no power in France was entitled to pronounce the infamous word bankruptcy.

The city of Paris was thrown into deep confternation by the news of M. Neckar's retreat. His buft and that of the Duke d'Orleans were dreffed in mourning, and carried through the freets. The royal Allemand, a German regiment, broke in pieces the bufts, and difperfed the populace. The prince De Lambeff, grand ecuyer of France, was ordered to advance with his regiment of cavalry, and take polt at the Thuilleries. Being a man of a violent temper, and enraged by the appearances of difapprobation which were vifible around him, he furioully cut down with his fword a poor old man who was walking peaceably in the gardens. The confequences of this act of inhumanity were fuch as might have been expefted; a fhout of execration in-- Itantly arofe; the cry to arms was heard; the military were affaulted on all fides; the French guards joined their countrymen, and compelled the Germans, overpowered by numbers, and unfupported by the reft of the army, to retire.

All order was now at an end, and as night approached an univerfal terror diffufed itfelf through the city. Bands of robbers were collecting; and from them or from the foreign foldiery a general pillage was expected. The night paffed away in confternation and tumult. It was found in the morning that the hofpital of St Lazare was already plundered. The alarm bells were rung; the citizens affembled at the Hotel de Ville, and adopt ed a propofal that was there made, of enrolling themfelves as a militia for general defence, under the appellation of the national guard. This day and the fücceeding night were fpent in tolerable quietnefs, without any attempt on the part of the army. On the morning of the memorable isth of July, it was difcovered that the troops encamped in the Champs Elifées had moved off, and an immediate affault was expected. The national guard now amounted to 150,000 men; but they were in general deftitute of arms. They had affumed a green cockade; but on recollecting that this was the livery of the Count d'Artois, they adopted one of red, blue, and white. M. de la Salle was named commander in chief, officers were chofen, and detachments fent atound in queft of arms. In the Hotel des Invalides upwards of 30,000 ftand of arms were found, along with 20 pieces of cannon; a variety of weapons was alfo procured from the garde meuble de la couronne, and from the fhops of armourers, cutlers, \&ic.

The celebrated fortrefs of the Baltile was an object
of much jealoufy to the Parifians. At II oclock in French the morning, M. de la Rofiere, at the head of a nume- Revolution rous deputation, waited upon M. de Launay the go- $\underbrace{1789 \text {. }}$ vernor, who promifed, along with the officers of his 39 garrifon, that they would not fire upon the city unlefs The saf-
they fhould be attacked. But a report was foon fpread ve attackthrough Paris, that M. de Launay had, in a fhort time ${ }^{\text {ed; }}$ thereafter, admitted into the fortreis a multitude of perfons, and then treacheroufly mallacred them. The caufe of this piece of perfidy has never been expiained. The fact itfelf bas been denied ; but it was attefted at the time by the duke of Dorfet, the Britifh ambalfador at the court of France. The effect of the report was, that a fudden refolution was adopted of affaulting the Baftile; an immenfe and furious multitude rufhed into its outer, and foon forced their way into its inner, courts, where they received and returned a fevere fire for the fpace of an hour. The French guards, who were now embodied into the national guard, conducted the attack with fkill and coolnefs : they dragged three waggons loaded with ftraw to the foot of the walls, and there fet them on fire; the fmoke of thefe broke the aim of the garrifon, while it gave no difturbance to the more diftant affailants. The befieging multitude preffed the attack with incredible obitinacy and vigour for the fpace of four hours; the garrifon was in confufion; the officers ferved the cannon in perfon, and fired their mufkets in the ranks; the governor in delpair, thrice attempted to blow up the fortrefs. A capitulation, when at laft fought, was refufed to the And furgarrifon, and an unconditional iurrender took place. rendered The governor, and M. de Lofme Salbrai his major, a uncondigentleman of diftinguifhed humanity and honour, be- tionallycame victims of popular fury in fite of every effort that could be made for their protection; but the French guards fucceeded in procuring the fafety of the garrifon. Only feven prifoners were found in the Battile. A guard was placed in it, and the keys were fent to the celebrated M. Briffot de Warville, who a few years before had inhabited one of its caverns.

The remaining part of this eventful day was fpent at Paris in a mixture of triumph and alarm. In the pocket of the Governor of the Baftile a letter was found, encouraging him to refiftance by the promife of fpeedy fuccours, written by M. de Fleffelles, the prevot de marchands, or chief city magiftrate, who had pretended to be a molt zealous patriot. This piece of treachery was punifhed by inftant death; and his bloody head was carried through the city on a pole, along with that of M. de Launay. At the approach of night a body of troops advanced towards the city, at the Barriere d'Enfer. The new national guard hurried thither, preceded by a train of artillery, and the troops withdrew upon the firlt fire: barricadoes were every where formed, the alarm-bells were rung, and a general illumination continued during the whole of this night of confufion.

In the mean time, it was obvious that the new mini. 41 ftry were entering upon a difficult fceñe of action, nifiry apwhere one falfe ftep might lead to ruin, and where pointed. their own plan of conduct ought to be maturely digefted. Marfhal Broglio was made minifter of war, the baron de Breteuil prefident of finance, M. de la Galeziere comptroller-general, M. de la Porte intendant of the war department, and M. Foulon intendant of the

## R E V [ 159 ] R E V

French navy; but thefe were only meant to act as official men, Revolution under the Count d'Artois, and the other leaders of the $\underbrace{1789 .}$ ariftocracy. To thefe leaders there did not even remain a ation difficult, and their conduct bad. choice of difficultie; ; no refource was left but that of overawing by military power the national affembly and the capital, and of riking the defperate meafure of a national bankruptcy, which the court had not formerly dared to encounter, and to avoid which it had convo-
ked the ftates-general. No trace remains, however, of any attempt to put this criminal, but latt refource, in execution. The evening after the departure of $M$. Neckar was fpent by the court of Verfalles in foalting and joy, as if a victory had been gained. The courtiers of both fexes went round among the foldiery, tiriving to fecure their fidelity by careffes, largeffes, and every fpecies of flattering attention. The miniftry not only failed to fupport the Prince de Lambefq in the poit which he had been fent to occupy, but they fuffered the whole of the 13 th to pafs in indecifion, while the capital was in a ftate of rebellion, while an army was formally muftering within its walls, and the names of the principal nobility were put up in lifts of profcriptions. They received the news of the capture of the Balile with confufion and difmay, which were increafed, if pofflble, by information given by Marfhal Broglio, that the troops refufed to act againit Paris or the national affembly. In this perplexity they adopted the miferable device of concealing from the king the ftate of public affairs ; and that unfortunate prince was thus perhaps the only perfon out of millions around him who remained ignorant of the convuifions in which his country was involved.

At length, at midnight, the Duke de Liancourt forced his way into the king's apartment, and told him of the revolt of his capital, of his army, and of the furrender of the fortrefs of the Baftile. The Count d'Artois, who was prefent, itill attempted to retain the monarch under his fatal delufion; but the Duke de Liancourt turning round, exclaimed, "As for you, Sir, your life can only be faved by inftant flight; I have feen with horror your name in the bloody lit of the profcribed." Accordingly the Count, with the members of his fhort lived adminiltration and their adherents, fled to the frontiers. And thas an emigration commenced, the fource of that terrible conelt which has covered Europe with bloodihed and mourning. This miniftry had, no doubt, many diffizulties to contend againft ; but an accurate attention oo their conduct excites a fufpicion which, while it exculpates them from many intended crimes that have been laid to their charge, at the dame time does little honour to their talents. It is this, that they had come into office without having formed any clear plan of conduct; that they were men acting without decilion and at randem, and confequently became the fport of the fe events which they wanted 1 kill and vigour to direct or controul. By their introduction into oftice, and their mifconduct while in it, the royal authority fell proftrate $b$-fore the popular party in the national alfembly. The nobles and the clergy fill remained, but confounded in one affembly wich the more numerous order of the tivis etat; and no longer rallying round a throne that uas too feeble to afford protection, they foon jielded to that fierce and levelling fpirit of democracy that now rofe around them.

But the perfon of the monarch was titl beloved.Early next morning the king went to the aftembly, but with none of the ufual folemnities. He " regretted the commotions of the capital, difavowed any knowledge of an intention againlt the perfons of the deputies, and intimated that he had commanded the removal of the troops." A deep and expreffive filence prevailed for a few moments; this was fucceeded by vehement and univerfal houts of applaufe. The king arofe to depart, and inftantly the whole affembly crouded around, and attended him to his palace. The queen appeared at a balcony with the dauphin in her arms; the mufic played the pathetic air of Oì pout-on êirc mieux qu' au feint de fa famille. The enthufiafm of loyalty communicated itielf to the furrounding multitudes, and nothing was heard but acciamations of joy.

On the following day, the king declared his refolu- And fuxt tion to vifit the city of Paris in perfon. Accordingly day vilis that prince, who never wanted perfonal courage, how- the city of ever deficient he might be in political ftedfaftnefs, fet Paris in out, attended by fome members of the affembly and by perfon. the militia of Verfailles. He was met by the celebrated M. de la Fayette, at the head of a body of the national guard, of which he had now been chofen commander in chief. M. Bailly, in whofe perfon the ancient office of mayor of Paris had been revived, received the king at the gates, and delivered to him the keys. All this while no fhout was heard from the crowd of innumerable fpectators but that of Vive la nation. The king advanced to the Hotel de Ville, where the new cockade was prefented to him, which he put on, and prefented himfelf with it at a window. At the fight of this badge of patriotifm an univerfal fhout of Vive le Roi burlt forth from every quarter; and he returned to Verlailles amida general triumph and applaufe.

Much confufion fill prevailed in the capital; but In which there was more appearance of regularity than could have much conbeen expected at the conclufion of fuch important fufion flith events. This arofe from a cafud concurrence of cir-prevailed. cumftances. To conduct with eafe the elections to the ftates-general, Paris had been divided into 60 diftricts, cach of which had a feparate place of meeting. The people did not elect the members to the ftates-general; but they chofe delegates, who, under the name of elec. tors, voted for the members. At the commencement of the difturbances, the electors, at the requelt of their fellow citisens, afumed a temporary authority; of which, however, they were foon weary, and as foon as poffible procured the public election of 120 perfons as municipal oficers for the government of the city. The citizens having got the habit of affembling in their diftricts, grew fond of it: they affembled frequently, made rules for their own government, and fent commiffioners to communicate with other difricts. The tumultuous nature of thefe meetings, and the vehemence of debate which prevailed in them, will beft be conceived from the ludicrous contrivance of one of their prefidents, who ftationed a drummer at the back of his chair, and when the confufion and noife became altogether ungovernable, gave the fignal for beating the drum, which fpeedily overpowered every other noife. Thefe meetings, however, gradually ripened into clubs, fin which much dexterity and intrigue were exerted.

The whole of the late miniftry efcaped excepting M. Foulan.

Fremi. Foulon. His chara\&ter, it may well be imagined, was Revolution $\underbrace{1789 .}$

46 Fate of $M$. Foulon, one of the late miniftry, and his ion-inlaw Berthitr. extremely unpopular; for he is faid to have afferted, that he would " make the people of Paris eat hay." He had retired to the country, but was feized by his own vaffals, and brought to Paris with a bundle of hay tied to his back. In fite of every effort made by M. M. Bailly and Payetie to procure him a fair trial at leaft, he was carried to the Place de Greve, and hanged at a lamp-iron by the enraged multitude. His fon-in-law M. Berthier, atttempting to defend himfelf againit a fimilar fate, fell, covered with wounds. Their heads were carried round on poles; and thus the populace became habituated to the fight of blood and murder: they were even taught by popular fongs to glory in fuch actions, and particularly by the well known fong Ca-ira.
47
M . Neckar ${ }^{47}$ In confequence of an invitation from the king, $M$. returns Neckar returned to France. He was received by the and the affembly with great applaufe, and in Paris with infinite inmediate confequeaces of it. a political error that made fome noife. In deploring the late exceffes and murders, and taking notice of
the arreft of M. Bezenval, an officer of the Swifs guards he requefted of the electors at the Hotel de Ville, in a folemn harangue, that the paft fhould be forgotten ; that profcriptions fhould ceafe, and a general amneity be proclaimed. In a moment of enthufiafm this was agreed to, and the electors decreed what unqueltionably exceeded their powers. The diftricts of Paris were inftantly in commotion; the electors alarmed, declared that they only meant that " henceforth the people would punifh no man but according to law ;" and, at the fame time, to prove that they themfelves were free from ambition, they formally renounced all their own powers. The affembly took up the queftion. Meff. Lally, Tolendal, Mounier, Clermont, Tonnerre, Garat junior, and others, declared that no perfon ought to be arrefted without a formal accufation. While Meff. Mirabeau, Robefpierre, Barnave, and Gleizen, alleged, or the contrary, that the people were entitled to lay hold of any man who had publicly appeared at the head of their enemies. The debate ended, by admitting the explanation of the electors, and by a declaration that it was the duty of the affem-

The com:motions, \&c. of the capital reach to the provin ces. bly to fee juftice executed in all cafes.

The commotions and enthufiafm of the capital were fpeedily communicated to the provinces. In every quarter the people feized upon all the arms that could be found, and the military iniformly refufed to act againft them. Many acts of outrage were committed in Brittany, at Strafbourg, in the Lionnois, and elfe- where, in which the nobility were the fufferers. The mifchiefs that occurred were ufually magnified at a diftance; but that very circumflance was an additional evil. For example: It was ftated in the National Arfembly that M. de Mefma;, lord of Quincy, invited a number of patriots, among whom were the officers of a neighbouring garrifon, to a fplendid entertainment at his houfe, to celebrate the happy union of the three orders: That in the midn of the feall the mafter of the houle contrived to withdraw unnoticed, and to fet fire to a train previoully laid, which communicated with a quantity of gunpowder in the cellars, in confequence of which the whole company, by a fudden explofion, were blown into the air. It was found on inquiry,
that there was not one word of trathinthe whole frory. French But before this inquiry could be made, all France Revolution had refounded with accounts of the pretended blondy 1789. tragedy; and the whole nobility of the kingdom fuffered in a lefs or greater degree, from the prejudices excited by this unhappy report, the origin of which has never been well explained. It would be vain to ftate all the idle rumours to which at this time the blind credulity of the multitude gave currency. At one time, the Arifocrats were cutting down the green corn, at another time they were burying flour in common fewers, or cafting loaves into the Seine. One report was no fooner proved to be falfe than another arofe, and the whole nation was agitated by fufpicion and alarm. The National Affembly were engaged in framing their celebrated declaration of the rights of man, which was to form the bafis of the new conftitution, when the alarming accounts, received from all quarters, of the fate of anarchy into which the kingdom was falling, obliged them fuddenily to turn their attention to objects of practical neceflity. The privileged orders found themfelves become the objects of univerfal jealoufy and hatred; and that fomething mult indtantly be done to fave their families and property, which were menanced on every fide with perfecution and pillage. Regarding the popular torrent as now become irrefiftible, to fave fomething they refolved to facrifice a part.

On the afternoon fitting of the $4^{\text {th }}$ of Augult, the Vifcount Vifcount de Noailles, fecomded by the Duke d'Aiguil. de Noailles lon, opened one of the moft important fcenes in the and Duke French Revolution, or in the hiftory of any country. d'AiguilThefe noblemen ftated, that the true caufe of the com- pofe that motions which convulfed the kingdom exilted in the mifery of the people, who groaned under the double oppreffion of public contributions and of fendal fervices. "For three months (faid M. de Noailles) the people have beheld us engaged in verbal difputes, while their own attention and their wifhes are directed only to things. What is the confequence? They are armed to reclaim their rights, and they fee no profpect of obtaining them but by force." He therefore propofed to do jultice as the fhorteft way of reftoring tranquillity, and for that purpofe to decree, that henceforth every tax fhould be impofed in proportion to the wealth of the contributors, and that no order of the fate fhould be exempted from the payment of pablic burdens; that feudal clairos fhould be redeemed at a fair valuation; but that fuch claims as confifted of perfonal fervices on the part of the vaffal fhould be abolifhed without compenfation, as contrary to the imprefcriptible rights of man. The extenive poffefions of the noblemen who made thefe propofals added much luftre to the difinterefted facrifice which they offered. Their fpeeches were received with the molt enthufiaftic applaufes by the Affembly and the galleries, and their propofals were decreed by acclamation without a vote. No nation is fo much led by the influence of fudden emotions as the French. The patriotic contagion now fpread falt through every breait, and a conteft of generofity enfued. The hereditary jurifdictions poffeffed by the nobles within their own territories were next facrificed. All places and penfions granted by the Court were fuppreffed, unlefs granted as the reward of merit or of actual fervices. The game laws, which condemned the The gamehufbandman, under fevere penalties, to leave his proper laws, \&c.

50 The raxes fhould be in proporion to the wealth of butors.

52 cient privi- of the Pais d'Etat, or privileged provinces, with the leges are
voluntarily
deputies of Dauphiné at their head, next came forward,
and a furrender of their ancient privileges, revoluntarily furrecderod. grievances of the French peafantry. Thefe were therefore renounced, along with the exclufive rights of rabbit warrens, filheries, and dovecotes. The fale of offices was abolifhed, and the fees exacted from the poor, together with the privilege of holding a plurality of and offered a furrender of their ancient privileges, requelting that the kingdom might no longer remain parcelled out among Dauphinois, Bretons, Provençaux, \&c. but that they hould all form one great mafs of French citizens. They were followed by the reprefentatives of Paris, Marfeilles, Lyons, Bourdeaux, Strabourg, \&c. who requelted leave to renounce all their feparate privileges as incorporations, for the fake of placing every man and every village in the nation upon a footing of equality. Thus the Affembly proceeded, till every member had exhaufted his imagination upon the fubject of reform. To clofe the whole, the Duc de Liancourt propofed that a folemn $T e$ Deum fhould be performed, that a medal fhould be ftruck in commemoration of the events of that night; and that the title of Restorer of Gallic Liberty fhould be beftowed upon the reigning monarch. A deputation was accordingly appointed to wait upon the king, refpectfully to inform him of thefe decrees.
53
Tithes and revenues of
the clergy taken
may.

Several fucceeding days wete neceffary to form into laws the decrees of the 4th Auguft, and committees were appointed to make out reports for that purpore. One of thefe reports having included the tithes and revenues of the clergy among the abufes that were to be done away, and having propofed in dieu of them to grant a certain ftipend to the different minifters of religion to be payable by the nation, the clergy attempted to make a ftand in defence of their property, and violent debates enfued. In thefe they were ably fupported by the Abbe Sieyes: but as the clergyo had formerly deferted the nobles, fo they were now in their turn abandoned to their fate by the hereditary ariftocracy. The popular party had long regarded the wealth of the church as an eafy refource for fupplying the wants of the itate.Never was there a more complete proof of the influence of opinion over the affairs of men. The Catholic clergy of France, though poffeffed of more property than they enjoyed at the time when princes took up arms or laid them down at their command, now found fo few defenders, that they were terrified into a voluntary furrender of all that they and their predecefors had poffeffed for ages. In their overthrow, they fearcely enjoyed even the barren honour of having fallen the 3aft of thofe privileged orders that fo long had ruled aver this ancient kingdom. They and the nobles, and the king, fiill polfeffed their former titles and nominal dignity; but all of them were now fubdued, and at the mercy of the comm ns of France, who fpeedily difmilfed them at tleeir pleafure.

As a hore fealon of tranquillity in the Court and the National Affembly fucceeded thefe great popular facrifices, the king laid hold of it as a fi: opportunity for the appointment of a new miniftry. They confifted of the Archbihicp of Vienne, the Archbifhop of Bourdeaux, MI. Neckar, the Count de St Prieft, Count de Vol. XVI.

Montmorin, the Count de la Luzerne, and the Count de la Tour du Pin Panlin. M. Neckar, as minifter of finance, having ftated the diftreffed fituation of the revenue, prefented the plan of a loan of thirty millions of livres. But M. Mirabeau, from a fpirit of rivalfhip, as it would feem, to M. Neckar, prevailed with the Affembly to alter and to narrow the conditions of it in fuch a degree that very few fubfcribers were found, and ne the loan could not be filled up. This failure involved the Aifembly in a confiderable degree of unpopularity; in confequence of which they allowed M. Neckar to prefcribe his own terms for the purpofe of obtaining a loan of eighty millions. But the happy inftant of public confidence had been allowed to pafs away, and this loan was never more than half filled up. Recourfe was next had to patriotic contributions ; and great numbers of gold rings, filver buckles, and pieces of plate, were prefented to the Affembly. The Royal family themfelves fent their plate to the mint, either to give countenance to thefe donations, or, as M. Neckar has fince afferted, through abfolute neceflity, for the purpofe of fupporting themfelves and their family. The confufion into which the nation had been thrown by the late events had produced a fufpenfion of the payment of all taxes. There exifted, in fact, no efficient government ; and if fociety elcaped entire diffolution, it was merely in confequence of thofe habits of order which are produced by a ftate of long continued civilization. The bufinefs of government could not be tranfacted without money, and many vain efforts were made by the miniftry to procure it. At length M. Neckar was driven to the defperate refource of propofing a compulfory loan, or that every individual poffeffed of property fhould advance to the ftate a fum equal to one-fourth of his annual income. This bold propofition was fupported by Mirabeau, and adopted by the Affembly ; but it does not appear to have ever been effectually executed.

In the mean time, the Affembly was bufily occupied bifcuffiom in framing the celebrated declaration of the Rights of on the Man, which was afterwards prefixed to the new confti- Rights of tution. This was followed by the difcufion of a point Man, of much delicacy and difficulty; viz. What fhare of legillative authority the king ought to poffers under the new conftitution; whether an abfolute negative or veto, a fufpenfive veto, or no veto at all ? This queltion operated like a touchitone for trying the fentiments of every perion; and the affembly, confifting of 1200 men, was now feen to arrange itfelf into two violent contending factions. The debates were vehement and tumultuous, and continued for many days. As the affembly fit in public, and as multitudes of people of all defcriptions were admitted into the galleries, and even into the body of the hall among the members, many indecent fcenes took place in confequence of the interference of the fpectators to applaud or cenfure the fentiments which were delivered. Thus the public at large became fpeedily interefted in the difcuffion; the city of Paris took a fide in oppofition to the veto, and the whole empire was thrown into agitation by new and fpeculative queftions. The diftinguifhed place which France holds among the nations of Europe rendered. thefe fingular events and difcuflions the object of univerfal atrention. The contagious love of novelty fread rapidly abroad, and gave rife to that watchful jealoufy on the part of the monarchs of Europe, which

> 57 And the king's reto.
lirench Revolution 1789.
was fpecing to burft forth in a bluody tempeft.-In the prefent cafe, the people of Paris became moit eagerly interefted. Rumours of plots were fpread through the country, and a new ftorm was obvioully gathering, when the queltion was thus got quit of. M. Mounier remarked, that the executive power could polfefs no negative againt the decrees of the prefent affembly, which had been nominated by the nation with fupreme powers for the exprefs purpofe of framing a conftitution, which was to remain binding over all orders of men in the ftate; and with regard to future legiflatures, the king declared by a meffage, that he wifhed to poffers no more than a fufpenfive veto. It is remarkable that the popular Mirabeau concluded a fpeech in favour of the abfolute veto of the crown with thefe words, "That it would be better to live in Contantinople than in France, if laws could be made without the royal fanction." This political adventurer is, however, accufed of having taken care to circulate in Paris a report that he had oppofed the veta with all his infuence ; and to give credit to the fory, he is faid to have quitted the affembly juit before the divifion, that his vote might not appear on record againft it.

In the debates about the veto the month of Angult was fpent; and in the beginning of September a new conftitutional queltion was prefented to the affembly by one of its numerous committees. This was, whether the legiflative body ought to confift of one or of two chambers? Mounier, Lally, Tollendal, Clermont Tonnerre and others, who were zealous lovers of freedom upon what were then accounted moderate principles, fupported eagerly the idea of eftablifhing two independent chambers in imitation of the Britifh conftitution; but they were deferted both by the democratic and ariftocratic parties. The firf of thefe regarded an upper houfe or tenate as a refuge for the old arifocracy, or as the cradle of a new one; while the higher nobles and clergy feared left fuch an arrangement might prevent the future re-eftablifhment of the ancient divifion into three orders. Of 1000 members who voted, only 89 fupported the propofal for dividing the legillature into two chambers.

Soon after this, the king gave his fanction to the important decrees of the $4^{\text {th }}$ of Augult, but not with. out fome hefitation, and expreffing doubts of the wifdom of fome of them in a letter to the affembly. At the fame time the inviolability of the perfon of the monarch was decreed, the indivifibility of the throne, and its hereditary defcent from male to male in the reign. ing family.-But we fhall not here attempt to enter into a detail of the various articles of the new conftitution as connected with the circumftances under which they became the fuhject of debatc. We thall only ftate thofe more remarkable circumftances which tend to afcertain the peculiar changes which the fentiments of the nation underwent in the pro $\varepsilon$ refs of a revolution the mof remarkable that occurs in human hifory.

In confequence of the debates upon the queftions of the veto and the two chambers, the minds of parties had become much irritated. Paris wore the fame threatening afpeet that it had done in the months of June and of July preceding; and every thing feemed tending towards an important crifis. The ariftocratic party accufed their antagonits of a delign to excite new infurrections; and the charge was xetorted, by cir-
culating a report that a plot for conveying the king to Metz was already ripe for execution. From the period of the defection of the French guards, who were now in the pay of the capital, the protection of the royal family had been entrufted to the militia or national guards of Verfailles, together with the regiment of the gardes $d u$ corps, which was compofed entirely of gentlemen. Upon the circula- fi tion of the report of the intended flight of the king, the French guards began to wifh to be reftored to their ancient employment of attending his perfon, for the purpofe of preventing any attempt of this nature. This idea was eagerly cherifhed by the capital ; and, in fpite of every effort ufed by M. de la Fayette, the obvious appearance of approaching difturbances could not be prevented. The popular party faw the advantages which they would derive from placing the affembly and the king in the midft of that turbulent metropolis which had given birth to the revolution, and upon the attachment of which they could moft fecurely depend. . Every encouragement was therefore given by the moft active leaders of what was now called the Democratic party to the project of eftablifhing the court at Paris. The miniftry were under no fmall degree of alarm; and the count d'Eftaing, who commanded the national guard of Verfailles, requefted the aid of an additional regiment. 'The regiment of Flanders was accordingly fent for: its arrival caufed no fmall degree of anxiety; and every effort was inftantly made to gain over both officers and foldiers to the popular caufe.

On the firtt of October the garde du corps, probably for the purpofe of ingratiating themfelves with the newly arrived regiment, and perhaps to attach them more fteadily to the royal caufe, invited the officers of the regiment of Flanders to a public entertainment. Several officers of the national guard, and others of the military, were invited. The entertainment was given in the opera houfe adjoining to the palace; feveral loyal toalts were drank: but it iseafierted, that when the favourite popular toaft The 嗢就ion was given, it was rejected by the gardestidu, corps. In ordinary cafes, fuch a trifling circumflance as this, or even any other of the tranfactions of a night of feftivity, would juftly be regarded as unworthy of notice in recording the more remarkable events in the hifory of a great nation; but fuch was now the fingular fate of affairs, that the moft trivial occurrences were inftrumental, by their combination, in the production of important confequences. The queen, having feen from a window of the palace the gaiety which prevailed among the military, prevailed with the king, who was jutt returned from hunting, to vifit them along with herfelf and the dauphin. Their fudden appearance in the faloon kindled in an inftant the ancient enthufiafm of French loyalty. The grenadiers of the regiment of Flanders, along with the Swifs chaffeurs, had been admitted to the defert; and they, as well as their officers, drank the health of the King, Queen, and Dauphin, with their fwords drawn. The royal family having bciwed with politenefs to the company, retired.-Of all nations, the Erench are molt liable to the influence of fudden impreflions : the mufic played the faveurite air, $O$ Ricard! O mon Roi! l'univers t'abandonne, "O Richard! O my king ! the world abandons thee." In the eagernefs of
logalty,

French Revolutica $\underbrace{1789 .}$ 61
Confequences of their mutual jcaloufies.

## $R E V \quad\left[\begin{array}{ll}163\end{array}\right] \quad$ R E V

French loyalty, the national cockade, which had been adoptRevolution ed by fome of the gardes du corps, was thrown 1789. atide, and white cockades were fupplied as quickly as they could be made by the ladies of the court.

When thele events were next day reported at Paris, accompanied by a multitude of exaggerations, they gave rite to the molt violent alarm. The capital was at that time fuffering all the horrors of famine; and in fuch a fituation, the news of a fealt which others have enjoyed, feldom gives much fleafure to hun $r$ ry men. To the former report of an intended fight on the part of the royal famity, it was now added, that a counter revolution was fpeedily to be attempted by force of arms; and that the prefent fcarcity was artificially created by the court for the purpofe of reducing the people to fubmiftion. Their ariftocratic antagonifts have fince afferted, that the famine was indeed artificial ; but that it was created by a portion of the violent party in the national affembly, which was then denominated the Cabal, whofe object was to excite commotions as the means of procuring an opportunicy of fetting the duke of Orleans at the head of the Itate, either as regent, or in fome other form. To this laft party Mirabeau is faid to have belonged.

For four days no notice was taken in the affembly of what had paffed at the entertainment given by the gardes du corps. On the 5 th of Jctober M. Petion mentioned it for the firft time, and a viol nt debate enfued; during which Mirabeau rofe and exclaimed, " Declare that the king's perfon alone is facred, and I myelf will bring forward an impeachment;" thereby alluding to the conduct of the queen. While this debate was proceeding at Verfailles, the city of Paris was in commotion. A valt multitucie of women of the loweft rank, with fome men in women's clothes, had affembled at the Hotel de Vith, and were calling aloud for arms and bread. They refolved to proceed initantly to Verfailles to demand bread from the king and from the bational affembly. La Fayette oppofed them in vain ; fir his own foldiers refufed to turn their bayonets againft the women. Upon this one Staniflaus Maillard, who had diltinguifhed himfelf at the taking of the Baftile, offered himfelf as a leader to the infurgents. He had the addrefs to prevail with them to lay afide fuch arms as they had procured; and he fet out for Verfailles about noon with as much order among his followers as could well be expected from fuch an affemblage. Either becaufe the paffion for going to Verfailles had fuddenly become too infectious to be refifted, or becaufe the multitude already gone thither was now accounted dangerous, the may or and municipality of Pa ris thought fit to give orders to La Fayette inftantly to fet out for that place at the head of the mational guard.

In the mean time, Maillard approached Verfailles with his tumultuous troop; he arranged them in three divifions, and perfuaded them to behave with tolerable decency. The king was hunting in the woods of Mendon when he was informed of the arival of a molt formidable l an i of women calling aloud for bread. "Alas! (replied he) if I had it, I fhoud nut wait to be afked." Maillard entered the affembly accompanied by a deputation of his followers to fate itie object of their journey. The affembly, to pacify them, fent a deputation of their own number along with them to
lay their complaint, before the king. His majuly recei- Prersi ved the whole with great politenel?, and readily agoed Revolution to go into any meatures for the fupply of the capital i-Ey. that could be fugesefted. The report of this behaviour had fuch an effect upon the multitude collected aruata the palace, that they beyan to difperfe ; but they were fpeedily fucceeded by another crowd not lefs numersus. A fudden refolution of flight feems now to have been propoied by the court ; for the king's carriages were brought to the gate of the palace which communicates with the Orangery : but the national guard of Verfalles refufed to allow them to pafs, and the king himielf refufed to remove, or to allow any blood to be fhed in his caufe.

La Fayette with his army at length arrived about La Fayette roo'clock at night, and found the affembly in a very witi his unpleafant fituation. Their hall and galleries wate crowded by the Parifian fin-women and others of theaches mob, who at every inftant, interrupted the debat ab, at every intant, interrupted the debates. at night. La Fayette waited upon the king, and informed him of the proceedings of the day, planted guards in every quarter; and after a fcanty banquet had been procured for the multitude, he prevailed with the affembly to clofe their fitting for the night. In this laft part of his conduct M. la Fayette has been much cenfurece, and probably not without reafon ; for it could fcarcely be expected that fuch a night would be fent in peace by the immenife affemblage of turbulent characters that were now brought together. All was quier, however, till about fix in the morning of the 6 h , when a great number of women and defperate perfons rufhed forward to the palace, and attempted to force their way into it. Two of the gardes du corps were killed; the crowd afcended the itair-cafe leading to the queen's apartment, but were bravely refifted by M. Miemandre a fentinel, who gave the alarm, and defended his poft till he fell covered with wounds, of which, however, he afterwards fortunately recovered. The ruffians, reeking with his blood, ruthed into the chamber of the queen, and pierced with bayonets and poinards the bed whence this perfecuted woman had but juft time to fly almoft naked, and, through ways unknown to the murderers, had efcaped to feek refuge at the feet of the king, who was al. ready alarmed, and had gone to feek her.

The tumult became more violent every moment, and fudden death feemed to threaten the royal family; but La Fayette was by this time at the head of his troops whom he befeeched earneftly to fave the gardes du corps from matracre. In this he was fuccefsful ; fome that had been taken prifoners were furrounded by the grenadiers of the French guards who protected them, and the retreat of the whole corps was eafily fecured. The crowd was fpeedily driven from the different quarters of the palare, which they were already begining to pillage ; and the royal family ventured to foow themfelves at a balcony. A few voices now exclamed, Le Roi is Par's, "the King to Paris." The fhout became general ; and the ling, after confulting with La Fagette, declared that he had no objection to take up lis refidence at Paris, pruvicted he was accompanied by the guen and his children. When the propofal was reported to the affembly, the popular leaders expreffed much fatisfaction. They ordered a deputation of 100 membars to attend the king thither; they voted the natinal .ftembly infeparable from the king. His majetty

Triumph of the popular party. guard, and, with all the prade of an execution, beheaded in the court of his palace. Their heads were fuck upon fpears, and led the procefion; whilft the royal captives who followed in the train, and beheld this fpectacle, were condncted fo flowly, that a thort journey of twelve miles was protracted to fix hours. The king, the queen, and their children, were lodged in the old palace of the Louvre, while Monfieur went to refide at the Linxemburg. The city was illuminated, and the evening fpent in trumpli by the Parifians.

The removal of the king to Paris was regarded as a triumph by the popular party. The higher order of nobies confidered it as completely ruinous to their hopes; and even many men of talents, fuch as Mounier and Lally Tollendal, whom we cannot avoid regarding as friends to the popular caufe in its out-fet, now regarded every profpes of attaining a happy conftitution. al freedom as at an end, as the national reprefentatives mult be for ever expofed to the infults, and overawed by the influence, of a turbulent capital. Many members of the affembly took refuge in foreign countries, and ufed every effort to excite the other nations of Europs to hoftility againt France. As the duke of Orleans had been regarded as a chief agent in promoring the late difturbances, the marquis de la Fayette waited upon him, and infifted upon his leaving the kingdom for a time. The duke was overawed, and, on pretence of public bufinefs, went to England, where he remained 60 for feveral months.
Fhe affem- On the 19 th of October, the National Affembly
and gradually conveyed to every corner of the kingdom the political ferment which had commenced at Paris.
The National Affembly being now, however, in tolerable fecurity, proceeded in the arduous attempt of forming a free conftitution for the great empire of France. The Abbé Sieyes prefented a plan for dividing the kingdom into 83 departments, of about ded into 342 fquare leagues, and of each department into feve- 3 depart ral diftritas, and each diftrict was fubdivided into cantons of four fquare leagues in extent. Thus the whole of the ancient divifions of the kingdom into governments, generalities, and bailiewicks, was in an inftant obliterated. An attempt was alfo made to fimplify in an equal degree the relative fituation of individuals in civil life, by a decree which put an end to all diltinction of orders and immunities, fo far as any privilege whatever was concerned. At the fame time, a bold and mof important meafure was adopted, which has fince proved the organ of thofe terrible efforts which France has been enabled to make againft the rett of Europe. This Thechur was the confifcation of the whole of the lands belong. lands coning to the charch, for the purpofe of fupplying the fifcated. exigencies of the ftate. In this tranfaction, all regard to juftice was thrown afide. The lands of the church were as certainly the property of the then poffeffors of them as any eftate among us is the property of him who occupies it. The ftate may have had a right to appropriate to itfelf the church lands upon the death of the incumbents; but it might with equal juftice, and perhaps greater propricty, have feized the encrmous revenues of the Duke of Orleans, as have confifcated a fingle acre belonging to the molt ufelefs abbot without his own confent. This bold meafure was propofed by the bifhop of Autun, M. Talleyrand Perigord, a man who had been promoted to the bench in a moft irregular manner to ferve this very purpofe. The mode in which this property was to be expended was by iffuing affignments (affignats) upon it ; which affignments were to be received by the ftate for the payment of taxes, or for the purchafe of church lands when fet up to fale. A provifion was at the fame time made for the national clergy, who were for the future to be paid by the fate. On the day following that on which this imp rtant meafure was adopted, a decree was palfed, fufpending the parliaments of the kingdom from the exercife of their functions.

Decrees, in which the interefts of fo valt a multitude Fruitlefs of individuals were involved, could not be carried into attempts effect without much murmuring and oppofition. The of the pare parliaments, in particular, began to exert themfelves with vigour, and, by protefts and other publications, attempted to invalidate the decrees of the Affembly as illegal; but thefe privileged bodies, who had often been accuftomed to contend with fome fuccefs againft the defpotic adminiftration of their country, and on that account had been for ages the objects of public applaufe, now found themfelves utterly forfaken, and unable to refilt the mandate of a popular Affemby. After a few fruitiefs ftruggles, they were all of them under the neceffity of fubmitting to their fate.

Nothing remarkable now occurred for fome time.— MunicipaThe affembly proceeded to organize the kingdom by lities eftathe eftablifhment of municipalities, and by reforming blified, \&en the juxifprudence of the courtry. It is to be cbferved, however, that when the parliament of Paris was abo-

Monafteries fuppreffed, and their lands con. ficated.
city, was retained for the purpofe of trying thofe perfons who had become molt obnoxious by their attachment to the royal caufe. This court had the fpirit to acquit the Baron de Bezenval, Marfhal Broglio, and the Prince de Lambefq. But having incurred much popular odium on this account, they were guilty of the unworthy meannefs of condemning to death the Marquis de Favres, for a pretended confiracy (of which no tolerable proof was ever brought) to maffacre La Fayette, Bailly, and Neckar, and to convey the King to Peronne.

Daring the whole of this winter the King had been very ftrictly watched by numerous guards placed around his palace, infomuch that the other nations of Europe confidered him as in a ftate of captivity. To do away this impreffion, if poffible, and to make their king appear a voluntary agent in the meafures that had lately been adopted, was now regarded as a matter of fome importance. Every effort was therefore made to prevail with him to come to the Affembly fuddenly, and, as it were, of his own voluntary motion, there to declare his adherence to the meafures which had lately been adopted. For fome time he refifted this propofal; but at length, on the $4^{\text {th }}$ of February, he did fuddenly appear in the National Affembly, where he complained of the attempts that had been made to fhake the new conltitution. He declared his wilh " that it fhould be univerfally known that the monarch and the reprefentatives of the nation were united, and their wifhes were the fame; that he would defend the conititutional liberty of the fate; that, in $\mathbf{c}$;njunction with the Queen, he would early form the fentiments of his fon for that new order of things which the circumftances of the empire had introduced." This declaration difpirited the ariftocratic party in no fmall degree, and increafed that unhappy tendency of looking for aid from foreign countries which they had always been too apt to indulge.

On the i3th of February, monaftic eftablifhments were fuppreffed, and their lands confifated; but the prefent friars and nuns were allowed penfions for their fubfiftence, and to continue the obfervance of their monaftic vows, if they thought fit. We may obferve here, that, in confequence of the evacuation of the monalteries, it is probable that about this time the Breton committee began to affume the appellation of the Jacobin Chab, from the hall belonging to the Jacobin friars at Paris, in which their meetings were now held.

An event occurred at this time which tended in no fmall degree to increafe the odium under which the old government already laboured. This was the publication of the Red Book, or lift of penfions and donations granted by the crown. In confequence of the moft prefling inftances, it had been communicated by M. Neckar to a committee of the Ariembly, after many intreaties, and the moft folemn promifes of fecrecy. It afforded, however, too Atriking an advantage to the popular party not to be made ufe of, and in a few days M. Neckar, to his no fmall furprife, faw this regifter publicly fold by every bookfeller in Paris. He ought not, indeed, to have been furprifed ; and the giving up of this lift is one of the many proofs which the tranfactions of that period afford of his great unfitnefs for the office which he held. With much indignation, however, he de-
manded why the committee had publifhed it without the permiffion of the Affembly or the King? But be Repolution was told by the committee, that "as to the Afembly, 195 c . they were fure of its approbation ; and as to the King, they were not his reprefentatives." To give an idea of the effect of this publication, it is only neceffary to remark, that, under the fhort adminiltration of M. Calonne, the two brothers of the King had received from the public treafury, independent of their legitimate income, nearly two millions fterling, and that L. 600,000 had been granted to an individual, becaufe he was the hufband of Madame de Polignac. M. Neckar's oppow fition to this publication tended in no fmall degree to injure his popularity, and the reft of the minittry began to lofe the confidence of the public. Indeed, at this time, fertile caufes of alarm prevailed on all fides. The clergy were attempting to revive in the provinces the ancient animofities between the Roman Catholics and the Proteftants, afcribing the late decrees of the Affembly to the latter. The German princes who poffeffed property in the north of France were complaining loudly of the violation of their rights by the abolition of the feudal fyftem, although the National Af: fembly had voted to them a compenfation. The molt melancholy intelligence was received from their colonies in the Weft Indies. In regulating thefe, the Affembly had not recognized the right of the free Negroes to enjoy the fame privileges with other citizens; at the fame time, they did not go the length of denying thefe privileges. This uncertain conduct produced infinite calamities. The whites contended with thofe commonly called people of colour. There again fometimes ftood in oppofition to the free negroes, or to the flaves; and hence it fometimes happened that no lefs than three hoftile alfemblies were held at the fame time in the fame colony, which made war upon each other with the moft inveterate fury. Each party found protectors in the National Affembly of the parent ftate. Thofe who favoured or oppofed the exiftence of diftinctions at home, in general followed out the fame principle with regard to the colonies.

On the 14th of May, M. de Montmorency commu. nicated to the National Affembly the preparations for war in which England and Spain were engaged. This brought forward the conltitutional queftion, "Who ought to polfefs the power of declaring peace and war?" The Count Clermont Tonnerre, Meffrs de Serent, Virieu, and Dupont, fupported the royal prerogative; while on the other fide, the exclufive right of the legiflative body to exercife this important prerogative was fupported by Meffrs d'Aiguillon, Garat jun. Freteav, Jellot, Charles Lameth, Sillery, Petion, Robefpierre, \&c. M. Petion propofed a decree "that the French nation renounced for ever all idea of conquelt, and confined itfelf entirely to defenfive war ;" which was paffed with univerfal acclamation. The Count de Mirabeau at length fuccefsfully propofed that peace and war fhould be declared by the king and the legiflative body in conjunction; and the decree that was paffed on the fubject is a ftrange farrago of contradictions and abfurdities. It enjoined the King to "guard the ftate from external attacks." But how could this be done, without repel. ling any attack that might be made upon it? This, however, he could not do, without previoully inform. ing the National Affembly : aud if that body charceid

French manded loudly the regimental accounts. They feized Revolution at the fame time the military cheft, and fent a deputa$\underbrace{1700}$. tion to fate their cafe at Paris to the national affembly. But the officers were before-hand, and prepoffeffed the minifter of war againft them ; upon whofe reprefentation a decree was paffed, authorifing the commander in chief of the province, M. Bouillé, to reduce the infiurgents by force. This was no fooner known, than the mational guard of Nancy affembled, and fent a deputation to give a fair ftatement of facts. But Bouillé, without waiting the refult of an explanation, haftened to Nancy at the head of all the troops he could fuddenly collect; and having fallen upon the regiments of Chateauvieux and Meftre de Camp, after putting an immenfe multitude to the fword, he took 400 prifoners.

The King's regiment was prevented from acting againit Bouille by the intrepidity of a young officer of the name of $D_{e f f i l l e s, ~ w h o, ~ h o w e v e r, ~ d i e d ~ o f ~ t h e ~ w o u n d s ~}^{\text {w }}$ which he received on the occafion. The news of thefe events filled Paris with indignation. The afembly af. terwards reverfed its own decrees againft the infurgents at Nancy. Public honours were decreed to the memory of Deffiles; but Bouillé could not be punifhed,
84 becaufe he had only acted in obedience to authority.
${ }^{8}{ }^{84}$ Neckar - M. Neckar's popularity had been gradually declirefigns, and ning, as he was unwilling to go all the lengths that the leaves the ruling party wihed. He gave in his refignation on kingriom the 4th of Septeniber, and fpeedily thereafter left the without kingdom. He was regretted by no party. He was
being being regretted. regarded, on the one fide, as having conducted the kingdum to its ruin, by the conceffions which he originally adviied the king to make in favour of the tiers etat; while he was defpifed by the oppofite party as a lukewarm politician, of narrow views, and a feeble mind. He departed, however, with the unblemifhed reputation of ftrict integrity. M. Neckar does not feem to have penetrated deeply into the characters of men, or to have had any conception of the effects of that terrible and reflefs energy which is called forth in a nation which attempts to make important changes in its ancient manners and government. Having no conception of the important era which was about to open upon that country of which he was the minifter, he was far from being qualified to direct or controul it amidtt the convulfions which it was deftined to encounter. Unable to brook the lnfs of his popularity, he peevifhly retired to Swifferland, where he publifhed a work, which fhows to the conviction of every unprejudiced reader the integrity of the French king, and the wicked projects of the leading democrates, whom he himfelf had armed with power.

The remaining part of tl is year was occupied in attempts to introduce fome degree of fubordination into the navy of France, which had been much diforganized, and in farther regulating the affairs of the clergy. It was now declared, that fuch clergymen as fhould not take the following oath, which had been prefcribed fome months before, fhould be comidered as ejected from their benefices: "To watch carefully over the faithful in the parifh or diocefe which was entrufted to his care ; to be faithful to the nation, the law, and the king : and to maintain to the utmoft of his power the new conftitution of Franc, and paricularly the decrees celative to the civil comitution of the clergy." This
decree rendered the fituation of confcientious men ex-
Fresc: tremely perplexing; efpecially as the pope teftified in $\underbrace{\text { Revolution }}$ marked terms his difapprobation of the oath. The people were reduced to the dilemma of choofing between their new political and their old religious preju. dices, and the refult was extremely unfavourable to the intereft of religion.
The affembly commenced the new year with a decree, announcing the termination of its feffion, which was to take place as foon as it fhould have finifhed the difcuffion of a lit of conftitutional articles. In the mean time, on the fide of Germany, Spain, Italy, and Savoy, hoftile appearances began to be exhibited, and bodies of troops advanced around the French frontier. The Emperor Leopold was, however, too cautious to announce his intentions; and the King foon communicated a letter from him, containing proteftations of amicable difpolitions, but adding, that "the innovations occalioned by the decrees of the 4 th of Augult ought to be done away." The king treated this merely as an official meafure on the part of the Emperor, that he might not appear to renounce the claims of certain German princes connected with Lorraine and Alface. But the affembly expreffed fome alarm, and voted an augmentation of the national force. About this period feveral new efforts were made by the difaffected clergy in various parts of the kingdom to excite difturbances, which it is unneceffary to mention in detail. On the 20 th of February the public attention was roufed by a circumftance that in any other ftate of affairs would have been accounted unimportant. The King announced to from the affembly, that his aunts, the daughters of Louis XV. Paris. had that morning lefr Paris; but as he did not apprehend that the exifting laws laid them under any reftraint in this refpect, he had not oppofed their departure. After fome debate, the affembly agreed that the King had judged well ; and thefe princeffes were left to purfue their journey to Rome, which they reached after fome delays occafioned by the jealoufy of certain municipalities through which they paffed. Thus the kingdom was gradually deferted by every branch of the royal family, excepting the King and his eldeft brother Monfieur. The aflembly, however, continued its labours with confiderable quietnefs. In the end of the month of March died que celebrated M Miraber Mirabcar. at the age of 42 diers; a celebrat . de Mrabean, many many good reafons been much fufpected, but whofe political addrefs and intrepidity, and whofe fplendid powers of eloquence, have been feldom equalled. He rectived from his countrymen at his death marks of refpect unparalleled in modern hiftory. During his fhort illnefs, his door was befieged by anxious citizens. A mourning of eight days was decreed by the affembly, and alfo a grand proceflion, which was attended by all the public functionaries. He was the firt who was interaed in the new magnificent Pantheon, confecrated to the reception of the remains of illuitrious men. But his afhes were afterwards removed, in confequence of very clear proofs that he had not been incorruptible by moncy.

During the whole of this fpring, much fear was en- An cmitertained thit fome attempts at a counter revolutio: grantarmy were about to be made. The emigrant army aflembled flembled on the borders of Alface was reviewed by the prince of $n$ the on the borders of Alace was reviewed by the prince of borders of
Condé. Their uniform was black ${ }_{2}$ faced with yellow, Alface.

97 Behaviour of Bouilié on the frontiers.

92
The king, queen, and royal family, leave Paris.

93
Moniteur
and ma-
dame ar-
tive at
Diruffels

Pren h rith a death's head, furrounded by a laurel wreath on "evolution one cuff, and a fword on the other ; with the motto,
do riod of the revolution has frikingly marked the French jealoufy of character, was kept on the alarm. On the 18 th of A-
the people pril, therefore, when the royal family was preparing to Jealoufy of character, was kept on the alarm. On the 18 th of A-
the people pril, therefore, when the royal family was preparing to the king ly fpread that the king was about to fly from the coungo to St Cloud to pafs fome days, a report was inftant-
ly fpread that the king was about to fy from the counhis fa-try. The carriages were immediately furrounded by mily fhould people. La Fayette drew out the national guard, but cnigrate. they refufed to act. "We know (exclaimed they) that we are violating the laws, but the fafety of our country is the firft law." The King inftantly went to the affembly, and with much fpirit complained of the infult. He was anfwered refpectfully by the prefident, and continued his journey. As the royal family had enjoyed a confiderable degree of freedom for fome time paft, which was demonfrated by the unfuccefsful opfition made to this journey-the prefent opportunity was embraced for intimating to foreign courts his acceprance of the contitution ; and all obnoxious perfons were difmiffed from about his perfon. The breach of difcipline on the part of the national guard on this occafion was fo much refented by La Fayette, that he refigned his command. Paris was thrown into confternation ; and it was not till after the moft univerfal folicitation that he was prevailed upon to refume his fice.
About this time M. de Bouillé, to whom the protection of the frontiers was entrufted, was employing, as it is now faid, every means in his power to render the country defencelefs. The garrifons were left unprovided ; diffunion was fpread among the national troops; they were removed from the frontiers, and their place was occupied by foreigners, wherever it could be done. The emigrants abroad, and theirfriends at home, were lying in wait for an opportunity of revolt; when fud-
"Conquer or die." The king was alfo furrounded by crowds of nonjuring priefts and other diffaffected perfons. Thus, that popular jealoufy which in every pe-induce the public at large to confider the royal authority as no neceffary part of a free conflitution. But the minds of men were by no means prepared for the reception of this new doctrine. The idea, however, having been thus publicly propofed, left fome imprefions, which in time contributed to give rife to important events. By far the greater number of leading men, however, were at prefent convinced, that it was impoffible to conduet a great empire like France, well and profperoully, without the affiftance of an hereditary chief. They therefore determined to pafs over the affair with as much filence as pofible, and to haften the period when their new conftitution fhould be complete. Bat there is reafon to believe, that this journey was at the long-tun highly inftrumental in producing very, fatal offeets to the perfonal fafety of the monarch.

His flight feemed a fignal for emigration. Many of the ariftocratic party ient in refignations of their feats in the national affembly. Troops were levied on, the frontiers in the King's name; who took care, however, to difavow any connection with fuch a procedure. Bouille emigrated, and afterswards fent to the affembly, a furious threatening letter: "You fall anfwer (faym he) for the lives of the king and of the queen to all; the monarchs of the univerfe. Touch but a fingle hair of their heads, and not one ftone fhall be left upon another in Paris. I know the roads. I will conduct the foreign armies. This letter is but the forerunner of the manifento of the fovereigns of Europe."

A confiderable calm throughout France followed thefe events, and it might be regarded as in a ftate of tranquillity. It contained, indeed, parties entertaining much animofity againft each other, and many citizens had, withdrawn to foreign countries; but the peace was not broken, and moderate men hoped that much profperity. would follow from the late agitations. . But this calm was delufive ; and in the midit of it thofe projects were formed which were afterwards to prove fo fatal to the peace of France and of Europe. Towards the clofe of Treaty of this fummer, a convention took place at Pilnitz in Sax. Pilitz. ony between the emperor Leopold and the king of Pruffia. Its object was not known at the time, but it gradually came into view, and is now by many under.
ture, the king had imprudently left behind him a me-
morial, in which he declared, that he never had thought morial, in which he declared, that he never had thought
any facrifice too great for the reftoration of order ; but that the dellruction of the kingdom, and the triumph
of anarchy, being the only reward of all his efforts be that the deflruction of the kingdom, and the triumph
of anarchy, being the only reward of all his efforts, be thought it neceffary to depart from it. Fe then takes a review of the faults of the new conltitution, the grievances he has fuffered; and protefts againft every thing that he had been compelled to do-during his captivity.

Different parties were very differently affected by this ill-conducted and unfortunate flight of the King. A imall republican party had already begun to appear, and during the king's abfence, attempts were made to
II o'clock without notice; but taking a companion with him, he went by a fhorter road to Varennes. With the affilance of the poltmafter there he gave the alarm, and overturned a carriage on the bridge, which detained the royal travellers till the national guard of the place had affembled, and the arreft was effected without bloodiked. They were brought back to Paris by a deputation from the affembly. At his depar-

French Revol:ition $\underbrace{1791 .}$ 94 The kiug and queen arrefted at Varenocs.

$\qquad$

$\square$
$\qquad$ denly, on the 21 ft of June, it was amounced from the Thuilleries, that the king, the queen, the dauphin, with monfieur and madame, had quitted the palace and the capital, without leaving any information of their inten. tion or their route. The emotion excited by this news among the multitude was a misture of coniternation and rage. The national affembly, however, acted with much coolnefs. They inftantly took upon themfelves the government, and decreed their fittings permanent. They fent meffengers, at the fame time, in all directions, to attempt to lay hold of the fugitives. Thefe had taken different routs. Monfieur and madame arrived fafely at Bruffels on the 23d. The king, queen, and their children, when they came to a confiderable diftance from the capital, were furnifhed by Bouillé with a guard of dragoons, under pretence of protecting treafure for the pay of the troops. At the diftance of 156 miles, and when only a few leagues from the frontiers, they were arrefted at St Menehould by the poftmafter, IV. Drouet, formerly a dragoon in the regiment of Condé. At half paft feven o'clock in the evening the carriages flopt to change horfes at his houfe; he though: he recollected the queen, and ima gined that the king's face refembled the impreffions. ftamped upon affigats. The efcort of dragoons increafed the fulpicion. He foffered them to depart at

## R E V

French frood to have been intended for the purpofe of concluding Revolution a league for the invafion of France, the new-modelling 1791.
of its government, and the partition of fome of its fair-
eft provinces. The following paper has been, repeatedly publibed as the copy of a treaty concluded and figned at Pavia, and is generally underfood to have been identical with, and therefore known by, the name of the Treaty of Pilnitz. We are far from vouching for its authenticity. It may have been fabicated by the French affembly, to unite all parties in the nation againft thie foreign powers which threatened to invade them. But in flating the events of this revolution, it is perhaps fill more neceffary, for the purpole of rendering the actions of men comprehenfible, to give an account of what was at the time believed to have occurred, than it now is to afcertain what was actually true.

## Partition Trealy between the Courts in Concert, concluded

 and forned at Pavia, in the Month of Fuly ryor.His majelly the emperor will take all that Louis XIV. conquered in the Auftrian Netherlands, will give them to his ferene highnefs the elector Palatine; fo that thefe new poffeffions, added to the Palatinate, may heresfter have the name of Auftafia.

His majelty will preferve for ever the property and poffeffion of Bavaria, to make in future an indivifible mafs with the domains and hereditary poffeffions of the houfe of Auftria.
. Her ferene highnefs the archduchefs Maria Chriftina fhall be, conjointly with his ferene highnefs her nephew the archduke Charles, put into hereditary poffef fion of the duchy of Lorraine.

Alface fhall be rellored to the empire; and the biShop of Stralbourg, as well as the chapter, fhall recover their ancient privileges, and the ecclefiaftical fovereigns of Germany flall do the fame.

If the Swifs Cantons confent to accede to the coalition, it may be propofed to them to annex to the Helvetic league the bifhopric of Porentrui, the defiles of Franche Comte, and even thofe of Tyrol, with the neighbouring bailiwicks, as well as the territory of Verfoy, which interfects the Pays de Vaud.

Should his majefty the king of Sardinia fubfrribe to the coalition, La Breffe, Le Bugey, and the Pays de Gex, ufurped by France from Savoy, thall be reftored to him.

In cafe his Sardinian majefty can make a grand diverfion, he fhall be fuffered to take Dauphiné, to belong: to him for ever as the nearelt defcendant of the ancient dauphins.

His majefty the king of Spain thall have Rouffillon and Bearn, with the iffand of Corfica; and he fhall have the French part of the ifland of St Domingo.

Her majefty the emprefs of all the Ruffias fhall take upon herfelf the invafion of Poland, and at the fame time retain Kaminiech, with that part of Podolia which borders on Moldavia.

His majefty the emperor fhall oblige the Porte to give up Chocfim, as well as the fmall forts of Servia, and thofe on the river Lurna.

His majefty the king of Pruffia, by means of the abovementioned invafion of the empreis of all the Ruffias into Poland, fhall make an acquifition of Thorn and Dantzic, and there unite the Palatinate on the eaf of the confines of Silefia.

Vol. XVI.
gally applied.
XI. Every man being prefumed innocent till fuch $\begin{gathered}\text { time }\end{gathered}$

His majefty the king of Pruflia fhall befiles acquire Luface; and his ferene highnefs the elector of Saxony thall in exchange receive the relt of Poland, and oc- $1 ; 91$. cupy the throne as hereditary fovereign.

His majefty the prefent king of Poland thall abdicate the throne on receiving a fuitable annuity.

His royal highnefs the elector of Saxony fhall give his daughter in marriage to his ferene highnefs the youngeft fon of his royal highnefs the grand duke of all the Ruffias, who will be the father of the race of the hereditary kings of Poland and Lithoania. (Signed) Leopold. Prince Nassau. Count Florida Blanca. Bischoffswerder.

In the mean time, the national affembly was haftening faft to the completion of the new contitution. It was finifhed on the 3 d of September, and prefented to the king. It berins with the followigg laded 1 to the king. It begins with the following decla- the afimration of the rights of a man and a citizen, and bly. thereafter follow the different branches; the chief of which are here tranflated.
I. All men are born, and remain, free and equal in rights : focial diftinctions cannot be founded but on common utility.

IL. The end of all political affociations is the pre-
fervation of the natural and imprefcriptible rights of man : thefe rights are liberty, property, fecurity, and refiftance againft oppreffion.
III. The principle of fovereignty refides effentially
in the nation: no body of men, no individual, can exercife an authority that does not emanate exprefily from that fource.
IV. Liberty confits in the power of doing every thing except that which is hurtful to another : hence the exercife of the natural rights of every man has no other bounds than thofe that are neceffary to enfure to the other members of fociety the enjoyment of the fame rights: thofe bounds can be determined by the law only.
V. The law has a right to forbid thofe actions alone that are hurtful to fociety. Whatever is not forbid. den by the law, cannot be hindered; and no perfon can be conftrained to do that which the law ordaineth not.
VI. The law is the expreffion of the general will: all the citizens have a right to concur perionally, or by their reprefentatives, to the formation of the law : it ought to be the fame for all, whether it protect, or whether it punifh. All cirizens being equal in the eye of the law, are equally admiffible to dignities, places, and public offices, according to their capacity, and without any other dindinction but that of their virtue and their talents.
VII. No man can be accufed, arrefted, or detained, except in cafes determined by the law, and according to the forms which the law hath prefcribed. Thole who folicit, difpatch, execute, or caufe to be executed, atbitrary orders, ought to be punifhed; but every citizen that is fummoned or feized in virtue of the law, ought to obey inflantly-he becomes culpable by red fiftance.

VLIT. The law ought to eftablifh fuch punifhments only as are friotly and evidently neceffary ; and no perfon can be punifhed but in virtue of a law eftablifhed and promulgated prior to the offence, and le-

French time as he has been declared guilty, if it fhall be deemRevolution
I7gI. ed abfolutely neceffary to arreft a man, every kind of 1791. rigour employed, not neceffary to fecure his perfon,
ought to be feverely repreffed by the law.
X. No perfon thall be molefted for his opinions, even fuch as are religious, provided that the manifertation of thofe opinions does not difturb the public order eftablifhed by the law.
XI. The free communication of thought, and of opinion, is one of the molt precious rights of man. Every citizen, therefore, may freely fpeak, write, and publifh, his fentiments; fubject, however, to anfwer for the abufe of that liberty, in cafes determined by the law.
XII. The guarantee of the Rights of Man and Citizens, involves a neceffity of public force: this force is then inflituted for the advantage of all, and not for the particular utility of thofe to whom it is confided.
XIII. For the maintenance of public force, and for the expences of adminiftration, a common contribution is indifpenfably neceifary : this contribution flould be equally divided amongft all the citizens, in proportion to their abilities.
XIV. Every citizen has a right, by himfelf, or by his reprefentatives, to decide concerning the neceffity of the public contribution; to confent to it freely; to look after the employment of it; to determine the quantity, the diftribution, the collection, and duration.
XV. The fociety has a right to demand from every public agent an account of his adminiftration.
XVI. Every fociety, in which the guarantee of rights is not affured, nor the feparation of powers determined, has noconfitution.
XVII. Property being a right inviolable and facred, no perfon can be deprived of it, except when the public neceffity, legally afcertained, fhall evidently require it, and on condition of a juft and previous indemnification.
The confitution guarantees; as natural and civil rights,

1. That all citizens are admifible to places and employments without any diftinction, but that of ability and virtue.
2. That all contributions fhall be divided equally among all the citizens, in propcrtion to their means.
3. That the fame crimes fhall be fubject to the fame punifhments, without any diftinction of perfons.
The conftitution in like manner guarantees, as natural and civil rights,

Liberty to all men of going, ftaying, or departing, without being arrefted, or detained, but according to the forms prefcribed by the conflitution.

Liberty to all men of fpeaking, writing, printing, and "publifhing their thoughts, without having their writings fubjected to any examination or infpection before publication;" and of exercifing the religious worthip to which they are attached.

Liberty to all citizens of affembling peaceably, and withoct arms, complying with the laws of police.

Liberty of addreffing to all conftitutional authorities petitions individually figned.
The conllitution guarantees the inviolability of property, or a juit and previous indemnity for that of which public neceffity, legally proved, fhall require the facrifice.

A public inftruction fhall be created and organized, French common to ail citizens, gratuitous with regard to thofe Revolution parts of tuition indifpenfable for all men, and of which the eftablifhment fhall be gradually diftributed in a proportion combined with the divifion of the kingdom.
" The kingdom is one and indivifible ;" its territory, for adminitration, is diftributed into 83 departments, each department into diftricts, each diftrict into cantons.

Thofe are French citizens,
Who are born in France, of a French father ;
Who having been born in France of a foreign father, have fixed their refidence in the kingdom;

Who having been born in a foreign country, of a French father, have returned to fettle in France, and have taken the civic oath :

In fine, who having been born in a foreign country, being defcended in whatever degree from a Frenchman
or a Frenchwoman, who have left their country from religious motives, come to refide in France, and take the civic oath.
The right of French citizenfhip is loft,
ift, By naturalization in a foreign country;
2dly, By being condemned to penalties which involve the civic degradation, provided the perfon condemned be not reinftated;

3 dly, By a fentence of contumacy, provided the fentence be not annulled;

4thly, By initiation into any foreign order or body which fuppofes either proofs of nobility " or diftinctions of birth, or requires religious vows."
"The law confiders marriage only as a civil contract."
The fovereignty is one, indivifible, " inalienable, and imprefcriptible," and it belongs to the nation : no fection of the people, or individual, can arrogate the exercife of it.
The nation, from which alone flow all powers, cannot exercife them but by delegation.
The French confitution is reprefentative : the reprefentatives are the legiflative body and the king.

The National Affembly, forming the legiflative body, is permanent, and confifts of one chamber only.
It fhall be formed by new elections, every two years.
The legiflative body cannot be diffolved by the king.
The number of reprefentatives to the legiflative body fhall be 745, on account of the 83 departments. of which the kingdom is compofed; and independent of thofe that may be granted to the colonies.
The reprefentatives fhall be diltributed among the 83 departments, according to the three proportions of land, of population, and the contribution direct.

Of the 745 reprefentatives 247 are attached to the land. Of there each department fhall nominate three, except the department of Paris, which fhall nominate only one.
Two hundred and forty-nine reprefentatives are attached to the population. The total mafs of the active population of the kingdom is divided into 249 parts, and each department nominates as many of the deputies as it contains parts of the population.
Two hundred and forty-nine reprefentatives are attached to the contribution direct. The fum total of the direct contribution of the kingdom is likewife divided into 249 parts; and each department nominates as many deputies as it pays parts of the contribution.

$$
\mathrm{REV} \quad\left[\begin{array}{lll}
1 / \mathrm{I}
\end{array}\right] \quad \mathrm{REV}
$$

French In order to form a legiflative national affembly, the Revolution active citizens fhall convene, in primary affemblies, every 1791. two years in the cities and cantons.
" The primary affemblies fhall meet of full right on the firft Sunday of March, if not convoked fooner by the public officers appointed to do fo by the law."

To be an active citizen, it is neceffary,
To be a Frenchman, or to have become a French. man;

To have attained 25 years complete;
To have refided in the city or the canton from the time determined by the law;

To pay in any part of the kingdom a direct contribution, at leaft equal to the value of three days labour, and to produce the acquittance ;

Not to be in a menial capacity, namely, that of a fervant receiving wages;

To be inferibed in the municipality of the place of his refidence in the lift of the national guards;

To have taken the civic oath.
The primary affemblies fhall name electors in the proportion of the number of active citizens refiding in the city or canton;

There fhall be named one elector to the affembly, or not, according as there fhall happen to be prefent ioo active citizens.

There fhall be named two, when there fhall be prefent from 15 I to 250 , and fo on in this proportion.

The electors named in each department fhall convene, in order to choofe the number of reprefentatives, whofe nomination fhall belong to their department, and a number of fublitutes equal to the third of the reprefentatives.
"The affemblies fhall be held of full right on the laft Sunday of March, if they have not been before convoked by the public officers appointed to do fo by law."

All active citizens, whatever be their ftate, profeffion, or contribution, may be chofen reprefentatives of the nation.

Excepting, neverthelefs, the minifters and other agents of the executive power, \&c.

The members of the legiflative body may be re-elected to a fubfequent legiflature, but not till after an interval of one leginature.

No active citizen can enter or vote in an affembly if he is armed.

The reprefentatives fhall meet on the firf Monday of May, in the place of the fittings of the laft legillature.

The royalty is indivifible, and delegated hereditarily to the race on the throne from male to male, by order of primogeniture, to the perpetual exclufion of women and their defcendants.

Nothing is prejudged on the effect of renunciations in the race on the throne.

The perfon of the king is inviolable and facred; his only title is king of the French.

If the hing put himfelf at the head of an army, and direct the forces of it ag inft the nation, or if he do not oppofe, by a firmal act, any fuch enterprife undertaken in his name, he fin 11 be held to have abdicated.

If the king having gone out of the kingdom, do not return to it, after an invitation by the legiflative body, winha the pace which that? be fixed by the pro-
clamation, "and which cannot be lefs than two months," he fhall be held to have abdicated the royalty.

After abdicution
After abdication, exprefs or legal, the king fhall be $\underbrace{179 \text { I. }}$ in the clafs of citizens, and may be accufed and tried like them, for acts pofterior to his abdication.

The nation makes provifion for the fplendour of the throne by a civil lift, of which the legiflative body thall fix the fum at the commencement of each reign, for the whole duration of that reign.

The king is a minor till the age of 18 complete; and during his minority there fhall be a regent of the kingdom.

The regency belongs to the relation of the king, next in degree according to the order of fucceffion to the throne who has attained the age of 25 ; provided he be a Frenchman refident in the kingdom, and not prefumptive heir to any other crown, and have previounly taken the civic oath.

The prefumptive heir fhall bear the name of Prince Royal.
"The members of the king's family called to the eventual fucceffion of the throne, fhall add the denomination of French Prince to the name which fhall be given them in the civil act proving their birth; and this name can neither be patronymic nor formed of any of the qualifications abolifhed by the prefent con. ftitution."
" The denomination of prince cannot be given to any individual, and fhall not carry with it any privilege or exception to the common right of all French citizens."

To the king alone belongs the choice and difmiffion of minifters.
"The members of the prefent national affembly, and of the fubfequent legiflatures, the members of the tribunal of appeal, and thofe who fhall be of the high jury, cannot be advanced to the miniftry, cannot receive any place, gift, penfion, allowance, or commiffion of the executive power or its agents during the continuance of their functions, or during two years after . ceafing to exercife them: the fame fhall be oblerved refpecting thofe who thall only be infcribed on the lift of high jurors as long as their infcription fhall continue."

No order of the king can be executed if it be not figned by him, and counterfigned by the minifter or comptroller of the department.

In no cafe can the written or verbal order of a king Ihelter a minifter from refponfibility.

The conftitution delegates exclufively to the legillative body the powers and functions following;

To propofe and decree laws-The king can only invite the legiflative body to take an object into confideration;

To fix the public expences;
To eftablifh the public contributions, to determine the nature of them, the amount of each fort, the duration, and the mode of collection, \&c.

War cannot be refolved on but by a decree of the national affembly, paffed on the formal and neceffary propofition of the king, and fanctioned by him.

During the whole courfe of war, the legillative body may require the king to negociate f cace; and the king is bound to yild to this requintion.

It belorgs to the legin rive body to ratify treaties of I 2 peace,

Fronch peace, alliance, and commerce ; and no treaty fhall have Revolution effect but by this ratification.

1/91.
The deliberations of the legillative body flall be
public, and the minutes of the fittings fhall be printed. The legiflative body may, however, on any occafion, form itfelf into a general committee.

The plan of a decree fhall be read thrice, at three intervals, the fhorteft of which cannot be lefs than eight days.

The decrees of the legillative body are prefented to the king, who may refufe them his confent.

In cafe of a refufal of the royal confent, that refufal is only fufpenfive.-When the two following legifla. tures fhall fucceffively prefent the fame decree in the fame terms on which it was originally conceived, the king fhall be deemed to have given his fanction.

The king is bound to exprefs his confent or refufal to each decree within two months after its prefentation.

No decree to which the king has refufed his confent - can be again prefented to him by the fame legiflature.

The fupreme executive power refides exclufively in the lands of the king.

The king is the fupreme head of the land and fea forces.

The king names ambaffadors, and the other agents of political negociations.

He beftows the command of armies and fleets, and the ranks of marfhal of France and admiral :
'He narnes two-thirds of the rear-admirals, one-half of the lieutenant-generals, camp-marfhals, captains of fhips, and colonels of the national gendarmerie :

He names a third of the colonels and lientenant-colonels, and a fixth of the lieutenants of fhips:

He appoints in the civil adminiftration of the marine, the directors, the comptrollers, the treafurers of the arfenals, the mafters of the works, the under matters of civil buildings, half of the mafters of adminiftration, and the under mafters of conftruction.

He appoints the commiffaries of the tribunals:
He appoints the fuperintendents in chief of the management of contributions indirect, "and the adminiftration of national domains :"

He fuperintends the coinage of money, and appoints officers entrulted with this fuperintendence in the general commiffion and the mints.

The effigy of the king is Itruck on all the coinage of the kingdom.

There is in each department a fuperior adminiltration, and in each diftrict a fubordinate adminifration.

The adminiltrators are feecially charged with dittributing the contributions direct, and with fuperintending the money arifing from the contributions, and the public revenues in their territory.

The king has the right of annulling fuch acts of the adminiftrators of department as are contrary to the law or the orders tranfmitted to them.

He may, in cafe of obftinate difobedience, or of their endangering, by their acts, the fafety or peace of the public, fufpend them from their functions.

The king alune can interfere in foreign political connedions.

Every declaration of war thall be made in thefe terms: By the king of the French in the name of the nation.

The judicial power can in no cafe be exercifed either by the legiflative body or the king.

Juftice thall be gratuitoufly rendered by judges cho fen from time to time by the people, and inftituted by letters patent of the king, who cannot refufe them. $\%$
"The public accufer thall be nominated by the people."
"The right of citizens to terminate difputes definitively by arbitration, cannot receive any infringement from the acts of the legiflative power."

In criminal matters, no citizen can be judged except in an accufation received by jurors, or decreed by. cept en an acculation received by jurors, or decreed by.
the legillative body in the cafes in which it belongs to it to profecute the accufation.

After the accufation fhall be admitted, the fact fhall be examined, and declared by the jurors.

The perfon accufed fhall have the privilege of challenging 20, "without affigning any reafon."

The jurors who declare the fact thall not be fewer than 12 .
The application of the law thall be made by the judges.
The procefs fhall be pablic ; "and the perfon accufed cannot be denied the aid of counfel."
No man acquitted by a legal jury can be apprehended or accufed on account of the fame fact.

For the whole kingdom there fhall be one tribunal of appeal, eitablifhed near the legiflative body.

A high national court, compofed of members of the tribunal of appeal and high jurors, fhall take cognizance of the crimes of minifters, and the principal. 'agents of the executive power; and of crimes which attack the general fafety of the fate, when the legiflative body fhall pars a decree of accufation.

It thall not affemble but on the proclamation of the legiflative body; " and at the diftance of 30,000 toifes. at leaft from the place of meeting of the legiflative body."

The national guards do not form a military body, or an inftitution in the fate; they are the citizens themfelves called to affif the public force.

Officers are chofen for a time, and cannot again be chofen till after a cerrain interval of fervice as privates.

None fhall command the national guard of more than one diftrict.

All the parts of the public force employed for the fafety of the fate from foreign enemies are under the command of the king.

Public contributions fhall be debated and fixed every year by the legillative body, and cannot continue in force longer than the laft day of the following feffion, if they are not exprefsly renewed.
" Detailed accounts of the expence of the minifte. rial departments, figned and certifed by the minifters or comptrollers-general, thall be printed and publifhed at the commencement of the felfions of each legillatare.
" The fame fhall be done with the ftatements of the receipt of the different taxes, and all the public revenues."

The French nation renounces the undertaking of any war with a view of making conquelts, and will never employ its forces againd the liberty of any people.

The conftituting national affembly declares, "That
After the accufation hall be admitted, the fact mall

Freach the nation has the impreferiptible right of changing Repolution its conftitution; and neverthelefs confidering that it 1791.

98
Andac-
cepted by
the king.
is more conformable to the national intereft to employ only by means provided in the conftitution itfelf, the right of reforming thofe articles of it, of which experience fhall have fhown the inconveniences, decrees, that the proceeding by an affembly of revifion thall be regulated in the form following :
"When three fucceffive legiflatures thall have expreffed an uniform wifh for the change of any conftitutional article, the revifion demanded thall take place.
"The next legiflature, and the following, cannot propofe the reform of any conltitutional article.
"The fourth legiflature, augmented with 249 members, chofen in each department, by doubling the or. dinary number which it furnifhes in proportion to its population, fhall form the affembly of revifion."

The French colonies and poffeffions in Afia, Africa, and America, "though they form part of the French empire," are not included in the prefent conflitution.

With refpect to the laws made by the national affembiy which are not included in the act of conftitution, and thofe anterior laws which it has not altered, they fhall be obferved, fo long as they fhall not be revoked or modified by the leginlative power.

On the $13^{\text {th }}$ of September the King announced, by a letter to the Prefident of the Affembly, his acceptance of the conltitution. This event was ordered to be notified to all the foreign courts, and the Affembly decreed a general amnefty with refpect to the events of the revolution. On the following day the King re. paired in perfon to the National Affembly; and being conducted to a chair of ftate prepared for him at the fide of the Prefident, he figned the confitutional act, and took an oath of fidelity to it. He then withdrew, and was attended back to the Thuilleries by the whole Affembly, with the Prefident at their head. On the 3oth of September, this National Affembly, which has fince been known by the name of the Confituent Afem. $b l y$, diffolved itfelf, and gave place to the fucceeding Legilative National Alfembly, which had been elected according to the rules preferibed by the new conflitution.

Ont the character and the labours of the Confituent Affembly, we fhall only remark, that it contained many men of talents, and, in all probability, a confiderable number of men of integrity. Towards the clofe of its feffion, it affunied a very friking character of modera- tion, and appears to have been completely monarchical, although its jealoufy of the ancient ariftocracy prevented it from fufficiently guarding the throne againft popular violence; for a very friking defect in the new conftitution foon appeared. The King polfefled a veto, or negative, upon the refolutions of the legiflative body: but this negative he was bound to exercife in perfon, without refponfibility, and without the intervention of his minitters. He had no fenate, or upper chamber, to ftand between him and popular violence; and there was fomething apparently abfurd in fettling the rote of an individual, in oppofition to the collective wifdom and will of a whole nation. In confequence of this, he was reduced to the hard alternative of yielding to every vote of the National Affembly, or of expofing himfelf perfonally to public odium.

The new Affembly was opened by the King on the

7th of October, with much apparent union on all French fides. His fpeech, recommending unanimity and con. Revolution fidence between the legiflative and executive powers, was received with unbounded applaufe. The character of the men who compofed the new National Afembly was unaufpicious to the Court. At the commencement of the revolution, the great body of the people at a diftance from the capital were little interefted in thofe projects of freedom which occupied the more enlightened or more turbulent inhabitants of Paris. They had gradually, however, been roufed from their lethargy. The variety of powers conferred by the new confitution upon the people at large, and the multiplicity of offices of which it gave them the patronage, had kindled in the minds of men a love of dominion, and a wifh to interfere in public affairs. This attached them to the new order of things. The love of power, which is the lealt difguifed paffion in the human heart, and equally ftrong in the brealt of the meaneft and of the higheft of mankind, was thus, under the name of liberty, become a leading paffion throughout this wide empire. They who flattered it moft, and were molt loud in praife of the rights of the people, became fpeedily the favourites of the public. The confequence of this was, that the new National Affembly was chiefly compofed of country gentlemen, of principles highly democratic, or of men of letters who had publifhed popular books, or conducted periodical publications. The members of the Conftituent Affembly had been excluded by their own decree from holding feats in the new legiflature. - The members of the latter, therefore, had little regard for a conftitution which they thernfelves had not framed, and which was not protected by the venerable fanction of antiquity.

When this Afembly firt met, it fhowed a very trifing attention to formalities, and a peevilh jealoufy of the minifters of the crown. In the mean time, the treaty of Pilnitz, already mentioned, began to be ru. moured abroad, and France was thrown into a ftate of anxious jealoufy for the fafety of its newly-acquired liberties. Although the Pruffians and Germans (the Elector of Mentz alone excepted) all continued to temporize, the northern powers, Sweden and Ruffia, entered into ftrict engagements to reftore the old defpotifm of France. On the 9 th of November, a decree was paffed, that the emigrants who, after the firft of January next, fhould be found affembled, as at prefert, in a hoftile manner, begond the frontiers, floould be confidered as guilty of a confpiracy, and fuffer death; that the Fiench Princes, and public functionaries, who lhould not return befcre that period, fhould le punifhable in the fame manner, and their property forfcited during their own lives. On the r8th, a feries of fevere decrees was alfo paffed againit fuch of the ejected clergy as ftill refufed to take the civic oath. To both thefe decrees the King oppofed his veto, or negative. The moderate party, who were attached to the confitution, rejoiced at this as a proof of the freedom of their fovereign. But, on the other fide, it excited a molt violent clamour, and became the means of exciting new fufpicion of the wilhes of the Court. At this Pacifican time anfiwers were received from the different foreign fwers are Courts to the notification fent them of the King's ac- received ceptance of the new conftitution. Thefe were general- from foly conceived in a file of caution, and avoided giving powers

French open offence. The Emperor even prohibited all affemRevolntion blages of emigrants within his ftates ; and the King
1791.

104
But the
court is flil
rufpected.

The minifiry changed. intimated to the allembly that he had declared to the Elector of Treves, that unlefs the emigrants fhould ceafe before the 15 th of January to make holtile preparations within his territories, he would be confidered as the enemy of France. All this, however, did not preferve the court from fufpicion; for although the different foreign courts had openly declared pacific intentions, yet the French emigrants boldly afferted, that all Europe was actually arming in their favour. Accordingly they ceafed not to folicit their equals in rank, who ftill remained within the country, to leave it to join with them in what they called the royal caufe.The unhappy Louis, placed between a republican party that was gradually gathering ftrength, and an arifocratical party that was roufing Europe to arms againt a nation of which he was the conftitutional chief, and a combination of Princes juftly fufpected of wifhing to feize upon a part of his dominions, ftood in a fituation which would have perplexed the moft kilful ftatefman; and it is no proof of incapacity that he fella facrifice to circumftances which might have overwhelmed any known meafure of human ingenuity. Addreffes were crowding into the Affembly, difapproving the conduct of the court. M. Montmorin refigned; M. Deleffart fucceeded him ; and M. Cahier de Gerville became minifter of the interior. M. du Portail refigned alfo, and M. Narbonne fucceeded him as minifter of war. In the month of November, M. Bailly's mayoralcy terminated; and the once popular La Fayette appeared as a candidate to fucceed him. But he was fuccefsfully oppofed by M. Petion, a violent Jacobin, and a declared republican, who was elected mayor of Paris by a great majoiity.

106
The Feuillans effablifhed to oppofe the Jacobin club.

507
State of
France in the end of 1791 and bequining of 1792.

At this period the moderate men, who were friends of the conftitution, attempted to counteract the influence of the Jacobin club by the eftablifhment of a $f_{i}-$ milar one. It derived its name from the vacant convent of the Feuillans, in which it affembled. The mont active members of the Conftituent Affembly belonged to it, fuch as M. M. D'Andre, Barnave, the Lameths, Du Port, Raband, Sieyes, Chapelier, Thouret, Labord, Taleyrand, Montefquieu, Beaumetz, \&c. The Jacobins contrived to excite a riot at the place of their meeting, which was in the vic nity of the hall of the National Affembly. This afforded a pretext for applying to the Affembly for the removal of the new club. The Affembly fhowed their difpofition, by complying with this requelt.

At the end of this year, the kingdom of France was by no means profperous. The public revenue had fallen far fhort of the expenditure. The emigrant nobility had carried ont of the kingdom the greater part of the current coin, and a variety of manufacturers, who defended upon their oftentatious luxury, were reduced to much diftrefs. The difpofitions of foreign courts appeared very doubtful. The new year, howerer, opened with delufive profpects of tranquillity. The German Princes appeared fatisfied with the mode of compeniation which the French had offered for the lofs of their poffefions in Alface and Lorraine. The Prince of Loweftein accepted of an indemnification, The Princes of Hohenlohé and Salm-Salm declared themfelves ready to treat upon the fame terms. Prince

Maximilian, and the Dukes of Wirtemberg and Deux- French Ponts, freely negociated. It is unneceffary to ftate in Revolution detail the fubterfuges employed, in the mean time, by $\underbrace{1792 .}$ the crafty Leopold, for amufing the French with the appearances of peace. M. Deleffart, minifter for foreign affairs, fell a facrifice to them, and probably to the undecided character of Louis. He was accufed by M. Briffot of not having given timely notice to the National Affembly of the difpofitions of foreign powers, and of not prefing proper meafures for fecuring the honour and fafety of the nation. A decree of accufation paffed againft him in his abfence. He was apprehended, tried by the high national court at Orleans, and executed in confequence of its fentence.

The fudden death of Leopold on the firlt of March The death gave rife to a tranfient hope that peace might ftill be of the empreferved. A fufpicion of poifon fell upon the French, peror and but it was removed by the detail of his difeafe that was the king of fpeedily publifhed. On the 16 th of the fame month, Sweden. the King of Sweden was wounded by a nobleman of the name of Ankerftrom, and died on the 29th. This enterprifing prince had overturned the conttitution of his own country, and he had formed the project of conducting in perfon his troops to the frontiers of France, and of commanding or accompanying the combined armies of Europe in their attempt to avenge the caufe of infulted royalty. In was in a great meafure to counteract this fcheme that he was affaffinated.

The fudden fall, however, of thefe two enemies ra. The emper ther accelerated than retarded the meditated hoftilities. ror's fucThe young king of Hungary, who fucceeded to the ceffor empire, made no fecret either of his own intentions or openly of the exittence of a concert of Princes againft France. warlike ins M. Dumourier was now at the head of the war.office, tentions. M. Rolland was minifter of the interior, and M. Clavier $\_$minifter of finance. The Jacobins were all-powerful. The Court gave way to the torrent. The property of the emigrants was confifcated, referving the rights of creditors. The Imperial minifter, Prince Kaunitz demanded three things of France; $1 / f$, The reftitution of their feudal rights to the German Princes; 2dly, To rellore Avignon to the Pope, the inhabitants of which had fome time before thrown off their allegiance, and prevailed with the Conftituent Affembly to receive their country as a part of France ; and lafly, Prince Kaunitz demanded, that "the neighbouring powers thould have no reafon for apprehenfion from the prefent weaknefs of the internal government of France." On receiving thefe demands, the king propofed a declaration of war, which was decreed by the National Af. fembly on the 2oth of April, againtt the King of Hungary and Bobemia.

The French immediately began the war, by attack- And the ing in three different columns the Auftrian Netherlands. Auftrian M. Theobald Dilion advanced from Lifle to Tournay, Netherwhere he found a ftrong body of Auftrians ready to receive him. The national troops, unaccuflomed to furtain the fire of regular foldiers, were initantly thrown fully atinto confufion, and fled even to the gates of Lifle. The the Frenc... cry of treafon refounded on all fides; and their commander, an experienced and faithful officer, was rurdered by his own foldiers and the mob. A fecond divifion of 10,000 men, under Lieutenant-General Biron, took poffeffion of Quiverain on the 29th, and marched towards Mons. General Biron was here attacked by

## R E V

French Revolution 1792.
the Auftrians, whom he repulfed. Hearing, however, of the defeat of Dillon, he retreated. A third party advanced to Furnes, but afterwards withdrew. La Fayette at the fame time advanced towards Bouvines, half way to Namur, from which he afterwards retreated. The whole of thefe expeditions were ill contrived, in as much as they divided the French undifciplined troops, and expofed them in fmall bodies to the attack of veteran forces. The Auftrians were fome time before they attempted to retaliate. At length, however, on the 1 Ith of June, they attacked M. Gouvion, who commanded the advanced guard of La Fayette's army near Maubeuge. M. Gouvion was killed by a rolling bullet; but La Fayette himfelf having come up, the Aultrians abandoned the field. In the mean time, matters were haftening in Paris towards a violent crifis. Two parties, both of which were hoftile to the prefent conftitution, had gradually been formed in the ftate. The one wifhed to give more effectual fupport to the royal authority, by eftablifhing a fenate or two cbambers, to prevent the king's vote from being the fole check upon popular enthufiafm. The other party wifhed to fet afide royalty altogether, and to hazard the bold experiment of converting France into a republic. Thefe laft were fupported by the Jacobin club, which had now contrived to concentrate in itfelf an immenfe mafs of influence. . Innumerable popular focieties were eftablifhed in every town and village throughout the provinces. With thefe a regular correfpondence was kept up by writing and by emiffaries. Thus fchemes and notions were inftantaneoufly propagated through a great empire, and all the violent fipirits which it contained were enabled to act in concert: But the more immediate engine of the republican party confilted of the immenfe population of the metropolis, whom they now endeavoured to keep in conftant alarm. For this purpofe they alleged, that an Aufrian Comuittee, that is to fay, a confpiracy in favour of the enemies of the country, exitted among the friends of the court. M. M. Genfonné and Briffot even offered in the affembly to prove the exiftence of this pretended Auftrian committee. A report was next circulated, that the king intended to abfcond from the capital on the 23 d of May. His majefty publicly contradicted thefe aeculations as calumines, but they made no fmall impreflion upon the minds of the public. New decrees were now made againt the refractory clergy, but thefe his ruajefty refufed to fanction. A propofal was alfo made and decreed in the affembly to form a camp of 20,000 men under the walls of Pari:, and that for this levy every canton in the kioghom fhould contribute one horfeman and four infantry. The $n$ ational guard of Paris difliked the pr pofa, and the king gave to it his negative. Indeed at this time the king feems to have come to a refolution of ftanding out againft the Jacobin party, to which he had for founs time yielded. The miniftry were therefore difmiffed, excepting M. Dumourier, and others were appointed in their flead. By this event Dumourice lut the conflence of the Jacobin club. He faw his error, refigned his office, and joined the army. In the mean time a decree hat been puffed, authoriing the manufacture of pikes fur the purpofe of arming cheaply the lower cluts of citizens. All means were afed to render the king odious by intammatory wri-

175 ] R E V
${ }^{\text {ti}}$ ngs and harangues; and in both thefe the noied incendiary Marat took the lead.

On the 2 th of June M. Roederer, the Procureur General Syndic informed the national affembly, that, contrary to law, formidable bodies of armed men were preparing to prefent petitions to the king, and to the national affembly. A part of them fpeedily appeared with St Huruge and Santerre a brewer at their head. They marched through the hall in a proceffion that lafted two hours, at four o'clock in the afternoon, to the number of about 40,000 . They furrounded the Thuilleries. The gates were thrown open; and on an attempt to break the door of the apartment, where the king then was, he ordered them to be admitted. His fifter the princels Elizabeth never departed from his fide during four or five hours that he was furrounded by the multitude, and compelled to liften to every indignity. All this while Petion, the mayor of Paris, was unaccountably abfent. He at length, however, arrived, and alfo a deputation from the affembly. The queen, with her children and the princefs de Lamballe, were in the mean time in the council-chamber, where, though protected from violence, they were yet expofed to much infult. At laft, in confequence of the approach of evening, and of the entreaties of Petion, the multitude gradually difperfed.
The indignities fuffered on this day by the royal fanily were in fome refpects not unfavourable to their caufe. A great number of the moft refpectable inhabitants of the capital were ahamed of fuch proceedings. They complained of them feverely in a petition to the affembly, and addreffes to the fame purpofe were re. ceived from feveral departments. The directory of the department of Paris, at the head of which were M. Rochefoucault and M. Talleyrand, publifhed a declaration difapproving of the conduct of the mayor, and of M. Manuel the procureur of the commune, whom they afterwards fufpended from their offices, although they were fpeedily reftored by a decree of the affembly. At the fame time, La Fayette leaving his army fuddenly, appeared on the $26: \mathrm{h}$ at the bar of the national afiembly. He declared that he came to exprefs the indignation which the whole army felt on account of the events of the 2oth: he called upon the affembly to punifh the promoters of thefe events, and to diffolve the factious clubs. The fudden appearance of La Fayette threw the Jacobins into confternation, and from that period they never ceafed to calumniate him.

On the rit of July, on the motion of M . Jean de The king Brie, the affembly ordered a proclamation to be made, of Prufia that the country was in danger. On the 6th, the king marches gave intimation that the king of Pruffia was marching againft with 52,000 men to co-operate againft France. The France. French arms were at this time fomewhat fuccefsful in the Auftrian Netherlands; but the cabinet fpeedily thought it neceffary to order the armies to retreat: a meafure which was afterwards publicly cenfured by Marfhal Luckner.

On the 7 th , a fingular fcene occurred in the nation IIS al affembly. At the inftant that M. Briffot was about fpeech of to commence an oration, M. Lammourette bifhop of the bifhop Lyons requefted to be heard for a few minutes. He of Lyons. expatiated on the neceffity of union among the members of tine alimbiy, and of facrificing their paffions and pre.

French judicas on the altar of their country. He concluded an Revolution animated addrefs with thefe words, " Let all who hold $\underbrace{1792 .}$

116 in equal deteftation a republic and two chambers, and who wifh to maintain the conflitution as it is, rife!" The words were fcarcely pronounced when the whole affembly ftarted from their feats. Men of all parties folemnly embraced each other, and protefted their adherence to the conflitution. A deputation announced this happy event to the king; who immediately came and congratulated them in a fhort fpeech, which was received with infinite applaufe. The only good effect; however, produced by this temporary agreement was, that the feftival of the $14^{\text {th }}$ of July, which was celebrated with the ufual magnificence, paffed over in tranquillity.

On the $25^{\text {th }}$ of July, the duke of Brunfwick iffued at Coblentz his celebrated manifefto. It declared the purpofe of the intended invafion of France to be the reftoration of the French king to full authority. It declared the national guard of France refponfible for the prefervation of tranquillity; and threatened with the punifhment of death, as rebels to their king, thofe who fhould appear in arms againft the allied powers. All men holding offices, civil or military, were threatened in the fame manner, as well as the inhabitants of all cities. The city of Paris in particular, and the national affembly, were declared refponfible for every infult which might be offered to the royal family. It was declared, that if they were not immediately placed in fafety, the allies were refolved to infict " on thofe who fhould deferve it the molt exemplary and ever memorable avenging punifhments, by giving up the city of Paris to military execution, and expofing it to total deftruction; and the rebels who fhould be guilty of illegal refiftance fhould fuffer the punifhments which they fhould have deferved." This fanguinary and imprudent manifefto operated as a warrant for the deftruation of the unfor- tunate Louis XVI. It left no middle party in the nation. All who wifhed to preferve freedom in any form, and all who loved the independence of their country, were inftantly united. At the fame time, the reproaches calt on the king by the Jacobins now gained univerfal credit. The kings of Pruffia and of Hungary told the French nation, that their monarch was fecretly hoftile to the conftitution; and the reforation of him and his family to defpotic power was made the fole pretence for a bloody and dangernus war.

The republican party faw the advantage which they had now gained, and refolved upnn the depofition of the king. The chief engine which they meant to employ in this fervice confifted of about 1500 men, who had come to Paris at the period of the confederation on the 14th of July, and therefore called Federés, and who were alfo fometimes denominated Marfeillois, from the place from which the greater number of them came. Next to thefe, dependence was placed in the populace of the fuburbs of the capital. The defigns of the republicans were not unknown to the court, and both parties were forming plans of operation. It is faid that the royal party interded that the king and his family fhould fuddenly leave the capital, and proceed to a.s great a ditance as the conffitation permitted. The republicans are faid to have intended to feize the perfon of the king, and to confine him in the caftle of Vincennes till a national convention hould decide upon his
fate. Both allegations are probably true. Every motive which can influence the mind of man mult have induced Louis to wilh to be at a diftance from the factious and fanguinary capital. And the fubfequent conduct of the republicans authorife us to believe them capable of the wort crime that was laid to their charge.
Various charges had been brought forward in the affembly againt La Fayette, and the 8th of Augult was appointed for their difcuffion. In the mean time, on acquitted. the 3 d of Augut, Petion the mayor, at the head of a deputation from the fections of Paris, appeared at the bar, and in a folemn fpeech demanded the depofition of the king. The difcuffion of the accufation againft La Fayette was confidered as a trial of flreagth between the parties : he was acquitted, however, by a majority of nearly 200 ; and the republican party, defpaining of carrying their point by a vote of the national affembly, refolved to have recourfe to infurrection and force.

On the evening of the gth of Auguft, about 1500 gentlemen, officers of the army, and others, repaired to the palace, refolved to protect the royal family or to die in their defence: added to thefe were 700 Swifs guards," with a body of cavalry amounting to about 1000. Mandat, the commander of the national guards, a man who was firmly attached to the conftitution, had procured 2400 of that body and 12 pieces of cannon. With fuch a force, it has been generally thought that, by vigorcus and fteady councils, the palace, which is a kind of cafle, might have been fuccefffully defended; and what is now called a revolution might have born the name of a rebellion. Meanwhile the affembly declared its fittings permanent. Petion was at the palace late on the evening of the 9th. Some apprehenfions wete entertained, or pretended to be entertained, for his fafety (for the whole of this bufinefs was, on the part of the republicans, a deep laid fcheme), and a deputation from the affembly brought him away. At midnight the toçfin or alarm bell was founded, and the drums beat to arms through the city. At this inftant a number of the mof active leaders of the republican party affembled, and elected a new common council or commune. The perfons thus irregularly chofen inftantly. took poffeffion of the common hall, and drove ost the lawful members; who, with that weaknefs with which men are apt to farink from ftations of refponfibility in perilous times, readily gave place to the ufirpers. The new commuse fent repeated meffages to M. Mandat, requiring his attendance upon important bufinefs. He was occupied in arranging the troops in the beft order around the palace; but fufpecting nothing, he went to the common hall, and was there aftonifhed to find a dif. ferent affembly from what he expected. He was abruply accufed of a plot to maffacre the people, and ordered to prifon; but as he defcended the ftairs, he was fhot with a piltol, and Santerre was appointed in his ftead to command the national guard.

On this eventful night no perfon in the palace went to bed. About fix o'clock in the morning of the 1oth the king defcended into the gardens to review the traops. He was received with houts of Vive le roi excepting from the artillery, who fhouted Vive la aation: The king retarned to the palace, and the multitude continued to collect. The national guard feemed undetermined about what they were to do, as they affembled in divifions near the palace; and had a feady re-

## R EV

Prench fiftance been made from within, it is probable they Revolution would have joined the royal party. But towards eight o'clock M. Roederer procured admittance to the palace, and told the king that armed multitudes were affembling in hoflile array around the Thuilleries; that the national guard was not to be depended upon; and that, in cafe of refifance, the whole royal family would moft certainly be maffacred. He therefore advifed the
n2r king to feek protection in the hall of the national afThe royal fembly. With this advice the king, with his ufual fafamily fy cility of temper, was ready to comply; but the queen for fafety to the bal of the national affembly. oppofed with vehemence the humiliating propofal. Becoming gradually, however, alarmed for the fifety of her children, the gave her confent; and the king and queen, the princefs Elizabeth, with the prince and
princefs royal, went on foot to the hall of the affembly. "I am come hither (faid his majelty) to prevent a great crime. Among you, gentlemen, I believe myfelf in fafety." By an article of the conftitution the affembly could not deliberate in prefence of the king. The royal family, were, therefore, placed in a narrow box feparated from the hall by a railing, where they remained for 14 hours without any place to which they could retire ffr refrefhment, excepting a very fmall clofet adjoining. Here they fat liftening to debates, in which the royal character and office were treated with every mark of infult.

When the king left the palace of the Thuilleries, he unfortunately forgot to order it to be immediately furrendered. He recollected this as foon as he reached the affembly, and fent orders for this purpofe; but it was now too late. The infurgents amounted to about 20,000 effective men. They were drawn up in tolerable order by Wefterman a Pruffian, and had about 30 pieces of cannon along with them. The gentlemen within the palace, who had affembled to protect the

122

## condict in

 the palace in which moft of the Swifeguards are maffacred. rion, were now part to act. The commander of the Swifs, M. Affry, was abfent, and the captains knew not what to do; and the national guard had no leader in confequence of the death of Mandat. About nine o'clock the outer gates were forced open; and the infurgents formed their line in front of the palace. A bloody combat commenced chiefly between the Marfeillois and the Swifs. After a brave refiltance of about an hour, the Swifs were overpowered by numbers, and gave way. All of them that could be found in the palace were maffacred; fome even while imploring quarter on their krees. Others cfaped into the city, and were protected by individuals. Of this brave regiment, however, only 200 lurvived; but every humali being, even the loweft lervants found in the palace, were put to death. The Swifs taken prifoners in various quarters were conducted to the door of the affembly, and taken by decree under the protection of the \{ate. But the fanguinary multitude infifted upon putting them to inftant death; and the affembly would, in all probability, have been unable to protect them, had not the Marfillois interfered in their favour.The fufpention of the royal authority was now decreed, and the nation was invited to eleft a Convention to determine the nature of its future government. On this uncommon occafion all Frenchmen of 21 years of age were declared capable of electing, and of bsing

Vol. XVI.
elected, deputics to the new national Convention. Com- Fre:ch miffioners were, in the mean time, fent on the fame Revoluticu evening to give to the armies a falfe and favourable ac- $\underbrace{\text { r792. }}$ count of thefe tranactions. The royal family were fent to the old palace of the Temple in the midft of the city, to remain there under a frict guard; and all perfons of rank who had been attached to them were feized and committed to the different prifons.
To give an idea of the temper of the people of Pa- Bloody ris at this time, it is proper to remark, that at the fame temper of inftant when the multitude with bloody fury were maf- the people facring the menial fervants in the palace, and could of iaris, fcarcely be reftrained from offering violence to the Swifs who were made prifoners, they would fuffer no act of pillage to pafs unpunifhed. Several attempts of this kind were accordingly followed by the inftant death of the criminals. The plate, the jewels, and money found in the Thuilleries were brought to the national affembly, and thrown down in the hall. One man, whofe drefs and appearance befpoke extreme poverty, caft upon the table an hat full of gold.- But the minds of thefe men were elevated by enthufiafm; and they conceived themfelves as at this moment the champions of freedom, and objects of terror to the kings of the earth.
In the mean time, the fituation of France was ex. tremely critical, and it appeared very doubtful if the ctation of Convention would ever be fuffered to affemble. the whole La Faytite bad accidentally got fpeedy notice of the kingdom. events of the roth of Auguft. He advifed the magiftrates of the town of Sedan to imprifon the commifioners from the national affembly when they fhould arrive there; which was accordingly done. He, at the fame time, publifhed an addrefs to his army, calling upon them to fupport the king and the cosflitution; but La Fayette finding that they were not to be depended upon, on the withdraws 19th Auguft he left his camp in the night, accompa- from the nied only by his ftaff and a few fervants. They took army-His the rout of Rochefort in Liege, which was a neutral fharad country; but were met by a party of the enemy, who took them prifoners, and they were detained in Pruffian and Auftrian dungeons till autumn 1794, when it was fuid that La Fayette himfelf made his efcape; the report, however, was premature. The fevere treatment of this man was probably a confiderable error in policy on the part of the allies. His fidelity to the king is very generally admitted; and his attach. ment to the conflitution, his love of his country, his bravery, and many amiable qualities merited a better fate.

To return from this digreffion. The commiffioners were foon fet at libertyat Sedan, and received with applaufe by the army of La Fayette. General Arthur Dillon at firft entered into the fentiments of La Fayette; but the politic Dumourier diverted him from his purfofe, and by this means regained his credit with the Jac bins, and was appointed commander in chief. The other generals, Biron, Montefquieu, Kellerman, and Cuftine, made no oppofition to the will of the national affembly.

Meanwhile, the combined armirs of Auftria and Pruffia had entered Fiance. The duke of Brunfwick's army was above 50,000 ftrong. General Clairfait had joined him wish i 5,000 Aufrians, and a confiderable
fate and
character.

1792.

127
The combined armies enter France in great force

Dumourier had only 17,000 men collected near the point from which the enemy were approaching in Luxembourg. The French emigrants had given the duke of Brunfwick fuch an account of the diftraeted ftate of their-own country, and of the pretended difaffection of all orders of men towards the ruling faction in Paris, that no refiftance of any importance was expected. When the combined troops, confifting either of feady Auftrian or Hungarian battalions, or of thofe well difciplined Pruffians which the great Frederick had inured to the beft military difcipline, were reviewed in Germany before fetting out on their march, it is faid that the fpectators, among whom the French caufe was not unpopular, beheld them with anxiety and regret, and pitied the unhappy country againft which this irrefiftible force was directed. The foldiers and their officers regarded themfelves as departing for a hunting match, or an excurfion of pleafure; and many of the ufual accommodations of an army were ill attended to, fuch as hofpitals, \&c. The beginning of their progrefs into France juftified thefe expectations. Longwy furrendered after a fiege of 15 hours, although well fortified, poffeffed of a garrifon of 3500 men , and defended by 71 pieces of cannon. The news of this event irritated the affembly fo much, that they decreed, that, when retaken, the houfes of the citizens fhould be razed to the ground; and, diftrultful of the officers of the army, they decreed that the municipal officers of a town hould hereafter have power to controul the deliberations of the council of war. Verdun was next fummoned; and here the municipality compelled the governor M. Beaurepiare to furrender. Thatt officer, difappointed and enraged, fhot himfelf dead with a piftol in prefence of the council, and on the 2d of Sep.

128

## Alarm at

 laris on account of their fuccels. tember the Pruffian troops entered the town.The news of this fecond capture, and of the approach of the Pruffians, fpread an inftant alarm through Paris. It was propofed to raife a volunteer army, which fhould fet out immediately to meet the enemy. The common council, which was now led by Robefpierre, Danton, Marat, and others of the moft fanguinary character, ordered the alarm-guns to be fired, and the populace to be fummoned 10 meet in the Champ de Mars to enroll themfelves to march againft the enemy. The people affembled, and either in confequence of a premeditated plan, or, which is not very probable, of an inftantaneous movement, a number of voices exclaimed, that "the domeltic foes of the nation ought to be deftroyed before its foreign enemies were aitacked."

Parties of armed men proceeded without delay to

1000 perfons were put to death. There is fcarce ant thing in hitory that can be reprefented as parallel to them ; they were committed, it is faid, by lefs than 300 men, in the midit of an immenfe city, which heard of them with horror, and in the vicinity of the national affembly, which, by going in a body, could have put an end to them. But fuch was the confufion and difmay of thefe two difgraceful days, that no man dared to ftir from his own houfe; and every one believed that the whole city, excepting his own freet, was engaged in maffacre and bloodfhed. The national guards were all ready at their refpective pofts, but no man directed them to act : and there is too much reafon to fufpect that Santerre and the chiefs of the com. mune connived, at leaft, at the tranfaction.

In the mean time, general Dumourier was taking State of the beft meafures to protract the march of the enemy the French till the army of Kellerman, confifting of 20,000 men, army, and could join him from Lorraine; and that of Bournonville conduct of from Flanders, amounting to 13,000 ; together with Dumouwhatever new levies Luckner might be able to fend him from Chalons. The foreft of Angonne extends from north to fouth upwards of 40 miles; it lay directly in the route of the duke of Brunfwick, who mult either force his way acrofs it, or make a circuit of 40 miles by the pafs of Grandpré on the north, or by Barleduc on the fouth. The pafs that lay. directly in his route was that of Biefme. After furveying Dillon's pofition here, he left a party of 20,000 men to watch it; and with the main body of his army took the circuitous route by Grandpré on the north. Here Du- The ${ }_{3 I}$ mourier waited to receive him, and was attacked on the fians oblige 12 th and 13 th without fuccefs: but on the 14 th, the him to reattack of the Pruffians was irrefitible, and Dumourier treat, but retreating, gave up the pals. On his march he was fo do not folviolently preffed by the advanced cavalry of the Pruf- their adfians, that his army, at one time, was feized with a pa-vantage. nic, and fled before 1500 men; who, if they had pufhed their advantage, might have difperfed it. On the 15 th, however, Dumourier encamped at St Menehould, and began to fortify it. Bournonville's army joined Dumourier on the 17 th. The duke of Brunfwick formed a plan of attacking Kellerman before his junc. tion could be completed. That general arrived on the 19th within a mile of Dumourier's camp; the projected attack took place; the Pruffians mancuvred with their ufual coolnefs and addrefs; they attempted to furround Kellerman's army, but this could not be accomplifhed. The French troops preferved excellent order, while the national vivacity was conftantly.fhowing itfelf in their fhouts and patriotic fongs: 400 French were killed, and 500 wounded; the lofs of the Pruflians was much greater : and, in the face of the enemy, Kellerman joined Dumourier at the end of the engagement without oppofition. At the time that the attack was made on the army of Kellerman, an attempt was made to force Dillon's camp at Biefme by the 20,000 men that had been left in its vicinity, but without fuccefs; and this large detachment was thus prevented from crofling the foreft of Argonne and joining the duke of Brunfwick. It is to be obferved, that in thefe engagements the French owed their fuperiority chiefly to the excellence of their artillery; a circumfance which ferved to convince their enemies that they

## R E V

## R E V

Trench had to contend with regular military bodies, and not Revolution with undifiplined multitudes, as they expected.
x792.
132
Lun, near the camp of Dumourier. And here the The Pruf- Pruffians began to be in extreme diftrefs botin from fians diftreffed by ficknefs and $\mathrm{fa}-$ mine. ficknefs and famine. No temptation could induce the inhabitants of the country to carry provifions to the hoftile camp, while at the fame time the French army was abundantly fapplied.

Bournonville, with a body of 4000 men, intercepted feveral droves of cattle and other convoys of provilions deftined for the Pruflians. The rain fell in torrents, and the roads were uncommonly deep. Expofed to the cold, the moiture, and want of provifions, the Pruffians rafhly ate great quantities of the grapes of Champagne. The confequence of this was, that an epidemical diftemper commenced and fpread through the army to fuch an extent, that ro,000 men at one time were unfit for duty. The duke of Brunfwick, however, ftill commanded a force much more numerous than that of Dumourier; and he has been much cenfured for not attacking his camp, and forcing him to engage. It has been faid, that the veteran and numerous force which he commanded would have marched to certain vittory againft the raw troops that oppofed them; that, having defeated Dumourier's army, there was nothing to oppofe their march to Paris. But the duke of Brunfwick bad entered France upon the fuppofition, that in its prefent diftracted fate no regular army could be brought into the field tigaint him, and that the people at large were hoftile to the ruling faction. The contrary of all this had turned out to be true. He found himfelf in the midf of an hoftile people, and oppofed by fkilful military chiefs. A defeat in fuch a fituation would have brought certain ruin to his army ; and even the lofs funtained in the acquifition of a vietory might have proved equally fatal. The remains of the French army would not fail to hang upon his rear ; and from the difpofition of the people it appeared impofible to afcertain to what amount that army might be fuddenly increafed. After propofing a truce, therefore, which lafted eight days, he commenced his retreat towards Grandpré, and no advantage was gained over him in the courfe of it. Verdun was retaken by the French on the 12th of October, and Longwy on the 18th ; the fiege of Thionville was at the fame time raifed. That fmall, but trong fortrefs, under the command of general Felix Wimpfen, had held in check an army of $133 \quad 15,000$.
mored the Pruwans were advancing from the northend and ealt, the Aultrians under the duke of Saxe Tefthen vigoroufly laid fiege to Lile. The council-general of the combefieged by mune aniwered the fummons of the befiegers thus, "We the Aufrians, but in vain.
have jult renewed our oath to be faithful to the nation, and to maintain liberty and equality, or to die at our, poft. We will not perjure ourfelves." Such was the anfwer of thefe men who had already perjured themfelves by contributing to overturn the conflitution which they had repeatedly fworn to defend. The Auftrian batteries began to play upon the twon on the 29th, and were chiefly directed againft that quarter which was inbabited by the lower clafs of citizens, for the purpofe of making them mutivous and feditious. This procedure was ill judged. The lower claffes of mankind are always much accuftomed to hardhips, and they go fartheft in
fupport of any enthofiattic principle they have been perfuaded to adopt. Accordingly, though a great part of the city was reduced to a haap of ruins, the citizens of Lifle became daily more obftinate. They received each other into the houfes that were Atill flanding, and every vault and cellar was occupied. Although upwards of 30,000 red-hot balls and 6000 bombs werc thrown into the city, befides the efforts made by an immenfe battering train of artillery, yet the lofs both to the garrifon and people did not exceed 500 perfons, mont of whom were women and children. After a fornight of fruitlefs labour the Aultrians raifed the fiege.

War had been declared againft the king of Sardinia War dia on account of the threatening appearances exhibited in clared athat quarter. On the zoth of September general gainft the Montefquieu entered the territories of Savoy, and was ${ }^{\mathrm{k} i n g}$ of received at Chambery and thronghout the whole Savoy ticountry with marks of unbounded welcome. On the ken, \&c. 29th general Anfelm, with another body of troops, took polfeffion of Nice and the country around it. On the 3 oth general Cuttine advanced to Spires, when he found the Aultrians drawn up in order of battle. He attacked and drove them through the city, taking 3000 of them prifoners. The capture of Worms fucceeded that of Spires ; Mentz furrendered by capitulation ; and Frankfort fell into the hands of the French on the 23 d . Out of this laft place, however, they were afterwards driven on the 2 d of December.

On the 20 oth of September the French National Con- The navention affembled. It was found to contain men of all tional concharacters, orders, and ranks. Many diftinguifhed vention afmembers of the Confituting Affembly were elected into fembles, it, and alfo feveral that had belonged to the Legifative Affembly; even foreigners were invited to become French legiflators. The famous Thomas Paine and Dr Prieftley of England were elected by certain depart. ments; but the latter declined accepting. Clouts a Pruffan, whom we formerly noticed as bringing a deputation to the bar of the conftituent affembly, confifting of perfons reprefenting all the nations of the earth, was alto chofen. The general afpect of the new convention thowed that the republican party had acquired a decided fuperiority. On the firft day of meeting M. Collot D'Herbois, who had formerly been an actor, afcended the tribune, and propofed the eternal abolition of royalty in France. The queltion was carried by acclamation, and the houfe adjourned. Meffages were fent to all parts of the country to intimate the decree, and by the influence of the Jacobins they were everywhere received with applaufe. It was next day decreed, that all public atts thould be dated by the year of the Frerch republic; and all citizens were declared eligible to all the vacant offices and places. The rage of republicanifm foon went fo far, that the ordimary titles of Monfieur and Madame were abolifhed, and the appellation of Citiron fubltituted in their ftead, as more fui:able to the principles of liberty and equality.-It may be re. marked, that in this lat trifling circumftance an attachment to the form of feeech to which they had been, accufomed appears even in its abolition: For, al. though the Roman orators addreffed their countrymen when afiembled by the honourable appellation of Citi. zeins, yet they never, in accofting an individual, called him Citizen Cato, or Citizen CaCar, according to the mode now adopted in France.

## REV

It was foon difcovered that the leading republicans Revolution had divided into two oppofite factions. The one of $\underbrace{\text { 1792. }}$ thefe was called Girondifls, becaufe Vergniaud, Gen-

137 Two opMfite factions in the convention. fonné, Guadet, and fome others of its leaders, were members from the department of La Gironde. The celeUrated Condorcet belonged to this party; and they were fometimes denominated Briffotines, from M. Brilfot de Warvile their principal leader. They fupported the minitry now in office, at the head of which was Roland; and the majority of the convention was obvioully attached to them. In oppofition to thefe was the fmaller party of the Mountain; fo called from its members ufually fitting in the convention on the upper feats of the hall. They were men poffeffed of lefs perfonal refpectability, and fewer literary accomplifhments, but of daring and fanguinary characters, whom the revolution had brought into public notice. At the head of this party were Danton and Robefpierre ; and fubordinate to thefe were Couthon, Bazire, Thuriot, Merlin de Thionvill, St André, Camille Demoulins, Chabot, Collot D'Herbois, Sergent, Legendre, Fabre D'Eglanine, Panis, and Marat.

Thefe two parties fhowed the diverfity of their characters in the manner in which they treated the maflacres of the 2 d and 3 d of September. The Briffotines, with the majority of the convention wifhed to bring the murderers to trial ; but the queltion was always eluded by the other party, with the affifance of the Jacobin club and of the populace.
Decree a jaing the
errieraasts, grants, when taken, fhould fuffer death; and on the $\&$. 15 th of November, in confequence of an infurrection in the duchy of Deux Ponts, and an application on the part of the infurgents to the convention for aid, the following decree was paffed: "The national convention declare, in the name of the French nation, that they will grant fraternity and affiltance to all thofe people who wifh to procure liberty; and they charge the executive power to fend orders to the generals to give affiftance to fuch people as have fuffered, or are now fuffering, in the caufe of liberty." Of this decree foreign nations, with great reafon, complained much, as will fhortly appear.
Battle of To retum to the military affairs of the new repubJemappe, lic. On the 12 th of October General Dumourier and furrender of the Anftrian Netherlands. came to Paris, and was fpeedily fent to commence a winter campaign in the Netherlands. He fuddenly attacked the Auftrians at the village of Boflu and drove them from their ground. On the 5 thi of November he
came in fight of the enemy upon the heights of $\mathfrak{F} e$ mappe. Three rows of fortifications arofe above each other defended by 100 pieces of cannon. Their right was covered by the village and a river, and their left by thick woods. The French were by their own account 30,000 , whilft others with great probability of truth compute them at double that number, and the number of the Auftrians was at leaft 20,000 . At feven in the morning of the following day a heavy cannonade commenced on both fides, and at noon a clofe attack was determined on by the French, whofe right wing was commanded by Generals Bournonville and Dampierre, and the centre by Generals Egalité (fon to the duke of Orleans who had affumed that name), Stetenboffe, Defporets, and Drouet. The mulic played the popular march of the Marfeillois, and the foldiers rufhed on with enthufiafm, fhouting "Vive la nation." The en-
gagement was warm and bloody; the Erench were French twice repulfed; but their impetuofity was at lait irre- Revolntion fitible, and about two o'clock the enemy fled from $\underbrace{1 \geqslant 93 .}$ their laft entrenchments. The lofs on both fides was very great, that of the Auftrians amounting to 4000 . This victory was decifive of the fate of the Netherlands. Mons and Bruffels furrendered to Dumourier ; Tournay, Malines, Ghent, and Antwerp, were taken poffeffion of by General Labourdonnaye; Louvain and Namur were taken by General Valence; and the whole Aultrian Netherlands, Luxembourg only excepted, fell into the hands of the French: Liege was taken on the 28 th of November after a fuccefsful engagement, in which the Auftians loft 5 or 600 men and an immenfe train of artillery.

France was now in a fituation not unufual in the hif Violent tory of thofe nations that either are free, or are at-conteftsbetempting to become fo; fucceffful in all quarters abroad, ${ }^{\text {tween the }}$ but diftracted by factions at home. The two parties in and the the convention were engaged in a ftruggle, which Mountain. daily became more implacable. The party called the Mountain did not hefitate about the nature of the means they were to employ to bring about the ruin of their antagonifts. They are even fufpected of having, through the medium of. Pache the war-minifter, retarded the fupply of the armies, to render the ruling party odious by want of fuccefs. They were for fome time, however, unfortunate in this refpect; and the daily news of victories fupported with the public the credit of the Girondifts. A new fubject was therefore fallen upon, which was the quetion, how the dethroned king was to be difpofed of? The moderate party wifhed to fave him; and this was a fufficient reafon for their antagonifts to refolve upon his ruin. A committee was appointed to give in a report upon his conduct. A variety of accufations were brought againit him; and the convention infamoufly refolved to act the part of accufers and of judges.

It was on the IIth of December when the ill-fated The king monarch was ordered to the bar of the convention : the brought to ant of accufation was read, and the king was fummon- trial, ed by the prefident, Barrere, to anfwer to each feparate charge.

Pref. "Louis, the French nation accures you of having committed a multitude of crimes to eftablifh your tyranny, in deftroying her freedom. Yon, on the 20th of June 1789 , attempted the fovereignty of the people, by fufperding the affemblies of their reprefentatives, and expelling them with violence from the places of their fittings. This is proved in the procefs verbal entered at the Tennis-court of Verfailles by the members of the conftituent affembly. On the 23 d of June you wanted to dictate laws to the nation; you furrounded their reprefentatives with troops; you prefented to them two royal declarations, fubverfive of all liberty, and ordered them to feparate. Your own declarations, and the minutes of the affembly, prove thefe attempts. What have you to anfwer-?"

Louis. "No laws were then exiting to prevent me from it."

Pref. "You ordered an army to march againft the citizens of Paris. Your fatellites have fhed the blood of feveral of them, and you would not remove this army till the taking of the Baftile and a general infurrection announced to you that the people were victorious. The fpeeches

R E V
French fpeeches you made on the 9 th, 12 th, and $14^{\text {th }}$ of Ju'y Revolution to the deputations of the confituent affembly, fhew I792. what were your intentions; and the malfacres of the Thuilleries rife in evidence againit you.-What have you to anfwer?"

Louis. "I was mafter at that time to order the troops to march; but I never had an intention of fhedding blood."
Pref. "After thefe events, and in fpite of thepromifes which you made on the 15 th in the conftituent affembly, and on the 17 th in the town-houfe of Paris, you have perfifted in your projects againft national liberty. You long eluded the execution of the decrees of the Ith of Auguft, refpecting the abolition of perfonal fervitude, the feudal government, and tythes: you long refufed acknowledging the rights of man: you doubled the number of the life-guards, and called the regiment of Flanders to Verfailles: you permitted, in orgies held before your eyes, the national cockade to be trampled under foot, the whire cockade to be hoifted, and the nation to be flandered. At laft, you rendered neceffary a frefh infurrection, occafioned the death of feveral citizens, and did not change your language till after your guards had been defeated, when you renewed your perfidious promiles. The proofs of thefe facts are in your obfervations of the 18th of September, in the decrees of the inth of Augult, in the minutes of the conftituent affembly, in the events of Verfailles of the 5 th and 6th of October, and in the converfation you had on the fame day with a deputation of the conftituent affembly, when you told them you would enlighten yourfelf with their councils, and never recede from them.-What have you to anfwer ?"

Louis. "I have made the obfervations which I thought jult on the two firlt heads. As to the cockade, it is falle ; it did not happen in my prefence ?"

Pref. "You took an oath at the federation of the 14th of July, which you did not keep. You foon tried to corrupt the public opinion, with the affitance of Talon who acted in Paris, and Mirabeau who was to have excited counter-revolutionary movements in the provinces.-What have you to anfwer ?"

Louis. "I do not know what happened at that time; but the whole is anterion to my acceptance of the conftitution."

Pref." You lavifhed millions of money to effect this corruption, and you would even ufe popularity as a means of enflaving the people. Theie facts are the refult of a memorial of Talon, on which you have made your m.rginal comments in your own hand-writing, and of a lutter which Laporte wrote to you on the rgth of April; in which, recapitulating a converfation he had with Rivarol, he told you, that the millions which you had been prevailed upon to throw away had been productive of nothing. For a long time y'u lad meditated on a plan of efcape. A memorial was delivered to you on the 28th of February, which pointed out the means for you to efect it ; you approve of it by matginal notes.-What have you to aniwer?"

Louis. "I felt no greater pleafure than that of relieving the needy : this proves no defign."

Pref. "On the 28th a great number of the robles and military came into your apartments in the caftle of the Thuilleries to favour that cicape: you wanted to

Preuch What have you to anfwer?"

Lcuis. "This accufation is abfurd."
Pref. "But the refift ince of the citizens made you fenfible that their diftrult was great ; you endeavoured to difcard it by communicating to the conftituent affembly a letter, which you addreffed to the agents of the nation near foreign powers, to announce to them that you had freely accepted the conflitutional articles, which had been prefented to you; and, notwithltanding, on the 21ft you took fight with a falfe palfport. You left behind a proteft againft thefe felf-fame conftitutional articles; you ordered the minifters to fign none of the acts iffued by the National Affembly; and you forbade the minifter of juftice to deliver up the feals of fate. The public money was lavifhed to infure the fuccefs of this treachery, and the public force was to protect it, under the orders of Bouillé, who fhortly before had been charged with the malfacre of Nancy, and to whom you wrote on this head, " to take care of his pepularity, becaufe it would be of fervice to you." Thefe facts are proved by the memorial of the 23 d of February, with marginal comments in your own hand-writing ; by your declaration of the 2oth of June, wholly in your own hand-writing; by your letter of the 4 th of September 1790 to Bouillé; and by a note of the latter, in which he gives you an account of the ufe he made of 993,000 livres, given by you, and employed partly in trepanning the troops who were to efcort you. -What have you to anfwer?"
Lonis. "I have no knowledge whatever of the memorial of the 23 d of February. As to what relates to my journey to Varennes, I appeal to my declaration to the commiffaries of the conftituent affembly at that period."

Pref. "After your detention at Varennes, the esercife of the executive power was for a moment fufpended in your hands, and you again formed a confpiracy. On the 17 th of July the blood of citizens was ihed in the Champ de Mars A letter, in your own handwriting, written in 1790 to La Fayette, proves that a criminal coalition fubfifted between you and La Fayette, to which Mirabeau acceded. The revifion began under thefe cruel aufpices; all kinds of corruptions were made ufe of. You have paid for libels, pamphlets, and newfpapers, defigned to corrupt the public opinion, to difcredit the allignats, and to fupport the caufe of the emigrants. The regifters of Septeuil fhew what immenfe fums have been made ufe of in thefe liberticide ma-nœuvres.-What have you to anfwer ?"

Louis. "What happened on the I7 of July has nothing at all to do with me. I know nothing cit it."

Prer. "You feemed to accept the conflitution on the 14th of September ; your fpeeches announced an intention of fupporting ir, and you were bufy in overturnirg. it, even before it was completed. A convention was entered into at Pilnitz on the $24^{t h}$ of July, between Leopold of Auftria and Frederic-Wi'liam of Brandenburif, who pledged themfelves to re-erect in France the throne of abfolute monarchy, and you were filent upon this convention till the moment when it was known by all Europe. -What have you to anfwer :"

Louis. "I made it known as foon as it came to my kn : wledge ; befides, every thing that refers to this fubjec: renceres the minifter."

## R E V

French Revolution you favoured it by fending three civil commiffaries, 1702.

Pref. "Arles had hoifted the ftandard of rebellion; who made it their bufinefs not to reprefs the counter- revolutionils, but to jultify their proceedings.-What have you to anfwer ?"

Louts. "The inftructions which were given to the commiffaries muft prove what was their miffion ; and I knew none of them when the miniters propofed them to me."

Pref. "Avignon, and the county of Venaifin, had been united with France; you caufed the decree to be executed; but a month after that time civil war defolated that country. The commiffaries you fent thither helped to ravage it.-What have you to anfwer ?"

Louis. "I do not remember what delay has been caufed in the execution of the decree ; befides, this occurrence has no perfonal reference to me ; it only concerns thofe that have been fent, not thofe who fent them."

Pref. "Nimes; Montauban, Mende, Jales, felt great fhocks during the firft days of freedom. You did nothing to ftifle thofe germens of counter-revolution till the moment when Saillant's confiracy became manifefly notorious.-What have you to anfwer ?"

Louis. "I gave, in this refpect, all the orders which were propofed to me by the minifters."

Pref: "You fent 22 battalions againft the Marfeillois, who marched to reduce the counter-revolutionifts of Arles.-What have you to anfwer ?"

Louis. "I ought to have the pieces referring to this matter, to give a juft anfwer."

Pref. "You gave the fouthern command to Wit. gentein, who wrote to you on the 2It of April I792, after he had been recalled: ' A few inftants more, and I fhall call around the throne of your Majefty thoufands of French, who are again become worthy of the wilhes you form for their happinefs.'- What have you to anfwer ?"

Louis. "This letter is dated fince his recall; he has not been employed fince. I do not recollect this letter."

Pref. "You paid your late life-guards at Coblentz; the regifters of Septeuil atteft this; and general orders figned by you prove that you fent confiderable remittances to Bouille, Rochefort, Vauguyon, Choifeul, Beaupre, Hamilton, and the wife of Polignac.-What have you to anfwer ?"

Louis. "When I firft learned that my life-guards affembled beyond the Rhine, I fopped their pay : as to the reft, I do not remember."

Pref. "Your brothers, enemies to the ftate, caufed the emigrants to rally under their banners : they raifed regiments, took up loans, and concluded alliances in your name : you did not difclaim them ; but at the moment when you were fully certain that you could no longer crofs their projects, your intelligence with them by a note, written by Louis Stanillaus Xavier, figned by your two brothers, was conceived in thefe words:

- I wrote to you, but it was by poft, and I could fay nothing. We are two here, who make but one ; one in fentiments, one in principles, one in zeal of ferving you. We keep filence; becaufe, were we to break it too foon, it would injure you : but we fhall fpeak as foon as we thail be ceriain of general fupport, and that moment is near. If we are fpoken to on the
part of thofe people, we fhall hear nothing ; but if on your part, we will liften: we thall purfue our road ftraight. It is therefore defired that you will enable us to fay fomething. Do not fand on ceremonies. Be eafy about your fafety: we only exift to ferve you; we are eagerly occupied with this point, and all goes on well; even our enemies feel themfelves too much interefted in your prefervation to commit an ufelefs crime which would terminate in their own deftruction. Adieu.
'L.S. Xavier and
- Charles Philippe.'
"What have you to anfwer?"
Louis. "I difowned all the proceerlings of my brothers, according as the conftitution prefcribed me to do, and from the moment they came to my knowledge. Of this note I know nothing."

Pref. "The foldiers of the line, who were to be put on the war eftablifhment, confilted but of 100,000 men at the end of December, you therefore neglected to provide for the fafety of the ftate from abroad. Narbonne required a levy of 50,000 men, but he ftopped the recruiting at 26,000 , in giving affurances that ail was ready; yet there was no truth in thefe affurances. Servan propofed after him to form a camp of 20,000 men near Paris; it was decreed by the legiflative affembly; you refufed your fanction.-What have you to anfwer?"

Louis. "I had given to the minitters all the orders for expediting the augmentation of the army: in the month of December lalt, the returns were laid before the Affembly. If they deceived themfelves, it is not my fault."

Pref. "A flight of patriotifm made the citizens repair to Paris from all quarters.' You iffued a proclamation, tending to fop their march; at the fame time our camps were without foldiers. Dumourier, the fucceffor of Servan, declared that the nation had neither arms, ammunition, nor provifions, and that the polts were left defencelefs. You waited to be urged by a requelt made to the miniter Lagard, when the legirlative affembly wihed to point out the means of providing for the external fafety of the fate, by propofing the levy of 42 battalions. You gave commiffion to the commanders of the troops to difband the army, to force whole regiments to defert, and to make them pafs the Rhine, to put them at the difpofal of your brothers, and of Leopold of Auftria, with whom you had intelligence. This fact is proved by the letter of Toulongeon, governor of Franche Comté.-What have you to anfwer?"

Louis. "I know nothing of this circumftance; there is not a word of truth in this charge."

Pref. "You charged your diplomatical agents to favour this coalition of foreign powers and your brothers againft France, and efpecially to cement the peace between Turkey and Auftria, and to procure thereby a larger number of troops againft France from the latter. A letter of Choifeul-Gouffer, ambaffador at Conftantinople verifies the fact.-What have you to anfwer?"
Louis. "M. Choifeul did not fpeak the truth : no fuch thing has ever been."

Pref. "The Pruffans advanced againt our frontiers: your minifter was fummoned on the 8 th of July to give an account of the flate of our political relations

French Revolution 1792.

## R E V <br> [183] <br> R EV

French with Prufia; you anfwered, on the roth, that 50,000 Revolution Pruffians were marching againft us, and that you gave 1792: notice to the legillative body of the formal acts of the
pending holtilities, in conformity to the conltitution. —What have you to anfwer?"

Louis. "It was only at that period I had knowledge of it: all the correfpondence paffed with the mimitters."
Pref. " You entrufted Dabancourt, the nephe w of Calonne, with the deparment of war; and fuch bas been the fuccefs of your confpiracy, that the poits of Longwy and Verdun were furrendered to the enemy at the moment of their appearance.-What have you to anfwer ?"

Lozis. "I did not know that Dabancourt was M. Calonne's nephew. I have not divelted the pofts. I would not have permitted myfelf fuch a thing. I know nothing of it, if it has been fo."

Pref. "You have deftroyed our navy-a vaft number of officers belonging to that cerps had emigrated; there fcarcely remained any to do duty in the harbours; meanwhile Bertrand was granting paffports every day ; and when the legiflative body reprefented to you his criminal conduct on the 8 th of March, you anfwered, that you were fatisfied with his fervices-What have you to anfwer?"

Louis. "I have done all I could to retain the officers. As to M . Bertrand, fince the legiflative alfembly prefented no complaint againft him that might have put him in a fate of accufation, I did net think proper to turn him out of office."

Pref. " You have favoured the maintenance of abfolute government in the colonies; your agents fomented troubles and counter-revolutions throughout them, which took place at the fame epoch when it was to have been brought about in France, which indicates plainly that your hand laid this plot.-What have you to anfwer ?"

Luuis. "If there are any of my agents in the colonies, they have not fpoken the truth; 1 had nothing to do with what you have juft mentioned."

Pref. "The interior of the ftate was convulfed by fanatics ; you avowed yourfelf their protector, in manifeiling your evident intention of recovering by them your ancient power.-What have you to anfwer ?"

Louis. "I cannot anfwer to this; I know nothing ofiuch a project."
pr.f. "The lex̧inative body had paffed a decree on the 29th of Jannary againit the factious priefts; you fupponded its execution.-What have you to anrwer ?"

Losis. "The confitution referved to me the free right to refufe my function of the decrees."

Pref. "The troubles had increafed; the miniter declared, that he knew no means in the laws extant to arraign the guilty. The legillative body earated a frefh decree, which you likswife fufpended.-What have you to fay to this?"
[Louis replied in the fame manner as in the preceding charge.]
pre "The uncitizen-like conduct of the guards whom the conftituion had granted you, had rendered it a ccellary to difard them. The day after, you fent them a letter expreflive of your futifation, and cen-
tinued their pay. This fact is proved by the trea- French furer of the civil lift. -What have you to anfwer ?" Revolution Louis. "I only continued them in pay till frefh $\underbrace{1792 .}$ ones could be raifed, according to the tenor of the decree."

Pref. "You kept near your perfon the Swifs guards : the conftitution forbade you this, and the legiflative affembly had exprefsly ordained their departure.What have you to anfwer ?"

Louis. "I have executed all the decrees that have been enacted in this refpect."

Pref. "You had private companies at Paris, charged to operate movements ufeiul to your projects of a counter-revolution. Dangremont and Gilles were two of your agents, who had falaries from the civil lift. The receipts of Gilles, who was ordered to raife a company of 60 men, fhall be prefented to you.-What have you to anfwer ?"

Louis. "I have no knowledge whatever of the projects laid to their charge : the idea of a counter-revolution never entered into my mind."

Pref. "You wifhed to fuborn, with confiderable fums, feveral members of the legitative and confituent affemblies. Letters from St Leon and others evince the reality of thefe deeds.-What have you to anm fiver ?"

Louis. "Several perfons prefented themfelves with fimilar decrees, but I have waved them."

Pref. "Who are they that prefented you with thofe projects?"

Louis. "The plans were fo vague that I do not recollect them now."

Pref. "Who are thofe to whom you gave money ?"
Lo is. "I gave money to nobody."
Pref. "You fuffered the French name to be reviled in Germany, Italy, and Spain, fince you omitted to demand fatisfaction for the bad treatment which the French fuffered in thofe countries.-Wl:at have you to anfwer?"

Louis. "The diplomatical correfpondence will prove the contrary; befides, this was a concern of the minifters."

Pref. "You reviewed the Swifs on the roth of Augult at five o'clock in the morning ; and the Swifs were the firt who fired upon the citizens."

Louis. "I went on that day to review all the troops that were affembled abuut me; the conftituted authorities were with me, the department, the mayor, and municipality; I had even invited thither a deputation of the national alfembly, and I afterwards repaired into the midft of them with my family."

Pref. "Why did you draw troops to the cafte?"
Louis. "All the conflituted authorities faw that the cafte was threatened; and as I was a conftituted authority, I had a right to defend myfelf."
$P_{r a f .}$ " Why did you fummon the mayor of Paris in the night between the gth and roth of fuguft to the catle?"

Louis. "On account of the reports that were circu. culated."

Pref. "You have caufed the blood of the French to be fhed."

Louis. "No, Sir, not I."
Pref. "You authorized Septeuil to carry on a con.

Frenets confiderable trade in corn, fugar, and coffee, at HamRevolution burg. This fact is proved by a letter of Septeuil."
$\underbrace{1792 .}$
Louis. "I know nothing of what you fay."
Pref. " Why did you affix a veto on the decree which ordained the formation of a camp of 20,000 men ?"

Louis. "The conftitution left to me the free right of refufing my fanction of the decrees; and even from that period I had demanded the affemblage of a camp at Soiffons.'

Prefident, addreffing the convention. "The queAions are done with."-(To Louis)" Louis, is there any thing that you wifh to add ?"

Louis. "I requeft a communication of the charges which I have heard, and of the pieces relating thereto, and the liberty of choofing counfel for my defence.

Valazé, who fat near the baŕ, prefented and read to Louis Capet the pieces, viz. The memoir of Laporte and Mirabeau, and fome others, containing plans of a counter-revolution.

Louis. "I difown them."
Valazé next prefented feveral other papers, on which the act of accufation was founded, and afked the king if he recognized them. Thefe papers were the following:

Valazé. "Letter of Louis Capet, dated June 2gth 1790, fettling his connections with Mirabeau and La Fayette to effect a revolution in the conftitution."

Louis. "I referve to myfelf to anfwer the con-tents"-(Valazé read the letter.)-"Itis only a plan, in which there is no queftion about a counter-revolution; the letter was not te have been fent."

Valazé. "Letter of Louis Capet, of the 22d of April, relative to converfations about the Jacobins, about the prefident of the committee of finances, and the committee of domains; it is dated by the hand of Lcuis Capet."

Louis. "I difown it."
Valazé. "Letter of Laporte, of Thurfday morning, March 3d, marked in the margin in the hand-writing of Louis Capet with March 3d 1791, implying a pretended rupture between Mirabeau and the Jacobins."

## Louis. "I difown it."

Valazé. "Letter of Laporte without date, in his land-writing, but marked in the margin by the harid of Louis Capet, containing particulars refpecting the laft moments of Mirabeau, and expreffing the care that had been taken to conceal from the knowledge of men fome papers of great concern which had been depofited with Mirabeau."

Valazé. "Plan of a contitution, or revifion of the conftitution, figned La Fayette, addreffed to Louis Capet, A pril Gth 1790 , marked in the margin with a line in his own hand-writing."

Lout. "Thefe things have been blotted out by the conflitution."

Valazé." "Do you know this writing ?"
Louis. "I do not."
Valazé. "Your marginal comments ?"
Louis. "I do not."
Valazé. "Letter of Laporte of the 19th of April, marked in the margin by Louis Capet April 19. 1791, mentioning a converfation with Rivarol."

Louis. "I difown it."
French

T42 Louis. "I know none of the priecss."
Heisallow- When the whole had been inselligated in this man-edtonomi- ner, the prefident, addrefing the king, faid, "I have nate his no other queftions to propofe-have you any thing own coun- more to add in you: defence?"-" I defire to have a to refer their fentence to the tribunal of the people.
"You have either forgoten or deftroyed (laid the colebrated M. Tronchet; the lenity which the law allows; to criminals, of requiring at leaft two thirds of the veices to conflitute a definitive judgment."

The fentence was ordered to be executed in twentyfuur hours.

The king and his family had been for fome time kept Anj ese= feparate from each other; but he was now allowed to dee cused. them, and to choofe an ecclefiafic to attend him. The meeting, and, above all, the f:paration from his fumily, was telider in the extreme. On Monday the 2 Ift $\mathrm{J}_{1}$ nuary, at eight o'clock in the morning, the urfortunate monarch was fummoned to his fate. He afenned the fcaffold with a firm air and ftep. Railing his rocs, ha faid, "Frenchamen, I die innocent; I pardon all my enemies; and may France"-at this inftant the inhuman Suaterre ordered the drums to beat, and the execu. tioners to perform their office. When they offered t,
;
copy of the accufation (replied the king), and of the papers on which it is founded. I allo defire to have a counfel of my orn nomination." Barrere informed him, that his two firft requefts were already decreed, and that the determination refpecting the oiker would be made known to him in due time.

It would have been an exceís of cruelty to refufe a requelt fo reafonable in itfelf; it was therefore decreed that counfel fhould be allowed to the king, and his choice fell upon M. M. Tronchet, Lamoignon Maleficrbes, and Defeze; he had previnully applied to M. Target, who exculed himfelf on account of his age and infirmity. On the 26th of December, the king appeared for the laft time at the bar of the convention; and M. Defeze read a defence which the couniel had frepared, and which was equally admired for the folidity of the argument and the beauty of the compoition.

When the defence was finifhed, the kirg arofe, and holding a paper in his hand, pronounced in a calm manner, and with a firm voice, what follows: "Citizens, you have heard my defence; I now fpeak to you, perhaps for the laft time, and declare that my counfel have afferted nothing to you but the truth; my confcience reproaches me with nothing: I never was atraid of having my conduct inveltigated; but I obferved with great uneatinefs, that I was accufed of giving orders for fhedding the blood of the people on the roth of Auguft. The proofs I have given through my whole life of a contrary difpofition, I hoped would have faved me from fuch an imputation, which I now folemnly declare is entire-
143
Eut is con- The difcufion was fatally clofed on the 16 ch of 5 denmed to nuary. Alier a fitting of near 34 hours, the punifl. death by ${ }^{2}$ fmallmajo
rity. ment of death was awarded by a fmall majority of the crnvention, and feveral of thefediffered in opinion from the relt, refpecting the time when it fhould be inflicted; fome contending that it fhould not be put in execution till after the end of the war, while others propofed to take the fenfe of the pecple, by referring the fentence to the primary affemblies.
M. Defere then folemnly invoked the affembly in the name of his cole egues, to confider by what a fmall majority the punthment of death was pronounced agrainit the dethroned monarch. "Do not afflif France (added this eloquent advocate) by a judgment that will appear terrible to her, when fove roices only were

Tol. XVI. bind his hands, he f:arted back as if about to refit; but recollected himfelf in a moment, and fubmitted. When the inltrument of death defcended, the prieft exclaimed, "Son of St Louis, afcend to heaven." The bleeding head was held up, and a few of the fopulace thonted rive la Risitulique. His body was interred in a grave that was filed up with quicklime, and a guard placed around till it fhould be confumed.

Thas fell Louis XVI. He poffelfed from nature Ch ${ }^{4} 5$ a good undertandine, which, however, was blunt- of this uned by the early indulgences of a court. He had a fortunate ftrong fenie of juftice, and his humariiy, was perhans monarch extreme. One deief rendered his virtues of little va. lue, which was the poifchion of an irrefolute and un. lleady ciacrater. Unambitious, and ealliy advifed, he was without difficulty induced to change his purpofes, efpecially by his queen, whofe connection with the houle of Aufria had always tended to render his counfels unpopular. Whether he was or was not conneeted with the foreign invaders of his country, polterity mu? decid:; but all men of fenfe and moderation mult be convinced that he was murdered by a band of ruffianc. Indeed a fentence fo infamous, and in all refpects unjult, is not to be found in the records of hitory. The greater part of the charges brought againtt him were trifing. Thofe which feem to be of importance relate to conduct authorifed by the conftitution under which he acted; and that conftitution declared his perfon inviolable. The fevereft punifhment that he conld incur by law, was not death, but depofition; and there is no doubt, that in putting him to death the French nation broke the focial compat which their reprefentatives made with him. In a political view, this tragical event was injurious to the republican caufe throughout Europe. Few men out of France ventured to jultify it ; and in all countries ic excited the moft violent indignation againf the rulers of the new republic.

New enemies were now haftening to join the general Ruptue league againit France. We do not mean here to enter with Gireat into a detail of the political ftruggles that occurred in Britain. any other ccuntry, than that in the narrative of whofe revolution we are now engaged. It will therefore oniy be neceflary to remark in general, that the Britih goverment at this time thoughi itfelf endangered by the propagation of thofe feculative orinions which had

## A a

overturned

## R E V <br> に E V

Frisch overturned the French monarchy. Almoft all the men Revolut on of property in the kingdom concurred with the miniftry 1993. in thinking a war with France neceffary for the purpofe of fecuring the conflitution at home. After the 1oth of Auguft the Britifh minifter had been recalled; but the new republic fill fuffered the former ambafia147 dor from France, M. Chauvelin, to remain in England. Grounds of The oftenfible grounds of quarrel on the part of the quarrel Great Britain were chiefly two; the decree of the 15 th un the part of November 1792, by which it was truly obferved that of Grest Britain. encouragement to rebellion was held out to the fubjects of every ftate, and that war was thereby waged againft every eftablifhed government. Of this decree the French executive council gave explanations, denying the fairnefs of the interpretation put upon it, and alleging, that the intention of the convention was only to give aid to fuch countries as had already acquired their freedom, and by a declaration of the general will requefted aid for its prefervation. But this explanation cannot be admitted. The decree exprefly fays, that the French nation will grant afiftance to all who wifh to procure liber$y y$; and when it is confidered what their notions of liberty are, it cannot be doubted but that their intention was to excite rebellion in foreign nations. The fecond point of difpute referred to the opening of the Scheldt. Thisriver runs from Brabant through the Dutch territory to the fea. The Dutch had thut up the mouth of it, and prevented any maritime commerce from being carried on by the people of Brabant by means of the river. Torender themfelves popular in Brabant, the French had declared, that they would open the navigation of the Scheldt. But Great Britain had fome time before bound herfelf by treaty with the Dutch to affilt them in obftructing this navigation, and now declared to the French, that the project of opening the Scheldt mult be renounced if peace with Great Britain was to remain. The French alleged, that by the law of nations navigable rivers ought to be open to all who refide on their banks; but that the point was of no importance either to France or England, and even of very little importance to Holland; that if the people of Brabant themfelves chofe to give it up, they would make no objection. It has been thought remarkable, that the Dutch gave themfelves no trouble about the matter. They did not aft the affiftance of England; and with that coolnefs which is peculiar to their character, the merchants individually declared, that if the Scheldt was opened, they could manage their commerce as well at Antwerp as at Amfterdam. But in all this there is nothing Arange. Among the Dutch were many republicans, who wifhed for the downfal of the ftadtholder. Thefe rejoiced at every thing which diftreffed him, or had a tendency to render his office ufelefs in the eyes of the people. Others, who thought differently, were afraid to fpeak their fentiments, as Dumourier was in their neighbourhood with a victorious army. The refult of the whole was, that M . Chauvelin was commanded by the Britifh government to leave the country. The French executive council gave powers to another mini-
for him; but he was not fuffered to land. The haughty republicans having thus far humbled themfelves before the Britifh government, at lait, on the it of February 1793, on the motion of Briffot, the national convention decreed, among other articles, that "George king of England had never ceafed fince the revolution
of the 10 th of Augult 1792 from giving to the French French nation proofs of his attachment to the concert Revolution of crowned heads; that he had drawn into the fame lake the ftadtholder of the United Provinces; that, contrary to the treaty of 1783 , the Englifh miniftry had granted protection to the emigrants and others who have openly appeared in arms againlt France; that they have committed an outrage againf the French republic, by ordering the ambaffador of France to quit Great Britain; that the Englifh have ftopped divers boats and veffels laden with corn for France, whilf, at the fame time, contrary to the treaty of 1786 , they continue the exportation of it to other foreign countries; that to thwart more efficaciounly the commercial tranfactions of the republic with England, they have by an act of parliament prohibited the circulation of affignats. The convention therefore declare, that in confequence of thefe acts of holtility and aggreffion, the French republic is at war with the king of England and the ftadtholder of the United Provinces."

The abfurdity of pretending that any treaty with France made in 1783 could be violated by protecting the emigrants who fled from the fury of the convention, mult be obvious to every reader. The convention was confidered a rebelliousjufurpation of the government with which fuch a treaty was made. The prohibition of affgnats was certainly contrary to no law, and was fanctioned by every motive of expediency, unlefs the convention could prove that all nations were bound by the law of nature to rifk their own credit upon the credit of the French republic.

## 149

About a fortnight after this declaration againg And Britain, war was likewife declared againf Spain; and againft in the courfe of the fummer France was at war with Spain. all Europe, excepting only Swilferland, Sweden, Denmark, and Turkey.

In the mean time General Dumourier, who was pro- $\begin{gathered}150 \\ \text { Progrefs of }\end{gathered}$ ceeding agreeably to his orders, made an attack upon DumouHolland; but in doing this he difperfed his troops in rier. fuch a manner as to expofe them much to any attack on the fide of Germany. He commanded General Miranda to invelt Maeftricht, while he advanced to block up Breda and Bergen-op-zoom.'The firt of thefe places, viz. Breda, furrendered on the 24th of February; Klundert was taken on the 26th ; and Gertruydenberg on the $4^{\text {th }}$ of March. But here the triumphs of Dumourier ended. The fieges of Williamftadt and Bergen-opzoom were vigoroully but unfuccefffully preffed. On the int of March General Clairfait having paffed the feated. Roer, attacked the French pofts, and compelled them to retreat with the lofs of 2000 men.

The following day the archduke attacked them anew with confiderable fuccefs. On the 3 d the French were driven from Aix-la-Chapelle, with the lofs of 4000 men killed and 1600 taken prifoners.

The fiege of Maeftricht was now raifed, and the French retreated to Tongres, where they were alfo attacked and forced to retreat to St Tron. Dumourier here joined them, but did not bring his army along with him from the attack upon Holland. After fome fkirmifhes a general engagement took place at Neerwinden. It was fought on the part of the French with great obltinacy; but they were at length overpowered by the number of their enemies, and perhaps alfo by the treachery of their commander. This defeat was fatal. The French loft 3000 men, and 6000 immediately

## REV [ 187$] \quad$ R E V

Frenci immediately deferted and went home to France. DumouRevolution rier continued to retreat, and on the 22d he was again 1793.

152
And joins the allies: attacked near Louvain. He now, through the medium of Colonel Mack, came to an agreement with the Imperialifts that his retreat fhould not be ferioufly interrupted. It was now fully agreed between him and the Imperialifts, that while the latter took poffefion of Condé and Valenciennes, he fhould march to Paris, diffolve the convention, and place the fon of the late king upon the throne.

The rapid retreat and fucceffive defeats of General Dumourier rendered his conduct fufpicious. Commif. fioners were fent from the executive power for the purpofe of difcovering his defigns. They diffembled, and pretended to communicate to him a fcheme of a coun-ter-revolution. He confeffed his intention of diffolving the convention and the Jacobin club by force, which he faid would not exift three weeks longer, and of reftoring monarchy. On the report of thefe commiffioners the convention fent Bournonville the miniter of war to fuperfede and arreft Dumourier, along with Camus, Blancal, La Marque, and Quinette, as commiffioners. The attempt on the part of thefe men was at leaft hazardous, to fay no more of it ; and the refult was, that on the firf of April Dumourier fent them

153
Buthis ar-
my refufe to act with him.

154
Proclimations of the Imperial conmander in chief. prifoners to General Clairfait's head quarters at Tournay as hoftages for the fafety of the royal family. He next attempted to feduce his army from their fidelity to the convention; but he fpeedily found that he had much mitaken the character of his troops. Upon the report that their general was to be carried as a criminal to Paris, they were feized with fudden indignation; but when they found that an attempt was making to prevail with them to turn their arms againft their country, their fentiments altered. On the 5 th of April two proclamations were iffued ; one by General Dumourier, and the other by the prince of Saxe Cobourg, declaring that their only purpofe was to reftore the conftitution of 1789 , 1790, and 1791. Prince Cobourg announced that the allied powers wifhed merely to co-operate with General Dumourier in giving to France her conftitutional king and the conftitution the had formed for herfelf, declaring, on his word of honour, that he came not to the French territory for the purpofe of miaking conquefts. On the fame day Dumourier went to the advanced guard of his own camp at Maulde. He there learned that the corps of artillery had rifen upon their general, and were marching to Valenciennes; and he foon found that the whole army had determined to ftand by their country. Seven hundred cayalry and 800 infantry was the whole amount of thofe that deferted with Dumourier to the Auitrians, and many of them afterwards returned.

By the defection of Dumourier, however, the whole army of the north was diffolved, and in part dibanded, in prefence of a numerous, well-difciplined, and victorions enemy. The Pruffians were at the fame time advancing on the Rhine with an immenfe force, and about to commence the fiege of Mentz. In the interior of the republic more ferious evils if rolifle were arifing. In the departments of La Vendée and La Loire, or the Provinces of Britany and Poitou, immenfe multitudes of emigrants and other royalifts had gradually affembled in the courfe of the winter. They profeffed to act in the name of Monfieur, as regent of France.

About the middle of March they advanced againfl Pronch Nantz to the amount of 40,000 . In the begiming Revolution of April they defeated the republicans in two pitched $\underbrace{177.3}$ battles, and poffeffed themfelves of 50 leagues of country. They even threatened by their own efforts to 156 fhake the new republic to its foundation. On the 8 th Congref of of April a congrefs of the combined powers affembled the comat Antwerp. It was attended by the prince of Orange bined and his two fons, with his excellency Vander Spiegel, powers. on the part of Holland; by the duke of York and Lord Auckland on the part of Great Britain ; by the prince of Saxe Cobourg, Counts Metterinch, Starenberg, and Mercy Dargenteau, with the Pruffian, Spanilh, and Neapolitan envoys. It was here determined to commence active operations againt France. The prince of Cobourg's proclamation was recalled, and a fcheme of conqueft announced.

Commiffioners from the convention now fet up the The repritftandard of the republic anew, and the fattered bat. lican an: $y$ talions flocked around it. General Dampierre vas ap- agaia aipointed commander, and on the $13^{\text {th }}$ he was able to refift a general attack upon his advanced polts. On the 14 th, his advanced guard yielded to fuperior numbers, but on the 15 th was victorious in a long and well-fought battle. On the 23 d the Aultrians were again repulfed, and on the ift of May General $\mathrm{D}_{\mathrm{a}} \mathrm{m}$ pierre was himfelf repulfed in an attack upon the enemy. On the 8th another engagement took place, in which the French general was killed by a cannon ball. On the 23 d a very determined attack was made by the allies upon the French fortified camp of Famars, which covered the town of Valenciennes. The French were overcome, and in the night abandoned their camp. In confequence of this the allies were enabled to commence the fiege of Valenciennes; for Conde had been blockaded from the it of April.

About the fame time General Cuftine on the Rhine made a violent but unfuccefsful attack upon the Pruffians, in confequence of which they were foon enabled 158 to lay fiege to Mentz. The Corfican General Paoli Revolt ot revolted at this period; and the new republic, affaulted Paoli. from without by the whole ftrength of Europe, was undermined by treachery and faction within.

While the country was in a ftate verging upon utter state of ruin, parties in the convention were gradually waxing parties in more fierce in their animofity ; and regardlefs of what France, and was paffing at a diftance, they feemed only anxious for the revoluM March, the celebrated Reqolutionary Tribunal was efta. blifhed. blifhed for the purpofe of trying crimes committed again!t the Atate; and the Girondift party, the mildnefs of whofe adminiftration had contributed not a little to increafe the evils of their country, began to fee the ne. ceffity of adopting meafures of feverity. But the public calamities, which now rapidly followed each other in fucceffion, were afcribed by their countrymen to their imbecility or perfidy. This gave to the party of the Mountain a fatal advantage. On the $15^{\text {th }}$ of Apria the communes of the 48 fections of Paris prefented a petition, requiring that the chiefs of the Girondifts therein named fhould be impeached and expelled from the convention. This was followed up on the it of May by anocher petition from the fuburb of St Antoine. The Girondilt party in the mean time impeached Marat, but he was acquitted by the jury at his trial. The

Trench Mountain, by the affitance of the Jacobin club, had scoution now acquired a complete afcendency over the city of 1793. Paris. The Girondifts or Briffotines propofed therefore to remove the convention from the capital; and to prevent this, the Mountain refolved to make the fame ufe of the people of the capital againt the Girondift party that they had formerly done againt the monarch on the roth of Auguit. It is unneceffary to fate in cletail all the tumulis that occurred either in Paris or in the convention during the remaining part of the month of May. On the 3 ith, at four oclock in the morning, the toctin was founded, the generale was beat, and the alarm guns fired. All was commotion and terror. The citizons flew to arms, and affembled round the convention. Some deputations demanded a decree of accufaion againft 35 of its members. The day, however, was ipent without decifion. On the afternoon of the 1 it of June an armed force made the fame demand. On the 2 d of June this was repeated, the tocfin again fimnded, and an leundred pieces of cannon furrounded the na:i nal hall. At lat Barrere mounted the tribune. He was confidered as a moderate man, and reipected by both parties; but he now artfully deferted the Girondifts. He invited the denounced members volustarily to refign their character of reprefentatives. Some of them complied, and the prefident attempted to diffolve the fitting; but the members were now imprifoned in their own hall. Henriot, commander of the armed force, compelled them to remain; and the obnoxious deputies, amounting to upwards of go in number, were put under arreft, and a decree of denunciation againtt them figned.

It is obvious, that on this ciccafion the liberties of France were trodden under foot. The minority of the national reprefentatives, by the affilance of an armed furce raifed in the capital, compelled the majority to fubmit to their meafures, and took the leading members prifoners. Thus the city of Paris affumed to itfelf the whole powers of the French republic; and the nation was no longer governed by reprefentatives fieely chofen, but by a minority of their members, whofe fentiments the city of Paris and the Jacobin club had thought fit to approve of. Human hiltory is a mafs of contradictions. The Mountain prarty came into power by preaching li. lerty, and by violating its fundamental principles. How far the plea of political necefity may excufe their conduct, we fhall not venture to decide explicitly. Certain it is, however, that they foon commenced a career of the mott terrible energy both at home and abroad that is to be found in the annals of natione.

The firft refult of their victory in the capital was calamitous to the republic at large. Briftot and fr me other diputies efcaped, and endeavoured to kindle the
flames of civil war. In general, however, the influence of the Jacobin club, and of its various branches, was fuch, that the nofth of France adhered to the convention as it ftood; but the fouthern departments were fpeedily in a fate of rebellion. The department of Lyons declared the Mountain party outlawed. Marfeilles and Teulon followed the example of Lyons, and entered into a confederacy, which has fince been known by the appellation of Focderalifm. The departments of La Gironde and Calvades broke out into open revolt. In fhort, the whole of France was in a fate of violent convulion. Still, however, the enthufiallic garrifons
of Mentz and Valenciennes protected it againf the im- French mediate entrance of a foreign force, and allowed leifure Revolution for one of its internal factions to gain an afiendancy, $\underbrace{x 792}$. and thereafter to protect its independence. In the mean time, the political enthufiafm of all orders of perfons was fuch, that even the female fex did not efcape 162 its contagion. A young woman of the name of Char- Marat lotte Cordé, in the beginning of July, came from the murdered department of Calvades to devote her life for what the by a woth ought the caufe of freedom and of her country. She mau. requefted an interview with Marat, the moft obnexious of the Mountain party. Having obtained it, and converfed with him calmly for fome time, fhe fuddenly plunged a dagger in his breaft, and walked carelefsly out of the houfe. She was immediately feized and condemned. At the place of execution fhe behaved with infinite conitancy, boiting Vive la republique. The remains of Marat were interred with great fplendor, and the convention attended his funeral. His party perhaps derived advantage from the manner of his death, as it feemed to faften the odious charge of affaffination upon their antagonifts, and gave them the appearance of fuffering in the caufe of liberty. The truth is, that affaffination was fanctioned by both parties under pretence of defendiag the liberties of the republic.

One of the firf acts of the Mountain junto after The repul. their triumph was to finifh the republican conftitution. Lican conPrevious to their fall, the Girondilts had brought for- fitution fiward the plan of a conflitution, chielly the work of nifhed by Condorcet ; but it never was fanctioned by the conven- tain.
tion, and was too intricate to be practically ufeful. The new conflitution now framed, which was afterwards fanctioned by the nation, but has never yet been put in practice, abolifhes the former mode of electing the reprefentatives of the people through the medium of electoral affemblies, and appoints them to be chofen: immediately by the primary affemblies, which are made to confift of from 200 to 600 citizens, each man voting by ballot or open vote at his option. There is one deputy for every 40,000 individuals, and population is the fole bafis of reprefentation. The elections. take place every year on the ift of May. Electoral affemblies are fill retained for one purpofe. Every. 200 citizens in the primary affemblies name one elector; and an affembly of all the electors of the department is afterwards held, which elects candidates for the executive council, or miniftry of the republic. The legiflative body choofes out of this lit of candidates the members of the executive council. One half of this council is renewed by each legillature in the laf month of the ferfion. Every law, after it is paffed by the legillative: body, is fent to the department. If in more than half of the depariments the tenth of the primary affemblies of each have not objected to it, it becomes effectual. Trial by jury is eftablifhed. National conventions may be called for altering the conftitution, and $m u / t$ be called, if required by the tenth of the primary affemblies. of each department in a majority of the departments.

The publication of this confitution procured no fmall degree of applaufe to the convention and the: Mountain party. The rapidity with which it was formed (being only a fortnight) feemed to calt a juft reproach upon the flownefs of their antagonifts, and it was regarded as a proof of their being decidedly fe-

## R E V

Prensh rious in the caufe of republicarifin. No regard, howReveiution ever, has been paid to it by the convention, which has ${ }^{1793 .}$ declared itfelf permanent, nor indeed does it feem poffible to carry it into execution.
Foll of We have mentioned that Conde was invefted from Condé and the beginning of April. It did not jeld till the icth of July, when the garition was fo much reduced by fa-
mine and difeafe, that out of 4000 men, of which it originally confifted, only 1500 were fit for fervice. The eyes of all Europe were in the mean time fixed upon the fiege of Valenciennes. Colonel Moncrieff had contended, that batteries ought immediately to be placed under the walls without afproaching it by regular parallels; but the Imperial eugineer Mr Ferraris afferted, that the work of the seat Vauban mult be treated with more refpect ; and lis opinion was adopted by the council (f war. The trenches ware opened on the $14^{\text {th }}$ of June. Few fallies were attempted by the garrion, on account of the fmallnefs of their number. The inhabitants at firlt wifhed to furrender; but the violence of the bombardment prevented their affemtling or giving much trouble on that head to General Yerrand the governor. Much of the labour of the fiege confilted of mines and countermines. Some of thefe laving been fuccefffully fprung by the allies, the town was furrendered on the 27 th of July by capitulat:on to the Dukc of York, who took poffeffion of it in behalf of the emperor of Germany. The ficge of Mentz was at the fame time going on. It fuifered much from famine. At laft, after an unfuccefsful attempt by the French army on the Rhine for its relief, 165 Mentz furrendered on the 22 d o? July.

Prince Cobourg and General Clainfait in the mean time unfuccefsfuliy attempted to befiege Cambray and Bouchain. Quefnoy was, however, titten by General Clairfait on tive 11 th of September; and here finally terminated for the prefent campaign the fuccefs of the allies in the Netherlands.
$f_{\perp}$ confiderable part of the French army of the north took a ftrong pofition ncar Maubeuge, where they were blockaded by Prince Cobourg; bat upon the 15 th and 16 th of Otober he was repeatedly attacked by the French troops under General Jourdan, who fucceeded Houchard. The French had now recovered their vigour. They bought into the field a formidable train of artillery, in which were many 24 pounders. Commiffioners from the convention hatrangued the foldicis, threatened the fearful, and applauded the brave. Crowds of women, without confufion, went through the ranks, diftributing fipituous li. quors in abundance, and carrying of the woundec. The attacks were repeated and terrible on both fides; but the Auftrians had confiderably the difadvantage, and Prince Cobourg retired during the night. ith: French now menaced maritime Flanders. They took Furnes and befieged Nieuport. A detachment of Britifh troops ready to fail to the Weft Indies were haftily fent to Oltend, and prevented for the prefent the farther progrefs of the French.

Such was the multiplicity of the events that new occurred in lrance, that it is difficult to fate the outlines of them with any tolerable peripicuity. We have already mentioned the extenfive diffenfions that occurred throughout the republic in confequence of the triumph of the Mountain party on the 3 If of May. The department of Calvades was firt in arms againf the convention under the command of Genesal Felix Wimpfen; but before the end of July the infurrection was quicted, after a few flight firmifhes. But the fuedera- I yons bue lim of the cities of Marfeilles, Lyon, and Toulon, fill fieged by remained. Lyons was attacked on the 81h of Auguft ventional by the cunventional troops. Several actions followed, which were attended with great lofs both on the part tulcin. of the affailaits and of the befieged. The city was reduced alrach to ruins; but it held cot during the whele munth of Seitembet. The befieging Gencral Ke!lerman was rome ce fom lis command, on account of lis fupp fit inactivity ; :ad the city furrendered on the 8 th of Oetoser to Gineral Doppet, a man wholad lately been a piy!ician. Such was the rage of party zel at this in the

French fubmitted. But the leading people of the important Revolution town and harbour of Toulon entered into a negocia1793. tion, and fubmitted to the Britifh admiral Lord Hood, under condition that the fhould preferve as a depofit the Toulon conditionally fubmits to Lord Hood, town and fhipping for Louis XVII, and under the Atipulation that he fhould affift in reftoring the conftitution of 1789 . The fiege of Toulon was commenred by General Cartaux in the beginning of September.

It continued without much vigour during that and the whole of the fucceeding month. Neapolitan, Spanifh, and Englifl troops, were brought by fea to affit in its defence. In the beginning of November, General Cartaux was removed to the command of the army in Italy, and General Dugommier fucceeded him. General $\mathrm{O}^{\prime}$ Hara arrived with reinforcements from Gibraltar, and took upon him the command of the town, under a commiffion from his Britannic majefty. On the 3 oth of November, the garrifon made a powerful fally to deftroy fome batteries that were erecting upon heights which commanded the city. The French were furprifed, and the allies fucceeded completely in their object ; but, elated by the facility of their conqueft, the allied troops rufhed forward in purfuit of the flying enemy, contrary to their orders, and were unexpectedIy met by a ftrong French force that was drawn out to protect the fugitives. General O'Hara now came from the city to endeavour to bring off his troops with regularity. He was wounded in the arm and taken prifnner. The total lofs of the allies in this affair was eftimated at nearly one thoufand men. The French had now multered in full force around Toulon, and prepared for the attack. It was begun on the 1 gth of December in the morning, and was chiefly directed againft Fort Mulgrave, defended by the Britifh. This fort was protected by

 ged to evaexate it.172
Proceedings of the royalifts in LaVendée. 36 and 24 pounders, \&c. 5 mortars, and 3000 troops. Such was - the ardour of affault, that it was carried in an hour, and the whole garrifon was deftroyed or taken. The allies now found it impouble to defend the place; and in the courfe of the day embarked their troops, after having fet on fire the arfenal and fhips. A fcene of confufion here enfued, fuch as has not been known in the hiltory of modern wars. Crowds of people of every rank, age, and fex, hurried on board the fhips, to avoid the vengeance of their enraged countrymen. Some of the inhabitants began to fire upon their late allies; others in defpair were feen plunging into the fea, rnaking a vain effort to reach the fhips; or putting an end at once to their own exittence upon the fhore. Thirty-one fhips of the line were found by the Britifh at Toulon; thirteen were left behind; ten were burnt; four had been previoully fent to the French ports of Breft and Rochefort, with 5000 republicans who could not be trufted; and Great Britain finally obtained by this expedition three fhips of the line and five frigates.

On the fide of Spain the war produced nothing of importance; and in the mountainous country of Piedmont it went on flowly. Nice and Chamberry were ftill retained by the French; but more terrible fcenes were acting in other quarters. In La Vendée a molt bloody war was perfifted in by the royalifts. In that quarter of the country the language of the reft of France is little underftood. The people were fuperfitious, and had acquired little idea of the new opinions that had lately been propagated in the relt of the empire. They
were chiefly headed by priefts, and regarded their caufe French as a religious one. Their mode of warfare ufually was, Revolurion to go on in their ordinary occupations as peaceable citi- $\underbrace{1793 .}$ zens, and fuddenly to affemble in immenfe bands, infomuch that at one time they were faid to amount to 150,000 men. They belieged Nantz and the city of Orleans, and even Paris itfelt was not thought altogether fafe from their enterprifes. The war was inconceivably bloody. Neither party gave quarter; and La Vendée proved a dreadful drain to the population of France. On the 28 th of June, the conventional general Biron drove the royalifts from Lucon; and Nantz was relieved by general Beyffer. After fome fuccefs, general Wefterman was furprifed by them, and compelled to retreat to Parthenay. In the beginning of Auguft the royalifts were defeated by general Roffignol ; but on the roth of that month, under Charette their commander in chief, they again attacked Nantz, but fuffered a repulfe. It would be tedious to give a minute detail of this obfcure but cruel war. The royalifts were often defeated and feemingly difperfed, but as often arofe in crowds around the altonifhed republicans. At laft, however, about the middle of October, they were completely defeated, driven from La Vendée, and forced to divide into feparate bodies. One of there threw itfelf into the ifland of Noirmoutier, where they were fubdued; another took the road of Maine and Brittany, where they ftruggled for fome time againft their enemies, and were at laft cut to pieces or difperfed.

The royalifs had long expected affiftance from Eng. land; and an armament under the earl of Moira was actually fitted out for that fervice, but it did not arrive till too late, and returned home without attempting a landing.

The Mountain party always difgraced their fucceffes Horrid by dreadful cruelties. Humanity is thocked, and hifto- cruelty of ry would almoft ceafe to obtain credit, were we to fate the Mourin detail the unrelenting cruelties which were exercifed ${ }^{\text {tain party. }}$ againft the unfortunate royalifts, chiefly by Carrier, a deputy from the convention, fent into this quarter with unlimited powers. Multitudes of prifoners were crowded on board veffels in the Loire, after which the veffels were funk. No age nor fex was fpared; and thefe executions were performed with every circumftance of wanton barbarity and infult.

On the fide of the Rhine a great variety of events Progrefs of occurred during the months of Augult and September, the allies Several engagements at firft took place, in which the on the French were, upon the whole, fuccefsful. In Septem- Rhine ber, however, Landau was invefted by the combined powers; and it was refolved to make every poflible effort to drive the French from the ftrong lines of Weiffembourg, on the river Lauter. On the $13^{\text {th }}$ of Oc tober, the Auftrian general Wurmfer made a grand attack upon thefe lines. The French fay that their generals betrayed them, and fuffered the lines to be taken almoft without refiftance. 'The general of the allies confeffed that the lines might have held out for feveral days. The French retreated to Hagenau, from which they were driven on the 18 th ; and fuffered two other defeats on the 25 th and 27 th. Some of the principal citizens of Strabourg now fent a private deputation to general Wurmfer, offering to furrender the town, to be preferved as a depofit to be reftored to Jouis

French Louis XVII. General Wurmfer refufed to accept of in this quarter was immenfe, and unexampled in the Freach

Revolution it upon thefe terms, infifing upon an abfolute furren1793. der to his Imperial Majefty. In confequence of the delay occafioned by difagreement, the negociation was difcovered, and the citizens of Strafbourg engaged in the plot were feized by St Juit and Lebas, commilitoners from the convention, and brought to the fcaffold. Prodigious efforts were now made by the French to recover their ground in this quarter. General Irembert was fhot at the head of the army on the 9 th of November, upon a charge, probably ill-founded, of treachery in the affair of the lines of Weiffembourg. On the 14 th, however, Fort Louis was taken by the allies, not without fufpicion of treachery in the governor. But bere the fuccefs of general Wurmfer might be faid to terminate. On the 2 if the republican army drove back the Auftrians, and penetrated almoft to Hagenau. An army from the Mofelle now advanced to co-operate with the army of the Rhine. On the 17 th the Prufians were defeated near Sarhruck. Next day their camp at Bliefcaftel was ftormed, and the French advanced to Deux Ponts. On the 29th and
hiftory of modern war. It is even faid that it might Revolution amount to more than 70,000 or 80,000 men.

Thus far we have attended to the military affairs of $\mathrm{I}_{76}$ the republic for fome time palt. Very violent efforts were in the mean time made at Paris by the new adminiftration, eftablifhed under the aufpices of the Jacoio club, and of the party called the Mountain. The new republican conftitution had been prefented to the people in the primary affemblies, and accepted. The bufinefs, therefore, for which the convention was called together, that of forming a conflitution for France, was at an end; and it was propofed that they thould dilfolve themfelves, and order a new legiflative body to al. femble, according to the rules prefcribed by that conftitution. This was, no doubt, the regular mode of procedure ; but the ruling party confidered it as hazardous to convene a new affembly, poffeffing only limites powers, in the prefent diftracted ftate of the country. It was indeed obvious, that France at this time food in need of a dictatornip, or of a government poffelfed of more abfolute authority than can be enjoyed by one that acts, or even pretends to act, upon the moderate principles of freedom. It was therefore determined that the convention fhould remain undiffolved till the end of the war ; and that a revolutionary government, to be conducted by its members, fhould be eftablifhed, with uncontrouled powers. Committees of its own body were felected for the purpofe of conducting every department of bufinefs. The chief of thefe committees was called the committee of public fafety. It fuperintended all the reft, and gave to the adminitration of France all the fecrecy and difpatch which have been accounted peculiar to a military government, together with a combination of k ill and energy hitherto unknown among mankind. A correfpondence was kept up with all the Jacobin clubs throughout the king. dom. Commiffioners from the convention were fent into all quarters, with unlimited authority over every order of perions. Thus a government poffeffed of infinite vigilance, and more abfolute and tyrannical than that of any fingle defpot, was eftablifhed; and the whole tranfactions and refources of the flate were known to the rulers. On the 23d of Augult, Barrere 177 in name of the committee of public fafety, procured the celebrated decree to be paffed for placing the whed in a fate of French nation in a fate of requifition for the public fer- requifition vice. "From this moment (fays the decree) till that when all enemies fhall have been driven from the territory of the republic, all Frenchmen fhall be in permanent readinefs for the fervice of the army. The young men fhall march to the combat; the married men fhali forge arms, and tranfport the provifions; the women fhall make tents and clothes, and attend in the hofpitals; the children fhall make lint of old linen; the old men thall caufe themfelves to be carried to the public fquares, to excite the courage of the warriors, to preach hatred againtt the enemies of the republic ; the cellars Shall be wafhed to procure faltpetre; the faddle-horfes fhall be given up to complete the cavalry; the unmarried citizens, from the age of 18 to 25 , fhall march firft, and none thall fend a fubotitute ; every battalion fhall have a banner, with this infcription, The French nation rifen againft tyrants." The decree alfo regulates the mode of organizing this mals. A decree more ty-

avolution and whea it was firk publifhed, foreigners were at a 1793. Inf, whether to regard it as a fublime effort of powerful government, or as a wild project which could produce nothing but confution. The effects of it, however have been truly terrible. We have already mentioned forne of them in the bloody conteft which occirreit upon the Rhine, and Europe was fon defined
173 to bear witnefs to fill more extraordinary events.
In the end of July, general Cuftine was brought to trial, and executed, in confequence of a variety of accufations of infidelity to his truft and difrefpect to the convention. The queen was next brought to trial before the revolutionaiy tribunal, on the 15 th of Ottober. The charges againlt her were very various; but the chief tendency of them was to prove that the had always been hoftile to the revolution, and had excited all the efrorts that had been made by the court againt it. On the reth of Ottober, this beautiful woman, whom fortune once placed fo high, ended her days on a fcaffold, after a mock trial, in which no regard was paid either to jultice or decency. She behaved with much dignity and compofare, and appeared deeply impreffed with a lemfe of religion. The members of the convention who had been at the head of the Girondit party, and had either been detained in prion fince the 3 Ift of May, or feized in the departments to which they had retired, were afterwards brought to trial. On the 30 th of Ottober, 21 of them were executed, viz. Brillot, Vergniaud, Genfonné, Duprat, Lehardi, Ducos, Fonfrede, Boileau, Gardien, Duchatel, Sillery, Fauchet, Dufriche, Duperret, La Source, Carra, Peau-
vais, Mainville, Antiboul, Vigée, and Lacaze. Seven-
18 r And of the Duke of

## Orleans.

182 Executions become prodigiouf ly common. y-one were fill detained in confinement. The duke of Orleans was afterwards condemned, on a charge of having afpired to the fovereignty from the beginning of the revolution. His execution gave fatisfaction to all parties. His vote for the puniffment of death upon the trial of the late king had done bim little honour even in the opinion of the Mountain, and had rendered him odious to all the reft mankind.
The executions of perfons of all ranks, particularly of prieft and nobles, became now fo common, that it would be in vain to attempt to give any detail of them. Every perfon brought before the revolutionary tribunal was condemned as a matter of courfe. The Jacobins feemed infatiable in their thirlt after blood, and the people at large appeared to regard their conduct with unaccountable indifference.
When the human mind is once roufed, its activity extends to every object. At this time a new table of weights and meafures was eftablifhed by the convention, in which the decimal arithmetic alone is employed. The court of Spain had the liberality, notwithftanding the war, to fuffer M. Mechain to proceed in his operations for meafuring a degree of the meridian in that country. He carried on his feries of triangles from Barcelona to Perpignan; and from this place the menfuration was continued to Paris. M. de Lambre, and his pupil M. le Francois, allo meafured a degree of latitude in the vicinity of the Metropolis. In all, 12 degrees of the meridian were meafured; of which the mean is 57027 toifes, and by this the univerfal ftandard of meafure is calculated. M. M. de Borde and Caffini d.te:mined the length of a pendulum that fwings fe-
conds, in vacus and in a mean tempsrature at Paris, to Fronch be 3 feet and 8,06 line. M. M. Lavoifier ane Hauy puphution found that a cubic foct of dililled water at the free- $\underbrace{179:}$ zing point weighs in wacuo 70 prunds and 60 gros French weight. We fhall infert a taide of the meatures and weights now eftablifhed.

new f
A new ka- At the fame period a new kalendar was formed.dendar
formed. worth 40 fols $10 \frac{3}{5}$ deniers. The milliare, or thoufand metres, is fubftituted for the mile; and the are, for the arpent in land-meafure. The latter two are to each other as 49 to 25 . The aftronomical circles with which M. M. de Borda and Caffini made the obfervations, are divided according to this plan. The quadrant contains 100 degrees, and each degree 100 mi nutcs. Hence the minute of a great circle on our globe is equal to a milliare, or new French mile. If, for the reduction of this meafure, we eftimate the Paris toile, according to the comparifon made with the ftandard kept in the Royal Society of London, at 6.3925 Englifh feet, the milliare or minute will be equal to 1093.633 yards, and the metre 3.280899 feet. By it the year is made to begin with the autumnal equinox, and is divided into 12 monchs. Thefe are called Vindemaire, Brumaire, Frimaire, Nivos, Ventos, Pluvios, Germinal, Florial, Praireal, Meffidor, Fervidor, and Fructidor. The months confilt of 30 days each, and are divided into three decades. The days of each decade are known by the names of Primidi, Duodi, Tridi, \&c. to Decadi : and the day of reft is appointed for every tenth day, inftead of the feventh. 'the day (which begins at mudnight) is diftributed into ten parts, and thefe are decimally divided and fubdivided. Five fupernumerary days are added every year after the 30 th of Fructidor. To thefe is given the ab. furd appellation of Scips Culiottides, a word borrowed from a term of reproach (jans cullotte), which had often been beftowed on the republican party from the meannets of their rank and fortune; but which that party now attempted to render honourable and popular. The childifh filly of this innevation has fruck every perfon wtth furprize, as it can ferve no gond purpofe whatever. It is a wonderful inftance of the waywardneis of the human mind, which can occupy itfelf one moment with deeds of favage barbarity, and the next with a matter fo unimportant as the artificial divifion of time.

The religion of France had been gradually lofing its influence; and on the 7 th of November, Gobet bithop of Paris, along with a great multitude of other ecclefiaflics, came into the hall of the convention, and folemenly refigned their functions and renounced the Chriftian relifion. All the clergymen, whether Proteltant or Ca tholic, that were members of the convention, followed this example, exepting only Gregoire, whom we formelly mentioned as having been one of the firl priet?s that joined the Tiers Etat after the meeting of the States General: : He had the courage to profefs himie f a Chriltian although be faid that the emoluments of his bifhopric were at the fervice of the republic. With the acclamations of the convention, it was decreed that the only French deities hereafter fhould be Liberty, Iquality, Reafon, \&c. and they would feem to have confecrated thefe as a kind of new objects of worflhip.What political purpote the leaders in the convention in. tended to ferve by this proceeding does not clearly appuar: unlefs, perhaps, their object was to render the Fiench manners and modes of thinking fo completely new, that it fle uld never be in their power to return to the flate from which they had juft emerged, or to unite

Voz. XVI.
in intercourfe with the other nations of Europe. Whe
populace, however, could not at once relinquifh entirely the religion of their fathers. The Commune of Paris ordered the churches to be thut up, but the Convention found it neceffary to annul this order; and Robefpierre gained no fmall degree of popularity by fupporting the liberty of religious worfhip on this occafion. Hebert and Fabre d'Eglantine, who led the oppofite party, haftened their own fall by this ill-judged contempt of popular opinion.

For, now that the republic faw itfelf fucceffful in Quarels all quarters, when the Mountain party and the Jacobins between had no rival at home, and accounted themfelves in no the Mounimmediate danger from abroad, they began to fplit into tain and factions, and the fierceft jealoufies arofe. 'The Jacobin Jacobins, Club was the ufual place in which their contelts were carried on; and at this time Robefpierre acted the part of a mediator between all parties. He attempted with great art to turn their attention from private animofities to public affairs. He fpread a report that an invafion of Great Britain was fpeedily to take place. He therefore propofed that the Jacobin Club fhould fet themfelves to work to difcover the vulnerable parts of the Britifh conflitution and government. They did fo: They made fpeeches, and wrote effays without number. And in this war the moft fierce and turbulent band of men that ever perhaps exifted in any country occupied and amufed for a very confiderable time. What is no lefs fingular, a great number of Britifh fubjects favoured the plans of thefe reforming Atheifts; the conduct of the government giving ample fcope for cenfure.

The winter paffed away in tolerable quietnefs, and no military enterprife was undertaken either by the allies or by the French. On the ift of February, Barrere afferted in the Convention that the confederate powers were willing provifonally to acknowledge the French republic, to confent to a ceffation of holtilities for two years, at the end of which a lalting peace fhould be ra. tified by the French people. But this propofal the Convention declared itfelf determined to rejeet, as affording to the other nations of Europe the means of undermining their new government. In the mean time, the revolutionary government was gradually becom.' Vigorous the revolutionary government was gradually becoming fate of the
more vigorous. Thirty committees of the Convention revalutionmanaged the whole bufinefs of the ftate, without fha- arygoverning much of the direct executive government, which ment. refted in the committee of public fafety. Thefe different committees were engaged in the utmof varicty of objects. The ruling party had no competitors for power. Without confufion or oppofition, therefore, the moft extenfive plans were rapidly caried into effect. The Convention was little more than a court in whicla every project was folemnly regitered. In the fame ferfion 30 decrees would fometimes be paffed upon objects the mott widely different. The finances were under one committee, at the head of which was Cambon.This committee, found refources for the molt lavifh expenditure. The allignats were received as money penditure. The allignats were received as money oes and
throughout the ftate; and thus a paper mill was faid to fources of have become more valuable than a mine of gold. Their the nation credit was fupported by an arbitrary law regulating the maximun or highelt price of aH provifions, and by the immenfe mafs of wealth which hat come into the hands of the Convention by feizing the church lands, and by conficating the property of royalifts, emigrants, and

ment of the finan the finances and other re-
fources of

Frenen perfons condemned by the revolutionary tribunal. So Revolption 1794. unequally had property been divided under the ancient
government, that by means of thefe confifcations about feven-tenths of the national territory was fuppofed to be in tive hands of the public. To this was added the plunder of the churches, confifing of gold and filver bints, and utenfils employed in divine worfhip, along with other articles of lefs value; among which may be mentioned the innumerable church bells, which were regarded as fufficient for the manufacture of 15,000 pieces of cannon. Thefe refources formed a mafs of property fuch as never was poffeffed by any government.

Other committees were engaged in very different objects. Highways were conltructed, and canals planned and cut throughout the country. Immenfe manufactories of arms were everywhere eftablifhed. At Paris alone 1100 mulkets were daily fabricated, and 100 pieces of cannon caft every month. Public fchools were affiduoufly infituted, and the French language fanght in its purity from the Pyrenees to the Rhine. The French Convention poffefled immenfe refources, and they did not hefitate to lavifh them upon their fchemes. Every fcience and every art was called upon for aid, and the moft accomplifhed men in every profeffion were employed in giving fplendour to their country. The chemifts, in particular, gave effential aid by the facility with which they fupplied materials for the manufacture of gun-powder; and in return for their fervices, Lavoifier, the greateft of them, fuffered death by a molt iniquitous fentence. Not fewer than 200 new dramatic performances were produced in lefs than two years; the object of which was to attach the people to the prefent order of things. The vigour with which the committees of fubfiltence exerted themfelves is particularly to be remarked. As all Europe was at war with France, and as England, Holland, and Spain, the three maritime powers, were engaged in the conteft, it had been thought not impolfble to reduce France to great diftrefs by famine, efpecially as it was imagined that the country had not refources to fupply its immenfe population. But the prefent leaders of that country acted with the policy of a belieged garrifon. They feized upon the whole provifions in the country, and carried them to pablic granaries. They regiftered the rattle, and made their owners refponfible for them.They provided the armies abundantly, and, as the people were accurately numbered, they dealt out in every diftrict, on fated occafions, what was abfolutely neceffary for fubfiftence, and no more. To all this the peophe fubmitted; and indeed, throughout the whole of the mixed fcenes of this revolution, the calm judgment of the hiftorian is not a little perplexed. We cannot avoid admiring the patience with which the people at large endured every hardhip that was reprefented as neceffary to the common caufe, and the enthufiatic energy wth which they lavifhed their blood in defence of the independence of their country. At the fame time, we mult regard with indignation and difgult the worthlefs intrigues by means of which the fanguinary factions in the Convention and the capital alternately maffacred each other.
bert, Ronin, Vincent, and others : but the old fociety French retained its afcendency, and Robefpierre was now de- Revolution cidedly its leader. This extraordinary man had gradu- $\underbrace{1794 .}$ ally accumulated in his own perfon the confidence of the people and the direction of the government. As the committees were above the Convention, which was become little more than a filent court of record, fo the committee of public fafety was above the other committees. Robefpierre was the leader of this ruling committee. Barrere, St Juft, Couthon, and others of its members, only acted a fecondary part. They laboured in the bufinefs of the ftate, but the radical power was with Robefpierre. He furrounded the members of the Convention with fpies. He was jealous and implacable, and fet no bounds to the fhedding of blood. On the $25^{\text {th }}$ of Margh he brought to trial the following active Jacobins, who were condemned and executed on the following day: Hebert, Ronfin, Momoro, Vincent, Du Croquet, Kocq, Col. Laumur, M. M. Bourgeois, Mazuel, La Boureau, Ancard, Le Clerc, Proly, Deffieux, Anacharfis Cloots, Pereira, Florent Armand, Defcombes, and Debuifon. Not fatisfied with this, oa the 2 d of April he brought to trial nine of thofe who had once been his molt vigorous affociates, Danton, Fabre d'Eglantine, Bazire, Chabot, Philippeaux, Camille Defmoulins, Lacroix, Delaunay d'Angers, Herault de Sechelles, who, along with Wefterman, were executed on the evening of the 5 th.

Still, however, the preparations for the enfuing Preparacampaign were proceeding with unabated vigour. The tions fur committee for military affairs, at the head of which the camwere Carnor, La Fitte, d'Aniffi, and others, was bufy paign of in arranging along the frontiers the immenfe force which plan of the the requifition had called forth. Plans of attack and allies defence were made out by this committee; and when ap. proved by the committee of public fafety they were fent to the generals to be executed. On the other fide, the allies were making powerful preparations for another attempt to fubjugate France. The Emperor himfelf took the field at the head of the armies in the Netherlands. The plan of the campaign is faid to have been formed by the Auftian Colonel Mack. Weft Flanders was to be protected by a frong body of men; the main army was to penetrate to Landrecies, and getting within the line of French frontier towns, it was to cut them off from the interior by covering the country from Maubeuge to the fea. The plan was bold. It belongs to military men to judge whether this was not its only merit. When attempting to put it in execution, the allies mult have been illinformed of the immenfe force which the French were collecting againft them. Eren the town of Litle alone, which is capable of containing a numerous army within its walls, and which was to be left in their rear, hould have feemed an infurmountable objection to the plan.

On the 16 th of April the Auftrian, Britifh, and Sate of Dutch armies affembled on the heights above Cateau, the allice and were reviewed by the emperor. On the following armes. day they advanced in eight columns againft the French, drove in their whole poits, and penetrated beyond Landrecies; which place the French attempted to relieve, but without fuccefs. The allied army now amounted to $187,000 \mathrm{men}$, who were difpofed in the following manner; 15,000 Dutch and 15,000 Auftrians, under the prince of Orange and general Latour, formed the

## REV [ 195$]$ R E V

French Revolution $\underbrace{1794 .}$ $\underbrace{\text { r94. }}$ Incge of Landrecies; 15,000 Britifh and 15,000 Aufrionded by the duke of York general Otto, prince of Saxe-Cobourg, at the head of 60,000 and the trians, were advanced as far as Guife; i2,000 Heffians and Auftrians under general Worms were ftationed near Douay and Bouchain; Count Kannitz with 15,000 Auftrians defended the Sambre and the quarter near Maubeuge ; and, laftly, general Clairfait, with 40,000 Aultrians and Hanoverians, protected Flanders from Tournay to the fea; 60,000 Pruffians, for whom a fubfidy had been paid by Great Britain, were expected in addition to thele, but they never arrived.

The French now commenced their active operations. On the morning of the 26th of April they attacked the duke of York near Cateau in great force. After a fevere conflift they were repulfed, and their general Chapuy was taken prifoner. At the fame time they attacked the troops under his Imperial majelty, but were there allo repulfed in a fimilar manner; lofing in all 57 pieces of cannon. On the fame day, however, general Pichegru advanced from Lifle, attacked and defeated general Clairfait, took 32 pieces of cannon; and, in the courfe of a few days, made himfelf mafter
of Warwick, Menin, and Courtray. On the 29th of April, the garrifon of Landrecies furrendered to the allies. When this event was known in the convention, it excited a confiderable degree of alarm. It was, however, the laft effectual piece of fuccefs enjoyed by the allies during this difaftrous campaign. General Clairfait was again completely defeated by Pichegru in a general engagement; and it wis found neceffary to fend the duke of York to his affiftance. This movement was no doubt unavoidable; but the effect of it was, that it fplit down the allied army into a variety of portions, capable of carrying on a defultory warfarc, but unfit for the vigorous objects of conquelt. On the 1oth the duke of York was attacked near Tournay by a body of the enemy, whom he repulfed; but he was unable to join Clairfait upon whofe deftruction the French were chiefly bent: for at the fame time that the duke of York was occupied by the attack upon himfelf, Pichegru fell upon Clairfait with fuch irrefiftible impetuofity, that he was compelled to retreat in confufion, and a part of his army appears to have fled to the neighbourhood of Bruges. While Pichegru was thus advancing fuccefsfully in Weft Flanders, general Jourdan advanced in Ealt Flanders from Maubeuge, croffed the Sambre, and forced general Kaunitz to retreat. On the 18 ih , however, general Kaunitz-fucceeded in repulfing the enemy in his turn, and they recroffed the Sambre with confiderable lofs.

The allies now found that no progrefs could be made in France while general Pichegru was advancingfuccefsfully and occupying Weft Flanders in their rear. The emperor, therefore, withdrew the greater part of his army to the neighbourhood of Tournay, and refolved to make a grand effort to cut off the communication between Courtray and Lifle, thus to prevent completely the retreat of Pichegru. On the night of the 16 th, the army moved forwards in five columns for this purpofe. Clairfait was at the fame time directed to crofs the Lys, to effect a general junction, if poflible, and complete the plan. The attempt during that evening feemed to promife fuccefs; but, in the courfe of next
day, the divifion under the duke of York was overTrend powered by numbers and defeated. The progrefs of Revolution the reft of the columns was Itopped, and Clairfait completely defeated. In the confufion of the day, when attempting to rally the different parts of the divifion which he commanded, the duke of York was feparated from his own troops by a party of the enemy's cavalry, and only efcaped being made prifoner by the fwiftnefs of his horfe. The plan of the allies being thus fruftrated, their army withdrew to the neighbourhood of Tournay.

Pichegru feeedily attempted to retaliate againf the allies. On the 22 d of May he brought down at day break his whole force againft them. The attack was commenced by a heavy fire of artillery, and all the advanced polts were forced. The engagement foon be* came general; the attacks were repeatedly renewed on both fides; the whole day was fpent in a fuccelfion of obttinate battes. All that military tkill could do was performed on both fides. The French and the allied foldiers fought with equal courage and equal difcipline. At nine o'clock in the evening the French at laft reluctantly withdrew from the atiack. The day on which a vanquifhed enemy flies from the field is not always that on which the vigtory is won. In this engagement the French were unfucceffful in their inmediate object; but the weight of their fire, their Iteady difcipline, and their violent obftinacy of attack, raifed their military character high in the eftimation of the officers and foldiers of the allied army. It was fonn perceived, that in addition to thefe they piffeffed other advantages. Their numbers were immenfe; they implicitly obeyed their generals; who, being men newly raifed from the rank of fubalterns, as implicitly fubmitted to the directions of the committee of public fafety. A combination of efforts was thus produced whofe operation was not retarded by divided counfels. On the other fide, the numbers of the allies were daily declining; their leaders were independent princes or powerful men, whofe fentiments and interefts were often very hoftile to each other, and their exertions were confequently difunited.

On the 24th the French again croffed the Sambre, but were driven back with much lofs. On the 27 th an attempt was made to befiege Charleroi, but the prince of Orange on the 3 d of June compelled them to raife the fiege. On the 12 th a fimilar atrempt was made, and they were again repulfed. In Welt Flan- He lays ders, however, Pichegru was fufficiently ftrong to com. fiege to mence the fiege of Ypres. He was foon attacked by Ypres, and general Clairfait for the purpofe of relieving it, but without fuccefs.-Ypres was garrifoned by 7000 men; reinforcements were therefore daily fent from the grand army to Clairfait for the purpofe of relieving it. It is unneceffary to mention the bloody contefts in which that unfortunate general was daily engaged with the French; it is fufficient to fay, that they were uniformly unfuccefsful, and were the means of wafting, in a great degree, the armies of the allies. Ypres held out till the 17 th of June, when it capitulated : and fuch was the difcipline of the French army at this time, that no notice could be obtained, for feveral days, of that event. In confequence of it and of other events, the duke of York found it neceffary to retreat to Oudes narde ; for Jourdan, after forming the Auftrian camp

Takes it.

Fricch of Betignies, now advanced with fech frength upon Revolution Chaleroi in the eaft that its inmediate fall was fear1794. ed. As this would have enabled the two French ar- known by the prince of Cobourg when he advanced on the 26th to attack in their entrenchments the army that covered the fiege near Fleurus: but the covering army being by this time reinforced by the accelfion of the belieging army, the allies were repulfed. Jourdan then drew his men out of their entrenchment; and, in his turn, attacked the Auftrians. He was three times.repulfed, but was at latt fucceffful : the lofs of the vanquifhed army is faid to have been prodigious; but no regular accounts of it have been publifhed. The French unqueftionably exaggerated their own fuccefis, when 1, 8 they faid that it amounted to 15,000 men.
Further The allies now retreated in all quarters. Nieuport, fucceffes of Oftend, and Bruges, were taken ; and Tournay, Mons, the French in Flanders, baft place the French armies of Eaft and Weft Flanders united. Landrecies, Valenciennes, Condé, and Quefrioy, were fruileflly left with garrifons in them. The allied troops, evacuating Namur, formed a line from Antwerp to Liege to protect the country behind. The French advanced in full force, and attacked general Clairfait, cut to pieces half of the troops that now remained under him, and broke the line. The allies retreated before them. The duke of York was joined by fome troops under the earl of Moira that with much difficulty had made their way to him from Oftend ; and with thefe and the Dutch troops he retired to the neighbourhood of Bergen-op-zoom and Breda for the protection of Holland. The prince of Cobourg evacuated Liege, croffed the Mefc, and placed a garrifon in Maeftricht. He foon, however, fent back a part of his troops to the neighbourhood of Tongres; for here, to the aftonifhment of all Europe, the French armies made a voluntary paufe in their career of victory, and ceafed to purfue their retiring foes. Sluys in Dutch Flanders was the only foreign poft that they continued to attack, and it furrendered after a fiege of 199. 21 days.

And of the On the Rhine the war was equally fuccefsful on the whius. part of the French. On the 12 th, $13^{\text {th }}$, and $14^{\text {th }}$ of Joly, repeated engagements were fought; in which the French enjoyed their ufual fuccefs. They had numerous armies in every quarter. Their mode of fighting was to make full preparation for accomplifhing their object, and to fight in great bodies day after day till it was obtained. The Palatinate was thus over-run, and Treves taken, by general Michaud. Flanders and the Falatinate have always been accounted the granaries of Germany; and both of them, at the commencement of the larveft, now fell into the hands of the French.
200

menfe quantities of grain and other flores. Thefe were French emburked on board $\mathbf{i} 60$ fail of merchantmen, convoyed Revolution by fix fail of the line. Lord Howe failed to intercept $\underbrace{179+4}$ this valuable convoy. The French fleet failed at the 201 fame time to protect it. On the morning of the 28 th Splendid of May the fleets came in fight of each other. The victury of Britifh admiral had previoully difpatched fix fhips of the Britifh the line under admiral Montague to intercept the fer Lord French convoy, while he fhould engage and detain the howe. grand fleet. The French difpatched eight fail to defeat this attempt. In the courfe of the 2gth Lord Howe got to windward of the French fleet. His force was 25 , and theirs was 26 , fail of the line. The following day he bore down upon them, and broke their line. The engagement was one of the fevereft ever fought. The French admiral, in lefs than an hour after the clofe action commenced in the centre, crouded off with 12 of his hips. The Britilh fleet was fo much difabled, or feparated, that feveral of the French dif. mantled fhips got away under fails raifed on the fump of their fore-malts. Seven fail of the line, however, remained in poffeffion of the Britifh, and two were unqueftionably funk. In the mean time, admiral Montague fell in with the French convoy, but it was now guarded by 14 fail of the line. As he could not encounter fuch a force, he returned home, and it was fafely conveyed into port. Thus, by one of thofe contradictions which fo often occur in human affairs, the Britifh fleet was vittorious, and the French were left in fome meafure malters of the fea. As this engagement however tefified that the Britifh feamen had not loft their ancient fuperiority on their own element, the nation regarded the prefent viatory as a pledge of its independence, and very general rejoicings took place in confequence of it.

In the mean time, the revolutionary fyltem of go- The horrid vernment in the lands of committees of the convention cxecutions at Paris, and of committees of the popular focieties in Puris throughout the country, was arrived at its higheft perfection, and proceeded without oppoftion in its fevere and fanguinary meafures.

On the 1 oth of May Madame Elizabeth, fifter of the late king, was facrificed by it in confequence of a decree of the revolutionary tribunal. Multitudes of others of every rank and fex were daily facrificed in a fimilar manner; the rich in particular were the great objects of perfecution, becaufe the confifcation of their property added to the ftrength of the ruling powers. But Innionfe neither were the poor fafe from the bloody vigilance of power of this new and fingular government. By the different Robere executions Robefpierre had contrived to deftroy every avowed rival. All the confituted authorities confifted wholly of perfons nominated with his approbation; and as the committees which conducted the bufinefs of the ftate were at his difpofal, his will was irrefiftible throughout the republic. He met with no oppofition in the convention; for that body was no longer the turbulent popular affembly which it had once appeared; it was little more than a name employed to give fome fort of refpectability to fuch fchemes as were propofed to it.
A midft this accumulation, however, of feemingly ir 204 refinible auh acculy refiftible authority, Robe ${ }^{\text {eierre was at at the brink of ruin. }}$ ruin. The whole of the old Girondift party was indeed fubdued and filent; but many members of the convention fill remained attached to it. The party of the

## RE V <br> [ 197 ] <br> RE V

French Mountain, by means of whom Robefpierre had rife Revolution to power, with little fitisfaction now found themfelves $\underbrace{1794 .}$ not only difregarded, but ready at every infant to fall a facrifice to that fylem of terror which they had contribute to ere it. Even the Jacobins themfelves, though neither timid nor cautious in the fhedding of blood, began to murmur when they fay that awful privilege, confined exclufively within a few hands, or rather monopolized by an individual. In this fate things remained for forme time ; and it appeared how pollible it is for an individual to govern a great nation even while the whole of that nation is holtile to his power. The banifhment or imprifonment of all foreigners, which had long been rigorvully prastifed, prevents us from polfelfing much accurate information concerning the internal tate of France at this period; but it is cervin, that one circumftance in particular tended much to accelerate the fall of Robefpierre. He had procured a decree to be palled, authorifing the committee of public fafety to imprifon at its pleafure, and bring to trial, any member of the convention. All the individuals of that body found themfelves placed by this decree in the hands of a man whole fever and fufpicious temper they well knew. Still, however, they were fo much furrounded by flies, that it was difficult to form a party or plan of operatons ; even the majority of the committee of public faffty were among the number of the difcontented, but they dared not to withstand their chief. At lat, on the 25 th
of July, the convention began to exhibit figns of agitation. It was underfood, that in the courfe of a few days Robefpierre would facrifice a number of the members to his fufpicions. On the following day the fitting of the convention was fill more tempeftuous. In a long fpeech Robefpierre defended his own conduct againft thole who had reproached him with aspiring to the dietatorlhip of France. He attacked the party whom he styled Moderates, as willing to overturn the revolution. ary government, and to reftore the feeble fyftem of the Briliotines. The refult of a long debate was, that Robefpierre was apparently victorious, and his fpeech was ordered to be printed. On the 27 th the convention appeared ripe for a change: St Jut, a member of the committee of public fifty, in attempting to defend Roberpierre, was repeatedly intermpted; and Biilaud Vatrennes flood forward and enumerated the crimes, and proclaimed the tyranny, of Robefpiarre. The speech was received with burls of applause. Robefierce in vain attempted to defend himfelf; he was filenced by thouts of execration from every part of the ball. Tallien feronded the former faker in his accuration. The fitting was declared permanent, and a decree of arreit was palled against Robefpierre and a your ger brother of his, along with St Jut, Couthon, and Lebas. There men lett the convention, and found fecurity in the hall of the commune of Paris; where the municipal officers agreed to protect and ftand by them. The tocfin was founded; the armed force was under their command; an infurrection was therefore attempted againit the convention : but the factions of Paris refufed their fupport. Very few of the troops could be collected, and thee were not firm ; the late ty. many had become odious. The hall of the commune was therefore fpeedily furrounded; and about three o'clock in the morning of the 28 th Robefpierte and his affociales were made prifoners. They had been outlawed
by the convention on account of their refinance. They French were not therefore tried, unlefs for the purpofe of ilion- Rewndatics tifying their perfons; and, in the courfe of that day, ${ }^{159.4 .}$ they were executed: 60 of the municipal officers were aldo executed for joining in their rebellion; and in this way a form paffed over, which at one time theatencd to involve the French capital in ruin, and filled all Earope with attonifhment. Thus alto terminated the carear of the mont extraordinary man that the French :evolution had brought forward. His talents were undonbtedly confiderable, and his ambition knew no bounds, bidding defiance to the ordinary feelings of humanity. Had Dumounier poffefed his cooinefs and caution, or had he pofiefled the military talents of Dumourier, the convention would certainly have been overarmed, and we Should have feen a fecond Cromwell on the throne of his murdered fovereign.

After the fall of Robespierre, the convention exhi:bitted no fall change of appearance. Infead of that was der with-
$m$ - out refinepromise after a fufpenfion of almond two months. The French army divided itfelf into two bodies. One of there under Jourdan advanced againf General Clairfait, who had facceeded the prince of Cobourg in the command

filence which formerly prevailed, all was bute and
noife; all accufed each other. There was no longer
any leader, and there was no formed party. The former
fyftem of terror was declared to be at an end, and a
new fyftem of moderatifm succeeded. This was carried
to as great a height as the fyftem of terror had former.
by been; and all means were taken to render popular
the fall of their late tyrant. The committees were or
ganifed anew, and their members ordered to be free
quently changed. The correspondence between the af
filiated Jacobin clubs was prohibited, and at lat the
Jacobin club itfelf was abolifhed. This lat event was
accomplifhed with cafe; and that fociety which had
been the great engine of the revolution, was itself with.
out refiftance overturned. Seventy-one deputies of the
Girondift party, who had been imprifoned fence the 3 rit
of May 1793, were fut at liberty. The name of Lyons
was reftored to it. Some of the agents of Robefpierre
were punifhed, particularly the infamous Carrier, whole
cruelties in La Vendee we formerly mentioned. Still,
however, the convention appeared fo little united and
fo little decided with regard to objects of the firn imp
portance, that in all probability they would not have
conducted the important Atruggle againft the nations
of Europe with more fuccefs than the Girondift party
had formerly dore, if the revolutionary government
and the late fyftem of terror had not already accumu
lated in their hands fuch vat refources, and traced out
foch a plan of procedure, as rendered it an eafy matter
to preferve their numerous armies in the train of fac
eff to which they were now habituated.

The allies in their retreat had left flong garrisons $\mathrm{Th}^{207}$
in the French towns which had furrendered to them.
There were Condí, Valenciennes, Quefnoi, and Lan-frongly
drecics. They now furrendered to the republican ar- garifioned
mites with fo little refiftance, that the conduct of the em- by the al
peron began to be confidered as ambiguous, and he was liesfurren
promife with the French. This idea proved erroneous; ante,
and as foo as the army which had befieged thee towns
was able to join the grand army under Pichegru and
Jourdan, the operations of the campaign were refumed

Frinch in the neighbourhood of Maetricht. On the 15 th of The French, on the contrary, well received, abounding !rench Rivolution Septeraber the French attacked the whole Auftrian 17\%4. poits in an extent of five leagues from Liege to MaeAtricht. On that and the following day the loffes were Futher fucceffes of the French, On the 17 th the French with 50 piece of camon attacked General Kray in his entrenched camp before Maeitricht. M. de Kray was already retiring when General Clairfait arrived with a ftrong reinforcement, and after a fevere combat the French were once more compelled to retire. On the 18 th the French renewed the attack with tenfold fury upen every part of the Auftrian line, and the whole was compelled to fly to the neighbourhood of Aix-la-Chapelle. General Clairfait now choie a frong pofition on the banks of the Roer, where he even declared it to be his wifh that he might be attacked. But by this time the fpirit of his army was humbled, defertions became numerous, and the want of difcipline was extreme. On the ift of October the French croffed the Maefe and the Roer, and attacked the whole Auftrian polts from Ruremond down to Juliers. After a bloody engagement, the brave and active, though unfortunate, General Clairfait was compelled haftily to crofs the Rhine, with the lofs of 10 or 12,000 men. The French general did not attempt to crofs that river, but one detachment of his army took poffeffion of Coblentz, while others laid clofe fiege to Venlo and Maeftricht, which foon furrendered.

The divifion of the French army, in the mean time, under General Pichegru came down upon Holland, and attacked the allied army under the duke of York between Bois-le-duc and Grave. They forced the advanced poft of Boxtel. Lieutenant-general Abercromby was fent to attempt to recover this poit on the fifteenth of September, but he found the French in fuch force that he was obliged to retreat. Indeed the French were difcovered to be no lefs than 80,000 ftrong in that neighbourhood. The duke of York was unable to contend againft a force fo fuperior, and retired acrofs the Maefe with the lofs of fomewhat lefs than 1500 men. Pichegru immediately laid fiege to Bois-le-duc. On the 3och of September, Creveccur was taken, and Bois-leduc furrendered in 10 days thereafter. In it 408 French emigrants were taken prifoners; and thefe, as well as 700 that had been taken at Nieuport, 500 at Sluys, and 1 reviat Valenciennes, wereall put to death, agreeably to the rigorous law formerly made by the convention. The French now followed the duke of York acrofs the Maefe. Upon this the greater part of the allied army under his royal highnefs croffed the Rhine and took poft at Arnheim. The remaining part of the army followed foon after, and Nimeguen was occupied by the French on the 7 th of November. The duke of Brunfwick was at this time requefted to take the command of the allied army, to protect Holland, if poflible. He came to Arnheim for that purpofe; but after examining the ftate of things there, he declined the undertaking. The allied troops had now fo often fled before their victorious and almolt innumerable enemies, they had fo often been in want of every neceffary, and had been received fo ill by the inhabitants of the countries through which they paffed, among whom the French caufe was extremely popular, that they had loft that aegularity of conduct and difcipline which alone can afford a fecure profpect of fuccefs in military affairs.
in every thing, and proud of fightirg in a popular caufe, now acted with much order, and fubmitted to the frictelt difcipline. In addition to all thefe advantures, the French leaders had the dexterity to perfuade the world that new and unkriown arts were employed to give aid to their caure. At this period the telegraphe was firlt ufed for conveying intelligence from the frontiers to the the capital, and from the capital to the frontiers. (See mies.
Telegraphe). Balloons were alfo ured by the French during this campaign to procure knowledge of the pofition of the enemy. An engineer afcended with the balloon, which was fuffered to rife to a great height, but prevented from flying awiy by a long cord. He made plans of the enemy's encampment; and during an attack he fent down notice of every holtile movement. In the affairs of men, and more efpecially in military tranfactions, opinion is of more importance than reality. The French foldiers confided in their own officers as men poffeffed of a kind of omnifcience, while the allied troops, no doubt, beheld with anxiety a new contrivance employed againt them, whofe importance would be readily magnified by credulity and ignorance. With all thefe advantages, however, atter the capture of Nimeguen, they once more made a halt in their career, and abftained from the attack of Holland, which now feemed almoft proftrate befure them.

While thefe events occurred in the north, the French Their fucarms were fcarcely lefs fuccefsful on the fide of Spain. ceffes in Bellegarde was taken ; in the Wettern Pyrenees, Fon. Spain. tarabia furrendered, and alfo St Sebatian ; the whole kingdom of Spain feemed panic ftruck. That feeble government, with an almoft impregnable front:er, and theimoft powerful fortreffes, could make little refiftance; and the difficult nature of their country was their only protection. The hiftory of this war is only a hiftory of victories on the part of the French. In the Eaftern Pyrenees, on the 17 th of November, the French general Dugommier was killed in an engagement, in which his army was fuccefsful. On the 2oth of that month the French again attacked the Spaniards, and routed them by means of the bayonet, without firing a fingle mulket-fhot. Tents, baggage, and cannon, for an army of 50,000 men, fell into the hand of the conquerors, along with a great part of the province of Navarre.. Towards the end of the year, an army of 40,000 Spaniards, entrenched behind 8 o redoubts, the labour of fix months, fuffered themfelves to be completely routed; their general count de La Union was found dead on the field of battle, and the whole Spanifh artillery was taken. In three days thereafter, the fort Fernando de Figuieres, containing a garrifon of 9107 men, furrendered, although it mounted 171 pieces of cánnon, and poffeffed abundance of provifions. The French. continued their conquefts; Rofas was taken, and the whole province of Catalonia was left at the mercy of the invaders.
The fucceffes of this wonderful campaign were not yet terminated; and the lalt part of them is perhaps the moft important, although no great effort was neceffary to its execution. The winter now fet in with uncom. mon feverity. For fome years palt the feafons of Europe had been uncommonly mild; there had been little froft in winter, and no intenfe heat in fummer. Bat during the late feafon the weather had long been remarkably

## R E V

French markably dry till the latter part of harveft, when there Revolution fell a confiderable, though by no means unufual, quan$\underbrace{1795 .}$ tity of rain. Towards the end of December a fevere frof bound up the whole of the rivers and lakes of Holland. The Waal was frozen over in the beginning of January ; a circumftance which had not occurred for 14 years paft. Taking advantage of this, the French crofled that river, and with little oppofition feized the important pafs of Bommeil, which at other feafons is fo ftrong by its inudations. The allied army had been joined by 17,000 Aultrians, and had received orders to defend Holland to the laft. They did fo, and were fuccefsful in repulfing the French for fome days between the Waal and the Leck; but the republican army, amcunting to 70,000 men, having at laft advanced in full force, the allied troops were compelled to retire acrofs the Yffel into Weltphalia. In the courfe of their march through this defert country, in the midit of fevere froft and a deep fnow, they are faid to have fuffered incredible hardihips, and to have loft a very great number of men. The French, in the mean time, advanced rapidly acrofs the country to the Zuyder fea, to prevent the inlabitants from flying, and carrying off their property. On the 16 th of January 1795 , a party of horfe, without refiftance, took poffeffion of Amfterdam. The orber towns furrendered at difcretion. In confequence of an order from the S ates General, the ftrong fortreffes of Bergen-op-zoom, Williamitadt, Breda, \&c, opened their gates to the French. The fleet and the hipping were fixed by the intenfe frof in their ftations, and fell a prey to the enemy; who thus, with little effort, made a complete conquelt of this populous and once powerful country. The French were well received by the people at large. The power of the Stadtholder had been fupported among them merely by the influence of Prufia and England. Through hatred to this office, which had now become odious chiefly to the mercantile ariftocracy of Holland, they were little attached to their allies, and grave them, during the prefent war, as little fupport as poffible. The Stadtholder and his family now fled to England. The French declared, that they did not mean to make fubjects but allies of the Dutch, and invited them to call together popular allemblies for fettling their own government, under the protection of the French republic.

Thus terminated a campaicu, the mot atonithing perhaps, that has been known in the hintory of mankind. In the courfe of it, even before the corqueft of Hollund, the French had taken 2000 pieces of cannon and 60,000 prifoners. After that event, the conquered tersitories added to them a population of nearly 14 millions of people. Luxembourg and Mentz were the only places on thistide of the Rhine that refifted them. The former was clofely blockaded, for the purpofe of compelling it to furrender; the latter was feveral times affaulted, but fuccefsfully held out.
213 Europe was now weary of this bloody Atrife. The The diet of German Diet of Ratifoon declared its refolution to with for реасе.
take meafures for procuring peace. The Grand Duke of Tufcany concluded a treaty with the French republic. France itfelf, exhaulled by maflacres, emigrations and the terrible efforts which it had made, wifhed for tranquillity; and the Convention found it neceffary to declare that they were willing to treat for peace with any of the powers of Europe, upon honourable terms.

## 199 ] <br> R E V

The frequent changes, however, which have with French aftonifhing rapidity taken place in $t^{?}$ : e mode of conduct- Revolution ing French affairs, and the different principles difplay- $\underbrace{1795 .}$ ed by the different factions as they fucceffivelygot into power, had produced in Great Britain and Auftria a very general perfuafion that no peace concluded with the deternine on a vigomanent ; and therefore thefe two mighty nations have rous prorefolved to continue the war with redoubled vigour.- fecution of In fupport of the wifdom of this refolution, it has been the war. obferved, that the hatred of the Mountain to the Girondifts was fuch, that it would have violated any treaty which had been concluded with them; that when Robefpierre became all powerful, and terror was the order of the day, all former meafures were changed, and peace or war made wholly fubfervient to the ambitious views of that relentlefs tyrant ; that Tallien, having originally belonged to the Mountain, introduced the prefent fyltem of moderation, not from principle, but only to reconcile the people to his ufurped authority, and the fall of his bloody predeceffor; that he may fuddenly change his meafures, or be denounced and executed by the influence of fome more daring dema gogue, who would again introduce the fyltem of terror ; and that in fuch a ftate of uncertainty, the only confequence to be expected from making peace at prefent is, that it would furnifh the next faction which may gain the afcendancy in France with an opportunity of attacking the allies when lefs prepared to receive them. Such reafoning as this has been admitted in the Britifh parliament, where a loan of fix millions Sterling has been voted to the Emperor, to enable him to begin the enfuing campaign with an army of 200,000 men. In what manner the war ought to be conducted, it is not for us to fay. The Britifl nation feems to relt its hopes on its fuperiority at fea; and the greateft exertions are making to augment and man the navy. But we are here under the neceffity of dropping this fubject, with fion. out being able completely to fulfil the promife which we made to our readers at the end of the article France. There is as little appearance at prefent of peace, and a fteady government being foon reftored to that diltracted country, as there was at the beginning of the troubles; and there is not the fmalleft probability that the republican conftitution, framed by the Convention, will laf one year after the diffulution of that aflembly.

In tracing the origin and progrefs of this wonderful revolution, we have confulted every work from which we had reafon to look for information, and we have confined ourfelves to a timple narration of facts, feldom: giving way to the refections which they fuggelted. Our facts, too, have been generally ftated from writers who are fuppofed to be not unfriendly to democracy, that they may gain the fulter credit with other reformers; for in the moft favourable point of view in which thofe facts can be placed, they furnifh frong objections to. precipitate innovations in moderate governments. If the horrible deeds of darknefs which have been acted. on the theatre of France cannot make us contented with the government under which we live, and which has been brought to its prefent fate of perfection, not by the metaphyfical fpeculations of reclufe philofo phers, but by obfervation and the practical experience of other nations we fhall be confidered by pofterity as a

Revulfion people incapable of inftruation, and ripe for the greateft miferies in which we may be involved.

REVULSION, in medicine, turning a flux of humours from one part to another by bleeding, cupping, friction, finapifms, bliters, fomentations, bathings, iffues, fetions, frong purging of the bowels, \&c.

REYN (Jan de), an eminent hiftory and portrait painter, born at Dunkirk in 1610. He had the good tortune to be a difciple of Vandyke, was the firt performer in his fchool, and was to attached to his mafter that he followed him to London, where it is thought he continued as long as he lived. In theie kingdoms he is mofly known by the name of Lans Fan. He died in 1678: and it is imagined that the ficarcity of his works is occafioned by fo many' of them being imputed to Vandyke; a circumftance which, if true, is beyond any thing that could be faid in his praife.

REYNOLDS (Sir Joflua), the celebrated painter, was, on July the 16 th, 1723 , born at Plympton, a fmall town in Devonthire. His father was minitter of the parifh, and alfo mater of the grammar fchool; and being a man of learning and philanthropy, he was beloved and refpected by all to whom he was known.Such a man, it will naturally be fuppofed, was affiduous in the cultivation of the minds of his children, among whom his fon Jofhua fhone confpicuous, by difplaying at a very early period a fuperiority of genius, and the rudiments of a correct tafte. Unlike other boys, who generally content themfelves with giving a literal explanation of their author, regardlefs of his beauties or his faults, young Reynolds attended to both thefe, difplaying a happy knowledge of what he read, and entering with ardour into the Ipirit of his author. He difcovered likewife talents for compofition, and a natural propenfity to drawing, in which his friends and intimates thought him qualified to excel. Emulation was a diftinguifhing feature in his mind, which his father perceived with the delight natural to a parent; and defigning him for the church, in which he hoped that his talents might raife him to eminence, he fent him to one of the univerfities.

Soon after this period he grew paffionately fond of painting; and, by the perufal of Richardíon's theory of that art, was determined to make it his profeffion through life. At his own earneft requef, therefore, he was removed to London; and about the year 1733 became a pupil to Mr Hudfon, who, though not himfelf an eminent painter was preceptor to feveral who afterwards excelled in the art. One of the firlt advices which he gave to Mr Reynolds was to copy carefully Guercino's drawings. This was done with fuch fkill,
that many of the copies are faid to be now preferved in Reynolds. the cabinets of the curious as the criginals of that very great mafter.

About the year ${ }^{1749}$, Mr Reynolds went to Italy under the aulpices, and in the company, of the late Lord (then Commodore) Keppel, who was appcinted to the command of the Britifh fquadron in the Mediterranean. In this $\xi$ arden of the world, this magic feat of the arts, he failed not to vifit the frhools of the great mafters, to fudy the productions of different ages, and to contemplate with unwearied attention the various beauties which are characteriftic of each. His labour here, as has been obferved of another painter, was "the labour of love, not the tafk of the hireling;" and how much he profited by it is known to all Europe.

Having remained about two years in Italy, and fudied the language as well as the arts of the country with great fucceif, he returned to England, improved by travel and refined by education. On the road to London from the port where he landed, he accidentally found in the inn where he lodged Johnfon's life of Savage; and was fo taken with the charms of compofition, and the mafterly delineation of character dipplayed in that performance, that having begun to read it while leaning with his arm on the chimney-piece, he continued in that attitude infenfible of pain till he was hardly able to raife his hand to his head. The admiration of the work naturally led him to feek the acquaintance of its anthor, who continued one of his fincereft admirers and warmelt friends, till $17^{84}$, when they were feparated by the flroke of death.

The firt thing that diftinguifhed him after his return to his native country, was a full length portrait of Commodore Keppel; which in the polite circles was fpoken of in terms of the higheft encomium, and teftified to what a degree of eminence he had arrived in his profeffion. This was followed by a portrait of Lord Edgecombe, and a few others, which at once introduced him to the firft bufinefs in portrait painting ; and that branch of the art he cultivated with fuch fuccefs as will for ever eftablifh his fame with all defcriptions of refined fociety. Having painted fome of the firt-rate beauties of the age, the polite world focked to fee the graces and the charms of his pencil; and he foon became the moft fafhionable painter, not only in England, but in all Europe. He has indeed preferved the refemblance of fo many illuftrious characters, that we feel the lefs regret for his having left behind him fo few hiftorical paintings; though what he has done in that way fhows (A) him to have been qualified to excel in both departments. The only landfcape, perhaps, which
(A) As the lovers of painting may wifh to have a catalogue of this great matter's hiftorical pieces, we fubjoin the following from the Europear Magazine, which we have good reafon to believe accurate, as the editors of that mifcellany grudge neither trouble nor expence to procure authentic information. Sir Jofhua's principal hiftorcal pieces, then, are the following : Hope nurfing Love; Venus chaftifing Cupid fcr having learned to caft accounts; Count Ugolino in the dungeon; the calling of Samuel ; Ariadne; a Captain of banditti; Beggar Boy; a Lady in the charafter of St Agnes; Thais; Dionylius the Are ppagite; an infant Jupiter ; Matter Crewe in the character of Henry VIII; the death of Dido; a Child afleep; Cupid fleeping ; Covent Garden Cupid; Cupid in the Clouds; Cupids painting ; Boy laughing; Malter Hebert in the character of Bacchus ; Hebe ; Mifs Meyer in the charater of Hebe ; Madona, a head; the Black-guard Mercury; a little boy (Samuel) praying; and old Man reading; Love loofing the zone of Beauty; the Children in the Wood; Cleo-

Reynolds. he ever painted, except thofe beautiful and chafte ones which compofe the back grounds of many of his portraits, is "A View on the Thames from Richmond," which in 1784 was exhibited by the Society for Promoting Painting and Defign in Liverpool.

In 1764 Mr Reynolds had the merit of being the firit promoter of that club, which, having long exifted without a name, became at laft difinguifed by the appellation of the Literary Club. Upon the foundation of the Royal Academy of Painting, Sculpture, and Architecture, he was appointed prefident; and his acknowledged excellence in his profeffion made the appointment acceptable to all the lovers of art. To add to the dignity of this new inflitution, his majefty conferred on the prefident the honour of knighthood; and Sir Joflua delivered his firft difcourfe at the opening of the Academy on January 2. 1769. The merit of that difcourfe has been univerfally admitted among painters; but it contains fome directions refpecting the proper mode of profecuting their ftudies, to which every fit? dent of every art would do well to pay attention. "I would chiefly recommend (fays he), that an implicit obedience to the rules of art, as eftablifhed by the practice of the great mafters, fhould be exacted from the young ftudents. That thofe models, which have paffed through the approbation of ages, fhould be confidered by them as perfect and infallible guides; as fubjects for their imitation, not their criticifm. I am confident, that this is the only efficacious method of making a progrefs in the arts; and that he who fets out with doubting, will find life finifhed before he becomes mafter of the rudiments. For it may be laid down as a maxim, that he who begins by prefuming on his own fenfe, has ended his Itudies as foon as he has commenced them. Every opportunity, therefore, fhould be taken to difcountenance that falle and vulgar opinion, that rules are the fetters of genitus. They are fetters only to men of no genius; as that armour which, upon the frong, becomes an ornament and a defence, upon the weak and mifhapen turns into a load, and cripples the body which it was made to protect."

Each fucceeding year, on the diftribution of the prizes, Sir Johna delivered to the Itudents a difcourfe of equal merit with this: and perhaps we do not hazard too much when we fay, that, from the whole collected, the lover of belles lettres and the fine arts will acquire jufter notions of what is meant by tafte in general, and better rules for acquiring a correct talte, than from multitudes of thofe volumes which have been profeffedly written on the fubject.

In the autumn of 1785 he went to Bruffels, where Vol. XVI.
he expended about L. 1000 on the purchafe of paint. Reyunlds. ings, which, having been taker from the different monafteries and religious houfes in Flanders and Germany, were then expofed to fale by the command of the Em. peror Jofeph! Gainfborough and he had engaged to paint each other's portrait; and the canvas for both being actually fretched, Sir Jofhua gave one fitting to his diftinguifhed rival ; but, to the regret of every admirer of the art, the unexpected death of the latter prevented all further progrefs.

In 1790 he was anxioully defircus to procure the vacant profefforfhip of perfpective in the academy for Mr Bonomi, an Italian architect ; but that artif not having been yet elected an afociate, was of courfe no academician, and it became neceflary to raife him to thofe fituations, in order to qualify him for being a profeffor. Mr Gilpin being his competitor for the affociatefhip, the numbers on the ballot proved equal, when the prefident by his calting vote decided the election in favour of his friend, who was thereby advanced fo far towards the profefforfhip. Soon after this, an academic feat being vacant, Sir Jchua exerted all his influence to obtain it for Mr Bonomi ; but finding himfelf outvored by a majority of two to one, he quitted the chair with great difatisfaction, and next day fent to the fecretary of the academy a formal refignation of the office, which for twenty-one years he had filled with honour to himfelf and his country. His indignation, however, fubfiding, he fuffered himfelf to be prevailed upon to return to the chair, which within a year and a half he was again defirous to quit for a better reafon.

Finding a difeafe of languor, occafioned by an enlargement of the liver, to which he had for fome time been fubject, increafe upon him, and daily expecting the total lofs of fight, he wrote a letter to the academy, intimating his intention to refign the office of prefident on account of bodily infirmities, which difabled him from exceuting the duties of it to his own fatisfaction. The academicians received this intelligence with the refpectful concern due to the talents and virtues of their prefident; and either then did enter, or defigned to enter, into a refolution, honourable to all parties, namely, that a deputation from the whole body of the academy fhould wait upon him, and inform him of their wifh, that the authority and privileges of the office of prefident might be his during his life; declaring their willingnefs topermit the performance of any of its duties which might be irkfome to him by a deputy.

From this period Sir Johua never painted more. The laf effort of his pencil was the portrait of the Honourable Charles James Fox, which was executed in his C c
belt
patra diffolving the pearl; Garrick in the character of Kitely; Garrick between Tragedy and Comedy; Mrs Abingdon in the character of Comędy; a Child furrounded by Guardian Angels; Mifs Beauclerc in the character of Spenfer's Una; Refignation; the Duchefs of Manchefter in the character of Diana; Lady Blake in the character of Juno ; Mrs Sheridan in the character of St Cecilia; Edwin, from Beattie's Minfrel ; the Nativity, Four Cardinal Virtues, and Faith, Hope, and Charity, for the window of New College Chapel, Oxford; the Studious Boy ; a Bacchante ; a daughter of Lord W. Gordon as an Angel; the Holy Family; the Cottagers, from Thomion ; the Veftal; the Careful Shepherdefs; a Gypfey telling Fortunes ; the infant Hercules Arangling the Serpent ; the Moufe-trap girl; Venus; Cornelia and her Children ; the Bird ; Melancholy; Mrs Siddons in Tragedy ; Head of Lear ; Mrs Talinafh in the character of Miranda, with Profpero and Callban; Robin Goedfellow; Death of Cardinal Beaufort; Macbeth, with the Caldron of the Witches.

## R E Y [ 202$] \quad \mathrm{RHAA}$

$\underbrace{\text { Reynelds. beft Atyle, and thows that his fancy, his imagination, and }}$ his other great powers in the art which he profeffed, remained unabated to the end of his life. When the laft touches were given to this picture,
" The hand of Reynolds fell, to rife no more."
On Thurfday February the 23 d 1792, the world was deprived of this amiable man and excellent artift at the age of 68 years; a man than whom no one, according to Johnfon, had paffed through life with more obfervation of men and manners. The following character of him is faid to be the production of Mr Burke:
© His illnefs was long, but borne with a mild and cheerful fortitude, without the leaft mixture of any thing irritable or querulous, agreeably to the placid and even tenor of his whole life. He had from the beginning of his malady a diftinet view of his diffolution, which he contemplated with that entire compofure which nothing but the innocence, integrity, and ufefulnefs of his life, and an unaffected fubmifion to the will of Providence, could beftow. In this fituation he had every confolation from family tendernefs, which his tendernefs to his family had always merited.
"Sir Jofhua Reynolds was, on very many accounts, one of the moft memorable men of his time: He was the firf Englifhman who added the praife of the elegant arts to the other glories of his country. In talte, in grace, in facility, in happy invention, and in the richnefs and harmony of colouring, he was equal to the great matters of the renowned ages. In portrait he went beyond them ; for he communicated to that defcription of the art in which Englifh artits are the moit engaged, a variety, a fancy, and a dignity, derived from the higher branches, which even thofe who profeffed them in a fuperior manner did not always preferve when they delineated individual nature. His portraits remind the fpectator of the invention of hiftory and the amenity of landfcape. In painting portraits, he appears not to be raifed upon that platform, but to defcend to it from a higher phere. His paintings illuftrate his leffons, and his leffons feem to be derived from his paintings.
" He poffeffed the theory as perfectly as the practice of his art. To be fuch a painter, he was a profound and penetrating philofopher.
" In full happinefs of foreign and dometic fame, admired by the expert in art, and by the learned in-fcience, courted by the grea!, careffed by fovereign powers, and celebrated by diftinguilhed poets, his native humility, modefty, and candour, never forfook him, even on furprife or provocation; nor was the leaft degree of arrogance or affumption vifible to the moft fcrutinizing eye in any part of his conduct or difcourle.
c: His talents of every kind-powerful from nature, and not meanly cultivated in letters-his focial virtues in all the relations and all the habitudes of life, rendered him the centre of a very great and unparalleled variety
of agrecable focieties, which will be diffipated by his death. He had too much merit not to excite fome jealoufy, too much innocence to provoke any enmity. The lofs of no man of his time can be felt with more fincere, general, and unmixed forrow."

REZAN, or Rezanskor, an ancient town of Ruffia, and capital of a duchy of the fame name, with an archbihnop's fee. It was formerly confiderable for its extent and riches ; but it was almoft ruined by the Tartars in 1568 . The country is populous, and was formerly governed by its own princes. . E. Long. 42.37. N. Lat. 54. 54.

RHADAMANTHUS, a fevere judge, and king of Lydia; the poets make him one of the three judges of hell.

RHAGADES, in medicine, denotes chaps or clefts in any part of the body. If feated in the anus, and recent, the patient mult fit fill, and fit over the feam of warm water. The epulotic cerate may alfo be applied. If the lips of thefe fiffures are callous, they muft be cut or otherwife treated as to become new ulcera. tions.

RHAMA, or RAMA, an incarnate deity of the firf rank, in Indian mythology. Sir William Jones believes he was the Dionyfos (A) of the Greeks, whom they named Bromius, without knowing why; and Bugenes, when they reprefented him horned, as well as Lyaios and Eleutherios the deliverer, and Triambos or Dythyrambos the triumphant. "Molt of thofe titles (fays Sir William) were Afiatic Re adopted by the Romans, by whom he was called Bruma, fearches, Tauriformis, Liber, and Triumphus; and both nationshad vol. i. records or traditionary accounts of his giving laws to p. 22r, \&c.e. men and deciding their contefts, of his improving ravigation and commerce, and, what may appear yet more obfervable, of his conquering India and other countries with an army of fatyrs, commanded by no lefs a perfonage than Pan ; whom Lillius Giraldus, on what authority I know not; afferts to have refided in Iberia ' when he had returned, fays the learned mythologit, from the Indian war, in which he accompanied Bacchus., It were fuperfluous in a mere effay to run any length in the parallel between this European god and the fovereign of Ayodhya, whom the Hindoos believe to have been an appearance on earth of the preferving power ; to have been a conqueror of the higheft renown, and the deliverer of nations from tyrants, as well as of his confort Sita from the giant Ravan king of Lanca; and to have commanded in chief a numerous and intrepid race of thofe large monkeys, which our naturalits, or fome of them, have denominated Indian fatyrs: his general, the prince of fatyrs, was named Hanumat, or " with high cheek bones;" and, with workmen of fuch agility, he foon raifed a bridge of rocks over the fea, part of which, fay the Hindoos, yet remain; and it is probable the feries of rocks to which the Muffulmans or the Portuguefe lave given the foolifh name of $A d a m$ 's (it fhould be called Rama's) bridge. Might not this army
(A) The learned prefident, whofe death will be lamented by every fcholar, by the orientalift and the divine efpecially, imagines, that this would fully appear from comparing together the Dionyfaca of Nonus and the Ramayan of Valmic, the firt poet of the Hindoos. He adds, that, in his opinion, Rhama was the fon of Cufh, and that he might have eftablifhed the firlt regular government in that part of Afia, in which his exploits are faid to have been performed.

## R H A $\quad[203] \quad$ R H A

Rhama, army of fatyrs have been only a race of mountaineers, Nhamnus. $\underbrace{\text { Rhamnus. }}$ whom Rama, if fuch a monarch ever exifted, had civilized? However that may be, the large breed of Indian
apes is at this moment held in high veneration by the Hindoos, and fed with devotion by the Brahmans, who feem in two or three places on the banks of the Ganges to have a regular endowment for the fupport of them : they live in tribes of three or four hundred, are wonderfully gentle (I fpeak as an eye-witnefs), and appear to have fome kind of order and fubordination in their little fylvan polity." The feltival of Rhama is held on the gth day of the new moon of Chaitra, on which the war of Lauca is dramatically reprefented, concluding with an exhibition of the fiery ordeal, by which the visior's wife Sita gave proof of her connubial fidelity. Among the Hindoos there are a variety of very fine dramas of great antiquity on the ftory of Rhama.

There are three Rhamas mentioned in the Indian mythology, who, together with Crifhna, the darling god of the Indian women, are defcribed as youths of perfes beauty. The third Rhama is Criffina's elder brother, and is confidered as the eighth Avatar (в), invelted with an emanation of his divine radiance. Like all the Avatars, Rhama is painted with gemmed Ethiopian or Parthian coronets; with rays encircling his head, jewels in his ears, two necklaces, one ftraight, and one pendant on his bofom, with dropping gems ; garlands of well-difpofed many-coloured fowers, or collars of pearls, hanging down below his waif ; loofe mantles of golden tiffue or dyed filk, embroidered on the hems with flowers elegantly thrown over one fhoulder, and folded like ribbands acrofs the breaft; with bracelets, two on one arm and on each wrift: all the A vatars are naked to the waifts, and uniformly with dark azure flefh, in allufion probably to the tint of that primordial fluid on which Narayan moved in the beginning of time; but their fkirts are bright yellow, the colour of the curious pericarpium in the centre of the water-lily.

RHAMNUS, the buckThorn, in botany: A genus of the monogynia order, belonging to the pentandria clafs of plants ; and in the natural method ranking under the 43 d order, Dumofe. The calyx is tubulous, with five minute fcales furrounding the famina; there is no corolla; the fruit is a berry. There are $27 \mathrm{fpe}-$ cies; of which the moft remarkable are,
I. The catharticus, or common purging buckthorn, growing naturally in fome parts of Britain. This grows to the height of 12 or 14 feet, with many irregular branches at the extremities. The leaves are oval-lanceolate, finely ferrated on the edges, their nerves converging together. The flowers grow in clufters, one on each foottalk, white, and in this Species divided into four fegments : the fruit is a round black berry, containing four feeds. The juice of the berries is a
ftrong purgative, and is made ufe of for making the Rhamus. common fyrup of buckthorn kept in the fhops. The bark is emetic : the juice of the unripe berries with alum dyes yellow, of the ripe ones a fine green; the bark alfo dyes yellow. The green colour yielded by the berries, called by the French verde-veflie, is much efteemed by miniature painters.

Of this fpecies there are two varieties, viz. the dwarf buckthorn, a fhrub of about a yard high, of a greenifh colour but little fhow ; and the long-leaved dwarf buckthern, which is a larger fhrub, with leaves fomewhat larger, but in other refpects very fimilar to the dwarf buckthorn.
2. The zizyphus is the fpecies in which the lac infect * forms its cells, and produces the wax called gumlac. See Lacca.
3. The lotus has the leaves, prickles, flowers, and fruit, of the zizyphus or jubeb; only with this difference, that the fruit is here round, fmaller, and more lufcious, and at the fame time the branches, like thofe of the paliurus, are neither fo much jointed nor crooked. The fruit is in great repute, taftes fomething like gingerbread, and is fold in the markets all over the fouthern diftricts of Great Britain. The Arabs call it aneb enta el feedra, or the jubeb of the feedra; which Olavus Celfius had fo high an opinion of, that he has defcribed it as the dudaim of the fcriptures. This fpecies is very common in the Jereede and other parts of Bombay; and has been fuppofed by fome to be the fame plant with that celebrated by Homer for its enchanting property; though the latter is more generally fuppofed to have been a fpecies of Drospyros (which fee). It is proper, however, to diftinguifh between both thefe fhrubs and an herb often mentioned by the ancients under the name of lotus, which Homer mentions as being fed upon by the horfes of Achilles, and Virgil as proper to increafe the milk of theep (fee Lotus). They are alfo different from the Egyptian lotus defcribed by Herodotus; for which fee NymPHeA.
4. The frangula, or berry-bearing alder, is a deciduous fhrub, a native of England and molt of the northern parts of Europe, and affords feveral varieties.
5. The Alpine, rough-leaved frangula, or berrybearing alder, is alfo a deciduous fhrub, and native of the Alps. It differs in no refpect from the common fort, except that it has no thorus, and that it will grow to be rather taller, with tough, large, and doubly laciniated leaves. The fmooth-leaved alpine frangula is a variety of this fpecies, with fmooth leaves and of a lower growth.
6. The paliurus, or thorn of Chrift, is a deciduous fhrub or tree, a native of Paleftine, Spain, Portugal, and Italy. It will grow to nearly the height of 14

C c 2
feet,
(в) Avatar means the defcent of the deity in his capacity of preferver. The three firf of thefe defcents relate to fome fupendous convulfion of our globe from the fountains of the deep, and the fourth exhibits the miraculous punifhment of pride and impiety, appearing to refer to the deluge. Three of the others were ordained for the ovelthrow of tyrants or giants. Of thefe Avatars we have mentioned in the text, that Rhama is the eighth; Buddha, who appears to have been a reformer of the doctrines contained in Vedas, is the ninth : the tenth Avatar, we are told, is yet to come, and is expected to appear mounted (like the crowned conqueror in the Apocalypfe) on a white horfe, with a fcimeter blazing like a comet to mow down all incorrigible and impenitent offenders who ghall then be on the earth.

## R H A

Rhamnus, feet, and is armed with fharp thorns, two of which are Rhanphaftos. at each joint, one of which is about half an inch long, ftraight, and upright ; the other is fcarcely half that length, and bent backward; and between them is the bud for next year's fhoot. June is the time of flower. ing, and the flowers are fucceeded by a fmall fruit, furrounded by a membrane. "This plant (fays Hanbury) is undoubtedly the fort of which the crown of thorns for our Bleffed Saviour was compofed. The branches are very pliant, and the fines of it are at every joint ftrong and harp. It grows naturally about Jerufalem, as well as in many parts of Judxa; and there is no doubt that the barbarous. Jews would make choice of it for their cruel purpofe. But what farther confirms the truth of thefe thorns being then ufed, are the ancient pictures of our Bleffed Saviour's crucifixion. The thorns of the crown on his head exactly anfwer to thofe of this tree; and there is great reafon to fuppofe thefe were taken from the earlieft paintings of the Lord of Life: and even now our modern painters copy from them, and reprefent the crown as compofed of thefe thorns. Thefe plants, therefore, thould principally have a thare in thofe parts of the plantation that are more peculiarly defigned for religious retirement; for they will prove excellent monitors, and conduce to due reflection on and gratitude to 'Him who hath loved is, and has wathed us from our fins," "\&c.
7. The common alaternus is an evergreen tree, and native of the fouth of Europe. There are feveral varieties of this fpecies; the mof remarkable of which are the broad-leaved and the jagged-leaved alaternus, which have all been confounded with the phillyrea.
8. The infectorius, or narrow-leaved buckthorn, is an evergreen fhrub or tree, and native of Spain. It grows to the height of 10 or 12 feet, and fends forth feveral branches from the bottorn to the top. They are covered with a blackifh or dark-coloured bark, and each of them is terminated by a long fharp thorn. The fruit continues on the trees all winter, making a beautiful appearance among the narrow-cluftered leaves at that feafon.
9. The oleoides, or olive-leaved buckthorn, is an evergreen fhrub, and native of Spain, and grows to the height of 8 or io feet. It fends forth numerous branches, each of which is terminated by a long farp finine. The flowers are fmall, of a whitifh green colour, and are fucceeded by round black berries.

RHAMPHASTOS, in ornithology, a genus belonging to the order of pica. The bill is very large, and Cerrated outwardly. The noftrils are fituated behind the bafe of the beak; and in moft of the fpecies the feet are toed, and placed two forwards and two backwards. The tongue is long, narrow, and feathered on the edges. Mr Latham enumerates 15 different fecies; of which the toucans are the moft remarkable, and were formerly divided into four or five varieties, though Mr Latham makes them diltinet fpecies, of which we fhall only defcribe that called the red-beaked toucan.
Plate cecexpeves milar fhape, with a large head to fupport its monfrous bill: this bill, from the angles of the mouth to its point, is $f x$ inches and an half; and its breadth in the - thicken part is a little more than two. Its thicknefs
near the head is one inch and a quarter; and it is a Rhamlittle rounded along the top of the upper chap, the un- phatos. der fide being round alfo; the whole of the bill extremely flight, and a little thicker than parchment. The upper chap is of a bright yellow, except on each fide, which is of a fine fcarlet colour; as is alfo the lower chap, except at the bafe, which is purple. Between the head and the bill there is a black line of feparation all round the bafe of the bill; in the upper part of which the noftrils are placed, and are almoft covered with feathers; which has occafioned fome writers to fay that the toucan has no noftrils. Round the eyes, on each fide of the head, is a fpace of bluifh fkin , void of feathers; above which the head is black, except a white fpot on each fide joined to the bafe of the upper chap. The hinder part of the neck, the back, wings, tail, belly, and thighs, are black. The under fide of the head, throat, and the beginning of the breaft, are white. Between the white on the breaft, and the black on the belly, is a fpace of red feathers, in the form of a new moon, with its horns upwards. The legs, feet, and ckaws, are of an afh-colour ; and the toes ftand like thofe of parrots, two before and two behind.

It is reported by travellers, that this bird, though furnilhed with fo formidable a beak, is harmless and gentle, being fo eafily made tame as to fit and hatch its young in houfes. It feeds chiefly upon pepper, which it devours very greedily, gorging itfelf in fuch a manner that it voids it crude and unconcocted. This, however, is no objection to the natives from ufing it again: they even prefer it before that pepper which is frefh gathered from the tree; and feem perfuaded that the frength and heat of the pepper is qualified by the bird, and that all its noxious qualities are thus exhaufted.

Whatever be the truth of this report, nothing is more certain than that the toucan lives only upon a vegetable diet; and, in a domeftic flate, to which it is frequently brought in the warm countries where it is bred, it is feen to prefer fuch food to all other. Pozzo, who bred one tame, afferts, that it leaped up and down, wagged the tail, and cried with a voice refembling that of a magpie. It fed upon the fame things that parrots do ; but was moll greedy of grapes, which, being plucked off one by one, and thrown in the air, it would mof dexteroully catch before they fell to the ground. Its bill, he adds, was hollow, and upon that account very light, fo that it had but littla ftrength in fo apparently formidable a weapon; nor could it peck or ftrike fnartly therewith. But its tongue feemed to affit the efforts of this unwieldy machine: it was long, thin, and flat, not unlike one of the feathers on the neck of a dunghill cock; this it moved up and down, and often extended five or fix inches from the bill. It was of a flefh colour, and remarkably fringed on each fide with very fmall filaments exacly refembling a feather.

It is probable that this long tongue has greater Arength than the thin hollow beak that contains it. It is likely that the beak is only a kind of fheath for this peculiar inftrument, ufed by the toucan, not only in masing itfelf a nef, but allo in obtaining its provifion. Nothing is more certain, than that this bird builds its neft in holes of trees, which have been previoufly

## $\mathrm{RHA}[205] \quad \mathrm{R}$ H.E

Rhapis vioufly foooped out for this purpofe; and it is not very piody. likeiy that fo feeble a bill could be very ferviceable in working upon fuch hard materials.

Be this as it will, there is no bird fecures its young better from external injury than the toucan. It has not only birds, men, and ferpents; to guard againt: but a numerous tribe of monkeys, fill more prying, mifchievous, and hungry, than all the reft. The toucan, however, fcoops out its neft into the hollow of fome tree, leaving only a hole large enough to go in and out at. There it fits, with its great beak, guarding the entrance; and if the monkey ventures to offur a vifit of curiofity, the toucan gives him fuch a welcome, that he prefently thinks proper to pack off, and is glad to efcape with fafety.

This bird is unly found in the warm climates of South America, where it is in great requeft, both for the delicacy of irs flelh, which is tender and nourifhing, and for the beanty of its plumage, particularly the feathers of the brealt. The ikin of this part the Indians pluck off, and when dry glue to their cheeks; and this they confider as an irrefintible addition to their beauty.

RHAPIS, in botany: A genus of the monogynia order, belonging to the lexandria clafs of plants; and in the natural method ranking under the firt order, Palma. The calyx is a monophyllous trifid fpatha; the corolla monopetalous and trifid. There are two fpecies, viz. 1. Flabilliformis, or ground ratan, a native of China; 2. Arundinacea, fimple leaved rhapis, a native of Carolina.

RHAPSODI, Rhapsodists, in antiquity, perfons who made a bufinefs of finging pieces of Homer's poems. Cuper informs us, that the Rhapfodi ware clothed in red when they fung the Iliad, and in blue when they fung the Odyffey. They performed on the theatres, and fometimes frove for prizes in contefts of poetry, finging, \&c. After the two antagonilts had finifhed their parts, the two pieces or papers they were written in were joined together again: whence the name, vis. from pawro, fuo, and win canticum : but there feem to have been other Rhapfodi of more antiquity than thefe people, who compofed heroic poems or fongs in praife of heroes and great men, and fung their own compofitions from town to town for a livelihond; of which profeffion Homer himfelf is faid to have been. See Bard

RHAPSODOMANCY, an ancient kind of divinacion performed by pitching on a paffage of a poet at hazard, and reckoning on it as a prediction of what was to come to pafs. There were various ways of practifing this rhapfodomancy. Sometimes they wrote feveral papers or fentences of a poet on fo many pieces of wood, paper, or the like, fhook them together in an urn, and drew out one which was accounted the lot: fometimes they calt dice on a table whereon verfes were written, and that whereon the die lodged contained the prediction. A third manner was by opening a book, and pitching on fome verfe at firft fight. This method they particularly called the fortes Praneftina; and afterwards, according to the poet, made ufe of, fortes Homerica, fortes Firgiliana, \&c. See Sortes.

RHAPSODY, in antiquity, a difcourfe in verfe fung or rehearfed by a rhapfodif. Others will have rhapfody to fignify a collection of verfes, efpecially
thofe of Homer, which having been a long time difperfed in pieces and fragments, were at length by $\mathrm{p}_{\mathrm{i}}$ fiftratus's order digefted into books called rbatfodies, from pactow fui and of contioum. Hence, among moderns, rbapfody is alfo ufed for an affemblage of palfages, thoughts, and authorities, raked together from divers authers, to compofe fome new piece.

RHE, or Ree, a little ifland in the Bay of Bifcay, near the coalt of Aunis in France. It was taken during the war with France which ended in 1763 , in the expedition commanded by Hawke and Mordaunt.

RHEA americana. The American oftrich of authors has been frequently mentioned, but till of late years very imperfectly known; being blended by fome with other genera, although forming of itfelf a diftinct one, differing in many things from all others. The older writers, however, have kept it feparate. It does not occur to us whether any author has figured this bird except Nieremberg, whofe reprefentation conveys no jult idea, which is wonderful, as is to be met with in fufficient plenty in various parts of South America; nor has the bird itfelf made its appearance in the cabinets of collectors, until the one now in the Leverian mureum.
M. Bajon, in his Mem. fur Cayenne, gives a figure and defcription of the jabirus, and feems clear that this bird is no other than the oftrich of America. From this affertion, Mr Latham, in his Synop/is, leaves the matier undecided; but this author, in his Index Ornithol. from having met with the fpecimen above alluded to, and fupported in an account of its manmers given by Molina in his Hifl. Nat. du Chili, treats this matter on more certain grounds, fo as to enable us to give the following defcription.

In fize the American oftrich is very little inferior to the common one : the bill is floped not unlike that of a goofe, being flat on the top and rounded at the end: the eyes are black, and the lids furrifhed wi:h hairs: the head is rounded, and covered with downy feathers: the neck is two feet eight inches long, and feathered alfo: from the tip of one wing to that of the other extended, the length is eight feet; but from the want of continuity of the webs of the feathers, and their laxity of texture, the bird is unable to raife itfelf from the ground ; it is, however, capable of greatly affifing itrelf hy their motion in running, which it does very fwiftly : the legs are ftout, bare of feathers above the knees, and furnilhed with three toes, all placed forwards, each having a ftraight and ftout claw as in the caflowary; on the heel is a callous knob, ferving in place of a back toe: the general colour of plumage is dull grey mixed with white, inclining to the latter on the under parts: the tail is very fhort, and not conficuous, being entirely covered with long loofe and floating feathers, having origin from the lower part of the back and rump, and entirely covering it : the bill and legs are brown.

Molina obferves that this bird varies; the body in fome being white, in others black. In refpect to manners, it is faid to be a general feeder, but more fond of flies, which it catches with great dexterity, and will alfo, like the common oftrich, fwallow bits of iron and any other trafh offered to it. In common with the oftrich of the old world, it lays a number of eggs, from 40 to 60 , in the fand, each of them holding a guart;

Rhe;
Rhra.

$\qquad$ . ros

Rheedia but it differs from that bird in many particulars, efpé- were not unlike the Athenian rhetores. See Orán Rhetorlans
cially in wanting the callofity on the fternum, and fpars on the wing. With thefe lalt the common oftrich is known to defend itfelf : in defect of them, the one here treated of ufes the feet with fuch addrefs as to become at once a furious and dangerous antagonift. The female calls its young ones together with a kind of whiftling note fomewhat fimilar to that of a man: when young it is very tame, frequently following the firft creature it meets with. The felh of this bird is faid to be very unpalatable. It is found in various parts of South America, from Patagonia to Guiana, and is known by the name of Choique. We are lappy to be able to prefent our readers with an accurate drawing of the bird. See Plate CCCCXXXVII.

RHEEDIA, in botany: A genus of the monogynia order, belonging to the polyandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. The corolla is tetrapetalous; there is no calyx; and the fruit is a trifpermous berry.

RHEGIUM (anc. gebg.), fo very ancient a city as to be fuppofed to take its name from the violent burfting of the coaft of Italy from Sicily; thought to have been formerly conjoined (Mela, Virgil). A city of the Bruttii, a colony of Chalcidians from Euboea: a ftrong barrier oppofed to Sicily (Strabo) ; mentioned by Luke; furnamed Fulium (Ptolemy), from a frefh fupply of inhabitants fent thither by Augultus, after driving Sextus Pompeius out of Sicily (Strabo); and thus was in part a colony, retaining ftill the right of a municipium (Infcription). The city is now called Reggia, in the Farther Calabria.

RHEIMS, a city of France in Champagne, and capital of Rhemois. It is one of the moft ancient, celebrared, and largeft places in the republic, had an archbifhop's fee, whofe archbifhop was duke and peer of France. It is about four miles in circumference, and contains feveral fine fquares, well-builc houfes, and magnificent churches. It had a mint, an univerfity, and five abbeys, the moft fanous of which was that of St Remy. There are alfo feveral triumphal arches and other monuments of the Romans. It is feated on the river Vefie, on a plain furrounded by hills, which produce excellent wine. E. Long. 4. 8. N. Lat. 49. 14.

RHENISH wINE, that produced on the hills about Rheims. This wine, is much ufed in medicine as a folvent of iron, for which it is well calculated on account of its acidity. Dr Percival obferves, that it is the beff folvent of the Peruvian bark; in which, however, he thinks its acidity has no fhare, becaufe an additi $n$ of vinegar to water does not augment its folvent power.

RHETORES, amongt the Athenians, were ten in number, elefted by lot to plead public caufes in the fenate-houfe or affembly. For every caufe in which they were retained, they received a drachm out of the public money. They were fometimes called इweropon, and their fee $\pi 0 \cdot E$ wor $20 \cos 0$ or. No man was admitted to this office before he was 40 years of age, though others fay 30. Valour in war, piety to their parents, prudence in their affairs, frugality, and temperance, were neetfiary qu.llifications for this office, and every candidate underwent an examination concerning thefe virtues provious to the election. The orators at Rome
ror.
RHETORIANS, a fect of heretics in Egypt, fo denominated from Rketorius their leader. The diftinguifhed tenets of this herefiarch, as reprefented by Philaftrius, was, that he approved of all the herefies before him, and taught that they were all in the right.

RHETORIC, the art of feaking copioully on any fubject, with all the advantages of beauty and force. See Oratory.

RHEUM, a thin ferous humor, occafionally oozing out of the glands about the mouth and throat.

Rheum, Rhubarb: A genus of the monogynia order, belonging to the enneandria clafs of plants; and in the natural method ranking under the i2th order, Holora. cea. There is no calyx; the corolla is fexfid and perfiftent ; and there is one triquetrous feed. There are five fpecies, viz. i. The rhaponticum, or common rhubarb, hath a large, thick, flefhy, branching, deeplyfriking root, yellowifh within; crowned by very large, roundifh, heart-fhaped fmooth leaves, on thick, flightlyfurrowed foot-Atalks: and an upright ftrong ftem, two or three feet high, adorned with leaves fingly, and terminated by thick clofe fpikes of white flowers. It grows in Thrace and Scythia, but has been long in the Englifh gardens. Its root affords a gentle purge. It is however of inferior quality to fome of the following forts ; but the plant being aftringent, its young ftalks in fpring, being cut and peeled, are ufed for tarts. 2. The palmatum, palmated-leaved true Chinefe rhubarb, hath a thick flefhy root, yellow within; crowned with very large palmated leaves, being deeply divided into acuminated fegments, expanded like an open hand ; upright ftems, five or fix feet high or more, terminated by large fpikes of flowers *. This is now pro- * Sec Botaved to be the true foreign rhubarb, the purgative qua- ny, p. 439 . lity of which is well known. 3. The compactum, or and Plate Tartarian rhubarb, hath a large, flefhy, branched root, CVII. yellow within; crowned by very large, heart-fhaped fomewhat lobated, fharply indented, fmooth leaves, and an upright large ftem, five or fix feett high, garnifhed with leaves fingly, and brauching above; having all the branches terminated by nodding panicles of white flowers. This has been fuppofed to be the true rhubarb; which, however, though of fuperior quality to fome forts, is accounted inferior to the rheun palmatum. 4. The undulatum, undulated, or waved-leaved Chinefe rhubarb, hath a thick, branchy, deep-ftriking root, yellow within; crowned with large, oblong, undulate, fomewhat hairy leaves, having equal foot-ftalks, and an upright firm ftem, four feet high; garnifhed with leaves fingly, and terminated by long loofe fpikes of white flowers. 5. The Arabian ribes, or currant rhubarb of Mount Libanus, hath a thick flefhy root, very broad leaves, full of granulated proruberances, and with equal foot-ftalks, and upright firm ftems, three or four feet high, terminated by fpikes of flowers, fucceeded by berry-like feeds, being furrounded by a purple pulp. All thefe plants are perennial in root, and the leaves and ftalks are annual. The roots being thick, flefty, generally divided, ftrike deep into the ground; of a brownifh colour without and yellow within: the leaves rife in the fpring, generally come up in a large head folded tegether,

## R H E

$\underbrace{\text { Rheum. }}$ treether, gradually expanding themelves, having thick fcet-Ralks; and grow from one to two feet high, or more, in length ard breadth, fpreading all round: amidit them rife the hower.fent, which are garnifhed at each joint by one leaf, and are of ftrong and expeditious growth, attaining their tull height in June, when they flower ; and are fuccee ed by large triangular feeds, ripening in Auguit. S inue, lints of each fint merit culture in gardens for varisty; they will effect a fingularity with their luxuriant folinge, fpikes, and flowers: and as medical plants, they demand culture both for private and public ufe.
They are gencrilly propagated by feeds fowed in autumn toon after they are ripe, or early in the fpring, in any open bed of light deep eartl ; remarking, thote intendel for medical ufe fhould generally be lowed where they are to remain, that the roots, being not difturbed by removal, may giow large. Scatter the feeds thinly, either by broad-cillt all over the furface, and raked well in ;, in in thalls.w drills a foot $n$ nd half diftance, covering them near an inch deep. The plants will rife in the fipring, but not flower till the fecond or third year: when they, however, are come up two or three inches high, thin them to eight or ten inches, and clear out all weeds; though thofe defigned always to fand fould afie: wands be hoed out to a foot and a half or two fect diftuce: oblerying, if any are required for the pleafure grourd, \&e. for variety, they fhould be tranfplated whee they are to remain in autum, when then leaves decay, or early in fpring, before they fhoot: the others remaining whe fowed, muft have the ground kept clan between them; and in autumn, when the leaves and fialks decay, cut them down, and flightly dig the grourd beiween the rows of plants, repeating the fame work every year. The roots remaining, they increate in fize annually : and in the fecond or third year many of them will hoot up ftalks, flower, and perfect feeds; and in thiee or four years the roots will be arrived to a large five; though older roots are generally preferable for medical ufe.

In Mr Bell's Travels we have an account of fome curious particulars relating to the culture of rhubarb. He te:1s $\mathbf{u}$, that the beft thubarb grows m that part of E.ftern Tartany called Mongalia, which now ferves as a boundary between Ruffia and China. The marmots contribute greatly to the culture of the rhubarb. Wharever you fee 10 or 20 plants growing, you are fure of finding feveral burrows under the thade, of their broadpreading leaves. Perhips they may femetimes eat the leave, and routs of this plunt; howerer, it is probable the manure they leave abcut the roos contibutes not a little to is increate; and their calting up the earth, makes it thoot out young bads, and nut. tiply. Thus plat does not run, and fpread itelif, linc docks and chens of the fame fpecies; but grews in tuft, at utcertain difunces, as if the feeds had been droppen with cefign. It appears that the Nimyals never accounced ii worth cultivating ; but that The world is obliged to the narmots tor the quanities frattered, at i.midom, in many parts of this counay: for whitever part of the ripe feed happens to be bown amons the thick grafs, can very feldom reach we gound, but mut there wither and die; whereas, Gould it fil: anong the loofe carth thrown up by
a new plant.
After digging and gathering the rhubarb, tbe Mongals cut the large rocts into hali piece, in onder to make them dry more readily. In the nifisie of wery piece they fcoop a hole, through which a c. rd is drawn, in order to fufpec, them in aily convenient pice. They hang them for the moft part about ther tent, and fometimes on the borns of their hlecp. This is a molt perricious cult $m$, as it deflroys fome of the beft part of the root: for ail about the hole is roiten and ufdefs; whereas, were people rightiy informe.t how to dig and dry this plant, there would not be one poun? of retofe in an hundred; which would fave a great deal of tomble and expence, that much diminifh the pr fits on this commodity. At prefent, the dealurs in this aticle think thefe improvemerts not wirthy of ticir aten. tion, as their gains are more confiderable on this then on any other branch of trade. Perhaps the government may hereafter think it proper to make fone regulations with regard to this matter.
' wo forts of rhubarb are met with in the fhops. The firft is imported from Turkes and Ruyt., in roundifh pieces freed from the bark, with a hole through the middle of each : they are externally of a yollowh colour, and on catting appear varicgated wi.h lively reddif ftreaks. The other, which is lefs eftened, comes immediately from the E.alt Iadies, in longith picces, harder, heavier, and more compat than the foregoing. The filt fort, unlefs kept ve! y dry, is apt to grow mouldy and worm-caten; the feoond is lefs fubjeft to thefe inconveniences. Some of the more induftious artifts are faid to fil up the viom-hoies with certain mixtures, and to colvur the outide of the damaged pieces $u$ ith powder of the finer forts of rhubarb, and fometimes with cheaper materials: t is is of en fo nicely done, as effectuilly to impofe upon the buycr, unjefs he very carefully examincs each piece. The marks of good rhubarb are, that it be inm and folid, but not finty ; that it be cafily pulverifuble, and appear, when powdered, of a fine bright yellow colour ; that, upon being chewed, it impart to the fipitle a fif. fron tinge, without proving flimy or mucilaginous in the mouth. Is tafle is fivacrid, bitterifh, and fomewhat altingent ; the fmell lighty aromatic.

Rhubarb is a mild cathariic, which operates with. out violence or irritation, and may be given with fafety even to preguant women and children. Belides its purgative quality, it is celebrated for an afringent one, by which it frongthens the tone of the flomach and intthines, ant proves ufefal in diarrhœas and diforders. proceeding from a laity of the fibres. Rhubarb in fubtane operates more powerfully as a cathatio than any of the preparations of it. Watery tiictares pase more then the fritithous cas; whit the later continn in greater perfection the aromatic. attongent, and corroborating virtues of the habarb. The dote, when intended as a purgite, is from a fcruple to a dam or nore.

The Turky rinbab is, areng us, urverflly preferred to the Rels hata fort, though this ide is for fome puppofes at leaft çual to the other; it is manifitly more altringen, but has fomewhat lets of en aromatic flavour. Tinctures drawa ficm both with roctifed finit bave nearly the fame tatle : on dilliling

Rheum.
of the Eaft India rhubarb proved confiderably the Atrongeff.

Rhubarb has been cultivated of late in Britain with confiderable fuccefs, and for medical purpofes is found to equal that of foreign growth, as is proved by the Tranfactions of the London Society for encouraging Arts, Manufactures, and Commerce, who have reward. ed feveral perfons both for cultivating and curing it. In the Tranfactions for $1 \% 92$, the gold medal was adjudged to Sir William Fordyce, for raifing from feed in the year 179 r upwards of 300 plants of the true rhubarb or rheum palmatum of the London Pharmacopocia 1788 , which in the fecond and third weeks of October were tranfplanted into a deep loam, at four feet diltance from each other, according to rules laid down by the fociety. In 1793 it was judged to Mr Thomas Jones, from whofe papers we derive the following information.

After giving an accurate account of his experiments and obfervations, he concludes, that the feafon for fowing is the fpring about March or April, or in autumn about Auguft and September; that thofe plants which are raifed in the fpring fould be tranfplanted in autumn, and vice verfa; that they cannot have too much room; that room and time are effentially neceffary to their being large, of a good appearance, and perhaps to the increafe of their purgative qualities; that to effect thefe purpofes, the foil muft be light, loamy, and rich, but not too much fo, left the roots. fhould be too fibrous; that their fituation can fcarcely be too dry, as more evils are to be expected from a fuperabundancy of moifture than any actual want of it: and lafly, we may conclude, that in particular the injuries which they are fubject to are principally during their infancy, and to be imputed to infects and inattention to the planting feafon; afterwards, from too great an expofure to froft: but that none can be dreaded from heat; and that in general they are hardy and eafy of cultivation, when arrived beyond a certain term.

The method of curing rhubarb, as propofed by Dr Tirruogel of Stockholm, is as follows: "No roots fhould be taken up till they have been planted ten years: they fhould be taken out of the ground either in winter, before the froft fets in, or in the beginning of fpring, and immediately cut into pieces, and carefully barked; let them befpread upon a table for three or four days, and be frequently turned, that the juices may thicken or condenfe within the roots. After this procefs, make a hole in each piece, and put a thread through it; by which let them hang feparately, either within doors, or in fome fheltered flady fhed. Some perfons dry them in a different way : they inclofe the roots in clay, and make a hole in the clay, about the thicknefs of a goofe quill, and in this manner hang up each piece to dry feparately, that the moifure may not evaporate, nos the ftrength of the root be weakened. But the methods which the Tartars follow is a bad one : they dig the roots out of the deferts where they grow, bark ticm, and immediately fring them, and hang them, round the necks of their camels, that they may dry as they travel; but this greatly leffens the medicinal vitue of the root."

Mr Thomas Halley of Pontefract in Yorkthire, to whom the London Society voted the filver medal in

1793, informs us, that his father tried various experiments for curing rhubarb, as wafhing, brufhing, bark" ing, and peeling, and he dried them in the fun, on a kiln, in a ftove, or in a warm kitchen. But of the fuce cefs of all or either of thefe methods we have no acm count, owing to the death of Mr Halley's father. Fis fent, however, to them, five different fpecimens, which the Society acknowledges to be fuperior to any rhubarb hitherto cured in England, and produced to them. The roots fent, Mr Halley fays, were planted ; about the year 1781 in a light fandyifh foil, but were much neglected. They were taken up in the fpring of 1792 , and being thoroughly divefted of the adhering earth, were placed for fome weeks on the floor of a cool warehoufe: the fibres were then taken off, cut up, and dried on the flue of a green-houfe; but, from mifmanage ment, were entirely fpoiled. The prime roots were fevered in fmall pieces, peeled clean, and thoroughly cleared of every particle of unfoundnefs. Part was feparately laid in fieves, and the remainder perforated, Arung, and fufpended in fettoons from the cieling of a warm kitchen. The manner of dreffing confifts in paring off the external coat with a fharp knife, as thin and clean as polible, and then finifhing it off by a piece of fifh-fkin, with its own powder ; which powder may be procured from the chips and fmall pieces, either by grinding or pounding it in a large mortar.

In the year 1794 the Society adjudged the gold medal to Mr William Hayward of Hanbury, Oxfordfhire, for propagating rhubarb by offsets taken from the crowns of large plants, inftead of feeds, for the purpofe of bringing it to perfection in a fhorter time, which fully anfwered his expectations. Mr Hayward was a candidate in the year 1789 for the gold medal ; but having mifunderttood their rules, he was not entitled to it, though with great propriety they voted to him the filver medal ; in confequence of which he fent them his method of culture and cure. His method of cultivating Turkey rhubarb from feed is thus explained to the Society: "I have ufually fown the feed about the beginning of February, on a bed of good foil (if rather fandy the better), expofed to an eaft or weft afpect, in preference to the fouth; obferving a full fun to be prejudicial to the vegetation of the feeds, and to the plants whilit young. The feeds are beft fown moderately thick (broad-caft), treading them regularly in, as is ufual with parfinips and other light feeds, and then raking the ground fmooth. I have fometimes, when the feafon has been wet, made a bed for fowing the rhubarb feeds upon, about two feet thick, with new dung from the fable, covering it near one fuot thick with good foil. The intent of this bed is not for the fake of warmth, but folely to prevent the rifing of earthworms, which, in a moft feafon, will frequently deftroy the young crop. If the feed is good, the plants often rife too thick; if fo, when they have attained fix leaves they fhould be taken carefully up (where too clofe), leaving the ftanding crop eight or ten inches apart: thofe taken up may be planted at the fame diftance, in a frefh fpot of ground, in order to furnifh other plantations. When the plants in general are grown to the fize that cabbage-plants are ufually fet out for a ltanding crop, they are beft planted where they are to remain, in beds four feet wide, one row along the middle of the bed, leaving two yards diftance between the plants,

Rheum:

## R H E [200 $] \quad$ R H I

退heum.
plants, allowing an alley between the beds about a foot wide, for conveniency of weeding the plants. In the autume, when the decayed leaves are removed, if the fhoveligg of the alleys are thrown over the crowns of the plauts, it will be found of fervice.

His mode of cuitivating the fame plant by offsets is thus given: "On taking up fome planes the hat fprine, I flipped off feveral offisets from the keads of large plants: thefe I fet with a dibble about a loot apart, in order, if I found them thrive, to remove them into st ther beds. On examining them in the autumn, I was furprifed to fee the progrels they had made, and pleafed to be able to furnifh my beds with 40 plants in the molt thriving ftate. Though this was my firf experiment of its kind, I do not mean to arrogate the difcovery to myfelf, having known it recently tried by others, but without being informed of their fuccefs. I have reafon to think this valuable drug will, by this method, be brought much fooner to perfection than from feed."

His method of curing rhubarb is thus defcribed: "The plants may be taken up either early in the fipring, or in autumn, when the leaves are decayed, in dry weather if pollible, when the roots are to be cleared from dirt (without wafhing) : let them be cut into pieces, and with a fharp knite freed from the outer coat, and expofed to the fun and air for a few days, to render the outide a little dry. In order to accelefiate the coring of the largeit pieces, a hole may be fcooped out with a penknife: thefe and the fmaller parts are then to be ftrung on packthread, and hung up in a warm room (I have always had the conveniency of fuch a one over a baker's oven), where it is to remain till perfectly dry. Each piece may be rendered more fighlly by a common file, fixing it in a fmall vice during that operation : afterwards rub over it a very fine powder, which the fmall roots furnifh in beautiful perfection, for this and every other purpofe where rhubarb is required."

In the year 1794, too, the Society adjudged the gold medal to Mr Ball for his method of curing the true rhubarb, which is as follows: "I take the roots up when I find the ftalks withering or dying away, clean them from the earth with a d: $\overline{\text { brufh, cut them in fmall }}$ pieces of about four Cr five inches in breadth, and about two in depth, taking away all the bark, and make a hole in the middle, and fring them on packthread, keeping every piece apart ; and every morning, if the weather is clear and fine, I place them in the open part of the garden, on ftages, erected by fixing fmall poits about fix feet ligh in the ground, and fix feet afunder, into which I fix horizontal pegs, about a foot apart, beginning at the top; and the rhubarb being fringed crofswife on lmall poles, I place them on thefe pegs; io that if it thould rain, I could eafily remove each pole with the fufpended pieces, into any covered place. I never Suffer them to be out at night, as the damps at this feaion would be apt to mould them; and if at any time I wrecive the leaf mark of mould, I rub it off with a dry cioth. In fome of the pieces of rhubarb which I have curd this year, I have made holes about half an inch diameter in the middle, for the free paffage of air, and

Vol. XVI.
have found that every one of there pieces dried better than the others where no fuch holes wore made; and have ihewife bung feveral ftengs in the kitchen, and never expofed them in the open $i_{i}$, and $f$ und them to dry exceedingly well, and much betier than th fe in the ope air. Some years fince I dricd a quatiey of rho virb on a malt-kiln, keeping up the therm meter to 80 degree, which anfivercd will, but I hink tathe: dried too quick: the roots which I have cured this year are a part of the plantat $n$ of 1789 , and for which the Society was fo kind as to give me a medal (A)."

RHEXIA, in botany: A genus of the monegynia order, belonging to the octandria clats of plants; and in the natural method ranking with thor of the 17 th order, Caiyconthema. The calyx is quadrifid, with four petals inferted into it ; the antheræ are declining; the capfule is quadrilocular, within the belly of the calyx.

RHINANTHUS, in botany: A genus of the angiofpermia order, belonging to the didynamia clafs of plants; and in the natural method ranking under the 4oth order, Perfonata. The calyx is quadrifid, and ventricofe; the capfule bilocular, obtufe, and compref. fed.

RHINE, a large river of Germany, famous both in ancient and modern hiftory. It rifes among the Alpes Lepontix, or Grifons; and firlt traverfing the Lacus Acronius, divides the Rhæti and Vindelici from the Helvetii, and then the Germans from the Gauls and Belgæ; and running from fouth to north for the greateft part of its way, and at length bending its courfe welt, it emplies itfelf at feveral mouths (Cxfar) ; at three mouths into the German ocean, (Pliny); viz. the weftern, or Helius; the northern, or Fleuvus; and the middle between both thefe, which retains the original name, Rhonus : and in this Ptolemy agrees.Mela and Tacitus mention two channels, and as many mouths, the right and left; the former running by Germany, and the latter by Gallia Belgica: and thus alio Afinius Pollio, and Virgil ; the cut or trench of Drufus not being made in their time, whereby the middle channel was much drained and reduced, and therefore overlooked by Tacitus and Mela ; and which Pliny calls the Scanty. To account for Cxfar's feveral mouchs, is a matter of no fmall difficulty with the commentators; and they do it no ocherwife than by admitting that the Rhine naturally formed fmall drains or rivulets from itfelf; the cut of Drufus being long pofterior to him; in whofe time Afinius Pollio, quoted by Strabo, who agrees with him therein, affirmed that there were but two mouths, finding fault with thofe who made them more: and he mult mean the larger mouths, which emitted Laryer ftreams. The Romans, efpecially the poets, ufed the term Rbenus for Germany, (Martial).-At prefent, the river, after enter. ing the Netherlands at Schenkinhaus, is divided into feveral channels, the two largeft of which obrain the names of the Lech and the Waal, which running thro' the United Provinces, falls into the German ocean below Rotterdam.

Lower Circie of the $R_{\text {hine }}$, confifts of the palatinate of the Rhine, and the three ecclefiatical electorates, viz. thofe of Cologne, Mentz, and Triers.

Upper Circle of the RHINE, confifted of the landgraviates of Alface and Heffe, comprehending the Wateraw ; but now only Heffe can be accounted a part of Germany, Alace being long ago united to France.

RHINEBERG, a town of Germany, in the circle of the Lower Rhine, and diocefe of Cologne. It was in the poffefion of the French, but reltored to the archbifhop of Cologne by the treaty of Utrecht. It is feated on the Rhine, in E. Long. 6. 39. N. Lat. 51. 30.

RHINECK, a town of Germany, in the archbifhopric of Cologne, feated on the Rhine, E. Long. 7. 53. N. Lat. 50. 27.-There is another town of the dame name in Swifferland, capital of Rhinthal, feated on the Rhine, near the lake of Conftance, with a good caftle. E. Long. 9. 53. N. Lat. 47. 38.

RHINFELD, a fmall but ftrong town of Germany, in the circle of Suabia, and the beft of the four foreft-towns belonging to the houfe of Aultia. It has been often taken and retaken in the German wars; and is feated on the Rhine, over which there is a handfome bridge. E. Long. 7. 53. N. Lat. 47. 40.

RHINEGAU, a beautiful diftrict of the electorate of Mentz, is fituated on the Rhine, about three miles from the city of Mentz, and is fo populous that it looks like one entire town intermixed with gardens and vineyards. The Rhine here grows altonifhingly wide, and forms a kind of fea, near a mile broad, in which are feveral well wooded little inlands. The Rhinegau forms an amphitheatre, the beauties of which are beyond all defcription. At Walluf, the very high hills come nearly down to the river fide; from thence they recede again into the country, forming a kind of half circle, the other end of which is 15 miles off at Rudefheim, on the banks of the Rhinde. The banks of the river, the hills which form the circles, and the flopes of the great mountains, are thick fown with villages and hamlets. The white appearance of the buildings, and the fine blue flated roofs of the houfes playing amidit the various green of the landfcape, have an admirable effect. In the fpace of every mile, as you fail $t^{3}$ bwn the river, you meet with a village which in any other place would pafs for a town. Many of the villages contain from 300 to 400 families; and there are 36 of them in a fpace of 15 miles long and fix miles broad, which is the width of this beautiful amphitheatre. The deslivities of all the hills and mountains are planted thick with vineyards and fruit trees, and the thick wonded tops of the hills calt a gloomy borror over the otherwife chee fol landfcape. Every now and hen a row of rugged hills run directly duwn to the firore, and domineer majeftically over the leffer hills under them. On one of thefe great mountains, juft about the middle of the Khincgau, you meet with Fohannis.Berg, a village which produces fome of the beft Rhefin Before this village is a pretty little rifing, and near the banks of the river there is a very fine old caftle, which gives unfeakable majefty to the whole landfcape. Iodeed, in every village, you mett with fome or other karge builuing, which contributes very much to the deorecion of the whole. This country is indebted for its
riches to this femicircular hill, which protects it from Rhinegzo. the cold winds of the eaft and north, at the fame time that it leaves room enough for the fun to exercife his benign influences. The groves and higher flopes of the hills make excellent paftures, and produce large quantities of dung, which, in a country of this fort, is of ineftimable value.

The bank of the Rhine, oppofite to the Rhinegac, is exceedingly barren, and heightens the beauiy of the profpect on the other fide by the contralt it exhibits; on this fide, you hardly meet above three or four villages, and thefe are far diftant from each othor. The great interval between them is occupied by heaths and meadows, only here and there a thick bufh affords fome flade, and a few corn fields among the villages enliven the gloomy landfcape. The back ground of this country is the molt picturefque part of it. It is formed by a narrow gullet of mountains, which diminifh in perfpective between Rudefheim and Bing n. Perpendicular mountains and rocks hang over the Rhine in this place, and feem to make it the dominion of eternal night. At a difance, the Rhine feems to come out of this landfcape through a hole under ground; and it appears to run tedioully, in order to enjoy its courfe through a pleafant country the longer. Amidit the darknefs which covers this back ground, the celebrated Moufe tower feems to fwim upon the river. In a word, there is not any thing in this whole tract that does not contribute fomething to the beauty and magnificence of the whole; or, if I may be permitted the expreffion, to make the paradife more welcome. As you fail along the Rhine, between Mentz and Bingen, the banks of the river form an oval amphitheatre, which makes one of the richeft and molt picturefque landfcapes to be feen in Earope. The inhabitants of thefe regions are fome of them extremely rich, and fome extremely poor. The happy middle fate is not for countries the chief product of which is wine; for, befides that the cultivation of the vineyard is infinitely more troublefome and expenfive than agriculture, it is fubjected to revo. lutions, which in an inftant reduce the holder of land to the condition of a day-labourer. It is a great miffortune for this country, that, though sen rained by law, the nobility are, through connivance of the Elector, allowed to purchafe as much land as they pleate. The peafant generally begins by running in ceit for his vineyard ; fo that if it does not turn out well, he is reduced to day-labour, and the rich man extends his poffefficns to the great detriment of the country. There are feveral peafants here, who having incomes of 30 , 50 , or 100,000 guilders a-year, have laid afide the peafant, and affumed the wine-merchant ; but, fplendid as their fituation is, it does not compenfate, in the eyes of the humane man, for the fight of fo many poor people with which the villages fwarm. In order to render a country of this kin. profperous, the ftate finnuld appropriate a fund to the purpofe of maintainin: the peafant in bad years, and giviag him the affitance which his necelities, and his want of ready money, may from time to time make convenient.

The inhabitants of the Rhinegau are a handfome and uncommonly ftrnng race of men. You fee at the very firft afpect that their wine gives them neerry hearts and found bodies. They have a great deal of natural wit, and a vivacity and jocofenefs, which diftinguifhes them

Whinfels very much from their neighbours. You need only com-
$y$ Pare them with tome of thefe, to be convinced that the Rhinoceros drinker of wine excels the drinker of beer and water, both in body and mind, and that the inhabitant of the fouth is much fouter than he who lives in the north; for though the wine drinker may not have quite as much fleth as he who drinks orly beer, he has bet:er blood, and can bear much more work. Tacitus had already obferved this, in his treatife De moribus Germanorum. "The large and corpulent bodies of the Germans (fays he) have a great appearance, but are not made to lafl." At that time almolt all the Germans drank only water; but the mere drinking of wine has effected a revolution in feveral parts of Germany, which makes the prefent inhabitants of thefe countries very differenc from thofe defcribed by Tacitus. Black and brown hair is much commoner here than the white, which made the Germans fo famous in old Rome. "It will be eafily imagined (fays Baron Reifbach), that the monks fare particu:arly well in fo rich a country. We made a vifit to the prelate of Erbach. Thefe lordly monks, for fo in every refpect they are, have an excellent hunt, rooms magnificently furnihed, billiard tables, half a dozen beautiful finging women, and a ftupendous wine cellar, the well ranged batteries of which made me fhudder. A monk, who faw my aftonifhment at the number of the cafks, affured me, that, without the bengn influence which flowed from them, it would be totally impofible for the cloifter to fubifit in fo damp a fituation."
RHINFELS, a caftle of Germany, in the circle of the Lower Rhine, in a county of the fame name. It is looked upon as one of the molt important places feated on the Rhine, as well in regard to its ftrength as fituation. It is near St Goar, and built on a craggy rock. This fortrefs commands the whole breadth of the Rhine, and thofe who pafs are always obliged to pay a confiderable toll. In the time of war it is of great importance to be malters of this place. E. Long. 7. 43. N. Lat. 50.3 .

RHINLAN $L$, a name given to a part of South Holland, which lies on both fides the Rhine, and of which Leyden is the capital town.

RHINOCEROS, in zoology, a genus of quadrupeds belonging to the order of bellux. The name is entirely Greek; but thefe animals were totally unknown to the ancient Greeks. Aritotle takes no notice of them, nor any other Greek writer till Strabo, nor Roman till Pliny. It is probable they did not frequent that part of India into which Alexander had penetrated, Hince it was near 300 years after that Pompey brought them to Europe. From this time till the days of Reliogabulus, the rhinceros was frequently exhibited in the homan fipectucles; and he has often been tranfpreded into Lurope in more modern times; but they were long very ill reprefented, and very imperfectly deferibed, till fome that artived in London in 1739 and 1741 were infpected, by wiich the errors and caprices wi former writers were detected.

Thure are two fpecies of rhinoceros, the firlt of which is the :/ncormis, the length of which, Buffon
tells us, from the extremity of the manol? to the rit Rhinoceros gin of the $\mathrm{zai}, \mathrm{i}$ at alt iz fect, and the circumio Flute rence of the body is neary the fame. "The meno cocoxnvas ceros which came ta Lum in the yar 1739 was fent Buffon's fiom beagal. Though not above two years of a e, Natural the expence of his to d and jouney am unsed to nen Hiftory, L. 1000 Sterling. He was fed with rice, fugar, and vol v.p. hay. He had daily feven pounds of rice, mixed with 92 , \&c. three pounds of fugar, and divided into threa portions. Fle had likewife hay ard green herb, which latt he preferred to hay. His drink was water, of which he took large quantities at a time (A). He was of a peaceable difpolition, and allowed all pres of his body to be touched. When hungry, or ftruck by any perfon, he became mifchievous, and in both cafes nothing appeafed him but food. When enraged, he fprung torward, and nimbly raifed himfelf to a great height, pufhing at the fame time his lead furioully againft the walls, which he performed with amazing quicknefs, notwithitanding his heavy afpect and unwieldy mafs. I of ten obferved, fays Dr Parfons, thefe muvements produced by rage or impatience, efpecially in the mornings before his rice and fugar were brought to him. The vivacity and promptitude of his movements, Dr Parfons adds, led me to think, that he is altogether unconquerable, and that he could eafily overtake any man who thould offend him.
" This rhinoceros, at the age of two years, was not taller than a young cow that has never produced. But his body was very long and very thick. His head was difproportionally large. From the ears to the horn there is a concavity, the two extremities of which, namely the upper end of the muzzle, and the part near the ears, are conliderably railed. The horn, which was not yet above an inch high, was black, fmooth at the top, but full of wrinkles directed backward at the bafe. The noftrils are fituated very low, being not above an inch diftant from the opening of the mouth. The under lip is pretty fimilar to that of the ox; but th: upper lip has a greater refemblance to that of the horfe, with this advantageous difference, that the rhinoceros can lengthen this lip, move it from fide to fide, roll it about a ftaff, and feize with it any object he wilhes to carry to his mouth. The tongue of this young rhinoceros was foft, like that of a calf. His eyes had no vivacity: In figure they refembled those of the hog, and were fituated lower, or nearer the noftrils, than in any other quadruped. His ears are large, thin at the extremities, and contracted at their origin by $n$ kind of annular rugofity. The neck is very hort, and furrounded with two large folds of fkin. The fhoulders are very thick, and at their juncture there is another fold of fkin, which defcends upon the fore legs. The body of this young rhinoceros was very thick, and pretry much refembled that of a-cow about to bring forth. Between the body and crupper there is another fold, which defends upon the hind legs. Lafly, an. ocher fold tranfverfely furrounds the inferior part of the crupper, at fome diftance from the tail. The belly was large, and hung near the ground, particularly its middle part. The legs are round, thick, ftrong, and D d 2 ther
(A) "Ther food in a flate of nature is the groffeft herbs, as thifles and thorny fhrubs, which they prefer to the foft palture of the beft meadows; they are fond of the fugar cane, and eat all kinds of grain, but for flefh hey have no appotite."

## R H I [ 212$] \quad$ R H I

Rhinoccros their joint bended backwards. This joint, which, when the animal lies, is covered with a remarkable fold of the $\mathbb{i k i n}$, appears when he flands. The tail is thin, and proportionally fhort ; that of the rhinoceros fo often mentioned, exceeded not 16 or 17 inches in length. It turns a little thicker at the extremity, which is garnifhed with fome flort, thick, hard hairs. The form of the penis is very extraordinary. It is contained in a prepuce, or fheath like that of the horfe; and the firt thing that appears in the time of erection is a fecurd piepuce, of a flefh-colour, from which there iffues a hollow tube, in the form of a funnel cut and bordered fomewhat like a ficwer-de-luce, and conftitutes the glans and extremity of the penis. This anomalous glans is of a paler flefh colour than the fecond prepuce. In the rooft vigorous erection, the penis extends not above ei het inches out of the body; and it is eatly procured by rubbing the animal with a handful of fraw when he lies at his eafe. The direction of this organ is not ftraight, but bended backward. Hence he throws out his urime behind; and from this circumftance, it may be inferred that the male covers not the female, but that they unite with their cruppers to each other. The female organs are fituated like thofe of the cow ; and fhe exactly refembles the male in figure and groffnefs of body. The kin is fo thick and impenetrable, that when a man lays hold of any of the folds, he would imagine he is touching a wooden plank of half an inch thick ( B . When tanned, Dr. Grew remarks, it is exceffively hard, and thicker than the hide of any other terreftrial animal. It is everywhere covered more or lefs with incruftations in the form of galls or tuberofities, which are pretty fmall on the top of the neck and back, but become larger on the fides. The largeft are on the fhoulders and crupper, are fill pretty large on the thighs and legs, upon which they are fpread all round, and even on the feet. But between the folds the fkin is penetrable, delicate, and as foft to the touch as filk, white the external part of the fold is equally hard with the reft. This tender fkin between the folds is of a light flef colour; and the fkin of the belly is nearly of the fame colour and confiftence. Thefe galls or tuberotities fhould not be compared, as fome authors have done, to fcales. They are only fimple indurations of the ikin, without any regularity in their figure or fymmetry in their repective pofitions. The flexibility of the fkin in the folds enables the rhinoceros to move with facility his head, neck, and members. The whole body, except at the joints, is inflexible, and refembles a coat of mail. Dr Parfons remarks, that this animal liftened with a cleep and long continued attention to any kind of noife; and that, though ie was lleeping, eating, or obeying any other prefing demands of nature, he raifed his head, and liftened till the noife ceried."

Thef animals never affemble or march together in troops lise elephants. Being of a more folitary and fayage difoofition, they are more difficult to hunt and to overcome. They never attack men, however, except when they are provoked, when they are very fusious and formidatile; but as they fee only before them, and
not very hharply, and as they turn with great difficuly, Rhinoceros: they mar be eafily avoided. The fkin of thefe animals is fo extremely hard as to refift fabres, lances, javelins, and even muket balls, the only penerrable parts being the belly, the eyes, and about the ears. Hence the hunters generally attack them when they lay down to neep.Their flefh is confidered as excellent by the Indians and Africans, but efpecially by the Hottentots; and if they wre trained when young, they might be rendered domeftic, in which cafe they would multiply more eafily than the elephant. They inhabit Bengal, Siam, Co-chin-China, Quangfi in China, the illes of Java and Sumatra, Congo, Angola, Ethiopia, and the country as low as the Cape. They love fhady forefts, the neighbour hood of rivers, and marlhy places. They wallow in the mire like hogs, and are faid by that means to give fleeter in the folds of their flins to fcorpions, centipedes, and other infects This is denied by Buffon and Edwards, though the furgeon of the Shaftefbury had obferved in a rhinoceros, newly taken after having weltered in the mud, feveral infects concealed under the ply of the ikin. This carries with it every appearance of probability; for as the creature welters in mud, it is impolfible for it to do fo without bringing up with it fome of the infects which live in that mud; and when this is the cafe, it furely cannot be unnatural to fuppofe that they would fhelter themfelves under the plaits of the fkin. Mr Bruce had an opportunity of examining the fkin of a rhinoceros befure his muddy covering had been fcraped off, and faw under it feveral very large worms, but not of the carnivorous kind. He faw likewife feveral fmaller animals refembling ear-wigs, which he took to be young fcolopendra; and, though he fearched no farther, we mut certainly confider this as a proof of what the furgeon of the Shaftelbury related. Mr Bruce fuppofes, too, that they welter in mire, partly in order to fcreen themfelves by a caie of mud from the attacks of that mifchievous fly which infefts the animals of Abyffinia to fach a degree. "The time of the fly (fays he) being in the rainy feafon, the whole black earth turns into mire. In the night, when the fly is at reft, the rhinoceros choofes a convenient place, and there, rolling himfelf in the mad, he clothes himelf with a kind of cafe, which defends him azaint his enemy the following day. The winkles and plaits of his tkin ferve to keep this moddy plafter firm upon him, all but about his hips;' fhoulders, and legs, where it cracks and falls off by motion, and leaves him expofed in thofe places to the attacks of the fly. The itching and pain which follow occafien him to zab limfelf in thofe parts againft the rougheft trees; and this is at leaf one caufe of the puitules or tubecles which we fee upon thefe places, both on the elephant and rhinoceros." They bring forth only one young at a time, about which they are very folicitous. They are faid to confort with tygers; a flory founded mere); on their common attachment to the fides of rivets, by with means they are often found near each other. Thcir lkin , fleth, hoofs, teeth, and even dung, are ufed in India medicinally. The horn, efpeciaily that of a vi:gin rhinoceros, is confidered as an antidote againft poifon. Every horn,
(в) This Mr Bruce denies to be the cafe, and fufpects, where it does occur, that it is the etrear of difeafe, or of a diferent habit acquired by keeping. In their natural \&tate, he thinks they prevent this rigitity by wallowing in the med.

## $\mathrm{RHII}\left[\begin{array}{ll}213\end{array}\right] \quad \mathrm{R} \mathrm{H} \mathrm{I}$

Rhinseres horn, however, has not this property ; fome of them felling very cheap, while others are extremely dear.

Some writers are of opinion, that the rhinoceros is the unicorn of holy writ and of the ancients, and that the oryx or Indian afs of Arifotle, who fays it has but one horn, was the fame, his informers comparing the clumfy fhape of the rhinoceros to that of the afs.It was alfo the bos unicornis and fera monoceros of Pliny, both of which were of India; and in his account of the monoceros he exactly defcribes the great black horn and hog-like tail. The unicorn of Scripture is confidered as having all the properties of the rhinoceros, as rage, untameablenefs, great fwiftnefs, and valt Atrength. This opinion is molt ably fupported by Mr Bruse. "' The derivation of the Hebrew word reem (fays he, which in our verfion is tranflated aniconn, both in the Hebrew and the Ethic:pic, feems to be from erestnefs, er flanding fraight. This is certainly no particular quaity in the animal itfelf, who is not more or even fo much erect as many other quadrupeds, for in its knees it is rather crooked; but it is from the circumftance and manner in which its horn is placed. The horns of all other animals are inclined to fome degree of parallelifm with his nofe or os frontis. The horn of the rhinoceros is erect and perpendicular to this bone, on which it ftands at right angles, thereby poffeffing a greater purchafe or puwer, as a lever, than an horn could pofibly have in any other polition. The fituation of the horn is very happily alluded to in Scripture; 'My horn fhalt thou exalt like the hoin of an unicorn.' And the horn here alluded to is not wholly figurative, but was really an ornament worn by great men in the days of victory, preferment, or rejoicing, when they were anointed with new, fweet, or frefh oil ; a circumftance which David joins with that of erecting the horn.
"Some authors, for what reafon I know not, have made the re $\epsilon \mathrm{m}$, or unicorn, to be of the deer or antelope kind; that is, of a genus whofe very character is fear and weaknefs, directly oppofite to the qualities by which the reem is defcribed in Scripture : befides, it is plain that the reem is not of the clafs of cl.ata quadrupeds; and a late modern traveller very whimfically takes hum for the leviathan, which certanly was a fifh. Ba. laam, a prieft of Midian, and fo in the neighbourhood of the haunts of the rhincceros, and intimately connected with Ethiopia, (for they thentives were hopherds of that country), in a tranfort, fion erntemplating the trength of Ifrael, whom he was brountr to curie, fays, they had, as it wers, the ftrength or the reen. Job makes frequent allution to his grat Atrength, ferocity, and indocility. He afks, "wah the reem be wiling to ferve thee, or alide by thy crib ?" that is, Will he wilingly cume into thy fluble, and eat at thy manger ? And again, 'Canft thou bind the reem with a band in the fursow; and will he harrow the valleys for thee?'-In other worsis, Canlt thou make him go to the plough or harrows?
"The rhinoceros, in Geez, is called Arme Haric", and in the Amharic Auraris ; both which names lignify 'the large wild beaf with the born.' This would deem as if applied to the fpectis with one horn. On the other hand, in the countiy of tine Ehaingalla and in Jubia he
is called Gimamgin, or 'horn upon horn;' and thiswould Rhinoceros feem to denote that he had two. The Ethiopic text renders the word reem, 'Arwe-Harich;' and this the Septuagint tranflates monoceros, or unicorn. The principal reafon of tranflating the word unicorn rather than rhinoceros, is from a prejudice that he mult have had but one horn. But this is by no means fo well founded as to be admitted the only argument for eftablifhing the exiftence of an animal, which never has appeared after the fearch of fo many ages. Scripture fpeaks of the horns of the unicorn; fo that even from this circumftance the reem may be the rhinoceros, as the Afiatic, and part of the African rhinoceros, may be the unicorn."

The rhinoceros bicornis was long known in Europe merely by the double horns which were preferved in various cabinets ; and its exiftence, though now paft all doubt, has been frequently queftioned. Dr Sparman, in his voyage to the Cape of Good Hope, killed two of thefe animals, which he diffected, and very minutely defcribes. The horns, he fays, in the live animal, are fo mobile and loofe, that when it walks carelefsly along, one may fee them waggle about, and hear them clafh and clatter againft each other. In the Phil. Tranf. for 1793 , we have a defcription of the double-horned rhinoceros of Sumatra, by Mr Bell, furgeon in the fervice of the Ealt India Company at Bencoolen; and this account, though it differs confiderably from that of Sparman in fome particulars, we hall infert here." The animal (fays Mr Bell) herein defcribed was thot with a leaden ball from a mulket about ten miles from Fort Marlborough. I faw it the day after; it was then not in the lealt putrid, and I put it into the pofition from which the accompanying drawing was made. (See Plate ccccxuxvin.) It was a male; the height at the fhoulder was 4 feet 4 inches; at the facrum nearly the fame; from the tip of the nole to the end of the tail eight feet five inches.From the appearance of its teeth and bones it was but young, and probably not near its full fize. The fhape of the animal was much like that of the hog. The general colour was a brownifl ath; under the belly, between the legs and folds of the flain, a dirty flefh colour. The head much refembled that of the fingle horned shinoceros; the eyes were fmall, of a brown colour ; the atmbrana niditans thick and ftrong : the fkin furmonding the eyes was wrinkled ; the noltrils were wide ; tine upper lip was pointed, and hanging over the under.
"There were fix molares or grinders, on each fide of the upler and lower jaw, becoming gradually larger bakward, particularly in the upper; two teeth in the front of cach jaw; the tongue was quite fmooth; the ears were fanil and pointed, lined and edged with hort black hair, and finated like thofe of the fingle-horned annoceros. The horns were black, the larecr was piaced immediately above the nofe, pointing upwards, and was bent a little back; it was about iine inches long. The fmall horn was four inches long, of a pyramidal hape, flattened a little, and placed above the eyes, rather a little more forward, fanding in a line with the larger horn, immediately above it. They were both firmly a:tached to the ikull, nor was there any appearance of joint or mufcles to move them ( $c$ ). The neck was thick and fhort, the fkin on the under file thrown in-

## RHI [ 214 ] RHI

Rhinneeros to folds, and thefe folds again wrinkled. The body
was buiky and round, and from the fhoulder ran a line, or $f$ lf, as in the fin le-horned rhinoceros, though it was but faintly marked. There were feveral other tolds and wrinkles on the body and legs; and the a hole gave rather the appearance of foftnef: : the legs were thick, flort, and remarkably Itrong; the feet armed with three diftinet hoofs, of a blackifh colour, which furrounded half the foot, one in front, the others on each fide. The foles of the feet were convex, of a light colour, and the cuticle on them not thicker than that on the foot of a man who is ufed to walking; the tefticles hardly appeared externally; the penis was bent backward, and opened about 18 inches below the anus. At its origin it was as thick as a man's leg, and about two feet and a half long; the bend in it occafions the urine to be difcharged backwards. The glans is very fingular; the opening of the urethra is like the mouth of a cup with its brim bending over a little, and is about three quarters of an inch in diameter; the glans here is about half an inch in diameter, and continues that thicknefs for an inch and a half: it is then inferted into another cup like the firt, but three times as large ; the glans afterwards gradually becomes thicker, and at about nine inches from the opening of the urethra are placed two bodies on the upper part of the glans, very like the nipples of a milch-cow, and as large; thefe become turgid when the penis is erected; the whole of this is contained in the prepuce, and may be confidered as glavs. From the os pubis arifes a ftrong mufcle, which ioon becomes tendinous: this tendon is continued along the back or upper part of the penis; it is flattened, is about the fize of a man's little finger, and is inferted into the upper part of the glans, near the end. The ufe of this mufcle is to ftraiten the penis. On the under fide of the penis there are two mufcles, antagonifts to the above; they arife from the os ifchium flefhy, run along the lower fide of the penis, on each fide of the corpus fpongiofum, and are inferted flefly into the lower fide of the glans; the action of thefe mufcles will draw in the penis, and bend it. The male has two nipples, like the female, fituated between the hind legs; they are about half an inch in length, of a pyramidal form, rounded at the er.d.
"The whole fkin of the animal is rough, and covered very thinly with fhort black hair. The fkin was not more than one third of an inch in thicknefs at the ftrongeft part; under the belly it was hardly a quarter of an inch; any part of it. might be cut through with eafe by a common diffecting knife. The animal had not that appearance of armour which is obferved in the fingle-horned rhinoceros. Since I diffected the male, I have had an opportunity of examining a female, which was more of a lead colour: it was younger than the male, and had not fo many folds or wrinkles in its fkin; of courfe it had fill lefs the appearance of armour. The only external mark which diftinguifhes it from the male is the vagina, which is clofe to the anus; whereas in the male the opening for the genis is 18 inches below the anus."

From the difference between this account and Spar-
man's, which in fome particulars is confiderable, and Rbiuocereo from the difference of ihape, we are difpufed to think them varieties. Mr Bruce's drawing of the rhinoceros bicornis is unqueltionably a deception; the body of the animal, as there reprefented, correfponds exaety with that of the unicornis except in its having two horns on its head. In the mufeum of the late Dr William Hunter, the two-horned animal was preferved, agreeing exactly with the general accounts and figures we have of that animal, but differing effentially frum Mr Bruce's. For further particulars refpecting thefe curious animals, we refer to Buffon, vol. vi. P. 92-117; Sparman's Voyage to the Cape, vol. ii. chap. I2.; and Bruce's Travels, vol. iv. p. 296, \&c. and Appendix, p. 85, \&c.

Rhitymna. See Retimo.
RHIZOBALUS, in botany: A genus of the tetragynia order, belonging to the polyandria clafs of plants; and in the natural method ranking under the 23d order, Tribilate. The calyx monophy ilous, flefhy, and downy ; the corolla confifts of five petals, which are round, concave, flefhy, and much larger than the calyx; the ftamina are very numerous, filiform, and longer than the corolla ; the Atyli are f.ur, filiform, and of the length of the flamina; the pericarpium has four drupx, kidney-fhaped, compreffed with a flefhy fubflance infide, and in the middle a flat large nut containing a kidney-fhaped kernel. Of this there is only one fpecies, viz. Pekia. The nut is fold in the fhops as American nuts; they are flat, tuberculated, and kid-ney-fhaped, containing a kernel of the fame fhape, which is fweet and agreeable. Clufus gives a good figure of the nut, and Aublet has one of the whole plant.

RHIZOPHORA, the mangrove, or Mangle, in botany : A genus of the monogynia order, belonging to the d decandria clafs of plants; and in the natural method ranking under the 12 th order, Holoracee. The calyx is quadripartite, the corolla partite; there is one feed, very long, and carnous at the bafe. Thefe plants are natives of the Eaft and Weft Indies, and often grow 40 or 50 feet high. They grow only in water and on the banks of rivers, where the tide flows up twice a-day. They preferve the verdurc of their leaves throughout the year. From the loweft branches iffue long roots, which hang down to the water, and penetrate into the earth. In this pofition they refemble fo many arcades, from five to ten feet high, which ferve to fupport the body of the tree, and even to advance it daily into the bed of the water. Thefe arcades are fo clofely intertwifted one with another, that they form a kind of natural and traniparent terrace, raifed with fuch folidity over the water, that one might walk upon them, were it not that the branches are too much encumbered with leaves. The moft natural way of propagating thefe trees, is to fuffer the feveral fiender fmall filaments which iffue from the main branches to take root in the earth. The moft common method, however, is that of laying the fmall lower branches in bafkets of mould or earth till they have taken root.
The defcription jult given pertains chiefly to a particular fpecies of mangrove, termed by the Weft Indians
that once at a hunting match he fays the point of a rhinoceros's horn broken off by a mulket-fhot; the confequence of which was, that the creature was for a moment deprived of all appearance of life.

Rhizo-
phora, Rhodes.
dians black mangles, on account of the brown dunky colour of the wood. The bark is very brown, fmooth, pliant when green, and generally ufed in the Weft India iflands for tanning of leather. Below this bark lies a cuticle, or k in, which is lighter, thinuer, and more tender. The wood is neariy of the fame colour as the bark; hard, pliant, and very heavy. It is frequently ufed for fue!, for which purpofe it is faid to be remarkably proper : the fires which are made of this wood being both clearer, more ardent and durable than thofe made of any other materials whatever.-The wood is compact; almoft incorruptible; never flinters; is eafly worked; and were it not for its enurmous weight, would be commodioully employed in almoft all kinds of work, as it poffeffes every property of good timber. To the roots and branches of mangroves that are immerfed in the water, oylters frequently attach themfelves; fo that wherever this curious plant is found growing on the fea-fhore, oyfter-filhing is very eafy; as in fuch cafes thefe fhell-filh may be literally faid to be gathered upon trees.

The red mangle or mangrove grows on the feafhore, and at the mouth of large rivers; but it does not advance, like the former, into the water. It generally rifes to the height of 20 or 30 feet, with crooked, knotty branches, which proceed from all parts of the trunk. The bark is flender, of a brown colour, and, when young, is fmooth, and adheres very clofely to the wood; but when old, appears quite cracked, and is eafily detached from it. Under this bark is a fkin as thick as parchment, red, and adhering clofely to the wood, from which it cannot be detached till the tree is feiled and dry. The wood is hard, compact, heavy, of a deep red, with a very fine grain. The pith or heart of the wood being cut inro fmall pieces, and boiled in water, imparts a very beautiful red to the liquid, which communicates the fame colour to wool and linen. The great weight and hardnefs of the wood prevents it from being generally ufed. Fron the iruit of this tree, which, when ripe, is of a vi let colcur, and refembles fome grapes in tafte, is prepared an agreeable liquor, much efteemed by the inhabitants of the Cariblee iflands.

White mangle, fo termed from the cnlour of its wood, grows, like the two firmer, upon the banks of rivers, but is feldom found near the far. The batk is grey; the wood, as we have faid, white, and when green, $f u, p l e$; bur it dries as fon as cut down, and hecomes very light and britte. This pecies is generaily called rope-nangrous, from the ufe to which the bark is applied by the inhabitants of the Weft Indies. This bark, which, by realon of the gre it abuniance of lap, is eafily detached when green from the wood, is beaten or bruifed betwixt two ftones, until the hard and woody part is totally feparated from that which is Iofi and tender. This laft, which is the true cortical fubftance, is twifted into ropes of all tizes, which are exceedingly
xames and the largeft and molt eafierly of the Cyclades, wis otynology known in ancient times by the names of Afieria. $O$ phiafa, IEbrcea, Trinacria, Corymia, Posffa, Atabyrit, Marcia, Olo. fa, Stadia Tcithinis, Pelagia, and Rbodus. In latir ages, the nami of Rloolus, or $R$ bodes, prevailed, from the Greek word tholen, as is commonly fup-
pofed, fignifying a " rofe;" the ifland abounding very much with thefe flowers. Others, however, give different etymologies, among which it is difficult to find one preferable to another. It is about 20 miles diftant from the coafts of Lycia and Caria, and about 120 miles in compafs.

Several ancient authors affert, that Rhodes was for- Its origin, merly covered by the fea, but gradually raifed its head above the waves, and became an ifland. Delos and

Rhodes (fays Pliny), iflands which have long been * celebrated, fprung at firlt from the fea. The fame fact is fupported by fuch a variety of other evidence as render it indubitable. Philo + afcribes the event to the
"Pliny,
lib. 2. lib. 2.
cap. 87. cap. 87. ${ }^{+}$Philo de. Mundo. decreafe of the waters of the ocean. If his conjecture be not without foundation, moft of the illes of the Archipelago, being lower than Rhodes, mult have had a fimilar origin. But it is much more probable that the volcanic fires, which in the fourth year of the 135 th O . lymp:ad, raifed Therafia and Thera, known at prefent by the name of Santorin, from the depths of the fea, and have in our days thrown out feveral fmall inlands adjacent, alfo produced in fome ancient era Rhodes and Delos.

The firf inhabitants of Rhodes, according to Dio. Firft inham dorus Siculus, were called the Telcbine, who came ori- bitants. ginally from the ifland of Crete. Thefe, by their fkill in aftrology, perceiving that the ifland was foon to be drowned with water, left their habitations, and made room for the Heliades, or grandfons of Phobus, who took poffeflion of the illand atter that god had cleared it from the water and mud with which it was overwhelmed. Thefe Heliades, it feems, excelled all other men in learning, and efpecially in aftrology; invented navigation, \&c. In after ages, however, being infefte.t with great ferpents which bred in the inland, they had recourfe to an oracle in Deli s, which adviled them to admit Phorbas, a Thefiflian, with his followers, into Rhodes. This was accordingly done; and Phorbas having deftroyed the ferpents, was, after his death, honoured as a demigod. Afterwards a colony of Cretans rettled in fome part of the ifland, and a little before the Trijan war, Tlep linius the fon of Hercules, who was made king of the whole illand, and governed with grear jatice and moderation.

After the Trojan war, all the ancient inhabitants were driven cut by the Dorians, who continued to be matters of the illand for many ages. The government virs at firit monarchical ; but a little before the expedition of Xuxes into Greece, a republican form of govirnment was itroduced; during which the Rhodians arplied themfelves to navigation, and became very po veriul by fea, planting feveral colonies in diltant countries. In the time of the Peloponnefian war, the republic of Rhodes was rent in two factions, one of whicn favoured the Athenians, and another the Spartans; but at leneth the latter prevailing, democracy was abolifhed, and an ariltocracy introduced. About $351 \mathrm{~B} . \mathrm{C}$. we find the Rhodians opprefled by Maufo. lus king of Caria, and at laft reduced by Artemifia bis widow. In this emergency, they applied to the Athenians; by whole atilitance, probabiy, they regained heir liberty.

For this time to that of Alexander the Great, the Subuit to Rhodians enjoye 3 an uninterrupted tranquillity. To Alexander, him they voluntarily fubmitted; and were on that ac.
count dafterhis

## R HO

age at that time, he committed the whole management of the war to his fon Demetrius, who appeared beture the city of lKhodes witi 200 dhips of war, i yo tran:ports having on board 40,000 men, and 1000 other ficged by veffels laden with prwifions and all forts of warlike en- Demetrius, gines. As thodes had enjoyed for many years a profound tranquillity, and been free from all devaftations, the expectation of booty, in the plunder of fo wealthy a city, allured multitudes of pirates and mercenaries to join Demetrius in this expedition; infomuch that the whole fea between the continent and the ifland was covered with hips; which Aruck the Rhodians, who had a profpect of this nighty armaca from the walls, with great terror and coniternation.

Demetrius, having landed his troops without the reach of the enemy's machines, detached feveral imall bodies to lay wafte the country round the city, and cut down the trees and groves, empluying the timber, and materials of the huufes without the walus, to fortify his camp with ftrong ramparts and a treble palifade; which work, as many hands were employed was finifhed in a few days. The Rhodians, on their part, prepared for a vigorous defence. Many great commanders, who had ignalized themfelves on orher occafions, The inhae ers, who had ingnalized themfelves on other occafions, hitantspre.
threw themfelves into the city, being defirous to try pare for a their 1 kill in military affairs againgt Demetrius, who was vigorous reputed one of the molt experienced captains in the defence. conduct of fieges that antiquity had produced. The befieged began with dimifing from the city all fuch perfons as were ufelefs; and then taking an account of thofe who were cdpable of bearing arms, they found that the citizens amounted to 6000, and the foreigners to 1000 . Liberty was promifed to all the flaves who fhould ditinguilh themfelves by any glorivas action, and the public engaged to pay the mafters their jull ranfom. A proclamation was likewife made, declaring, that whoever died in defence of their country thould be buried at the expence of the public; that his parents and children fhould be maintained out of the treafury; that fortunes thould be given to his daughters; and his fons, when they were grown up, hould be crowned and prefented with a complete fuit of armour at the great folemnity of Bacchus; which decree kindled an incredible ardour in all ranks of men.

Demetrius, having plarited all his engines, began to Engines of batter with incredible fury the walls on the fide of the Demetrius harbour ; but was for eight days fucceflively repulfed burat. by the befieged, who fet fire to moft of his warlike engines, and thereby obliged him to allow them fome refpite, which they made good ufe of in repairing the breaches, and building new walls where the old ones, were either weak or fow. When Demetrius had repaired his engines, be ordered a general aflauit to be made, and cauled his troops to advance with loud thouts, thinking by this means to ftrike terror into the enemy. But the befieged were fo far from being intimidated, that they repulfed the aggreffors witb great llaughter, and performed the moft aftonifing feats of brivery. Demetrius returned to the aifault neat day; but was in the fame manner forced to retire, after having lof a great number of men, and fome officers of diftinction. He had feized, at his Grft landing, an eminence at a fmall diftance from the city; and, having fortified this advantageous poft, he cauded feveral batteries to be erected there, with engines, which inceffantly difcharged

## R H O

Rhodes. againft the walls ftones of 150 pounds weight. The towers, being thus furioufly battered night and day, began to totter, and feveral breaches were opened in the walls: but the Rhodians, unexpectedly fallying out, drove the enemy from their poft, everturned their machines, and made a moft dreadful havock ; infomuch that fome of them retired on board their veffels, and were with much ado prevailed upon to come alhore perate af themetrius now ordered a fcalade by fea and land at fame time ; and fo employed the befieged, that out fuccefs. they were at a lors what place they fhould chiefly defend. The attack was carried on with the utmoft fury on all fides, and the befieged defended themfelves with the greateft intrepidity. Such of the enemy as advanced firlt were thrown down from the ladders, and miferably bruifed. Several of the chief officers, having mounted the walls to encourage the foldiers by their example, were there either killed or taken prifonexs. After the combat had lafted many hours, with great flaughter on both fides, Demetrius, notwithflanding all his valour, thought it neceflary to retire, in order to repair his engines, and give his men fome days reft.

Demetrius being fenfible that he could not reduce the city till he was mafter of the port, after having
 the fortifications which defended the entry into the harbour. When he came within the caft of a dart, he caufed a valt quantity of burning torches and firebrands to be thrown into the Rhodian fhips, which were riding there; and at the fame time galled, with dreadful fhowers of darts, arrows, and ftones, fuch as offered to extinguifh the flames. However, in fite of their utmoft efforts, the Rhodians put a ftop to the fire; and, having with great expedition manned three of their Itrongelt fhips, drove with fuch violence againft the veffels on which the enemy's machines were planted, that they were fhattered in pieces, and the engines difmounted and thrown into the fea. Exceftus the Rhodian admiral, being encouraged by this fuccefs attacked the enemy's fleet with his three fhips, and funk a great many veffels; but was himfelf at laft taken prif ner: the other two veffels made their efcape, and regained the port.

As unfortunate as this laft attack had proved to Demetrius, he determined to undertake another; and, in order to fucceed in his attempt, be ordered a machine of a new invention to be built, which was thrice the height and breadth of thofe he had lately loft. When the work was finifhed, he caufed the engine to be placed near the port, which he was refolved, at all adventures, to force. But as it was upon the point of entering the harbour, a dreadful Itorm arifing, drove it againft the thore, with the veffels on which it had been reared. The befieged, who were attentive to improve all favourable conjunctures, while the tempelt was till raging, made a fally againt thofe who defended the cminence mentioned abore; and, though repulfed feveral times, carried it at lalt, obliging the Demetrians, to the number of 400 , to throw down their arms and fubmit. After this victory gained by the Rhodians, there arrived to their aid 150 Gnotflans, and 500 men fent by Ptolemy from Egypt, molt Vol. Xiv.
of them being natives of Rhodes, who had ferved $\underbrace{\text { Rhunces. }}$ among the king's troops.

Demetrius being extremely mortified to fee all his batteries againft the harbour rendered ineffectual, refolved to employ them by land, in hopes of carrying the city by affault, or at leaft reducing it to the ne-Demerrics ceffity of capitulating. With this view, having got frames a together a valt quantity of timber and other mate- new marials, he framed the famous engine called belepolis, chine calle which was by many degrees larger than any that had ever been invented before. Its bafis was fquare, each fide being in length near 50 cubits, and made up of fquare pieces of timber, bound together with plates of iron. In the middle part he placed thick planks, about a cubit diftant from each other; and on the fe the men were to fland who forced the engine forward. The whole was moved upon eight ftrong and large wheels whofe felloes were ftrengthened with Atrong iron plates. In order to facilitate and vary the movements of the helepolis, cafters were placed under it, whereby it was turned in an inftant to what fide the workmen and engineers pleafed. From each of the four angles a large pillar of wood was carried to about the height of 100 eubits, and inclining to each other; the whole machine confifting of nine ftories, whofe dimenfions gradually leffened in the afcent. The firl ftory was fupported by 43 beams, and the laft by no more than nine. Three fides of the machine were plated over with iron, to prevent its being damaged by the fire that might be thrown from the city. In the front of each ftory were windows of the fame fize and fhape as the engines that were to be difcharged from thence. To each window were hutters, to draw up for the defence of thofe who managed the machines, and to deaden the force of the fones thrown by the enemy, the fhutters being convered with fkins fuffed with wool. Every fory was furnifhed with two large ftaircafes, that whatever was neceffary might be brought up by one, while others were going down by the other, and fo every thing might be difpatched without tumult or confufion. This huge machine was moved forwards by 3000 of the ftrongell men of the whole army ; but the art with which it was built greatly facilitated the motion. Demetrius caufed likewife to be made feveral teftudoes or pent-houfes, to cover his men while they advanced to fill up the trenches and ditches; and invented a new fort of galleries, through which thofe who were en.ployed at the fiege might pafs and repafs at their pleafure, without the leaft danger. He employed all his feamen in levelling the ground over which the machines were to be brought up to the fpace of four furlongs. The number of workmen who were employed on this occafion amounted to 30,000 .

In the mean time, the Rhodians, obferving thefe The Phoformidable preparations, were bufy in raifing a new dians raifc wall within that which the enemy intended to batter a new wall. with the helepolis. In order to accomplifh this work, they pulled down the wall which furrounded the theatre, fome neighbruring houfes, and even fome temples, after having folemnly promifed to build more magnificent ftructures in honour of the gnde, if the city were preferved. At the fame time, they fent out nine of their belt fhips to feize fuch of the enemy's veffels as they coald mest with, and thercby diftrefs them for E
want
want of proviinns. As thefe flips were commanded by their bravelt fea-officers, they foon returned with an immenfe bcoty, and a great many prifoners. Among other veffels they took a galley richly laden, on board of which they found a great variety of valuable furniture, and a royal robe, which Phila herfelf had wrought and fent as a prefent to her hufband Demetrius, accompanied with a letter written with her own hand. The Rhodians fent the furniture, the royal robe, and even the letter, to Ptolemy ; which exafperated Demetrius to a great degree.

While Demetrius was preparing to attack the city, the Rhodians having affembled the people and magiftrates to confult about the meafures they fhould take, fome propofed in the affembly the pulling down of the ftatues of Antigonus and his fon Demetrius, which till then had been held in the utmolt veneration. But this propofal was generally rejected with indignation, and their prudent conduce greatly allayed the wrath both of Antigonus and Demetrius. However, the latter continued to carry on the fiege with the utmont vigour, thinking it would reflect no fmall difhonour

14
The walls undermin. ed without fuccefs. on him were he obliged to quit the place without making himfelf mater of it. He caufed the walls to be fecretly undermined: but, when they were ready to fall, a deferter very opportunety gave notice of the whole to the townfmen ; who having, with all expedition, drawn a deep trench all along the wall, began to countermine, and, meeting the enemy under ground, obliged them to abandon the work. While both parties guarded the mines, one Athenagoras a Mileffan, who had been fent to the affiftance of the Rhodians by Ptolemy with a body of mercenaries, promifed to betray the city to the Demetrians, and let them in thro' the mines in the night-time. But this was only in order to enfnare them; for Alexander, a noble Macedonian, whom Demetrius had fent with a choice body of troops to take poffeffion of a pof agreed on, no fooner appeared, but he was taken prifoner by the Rhodians, who were waiting for him under arms.Athenagoras was crowned by the fenate with a crown of gold, and prefented with five talents of filver.
mining the walls, and placed all his hopes of reducing the city in the battering-engines which he had contrived, Having therefore levelled the ground under the walls, he brought up his helepolis, with four tefludoes on each fide of it. Two other teftudoes of an ext:aordinary fize, bearing battering-rams, were likewife moved forwards by 1000 men. Each fory of the helepolis was filled with all forts of engines for difcharging of fones, arrows, and darts. When all things were ready, Demetrius ordered the fignal to be given; when this men, fetting up a fhout, affaulted the city on all fides both by fea and land. But, in the heat of the attack, when the walls were ready to fall by the repeated Atrokes of the battering-rams, ambafladors arrived from Cridus, earnefly foliciting Demetrius to fufpend all further boltilities, and at the fime time giving him hopes that they fhould prevail upon the Rhodians to febmit to an honourable capitalation. A furpenfion of arms was accordingly agreed on, and amballadors fent from both fides: But the Rhodiars refufing to captulate on the conditions offred them, the attack was ronewed with to much fury,
and the maciines played off in fo brifk a manser, rhoder. that a large tower built with fquare fones, and the wall that fanked it, were battered down. The befieged, neverthelefs, frught in the breach with fo much courage and refolution, that the enemy, after various unfucceffful attempe, were forced to abandon the enterprife, and retire.

In this conjuncture, a fleet which Ptolemy had The befreighted with 300,000 meafures of corn, and diffe-fieged rerent kinds of pulfe for the ufe of the Rhodians, ar- ceive a rived very feafonably in the port, nothwithftanding the vigilance of the enemy's fhips, which cruized on the coafts of the ifland to furprife them. A few days large fupply of provic,ns, after came in fafe two other fleets, one fent by Caf and fet th fander, with 100,00 burhels of barley; the Char engines by Lyfimachus, with 400,000 buflels of corn and as fire. many of barley. This feafonable and plentiful fupply arriving when the city began to fuffer for want of provifions, infpired the beffeged with new courage, and raifed their drooping fipirits. Being thus animated they formed a defign of fetting the enemy's engines on fire ; and with this view ordered a body of men to fally out the night enfuing, about the fecond watch, with torches and fixebrands, having firft placed on the walls an incredible number of engines, to difcharge fones, arrows, darts, and fire-balls, againft thofe who fhould attempt to oppofe their detachment. The Rhodian troops, purfuant to their orders, all on a fudden fallied out, and advancing, in fpite of all oppofition, to the batteries, fet them on fire, while the engines from the walls played inceffantly on thofe who endeavoured to extinguifh the flames. The Demetrians on this occafion fell in great numbers, being incapable, in the darknefs of the night, either to fee the engines that continually difcharged fhowers of fones and arrows upon them, or to join in one body and repulfe the enemy. The conflagration was fo great, that feveral plates of iron falling from the helepolis, that vaft engine would have been entirely confumed, had not the troops that were fationed in it with all poffible fpeed quenched the fire with water, before prepared, and ready in the apartments of the engine againft fuch accidents. Demetrius, fearing left all his machines hould be confumed, called together, by found of trumpet, thofe whofe pro. vince it was to move them ; and, by their help, brought them off before they were entirely deftroyed. When it was day, he commanded all the darts and arrows that had been fhot by the Rhodians to be carefully gathered, that he might from their number form fome judgement of the number of machines in the city. Above 800 firebrands were found on the fpot, and no fewer than 1500 darts, all difcharged in a very fmall portion of the night. This ftruck the prince himfelf with no fmall terror; fur he never imagined that they would have been able to bear the charges of fuch formidable preparations. However, after having caufed the flain to be buried, and given directions for the curing of the wounded, he applied himfelf to the repairing of his machines, which had been difmounted and rendered quite unferviceable.
In the mean time, the befieged, improving the refpite They build allowed them by the removal of the machines, built a a third third wall in the form of a crefcent, which took in al that part that was moft expofed to the enemy's batteries; and, befides, drew a deen trench behind the

## R H O

Rhodes. breach, to prevent the enemy from entering the city that way. At the fame time, they detached a fquadron of their beft fhips, under the command of Amyntas, who made over to the continent of Afia; and there meeting with fome privateers who were commiffioned by Demetrius, took both the fhips and the men, among whom were Timocles the chief of the pirates, and feveral other officers of diftinction belonging to the fleet of Demetrius. On their return, they fell in with feveral veffels laden with corn for the enemy's camp, which they likewife took, and brought into the port. Thels were foon followed by a numerous fleet of fmall vefiels loaded with corn and provifions fent them by Ptolemy, together with if 00 men, commanded by Antigonus a Macedonian of great experience in military affairs.Demetrius, in the mean time, heving repaired his machines, brought them up anew to the walls; which he inceffantly battered till he opened a great breach and

Dametrius makes a breach in the walls but is fill repulfed. threw down Ceveral towers. But when he came to the affault, the Rhodians, under the command of Aminias, defended themfelves with fuch refolution and intrepidity, that he was in three fucceflive attacks repulfed with great flaughter, and at laft forced to retire. The Rhodians likewife, on this occafion, loft feveral officers ; and amonglt others, the brave Aminias their commander.

While the Rhodians were thus fignalizing themfelves in the defence of their country, a fecond embalfy arrived at the camp of Demetrius from Athens and the other cities of Greece, foliciting Demetrius to compofe matters, and frike up a peace with the Rhodians. At the requeft of the ambaffadors, who were in all above 50, a ceffation of arms was agreed upon; but the terms offered by Demetrius being anew rejected by the Rhodians, the ambaffadors returned home without being able to bring the contending parties to an agreement. Hoftilities were therefore renewed; and Demetrius, whofe imagination was fertile in expedients tor fucceeding in his projects, formed a detachment of 1500 of his belt troops, under the conduct of Alcimus and Mancius, two officers of great refolution and experience, ordering them to enter the breach at midnight, and, forcing the entrenchmert behind it, to por: fefs themfelves of the pofts about the theatre, where it would be no difficult matter to maintain themelves againft any efforts of the townimen. In rder to facilitate the execution of fo important and dangerous an undertaking, and amufe the enemy with falle aitacks, he at the fame time, upon a figual given, ordered the reft of the army to fet up a fhout, and attack the city on all fides both by fea and land. By this meano he hoped that, the belieged being alarmed in all parts, his detachment might find an opporturity of forcing the entrenchments which covered the breach, and atterwards of feizing the advantageous poft about the theatre. This feint had all the fuccefs the prince coudd expect; for the troops having fet up a fhout from all quarters, as if they were advancing to a general affailt, the detachment commanded by Alcimus and Mancius entered the breach, and fell upon thofe who defended the ditch, and the wall that covered it, with fixh vigour, that, having flain the molt part of them and put the relt in confufion, they advanced to the theatre, and feized on the pott adjoming to it. This occafioned a general upioar in heccioy as if it fad been
already taken; but the commanding officons dipatched orders to the foldiers on the ramparts not to quit their Fofts, nor fitir from their refpelive flations. fitaving thus fecured the walls, they put themfelves at the head of a chofen body of their own troops, and of thofe who were lately come from Egypt, and with thefe charged the enemy's detachment. But the darknefs of the night prevented them from diflod firs the enemy and regaining the advantageous poits they had feized. Day, however, no fooner appeared, than they renewed their attack with wonderful bravery. The Demetrians with. out the walls, with loud fhouts endeavoured to animate thofe who had entered the place, and infpire them with refolution to maintain their ground till they were relieved with frefh troops. The Rhodians being fenfible that their fortunes, liberties, and all that was dear to them in the world, lay at Itake, fought like men ia the utmoft defpair, the enemy defending their pofts fur feveral hours without giving ground in the leaft. At length the Rhodians, encouraging each other to exert themfelves in defence of their country, and animated by the example of their leaders, made a laft effort, and, breaking into the very heart of the enemy's battalion, there killed both their commanders. After their death the reft were eafily put in diforder, and all to a man either killed or taken prifoners. The Rhodians like villed or wife en this occafion loft many of their beft commanders; and among the reft Damotetis, their chief magiArate, a man of extraordinary valour, ${ }^{\text {' }}$ who had fignalized himfelf during the whole time of the fiege.

Demetrius, not at all difcouraged by this check, was making the neceffary preparations for a new affault, when he received letters from his father Antigonus, enjoining hira to conclude a peace with the Rhodians upon the beft terms he could get, lef he fhould lofe his whole army in the fiege of a fingle town. From this time Demetrius wanted only fome plaufible pre. tence for breaking up the fiege. The Rhodians likewife were now more inclined to come to an agreement than formerly ; Ptolemy having acquainted them that he intended to fend a great quantity of corn, and 5000 men to their affiftance, but that he would firf have them try whether they could make up matters with Demetrius upon reafonable terms. At the fame time am. baffadors arrived from the Attolian republic, fuliciting the contending parties to put an end to the war which might invulve all the ealt in endlefs calamities.

An accident which happened to Demetrius in this $2 I$ conjuncture, did not a little contribute towards the The hele-wilhed-for facification. This prince was preparing to polis ren. advance his helepolis againft the city, when a Rhodian lefs. engineer found means to render it quite urelefs. He undermined the tract of ground over which the helepolis was to pafs the next day in order to approach the walle. Demetrius, not fufpecting any ftratagem of this nature, caufed the engine to be moved forward, which comin: t) the place that was undermined, funk fo deep into the ground that it was imponfibie to draw it out again. This misfortune, if we believe Vcgetius and Vitrivius, determined Demetrius to hearken to the Etolian amm baffadors, and at laft to Itrike up a peace upon the following conditions: That the republic of Rhodes hould be maintained in the full enjoyment of their ancient The fiege rights, privieges, and liberties, without any foreign raifed. garrifon; that they fould renew their ancient allance E e 2

Atutes and princes except Ptolemy king of Egypt ; and that, for the effectual performance of the articles fipulated between them, they fhould deliver 100 hoftages, fuch as Demetrius fhould make choice of, except thofe who bore any public employment.

Thus was the fiege raifed, after it had continued a whole year ; and the Rhodians amply rewarded all thofe who had diftinguifhed themfelves in the fervice of their country. They alfo fet up itatues to Ptolemy, Caffander, and Lyfimachus; to all of whom they paid the higkth honours, efpecially to the firft, whom they worfhipped as a god. Demetrius at his departure prefented them with the helepolis, and all the other ma chines which he had employed in battering the city; from the fale of which, with fome additional fums of their own, they erected the famous coloffus. After this they applied themfelves extirely to trade and navigation; by which means they became quite mafters of the fea, and much more opulent than any of the neighbouring nations. As far as lay in their power, they endeavoured to preferve a neutrality with regard to the jarring nations of the eaft. However, they could not avoid a war with the Byzantines, the occafion of which was as follows: Tke Byzantines being sbliged to pay a yearly tribute of 80 talents to the Gauls, in order to raife this fum, they came to a refolution of laying a toll on all thips, that traded to the Pontic fea. This refolution provoked the Rhodians, who were a trading nation, above all the refl. For this reafon they immediately difpatched ambaffadors to the Byzantines, complaining of the new tax; but as the Byzantines had no cther method of fatisfying the Gauls, they perfifted in their refolution. The Rhodians now declared war, and prevailed upon Prufias king of Bithynia, and Attalus king of Pergamus, to affit them; by which confederacy the Byzantines were fo intimidated, that they agreed to exact no toll from fhips trading to the Pontic fea, the demand which had been the occafion of the war. A dreadful About this time happened a dreadful earthquake, earttquake which threw down the coloffus, the arfenal, and great at Rhodes.
part of the city-walls of Rhodes; which calamity the Rhodians improved to their advantage, fending ambaffadurs to all the Grecian princes and fates to whom their loffes were fo much exaggerated, that their countrymen obtained immenfe fums of money under pretence of repairing them. Hiero king of Syracufe prefented them with 100 talents; and, befides, exempted from all tolls and duties fuch as traded to Rhodes. Ptolemy ling of Egypt gave them 100 talents, a million of meafures of wheat, materials for building 20 quinqueremes and the like number of triremes; and, befides, fent them 100 architects, 302 workmen, and materials for repairing their public buildings, to a great value, paying them moreover 24 talents a-year for the maintenance of the workmen whom he fent them. Antigonus gave them 100 talents of filver, with 10,000 pieces of timber, each piece being 16 cubits long; 7000 planks; 3000 pounds of ircn, as many of pitch and refin, and 1000 meafures of tar. Chryfeis, a woman of diftinction, fent them 100,000 meafures of wheat, and 3000 pounds of lead. Antiochus exempted from all taxes and duties the Rhodian fhips trading to his dominions; prefented them with 10 galleys, and 200,000
meafures of corn, with many other things of great ra-
lue. Prufias, Mithridates, and all the princes then reigning in Afia, made them proportionable, prefents: in thort, all the Greek towns and nations, all the princes of Europe and Afia, contributed, according to their ability, to the relief of the Rhodians on that occafion ; infomach that their city not only foon rofe from its ruins, but attained to an higher pitch of fplendor than ever.

In the year 203 B. C. the Rhodians engaged in a War with war wich Philip of Macedon. This monarch had inva- Philip of ded the territories of Attalus king of Pergamus ; and Macedon. becaufe the Rhodians feemed to favour their ancient friend," fent one Heraclides, by birth a Tarentine, to fet fire to their fleet; at the fame time that he difpatched ambaffadors into Crete, in order to ftir up the Cretans againt the Rhodians, and prevent them from fending any affiftance to Attalus. Upon this war was immediately proclaimed. Philip at firft gained an inconfiderable advantage in a naval engagement; but the next year was defeated with the lofs of $11,000 \mathrm{men}$, while the Rhodians loft but 60 men and Attalus 70. After this he carefully avoided coming to an engagement at fea either with Attalus or the Rhodians. The combined fleet, in the mean time, failed towards the inland of $\mathbb{F g i n a}$ in hopes of intercepting him : but having failed in their purpofe, they failed to Achens, where they concluded a treaty with that people; and, on their return, drew all the Cyclades into a confederacy againft Philip. But while the allies were thus wafting their time in negociations, Philip, having divided has forces into two bodies, fent one, under the command of Philocles, to ravage the Athenian territories; and put the other aboard his fleet, with orders to fail to Meronea, a city on the north fide of Thrace. He then marched towards that city himfelf with a body of forces, took it by affault, and reduced a great many others; fo that the confederates would, in all probability, have had little reafon to boalt of their fuccefs, had not the Romans come to their affitance, by whofe help the war was foon terminated to their advantage. In the war which took place between the Romans and Antiochus the Great king of Syria, the Rhodians were very ufeful allies to the former. The beft part of their fleet was indeed deftroyed by a treacherous contrivance of Polyxeniades the Syrian admiral; but they foon fitted out another, and defeated a Syrian fquadron commanded by the celebrated Hannibal, the Carthaginian commander; after which, in conjunction with the Romans, they utterly defeated the whole Syrian fleet cornmanded by Polyxeniades; which, together with the lofs of the battle of Magnefia, fo difpirited Antiochus, that he fubmitted to whatever conditions the Romans pleafed.
For thefe fervices the Rhodians were rewarded with the provinces of Lycia and Caria; but tyrannizing over the people in a terrible manner, the Lycians applied to the Romans for protection. This was readily granted; but the Rhodians were fo much difpleafed with their interfering in this matter, that they fecretly favoured Perfes in the war which broke out between him and the Roman republic. For this offence the two provinces abovementioned were taken from them; but the Rhodians, having banifhed or put to death thofe who had favoured Perfes, were again admitted into fa-

Rhodef.
vour, and greatly honoured by the fenate. In the Mithridatic war, their alliance with Rome brought upon them the king of Pontus with all his force; but having loft the greateft part of his fleet before the city, he was obliged to raife the fiege without performing any remarkable exploit. In the war which Pompey made on the Cilician pirates, the Rhodians affifted him with all their naval force, and had a great thare in the victories which he gained. In the civil war between Cæfar and Pompey, they affifted the latter with a very numerous fleet. After his death they fided with Cæfar ; which drew upon them the refentment of C. Caffies, who advanced to the iflands of Rhodes with a powerful fleet, after having reduced the greateft part of the continent. The Rhodians, terrified at his approach, fent ambaffadors intreating him to make up matters in an amicable manner, and promifing to ftand neuter, and recal the thips which they had fent to the affiftance of the triumviri. "Caffius infifted upon their delivering up their fleet to him, and putting him in poffeffion both of their harbour and city. This demand the Rhodians would by no means comply with, and therefore began to put themfelves in a condition to ftand a fiege; but firft fent Archelaus, who had taught Caffius the Greek tongue while he ftudied at Rhodes, to intercede with his difciple in their behalf. Archelaus could not, with all his authority, prevail upon him to moderate his demands wherefore the Rhodians, having created one Alexander a bold and enterprifing man, their prætor or prytanis, equipped a fleet of 33 fail, and fent it out under the

28
The Rhodians defcated in two maval engagemeuts by Caffius. command of Mnafeus, an experienced fea-officer, to of. fer Caffius battie. Both fleets fought with incredible bravery; and the vitory was long doubtiul: but the Rhodians, being at length overpowered by numbers, were forced to return with their fleet to Rhodes; two of their fhips being funk, and the reft ver y much damaged by the heavy fhips of the Romans. This was the firt time, as our author obferves, that the Rhodians were fairly overcome in a fea-fight.
Caffus, who had beheld this fight from a neighbouring hill, having refitted his fleet, which had been no leis damaged than that of the Rhodians, repaired to Loryma, a frong hold on the contiuent belonging to the Rhodians. This cafle he took by affult; and from hence conveyed his land forces, under the conduct of Fannius and Lentulus, over into the ifland. His feet confilted of 80 fhips of war and above 200 tranfports. The Rhodians no fooner faw this mighty flet appear, but they went out again to meet the enemy. The fecond engagement was far more bloody that the firt; many fhips were funk, and great numbers of men killed on both fides. But victory anew declared for the Romans; who immediately blocked up the city of Rhodes both by fea and land. As the Rhodians had not had time to furnifh the city with fufficient ftore of provifions, fome of the inhabitants, fearing that if it were taken either by affault or by famine, Calfius would put all the inhabitants to the fword, as Brutus had lately done at Xanthus, privately opened the gate to him, and put him in poffefifion of the town, which he neverthelefs treated as if it had been taken by affuult. He commanded 50 of the clieff citizens, who were fufpected to favour the adverfe party, to be brought before him, and fentenced them all to die ; others, to the number of 25 , who had commanded the fleet or army
becaufe they did not appear when fummoned, he pro- Rhoder. fcribed. Having thus punifhed fuch as had either acted or fpoken againft him or his party, he commanded the Rhodians to deliver up to him all their hips, and whatever money they had in the public treafury. He then plundered the temples; fripping them of all their valuable furniture, veffels, and ftatues. He is faid not to have left one ftatue in the whole city, except that of the fun; bragging at his departure, that he had fripped the Rhodians of all they had, leaving them nothing but the fun. As to private perfons, he command. ed them, under fevere penalties, to bring to him all the gold and filver they had, promifing by a public crier, a tenth part to fuch as hould difcover any hidden treafures. The Rhodians at firf concealed fome part of their wealth, imagining that Caffis intended by this proclamation only to terrify them; but when they found he was in earneft, and feveral wealthy citizens putto death for concealing only a fmall portion of their riches, they defired that the time prefixed for the bringing in their gold and filver might be prolonged. Caflus willingly granted them their requeft ; and then through fear they dug up what they had hid under ground, and laid at his feet all they were worth in the world. By this means he extorted from private perfons above 8000 talents. He then fined the city in $50^{\circ}$ more ; and leaving L. Varus there with a ftrong garrifon to exact the fine without any abatement, he returned to the continent.

After the death of Caffius, Marc Antony reftored the Rhodians to their ancient rights and privileges; beftowing upon them the iflands of Andros, Naxos, Tenos, and the city of Myndus. But thefe the Rhodians fo oppreffed and loaded with taxes, that the fame Antony, though a great friend to the Rhodian republic, was obliged to diveft her of the fovereignty over thofe places, which he had a little before fo liberally beftowedjupon her. From this time till the reign of the Emperor Claudius we find no mention made of the Rhodians. That prince, as Dion informs us, deprived them of their liberty for having crucified fome Roman citizens. However, he foon reftured them to their former condition, as we read in Suetonius and Tacitus. The latter adds, that they had been as often deprived of, as reftored to, their liberty by way of punifhment or reward for their different behaviour, as they had obliged the Romans with their affitance in foreign wars, or provoked them with their feditions at home. Pliny who wrote in the beginning of Vefpafian's reign, ftyles Rhodes a beautifuland free lown. But this liberty they did not long enjoy, the ifland being foon after reduced by the fame Velpafian to a Roman province, and obli duced to a ged to pay a yearly tribute to their province, and obli- Roman province was called the province of the iflands. The Ro-Vefinain. man pretor who governed it refided at Rhodes, as the chief city under his jurifdiction ; and Rome, notwithftanding the eminent fervices rendered her by this republic, thenceforth treated the Rhodians not as allies, but vaffals.
$\underset{\text { Expedi- }}{\frac{3 \mathbf{r}}{2}}$
The ifland of Rhodes continued fubject to the Ro- tions of mans till the reign of the emperor Andronicus; when Villaret, grand-mafter of the knights of Jerufalem, then refiding in Cyprus, finding himfelf much expofed to fler of the the attacks of the Saracens in that mind expoled to knights of exchange it for that of Rhodes. The ifland too was againh

## R H O <br> $\left[\begin{array}{ll}222\end{array}\right]$ <br> R H O

Rhodes. almoft entirely occupied by the Saracens; Andronicus the eaftern emperor poffeffing little more in it than a cafle. Neverthelefs he refufed to grant the inveftiture of the iffand to Villaret. The latter, without fpending time in fruitlefs negociations, failed directly for Rhodes, where he landed his troops, provifions, and warlike fores, in $f_{\text {fite }}$ of the oppofition made by the Saracens, who then united againft the common enemy. As Villaret forefaw that the capital mult be taken before he could reduce the ifland, he inftantly laid fiege to it. The inhabitants defended themfelves obftinately, upon which the grand-mafter thought proper to turn the fiege into a blockade; but he foon found himfelf fo clofely furrounded by the Greeks and Saracens, that

He conquers the Saracens, and redures the ifland,
he could get no fupply either of forage or provifions for his army. But having at length obtained a fupply of provifions by means of large fums borrowed of the Florentines, he came out of his trenches and attacked the Saracens, with a full refolution either to conquer or die. A bloody fight enfued, in which a great number of the braveft knights were killed: but at length the Saracens gave way, and fled to their fhips; upon which the city was immediately affaulted and taken. The Greeks and other Chriftians had their lives and liberties given them, but the Saracens were all cut to pieces. The reduction of the capital was followed by that of all the other places of inferior Atrength throughout the ifland ; and in four years after their landing, the whole was fubjugated, and the conquerors tonk the title of the Knights of Rhodes. For many years thoie knights continued the terror of the Saracens and Turks, and fultained a fevere fiege from Mohammed II. who was compelled to abandon the enterprife; but at length the Turkifh fultan Solyman refolved at all events to drive them from it. Before he undertook the expedition, he fent a meffage commanding them to depart the inland without delay; in which cafe he promifed that neither they nor the inhabitants fhould fuffer any injury, but threatened them with his utmoft vengeance if they refufed his offer. The knights, however, proving obItinate, Solyman attacked the city with a fleet of 400 fail and an army of $140,000 \mathrm{men}$.

The trenches were foon brought clofe to the counterfcarp, and a frong battery raifed againft the town; which, however, did but little damage, till the fultan being informed by a fpy of this particular, and that he was in danger of receiving fome fatal fhot from the tower of St John which overlooked his camp, he planted a battery againt that tower, and quickly brought it down. Solyman, however, finding the whole place in fome meafure covered with frong fortifications of fuch height as to command all his batteries, ordered an immenfe quantity of funes and earth to be brought; in which fo great a number of hands were employed night and day by turns, that they quickly raifed a couple of hillocks high enough to overtop the city-wall. They plied them accordingly with fuch a continual fire, that the grand-mafter wasobliged to caufe them to be ftrongly propped within with earth and timber. All this while the befieged, who, from the top of the grand-mafter's palace, could difcover how their batteries were planted, demolifhed them with their cannon almoft as faft as they raifed them.

Here the enemy thought proper to alter their meam fures, and to plant a frong battery againd the tower of

St Nicholas, which, in the former fiege by Mohammed, had refifted all the efforts of the chen grand-vizier. This the bafhaw of Romania caufed to be battered with 12 large pieces of brafs cannon, but had the mortifica- battered. tion to fee them all difmounted by thofe of the tower; to prevent which in future, he ordered them to be fired only in the night, and in the day had them covered with gabions and earth. This had fuch fuccefs, that, after 500 cannon-fiot, the well began to thake and tumble into the ditch; but he was furprifed to find another wall behind it, well terraced, and bordered with artillery, and himfelf obliged either to begin afrefh or give up the enterprife : and yet this laft was what Solyman preferred, when he was told of its being built on a hard rock, incapable of being fapped, and how firmly it had held out againtt all the efforts of Mohammed's vizier. The next attack was therefore ordered by him to be made againtt the baftions of the town, and that with a valt number of the largelt artillery, which continued firing during a whole month; fo that the new wall of the baftion of England was quite demolifhed, though the old one food proof againit all their hot. That of Italy, which was battered by 17 large pieces of cannon, was ftill worfe damaged; upon which Marm tinengo the engineer advifed the grand-mafter to cauf a fally to be made on the trenches of the enemy out of the breach, whillt he was making frefh entrenchments behind it. His advice fucceeded ; and the 200 men that fallied out fword in hand having furprifed the 'lurks in the trench, cut molt of them in pieces. At the fame time a new detachment, which was fent to repulfe them, being obliged, as that engineer rightly judged, to pafs by a pot which lay open to their artillery, were likewife moftly deftroyed by the continual fire that came from it, whilf the affailants were employed in filling up feveral fathoms of the trench before they retired. By that time the breach had been repaired with fuch new works, that all the efforts to mount it by affault proved equally ineffectual and defructive.

Unfortunately for the befieged, the continual fire The befiee they had made caufed fuch a confumption of their pow- ged want der, that they began to feel the want of it ; the per- powder, fidious d'Amarald, whofe province it had been to vifit but find the magazines of it, having amufed the council with a falfe report, that there was more than fufficient to fupply the maintain the fiege, though it fhould laft a whole twelve month. But here the grand-malter found means to fupply in fome meafure that unexpected defect, by the cautious provifion he had made of a large quantity of faltpetre, which was immediately ground and made into gunpowder, though he was at the fame time obliged to order the engineers to be more fparing of it for the future, and to make ufe of it only in the defence of fuch breaches as the enemy thould make.

All this while the Turks had not gained an inch of $\frac{36}{36}$ ground; and the breaches they had made were fo fud- encounters denly either repaired or defended by new entrenchments, in mines, that the very rubbilh of them muft be mounted by af- \&c.
fault. Solyman, therefore, thought it now advifable to fet his numerous pioneers at work, in fve different parts, in digging of mines, each of which led to the baftion oppofite to it. Some of thefe were countermined by a new invented method of Martinengo ; who by the help of braced fikins, or drums, could difcover where

## $\mathrm{RHOO}\left[\begin{array}{ll}223\end{array}\right] \quad \mathrm{RHO}$

where the miners were at work. Some of thefe he perceived, which he caufed to be opened, and the miners to be driven out by hand grenadoes; others to be fmothered, or burned, by fetting fire to gunpowder. Yet did not this hinder two confiderable ones to be fprung, which did a vait deal of damage to the baition of England, by throwing down about fix fathoms of the wall, and filling up the ditch with its rubbifh: whereupon the Turks immediately climbed up fword in hand to the top of it, and planted feven of their flandards upon the parapet; but being ftopped by a traverfe, the knights, recovering from their furprife, fell upon them with fuch fury, that they were obliged to abandon it with great lofs. The grand-mafter, who was then at church, quickly came to the place with his fhort pike in his hand, attended by his knights, encouraging all he met with, burghers, foldiers, and others, to fight bravely in defence of their religion and country, and arrived time enough to affilt in the taking down their fandards, and driving down the enemy by the way they came up. In vain did the vizier Muftapha endeavour to prevent their flight by killing fome of the foremuft with his fword, and driving the reft back; they were obliged to abandon the baftion, and, which was fill worfe, met with that death in their flight, which they had ftrove to thun from the fire-arms which were difcharged upon them from the ramparts. Three fangiacs loft their lives in this attack, befides fome thoufands of the Turks; the grandmafter, on his fide, loft fome of his braveft knights, particularly his fandard-bearer.

The attacks were almoft daily renewed with the fame ill fuccefs and lofs of men, every general ftriving to fignalize himfelf in the fight of his emperor. At length the old general Peri, or Pyrrus, having haraffed the troops which guarded the baftion of Italy for feveral days fucceffively without intermifion, caufed a frong detachment, which he had kept concealed behind a cavalier, to mount the place by break of day, on the $13^{\text {th }}$ of September; where, finding them overcome with fleep and fatigue, they cut the throats of the fentinels, and, fliding through the breach, were juft going to fall upon them. The Italians, however, quickly recovered themfelves and their arms, and gave them an obftinate repulfe. The conteft was fierce and bloody on both fides; and the balhaw ftill fupplying his own with new reinforcements, would hardly have failed of overpowering the other, had not the grind-mafter, whom the alarm had quickly reached, timely intervened, and, by his prefence, as well as example, revived his Rhodians, and thrown a fudden panic among the enemy. Pyrrus, defirous to do fomething to wipe of the difgrace of this repulfe, tried his fortune next on an adjoining work, lately raifed by the grand-mafter Carettii : but here his foldiers met with a fill worfe treatment, being almolt overwhelmed with the hand-grenadoes, melted pitch, and boiling oil, which came pouring upon them, whillt the forces which were on the adjacent flanks made as great a flaughter of thofe that fled ; infomuch that the janiffaries began to refume their old murmuring tone, and cry out that they were brought thither only to be flaughtered.

The grand vizier Multapha, afraid left their comfhints thould reach his mafter, agreed at length, as the lalt refort, to male a frcfh attempt on the baltion
of England, whilt, to caufe a diverfon, the buinw Ahmed fprung fome freh mines at an oppofite part of the city. This was according executed on the 17 th of September; when the former, at the head of Give battalions, refolutely mounted or rather crept up the breach, and, in fpite of the fire of the Englifh, advanced fo far as to pitch fome ftandards on the top; when, on a fudden, a crowd of Englifh knights, commanded by one Bouk, or Burk, fallied out of their entrenchments, and, affifted by fome other officers of diftinction, obliged them to retire, though in good order. Multapha, provoked at it, led them back, and killed feveral knights with his own hand; and had his men fupported him as they ought, the place muft have been yielded to him : but the fire which was made from the acjacent batteries and mulketry difconcerted them to fuch a degiee, that neither threats nor entreaties could prevent their abandoning the enterprife, and dragging him away with them by main force. The Rhodians loft in that action feveral brave knights, both Englifh and German ; and, in particular, John Burk, their valiant commander: but the Turks loft above 3000 men , befides many officers of diftinction. Much the fame ill fuccefs having attended. Ahmed with his mines, one of which had been opened, and the other only bringing fome fathoms of the wall down, he was alfo obliged to retreat; his troops, though fome of the very beft, being forced to difperfe themfelves, after having borne the fire and fury of the Spanifh and Auvergnian knights as long as they were able.

By this time Solyman, afhamed and exafperated at his ill fuccefs, called a general council; in which he made fome finging reflections on his vizier, for having roprefented, the reduciion of Rhodes as a very eafy enterprife. To avoid the effects of the fultan's refentment, the fubtle Muftajla declared, that hitherto they had fought the enemy as it were upon equal terms, as if they had been afraid of taking an ungenerous advan. tage of their fupericrity, by which, faid he, we have given them an opportunity of oppoing us with their united force wherever we attacked them. But let us now refolve upon a general affalt on feveral fides of the town; and fee what a poor defence their ftrength, thus divided, will be able to make againft our united force. The advice was immediately approved by all, and the time appointed for the execution of it was on the $24^{\text {th }}$ of that month, and every thing was ordered to be got ready againft that day. Accordingly the town was actually affaulted at four different parts, after having fuffered a continual fire for fome time from their artillery in order to widen the breaches; by which the ferent grand-mafter eafily underfood their defign, and that places at the bations of England and Spain, the poft of Provence, and Terrace of Italy, were pitched upon for the affault, and took his precautions accordingly.

The morning was no fooner come, than each party mounted their refpective breach with an undaunted bravery, the young fultan, to animate them the more, having ordered his throne to be reared on an eminence, whence be could fee all that was done. The Rhodians, on the other hand, were no lefs diligent in repulfing them with their cannon and other fire-arms, with their melted lead, boiling oil, ftink-pots, and other ufual ex. pedients. The one fide afcend the fcaling ladders, fearlefs of ail that cppofed them; the other overturn

## R H O.

Rhodes. their ladders and fend them tumbling down headlong into the ditches, where they were overwheimed with fones or difpatched with darts and other mififile weapons. The bation of England proves the fcene of the greateft flaughter and bloodihed; and the grand-matter makes that his pof of honour, and, by his prefence and example, infires his men with frefh vigour and bravery, whilf the continual thunder of his artillery makes fuch horrid work among the affailants as chills all their courage, and forces them to give way : the lieutenant-general, who commands the attack, leads them back with frefh vigour, and mounts the breach at the head of all; immediately after comes a cannonball from the Spanifh baftion, which overturns him dead into the ditch. This difafter, inftead of fear and dread, fills them with a furious defire of revenging his death : but all their obftinacy cannot make the Rhodians go one flep back, whillt the priefts, menks, young men and old, and even women of every rank and age, affift them with an uncommon ardour and firmnefs; fome in overwhelming the en my with ftones; others in deftroying them with melted lead, fulphur, and other combuftibles ; and a third fort in fupplying the combatants with bread, wine, and other refreh. ments.

The affault was no lefs defperate and bloody on the baftion of Spain, where the knights, who guarded it, not expecting to be fo foon attacked, and afhamed to ftand idle, were affifing the baftion of Italy; which gave the Turks an opportunity to mount the breach and penetrate as far as their intrenchments, where they planted no lefs than 30 of their flandards on them. The grand-mafter was quickly apprifed of it, and ordered the baltion of Auvergne to play againt them; which was done with fuch diligence, and fuch continual fire, whilt the Rhodians enter the baftion by the help of their cafemates, and, fword in hand, fall upon them with equal fury, that the Turks alike befet by the fire of the artillery and the arms of the Rhodian knights, were forced to abandon the place with a confiderable lofs. The aga with great bravery rallies them afrefh, and brings them back, by which time the grand mafter likewife appeared. The fight was renewed with greater fiercenefs; and fuch flaugther was made on both fides that the grand-mafter was obliged to draw 202 men out of St Nicholas tower to his affiftance; thefe were commanded by fome Roman knights, who led them on with fuch fpeed and bravery, that their very appearance on the baftion made the janiffaries draw back; which Solyman obferving from his eminénce, caufed a retreat to be founded, to conceal the difgrace of their fight. In thefe attacks there fell about 15,000 of his beit troops, befides feveral officers of difinction. The lofs of the befieged was no lefs confiderable, if we judge from the fmall number of their forces; but the greatef of all to them was that of fome of their bravelt and moft diftinguifhed knights and commanders, many of whom were killed, and fearce any efcaped unwounded. But the moft dreadful fate of all had like to have fallen on the favour:te vizier Muftapha, who had propofed this general affault : the ill fucceefs of which had fo enraged the proud fuitan, that he condemned him to be fhot with arrows at the head of his army ; which dreadful fentence was juft-ready to be executed, when the old bafhaw, by his intreaties, obtained a fulpenfion
of it, in hopes that when his fury was abated, he flould Rhodes. alfo obtain his pardon.
Solyman, however was fo difcouraged by his ill fuc. ceffes, that he was on the point of raifing the fiege, and would have actually done fo, had he not been diverted from it by the advice which be received from an Albanian deferter, fome fay by a letter from the traitor d'Amarald, that the far greater part of the knights were either killed or wounded, and thofe that remained altogether incapable of futtaining a frefh affault. This having determined him to try his fortune once more, the command of his forces was turned over to the bafhaw Achmed; and, to fhow that he defigned not to Atir till he was malter of the place, he ordered a houfe to be built on the adjacent mount Philermo fur his winter-quarters. Achmed marched directly againft the baftion of Spain, which had fuffered the moft; where, before he could open the trenches, his men fell-thick and threefold by the conftant fire both of fmall and great guns from the baltion of Auvergne. He loft Itill a much greater number in rearing a rampart of earth to cover the attack, and give him an opportunity of fapping the wall ; and, as foon as he faw a large piece fall, ordered his men to mount the breach. They were no fooner come to the top, than they found a new work and entrenchments which Martinengo had reared; and there they were welcomed with fuch a brikk fire from the artillery, that they were glad to recover their trenches with the utmoft precipitation, after having lof the much greater part of their men. The attack was renewed, and a reciprocal fire continued with great obftinacy, till a mufket-fhot deprived that indefatigable engineer of one of his eyes, and the order of his aftiduous fervices for fome time. The grandmafter, having ordered him to be carried to his palace took his place, and kept it till he was quite cured, which was not till 34 days after; and continued all the time in the intrenchments with his handful of knights, fcarcely allowing himfelf reft night or day, and ever ready to expofe himfelf to the greatelt dangers, with an ardour more becoming a junior officer than an old worn-out fovereign; which made his knights more lavih of their own lives than their paucity and prefent circumftances could well admit of.
Soon after this, the treafon of $D^{\prime}$ Amarald was difcovered, and he was condemned to death and executed; but by this time the city' was reduced to the laft ex. tremity. The pope, emperor, and other crowned heads, had been long and often importuned by the grand-matter for fpeedy affitance, without fuccefs; and, as an addition to all the other difalters, thofe fuccours which were fent to him from France and England perifhed at fea. The new fupply which he had fent for of provifions from Candia had the fame ill fate; fo that the winds, feas, and every thing, feemed combined to bring on the deftruction of that city and order. The only refource which could be thought of, under fo difmal a fituation, was, to fend for the few remaining knights and forces which were left to guard the other inlands, to come to the defence of their capit.1, in hopes that, if they could fave this, the others might in time be recovered, in cafe the Turks fhould feize upon them. On the other hand, Solyman, grown impatient at the fmall ground his general had gained, gave hin exprefs orders to renew the attack with all imaginable !peed

## RHO [ 225$]$ \& HO

Whoses, and vigour; before the fuccours which he apprehended were coming from Europe, obliged him to raife the fiege. Achmed inftantly obeyed, raifed a battery of 17 large cannon againft the baftion of Italy, and quickly after made himielf mafter of it, obliging the garrifon to retire farther into the city. Here the grand mafter was forced to demolifh two of the churches, to prevent the enemy's feizing on them; and, with their materials, caufed fome rew works and entrenchments to be made to hinder their proceeding farther.

The Turks, however, gained ground every day, though they fill loft valt numbers of their men : at length the 30 th of November came, when the grandmafter, and both the befiegers and befieged, thought the lalt affault was to be given. The bathaw Pyrrus, who commanded it, led his men directly to the entrenchments; upon which the bells of all the churches founded the alarm. The grand-mafter, and his few knights, troops, and citizens ran in crowds, and in a corififed diforderly manner, to the entrenchments, each fighting in his own way, or rather as his fear directed him. This attack would have proved one of the moft defperate that had yet been felt, had not a moft vehement rain intervened, which carried away all the earth which the enemy had reared to ferve them as a rampart againit the artillery of the baltion of Auvergne; fo that being now quite expofed to their continual fire, they fell in fuch great numbers, that the bafhaw could no longer make them ftand their ground, bat all precipitately fled towards their camp. This laft repulfe threw the proud fultan into fuch a fury, that none of his officers dared to come near him ; and the fhame of his having now fpent near fix whole months with fuch a numerous army before the place, and having loft fuch myriads of his brave troops with fo litie advantage, had made him quite defperate, and they all dreaded the confequences of his refentment.

Pyrrus at length, having given it time to cool, ventured to approach him, and propofe a new project to him, which, if approved, could hardly fail of fuccefs; which was, to offer the cown a generous capitulation; and he obferved, that in cafe the ftubborn knights fhould reject it, yet being now reduced to fo fmall a number, as well as their forces and fortifications almoft deftroyed, the citizens, who were moft of them Greeks, and lefs ambitious of glory than folicitous for their own prefervation, would undoubtedly accept of any compofition that thould fecure to them their lives and effects.

This propofal being relifhed by the fultan, letters were immediately difperfed about the city, in his name, exhorting them to fubmit to his government, and threatening them at the fame time with the moft dreadful effects of his refentment if they perfifted in their obltinacy. Pyrrus likewife difpatched a Genoefe to approach as near as he could to the baftion of Auvergne, and to intreat the kinghts to take pity of fo many of their Chrifian brethren, and not expole them to the dreadful effects winch muft follow their refufal of a capitulation, fo gener efly offered them a their laft extremiry. Other agents were likewife employed in other places: to all of whom the grand-mafter crdered fome of his men to return this anfwer, That his order never treated with infidels but with fword in hard. An Alhanian was fent next with a letter from the fultan to him, who met with the fame repulfe; Vol. XVI.
after which he ordered his men to fire upon any that Rhodec. fhould prefent themfelves upon the fame pretence; which was actually done. But this did not prevent the Rhodians from liftening to the terms offered by the Turks, and holding frequent cabals upon that dubject; in which the general maffacre of a town taken by affault, the dreadful flavery of thofe that efcaped, the rape of their wives and daughters, the deltruction of their churches, the profanation of their holy relics and facred utenfils, and other dire confequences of an obftinate refufal, being duly weighed againft the fultan's offers, quickly determined them which party to take. The grand-mafter, however, proving inexorable to all their intreaties, they applied to their Greek metropolitan, who readily went and reprefented all thefe things to him in the molt-pathetic terms: Yet he met wich no better reception; but was told, that tee and his knights were determined to be buried under the ruins of the city if their fwords could no longer defend it, and he hoped their example would not permit them to fhow lefs courage on that occafion. This anfwer produced a quite contrary effect; and, as the citizens thought delays dangerous at fuch a juncture; they came in a body to him by the very next morning, and plainly told him, that if he paid no greater regard to their prefervation, they would not fail of taking the moft proper meafures to preferve the lives and chaltity of their wives and children.

This refolution could not but greatly alarm the grand-mafter; who thereupon called a council of all the knights, and informed them himfelf of the condition of the place. Thefe all agreed, particularly the engineer Martinengo, that it was no longer defenfible, and no other refource left but to accept the fultan's offers; adding, at the fame time, that though they were all ready, according to the obligations of their order, to fight to the laft drop of their blood, yet it was no lefs their duty to provide for the fafety of the inhabitants, who, not being bound by the fame obligations, ought not to be made a facrifice to their glory. It was therefore agreed, with the grand-mafter's confent, to accept of the next offers the fultan fhould make. He did not let them wait long: for the fear he was in of a frell fuccour from Europe, the intrepidity of the knights, and the fhame of being forced to raife the fiege, prevailed upon him to hang out his pacific flag, which was quickly anfwered by another on the Rhodian fide; upon which the Turks, coming out of their trenches, delivered up the fultan's letter for the grandmalter, to the grand-prior of St Giles, and the engineer Martinengo. The terms offered in it by Soly. man appeared fo advantageous, that they immediately exchanged holtages ; and the knights that were fent to him had the honour to be introduced to him, and to hear them confirmed by his own mouth, though not with ut threats of putting all to fire and fword in cafe of refufal, or even delay. Two ambaffaders were forthwith fent to him, to demand a truce of three days to fettle the capitulation and interefts of the inhabitants, who were part Greeks and part Latins; but this was abfolutely refufed by the impatient monarch, out of a fufpicion of the rumoured fuccour being near, and that the truce was only to gain time till it was come.

He therefore ordered the hoftilities to be renewed FI with, with frefh fury; in which the Rhodians made a moft noble defence, confidering their fmall number, and that they had now only the barbican or falfe bray of the baftion of Spain left to defend themfelves, and once more repulfed the enemy : at which the fultan was fo enraged, that he refolved to overpower them by numbers on the next day; which was, after a flout defence, fo effectually done, that they were forced to abandon that outwork, and retire into the city. In the meanwhile, the burghers, who had but a day or two before raifed a frefh uproar againft the grand-matter, under pretence that he was going to give them up a prey to an infidel who regarded neither oaths nor folemn treaties, perceiving their own danger, came now to defire him to renew the negociations, and only begged the liberty of fending one of their deputies along with his, to fecure their interefts in the capitulation. He readily confented to it; but gave them a charge to fhow the bafhaw Achmed the treaty formerly concluded between Bajazet and his predeceffor d'Aubuffon, in which the former had entailed a dreadful curfe on any of his fucceffors that fhould infringe it. This was done, in hopes that the fhowing it to his mafter, who valued himfelf fo much upon his frict obfervance of his law, might produce fome qualm in him which might lengthen the agreement, for they were fill as much in hopes of a fuccour from Europe as he was in fear of it ; but to their great furprife, Achmed had no fooner perufed than he tore it all in pieces, trampled it under his feet, and in a rage ordered them to be gone. The grand-matter found no other refource than to fend them back to him the next day; when that minifter, who knew his mafter's impatience to have the affair concluded, quickly agreed with them upon the terms, which were in fubtance as follow:

1. That the churches fhould not be profaned. 2. That the inhabitants fhould not be forced to part with their children to be made janiffaries. 3. That they fhould enjoy the free exercife of their religion. 4. That they fhould be free from taxes during five years. 5. That thofe who had a mind to leave the ifland fhould have free leave to do fo. 6. That if the grand-mafter and his knights had not a fufficient number of veffels to tranfport themfelves and their effects into Candia, the fultan fhould fupply that defect. 7. That they fhould have 12 days allowed them, from the figning of the articles, to fend all their effects on board. 8. That they fhould have the liberty of carrying away their relics, chalices, and other facred utenfils belonging to the great church of St John, together with all their ornaments and other effects. 9. That they thould likewife carry with them all the artillery with which they were wont to arm the galleys of the order. 1o. That the iflands belonging to it, together with the cafle of St Peter, fhould be delivered up to the Turks. if. That, for the more eaiy execution of thefe articles, the Turkifh army fhould be removed at fome miles diflance from the capital. 12. That the aga of the janiffaries, at the head of 4000 of his men, fhould be allowed to go and take poffefion of the place.

From this time the ifland of Rhodes has Been fubject to the Turks; and, like other countries fubject to that tyrannical yoke, has lof its former importance. The air is good, and the foil fertile, but ill cultivated. The capital is furrounded with triple walls and double
ditches, and is looked upon to be impregnable. It is Rhodiold inhabited by Turks and Jews; the Chriftians being obliged to occupy the fuburbs, as not being allowed to Rhollodenflay in the town during the night. The town is fitua- dron. ted in E. Long. 28. 25 . N. Lat. 36. 54.

RHODIOLA, rose-wort, in botany: A genus of the octandria order, belonging to the diæcia clafs of plants; and in the natural method ranking under the $13^{\text {th }}$ order, Succulenta. The male calyx is quadripartite; the corolla tetrapetalous. The female calyx is quadripartite, and there is no corolla; the neetaria are four ; the piftils four ; and there are four polyfpermous capfules. There are two fpecies, the rofea and the minor: the firt grows naturally in the clefts of the rocks and ragged mountains of Wales, Yorkhire, and Weftmoreland. It has a very thick flefhy root, which when cut or bruifed fends out an odour like rofes. It has thick fucculent ftalks, like thofe of orpine, about nine inches long, clofely garnifhed with thick fucculent leaves indented at the top. The ftalk is terminated by a cluw fter of yellowifh herbaceous lowers, which have an agreeable fcent, but are of fhort continuance. The fecond fort is a native of the Alps, and has purplifh flowers which come out later than the former ; it is alfo of a fmaller fize. Both fpecies are eafily propagated by parting their roots; and require a Phady fituation, and dry undunged foil. The fragrance of the firft fpecies, however, is greatly diminifhed by cultivation.

Oil of RHODIUM. See Asphalatus.
RHODODENDRON, dwarf rose-bay, in botany: A genus of the monogynia order, belonging to the decandria clafs of plants; and in the natural method ranking under the 18 th order, Bicornes. The calyx is quinquepartite; the corolla funnel-haped; the ftamina declining; the capfule quinquelocular. There are feven fpecies : the moft remarkable of which are, 1. The hiriutum, with naked hairy leaves, grows naturally on the Alps and feveral mountains of Italy. It is a low fhrub, which feldom rifes two feet high, fending out many ligneous branches covered with a lightbrown bark, garnifhed clofely with oval fpear-hhaped leaves, fitting precty clofe to the branches. They are entire, having a great number of fine iron-coloured hairs on their edges and underfide. The flowers are produced in bunches at the end of the branches in May, having one funnel-fhaped petal cut into five obtufe fegments, and of a pale-red colour. They make a good fhow, and are fucceeded by oval capfules, containing. ripe feeds in Augult. 2. The ferrugineum, with fmooth leaves, hairy on their underfide, is a native of the Alps. and Apennines. It rifes with a fhrubby falk near three feet high, fending out many irregular branches. covered with a purplifh bark, and cinfely garnifhed with fmooth fpear-fhaped entire leaves, whofe borders are reflexed backward; the upper fide is of a light lucid green, their under fide of an iron colour. The flowers are produced at the ends of the branches, are funnelfhaped, cut into five fegments, and of a pale rofe colour. Thefe plants are propagated by feeds; but, being natives of barren rocky foils and cold fituations, they do not thrive in gardens, and for want of their ufual covering of fnow in the winter are often killed by froft in warmer climates. 3.The chamæcitus, or ciliated.leaved dwarf rofe-bay, is a low deciduous fhrub, rative of Mount Baldus $\varepsilon_{2}$ and near Saltzburg in Germany. It

## R H O [ 227 〕 R H O

Bholoden. grows to the height of about a yard; the branches are dron.
tea, from their drinking, in common, a weak infufion of it, as we do the Chinefe plant of that name. This practice fhows that the plant, ufed in fmall quantities, mult beinnocent. Profeffor Pallas informs me, that he fent fome time ago fome of this fhrub dried to Profeffor Koelpin at Stetin; and he fhowed me a letter from that gentleman, where he fays, that he has given it with fuccefs in feveral cafes, particularly in what he calls the artbritica venerea, with a tophus arthriticus on the carpus, and it produced a complete cure. It mult be remarked, that the dofe which thefe hardy Siberians take, who are alfo in the habit of drinking it as tea, would, in all probability, be too ftrong for our countrymen; however, it is a medicine which we may certainly give with fafety, beginning with fmall dofes."

RHEA. See Rhia.
RHGEADE®E (rbaas, Linnæus's name, after Diofcorides, for the red poppy), the name, of the 27 th order in Linnæus's fragments of a natural method, confiting of poppy and a few genera which refemble it in habit and ftructure. See Botany, p. 462.

RHOMBOIDES, in geometry, a quadrilateral fgure whofe oppofite lides and angles are equal, but is neither equilateral nor equiangular.

Rhomboides, in anatomy, a thin, broad, and obliquely fquare flefhy mufcle, fituated between the bafis of the fcapula and the fpina dorfi ; fo called from its figure. Its general ufe is to draw backward and up. ward the fubfpinal portion of the bafis fcapulæ.

RHOMBUS, in geometry, an oblique-angled parallelogram, or quadrilateral figure whofe fides are equal and parallel, but the angles unequal, two of the oppofite ones being obtufe and two acute.

RHONE, one of the largeft rivers in France, which, rifing among the Alps of Switzerland, paffes through the lake of Geneva, vilits that city, and then runs fouthwelt to Lyons; where, joining the river Soane, it continues its courfe due fouth, paffing by Orange, Avignon, and Arles, and falls into the Mediterranean a little above Marfeilles.

RHOPFUM, in botany: A genus of the triandria order, belonging to the gynandria clafs of plants ; and in the natural method ranking with thofe that are doubtful. The calyx is monophyllous and fexpartite; there is no corolla nor any ftamina; the three antherre are each attached to one of the fyyli; the capfule is tricoccous and fexlocular, each containing two feeds. There is only one fpecies, vix. the meborea, a native of Guiana. This is a flrub rifing about three or four feet in beight. The flowers grow in the form of a corymbus; they are of a yellowifh green colour; the capfules are black.

RHOPOLA, in botany : A genus of the monogynia crder, belonging to the tetrandria clafs of plants; and in the natural method ranking with thofe that are doubtful. Tiere is no calyx; the petals are four, oblong, obtufe, and narrowing at the bafe; the ftamina are four, inferted in the corolla, and have large antheræ; the feed-velfel unilocular, and contains one feed. There is only one fpecies, viz. the montana. This is a fhrubby plant growing in Guiana, and remarkable for the great number of branches fent off from its trunk in every direction, and for the fetid fmell of the wood and bark of this flant.

RHUBARB. See Rheum.
RHUMB, in navigation, a vertical circle of any given place, or interfection of fuch a circle with the horizon; in which laft fenfe rhumb is the fame with a point of the compals.
$R_{\text {hUMB-Line }}$ is alfo ufed for the line which a fhip defcribes when failing in the fame collateral point of the compafs, or oblique to the meridians.

RHUS, sumach, in botany : A genus of the trigynia order, belonging to the pentandria clafs of plants; and in the natural methed ranking under the 43 d order, Dumofa. The calyx is quinquepartite; the petals five; the berry monofpermous. There are 24 fpecies, of which the moft remarkable are,
I. The coriaria, or elm-leaved fumach, grows naturally in Italy, Spain, Turkey, Syria, and Paleftine. The branckes of this tree are ufed inftead of oak-bark for tanning of leather; and it is faid that the Turkey leather is all tanned with this fhrub. It has a ligneous ftalk, which divides at bottom into many irregular branches, rifing to the height of eight or ten feet; the bark is hairy, of an herbaceous brown colour; the leaves are winged, compofed of feven or eight pair of lobes, terminated by an odd one, bluntly fawed on their edges, hairy on their under fide, of a yellowifh-green colour, and placed alternately on the branches; the flowers grow in loofe panicles on the end of the branches, which are of a whitifh herbaceous colour, each panicle being compofed of feveral fpikes of flowers fitting clofe to the footitalks. The leaves and feeds of this fort are ufed in medicine, and are efteemed very reftringent and ftiptic.
2. The typhinum, Virginian fumach, or vinegar plant, grows naturally in almolt every part of North America. This hath a woody ftem, with many irregular branches, which are generally crooked and deformed. The young branches are covered with a foft velvet-like down, refembling greatly that of a young ftag's horn, both in colour and texture, from whence the common people have given it the appellation of fag's born; the leaves are winged, compofed of fix or feven pair of oblong heart-fhaped lobes, terminated by an odd one, ending in acute points, hairy on their underfide, as is alfo the midrib. The flowers are produced in clofe tufts at the end of the branches, and are fucceeded by feeds, inclofed in purple woolly fucculent covers; fo that the bunches are of a beautiful purple colour in autumn; and the leaves, before they fall in autumn, change to a purplifh colour at firft, and before they fall to a feuillemort. This plant, originally a native of North America, has been long cultivated in the north of Germany, and is lately introduced into Ruffia. It has got the name of the vinegar plant from the double reafon of the young germen of its fruit, when fermented, producing either new or adding to the ftrength of old weak vinegar, whilft its ripe berries afford an agreeable acid, which might fupply the place when neceffary of the citric acid. The powerful aftringency of this plant in all its parts xecommends it as ufeful in feveral of the arts. As for example, the ripe berries boiled with alum make a good dye for hats. The plant in all its parts may be ufed as a fuccedaneum for oak-bark in tanning, efpecially the white glove leather. It will likewife anfwer to prepare a dye for black, green, and yellow colours; and with martial vitriol it makes a good ink. The milky juice
that flows from incifionsmade in the trunk or branches, makes when dried the bafis of a varnilh little inferior to the Chinefe. Bees are remarkably fond of its flowers; and it affords more honey than any of the flowering fhrubs, fo that it may prove a ufeful branch of economy, where rearing thefe infects is an object. The natives of America ufe the dried leaves as tobacco.
3. The glabrum, with winged leaves, grows naturally in many parts of North America; this is commonly titled by the gardeners New England fumach. The ftem of this is itronger and rifes higher than that of the former ; the branches fpread more horizcntally; they are not quite fo downy as thofe of the laft, and the down is of a brownifh colour; the leaves are compofed of many more pair of lobes, which are fmooth on both fides; the flowers are difpofed in loofe panicles, which are of an herbactous colour.
4. The Carolinianum, with fawed winged leaves, grows naturally in Carolina; the feeds of this were taken from thence by the late $\mathrm{Mr}_{r}$ Catefby, who has given a figure of the plant in his Natural Hift ry of Carolina. This is by the gardeners called the farlet Carolina famach; it rifes commonly to the height of feven or eight feet, dividing into many irregular branches, which are fmooth, of a purple colour, and pounced over with a greyifh powder, as are alfo the footftalks of the leaves. The leaves are compifed of feven or eight pair of lobes, terminated by an odd one; thefe are not always placed exactly oppofi:e on the midrib, but are fometimes alternate, The upper fide of the lobes are of a dark green, and their under hoary, but fmooth. The Howers are produced at the end of the branches in very clofe panicles, which are large, and of a bright red colour.
5. The Canadenfe, with winged fpear-fhaped leaves, grows naturally in Canada, Maryland, and feveral other parts of North America. This hath fmooth branches of a purple colour, covered with a grey pounce. The leaves are compofed of feven or eight pair of lobes, terminated by an odd one; the lobes are fpear-flaped, fawed on their edges, of a lucid green on their upper furface, but hoary on their under, and are fmooth. The flowers are produced at the end if the branches in large panicles, which are compofed of feveral fmaller, each ftanding upon feparate footftalks; they are of a deep red colour, and the whole panicle is covered with a grey pounce, as if it had been fcattered over them.
6. The copallinum, or narrow-leaved fumach, grows naturally in molt parts of North America, where it is known by the title of beach fumach, probably from the place where it grows. This is of humbler growth than either of the former, feldom rifing more than four or five feet high in Britain, dividing into many fpreading branches, which are imooth, of a light brown colour, clofely garnifhed with winged leaves, compofed of four or five pair of narrow lobes, terminated by an odd one they are of a light green on both fides, and in autumn change purplifh. The midrib, which futains the lobes, has on each fide a winged or leafy border, which runs. from one pair of lobes to another, ending in joints at each pair, by which it is eafly diftinguifhed from the other forts. The flowers are produced in loofe panicles at the end of the branches, of a yellowifh herbaceous colour.

䉼hes.
Theie fix forts are hardy plants, and will thrive in the open air The firt and fourth forts are not quite fo hardy as the others, fo mult have a better fituation, otherwife their branches will be injured by fevere froft in the winter. They are eafily propagated by feeds, which if fown in autumn the plants will come up the following fpring; but if they are fown in fpring, they will not come up till the next faring; they may be either fown in pots, or the full ground. If they are fown in pots in autumn, the pots fhould be placed under a common frame in winter, where the feeds may be protected from hard froft; and in the fpring, if the pots are plunged into a very moderate hot-bed, the plants will foon rife, and have thereby more time to get ittength before winter. When the plants come up, they mult be gradually hardened to bear the open air, into which they fhould be removed as foon as the weather is favourable, placing them where they may have the morning fun; in the fummer, they muft be kept clean from weeds, and in dry weather watered. Toward autumn it will be proper to fint their growth by keeping them dry, that the extremity of their fhoots may harden; for if they are replete with moiture, the early frofts in autumn will pinch them, which will caufe thrir fhoots to decay almoft to the bottom, if the plants are not fcreened from them. If the pots are put under a common frame in autumn, it will fecure the plants from injury: for while they are young and the fhoots foft, they will be in danger of fuffering, if the winter proves very fevere; but in mild weatlier they mult always enjoy the open air, therefore fhould never be covered but in froft. The fpring following, juft before the plarts begin to fhoot, they fhould be fhaken out of the pots, and carefully feparated, fo as not to tear the roots; and tranfplanted into a nurfery, in rows three feet afunder, and one foct diftance in the rows. In this nurfery they may ftand two years to get frength, and then may be tranfplanted where they are to remain.
7. Befides thefe, Linneus has included in this genus the toxicodendron or poifon-tree, under the name of rbus vernix or poifon-a/b. This grows naturally in Virginia, Pennfflvania, New England, Carolina, and Japan, rifing with a ftrong woody ftalk to the height of 20 feet and upwards; though in Britain it is feliom feen zbove 12, by reafon of the plants being extremely tender. The bark is brown, inclining to grey ; the branches are garnifhed with winged leaves conpofed of three or four pair of lobes terminated by an odd ene. The lobes vary greatly in their lhape, but for the moll part they are oval and $f_{f}$ ear-thaped. The footitalks become of a bright purple towards the latter part of fummer, and in autumn all tie leaves are of a beautiful purple beiore they fall ©ff.
All the fpecies of fumach abound with an acrid milky juice, which is reckoned poifonous; but this property is moft remarkable in the vernix. The nout diltinct account of it is to be found in Pr feffor Kalm's Travels in North America. "An incifion (fays he) being made into the tree, a whitifh yellow juice, which has a naufeous fmell, $\mathbf{c}$ © mes out between the bark and the wood. This tree is $n \cdot t \mathrm{kn}$ wn for its good qualities, but greatly fo for the effect of its ; which, tho, it is noxious to fome people, yei dres not in the leaft affect others. And thenefore one perfon can handle the tree as be pleafes, cut ci, peel orit its bark, rub it or
the wood upon his hands, fmell at it, fpread the juice upon his fkin, and make more experiments, with no inconvenience to himfelf: another perfon, on the contrary, dares not meddle with the tree while its wood is frefh; nor can he venture to touch a hand which has handled it, nor even to expofe himfelf to the fmoke of a fire which is made with this wood, without foon feeling its bad effects; for the face, the hands, and frequently the whole body, fwell exceffively, and is affected with a very acute pain. Sometimes bladders or bliters arife in great plenty, and make the fick perfon look as if he was infected by a leprofy. In fome people the external thin fkin, or cuticle, peels off in a few days, as is the cafe when a perfon has fcalded or burnt any part of his body. Nay, the nature of fome perfons will not even allow them to approach the place wherethe tree grows, or to expofe themfelves to the wind when it carries the effluvia or exhalations of this tree with it, without letting them feel the inconvenience of tlee fwelling which I have jult now defcribed. Their eyes are fometimes fhut up tor one, or two, or more days together, by the fwelling. I know two brothers, one of whom could without danger handle this tree in what manner he pleafed, whereas the other could not come near it without fwelling. A perion fometimes does not know that he has touched this poifonous plant, or that he has been near it, before his face and hands fhow it by their fwelling. I have known old people who were more afraid of this tree than of a viper; and I was acquainted with a perfon who, merely by the noxious exhalations of it, was fwelled to fuch a decree, that he was as itifi as a log of wood, and could only be turned about in flueets.
"I have tried experiments of every kind with the poifon-tree on myfelt. I have fpread its juice upon my hands, cut and broke its branches, peeled off its bark, and rubbed my hands with it, fmelt at it, carried pieces of it in my bare hands, and repeated all this frequently, without felling the baneful effects fo commonly annexed to it; but I, however, once experienced, that the poifon of the fumach was not entirely without effecz upon me. On a hot day in fummer, as I was in fome dos ree of perfiration, I cut a branch of the tree, and carried it in my hand for about half an hour together, and fmelt at it now and then. I felt no effects from it in the evening. But next morning I awoke with a vio. lent itching or my eye-lids and the parcs thereabouts; and this was fo painfil, that I could hardly keep my hands from it. It ceafed after I had walhed my eyes for a while with very cold water. But my eye-lids were very fiff all that day. At night the itching returned; and in the morning when $I$ awoke, $I$ felt it as ill as the morning before, and I ufed the fame remedy againft it. However, it continued almolt for a whole week trgether ; and my eyes were very red, and my eye-lids were with difficulty moved during all that time. My pain ceafed entirely afterwards. About the fame time I had fpread the juice of the tree very thick upon my hand. Three days after, they occafioned blifters, which foon went off without affecting me much. 1 have not experienced any thing more of the effects of this plant, nor had I any defire fo to do. However, I found that it could not exert its power upon me when I was not perfpiring.
"I have never heard that the poifor of this fumach.

## R I B

Rhime Riband
Nowand.
has been motal, but the pain ceafes after a few days duration. The natives formerly made their flutes of this tree, becaufe it has a great deal of pith. Some people affured me, that a perfon fuffering from its noifome exhalations, would eafily recover by fpreading a mixture of the wood burnt to charcoal, and hog's lard, upon the fwelled parts. Scme afferted, that they had really tried this remedy. In fome places this tree is rooted out, in purpofe that its poifor may not affect the workmen."

The natives are faid to diftinguifh this tree in the dark by its extreme coldnefs to the touch. The juice of fome kinds of fumach, when expofed to the heat of the fun, becomes fo thick and clammy, that it is uied for bird-lime, and the infpiflated juice of the poifon-afh is faid to be the fine varnifh of Japan. A cataplafm made with the frefh juice of the poifon-afh, applied to the feet, is faid by Hughe, in his Natural Hitory of Barbadoes, to kill the vermin called by the Weft Indian shigers. Very good vinegar is made from an infufion of the fruit of an American fumach, which for that reafon is called the vinegar-tree. The refin called gumb copal is from the rhus copallinum. See Copal.

RHYME, Rhime, Ryme, or Rime, in poetry, the fimilar found or cadence and termination of two words which end two verfes, \&c. Or rhyme is a fimilitude of found between the laft fyllable or fyllables of a verfe, fucceeding either immediately or at a diftance of two or three lines. See Poetry, $\mathrm{n}^{0}$. ${ }^{7} 77$, \&c.

RHYMER (Thomas the), was a native of the parifh of Earlftown, in the county of Berwick. His real name and title was Sir Thomas Lermont. He lived at the weft end of Earlltown, where part of his houfe is now fanding, called Rhymer's Tower; and there is a fone built in the fore wall of the church with this iafription on it,

## Auld Rhymet's race lies in this place.

He lived in the $13^{\text {th }}$ century, and was contemporary with one of the earls of March, who lived in the fame place.

RHYTHM, in mufic, the variety in the movement, as to the quicknefs or flownefs, length or fhortnefs, of the notes. Or it may be defined more generally, the proportion which the parts of the motion have to each other.

RIAL, or Ryal, a Spanifh coin. See MoneyTable.

Rial, or Rayal, is alfo the name of a piece of gold anciently current: in Britain for 10 s .

RibAN, or Ribban, in heraldry, the eighth part of a bend. See Heraldry, p. 447-

RIBAND, or Ribbon, a narrew fort of filk, chiefly ufed for head-ornaments, badges of chivalry, \&c.

In order to give our readers an idea of the manner in which this curious and valuable branch of manufactures is managed, a view of the ribbon weaver at his loom is reprefented in Plate CCCCXXXV. where 1. Is the frame of the loom. 2. The cafte, containing 48 pulleys. 3. The branches, on which the pulleys turn. 4. The tires, or the riding cords, which run on the pulieys, and pull up the high-liffes. 5. The lift-fticks, to which the high-liffes are tied. 6. The high-1 fes, or lifts, are a number of long threads, with platines, or plate-leads, at $\mathfrak{t}$ ' e bottom; and ringlets, or
loops, about their middle, through which the cords or crofs-threads of the ground-liarnefs ride. 7. The plateleads, or platines, are flat pieces of lead, of about fix inches long, and three or four inches broad at the top, but tound at the bottom; forme ufe black flates inftead of them : their ufe is to pull down thofe liffes which the workman had raifed by the treddle, after his foot is taken off. 8. The branches or cords of the ground-barnefs, which go thro' the loops in the middle of the highliffes: on the well-ordering of thefe cords chiefly depends the art of ribbon-weaving, becaufe it is by means of this contrivance that the weaver draws in the thread or filk that makes the flower, and rejects or excludes the rell. 9. The batton: this is the wooden framethat holds the reed or fhuttle, and beats or clofes the work : where, obferve, that the ribbon-weaver does not beat hiswork; but as foon as the fhuttle is paffed, and his hand is taken away, the batton is forced, by a fpring from the top, to beat the work clofe. 10. The fhuttle, or reed. 11. The fpring of the batton, by which it is made to clofe the work. 12. The long-harnefs are the front-reeds, by which the figure is raifed. 13. The linguas are the long pieces of round or fquare lead, tied to the end of each thread of the long-harnefs to keep them tight. 14. The broad piece of wood, about a foot fquare, leaning fomewhat forward, intended to eafe the vreaver as he ftoops to his thuttle; it is fixed in the middle of the brealt-beam. Some weavers, inftead of this, have a contrivance of a cord or rope that is faftened to the front-frame, and comes acrofs his breaft ; this is called a fopfall. 15. The feat-bench; this leans forward very much. 16. The foot-ftep to the treddles. 17. The breaf-beam, being a crofs-bar that paffes from one of the flandards to the other, fo as to front the workman's breaft : to this breaft-bar is fixed a roll, upon which the ribbon paffes in its way to be rolled upon the roller, that turns a little below. 18. The clamps, or pieces of wood, in which the broaches that confine the treddles reft. 19. The treddles are long narrow pieces of wood, to the ends of which the cords that move the liffes are faftened. 20. The treddle-cords are only diftinguifhed from the riding-cords by a board full of holes, which divide them, in order to prevert the plate-leads, which are tied to the high-liffes, from pulling them too high when the workman's foot is off the treddle : which ftop is made by a knot in the treddlecord, too big to be forced through that hole in the buard. 25. The lames are two pieces of thin narrow boards, only ufed in plain works, and then to fupply the place of the long-harnefs. 22. The knee-roll, by which the weaver rolls up his ribbon as he fees proper, or by bit and bit as it is finifhed. 23. The backrolls, on which the warp is rolled. It is to be obferved, that there are always as many rolls as colours in the work to be wove. 24. The clamps, which fupport the rollers. 25. The returning flicks, or, as others call them, the returns, or the tumblers, or pulleys, to which the tiers are tied, to clear the courfe of cords through the high-liffes. 26. The catch-board for the tumblers. 27. The tire-board. 28. The buttons for the knee-rolls and treddle-board, defribed in number 20.

Ribbons of all forts are prohibited from being imported into Britain.

RIBANDS (from rid and $b c x d$ ), in naval architeo ture,

Ribind, $\underbrace{\text { Rilands. }}$

## R I B

Ribands, ture, long narrow flexible pieces of timber, nailed upRibes. on the outfide of the ribs, from the fem to the ftern. poft, fo as to envelope the thip lengthwife, and appear on her fide and bottom like the meridians on the furface of the globe. The ribands being judicioufly arranged with regard to their height and diftance from each other, and forming regular fweeps about the fhip's body, will comp fe a kind of frame, whofe interior furface will determine the curve of all the intermediate or filling-timbers which are ftationed between the principal ones. As the figure of the fhip's bottom approaches to that of a conoid, and the ribands have a limited breadth, it is apparent that they cannot be applied to this convex furface without forming a double curve, which will be partly vertical and partly horizontal ; fo that the vertical curve will increafe by approaching the ftem, and Aill more by drawing near the ftern-poft. It is alfo evident, that by deviating from the middle line of the fhip's length, as they approach the extreme breadth at the midfhip-frame, the ribands will allo form an horizontal curve. The lowelt of thefe, which is ierminated upon the ftem and ftern-poft, at the height of the rifing-line of the floor, and anfwers to the upper part of the floor-timber upon the midfhipframe, is called the floor-riband. That which coincides with the wing-tranfom, at the height of the lower-deck upon the midfhip-frame, is termed the breadth-riband; all the reft, which are placed between thefe two, are called intermediate ribands. See Ship-building.

RIBES, the Currant and Gooseberry-bush: A genus of the monogynia order, belonging to the pentandrid clafs of plants ; and in the natural method ranking under the $3^{6 \text { th }}$ order, Pomacea. There are five petals, and famina inferted into the calyx; the Ityle is bifid; the berry polyfpermous, inferior.

The currant and the goofeberry were long confidered each as a feparate genus; ribes the currant, and grofularia the goofeberry ; but they are now joined together, the groffularia being made a fpecies of ribes; all the currant kinds having inermous or thomlefs branches, and racemous clufters of flowers and fruit, and the goofeberry, have fpinous brandhes, and flowers and fruit for the moft part fingly.

There are three fpecies of the currant-tree, two of which, and their varieties, merit culture for their fruit; the other as a plant of variety for obfervation: all of which are inermous or unarmed, having no thorns on the branches.

1. Rubrum, common red-currant tree, \&c. hath a lhrubby fem, dividing low into many branches, forming a bufhy head, five or fix feet high or more, without thorns; broad trilobate leaves, and fmooth pendulous clufters of plane greenith flowers, fucceeded by fmall clufters of berries. It grows naturally in woods and the hedges in molt parts of Europe, and comprifes all forts of red and white currants ; as, common fmall red cur-rant-large bunched red currant-Champaigne palered currant-common fmall white currant-large white Dutch currant-yellow blotched-leaved curtant-hil. ver ftriped leave i-g ld ftriped leaved-goofeberryleaved. All thefe forts are varieties of one fpecies, ribes rubrum, or comm red currant; it being the parent from which all the others were firft obtained fr m the feed, and improved by culture. They all flower in the fprirg, and the fruit ripens in June and

July ; and by having the trees in different fituations and modes of training, fuch as plantations of ftandards in the open quarters for the general fupply, others trained againft walls or pales of different dipect, the fruit may be continued ripe in good perfection from about the middle of June until November, provided the later crops are defended with mats or nets from the birds.
2. The nigrum, or black carrant tree, hath a fhrubby ftem, dividing low into many branches, forming a bufhy head five or fix feet high; broad trilobate leaves of a rank odour, and having racemous clutters of oblong greenifh flowers, fucceeded by thin clufters of black berries. The fruit of this fpecies being of a ftrong flavour, and fomewhat phyfical relifh, is not generally liked; it, however, is accounted very wholefome: there is alfo made of it a fyrup of high eftimation for fore throats and quinfies; hence the fruit is often called fquinancy berries. There is a variety called this Pennfylvanian black currant, having fmaller fhoots and leaves, not frong fcented, and finall fruit but of little value; fo the fhrub is elteemed only for variety and fhrubberies. The mode of bearing of all the varieties of currants is both in the old and ycung wood all along the fides of the branches and fhoots, often upon a fort of fmall fprigs and fnags, producing the fruit in numerous long pendulous clufters.
3. The groffularia, or common goofeberry bufh, rife, with a low fhrubby ftem, dividing low into a very branchy bulhy head, armed with fpines; trilobate fmallill leaves, having hairy ciliated footitalks; and fmall greenifh flowers, fucceeded by hairy berries. It confifts of many varieties, of different fizes and colours.
4. The reclinatum, or reclinated broad-leaved goofe-berry-bufh, rifes with a low fhrubby Item, and reclinated fomewhat prickly branches, trilobate broadifh leaves, and fmall greenifh flowers having the pedunculi furnifhed with tryphyllous bractea.
5. The oxyacanthoides, or oxyacantha-leaved goofeberry, hath a fhrubby fem, and branches armed on all fides with fpines, and largith trilobate hawthorn leaves.
6. The uva cifpa, or fmooth goofeberry, hath a fhrubby ftem, and branches armed with fpines; trilo. bate leaves; pedicles having monophyllous bractea; and fmooth fruit.
7. The cynofbati, or prick!y-fruited goofeberry bufh, hath a thrubby ftem and branches, armed with fines, moflly at the axillas, and prickly friit in cluters.

All the above feven fpecies of ribes, both currants and goofeberry kinds, and their refpective varieties, are very hardy fhrubs, that profper almoft anywhere, both in upen and fhady fituations, and in any com. mon foil ; bearing plentifully in any expofure, though in open funny fituations they produce the largeft and faireft fruit, ripening to a richer vinous flavour; but it is eligible to plant them in different fituations and afpects, in order to have the fruit as early and late as pofible.

They are commonly planted in the kitchen-gardem, mofly as dwarf fandards, in the open quarters, for the general fupply; being diffofed fometimes in continued plantations in rows, eight or ten feet by fix afunder, where ereat quantities of the fruit are required for market or other large fupplies; and are fometimes difpofed in fingle ranges round the cutward

## kIC 「 132 J RIC

Ribes
iccia. Riccias
sage of the quarters, eight feet afunder; frequently in fingle crots rows, in order to dives the ground into feparate wide plats or brcaks, of from 20 to 30 or 40 feet wide, whicii alfo ferves to fhelter the ground a lithe in winter; in all of which methods of planting them as ftandards, they fhould be generally trained up to a lingle dem about a foot high, then fuffered to branch out every way all around into bufly heads, keeping the midale, however, open, aud the branches moderately thin, to admit the lin and free arr; though if fome are fanned, that is, trimmed on two fides oppofitely, fo as to make the other branches range in a Iine like an efpalier, they will take up much lefs of the ground, and, by admitting the fuin and air more freely, they will produce laye fair fruit. They are likewife trained againut walls or paings, like other wallarees, but principally fome of the large red and white Dutch corrants, in which they will produce fine large fruit, and thofe againt any fouth fence will ripen early , and be high flavoured; but it is proper to plant a few both againft fouth, north, ealt, and weft walls, in order to obtain the fruit ripe both early and late, in a long fucceffion. It is alfo proper to plant a few of the fineit forts of goofeberries againft a warm fence, both to have early green goofeberries for tarts, \&e. as well as to ripen early; and they will grow very large and fine. Sometimes both currants and goofeberries are allo trained in low efpaliers for variety, and they produce very fine fruit.

The fruits borh of the currant and goofeberry are of an acid and cooling nature, and as juch are fornetimes ufed in medicine, efpecially the juice reduced to a jelly by boiling with fugar. Frum the juice of curre zants alio a very agreeable wine is made.

RICAUT, or Rteaut (Sir Paul), an eminent Eayliih traveller, of the time of whofe birth we find no account ; but in 1661, he was appointed fecretary to the earl of Winchelfea, who was fent ambaifidor extraordinary to the Ottoman Porte. During his continuance in that flation, he wrote, "The prefent State of the Ottoman Empire, in three books, containing the maxims of the Turkifh policy, their religion, aind military difcipline," London, folia, 167 o . He afterwards refided 1 i years as conful at Smy:na, where, at the command of Charles II. he compofed "The prefent ftate of the Greek and Armenian: Churches, anno Cbrijiti $1678 . "$ On his return, Lord Clarendon being appointed lord lieutenant of Ireland, made hira his prindipal fecretary for Leinter and Connaught: king James II. kuighted him; and made him one of the privy council in Ireland, and judge of the court of admiralty; all which he held till the Revolution. He was employed by Kiig William as refident at the Hanfetowns in Lower Saxony, where he oontinued for ten years ; but being worn out with age and infirmities, he obtained leave tureturn in 1700 , and died the fame year. Ricaut continued "Knolles's Hitory of the Turks, and Platina's Lives (ff the Popes;" befides which, there are fome oher productions uider his name.

RICCIA, in b tany: A genus of the natural order of alga, belonging to the cryptogamia clafs of plants. Theie is no calyx, bat a veffeular cavity within the fubflance of the leat. The:e is no corolla ; the anthere are cylindrical, and ieffile, placef oin the ermen, which is turbinated; the fyle is fliform, perforating the an-
thera; and the feed cafe is fpherical, crowned with the withered anthera; the feeds are hemifpherical and pedicellated. den) whilf in the hulk, is in India called paddee, and Sumatra, affumes a different name in each of its other various P. 60 . flates. We obferve no diftinction of this kind in Europe, where our grain retains through all its ftages, till it becomes flour, its original name of barley, wheat, or oats: The following, befide many others, are names applied to rice, in its different flages of growth and preparation : paddee, original name of the feed : oofay, grain of laft feafon : bunnee, the plants before removed to the fawoors: bras or bray, rice, the hulk of the paddee being taken off: charroop, rice cleaned for boiling; naffce, boiled rice : peerang, yellow rice: jambar, a fervice of rice, \&c.

Among people whofe general objects of contemplation are few, thofe which do of neceffity engage their attention, are often more nicely difcriminated than the fame objects among more enlightened people, whofe ideas ranging over the extenfive field of art and fcience; difdain to fix long on obvious and common matters: Padde, on Sumatra and the Malay illands, is difinguifhed into two forts; Laddang or up-land paddee, and Sawoor or low-land, which are always kept feparate, and will not grow reciprocally, Of thefe the fornier bears the higher price, being a whiter, heartier, atid better flavoured grain, and having the advantage in point of keeping. The latter is mach more prolific from the feed, and liable to lefs rifk in the culture, but is of a watery fubtance, produces lefs increafe in boiling, and is fubject to a fwifter decay. It is, however, in more common ufe than the former. Befide this general diftinction, the paddee of each fort, particularly the Laddang, prefents a variety of fpecies, which, as far as my information extends, I fhall enumerate, and endeavour to defcribe. The common kind of dry ground paddee: culour, light brown : the fize rather large, and very little crooked at the extremity. Paddec andallong : dry ground: flort round grain: grows in whorles er: bunches round the flock. Paddee ebbafs: dry ground: large grain: common. Paddee gralloo: dry ground: light coloured: fcatce. Paddee fennee: dry ground: deep coloured; fmall grain: fcarce. Paddee gjos: dry ground : light coloured. Paddee kooning: dry grounde deep yellow : fine rice: crooked, and pointed. Paddec coocoor ballum: dry ground: much efteemed: light coloured; frall, and very much crooked, refembling a dove's nail, from whence its name. Paddee pefang : dry ground: outer coat light brown ; inner red: longer, fmaller, and lefs crooked than the coocoor butluws Paddee Saniong: the fineft fort that is planted in wet ground : fmall, ftraight, and light coloured. In general it may be obferved that the larger grained rice is the leaft efteemed, and the fmaller and whiter the mon priced. In the Lamponn country they make a diffinction of paddee crawang and paddee jerroo; the former "f which is a munth earlier in growth than the latter."

RICHARDIA, in botany: A genus of the monogyuia order, belonging to the hexandria clafs of plants;

## R I C [ 233 ] R I C

$\underbrace{\text { Richardfor }}$ and in the natural method ranking under the 47 th order, Stellate. The calyx is fexpartite; the corolla monopetalous, and fubcylindrical; and there are three feeds.

RICHARDSON (Samuel), a celebrated Englifh fentimental novel-writer, born in 1688 , was bred to the bufinefs of a printer, which he exercifed all his lite with eminence. Though he is faid to have undertood no language but his own, yet he acquired great reputation by his three epiftolary novels, intitled Pame!a, Clariffa, and Sir Cbarles Grandifon; which fhow an uncommon knowledge of human nature. His purpofe being to promote virtue, his pictures of moral excellence are by much too highly coloured; and he has defcribed his favourite characters fuch rather as we might wifh them to be, than as they are to be found in reality. It is alfo objected by fome, that his writings have not always the good effect intended: for that, inftead of improving natural characters, they have fafhioned many artificial ones; and have taught delicate and refined ladies and gentlemen to defpife every one but their own felf-exalted perfons. But after all that can be urged of the ill effects of Mr Richardfon's novels on weak minds, eager to adopt characters they can only burlefque; a fenlible reader will improve more by ftudying fuch models of perfection, than of thofe nearer to the natural ftandard of human frailty, and where thofe frailties are artfully exaggerated fo as to fix and mifemploy the attention on them. A ftroke of the palfy carried off Mr Richardfon, after a few days illnefs, upon the $4^{\text {th }}$ of July 1761. He was a man of fine parts, and a lover of virtue; which, for aught we have ever heard to the contrary, he fhowed in his life and converfation as well as in his writings. Befides the works abovementioned, he is the author of an $\not Æ$ fop's Fables, a Tour through Britain, 4 vols. and a volume of Familiar Letters upon bufinefs and other fubjects. He is faid from his childhood to have delighted in letter-writing ; and therefore was the more eafily led to throw his romances into that form; which, if it enlivens the hiftory in fome refpects, yet lengthens it with uninterefing prate, and formalities that mean nothing, and on that account is fometimes found a little tedious and fatiguing.

The molt eminent writers of his own country, and even of foreign parts, have paid their tribute to the tranfcendant talents of Mr Richardfon, whofe works have been publifhed in almoft every language and country of Europe. They have been greatly admired, notwithftanding every diffimilitude of manners, or every difadvantage of tranflation. M. Diderot, a late celebrated French author, fpeaking of the means employed to move the paffions, in his Effay on Dramatic Poetry, mentions Richardfon as a perfect mafter of that art: "How ftriking (fays he), how pathetic, are his defcriptions! His perfonages, though filent, are alive before me; and of thofe who fpeak, the actions are till more affecing than the words."-The famous John James Roulieau, fpeaking, in his letter to M. d'Alembert, of the novels of Richardfon, afferts, "that nothing was ever written equal to, or even approaching them, in any language."-Mr Aaron Hill calls his Pamela a "delightul rurfery of virtue."-Dr Warton fpeaks thas of Clementina: "Of all reprefentations of madnefs, that of Clementina, in the Hitury of Si- Chatles Grandion, Vo.., XVI.
is the moft deeply interefting. I know nei whelhot
even the madnefs of Lear is wrought up, and expreffed, by fo many little ftrokes of nature and paffion. It is abfolute pedantry to prefer and compare the madnefs of Oreftes in Euripides to this of Clementina."- Dr Johnfon, in his Introduction to the 97 th number of the Rambler, which was written by Mr Rinhardfon, cb. ferves, that the reader was indebted for that day's entertainment to an author, "from whom the are has received greater favours, who has enlarged the knowledge of human nature, and taught the pallons to move at the command of virtue ;" and, in his Life of Rowe, he fays, "The character of Lothario feems to have been expanded by Richardion into that of Lovelace; but he has excelled his original in the moral effect ci the fiction. Lothario, with gaiety which cannot be hated, and bravery which cannot be defpifed, retains too much of the fpectator's kindnefs. It was in the power of Richardfon alone to teach us at once efteem and deteftation; to make virtuous refentment overpower all the benevolence which wit, and elegance, and courage, naturally excite; and to lofe at laft the hero in the villain."-Dr Young very pertinently obferyed, that Mr Richardfon, with the mere advantages of nature, improved by a very moderate progrefs in education, Aruck out at once, and of his own accord, into a new province of writing, in which he fucceeded to admiration. And what is more remarkable, that he not only began, but finifhed, the plan on which he fet out, leaving no room for any one after him to render it more complete : and that not one of the various writers that have ever fince attempted to imitate him, have in any refpect equalled, or at all approached near him. This kind of romance is peculiarly his own; and "I confider him (continues the Doctor) as a truly great natural genius; as great and fupereminent in his way as Shakefpeare and Milton were in theirs."

Richardson (Jonathan), a celebrated painter of Walpole's heads, was born about the year 1665, and againlt his inclination was placed by his father-in-law apprentice to a fcrivener, with whom he lived fix years; when obtaining his freedom by the death of his malter, he followed the bent of his difpofition, and at 20 years old became the difciple of Riley; with whom he lived four years, whofe niece he married, and of whofe manner he acquired enough to maintain a folid and lafting reputation, even during the lives of Kneller and Dahl ; and to remain at the head of the profeflion when they went off the ftage.

There is ftrength, roundnefs, and boldnefs in his co. louring; but his men want dignity, aiid his women grace. The good fenfe of the nation is characterifed in his portraits. You fee he lived in an age when neither enthufiafm nor fervility were predominant. Yet with a pencil ro firm, poffeffed of a numerous and excellent coliection of drawings, full of the theory, and profound in reftestions on his art, he drew nothing well below the head, and was void of imagination. His attitudes, draperies, and back-grounds, are totally infipid and unmeaning; fo ill did he apply to his own practice the fagacious rules and hints he beftowed on others. Though he wrote with fire and judgment, his painings owed little to either. No man dived deeper into the inexhautible fores of Raphael, or was more fmitren with the native lufre of Vandyck. Yet though capran $G \mathrm{~g}$
ble

Richardion ble of afting the elcyation of the one and the elegance of the otrer, he could never contrive to fee with their ejes, when le was to copy nature himfelf. One wonders that he could comment their works fo well, and in tate them fo little.

He quitted bufinefs himfelf fome years before his death ; but his temperance and virtue contributed to protract his life to a great length in the full enjoyment of his underftanding, and in the felicity of domeftic friendlhip. He had had a paralytic ftroke that affected his arm, yet never difabled him from his cuftomary walks and exercife. He had been in St James's Park, and died fuddenly at his houfe in Queen's-fquare on his return home, May 28. 1745, when he had paffed the soth year (f his age. He left a fon and four daughters, one of whom was married to his difciple Mr Hudfon, and another to Mr Grigfon an attorney. The tafte and learning of the fon, and the harmony in which he lived with his father, are vifible in the joint works they compofed. The father in 1719 publifhed two difcourfes: 1. An Effay on the whole Art of Criticifm as it relates to Painting ; 2. An Argument in behalf of the Science of a Connoiffeur ; bound in one volume octavo. In 1722 came forth An Account of fome of the ftatues, bas-reliefs, drawings, and pittures, in Italy, \&c. with Remarks by Mr Richardfon, fenior and junior. The fon made the journey; and from his notes, letters, and obfervations, they both at his return compiled this valuable work. As the father was a formal man, with a flow, but loud and fonorous voice, and, in truth, with fome affectation in his manner ; and as there is much fingularity in his fyle and expreffion, thefe peculiarities, (for they were farcely foibles) fruck fuperficial readers, and between the laughers and the envious the book was much ridiculed. Yet both this and the former are full of matter, good fenfe, and infruction: and the very quaintnefs of fome expreffions, and their laboured novelty, fhow the difficulty the author had to convey mere vifible ideas through the medium of language. Thofe works remind one of Cibber's inimitable treatife on the ftage : when an author writes on his own profeffion, feels it profoundly, and is fenfible his readers do not, he is not only excufable, but meritorious, for illuminating the fubject by new metaphors or bolder figures than ordinary. He is the coxcomb that fneers, not he that inftructs, in appropriated diction.

If thefe authors were cenfured when converfant within their own circle, it was not to be expected that they would be treated with milder indulgence when they ventured into a fifter region. In 1734 they publifhed a very thick oftavo, containing explanatory notes and remarks on Milton's Paradife Loft, with the life of the author, and a difcourfe on the poem. Again were the good fenfe, the judicious criticifms, and the fentiments that broke forth in this work, forgotten in the fingularities that diftinguifh it. The father having faid in apulcgy for being little converfant in claffic literature, that he had looked into them through his fon, Hogarth, whom a quibble could furnif with wit, drew the father peeping through the nether end of a telefcope, with which his fon was perforated, at a Virgil aloft on a fhelf. Yet how forcibly Richardfon entered into the fpirit of his author, appears from his comprehenfive exprefficn, that Milton was an ancient, born
two thoufand years after bis tome. Richardfon, howevep, Biethelet, was as incapable of :eaching the fublime or harmonious Rimes. in poetry, as he was in painting, though fo capable of illultrating both. Some fpecimens of verfe that he has given us here and there in his works, excite no curiofity for more, though he informs us in his Milton, that if painting was his wife, poetry had been his fecret concubine. It is remarkable, that another commentator of Milton has made the fame confefion,

## _Sunt छ์ mibi carmina, me quoque dicunt <br> Vatem paftores-_

fays Dr Bentley. Neither the doctor nor the painter add fed non ego credulus illis, though all their readers are ready to fupply it for both. Befides his pictures and commentaries, we have a few etchings by his hand, particularly two or three of Milton, and his own head. The fale of his collection of drawings, in February 1747, lafted 18 days, and produced about 2060 l. his pictures about 700 l . Hudfon his fon-in-law bought many of the drawings.

RICHELET (Cæfar Peter), a French writer, born in 1631 at Chemin in Champagne. He was the friend of Patru and Ablancourt ; and like them applied himfelf to the fudy of the French language with fuccefs. He compiled a dictionary of that language, full of new and ufeful remarks; but exceptionable, as containingmany fatirical reflections and obfcenities. The beft edition is that of Lyons, 3 vols folio, ${ }_{1} 728$. He alfo. collected a fmall ditionary of rhymes, and compofed fome other pieces in the grammatical and critical way.. He died in 1698.

RICHES, a word ufed always in the plural number, means wealth, money, poffeffion, or a fplendid fumptuous appearance. When ufed to exprefs the fortune of private perfons, whether patrimonial or acquired, it fignifies opulencea; terms which exprefs not the enjoy-* ment, but the poffefion, of numerous fuperfluities.The riches of a fate or kingdom expreffes the produce of indultry, of commerce, of different incorporated bodies, of the internal and external adminiftration of the principal members of which the fociety is compofed, $\& c$.
Cur Saviour fays, that it is more eafy for a camel to go through the eye of a needle, than for a rich man to enter the kingdom of heaven; and we find, in fact, that riches frequently bring along with them a degree of inattention, lukewarmnefs, and irreligion, fuch as fufficiently confirms the divine affertion; which is merely a general truth, and which by no means afferts the abfolute impoffibility of being virtuous and rich at the fame time. For as the ancient philofophers wifely taught, riches, confidered in themfelves, and abfractedly from the bad purpofes to which they may be applied, are not neceffarily incompatible with virtue and wifdom. They are indeed abfolutely indifferent; in good hands they will be ufeful, and promote the caufe of truth, virtue, and humanity; and in bad hands they are the fource of much mifchief; on the one hand they confer the power of doing much good, and on the other they are equally powerful in doing ill.

To men, however, whofe principles of virtue are not fufficiently founded, riches are unqueftionably a dangerous and feducing bait; and as the ancients rightly taught, they are to the greatelt number of men, in an
infinite

## R I C

Riches. $\underbrace{\text { Niches. }}$
infinite variety of circumfances, a powerful obftacle to the practice of moral virtues, to the progrefs of truth, and a weight which prevents them from rifing to that degree of knowledge and perfection of which human nature is capable. They multiply without ceafing the occafions of vice, by the facility which they give to fatisfy a multitude of irregular paffions, and to turn at length thore who are attached to them from the road of virtue, and from the defire of enquiring after truth.

It is this which Seneca means to exprefs, when he fays, " that riches in a valt number of cafes have been a great obftarle to philofophy; and that, to enjoy freedom of mind neceffary for ftudy, a man mult live in poverty, or as if he were poor. Every man (adds he) who wifhes to lead a pleafant, tranquil, and fecure life, muft avoid, as much as poffible, the deceitfulnefs of riches, which are a bait with which we allow ourfelves to be taken as in a fnare, without afterwards having the power to extricate ourfelves, being fo much the more unhappy, that we believe we poffefs them, while, on the contrary, they tyrannize over us." Senec. Epift. 17. and Epij/t. 8.
"The wife man (fays the fame author in another place) does not love riches to excefs, but he would not choofe wholly to diveft himfelf of them; he does not receive them into his foul, but into his houfe; he is careful of them, and employs them for the purpofe of opening a wide field for virtue, and of making it appear in all its fplendor. Who can doubt that a wife man has not more occafions of difplaying the elevation and greatnefs of his mind when he is poffeffed of riches than when he labours under indigence, fince, in the laft condition, he can exercife only one virtue, namely, refiguation; whereas, riches give him an opportunity of difplaying, in their greateft luftre, the virtues of temperance, liberality, diligence, regularity, and magnifi.cence. There is no occafion, then, to prohibit philofophers from the ufe of wealth, or to condemn wifdom to poverty. The philofopher may poffefs the greatelt riches, provided he has not employed force or thed blood in acquiring them; provided he has not gained .them by unjult or illegal means; in a word, provided the ufe which he makes of them be as pure as the fource from which they were derived, and no perfon (the envious excepted) regretting his poffeflion; lie will not refufe the kindnefs of fertune, and will enjor, without flame or pride, the weath acquired by honelt means; he will have more reafon to glory, if, after expofing his riches to the view of the whole world, be can defire any perfon to carry away the reward of treachery or the fruits of oppreffion. If, after thefe words, his riches continue undiminifhed, this man is truly great, and worthy to be rich. If he has not allowed to enter into his poffeflion the fmallelt piece of money gained by unwarrantable means, neither will he refufe the greatelt riches, which are the bleflings of fortune, and the fruit of viruc: if he can be rich, he will choofe to be fo, and he fhall have riches; but he will regard them as bleflings of uncertain poffetion, and of which he may be every moment deprived; he wiil not permit them to be a load to himfelf or to others; he will give them to the good, or to thofe whom he woald make good; but he will give them with the nicelt wif dom, taking care always to difribute them to the mof

## 2351 <br> R I C

worthy, and to thofe who remember that they mult Ricilie: give an account, as well of the wealh which they receive from heaven, as of the purpofes to which it is applied." Senec. de Vita Beata, cap. 21, 22, \& 23 .

RICHLIEU (John Armand du Plemis de), carcinal of Richlieu and Fronfac, bifhop of Lucon, \&cc. was born at Paris in 1585. He was of excellent parts; and at the age of 22 had the addrefs to obtain a difpenfation to enjoy the bifhopric of Lucon in 1607. Re. turning into France, he applisd himeit in a particular manner-to the function of preaching ; and his reputation this way procured him the office of almoner to the queen Mary de Medicis. His abilities in the management of affairs advanced him to be fecretary of ftate in 1616; and the king foon gave him the preference to all his other fecretaries. The death of the marquis $d^{\prime}$ Ancre having produced a revolution in ftate affairs, Richlieu retired to Avignon ; where he employed himfelf in compofing books of controverfy and piety. The king having recalled him to court, he was made a cardinal in 1622 ; and, two years after, firt minifter of fate, and grand mafter of the navigation. In 1626, the ille of Rhée was preferved by his care, and Rochelle taken, having fopped up the haven by that famous dyke whicl le ordered to be made there. He accompanied the king to the fiege of Cazal, and contributed not a little to the raifing of it in r629. He alfo obliged the Hugue. nots to the peace at Alets, which proved the ruin of that party; he took Pamerol, and fuccoured Cazal befieged by Spinola. In the mean time the nobles found fault with his conduct, and perfuaded the king to difcard him. The cardinal, for his part, was unmoved with it; and by his reafonings overthrew what was thought to be determined againft him ; fo that, inflead of being difgraced, he from that moment became more powerful than ever. He punifhed all his enemies in the fame manner as they would have had him fuffer ; and the day which produced this event, fo glorious to cardinal Richlieu, was called the day of dupes. This able minifter had from thenceforwards an afcendancy over the king's mind; and he now refolved to humble the exceffive pride of the houfe of Aultria. For that purpofe he concluded a treaty with Gultavus Adolphus king of Sweden, for carrying the war into the heart of Germany. He alfo entered into a league with the duke of: Bavaria; fecured Lorrain ; raifed a part of the princes of the empire againit the emperor; treated with the Dutch to continue the war againft Spain; favoured the Catalans and Portuguefe till they hook off the Spanifh yoke; and, in fhort, took fo many different meafures, that he accomplifhed his defign; and after having carried on the war with fuccefs, was thinking of concluding it by a peace, when he died at Paris on the 4 th of $D e-$ cember $1 C_{12} \frac{1}{2}^{2}$, aged 58 . He was interred in the Sorbonne, where a magnificent maufoleum is erected to his memory. This great politician made the arts and fiences flourith; formed the botanical garden at Paris, called the king's garden; founded the Fie rch academy ; eftablihed the royal printing-houfe; erected the palace afterwards called Le Pulais Rayal, which he prefented to the king; and rebuilt the Sorbonne $v$ ith a magnificence that ap. Fe'rs truly royal. Befides his books of controverfy and piety, there go under the name of this minifter, A Journal, in 2 vols 12 mo ; and a $P$ litical Teftamert, $i_{2}$ 12 mo ; all tresing of poitics and ftate affairs. Cardi-

mal Mazarine purfued Richlieu's plan, and completed many of the fclemes winch he had begun, butleft unifnifhed.

RICIINUS, or paima Christi, in botany: A gerus of the monodelphid order, belonging to the monoecia clafs of flants; and in the natural method rank. ing under the 38 th order, Tricocce. The male calyx is quinquepartite; there is no corolla; the ftamina numetous. The female calyx is tripartite; there is no corolla, but three bifid ftyles, with a trilocular capfule, and a fingle feed. There are three fpecies, of which the moft remarkable is the communis, or common
N. London palma Chrilti. This tree is of a fpeedy growth, as in one Medical journal, vol. viii. part iii. F. 278 .

Plate cccexuxyin. year it arrives at its full height, which feldom exceeds 20 feet. The trunk is fubligneous; the pith is large; the leaves broad and palmated; the flower foike is fimple, and thickly fet with yellow bloffoms in the fhape of a cone ; the capfules are triangular and prickly, containing three fmooth gray mottled feeds. When the bunches begin to turn black, they are gathered, dried in che fun, and the feeds picked out. They are afterwards put up for ufe as wanted, or for exportation.

Caftor oil is obtained either by expreffion or by decoction. The firft method is practifed in England; the latter in Jamaica. It is common firlt to parch the nuts or feeds in an iron pot over the fire; but this gives the oil an empyreumatic tafte, fmell, and colour; and it is beft prepared in this manner : A large iron pot or boiler is firft prepared, and half filled with water. The nuts are then beaten in parcels in deep wooden mortars, and after a quantity is beaten it is thrown into the iron veffel. The fire is then lighted, and the liquor is gently boiled for two hours, and kept conflantly ftirred. About this time the oil begins to feparate, and fwims on the top, mixed with a white froth, and is 1 kimmed off till no more rifes. The fkimmings are heated in a fmall iron pot, and Arained through a cloth. When cold, it is put up in jars or bottles for ufe.

Caftor oil, thus made, is clear and well flavoured, and if putinto proper bottles will keep fweet for years. The expreffed caftor oil foon turns rancid, becaufe the mucilaginous and acrid parts of the nut are fqueezed out with the oil. On this account the preference is given to well prepared oil by decoction. An Englifh gallon of the feeds yield about two pounds of oil, which is a great proportion.

Before the revolution in America, the planters im. ported train oil for lamps and other purpofes about fugar works. It is now found that the cattor oil can be procured as cheap as the fifh oil of America: it burns clearer, and has not any offenfive fmell. This oil, too, is fit for all the purpofes of the painter, or for the apothecary in ointments and plafters. As a medicine, it purges without ftimulus, and is fo mild as to be given to infants foon after birth, to purge off the meconium. All oils are noxious to infedts, but the caftor oil kills and expels them. It is generally given as a purge after ufing the cabbage bark fome days. In conftipation and belly-ach this oil is ufed with remarkable fuccefs. It fits well on the fomach, allays the fpafm, and brings about a plentiful evacuation by fool, efpecially if at the fame time fomentations, or the warm bath, are ufed.-Delly-ach is at prefent lefs frequent in Jamaica than formerly, owing to feveral caufes. The inhabitants, in seneral, live better, and drink better liquors; but the
exceflive driating of new rum fill makes it fueçent amongft foldicrs, failors, and the lower order of white people. It has been known to happen too from vifceral obfructions after intermittents, or marfh fevers, in Jamaica.

The ricinus Americanus grows as tall as a little tree, and is fo beautiful that Millar fays it deferves a place in every curious garden, and he planted it himfelf at Chelfea. It expands into many branches; the leaves are fometimes two feet in didmeter, and the ftem as large as a middle-fized broom ftaff; towards the top of the branch it has a clufter of flowers, fomething refembling a bunch of grapes; the flowers are fmall and ftaminous, but on the body of the plant grow bunches of rough triangular huks, each containing three fpeckled feeds, generally fomewhat lefs than horfe beans; the fhell is brittle, and contains white kernels of a fweet, oily, and naffeous talte. From this kernsl the oil is extracted, and if the medicine fhould become officinal, the feeds may be imported at a reafonable rate, as the plant grows wild and in great plenty in all the Britifh and French American inands. Seé OLEUM Palme Cbrifti. Of the ricinus communis there are a great many varieties ; all of them fine majeftic plants, annual, or at mof biennial, in Britain; but in their native foil they are faid to be perennial both in root and ftem. They are propagated by feeds fown on a hot-bed, and require the fame treatment as other tender exotics.

RICKETS, in medicine. See there, $n^{\circ} 347$.
RICOCHET, in gunnery, is when guns, howitzers, or mortars, are loaded with fmall charges, and elevated from 5 to 12 degrees, fo as to fire over the parapet, and the fhot or thell rolls along the oppofite rampart: it is called ricochet-firing, and the batteries are likewife called ricocbet-batteries. This method of firing was firft invented by M. Belidor, and firlt ufed at the fiege of Ath in 1697. This mode of firing out of mortars was firlt tried in 1723 at the military fchool at Strafburg, and with fuccefs. At the battle of Rofbach, in 1757 , the king of Pruflia had feveral 6 -inch mortars made with trunnions, and mounted on travel-ling-carriages, which fired obliquely on the enemy's lines, and amongft their horfe, loaded with 8 ounces of powder, and at an elevation of one degree 15 minutes, which did great execution ; for the fhells rolling along the lines, with burning fuzes, made the ftoutelt of the enemy not wait for their burlting.

RICOTIA, in botany: A genus of the filiquofa order, belonging to the tetradynamia clafs of plants; and in the natural method ranking under the 39th order, Siliquofa. The filiqua is unilocular, oblong, and compreffed with plain valvules.

RIDGE, in agriculture, a long piece of rifing land between two furrows. See Agriculture, $\mathrm{n}^{\circ}$ iif.

RIDGLING, or Ridgel, among farriers, \&c. the male of any beaf that has been but half-geit.

RIDICULE, in matters of literature, is that fpe. cies of writing which excites contempt with laughter.

The ridiculous, however, differs from the rifible, (fee Risible.) A rifible object produceth an emotion of laughter merely : a ridiculous object is improper as well as rifible; and produceth a mixed emotion, which is vented by a laugh of derifion or foorn.

Burlefque, though a great engine of ridicule, is not confined to that fubject ; for it is clearly diftinguifhable into burlefque that excites laughter merely, and burlefque

Plate cccesxuvir.

## R I D

R:dicale burtefque that provokes derifion or ridicule. A grave fubject in which there is no impropriety, mi.y be brought down by a certain colouring fo as to be riaible; which is the cafe of Virgil Iravefie, and alfo the cafe of the Secchia Repita; the authors laugh firlt, in order to make their readers laugh. 'Whe Lutrin is a Ficments burlefque poem of the other fort, laying hold of a low and trifing incident, to expofe the luxury, indolence, and contentious fpirit of a fet of monks. Boileau, the author, gives a ridiculous air to the fubject, by dreffing it in the heroic ftyle, and affecting to confider it as of the utmolt dignity and importance. In a compofition of this kind, no image profeffedly ludicrous ought to find quarter, becaufe fuch images deftroy the contraft; and accordingly the author fhaws always the grave face, and never once betrays a fmile.

Though the burlefque that aims at ridicule produces its effects by elevating the ftyle far above the fubject, yet it has limits beyond which the elevation ought not to be carried: the poet, confulting the imagination of his readers, ought to confine himfelf to fuch images as are lively and readily apprehended: a ftrained elevation, foaring above an ordinary reach of fancy, makes not a pleafant impreffion: the reader, fatigued with being always upon the ftretch, is foon difgutted; and, if he perfevere, becomes thoughtlefs and indifferent.Further, a fiction gives no pleafure unlefs it be painted in colours fo lively as to produce fome perception of reality; which never can be done effectually where the images are formed with labour or difficulty. For thefe seafons, we cannot avoid condemning the Batrachomuomackia, faid to be the compofition of Homer : it is beyond the power of imagination to form a clear and lively image of frogs and mice acting with the dignity of the higheft of our fpecies; nor can we form a conceprion of the reality of fuch an action, in any manner fo diftinct as to interef our affectoons even in the flightef degree.

The Rape of the Lock is of a charaEter clearly diftinguifhable from thofe now mentioned; it is not properly a burlefque performance, but what may rather be termed an beroi-comical poem: it treats a gay and familiar fubject with pleafantry, and with a moderate degree of dignity : the author puts not on a mafk like Boileau, nor profeffes to make us laugh like Taffoni. The Rape of the Lock is a genteel fpecies of writing, lefs frained than thofe mentioned; and is pleafant or ludicrous without having ridicule for its chief aim ; giving way, however, to ridicule where it arifes naturally from a particular character, fuch as that of Sir Plume. Addi-

- $N^{Q}$ rcz-jon's $S_{p e n a t i o r ~ *, ~ u p o n ~ t h e ~ e x e r c i f e ~ o f ~ t h e ~ f a n, ~ i s ~ e x-~}^{\text {a }}$ tremely gay and ludicrous, refembling in its fabject the Fape of the Lock.

There remains to fhow, by examples, the manner of treating fubjects $f o$ as to give them a ridiculous appearance.

Il ne dit jamais, je vous donne, mais, je vons prete le bon jour.

Moliere.
Orlans. I know him to be valiant.
Confable. I was told that by one that knows him better than you.

Orleans. What's he?
Conffable. Marry, he told me fo himfelf; and he faid, he cas'd uct who knew ir. Hory V. Shakefpeare.

He never broke ary man's head but his own, and Fificute. th it was againft a pof when le ras drunk.

Iut.
Piillomont. Sententious Mirabel! prithee don't lock with that violent and inflexible wife face, like Solomon at the diveding of the child in an old tapeftry-hanging. Way of the $/$ Foril.
A true crit: $s$, in the perufal of a book, is like a do ${ }_{\mathrm{t}}^{\mathrm{g}}$ at a feaft, whofe thoughts and fomach are whclly fe ${ }^{\text {t }}$ upon what the guefts fling away, and confequently is apt to farl molt when there are the feweft bones.

Tale of a Tub.
In the following intances, the ridicule arifes from abfurd conceptions in the perfons introduced.

Mafcarille. Te fouvient-il, vicomte, de cette de. mi-lune, que nous emportames fur les enemis au fizge d'Afras?

Fodelet. Que veux-tu dire avec ta demi-lune? c'eto: bien une lune tout entiere.

AFoiticre, les Precieufes Ridicules, fc. 1 i.
Slander. I came yonder at Eaton to marry Mrs Anne. Page; and fhe's a great lubberly boy.

Page. Upon my life then you took the wrong-
Slander. What need you tell me that? I think fo when I took a boy for a girl: if I had been married to him, for all he was in woman's apparel, I would not have had him.

Merry Wives of Windfor.
$V$ alentine. Your bleffing, Sir.
Sir Sampfon. You've had it already, Sir: I think I fent it you to day in a bill for fuer thoufand pound; a great deal of money, brother Forefight.

Forefight. Ay, indeed, Sir Sampfon, a great deal of money for a young man; I wonder what he can do with it.

Love for Love, act 2. fc. 7.
Millament. I naufeate walking ; 'tis a country d:verfion; I lothe the country, and every thing that relates to it.

Sir Wilfull. Indeed, hah! look ye, look ye, you do? nay, 'tis like you may-here are choice of paftimes here in town, as plays and the like ; that muft be confefs'd, indeed.
Millament. Ah l'etourdie! I hate the town to:
Sir Wilfull. Dear heart, that's much-hah! that you fhould hate 'em both! hah!'tis like you may; there are fome can't relifh the town, and others can't away with the country - tis like you may be one of thefe, Coufin. Way of the World, act 4. fc. 4.

Lord Froth. I affure you, Sir Paul, I laugh at nobody's jelts but my own, or a lady's: I affure you, Sir Paul.
Brik. How? how, my Lord? what, affront my wit? Let me perifh, do I never fay any thing worthy to be laugh'd at?
Lord Froth. O foy, don't mifapprehen 1 me, I don't fay fo, for I often fmile at your conceptions. But there is nothing more unbecoming a man of quality than to laugh; 'tis fuch a vulgat expreffion of the paffions ! every body can laugh. Then efpecially to laugh at the jeft of an inferior perfon, or when any body elfe of the fame quality does not laugh with one; ridicu. lous! To be pleas'd with what pleafes the crowd! Now, when I laugh I always laugh aione.
l) ouble Dealer, act x. fc. 40

## R I D

## R I D

Ridiculc. So fharp-fighted is pride in blemifhes, and fo will. ing to be gratified, that it takes up with the very flighteft improprieties: fuch as a blunder by a foreigner in fpeaking our language, efpecially if the blunder can bear a fenfe that reflects on the fpeaker:

Quick'y. The young man is an honett man.
Caius. What fhall de honeft man do in my clofet? dere is no honeft man dat fhall come in my clofet.

Merry Wives of Windfor.
Love fpeeches are finely ridiculed in the following paffage,

Quoth he, My faith as adamantine, As chains of deftiny, I'll maintain; True as Apollo ever fpoke, Or oracle from heart of oak; And if you'll give my flame but vent, Now in clofe hugger-mugger pent, And thine upon me but benignly, With that one and that other pigfney, The fun and day thall fooner part Thar love, or you, fhake off my heart; The fun, that fhall no more difpenfe His own, but your bright influence: I'll carve your name on barks of trees, With true love-knots and flourifhes; That fhall infufe eternal fpring, And everlafting flourifhing : Drink every letter on't in ftum, And make it brifk champaign become. Where'er you tread, your foot fhall fet The primrofe and the violet; All fpices, perfumes, and fweet powders, Shall borrow from your breath their odours ;
Nature her charter fhall renew And take all lives of things from you; The world depend upon your eye, And, when you frown upon it, die. Only our loves fhall fill furvive, New worlds and natures to out-live; And, like to herald's moons, remain All crefcents, without change or wane.

Hudibras, part 2. canto 1.
Thofe who have a talent for ridicule, which is feldom united with a tafte for delicate and refined beauties, are quick-fighted in improprieties; and thefe they eagerly grafp, in order to gratify their favourite propenfity. Perfons galled are provoked to maintain that ridicule is improper for grave fubjects. Subjecta really grave are by no means fit for ridicule ; but then it is urged againft them, that, when called in queftion whether a certain fubject be really grave, ridicule is the only means of determining the controverfy. Hence a celebrated queftion, Whether ridicule be or be not a teft of truth ?

On one fide, it is obferved, that the objects of ridicule are falfehood, incongruity, impropriety, or turpitude of certain kinds : but as the object of every excited paffion mutt be examined by reaton, before we can determine whether it be proper or improper ; fo ridicule muft, apparently at leatt, eftablifh the truth of the improprieties defigned to excite the paffion of contempt. Hence it comes in to the aid of argument and reaton, when its innprefions on the imagination are confiftent with the nature of things; but when it frikes the fancy
and affections with fictitious imagres, it becomes the in- Riding. ftrument of deceit. But however ridicule may imprefs the idea of apparent turpitude or falfehond in the imagination, yet ftill reafon remains the fupreme judge; and thus ridicule can never be the final teft or touchftone of truth and faliehood.

On the other fide, it is contended that ridicule is not a fubject of reafoning, but of fenfe or tafte; (fee and compare the articles Risible and Congruiту). Stating the queftion, then, in more accurate terms, Whether the fenfe of ridicule be the proper teft for diftinguifhing ridiculous objects from what are not fo? they proceed thus: No perfon doubts that our fenfe of beauty is the true tef of what is beautiful: and our fenfe of grandeur, of what is great or fublime. Is it more doubtful whether our fenfe of ridicule be the true teft of what is ridiculous? It is not only the the true teft, but indeed the only teft; for this fubject comes not, more than beauty or grandeur, under the province of reafon. If any fubject, by the influence of fafhion or cuftom, have acquired a degree of veneration to which naturally it is not intitled, what are the proper means for wiping of the artificial colouring, and difplaying the fubject in its true light? A man of true tafte fees the fubject without difguife; but if he hefitate, let him apply the teft of ridicule, which feparates it from its artificial connections, and expofes it naked with all its native improprieties.- But it is urged, that the gravelt and moft ferious matters may be fet in a ridiculous light. Hardly fo; for where an object is neither rifible nor improper, it lies not open in any quarter to an attack from ridicule.
RIDING, in general, fignifies the being carried along on any vehicle.
Riding on horfeback. See Horsemanship.
Riding, in medicine. During this exercife all the vifcera are fhaken, and preffed againft each other ; at the fame time the pure air acts with a greater force on the lungs. Weakly perfons, or thofe whofe ftomachs are infirm, fhould, however, be cautious of riding before theit meals are fomewhat digefted.

Riding, in naval affairs, is the ftate of a fhip's being retained in a particular ftation, by means of one or more cables with their anchors, which are for this purpofe funk into the bottom of the fea, \&c. in order to prevent the veffel from being driven at the mercy of the wind or current.-A rope is faid to ride, when one of the turns by which it is wound about the capfern or windlafs lies over another, fo as to interrupt the operation of heaving.

Riding Atbruart, the pofition of a fhip which lies acrofs the direction of the wind and tide, when the former is fo Arong as to prevent her from falling into the current of the latter.

Riding between the Wind and Tide, the fituation of a veffel at anchor, when the wind and tide act upon her in direct oppofition, in fuch a manner as to deftroy the effort of each other upon her hull; fo that fhe is in a manner balanced between their reciprocal force, and rides without the leaft frain on her cables. When a fhip does not labour heavily, or feel a great frain when anchored in an open road or bay, fhe is faid to ride eafy. On the contrary, when fhe pitches violently into the fea, fo as to ftrain her cables, mafts, or hull, it is called riding hard, and the vefel is termed a bad

Riding. roader. A thip is rarely faid to ride when fhe is fatened at both the ends, as in a harbour or river, that fituation being comprehended in the article Mooring.

Riding, a diftrict vifited by an officer.-Yorkihire is divided into three ridings, viz. the ealt, weft, and north ridings. In all indictments if that county, both the town and riding mult be expreffed.

Riding, as connected with gardening, and fufceptible of embellifhment. See Gardening.

A riding, though in extent differing fo widely from a garden, yet agrees with it in many particulars: for, exclufive of that community of character which refults from their being both improvements, and both deftined , to pleafure, a clofer relation arifes from the property of a riding, to extend the idea of a feat, and appropriate a whole country to the manfion ; for which purpofe it mult be diftinguifhed from common roads, and the marks of diflinction mult be borrowed from a garden. Thofe which a farm or a park can fupply are faint and few; but.whenever circumftances belonging to a garden occur, they are immediately received as evidence of the domain. The fpecies of the trees will often be decifive: plantations of firs, whether placed on the fides of the way, or in clumps or woods in the view, denote the neighbourhood of a feat: even limes and horfe-chefnuts are not indifferent ; for they have always been frequent in improvements, and rare in the ordinary fcenes of cultivated nature. If the riding be carried through a wood, the fhrubs, which for their beauty or their fragrance have been tranfplanted from the country into gardens, fuch as the fweet-briar, the viburnum, the euonymus, and the wood-bine, fhould be encouraged in the underwood; and to thefe may be added feveral which are ftill peculiar to fhrubberies, but which might eaflly be transferred to the wildeft coverts, and would require no farther care.

Where the fpecies are not, the difpofition may be particular, and any appearance of defign is a mark of improvement. A few trees ftanding out from a hedgerow, raife it to an elegance above common rufticity : and fill more may be done by clumps in a fielde they give it the air of a park. A clofe lane may be decorated with plantations in all the little vacant fpaces: and even the groups originally on the fpot (whether it be a wood, a field, or a lane), if properly felected, and thofe only left which are elegant, will have an effect : though every beauty of this kind may be found in nature, yet many of them are feldom feen together, and never unmixed. The number and the choice are fymptoms of defign.

Another fymptom is variety. If the appendages of the riding be different in different fields, if in a lane, or a wood, fome ditinguibing circumftance be provided for every bend; or when, carried over an open expofure, it winds to feveral points of view; if this be the conduct throughout, the intention is evident, to amufe the length of the way: variety of ground is alfo a characteriftic of a riding, when it feems to have proceeded from choice; and pleafure being the purfuit, the changes of the ficene both compenfate and account for the circuity.

But a part undiftinguifhed from a common road, fucceeding to others more adorned, will by the contraft alone be fometimes agreeable; and there are beauties frequent in the high-way, and almont peculiar to it,
which may be very acceptable in a riding : a green lane is always delightful; a paffage winding between thickets of brambles and briars, fometimes with, fometimes without a little fpring-wood rifing amongft them, or a cat in a continued fweep through the furze of a down or the fern of a heath, is generally pleafant. Nor will the character be abfolutely loft in the interruption, it will foon be refumed, and never forgotten; when it has been once ftrongly impreffed, very flight means will preferve the idea.

Simplicity may prevail the whole length of the way when the way is all naturally pleafant, but efpecially if it be a communication between feveral fpots, which in character are raifed above the relt of the country: A fine open grove is unufual, except in a park or a garden; it has an elegance in the difpofition which cannot be attributed to accident, and it feems to require a degree of prefervation beyond the care of mere hubandry. A neat railing on the edge of a fteep which commands a profpect, alone diftinguifhes that from other points of view. A building is ftill more frongly characteriftic: it may be only ornamental, or it may be accommodated to the reception of company ; for though a place to alight at interrupts the range of a riding, yet, as the object of an airing, it may often be acceptable. A fmall foot which may be kept by the labour of one man, inclofed from the fields, and converted into a fhrubbery or any other fcene of a garden, will fometimes be a pleafing end to a fhort excurfion from home : nothing to effectually extends the idea of a feat to a diftance; and not being conftantly vifited, it will alway's retain the charms of novelty and variety.

When a riding is carried along a high road, a kind of a ${ }^{2}$ of property may in appearance be claimed even there, lage. by planting on both fides trees equidiftant from each other, to give it the air of an approach : regularity intimates the neighbourhood of a manfion. A village therefore feems to be within the domain, if any of the inlets to it are avenues: other formed plantations about it, and ftill more trivial circumftances, when they are evidently ornamental, fometimes produce and always corroborate fuch an effect; but even without raifing this idea, if the village be remarkable for its beauty, or only for its fingularity, a paffage through it may be an agreeable incident in a riding.

The fame ground which in the fields is no more than rough, often feems to be romantic when it is the fite of a village ; the buildings and other circumftances mark and aggravate the irregularity. To ftrengthen this appearance, one cottage may be placed on the edge of a fteep, and fome winding fteps of unhewn fone lead up to the door; another in a hollow, with all its little appurtenances hanging above it. The pofition of a $f \in w$ trees will fometimes anfwer the fame purpofe ; a footbridge here and there for a communication between the fides of a narrow dip, will add to the character ; and if there be any rills, they may be conducted fo as greatly to improve it.

A village which has not thefe advantages of ground, may, however, be beautiful; it is diftinguifhed by i:s elegance, when the larger intervals between the houfes are filled with open groves, and little clumps are introduced upon other occafions. The church often is, it generally may be, made a picturefque object. Even the cottages may be neat and fometimes grouped

## RID

 the croflings may be in a variety of pleafing defigns; and if a fpring rife, or only a well for common ufe be funk by the fide of the way, a little covering over it may be contrived which thail at the fame time be fim. ple and pretty.There are few villages which may not eafily be ren. dered agreeable. A fmall alteration in a houfe will fometimes occafion a great difference in the appearance. By the help of a few trifing plantations, the objects which have a good effect may be fhown to advantage, thofe which have not may be concealed, and fuch as are fimilar be difguifed. And any form which offends the eye, whether of ground, of trees, or of buildings, may fometimes be broken by the flighteft circumittances, by an advanced paling, or only by a bench. Variety and beauty, in fuch a fubject, are rather the effects of attention than expence.

But if the paflage through the village cannot be pleafant; if the buildings are all alike, or ftand in unmeaning rows and fimilar fituations; if the place furnifhes no opportunities to contraft the forms of dwellings with thofe of out-houfes; to introduce trees and thickers; to interpofe fields and meadows ; to mix farms with cottages; and to place the feveral objects in different pofitions: yet on the outfide even of fuch a village there certainly is room for wood; and by that alone the whole may be grouped into a mafs, which thall be agreeable when fkirted by a riding ; and fill more fo when feen from a diftance. The feparate farms in the fields, alfo, by planting fome trees about them, or perhaps only by managing thofe already on the fpot, may be made very interelling objects; or if a new one is to be built, beauty may be confulted in the form of the houfe, and the difpofition of its appurtenances. Sometimes a character not their own, as the femblance of a caftle or an abbey, may be given to them; they will thereby acquire a degree of confideration, which they cannot otherwife be entitled to: and objects to improve the views are fo important to a riding, that buildings muft fometimes be erected for that purpofe only : but they fhould be fuch as by an attual effect adorn or dignify the fcene; not thofe little flight deceptions which are too well known to fucceed, and have no merit if they fail : for though a fallacy fometimes contributes to fupport a character, or fuggefts ideas to the imagination, yet in itfelf it may be no improvement of a fcene; and a bit of turret, the tip of a fpire, and the other ordinary fubjects of thefe frivolous attempts, are fo infignificant as objects, that whether they are real or fictitious is almof a matter of indifference.
The fame means by which the profpects from a
very near to each other : but ftill each has its peculiarities. Progrefs is a prevailing idea in a riding; and the pleafantnels of the way is, therefore, a principal confideration : but particular foots are more attended to in a garden; and to them the communications ought to be fubordinate; their direction muft be generally accommodated, their beauties fometimes facrificed to the fituation and the character of the feenes they lead to; an advantageous approach to thefe muit be preferred to an agreeable line for the walk; and the circumftances which might otherwife become it are mifplaced, if they anticipate the openings: it fhould fometimes be contrafted to them; be retired and dark if they are fplendid or gay, and fimple if they are richly adorned. At other times it may burf unexpectedly out upon them; not on account of the furprife, which can have its effect only once; but the impreffions are ftronger by being fudden; and the contraft is enforced by the quicknefs of the tranfition.

In a riding, the fcenes are only the amufements of the way, through which it proceeds without ftopping : in a garden they are principal; and the fubordination of the walk raifes their importance. Every art, therefore, fhould be exerted to make them feem parts of the place. Diftant profpects cannot be fo ; and the alies nation does not offend us; we are familiarized to it ; the extent forbids every thought of a clofer connefion; and if a continuation be preferved between them and the points which command them, we are fatisfied. But bomenviews fuggeft other ideas; they appear to be with: in our reach: they are not only beautiful in profpeet, and wo can perceive that the fpots are delightful; but we wifh to examine, to inhabit, and to enjoy them: Every apparent impediment to that gratification is a difappointment; and when the fcenes begin beyond the opening, the confequence of the place is lowered; nothing within it engages our notice: it is an exhibition only of beauties, the property of which does not belong to it ; and that idea, though indifferent in a riding, which is but a paffage, is very difadvantageous to fuch a refidence as a garden. To obviate fuch an idea, the points of view fhould be made important; the objects within be appendages to thofe without; the feparations be removed or concealed; and large portions of the garden be annexed to the fpots which are contiguous to it. The ideal boundary of the place is then carried beyond the fcenes which are thus appropriated to it ; and the wide circuit in which they lie, and the different pofitions in which they may be fhown, afford a greater variety than can generally be found in any garden, the fcenery of which is confined to the inclofure.

Persfield ( $A$ ) is not a large place; the park con- Defcriptains about 300 acres; and the houfe ftands in the midft tion of. of it. On the fide of the approach, the inequalities of Persfisld. the ground are gentle, and the plantations pretty ; but nothing there is great. On the other fide, a beautiful lawn falls precipitately every way into a deep vale which thelves down the middle ; the declivities are divertified with clumps and with groves; and a number of large trees Araggle along the bottom. This lawn is encom-
paffed
(A) The feat of Mr Morris, near Chepfowe, in Monmouthinire.

## R I D

Fiding.
paffed with wood; and through the wood are walks, which open beyond it upon thofe romantic fcenes which furround the park, and which are the glory of Persfield. The Wye runs immediately below the wood: the river is of a dirty colour; but the fhape of its courfe is very varlous, winding firft in the form of a horfe-fhoe, then proceeding in a large, fweep to the cown of Chepfowe, and afterwards to the Severn. The banks are higli hills ; in different places fteep, bulging out, or hollow on the fides; rounded, flattened, or irregular at top; and covered with wood, or broken by rocks. They are fometimes feen in front; fometifnes in perfpective; falling back for the paffage, or clofing behind the bend of the river; appearing to meet, rifing above, or fhooting out beyond one another. The wood which inclofes the lawn crowns an extenfive fange of thefe hills, which overlook all thofe on the oppofite fhore, with the country which appears above or between them; and winding themfelves as the siver winds; their fides, all rich and beatiful, are alternately exhibited; and the point of view in one foot becomes an object to the next.

In manty places the principal feature is a contitided rock, in length a quarter of a mile, perpendicular, high, and placed upon a height. To refemble ruins is common to rocks : but no rüin of any fingle ftracture was ever equal to this enormous pile; it feems to be the remains of a city; and other fmaller heaps feattered about it appear to be fainter traces of the tormer extent, and ftrengthen the fimilitude. It fretches along the brow which termsinates the foreft of Dean; the face of it is compofed of immenfe blocks of fone, but not rugged ; the top is bare and uneven, but not craggy; and from the foot of it, a declivity, covered with thicket, finpes gently towards the Wye, but in one part is abruptly broken off by a ledge of rocks, of a different hue, and in a different direction. From the grotto it feems to rife immediately over a thick wood, which extends down a hill below the point of view, acrofs the valley through which the Wye flows, and up the oppofite banks, hides the river, and continues without interruption to the bottom of the rock : from another feat it is feen by itfelf without even its bafe; it faces another, with all its appendages about. it ; and fometimes the fight of it is partially intercepted by trees, beyond which, at a diftance, its long line continues on through all the openings between them.

Another capital object is the caftle of Chepltowe, a noble ruin of great extent; advanced to the very edge of a perpendicular rock, and fo immediately rivetted into it, that from the top of the battlements down to the river feems bat one precipice : the fame ivy which overfpreads the face of the one, twines and clufters among thie fragments of the cther; many towers, much of the walls, and large remains of the chapel, vare Atanding. Clofe to it is a moft romancic wooden bridge, very ancient, very grotefque, at an extraordinary beight above the river, and feeming to abut againtt the ruins at one end, and fome rocky hills at the other. The cante is fo near to the alcove at Persfield, that little circumftances in it may be difcerned; from other fpots more diftant, even from the lawn, and from a flarubbery on the fide of the lawn, it is ditinetly vifible, and always beautiful, whether it is feen alone, or with the bridge, with the town, with more or with lefs of

Vow, XVI.
the rich meadows which lie along the banks of the Eiding, Wye, to its junction three miles off with the Severn. A long fweep of that river alfo, its red cliffs, and the fine rifing couhtry in the counties of Somerfet and Gloucefter, geinerally terminate the profpect.

Molt of the hills about Persfield are full of rocks; fome are intermixed with hanging woods, and either advance a little before them, or retire within them, and are backed, or overhung, or feparated by trees. In the walk to the cave, a long fucceffion of them is frequently feen in perfpective, all of a dark colour, and with wood in the intervals between them. In other parts the rocks are more wild and uncouth; and fometimes they ftand on the tops of the higheft hills; at other times down as low as the river ; they are homely objects in one fpot, and appeat only in the back-ground of another.

The woods concur with the rocks to render the fcenes of Persfield romaritic: the place everywhere abounds with them; they cover the tojps of the hills; they liang on the Iteeps; or they fill the depths of the valleys. In one place they front, in another they rife above, in another they fink below the point of riew ; they are feen fometimes retiring beyond each other, and darkening as they recede; and fometimes an opening between two is clofed by a third at a diftance beyond them. A point, called the Lover's Leap, commands a continued furface of the thickeft foliage, which overfpreads a vaft hollow immediately underneath. Below the Chinefe feat the courfe of the $W$ ye is in the fhape of a horfe-fhoe : it is on one fide inclofed by a femicircular hanging wood; the direct fleeps of a table-hill fhut it in on the other ; and the great rock fills the interval between them : in the midft of this rude fcene lies the peninfula formed by the river, a mile at the leaft in length, and in the highelt fate of cultivation : near the itthmus the ground rifes conifiderably, and thence defcends in a btokenf furface, till it flattens to the water's edge at the other extremity. The whole is divided into cornifields and pattures ; they are feparated by hedge-rows, coppices, and thickets; open clumps and fingle trees ftand out in the meadows; and houfes and other buildings, which belong to the farms, are fcattered amongit them : nature fo cultivated, furrounded' by' nature fo wild, compofe a moft lovely landfcape together.

The communications between thefe feveral points are generrally by clofe walks; but the covert ends near the Chinefe feat; and a path is afterwards conducted through the upper park to a ruftic temple, which overlooks on one fide fome of the romantic views which have been defcribed, and on the other the cultivated hills and valleys of Monmouthfhire. To the rude and magnificent fceñes of nature now fucceeds a pleafant, fertile, and beautiful country, divided into inclofures, not covered with woods, nor broken by rocks and precipices, but only varied by eafy fwells and gentle declivities. Yet the profpect is not tame : the hills in it are high ; and it is bounded by a valt fweep of the Severn, which is here vifible for many miles together, and receives in its courfe the Wye and the Avon.

From the temple a road leads to the Windeliff, an eminence much above the reft, and comitanding the whole in one view. The Wye runs at the foct of the hill ; the peninfula lies jult below; the deep bofom of Hh
the

## Rialler.

the femicircalar hanging wood is full in fight; over part of it the great rock appears; all its bafe, all its accompaniments, are feen; the country immediately beyond it is full of lovely hillocks; and the higher grounds in the counties of Somerfet and Gloucefter rife in the horizon. The Severn feems to be, as it really is, above Chepfowe, three or four miles wide; below the town it fpreads almoft to a fea; the county of Monmouth is there the hither fhore, and between its beautiful hills appear at a great diftance the mountains of Brecknock and Glamorganfhire. In extent, in variety, and grandeur, few profpects are equal to this. It comprehends all the noble fcenes of Persfield, encompaffed by fome of the fineft country in Britain. See Gardening.

RIDLEY (Nicholas), biflop of London, and a martyr to the Reformation, was defcended of an ancient family, and born in the beginning of the 16 th century, at Wilmontfwick in Northumberland. From the grammar-fchool at Newcaftle upon Tyne, he was fent to Pembroke-hall in Cambridge, in the year 1518, where he was fupported by his uncle Dr Robert Ridley, fellow of Queen's college. In 1522 he took his firft degree in arts; two years after, was elected fellow; and, in 1525, he commenced mafter of arts. In 1527, having taken orders, he was fent by his uncle, for further improvement, to the Sorbonne at Paris; from thence he went to Louvain, and continued abroad till the year 1529 . On his return to Cambridge, he was chofen under-treafurer of the univerfity; and, in 1533 , was elected fenior proctor. He afterwards proceeded bachelor of divinity, and was chofen chapJain of the univerfity, orator, and magifer glomeria. At this time he was much admired as a preacher and difputant. He loft his kind uncle in 1536 ; but was soon after patronifed by Dr Cranmer, archbihop of Canterbury, who made him his domeftic chap!ain, and prefented him to the vicarage of Herne in Ealt Kent ; where, we are told, he preached the doctrine of the Reformation. In 1540, having commenced doctor of divinity, he was made king's chaplain; and, in the fame year, was elected mafter of his college in Cam. bridge. Soon after, Ridley was collated to a prebend in the church of Canterbury; and it was not long before he was accufed in the bifhop's court, at the inftigation of bilhop Gardiner, of preaching againft the doctrine of the Six Articles. The matter being referred to Cranmer, Ridley was acquitted. In 1545, he was made a prebendary of Weftminter abbey; in 1547 was prefented, by the fellows of Pembroke-hall, to the living of Solam, in the diocefe of Norwich; and the fame year was confecrated bifhop of Rochefter. In 1550 he was tranflated to the fee of London; in which year he was one of the commifioners for examining bifhop Gardiner, and concurred in his deprivation. In the year 1552 , our prelate returning from Cambridge, unfortunately for himfelf, paid a vifit to the Princefs, afterwards Queen Mary; to whom, prompted by his zeal for yeformation, he exprefied himfelf with too much freedom; for the was fcarcely feated on the throne when Kidley was dormed a vietim to her revenge. With Canmer and Latimer he was burnt alive at Oxford, on the 16 th of October 1555. He wrote. I. A treatife concerning images in churches. 2. Brief declaration of the Lord's Supper.
3. Cettain godly and comfortable conferences betwe:n bithop Ridiey and Mr Hugh Latimer, during their imprifonment. 4. A comparifon between the comfort- able doctrine of the Gofpel and the traditions of the Popilh religion ; and other works.

RIFLE, in gumery. See Gunnery, $n^{\circ} 36$, et $f q q^{\circ}$.

RIGA, a large, frong, populous, and rich town of the Ruffian empire, and capital of Livonia. It is a large trading place, and has a very confiderable fortrefs; the trade is chiefly in corn, fkins, leather, and naval fores. It was taken by the Ruffians in 1710, after they had blocked it up a long while, during which the inhabitants were aflicted with the plague. The cafte is fquare, and defended by four towers and fix baftions; befides which, it has a fine arfenal. The Proteftants have fill a handfome college here, It is feated on a large plain on the river Dwina. E. Long. 24. 25. N. Lat 57.0.

RIGADOON, a gay and brifk dance, borrowed originally from Provence in France, and performed in figure by a man and woman.

RIGGING of a $S_{H I P}$, a general name given to all the ropes employed to fupport the mafts, and to extend or reduce the fails, or arrange them to the difpofition of the wind. The former, which are ufed to fuftain the maft, remain ufually in a fixed pofition, and are called fanding rigging; fuch are the fhrouds, fays, and back-ftays. The latter, whofe office is to manage the fails, by communicating with various blocks or pulleys, fituated in different places of the mafts, yards, fhrouds, \&c. are comprehended in the general term of running rigging; fuch are the braces, heets, haliards, clue-lines, brails, \&c.

In rigging a maft, the firft thing ufually fixed upon its head is a circular wreath or rope, called the gromet, or collar, which is firmly beat down upon the top of the hounds. The intent of this is to prevent the fhrouds from being fretted or worn by the trefle-trees, or fhoulders of the malt; after this are laid on the two pendents, from whofe lower ends the main or fore tackles are fufpended; and next, the fhrouds of the ftarboard and larboard fide, in pairs, alternately. The whole is covered by the fays, which are the largeft ropes of the rigging. When a yard is to be rigged, a gromet is alfo driven firt on each of its extremities; next to this are fitted on the horfes, the braces, and lafly the lifts or top-fail fheet-blocks.

The principal objects to be confidered in rigging a fhip, appear to be itrength, convenience, and fimplicity: or, the properties of affording fufficient fecurity to the mafts, yards, and fails; of arrauging the whole machinery in the moft advantageous manner, to fufain the mafts, and facilitate the management of the fdils; and of avoiding perplexity, and rcjecting whatever is fuperfluous or unneceffary. The perfection of this art, then, confifts in retaining all thofe qualities, and in preferving a judicious medium between them. See Ship-builiding.

RIGHT, in geometry, fignifies the fame with Atraight ; thus, a ftraight line is called a right one.

Richt is a title conferred, I. Together with Reverent, upon all bifhops. 2. Together with Honourable, upne earls, vifcounts, and barons. 3. By courtefy, together with Honourable, upon the fons of dukes, mar-
quifes

## R I G

Hilfes, and the eldelt fons of earls." 4. Together with Honourable, to the fpeaker of the houfe of commons; but to no other commoner excepting thofe who are members of his majefty's moft honourable privy-council; and the three lord mayors of London, York, and Dublin, and the lord provoft of Edinburgh, during their office. See Honourable and Provost.

## Heredilary Right. See Hereditary.

Right is a word which, in the propriety of the Englifh language, is ufed fometimes as an adjective and fometimes as a fubftantive. As an adjetive it is near'y of the fame import with fit, fuitall, b.coming, pror, and whilft it expreffes a quality, it indicates a relation*. Thus when we fay that an action is right, we mu't rot only know the nature of the ation, but, if we feak intelligibly, mult alfo perceive its relation to the end for which it was performed; for an action may be right with one end in view which would be wrong with another. The conduct of that general would be risht, who, to fave an army that could not be otherwife faved, fhould place a fmall detachment in a ftation where he knew they would all be inevitably cut ori ; but his conduct would be very wrong were he to throw away the life of a fingle individual for any purpofe, however important, which he knew how to accomplifh without fuch a facrifice.

Many philofophers have talked of actions being riglit and wrong in the abftract without regard to their natural confequences; and converting the word into a fubftantive they have fancied an eternal rule of right, by which the morality of human condutt is in every particular cafe to be tried. But in thefe phrafes we can difcover no meaning. Whatcver is right mult be fo on fome account or otber; and whatever is ft, nuef be fit for fome purpofe. When he who refts the foundatien of virtue on the moral fenfe, fpeaks of an action boing right, he muft mean that it is fuch as, through the meedium of that fenfe, will excite complacency in the mind of the agent, and gain to him the general approbation of mankind. When he who refts moral obligation on the will of God, fpeaks of fome actions as right and of others as zurong, he mult mean that the tormer are agreeable to the divine will, however made known to men, and the latter difagreedble to it; and the man who deduces the laws of virtue from what he calls the fitnefs of things, muft have fome end in winro, for which things are fit, and denominate actions right or aur.ng as they tend to promote or counteract that end.

But the word right, ufed as a fubitantive; has in common as well as in philofophical language a fignification which at firf view appears to be very diferent from this. It denotes a juf cluin or an boneft poffeffion. Thus we fay, a father has a rigbt to reverence from his children; a huband to the love and fidelity of his wife, and a king to the allegiance of lis fubjects. But if we trace thefe rights to their fource, we thall find that they are all laws of moral obligation, and that they are called rigbts only becaufe it is agreeable to the will of God, to the inftinctive dictates of the meral fenfe, or to the fiteefs of things, if fuch a phrafe has any meanin. , that children reverence their parcats, that wives love their hubands, and that fubjects pay allegiance to their fowercinr. This will be apparent to any man who thall rut to himfelf fuch queftions as thele: "Why have pareits a fich to - reverence from their chiidren, huibands to he love of
their wivcs, and fovereigns to the allegiance of their fubjects "" As thefe queltions contain in tlem nothing abfurd, it is obvious that they are each capable of a precife anfwer ; but it is impoffible to give to aty of them an arifier which furilhave any meanine, and net imply that right and diligition are reciprocal, or, in other words, that wherever there is a right in ous porfon, there is a correfponding obligation upon ctiers. Thus. to the qualting, "Why have parents a right to reverence from their chitdren ?" it may be anfwered, "becautc, under God, leey were the authors of their children's bsigg, and prosected them from danger, and furnithed them with neceffaries, when they were in a fate fo hel lefs that they could do nothing for themfelves." This anfwer conveys no other meaning than that there is an obligation upon children, in return fir benefits received, to reverence their parents. But what is the fource of this obligation? It can only be the will of God, the moral fenfe, or the fitnefs of things.

This view of the nature of right will enable us to form a proper judgment of the affertion of a late writer, "that man has no rights." The arguments by which Godwn's this apparent paradox is maintained, are not merely in- Political genious and plaufible ; they are abfolutely conclufive. Juftice. But then our philofopher, who never choofes to travel in the beaten track, takes the word right in a fenfe very different from that in which it has been ufed by all other men, and confiders it as equivalent to difictionary porver. "By the word right (fays he) is underftood a full and complete power of either doing a thing or onitting it, without the perfon's becoming liable to animadverion or cenfure from another; that is, in other words, without his incurring any degree of turpitude cr guile." In this fenfe of the word he affirms, and affirms truly, that a man has no rights, no difct etionary power whatever, except in things of fuch total indifference as, whether " he fhall itit on the right or on the left fide of his tirz, or dine on beef to day or to-morrow."

A popoftion fo evidently true as this, ftood not in necd of argument to fupport it ; but as his arguments are clearly expreffed, and afford a complete confutation of fome popular errors fanctioned by the refpectable phrafe rights of man, we fhall give our readers an opportunity of ltudying them in his own words.
" Political fociety is founded on the principles of morality and juftice. It is impoffible for intellectual beings to be brought into coaliticn and intercourfe without a certain mole of conduct, adapted to their nature and connection, immediately becoming a daty incumbent on the parties concerned. Men would ncver hove aflociated if they had not imagined that, in confequence of tiat affociation, they woald mutna:" conduce to the advantage and happinefs of each othe:. This is the real purpore, the genuine balis, of their intercourfe; and, as fir as this purpofe is anivered, of far does fociery anfwer the end of its infitution. Theo is only one potulate more that is neceffary to bring $u$; to a conclufive mode of retoing unon this fabect. Whatever is meant by the term righ, there can neither be rppofite rights, nor rights and duties hontle to each other. The rights of one man cannot clath with or be deftrugive of the rights of wotler: for this, infead of renueriag, the ful, ject an import int brinci of truth and monilly as the acuoces of the rights of man certain. Hh:
man,

## R I G

If underfand it to be, would be to reduce it to a heap of unintellignble jargon and inconfiftency. If one man have a right to be free, another man cannot have a right to make him a flave; if one man have a right to inflict chaftifement upon me, I cannot have a right to withdraw myfelf from chaftifement ; if my neighbour have a right to a fum of money in my pofeffion, I cannot have a right to retain it in my pocket. It cannot be lefs incontrovertible, that I have no right to omit what my duty prefcribes. From hence it inevitably follows hat men have no rights.
"It is commonly faid, ' that a man has a right to the difpofal of his forture, a right to the employment of his time, a right to the uncontrolled choice of his profefion or purfuits.' But this can never be confittently aflumed till it can be fhown that he has no duties prefcribing and limiting his mode of proeeding in all thefe refpects.
" In reality, nothing can appear more wonderful to i careful inouirer, than that two ideas fo incompatible as man and riglis fhould ever have been affociated togegether. Certain it is, than one of them mult be utterly exclufive and annibilatory of the other. Before we afcribe rights to man, we muft conceive of him as a being endowed with intellect, and capable of difcerning the differences and tendencies of things. But a being endowed with intellest, and capable of difcerning the differences and tendencies of things, inttantly becomes a moral being, and has duties incumbent on him to difcharge: and duties and rights, as has already been fhown, are abfolutely exclufive of each other.
" It has been affirmed by the zealous advocates of liberty, 'that princes and magiftrates have no rights;' and no pofition can be more incontrovertible. There is no fituation of their lives that has not its correfpondent duties. There is no power intruted to them that they are not bound to exercife exclufvely for the public good. It is Arange, that perfons adopting this principle did not go a flep farther, and perceive that the fame reftrictions were applicable to fubjects and citizens."
This reafoning is unanfwerble; but it militates not againf the rights of man in the ufual acceptation of the words, which are never employed to denote difcretionary power, but a juft claim on the one hand, implying a correfponding obligation on the other. Whether the phrafe be abfolutely proper is not worth the debatipg; it is authorifed by cuttom-the jus et norma loquindiand is univerfally underfood except by fuch as the dxmons of facion, in the form of paradoxical writers on political juftice, have been able to miflead by fophiftical reafonings.

Rights, in the common acceptation of the word, are of various kinds : they are natural of advent tious, alienable or unalienable, perfeat or imperfect, particular or general. See the article Liberty.

Natural rights are thofe which a man has to his life, limbs, and liberty; to the produce of his perfonal labour; to the ufe, in common with others, of air, light, and water, \&c. That every man has a natural right or juft claim to thefe things, is evident from their being abfolutely neceffary to enable him to anfwer that purpofe, whatever it may be, for which he was made a li. ving and a rational being. This fhows undeniatly, that the Author of his nature defigned that he fhould have the ufe of them, and that the man who lhould wanton.
ly deprive him of any one of them, would be guiley of a breach of the divine law, as well as act inconfitently with the fitnefs things in every fenfe in which that phrafe can poffibly be underfood.

Adventitious rights are thofe which a king has cver his fubjects, a general over his foldiers, a hufband to the perion and affections of his wife, and which every man has to the greater part of his property. That the right of the king and the general are adventitious, is univerfally admitted. The rights of property have been confidered elfewhere (fee Property) ; and though the human conftitution fhows fufficiently that men and women have a natural right to the ufe of each other, yet it is evident that the exclufive right of any one man to any one woman, and oice verfa mult be an adventitious right: But the important queltion is, How are adventitious rights acquired?

In anfwer to this queftion, the moralift who deduces ${ }^{7}{ }^{7}$ the laws of virtue from the will of God, obferves, that quired. as God appears from his works to be a benevolent Being, who wills the happinefs of all his creatures (fee Metaphysics, no 3I2.), he mult of courfe will every thing which naturally tends to promote that happinefs. But the exittence of civil fociety evidently contridutes in a great dgree to promote the fum of human happinefs (See Society); and therefore whatever is neceffary for the fupport of civil fociety in general, or for the conduct of particular focieties already eftablifhed, mult be agreeable to the will of God : But the allegiance of fubjects to their fovereign, the obedience of foldiers to their leader, the protection of prixate pror perty, and the fulfiling of contracts, are all abolutely neceflary to the fupport of fociety; and hence the rights of kings, generals, hubbands, and wives, \&c. though adventitious, and immediately derived from human appointment, are not lefs facred than natural rights fince they may all be ultimately traced to the lame fource. The fame conclufion may eafily be drawn by the philofopher; who refts moral obligation on the fitnefs of things or on a moral fenfe; only it muft in each of thefe cafes partake of the inftability of its foundation.

To the facrednefs of the rights of marriage, an au. Objections. thor already quoted has lately urged fome declamatory objections. "It is abfurd (fays he) to expect, that the inclinations and wifles of two human beings theuld coincide through any long period of time. To oblige: them to act and to live together, is to fubject them to fome inevitable portion of thwarting, bickering, and unhappinefs: This cannot be otherwite, a long as man has failed to reach the itandard of abfolute perfection. The fuppofition that I mult have a companion for life, is the refulc of a complication of vices. It is the dichate of cowardice, and not of fortitude. It fows from the defire of being loved and efteemed for fomething that is not defert.
"But the evil of marriage, as it is prastifed in European countries, lies deeper than this. The habit is. for a thoughtlefs and romantic youth of each fex to come together, to fee each other for a few times, and under circumftances full of delufion, and then to yow to each other eternal attachment. What is the coriequence of this? In almoft every inftance they find themfelves deceived. They are reduced to make the beft of an irretrievable miltake. They are prefented with the ftrongell imaginable temptation to become the dupes.

Right $\underbrace{\text { Ruty }}$
of falrehood. They are led to conceive it their wifeft policy to thut their eyes upon realities; happy if by any perverfion of in ellect they can perfuade themfelves that they were right in their firlt crade opinion of their companion.
"So long as two human beings are forbidden by pofitive inftitution to follow the dictates of their own mind, prejudice is alive and vigorous. So long as I feek to engrofs one woman to myfelf, and to prohibit my neighbour from proving his fuperior defert and reaping the fruits of it, I am guilty of the malt odious of all monopolies. Over this imaginary prize men watch with perpetual jealoufy; and one man will find his defires and his capacity to circumvent as much excited, as the other is excited to traverfe his projects and fruftrate his hopes. As long as this Atate of fociety continues, philanthropy will be croffed and checked in a thoufand ways, and the fill augmenting fream of abufe will continue to flow.
.: The abolition of marriage will be attended with no evils. The intercourfe of the feres will fall under the fame fyftem as any other fpecies of friendihip. Exclufively of all groundlefs and obltinate attachments, it will be impolible for me to live in the world without tinding one man of a worth fuperior to that of any other whom I have an opportunity of cherving. To this man 1 thall feel a kindnefs in exact proportion to any apprehenfion of his worth. The cafe will be precifely the fame with refpect to the female fex; I fhall athduouny cultivate the intercourfe of that woman whole accomplifments thall frike que in the moft powerful manner. 'But it may happen that other men will feel for her the fame preference that I do.' This will create no difficulty. We may all enjoy her converfation; and we fhall all be wife enough to confider the denfual intercourle as a very trivial object. This, like every other affair in which two perfons are concerned, muft be regulated in each fucceffive inflance by the un. forced confent of either party. It is a mark of the extreme depravity of our prefent habits, that we are inclined to fuppofe the fenfual intercourfe anywife material to the advantuges arifing from the pureft affection. Reafonable mer now cat and drink, not from the love of plealure, but becaule eatiog and drinking are effential to our healthful exiftence. Reafonable men then will propagate their ipecies, not becaufe a certain fenfible pleafure is anmexed to this action, but becaufe it is right the fpecies fhould be propagated and the manner in which they exereife this function will be regulated by the dietates of redfon and duty."

It is igh: then, according to this political innovator, that the fpecies the ukl be propagated, and reafonable men in his Utopian commonwealth would be incited by reafon and duty to propagare them : but the way to fulfil this duty, experience, which is feldom at one with feculative reformation, his already demonltrated, not to confift in the promifouousintercourfe of feveral men with one woman, but in the fidelity of individuals of the two fexes to each other. Common proftitutes among us feldom prove with child; and the fociety of Arreoys in Otaheitee, who have completely divelted themfives of what our author calls prejulice, and are by no means guilty of his mgt odious of all monapo ies, are for the molt part childlefs (See Orameitee). He feems to think that a itate of equal property would ne-
ceffarily deftroy our relig for luxury, decreafe our inordinate appetites of every kind, and lead us univerfally to prefer the pleafures of intellect to the pleafures of fente. But here again experience is againft him. The Arreoys who have a property in their women perfectly equal, are the mof luxurious and fenfual wretches on the face of the earth; fenfual ind $t$ to a degree of which the moft libidinous European can hardly form a conception.

By admitting it to be a duty to propagate the fpecies, our author mut neceffarily grat that every thing is right which is requifite to the fulflling of that duty, and the contrary wrong. If fo, promifcuous concubinage is wrong, fince we have feen, that by a law of nature it is incompatible with the duty; whence it follows on his own principles, that the fexual union by pairs mult be right. The only queftion therefore to be decided between him and his opponents is, "Whether (hauld that union be temporary or permanent?" And we think the following obfervations by Mr Paley fuff. cient to decide it to the conviction of every perfon not blinded by the rage of innovation.
"A lawgiver, whofe counfels were direcked by views of general utility, and obltructed by no local impediments, would make the marriage-contract indifioluble during the joint lives of the partes, for the fake of the following advantages: Such a unlor tends to preferve peace and concord between married perfons, by perpetuating their common intereft, and by inducing a neceffity of mutual compliance. An earlier termination of it would produce a feparate intereft. The wife would naturally look forward to the diffolution of the partnerfhip, and endeavour to draw to herfelf a fund againf the time when fhe was no longer to have acceds to the fame refources. This would beget fpeculation on one fide, and miltrult on the other ; evils which at prefent very little difturb the confidence of married life. The fecond effect of making the union determinable only by death, is not lefs beneficial. It neceffarily happens, the adverfe tempers, hahits, and taftes, oftentimes meet, in marriage. In which cafe each party mult take pains to give up what offends, and practice what may gratify, the other. A man and woman in love with cach other do this infenfibly: but love is neither general nor durable; and where this is wanting, no leffons of duty, no delicacy of fentiment, will go half fo far with the generality of mankind and womankind as this one intelligible reflection, that they mult each make the beft of their bargain; and that feeing they muit either both be miferable or both thare in the fame nappinefs neither can find their own comfort but in promoting the pleafure of the other. Thefe compliances, though at firf extorted by neceffity, become in time eafy and mutual; and though lefs endeaning than afluduities which take their rife from affection, generally procure to the married pair a repole and fatisfaction fufficient for their happineis."

So differently from our author does this judicious writer reafon concerning the effects of a permanent uni $n$ on the tempers of the married pair. Inftead of fubjecting them to fome inevitable portion of thwarting, bickeri $g$, and unhappinefs, it lays them, in his opinion, under the neceflity of curbing their untuly pations, and acquiring h.bits of gentlenels, forbearance, and peace. To this we may add, that both believing

## R I G

## Right.

the children propagated during their marriage to be their own (a belief unattainable by the father in a ftate of promifcuous concubinage), they come by a natural procefs of the human paffions (fee Passion) to love each other through the medium of their offspring. But if it be the duty of man to acquire a fpirit firit pure, then peaceaßle, gentle, and eafy to be intreated, it mult be agreeable to the will of God, and a branch of the fitnefs of things, that the fexual union laft during the joint lives of the parties; and therefore the ex. clufive right of marriage, though adventitious, mult be equally facred with thofe which are natural.

But to return from this digreflion, into which the importance of the fubject led us, rights, befides being natural or adventitious, are likewife alienable or unalienable. Every man, when he becomes the member of a civil community, alienates a part of his natural rights. In a ftate of nature, no man has a fuperior on earti, and each has a right to defend his life, liberty, and property, by all the means which nature has put in his power. In civil fociety, however, thefe rights are all transferred to the laws and the magiftrate, except in cafes of fuch extreme urgency as leave not time for legal interpofition. This fingle confideration is fuff. cient to fhow, that the right to civil liberty is alienable; though, in the vehemence of men's zeal for it, and in the language of fome political remonfrances, it has often been pronounced to be an unalienable right. "The true reafon (fays Mr Paley) why mankind hold in deteftation the memory of thofe who have fold their liberty to a tyrant is, that, together with their own, they fold commonly or endangered the liberty of others; of which they had certainly no right to difpofe." The rights of a prince over his people, and of a hubband over II "his wife, are generally and naturally unalienable.
Petfect and : Another divifion of rights is into thofe which are perimperfect, fect and thofe which are imperfect. Perfect rights are fuch as may be precifely afcertained and afferted by force, or in civil fociety by the courfe of law. To imperfect rights neither force nor law is applicable. A man's rights to his life, perfon, and property, are all perfect ; for if any of thefe be attacked, he may repel the attack by inftant violence, punifh the agreffor by the courfe of law, or compel the author of the injury to make reftitution or fatisfaction. A woman's right to her honour is likewife perfect; for if the cannot otherwife efcape, the may kill the ravither. Every poor man has undoubted right to relief from the rich; but his right is imperfect, for if the relief be not voluntarily given, he cannot compel it either by law or by "violence. There is no duty upon which the Chriftian religirn puts a greater value than alms-giving; and every preacher of the gofpel has an undoubted right to in. culcate the practice of it upon his andience; but even this right is imperfect, for he cannot refufe the communion to a man merely on account of his illiberality to the poor, as he can to another for the neglect of any duty comprehended under the term juftice. In elections or appointments to offices, where the qualifications are prefcribed, the beft qualified candidate has unqueftionably a right to fuccefs; yet if he be rejected, he can neither feize the office by force, nor obtain redrefs at law. His right, therefore, is imperfect.

Here a queftion naturally offers itfelf to our confidera. tion: "How comes a perion to have a right to a thing,
and yet have no right to ufe the means neceflary to obtain it ?" The anfwer is, That in fuch cafes the object or the circumffances of the right are fo indeterminate, that the permiffion of force, even where the right is real and certain, would lead to force in other cafes where there exifts no right at all. Thus, though the poor man has a right to relief, who thall afcertain the mode, feafon, and quantum of it, or the perfon by whom it Thall be adminittered? Thefe things muft be afcertainel before the right to relief can be enforced by law ; but to allow them to be afcertained by the poor themfelves, would be to expofe property to endlefs claims. In like manner, the comparative qualifications of the candidate mult be afcertained, before he can enforce his right to the office ; but to allow him to afcertain his qualifications himfelf, would be to make him judge in his own caufe between himfelf and his neighbour.

12
Wherever the right is imperfect on one fide, the cor- Imperfee: refpending obligation on the other mult be imperfect rights elikewife. The violation of it, however, is often not qually falefs criminal in a moral and religious view than of a cred with less criminal in a morol and regous perfect obligation. It is well obferved by Mr Paley, whichare that greater guilt is incurred by difappointing a wor- perfect. thy candidate of a place upon which perhaps his livelihood depends, and in which he could eminently ferve the public, than by filching a book out of a library or picking a pocket of a handkerchief. The fame fentiment has been exprefled by Mr Godwin, but in terms by much too ftrong, and fuch as fhow that he was not at the time complete mafter of his fubject. "My neighbour (fays he) has juit as much right to put an end to my exiftence with dagger or poifon, as to deny me that pecuniary affiftance without which I muft ftarve, or as to deny me that affiftance without which my intellectual attainments, or my moral exertions, will be materially injured. He has juft as much right to amufe himfelf with burning my houfe, or torturing my children upon the rack, as to thut himfelf up in a cell, carelefs about his fellow men, and to hide 'his talent in a napkin."

It is certainly true, that the man who fhould fuffer another to ftarve for want of that relief which he knew that he alone could afford him, would be guilty of murder, and murder of the cruelleft kind ; but there is an immenfe difference between depriving fociety of one of its members, and with-holding from that member what might be neceffary to enable him to make the greater poflible intellectual attainments. Newton might have been ufeful and happy though he had never been acquainted with the elements of mathematics ; and the late celebrated Mr Fergufion might have been a valuable member of fociety, though he had never emerged from his original condition of a fhepherd. The remainder of the paragraph is too abfurd to require a formal confutation. Hadour author, burying his talent in a napkin, thut himfelf up fevea years ago in a ce!l, carelefs about his fellow men and political jufice, he would have deprived the public of what he doubtlefs believes to be much ufeful inftuction; but had he at that period amured him. felf with burning his neighbour's hous, and torturing on the rack two or three children, he would have cut off, for any thing he could know, two or three future Newtons, and have himfelf been cut off by the infalted laws of his country. Now, without fupoing the value

Wight, of ten Newtons to be equal to that of one Godwin, we Rightcoufnefl.

## Rights of

Ricular ard are fuch as belong to certain individuals or orders of general. men, and not to others. The rights of kings, of mafters, of hufbands, of wives, and, in fhort, all the rights fters, of hulbands, of wives, and, in fhort, all the rights
which originate in fociety, are particular. General rights are thofefwich belong to the fpecies collectively Such are our rights to the vegetable produce of the
earth, and to the fleth of animals for food, though Such are our rights to the vegetable produce of the
earth, and to the fleth of animals for food, though about the origin of this latter right there has been much diverfity of opinion, which we have noticed in another place. (See Theology, Part I. fect. 2d). If the vegetable produce of the earth be included under the vegetable produce of the earth be included under the
general rights of mankind, it is plain that he is guilty of wrong who leaves any confiderable portion of land wafte merels for his own amufement : he is leffening the
common ftock of provifion which Providence intended wafte merels for his own amufement : he is leffening the
common ftock of provifion which Providence intended to diftribute among the fpecies. On this principle it would not be eafy to vindicate certain regulations refpecting game, as well as fome other monopolies which are protected by the municipal laws of moft countries. Mr Paley, by jult reafoning, has eftablifhed this conclufion, " that no thing ought to be made exclufive property which can be conveniently enjoyed in common." An equal divifion of land, however, the dream of fome vifionary reformers, would be injurious to the general rights of mankind, as it may be demonftrated, that it would leffen the common fock of provifions, by laying cvery man under the neceflity of being his own weaver,
are warranted to fay, that however great his merits may be, they are not infinite, and that the addition of thofe of one Newton to them would undoubtedly increafe their fum.

Rights, are particular or general. Particular rights tailor, fhoemaker, fmith, and carpenter, as well as ploughman, miller, and baker. Among the general rights of mankind, is the right of nece/fity; by which a man may ufe or deftroy his neighbour's property when it is abfolutely neceffary for his own prefervation. It is on this principie that goods are thrown overboard to fave the fhip, and houiss pulled down to ftop the progrefs of a fire. In fuch cafes, however, at leat in the laft, reflitution ought to be made when it is in our power; but this reftitution will not extend to the original value of the property deftroyed, but only to what it was worth at the time of defuroying it, which, confidering its danger, might be very little.

RIGHTEOUSNESS, means juAtice, honelty, virtuc, goodnefs, and amongft Chriltians is of exactly the fame import with holinefs, without which, we are told, no man thall fee the Lord. The doctrine of the fall, and of redemption through Jefus Chrit, has occafiened much difputation, and given rife to many fingular notions in the world. The haughty philofopher, diffatisfied with myfteries, and with the humiliating doctrine of atonement by a crucified Saviour, has made a religion for himfelf, which he calls rational Chriffianity; and the enthufialt, by extracting doctrines from Scripture which are not contained in it, and which are repugnant to its firit, has given too much countenance to this prefumption. The doctrine of imputed righteoufnefs, by which the merit of Chrint is faid to be imputed to us, appears to be of this number ; and though it has been held by many good, and by fome learned men, it is certainly in seneral unfriendly to virtue as will be readily allowed by all who have converfed with the more ignorant fort of Methodits in England or Se-
ceders in Scotland. That it does not follow from the doctrine of the atonement, and confequently that it has no foundation in Scripture, will appear elfewhere. '1'heology.

Bill of Rights, in law, is a declaration delivered by the lords and commons to the prince and princefs of. Orange, 13th February 1688 ; and afterwards enacted in parliament, when they became king and queen. It fets forth, that king James did, by the afliftance of divers evil counfellors, endeavour to fubvert the laws and liberties of this kingdom, by exercifing a power of difpenfing with and fufpending of laws; by levying money for the ufe of the crown by pretence of preroga. tive without confent of parliament; by profecuting thofe who petitioned the king, and difcouraging petitions; by raifing and keeping a ftanding army in time of peace; by violating the freedom of election of members to ferve in parliament; by violent profecutions in the court of king's bench ; and caufing partial and corrupt jurors to be returned on trials, exceffive bail to be taken, exceffive fines to be impofed, and cruel punihments inflicted; all which were declared to be illegal. And the declaration concludes in thefe remarkable words;" And they do claim, demand, and infift upon, all and fingular the premifes, as their undoubted rights and liberties." And the act of parliament itfelf ( I W. \& M. ftat. 2. cap. 2.) recognizes s، all and fingular the rights and liberties, afferted and claimed in the faid declaration, to be the true, ancient, indubitable rights of the people of this kingdom." See Liberty.

RIGIDIT'Y, in phyfics, denotes a brittle hardnefs. It is oppofed to durtility, malleability, and foftnefs.

RIGOLL, or Regals, a kind of mufical inftum. ment, confifting of feveral fticks bound together, only feparated by beads. It is tolerably harmonious, being well ftruck with a ball at the end of a ftick. Such is the account which Graffineau gives of this infrument. Skinner, upon the anthority of an old Englifh-dictionary, reprefents it as a clavichord, or claricord; poffibly founding his opinion on the nature of the office of the tuner of the regals, who ftill fubfits in the eltablifhment of the king's chapel at St James's, and whofe bufinefs is to keep the organ of the chapel royal in tune; and not knowing that fuch wind inftruments as the orgen need frequent tuning, as well as the clavichord and uther ftringed inftruments. Sir Henry Spelman derives the word rigoll from the Italian rigalello, a mufical inftrument, anciently ufed in churches inftead of the organ. Walther, in his defcription of the regal, makes it to be a reed-work in an organ, with metal and allo wooden pipes and bellows adapted to it. And he adds, that the name of it is fuppofed to be owing to its having been prefented by the inventor to fome king. From an account of the regal ufed in Germany, and other parts of Europe, it appears to confilt of pipes and keys on one fide, and the bellows and wind-cheft on the other. We may add, that Lord Bacon (Nat. Hift. cent. ii. §. 102.) diftinguifhes between the regal and organ, in a manner which fhowsthem to be inftruments of the fame clafs. Upon the whole, there is reafon to conclude, that the regal or rigoll was a pneumatic, and not a ftringed inftrument.

Merfennus relates, that the Flemings invented an inArument, his rales de leis, confiting of $7 \mathrm{c} \boldsymbol{c}$ lindrical

## RIN [ 248$] \quad$ R I O

Rigor pieces of wood, decreafing gradually in length, fo as to produce a fucceffion of tones and femitones in the diatonic feries, which had keys, and was played on as a fpinet ; the hint of which, he fays, was taken from an inftrument in ufe among the Turls, conlifting of 12 wooden cylinders, of different lengths, ftrung together, which being fufpended and ftruck with a ftick, having a ball at the end, produced mufic. Hawkins's Hift. Muf. vol. ii. p. 449:

RIGOR, in medicine, a convulfive fhuddering from fevere cold, an ague fit, or other diforder.

RIMINI, an ancient, populous, and handfome town of Itaiy, in Romagna, which is part of the territory of the church, with a bifhop's fee, an old cafte, and a ftrong tower; as alfo many remains of antiquity, and very fine buildings. It is famous for a council in ${ }^{1} 359$, confifing of 400 bifhops, who were all Arians except 20. It is feated in a fertile plain; at the mount of the river Marecchia, on the gulpli of Venice. E. Long. 12. 39. N. Lat. 44. 6.

RIND, the fkin of any fruit that may be cut off- or pared. Rind is alfo ufed for the inner bark of trees, or that whitih foft fubftance which adheres immediately to the wood. See Plant.

RING; an ornament of gold and filver, of a circular figure, and ufually worn on the finger.

The epifcopal ring (which makes a part of the pontiGieal apparatus, and is efteemed a pledge of the fpiritual marriage between the bilhop and his church) is of very ancient ftanding. The fourth council of Toledo, held in 633, appoints, that a bifhop condemned by one council, and found afterwards innocent by a fecond, flatl be reftored, by giving him the ring, ftaff, \&c. From bifhops, the cuftom of the ring has paffed to cardinals, who are to pay a very great fum pro jure annuli cardinalitii.

RINGS. The antiquity of rings is known from Scripture and profane authors. Judah left his ring or fignet with Tamar (Gen. xxxviii. 18). When Pharaoh committed the government of all Egypt to Jo. Ceph, he took his ring from his finger, and gave it to Jofepli (Gen. xi. 4z). After the victory that the 1 Iraelites obtained over the Midianites, they offered to the Lord the rings, the bracelets, and the golden necklaces, and the eap-rings, that they had taken from the enemy (Numb. xxxi 50). The Ifraelitifh women wore rings not only on their fingers, but alfo in their noftrils and their ears. St James diftinguifhes a man of wealth and dignity by the ring of gold that he wore on his finger (James ii. 2). At the return of the prodigal fon, his father orders him to be dreffed in a new fuit of clothes, and to have a ring put upon his finger (Luke xv. 22). When the Lord threatened King Jeconiah with the utmoft effects of his anger, he tells him, that though he were the fignet or ring upon his finger, yet he fhould be torn off (Jer. xxii. 24.)

The ring was ufed chiefly to feal with: and the Scripture generally puts it in the hands of princes and great perfons; as the king of Egypr, Jofeph; Ahaz, Jezebel, King Ahafuerus, his favourite Haman, Mordecai, who fucceeded Haman in his dignity, King Darius (I Kings xxi. 8. ; Efther iii. IO, \&xc. ; Dan. vi. 17). The patents and orders of there princes were fealed with their rings or fignets; and it was this that fecured to them their authority and refpect. See the article Seal.

Ring-Bome. S'ee Farriery, Sect. xxxi.
Ring-Oufel, in ornithology, a fpecies of Turdus.
RIO-grande, a river of Africa, which runs from
 eaft to weft through Negroland, and falls into the Atlantic ocean, in 11 degrees of latitude. Some take it to be a branch of the Niger, of which there is not the leaft proof.

Rio-Grande, a river of South America, in Brafil, which has its fource in an unknown country: it croffes the captainfhip of Rio-Grande, and falls into the fea at' Natal los Reycs.

Roo- Faneiro, a river of South America, which rifes-in the mountains weft of Brafil, and running ealt through that country, falls into the Atlantic Ocean, in S. Lat. 23.30. The province of Janeiro is one of the richeit in Brafil; and prodaces gold, filver, diamonds, and other precions itones.

RIOM, a town of France, in Auvergne ; feated on a hill, in fo agreeable a country, that it is called the garden of Auvergne. E. Long. 3. 12. N. Lat. 45.51 . RIOT, in law. The riotous affembling of 12 perfons, or more, and not difperfing upon proclamation, $w^{2} \not{ }^{2}$ firft made high treafon by ftatute $3 \not \mathscr{Z}_{4}$ Edw. Vl. c. $5 \cdot$ when the king was a minor, and a change of religion to be effected : but that fatute was repealed ty itatute 1 Mar. c. I. among the other treafons created fince the 25 Edw . III. ; though the prohibition was in fubltance re-enacted, with an inferior degree of punilhment, by flatute 1 Mar. It. 2: c. 12. which made the fame offence a fingle felony. Thefe flatutes fpecified and particularized the nature of the riots they were meant to fupprefs; as, for' example, fuch as were fet on foot with intention to offer violence to the privy-counscil, or to change the laws of the kingdom, or for certain other fpecific purpofes; in which cafes, if the perfons were comnranded by proclamation to difperfe, and they did not, it was by the ftatute of Mary made felony, but within the benefit of clergy; and alfo the act indemnified the peace-officers and their affiftants, if they killed any of the mob in endeavouring to fupprefs fuch riot. This was thought a necerfary fecurity in that fanguinary reign, when poperý was intended to be re-efiabliffred, which was like to produce great difcontents: but at firft it was made only for a year, and was afterwards continued for that queen's life. And, by ftatute 1 Eliz. c. 16. when a reformation in religion was to be once more attempted, it was revived and continued during her life alifo; and then expired. From the acceffion of James l. to the death of Queen Anne, it was never once thought expredient to revive it; but, in the firf year of George I. it was judged neceffary, in order to fupport the execútion of the act: of fettlement, to renew it, and at one froke to make it perpetual, with large additions. For whereas the former aets expretsly defined and pecified what fhould be accounted a riot, the ftatute I Geo. I. c. 5. enacts, generally, that if any 15 perfons are unlawiully affembled to the difturbance of the peace, and any one jutice of the peace, fheriff, under fheriff, or mayor of a town, fiall think proper to command them by proclamation to difperfe, if they contemn his orders and continue together for one hour afterwards, fuch contempt fhall be felony without benefit of clergy. And farther, if the reading of the proclamation be by force oppofed, or the reader be in any manner wilfully hindered

## $R$ I P

Riot, Bipen.
hindered from the reading of it, fuch opprers and hinderers are felons without benefit of clersy; and all perfons to whom fuch proclamation ought to bave been made, and knowing of fuch hindrance, and not difperting, are felons without benefic of clergy. There is the like indemnifying claufe, in cafe any of the mob be unfortunately killed in the endeavour to difperfe them; being copied from the att of queen Mary. And by a fubfequent claufe of the new act, if any perfon, fo riotoufly affembled, begin even before proclamation to pull dow: any church, chapel, meeting-houfe, dwell-ing-houfe, or out houfes, they fhall be felons without benefit of clergy.

Riots, routs, and unlawful affemblies, muft have three perions at leaft to conltitute them. An unlawful affembly is, when three, or more, do affemble themfelves together to do an unlawful act, as to pull down incloures, to deftroy a warren or the game therein; and part without doing it, or making any motion towards it. A rout is where three or more meet to do an unlawful act upon a common quarrel, as forcibly breaking down fences upon a right claimed of common, or of way, and make fome advances towards it. A riot is where three or more atually do an unlawful act of - violence, either with or without a common caufe or quarrel; as if they beat a man; or hunt and kill game in another's park, chafe, warren, or liberty; or do any other unlawful act with force and violence; or even do a lawful act, as removing a nuifance, in a violent and tumultuous manner. The punifhment of unlawful affembling, if to the number of 12 , we have juft now feen, may be capital, according to the ciscumftances that attend it; but, from the number of three to eleven, is by fine and imprifonment only. The fame is the cafe in riots and routs by the common law; to which the : pillory in very enormpus cafes has been fometimes faperadded. And by the Itatute 13 Hen. IV. c. 7, any two jultices, together with the fheriff or under-fheriff of the county, may come with the poffe comitatus, if need, be, and fupprefs any fuch riot, affembly, or rout, arreft the rioters, and record upon the fpot the nature and circumftances of the whole tranfaction; which record.alone fhall be a fufficient conviction of the offenders. In the interpretation of which fatute it hath been holden, that all perfons, noblemen and others, except women, clergymen, perfons decrepid, and infants under 15, are bound to attend the jultices in fup. preding a riot, upor pain of fine and imprifonment; and that any battery, wounding, or killing the rioters, that may happen in fupprefing the riot, is juftifiable. So that our ancient law, previous to the modern riotict, feems pretty well to have guarded againlt any violent breach of the public peace; efpecially as any riot. ous aflembly on a public or general account, as to redrefs grivevances or pull down all inclofures, and allo rehiting the king's forces if fent to keep the peace, may amount to overt, acts of high treafon, by levying war agrimilt the kirg.

RIPEN, a town of Denmark, in north Jutland, and capital of a diocefe of the fame name, with a bichop's fee, a good harbour, a cafle, two colleges, and a public library. The tombs of feveral of the kings of Denmark are in the cathedral church, which is a very handfome itructure. The harbour, which has contributed grearly to the profperity of this place, is at a Vor. XVI.
fmall difance, being feated at the mouth of the river
Nipfata, in a country which fupplies the beft beeves in Denmark. It is 45 miles north-welt of Slefrick and 25 fcuth-1)y-welt of Wiburg. E. Long. 8. リ+. N. Lat. 55-25. The diocefe is bounded on the north by thofe of Wiburg and Athuys, on the foutia by the duchy of Slefwick, and on the eaft and weft by the fea.

RIPEIVING of Grain, means its arriving to mata. rity. The following paper, which appeared in the firlt volume of the Tranfactions of the Royal Society of: Edinburgl, is worthy the attention of farmers in cold countries; where it frequently happens, from continued rains, that the corn is quite green when the froft fets in; in confequence of which, the farmers cut it down, without thinking it can polfibly arrive at further maturity.
"Summer 1732 having been remarkably cold and unfavourable, the harvelt was very late, and much of the grain, efpecially oats, was green even in October. In the beginning of October the cold was fo great, that, in one night, there was produced on ponds reat Kinneil, in the neighbourhood of; Borrowtounnefs, ice three quarters of an inch thick. It was apprehended by many farmers, that fuch a degree of cold would effectually prevent the further filling and ripening of their corn. In order to afcertain this point, Dr Roebuc: felected feveral falks of oats, of nearly equal fulnefs, and immediately cut thofe which, on the moit atten. tive comparifon, appeared the beft, and marked the others, but allowed them to remain in the field 14 days longer; at the end of which time they, too, were cut, and kept in a dry room for iodays. The grains of each parcel were then weighed; when 1 I of the grains which had been left ftanding in the field were found to be equal in weight to 30 of the grains which had been cut a fortnight fooner, though even the beft of the grains were far from being ripe. During that fortnight (viz. from October 7 th to October 2 ift) the average hear, according to Fahrenheit's thermometer, which was obferved every day at eight o'clock in the morning and fix in the evening, was a little above 43. Dr Roebuck obferves, that this ripening and filling of corn in fo low a temperature fhould be the lefs farprifing to us, when we reflect, that feed-corn will vegetate in the fame degree of heat; and he draws an important inference from this obfervations, viz. That farmers thould be cautions of cutting down their unripe corn, on the fuppolition that in a cold autumn it could fill no more."

A writer in the Scots Magazine for June 1792, under the fignature of Agricola, when fpeaking on this fubject, adds the following piece of information, viz. "That grain cut down before it is quite ripe will grow or fpring equally well as ripe and plump grain, provided it is properly preferved. I relate this from a fact, and alfo on the authority of one of the moft judicious and experienced farmers in this ifland, William Craik of Arbigland, Efq; near Dumfries, who was taught by fuch a feafon as this threatens to prove. This being the cafe, every wife economical farmer will preferve his ripe and plunup grain for bread, and fow the green and feemingly fhrivelled grain, with a perfect conviction that the plant: proceeding from fuch feed will yield as Itrong and thri. ving corn as what grows from plump feed. By this means the farmer will enjoy the double advantage of having the corn mof productive in flour for bread, and 1 i
V.peniop of Grain.

R I S
Riphoean his light fhrivelled grain will go much farther in feed Rifible. than the plump grain would do. I faw the experiment made on wheat which was fo flrivelled that it was thought farcely wor:h giving to fowls, and yet produced heavy large ears."

RIPHOEAN mountains, are a chain of high mountains in Ruffia, to the north eaft of the river Oby, where there are faid to be the fineft fables of the whole empire.

RIPHATH, or Riphat, fecond fon of Gomer, and grandfon of Japhet (Gen. x. 3. ת Riphat). In molt copies he is called Diphath in the Chronicles (i Chr. i. 6. . two Hebrew letters 7 Refo and 7 Daleth is fo much, that they are very often confounded. But, to the credit of the tranflators of our Englifh verfion be it faid, that in this inftance, as well as in many others, they have reftored the original reading, and rendered it $\mathrm{Ri}-$ phath. The learned are not agreed about the country that was peopled by the defcendants of Riphath. The Chaldee and Arabic take it for France; Eulebius for the country of the Sauromatæ; the Chronicon Alexandrinum for that of the Garamantr ; Jofephus for Pidphlagonia. Mela affures us, that anciently the people of this province were called Riphatai, or Riphaces; and in Bithynia, bordering upon Paphlagonia, may be found the river Rhebeus, a peoplé called Rbebantes, and a canton of the fame name. Thefe reafons have prevailed with Bochart to believe, that Riphath peopled Paphlagonia. Others think he peopled the Montes Riphei ; and this opinion feems the moft reafonable to us, becaufe the other fons of Gomer peopled the northern countries towards Scythia, and beyond the Euxine fea.

RISIBLE, any thing capable of exciting laughter.
Ludicrous is a general term, fignifying, as may appear from its derivation, what is playfome, fportive, or jocular. Ludicrous therefore feems the genus, of which rifble is a fpecies, limited as above to what makes us laugh.

However eafy it may be, concerning any particular object, to fay whether it be rifible or not, it feems difficult, if at all practicable, to eftablifh any general character, by which objects of that kind may be diftinguifhed from others. Nor is that a fingular cafe; for, ypon a review, we find the fame difficulty in moft of the articles already handled. There is nothing more eafy, viewing a particular object, than to pronounce that it is beautiful or ugly, grand or little: but were we to attempt general rules for ranging objects under different clafles acccording to thefe qualities, we thould be much gravelled. A feparate caufe increales the difficulty of diftinguifhing rifible objects by a general character : all men are not equally affected by rifible objects, nor the fame man at all times; for in high fpirits a thing will make him laugh outright, which will fearce provoke a fmile in a grave mond. Rifible objects, however, are circumfcribed within certain limits. No object is rifible but what appears llight, little, or trivial ; for we laugh at nothing that is of importance to our own intereft or to that of others. A real diltrefs raifes pity, and therefore cannot be rifible; but 2 flight or imaginary diftrefs, which moves not pity, is iffible. The adventure of the fulling-mills in Don Quixote, is exremely rifible; fo is the fcene where Sancho, in a dark night tumbling into a pit, and at-
taching himfelf to the fide by hand and foot, hangs there in terrible difmay till the morning, when he difcovers himfelf to be within a foot of the bottom, A nofe remaikably long or fhort, is rifible; but to want it altogether, fo far from provoking laughter, raifes horror in the fpectator. With refpect to works both of nature and of art, none of them are rifible but what are out of rule; fome remarkable defect or excefs, a very long vifage, for example, or a very fhort one. Hence nothing juft, proper, decent, beautiful, proportioned, or grand, is rifible.

Even from this light 1 ketch it will be readily conjectured, that the emotion raifed by a rifible object is of a nature fo fingular, as farce to find place while the rnind is occupied with any other paffion or emotion; and the conjecture is verified by experience; for we farce ever find that emotion blended with any other. One emotion we muft except; and that is, contempt raifed by certain improprieties : every improper act infpires us with fome degree of contempt for the author; and if an improper act be at the fame time rifible to provoke laughter, of which blunders and abfurdities are noted inflances, the two emotions of contempt and of laughter unite intimately in the mind, and produce externally what is termed a laugh of derifon or of foorn. Hence objects that caufe laughter may be diftinguifhed into two kinds: they are either rifible or ridiculous. A rifible object is mirthful only ; a ridiculous object is both mirthful and contemptible. The firf raifes an emotion of laughter that is altogether pleafant : the pleafant emotion of laughter raifed by the other, is blended with the painful emotion of contempt; and the mixed emotion is termed the emotion of ridicule. The pain a ridiculous object gives me, is refented and punithed by a laugh of derifion. A rifible object, on the other hand, gives me no pain: it is altogether pleafant by a certain fort of titillation, which is expreffed externally by mirthful laughter. See Ridicule.

Rifible objects are fo common, and fo well underftood, that it is unneceffary to confume paper or time upon them. Take the few following examples :

Falfaff. I do remember him at Clement's inn, like a man made after fupper of a checfe-paring. When he was naked, he was for all the world like a forked radifh, with a head fantaftically carved upon it with a knife.

Second Part, Henry IV. act. 3. /c. 5.
The foregoing is of difproportion. The fullowing examples are of Aight or imaginary misfortunes.

Falfaff. Go fetch me a quart of fack, put a toaft in't. Have I lived to be carried in a banket, like a barrow of butcher's offal, and to be thrown into the Thames! Well, if I be ferved fuch ancther trick I'll have my brains ta'en out and butter'd, and give them to a dog for a new-year's gift. The regues flighted me into the river with as little remorfe as they would have drown'd a bitch's blind puppies, fifteen i'th'litter ; and you may know by my fize that I have a kind of alacrity in finking; if the bottom were as deep as hell, I hould down. I had been drowned, but that the fhore was fhelvy and fhallow; a death that I abhor: for the water fwells a man; and what a thing flould I have been when I had been fwelled? I fhould have been a mountain of mummy.

Merry Wives of Windfor, aff 3.fc. ${ }^{15}$.

## R I V [ 25 L$] \quad \mathrm{R}$ I V

Falfaff. Nay, you fhall hear, Mafter Brook, what I have fuffer'd to bring this woman to evil for your good. Being thus crammed in the balket, a couple of Ford's knaves, his hinds, were call'd forth by their miftrefs, to carry me in the name of foul clothes to Datchet-lane. They took me on their fhouldars, met the jealous knave their mafter in the door, who afk'd them once or twice what they had in their banket. I quak'd for fear, leaft the lunatic knave would have fearch'd it; but Fate, ordaining he fhould be a cuckold, held his hand. Well, on went he for a fearch, and away went I for foul clothes. But mark the fequel, Malter Brook. I fuffer'd the pangs of three egregious deaths: firt, an intolerable fright, to be detected by a jalous rotten bell-weather; next, to be compafs'd like a good bilbo, in the circumference of a peck hilt to point, heel to head; and then to be ftopt in, like a ftrong diftillation, with finking clothes that fretted in their own greafe. Think of that, a man of my kidney; think of that, that am as fubject to heat as butter; a man of continual diffolution and thaw ; it was a miracle to 'fcape fuffocation. And in the height of this bath, when I was more than half flew'd in greafe, like a Dutch difh, to be thrown into the Thames, and cool'd glowing hot, in that furge, like a horfe-fhoe ; think of that ; hiffing hot; think of that, Mr Brook.

Merry Wives of Windfor, act 3. fc. 17 .

RITE, among divines, denotes the particulir manner of celebrating divine fervice in this or that country. RiTORNELLO, or Repeat, in mufic the burden of a fong, or the reperiti n of the firlt or other veifes of a fong at the end of each couplet.

RITTERHUSIUS (Conraid), a learned German civilian, born at Brunfwick in 1560 . He was profeffor of civil litw at Altdorf, and publifhed a variety of works, partcularly as a civilian; together with and edition of Oppian in Greek and Latin : he was moreover an excellent critic; his notes upon many eminen: authors having been inferted in the beft editions of them. He died in 1613.

RITUAL, a book directing the order and man. ner to be obferved in performing divine fervice in a particular church, diocefe, or the like. The ancient heathens had alfo their rituals, which contained their rites and ceremonies to be obferved in building a cit $\rangle$, co: fecrating a temple or altar, in facrificing, and deifying, in dividing the curix, tribes, centuries, and in general, in all their religious ceremonies. There are feveral palfages in Cato's books, De re Rufica, which may give us fome idea of the situals of the ancients.

RIVAL, a term applied to two or more perfons who have the fame pretenfions; and which is properly applied to a competitor in love, and figuratively to att antagonift in any other purfuit.

Kite,
í River.

efinition. 1S a current of frefh water, flowing in a Bed or Channel from its fource to the fea.
The term is appropriated to a confulerable collection of waters, formed by the conflux of two or more Brooks, which deliver into its channel the united freams of feveral Rivulers, which have collected the fupplies of many Risls trickling down from numberlefs fprings, and the torrents which carry off from the floping grounds the furplus of every fhower.

Rivers form one of the chief features of the furface of this globe, ferving as voiders of all that is immediately redundant in our rains and fprings, and alfo as boundaries and barriers, and even as highways, and in many countries as plentiful forehoufes. They alio fertilife our foil by laying upon our warm fields the richelt mould, brought from the high mountains, where it would have remained ufelefs for want of genial heat.

Being fuch interefting obje\&s of attention, every branch acquires a proper name, and the whole acquires a fort of perfonal identity, of which it is frequently difficult to find the principle; for the name of the great body of waters which dicharges itfelf into the fea is traced backwards to one of the fources, while all the contributing ftreams are loft, although their waters form the chief part of the collection. And fome. times the feeder in which the name is preferved is fmallor than others which are united to the current, and which like a rich but ignoble alliance lofe their name in that of the more illuftrious family. Some rivers indeed are refpectable even at their birth, coming at once in force from fome great lake. Such is the Rio de la Plata, the river St Laurence, and the mighty freams which iffue in all direstions from the Ba:callake. But,
like the fons of Adam, they are all of equal defcent, and fhould take their name from one the feeders of thefe lakes. This is indeed the cafe with a few, fuch as the Rhone, the Rhine, the Nile. Thefe, after having mixed their waters with thofe of the lake, refume their appearance and their name at its outfct.

But in general their origin and progrefs, and even Origin and the features of their character, bear fome refemblance progrefs fi(as has been prettily obferved by Pliny) to the life of milar to man. The river fprings from the earth; but its origin the life of is in heaven. lis beginnings are infignificant, and its infancy is frivolous; it plays among the flowers of a meadow; it waters a garden, or turns a little mill. Gathering Atrength in its youth, it becomes wild and impetuous. Impatient of the reftraints which it fill meets with in the hollows among the mountains, it is reftefs and fretful; quick in its turnings, and unfleady in its courfe. Now it is a roaring cataract, tearing up and overturning whatever oppofes its progref, and it thoots headlong down from a rock; then it becomes a fullen and gloomy pool, buried in the bottom of a glin. Kecovering breath by repofe, it again dafhes al ng, till tired of the uproar and mifchief, it quits all that it has fwept along, and leaves the opening of the valley flrewed with the rejefted wafte. Now, quiting its retirement, it comes abroad into the world, journeying with more prudence and difcretion through cultivated fields, yielding to circumfances, and winding round what would trouble it to overwhelm or remove. It paffes through the populous cities and all the bufy haunts of man, tendering its fervices on every fide, and becomes the fupport and ornament of the country. Now increafed by numerous alliances, and advanced

252
in its courte of exiftence, it becomes grave and flately in its motions, loves peace and quiet; and in majeltic filence rolls on its mighty waters, till it is laid to reft in the valt abyfs.

The philof pher, the real lover of wifdom, fees much to admire in the economy and mechanifm of running waters; and their are few operations of nature which give him more oppurtunities of remarking the nice adjuitment of the molt fimple means for attaining many purpofes of moft extenfive benificence. All mankind teem to have felt this. The heart of man is ever cpen (unlefs perverted by the habits of felfifh indulgence and arrogant felf-conceit) to impreffions of gratitude and love. He who afcribes the religious principle (debafed, though it be by the humbling abufes of fuperftition) to the workings of fear alone, may betray the flavifh meannefs of his own mind, but gives a very ynfair and a falle picture of the hearts of his neighbours. Lucretius was but half a philofopher when he pentued his often-quoted apophthegm. Indeed his own invocations fhow how much the animal was blended with the fage.

We apprehend, that whoever will read with an honeft and candid mind, unbiaffed by licentious wifhes, the accounts of the ancient fuperlitions will acknowledge that the amiable emotions of the human foul have had their fhare in creating the numerous divinities whofe worhip filled up their kalendars. The fun and the hoft of heaven have in all ages and nations been the objects of a fincere worhip. Next to them, the rivers feem to have attracted the grateful acknowledgments of the inhabitants of the adjacent countries. They have every where been confidered as a fort of tutelar divinities; and each little diftrif, every retired valley, had its river god, who was preferred to all others with a partial fondnefs. The expoftulation of Naaman the Syrian, who was offended with the prophet for enjoining him to wafh in the river Jordan, was the natural effufion of this attachment. "What! (faid he), are not Abana and Parphar, zivers of Damafcus, more excellent than all the waters of Judwa? Might I not wath in them and be clean? So he went away wroth."
In thofe countries particularly, where the rural labours, and the hopes of the thepherd and the hufbandman, were not fo immediately connected with the ap. proach and recefs of the fun, and depended rather on what happened in a far diftant country by the falls of periodical rains or the melting of collected friows, the Mile, the Ganges, the Induc, the river of Pegu, were the fenfible agents of nature in procuring to the inhabitants of their fertile banks all their abundance, and they became the objects of grateful veneration. Their fources were forght out with anxious care even by conquering princes; and when found, were univerfally worihipped with the moll affectionate devotion. Thefe remarkable rivers, fo eminertly and fo palpably beneficent, preferve to this day, amidft every change of habit, and every increafe of civilization and improvement, the foud adoration of the inhabitants of thofe fruitful countries through which they hold their ftately courfe, and their waters are ftill held facred. No progrefs ot artificial refinement, not all the corruption of luxurious fenfuality, has been able to eradicate this plant of na. tive growth from the heart of man. The fentiment is
congenial to his nature, and dierefore it is univcrat; and we could almoft appeal to the feeling's of every reader, whether he does not perceive it in his own breatt. Perhaps we may be mifaken in our opinion in the cafe of the corrupted inhabitants of the populous and bufy cities, who are habituated to the fond contemplation of their own individual exertions as the fources of all their hopes. Give the thoemaker but leather and a few tools, and he defies the powers of nature to dilappoint him; but the fimpler inhabitants of the country, the moft worthy and the moft refpectable part of every nation, after equal, perhaps greater exertion both of ikill and of induftry, are more accultomed to refign themfelves to the great miniters of Providence, and to look up to heaven for the "early and the latter rains," without which all their labours are fruitlefs.

## --untrena per illos <br> Numenque excecdrons terris veft g:a fecit.

And ang the hufbandmen and the fhepherds of all nations und ages, we find the fame fond attachment to their fprings and rivulets.

FFortiniate fenex, bic inter flumina noti
Et fontes facros frigus cuptabis opacum,
was the mournful ejaculation of poor Melibxus. We hardly know a river of any note in our own country whofe fource is not looked on with fome refpect.
We repeat our affertion, that this worthi; was the offspring of affection and gratitude, and that it is giving a very unfair and falfe pifture of the human mind to afcribe thefe fuperflitions to the working of fear alone. Thefe would have reprefented the river-gods as feated on ruins, brandilhing rooted-up trees, with angry looks, pouring out their fweeping torrents. But no fuch thing. The lively imagination of the Greeks felt, and expreffed with an energy unknown to all other nations, every emotion of the human foal. They figured the Naiads as beáutiful nymphs, patterns of gentlenefs and of elegance. They are reprefented as partially attached to the children of men; and their interference in human affairs is always in acts of kind affiftance and protecion. They relembie, in this refpect, the rural deities of the northern nations, the fairies, but without their caprices and refentments. And, if we attend to the defcriptions and reprefentations of their RiverGods, beings atmed with power, an attribute which flavifh fear never tails to couple with cruelty and vengeance, wie find the fame expreffion of affectionate truft and confidence in their kind difpofitions. They are generally called by the refpectable but endearing name of father. "Da Tyberi pater," fays Virgil. Mr Bruce fays that the Nile at its fource is called the abay or "father."-We obferve this word, or its radix, blended with many names of rivers of the eaft; and think it probable that when our traveller got this name from the inhabitants of the neighbourhood, they applied to the ftream what is meant to exprefs the tutelar or prefiding fipirit. The river-gods are always reprefented as, venerable old men, to indicate their being coeval with the world. But it is always a cruda viridiffuc fenefus, and they are never reprefented as opprefled with age and decrepitude. Their beards are long and flowing, their looks placid, their attitude eafy, reclined on a bank, covered, as they are crowned, with never-fading fedges. and bulrufhes, and leaning on their urns, from which they pour out their plentiful and fertilizing areams.-

## R I V E R.

$\underbrace{\text { Hiningy. }}$
Mr Bruce's defription of the fources of the Nile, and of the refpect paid to the facred waters, has not a frowning feature; and the hofpitable old man, with his fair daughter Irepone, and the gentle prielthood which peopled the little village of Gefh, forms a contraft with the neighbouring Galla (among whom a military leader was called the lamb, becaufe be did not murder pregnant women), which very diftinaly paints the infpiring principle of this fuperfition. Pliny fays (VIII. 8.) that at the fource of the Clitumnus there is an ancient temple highly refpected. The prefence and the power of the divinity are expreffed by the fates which ftand in the veftibule.-Around this temple are feveral little chapels, each of which covers a facred fountain; for the Clitumnus is the father (f feveral little rivers which unite their freams with hum. At fome diftance below the temple is a bridge which divides the facred waters from thofe which are open to common ufe. No one mult prefume to fet his foot in the flreams above this bridee; and to fep over any of them is an indignity which renders a perfin infamous. They can only be vifited in a confecrated boat. Below the bridge we are permitted to bathe, and the place is inceffantly occupied by the neighbouring villagers. (See alfo Vibius Sequefr. Orbelini. p. 101-103. and $22 \mathrm{I}-223$. alfo Sution. Caligula, c. 43. Virg. Georg. II. 146.)

What is the caufe of all this? The Clitumnus flows (near its fource) through the richeft paftures, through which it was carefully diffributed by numberlefs drains; and thefe nourifhed cattle of fuch fpotlefs whitenefs and extraordinary beauty, that they were fought for with eagernefs over all Italy, as the moft acceptable vietims in their facrifices. Is not this fuperfition then an effafion of gratitude ?

Such are the difates of kind-hearted nature in our brealts, befure it has been viliated by vanity and felfconceit, and we fhould not be athamed of feeling the impreffion. We hardly think of making any apology for dwelling a little on this incidental circumftance of the fupertitious veneration paid to rivers. We cannot think that our readers will be dipleafed at having agreeable ideas excited in their minds, being always of opinion that the torch of true philufophy will not only enlighten the underftanding, but alfo warm and cherifh the affections of the heart.

With refpect to the origin of rivers, we have very little to offer in this place. It is obvious to every perfon, that befides the torrents which carry down into the rivers what part of the rains and melted fnows is not abforbed by the foil or taken up by the plants which cover the earth, they are fed either immediately or remotely by the fprings. A few remark:able flreams rufl at once out of the earth in force, and mult be confidered as the continuation of fubterraneous rivers, whole origin we are therefore to feek out; and we do not know any circumfance in which their firt beginnings differ from thofe of other rivers, which are formed by the union of little ftre:ms and rills, each of which has its own fource in a fpring or fountain. This queftion, therefore, What is the procefs of nature, and what are the fupplies which fill our fprings? will be treated of under the word Spring.

Whatever be the fource of rivers, it is to be met with in almolt every part of the globe. The crult of
earth with which the rocky framing of this globe is covered is generally Rratified. Some of thefe frata are extremely pervious to water, having but fmall attraction for its particłes, and being very porous. Such is the quality of gravelly frat:a in an eminent degree. Other ftrata are much more 6 rm , or attract water more ftrongly, and refufe it a paffage, This is the cafe with firm rock and with clay. When a ftratum of the firt kind has one of the other immediately under it, the water remains in the upper ftratum, and burfts out wherever the floping fides of the hills cut off the frata, and this will be in the form of a trickling fpring, becaufe the water in the porous fratum is greatly obftructed in its paffage cowards the outlet. As this irregular formation of the earth is very $g$ neral, we mult have fprings, and of courfe rivers or rivulets, in every corner where there are high grounds.
Rivers flow from the hither to the lower grounds. It is the arrangement of this elevation which diftributes them over the furface of the earth. And this appears to be accomplifhed with confiderable regularity; and, except the great defert of Kobi on the confines of Chinefe Tartary, we do not remember any very extenfive track of ground that is deprived of thofe channels for voiding the fuperfluous waters; and even there they are far from being redundant.
The courfe of river gives us the beft general method courfe of for judgirg of the elevation of a country. Thus it the rivers appears that Savoy and Switzerland are the higheft of Europe ${ }_{x}$ grounds of Europe, from whence the ground flopes in every directinn. From the Alps proceed the Danube and the Rhine, whofe courfes mark the two great valleys, into which many lateral ftreams defcend. The Po alfo and the Rhone come from the fame head, and with a feeper and fhorter courfe find their way to the fea through valleys of lefs breadth and length. On the weft fide of the valleys of the Rhine and the Rhone the ground rifes pxetty fat, fo that few tributary ftreams come into them from that fide; and from this gentle elevation France flopes to the weftward. If a line, nearly fraight, but bending a little to the northward, be drawn from the head of Savoy and Svitzerland all the way to Solikamkoy in Siberia, it will nearly pafs through the moft elevated part of Europe; for in this track moit of the rivers have their rife. On the left go off the various feeders of the Elbe, the Oder, the Wefel, the Niemen, the Duna, the Neva, the Dwina, the Petzora. On the right, after pafling the feeders of the Danube, we fee the fources of the Sereth and Pruth, the Dniefter, the Bog, the Drieper, the Don, and the mighty Volga. The elevation, however, is exiremely moderate; and it appears from. the levels taken with the barometer by the Abbé Chappe d'Auteroche, that the head of the Volga is not more than 470 feet above the furface of the ocean. And we may obferve here by the bye, that its mouth, where it difcharges its waters into the Cafpian fea, is undoubtedly lower, by many feet, than the furface of the ocean. See Pneumatics, n ${ }^{\circ}$ 277. Spain and Finland, with Lapland, Norway, and $S$ weden, fo*m $t \geqslant 0$ detached parts, which have litile fymmetry with the reft of Europe.

A chain of mountains berins in Nova Zembla, and of atu., Aretches due fonth to near the Cafpian Sea, dividing Europe from Afia. About three or four degrees nort'?

Hilary.
of the Cafpian fea it bends to the fouthicalt, traverfes weftern Tartary, and paffing between the T'engis and Zaiann lakes, it then branches to the eaft and fouth. The taftern branch runs to the fhores of Korea and Kamrfchatka. The fouthern beanch traverifes Turketton and Thibet, feparating them from India, and at the head of the kingdom of Ava joins an arm fretching from the great eaftern branch, and here forms the cen're ot a very fingular radiation. Chains of mountains iffue frum it in every direction. Three or four of them keep very clofe together, dividing the continent into narrow flips, which have each a great river flowing in the middle, and reaching to the extreme points of Malacca, Cambodia, and Cochin-china. From the fame central point proceeds another great ridge due eaft, and paffes a little north of Canton in China. We cailed this a fingular centre: for though it ferds off fo many branches, it is by no means the molt elevated part of the continent. In the triangle which is included between the firtt futhern rid e ( which comes from between the lakes Tenges and Zaizan), the great eaftern ridge, and its branch which almoft unites with the fouthern ridge, lies the Boutan, and part of Thibet, and the many little rivers which occupy its furface, flow fouthward and eaftward, uniting a little to the north of the centre often mentioned, and then pafs through a gorge eaftward into China. And it is farther to be obferved, that thefe great ridges do not appear to be feated on the highent parts of the country; for the rivers which correfpond to them are at no great diflance from them, and receive their chief fupplies from the other fides. This is remarkably the cafe with the great Oby, which runs almof parallel to the ridge from the lakes to Nova Zem. bla. It receives its fupplies from the eaft, and indeed it has its fource far eaft. The higheft grounds (if we except the ridges of mountains which are boundaries) of the continent feem to be in the country of the Calmucs, about $95^{\circ}$ ealt from London, and latitude $43^{\circ}$ or $45^{\circ}$ north. It is reprefented as a fine though fandy country, having many little rivers which lofe themfelves in the fand, or end in little falt lakes. This elevation fretches north-eaft to a great diftance; and in this track we find the heads of the Irtifh, Selenga, and Tungufkaia (the great feeders of the Oby), the Olenitz, the Lena, the Yana, and fome other rivers which all go off to the north. On the other fide we have the great river Amur, and many fmaller rivers, whofe names are not familiar. The Hoangho, the great river of China, rifes on the fouth fide of the great eaftern ridge we have fo often mentioned. This elevation, which is a continuation of the former, is fomewhat of the fame complexion, being very fandy, and at prefent is a defert of prodigious extent. It is defcribed, however, as interiperfed with vaft tracks of rich pafture ; and we know that it was formerly the refidence of a great nation, who came fouth by the name of Turks, and poffeffed themfelves of mott of the richeft kingdrms of Afia. In the fouth-weftern extremity of this country are found remains not only of barbaric magnificence, but even of cultivation and elegance. It was a profitable privilege granted by Peter the Great to fome adventurers to fearch thefe fandy deferts for remains of former opulence, and many pieces of delicate workmanfip (tho' not in a fyle which we would admire) in gold and fil-
ver were found. Vaults were found buried in the fand Hifory, filled with written papers, in a charaker whelly unknown; and a wall was difcovered extending íceval mile, , built with hewn fone and ornamented with corniches and battlements. But we are forgetting ourfelves, and return to the confideration of the diltribution of the rivers on the furface of the earth. A great ridge of mountains begins at the fouthealt corne of the Euxine Sea, and proceeds eaftward, ranging along the fouth fide of the Cafpan, and fill advancing unites with the mountains firt mentioned in Th bet, fending off fome branches to the fouth, which divide Perta, India, and Thiber. From the fouth fide of this ridge flow the Euphrates, Tigris, Indus, Ganges, \&c and from the north the ancient $O_{\text {a us }}$ and many unknown freams.

There is a remarkable circumftance in this quarter of the globe. Although it feems to be neareft to the greateft elevations, it feems alfo to have places of the greatefl deprefion. We have already faid that the Calpian Sea is lower than the ocean. There is in its neighburhood another great bafon of falt water, the lake Aral, which receives the waters of the Oxus or Gihon, which were faid to have formerly run into the Cafpian Sea. There cannot therefore be a great difference in the level of thefe two bafons; neither have they any outlet, tho' they receive great river.-. There is another great lake in the very middle of Perfia, the Zare or Zara, which receives the river Hindemend, of near 250 miles length, befides other ftreams. There is another fuch in Afia Minor. The fea of Sodom and Gomorrah is another inftance. And in the high countries we mentioned, there are many fmall falt lakes, which receive little rivers, and have no outlet. The lake Zara in Perfia, however, is the only one which indicates a confiderable hollow of the countr:- It is now afcertained by actual furvey, that the fea of Sodom is confiderably higher than the Mediterranean. This feature is not, however, peculiar to Afia. It obtains alfo in Africa, whofe rivers we now proceed to mention.
Of them, however, we know very little. The Nile indeed is perhaps better known than any river out of Europe; and of its fource and progrefs we have given a full account in a feparate article. See Nile.

By the regifter of the weather kept by Mr Bruce at Gondar in 1770 and 1771 , it appears that the greatef rains are about the beginning of July. He fays that at an average each month atter June it doubles its rains. The califh or canal is opened at Cairo about the gth of Auguft, when the river has rifen 14 peeks (each 21 inches), and the waters begin to decreafe about the 1oth of September. Hence we may form a conjecture concerning the time which the water employs in coming from Abyfinia. Mr Bruce fuppofes it 9 days, which fuppofes a velocity not lefs than 14 feet in a fecond; a thing palt belief, and inconfiltent with all our notions. The general llope of the river is greatly diminifhed by feveral great cataracts; and Mr Bruce exprefsly fays, that he might have come down from Sennaar to the cataracts of Syene in a boat, and that it is navigable for boats far above Sennaar. He came from Syene to Cairo by water. We apprehend that no boat would venture down a fream moving even fix feet in a fecond, and none could row up if the velocity was three feet. As the waters begin to decreafe about the roth of

September, we mult conclule that the water then flowing paft Cairo had left Abyffinia when the rains had greatly abated. Judging in this way, we muft fill allow the flream a velocity of more than fix feet. Had the firft fwell at Cairo been noticed in 1770 or 177 I , we might have gueffed better. The year that Thevenot was in Egypt, the firt fwell of 8 peeks was obferved Jan. 28. The califh was opened for 14 peeks on Auguft 14th, and the waters began to decreafe on September 23 d, having rifen to $21 \frac{2}{3}$ peeks. We may fuppofe a fimilar progrefs at Cairo correfponding to Mr Bruce's obfervations at Gondar, and date every thing five days earlier.

We underftand that fome of our gentlemen fationed far up the Ganges have had the curiofity to take notes of the fwellings of that river, and compare them with the overffowings at Calcutta, and that their obfervations are about to be made public. Such accounts are valuable additions to our practical knowledge, and we fhall not neglect to infert the information in fome kindred article of this work.
The fame mountains which attract the tropical vapours, and produce the fertilizing inundations of the Nile, perform the fame office to the famous Niger, whofe exiftence has often been accounted fabulous, and with whofe courfe we have very little acquaintance. The refearches of the gentlemen of the African affociation render its exiftence no 1 nger doubtful, and have greatly excited the public curiofity. For a farther account of its track, fee Niger.

From the great number, and the very moderate fize, of the rivers which fall into the Atlantic Ocean all the way fouth of the Gambia, we conclude that the weftern fhore is the molt elevated, and that the mountains are at no great dittance inlind. On the other hand, the rivers at Melinda and Sofala are of a magnitude which indicate a much longer courfe. But of all this we fpeak with much uncertainty.
The frame-work (fo to call it) of America is better known, and is fingular.

A chain of mountains begins, or at leaft is found, in longitude $110^{\circ}$ welt of London, and latitude $40^{\circ}$ north, on the $n \cdot$ rthern confines of the kingdom of Mexico, and ftretching fouthward through that kingdom, forms the ridge of the neck of land which feparates North from South America, and keeping almoft clufe to the fhore, ranges aling the whole w ffern coaft of Scuth America, terminating at Cape Horn. In its courie it fends off branches, which after feparating from it for a few leagues, rejoin it again, inclofing valleys of great extent from north to $f$ uth, and of prodigious elevation. In one of thefe, under the equatorial fun, fands the city of Quito, in the midf of extenfive fields of barley, oats, wheat, and gardens, containing apples, pears, and goofeberries, and in fhort all the grains and fruits of the cooler parts of Europe; and although the vine is alo there in perfection, the olive is wanting. Not a dozen miles from it in the low countries, the fugar-cane, the indigo, and all the fruis of the torrid zone, find their congenial heat, and the iuhabitants fwelter under a burning fun. At as fmall a diftance on the other hand tower aloft the pinacles of Pichincha, Corambourou, and Chemburacaô, crowned with never melting fnows.
The individul mountains of this ftupendous range not only exceed in height all others in the world (if
we except the feak of Teneriffe, Mount Æetna, and Mount Blanc) ; but they are fet down on a bafe incomparably more elevated than any other country. They cut off therefore all communication between the Pacific Ocean and the inland continent; and no rivers are to be found on the welt coalt of South A merica which have any confiderable length of courfe or body of waters. The country is drained, like Africa, in the oppofite direc. tion. Not 100 miles from the cicy of L'ma, the capital of Peru, which lies almoft on the fea fhore, and juft at the foot of the high Cotdilleras, ariles out of a fmall. lake the Maragnon or Amazon's river, which, after running northward for about 100 miles, takes an eafterly direction, and croffes nearly the broadeft part of Suuth America, and falls into the great weftern ocean at Para, after a courfe of not lefs than 3500 miles. In the firit half of its defcent it receives a few middle-fized rivers from the north, and from the fouth it receives the great river Combos, fpringing from another little lake not 50 miles diftant from the head of the Maragnon, and inclo. fing between them a wide extent of country. Then it receives the Yuta, the Yuerva, the Cuchivara, and Parana Mire, each of which is equal to the Rhine; and then the Madeira, which has flowed above 300 miles. At their junction the breadth is fo great, that neither fhore can be feen by a perfon flanding up in a canoe; fo that the united fream mult be about 6 miles broad. In this majeftic form it rolls along at a prodigious rate through a flat country, covered with impenetrable forefts, and moft of it as yet untrodden by human feet. Mr Condamine, who came down the ftream, fays, that all is fi,ent as the defert, and the wild bealts and numberlefs birds crowd round the boat, eyeing it as fome animal of which they did not feem afraid. The bed was cut deep through an equal and yielding foil, which feemed rich in every part, if he could judge by the vegetation, which was rank in the extreme. What an addition this to the poffible population of this globe! A narrow flip along each bank of this mighty river would equal in furface the whole of Europe, and would probably exceed it in general fertility : and alth ugh the velocity in the main Itream was great, he obierved that it was extremely moderate, nay almoft fill, at the fides; fo that in thofe parts where the country was inhabited by men, the Indians paddled up the river with perfect eafe. Boats could go from Para to near the Mouth of the Madeira in 38 days, which is near 1200 miles.
MrCondamine made an obfervation during his paffage down the Maragnon, which is extremely curious and infructive, although it puzzled him very much. He oblerved that the tide was fenfible at a valt diftance from the mouth: It was very confiderable at the junction of the Madeira; and he fuppofes that it might have been obferved much farther up. This appeared to him very furprifing, becaufe there could be no doubt but that the furface of the water there was higher by a great many feet than the furface of the flood of the Atlantic ocean at the mouth of the river. It was therefore very natural for him to afcribe the tide in the Ma. ragnon to the immediate action of the moon on its waters; and this explanation was the more reafonable, becaufe the r:var extends in the diretion of terreltrial longitude, which by the Newtonian theory is mott favourable to the produstion of a tide. Journeying as he
did in an Indian canoe, we comot fuppofe that he had much leifure or conveniency for calculations, and therewre are not furprifed that he did not fee that even this cicumfance was of hittle avail in fo fmall or hallow a body of water. He carefully noted, however, the times of high and low water as he paffed along. When arrived at Para, he found not only that the high water was later and later as we are farther froms the mouth, but he found that at one and the fame inftant there were feveral points of high water between Para and che confluence of the Madeira, with points of low water intervening. This conclufion was eafily drawn from his own obfervations, although he could not fee at one infant the high waters in different places, He had only to compute the time of high water at a paricular fpot, on the day he obferved it at another; allowing, as ufual, for the moon's change of pofition. The refult of his obfervations therefore was, that the farface of the river was not an inclined plane whofe flope was leffened by the tide of flood at the mouth of the river, but that it was a waving line, and that the propagation of the tide up the river was nothing different from the propagation of any other wave. We may conceive it clearly, though imperfectly, in this way. Let the place be noted where the tide happens 12 hours later than at the mouth of the river. It is evident that there is alfo a tide at the very mouth at the fame inftant; and, fince the ocean tide had withdrawn itfelf during the time that the former tide had proceeded fo far up the river, and the tide of ebb is fucceffively felt above as well as the tide of flood, there muft be a low water between thefe two high waters.

Newton had: pointed out this curious fact, and obferved that the tide at London-Bridge, which is 43 feet above the fea, is not the fame with that at Gravefend, but the preceding tide (See Pbil. Tranf. 67.) This will be more particularly infifted on in another place.

Not far from the head of the Maragnon, the Cordilleras fend off a branch to the north-eaft, which reaches and ranges along the fhore of the Mexican Gulf, and the Rio Grande de Sta Martha occupies the angle between the ridges.

Another ridge ranges with interruptions along the eaft coalt of Terra Firma, fo that the whole waters of this country are collected into the Oroonoko. In like manner the north and eaft of Brafil are hemmed in by mountainous ridges, through which there is no confiderable paffage; and the ground noping backwards, all the waters of this immenfe track are collected from both fides by many confiderable rivers into the great river Paraguay, or Rio de la Plata, which runs down the middle of this country for more than 1400 miles, and falls into the fea through a valt mouth in latitude $35^{\circ}$.

Thus the whole of South America feems as if it had been formerly furrounded by a mound, and been a great bafon. The ground in the middle, where the Parama, the Madeira, and the Plata, take their rife, is an immenfe marth, uninbabitable for its exhalations, and quite impervions in its prefent itate.

The manner in which the continent of North Ame. rica is watered, or rather drained, has alfo fome peculiarities. By looking at the map, one will obferve firft of all a general divifion of the whole of the ben known
part into two, by the valleys in which the beds of the river $\operatorname{st}$ Laurence and Minnippi ate fituated. 'The head of this is occupied by a fingular feries of frefh water feas or lakes, viz. the lake Superior and Michigan, which empty themfelves into lake Huron by two cataracts. This again runs into lake Erie by the river Detroit, and the Erie pours its waters into the On. tario by the famous fall of Niagara, and from the Ontario proceeds the great river St Laurence.

The ground to the fouth weit of the lakes Superior and Erie is fomewhat lower, and the middle of the valley is occupied by the Miniflippi and the Miffouri, which receives on both fides a number of fmuller Itreams, and having joined, proceed to the fouth, under the name Miffilippi. In latitude 37 , this river receives into its bed the Ohio, a river of equal magniande, and the Cherokee river, which drains all the country lying at the back of the United States, feparated from them by the ranges of the Apalachian mountains. The Miffiffipi is now one of the chief rivers on the globe, and proceeds due fouth, till it falls into the Mexican bay through feveral fhifting mouhs, which greatly relemble thofe of the Danube and the Nile, having run above 1200 miles.

The elevated country between this bed of the Miffilfippi and St Laurence and the Atlantic ocean is drained on the ealt fide by a great number of rivers, fome of which are very confiderable, and of long courfe; becaufe inftead of being nearly at right, angles to the coalt, as in other countries, they are in a great meafure parallel to it. This is more remarkably the cafe with Hudfon's river, the Deldware, Patomack, Rapahanoc, \&c. Indeed the whole of North America feems to confif of ribs or beams laid nearly parallel to each other from north to fouth, and the rivers occupy the interitices. All thofe which empty themfelves into the bay of Mexico are parahel and almot perfectly ftraight, unlike what are feen in other parts of the world. The weftermoft of them all, the North River, as it is named by the Spaniards, as nearly as long is the Miffilippi.

We are very little informed as yet of the diftribu. tion of rivers on the north-weft coait of America, or the courfe of thofe which run into Hudfon's and Baffin's bay.

The Maragnon is undoubtedly the greateft river in of the the world, both as to length of run and the valt body greatria of water which it rolls along. The other great rivers riversfucceed nearly in the following order.

We have been much affifted in this account of the courfe of rivers, and their diftribution over the globe, by a beautiful planifphere or map of the world publifhed by Mr Bode aftronomer royal at Berlin. The ranges of mountains are there laid down with philofophical dif. cernment and precifion ; and we recommend it to the
notice

Thenry.
Ther.
notice of our geographers. We cannot divine what has caufed Mr Buffon to fay that the courfe of moft rivers is from ealt to welt or from weft to ealt. No phyfical point of his fyftem feems to require it, and it needs only that we look at his own map to ree its falfity. We Should naturally expect to find the general courfe of rivers nearly perpendicular to the line of fea-coalt; and
we find it fo; and the chief exceptions are in opsoftion to Mr Buffon's affertion. The ftructure of $\therefore$. m . rica is fo particular, that vory ferw of its rivers hase their general courfe in this direction. We proceed now to confider the motion of rivers; a fubject which naturally refolves itfelf into two parts, theoretical and prustical.

## Part I. Theory of the MOTION of RIVERS and CANALS.

14
lmportance of the doctrine of the motion of rivers and canali.

THE importance of this fubject needs no commentary. Every nation, every country, every city, is interefted in it. Neither our wants, our comforts, nor our pleafures, can difpenfe with an ignorance of it. We muit conduct their waters to the centre of our dwellings; we mult fecure ourfelves againit their ravages; we muft employ them to drive thofe machines which, by compenfating for our perfonal weaknefs, make a few able to perform the work of thoufands; we employ them to water and fertilize our fields, to decorate our manfions, to cleanfe and embellifh our cities, to preferve or extend our demednes, to tranfport from county to coluity every thing which neceffity, convenience, or luxury, has rendered precious to man: for thefe purpres we mult confine and govern the mighty rivers, we muft preferve or change the beds of the fmaller ftreams, draw off from them what fhall water our fields, drive our machines, or fupply our houfes. We mult keep up their waters for the purpres of navigation, or fupply their places by canals; we mult drain our fens, and detend them when drained; we meft underfand their motions, and their mode of fecret, flow, but unceafing action, that our bridges, our wharfs, our dikes, may not become heaps of ruins. Ignorant how to proceed in thefe daily recurring cafes, how often do we fee projects of high expectation and heavy expence fail of their object, leaving the ftate burdened with works not only ufelefs but frequently hurtful?
'This has long been a moft interefting fubject of fudy in Italy, where the fertility of their fields is not more indebted to their rich foil and happy climate, than to their numerous derivations from the rivers which traverfe them: and in Holland and Flanders, where their very exiftence requires uncealing attention to the waters, which are every moment ready to fwallow up the inhahitants; and where the inhabicants, having once fubdued this fornidable enemy, have made thole very waters their indefatigatle drudges, trantporting through every corner of the country the materials of the molt extenfive commerce on the face of this globe.

Such having been our inceffant occupations with moring waters, we thould expect that while the operative artilts are $\mathbf{c}$ ntinually furnilhing facts and experiments, the men of fpeculative and fcientific curiofity, excited by the impurtance of the fubject, would ere now have made contiderable progrels in the fcience; and that the profeffional engineer would be daily acting from eit.s. biilhed principle, and be feldom difappointed in lus expectations. Unfortunately the reverie of this is nearly the tiut fate of the calie; each engineer is obliged (1) c. Hest the greatelt part of his knowledge from lus own experience, and by many dear-bought leffons, to urect his fiture operations, in which he fill proceeds ' ol . XVI.
with anxiety and hefitation : for we have not yet acquired principles of theory, and experiments have not yet been collected and publifhed, by which an empirical practice might be fafely formed. Many experiments of ineftimable value are daily made; but they remain with their authors, who feldom have either leifure, ability, or generofity, to add them to the public flock.

The motion of waters has been really fo little inveftigated as yet, that hydraulics may fill be called a new fudy. We have merely fkimmed over a few common notions concerning the motions of water; and the mathematicians of the firlt order feem to have contented themfelves with fuch views as allowed them to entertain themfelves with elegant applications of calculus. This, however, has not been their fault. They rately had any opportunity of doing more, for want of a knowledge of facts. They have made excellent ufe of the few which have been given them; but it required much labour, great variety of opportunity, and great expence, to learn the multiplicity of things which are combined even in the fimpleft cafes of water in motion. Thefe are feldom the lot of the mathematician; and he is without blame when he enjoys the pleafures within his reach, and cultivates the fcience of geometry in its moft abitrafted form. Here he makes a progrefs which is the boaft of human reafon, being almoft infured from error by the intellectual fimplicity of his fubject. But when we turn our attention to material objects, and without knowing either the fize and thape of the elementary particles, or the laws which nature has prefcribed for their aftion, prefume to forefee their effects, calculate their exertions, direct their actions, what mult be the confequence? Nature thows her independence with refpest to our notions, and, always faithful to the laws which are enjoined, and of which we are ignorant, fhe never fails to thwart our views, to difconcer tour projects, and render ufclefs all our efforts.

To wifh to know the nature of the elements is vain, Propis ${ }^{16}$ and our grofs organs are infufficient for the fudy To mode of infuppole what we do not know, and to fancy fhapes and veftication. fizes at will; this is to raife phantoms, and will produce a fyltem, but will not prove a foundation, for any fcience. But to interrogate Nature herfelf, tudy the laws which the fo faiihfully obferves, catch her, as we fay, in the faft, and thus wrelt from her the fecret; this is the only way to become her matter, and it is the only procedure confitent with good fenfe. And we fee, that foon after Kepler detected the laws of the planetary motions, when Galileo difoovered the uniform ac. celeration of gravity, when Pafchal dilicovered the preifure of the atmopiere, and Newton difcovered the lam: of attraction and the track of a ray of light; aftronmm, mechanics, hydroltatics, chemiltry, optics, quifkly ie K

If
came bodies of found doctrine; and the deductions from their refieciive theories were found fair reprefentations of the phenomena of nature. Whenever a man has difcovered a law of nature, he has laid the foundation of a fcience, and he has given us a new mean of fubjecting to our fervice fome element hitherto independent: and fo long as groups of natural operations follow a route which appears to us whimfical, and will not admit our calculations, we may be affured that we are ignorant of the principle which connects them all,

This is remarkably the cafe with feveral phenomena in the motions of fluids, and particularly in the motion of water in a bed or conduit of any kind. Although the firlt geniufes of Europe have for this century paft turned much of their attention to this fubject, we are almoft ignorant of the general laws which may be obferved in their motions. We have been able to felect very few points of refemblance, and every cafe remains nearly an individual. About 150 years ago we difcovered, by experience only, the quantity and velocity of water iffuing from a fmall orifice, and, after much labour, have extended this to any orifice; and this is almoit the whole of our confidential knowledge. But as to the uniform conrfe of the ftreams which water the face of the earth, and the maxims which will certainly regulate this agreeably to our wilhes, we are in a manner totally ignorant. Who can pretend to fay what is the velocity of a river of which you tell him the breadth, the depth, and the declivity? Who can fay what fwell will be produced in different parts of its courfe, if a dam or wair of given dimenfions be made in it, or a bridge be thrown acrofs it? or how much its waters will be raifed by turning another ftream into it, or funk by taking off a branch to drive a mill? Who can fay with confidence what mult be the dimenfions or flope of this branch, in order to furnifh the water that is wanted, or the dimenfions and flope of a canal which thall effectually drain a fenny dittrict? Who can fay what form will caufe or will prevent the undermining of banks, the forming of elbows, the pooling of the bed, or the depofition of fands? Yet thefe are the moft important queftions.

The caufes of this ignorance are the want or uncertainty of our principles; the fallity of our only theory, which is belied by experience; and the fmall number of proper obfervations or experiments, and difficulty of making fuch as fhall be ferviceable. We have, it is true, made a few experiments on the efflux of water from fmall orifices and from them we have deduced a fort of theory, dependant on the fall of heavy bodies and the laws of hydroftatic preffure. Hydroftatics is indeed founded on very fimple principles, which give a very good account of the laws of the quiefeent equilibrium of flaids, in confequence of gravity and perfect fluidity. Hut by what train of reafoning can we conneet the e with the phenomena of the uniform motion of the waters of a river or open fream, which can derive its motion only from the flope of its furface, and the moditications of this motion or its velocity only from the width and depth of the fiream? Thefe are the only circumfances which can diftinguilh a poition of a river from a veffel of the fame fize and hape, in which, however, the water is at reft. In both, gravity is the fole caufe of preffere and motion; but there nual be fome
circumfance peculiar to running wraters which modifies Theory. the exertions of this active principle, and which, when difcovered, mult be the bafis of hydraulics, and mult oblige us to reject every theory founded on fancied hypothefes, and which can only lead to abfurd conclufions: and furely abfurd confequences, when legitimately drawn, ate complete evidence of improper principles.
When it was difcovered experimentally, that the ve- princip locities of water iffuing from orifices at various depths on which under the furface were as the fquare roots of thofe the fyltems depths, and the fact was verified by repeated experi- of hydauments, this principle was immediately and without mo- lics depend. dification applied to every motion of water. Mariotte, Varignon, Guglielmini, made it the bafis of complete fyftems of hydraulics, which prevail to this day, after having received various amendments and modifications. The fame reafoning obtains through them all, though frequently obfcured by other circumftances, which are more perfpicuoully expreffed by Guglielmini in his Fundamental Theorems.

Plate
He confiders every point $P$ (fig. I.) in a mafs of ceccexsmus fluid as an orifice in the fide of a veffel, and conceives the particle as having a tendency to move with the fame velocity with which it would iffue from the orifice. Therefore, if a vertical line APC be drawn thro' that point, and if this be made the axis of a parabolic ADE, of which $A$ at the furface of the fluid is the vertex, and $A B$ (four times the height through which a heavy body would fall in a fecond) is the parameter, the velocity of this particle will be reprefented by the ordinate PD of.this parabola ; that is, PD is the fpace which it would uniformly defribe in a fecond.
From this principie is derived the following theory Theory deof running waters.
Let DC (fig. 2.) be the horizontal bottom of a $\mathrm{re}^{-}{ }^{-1}$ fervoir, to which is joined a floping channel CK of uniform breadth, and let AB be the furface of the ftanding water in the refervoir. Suppofe the vertical plane BC pierced with an infinity of holes, through each of which the water iffues. The velocity of each filament will be that which is acquired by falling from the furface $\mathrm{AB}+$. The filament C , iffuing with this ve- $\dagger$ See Gu : locity, will then glide down the inclined plane like glielmini's any other heavy body; and (by the common doctrine of lics Hax'the motion down an inclined plane) when it has arrived at $F$, it will have the fame velocity which it would have acquired by falling through the height OF, the point $O$ being in the horizontal plane $A B$ produced. The fame, may be faid of its velocity when it arrives at H or K . The flament immediately above C will alfo iffue with a velocity which is in the fubduplicate ratio of its depth, and will then glide down above the firt filament. The fame may be affirmed of all the filaments; and of the fuperficial filament, which will occupy the furface of the defeending flream.
From this account of the genefis of a running ftream of The confewater, we may fairly draw the following confequences. quences
I. The velocity of any particle $R$, in any part of drawn the ftream, is that acquired by falling from the horizontal plane AN.
2. The velocity at the bottom of the fream is everywhere greater than anywhere above it, and is leaft of all at the furface.
3. The velocity of the fream increafes continually as the itream recedes from its fource.
4. The depths EF, GH, \&c. in different parts of the other confequences are equally contrary to experithe fream, will be nearly in the inverfe fubduplicate ratio of the depths under the furface $A N$ : for fince the fame quantity of water is running through every fection EF and GH, and the channel is fuppofed of uniform breadth, the depth of each fection mult be in. verfely as the velocity of the water paffing through it. This velocity is indeed different in different filaments of the fection ; but the mean velocity in each fection is in the fubduplicate ratio of the depth of the filament under the furface $A B$. Therefore the ftream becomes more fhallow as it recedes from the fource ; and in confequence of this the difference between LH and MG continually diminifhes, and the velocities at the bottom and furface of the Atream continually approach to equality, and at a great difance from the fource they differ infenfibly.
5. If the breadth of the fream be contracted in any part, the depth of the rumning water will be increafed in that part, becaufe the fame quantity muft fill pafs through ; but the velocity at the bottom will remain the fame, and that at the furface will be lefs than it was before; and the area of the fection will be increafed on the whole.
6. Should a flaice be put acrofs the ftream, dipping a little into the water, the water mult immediately rife on the upper fide of the flaice till it rifes above the level of the refervoir, and the fmalleft immerfion of the fluice will produce this effect. For by lowering the fluice, the area of the fection is diminifhed, and the velocity cannot be increafed till the water heap up to a greater height than the furface of the refervoir, and this acquires a preffure which will produce a greater velocity of efflux through the orifice left below the fluice.
7. An additional quantity of water coming into this channel will increafe the depth of the ftream, and the quantity of water which it conveys; but it will not in. creafe the velocity of the bottom filaments, unlefs it comes from a higher fource.

All thefe confequences are contrary to experience, and fhow the imperfection, at leaft, of the explanation.

The third confequence is of all the molt contrary to experience. If any one will but take the trouble of following a fingle brook from its fource to the fea, he will find it molt rapid in its beginnings among the mountains, gradually flackening its pace as it winds among the hills and gentler declivities, and at laft creeping dowly along through the flat grounds, till it is checked and brought to relt by the tides of the ocean.

Nor is the fecond confequence more agreeable to obfervation. It is univerfally found, that the velocity of the furface in the middle of the ftream is the greate! of all, and that it gradually diminilhes from thence to the bottom and fides.

And the firlt confequence, if true, would render the runninge waters on the furface of this earth the inftruments of imrodiate ruin and devaftation. If the waters of our rivers, in the cultivated parts of a country, which are two, thrce, and four hundred feet lower than their fources, run with the velocity due to that height, they would in a fow minutes lay the earth bare to the very benes.

The velocities of car rivers, brooks, and rihs, being fo ereatly iferion to whis this theory aflions to them
ence. When a ltream has its fection diminithed by marrowing the channel, the current increafes in depth, and this is always accompanied by an increafe of velecity through the whole of the fection, and molt of all at the furface; and the area of the fertion does not increafe, but diminifhes, all the phenomena, thus contradisting in every circumftance the deduction from the theory; and when the fection has been diminifhed by a flaice let down into the ftream, the water gradually heaps up on the upper fide of the fluice, and, by its preffare, prodnces an acceleration of the fream below the fluice, in the fame way as if it were the beginining of a fream, as explained in the theory. The velocity now is compofed of the velocity preferved from the fource and the velocity produced by this fubordinate accumulation; and this accumulation and velocity continually increafe, till they become fuch that the whole fupply is again difcharged through this contracted fection : any additional water not only increafes the quantity carried along the ftream, but alfo increales the velocity, and therefore the fection does not increafe in the proportion of the quantity.

It is furprifing that a theory really founded on a conceit, and which in every the moft familiar and obvious circumftance is contradicted by facts, fhould have met with fo much attention. That Varignon fhould immediately catch at this notion of Guglielmini, and collowed by immediately catch at this notion of Guglielmini, and the writers
make it the fubject of many elaborate analytical me- on the fubmoirs, is not to be wondered at. This author only want. jeet, ed donner prife au calcul; and it was a ufual joke among the academicians of Paris, when any new theorem was invented, donnons le à Varignon à generalifer. But his numerous theorems and corollaries were adopted by all, and ftill make the fubitance of the prefent fyftems of hydraulics. Gravefande, Mufhenbroek, and all the elementary treatifes of natural philofophy, deliver no other doctrines; and Belidor, who has been confidered as the firt of all the fcientific engineers, details the fame theory in his great work the Architecture Hydraulique.

Guglielmini was, however, not altogether the dupe Though of his own ingenuity. He was not only a pretty good fome of the mathematician, but an affiducus and fagacious obferver. more ingeHe had applied his theory to fome important cafes its defects, which occurred in the courfe of his profeffion as in its defects, fpector of the rivers and canals in the Milanefe, and to tempted the courfe of the Danube ; and could not but perceive to fu;ply that great corrections were neceffary for making the them. theory quadrate in fome tolcrable manner with obfervation; and he immediately faw that the motion was greatly obltructed by inequalities of the canal, which gave to the contiguous filaments of the fream tranfverfe motions, which thwarted and confufed the regular progrefs of the relt of the ftream, and thus checked itis general progre!s. There obitructions, he oberved, were molt effectual in the beginning of its courfe, while yet a fmall riil, running among fones, and in a very unequal bed. The whole fream buing fmall, the insqualiiies bore a great proportion to it, and the the general effect was great. He alfo fav that the fame ciaufes (thefe tranfverfe motions produced by the unequal bottom) chiefly affected the contiguous filaments, and were the reafons why the velocisy at the fides and botton was fo much diminifhed as to be lefs th an the faperfcill velocity, end that even this mint come to be Kね2 diminifled

71?sory. now remer diminithed by the farme caufe. For he obferved, that 2 fert of boiling or tumbling motion, by which maffes of water are brought up to the furface and again defcend. Every perfon mult recollect fuch appearances in the frethes of a muddy river; and in this way Guglielmini was enabled to account in fome meafure for the difagreement of his theory with obfervation.

Mariotte had obferved the fame obfructions even in the fmoothef glafs pipes. Here it could not be afribed to the checks occiafioned by tranfverfe motions. He therefore accribed it to fristion, which he fuppofed to dirrinifh the motion of fluid bodies in the fame manner as of folids: and he thence concludes, that the filaments which immediately rub on the fides of the tube have their velocity gradually diminifhed; and that the filaments immediately adjoining to thefe, being thus obliged to pafs over them or cutfrip them, rub upon them, und have their own velocity diminifhed ia like manner, Lut in a fmaller degree; and that the fucceeding filaments towards the axis of the tube fuffer fimilar but fmaller diminutiors. By this means the whole ftream may come to have a fimaller velocity; and at any rate the medium velocity by which the quantity difcharged is determined, is fmaller than it would have beeri independent of friction.

Guglielmini adopted this opinion of Mariotte, and in his next work on the Motion of Rivers, confidered this as the chief caufe of the retardation; and he added a third circumitante, which he confidered as of no lefs conf quence, the vifcidity or tenacity of water. He obferves that fyrup, oil, and other fluids, where this vifcidity is more remarkable, have their motions prodigioully retarded by it, and fuppofes that water differs from them only in the degree in which it poffeffes this quality: and he fays, that by this means not only the particles which are moving more rapidly have their motions diminithed by thofe in their neighbourhood which move flower, but that the filaments alfo which would have moved more flowly are accelerated by their more astive neighbours; and that in this manner the fuperficial and inferior velocities are brought nearer to an equality. But this will never account for the univerfal fact, that the fuperficial particles are the fwiftelt of all. The fuperficial particles, fays he, acquire by this means a greater velocity than the parabolic law allows them; the medium velocity is often in the middle of the depth; the numerous obflacles, continually multiplied and repeated, caufe the current to lofe the velocity acquired by the fall; the flope of the bottom then diminilhes, and often becomes very fmall, fo that the force remaining is hardly able to overcome the obftacles which are ftill repeated, and the river is reduced almoft to a flate of flagnation. He obferves, that the Rheno, a river of the Milanefe, has near its mouth a flope of no more than $50^{\prime \prime}$, which he confiders as quite inadequate to the tafk ; and here he introduces another principle, which he confiders as an effential part of the theory of open currents. This is, that there arifes from the very depth of the ftream a propelling force which reftores a part of the loft velocity. He offers nothing in proof of this principle, but ufes it to account for and explain the motion of waters in horizontal canals. The principle has been adopted by the numerous Italian writers on hydraulics, and, by various contrivances, interwoven with the para.
bolic theory, as it is called, of Guglielmini. Our reader may fee it in various modifications in the Idrofatica e Idraulica of P. Lecchi, and in the Sperienze Idrauliche of Micheletti. It is by no means diftinct either in its origin or in the manner of its application to the explanation of phenomena, and feems only to ferve for giving fomething like confitency to the vague and obfcure difcuffions which have been publifhed on this fubject in Italy. We have already remarked, that in that country the fubject is particularly interefting, and has heen much commented upon. But the writers of Engiand, France, and Germany, have not paid fo much attention to it, and have more generally occupied themfelves with the motion of water in clofe conduits, which feem to admit of a more precife application of mathematical reafüning.

Some of thofe have confidered with more attention Sir Iface the effects of fristion and vifcidity. Sir Ifaac Newton, Newton's with his ufual penetration, had feen diftinctly the man. obfervaner in which it behoved thefe circumftances to operate, tions on He had occafion, in his refearches into the mechanifm of the celeftial motions, to examine the famous hypothefis of Defcartes, that the planets were carried round the fun by fluid vortices, and faw that there would be no end to uncertainty and difpute till the modus operandi of the vortices was mechanically confidered. He therefore employed himfif in the inveftigation of the marner in which the acknowledged powers of natural bodies, acting according to the received laws of mectanics, could produce and preferve thefe vortices, and reRore that motion which was expended in carrying the planets round the fun. He therefore, in the fecond book of the Principles of Natural Philofophy, gives a feries of beautiful propofitions, viz. 51,52 , \&c. with their corollaries, fhowing how the rotation of a cylinder or fphere round its axis in the midt of a fluid will excite a vortical motion in this fluid; and he afcertains with mathematical precifion the motion of every filament of this vortex.

He fets out from the fuppefition that this motion is excited in the furrounding fratum of fluid in confequence of a want of perfect lubricity, and affumes as an hypothefis, that the initial refiftance (or diminution of the motion of the cylinder) which arifes from this want of lubricity, is proportional to the velocity with which the furface of the cylinder is feparated from the contiguous furface of the furrounding fluid, and that the whole refiftance is proportional to the velocity with which the parts of the fluid are mutually feparated from each other. From this, and the equality of action and re-action, it evidently follows, that the velocity of any ftratum of the vortex is the arithmetical medium between the velocities of the frata immediately within and without it. For the intermediate fratum cannot be in equilibrio, unlefs it is as much prefled forward by the fuperior motion of the flratum within it, as it is kept back by the flower motion of the fratum without it.

This beautiful inveftigation applies in the mof perfect manner to every change produced in the motion of a fluid filament, in confequence of the vifcidity and friction of the adjoining filaments; and a filament proceeding along a tube at fome fmall diftance from the fides has, in like manner, a velocity which is the medium between thofe of the filaments immediately furrounding

Theory. it. It is therefore a problem of no very difficult folution to afign the law by which the velocity will gradually diminith as the flament recedes from the axis of a cylindrical tube. It is fomewhat furprifing that fo neat a problem has never occupied the attention of the mathematicians during the time that thefe fubjects were fo affiduouny fudied; but fo it is, that nothing precife has been publifhed on the fubjest. The only approach to a difcullion of this kind, is a Memoire of Mr Pitot, read to the academy of Paris in 1726 , where he confiders the velocity of efllux though a pipe. Here, by at ending to the comparative fuperiority of the quantity of $n, t i s n$ in large pipes, he affirms, that the total dimi. nution, arifing from friction will be (ceteris paribus) in the inverfe ratio of the diameters. This was thankfully received by other writers, and is now a part of our hydraulic theories. Is has not, however, been attended $t$., by thofe who write on the motion of rivers, though it is evident that it is applicable to thefe with equal propriety; and had it been introduced, it would at once have folved all their difficulties, and particuiarly would have thown how an almolt imperceptible declivity would produce the gentle motion of a great river, without having recourle to the unintelligible principle of Guglie.mini.

Mr Couplet made fome experiments on the motion of the water in the griat main pipes of Verlailles, in order to obtain fome notions of the retardations occationed by friction. 'They were found prodigious; but were fo irregular, and unfufceptible of reduction to any general I rinciple, (and the cxperiments were indeed fo few that they were unfit for this reduction), that he could eftablilh no theory.-What Mr Belidor eltablifhed on them, and makes a fort of fyftem to direct future engineers, is quite unworthy of attention.

Ipon the whole, this brarich of hydraulics, although of much greater practical importance than the cunduct of water in pipes, has never yet obtained more than a vague, and, we may call it, flovenly attention from the mathematiciass; and we alcribe it to their not having taken the puins to fettle its firlt principles with the

26
Scarce at all improred fince his time. fame precifion as had been dune in the other banch. They were, from the beginning, f.tisfied with a fort of applicability of mathematical principles, without ever making the application. Were it not that fome would accule us of national partiality, we would alcribe it to this, that Newton had not pointed out the way in this as in the other branch. For any inteiligent reader of the performances on the motions of fluids in cloie veffels; will fee that there has not a principle, nay hard!y a ftep of inveltigation, been added to thafe which were ufed or pointer out by Sir Iface Newton. He has nowhere touchas this queftion, the motion of mater in an open canal. In his theories of the tides, and of the propagation of waves, he hid an excellent opportuni:y for giving at cnee the fundamental principles of motion in a tree fluid whofe furface was not hoizontal. But, by means of fome of thofe happy and hrewd gueffes, in which, as Daniel Bernoulli fays, he excelled all men, he faw the undoubted coniequences of fome palpable phenomenon which would antuer all his prefent purpores, and therefore entered no farther into the inveftigation.

The original theory of Guglielmini, or the principle adopted by him, that each particle of the vertical fec-
tion of a running fream has a tendency to move as if it were iffuing from an orifice at that depth under the furface, is falie; and that it really does fo in the face of a dam when the flood-gate is taken away, is no lefs fo: and if it did, the fubfequent motions would hardly have any refemblance to thofe which he affigns them. Were this the cale, the exterior form of the cafcade would be fomething like what is fketched in fig. 3. with an abrupt angle at B , and a concave furface BE.G. This will be evident to every one who combines the greater velocity of the lower filaments with the flower motion of thofe which muit flide down above them. But this greater advance of the lower filaments cannot take place without an expenditure of the water under the furface $A B$. The furface therefore finks, and $B$ infantly ceafes to retain its place in the horizontal plane. The water does not fucceflively flow forward from $A$ to $B$, and then tumble over the precipice; but immediately upon opening the floodgate, the water waftes from the fpace immediately behind it, and the whole puts on the form reprefented in fig. 4. confifting of the curve A a PcEG, convex from A to $c$, and concave from thence forward. The fuperficial water begins to accelerate all the way from A; and the particles may be fuppofed (for the prefent) to have acquired the velocity correfponding to their depth under the horizontal furface. This mult be undertood as nothing more than a vague fketch of the motions. It requires a very critical and intricate inveftigation to determine either the form of the upper curve or the motions of the different filaments. The place A, where the curvature begins, is of equally difficult determination, and is various according to the differences of depth and of inclination of the fucceeding canal.

We have given this fort of hiftory of the progrefs Uncerwhich had been made in this part of hydraulics, that tainty of our readers might form fome opinion of the many dif- the thenfertations which have been written on the motion of applied to rivers, and of the ftate of the arts depending on it. practiceexMuch of the bulinefs of the civil engineer is intimately emplified. connected with it: and we may therefore believe, that fince there was to little principle in the theories, there could be but very little certainty in the practical operations. The fact has been, that no engineer could pretend to fay, with any precifion, what would be the effect of his operations. One whofe bufinefs had given him many opportunities, and who kept accurate and judicious regifters of his own works, could pronounce, with fume probability, how much water would be brought of by a drain of certain dimenfions and a given flope, when the ciccumftances of the cafe happened t.) tally with fume former work in which he had fucceeced or failed; but out of the pale of his own experience he could only make a fagacious guefs. A remarkab.e intance of this occurred not long ago. A fmall aqueduct was la:ely carried into Paris. It had been conducted on a plan prefented to the academy, who had corrected it, and gave a report of what its performance would be. When executed in t?e moft accurate manner, it was deficient in the proportion of five to nine. When the celehrated Defaguliers was employed by the city of Edinburgh to fuperintend the bringing in the water for the fupply of the city, he gave a reporn on the plan which was to be followed. It was execa. ted to his complete fatisfaction; and the quantity of

Theory.
water delivered was about one fixth of the quantity which he promifed, and about one-eleventh of the quantity which the no lefs celebrated M‘Laurin calculated from the fame plan.

Such being the fate of our theoretical knowledge (if it can be called by this name), naturalifts began to be perfuaded that it was but lofing time to make any ufe of a theory fo incongruous with obfervation, and that the only fafe method of proceeding was to multiply experiments in every variety of circumftances, and to make a feries of experiments in every important cafe, which hould comprehend all the practicable modifications of that cafe. Perhaps circumftances of refemblance might occur, which would enable us to connect many of them together, and at laft difcover the principles which occafioned this connection; by which means a theory founded on fcience might be obtained. And if this point thould not be gained, we might perhaps find a few general facts, which are modified in all thefe particular cafes, in fuch a manner that we can aill trace the general facts, and fee the part of the particular cafe which depends on it. This would be the acquifition of what may be called an empirical theory, by which every phenomenon would be explained, in fo far as the explanation of a phenomenon is nothing more than the pointing out the general fact or law under which it is comprehended ; and this theory would anfwer every practical purpofe, becaufe we fhould confidently forefee what confequences would refult from fuch and fuch premifes; or if we fhould fail even in this, we fhould ftill have a feries of experiments fo comprehenfive, that we could tell what place in the feries would correfpond to any particular cafe which might be propofed.
Labours of There are two gentleman, whofe labours in this reMichelotif pect deferve very particular notice, profeffor Micheand Boffut lotti at Turin, and Abbé Boffut at Paris. The firft in thisway, made a prodigious number of experiments both on the motion of water. through pipes and in open canals. They were performed at the expence of the fovereign, and no expence was fpared. A tower was built of the finelt mafonry, to ferve as a veffel from which the water was to ifue through holes of various fizes, under preffures from 5 to 22 feet. The water was received into bafons conftructed of mafonry and nicely lined with ftucco, from whence it was conveyed in canals of brick. work lined with ftucco, and of various forms and declivities. The experiments on the expence of water through pipes are of all that have yet been made the molt numerous and exact, and may be appealed to on every occafion. Thofe made in open canals are ftill more numerous, and are no doubt equally accurate; but they have not been fo contrived as to be fo generally ufeful, being in general very unlike the important cafes which will occur in practice, and they feem to have been contrived chiefly with the view of eftablifhing or overturning certain points of hydraulic doarine which were probably prevalent at the time among the practical hydraulifts.

The experiments of Boffut are alfo of both kinds; and though on a much fmaller fcale than thofe of Mi chelotti, feem to deferve equal confidence. As far as they follow the fame track, they perfectly coincide in their refults, which fhould procure confidence in the other ; and they are made in fituations much more analogous to the ufual practical cafes. This makes
then doubly valuable. They are to be found in his two volumes intitled Hydrodynamique. He has opened this path of procedure in a manner fo new and fo judicions, that he has in fome meafure the merit of fuch as thall follow him in the fame path.

This has been moft candidly and liberally allowed him by the chevalier de Buat, who has taken up this matter where the Abbé Boffut left it, and has profe cuted his experiments with great affiduity; and we ments of ar we Duat. muft now add with fingular fuccefs. By a very judi: cious confideration of the fubjeet, he hit on a particular view of it, which faved him the trouble of a minute confideration of the fmall internal motions, and enabled him to proceed from a very general and evident propofition, which may be received as the key to a complete fyftem of practical hydraulics. We fhall follow this ingenious author in what we have farther to fay on the fubject; and we doubt not but that our readers will think we do a fervice to the public by making thefe difcuffions of the chevalier de Buat more generally known in this country. It mult not however be expected that we fhall give more than a fynoptical view of them, connected by fuch familiar reafoning as fhall be either comprehended or confided in by perfons not deeply verfed in mathematical fcience.

## Sect. I. Theory of Rivers.

Ir is certain that the motion of open ftreams muft, His leading in fome refpects, refemble that of bodies fliding down propofiinclined planes perfectly polifhed; and that they would tion. accelerate continually, were they not obftructed : but they are obftructed, and frequently move uniformly. This can only arife from an equilibrium between the forces which promote their defeent and thofe which oppofe it. Mr Buat, therefore, affumes the leading propofition, that

When water flows uniformly on any channel or bed, the accelerating force which obliges it to move is equal to the fum of all the refiftances zubich it meets with, whether arifing from its own vifcidity, or from the friction of its bed.

This law is as old as the formation of rivers, and fhould be the key of hydraulic fcience. Its evidence is clear; and it is, at any rate, the bafis of all uniform motion. And fince it is fo, there mult be fome confiderable analogy between the motion in pipes and in open channels. Both owe their origin to an inequality of preffure; both would accelerate continually, if nothing hindered; and both are reduced to uniformity by the vifcidity of the fluid and the friction of the channel.

It will therefore be convenient to examine the phe. The ${ }^{32}$ nomena of water moving in pipes by the action of its of the folweight only along the floping channel. But previous lowing difto this, we mult take fome notice of the obtruation cuffien proto the entry of water into a channel of any kind, ari-pofed. fing from the deflection of the many different filaments which prefs into the channel from the refervoir from every fide. Then we thall be able to feparate this diminu-埌别 of motion from the fum total that is obferved, Fid afcertain what part remains as produced by the fubfequent obAructions.

We then fhall confider the principle of uniform motion, the equilibrium between the power and the refiftance. The power is the relative height of the column of fluid which tends to move along the inclined plane of its bed; the refiftance is the fricion
of the bed, the vifcidity of the fluid, and its adhefion to the fides. Here are neceffarily combined a number of circumftances which muft be gradually detached that we may fee the effect of each, viz. the extent of the bed, its perimeter, and its flope. By examining the cffors produced by variations of each of there ferarately, we difcover what fhare each has in the general effeet ; and having thus analyfed the complicated phenomenon, we fhall be able to combine thofe its elements, and frame a formula which thall comprehend every circumitance, from the greateft velocity to the extinction of all motion, and from the extent of a river to the narrow dimenfions of a quill. We fhall compare this formula with a feries of experiments in all this variety of circumftances, partly made by Mr Buat, and partly collected from other authors; and we fhall leave the reader to judge of the agreement.

Confident that this agreement will be found mof fatisfactory, we fhall then proceed to confider very curforily the chief varieties which nature or art may introduce into thefe beds, the different velocities of the fame ftream, the intenfity of the refiftance produced by the inertia of the materials of the channel, and the force of the current by which it continually acts on this channel, tending to change either its dimenfions or its form. We fhall endeavour to trace the origin of thefe great rivers which fpread like the branches of a vigorous tree, and occupy the furface even of a valt continent. We fhall follow them in their courfe, unfold all their windings, fudy their train, and regimen, and point out the law of its ftability ; and we fhall invelligate the caufes of their deviations and wanderings.

The fudy of thefe natural laws pleafes the mind: but it anfwers a ftill greater purpore; it enables us to affift nature, and to haften her operations, which vur wants and our impatience often find too flow. It enables us to command the elements, and to force them to adminifter to our wants and our pleafures.

We fhall therefore, in the next place, apply the knowledge which we may acquire to the folution of the molt important hydranlic queftions which occur in the practice of the civil ensineer.

We fhall confider the effects produced by a permanent addition to any river or ftream by the union of another, and the oppofite effect produced by any draught or offset, fhowing the elevation or depreflon produced up the fream, and the change made in the depth and velocity below the addiuion or offset.

We fhall pay a fimilar attention to the temporary fwells produced by frethes.

We fhall afcertain the effects of Araightening the courle of a fream, which, by inceraling its flope, mult increale its velocity, and therefore tink the waters above the place where the curvature was removed, and diminifh the tendency to overilow, while the fame immediat conicguence muft expofe the places farther down to the rill: of floods from which they would otherwile have been free.

The effecs of dams or weirs, and of bars, mult then be conitiderd; the gorge or fwell which they produce up the fream muft be dete:mined for every diftance from the weir or bar. This will furnifh us with rules for rendering navigable or Hoatable fuch waters as have too litile deith cr too grat dope. And it will appear
that immenfe advantages may be thus derived, with a moderate expence, even from trifing brooks, if we wil ${ }^{\text {P }} \underbrace{\text { Theory. }}$ relinquifh all prejudices, and not imagine that fuch conveyance is impoffiole, becaufe it cannot be carried on by fuch boats and fmall craft as we have been accuftomed to look at.

The effects of canals of derivation, the rules or maxims of draining, and the general maxims of embarkment, come in the next place; and our difcultions will conclude with remarks on the moft proper forms for the entry to canals, lochs, docks, harbours, and mouths of rivers, the beft fhape for the ftarlings of bridges and of boats for inland navigations, and fuch like fubordinate but interefting particular, which will be fuggelted by the general thread of difcuffion.

It is confidered, as phyficaily demonitrated (fee Hy- Natural drostatics and Hydral lics), that water iffuing locity, exfrom a fmall orifice in the bottom or fide of a very large pence and veffel, almolt inttantly acquires and maintains the velo- difcharge city which a heavy body would acquire by falling to $\begin{gathered}\text { throull orifi }\end{gathered}$ the orifice from the horizontal furface of the ftagnant ces. water. This we fhall call its Natural Velocity. Therefore if we multiply the area of the orifice by this velocity, the product will be the bulk or quantity of the water which is difcharged. This we may call the Natural Expence of water, or the Natural Discharge.

Let $O$ reprefent the area or fection of the orifice expreffed in fome known meafure, and $b$ its depth under the furface. Let $g$ exprefs the velocity acquired by a heavy body during a fecond by falling. Let $V$ be the medium velocity of the water's motion, $Q$ the quantity of water difcharged during a fecond, and N the natural expence.

We know that $V$ is equai to $\sqrt{2 g} \times \sqrt{ } b$. Thercfore $\mathrm{N}=\mathrm{O}, \sqrt{2 g} \cdot \sqrt{ } b$.

If thefe dimenfions be all taken in Englifh feet, we have $\sqrt{2 g}$ very nearly equal to 8 ; and therefore $\mathrm{V}=$ $8 \sqrt{ } b$, and $\mathrm{N}=0.2 \sqrt{ } b$.

But in our prefent bufinefs it is much more convenient to meafure every thing by inches. Therefore fince a body acquires the velocity of 32 feet 2 inches in a fecond, we have $2 \mathrm{~g}=64$ feet 4 inches or 772 inch. es, and $\sqrt{2 g}=27,78$ inches nearly $27 \frac{3}{4}$ inches.
Therefore $T=\sqrt{772} v^{\prime} h,=27,78 \sqrt{ } h$, and $N=0$. $\sqrt{772} \sqrt{ } h=0.27,78 \sqrt{ } b$.

But it is alfo well known, that if we were to calctrlate the expence or difcharge for every orifice by this fimple rule, we fhould in every inftance find it much greater than nature really gives us.

When water iflues through a hole in a thin plate, the lateral columns, preffing into the hole from all fides, caufe the iffuing filaments to converge to the axis of the jet, and contract its dimenfions at a little diftance from the hole. And it is in this place of greatelt contraction that the water acquires that velocity which we obferve in our experiments, and which we affume as equal to that acquired by falling from the furface. Therefore, that our computed difcharge may belt agree with obfervation, it mult be calculated on the fuppofition that the orifice is diminifhed to the fize of this fmalleft fection. But the contraction is fubject to variations, and the dimenfions of this fmalleft fection

§ See Re-
fiftance of Fluids, $n^{\circ} 67$.

35
Motion of filaments in various particular fituations,
aro at all times difficult to afcertain with precifion, It is therefore much more convenient to compute from the real dimenfions of the orifice, and to correct this compured difcharge, by reeans of an actual comparifon of the computed and effective difcharges in a feries of experiments made in fituations refembling thofe cafes which mof frequently occur in practice. This correction or its caufe, in the mechanifm of thofe inter nal motions, is generally called Contraction by the writers on hydraulics; and it is not confined to a hole in a thin plate: it happens in fome degree in all cafes where fluids are made to pals through narrow places. It happens in the entry into all pipes, canals, and fluices; nay even in the paffage of water over the edge of a board, fuch as is ufually fet up on the head of a dam or weir, and even when this is immerfed in water on both fides, as in a bar or keep, fre. quently employed for raiting the waters of the level freams in Flanders, in order to render them navigable. We mentioned an obfervation $\oint$ of Mr Buat to this effect, when he faw a goolberry rife up from the bottom of the canal along the face of the bar, and then rapidly fly over its top. We have attempted to reprefent this motion of the filaments in the fe different fituations.

Fig. 5. A fhows the motion through a thin plate.
B fhows the motion when a tube of about two diameters long is added, and when the water flows with a full mouth. This does not always happen in fo thort a pipe (and never in one that is fhorter), but the water frequently detaches itfelf from the fides of the pipe, and flows with a contracted jet.

C fhows the motion when the pipe projects into the infide of the veffel. In this cafe it is difficult to make it flow full.

D reprefents a mouth-piece fitted to the hole, and formed agreeably to that fhape which a jet would affume of itfelf. In this cafe all contraction is avoided, becaufe the mouth of this pipe may be confidered as the real orifice, and nothing now diminifhes the difcharge but a trifling friction of the fides.

E fhows the motion of water over a dam or weir, where the fall is free or unobftructed; the furface of the lower ftream being lower than the edge or fole of the wafte-board.
$F$ is a fimilar reprefentation of the motion of water over what we we uld call a bar or keep.

It was one great aim of the experiments of Michelotti and Boffut to determine the effects of contraction in thefe cafes. Michelotti, after carefully oblerving the form and dimenfions of the natural jet, made various muth-pieces refembling it, till he obtained one which produced the fmalleft dimination of the computed difcharge, or till the difcharge computed for the area of its fmaller end appioached the nearelt to the effective difcharge. And he at laft obtained one which gave a difcharge of 983 , when the natural difcharge would have been a 1000 . This piece was formed by the revolution of a trochoid round the axis of the jet, and the dimenfions were as follow:

| Diameter of the outer orifice | $=36$ |
| ---: | :--- |
|  | $=46$ |
| Length of the axis | $=96$ |

The refults of the experiments of the Abbe Boffut and of Michelotti fcarcely differ, and they are exprefled in the following table:
N. or the natural expence
for the thin plate fig. A\}
$Q$ for ditto at the depth of 8 feet
$Q$ for ditto at the depth of 16 feet
$Q$ for a tube 2 diameters long, $\}$ Fig. B.
Q for ditto projecting inwards $\}$
and fowing full
Q for ditto with a contracted jer, $\}$
fig. C .
Q for the mouth-piece, fig. D.
$Q$ for a weir, fig. $E$.
$Q$ for a bar, fig. $F$ :
$10000=0.27,78 \sqrt{ } b \underbrace{\text { Theory. }}$.
$6526 \quad 0.18,13 \sqrt{ } b$

| 6195 | $0.17,21 \sqrt{ } b$ |
| :--- | :--- |
| 6173 | $0.17,15 \sqrt{ } b$ |
| 8125 | $0.22,57 \sqrt{ } b$ |
| 6814 | $0.18,93 \sqrt{ } b$ |
| 5137 | $0.14,27 \sqrt{ } b$ |
| 9831 | $0.27,31 \sqrt{ } b$ |
| 9536 | $026,49 \sqrt{b}$ |
| 9730 | $0.27,03 \sqrt{ } b$ |

The numbers in the laft column of this little table are the cubical inches of water difcharged in a fecond when the height $b$ is ele inch.

It mult be obferved that the difcharges affigned here for the weir and bar relate only to the contractions occafioned by the paffage over the edge of the board. The weir may alfo fuffer a diminution by the contractions at its two ends, if it thould be narrower than the fream, which is generally the cafe, becaule the two ends are commonly of fquare mafoniy or woodwork. The contraction there is neariy the fame with that at the edge of a thin plate. But this could not be introduced into this table, becaufe its effect on the expence is the fame in quantity whatever is the length of the wafte-board of the weir.

In like manner, the diminution of difcharge through niminua fluice could not be expreffed here. When a flaice is tion of dif drawn up, but its lower edge fill remains under water, charge the difcharge is contracted both above and at the fides, through a and the diminution of difcharge by each is in propor. Iuice, sce. tion to its extent. It is not eafy to reduce either of thefe contractions to computation, but they may be very eafily obferved. We frequently can obferve the water, at coming out of a lluice inio a mill-courfe, quit the edge of the aperture, and fhow a part of the bottom quite dry. This is always the cafe when the velocity of efflux is confiderable. When it is very moderate, this place is occupied by an eddy water almoft ftagnant. When the head of the water is 8 or io inches, and runs off freely, the fpace left between it and the fides is about $1 \frac{1}{2}$ inches. If the fides of the entry have a llope, this void face can never appear; but there is always this tendency to convergence, which diminifhes the quanticy of the difcharge.

It will frequently abridge computation very much to confider the water difcharged in thefe different fituations as moving with a common velocity, which we conceive as produced $n$ t by a fall from the furface of the fluid (which is exact only when the expence is equal to the natural expence, but by a fall $b$ accommodated to the difcharge : or it is convenient to know the beight which would produce that very velocity which the water iffues with in thefe fituations.

And alfo, when the water is obferved to be actually moving with a velucity $V$, and we know whether it is coming through a thin plate, through a tubs, over a dam, \&c. it is neceffary to know the preffure or head of water $b$ which has actually produced this velocity. It is convenient therefore to have the following numbers in readinefs.

Part I.

$$
\begin{aligned}
& b \text { for the natural expence }=\frac{\mathrm{V}^{2}}{77^{2}} \\
& b \text { for a thin plate }=\frac{\mathrm{V}^{2}}{29^{6}} \\
& b \text { for a tube } 2 \text { diam. long }=\frac{\mathrm{V}^{2}}{505} \\
& b \text { for a dam or weir } \quad=\frac{\mathrm{V}^{2}}{7^{26}} \\
& b \text { for a bar }
\end{aligned}
$$

It was neceffary to premife thefe facts in hydraulics, that we may be able in every cafe to diftinguifh between the force expended in the entry of the water into the conduit or canal, and the force employed in overcoming the refiftances along the canal, and in preferving or accelerating its motion in it.

The motion or running water is produced by two caufes; 1. The action of gravity; and, 2. The mobility of the particles, which makes them affume a level in confined veffels, or determines them to move to that fide where there is a defect of preffure. When the fur- face is level, every particle is at reft, being equally preffed in all directions; but if the furface is not level, not only does a particle on the very furface tend by its own weight towards the lower fide, as a body would flide along an inclined plane, but there is a force, external to itfelf, arifing from a fuperiority of preffure on the upper end of the furface, which pulhes this fuperficial particle towards the lower end; and this is not peculiar to the fuperficial particles, but affects every particle within the mals of water. In the veffel ACDE (fig. 6.), containing water with an inclined furface AE, if we fuppofe all frozen but the extreme columns AKHB , FGLE, and a connecting portion HKCDLG, it is evident, from hydroflatical laws, that the water on this convecting part will be pufhed in the direction CD; and if the frozen mafs BHGF were moveable, it would alfo be pufhed along. Giving it fluidity will make no change in this refpeet; and it is indifferent what is the fituation and fhipe of the connecting column or colamns. The propelling force (MNF being horizontal) is the weight of the column AMNB. The fame thing will obtain wherever we felect the vertical columns. There will always be a force tending to pulh every particle of water in the direction of the declivity. The confequence will be, that the water will fink at one end and rife at the other, and its furface will relt in the horizontal pofition $a \mathrm{O}_{e}$, cutting the former in its middle O. This cannot be unlefs there be not only a motion of perpendicular defcent and afcent of the vertical columns, but alfo a real motion of tranflation from $K$ to. wards L. It perhaps exceeds our mathematical fkill to tell what will be the motion of each particle. Newton did not attempt it in his inveltigation of the motion of wares, nor is it at all neceffary here. We may, however, acquire a very diftinct notion of its general effect. Let OPQ be a vertical plane paffing through the middle point $O$. It is evident that every particle in PQ , fuch as $P$, is preffed in the direction $Q D$, with a force equal to the weitht of a fingle row of particles, whofe length is the difference between the columns BH and FG . The force acting on the particle $Q$ is, in like manner, the weight of a row of particles $=A C-E D$. Now if $O Q, O A, O E$, be divided in the fame ratio, fo that Vus. XVI.
$V E$ R.
all the figures $A C D E, B H G F, \& c$. may be fimilar, Theory. we fee that the force ariiing folely from the declivity and acting on each particle on the plane $O Q$, is proportional to its depth under the furface, and that the row of particles ACQDE, $13 H P G F$, \&c. which is to be moved by it, is in the fame proportion. Hence it unqueftionably follows, that the accelerating force on each particle of the row is the fame in all. Therefore the whole plane $O Q$ tends to advance forward together with the fame velocity; and in the inltant immediately fucceeding, all thefe particles would be fuund again in a vertical plain indefinitely near to $O Q$; and if we fum up the forces, we fhall find them the fame as if $O Q$ were the opening of a fluice, having the water on the fide of $D$ flanding level with $O$, and the water on the other fide ftanding at the height AC. This refult is extremely different from that of the hafty theory of Guglielmini. He confiders each particle in $O Q$ as urged by an accelerating force proportional to its depth, it is true; but he makes it equal to the weight of the row OP, and never recollects that the greateft part of it is balanced by an oppofite preffure, nor perceives that the force which is not balanced mult be diftributed among a row of particles which varies in the fame proportion with itfelf. When thefe two circumflances are neglected, the refult mult be incompatible with obfervation. When the balanced forces are taken into the account of preffure, it is evident that the furface mes: be fuppofed horizontal, and that motion hould ottain in this cafe as well as in the cafe of a floping furface: and indeed this is Guglielmini's profeffed theory, ans what he highly values himfelf on. He announces this difcovery of a new principle, which he calls the energy of deep waters, as an important addition to hydraulics. It is owing to this, fays he, that the great rivers are not ftagnant at their mouths, where they have no percep. tible declivity of furface, but, on the contrary, havi greater energy and velocity than farther up, where they are fhallower. This principle is the bafis of his improved theory of rivers, and is infifted on at great length by all the fubfequent writers. Buffon, in his theory of the earth makes much ufe of it. We cannot but wonder that it has been allowed a place in the theory of rivers given in the great Encyclopédie of Paris, and in an article having the fignature ( $O$ ) of D'Alembert. We have been very anxious to thow the falfity of this principle, becaufe we confider it as a mere fubterfuge of Guglielmini, by which he was able to patch up the mathematical theory which he had fo hatily taken from Newton or Galileo; and we think that we have fec: red our readers from being milled by it, when we fhow that this energy muft be equally operative when the furface is on a dead level. The abfurdity of this is evident. We fhall fee by and by, that deep waters, when in actual motion, have an energy not to be found in fhallow running waters, by which they are enabled to continue that motion: but this is not a moving principle ; and it will be fully explained, as an immediate refult of principles, not vaguely conceived and indifinctly expreffed, like this of Guglielmini, but eafily underfood, and appreciable with the greateft precifion. Ic is an energy common to all great bodics. Although they lofe as much momentum in furmounting any ob. facle as finall ones, they lofe but a fmall portion of their vel city. At prefent, employed only in confider-

LI

Thenry, ing the progrellive roction of an open fream, whofe furface is not level, it is quite enough that we fee that fuch a motion muft obtain, and that we fee that there are propelling forces; and that thofe forces arife folcy from the want of a level furface, or from the flope of the furface; and that; with refpect to any one particle, the force acting on it is proportional to the difiference of level between each of the two columns (one on each fide of the particle) which produce it. Were the furface level, there would be no motion ; if it is not level there will be motion; and this motion will be.proportional to the want of level or the declivity of the furface: it is of no confequence whether the bottom be level or not, or what is its flape.

Hence we draw a fundamental principle, that the motion of rivers, depends. entively on the hope of the furfice.

The slope or declivity of any inclined plane is not properly expreffed by the difference of height alone of its extremities; we muft alfo confider its length : and the meafure of the flope mult be fuch that it may be the fame while the declivity is the fame. It muft therefue be the fame over the whole of any one inclined. plane. We fhall anfwer thefe conditions exacty, if we lake for the meafure of a flope the fration which exprelies the elevation of one extremity above the other divided by the length of the plane. Thus $\frac{A M}{A F}$ will exprefs the declivity of the plane AF.

If the water met with no refiftance from the bed in which it runs, if it had no adhefion to its fides and bottom, and if its fuidity were perfect, its gravity would accelerate its courfe continually, and the earth and its inhabitants would be deprived of all the advantages which they derive from its numberlefs freams. They would run off fo quickly, that our fields, dried up as foon as watered, would be barren and ufelefs. No foil. could refill the impetuofity of the torrents; and their accelerating force would render them a deftroying fcourge, were it not that, by kind Providence, the refiftance of the bed, and the vifcidity of the fluid, become a check which reins them in and fets bounds to their rapidity. In this manner the friction on the fides, which, by the vifcidity of the water, is communicated to the whole mafs, and the very adhefion of the particles to each other, and to the fides of the channel, are the caufes which make the refiftances bear a relation to the velocity; fo that the refiftances augmenting with the velocities, come at laft to balance the accelerating force. Then the velocity now acquired is preferved, and the motion becomes uniform, without being able to acquire new increafe, unlefs fome change fucceeds either in the flope or in the capacity of the channel. Hence arifes the fecond maxim in the motion of rivers. that when a Aream moves uniformly, the refifance is equal ta the accelerating force.

As in the cfflus of water through orifices, we pafs over the very beginning of theaccelerated motion, which is a matter of fpeculative curiofity, and confider the motion in a fate of permanency, depending on the head of water, the area of the orifice, the velocity, and the expence; $\mathrm{f}_{\mathrm{o}}$, in the theory of the uniform motion of rivers, we confider the flope, the tranfverfe fection or area of the Atream, the uniform velocity, and the ex.
pence. It will be convenient to affix precife meanings to the terms which we fhall employ.

The secrion of a fream is the area of a plane per- 40 pendicular to the direction of the general motion. cifely ex-

The refiftances arife ultimately from the action of the plained. water on the internal furface of the channel, and muft be proportional (cateris paribus) to the extent of the action. Therefore if we unfold the whole edge of this fection, which is rubbed as it were by the paffing water, we fhall have a meafure of the extent of this action. In a pipe, circular or prifmatical, the whole circumference is acted on ; but in a river or canal ACDQ (fig. 6.) the horizontal line $a \mathrm{O} e_{\text {n }}$ which makes the upper boundary of the fectioni $a \mathrm{CD}_{e} e$ is free from all action. The action is confined to the three lines $a \mathrm{C}, \mathrm{CD}, \mathrm{D} e$. We fhall call this line $a \mathrm{CD} e$ the boraer of the fection.

The mean velocity is that with which the whole fection, moving equally, would generate a folid equal to the expence of the fream. This velocity is to be found perhaps but in one filament of the fream, and we d not know in which filament it is to be found

Since we are attempting to eftablifh an empirical theorv of the motion of rivers, founded entirely on experiment and palpable deductions from them; and fince. it is extremely difficult to make experiments on open ftreams which fhall have a precifion fufficient for fuch an important purpofe-it would be a moft defirable thing to demonftrate an exact analogy between the mutual balancing of the acceleration and refiftance in pipes and rivers; for in thofe we can not only make experiments with all the defired accuracy, and admitting precife meafures, but we can make them in a number of cafes that are almoft imprasticable in tivers. We can increafe the flope of a pipe from nothing to the. vertical pofition, and we can employ every defired degree of preffure, fo as to afcertain its effect on the velocity in degrees which open ftreams will not admit. The Chevalier de Buat has mof happily fucceeded in. this demonftration; and it is here that his g od fortune. and his penetration have done fo much fervice to practical fcience.

Let $\exists \mathrm{B}$ (fig. 7.) be a horizontal tube, through $\mathrm{The}^{4 \mathrm{a}}$ acele which the water is impelled by the preflure or HEAD ration and DA. This head is the moving pewer ; and it may be refifance conceived as confiling of two parts, performing two diftinct offices: One of them is employed in impreffing on' the water that velceity with which it actually moves in the tube. Were there no obftructions to this motion, no greater head would be wanted ; but there are obftructions arifing from friction, adhefion, and. vifcidity. This requires force. Let this be the office of the reft of the head of water in the refervoir. There is but one allotment, appropriation, or repartition, of the whole head which will anfwer. Suppofe E to be the point of partition, fo that DE is the head neceffary for impreffing the actual velocity on the water (a bead or preffure which has a relation to the form or circumftance of the entry, and the contraction which takes place there). The reft EA is wholly employed in overcoming the fimultaneous reffitances which take place along the hole tube $A B$, and is in equilibrio with this refinance. Therefore if we apply at E a tube EC of the fame length and diameter with $A B$,

Theory.

and having the famc degree of polifh or roughnefs; and if this tube be inclined in fuch a manner that the axis of its extreimty may coincide with the axis of $A B$ in the point C-we affirm that the velocity will be the fame in both pipes, and that they will have the fame expence; for the moving force in the floping pipe EC is compofed of the whole weight of the column DE and the relative weight of the column EC ; but this relative weight, by which alone it defcends along the inclined pipe EC, is precifely equal to the weight of a vertical column EA of the fame diameter. Every thing therefore is equal in the two pipes, viz. the lengths, the diameters, the moving forces, and the refiftances; therefore the velocities and difcharges will alfo be equal.

This is not only the cafe on the whole, but alfo in every part of it. The relative weight of any part of it EK is precifely in equilibrio with the refifances along that part of the pipe; for it has the fame proportion to the whole relative weight that the refiftance has to the whole refiftance. Therefore (and this is the moft important circumftance, and the bafis of the awbole theo$r y$ ) the pipe EC may be cut thorter, or may be lengthened to infinity, without making any change in the velocity or expence, fo long as the propelling head DE remains the fame.

Leaving the whole head DA as it is, if we lengthen the horizontal pipe $A B$ to $G$, it is evident that we in. creafe the refiftance without any addition of force to overcome it. The velocity mult therefore be diminifhed; and it will now be a velocity which is produced by a fmaller head than DE : therefore if we were to put in a pipe of equal length at $E$, terminating in the horizontal line $A G$, the water will not run equally in both pipes. In order that it may, we muft difcover the diminifhed velocity with which the water now actually runs along AG, and we muft make a head DI capable of impreffing this velocity at the entry of the pipe, and then infert at I a pipe IH of the fame length uith AG. The expence and velocity of both pipes will now be the fame ( A ).

What has now been faid of a horizontal pipe AB wuold have been equally true of any inclined pipe $A B$, $A^{\prime} B$ (fig. 8.) Drawing the horizontal line $C B$, we fee that DC is the whole head or propelling preffure for either pipe $A B$ or $A^{\prime} B$; and if $D E$ is the head neceffary for the aetual velocity, EC is the head neceffary for balancing the refiftances; and the pipe EF of the fame length with $A B$, and terminating in the fame horizontal line, will have the fome velocity; and its in-
clination being thus determined, it will have tie fane velocity and expence whatever be its length.

Thus we fee that the motion in any pipe, horizontal Analegy or floping, may be referred to or fublituted for the between motion in another inclined pipe, whofe head of water, thefe pipes above the place of entry, is tiat productive of the actual velocity of the water in the pipe. Now, in this cale, the accelerating force is equal to the refiftance: we may therefore confider this lalt pipe as a river, of which the bed and the flope are uniform or conitant, and the current in a flate of permanency; and we now may clearly draw this impoitant conclution, that pipes and open ftreams, when in a tate of permanency, perfectly refemble each other in the circumitances which are the immediate caufes of this permanency. The equilibrium between the accelerating force obtains not only in general, but takes place through the whole length of tiee pipe or ftream, and is predicable of every individual tranfverfe fection of either. To make this more palpably evident if poffible, let us confider a floping cylindrical pipe, the current of which is in a flate of permanency. We can conceive it as confiting of two half cylinders, an upper and a lower. Thefe are running together at an equal pace; and the filaments of each immediately contiguous to the feparating plane and to each other, are not rubbing on each other, nor affecting each other's motions in the fmalleft degree. It is true that the upper half is preffing on the lower, but in a direction perpendicular to the motion, and therefore not affecting the velocity; and we fhall fee prefently, that although the lower fide of the pipe bears fomewhat more preffiure than the other, the refilances are not changed. (Indeed this odds of prefiure is accompanied with a difference of motion, which need not be confidered at prefent ; and we may fappofe the pipe fo fmall or to far below the furface, that this fhall be infenible). Now let us fuppofe, that in an inftant the upper half cylinder is annihilated: We then have an open Atream; and every circumftance of accelerating force and of refiltance remains precifely as it was. The motion mult therefore continue as it did; and in this ftate the only accelerating force is the flope of the furface. The demonfration therefore is complete.

From thefe obfervations and reafonings we draw a Confe- 44 general and important conclufion, "That the fame qucace. pipe will be fufceptible of different velocities, which it will preferve uniform to any diftance, according as it has different inclinations; and each inclination of a pipe of given diameter has a certain velocity peculiar to itfelf, which will be maintained uniform to any diftance Ll 2
what-
(A) We recommend it to the reader to make this difribution or allotment of the different portions of the preffure very familiar to his mind. It is of the moftextenfive influence in every queftion of hydraulics, and will on every occafion give him diftinct conceptions of the internal procedure. Obvious as the thought feems to be, it has ffcaped the attention of all the wricers, on the fubject. Lecchi, in his Hydraulics publifhed in 1766 , afcribes fometling like it to Daniel Bernoulli ; but Bernoulli, in the paflage quoted, ouly fpeaks of the partition of preffure in the inftant of opening an orifice. Part of it, fays he, is employed in accelerating the quiefcent water, and producing the velocity of eflux, and the remainder produces the preffure (now diminihed) on the fides of the veffel. Bernoulli, Boffut, and all the good writers, make this diftribution in exprefs terms in their evplanation of the motion of water through fucceflive orifices; and it is furprifing that no one before the Chevalier de Buat faw that the refiftance avifing from friction required a fimilar partition of the preffure; but though we fhould call this good fortune, we muft afcribe to his great fagacity and jufnefs of conception the beautiful we that he has made of it : "faum cuipue."

Whatever; atad this velocity incrafes continually, accurding to fome law, to be dicovered by thicory or experiment, as the pofition of the pipe changes, from being horizontal till it becomes vertical; in which pofition it has the greatelt uniform velocity poffible relative to its inclination, or dependin's on inclination alone.

Let this velocity be called the train, or the rate of each pipe.

It is evident that this principle is of the utmoft confequence in the theory of hydraulics; for by experiment we can find the train of any pipe. It is in train when an increafe of length makes no change in the velocity. If lengthening the pipe increafes the velocity, the flope of the pipe is too great, and vice verfa. And laving difcovered the train of the pipe, and obferved its velocity, and computed the head productive of this velicity with the contraction at the entry, the remainder of the head, that is, the flope (for this is equivalent to EA), is the meafure of the refiltance. Thus we obtain the meafure of the refiftance to the motion with a given velocity in a pipe of given diameter. If we change only the velocity, we get the meafure of the new refilance relative to the velocity; and thus difcover the law of relation between the refiftance and velocity. Then changing only the diameter of the pipe, we get the meafure of the refiftance relative to the diameter. This is the aim of a prodigious number of experiments made and collected by Buat, and which we ihall not repeat, but only give the refults of the different parts of his invefligation.

We may exprefs the llope of a pipe by the fymbol $\frac{1}{s}$, I being an inch for infance, and $s$ being the flant length of a pipe which is one inch more elevated at one end than at the other. Thus a river which has a declivity of an inch and a half in 120 fathoms or 8640 inches, has its Hope $=\frac{1 \frac{1}{2}}{8640}$, or $\frac{1}{5760^{\circ}}$. But in order to obtain the hydraulic flope of a conduit pipe, the heights of the refervoir and place of difcharge being given, we mult fubtract from the difference of elevation the height or head of water necelfary for propelling the water into any pipe with the velocity V , which it is fuppofed actually to have. This is $\frac{\mathrm{V}^{2}}{505^{\circ}}$ The remainder $d$ is to be confidered as the height of the declivity, which is to be diltributed equally over the whole length $l$ of the pipe, and the flope is then $\frac{d}{l},=\frac{1}{s}$.

There is another important view to be taken of the Alope, which the reader fhould make very familiar to his thoughts. It expreffes the proportion between the weight of the whole column which is in motion and the weight which is employed in overcoming the refiftance; and the refiftance to the motion of any column of water is equal to the weight of that column multiplied by the fraction $\frac{1}{s}$, which expreffes its nope.

We come now to confider more particularly the refiftances which in this manner bring the motions to a fate of uniformity. If we confider the refifances which arife from a caufe analogous to friction, we fee that they muft depend entire'y on the inertia of the
water. What we call the rcfifance is the diminution of a motion which would have obtained but for thefe refiftances; and the beft way we have of meafuring them is by the force which we mult employ in order to keep up or reftore this motion. We eftimate this motion by a progreffive velocity, which we meafure by the expence of water in a given time. We judge the velocity to diminifh, when the quantity difcharged diminifhes; yet it may be otherwife, and probably is otherwife. The abfolute velocity of many, if not all, of the particles, may even be increafed; but many of the motions, being tranfverfe to the general direction, the quantity of motion in this direction may be lefs, while the fum of the abfolute motions of all the particles may be greater. When we increafe the general velocity, it is not unreafonable to fuppofe that the impulfes on all the inequalities are increafed in this proportion ; and the number of particles thus impelling and deflected at the fame time will increafe in the fame proportion. The whole quantity therefore of thefe ufelefs and loft motions will increafe in the duplicate ratio of the velocities, and the force neceffary for keeping up the motion will do fo alfo ; that is, the refiltances fhould increafe as the fquares of the velocities.

Or if we confider the refiftances as arifing merely from the curvature of the imperceptible internal motions occafioned by the inequalities of the fides of the pipe, and as meafured by the forces neceffary for preducing thefe curvilineal motions; then, becaufe the curves will be the fame whatever are the velocities, the deflecting forces will be as the fquares of the velocities; but thefe deflecting forces are preffures, propagated from the parts urged or preffed by the external force, and are proportional to thefe external preflures by the principles of hydroftatics. Therefore the preffures or forces neceflary for keeping up the velocities are as the fquares of thefe velocities; and they are our only meafures of the refiltances which mult be confidered as following the fame ratio. Whatever view therefore we take of the nature of thefe refiftances, we are led to confider them as proportional to the fquares of the velocities.

We may therefore exprefs the refiftances by the fymbol $\frac{\mathrm{V}^{2}}{m}, m$ being fome number to be difcovered by experiment. Thus, in a particular pipe, the diminution of the motion or the refiltance may be the roooth part of the fquare of the velocity, and $R=\frac{V^{2}}{1000}$.

Now if $g$ be the accelerating power of gravity on any particle, $\frac{g}{s}$ will be its accelerating power, by which it would urge it down the pipe whofe flope is $\frac{\mathrm{r}}{\mathrm{s}}$. Therefore, by the principle of uniform motion, the equality of the accelerating force, and the refiftance, we hall have $\frac{V^{2}}{m}=\frac{g}{s}$, and $V \sqrt{ }=\sqrt{m g}$; that is, the product of the velocity, and the reciprocal of the fquare root of the flope, or the quotient of the velocity divided by the flope, is a corftant quantity $\sqrt{m g}$ for any given pipe; and the primary formula for all the uniform velo. cities of one pipe is $\mathrm{V}=\frac{\sqrt{m g}}{\sqrt{s}}$.

Mr Buat therefore examined this by experiment, but found, that even with refpect to a pipe or channel which was uniform throughout, this was not true. We could give at once the final formula which he found to exprefs the velocity in every cafe whatever; but this would be too empirical. The chief fteps of his very fagacious inveftigation are inftruative. We fhall therefore mention them brisuly, at leah as far as they tend to give us any collaterd information: and let it always be noted, that the inltiaction which they convey is not abftract fpeculation, bus experimental truths, which muft ever remain as an addition to our fock of knowledge, although Mr Buat's deductions from them fhould prove falfe.

He found, in the firlt place, that in the fame channel the product of V and $\sqrt{s}$ increafed as $\sqrt{s}$ increafed; that is, the velocities increafed fafter than the fquare roots of the flope, or the refiftances did not increafe as faft as the fquares of the velocities. We beg leave to refer our readers to what we faid on the refilt. ance of pipes to the motion of fluids through them, in the article $P_{\text {neumatics, }}$ when fpeaking of bellows. They will there fee very valid reafons (we apprehend) for thinking that the refiftances muft increafe more flowly than the fquares of the veloci ies.

It being found, then that $\mathrm{V} \sqrt{s}$ is not equal to a conftant quantity $\sqrt{m g}$, it becomes neceffary to inveAtigate fome quantity depensing on $\sqrt{\mathrm{s}}$, or, as it is called, fome function of $\sqrt{s}$, which flatl render $\sqrt{m g}$ a conftant quantity. Let $X$ be this function of $\sqrt{s}$, fo that we fhall always have VX equal to the confant quantity $\sqrt{m g}$, or $\frac{\sqrt{m g}}{\mathrm{X}}$ equal to the actual velocity $V$ of a pipe or channel which is in train.

Mr Buat, after many trials and reflections, the chief of which will be mentioned by and by, found a value of $X$ which correfponded with a valt variety of flopes and velocities, from motions almof imperceptible, in a bed nearly horizontal, to the greatelt velocities which could be produced by gravity alone in a vertical pipe; and when he compared them $t$ gether, he found a very difcernible relation between the refiltances and the magnitude of the fection: that is, that in two channels which had the fime flope, and the fame propelling force, the velocity was greatelt in the channel which had the greatelt fection relative $t$.) its border. This may reafonably be expected. The refiftances arife from the murual action of the water and this $b$ rder. The water immeduately contiguus to it is retarded, and this retards the next, and fo on. It is to be expected, therefore, that if the border, and the velocity, and the flope, be the fame, the diminu ion of this velocity will be fo much the lefs as it is to be thared among a greater number of partices; that is, as the area of the fection is greater in proportion to the extent of its border. The diminution of the general or medium velocity muft be lefs in a cylindrical pipe than in a fquare one of the fame area, becaufe the border of its fection is lefs.

It appears evident, that the refiftance of each particle is in the direct proportion of the whole refiftance, and the inverfe proportion of the numler of particles which seceive equal hares of it. It is therefore directly as the
border, and inverfely as the fection. Therefore in the expreflion $\frac{\mathrm{V}^{2}}{m}$ which we have given for the refilance, the quantity $m$ cannot be conitant, except in the fame channel; and in different channels it mult vary along with the relation of the fection to its border, becaufe the refiftances diminifh in proportion as this relation increafes.

Without attempting to difcover this relation by theo. retical examination of the particular motions of the va. rious filaments, Mr Buat endeavoured to difcover it by a compariton of experiments. But this required fome manner of fating this proportion between the augmentation of the fection and the augmentation of its border.

His ftatement is this: : He reduces every fection to a rectangular parallelogram of the fame area, and having its bafe equal to the border unfolded into a Atraight line. The product of this bafe by the height of the rectangle will be equal to the area of the fection. Therefore this height will be a reprefentative of this variable ratio of the fection to its border. (We do not mean that there is any ratio between a furface and a line : but the ratio of fection to fection is different from that of border to border ; and it is the ratio of thefe ratios which is thus expreffed by the height of this rectangle). If $S$ be the fection, and $B$ the border, $\underline{\mathrm{S}}$ $\frac{\mathrm{S}}{\mathrm{B}}$ is evidently a line equal to the height of this rectangle. Every fection being in this manner reduced to a rectangle, the perpendicular height of it may be called the hydraulic mean depth of the fection, and may be expreffed by the fymbol $d$. (Buat calls it the mean ra. dius). If the channel be a cylindrical pipe, or an open half cylinder, it is evident that $d$ is half the radius. If the fection is a rectangle, whofe width is $w$, and heigbt $h$, the mean depth is $\frac{w b}{b+2 b}$, \&c. In general, if $q$ re. prefent the proportion of the breadth of a rectangular canal to its depth, that is, if $q$ be made $=\frac{w}{b}$, we thall have $d=\frac{w}{q+2}$, or $d=\frac{q b}{q+2}$.

Now, fince the refiftances mult augment as the propor. tion of the border to the fection augments, $m$ in the formulas $\frac{\mathrm{V}^{2}}{m /}=\frac{g}{s}$ and $\mathrm{V} \sqrt{ } / s=\sqrt{m g}$, mult follow the proportions of $d$, and the quantity $\sqrt{m g}$ mult be proportional to $V d$ for different channels, and $\frac{\sqrt{m g}}{\sqrt{d}}$ fhould be a conftant quantity in every cafe.

Mur author was aware, however, of a very fpecious a 49 objection to the clofe dependence of the refiftance on ofjestion. the extent of the border; and that it might be faid that a double border did not occafion a double retiltance, unlefs the preffure on all the parts was the fame. For it may be naturally (and it is generally) fuppofed, that the refiftance will be greater when the prelfure is greater. The friction or refiltance analogous to friction may therefo e be greater on an inch of the bettem than on an inch of the fides; but Mr D'Alembert and many others have demorffrated, that the paths of the filaments will be the fame whatever be the preffares.

Theory.
50 Obviated by an experiment on the ofcillation of water in fyphons.

This might ferve to juftify our ingenious author; but He therefore made an experiment on the ofcillation of water in fyphons, which we have repeated in the following form, which is affeted by the fame circumftances, and is fufceptible of much greater precition, and of more extenfive and important application.
The two velfe's ABCD, abcd (fig. 9.) were connected by the fyphon EFG $g f f$, which turned round in the fhort tubes E and $\ell$, without allowing any water to efcape; the axes of thefe tubes being in one fraight line. The veffels were about 10 inches deep, and the bracches FG, $f g$ of the fyphon were about five feet long. The veffels were fet on two tables of equal height, and (the hole $e$ being ftopped) the veffel $A B C D$, and the whole fyphon, were filled with water, and water was poured into the veffel $a b c d$ till it flood at a certain height LM. The fyphon was then turned into a horizontal pofition, and the plug drawn out of $e$, and the time carefully noted which the water employed in rifing to the level HK $k b$ in both veffels. The whole apparatus was now inclined, fo that the water run back into ABCD. The fyphon was now put in a vertical pofition, and the experiment was repeated. -No fenfible or regular difference was obferved in the time. Yet in this experiment the preflure on the part G $g$ of the fyphon was more than fix times greater than beiore. As it was thought that the friction on this fmall part (only fix inches) was too fmall a portion of the whole obftruction, various additional obftructions were put into this part of the fyphon, and it was even lengthened to nine feet; but fill no remarkable difference was obferved. It was even thought that the
times were lefs when the fyphon was vertical.
51
The refin-
ance depends chief ly on the rulation between the fection and tity.
its b rder. To afcertain this point was the object of the next feries of experiments; to fee whether this quantiry was really conftant, and, if not, to difcover the law of its variation, and the phyfical circumitances which accompanied the variations, and may therefore be confidered as their caufes. A careful comparifon of a very great number of experiments, made with the fame flope, and with very different channels and velocities, fhowed that $\sqrt{m g}$ did not follow the proportion of $\sqrt{d}$, nor of any power of $\sqrt{d .}$. This quantity $\sqrt{m g}$ increafed by fmaller degrees in proportion as $\sqrt{d}$ was greater. In very great beds $\sqrt{m g}$ was nearly proportional to $\sqrt{ } \bar{d}$, but in fmaller channels, the velocities diminifhed mech more than $\sqrt{d}$ did. Cafting about for fome way of accommodation, Mr Buat confidered, that fome approximation at leaf would be had by taking off from $\sqrt{d}$ fome confant fmall quantity. This is evident: For fuch a diminution will have but a trifing effect when $\sqrt{d}$ is great, and its effect will increafe rapidly when $\sqrt{d}$ is very fmall. He therefore tried various values for this fubtraction, and compared the refults with the former experiments ; and he found, that if in

Thus Mr De Buat's of inion is completely juftified ; and he may be allowed to affert, that the refiftance depends chiefly on the relation between the fection and its $\frac{\sqrt{m g}}{\sqrt{d}}$ fhould be a conftant quan-- as we recede from the
a very fmall diftance.

The writer of this article verified this by a very fimple The writer of this article verined this by a very fimple And con-
and inftructive experiment. He was making experiments firmed by on the production of vortices, in the manner fuggefted by experiSir Ifaac Newton, by whirling a very accurate andfmooth- ment. ly polifhed cylinder in water; and he found that the rapid motion of the furrounding water was confined to an exceeding fmall diftance from the cylinder, and it was not till after many revolutions that it was fenfible even at the diftance of half an inch. We may, by the way, fuggeft this as the beft form of experiments for examining the reffitances of pipes. The motion excited by the whirling cylinder in the ftagnant water is equal ard oppofite to the motion loft by water paffing alcng a furface equal to that of the cylinder with the fame velocity. Be this as it may, we are juftified in confidering, with Mr Buat, the fection of the ftream as thus diminifhed by cutting off a narrow border all round the touching parts, and fuppofing that the motion and difcharge is the fame as if the root of the mean depth of the fection were dimicithed by a fmall quantity, nearly conftant. We fee, too, that the effect of this mult be infenfible in great canals and rivers; fo that, fortunately , its quantity is beft afcertained by experiments made with fmall pipes. This is attended with another conveniency, in the opinion of Mr Buat, namely, that the effest
'Theory.
effect of vifcidity is mof fenfible in great malles of wa- by increafing the head of water beyond what produces ter in flow motion, and is almof infenfible in fmall the velocity of the train. pipes, fo as not to difurb there experiments. We may therefore affume 297 as the general value of $\frac{\sqrt{m g}}{\sqrt{d}-0,1}$.

Since we have $\frac{\sqrt{m g}}{\sqrt{d}-0,1}=297$, we have alfo $m=\frac{\overline{297}_{g}^{2}}{\sqrt{d}-0, \mathrm{I}^{2}},=\frac{88209}{362}(\sqrt{d}-0,1)^{2},=$ 243.7. $(\sqrt{d}-n, 1)^{2}$. This we may exprefs by $n(\sqrt{d}-0,1)^{2}$. Arrd thus, when we have expreffed the effect of friction by $\frac{V^{2}}{m}$, the quantity $m$ is variable, and its. general value is $\frac{\mathrm{V}^{2}}{n(\sqrt{d}-0,1)^{2}}$, in which $r$ is an invariable abltract number equal to 243,7 given by the nature of the refiftance which water fultains from its bed, and which indicates its intenfity.

And, latly, fince $m=n(\sqrt{d-0,1})^{2}$, we have $\sqrt{m g}=\sqrt{n g}(\sqrt{ } d-0,1)$, and the expreffion of the velocity $V$, which water acquires and maintains along any channel whatever, now becomes $V=$ $\frac{\sqrt{n g} \sqrt{d}-0,1)}{\mathrm{X}}$, or $\frac{297(\sqrt{d}-0,1)}{\mathrm{X}}$, in which $X$ is alfo a variable quantity, depending on the flope of the furface or channel, and exprefling the accelerating force which, in the cafe of water in train, is in equilibrio with the reffitances expreffed by the numerator of the fraction.
I.aw of a:celeration inveftigated.

Having fo happily fucceeded in afcertaining the variations of refiftance, let us accompany Mr Buat in his inveltigation of the law of acceleration, expreffed by the value of $X$.

Experience, in penfect agreement with any diftinct opinions that we can form on this fubject, had already fhowed him, that the refiltances increafed in a flower ratio than that of the fquares of the velocities, or that the velocities increafed flower than $\sqrt{s}$. Therefore, in the formula $\mathrm{V}=\frac{\sqrt{n g}(\sqrt{ } d-0,1)}{\mathrm{X}}$, which, for one channel, we may exprefs thus, $V=\frac{A}{X}$, we mult admit that X is fenibly equal to $\sqrt{s}$ when the flope is very fmall or s.very great. But, that we may accurately exprefs the velocity in proportion as the flope augments, we mult have $X$ greater than $\sqrt{s}$; and moreover, $\frac{\sqrt{s}}{\mathrm{X}}$ muf increale as $\sqrt{s}$ dimisifnes. There conditions are necelfary, that our values of $V$, deduced from: the formu'a. $V=\frac{A}{X}$, may agree with the experiment.

In order to comprehend every degree of flope, we mult particularly a tend to the motion through pipes, becaufe open canals will net furnifh us with inftances of exict trins with gracit flopes and velocities. We can make pipes vertical. In this cafe $\frac{1}{s}$ is $\frac{1}{1}$, and the. velocity is the greatelt pollible for a train by the action of gravity: But we can give greater velocities than this

Let AB (fig. 10.) be a vertical tube, and let CA be the head competent to the velocity in the tube, which we fuppofe to be in train. The flope is I , and the full weight of the column in motion is the precife meafure of the refiftance. The value of $\frac{1}{s}$, confidered as a flope, is now a maximum; but, confidered as ex. preffing the proportion of the weight of the column in motion to the weight which is in equilibrio with the refiftance, it may not be a maximum; it may furpafs unity, and s may be lefs than 1 . For if the veffel be filled to $\mathbf{E}$, the head of water is increafed, and will produce a greater velocity, and this will produce a greater refiltance. The velocity being now greater, the head EF which imparts it mult be greater than CA But it will nut be equal to EA, becaufe the unif m velocities are found to increafe fatter than the iquare roots of the preffures. This is the general fact. The: efore $F$ is above $A$, and the weight of the column FB, now employed to overcome the refiftance, is greater than the weight of the column $A B$ in motion. In fuch cafes, therefore, $\frac{1}{s}$, greater than unity, is a fort of fictitious flope, and only reprefents the proportion of the refitance to the weight of the moving column. This proportion may furpafs unity.

But it cannot be infinite: for fuppofing the head of water infinite; if this produce a finite velocity, and we deduct from the whole height the height correfponding to this finite velocity, there will remain an infinite head, the meafure of an infinite refiftance produced by a finite velocity. This does not accord with the obferved law of the velocities, where the refift. ances actually do not increafe as faft as the fquares of. the velocities. Therefore an infinite head would have produced an infinite velocity, in oppofition to the refitances : taking off the head of the tube, competent to this velocity, at the entry of the tube, which head would allo be-infinite, the remainder would in all probability be fini e, balancing a finite refiftance.

Therefore the va ve of s may remain finite, although the velocity be infinite; and this is agrecable to all our clearelt notions of the refiftances.

Adopting this pinciple, we muft find a value of $X$ which will anfwer all thefe conditions. 2. It muft be fenfibly proportional to $\sqrt{ } \boldsymbol{s}$, while $s$ is great. It muft always be lefs than $\sqrt{s}$. 3. It muft deviate from the proportion of $\sqrt{s}$, fo much the more as $\sqrt{s}$ is fmaller. 4. It mult not varifh when the velocity is infinite. 5. It muft agree with a range of experiments with every variety of channel and of flope.

We fhell underitand the nature of this quantity $X$ better by reprefenting by lines the quantities concerned in forming it.

If the velocities were exactly as the fquare roots of the flopes, the equilateral hyperbola NKS (fig. 10. $n^{\circ}$ 2) between its affymptotes $M A, A B$, would repre. fent the equation $V=\frac{A}{\sqrt{s}}$. The values of $\sqrt{s}$ would. be reprefented by the abfciffo, and the velocities by the ordinate, and $V \sqrt{ } \cdot f=A$ would be the power of the hyperbola. But fince thefe velocities are not fenfibly
by making $K=\log . \sqrt{s+1,6}$, and that the velocities exhibited in his experiments would be very well reprefented by the formula $V=\frac{297(\sqrt{ } d \cdots-\mathrm{O})}{\sqrt{s}-\mathrm{L} \sqrt{s+\mathrm{I}, 6}}$.

Theory. There is a circumftance which our author feems to Mutual adhave overlooked on this occafion, and which is undoubt- hefion of edly of great effect in thefe motions, viz. the mutual the paradhefion of the particles of water. This caufes the $\begin{gathered}\text { ticles } \\ \text { water }\end{gathered}$ water which is defcending (in a vertical pipe for example) to drag more water after it, and thus greatly increafes its velocity. We have feen an experiment in which the water ifined from the bottom of a refervoir through a long vertical pipe having a very gentle taper. It was 15 feet long, one inch diameter at the upper end, and two inches at the lower. The depth of the water in the refervoir was exactly one foot ; in a minute there were difcharged $2 \frac{9}{10}$ cubic feet of water. It muft therefore have iflued through the hole in the bottom of the refervoir with the velocity of 8,85 feet per fecond. And yet we know that this head of water could not make it pafs through the hole with a velocity greater than 6,56 feet per fecond. This increafe muft therefore have arifen from the caufe we have mentioned, and is a proof of the great intenfity of this force. We doubt not but that the difcharge might have been much more increafed by proper contrivances; and we know many inftances in water pipes where this effect is produced in a very great degree.

The following cafe is very diftinet : water is brought 56 into the town of Dunbar in the county of Ealt Lothian cafe, in from a fpring at the diftance of about 3200 yards. It Scotland is conveyed along the firft 1100 yards in a pipe of two inches diameter, and the declivity is 12 feet nine inches; from thence the water flows in a pipe of $I^{\frac{1}{2}}$ diameter, with a declivity of 44 feet 3 inches, making in all 57 feet. When the work was carried as far as the two inch pipe reached, the difcharge was found to be 27 Scotch pints, of $103 \frac{1}{2}$ cubic inches each in a minute. When it was brought into the town, the difcharge was 28. Here it is plain that the defcent along the fecond ftretch of the pipe could derive no impulfion from the firt. This was only able to fupply 27 pints, and to deliver it into a pipe of equal bore. It was not equivalent to the forcing it into a fmaller pipe, and almoft doubling its velocity. It mult therefore have been dragged into this fmaller pipe by the weight of what was defcending along it, and this water was exerting a force equivalent to a head of 16 inches, increafing the velocity from 14 to about 28.

It muft be obferved, that if this formula be juft, there can be no declivity fo fmall that a current of wa. ter will not take place in it. And accordingly none drealleft has been ob place in in. And accordingly none declivity did men of a fream when this will prodid not happen. But it alfo fhould happen with re. duce a curfpect to any declivity of bottom. Yet we know that ${ }^{\text {rent. }}$ water will hang on the floping furface of a board without proceeding furcher. The caufe of this feems to be the adhefion of the water combined with its vifcidity The vifcidity of a fluid prefents a certain force which muft be overcome before any current can tike place.

A feries of important experiments were made by our author in order to afcertain the relation between the velocity at the furface of any fream and that at

Part I.
Theory.

the bottom. Thefe are curious and valuable on many accounts. One circumfance deferves our notice here, viz. that the difference between the fuperficial and bottom velocilies of any fream are proportional to the fquare roots of the Juperficial velocities. From what has been already faid on the gradual diminution of the velocities among the adjoining fildments, we mult conclude that the fame rule holds good with refpect to the velocity of feparation of two filaments immediately adjoining. Hence we learn that this velocity of feparation is in all cafes indefinitely fmall, and that we may, without danger of any fenfible error, fuppofe it a conftant quantity in all 58 cafes.
A couftant We think, with our ingenious author, that on a part of the review of thefe circumftances, there is a conftant or in-accelera- variable portion of the accelerating force employed in ting force employed in overconing the vifcidity, \&c. overcoming this vifcidity and producing this mutual feparation of the adjoining filaments. We may exprefs this part of the accelerating force by a part $\frac{1}{S}$ of that flope which conflitutes the whole of it. If it were not employed in overcoming this refiftance, it would produce a velocity which (on account of this refiftance) is not produced, or is loft. This would be $\frac{A}{\sqrt{ } \mathrm{~S}-\mathrm{L} \sqrt{ } \mathrm{S}}$. This muft therefore be taken from the velocity exhibited by our general formula. When thus corrected, it would become $\mathrm{V}=(\sqrt{\bar{d}}-0,1)\left(\frac{\sqrt{n g}}{\sqrt{s-\mathrm{L} \sqrt{s+1,6}}}=\right.$ $\left.-\frac{\sqrt{n g}}{\sqrt{\mathrm{~S}-\mathrm{L} \sqrt{ } \mathrm{S}}}\right)$. But as the term $\frac{\sqrt{n g}}{\sqrt{\mathrm{~S}}-\mathrm{L} \sqrt{ } \mathrm{S}}$ is compounded only of conftant quantities, we may exprefs it by a fingle number. This has been collected from a fcrupulous attention to the experiments (efpecially in canals and great bodies of water moving with very fmall velocities; in which cafe the effects of vifcidity muft become more remarkable), and it appears that it may be valued at $\sqrt{\text { incl }}$ or 0,0 inches very nearly.

From the whole of the foregoing confiderations, drawn from nature, fupported by fuch reafoning as our rof diftinct notions of the internal motions will ad$m_{i}$, and authorifed by a very extenfive comparifon wit? experiment, we are now in a condition to conclude a con wlete formula, expreffive of the uniform motion of wate. and involving every circumftance which appears to $t$. 'e any fhare in the operation.
Therefore it

Formula exprefling exprefing m is is TRAIN, in a pipe or open channel, whofe fec motion of tion, figure, and nope, are conftant, but its length water.
$V$ reprefer. the mean velocity, in inches per fecond, of any current of water, running uniformly, or which tion, figure, and flope, are conftant, but its length indefirite.
d the hydraulic mean depth, that is, the quotient ariling from dividing the fection of the channel, in fquare inches, by its border, expreffed in linear inches.
$s$ The flope of the pipe, or of the furface of the current. It is the denominator of the frastion expreffing this flope, the numerator being always unity ; and is had by dividing the expanded length of the pipe or channel by the difference of height of its two extremities.

Vol. XVT.
$g$ The velocity (in inches per feeond) which a heavr body acquires by falling during one fecond.
$n$ An abltact conftant number, determined by experiment to be 243,7.

L the hyperbolic logarithm of the quantity to which it is prefixed, and is had by multiplying the common logarithm of that quantity by 2,3026 .

We fhall have in every inftance

$$
\mathrm{V}=\frac{\sqrt{n g}(\sqrt{d}-0,1)}{\sqrt{s}-\mathrm{L} \cdot \sqrt{s+1,6}} 0,3(\sqrt{d}-0,1)
$$

This, in numbers, and Englifh meafure, is
$\mathrm{V}=\frac{307(\sqrt{d-0,1})}{\sqrt{s}-\mathrm{L} \sqrt{s+1,6}}-0,3 \quad(\sqrt{d}-0, \mathrm{I})$
And in French meafure

$$
\mathrm{V}=\frac{297(\sqrt{d}-0,1)}{\sqrt{s}-\mathrm{L} \sqrt{s+1,} \bar{\sigma}}-0,3(\sqrt{d}-0,1)
$$

The following table contains the real experiments from which this formula was deduced, and the comparifon of the real velocities with the velocities computed by the formula. It confifts of two principal fets of experiments. The firlt are thofe made on the motion of water in pipes. The fecond are experiments made on open canals and rivers. In the firlt fet, column ift contains the number of the experiments; 2 d , the length of the tube; $3^{\text {d, the height of the refervoir; } 4 \text { th, the va- }}$ lues of $S$, deduced from column fecond and third; $5^{\text {th }}$ gives the obferved velocities; and 6th the velocities calculated ty the formula.

In the fecond fet, column 2 d gives the area of the fection of the channel ; 3 d , the border of the canal or circumference of the fection, deducting the horizontal width, which fuftains no friction; $4^{\text {th }}$, the fquare root $\sqrt{d}$ of the hydraulic mean depth; 5 th, the denominator $S$ of the flope; 6th, the obferved mean velocities; and 7 th, the mean velocities by the formula. In the laft ten experiments on large canals and a natural river the 6th column gives the obferved velocities at the furface.

This comparifon mult be acknowitdged to be mott fatisfactory, and thows the great penetration and addrefs of the author, in fo fuccefsfully fifting and ap. preciating the fhare which each co-orerating ci.curaftance has had in producing the very i.tricate and complicated effect. It adds inme weight $t$, the principles on which he has proceeded in this analyfis of the mechanifm of hydraulic morion, and mu:t give us great confidence in a theory fo fairly eftablifhed on a very co- The theory pinus induction. The audhr offers it only as a ratio- a wellnal and well-founded probability. To this character it founded i, certainly intitled ; for the fuppotitions made in it probability are asreeale the of thefe internal mitions. And it mult always be remembered that the inveftigation of the formula, although it be rendered fomewhat more perficuous by thus having recourie to thofe notions, has no dependence on the truth of the principles. For it is, in fast, nothing but a claffification of experiments, which are grouped together by fome one circumflance of lope, velocity, form of fection, \&c. in order to difcover the law of the changes which are induced by a variation of the circumftances which do not refemble. The procedure was precifely fimilar to that of the aftronomer when be deduces the elements of an orbit from a multitude of obfervations. This was the talk of Mr de Buat and he candidly and modeflly informs us, that the finding out analytical forms of expreffion which would exhibit thefe changes was the work of Mr Benezech de St Honoré, a young officer of engineers, and his colleague in the experimental courfe. It does honour to his fkill and addrefs; and we think the whole both a pretty and inltructive fecimen of the method of difcovering the laws of nature in the midft of complicated phenomena. Daniel Bernoulli firt gave the rules of this method, and they have been greatly improved by Lambert, Condorcet, and De la Grange. Mr Coulomb has given fome excellent examples of their application to the difcovery of the laws of friction, of magnetical and electrical attrattion, \&c. But this prefent work is the moft perfpicuous and familiar of them all. It is the empirical method of generalifing natural phenomena, and of deducing general rules, of which we can give no other demonitration but that they are faithful reprefentations of matters of fact. We hope that others, encouraged by the fuccefs of Mr de Buat, will follow this example, where public utility is preferred to a difplay of mathematical knowledge

Although the author may not have hit upon the precife modus operandi, we agree with him in thinking that nature feems to aft in a way not unlike what is here fuppofed. At any rate, the range of experiments The cxpe is fo extenfive, and fo multifarious, that few cafes can riments occur which are not included among them. The ex- highly vaperiments will always retain their value (as we prefume luable. that they are faithfully narrated), whatever may become of the theory; and we are confident that the formula will give an anfiver to any queftion to which it may be applicable infinitely preferable to the vague guefs of the mof ragacious and experienced engineer.

We muft however obferve, that as the experiments on pipes were all made with fertpulous care in the contrivance and execution of the apparatus, excepting only thofe of Mr Couple on the main pipes at Verfailles, Mm ${ }^{2}$
we

Theory.

6.3The veloci ty given by where joints are roug h orleaky, where drops of folder解 too large for ordinary works.

Let us compare thefe velocities with the velocities calculated by Buat's formula.

The hydraulic mean depths $d$ and D of the Rheno and $P_{0}$ in the great frefhes deduced from the above meafures, are 98,6 and 344 inches; and their flopes

$\frac{307(\sqrt{\mathrm{D}}-0,1)}{\sqrt{\mathrm{S}}-\mathrm{L} \sqrt{\mathrm{S}+1,6}}-0,3(\sqrt{\mathrm{D}}-0,1)=52,176$ inches and $\frac{307}{\sqrt{s}-\mathrm{L} \sqrt{d}-0,1)}-0,3(\sqrt{d+1,6}-0,1)=46,727$
inches.
Thefe refults differ very little from the velocities abovementioned. And if the velocity correfponding to a depth of 3 I feet be deduced from that obferved by Montanari in the Po Magra io feet deep, on the fuppofition that they are in the proportion of $\sqrt{d}$, it will be found to be about $53 \frac{1}{2}$ inches per fecond.

This comparifon is therefore highly to the credit of Highly to the theory, and would have been very agreeable to the credit M. de Buat, had he known it, as we hope it is to our of the thereaders.

We have collected many accounts of water pipes, and made the comparifons, and we flatter ourfelves that the ee have enabled us to improve the theory. They fhall appear in their proper place; and we may juft obferve here, that the two-inch pipe, which we formerly fpoke of as conveying the water to Dunbar, fhould have yielded only $25 \frac{2}{3}$ Scotch pints per minute by the formula, inflead of 27 ; a fmall error.

We have, therefore, no hefitation in faying that this fingle formula of the uniform motion of water is one of the moft valuable prefents which natural fcience and the arts have received during the courfe of this century.

We hoped to have made this fortunate inveltigation of the chevalier de Buat ftill more acceptable to our readers by another table, which fhould contain the values of $\frac{307}{\sqrt{s}-\mathrm{L} \sqrt{s+1,6}}$ ready calculated for every declivity that can occur in water pipes, canals, or rivers. Aided by this, which fuperfedes the only difficult part of the computation, a perfon could calculate the velocity for any propofed cafe in lefs than two minutes. But we have not been able to get it ready for its appearance in this article, but we fhall not fail to give it when we refume the fubject in the article $W_{A T E R}-$ Warks; and we hope even to give its refults on a fcale which may be carried in the pocket, and will enable the unlearned practitioner to folve any queftion with accuracy in half a minute.

We have now eftablifhed in fome meafure a Theory of Hydraulics, by exhibiting a general theorem which expreffes the relation of the chief circumftances of all fuch motions as have attained a flate of permanency, in fo far as this depends on the magnitude, form, and flope of the channel. This permanency we have expreffed by the term riain, faying that the fream is in train.

We proceed to confider the fubordinate circumftances contained in this theorem; fuch as; $\mathrm{I} f$, The forms which nature or art may give to the bed of a running Aream, and the manner of expreffing this form in our theorem. 2d, The gradations of the velocity, by which
it decreafes in the different nlaments, from the axis or moft rapid filament to the border; and the connection of this with the mean velocity, which is expreffed by our formula. $3^{d}$, Having acquired fome diftinct notions of this, we fhall be able to fee the manner in which undifturbed nature works in forming the beds of our rivers, the forms which the affects, and which we mult imitate in all their local modifications, if we would fecure that permanency which is the evident aim of all her operations. We thall here learn the mutual action of the current and its bed, and the circumitances which enfure the fability of both. Thefe we may call the regimen or the confervation of the ftrean, and may fay that it is in regimen, or in confervation. This has a relation, not to the dimenfions and the flope alone, or to the accelerating force and the reffitance arifing from mere inertia; it refpects immediately the tenacity of the bed, and is different from the train.

4 th, Thefe pieces of information will explain the deviation of rivers from the rectilineal courfe ; the refiftance occafioned by thefe deviations; and the circumftances on which the regimen of a winding Itream depends.

## § 1. Of the Forms of the Cbannel.

67

68

## But incom

 patible with regimen.$\mathrm{T}_{\mathrm{HE}}$ numerator of the fraction which expreffes the velucity of a river in train has $\sqrt{d}$ for one of its factors. That form, theref re, is moft favourable to the motion which gives the greateft value to what we have called the hydraulic mean depth $d$. This is the prerogative of the femicircle, and here $d$ is equal to half the radius; and all other figures of the fame area are the more fävourable, as they approach nearer to a femicircle. This is the form, therefore, of all conduit pipes, and fhould be taken for aqueducts which are built of maionry. Eafe and accuracy of execution, however, have made engineers prefer a rectangular form ; but neither of thefe will do for a channel formed out of the ground. We fhall foon fee that the femicircle is incompatible with a regimen; and, if we proceed through the regular polygons, we fhall find that the half hexagon is the only one which has any pretenfions to a regimen ; yet experience fhows us, that even its banks are too fteep for almoft any foil. A dry earthen bank, not bound together by grafs roots, will hardly ftand with a

Eanks that waters will not ftand with this flope. Banks whofe
bafe is to their height as 4 to 3 will ftand very well in moift foils, and this is a flope very ufually given. This form is even affected in the fpontaneous operations of nature, in the channels which the digs for the rills and rivulets in the higher and Iteeper grounds.

This form has fome mathematical and mechanical properties which intitle it to fome further notice. Let ABEC (fig. 1s.) be fuch a trapezium, and AHGC the rectangle of equal width and depth. Bifect HB and EG by the verticals FD and KI, and draw the verticals $b \mathrm{~B}, e \mathrm{E}$. Becaufe $\mathrm{AH}: \mathrm{HB}=3: 4$, we have $\mathrm{AB}=5$, and $\mathrm{BD}_{2}=$, and FD 3 , and $\mathrm{BD}+\mathrm{DF}=$ BA. From thefe premifles it follows that the trapezium $A B E C$ has the fame area with the rectangle ; for HB being bifected in D , the triangles $\mathrm{ACF}, \mathrm{BCD}$ are equal. Alfo the border ABEC, which is touched by the paffing fream, is equal to FDIK. Therefore the mean depth, which is the quotient of the area divided by the border, is the fame in both; and this is the
cafe, whatever is the width BE at the bottom, or even
though there be no rectangle fuch as $b \mathrm{BE} e$ interpofed between the flant fides.

Cf all rectangles, that whofe breadth is twice the Beaf form height, or which is half of a fquare, gives the greateft of a chanmean depth. If, therefore, F K be double of FD, the nel.
trapezium ABEC, which has the fame area, will have the largeft mean depth of any fuch trapezium, and will be the beft form of a channel for conveying running waters. In this cafe, we have $\mathrm{AC}=10, \mathrm{AH}=$ 3 , and $\mathrm{BE}=2$. Or we may fay that the belt form is a trapezium, whofe bottom width is $\frac{2}{3}$ of the depth, and whofe extreme width is $\frac{10}{3}$. This form approaches very near to that width the torrents in the hills naturally dig for themfelves in uniform ground, where their action is not checked by ftones which they lay bare, or which they depofite in their courfe. This flows us, and it will be fully confirmed by and by, that the channel of a river is not a fortuitous thing, but has a relation to the confiftency of the foil and velocity of the ftream.

A rectangle, whofe breadth is $\frac{4}{3}$ of the depth of water, will therefore have the fame mean depth with a triangle whofe furface width is $\frac{8}{3}$ of its vertical depth; for this is the dimenfions when the rectangle $b \mathrm{BE} e$ is taken away.

Let A be the area of the fection of any channel, $\boldsymbol{w}$ its width (when rectangular), and $b$ its depth of water. Then what we have called its mean depth, or $d$, will be $\frac{A}{w+} \frac{2 b}{},=\frac{w b}{w+2 b} . \quad$ Or if $q$ expreffes the ratio of the width to the depth of a rectangular bed; that is, if $q=\frac{w}{b}$, we have a very fimple and ready expreftion for the mean depth, either from the width or depth. For $d=\frac{w}{q+2}$, or $d=\frac{q b}{q+2}$.

Therefore, if the depth were infinite, and the width finite, we fhould have $d=\frac{w}{2}$; or if the width be infinite, and the depth finite, we have $d=b$. And thefe are the limits of the values of $d$; and therefore, in rivers whofe width is always great in comparifon of the depth, we may without much error take their real depth for their h;draulic mean depth. Hence we de- Eftimate rive a rule of eafy recollection, and which will at all of the extimes give us a very near eftimate of the velocity and perce of a expence of a running fream, viz. that the velocities are running nearly as the fquare roots of the depths. We find this fream. confirmed by many experiments of Michelotti.

Alfo, when we are allowed to fuppofe this ratio of the velocities and depths, that is, in a rectangular canal of great breadth and fmall depth, we fhall bave the quantities $d$ fcharged nearly in the proportion of the cubes of the velncities. For the quantity difcharged $d$ is as the velocity and area jointly, that is, as the height and velocity jointly, becaufe when the width is the fame the area is as the height. Therefore, we have $d \doteq b v$. But, by the above remark, $b \doteq v^{2}$. Therefore, $d 亡$ $v^{3}$; and this is confirmed by the experiments of Boffut, vol. ii. 236. Alfo, becaute $d$ is as $v b$, when $w$ is conftant, and by the above remark (allowable when $w$ is very great in proportion to $b$ ) $v$ is as $\sqrt{ } h$, we have $d$ as $b v b$, or $b \frac{3}{2}$, or the fquares of the diucharges

Theors. proportional to the cubes of the heights in redangular 72 beds, and in their correfponding trapeziums.
Ruties for 1. Knowing the mean depth and the proportion of finding the the width and real depth, we can determine the dimendimenfions, fions of the bed, and we have $\varepsilon v=q d+2 d$, and $b=d$
$+\frac{2 d}{q}$.
2. If we know the area and mean depth, we can in like manner find the dimenfions, that is, $w$ and $b$; for $A=w b$, and $d=\frac{w b}{w+2 b} ;$ therefore $w= \pm \sqrt{\frac{A^{2}}{4 d^{2}}-2 A}$

3. If $d$ be known, and one of the dimenfions be given, we can find the other ; for $d=\frac{w h}{v+2 b}$ gives $w=\frac{2 b d}{b-d}$, and $b=\frac{w d}{w-2 d}$.
Mean : 4. If the velocity $V$ and the nlope $S$ for a river in depth, train be given, we can find the mean depth; for $V=$

$\sqrt{\bar{d}}=$ to this quantity $+0, \mathrm{x}$.
And lope. 5. We can deduce the flope which will put in train a river whofe channel has given dimentions. We make $\frac{297(\sqrt{d-0,1})}{\mathrm{V}+0,3(\sqrt{d}-0,1)}=\checkmark \mathrm{S} . \quad$ This fould be $=\sqrt{ } \mathrm{S}$ $-\mathrm{L} \sqrt{\mathrm{S}+1,6}$, which we correct by trials, which will be exemplified when we apply thefe doctrines to practice.

Having thus eftablifhed the relation between the different circumplances of the form of the channel to our general formula, we proceed to confider,

## § 2. The gradations of velacity from the middle of the fiveam to the fides.

The knowledge of this is neceffary for underftanding the regimen of a river; for it is the velucity of the fildments in contact with the bed which produces any change in it, and occafinns any preference of one to another, in refpect of regimen or ftability. Did thefe circumftances not operate, the waters, true to the laws of hydraulics, and confined within the bounds which have been aftigned them, would neither enlarge nor diminifh the area of the channel. But this is all that ive can promife of waters perfectly clear, running in pipes or hewn channels. But rivers, brooks, and fmaller freams, carry along waters loaded with mud or fand, which they depofit wherever their velocity is checked; and they tear up, on the other hand, the materials of the channel wherever their velocity is fufficiently great. Nature, indeed, aims continually at an equilibrium, and works without ceafing to perpetuate her own peformances, by eftablithing an equality of action and reaction, and proportioning the forms and direction of the motions to her agents, and to local circumitances. Her work is flow but uncealing; and what he cannot ac-
complifh in a year the will do in a century. The beds of our rivers have acquired fome Itability, becaufe they are the labour of ages; and it is to time that we owe thofe deep and wide valleys which receive and confine our rivers in channels, which are now confolidate, and with flopes which have been gradually moderated, fo that they no longer either ravage our habitations or confound our boundaries. Art may imitate nature, and Nature by directing her operations (which fle ftill carries on ac-be imitated cording, to her own imprefcriptible laws) according to in making our views, we can haften her progrefs, and accomplifh artificial our purpofe, during the fhort period of human life. But we can do this ouly by ftudying the unalterable laws of mechanifm. Thefe are prefented to us by fpontaneous nature. Frequently we remain ignorant of their foundation : but it is not neceffary for the proiperity of the fubject that he have the talents of the fenator ; he can profit by the fatute without underftanding its grounds. It is fo in the prefent inftance. We have not as yet been able to infer the law of retardation obferved in the filaments of a running Aream from any found mechanical principle. The problem, however, does not appear beyond our powers, if we affume, with Sir Ifaac Newton, that the velocity of any particular filament is the arithmetical mean between thofe of the filaments immediately adjoining. We may be affured, that the filament in the axis of an inclined cylindrical tube, of which the current is in train, moves the falteft, and that all thofe in the fame circumference round it are moving with one velocity, and that the flowelt are thofe which glide along the pipe. We may affirm the fame thing of the motions in a femi-cylindrical finclined channel conveying an open Atream. But even in thefe we have not yet demonitrated the ratio between the extreme velocities, nor in the different circles. This mult be decided experimentally.

And here we are under great obligations to Mr de Buat. He has compared the velocity in the axis of a prodigious number and variety of ftreams, differing in fize, form, flope, and velocity, and has computed in them all the mean velocity, by meafuring the quantities: of water difcharged in a given time. His method of meafuring the bottom velocity was fimple and jult. He threw in a goofeberry, as nearly as poffible, of the fame fpecific gravity with the water. It was carried along: the bottom almolt without touching it. See ResistANCE of Fluids, $\mathrm{n}^{0} 67$.

He difcovered the following laws : 1. In fmall velo- Laws of cities the velocity in the axis is to that at the bottom the velociin a ratio of confiderable inequality. 2. This ratio di- ties of difminifhes as the velocity increafes, and in very great ve- ferent porlocities approaches to the ratio of equality. 3. What tions of the was molt remarkable was, that neither the magnitude of the channel, nor its flope, had any influence in changing. this proportion, while the mean velocity remained the fame. Nay, theugh the fream ran on a channel covered $w$ th pebbles or coarfe fand, no difference worth minding was to be obferved from the velocity over a polifhed channel. 4. And if the velocity in the axis is conftant, the velocity at the bottom is alfo conftant, and is not affected by the depth of water or magnitude of the fream. In fome experiments the depth was thrice the width, and in others the width was thrice the depth. This changed the proportion of the magnitude of the
fection

Thenry. fection to the magnitude of the rubbing part, but made ~~ no change on the ratio of the velocities. This is a thing which no theory could point out.
Mean velo- Another mof important fact was alfo the refult of city his obfervation, viz. that the mean velocily in any pipe or open fream is the arithmetical mean between the velacity in the axis and the velocity at the fides of a pipe or botton of an open fream. We have already obferved, that the ratio of the velocity in the axis to the velocity at the bottom diminifhed as the mean velocity increafed. This variation he was enabled to exprefs in a very fimple manner, fo as to be eafily remembered, and to enable us to tell any one of them by obferving another.

If we take unity from the fquare root of the fuperficial velocity, expreffed in inches, the fquare of the remainder is the velocity at the botoon; and the mean velocity is the balf fum of thefe two. Thus, if the velocity in the middle of the fream be 25 inches per fecond, its fquare root is five; from which if we take unity, there remains four. The fquare of this, or 16 , is the velocity at the bottom, and $\frac{25+16}{2}$, or $20 \frac{1}{2}$, is the mean velocity.

This is a very curious and moft ufeful piece of in. formation. The velocity in the middle of the ftream is the eafief meafured of all, by any light fmall body floating down, it; and the mean velocity is the one which regulates the train, the difcharge, the effect on machines, and all the mof important confequences.

We may exprefs this by a formula of moft eafy recollection. Let V be the mean velocity, $v$ the velocity in the axis, and $u$ the velocity at the bottom; we have $u=\overline{\sqrt{v}}-1,^{2}$ and $\mathrm{V}=\frac{v+u}{2}$.

Alfo $v=\left(\sqrt{V-\frac{1}{4}}+\frac{1}{2}\right)^{2}$, and $v=(\sqrt{u}+1)^{2}$. $\mathrm{V}=\left(\sqrt{v}-\frac{1}{2}\right)^{2}+\frac{1}{4}$, and $\mathrm{V}=\left(\sqrt{u}+\frac{x}{2}\right)^{2}+\frac{1}{4}$.
$u=(\sqrt{v}-\mathrm{r})^{2}$ and $u=\left(\sqrt{\sqrt{V}}-\frac{\mathrm{x}}{4}-\frac{x}{2}\right)^{2}$.
Theory.
Alfo $v-u=2 \sqrt{ } \overline{\mathrm{~V}-\frac{\mathrm{x}}{4}}$ and $v-\mathrm{V},=\mathrm{V}-u$, $=$ $\overline{\sqrt{V}}-\frac{3}{4}:$ that is, the difference between thefe velocities increafes in the ratio of the fquare roots of the mean velocities diminifhed by a fmall conftant quan. tity.

This may perhaps give the mathematicians fome help in afcertaining the law of degradation from the axis to the fides. Thus, in a cylindrical pipe, we may conceive the current as confifing of an infinite number of cylindrical fhells fliding within each other like the draw tubes of a fpy-glafs. Each of thefe is in equilibrio, or as much accelerated by the one within it as it is retarded by the one without; therefore as the momentum of each diminifhes in the proportion of its diameter (the thicknefs being fuppofed the fame in all), the velocity of feparation moft increafe by a certain law from the fides to the axis. The magnitude of the fmall conftant quantity here fooken of feems to fix this law.

The place of the mean velocity could not be difco. vered with any precifion. In moderate velocities it was not more than one-fourth or one-fifth of the depth diftant from the bottom. In very great velocities it was fenfibly higher, but never in the middle of the depth.

The knowledge of thefe three velocities is of great importance. The fuperficial velocity is eafily obferved; hence the mean velocity is eafily computed. This multiplied by the fection gives the expence; and if we alfo meafure the expanded border, and then obtain the mean depth (or $\sqrt{d}$ ), we can, by the formula of uniform motion, deduce the flope; or, knowing the flope, we can deduce any of the other circumitances.

The following table of thefe three velocities will fave the trouble of calculation in one of the molt frequent queltions of bydraulics.

| Vclocity in Inches. |  |  | Velocity in Inches. |  |  | Velocity in Inches. |  |  |

The knowledge of the velocity at the bottom is of the greatelt ufe for enabling us to judge of the action of the ftream on its bed; and we flhall now make fome obfer vations on this particular.

Every kind of foil has a certain velocity confiftent with the fability of the channel. A greater velocity would enable the water to tear it up, and a fmaller velocity would permit the depofition of more moveable materials from above. It is not enough, then for the ftability of a river, that the accelerating forces are fo adjufted to the fize and figure of its channel that the current may be in train: it muft alfo be in equilibrio with the tenacity of the channel.

We learn from obfervation, that a velocity of three inches per fecond at the bottom will juft begin to work upon fine clay fit for pottery, and however firm and compaet it may be, it will tear it up. Yet no beds are more frable than clay when the velocities do not exceed this: for the water foon takes away the impalpable particles of the fuperficial clay, leaving the particles of fand fticking by their lower half in the relt of the clay, which they now protect, making a very permanent bottom, if the ftream does not bring down gravel or coarfe fand, which will rub off this very thin cruft, and allow
another layer to be worn off; a velocity of fix inches will lift fine fand ; eight inches will lift fand as coarfe as lintfeed; 12 inches will fweep along fine gravel; 24 inches will roll along round pebbles an inch diameter; and it requires three feet per fecond at the botrom to fiweep along fhivery angular ftones of the fize of an egg.
The manner in which unwearied nature carries on How carfome of thefe operations is curious, and deferves to be ried on, noticed a little. All muft recollect the narrow ridges or wrinkles which are left on the fand by a temporary frefh or ftream. They are obferved to lie acrofs the ftream, and each ridge confifts of a fteep face AD, BF (fig. H.) which looks down the fream, and a gentler flope $\mathrm{BB}, \mathrm{FC}$, which connects this with the next ridge. As the ftream comes over the firt feep AD , it is directed almoft perpeindicularly againt the point E immediately below D , and thus it gets hold of a particle of coarfe fand, which it could not have detached from the reft had it been moving parallel to the furface of it. It eafily rolls it up the gentle flope EB; arrived there, the particle tumbles over the ridge, and lies clofe at the bottom of it at F , where it is protected by the little eddy, which is formed in the very angle; other par-

Theory.
ticles lying about E are treated in the fame way, and, tumbling over the ridge B , cover the firit partile, and now proiect it effectually from any further ditiorbance. The fame operation is going on at the bottom of each ridge. The brow or tteep of the ridge gradually advances down the ftr:am, and the whole fet change their places, as reprefented by the dotted line $a d b f$; and after a certan time the particle which was depo. fited at F is tound in an unpiotested fituation, as it was in E , and it now mases another ftep down the ftream.

The Abbe Boffut fin nd, that when the velocity of the ftream was juit futficient for lifting the fand (and a fmall excelis hindered this operation altogether) a ridge advanced about 20 feet in a day.

Since the current carries off the moft moveable matters of the channel, it leaves the bottom covered with the remaining coarfer fand, gravel, pebbles, and larger ftunes. To thefe are added many which come down the ftream whie it is more rapid, and alfo many which roll in from the fides as the banks wear away. All theie form a bottom nuch more ficlid and immoveable than a bottom of the medium coil would have been. But this dues not always maintain the channel in a permanent form ; but frequently occafions great changes, by obliging the current, in the event of any fudden frefh or fwell, to enlarge its bed, and even to change it altogether, by wurking to the right and to the left, fince it cannot work downwards. It is generally from fuch accumulation of gravel and pebbles in the bottom of the bed that rivers change their channels.

It remains to afce: tain, in abfolute meafures, the force which a current really exerts in attempting to drag along with the materials of its channel; and which will produce this effect unlefs refifted by the inertia of thefe materials. It is.thereffore of practical importance to know this force.
$\mathrm{N} \dot{\mathrm{or}}$ is it abitrufe or difficult. For when a current is in train, the accelerating force is in equilibrio with the reliftance, and is therefore its immediate meafure. Now this accelerating force is precifely equal to the weight of the body of water in motion multiplied by the fraction which expreffes the flope. The mean depth being equal to the quotient of the fection divided by the border, the fection is equal to the product of the mean depth multiplied by the boider. Therefore, calling the border $b$, and the mean depth $d$, we have the fection $=d b$. The body of water in motion is therefore $d b s$ (becaufe $s$ was the flant length of a part whule difference of elevation is $I$ ), and the accelerating
force is $d b s \times \frac{\mathrm{I}}{\mathrm{f}}$, or $d b$. But if we would only confider this refiftance as correfponding to an unit of the length of the channel, we mult divide the quantity $d b$ by $s$, and the refiftance is then $\frac{d b}{s}$. And if we would confider the refiftance only for an unit of the border, we mult divide this exprelifion by $b$; and thus this refiftance (taking an inch for the unit) will be expreffed for one fquare inch of the bed by the weight of a bulk of water which has a fquare inch for its bafe, and d ${ }_{5}^{d}$ for its height. And lafly, if E be taken for any given fuperficial extent of the channel or bed, and $F$ the
obtruction which we confider as a fort of friction, we Therry. flall have $\mathrm{F}=\frac{\mathrm{E} d}{s}$.
Thus, let it be required to determine in pounds the refilta, ce or fricion on a fquare yard of a chantel whofe current is in train, which is 10 fee wide, our feet deep, and has a flope of ore foot in a mile. Here $E$ is ni: e feet. Ten feet width and four fiet depth give a fection of 40 f.et. The border is 18 feet. There, fore $d=\frac{40}{18}=2,1111$, and $s$ is 5280 . Therefore the friction is the weight of a column of water whofe bafe is nine feer, and height $\frac{2,1111}{5280}$, or nearly $3 \frac{5}{10}$ ounces avoirdupois.

## § 3. Settlement of the Beds of Rivers.

$\mathrm{H}_{\mathrm{E}}$ who looks with a carelefs eye at a map of the s:mpiicity world, is apt to confider the rivers which ramble over and wifits furface as a chance-medly difpofition of the drainers dom difwhich carry off the waters. But it will afford a moft agreeable object to a confiderate and contemplative mind, $t$, take it up in this very fimple light; and having confidered the many ways in which the drenched furface might have been cleared of the fuperfluous waters, to attend particularly to the very way which nature has followed. In following the troubled waters of a mountain torrent, or the pure ftreams which trickle from their bafes, till he fees them fwallowed up in the ocean, and in attending to the many varieties in their motions, he will be delighted with obierving how the fimple kaws of mechanifm are made fo fruitful in good confequences, hoth by modifying the motions of the waters themfelves, and alfo by inducing new forms on the furface of the earth, fitted for re-asling on the waters, and producing thefe'very modifications of their motions which render them fo beneficini.. The permanent beds of tivers are by no means fortuitous gucters haftily fenoped out by dalhing torrents; but both they and the valleys through which they flow are the patient but unceafing labours of nature, prompted by groodnefs and dirested by wildom.

Whether we trace a river from the torrents which collect the fuperfluous waters of heaven, or from the fprings which difcharge what would otherwife be condemned to perpettal inactivitys each feeder is but a little rill which could not ramble far from its fcanty fource among growing plants and abforbent earth, without being fucked. up and evaporated, did it not meet with other rills in its courfe. When united they frotm a body of water ftill inconfiderable, but much more able, by its bulk, to ovetcome the little obftacles to its motion; and the rivulet then moves with greater fpeed, as we have now learned. At the fame time, the furface expofed to evaporation and abforption is diminilhed by the union of the rills. Four equal rills have only the furface of two when united. Thus the portion which efcapes arreftment, and travels downward, is continually increafing. This is a happy adjufment to the other operations of nature. Were is otherwife, the lower and more vaiuable countries would be loaded with the paffing waters in addition to their own fur. plus rains, and the imniediate neighbourhood of the fea would be almoft covered by the drains of the interior
countries. But, fortunately, thofe paffing waters occupy lefs room as they advance, and by this wife employ. ment of the moft fimple means, not only are the fuperfuous waters drained off from our fertile fields, but the drains themfelves become an ufeful patt of the country by their magnitude. They become the habitation of a podigious number of filhes, which thare the Creator's bounty; and they become the means of mutual communication of all the bleflings of cultivated fociety. The vague ramblings of the rivers fcatter them over the face of the country, and bring them to every door. It is not eren an indifferent circumftance, that they gather Itrength to cut out deep beds for themfelves. By this neans they cut open many fprings. Without this, the produce of a heavy fhower would make a fwamp which would not dry up in many days. And ir muft be obferved, that the fame heat which is neceffary for the vigorous growth of ufeful plants will produce a very copious evaporation. This muft return in fhowers much too copious for immediate vegetation, and the overplus would be deftructive. Is it not pleafant to contemplate this adjuftment of the great operations of nature, fo different from each other, that if chance alone directed the detail, it was almoft an infinite odds that

84
Their effeet on the countries through which they pafa. the earth would be uninhabitable?
But let us follow the waters in their operations, and note the face of the countries through which they flow : attending to the breadth, the depth, and the flope of the valleys, we fhall be convinced that their prefent fituation is extremely different from what it was in ancient days; and that the valleys themfelves are the works of the rivers, or at leaft of waters which have defcended from the heights, loaded with all the lighter matters which they were able to bring away with them. The rivers flow now in beds which have a confiderable permanency; but this has been the work of ages. This has given ftability, both by. filling up and fmoothing the valleys, and thus leffening the changing caufes, and alfo by hardening the beds themfelves, which are now covered with aquatic plants, and lined with the flones, gravel, and coarfer fand, out of which all the lighter matters have been wafhed away.

The furface of the high grounds is undergoing a continual change; and the ground on which we now walk is by no means the fame which was trodden by our remote ancefors. The fhowers from heaven carry down into the valleys, or fweep along by the torrents, a part of the foil which covers the heights and fteeps. The torrents carry this foil into the brooks, and thefe deliver part of it into the great rivers, and thefe difcharge into the fea this fertilizing fat of the earth, where it is fwallowed up, and forever loft for the purpofes of vegetation. Thus the hillocks lofe of their height, the valleys are filled up, and the mountains are laid bare, and flow their naked precipices, which formerly were covered over with a flefh and fkin, but now look like the fkeleton of this globe. The low counuries, raifed and nourifhed for fome time by the fubftance of the high lands, will go in their turn to be buried in the ocean; and then the earth, reduced to a dreary flat, will become an immenfe uninhabitable mafs. This cataftrophe is far diftant, becaufe this globe is in its youth, but it is not the lefs certain; and the united labours of the human race could not long protract the term. But, in the mean time, we can trace a beneficent
purpofe, and a nice adjufment of feemingly remote circumftances. The grounds near the fources of all our rivers are indeed gradually Aripped of their mof fertile 85 ingredients. But had they retained them for ages, the difheens fentints. But had they retained them for ages, the diplayed fentient inhabitants of the earth, or at leaft the nobler animals, with man at their head, would not have derived much advansage from it. The general laws of nature produce changes in our atmorphere which muft ever render thefe great elevations venfruitful. That genial warmth, which is eqally neceffary for the ufeful plant as for the animal which lives on it, is confined to the 1 wer grounds. The earth, which on the top of mount Hxmus could only bring forth mofs and dittany, when brought into the gardens of Spalatro, produced pot-herbs fo luxuriant, that Dioclefian told his colleague Maximian that he had more pleafure in their cultivation than the Roman empire could confer. Thus nature not only provides us manure, but conveys it to our fields. She even keeps it fafe in topre for us till it fhall be wanted. The tracts of country which are but newly inhabited by man, fuch as great part of America, and the newly difcovered regions of Terra Auftralis, are fill almolt occupied by marlhes and lakes, or covered with impenetrable forefts; and they would remain long enough in this fate, if population, continually increafing, did not increafe induftry, and multiply the hands of cultivators along with their neceffities. The Author of Nature was alone able to form the huge ridges of the mountains, to model the hillocks and the valleys, to mark out the courfes of the great rivers, and give the firft trace to every rivulet; but has left to man the talk of draining his own habitation and the fields which are to fupport him, becaufe this is a tafk not beyond his powers. It was therefore of immenfe advantage to him that thofe parts of the globe into which he has not yet penetratet fhould remain covered with lakes, marfhes, and forefts, which keep in fore the juice of the earth, which the influence of the air and the vivifying warmth of the fun would have expended long ere now in ufelefs vegetation, and which the rain; of heaven would have fwept into the fea, had they not been thus protected by their fituation or their cover. It is therefore the bufinefs of man to open up thefe mines of hoarded wealh and to thank the Author of all good, who has thus hufbanded them for his ufe, and left them as a rightful heritage for thofe of after days.

The earth had not in the remote ages, as in our day, thofe great canals, thofe capacious voiders, always ready to drain off the rain waters (of which only part is abforbed by the thirlty ground), and the pure waters of the fprings from the foot of the hills. The rivers did not then exit, or were only torrents, whofe watirs, confined by the gullies and glens, are fearching for a place to efcape. 'Hence arife thofe numerous lakes in the interior of great continents, of which there are ftill remarkable relicks in North America, 'which in procefs of time will difappear, and become champaign countries. The moft remote from the fea, unable to contain its waters, finds an iffue through fome gorge of the hills, and pours over its fuperfluous waters into a lower bafon, which, in its turn, difcharges its contents into another, and the laft of the chain delivers its waters by a river into the ocean. The communication was originally begun by a dimple overflowing at the loweft part of the margin. This made a torrent, which quickly.

## Part I.

 R I V E R.Theory.

## $\underbrace{\text { Thery. }}$

quickis deepened its bed ; and this circumftance increa- tains (were there any grounds high enough to reccive fing its velocity, as we have feen, would extend this deepering backward to the lake, and draw off more of its waters. The work would go on rapidly at firt, while earth and fmall fones only refifted the labours of nature ; but thefe being wafhed away, and the channel hollowed out to the firm rock on all fides, the operation muft go on very flowly, till the immenfe cafcade fhall undermine what it cannot break off, and then a new difcharge will commence, and a quantity of flat ground will emerge all round the lake. The torrent, in the mean time, makes its way down the country, and digs a canal, which may be called the firlt $\mathbb{k e t c h}$ of a river, which will deepen and widen its bed continually. The waters of feveral bafons united, and running together in a great body, will (according to the principles we have eftablifhed) have a much greater velocity, with the fame flope, than thofe of the lakes in the interior parts of the continent; and the fum of them all united in the bafon next the fea, after having broken through its natural mound, will make a prodigious torrent, which will dig for itfelf a bed fo much the deeper as it has more flope and a greater body of waters.

The formation of the firft valleys, by cutting open many fprings which were formerly concealed under ground, will add to the mafs of running waters, and contribute to drain off the waters of thefe bafons. In courfe of time many of them will difappear, and flat valleys among the mountains and hills are the traces of their former exiftence.

When nature thus traces out the courfes of future rivers, it is to be expected that thofe freams will moft deepen their channels which in their approach to the fea receive into their bed the greateft quantities of rain and fpring waters, and that towards the middle of the continent they will deepen their channels lefs. In there laft fituations the natural flope of the fields caufes the rain-water, rills, and the little rivulets from the fprings, to feek their way to the rivers. The ground can fink only by the flattening of the hills and high grounds; and this muft proceed with extreme flownefs, becaufe it is only the gentle, though inceffant, work of the rains and fprings. But the rivers, increaing in bulk and Arength, and of neceffity flowing over every thing, form to themfelves capacious beds in a more yielding foil, and dig them even to the level of the ocean.

The beds of rivers by no means form themfelves in Beds of rivers not formed in one in-
clined
plase.
it), and, excert its firft cafcade, would foon acquire a more gentle flope. But the fact is, and it is the refult of the imprefcriptible laws of nature, that the continued track of a river is a fucceffion of inclined channels, whoie flope diminifhes by fteps as the river approachos to the fea. It is not enough to fay that this refults from the natural flope of the countries through whici: it flows, which we obferve to increafe in declivity as we go to the interior parts of the continent. Were it otherwife, the equilibrium to which nature aims in all her operations would fill produce the gradual diminution of the flope of rivers. Without it they could not be in a permanent train.

That we may more eafily form a notion of the man. ner in which the permanent courfe of a river is eftablifhed, let us fuppofe a ftream or rivulet $s$ (fig. I3.) far up the country, make its way through a foil perfectly uniform to the fea, taking the courie sabcdef, and receiving the permanent additions of the Areams $g a$, $b b, i c, k d, l e$, and that its velocity and flope in all its parts are fo fuited to the tenacity of the foil and magnitude of its fection, that neither do its waters during the annual frefhes tear up its banks or deepen its bed, nor do they bring down from the high lands materials which they depofit in the channel in times of fmaller velocity. Such a river may be faid to be in a permanent fate, to be in confervation, or to have flability. Let us call this fate of a river its regimen, denoting by the word the proper adjultment of the velocity of the ftream to the tenacity of the channel. The velocity of its regimen muft be the fame throughout, becaufe it is this which regulates its action on the bottom, which is the fame from its head to the fea. That its bed may have ftability, the mean velocity of the current muft be conftant, notwithftanding the inequality of difcharge, through its different fections by the brooks which it receives in its courfe, and not withftanding the augmentation of its fection as it approaches the fea.

On the other hand, it behoved this exact regimen to commence at the mouth of the river, by the working of the whole body of the river, in concert with the waters of the ocean, which always keep within the fame limits, and make the ultimate level invariable. 'This working will begin to dig the bed, giving it as little breadth as poflible : for this working confifts chiefly in the efforts of falls and rapid freams, which arife of themfelves in every channel which has too much flope. The bottom deepens, and the fides remain very feep, till they are undermined and crumble down; and being then diluted in the water, they are carried down the fream, and depofited where the ocean checks its fpeed. The banks crumble down anew, the valley or hollow forms; but the fection, always confined to its bottom, cannot acquire a great breadth, and it retains a good deal of the form of the trapezium formerly mentioned. In this manner does the regimen begin to be eftablinhed from $f$ to $e$.

With refpect to the next part $d e$, the difcharge or produce is diminifhed by the want of the brook $l_{e}$. It muft take a fimilar form, but its area will be diminifhed, in order that its velocity may be the fame; and its mean depth $d$ being lefs than in the portion ef below, the flope mult be greater. Without thefe conditions we could not have the uniform velocity, which the affumed Nn 2
permaren.
one inclined plane. If we fhould fuppofe a canal AB (fig. 12.) perfectly ftraight and horizontal at $B$, where it joins with the fea, this canal would really be an inclined channel of greater and greater flope as it is farther from B. This is evident; becaufe gravity is directed towards the centre of the earth, and the angle CAB contained between the channel and the plumbline at $A$ is fmaller than the fimilar angle $C D B$; and confeguently the inclination to the horizon is greater in A than in D. Such a canal therefore would make the bed of a river; and fome have thought that this was the real form of nature's work; but the fuppofition is a whim, and it is falfe. No river has a nope at all approaching to this. It would be 8 inches declivity in the mile next the ocean, $2+$ inches in the fecond mile, 40 inches in the third, and fo on in the duplicate ratio (for the whole elevation) of the diftances from the fea. Such a river would quickly tear up its bed in the moun-

the diminution of the flope, by augmenting the velocity during their continuance. But when the regimen of the permanent additions is once eftablifhed, the frefhes tend chiefly to widen the bed, without greatly deepening it: for the aquatic plants, which have been growing and thriving during the peaceable flate of the river, are now laid alng, but not fwept away, by the frefhes and protect the bottom from their attacks; and the ftones and gravel, which mult have been left bare in a courfe of years, wcrking on the foil, will alfo collect in the bottom, and greatly augment its power of refiftance; and even if the floods fhould have deepened the bottom fome fmall matter, fome mud will be depofited as the velocity of the frefhes diminifhes, and this will remain till the next flood.

We have fuppofed the foil usiform through the whole courfe: This feldom happens; therefore the circumflances which infure permanency, or the regimen of a river, may be very different in its different parts and in different rivers. We may fay in general, that the
$\qquad$

$\qquad$
 nills.

it depofits : but as foon as it overflows its barks, the very enlargement of its fection diminilhes the velocity of the water; and it may be obferved ftill running in the track of its bed with great velocity, while the waters on each fide are ftagnant at a very fmall diftance : Therefore the water, on getting over the banks, mult depofit the heavieft, the firmelt, and even the greateft part of iss burden, and mult become gradually clearer as it approaches the hills. Thus a gentle flope is given to the valley in a direction which is the reverfe of what one would expect. It is, however, almolt always the cafe in wide valle'ys, efpecially if the great river comes through a foft country. The banks of the brooks and ditches are oblerved to be deeper as they approach the river, and the merely fuperficial drains run backwards from it.

We have already obferved, that the enlargement of the bed of a river, in its approach to the fea, is not in proportion to the increafe of its waters. This would be the cafe even if the velocity contimued the fame: and therefore, fince the velocity even increafes, in confequence of the greater energy of a large body of water, which we now underftand diftinetly, a fill fmaller bed is fufficient for conveying all the 'water 'to the fea.
This general law is broken, however, in the immediate rieighbourhood of the fea; becaufe in this fituation the velocity of the water is checked by the pafling flood-tides of the ocean. As the whole waters muit ftill be dilcharged, they raquire a larger bed, and the enlargement will be chiefly in widh. The fand and mud are depofited when the motion is retarded. The depth of the mouth of the clannel is therefore diminifhed. It mutt therefore become vider. If this be done on a coaft expoled to the force of a regular tide, which carries the waters of the ocean acrefs the mouth of the river, this regular enlargement of the mouth will be the only confequence, and it will generally widen till it wathes the foot of the adjoining hills; but if there be no tide in the tea, or a tide which does not fet acrofs the meuth of the river, the fands mult be depolited at the fides of the opening, and become additions to the fhore, lenglhening the mouth of the channel. In this heltered fituation, every trivial circumftance will caufe the river to work more on particular parts of the bottom, and deepen the channel there. This keeps the mad fufpended in fuch parts of the channel, and is is not depofited till the ftream has fhot farther out into the fea. It is depofited on the fides of thofe deeper parts of the channel, and increafes the velocity in them, and thus fill farther protracts the depofition. Rivers fo fituated will not only lengthen their channels, but will divide them, and produce iflands at their mouths. A bufh, a tree torn up by the roots by a mountain torrent, and floated down the fream, will thus inevitably produce an ifland; and rivers in which this is common w.ll be continually thifting their mouths. The Miliflipt is a mut remarkable intance of this. It has a long cour e through a rich foil, and difembogues itfelf into the Bay of Mexico, in a place where there is no paffing tic'e, as may be feen by comparing the hours of high water in different places. No river that we know carries down its ftream fuch numbers of rooted-up trees: they frequently interrupt the navigation, and render it always dangerous in the night-
time. This river is fo befet with fats and fhifting fands at its mouth, that the mof experienced pilots are puzzled ; and it has protruded its channel above 50 miles in the fhott period that we have known it. The difcharge of the Danube is very fimilar: fo is that of the Nile; for it is difcharged into a ftill corner of the Mediterıanean. It may now be faid to hare aequired cunfiderable permanency; but much of this is oving to human indultry, which frips it as much as poffible of its fubfideable matter. The Ganges too is in a fituation pretty fimilar, and exhibits finilar phenomena. The Maragnon might be noticed as an exception; but it is not an exception. It has flowed very far in a level bed, and its waters come pretty clear to Para; but betides, there is a ftrong tranfverfe tide, or rather current, at its mouth, fetting to the fouth-ealt both during flood and ebb. The mouth of the Po is pern haps the mont remarkable of any on the furface of this globe, and exhibits appearances extremely fingular. Its difcharge is into a fequeftered corner of the Adriatia Though there be a more remarkable tide in this gulph than in any part of the Mediterranean, it is ftill but trifling, and it either fets directly in upon the mouth of the river, or retires ftraight away from it. The river has many mouths, and they hift prodigioully. There has been a general increafe of the land very remarkable. 'The marfhes where Venice now ftands were, in the Augultan age, everywhere penetrable by the fifhing boats, and in the 5 th century could only bear a few miferable huts; now they are covered with crowds of ftately buildings. Ravenna, fituated on the iouthernmolt mouth of the Po, was, in the Auguftan age, at the extremity of a fwamp, and the road $t$, it was along the top of an artificial mound, made by Auguftus at immenfe expence. It was, however, a fine city, containing extenlive docks, arfenals, and other maffy buildings, being the great military port of the empire, where Augultus laid up his great fhips of war. In the Gothic times it became almoit the capital of the Weftern empire, and was the ieat of government and of luxury. It mult, therefore, be fuppofed to have every accommodation of opulence, and we cannot doubt of its having paved ftreets, wharfs, \&c. ; fo that its wealthy inhabitants were at leaft walking dryfooted from houfe to houfe. But now it is an Italian mile from tie fea, and furrounded with vinegards and cultivated fields, and is acceffible in every direction. All this mult have been formed by depotitions from the $\mathrm{Po}_{3}$ flowing through Lombardy loaded with the fpoils of the Alps, which were here arretted by the reeds and bulruithes of the marth. Thefe things are in common courfe; but when wells are dug, we come to the pavements of the ancient city, and thefe pavements are all on one exact level, and they are eight feet below the furm face of the fea at low woter. This cannot be afcribed to the fubliding of the ancient city. This would be irregular, and greateft among the heavy buildi:.gs. The tomb of Theodoric remains, and the pavement round it is on a level with all the others. The lower flory is always full of water; fo is the lower flory of the cathedral to the depth of three feet. The ornaments of both thefe buildings leave no room to doubt that they were formerly dry; and fuch a building as the cathedral could not fink without crumbling into pieces.

It is by no means eafy to account for all this. The depofitions and the caufe of it.
formed.
furface would be a perfect level. But fuppofe it poffible by any means to give the middle waters a motion in the direction of its length, they muft drag along with them the waters immediately contiguous. Thefe with them the waters immediately contiguous. Thete
will move lefs fwittly, and will in like manner drag the waters without them ; and thus the water at the fides being abftracted, the depth mult be lefs, and the gene-
ral furface mult be convex acrofs. The fact in a runbeing abftracted, the depth muft be lefs, and the gene-
ral furface mult be convex acrofs. The fact in a running ftream is fimilar to this; the fide waters are withning itream is fimilar to this; the fide waters are with-
held by the fides, and every filament is moving more f.owly than the one next it towards the middle of the
river, but fafter than the adjoining filament on the land river, but fafter than the adjoining filament on the land fide. This alone muft produce a convexity of furface. But befides this, it is demonftrable that the preffure of a running ftream is diminifhed by its motion, and the diminution is proportional to the height which would produce the velocity with which it is gliding paft the adjoining filament. This convexity mult in all cafes be very fmall. Few rivers have the velocity nearly equal to eight feet per fecond, and this requires a height of one foot only. An author quoted by Mr Buffon fays, that he has obferved on the river Aveiron an elevation of three feet in the middle during floods; but we fufpect fome error in the obfervation.

## (4. Of the Windings of Rivers.

depofitions of the Po and ocher rivers muft raife the ground; and yet the rivers mult fill flow over all. We muft conclude that the furface of the Adriatic is ty no means level, and that it flopes like a river from the Lagoon of Venice to the eaftward. In all probability it even flopes confiderably outwards from the fhore. This will not hinder the alternations of ebb and flow tide, as will be fhown in its proper place. The whole fhores of this gulph exhibit moft uncommon appearancec.

The laft general obfervations which we fhall make in this place is, that the furface of a river is not flat, confidered athwart the ftream, but convex: this is owing to its motion. Suppofe a canal of ftagnant water; its d und underltand the relation between the force of a river and from a rectilineal courfe; for it may frequently happen that the general procedure of nature may be inconfiftent with our local purpofes. Man was fet dowi on this globe, and the talk of cultivating it was given him by nature, and his chief emjoyment feems to be to fruggle with the elements. He muft not find things to his mind, but he mult mould them to his own fancy. Yet even this feeming anomaly is one of nature's moft beneficent laws; and his exertions muft ftill be made in conformity with the general train of the operations of mechanical nature : and when we have any work to undertake relative to the courfe of rivers, we muft be careful not to thwart their general rules, otherwife we fhall be fooner or later punifhed for their infraction. Things will be brought back to their former ftate, if our operations are inconfiftent with that equilibrium which is contantly aimed at, or fome new flate of things which is equivalent will be foon induced. If a well regulated river has been improperly deepened in fome place, to anfwer fome particular purpofe of our own, or if its breadth has been improperly augmented, we fhall foon fee a depofition of mud or fand choak up our fancied improvements; becaufe, as we have enlarged the fection without increating the flope or the fupply, the velocity muft diminifh, and floating matters muift be depofited.

It is true, we frequently fee permanent channels where the forms are extremely different from that which the waters would dig for themfelves in an uniform foil, and which approaches a good deal to the trapezium defrribed formerly. We fee a greater breadth frequently compenfate for a want of depth ; but all fuch deviations are a fort of conftraint, or rather are indications of inequality of foil. Such irregular forms are the works of nature; and if they are permanent, the equilibrium is obtained. Commonly the bottom is harder than the fides, confiling of the coarfeft of the fand and of gravel; and therefore the neceflary fection can be obtained only by increafing the width. We
are accuftomed to attend chiefly to the appearances which prognolticate mifchief, and we interpret the appearances of a permanent bed in the fame way, and frequently form very falfe judgments. When we fee one bank low and flat, and the other high and abrapt, we impose that the waters are puffing along the firft in peace, and with a gentle stream, but that they are rapid on the other fade, and are tearing away the bank; but it is juft the contrary. 'The bed being permanent, things are in equilibrio, and each bank is of a form jut competent to that equilibrium. If the foil on both fides be uniform, the Itream is molt rapid on that fide where the bank is low and flat, for in no other form would it withfand the action of the ftrearm ; and it has been worn away till its flatnefs compenfates for the greater force of the fleam. The fleam on the other fide muff be more gentle, otherwife the bank could not remain abrupt. In fort, in a tate of permanency, the velocity of the fleam and form of the bank are jult fuited to each other. It is quite otherwise before the river has acquired its proper regimen.

Neceffity of attending to natare in regulating the course of rivers.

A careful confideration therefore of the general features of rivers which have fetched their regimen, is of ufe for informing us concerning their internal motions, and directing us to the moll effectual methods of regulating their courfe.

We have already fid that perpendicular brims are inconfiftent with ftability. A fimicircular fection is the form which would produce the quicker train of a river whore expence and lope are given; but the banks at B and D (fig. 14.) would crumble in, and lie at the bottom, where their horizontal furface would fecure them from farther change. The bed will acquire the form $\mathrm{G} c \mathrm{~F}$, of equal lection, but greater width, and with brims lefs fhelving. The proportion of the velocities at A and $c$ may be the fame with that of the velocities at $A$ and $C$; but the velocity at $G$ and $F$ will be leis than it was formerly at B, C, or D; and the velocity in any intermediate point E , being fomewhat between thole at $F$ and $c$, muff be less than it was in any intermediate point of the femicircular bed. The velocities will therefore decrease along the border from $c$ towards $G$ and $F$, and the feepnefs of the border will augment at the fame time, till, in every point of the new border $\mathbf{G} c F$, there two circumftances will be fo adjufted that the neceffary equilibrium is eftablifhed.

The fame thing mut happen in our trapezium. The nope of the brims may be exact, and will be retained; it will, however, be too great anywhere below, where the velocity is greater, and the fides will be worn away till the banks are undermined and crumble down, and the river will maintain its fection by increafing its width. In hort, no border made up of ftraight lines is confiftent with that gradation of velocity which will take place whenever we depart from a femicircular form. And we accordingly fee, that in all natural channels the faction has a curvilinear border, with the lope increasing gradually from the bottom to the brim.

There observations will enable us to underftand how nature operates when the inequality of furface or of tenacity obliges the current to change its direction, and the river forms an elbow.

Suppoling always that the discharge continues the fame, and that the mean velocity is either preserved or
reftored, the following conditions are neceffary for a $\underbrace{\text { Theory. }}$ permanent regimen.

1. The depth of water mut be greater in the elbow Conditions than anywhere elfe.
2. The main fleam, after having fuck the concave for a
bank, mut be reflected in an equal angle, and mut then manient rebe in the direction of the next reach of the river.
3. The angle of incidence mut be proportioned to the tenacity of the foil.
4. There mut be in the elbow an increase of lope, or of head of water, capable of overcoming the refitane occafioned by the elbow.
The reafonablenefs, at leafs, of there conditions will appear from the following confiderations.
I. It is certain that force is expended in producing Reafonathis change of direction in a channel which by fuppofi- beefs of ion diminishes the current. The diminution arifing there confrom any cause which can be compared with friction ditions. muff be greater when the fleam is directed againft one of the banks. It may be very difficult to fate the proportion, and it would occupy too much of our time to attempt it ; but it is fufficient that we be convinced that the retardation is greater in this cafe. We fee no cause to increafe the mean velocity in the elbow, and we mut therefore conclude that it is diminifhed. But we are fuppofing that the difcharge continues the fame; the faction mut therefore augment, or the channel increate its tranfverfe dimenfions. The only queftion is, In what manner it does this, and what change of form does it affect, and what form is competent to the final equilibrium and the consequent permanency of the bed? Here there is much room for conjecture. Mr Buat reafons as follows. If we fuppofe that the points $B$ and C (fig. 15.) continue on a level, and that the points $H$ and $I$ at the beginning of the next reach are aldo on a level, it is an inevitable consequence that the lope along CMI mut be greater than along BEH, because the depreffion of $H$ below $B$ is equal to that of I below C, and BEH is longer than CMI. Therefore the velocity along the convex bank CMI muff be greater than along BEH. There may even be a ftagnation and an eddy in the contrary direction along the concave bank. Therefore, if the form of the fection were the fame as up the ftream, the fides could not ftand on the convex bank. When therefore the fection has attained a permanent form, and the banks are again in equilibrio with the action of the current, the convex bank malt be much flatter than the concave. If the water is really fill on the concave bank, that bank will be abfo. lately perpendicular; nay, may overhang.-According. ty this fate of things is matter of daily observation, and juftifies our reasoning, and entitles us to fay, that this is the nature of the internal motion of the filaments which we cannot difinctly ebferve. The water moves mot rapidly along the convex bank, and the thread of the fleam is neareft to this fide. Reafoning in this way, the festion, which we may fuppofe to have been orig. nelly of the form Mb aE (fig. if.) alums the flat MBAE.
5. Without prefuming to know the mechanism of the internal motions of fluids, we know that fuperficial waves are reflected precifely as if they were elaflic bo. dies, making the angles of incidence and reflection equal. In as far therefore as the fuperficial wave is concerned in the operation, Mr Bat's fecond pofition is jar.

The permanency of the next reach requires that its axis fhall be in the direction of the line EP which makes the angle GEP $=F E N$. If the next reach has the direction EQ, MR, the wave reflected in the line ES will work on the bank at $S$, and will be reflected in the line ST, and work again on the oppofite bank at $T$. We know that the effect of the fuperficial motion is great, and that it is the principal agent in dettroying tue banks of canals. So far therefore Mr Buat is right. We cannut fay with any precifion or confidence bow the actions of the unden filaments are modified ; but we know no reafon fir not extending to the under filaments "hat appears fo probable with refpect to the furface water.
3. The third pofition is no lefs evident. We do not know the mode of action of the water on the bank; but our general notions on this fubject, confirmed by common experience, tell us that the more obliquely a flream of water beats on any bank, the lefs it tends to undermine it or wafh it away. A tiff and cohefive toil therefore will fuffer no more from being almoft perpendicularly buffeted by a fream than a friable Fand would fuffer from water gliding along its face. Mr Buat thinks, from experience, that a clay bank is not fenfibly affected till the angle FEB is abcut 36 degrees.
4. Since there are caufes of retardation, and we fill fuppofe that the difcharge is kept up, and that the mean velocity, which had been diminifhed by the enlargement of the fection, is again reftored, we mult grant that there is provided, in the mechanifm of thefe motions, an acceierating force adequate to this effect. There can be no accelerating firce in an open ftream but the fuperficial flope. In the prefent cafe it is undoubtedy fo; becaufe by the deepening of the bottom where there is an elbow in the fream, we have of neeefity a counter Alope. Now, all this head of water, which mult produce the augmentation of velocity in that part of the ftream which ranges round the convex bank, will arife from the check which the water gets from the concave bank. This occafions a gorge or fwell up the fream, enlarges a littie the fection at BVC ; and this, by the principle of uniform motion, will augment all the velocities, deepen the channel, and put every thing again into its train as foon as the water gets into the next reach. The water at the bottom of this bafon has very little motion, but it defends the bottom by this very circumftance.

Such are the notions which Mr de Buat entertains of this part of the mechanifm of running waters. We cannot fay that they are very fatisfactory, and they are vety oppofite to the opinions commonly entertained on the fubject. Mof perfons think that the motion is moft rapid and turbulent on the fide of the concave bank, and that it is owing to this that the bank is worn away till it become perpendicular, and that the oppofite bank is flat, becaufe it has not been goawed away in this manner. With refpes to this general view of the matter, thefe perfons may be in the right; and when a ftream is turned into a crooked and yielding channel fur the firft time, this is its manner of action. But Mr Buat's aim is to inveftigate the circumftances which obtain in the cafe of a regimen; and in this view he is undoubtedly right as to the facts, though his mode of accounting for thefe fats may be erroneous. And as
this is the only ufeful view to be taken of the fubject, it ought chiefly to be attended to in all our attemprs to procure ftability to the bed of a river, without the expentive helps of mafonry, \&c. If $v e$ e attempt to fecure permanency by deepening on the infide of the elbow, our bank will undoubtedly crumble down, diminifh the paffage, and occafion a more violent action on the hollow bank. The molt effectual mean of fecurity is to enlarge the fection : and if we do this on the infide bank, we mult do it b: widening the ftream very much, that we may give a very floping bank. Our attention is commonly drawn to it when the hollow bank is giving way, and with a view to top the ravages of the ftream. Things are nut now in a ftate of permanency, but nature is working in her own way to bring. it about. This may not fuit pur purpofe, and we muft thwart her. The phenomena wlich we then obferve are frequently very unlike to thofe defcribed in the preceding paragraphs. We fee a violent tumbling motion in the fream towards the hollow bank. We fee an evident accumulation of water on that fide, and the point $B$ is frequently higher than $C$. "This regorging of the water extends to come diftance, and is of itfelf a caufe of greater velocity, and contributes, like a head of ftagnant water, to force the ftream through the bend, and to deepen the bottom. This is clearly the cafe when the velocity is exceffive, and the hollow bants able to abide the fhock. In this fituation the water thus heaped up efcapes where it beit can; and as the water, obftucted by an obftacle put in its way, efcapes by the fides, and there has its velocity increafed, fo here the water gorged up againft the hollow bank fwells over towards the oppofite fide, and paffes round the conver bank with an increafed velocity. It depends much on the adjultment between the velocity and confequent accumulation, and the breadth of the fream and the angle of the elbow, whether this augmentation of velocity thall reach the convex bank ; and we fometimes fee the motion very languid in that place, and even depofitions of mud and fand are made there. The whole phenomena are too complicated to be accurately defcribed in general terms, even in the cafe of perfect regimen : for this regimen is relative to the confiftence of the channel ; and when this is very great, the motions may be molt violent in every quarter. But the preceding obfervations are of importance, becaufe they relate to ordinary cafes and to ordinary channels.

It is evident, from Mr Buat's fecond pofition, that the proper form of an elbow depends on the breadth of the flream as well as on the radius of curvature, and that every angle of elbow will require a certain proportion between the width of the river and the radius of the fweep. Mr Buat gives rules and formule for all thefe purpores, and thows that in one fweep there may be more than one reflection or rebound. It is needlefs. to endarge on this matter of mere geometrical difcuffion. It is with the view of enabling the engineer to trace the windings of a river in tuch a manner that there flall be no rebounds which hall direct the Aream againft the fides, but preferve it always in the axis of every reach. This is of confequence, even when the bends of the river are to be fecured by mafonry or piling; for we have feen the neceffity of increafing the fection, and the tendency which the waters have to deepen the changel on that fide where the rebound is made. This tends

Theory.

OI Refinance
caused by an elbow, and mode of over-
coming it.
to undermine our defences, and oblige us to give them deeper and more fold foundations in fuck places. But any perron accuftomed to the fe of the fcale and compatties will form to himfelf rules of practice equally fare and more expeditious than Mr de Buat's formula.
We proceed, therefore, to what is more to our purpore, the confideration of the refiftance caused by an elbow, an the methods of providing a force capable of overcoming it. We have already taken notice of the falutiry consequences arifing from the rambling course of rivers, inasmuch as it more effectually fpreads them over the face of a country. It is no left benefical by diminishing their velocity. This it does both by lengthening their courfe, which diminiflas the declivity, and by the very refinance which they meet with at every bend. We derive the chicf advantages from our rivers, when they $n$ ) longer hoot their way, from precipice, to precipice, loaded with mud and fand, but peaceably roll along their clear waters, purified during their gentler courfe, and offer themfelves for all the parpores of pafturage, agriculture, and navigation. The more a river winds its way round the foot of the hills, the more is the refiftance of its bed multiplied; the more obftacles it meets with in its way from its fource to the feat, the more moderate is its velocity ; and inHead of tearing up the very bowels of the earth, and digging for itfelf a deep trough, along which it fweeps rocks and rooted up trees, it flows with majeftic pace even with the furface of our cultivated grounds, which it èmbellifhes and fertilizes.
We may with fafety proceed on the fuppofition, that the force neceflary for overcoming the refiftance arifing from a rebound is as the fquare of the velocity; and it is reasonable to fuppofe it proportional to the fquare of the fine of the angle of incidence and this for the reafons given for adopting this meafure of the general $R E$ sistance of Fluids. It cannot, however, claim a greater confidence here than in that application; and it has been flown in that article with what uncertainty and limitatons it molt be received. We leave it to our readers to adopt either this or the fipple ratio of the fines, and fall abide by the duplicate ratio with Mr Buat, becaufe it appears by his experiments that this law is very exactly observed in tubes in inclinations not exceeding 40 ; whereas it is in there fall angles that the application to the general refiftance of fluids, is mot in fault. But the correction is very fipple, if this value that be found erroneous. There can be little doubt that the force neceffary for overcoming the refiftance will increase as the number of rebounds.-Therefore we may exprefsthe refinance, in general, by the formula $r=\frac{V^{2} s^{2} n}{m}$; where $r$ is the refiftance, $V$ the mean velocity of the fleam, $s$ the fine of the angle of incidence, $n$ the number of equal rebounds (that is, having equal angles of incidene), and $m$ is a number to be determined by experimint. Mr de Guat made many experiments on the refiftance occalioned by the bending of pipes, none of which differed from the refult of the above formula above one part in twelve; and he concludes, that the refinance to one bend may be eflimated at $\frac{V^{2} s^{2}}{3000}$. The experiment was in this form: A pipe of 1 inch diameter, and 10 feet lung was formed with oreVol. XTI.r
bounds of $36^{\circ}$ each. A head of water was applied
to $i_{2}$ which gave the water a velocity of fix feet per focon. Another pipe of the fame diameter and length, but without any bendings, was fubjected to a preffure of a head of water, which was increafed till the velocity of efflux was alto fix feet per fecond. The additonal head of water was $5 \%$ inches. Another of the fame diameter and length, having one bend of $24^{\circ} 34^{\prime}$, and running 85 inches per fecond, was compared with a fraight pipe having the fame velocity, and the difference of the heads of water was $\frac{3}{10} \overline{5} \bar{\sigma}$ of an inch. A computation from there two experiments will give the above refult, or in Englifh mature $r=\frac{\mathrm{V}^{2} s^{2}}{3200}$ very nearly. lt is probable that this meafure of the refinance is too great; for the pipe was of uniform diameter even in the bends: whereas in a river properly formed, where the regimen is exact, the capacity of the faction of the bend is increafed.

The application of this theory to inclined tubes and to open freams is very obvious, and very ligitimate and faff. Let AB (fig. 17.) be the whole height of the refervoir AB I K, and BC the horizontal length of a pipe, containing any number of rebounds, equal or unequal, but all regular, that is, conftructed according to the conditions formerly mentioned. The whole head of water fhould be conceived as performing, or as divided into portions which perform, three different offices.One portion, $\mathrm{AD}=\frac{\mathrm{V}^{2}}{505}$, impels the water into the entry of the pipe with the velocity with which it really moves in it ; another portion EB is in equilibrio with the refiftances arifing from the mere length of the pipe expanded into a ftraight line; and the third portion DE ferves to overcome the refinance of the bends. If, therefore, we draw the horizontal line BC, and, taking the pipe BC out of its place, put it in the poriton DH , with its mouth C in H , fo that DH is equal to BC , the water will have the fame velocity in it that it had before. N. B. For greater fimplicity of argoment, we may fuppofe that when the pipe was inferred at B , its bends lay all in a horizontal plane, and that when it is inserted at $D$, the plane in which all its bends lie lopes only in the direction DH, and is perpendicular to the plane of the figure. We repeat it, the water will have the fame velocity in the pipes BC and DH , and the refiftances will be overcome. If we now prolong the pipe DH towards $L$ to any diftance, repeating continually the fame bendings in a faeries of lengths, each equal to DH , the motion will be contnued with the velocity correfponding to the preffure of the column AD; because the declivity of the pipe is augmented in each length equal to DH , by a quantity precifely fufficient for overcoming all the refillances in that length; and the true lope in there cafes is $\mathrm{BE}+$ ED, divided by the expanded length of the pipe BC or DH .
The analogy which we were enabled to eftablifh between the uniform motion or the train of pipes and of open ftreams, entitles us now to fay, that when a river has bendings, which are regularly repeated at equal intervals, its lope is compounded of the lope which is neceffary for overcoming the rcfiftance of a fright channel of its whole expanded length, agreeably to O the

#### Abstract

## Theory.

$\qquad$
$\qquad$

Theory. the formula for uniform motion, and of the flope which is neceffary for overcoming the refiftance arifing from its bendings alone.

Thus, let there be a river which, in the expanded courfe of 6000 fathoms, has to elbows, each of which has $30^{\circ}$ of rebound; and let its mean velocity be 20 inches in a fecond. If we would learn its whole flope in this 6000 fathoms, we mult firt find (by the formula of uniform motion) the flope $s$ which will produce the velocity of 20 inches in a ftraight river of this length, fection, and mean depth. Suppofe this to be
$\frac{1}{2 \times 500}$, or 20 inches in this whole length. We muft then find (by the formula $\frac{\mathrm{V}^{2} \operatorname{Sin}^{2}}{3^{200}}$ ) the flope neceffary for overcoming the refiftance of 10 rebounds of $30^{\circ}$ each. This we fhall find to be $6 \frac{2}{\frac{2}{3}}$ inches in the 6000 fathoms. Therefore the river mult have a flope of $26^{2}$ inches in 6000 fathoms, or $\frac{r^{\frac{1}{2}} 00}{}$; and this flope will produce the fame velocity which 20 inches, or $\frac{\pi}{2} \frac{\mathrm{r}}{\boldsymbol{T}} \mathrm{\delta} \mathrm{\delta}$, would do in a fraight zunning river of the fame length.

## Partil. PRACTCAL INFERENCES.

HAVING thus eftablifhed a theory of a moft important part of hydraulics, which may be confided in as a juft reprefentation of nature's procedure, we fhall apply it to the examination of the chief refults of every thing which art has contrived for limiting the operations of nature, or modifying them fo as to fuit our particular views, Trufting to the detail which we have given of the connecting principles, and the chief circumftances whichco-operatein producing the oftenfible effect; and fuppofing that fuch of our readers as are interefted in this fubject will not think it too much trouble to make the applications in the fame detail; we fhall content ourfelves with merely pointing out the feps of the procefs, and fhowing their foundation in the theory itfelf: and frequently, in place of the direct ana-
103.

Approximation by trial and correction recommended to practical engineers.
lyfis which the theory enables us to employ for the folution of the problems, we fhall recommend a procefs of approximation by trial and correction, fufficiently accurate, and more within the reach of practical engineers. We are naturally led to confider in order the following articles.
I. The effects of permanent additions of every kind to the waters of a river, and the moft effectual methods of preventing or removing inundations.
2. The effects of weirs, bars, fluices, and keeps of every kind, for raifing the furface of a river; and the fimilar effects of bridges, piers, and every thing which contracts the fection of the fream.
3. The nature of canals; how they differ from rivers in refpect of origin, difcharge, and regimen, and what conditions are neceffary for their moft perfect conftruction.
4. Canals for draining land, and drafts or canals of derivation from the main fream. The principles of their conftruction, fo that they may fuit their intended purpofes, and the change which they produce on the main fream, both above and below the point of derivation.
Of the effects of permanent additions to the zuaters of a river.
From what has been faid already, it appears that to every kind of foil or bed there correfponds a certain velocity of current, too fmall to hurt it by digging it up, and too great to allow the depofition of the materials which it is'carrying along. Suppofing this known for any particular fituation, and the quantity of water which the channel mult of neceffity difcharge, we may wifh to learn the fmalleft flope which muft be given to this fream, that the waters may run with the required velocity. This fuggefts

Prob. I. Given the difcharge $D$ of a river, and $V$ its velocity of regimen : required the fmalleft flope $s$, and the dimentions of its bed ?
Since the flope mult be the fmalleft poffible, the bed mut have the form which will give the greateft mean depth $d$, and fhould therefore be the trapezium formerly defcribed; and its area and perimeter are the fame with thofe of a rectangle whofe breadth is twice its height b. Thefe circumftances give us the equation $\frac{\mathrm{D}}{\mathrm{V}}=2 b^{2}$. For the area of the fection is twice the fquare of the height, and the difcharge is the product of this area and the velocity. Therefore $\sqrt{\frac{\bar{D}}{2 V}}=b$ and $\sqrt{\frac{2 D}{V}}$ $=$ the breadth $b$.
The formula of uniform motion gives $\sqrt{s}-\mathrm{L} \sqrt{\mathrm{s}+\mathrm{I}, 6}$ $=\frac{297(\sqrt{d}-0,1}{\overline{\mathrm{C}}+0,3(\sqrt{d}-0, \mathrm{I})}$.

Inftead of $\sqrt{\bar{d}}-0, \mathrm{I}$, put its equal $\sqrt{\frac{b}{2}}-0,1$, and every thing being known in the fecond member of this equation, we eafily get the value of $s$ by a few trials after the following manner. Suppofe that the fecond member is equal to any number, fuch as 9. Firt fuppofe that $\sqrt{5}$ is $=9$. Then the hyperbolic $\log$ arithm of $9+1,6$ or of 10,6 is 2,36 . Therefore we have $\sqrt{ } s-L \sqrt{s+1}, \overline{6}=9-2,36,=664$; whereas it fhould have been $=9$. Therefore fay $6,64: 9=9: 12,2$ nearly. Now fuppofe that $\sqrt{ } s$ is $=12,2$. Then $L$. $12,2+1,6=\operatorname{Lr}_{3}, 8,=2,625$ nearly, and $12,2-2625$ is 9,575 , whereas it fhould be 9 . Now we find that changing the value of $\sqrt{5}$ from 9 to 12,2 has changed the anfwer from 6,64 to 9,575 , or a change of 3,2 in our affumption has made a change of 2,935 in the anfwer, and has left an error of 0,575 . Therefore fay $2,9,35: 0,575$. $=3,2: 0,628$. Then, taking 0,628 from 12,2 , we have (for our next affumption or value of $\sqrt{s}$ ) $\mathrm{I}, 572$. Now $11,57_{2}+1,6=13,172$, and $L_{13,172}$ is 2,58 nearly. Now try this laft value $11,572-2,58$ is 9,008 , fufficiently exact. This may ferve as a fpecimen of the trials by which we may avoid an intricate analy fis.

Рrob. II. Given tire difcharge D the fiope s, and the velocity V , of permanent regimen, to find the dimenfions of the bed.
Let $x$ be the widtb, and $y$ the depth of the channel, and $S$ the area of the fection. This mult be $=\frac{D}{\bar{V}^{2}}$ which is therefure $=x y$. The denominator's being given,

Pratical, given, we may make $\sqrt{ } s-L \sqrt{s+1,6}=\sqrt{B}$, and the
tnferences. $\underbrace{\text { Inferences. }}$
formula of mean velocity will give $V=\frac{297(\sqrt{d}-c, 1)}{\sqrt{B}}$ $-0,3(\sqrt{d}-0,1)$, which we may exprefs thus: $\mathrm{V}=$ $(\sqrt{d}-0,1)\left(\frac{297}{\sqrt{B}}-0,3\right)$, which gives $\frac{V}{\frac{297}{\sqrt{B}}-0,3}=$ $\sqrt{d}-0,1$ ) ; and finall $\Gamma, \frac{\mathrm{V}}{\frac{297}{\sqrt{B}}-0,3}+0,1=\sqrt{ } d$.

Having thus obtained what we called the mean depth, we may fuppofe the fection rectangular. This gives $d=\frac{x y}{x+2 y}$. Thus we have two equations, $\mathrm{S}=x y$ and $d=\frac{x y}{x+2 y}$.
From which we obtain $x=\sqrt{\left(\frac{S}{2 d}\right)^{2}-2 S}+\frac{S}{2 d}$.
And having the breadth $x$ and area $S$, we have $y=\frac{S}{x^{\circ}}$ And then we may change this for the trapezium of mentioned.

Thefe are the chief problems on this part of the fubject, and they enable us to adjuit the flope and channel of a river which receives any number of fucceflive permanent additions by the influx of other fleams. This laft informs us of the rife which a new fupply will produce, becaufe the additional fupply will require additional dimenfions of the channel; and as this is not fuppofed to increafe in breadth, the addition will be in depth. The queftion may be propofed in the following problem.

Рrob. III. Given the dope $s$, the depth and the bafe of a rectangular bed (or a trapezium), and confequently the difcharge $D$, to find how much the fection will rife, if the difcharge be augmented by a given quantity.

Let $b$ be the height after the augmentation, and $w$ the width for the rectangular bed. We have in any uniform current $\sqrt{\bar{d}}=\frac{\mathrm{V}}{\frac{297}{\sqrt{B}}-0,3}$ Raifing this to a fquare, and putting for $d$ and V their values $\frac{w b}{w+2 b}$ and $\frac{\mathrm{D}}{w b}$, and making $\frac{297}{\sqrt{ } B}-0,3=\mathrm{K}$, the equation becomes $\frac{w b}{w+2 b}$ $=\left(\frac{\mathrm{D}}{w h \mathrm{~K}}+0, \mathrm{I}\right)^{2} \quad$ Raifing the fecond member to a fquare, and reducing, we obtain a cubic equation, to be folved in the ufual manner.

But the folution would be extremely complicated. We may obtain a very expeditious and exact approximation from this confideration, that a fmall change in one of the dimenfions of the fection will produce a much greater change in the fection and the difcharge than in the mean depth $d$. Having therefore augmented the unknown dimenfion, which is here the height, make ule of this to form a new mean depth, and then the new equation $\sqrt{ } \bar{d}=\frac{D}{w w h\left(\frac{297}{\sqrt{B}}-0,3\right.}+\infty, 1$ will
give us another value of $b$, which will rarely exceed Prasical the truth by $\frac{1}{T 0}$. This ferves (by the fame procefs) $\underbrace{\text { Inferences }}$ for finding another, which will commonly be fufficiently exact. We fhall illuftrate this by an example.

Let there be a river whofe channel is a rectangle 150 feet wide and fix feet deep, and which difcharges 1500 cubic $f$ tet of water per fecond, having a velocity of 20 inches, and nope of $\frac{x}{12} \frac{x}{6} 60$, or about $\frac{7}{T^{2}}$ of an inch in 100 fathoms. How much will it rife it it receives an addition which triples its difcharge ; and what will be its velocity?

If the velocity remained the fame, its depth would be tripled; but we know by the general formula that its velocity will be greatly increafed, and therefore its depth will not be tripled. Suppofe it to be doubled, and to become 12 fect. This will give $d=10,34483$, or 124,138 inches; then the equation $\sqrt{d}-\mathrm{C}, 1=$ $\frac{\mathrm{D}}{w b\left(\frac{297}{\sqrt{B}}-0,3\right.}$, or $b=\frac{\mathrm{D}}{w(\sqrt{d}-0,1)\left(\frac{297}{\sqrt{B}}-0,3\right)}$, and
in which we have $\sqrt{ } \mathrm{B}=107,8, \mathrm{D}=4500 ; \sqrt{d}-0,1$ $=11,0417$, will give $b=13,276$; whereas it fhould have been I2. This fhows that our calculated value of $d$ was too fmall. Let us therefore increafe the depth by 0,9 , or make it 12,9 , and repeat the calculation. This will give us $\sqrt{d}-0,1=11,3927$, and $b=12,867$, inftead of 13,276. Therefore augmenting our data 0,9 changes our anfwer 0,409 . If we fuppofe thefe fmall changes to retain their proportions, we may conclude that if 12 be augmented by the quantity $x \times 0,9$, the quantity 13,276 will diminifh by the quantity $x \times 0,409$. Therefore, that the eftimated value of $b$ may agree with the one which refults from the calculation, we mult have $12+x \times 0,9=13,276-x \times 0,409$. This will give $x=\frac{1,276}{1,309},=0,9748$, and $x \times 0,9=0,8773$; and $h=12,8773$. If we repeat the calculation with this value of $h$, we thall find no change.

This value of $b$ gives $d=131,88{ }_{3} 6$ inches. If we now compute the new velocity by dividing the new difcharge 4500 by the new area $150 \times 12,8773$, we fhall find it to be 27,95 inches, in place of 20 , the former velocity.

We might have made a pretty exact firf aflumption, by recollecting what was formerly obferved, that when the breadth is very great in proportion to the depth, the mean depth differs infenfibly from the real depth, or rather follows nearly the fame proportions, and that the velocities are proportional to the fquare roots of the depths. Call the firlt difcharge $d$, the height $b$, and velocity $v$; and let $\mathrm{D}, \mathrm{H}$, and V , exprefs thefe things in their augmented fate. We have $v=\frac{d}{w / b}$ and $\mathrm{V}=\frac{\mathrm{D}}{w \mathrm{H}}$, and $v: \mathrm{V}=\frac{d}{b}: \frac{\mathrm{D}}{\mathrm{H}}$, and $v^{2}: \mathrm{V}^{2}=\frac{d^{2}}{b^{2}}:$
$\frac{\mathrm{D}^{2}}{\mathrm{H}^{2}} . \quad$ But by this remark $v^{2}: \mathrm{V}^{2}=b: \mathrm{H}$. Thercfore $b: \mathrm{H}=\frac{d^{2}}{b^{2}}: \frac{\mathrm{D}^{2}}{\mathrm{H}^{2}}$, and $\frac{b \mathrm{D}^{2}}{\mathrm{H}^{2}}=\frac{\mathrm{H} d^{2}}{b^{2}}$, and $b^{3} \mathrm{D}^{2}=\mathrm{H}^{3} d^{2}$, and $d^{2}: \mathrm{D}^{2}=b^{3}: \mathrm{H}^{3}$ (a ufeful theorem) and $\mathrm{H}^{3}=$ $\frac{b^{3} \mathrm{D}^{2}}{d^{2}}$, and $\mathrm{H}=\sqrt{\frac{b \mathrm{D}^{2}}{d^{2}}}=12,48$.

Or we might have made the fame affumption by tie 002
remar

Practical $\underbrace{\text { Inferences. }}$
remark alfo formerly made on this cafe, that the fquares of the difcharges are nearly as the cubes of the height, or $1500^{2}: 4500^{2}=6^{3}: ~ 12,48^{3}$.

And in making thefe firft gueffes we thall do'it more exactly, by recollecting that a certain variation of the mean depth $d$ requires a greater variation of the height, and the increment will be to the height nearly as half the height to the width, as may eanily be feen. Therefore, if we add to 12,48 its $\frac{6,24}{150}$ th part, or its 24 th part, viz. 0,52 , we have 13 for our firlt affumption, exceeding the truth only an inch and a half. We mention thefe circumftances, that thofe who are difpofed to apply thefe doctrines to the folution of practical cafes may be at no lofs when one occurs of which the regular folution requires an intricate analyfis.

It is evident that the inverfe of the foregoing problems will fhow the effects of enlarging the fection of a river, that is, will fhow how much its furface will be funk by any propofed enlargement of its bed. It is therefore needlefs to propole fuch problems in this place. Common fenfe directs us to make thefe enlargements in thofe parts of the river where their effect will be greatef, that is, where it is fhalloweit when its breadth greatly exceeds its depth, or where it is narroweft (if its depth exceed the breadth, which is a very rare cafe), or in general, where the llope is
. 106
And direct us in the method of embanik. ments.
the fmallelt for a fhort run.
The fame general principles direct us in the method of embankments, for the prevention of floods, by enabling us to afcertain the heights neceffary to be given to our banks. This will evidently depend, not only on the additional quantity of water which experience tells us a river brings down during its frelhes, but alfo on the diftance at which we place the banks from the natural banks of the river. This is a point where miftaken economy frequently defeats its own purpofe. If we raife our embankment at fome diftance from the natural banks of the river, not only will a fmaller height fuffice, and confequently a fmaller bafe, which will make a faving in the duplicate proportion of the height ; but our works will be fo much the more durable nearly, if not exactly, in the fame proportion. For by thus enlarging the additional bed which we give to the fwollen river, we diminifh its velocity almoft in the fame proportion that we enlarge its channel, and thus diminifh its power of ruining our works. Except, therefore, in the cafe of a river whofe frefhes are loaded with fine fand to deftroy the turf, it is always proper to place the embankment at a confiderable diftance from the natural banks. Placing them at half the breadth of the fream from its natural banks, will nearly double its channel; and, except in the cafe now mentioned, the fpace thus detached from our fields will afford excellent pafture.

The limits of fuch a work as ours will not permit ws to enter into any detail on the method of embankment. It would require a volume to give inftructions as to the manner of founding, raifing, and fecuring the dykes which mult be raifed, and a thoufand circumitances which mult be attended to. But a few general obfervations may be made, which naturally occur while tre are confidering the manner in which a river works in Ettling or altering tis channel.

E R.
Part II
It mult be remarked, in the firf place, that the ri- Practical ver will rife higher when embanked than it does while Inferences. it was allowed to fpread; and it is by no means eafy to conclude to what height it will rife from the greatef height to which it has been obferved to rife in its floods. When at liberty to expand over a_ wide valley; then it could only rife till it overflowed with a thicknefs or depth of water fufficient to produce a motion backwards into the valley quick enough to take off the water as faft as it was fupplied; and we imagine that a foot or two would fuffice in moft cafes. The beft way for a prudent engineer will be to obferve the utmolt rife remembered by the neighbours in fome gorge, where the river cannot fpread out. Meafure the increafed fection in this place, and at the fame time recollect, that the water increafes in a much greater proportion than the fection; becaufe an increafe of the hydraulic mean depth produces an increafe of velocity in the duplicate proportion of the depth nearly. But as this augmen: tation of velocity will obtain alfo between the embankments, it will be fufficiently exact to fuppofe that the fection mult be increafed here nearly in the fame proportion as at the gorge already mentioned. Neglecting this method of information, and regulating the height of our embankment by the greatent fwell that has been obferved in the plain, will affuredly make them too low, and render them totally ufelefs.

A line of embankment fhould always be carried on by a ftrict concert of the proprietors of both banks through its whole extent. A greedy proprietor, by advancing his own embankment beyond that of his neighbours, not only expofes himfelf to rifk by the working of the waters on the angles which this will pror duce, but expofes his neighbours alfo to danger, by narrowing the fection, and thereby raifing the furface and increafing the velocity, and by turning the ftream athwart, and caufing it to fhoot againft the oppofite bank. The whole fhould be as much as poffible in a line; and the general effect fhould be to make the coarfe of the ftream Itraighter than it was before. All bends fhould be made more gentle, by keeping the embankment further from the river in all convex lines of the natural bank, and bringing it nearer where the bank is concave. This will greatly diminifh the action of the waters on the bankment, and infure their duration. The fame maxim mut be followed in fencing any brook which difcharges itfelf into the river. The bends given at its mouth to the two lines of embankment flould be made lefs acute than thofe of the natural brook, although, by this means, two points of land are left out. And the opportunity hould be embraced of making the direction of this tranfverfe brook more floping than before, that is, lefs athwart the direction of the river.

It is of great confequence to cover the outfide of the dyke with very compact turf clofely united. If it admit water, the interior part of the wall, which is always more porous, becomes drenched in water, and this wa. ter acts with its fatical preffure, tending to bart the bank on the land-fide, and will quickly fhift it from its. feat. The utmoft care thould therefore be taken to make it and keep it perfectly tight. It fhould be a continued fine turf, and every bare fpot fhould be carefully covered with frefh fod; and rat holes mult be carefully clofed up.

## Part II.

Practical Inferences.

107
Of the
flope required at the bend of a river and the confequences.

## Of fraighting or changing the courfe of rivers.

We have feen, that every bending of a river requires an additional llope in order to continue its train, or enable, it to convey the fame quantity of water withont fwelling in its bed. Therefore the effect of taking away any of thefe bends mult be to fink the waters of the river. It is proper, therefore, to have it in our power to eftimate thefe effects. It may be defirable to gain property, by taking away the fweeps of a very winding ftream. But this may be prejudicial, by defroying the navigation on fuch a river. It may alfo hurt the proprietors below, by increaing the velocity of the itream, which will expofe them to the rifk of its overflowing, or of its deftroyiug its bed, and taking a new courfe. Or this increafe of velocity may be inconfiftent with the regimen of the new channel, or at leaft require larger dimenfions than we fhould have given it if ignorant of this effect.

Our principles of uniform motion enable us to anfwer every queftion of this kind which can occur ; and Mr de Buat propofes feveral problems to this effect. The regular folutions of them are complicated and difficult; and we do not think them neceffary in this place, becaufe they may all be folved in a manner not indeed fo elegant, becaufe indirect, but abundantly accurate, and eafy to any perfon familiar with thole which we have already confidered.

We car. take the exact level acrofs all thefe fweeps, and thus obtain the whole flope. We can meafure with accuracy the velocity in fome part of the channel which is moft remote from any bend, and where the channel itfelf has the greateft regularity of form. This will give us the expence or difcharge of the river, and the mean depth connected with it. We can then examine whether this velocity is precifely fuch as is compatible with ftability in the ftraight courfe. If it is, it is evident that if we cut off the bends, the greater flope which this will produce will communicate to the waters a velocity incompatible with the regimen fuited to this foil, unlefs we enlarge the width of the fream, that is unlefs we make the new channel more capacious than the old one. We muit now calculate the dimenfions of the channel which, with this increafed flope, will conduct the waters with the velocity that is neceffary. All this may be done by the foregoing problems; and we may eafielt accomplifh this by fteps. Firt, fuppore the bed the fame with the old one, and calculate the velocity for the increafed flope by the general formula. Then change one of the dimenfions of the channel, fo as to produce the velocity we want, which is a very fimple procefs. And in doing this, the object to be kept chiefly in view is not to make the new velocity fuch as will be incompatible with the ftability of the new bed.

Having accomplifhed this firt purpofe, we learn (in the very folution) how much fhallower this channel with its greater flope will be than the former, while it dicharges all the waters. This diminution of depth muft increafe the flope and the velocity, and muft diminith the depth of the river, above the place where the alteration is to be made. How far it produces thefe effects may be calculated by the general formula. We then fee whether the navigation will be hurt, either in the old river up the ftream, or in the new channel. It is

Plain that all thefe points cannct bo veconciled. We may make the new channel fuch, that it fhall leave a velocity compatible with ftability, and that it fhall not diminilh the depth of the river up the fream. But, having a greater flope, it mult have a fmaller mean depth, and alfo a fmaller real depth, unlefs we make it of $a$ very inconvenient form.

The fame things viewed in a different light, will how us what depreffion of waters may be produced by rectifying the courfe of a river in order to prevent its overflowing. And the procels which we would recommend is the fame with the foregoing. We apprehend it to be quite needlefs to meafure the angles of rebound, in order to compute the flope which is employed for fending the river through the bend, with a view to fuperfede this by ftraighting the river. It is infinitely eansr and more exact to meafure the levels themfelves, ant then we know the effect of removing them.

Nor need we follow Mr de Buat in folving problem; for diminifhing the flope and velocity, and deepeningr the channel of a river by bending its courfe. The expence of this would be in every cafe enormous; and the practices which we are jult going to enter upon afford infinitely eafier methods of accomplifhing all the purpofes which are to be gained by thefe changes.

$$
\begin{gathered}
\text { Of Bars, Weirs, and Fetters, for raifng the Surface of } \\
\text { Rivers. }
\end{gathered}
$$

We propofe, under the article Water. Works, to Problen1s, 108 conlider in fufficient practical detail all that relates to examples, the contruction and mechanifm of thefe and other erec- and confetions in water; and we confine ourfelves, in this place, quences of to the mere effect which they will produce on the cur- raifing the rent of the river.

We gave the name of zueir or bar to a dam erected acrofs a river for the purpofe of raifing its waters, whether in order to take off a draft for a mill or to deepen the channel. Before we can tell the effect which they will produce, we mult have a general rule for afcertaining the relation between the height of the water above the lip of the weir or bar, and the quantity of water which will flow over.

Firf, then, with refpect to a weir, reprefented in fig. 18. and fig. i8. $\mathrm{n}^{\circ}$ 2. The latter figure more refembles their ufual form, confifting of a dam of folid mafonry, or built of timber, properly fortified with fhoars and banks. On the top is $f t$ up a Rrong plank FR, called the wafteboard, or watter, over which the water flows. This is brought to an accurate level, of the proper height. Such voiders are frequently made in the fide of a mill-courf, for letting the fuperfluous water run off. This is properly the waster, voider: it is alfo called an offset. The fome obfervations wiil explain all thefe different pieces of practice. The following queftions occur in coure.

Prob. I. Given the length of an offet or wafeboard, made in the face of a refervoir of Itagnant w, ter, and the depth of its lip under the horizontal furface of the water, to determine the difcharge, or the quantity of water which will run Cver in a fecond?

Let $A B$ be the horizontal fiafiace of the fill water, and $F$ the lip of the wafteboard. Call the depth $B V^{\prime}$ under the furface $b$, and the length of the wafeboard $l$. $N$. B. The water is fuppofed to fow over into ano. ther bafon or chanal, fo much lywer than the farface

HI. of the water is luwer, or at lealt not higher, an $F$.

If the ware could be fopported at the height BF, BF might be confidered as an orifice in the fide of a velfcl. In which cafe, the difcharge would be the fame as if the whole water were flowing with the velocity acquived from the height $\frac{4}{3} \mathrm{BF}$, or $\frac{4}{9} b$. And if we fuppofe that there is no cortraction at the orifice, the mean velocity would be $\sqrt{2 g \frac{4}{9} b}=\sqrt{77^{2} \frac{4}{9} b}$, in Englifh inches per fecond. The area of this orifice is $l b$. Therefore the difcharge would be $l b \sqrt{772 \frac{4}{9}} \bar{b}$, all being meafured in inches. This is the uftal theory; but it is not an exact reprefentation of the manner in which tis etllux really happens. The water cannot remain at the leight BF ; but in drawing towards the wafteboard from all fides, it forms a convex furface AIH, fo that the point 1 , where the vertical drawn from the edge of the watteboard meets the curve, is confiderably lower than B. But as all the mafs above $F$ is fuppofed perfectly fluid, the preffure of the incumbent water is propagated, in the opinion of Mr de Buat, to the filament paffing over at $F$ without any diminution. The fame may be faid of any filament between $F$ and $I$. Each tends, therefore, to. move in the fame manner as if it were really impelled though an orifice in its place. Therefore the motions through every part of the line or plane IF are the fame as if the water were efcaping through an orifice IF, made by a fluice let down on the water, and keeping up the water of the refervoir to the level AB. It is beyond a doubt (fays he) that the height IF mult depend on the whole height BF, and that there mult be a certain determined proportion between them. He does not attempt to determine this proportion theoretically, but fays, that his experiments afcertain it with great precifion to be the proportion of one to two, or that IF is always one-half of BF. He fays, however, that this determination was not by an immediate and direct meafurement; he concluded it from the comparifon of the quantities of water difcharged under different heights of the water in the reiervoir.

We cannot help thinking that this reafoning is very Cefegive in feveral particulars. It cannot be inferred, fiom the laws of hydroltatical preffure, that the filament at $I$ is preffed forward with all the weight of the column BI. The particle I is really at the furface; and confidering it as making part of the furface of a runthing ftream, it is fubjested to hardly any preffure, any more than the particles on the furface of a cup of wain held in the hand, while it is carried round the acis of the earth and round the fun. Reafoning according to his own principles, and availing himfelf of his own difcovery, he fhould fay, that the particle at I has an accelerating force depending on its flope only; and then he fhould have endeavoured to afcertain this flope. The motion of the particle at I has no immediate connection with the preffure of the column BI; and if it had, the motion would be extremely different from what it is: for this preflure alone would give it the velocity which Mr Buat affigns it. Now it is already paffing through the point I with the velocity which it has acquired in defcending along the curve $A I$; and this is the real ftate of the cafe. The particles are paffing through with a velocity already ac.

E R.
Part II.
quired by a floping current; and they are accelerated by the hydroftatical preffure of the water above them.
The internal mechanifm of thefe motions is infinitely more complex than Mr Buat here fuppofes; and on this fuppofition, he very nearly abandous the theory which he has fo ingeniounly eftablifhed, and adopts the theory of Guglielmini which he had exploded. At the fame time, we think that he is not much miftaken when he afferts, that the motions are nearly the fame as if a fluice had been let down from the furface to $I$. For the filament which paffes at I has been gliding down a curved furface, and has not been expofed to any frifion. It is perhaps the very cafe of hydraulics, where the obftructions are the fmallelt ; and we fhould therefore expect that its motion will be the lealt retarded.

We have therefore no hefitation in faying, that the filament at $I$ is in the very ftate of motion which the theory would aflign to it if it were paffing under a fuice, as Mr Buat fuppofes. And with refpect to the inferior filaments, without attempting the very difficult taik of inveftigating their motions, we fhall juft fay, that we do not fee any reafon for fuppofing that they will move flower than our author fuppofes. Therefore, though we reject his theory, we admit his experimental propofition in general ; that is, we admit that the woble water which paffes through the plane IF moves with the velocity (though not in the fame direction) with which it would have run through a fluice of the fame depth; and we may proceed with his determination of the quantity of water difcharged.

If we make BC the axis of a parabola BEGH, the velocities of the filaments paffing at $I$ and $F$ will be reprefented by the ordinates IE and FG, and the difcharge by the area IEGF. This allows a very neat folution of the problem. Let the quantity difcharged per fecond be $D$, and let the whole height BF be $b$. Let $2 G$ be the quantity by which we muft divide the fquare of the mean velocity, in order to have the producing height. This will be-lefs than $2 g$, the acceleration of gravity, on account of the convergency at the fides and the tendency to convergence at the lip $F$. We formerly gave for its meafure 726 inches, intead of 772 , and faid that the inches difcharged per fecond from an orifice of one inch were 26,49 , inftead of 27,78 . Let $x$ be the diftance of any filament from the horizontal line AB . An element of the orifice, therefore, (for we may give it this name) is $l \dot{x}$. The velocity of this element is $\sqrt{2 \mathrm{Gx}}$, or $\sqrt{2 \mathrm{G}} \times \sqrt{ } x$. The difcharge from it is $l \sqrt{2 \mathrm{G} x} \frac{\frac{1}{2}}{x}$, and the fluent of this, or $\mathrm{D}=f l \sqrt{2 \mathrm{G}} x^{\frac{1}{2}} x$, which is $\frac{2}{3} l \sqrt{2 \mathrm{G}} \boldsymbol{x}^{\frac{3}{2}}+\dot{\mathrm{C}}$. To determine the conftant quantity C , obferve that $\mathrm{Mr}_{\mathrm{r}}$ de Buat found by experiment that BI was in all cafes $\frac{x}{2} B F$. Therefore D mult be nothing when $x=\frac{\pi}{2} b$; confequently $C=-\frac{2}{3} l \sqrt{2 G}\left(\frac{b}{2}\right)^{\frac{3}{2}}$, and the com. pleted fluent, will be $\mathrm{D}=\frac{2}{3} l \sqrt{ } 2 \mathrm{G}\left(x^{\frac{3}{2}}-\left(\frac{h}{2}\right)^{\frac{3}{2}}\right)$.

Now make $x=h$, and we have
$\mathrm{D}=\frac{2}{3} l \sqrt{2 \mathrm{G}}\left(b \frac{3}{2}-\left(\frac{b}{2}\right)^{\frac{3}{2}}\right)=\frac{2}{3} l \sqrt{2 \mathrm{G}}\left(1-\left(\frac{1}{2}\right)^{\frac{3}{2}}\right) b_{\frac{3}{2}}$. But $-\left(\frac{1}{2}\right) \frac{3}{2}=0,64645$, and $\frac{2}{3}$ of this is 0,431 : Therefore, finally,

Practical $\quad \mathrm{D}=0,43 \mathrm{I}\left(\sqrt{2 \mathrm{G}} b \frac{3}{2} \times 1\right.$.).
 locity with which a head of water of one inch will impel the water over a weir, and multiply this by 0,431 , we get the following quantity 11,4172 , or, in numbers of eafy recollection, $1 \times \frac{x}{2}$, for the cubic inches of water per fecond, which runs over every inch of a walteboard when the edge of it is one inch below the furface of the refervoir; and this mult be multiplied by $h \frac{3}{2}$, or by the fquare root of the cube of the head of water. Thus let the edge of the walteboard be four inches below the furface of the water. The cube of this is 64 , of which the fquare root is eight. Therefore a walteboard of this depth under the furface, and three feet long, will difcharge every fecond $8 \times 36 \times 11 \frac{1}{2}$ cubic inches of water, or $\mathrm{I}_{\mathrm{T}}^{\mathrm{g}}$ cubic feet, Englifh meafure.

The following comparifons will fhow how much this theory may be depended on. Col. I. fhows the depth of the edge of the board under the furface; 2 . Thows the difcharge by theory; and, 3. the difcharge actually obferved. The length of the board was $18 \frac{1}{3}$ inches. N. B. The numbers in Mr Buat's experiments are here reduced to Englifh meafure.

| D. | D. Thenr. | D. Exp. | E. |
| :---: | :---: | :---: | ---: |
| $\mathbf{1 , 7 7 8}$ | 506 | 524 | 28,98 |
| 3,199 | $\mathbf{1 2 2 2}$ | $\mathbf{1 2 1 8}$ | 69,83 |
| 4,665 | 2153 | 2155 | 123,03 |
| 6,753 | 3750 | 3771 | 214,29 |

The laft column is the cubic inches difcharged in a fecond by each inch of the walteboard. The correfpondence is undoubtedly very great. The greateft error is in the firf, which may be attributed to a much fmaller lateral contraction under fo fmall a head of water.

But it mult be remarked, that the calculation proceeds on two fuppofitions. The height FI is fuppofed $\frac{x}{2}$ of BI ; and 2 G is fuppofed 726 . It is evident, that by increafing the one and diminifhing the other, nearly the fame anfwers may be produced, unlefs much greater variations of $h$ be examined. Both of thefe quantities are matters of confiderable uncertainty, particularly the firlt; and it mult be farther remarked, that this was not meafured, but deduced from the uniformity of the experiments. We prefume that Mr Buat tried various values of $G$, till he found one which gave the ratios of difcharge which he obferved. We beg leave to obferve, that in a fet of numerous experiments which he had accefs to examine, BI was uniformly much lefs than $\frac{x}{2}$; it was very nearly $\frac{2}{7}$ : and the quantity difcharged was greater than what would refult from Mr Buat's calculation. It was farther obferved, that IF depended very much on the form of the watteboard. When it was a very thin board of confiderable depth, JF was very confiderably greater than if the board was thick, or narrow, and fet on the top of a broad dam-head, as in fig. 18. $n^{\circ} 2$.

It may be proper to give the formula a form which will correfpond to any ratio which experience may dif. cover between BF and IF. Thus, let BI be $\frac{m}{n} B F$. The formula will be $\mathrm{D}=\frac{2}{3} l \sqrt{2 \mathrm{G}}\left(\mathrm{I}-\left(\frac{m}{n}\right)^{\frac{3}{2}}\right)^{b \frac{3}{2}}$

It is hoped that this and fome other fundamental
accurate experiments. The honourable Board for Fifh. Practical eries and Inprovements in Scotland have allotted a fum Inferenct: of money for making the neceffary experiments, and the refults will be publifhed by their authority. Meantime, this theory of Mr de Buat is of great value to the practical engineer, who at prefent mult content himfelf with a very vague conjecture, or take the calculation of the erroneous theory of Guglielmini. By that theory, the board of three feet, at the depth of four inches, fhould difcharge nearly $3 \frac{1}{70}$ cubic feet per fecond, which is almoft double of what it really delivers.

We prefume, therefore, that the following table will be acceptable to practical engineers, who are not familiar with fuch computations. It contains, in the firft column, the depth in Englifh inches from the furface of the ftagnant water of a refervoir to the edge of the walteboard. The fecond column is the cubic feet of water difcharged in a minute by every inch of the wafteboard.

| Depth. | Difcharge. |
| :---: | :---: |
| 1 | 0,403 |
| 2 | 1,140 |
| 3 | 2,095 |
| 4 | 3,225 |
| 5 | 4,507 |
| 6 | 5,925 |
| 7 | 7,466 |
| 8 | 9,122 |
| 9 | 10,884 |
| 10 | 12,748 |
| 11 | 14,707 |
| 12 | 16,758 |
| 13 | 18,895 |
| 14 | 21,117 |
| 15 | 23,419 |
| 16 | 25,800 |
| 17 | 28,258 |
| 18 | 30,786 |

When the depth does not exceed four inches, it will. not be exact enough to take proportional parts for the fractions of an inch. The following method is exact.

If they be odd quarters of an inch, look in the table for as many inches as the depth contains quarters, and take the eighth part of the anfwer. Thus, for $3 \frac{3}{4}$ inches, take the eighth part of 23,419 , which correfponds to 15 inches. This is 2,927 .
If the walteboard is not on the face of a dam, but: in a running ftream, we muft augment the difcharge by multiplying the fection by the velocity of the ftream. But this correction can feldom occur in practice; becaufe, in this cafe, the difcharge is previoully known; and it is $b$ that we want; which is the object of the nest problem.

We only beg leave to add, that the experiments which we mention as having been already made in this country, give a refult fomewhat greater than this table, viz. about ${ }_{x} \frac{1}{6}$. Therefore, having obtained the anfwer by this table, add to it its 16 th part, and we apprehend that it will be extremely near the truth.

When, on the other hand, we know the difcha:re over a wafteboard, we can tell the depth of its edge under the furface of the ftagnant water of the refervoir, becaufe we have $h=\left(\frac{\mathrm{D}}{1+1}\right)^{\frac{2}{3}}$ very nearly.

We are 50 in a condition to wive the problem refpecting a weis actofs a river.

Prob. II. 'l'se difcharge and feetion of a river being given, it is required to determine how much the waters wili be raifed by a weir of the whole breadth of the river, difcharging the water with a clear fall, that $i$;, the faface of the watcr in the lower channel being below the edge of the weir?

In this cafe we have $2 G=746$ nearly, becaule there will be no contraction at the fides when the weir is tl:e whole breadth of the river. But further, the wa$t: r$ is not now fagnant, but moving with the velocity I), $S$ being the fection of the river.

Therefore let $a$ be the height of the weir from the bottom of the river, and $b$ the height of the water above the edge of the weir. We have the velocity with which the water approaches the weir $=\frac{\mathrm{D}}{l(a+b)^{\prime}}$ $l$ being the length of the weir or breadth of the river. Therefore the height producing the primary mean velocity is $\left(\frac{\mathrm{D}}{\ln 2 g \cdot(a+b)}\right)^{\prime}$. The equation given a little ago will give $b=\left(\frac{D}{0,43 I / \sqrt{2 G}}\right) \frac{2}{3}$, when the water above the weir is Itagnant. Therefore, when it is already moving with the velocity $\frac{\mathrm{D}}{l a+b}$, we fhall

would be very troublefome to folve this equation regularly, becaufe the unknown quantity $b$ is found in the fecond term of the anfwer. But we know that the height producing the velocity above the weir is very fmall in comparifon of $b$ and of $a$, and, if only eftimated roughly, will make a very infenfible change in the value of $b$; and, by repeating the operation, we can correct this value, and obtain $b$ to any degree of exactneers.

To illuftrate this by an example. Suppofe a river, the fection of whofe ftream is 150 feet, and that it difcharges $\mathrm{I}_{7}+$ cubic feet of water in a fecond; how much will the waters of this river be raifed by a weir of the fame width, and 3 feet high ?

Suppofe the width to be 50 feet. This will give 3 feet for the depth; and we fee that the water will have a clear fall, becaufe the lower fream will be the fame as before.

The fection being 150 feet, and the difcharge 174, the mean velocity is $\frac{174}{15},=1,16$ feet, $=14$ inches nearly, which requires the height of $\frac{\pi}{4}$ of an inch very nearly. This may be taken for the fecond term of the value of $b$. Therefore $b=\left(\frac{\mathrm{D}}{0,43 \mathrm{I} \sqrt{2 \mathrm{G} l}}\right)^{\frac{2}{3}}-\frac{3}{4}$. Now $\sqrt{2 \mathrm{G}}$ is, in the prefent cale, $=27,3{ }^{1} 3 ; l$ is 600 , and D is $174 \times 1728,=300672$. Therefore $b=12,192$ $-0,25$, $=11,942$. Now correct this value of $h$, by correcting the fecond term, which is $\frac{x}{+}$ of an inch, in. ftead of $\left(\frac{\mathrm{D}}{\sqrt{2 g l(a+b)}}\right)^{2}$, or 0,141 . This will give us $h=12,192-0,1+1,=12,051$, differing from the firlt value about $\frac{T}{\text { rs of }}$ on inch. It is needlefs to carry
the approximation farther. Thus we fee that a weir, which dams up the whole of the former current of three feet deep, will only raife the waters of this river one foot.

The fame rule ferves for fhowing how high we ought to raife this weir in order to produce any given rife of the waters, whether for the purpoles of navigation, or ${ }^{3}$ for taking off a draft to drive mills, or for any other fervice; for if the breadth of the river remain the fame, the water will ftill flow over the weir with nearly; the fame depth. A very fmall and hardly perceptible difference will indeed arife from the diminution of flope occafioned by this rife, and a confequent diminution of the velocity with which the river approaches the weir. But this difference mult always be a fmall fraction of the fecond term of our anfwer; which term is itfelf very fmall: and even this will be compenfated, in fome degree, by the freer fall which the water will have over the weir.

If the intended weir is not to have the whole breadth of the river (which is feldom neceffary even for the' - purpofes of navigation), the waters will be raifed higher, by the fame height of the wafteboard. The calculation is precifely the fame for this cafe. Only in the fecond term, which gives the head of water correfponding to the velocity of the river, $l$ muft ftill be taken for the whole breadth of the river, while in the firt term $l$ is the length of the wafteboard: Alfo $\sqrt{2 \mathrm{G}}$ muft be a little lefs, on account of the contractions at the ends of the weir, unlefs thefe be avoided by giving the mafonry at the ends of the wafteboard a curved fhape on the upper fide of the wafteboard. This fhould not be done when the fole object of the weir is to raife the furface of the waters. Its effect is but trifling at any rate, when the length of the waltebard is confiderable, in proportion to the thicknefs of the fheet of water flowing over it

The following comparifons of this rule with experi. ment will give our readers fome notion of its utility.

| Difcharge <br> of the Weir <br> per Second. | Head pro- <br> ducing the <br> velocity at <br> the Weir. | Head pro- <br> ducing the <br> Velocity <br> above it. | Calculated <br> Height of <br> the River. <br> above the <br> Wailteboard. | Obferved <br> Height. |
| :---: | :---: | :---: | :---: | :---: |
| Incbes. | Incbes. | Incbes. | Incbes. | Inches. |
| 3888 | 7,302 | 0,625 | 6,677 | 6,583 |
| 2462 | 5,385 | 0,350 | 5,035 | 4,750 |
| 1112 | 3,171 | 0,116 | 3,055 | 3,166 |
| 259 | 1,201 | 0,0114 | 1,189 | 1,250 |

It was found extremely difficuit to meafure the exact height of the water in the upper flream above the walteboard. The curvature A I extended feveral feet up the ftream. Indeed there mult be fomething arbitrary in this meafurement, becaufe the furface of the ftream is not horizontal. The deviation fhould be taken, not from a horizontal plane, but from the inclined furface of the river.

It is plain that a river cannot be fitted for continued navigation by weirs. Thefe occafion interruptions; but a few inches may fometimes be added to the waters of a river by a BAR, which may ftill allow a flat-bottomed lighter or a raft to pafs over it. This is a very frequent practice in Holland and Flanders; and a very
cheap

Practical cheap and certain conveyance of goods is there obtained $\underbrace{\text { Inferences, }}$ by means of ftreams which we would think no better than boundary ditches, and unfit for every purpofe of this kind. By means of a bar the water is kept up a very few inches, and the Aream has free courfe to the fea. The fhoet over the bar is prevented by means of another bar placed a little way below it, lying flat in the bottom of the ditch, but which may be raifed up on hinges. The lighterman makes his boat falt to a ftake immediately above the bar, raifes the lower bar, brings over his boat, again makes it faft, and, having laid down the other bar again, proceeds on his journey. This contrivance anfwers the end of a lock at a very trifling expence; and though it does not admit of what we are accuftomed to call navigation, it gives a very fure conveyance, which would otherwife be impoflible. When the waters can be raifed by bars, fo that they may be drawn off for machinery or other purpofes, they are preferable to weirs, becaufe they do not obftruct floating with rafts, and are not deftroyed by the ice.
$P_{r o b}$. III. Given the height of a bar, the depth of water both above and below it, and the width of the river, to determine the difcharge?

This is by no means fo eafily folved as the difcharge over a weir, and we cannot do it with the fame degree of evidence. We imagine, however, that the following obfervations will not be very far from a true account of the matter.

We may firft fuppofe a refervoir LFBM (fig. 19.) of ftagnant water, and that it has a watteboard of the height CB. We may then determine, by the foregoing problems, the difcharge through the plane EC. With refpect to the difcharge through the part CA, it fhould be equal to this product of the part of the fection by the velocity correfponding to the fall EC, which is the difference of the heighis of water above and below the bar; for, becaure the difference of $\mathrm{E} a$ and $\mathrm{C} a$ is equal to EC , every particle $a$ of water in the plane CA is preffed in the direction of this Itream with the fame force, viz. the weight of the column E C. The fum of thefe difcharges thould be the whole difcharge over the bar; but fince the bar is fet up acrofs a running river, its difcharge mult be the fame with that of the river. The water of the river, when it comes to the place of the bar, has acquired fome velocity by its flope or other caufes, and this correfponds to fome height $F$ E. This velocity multiplied by the fection of the river, having the height E B , Chould give a difcharge equal to the difcharge over the bar.

To avoid this complication of conditions, we may firf compute the difcharge of the bar in the manner now pointed out, without the confideration of the previous velocity of the ftream. This difcharge will be a little too fmall. If we divide it by the fection $F B$, it will give a primary velocity too fmall, but not far from the truth. Therefore we fhall get the height F E, by means of which we fhall be able to determine a velocity intermediate between D G and CH, which would correfpond to a weir, as alfo the velocity CH , which correfponds to the part of the fection C A, which is wholly under water. Then we correct all thefe quan.
V.oz. XVI.
tities by repeating the operation with them infead of our firft affumptions.

Practical
Mr Buat found this computation extremely near the truth, but in all cafes a little greater than obfervation exhibited.
We may now folve the problem in the moft general terms.
$P_{\text {rob. IV. Giver the breadth, depth, and the flope }}$ of a river, if we confine its paffage by a bar or weir of a known height and width, to determine the rife of the waters above the bar.

The flope and dimenfions of the channel being given, our formula will give us the velocity and the quantity of water difcharged. Then, by the preceding problem, find the height of water above the wafteboard. From the fum of thefe two heights deduct the ordinary depth of the river. The remainder is the rife of the waters. For example :

Let there be a river whofe ordinary depth is 3 feet, and breath 40 , and whofe flope is $1 \frac{1}{2}$ inches in 100 fathoms, or $\frac{x}{880}$. Suppofe a weir on this river 6 feet high and 18 feet wide.

We mult firft find the velocity and difcharge of the river in its natural fate, we have $l=480$ inches, $b=$ $36, \frac{\mathbf{I}}{s}=\frac{\mathrm{r}}{4800}$. Our formula of uniform motion gives $V=23,45$, and $D=405216$ cubic inches.

The contraction obtains here on the three fides of the orifice. We may therefore take $\sqrt{2 \mathrm{G}}=26, \mathrm{r}$. $N . B$. This example is Mr Buat's, and all the meafures are French. We have alfo $a$ (the height of the weir) 72, and $2 g=724$. Therefore the equation $b=$ $\left(\frac{\mathrm{D}}{0,43 \mathrm{I} \sqrt{2 \mathrm{G} l}}\right) \frac{2}{3}-\left(\frac{\mathrm{D}}{\operatorname{l\sqrt {2g}(a+b}) \text { becomes } 30,182 . . . . ~ . ~}\right.$ Add this to the height of the weir, and the depth of the river above the fluice is $102,182,=8$ feet and 6,182 inches. From this take 3 feet, and there remains 5 feet and 6,182 inches for the rife of the waters.

There is, however, an important circumftance in this rife of the waters, which mult be diltinctly underftood before we can fay what are the interefting effects of this weir. This fwell extends, as we all know, to a confiderable diftance up the fream, but is lefs fenfible as we go away from the weir. What is the diftance to which the fwell extends, and what increafe does it produce in the depth at different diftances from the weir ?

If we fuppofe that the flope and the breadth of the channel remain as before, it is plain, that as we come down the fream from that point where the fwell is infenfible, the depth of the channel increafes all the way to the dam. Therefore, as the fame quantity of water paffes through every fection of the river, the velocity mult diminifh in the fame proportion (very nearly) that the fection increafes. But this being an open ftream, and therefore the velocity being infeparably connected with the flope of the furface, it follows, that the flope of the furface mult diminifh all the way from that point where the fwell of the water is infenfible to the dam. The furface, therefore, cannot be a fimple inclined plane, but mult be concave upwards, as reprefented in fig. 20. where FKLB reprefents the channel of a river, and FB the furface of the water running in it. If this be kept up to $A$ by a weir $A L$, the furface $P_{p}$ will

Practical
Inferences. $\underbrace{\text { Inferences. }}$
touches it in $A$ will have the flope $S$ correfponding the velocity which the waters have immediately before going over the weir. We know this flope, becaufe we are fuppofed to know the difcharge of the river and its flope and other circumftances before barring it with a dam; and we know the height of the dam H , and therefore the new velocity at $A$, or immediately above $A$, and confequently the flope $S$. Therefore, drawing the horizontal lines DC, AG, it is plain that $C B$ and CA will be the primary flope of the river, and the flope $S$ correfponding to the velocity in the immediate neigh. bourhood of A, becanfe thefe verticals have the fame horizontal difance DC. We have therefore CB:CA $=S: s$ very nearly, and $\mathrm{S}-\mathrm{s}: s=\mathrm{CB}-\mathrm{CA}: \mathrm{CA}$, $=\underset{H}{A B}$ (nearly) : CA. Therefore $C A=\frac{A B \times s}{S-s},=$ $\frac{\mathrm{H}_{s}}{\mathrm{~S}-s}$. But DA $=\mathrm{CA} \times \mathrm{S}$, by our definition of flope; therefore DA $=\frac{\text { H.S. } s}{S-s}$.

This is all that we can fay with precifion of this curve. Mr Buat examined what would refult from fuppofing it an arch of a circle. In this cafe we fhould have $D A=D F$, and $A F$ very nearly equal to 2 AD : and as we can thus find AD, we get the whole length FIA of the fwell, and alfo the diftances of any part of the curve from the primitive furface FB of the river ; for thefe will be very nearly in the duplicate proportion of their diftances from F. Thus ID will be $\frac{1}{4}$ of $A B$, \&c. Therefore we ihould obtain the depth I $d$ of the ftream in that place. Getting the depth of the fream, and knowing the difcharge, we get the velocity, and can compare this with the flope of the furface at I. This fhould be the flope of that part of the arch of the circle. Making this comparifon, he found thefe circumflances to be incompatable. He found that the fection and fwell at I, correfponding to an arch of a circle, gave a difcharge nearly $\frac{1}{4}$ th too great (they were as 405216 to 492142 ). Therefore the curve is fuch, that AD is greater than DF , and that it is more incurvated at $F$ than at $A$. He found, that making DA to DF as 10 to 9 , and the curve FIA an arch of an ellipfe whofe longer axis was vertical, would give a very nice correfpondence of the fections, velocities, and flopes. The whole extent of the fwell therefore can never be double of $A D$, and mult always greatly furpafs AD; and thefe limits will do very well for every practical queltion. Therefore making $\mathrm{DF} \frac{9}{x_{0}}$ of AD , and drawing the chord $A D$, and making $D I \frac{1}{2}$ of $D i$, we fhall be very near the truth. Then we get the fwell with fufficient precifion for any point $H$ between $F$ and D , by making $\mathrm{FD}^{2}: \mathrm{FH}^{2}=\mathrm{ID}: \mathrm{H} b$; and if H is between $D$ and $A$, we get its diftance from the tangent DA by a fimilar procefs.

It only remains to determine the fwell produced in the waters of a river by the erection of a bridge or cleaning fluice which contracts the paffage. This requires the folution of

Pros. V. Given the depth, breadth, and flope of a river, to determine the fwell occafioned by the piers of a bridge or fides of a cleaning fluice, which contract
the paffage by a given quantity, for a given length of channel.

This fwell depends on two circumftances.

1. The whole river mult pafs through a narrow fpace, with a velocity proportionably increafed; and this requires a certain head of water above the bridge.
2. The water, in paffing the length of the piers with a velocity greater than that correfponding to the primary flope of the river, will require a greater flope in order to acquire this velocity.

Let V be the velocity of the river before the erection of the bridge, and $K$ the quotient of the width of the river divided by the fum of the widths between the piers. If the length of the piers, or their dimenfion in the direction of the ftream, is not very great, KV will nearly exprefs the velocity of the river under the arches; and if we fuppofe for a moment the contraction (in the fenfe hitherto ufed) to be nothing, the height produ: cing this velocity will be $\frac{K^{2} V^{2}}{2 g}$. But the river will not rife fo high, having already a flope and velocity before getting under the arches, and the height correfponding to this velocity is $\frac{\mathrm{V}^{2}}{2 g}$; therefore the height for producing the augmentation of velocity is $\frac{\dot{\mathrm{K}}^{2} \mathrm{~V}^{2}}{2 g}$ $-\frac{V^{2}}{2 g}$. But if we make allowance for contraction, we muft employ a 2 G lefs than $2 g$, and we muft multiply the height now found by $\frac{2 g}{2 G}$. It will then become $\left(\frac{\mathrm{K}^{2} \mathrm{~V}^{2}}{2 g}-\frac{\mathrm{V}^{2}}{2 g}\right)_{2} \frac{2 g}{2 \mathrm{G}},=\frac{\mathrm{V}^{2}}{2 \mathrm{G}}\left(\mathrm{K}^{2}-\mathrm{I}\right)$. This is that part of the fwell which mult produce the augmentation of velocity.

With refpect to what is neceffary for producing the additional flope between the piers, let $p$ be the natural flope of the river (or rather the difference of level in the length of the piers) before the erection of the bridge, and correfponding to the velocity $\mathrm{V} ; \mathrm{K}^{2} p$ will very nearly exprefs the difference of fuperficial level for the length of the piers, which is neceffary for maintaining the velocity KV through the fame length. The increafe of flope therefore is $\mathrm{K}^{2} p-p=p\left(\mathrm{~K}^{2}-\mathrm{L}_{4}\right.$. Therefore the whole fwell will be $\left(\frac{V^{2}}{2 \mathrm{G}}+p\right) \frac{\mathrm{K}^{2}-1}{}$.

These are the ckief quetions or problems on this further atfubject which occur in the practice of an engineer; and tention to the folutions which we have given may in every cafe be the finbject depended on as very near the truth, and we are confi- recomdent that the errors will never amount to one-fifth of mended. the whole quantity. We are equally certain, that of thofe who call themfelves engineers, and who, without hefitation, undertake jobs of enormous expence, not one in ten is able even to guefs at the refult of fuch operations, unlefs the circumances of the cafe happen to coincide with thofe of fome other project which he has exccuted, or has diftinctly examined; and very few have the fagacity and penetration neceffary for appreciating the effects of the diftinguifhing circumftances which yet remain. The fociety eftablifhed for the er,couragement

Pratical couragement of arts and manufactures could fcarcely do Inferences. a more important fervice to the public in the line of Their inftitution, that by publifhing in their Tranfactions a defcription of every work of this kind executed in the kingdom, with an accouat of its performance. This would be a molt valuable collection of experiments and facts. The unlearned practitioner would find among them fomething which relembles in its chief circumftances almoft any project which could occur to him in his bufinefs, and would tell him what to expect in the cale under his management: and the intelligent engineer, affited by mathematical knowledge and the habit of claffing things together, would frequently be able to frame general rules. To a gentlman qualified as was the Chevalier de Buat, fuch a collection would be ineftimable, and raight fuggeft a theory as far fuperior to his as he has gone before all other writers.

110 Modes of making Tmatl rivers and brooks fit for inland navigation.

We fhall conclude this article with fome obfervations on the methods which may be taken for rendering fmall rivers and brooks fit for inland navigation, or at leaft We get much inftruction on this fubject from what has been faid concerning the fwell produced in a river by weirs, bars, or any diminution of its former fection. Our knowledge of the form which the furface of this fwell affects, will furnilh rules for fpacing thefe obftructions in fuch a manner, and at fuch diftances from each other, that the fwell produced by one thall extend to the one above it.

If we know the flope, the breadth, and the depth of a river, in the droughts of fummer, and have determined on the height of the flood-gates, or keeps, which are to be fet up in its bed, it is evident that their fations are not matters of arbitrary choice, if we would derive the greatelt poffible advantage from them.

Some rivers in Flanders and Italy are made navigable in fome fort by fimple fluices, which, being fhut, form magazines of water, which, being difcharged by opening the gates, raifes the inferior reach enough to permit the paffage of the craft which are kept on it. After this momentary rife the keeps are fhut again, the water finks in the lower reach, and the lighters which were floated though the fhallows are now obliged to draw into thofe parts of the reach where they can lie afloat till the next fupply of water from abcve enables them to proceed. This is a very rude and imperfect method, and unjuftifiable at this day, when we know the effect of locks, or at lealt of double gates. We do not mean to enter on the confideration of thefe contrivances, and to give the methods of their conftruction, in this place, but refer our readersto what has been already faid on this fubject in the articles Canal, Lock, Navigation (Inland), and to what will be faid in the article $W_{\text {ater. }}$ Works. At prefent we confine ourfelves to the fingle point of hufbanding the different falls in the bed of the river, in fuch a manner that there may be everywhere a fufficient depth of water: and, in what we have to deliver on the fubject, we thall take the form of an example to illuatrate the application of the foregoing rules.

Suppofe then a river 40 feet wide and 3 feet deep in the droughts of fummer, with a llope of 1 in 4800. This, by the formala of uniform motion, will have a
velocity $V=23^{\frac{x}{2}}$ inches per fecond, and its difcharge Pradical will be 405216 cubic inches, or $234 \frac{1}{2}$ feet. It is pro- Inferences. pofed to give this river a depth not lefs than five feet in any place, by means of flood-gates of fix feet high and 18 feet wide.

We firft compute the height-at which this body of $234^{\frac{1}{2}}$ cubic feet of water will difcharge itfelf over the flood-gates. This we fhall find by Prob. II. to be $30 \frac{x}{7}$ inches, to which adding 72, the height of the gate, we have $102 \frac{1}{4}$ for the whole height of the water above the floor of the gate; the primitive depth of the river being 3 feet, the rife or fwell 5 feet $6 \frac{1}{4}$ inches. In the next place, we find the range or fenfible extent of this fwell by Prob. I. and the oblevations which accompany it. This will be found to be nearly 9177 fathoms. Now fince the primitive depth of the river is three feet there is only, wanted two feet of addition; and the queftion is reduced to the finding what point of the curved furface of the fwell is two feet above the tangent plane at the head of the fwell ? or how far this point is from the gate? The whole extent being 9177 fathoms, and the deviation from the tangent plane being nearly in the duplicate ratio of the diftances from the point of contact, we may inftitute this proportion $66 \frac{1}{2}: 24=9177^{2}: 55^{2} 6^{3}$. The laft term is the diftance (from the head of the fwell) of that part of the furface which is two feet above the primitive furface of the river. Therefore $9177-5526$, or 365 I fathoms, is the diftance of this part from the flood-gate; and this is the diftance at which the gates flould be placed from each other. No inconvenience would arife from having them nearer, if the banks be high enough to contain the waters $;$ but if they are farther ditant, the required depth of water cannot be had without increafing the height of the gates; butif reafons of conveniency fhould induce us to place them nearer, the fame depth may be fecured by lower gates, and no additional height will be required for the banks. This is generally a matter of moment, becaufe the raifing the water brings along with it the cbance of flooding the adjoining fields. Knowing the place where the fwell ceafes to be fenfible, we can keep the top of the intermediate flood-gate at the precife height of the curved furface of the fwell by means of the proportionality of the deviations from the tangent to the diftances from the point of contact.

But this rule will not do for a gate which is at a greater diftance from the one above it than the 365 I fathoms already mentioned. We know that a higher gate is required, producing a more extenfive fwell; and the one fwell does not coincide with the other, although they may both begin from the fame point A (fig. 2 I.) Nor will the curves even be fimilar, unlefs the thicknefs of the fheet of water flowing over the gate be increafed in the fame ratio. But this is not the cafe; becaufe the produce of the river, and therefore the thicknefs of the fheet of water, is conftant.

But we may fuppofe them fimilar without erring more than two or three decimalsof. an inch; and then we fhall have $\mathrm{AF}: \mathrm{AL}=f \mathrm{~F}: \mathrm{DL}$; from which, if. we take the thicknefs of the fheet of water already calculated for the other gates, there will remain the heigl, of the gate BL

Pratical $\underbrace{1 \text { Iuferences. }}$

111 Effects of ircines,

112
And of lo-
And of lo- In order therefore to procure durability to works of ftuinces,

By following thefe methods, intead of proceeding by water at the fmalleft expence pofible.

But there is a circumftance which muft be attended to, and which, if neglected, may in a fhort time render all our works ufelefs. Thefe gates mult frequently be open in the time of freftes; and as this channel then has its natural flope increafed in every reach by the great contraction of the festion in the gates, and alfo rolls along a greater body or water, the action of the fream on its bed mult be increafed by the augmentation of velocity which thefe circumftances will produce: and although we may fay that the general flope is neceffarily fecured by the cills of the flood-gates, which are paved with foone or covered with planks, yet this will not hinder this increafed current from digging up the bottom in the intervals, undermining the banks, and lodging the mud and earth thas carried off in places whene the current meets with any check. All thefe confequences will affuredly follow if the increafed velocity is greater than what corref ponds to the regimen relative to the foil in which the river holds on its courié. this kind, which are generally of enormous expence,
the local circumftances muft be mof fcrupuioufly fu- died. It is not the ordinary hurried furvey of an en. gineer that will free us from the rifk of our navigation becoming very troublefome by the rife of the waters being diminifhed from their former quantity, and banks formed at a fmall diftance below every fluice. We mult attentively fudy the nature of the foil, and difcover experimentally the velocity which is not inconfifent with the permanency of the channel. If this be not a great deal lefs than that of the river when accelerated by frefhes, the regimen may be preferved after the eftablifhment of the gate, and no great changes in the channel will be neceffary: but if, on the other hand, the natural velocity of the river during its frefhes greatly exceeds what is confiftent with ftability, we mult enlarge the width of the channel, that we may diminifh the hydraulic mean depth, and along with this the velocity. Therefore, lnowing the quanity difcharged during the frefhes, divide it by the velocity of regimen, or mather by a velocity fomewhat greater (for a reafon which will appear by and by), the quotient will be the area of a new fection. Then taking the natural fope of the river for the llope which it will preferve in this enlarged channel, and after the cills of the food-gates bave been fixed, we mult calculate the hydraulic mean depth, and then the other dimenfions of the channel. And, laftly, from the known dimenfions of the channel and the difcharge (which we mur now compute), we proceed to calculate the height and the diftances of the flond gates, adjufted to their widths, which muft be regulated by the room which may be thought proper for the free paffage of the lighters which are to ply on the river. An example will illuitrate the whole of this 113 procels.
Inurrated Suppofe then a fmall river having a flope of 2 inches
Sy an example. of fuch fmall itreams, and whofe depth in fummer is 2 feet, but fubject to floods which raife it to nine feet.

Let its breadth at the bottom be 18 fect, and the bafe Let its breadth at the bottom be 18 fect, and the bafe Practical
of its flanting fides $\frac{4}{3}$ of their height. All of thefe di. Inferences. menfions are very conformable to the ordinary courfe of things. It is propofed to make this river navigable in all fearons by means of keeps and gates placed at proper diftances; and we want to know the dimenfions of a channel which will be permanent, in a foil which begins to yield to a velocity of 80 inches per fecond, but will be fafe under a velocity of 24 .

The primitive channel having the properties of a rectangular channel, its breadth during the frefhes mult be $B=30$ feet, or 360 inches, and its depth $b 9$ feet or 108 inches; therefore its hydraulic mean depth $d=\frac{\mathrm{B} b}{\mathrm{~B}+2 b}=61,88$ inches. Its real velocity therefore, during the frefhes, will be 38,9447 inches, and its difcharge 1514169 cubic inches, or $876 \frac{1}{4}$ cubic. feet per fecond. We fee therefore that the natural channel will not be permanent, and will be very quickly deltroyed or changed by this great velocity. We have two mretheds for procuring flability, viz. diminilhing the flope, or widening the bed. The firt method will require the courfe to be lengthened in the proportion of $24^{2}$ to $3988^{2}$, or nearly of 36 to 100 . The expence of this would be enormous. The fecond method will require the hydraulic mean depth to be increafed nearly in the fame proportion (becaufe the velocities are nearly as $\frac{\sqrt{d}}{\sqrt{s}}$. This will evidently be much lefs coit. ly, and, even to procure convenient room for the navigation, mult be preferred.

We mult now obferve, that the great velocity, of which we are afraid, obtains only during the winter floods. It therefore we reduce this to 24 inches, it mult happen that the autumnal frefhes, loaded with fand and mud, will certainly depofit a part of it, and choak up our channel below the flood-gates. We muft therefore felect a mean velocity fomewhat exceeding the regimen, that it may carry off thefe depofitions. We fhall take 27 inches, which will produce this effect on the loofe mud without endangering our channel in any remarkable degree.
Therefore we have, by the theorem for uniform mo. tion, $\mathrm{V}=27,=\frac{297(\sqrt{d}-0,1)}{\sqrt{s}-\mathrm{L} \sqrt{s+1,6}}-0,3(\sqrt{s}-0,1)$. Calculating the divifor of this formula, we find it $=55,884$. Hence $\sqrt{d}-0,1=\frac{27 \text { inch. }}{\frac{297}{55,884}-0,3}=$
$5,3^{8} 43$, and therefore $d=30 \frac{*}{T_{2}^{2}}$. Having thus determined the hydraulic mean depth, we find the area S of the fection by dividing the difcharge 1514169 by the velocity 27. This gives us 56080,368 . Then we get the breadth B by the formula formerly given, $\left.B=\sqrt{\left(\frac{S}{2 d}\right)^{2}-{ }_{2} S} \right\rvert\,+\frac{S}{2 d}=1802,296$ inches, or 150,19 feet, and the depth $h=31,115$ inches.

With thefe dimenfions of the fection we are certain that the channel will be permanent; and the cills of the flood gates being all fixed agreeable to the primitive
ilope,

Prattical flope, we need not fear that it will be changed in the tion produced by a flood-gate is confiderable, exceeding Prasical $\underbrace{\text { lnferences. intervals by the action of the current. The gates be- }}$ $\underbrace{}_{\text {ing all open during the frefhes, the bottom will be }}$ cleared of all depofited mud.
114 Station of the flood-

We noult now flation the flood-gates along the new Satcs, \&c. channel, at fuch diflances that we may have the depth of water which is proper for the lighters that are to be employed in the navigation. Suppofe this to be four feet. We mult firlt of all learn how high the water will be kept in this new channel during the fummer droughts. There remained in the primitive channel only 2 feet, and the fection in this cafe had 20 feet 8 inches mean width; and the difcharge correfponding to this fection and flope of $\overline{3} \frac{8}{6} \sigma \mathrm{a}$ is, by the theorem of uniform motion, $13^{\circ}, 849$ cubic inches per fecond. To find the depth of water in the new channel correfponding to this difcharge, and the fame flope, we mult take the method of approximation formerly exemplified, remembering that the difcharge $D$ is 130849 , and the breadth 15 is 1760,8 at the bottom (he flant fides being $\frac{4}{3}$ ). Thefe data will produce a depth of water $=6 \frac{5}{3}$ inches. 'To obtain four feet therefore behind any of the flood-gates, we mult have a fevell of $41^{\frac{2}{3}}$ inches produced by the gate below.

We mult now determine the width of paffage which muft be given at the gates. This will regulate the thicknefs of the fleet of water which flows over them when thut ; and this, with the height of the gate, fixes the fwell at the gate. The extent of this fwell, and the elevation of every point of its curved furface above the new furface of the river, requires a combination of the height of fwell at the flood-gate, with the primitive flope and the new velocity. Thefe being computed, the flations of the gates may be affigned, which will fecure four feet of water behind each in fummer. We need not give thefe computations, having already exemplified them all with relation to another river.

This example not only illuftrates the method of proceeding, fo as to be enfured of fuccefs, but alfo gives us a precife infance of what muft be done in a cafe which cannot but frequently occur. We fee what a prodigious excavation is neceffary, in order to abtain permanency. We have been obliged to enlarge the primitive bed to about thrice its former fize, fo that the excavation is at leaft two-thirds of what the other method required. The expence, however, will fill be vaftly inferior to the other, both from the nature of the work and the quantity of ground occupied. At all events, the expence is enormous, and what could never be repaid by the navigation, except in a very rich and populous country.

There is another circumftance to be attended to.The navigation of this river by fluices mult be very defultory, uniefs they are extremely numerous, and of fmail heights. The natural fuaface of the fwell being concave upwards, the additions made by its different parts to the primitive height of the river decreafe rapidly as they atproach to the place A (fig. 20), where the fwell terminates; and three gates, each of which raifes the water on:e foot when placed at the proper diftance from each other, will raife the water much more than two gates at twice this diftance, each raifing the water two fett. Morecver, when the eleva-
a very few inches, the fall and current produced by the $\underbrace{\text { Inferences. }}$ opening of the gate is fuch, that no boat can poffibly pals up the river, and it runs imminent rifk of being overfet and funk, in the attempt to go down the ftream. This renders the navigation defultory. A number of lighters collect themtelves at the gates, and wair their opening. They pafs through as foon as the current becomes moderate. This would not, perhaps be very hurfful in a regulated navigation, if they could then proceed on their veyage. But the boats boind up the river mult flay on the upper fide of the gate which they have juft now paffed, becaufe the channel is now too thallow for them to proceed. Thofe bound down the river can only go to the nest gate, unlefs it has been opened at a time nicely adjufted to the opening of the one above it. The palfage downwards may, in many cafes, be continued, by very intelligent and attentive lockmen, but the paffage up $m u / t$ be exceedingly tedious. Nay, we may fay, that wobile the paffage downwards is continuous, it is but in a very few cafes that the paflage upwards is practicabie. If we add to thefe inconveniencies the great danger of palfage during the frefhes, while all the gates are open, and the immenfe ard unavoidable accumulations of ice, on occafion even of flight frofts, we may fee that this method of procuring an inland navigation is amazingly expenfive, defultory, tedious, and hazardous. It did not therefore merit, on its own account, the attention we have beflowed on it. Rut the difcuffion was abfolutely neceflary, in orjer to fhow what mult be done in order to obtain effect and permanency, and thus to prevent us from engaging in a project which, to a perfon not duly and confidently informed, is fo feafible and promifing. Many profellional engineers are ready, and with honeft intentions, to undertake fuch taiks; and by awoiding this immenfe expence, and contenting themfelves with a much narrower channel, they fucceed, (witnefs the old navigation of the river Merfey). But the work has no duration; and, not having been found very ferviceable, its ceffation is not matter of much regret. The work is not much fpoken of during its continuance. It is foon forgotten, as well as its failure, and engineers are found ready to engage for fuch another.

It was not a very refined thought to change this introduc impertect mode for another íree from moft of its incon-tion of veniencies. A boat was brought up the river, through locks. one of thefe gates, only by raifing the waters of the inferior reach, and deprefling thofe of the upper : and it could not efcape obfervation, that when the gates were far afunder, a vaft body of water mult be difcharged before this could be done, and that it would be a great im. provement to double each gate, with a very fmall diftance between. Thus a very fmall quartity of water would fill the interval to the defired height, and allow the boat to come through; and this thought was the more cbvious, from a fimilar practice having preceded it, viz. that of navigating a fmall river by means of double bars, the lowefl of which lay flat in the bottom of the river, but could be raifed up on hinges. We have mentioned this already ; and it appears to have been an old practice, being mentioned by Stevinus in Eis valuable work

Vractical $\underbrace{\text { Inferences. }}$ century ; yet no trace of this method is to be found of much older dates. It occurred, however, accidentally, pretty often in the flat countries of Holland and Flan. ders, which being the feat of frequent wars, almolt every town and village was fortified with wet ditches, connected with the adjoining rivers. Stevinus mentions particularly the works of Condé, as having been long employed, with great ingenuity, for rendering navigable a very long ftretch of the Scheldt. The boats were received into the lower part of the foffee, which was feparated from the reft by a ftone batardeau, ferving to keep up the waters in the reft of the foffee about eight feet. In this was a fluice and another dam, by which the boats could be taken into the upper foffee, which communicated with a remote part of the Scheldt by a long canal. This appears to be one of the earlieft locks.

In the firt attempt to introduce this improvement in the navigation of rivers already kept up by weirs, which gave a partial and interrupted navigation, it was ufual to avoid the great expence of the fecond dam and gate, by making the lock altogether detached from the river, within land, and having its bafon parallel to the river, and communicating by one end with the river above the weir, and by the other end with the river below the weir, and having a flood-gate at each end.This was a moft ingenious thought ; and it was a prodigious improvement, free from all the inconveniences of currents, ice, \&c. \&c. It was called a Schluffel, or lock, with confiderable propriety ; and this was the origin of the word fluice, and of our application of its tranflation lock. This practice being once introduced, it was not long before engineers found that a complete feparation of the navigation from the bed of the river was not only the moft perfect method for obtaining a fure, eafy, and uninterrupted navigation, but that it was in general the mof œconomical in its firft conftruction, and fubject to no rifk of deterioration by the action of the current, which was here entirely removed. Locked canals, therefore, have almoft entirely fupplanted all attempts to improve the natural beds of rivers; and this is hardly ever attempted except in the flat countries, where they can hardly be faid to differ from horizontal canals. We therefore clofe with thefe obfervations this article, and referve what is yet to be faid on the conftructoin of canals and locks for the article Whter.Works.

We beg leave, however, to detain the reader for a few moments. He cannot but have obferved our anxiety to render this differtation worthy of his notice, by making it practically ufeful. We have on every occafion appealed, from all theoretical deductions, however fpecious and well fupported, to fact and obfervation of thofe fpontaneous phenomena of nature which are continually paffing in review before us in the motion of running waters. Refting in this manner our whole doctrines on experiment, on the obfervation of what really happens, and what happens in a way which we cannot or do not fully explain, thefe fipontaneous operations of nature came infenfibly to acquire a particular value in our imagination. It has alfo happened in the courfe of our reflections on thefe fub-
jects, that thefe phenomena have frequently prefented themfelves to our view in groups, not lefs remarkable for the extent and the importance of their confequences than for the fimplicity, and frequently the feeming infignificancy, nay frivolity, of the means employed. Our fancy has therefore been fometimes warmed with the view of a fomething; an

## Ens agitans molem, et magno fe corpore mifiens.

This has fometines made us exprefs ourfelves in a way that is fufceptible of mifinterpretation, and may even lead into a miftake of our meaning.

We therefore find ourfelves obliged to declare, that by the term nature, which we have fo frequently ufed con amore, we do not mean that indefcribable idol which the felf-conceit and vanity of certain would-be philofophers have fet up of late, and oftentatioufly ftand on tiptoe to worfhip. This ens rationis, this creature of the imagination, has long been the object of cool of the imagination, has long been the object of cool Thared his attention with many other play-things of his
ever-working fancy. But the more the works of NA-ever-working fancy. But the more the works of NaTURE are inveftigated by thofe who alone deferve the name of true philofophers, the more evidently will they be difcovered to be not the chance fragments of a fatal chaos, but the beautiful productions of a wonderful Artift, and the darling objects of his care : and we perfuade ourfelves that many thoufands are
ready to rally under the banners of true religion and and we perfuade ourfelves that many thoufands are
ready to rally under the banners of true religion and found philofophy, and to follow the fteps of a Clarke, a Butler, a Newton, and a Boyle, who fo eminently diftinguifhed themfelves in the caufe of Nature's God.

By nature, then we mean that admirable fyftem of
general laws, by which the adored Author and Governor of the univerfe has thought fit to connect the various parts of this wonderful and goodly frame of things, and ' to regulate all their operations.

We are not afraid of continually appealing to the
laws of nature; and as we have already obferved in the article Philosofhy, we confider thefe general laws as the moft magnificent difplays of ,Infinite Wifdom, and the contemplation of them as the molt cheering employment of our underftandings.

At the fame time we defpife the cold-hearted philofopher who ftops fhort here and is fatisfied (perhaps inwardly pleafed) that he has completely accounted for every thing by the laws of unchanging nature; and we fufpect that this philofopher would analyfe with the fame frigid ingenuity, and explain by irrefintible: sop $2 n$, the tender attachment of her whofe breaft he fucked, and who by many anxious and fleeplefs nights preferved alive the puling infant. But let us rather liften to the words of him who was the molt fagacious obferver and the moft faithful interpreter of nature's laws, the illuftrious Sir Ifaac Newton. He fays,
"Elegantiffima hæcce rerum compages non nificonfilio et dominio entis fapientiffimi et potentiflimi oriri potuit. Omnia, fimili conftructa confilio, fuberunt unius dominio. Hic omnia regit, non ut anima mundi, fed ut univerforum dominus. Propter dominium fuum dominus

" Hunc cognofcimus, folummodo per proprietates Prastical ejus et attributa. Attribuuntur ut ex phenomenis Inferences dignofcuntur. Phenomena funt fapientiffimæ et optimæ rerum ftructuræ, atque caufx finales.- Hunc admiramur ob ferfectiones; hunc veneramur et colimus ob domininm" ( B ).
'(в) Our readers will probably be pleafed with the following lift of authors who have treated profeffedly of the motions of rivers: Guglielmini De Fluvis et Caftellis Aquarum-Danubius Illuftratus; Grandi De Caftellis; Zendrini De Motu Aquarum; Frilius D: Fluviis; Lecchi Idrofotica i Idraulica; Michelotii Spereince Idrauliche; Beldior's Architecture Hydraulique; Boffut Hydrodynamique; Buat Hydraulique ; Silberfchlag Theorie des Fleuves; Lettres de M. L'Epinaffe au P. Frifl touchant fa Theorie des Fleuves; Tableau dis principales Rivieris du Monde, par Genetté; Stevins fur les Eclufes, T'raitédes Eclufes; par Boulard, qui a remporté le Prix de l'Acad. de Lyons; Bleivwyck Differtatio de Aggeribus; Boffut et Viallet fur la Confruction des Digues; Stevin Hydrofatica; Tielman van der Horft Theatrum Machinarum Univerfale; De la Lande fur les Canaux d: Naviçation; Racolta di Autori chi Trattano del Moto dell' Aque, 3 tom. 4to, Firenza 1723. -This moft valuable collection contains the writings of Archimedes, Albizi, Galileo, Caftelli, Michelini, Borelli, Montanari, Viviani, Caffini, Guglielmini, Grandi, Manfredi, Picard, and Narduci; and an account of the numberlels works which have been carried on in the embankment of the Po.
$R_{I I^{\prime} \mathrm{ER} \text {.Water. This is generally much fofter and }}$ better accommodated to economical purpofes than fpring-water. For though rivers proceed originally from fprings, yet, by their rapid motion, and by being expofed during a long courle to the influence of the fun and air, the ear thy and metallic falts which they contain are decompoled, the acid flies off, and the terreftrial parts precipitate to the bottom. Rivers are alfo rendered fofter by the valt quantity of rain-water, which, paffing along the furface of the earth, is conveyed into their channels. But all rivers carry with them a great deal of mud and other impurities; and, when they flow near large and populous towns, they become impregnated with a number of heterogeneous fubftances, in which ftate the water is certainly unfit for the parpofes of life; yet, by remaining for fome time at reft, all the feculencies fubfide, and the water becomes fufficiently pure and potable.

RIVERS (Earl). See Wodevile.
RIVINIA, in botany: A geizus of the monogynia order, belonging to the tetrandria clafs of plants.- The perianth is four-leaved, coloured, and permanent, the leaflet oblong-egged and obtufe; there is no corolla, unlefs the calyx be confidered as fuch. There are four or eight filaments, fhorter than the calyx, approaching by pairs, permanent; the anthers are fmall. The germ is large and roundith; the ftyle very fhort; the ftigma fimple and obtufe. The berry is globular, fitting on the green reflected calyx, one-celled with an incurved point. There is one feed, lensform and rugged. This plant is called Solonoides by Tournefort, and Piercea by Mriller. It grows naturally in moft of the iflands of the Weft Indies. The juice of the berries of the plant will fain paper and linen of a bright red colour, and many experiments made with it to colour flowers have fucceeded extremely well in the following mauner: the juice of the berries was preffed out, and mixed with common water, putting it into a phial, fhaking it well together for fume time, till the water was thoroughly tinged; then the flowers, which were white and juft fully blown, were cut off, and their falks placed into the phial ; and in one night the flowers have been finely variegated with red; the flowers on which the experiments were made were the tuberofe, and the double white narciffus.

RIVULET, a diminutive of river. See River.
RQACH, in ichthyology. See Cyprinus.
ROAD, an open way, or public paffage, forming a communication between one place and another.

Of all the people in the world the Romans took the moft pains in forming roads; and the labour and expences they were at in rendering them fpacious, firm, ftraight, and fmooth, are incredible. They ufually ftrengthened the ground by ramming it, laying it with fints, pebbles, or fands, and fometimes with a lining of maforiry, rubbih, bricks, \&c. bound together with mortar. In fome places in the Lionois, F. Meneftrier obferves, that he has found hage clufters of flints cemented with lime, reaching 10 or 12 feet deep, and making a mafs as hard and compat as marble; and which, after refifing the injuries of time for 1600 years, is ftiil fcaree penetrable by all the force of hammers, mattocks, \&c. and yet the flints it confilts of are not bigger than eggs. The moft noble of the Roman road; was the Via Appia, which was carried to fuch a
valt length, that Procopius reckons it five days journey to the end of it, and Leipfius computes it at 350 miles: it is 12 feet broad, and made of fquare free-ftone generally a foot and a half on each fide; and though this has lated for above isoo years, yet in many places if is for feveral miles together as entire as when it was firft made.

The ancient roads are diftinguifhed into military roads, double roads, fubterraneous roads, \&c. The military roads where grand roads, formed by the Romans for marching their armies into the provinces of the empire ; the principal of thefe Roman roads in England are Watling-ftreet, Ikenild-ftreet, Fofs-way, and Erminage-freet. Double roads among the Romans, were roads for carriages, with two pavements, the one for thofe going one way, and the other for thofe returning the other: thefe were feparated from each other by a caufeway raifed in the middle, paved with bricks, for the conveniency of foot paffengers; with borders and mounting fones from fpace to fpace, and military columns to mark the diftance. Subterraneous roads are thofe dug through a rock, and lett vaulted ; as that of Puzzuoli near Naples, which is near half a league long, and is 15 feet broad and as many high.

The firt law enacted refpecting highways and roads in England was in the year 1285 ; when the lords of the foil were enjoined to enlarge thofe rways where buthes, woods, or ditches be, in order to prevent robberies. The next law was made by Edward III. in the year I346; when a commiffion was granted by the king to lay a toll on all forts of carriages paffing from the hofpital of St Giles in the fields to the bar of the Old Temple, and alfo through another highway called Portpool (now Gray's Inn Lane) joined to the before-named highway ; which roads were become almoft impaffable. Little further relating to this fubject occurs, till the reign of Henry VIII. when the parifhes were entrufted with the care of the roads, and furveyors were annually elected to take care of them. But the increafe of luxury and commerce introduced fuch a number of heavy carriages for the conveyance of goods, and lighter ones for the convenience and eafe of travelling, that parifh aid was found infufficient to keep the beft frequented roads in repair. This introduced toll-gates or turnpikes; that fomething might be paid towards their fupport by every individual who enjoyed the benefit of thefe improvements, by paffing over the roads.

Speaking of roads, the Abbé Raynal juflly remarks. "Let us travel over all the countries of the earth, and wherever we fhall find no facility of trading from a city to a town, and from a village to a hamlet, we may pronounce the people to be barbarians; and we fhall only be deceived refpecting the degree of barbarifm."

Road, in navigation, a bay, or place of anchnrage, at fome diftance from the fhore, whither fhips. or veffels occafionally repair to receive intelligence, orders, or neceffary fupplies ; or to wait for a fair wind, \&c. The excellence of a road confifts chiefly in its being protected from the reigning winds and the fwell of the fea; in having a good anchoringground, and being at a competent diftance from the fhore. Thofe which are not fufficiently inclofed are termed open roads.
ROAit, in the manege : A roan horfe is one of a bay,
$\underbrace{\begin{array}{l}\text { Road, } \\ \text { Rom. }\end{array}}$

## $\mathrm{ROBB} \quad[305] \quad \mathrm{OBB}$

Rosinoak bay, forrel, or black colour, with grey or white fpots
Hery interfperfed very thick. When this party-coloured Robbery. coat is accompanied with a black head and black extre. mities, he is called a roan borfe with a black-a-moor's head: and if the fame mixture is predominant upon a deep forrel, he is called claret-roan.

ROANOAK, an ifland of North America, near the coaft of North Carolina. Here the Engiifh firt attempted to fettle in 1585 , but were obliged to leave it for want of provifions. E. Long. 75. o. N. Lat. 35. 40 .

Roanoak, a river of North America, which rifes in Virginia, runs through Carolina, and at length falls into the fea, where it forms a long narrow bay called Albemarle found.
ROASTING, in metallurgic operations, fignifies the diffipation of the volatile parts of an ore by heat. See Metallurgy, pafim.

ROB, in pharmacy, the juices of fruits purified and infpiffated till they are of the confiftence of honey.

ROBBERY, the rapina of the civilians, is the felonious and forcible taking, from the perfon of another, of goods or money to any value, by violence or putting him in fear. 1. There mult be a taking, otherwife it is no robbery. A mere attempt to rob was indeed held to be felony fo late as Henry IVth's time ; but afterwards it was taken to be only a mifdemeanour, and punifhable with fine and imprifoument; till the ftatute 7 Geo. II. c. 2I. which makes it a felony (tranfportable for feven years) unlawfully and malicioufly to affault another, with any offenfive weapon or inftrument;-or by menaces, or by other forcible or violent manner, to demand any money or goods;-with a felonious intent to rob. If the thief, having once taken a purfe, returns it, fill it is a robbery: and fo it is whether the taking be friclly from the perfon of another, or in his prefence only; as where a robber by menaces and violence puts a man in fear, and drives away his fheep or his cattle before his face. 2. It is immaterial of what value the thing taken is: a penny, as well as a pound thus forcibly extorted, makes a robbery. 3. Lafly, the taking muft be by force, or a previous putting in fear; which makes the violation of the perfon more atrocious than privately flealing. For, according to the maxim of the civil law, "qui vi rapuit, fur improbior effe videtur." This previous violence, or putting in fear, is the criterion that diftinguifhes robbery from other larcenies. For if one privately fteals fixpence from the perfon of another, and afterwards keeps it by putting him in fear, this is no robbery, for the fear is fubfequent ; neither is it capital as privately ftealing, being under the value of twelvepence. Not that it is indeed neceffary, though ufual, to lay in the indiament that the robbery was committed by putting in fear : it is fufficient, if laid to be dune by violence. And when it is laid to be done by putting in fear, this does not imply any great degree of terror or affright in the party roboed: it is enough that fo much force or threatening, by word or geture, be we?, as might create an appichenfion of danger, or induce a man to part witit his property wibout or againat his confent. Thus, if a man be knocked down withon previous warning, and fripped of bis property while renfelefs, though frielly he cannot be faid to be fot in for, yet this is undoubtcity a robbery. Or, if a per. Von. XVI.
fon with a fword drawn begs an alms, and I give it him through miftrut and apprehenfion of violence, this is a felonious robbery. So if, under a pretence of fale, a man forcibly extorts money from another, neither flam this fubterfuge avail him. But it is doubted, whether the forcing a higler, or other chapman, to fell his wares, and giving him the full value of them, amounts to fo heinous a crime as robbery.
This fpecies of Larceny is debarred of the benefit of clergy by flatate 23 Hen . VIII. c. I. and other fubfequent flatutes; not indeed in general, but only when committed in a dwelling.houfe, or in or near the king's highway. A robbery therefore in a difant field, or footpath, was not punifhed with death; but was open to the benefit of clergy, till the flatute 3 \& 4 W . and M. c. 9. which takes away clergy from both principals and acceffories before the fact, in robbery, wherefoever committed. See Law, No clxxxvi. 3 .
ROBERT bruce, king of Scotland, in 1306; a renowned general, and the deliverer of his country from a flate of vaffalage to the Englifh. See Scotland.

Robert, king of France, furnamed the Wife and the Pious, came to the crown in 996 , after the death of Hugh Capet his father. He was crowned at Orleans, the place of his nativity, and afterwards at Rheims, after the imprifonment of Charles of Lorraine. He married Bertha his coufin, daughter of Conrad king of Burgundy ; but the marriage was declared null by Gregory V.; and the king, if we can give credit to cardinal Peter Damien, was excommunicated. This anathema made fuch a noife in France, that all the king's courtefans, and even his very domeftics, went away from him. Only two continued with him ; who were fo deeply impreffed with a fenfe of horror at whatever the king touched, that they purified it with fire : this fcruple they carried fo far, as to the very plates on which he was ferved with his meat, and the veffels out of which he drank. The fame cardinal reports, that as a punifhment for this pretended inceft, the queen was delivered of a monfter, which had the head and neck of a duck. He adds, that Robert was fo fruck with aftonifhment at this fpecies of prodigy, that he lived apart from the queen. He contracted a fecond marriage with Conftance, dangiter of William count of Arles and Provence; but the arrogant difpofition of this princefs would have totally overturned the kingdom, and thrown it into confufion, had not the wifdom of the king prevented ber from intermeddling with the affairs of the ftats. He carefully concealed from her whatever acts of liberaility he fhowed to any of his domeftics. "Take care (faid he to them) that the qu:een don't perceive it."-Henry dake of Burgundy, brother of Hugh Capet, dying in 1002 , without lavflat in:e, left his dukedom to his nephew the king of France. Robert invelted his fecond fon Henry with this dukedom, who afte:wards coming to the crow, refigned it in favour of Rebert his cacet. I'mis duke Robert was chief of
 fourimel till 13 ${ }^{\text {fr }}$. This cukedom was then re unied to the crown by king Jobn, whe gave is to his foteth fon Piniti? the Bold, cliff of the focond hate of Durm:ndy, which w.s tomnated in the perfa of Chales the Rifh, who was flain in fot7. King Rolleit was fo much citeren for his whitom and pulerce, thit

## R O B

he was offered the empire and kingdom of Italy, which, however, he declined to accept. Hugh, called the Great, whom he had had by Confantine, being dead, he caufed his fecond fon Henry I. to be crowned at Rheims. He died at Melun, July 20. 1031, at the age of 60 . Robert was, according to the knowledge of the times, a wife prince. Helgand, friar of Fleury, relates, in his life of him, that, to prevent his fubjects from falling into the crime of perjury, and incurring the penalties which followed thereon, he made them fwear upon a Chrine from which the relics bad been previoully removed, as if intention did not contitute perjiry! and long after fimilar reafoning was adopted. Robert built a great number of churches, and procured a reftitution to the clergy of the tithes and wealth which the laylords had made themfelves mafters of. The depredations were fuch, that the laity poffeffed the ecclefiaftical treafures by hereditary titles; they divided them among their children; they even gave benefices as a dowry with their daughters, or left them to their fons as lawful inheritance. Although Robert was pious, and although he refpected the clergy, yet it was evident that he oppofed the bifhops with a firmnefs and refolution of which, for many ages, they had had no examples. Lutheric archbifhop of Sens had introduced into his diocefe the cuftom of proving by the eucharil perfons accufed as guilty of any crime. The king wrote to him in the following frong terms: "I fwear (fays he) by the faith I owe to God, that if you do not put a ftop to the grofs abufe complained of, you fhall be deprived of your priefthood." The prelate was forced to comply. He punifhed in 1022, the Manichéens, canons of Orleans, by burning them at the ftake. There are, however, recorded of him fome lefs fevere actions, which it is right to mention, A dangerous confpiracy againt hiṣ perfon and government having been difcovered, and the authors taken into cuftody, he feized the moment when their judges had met to fentence them to death, to caufe an elegant repaft to be ferved up to them. Next day they were admitted to the eucharit. Then Robert told them, that he gave them their pardon, "becaufe none of thofe can die whom Jefus Chritt came to receive at his table." One day when he was at prayers in the chapel, he perceived a thief, who had cut off the half of the fringe of his mantle, proceeding to take the remainder ; "Friend (fays he with a pleafant countenance), be content with what you have already taken, the reft will very well ferve fome other." Robert cultivated, and was a patronizer of the fciences. There are feveral hymns wrote by him, which fill continue to be fung in the church. His reign was happy and tranquil. Accordisg to fome authors, he inflituted the order of the Star, commonly attributed to king John.

Robert of France, fecond fon of Louis VIII. and brother to St Louis, who erected in his favour Artois into a royal peerage in the year 1237. It was during this time that the unlucky difference between pope Gregory IX. and the emperor Frederic II. took place. Gregory offered to St Louis the empire for Robert; but the French nobleffe, having met to deliberate on this propofal, were of opinion that he ought to rejeet it. He gave the pope for anfwer: "That Count Robert efteemed himfelf fufficiently honoured by being the brother of a king, who furpaffed in dignity, in

Arength, in wealth, and in birth, all other monarchs in the world." Robert accompanied St Louis into Egypt, and fought with more bravery than prudence at the battle of Maffoure, on the 9th of February 1250. In his purfuit of the cowards through a certain fmall village, he was killed by ftones, ticks, and other things which they threw at him from the windows. He was an intrepid prince, but too paffionate, dogmatical, and quarrelfome.

Robert II. Count of Artois, fon of the preceding, furnamed the Good and the Noble, was at the expedition into Africa in 1270 . He drove the rebels from Navarre in 1276 . He brought a very powerful affitance to Charles I. king of Naples, of which kingdom he was regent during the captivity of Charles II. He defeated the Arragonians in Sicily in 1289, the Englifh near Bayonne in $\pm 296$, and the Flemifh at Furnes in 1298 . But having in 1302 imprudently attempted to force thefe laft, when encamped near Courtray, he received no lefs than 30 wounds; and in that expedition loft both his honour and his life. He was a brave, but paffionate and fierce man, and good at nothing but pugiliftic encounters. Mahaud his daughter inherited the dukedom of Artois, and gave herfelf in marriage to Otho duke of Burgundy, by whom the had two daugh. ters, Jane wife of Philip the Long, and Blanche wife of Charles the Fiair. In the mean time Philip, fon of Robert II, had a fon.

Robert III. who difputed the dukedom of Artois with Mahaud his aunt; but he loft his fuit by two fentences given in againft him in 1302 and $1318{ }^{\circ} \mathrm{He}$ wifhed to revive the procefs in 1329 , under Philip of Valois, by means of pretended new titles, which were found to be falfe. Robert was condemned the third time, and banifhed the kingdom in 1331. Having found an afylurn with Edward III. king of England, he undertook to declare him king of France; which proved the caufe of thofe long and cruel wars which diftreffed that kingdom. Robert was wounded at the fiege of Vannes in I 342 , and died of his wound in England. John, fon to Robert, and count of Eu, was taken prifoner at the battle of Poitiers in 1356, and terminated his career in 1387. His fon Philip II. high conftable of France, carried cn war in Africa and Hungary, and died in 1397 , being a prifoner of the Turks. He had a fon named Charles, who died in 1472, leaving no iffue.

Robert of Anjou, furnamed the Wife, third fon of Charles the Lame, fucceeded his father in the kingdom of Naples in 1309, by the protection of the popes, and the will of the people, to the exclufion of Charobert fon of his eldeft brother. He aided the Roman pontiffs againg the emperor Henry VII. and, after the death of that prince, was nominated in 1313 vicar of the empire in Italy, in temporal matters, unlefs a new. emperor was elected, 'This title was given him by Clement V. in virtue of a right which he pretended to have to govern the empire during an interregnum. Robert reigned with glory 33 years, eight months, and died on the 19th of January 1343, aged 64. "This prince (fays M, De Montigni) had not thofe qualities which corftitute heroes, but he had thofe which make good kings. He was religious, affable, generous, kind, wife, prudent, and a zealous promoter of juftice." He was called the Solomon of his age. He loved the poor,
and

## ROB

Rubert. and caufed a ticket to be placed upon his palace, $t$, give notice when he meant to diftribute from the throne. He had no other paffion but a very great love for learning. He ufed to fay, that he would rather renounce his crown than his ftudy. His court foon be. came the fanctuary of the fciences, which he encouraged equally by his example and his bounty. This prince was verfed in theology, jurifprudence, philofophy, mathematics, and medicine. Bocace fays, "that fince the days of Solomon we have not feen fo wife a prince upon the throne." For a great part of his life he had no tafte for poetry; he even defpifed it, as, in his opinion, unworthy of a man of learning. A converfation which he had with Petrarch, however, undeceived him ; he retained this poet at his court, and attempted himfelf to write fome poems, which are ftill extant. He wis forced to engage a little in war, for which he poffeffed no great talents : alluding to which, may be feen on his tomb a wolf and a lamb drinking out of the fame veffel. Philip of Valois refrained from giving battle in 1339 , by the repeated advice which this prince gave him, who was a great friend to France, both from inclination and intereft. He detefted quarrels among Chriftian princes, and had Itudied the fcience of aftrology, not fo much to know the courfe of the ftars, as to learn by this chimerical fcience the hidden things of futurity. He believed that he read in the grand book of heaven a very great misfortune which would befal France if Philip hazarded a battle againft the Englifh.

Robert the Firft, called the Magnificent, duke of Normandy, fecond fon of 'Richard II. fucceeded in 1208 his brother Richard III, whom it is reported he poifoned. He had early in his reign to fupprefs frequent rebellions of feveral of the great vaffals. He re eftablifhed in his eftates Baudouin IV. count of Flanders, who had been unjuftly ftript of his poffeffions by his own fon. He forced Canute king of Denmark, who was allo king of England, to divide his poffeffions with his coufins Alfred and Edward. In the year 1235, he undertook barefooted a journey to the Holy Land; on his return from which he died, teing poifoned at Nice in Bithynia, leaving as his fucceffor W:1liam his natural fon, afterwards king of England, whom he had caufed before his departure to be publicly acknowledged in an Affembly of the fates of Normandy.

Robert, or Rupert, furnamed the Short and the Mild, elector Palatine, fon of Robert the Niggardly, was born in 1352, and elected Emperor of Germany in 1400, atter the depofition of the cruel Wenceflas. In order to gain the affections of the Germans, he wifhed to reftore Milanès to the empire, which Wenceflas had taken from it; but his atiempts in this refpect were unfucceisful. His attachment to the anti-pofe Grecory XIl. entirely alienated the affections of the German princes. To minh a degree were they incenfed againtt him, that they entered into a confpiracy to cut him off; but his death, which happened on the i8th of May 1410 , being then $5^{8}$ years old, put a fop to their machinations. Robert beran to fittie the fovereignty of the German Princes. The er?perors had formerly retained in their own Iands the power of life and death, within the teritories of a great mer of the nobles; hut he rided them tive light by his inters patent. The chicf fent imputed to this pince was an excefs of
