The height of high water above the low water constitutes what is usually called the tide. This is the interesting circumstance in practice. Many circumstances render it almost impossible to say what is the elevation of high water above the natural surface of the ocean. In many places the surface at low water is above the natural surface of the ocean. This is the case in rivers at a great distance from

Tide. their mouths. This may appear abſurd, and is certainly very paradoxical; but it is a fact eſtabliſhed on the moſt unexceptionable authority. One inſtance fell under our own obſervation. The low water mark at ſpring tide in the harbour of Alloa was found by accurate levelling to be three feet higher than the top of the ſtone pier at Leith, which is ſeveral feet above the high water mark of this harbour. A little attention to the motion of running waters will explain this completely. Whatever checks the motion of water in a canal muſt raiſe its ſurface. Water in a canal runs only in conſequence of the declivity of this ſurface: (See RIVER). Therefore a flood tide coming to the mouth of a river checks the current of its waters, and they accumulate at the mouth. This checks the current farther up, and therefore the waters accumulate there alſo: and this checking of the ſtream, and conſequent riſing of the waters, is gradually communicated up the river to a great diſtance. The water riſes every where, though its ſurface ſtill has a ſlope. In the mean time, the flood tide at the mouth paſſes by, and an ebb ſucceeds. This muſt accelerate even the ordinary courſe of the river. It will more remarkably accelerate the river now raiſed above its ordinary level, becauſe the declivity at the mouth will be ſo much greater. Therefore the waters near the mouth, by accelerating, will ſink in their channel, and increaſe the declivity of the canal beyond them. This will accelerate the waters beyond them; and thus a ſtream more rapid than ordinary will be produced along the whole river, and the waters will ſink below their ordinary level. Thus there will be an ebb below the ordinary ſurface as well as a flood above it, however ſloping that ſurface may be.

Hence it follows, that we cannot tell what is the natural ſurface of the ocean by any obſervations made in a river, even though near its mouth. Yet even in rivers we have regular tides, ſubjected to all the varieties deduced from this theory.

We have ſeen that the tide is always proportional to M S. It is greateſt therefore when the moon is in conjunction or oppoſition, being then S s, the ſum of the ſeparate tides produced by the ſun and moon. It gradually decreaſes as the moon approaches to quadrature; and when ſhe is at Q or q, it is SO, or the difference of the ſeparate tides. Suppoſing S s divided into 1000 equal parts, the length of MS. is expreſſed in theſe parts in the fourth column of the foregoing table, and their differences are expreſſed in the fifth column.

We may here obſerve, that the variations of the tides in equal ſmall times are proportional to the ſine of twice the diſtance of the place of high water from the moon. For ſince M n is a conſtant quantity, on the ſuppoſition of the moon's uniform motion, M v is proportional to the variation of MS. Now M n: M v = MC : CI = 1 : ſin. 2 y, and M n and MC are conſtant quantities.

Thus we have ſeen with what eaſe the geometrical conſtruction of this problem not only explains all the intereſting circumſtances of the tides, but alſo points them out, almoſt without employing the judgment, and exhibits to the eye the gradual progreſs of each phenomenon. In theſe reſpects it has great advantages over the very elegant algebraic analyſis of Mr Bernoulli. In that proceſs we advance almoſt without ideas, and obtain our ſolutions as detached facts, without perceiving their regular ſeries. This is the uſual pre-eminence of geometrical analyſis; and we regret that Mr Bernoulli, who was eminent in this branch, did not rather employ it. We doubt not but that he would have ſhown ſtill more clearly the connection and gradual progreſs of every particular. His aim, however, being to inſtruct thoſe who were to calculate tables of the different affections of the tides, he adhered to the algebraic method. Unfortunately it did not preſent him with the eaſieſt formulæ for practice. But the geometrical conſtruction which we have given ſuggeſts ſeveral formulæ which are exceedingly ſimple, and afford a very ready mode of calculation. Tide.

The fundamental problems are to determine the angle s O h or m O h, having m O s given; and to determine M S.

Let the given angle m O s be called a; and, to avoid the ambiguity of algebraic ſigns, let it always be reckoned from the neareſt ſyzigy, ſo that we may always have a equal to the ſum of x and y. Alſo make $d^2 = \frac{S^2 \times \text{ſin.}^2 2a}{M^2 + S^2 + 2M \times S \times \text{coſ. } 2a}$, which repreſents the $\frac{S\,c^2}{S\,M^2}$ of fig. 4. or ſin.$^2 2y$, and make $p = \frac{S \times \text{ſin. } 2a}{M + S \times \text{coſ. } 2a}$, which is the expreſſion of $\frac{Sc}{Mc}$ of that figure, or of tan. $2y$. Then we ſhall have,

1. Sin. $y = \sqrt{\frac{1 - \sqrt{1 - d^2}}{2}}$. For we ſhall have coſ. $2y = \sqrt{1 - d^2}$. But ſin.$^2 y = \frac{1}{2} - \frac{1}{2}$ coſ. $2y = \frac{1 - \sqrt{1 - d^2}}{2}$, and ſin. $y = \sqrt{\frac{1 - \sqrt{1 - d^2}}{2}}$.

2. Tan. $y = \frac{p}{1 + \sqrt{1 + p^2}}$. For becauſe p is = tan. $2y$, $\sqrt{1 + p^2}$ is the ſecant of $2y$, and $1 + \sqrt{1 + p^2} : 1 = p$: tan. y.

Theſe proceſſes for obtaining y directly are abundantly ſimple. But it will be much more expeditious and eaſy to content ourſelves with obtaining $2y$ by means of the value of its tangent, viz. $\frac{S \cdot \text{ſin. } 2a}{M + S \cdot \text{coſ. } 2a}$. Or, we may find x by means of the ſimilar value of its tangent $\frac{M\,d}{S\,d}$ of fig. 4.

There is ſtill an eaſier method of finding both $2x$ and $2y$, as follows.

Make M + S : M — S = tan. a : tan. b. Then b is the difference of x and y, as a is their ſum. For this analogy evidently gives the tangent of half the difference of the angles CSM and CMS of fig. 4. or of $2x$ and $2y$. Therefore to a, which is half of the ſum of $2x + 2y$, add b, and we have $2x = a + b$, or $x = \frac{a + b}{2}$, and $y = \frac{a - b}{2}$.

By either of theſe methods a table may be readily computed of the value of x or y for every value of a.

But we muſt recollect that the values of S and M are by no means conſtant, but vary in the inverſe triplicate ratio of the earth's diſtance from the ſun and moon; and the ratio of 2 to 5 obtains only when theſe luminaries are at their mean diſtances from the earth. The forces correſponding to the perigean medium and apogean diſtances are as follow.

	Sun.	Moon.
Apogean - -	1,901	4,258
Medium - - -	2,	5,
Perigean - -	2,105	5,925

Hence we ſee that the ratio of S to M may vary from 1,901 : 5,925 to 2,105 : 4,258, that is, nearly from 1 : 3 to 1 : 2, or from 2 : 6 to 2 : 4. The ſolar force does not vary much, and may be retained as conſtant without any great error. But the change of the moon's force has great effects on the tides both as to their time and their quantity.

1. In

Tide.

I. In reſpect of their Time.

1. The tide day following a ſpring tide is 24h. 27′ when the moon is in perigee, but 24h. 33′ when ſhe is in apogee.

2. The tide day following neap tide is 25h. 15′, and 25h. 40′ in theſe two ſituations of the moon.

3. The greateſt interval of time between high water and the moon's ſouthing is 39′ and 61′; the angle y being 9° 45′ in the firſt caſe, and 15° 15′ in the ſecond.

II. In reſpect of their Heights.

1. If the moon is in perigee when new or full, the ſpring tide will be 8 feet inſtead of 7, which correſponds to her mean diſtance. The very next ſpring tide happens when ſhe is near her apogee, and will be 6 feet inſtead of 7. The neap tides happen when ſhe is at her mean diſtance, and will therefore be 3 feet.

But if the moon be at her mean diſtance when new or full, the two ſucceeding ſpring tides will be regular or 7 feet, and one of the neap tides will be 4 feet and the other only 2 feet.

Mr Bernoulli has given us the following table of the time of high water for theſe three chief ſituations of the moon, namely, her perigee, mean diſtance, and apogee. It may be had by interpolation for all intermediate poſitions with as great accuracy as can be hoped for in phenomena which are ſubject to ſuch a complication of diſturbances. The firſt column contains the moon's elongation from the ſun. The columns P, M, A, contain the minutes of time which elapſe between the moon's ſouthing and high water, according as ſhe is in perigee, at her mean diſtance, or in apogee. The ſign— indicates the priority, and + the poſteriority, of high water to the moon's ſouthing.

The reader will undoubtedly be making ſome compariſon in his own mind of the deductions from this theory with the actual ſtate of things. He will find ſome conſiderable reſemblances; but he will alſo find ſuch great differences as will make him very doubtful of its juſtneſs. In very few places does the high water happen within ¼ths of an hour of the moon's ſouthing, as the theory leads him to expect; and in no place whatever does the ſpring tide fall on the day of new and full moon, nor the neap tide on the day of her quadrature. Theſe always happen two or three days later. By comparing the difference of high water and the moon's ſouthing in different places, he will hardly find any connecting principle. This ſhows evidently that the cauſe of this irregularity is local, and that the juſtneſs of the theory is not affected by it. By conſidering the phenomena in a navigable river, he will learn the real cauſe of the deviation. A flood tide arrives at the mouth of a river. The true theoretical tide differs in no reſpect from a wave. Suppoſe a ſpring tide actually formed on a fluid ſphere, and the ſun and moon then annihilated. The elevation muſt ſink, preſſing the under waters aſide, and cauſing them to riſe where they were depreſſed. The motion will not ſtop when the ſurface comes to a level; for the waters arrived at that poſition with a motion continually accelerated. They will therefore paſs this poſition as a pendulum paſſes the perpendicular, and will riſe as far on the other ſide, forming a high water where it was low water, and a low water where it was high water; and this would go on for ever, oſcillating in a time which mathematicans can determine, if it were not for the viſcidity, or ſomething like friction, of the waters. If the ſphere is not fluid to the centre, the motion of this wave will be different. The elevated waters cannot ſink without diffuſing themſelves ſidewiſe, and occaſioning a great horizontal motion, in order to fill up the hollow at the place of low water. This motion will be greateſt about half way between the places of high and low water. The ſhallower we ſuppoſe the ocean the greater muſt this horizontal motion be. The reſiſtance of the bottom (tho' perfectly ſmooth and even) will greatly retard it all the way to the ſurface. Still, however, it will move till all be level, and will even move a little farther, and produce a ſmall flood and ebb where the ebb and flood had been. Then a contrary motion will obtain; and after a few oſcillations, which can be calculated, it will be inſenſible. If the bottom of the ocean (which we ſtill ſuppoſe to cover the whole earth) be uneven, with long extended valleys running in various directions, and with elevations reaching near the ſurface, it is evident that this muſt occaſion great irregularities in the motion of the undermoſt waters, both in reſpect of velocity and direction, and even occaſion ſmall inequalities on the ſurface, as we ſee in a river with a rugged bottom and rapid current. The deviations of the under currents will drag with them the contiguous incumbent waters, and thus occaſion greater ſuperficial irregularities.

Now a flood arriving at the mouth of a river, muſt act preciſely as this great wave does. It muſt be propagated up the river (or along it, even though perfectly level) in a certain time, and we ſhall have high water at all the different places in ſucceſſion. This is diſtinctly ſeen in all rivers. It is high water at the mouth of the Thames at three o'clock, and later as we go up the river, till at London bridge we have not high water till three o'clock in the morning, at which time it is again high water at the Nore. But in the mean time, there has been low water at the Nore, and high water about half way to London; and while the high water is proceeding to London, it is ebbing at this intermediate place, and is low water there when it is high water at London and at the Nore. Did the tide extend as far beyond London as London is from the Nore, we ſhould have three high waters with two low waters interpoſed. The moſt remarkable inſtance of this kind is the Maragnon or Amazon river in South America. It appears by the obſervations of Condamine and others, that between Para, at the mouth of the river, and the conflux of the Ma-

Tide. dera and Maragnon, there are ſeven coexiſtent high waters, with ſix low waters between them. Nothing can more evidently ſhow that the tides in theſe places are nothing but the propagation of a wave. The velocity of its ſuperficial motion, and the diſtance to which it will ſenſibly go, muſt depend on many circumſtances. A deep channel and gentle acclivity will allow it to proceed much farther up the river, and the diſtance between the ſucceſſive ſummits will be greater than when the channel is ſhallow and ſteep. If we apply the ingenious theory of Chevalier Buat, delivered in the article RIVER, we may tell both the velocity of the motion and the interval of the ſucceſſive high waters. It may be imitated in artificial canals, and experiments of this kind would be very inſtructive. We have ſaid enough at preſent for our purpoſe of explaining the irregularity of the times of high water in different places, with reſpect to the moon's ſouthing. For we now ſee clearly, that ſomething of the ſame kind muſt happen in all great arms of the ſea which are of an oblong ſhape, and communicate by one end with the open ocean. The general tide in this ocean muſt proceed along this channel, and the high water will happen on its ſhores in ſucceſſion. This alſo is diſtinctly ſeen. The tide in the Atlantic ocean produces high water at new and full moon at a later and later hour along the ſouth coaſt of Great Britain in proportion as we proceed from Scilly iſlands to Dover. In the ſame manner it is later and later as we come along the eaſt coaſt from Orkney to Dover. Yet even in this progreſs there are conſiderable irregularities owing to the ſinuoſities of the ſhores, deep indented bays, prominent capes, and extenſive ridges and valleys in the channel. A ſimilar progreſs is obſerved along the coaſts of Spain and France, the tide advancing gradually from the ſouth, turning round Cape Finiſterre, ranging along the north coaſt of Spain, and along the weſt and north coaſts of France.

The attentive conſideration of theſe facts will not only ſatisfy us with reſpect to this difficulty, but will enable us to trace a principle of connection amidſt all the irregularities that we obſerve.

We now add, that if we note the difference between the time of high water of ſpring tide, as given by theory, for any place, and the *obſerved time* of high water, we ſhall find this interval to be very nearly conſtant thro' the whole ſeries of tides during a lunation. Suppoſe this interval to be forty hours. We ſhall find every other phenomenon ſucceed after the ſame interval. And if we ſuppoſe the moon to be in the place where ſhe was 40 hours before, the obſervation will agree pretty well with the theory, as to the ſucceſſion of tides, the length of tide day, the retardations of the tides, and their gradual diminution from ſpring to neap tide. We ſay pretty well; for there ſtill remain ſeveral ſmall irregularities, different in different places, and not following any obſervable law. Theſe are therefore local, and owing to local cauſes. Some of theſe we ſhall afterwards point out. There is alſo a general deviation of the theory from the real ſeries of tides. The neap tides, and thoſe adjoining, happen a little earlier than the corrected theory points out. Thus at Breſt (where more numerous and accurate obſervations have been made than at any other place in Europe), when the moon changes preciſely at noon, it is high water at 3h. 28′. When the moon enters her ſecond quarter at noon, it is high water at 8h. 40′, inſtead of 9h. 48′, which theory aſſigns.

Something ſimilar, and within a very few minutes equal, to this is obſerved in *every* place on the ſea-coaſt. This is therefore ſomething general, and indicates a real defect in the theory.

But this ariſes from the ſame cauſe with the other general deviation, viz. that the greateſt and leaſt tides do not happen on the days of full and half moon, but a certain time after. We ſhall attempt to explain this. Tide.

We ſet out with the ſuppoſition, that the water acquired in an inſtant the elevation competent to its equilibrium. But this is not true. No motion is inſtantaneous, however great the force; and every motion and change of motion produced by a ſenſible or finite force increaſes from nothing to a ſenſible quantity by infinitely ſmall degrees. Time elapſes before the body can acquire any ſenſible velocity; and in order to acquire the ſame ſenſible velocity by the action of different forces acting ſimilarly, a time muſt elapſe inverſely proportional to the force. An infinitely ſmall force requires a finite time for communicating even an infinitely ſmall velocity; and a finite force, in an infinitely ſmall time, communicates only an infinitely ſmall velocity; and if there be any kind of motion which changes by inſenſible degrees, it requires a finite force to prevent this change. Thus a bucket of water, hanging by a cord lapped round a light and eaſily moveable cylinder, will run down with a motion uniformly accelerated; but this motion will be prevented by hanging an equal bucket on the other ſide, ſo as to act with a finite force. This force prevents only infinitely ſmall accelerations.

Now let ALKF (fig. 6) be the ſolid nucleus of the earth, ſurrounded by the ſpherical ocean *b h d g*. Let this be raiſed to a ſpheroid BHDG by the action of the moon at M, or in the direction of the axis CM. If all be at reſt, this ſpheroid may have the form preciſely competent to its equilibrium. But let the nucleus, with its ſpheroidal ocean, have a motion round C in the direction AFKL from weſt to eaſt. When the line of water BA is carried into the ſituation *s q* infinitely near to BA, it is no longer in equilibrio; for *s* is too elevated, and the part now come to B is too much depreſſed. There is a force tending to depreſs the waters at *s*, and to raiſe thoſe now at B; but this force is infinitely ſmall. It cannot therefore reſtore the ſhape competent to equilibrium till a ſenſible time has elapſed; therefore the diſturbing force of the moon cannot keep the ſummit of the ocean in the line MC. The force muſt be of a certain determinate magnitude before it can in an inſtant undo the inſtantaneous effect of the rotation of the waters and keep the ſummit of the ocean in the ſame place. But this effect is poſſible; for the depreſſion at *s* neceſſary for this purpoſe is nearly as the diſtance from B, being a depreſſion, not from a ſtraight line, but from a circle deſcribed with the radius CB. It is therefore an infiniteſimal of the firſt order, and may be reſtored in an inſtant, or the continuation of the depreſſion prevented by a certain finite force. Therefore there is ſome diſtance, ſuch as B*y*, where the diſturbing force of the moon may have the neceſſary intenſity. Therefore the ſpherical ocean, inſtead of being kept continually accumulated at B and D, as the waters turn round, will be kept accumulated at *y* and *y′*, but at a height ſomewhat ſmaller. It is much in this way that we keep melted pitch or other clammy matter from running off from a bruſh, by continually turning it round, and it hangs protuberant, not from the loweſt point, but from a point beyond it, in the direction of its motion. The facts are very ſimilar. The following experiment will illuſtrate this completely, and is quite a parallel fact. Conceive GDH, the lower half of the ellipſe, to be a ſupple heavy rope or chain hanging from a roller with a handle. The weight of the rope makes it hang in an oblong curve, juſt as the force of the moon raiſes the waters of the ocean. Turn the roller very ſlowly, and the rope, unwinding at one ſide and winding up on the other ſide of the roller, will continue to form the ſame curve: but turn the roller very briſkly in the direction FKL, and the rope will now hang like the curve *u y′ v*, conſiderably advanced

Tide. advanced from the perpendicular, ſo far, to wit, that the force of gravity may be able in an inſtant to undo the infinitely ſmall elevation produced by the turning.

We are very anxious to have this circumſtance clearly conceived, and its truth firmly eſtabliſhed; becauſe we have obſerved it to puzzle many perſons not unaccuſtomed to ſuch diſcuſſions: we therefore hope that our readers, who have got over the difficulty, will indulge us while we give yet another view of this matter, which leads to the ſame concluſion.

It is certain that the interval between high and low water is not ſufficient for producing all the accumulation neceſſary for equilibrium in an ocean ſo very ſhallow. The horizontal motion neceſſary for gathering together ſo much water along a ſhallow ſea would be prodigious. Therefore it never attains its full height; and when the waters, already raiſed to a certain degree, have paſſed the ſituation immediately under the moon, they are ſtill under the action of accumulating forces, although theſe forces are now diminiſhed. They will continue riſing till they have ſo far paſt the moon that their ſituation ſubjects them to depreſſing forces. If they have acquired this ſituation with an accelerated motion, they will riſe ſtill farther by their inherent motion, till the depreſſing forces have deſtroyed all their acceleration, and then they will begin to ſink again. It is in this way that the nutation of the earth's axis produces the greateſt inclination, not when the inclining forces are greateſt, but three months after. It is thus that the warmeſt time of the day is a conſiderable while after noon, and that the warmeſt ſeaſon is conſiderably after midſummer. The warmth increaſes till the momentary waſte of heat exceeds the momentary ſupply. We conclude by ſaying, that it may be demonſtrated, that, in a ſphere, fluid to the centre, the time of high water cannot be leſs, and may be more, than three lunar hours after the moon's ſouthing. As the depth of the ocean diminiſhes, this interval alſo diminiſhes.

It is perhaps impoſſible to aſſign the diſtance By at which the ſummit of the ocean may be kept while the earth turns round its axis. We can only ſee, that it muſt be leſs when the accumulating force is greater, and therefore leſs in ſpring tides than in neap tides; but the difference may be inſenſible. All this depends on circumſtances which we are little acquainted with: many of theſe circumſtances are local; and the ſituation of the ſummit of the ocean, with reſpect to the moon, may be different in different places.

Nor have we been able to determine theoretically what will be the height of the ſummit. It will certainly be leſs than the height neceſſary for perfect equilibrium. Daniel Bernoulli ſays, that, after very attentive conſideration, he is convinced that the height at new or full moon will be to the theoretical height as the coſine of the angle BCy to radius, or that the height at y will be $B b \times \frac{C \alpha}{C b}$.

The reſult of all this reaſoning is, that we muſt always ſuppoſe the ſummit of the tide is at a certain diſtance eaſtward from the place aſſigned by the theory. Mr Bernoulli concludes, from a very copious compariſon of obſervations at different places, that the place of high water is about 20 degrees to the eaſtward of the place aſſigned by the theory. Therefore the table formerly given will correſpond with obſervation, if the leading column of the moon's elongation from the ſun be altered accordingly. We have inſerted it again in this place, with this alteration, and added three columns for the times of high water. Thus changed it will be of great uſe.

We have now an explanation of the acceleration of the neap tides, which ſhould happen 6 hours later than the ſpring tides. They are in fact tides corresponding to poſitions of the moon, which are 20° more, and not the real ſpring and neap tides. Theſe do not happen till two days after; and if the really greateſt and leaſt tides be obſerved, the leaſt will be found 6 hours later than the firſt. Tide.

180	18	22	27½	0.18	0 22	0 27

This table is general; and exhibits the time of high water, and their difference from thoſe of the moon's ſouthing, in the open ſea, free from all local obſtructions. If therefore the time of high water in any place on the earth's equator (for we have hitherto conſidered no other) be different from this table (ſuppoſed correct), we muſt attribute the difference to the diſtinguiſhing circumſtances of the ſituation. Thus every place in the equator ſhould have high water on the day that the moon, ſituated at her mean diſtance, changes preciſely at noon, at 22 minutes paſt noon; becauſe the moon paſſes the meridian along with the ſun by ſuppoſition. Therefore, to make uſe of this table, we muſt take the difference between the firſt number of the column, intitled time of high water, from the time of high water at full and change peculiar to any place, and add this to all the other numbers of that column. This adapts the table to the given place. Thus to know the time of high water at Leith when the moon is 50° eaſt of the ſun, at her mean diſtance from the earth, take 22′ from 4h 30′, there remains 4.08. Add this to 2h. 48′, and we have 6h. 56′ for the hour of high water. (The hour of high water at new and full moon for Edinburgh is marked 4h. 30′ in Maſkelyne's tables, but we do not pretend to give it as the exact determination. This would require a ſeries of accurate obſervations.)

It is by no means an eaſy matter to aſcertain the time of high water with preciſion. It changes ſo very ſlowly, that we may eaſily miſtake the exact minute. The beſt method is to have a pipe with a ſmall hole near its bottom, and a float with a long graduated rod. The water gets in by the ſmall hole and raiſes the float, and the ſmallneſs of the hole prevents the ſudden and irregular ſtarts which waves would occaſion. Inſtead of obſerving the moment of high water, obſerve the height of the rod about half an hour before, and wait after high water till the rod comes again to that height: take the middle between them. The water riſes

ſenſibly

Tide. sensibly half an hour before the top of the tide, and quickly changes the height of the rod, so that we cannot make a great mistake in the time.

Mr Bernoulli has made a very careful comparison of the theory thus corrected, with the great collection of observations preserved in the *Depot de la Marine* at Brest and Rochefort *; and finds the coincidence very great, and far exceeding any rule which he had ever seen. Indeed we have no rules but what are purely empirical, or which suppose a uniform progression of the tides.

* See Mr Cassini. Mem. Acad. Paris, 1734.

The heights of the tides are much more affected by local circumstances than the regular series of their times. The regular spring tide should be to the neap tide in the same proportion in all places; but nothing is more different than this proportion. In some places the spring tide is not double of the neap tide, and in other places it is more than quadruple. This prevented Bernoulli from attempting to fix the proportion of M to S by means of the heights of the tides. Newton had, however, done it by the tides at Bristol, and made the lunar force almost five times greater than the solar force. But this was very ill-founded, for the reason now given.

Yet Bernoulli saw, that in all places the tides gradually decreased from the syzigies to the quadratures. He therefore presumed, that they decreased by a similar law with the theoretical tides, and has given a very ingenious method of accommodating the theory to any tides which may be observed. Let A be the spring tide, and B the neap tide in any place. Then form an M and an S from these, by making $M = \frac{A+B}{2}$, and $S = \frac{A-B}{2}$; so that M + S may be = A, and M − S = B agreeable to theory. Then with this M and S compose the general tide T, agreeable to the construction of the problem. We may be persuaded that the result cannot be far from the truth. The following table is calculated for the three chief distances of the moon from the earth.

Elong. ☽ & ☉	Height of the Tide.		
	Moon in Perigee.	Moon in M. Dist.	Moon in Apogee.
0	0,99A+0,15B	0,88A+0,12B	0,79A+0,08B
10	1,10A+0,04B	0,97A+0,03B	0,87A+0,02B
20	1,14A+0,00B	1,00A+0,00B	0,90A+0,00B
30	1,10A+0,04B	0,97A+0,03B	0,87A+0,02B
40	0,99A+0,15B	0,88A+0,12B	0,79A+0,08B
50	0,85A+0,32B	0,75A+0,25B	0,68A+0,18B
60	0,67A+0,53B	0,59A+0,41B	0,53A+0,29B
70	0,46A+0,75B	0,41A+0,59B	0,37A+0,41B
80	0,28A+0,96B	0,25A+0,75B	0,23A+0,53B
90	0,13A+1,13B	0,12A+0,88B	0,11A+0,62B
100	0,03A+1,24B	0,03A+0,97B	0,03A+0,68B
110	0,00A+1,28B	0,00A+1,00B	0,00A+0,70B
120	0,03A+1,24B	0,03A+0,97B	0,03A+0,68B
130	0,13A+1,13B	0,12A+0,88B	0,11A+0,62B
140	0,28A+0,96B	0,25A+0,75B	0,23A+0,53B
150	0,46A+0,75B	0,41A+0,59B	0,37A+0,41B
160	0,67A+0,53B	0,59A+0,41B	0,53A+0,29B
170	0,85A+0,32B	0,75A+0,25B	0,68A+0,18B
180	0,99A+0,15B	0,88A+0,12B	0,79A+0,08B

Observe that this table is corrected for the retardation arising from the inertia of the waters. Thus when the moon is 20 degrees from the sun, the mean distance tide is 1,00A+0,00B, which is the theoretical tide corresponding to conjunction or opposition.

We have now given in sufficient detail the phenomena of the tides along the equator, when the sun and moon are both in the equator, shewing both their times and their magnitude. When we recollect that all the sections of an oblong spheroid by a plane passing through an equatorial diameter are ellipses, and that the compound tide is a combination of two such spheroids, we perceive that every section of it through the centre, and perpendicular to the plane in which the sun and moon are situated, is also an ellipse, whose shorter axis is the equatorial diameter of a spring tide. This is the greatest depression in all situations of the luminaries; and the points of greatest depression are the lower poles of every compound tide. When the luminaries are in the equator, these lower poles coincide with the poles of the earth. The equator, therefore, of every compound tide is also an ellipse; the whole circumference of which is lower than any other section of this tide, and gives the place of low water in every part of the earth. In like manner, the section through the four poles, upper and lower, gives the place of high water. These two sections are terrestrial meridians or hour circles, when the luminaries are in the equator. Tide.

Hence it follows, that all that we have already said as to the times of high and low water may be applied to every place on the surface of the earth, when the sun and moon are in the equator. But the heights of tide will diminish as we recede from the equator. The heights must be reduced in the proportion of radius to the cosine of the latitude of the place. But in every other situation of the sun and moon all the circumstances vary exceedingly. It is very true, that the determination of the elevation of the waters in any place whatever is equally easy. The difficulty is, to exhibit for that place a connected view of the whole tide, with the hours of flood and ebb, and the difference between high and low water. This is not indeed difficult; but the process by the ordinary rules of spherical trigonometry is tedious. When the sun and moon are not near conjunction or opposition, the shape of the ocean resembles a turnip, which is flat and not round in its broadest part. Before we can determine with precision the different phenomena in connection, we must ascertain the position or attitude of this turnip; marking on the surface of the earth both its elliptical equators. One of these is the plane passing thro' the sun and moon, and the other is perpendicular to it, and marks the place of low water. And we must mark in like manner its first meridian, which passes through all the four poles, and marks on the surface of the earth the place of high water. The position of the greatest section of this compound spheroid is frequently much inclined to the earth's equator; nay, sometimes is at right angles to it, when the moon has the same right ascension with the sun, but a different declination. In these cases the ebb tide on the equator is the greatest possible; for the lower poles of the compound spheroid are in the equator. Such situations occasion a very complicated calculus. We must therefore content ourselves with a good approximation.

And first, with respect to the times of high water. It will be sufficient to conceive the sun and moon as always in one plane, *viz.* the ecliptic. The orbits of the sun and moon are never more inclined than 5½ degrees. This will make very little difference; for when the luminaries are so situated that the great circle through them is much inclined to the equator, they are then very near to each other, and the form of the spheroid is little different from what it would be if they were really in conjunction or opposition. It will therefore be sufficient to consider the moon in three different situations.

1. In the equator. The point of highest water is never farther

Tide. ther from the moon than 15°, when ſhe is in apogee and the ſun in perigee. Therefore if a meridian be drawn thro' the point of higheſt water to the equator, the arch *m h* of fig. 4. will be repreſented on the equator by another arch about $\frac{92}{100}$ of this by reaſon of the inclination of the equator and ecliptic. Therefore, to have the time of high water, multiply the numbers of the columns which expreſs the difference of high water and the moon's ſouthing by $\frac{92}{100}$, and the products give the real difference.

2. Let the moon be in her greateſt declination. The arch of right aſcenſion correſponding to *m h* will be had by multiplying *m h*, or the time correſponding to it in the table, by $\frac{102}{92}$.

3. When the moon is in a middle ſituation between theſe two extremes, the numbers of the table will give the right aſcenſion correſponding to *m h* without any correction, the diſtance from the equator compenſating for the obliquity of the ecliptic arch *m h*.

The time of low water is not ſo eaſily found; and we muſt either go through the whole trigonometrical proceſs, or content ourſelves with a leſs perfect approximation. The trigonometrical proceſs is not indeed difficult: We muſt find the poſition of the plane through the ſun and moon. A great circle through the moon perpendicular to this is the line of high water; and another perpendicular circle cutting this at right angles is the circle of low water.

But it will be abundantly exact to conſider the tide as accompanying the moon only.

Let NQSE (fig. 7.) be a ſection of the terraqueous globe, of which N and S are the north and ſouth poles and EOQ the equator. Let the moon be in the direction OM, having the declination BQ. Let D be any place on the earth's ſurface. Draw the parallel LDC of latitude. Let B′ F *b′ f* be the ocean, formed into a ſpheroid, of which B*b* is the axis and *f* F the equator.

As the place D is carried along the parallel CDL by the rotation of the earth, it will paſs in ſucceſſion through different depths of the watery ſpheroid. It will have high water when at C and L, and low water when it croſſes the circle *f* OF. Draw the meridian N *d* G, and the great circle B *d b*. The arch GQ, when converted into lunar hours (each about 62 minutes), gives the duration of the flood *d c* and of the ſubſequent ebb *c d*, which happen while the moon is above the horizon; and the arch EG will give the durations of the flood and of the ebb which happen when the moon is below the horizon. It is evident, that theſe two floods and two ebbs have unequal durations. When D is at C it has high water; and the height of the tide is CC′. For the ſpheroid is ſuppoſed to touch the ſphere on the equator *f* OF, ſo that CC′ is the difference between high and low water. At L the height of the tide is LL′; and if we deſcribe the circle L′ N *q*, C′ *q* is the difference of theſe high waters, or of theſe tides.

Hence it appears, that the two tides of one lunar day may be conſiderably different, and it is proper to diſtinguiſh them by different names. We ſhall call that a *ſuperior tide* which happens when the moon is above the horizon during high water. The other may be called the *inferior tide*. The duration of the ſuperior tide is meaſured by 2 GQ, and that of the inferior tide by 2 EG, and 4 GO meaſures the difference between the whole duration of a ſuperior and of an inferior tide.

From this conſtruction we may learn in general, 1. When the moon has no declination, the durations and alſo the heights of the ſuperior and inferior tides are equal in all parts of the world. For in this caſe the tide equator *f* F coincides with the meridian NOS, and the poles B′ *b′* of the watery ſpheroid are on the earth's equator.

2. When the moon has declination, the duration and alſo the height of a ſuperior tide at any place is greater than that of the inferior; or is leſs than it, according as the moon's declination and the latitude of the place are of the ſame or oppoſite names. Tide.

This is an important circumſtance. It frequently happens that the inferior tide is found the greateſt when it ſhould be the leaſt; which is particularly the caſe at the Nore. This ſhows, without further reaſoning, that the tide at the Nore is only a branch of the regular tide. The regular tide comes in between Scotland and the continent; and after travelling along the coaſt reaches the Thames, while the regular tide is juſt coming in again between Scotland and the continent.

3. If the moon's declination is equal to the colatitude of the place, or exceeds it, there will be only one tide in a lunar day. It will be a ſuperior or an inferior tide, according as the declination of the moon and the latitude of the place are of the ſame or oppoſite kinds. For the equator of the tide cuts the meridian in *f* and F. Therefore a place which moves in the parallel *c f* has high water when at *c*, and 12 lunar hours afterwards, has low water when at *f*. And any place *k* which is ſtill nearer to the pole N has high water when at *k*, and 12 lunar hours afterwards has low water at *m*. Therefore, as the moon's declination extends to 30°, all places farther north or ſouth than the latitude 60° will ſometimes have only one tide in a lunar day.

4. The ſine of the arch GO, which meaſures $\frac{1}{4}$ of the difference between the duration of a ſuperior and inferior tide, is = tan. lat. × tan. decl. For in the ſpherical triangle *d* OG

Rad : cotan. *d* OG = tan. *d* G : ſin. GO, and

Sin. GO = tan. *d* OQ × tan. *d* G, = tan. decl. × tan. lat.

Hence we ſee, that the difference of the durations of the ſuperior and inferior tides of the ſame day increaſe both with the moon's declination and with the latitude of the place.

The different ſituations of the moon and of the place of obſervation affect the heights of the tides no leſs remarkably. When the point D comes under the meridian NBQ in which the moon is ſituated, there is a ſuperior high water, and the height of the tide above the low water of that day is CC′. When D is at L, the height of the inferior tide is LL′. The elevation above the inſcribed ſphere is M × cof.^{2} *y*, *y* being the zenith diſtance of the moon at the place of obſervation. Therefore at high water, which by the theory is in the place directly under the moon, the height of the tide is as the ſquare of the coſine of the moon's zenith or nadir diſtance.

Hence we derive a conſtruction which ſolves all queſtions relating to the height of the tides with great facility, free from all the intricacy and ambiguities of the algebraic analyſis employed by Bernoulli.

With the radius CQ = M (the elevation produced by the moon above the inſcribed ſphere) deſcribe the circle *p* QPE (fig. 8.) to repreſent a meridian, of which P and *p* are the poles, and EQ the equator. Biſect CP in O; and round O deſcribe the circle PBCD. Let M be the place over which the moon is vertical, and Z be the place of obſervation. MQ is the moon's declination, and ZQ is the latitude of the place. Draw MC *m*, ZCN, cutting the ſmall circle in A and B. Draw AGI perpendicular to CP, and draw CI *μ*, which will cut off an arch E *μ* = QM. MZ and *μ* N are the moon's zenith and nadir diſtances. Draw the diameter BD, and the perpendiculars IK, GH, and AF. Alſo draw OA, PA, AB, ID.

Then DF is the ſuperior tide, DK is the inferior tide, and DH is the arithmetical mean tide.

For

Tide. For the angles BCA, BDA, ſtanding on BA, are equal. Alſo the angles IDB, μCN, are equal, being ſupplements of the angle ICB. Therefore, if BD be made radius, DA and DI are the ſines of the zenith and nadir diſtances of the moon.

But BD : DA = DA : DF. Therefore DF = M × cof.^{2} y, = the height Z z of the ſuperior tide. Alſo DK = M cof.^{2} y', = the height nn' of the inferior tide.

Alſo, becauſe IA is biſected in G, KF is biſected in H, and $DH = \frac{DK + DF}{2}$, = the medium tide.

Let us trace the relation of the conſequences of the various poſitions of Z and M, as we formerly conſidered the reſults of the various ſituations of the ſun and moon.

Firſt, then, let Z retain its place, and let M gradually approach it from the equator. When M is in the equator, A and I coincide with C, and the three points F, K, and H, coincide in i.

As M approaches to Z, A and I approach to B and D; DF increaſes, and DK diminiſhes. The ſuperior or inferior tide is greateſt when the moon is in M or in N; and DF is then = M. As the moon paſſes to the northward of the place, the ſuperior and inferior tides both diminiſh till I comes to D; at which time MQ is equal to ZP, and there is no inferior tide. This however cannot happen if zP is greater than 30°, becauſe the moon never goes farther from the equator. M ſtill going north, we have again a perpendicular from I on BD, but below I, indicating that the inferior tide, now meaſured by DK, belongs to the hemiſpheriod next the moon. Alſo, as M advances from the equator northward, DH diminiſhes continually. Firſt, while H lies between O and B, becauſe G approaches O; and afterwards, when G is above O and H lies between O and D. It is otherwiſe, however, if ZQ is greater than 45°; for then DB is inclined to EQ the other way, and DH increaſes as the point G riſes.

In the next place, let M retain its poſition, and Z proceed along the meridian.

Let us begin at the equator, or ſuppoſe Q the place of obſervation. BD then coincides with CP, and the three lines DF, DK, and DH, all coincide with PG, denoting the two equal tides Q q and E e and their medium, equal to either. As Z goes northward from Q, BOD detaches itſelf from COP; the line DF increaſes, while DK and DH diminiſh. When Z has come to M, F and B coincide with A, and DK and DH are ſtill more diminiſhed. When Z paſſes M, all the three lines DF, DK, and DH, continue to diminiſh. When Z comes to latitude 45°, DB is parallel to IA and EQ, and the point H coincides with O. This ſituation of Z has the peculiar property that DH (now DO) is the ſame, whatever be the declination of the moon. For IA being always parallel to DB, OK and OF will be equal, and DO will be half of DK and DF however they may vary. When Z gets ſo far north that ZP is = MQ, the diameter bd falls on I; ſo that dk vaniſhes, and we have only df. And when Z goes ſtill farther north, dk appears on the other ſide of I. When Z arrives at the pole, BD again coincides with PC, D with C, and DF, DK, and DH, coincide with CG.

Theſe variations of the points F, K, and H, indicate the following phenomena.

1. The greateſt tides happen when the moon is in the zenith or nadir of the place of obſervation; for then the point B coincides with A, and DF becomes DB; that is, = M, indicating the full tide BB.

2. When the moon is in the equator, the ſuperior and inferior tides have equal heights, = M. cof.^{2} lat. For then A and I coincide with C, and the points F and K coincide in i, and Di is = DB cof.^{2} BDC, = M· cof.^{2} lat. Tide.

3. If the place of obſervation is in the equator, the inferior and ſuperior tides are again equal, whatever is the moon's declination: For then B coincides with C, and the points F, K, and H, coincide with G; and PG = PC· cof.^{2} APG, = M· cof.^{2} decl. moon.

4. The ſuperior tides are greater or leſs than the inferior tides according as the latitude and declination are of the ſame or of oppoſite names. For by making Qζ = QZ, and drawing ζC n, cutting the ſmall circle in β, we ſee that the figure is reverſed. The difference between the ſuperior and inferior tides is KF, or IA × coſin. of the angle formed by IA and DB; that is, of the angle BDδ, which is the complement of twice ZQ; becauſe BOC = 2 ZCQ. Now IA is 2 GA, = 2 OA·ſin. 2 MQ = PC·ſin. 2 MQ, = M · ſin. 2 decl. Therefore the difference of the ſuperior and inferior tides is M · ſin. 2 declin. ſin. 2 lat.

5. If the colatitude be equal to the declination, or leſs than it, there will be no inferior tide, or no ſuperior tide, according as the latitude of the place and declination of the moon are of the ſame or oppoſite names.

For when PZ = MQ, D coincides with I, and IK vaniſhes. When PZ is leſs than MQ, the point D is between C and I, and the point Z never paſſes through the equator of the watery ſpheroid; and the low water of its only tide is really the ſummit of the inferior tide.

6. At the pole there is no daily tide; but there are two monthly tides = M · ſin.^{2} declin. and it is low water when the moon is in the equator.

7. The medium tide, repreſented by DH, is = M × $\frac{1 + \text{cof. 2 lat.} \times \text{cof. 2 declin.}}{2}$. For DH = DO + OH. Now OH is equal to OG × cof. GOH = OG · cof. 2 ZQ. And OG = OA · cof. GOA, = OA· cof. 2 MQ. Therefore OH = OA · cof. 2 ZQ · cof. 2 MQ. Therefore DH = OA + OA · cof. 2 ZQ · cof. 2 MQ = M × $\frac{1 + \text{cof. 2 ZQ} \cdot \text{cof. 2 MQ.}}{2}$. Let this for the future be called m.

N. B. The moon's declination never exceeds 30°. Therefore cof. 2 MQ is always a poſitive quantity, and never leſs than $\frac{1}{2}$, which is the coſine of 60°. While the latitude is leſs than 45°, cof. 2 lat. is alſo a poſitive quantity. When it is preciſely 45° the coſine of its double is o; and when it is greater than 45, the coſine of its double is negative. Hence we ſee,

1. That the medium tides are equally affected by the northern and ſouthern declinations of the moon.

2. If the latitude of the place is 45°, the medium tide is always $\frac{1}{2}$ M. This is the reaſon why the tides along the coaſts of France and Spain are ſo little affected by the declination of the moon.

3. If the latitude is leſs than 45°, the mean tides increaſe as the moon's declination diminiſhes. The contrary happens if ZQ is greater than 45°. For DH increaſes or diminiſhes while the point G ſeparates from C according as the angle COD is greater or leſs than COB; that is, according as PCZ is greater or leſs than ZCQ.

4. When Z is in the equator, H coincides with G, and the effect of the moon's declination on the height of the tides is the moſt ſenſible. The mean tide is then = M $\frac{1 + \text{cof. 2 MQ}}{2}$.

All that we have now ſaid may be ſaid of the ſolar tide, putting S in place of M.

Alſo the ſame things hold true of ſpring tides, putting M + S in place of M.

But,

Fig. 1.

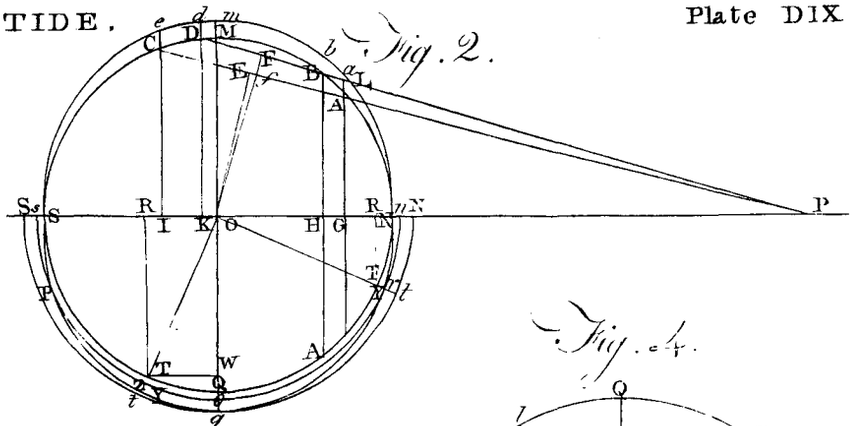

Fig. 3

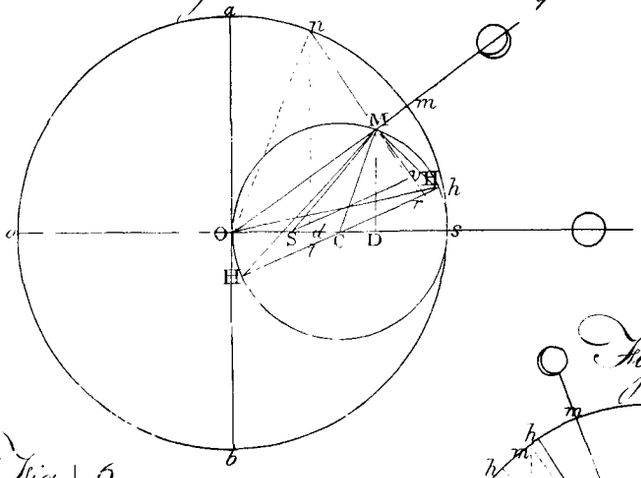

Fig. 4.

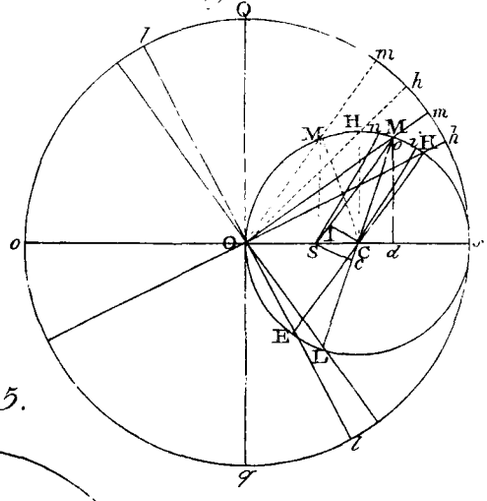

Fig. 5.

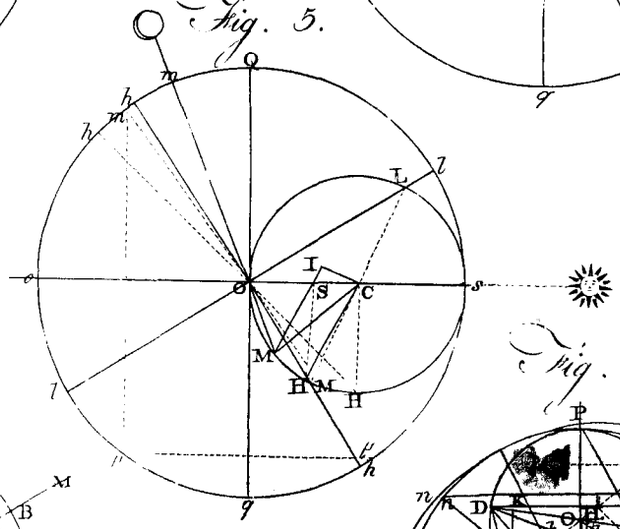

Fig. 6.

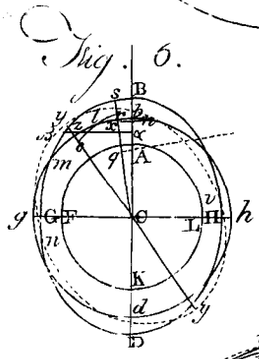

Fig. 7.

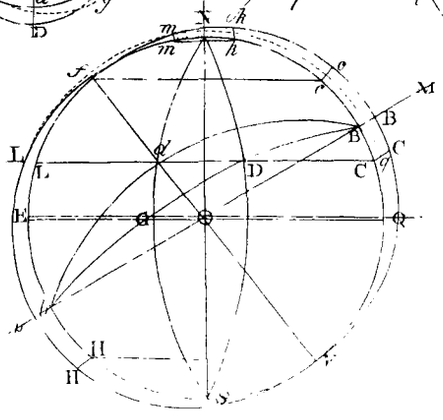

Fig. 8.

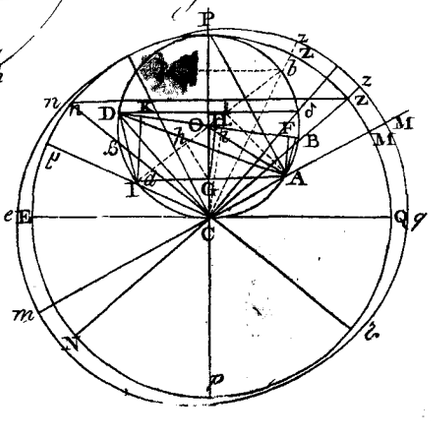

Tide. But in order to aſcertain the effects of declination and latitude on other tides, we muſt make a much more complicated conſtruction, even tho' we ſuppoſe both luminaries in the ecliptic. For in this caſe the two depreſſed poles of the watery ſpheroid are not in the poles of the earth; and therefore the ſections of the ocean, made by meridians, are by no means ellipſes.

In a neap tide, the moon is vertical at B (fig. 7. or 8.), and the ſun at ſome point of fF, 90° from B. If O be this point, the conſtruction for the heights of the tides may be made by adding to both the ſuperior and inferior tides for any point D, the quantity $\overline{M + S - D'F}$ or $\overline{DK} \times$ ſin.^{2} dO, $= \overline{M + S - \text{tide}} \times \frac{\text{ſin.}^2\ 2Q}{\text{cof.}^2\ MQ}$, as is evident.

But if the ſun be vertical at d, d will be the higheſt part of the circle fOF, and no correction is neceſſary. But in this caſe the circle of high water will be inclined to the meridian in an angle equal to dBO (fig. 7.), and neither the times nor elevations of high water will be properly aſcertained, and the error in time may be conſiderable in high latitudes.

The inaccuracies are not ſo great in intermediate tides, and reſpect chiefly the time of high water and the height of low water.

The exact computation is very tedious and peculiar, ſo that it is hardly poſſible to give any account of a regular progreſs of phenomena; and all we can do is, to aſcertain the preciſe heights of detached points. For which reaſons, we muſt content ourſelves with the conſtruction already given. It is the exact geometrical expreſſion of Bernoulli's analyſis, and its conſequences now related contain all that he has inveſtigated. We may accommodate it very nearly to the real ſtate of things, by ſuppoſing PC equal, not to CO of fig. 4. but to MS, exhibiting the whole compound tide. And the point B, inſtead of repreſenting the moon's place, muſt repreſent the place of high water.

Thus have we obtained a general, though not very accurate, view of the phenomena which muſt take place in different latitudes and in different declinations of the ſun and moon, provided that the phyſical theory which determines the form and poſition of the watery ſpheroid be juſt. We have only to compute, by a very ſimple proceſs of ſpherical trigonometry, the place of the pole of this ſpheroid. The ſecond conſtruction, in fig. 8. ſhows us all the circumſtances of the time and height of high water at any point. It will be recollected, that in computing this place of the pole, the anticipation of 20 degrees, ariſing from the inertia of the waters, muſt be attended to.

Were we to inſtitute a compariſon of this theory with obſervation, without farther conſideration, we ſhould ſtill find it unfavourable, partly in reſpect of the heights of the tides, and more remarkably in reſpect of the time of low water. We muſt again conſider the effects of the inertia of the waters, and recollect, that a regular theoretical tide differs very little in its progreſs from the motion of a wave. Even along the free ocean, its motion much reſembles that of any other wave. All waves are propagated by an oſcillatory motion of the waters, preciſely ſimilar to that of a pendulum. It is well known, that if a pendulum receive a ſmall impulſe in the time of every deſcent, its vibrations may be increaſed to infinity. Did the ſucceſſive actions of the ſun or moon juſt keep time with the natural propagation of the tides, or the natural oſcillations of the waters, the tides would alſo augment to infinity: But there is an infinite odds againſt this exact adjuſtment. It is much more probable that the action of to-day interrupts or checks the oſcillation produced by yeſterday's action, and that the motion which we perceive in this day's tide is what remains, and is compounded with the action of to-day. This being the caſe, we ſhould expect that the nature of any tide will depend much on the nature of the preceding tide. Therefore we ſhould expect that the ſuperior and inferior tides of the ſame day will be more nearly equal than the theory determines. The whole courſe of obſervation confirms this. In latitude 45°, the ſuperior and inferior tides of one day may differ in the proportion of $2\frac{1}{2}$ to 1, and the tides correſponding to the greateſt and leaſt declinations of the moon may differ nearly as much. But the difference of the ſuperior and inferior tides, as they occur in the liſt of Obſervations at Rochefort, is not the third part of this, and the changes made by the moon's declination is not above one-half. Therefore we ſhall come much nearer the true meaſure of a ſpring tide, by taking the arithmetical mean, than by taking either the ſuperior or inferior. Tide.

We ſhould expect leſs deviation from the theory in the gradual diminution of the tides from ſpring tide to neap tide, and in the gradual changes of the medium tide by the declination of the moon; becauſe the ſucceſſive changes are very ſmall; and when they change in kind, that is, diminiſh after having for ſome time augmented, the change is by inſenſible degrees. This is moſt accurately confirmed by obſervation. The vaſt collection made by Caſſini of the Obſervations at Breſt being examined by Bernoulli, and the medium of the two tides in one day being taken for the tide of that day, he found ſuch an agreement between the progreſſion of theſe medium tides and the progreſſion of the lines MS of fig. 4. that the one ſeemed to be calculated by the other. He found no leſs agreement in the changes of the medium tides by the moon's declination.

In like manner, the changes produced by the different diſtances of the moon from the earth, were found abundantly conformable to the theory, although not ſo exact as the other. This difference or inferiority is eaſily accounted for: When the moon changes in her mean diſtance, one of the neap tides is uncommonly ſmall, and therefore the ſucceſſive diminutions are very great, and one tide ſenſibly affects another. The ſame circumſtance operates when ſhe changes in apogee, by reaſon of a very large ſpring tide. And the changes correſponding both to the ſun's diſtance from the earth and his declination agreed almoſt exactly.

All theſe things conſidered together, we have abundant reaſon to conclude, that not only the theory itſelf is juſt in principle (a thing which no intelligent naturaliſt can doubt), but alſo that the data which are aſſumed in the application are properly choſen; that is, that the proportion of 2 to 5 is very nearly the true proportion of the mean ſolar and lunar forces. If we now compute the medium tide for any place in ſucceſſion, from ſpring tide to neap tide, and ſtill more, if we compute the ſeries of times of their occurrence, we ſhall find as great an agreement as can be deſired. Not but that there are many irregularities; but theſe are evidently ſo anomalous, that we can aſcribe them to nothing but circumſtances which are purely local.

This general rule of computation muſt be formed in the following manner:

The ſpring tide, according to theory, being called A, and the neap tide B, recollect that the ſpring tide, according to the regular theory, is meaſured by M + S. Recollect alſo, that when the lunar tide only is conſidered, the ſuperior ſpring tide is M × ſin.^{2}, ZM (fig. 8). But when we conſider the action of two adjoining tides on each other, we find it ſafer to take the medium of the ſuperior and inferior tides for the meaſure; and this is $M \times \frac{1 + \text{cof.}^2\ 2ZQ \times \text{cof.}\ 2MQ}{2}$. Let this be called M. This

Tide. being totally the effect of M as modified by latitude and declination, may be taken as its proper measure, by which we are to calculate the other tides of the monthly series from spring tide to neap tide.

In like manner, we must compute a value for S, as modified by declination and latitude; call this s. Then say,

$$M + S : A = m + s : A \times \frac{m+s}{M+S}.$$

This fourth proportional will give the spring tide as modified for the given declination of the luminaries, and the latitude of the place.

Now recollect, that the medium tide, when the luminaries are in the equator, is A × cos.² lat. Therefore let F be the spring tide *observed* at any place when the luminaries are in the equator; and let this be the medium of a great many observations made in these circumstances. This gives A : cos.² lat. (as modified by the peculiar circumstances of the place) = F. Therefore the fourth proportional now given changes to $F \times \frac{m+s}{M+S \cdot \text{cos.}^2 \text{lat.}}$ And a similar substitute for B is $G \times \frac{m-s}{M-S \cdot \text{cos.}^2 \text{lat.}}$

Lastly, To accommodate our formulæ to every distance of the earth from the sun and moon, let D and Δ be the mean distances of the sun and moon, and d and δ their distances at the given time; and then the two substitutes become

$$\frac{\Delta^3 d^3 M + \delta^3 D^3 S}{d^3 \delta^3 (M+S)} \times F \times \frac{m+s}{(M+S)\,\text{cos.}^2 \text{lat.}}$$

$$\frac{\Delta^3 d^3 M - \delta^3 D^3 S}{d^3 \delta^3 (M-S)} \times G \times \frac{m+s}{(M-S)\,\text{cos.}^2 \text{lat.}}$$

The half sum of these two quantities will be the MC, and their half difference will be the SC, of fig. 4. with which we may now operate, in order to find the tide for any other day of the menstrual series, by means of the elongation a of the moon from the sun; that is, we must say MC + CS : MC − CS = tan. a : tan. b; then $x = \frac{a+b}{2}$, and $y = \frac{a-b}{2}$. And MS, the height of the tide, is MC × cos. 2y + CS × cos. 2x.

Such is the general theory of the tides, deduced from the principle of universal gravitation, and adjusted to that proportion of the solar and lunar forces which is most consistent with other celestial phenomena. The comparison of the greatest and least daily retardations of the tides was with great judgment preferred to the proportion of spring and neap tides, selected by Sir Isaac Newton for this purpose. This proportion must depend on many local circumstances. When a wave or tide comes to the mouths of two rivers, and sends a tide up each, and another tide of half the magnitude comes a fortnight after; the proportion of tides sent up to any given places of these rivers may be extremely different. Nay, the proportion of tides sent up to two distant places of the same river can hardly be the same; nor are they the same in any river that we know. It can be demonstrated, in the strictest manner, that the farther we go up the river, where the declivity is greater, the neap tide will be smaller in proportion to the spring tide. But it does not appear that the time of succession of the different tides will be much affected by local circumstances. The tide of the second day of the moon being very little less than that of the first, will be nearly as much retarded, and the intervals between their arrivals cannot be very different from the real intervals of the undisturbed tides; accordingly, the succession of the highest to the highest but one is found to be the same in all places, when not disturbed by *different* winds. In like manner, the succession of the lowest and the lowest but one is found equally invariable; and the highest and the lowest tides observed in any place *must* be accounted the spring and neap tides of that place, whether they happen on the day of full and half moon or not. Nay, we can see here the explanation of a general deviation of the theory which we formerly noticed. A low tide, being less able to overcome obstructions, will be sooner stopped, and the neap tides should happen a little earlier than by the undisturbed theory. Tide.

With all these corrections, the theory now delivered will be found to correspond, with observation, with all the exactness that we can reasonably expect. We had an opportunity of comparing it with the phenomena in a place where they are very singular, viz. in the harbour of Bissestedt in Iceland. The equator of the watery spheroid frequently passes through the neighbourhood of this place, in a variety of positions with respect to its parallel of diurnal revolution, and the differences of superior and inferior tides are most remarkable and various. We found a wonderful conformity to the most diversified circumstances of the theory.

There is a period of 18 years, respecting the tides in Iceland, taken notice of by the ancient Saxons; but it is not distinctly described. Now this is the period of the moon's nodes, and of the greatest and least inclination of her orbit to the equator. It is therefore the period of the positions of the equator of the tides which ranges round this island, and very sensibly affects them.

Hitherto we have supposed the tides to be formed on an ocean completely covering the earth. Let us see how those may be determined which happen in a small and confined sea, such as the Caspian or the Black Sea. The determination in this case is very simple. As no supply of water is supposed to come into the bason, it is susceptible of a tide only by sinking at one end and rising at the other. This may be illustrated by fig. 6. where C s, C y, are two perpendicular planes bounding a small portion of the natural ocean. The water will sink at z and rise at x, and form a surface $o\ t\ r$ parallel to the equilibrated surface $y\ s$. It is evident that there will be high water, or the greatest possible rise at r, when the bason comes to that position where the tangent is most of all inclined to the diameter. This will be when the angle t CB is 45° nearly, and therefore three lunar hours after the moon's southing; at the same time, it will be low water at the other end. It is plain that the rise and fall must be exceedingly small, and that there will be no change in the middle. The tides of this kind in the Caspian Sea, in latitude 45°, whose extent in longitude does not exceed eight degrees, are not above seven inches; a quantity so small, that a slight breeze of wind is sufficient to check it, and even to produce a rise of the waters in the opposite direction. We have not met with any accounts of a tide being observed in this sea.

It should be much greater, though still very small, in the Mediterranean Sea. Accordingly, tides are observed there, but still more remarkably in the Adriatic, for a reason which will be given by and by. We do not know that tides have been observed in the great lakes of North America. These tides, though small, should be very regular.

Should there be another great bason in the neighbourhood of $z\ x$, lying east or west of it, we should observe a curious phenomenon. It would be low water on one side of the shore z when it is high water on the other side of this partition. If the tides in the Euxine and Caspian Seas, or in the American lakes which are near each other, could be observed, this phenomenon should appear, and would be one of the prettiest examples of universal gravitation that can

be

Tide. be conceived. Something like it is to be ſeen at Gibraltar. It is high water on the eaſt ſide of the rock about 10 o'clock at full and change, and it is high water on the weſt ſide, not a mile diſtant, at 12. This difference is perhaps the chief cauſe of the ſingular current which is obſerved in the Straits mouth. There are three currents obſerved at the ſame time, which change their directions every 12 hours. The ſmall tide of the Mediterranean proceeds along the Barbary ſhore, which is very uniform all the way from Egypt, with tolerable regularity. But along the northern ſide, where it is greatly obſtructed by Italy, the iſlands, and the eaſt coaſt of Spain, it ſets very irregularly; and the perceptible high water on the Spaniſh coaſt differs four hours from that of the ſouthern coaſt. Thus it happens, that one tide ranges round Europa point, and another along the ſhore near Ceuta, and there is a third current in the middle different from both. Its general direction is from the Atlantic Ocean into the Mediterranean Sea, but it ſometimes comes out when the ebb tide in the Atlantic is conſiderable.

Suppoſe the moon over the middle of the Mediterranean. The ſurface of the ſea will be level, and it will be half tide at both ends, and therefore within the Straits of Gibraltar. But without the Straits it is within half an hour of high water. Therefore there will be a current ſetting *in* from the Atlantic. About three and an half hours after, it is high water within and half ebb without. The current now ſets out from the Mediterranean. Three hours later, it is low water without the Straits and half ebb within; therefore the current has been ſetting out all this while. Three hours later, it is half flood without the Straits and low water within, and the current is again ſetting in, &c.

Were the earth fluid to the centre, the only ſenſible motion of the waters would be up and down, like the waves on the open ocean, which are not bruſhed along by ſtrong gales. But the ſhallowneſs of the channel makes a horizontal motion neceſſary, that water may be ſupplied to form the accumulation of the tide. When this is formed on a flat ſhelving coaſt, the water muſt flow in and out, on the flats and ſands, while it riſes and falls. Theſe horizontal motions muſt be greatly modified by the channel or bed along which they move. When the channel contracts along the line of flowing water, the wave, as it moves up the channel, and is checked by the narrowing ſhores, muſt be reflected back, and keep a-top of the waters ſtill flowing in underneath. Thus it may riſe higher in theſe narrow ſeas than in the open ocean. This may ſerve to explain a little the great tides which happen on ſome coaſts, ſuch as the coaſt of Normandy. At St Malo the flood frequently riſes 50 feet. But we cannot give any thing like a full or ſatisfactory account of theſe ſingularities. In the Bay of Fundy, and particularly at Annapolis Royal, the water ſometimes riſes above 100 feet. This ſeems quite inexplicable by any force of the ſun and moon, which cannot raiſe the waters of the free ocean more that eight feet. Theſe great floods are unqueſtionably owing to the proper timing of certain oſcillations or currents adjoining, by which they unite, and from one of great force. Such violent motions of water are frequently ſeen on a ſmall ſcale in the motions of brooks and rivers; but we are too little acquainted with hydraulics to explain them with any preciſion.

We have ſeen that there is an oſcillation of waters formed under the ſun and moon; and that in conſequence of the rotation of the earth, the inertia and the want of perfect fluidity of the waters, and obſtructions in the channel, this accumulation never reaches the place where it would finally ſettle if the earth did not turn round its axis. The conſequence of this muſt be a general current of the waters from eaſt to weſt. This may be ſeen in another way. The moon in her orbit round the earth has her gravity to the earth diminiſhed by the ſun's diſturbing force, and therefore moves in an orbit leſs incurvated than ſhe would deſcribe independent of the ſun's action. She therefore employs a longer time. If the moon were ſo near the earth as almoſt to touch it, the ſame thing would happen. Therefore ſuppoſe the moon turning round the earth, almoſt in contact with the equator, with her natural undiſturbed periodic time, and that the earth is revolving round its axis in the ſame time, the moon would remain continually above the ſame ſpot of the earth's ſurface (ſuppoſe the city of Quito), and a ſpectator in another planet would ſee the moon always covering the ſame ſpot. Now let the ſun act. This will not affect the rotation of the earth, becauſe the action on one part is exactly balanced by the action on another. But it will affect the moon. It will move more ſlowly round the earth's centre, and at a greater diſtance. It will be left behind by the city of Quito, which it formerly covered. And as the earth moves round from weſt to eaſt, the moon, moving more ſlowly, will have a motion to the weſt with reſpect to Quito. In like manner, every particle of water has its gravity diminiſhed, and its diurnal motion retarded; and hence ariſes a general motion or current from eaſt to weſt. This is very diſtinctly perceived in the Atlantic and Pacific Oceans. It comes round the Cape of Good Hope, ranges along the coaſt of Africa, and then ſets directly over to America, where it meets a ſimilar ſtream which comes in by the north of Europe. Meeting the ſhores of America, it is deflected both to the ſouth along the coaſt of Brazil, and to the north along the North American ſhores, where it forms what is called the *Gulf Stream*, becauſe it comes from the Gulf of Mexico. This motion is indeed very ſlow, this being ſufficient for the accumulation of ſeven or eight feet on the deep ocean; but it is not altogether inſenſible.

We may expect differences in the appearances on the weſtern ſhores of Europe and Africa, and on the weſtern ſhore of America, from the appearances on the eaſtern coaſts of America and of Aſia, for the general current obſtructs the waters from the weſtern ſhores, and ſends them to the eaſtern ſhores. Alſo when we compare the wide opening of the northern extremity of the Atlantic Ocean with the narrow opening between Kamtſchatka and America, we ſhould expect differences between the appearances on the weſt coaſts of Europe and of America. The obſervations made during the circumnavigations of Captain Cook and others ſhow a remarkable difference. All along the weſt coaſt of North America the inferior tide is very trifling, and frequently is not perceived.

In the very ſame manner, the diſturbing forces of the ſun and moon form a tide in the fluid air which ſurrounds this globe, conſiſting of an elevation and depreſſion, which move gradually from eaſt to weſt. Neither does this tide ever attain that poſition with reſpect to the diſturbing planets which it would do were the earth at reſt on its axis. Hence ariſes a motion of the whole air from eaſt to weſt; and this is the principal cauſe of the trade winds. They are a little accelerated by being heated, and therefore expanding. They expand more to the weſtward than in the oppoſite direction, becauſe the air expands on that ſide into air, which is now cooling and contracting. Theſe winds very evidently follow the ſun's motion, tending more to the ſouth or north as he goes ſouth or north. Were this motion conſiderably affected by the expanſion of heated air, we ſhould find the air rather coming northward and ſouthward from the torrid

Tide. zone, in conſequence of its expanſion in that climate. We repeat it, it is almoſt ſolely produced by the aerial tide, and is neceſſary for the very formation of this tide. We cannot perceive the accumulation. It cannot affect the barometer, as many think, becauſe, though the air becomes deeper, it becomes deeper only becauſe it is made lighter by the gravitation to the ſun. Inſtead of preſſing more on the ciſtern of the barometer, we imagine that it preſſes leſs; becauſe, like the ocean, it never attains the height to which it tends. It remains always too low for equilibrium, and therefore it ſhould preſs with leſs force on the ciſtern of a barometer.

There is an appearance preciſely ſimilar to this in the planet Jupiter. He is ſurrounded by an atmoſphere which is arranged in zones or belts, probably owing to climate differences of the different latitudes, by which each ſeems to have a different kind of ſky. Something like this will appear to a ſpectator in the moon looking at this earth. The general weather and appearance of the ſky is conſiderably different in the torrid and temperate zones. Jupiter's belts are not of a conſtant ſhape and colour; but there often appear large ſpots or tracts of cloud, which retain their ſhape during ſeveral revolutions of Jupiter round his axis. To judge of his rotation by one of theſe, we ſhould ſay that he turns round in 9.55. There is alſo a brighter ſpot which is frequently ſeen, occupying one certain ſituation on the body of Jupiter. This is ſurely adherent to his body, and is either a bright coloured country, or perhaps a tract of clouds hovering over ſome volcano. This ſpot turns round in 9.51¼. And thus there is a general current in his atmoſphere from eaſt to weſt.

Both the motion of the air and of the water tend to diminiſh the rotation of the earth round its axis: for they move ſlower than the earth, becauſe they are retarded by the luminaries. They muſt communicate this retardation to the earth, and muſt take from it a quantity of motion preciſely equal to what they want, in order to make up the equilibrated tide. In all probability this retardation is compenſated by other cauſes; for no retardation can be obſerved. This would have altered the length of the year ſince the time of Hipparchus, giving it a ſmaller number of days. We ſee cauſes of compenſation. The continual waſhing down of ſoil from the elevated parts of the earth muſt produce this effect, by communicating to the valley on which it is brought to reſt the exceſs of diurnal velocity which it had on the mountain top.

While we were employed on this article, a book was put into our hands called *Studies of Nature*, by a Mr Saint Pierre. This author ſcouts the Newtonian theory of the tides, as erroneous in principle, and as quite inſufficient for explaining the phenomena; and he aſcribes all phenomena of the tides to the liquefaction of the ices and ſnows of the circumpolar regions, and the greater length of the polar than of the equatorial axis of the earth. He is a man of whom we wiſh to ſpeak with reſpect, for his conſtant attention to final cauſes, and the proof thence reſulting of the wiſdom and goodneſs of God. For this he is entitled to the greater praiſe, that it required no ſmall degree of fortitude to reſiſt the influence of national example, and to retain his piety in the midſt of a people who have drunk the very dregs of the atheiſm of ancient Greece. This is a ſpecies of merit rarely to be met with in a Frenchman of the preſent day; but as a philoſopher, M. de St Pierre can lay claim to no other merit except that of having collected many important facts. The argument which he employs to prove that the earth is a prolate ſpheroid, is a direct demonſtration of the truth of the contrary opinion; and the melting of the ice and ſnows at the poles cannot produce the ſmalleſt motion in the waters. Were there even 10 times more ice and ſnow floating on the northern ſea than there is, and were it all to melt in one minute, there would be no flux from it; for it would only fill up the ſpace which it formerly occupied in the water. Of this any perſon will be convinced, who ſhall put a handful of ſnow ſqueezed hard into a jar of water, and note the exact height of the water. Let the ſnow melt, and he will find the water of the ſame height as before. Tide. || Tillœa.

Tide-Waiters, or *Tideſmen*, are inferior officers belonging to the cuſtomhouſe, whoſe employment is to watch or attend upon ſhips until the cuſtoms be paid; they get this name from their going on board ſhips on their arrival in the mouth of the Thames or other ports, and ſo come up with the tide.

TIEND, in Scots law. See TEIND.

TIERCE, or TEIRCE, a meaſure of liquid things, as wine, oil, &c. containing the third part of a pipe, or 42 gallons.

TIERCED, in heraldry, denotes the ſhield to be divided by any part of the partition-lines, as party, coupy, tranchy, or tailly, into three equal parts of different colours or metals.

TIGER, in zoology. See FELIS.

Tiger-Wolf, the name by which the hyæna is called at the Cape of Good Hope. See HYÆNA.

TIGRIS, a river of Aſia, which has its ſource near that of the Euphrates in the mountain Tchildir in Turkomania: afterwards it ſeparates Diarbeck from Erzerum, and Khuſiſtan from Irac-Arabia; and uniting with the Euphrates at Gorno, it falls into the gulf of Baſſorah, under the name of *Schat el-Arab*. This river paſſes by Diarbekar, Gezira, Mouſul, Bagdad, Gorno, and Baſſorah.

TILIA, LIME or LINDEN-TREE, in botany: A genus of plants belonging to the claſs of *polyandria*, and order of *monogynia*; and in the natural ſyſtem ranging under the *Columniferæ*. The calyx is quinquepartite; the corolla pentapetalous; the berry is dry, globoſe, quinquelocular, quinquevalve, and opening at the baſe. There are four ſpecies; the europæa and americana, pubeſcens and alba.

The *europæa*, or common lime-tree, is generally ſuppoſed to be a native of Britain; but we are informed by Mr Coxe, that Mr Pennant told him (on what authority is not mentioned), that it was imported into England before the year 1652. Cox's Travels in Switzerland, vol. ii. p. 64.

The leaves are heart-ſhaped, with the apex produced, and ſerrated on the edges; the flowers grow in a thin umbel, from three to nine together, of a whitiſh colour and a fragrant ſmell; very grateful to bees. The wood is light, ſmooth, and of a ſpongy texture, uſed for making laſts and tables for ſhoemakers, &c. Ropes and bandages are made of the bark, and mats and ruſtic garments of the inner rind, in Carniola and ſome other countries.—The lime-tree contains a gummy juice, which being repeatedly boiled and clarified produces a ſubſtance like ſugar.

TILLEMONT (Sebaſtian le Nain de). See NAIN.

TILLER *of a* SHIP, a ſtrong piece of wood faſtened in the head of the rudder, and in ſmall ſhips and boats called the *helm*.

TILLŒA, in botany: A genius of plants belonging to the claſs of *tetrandria*, the order of *tetragynia*, and in the natural ſyſtem ranging under the 13th order, *Succulentæ*. The calyx has three or four diviſions; the petals are three or four, and equal; the capſules three or four, and polyſpermous. There are four ſpecies; of which one only, the muſcoſa, is a native of England, and is not mentioned among the Scotch plants.

The *muſcoſa*, or procumbent tillœa, has proſtrate ſtems, almoſt

Tillotſon. almoſt erect, generally red, and grow longer after flowering. The parts of fructification are always three. The leaves grow in pairs, and are fleſhy. It is found on dry heaths in Norfolk and Suffolk, and flowers in May and June.

TILLOTSON (John), a celebrated archbiſhop of Canterbury, was the ſon of Robert Tillotſon of Sowerby, in the pariſh of Hallifax in Yorkſhire, clothier; and was born there in the year 1630. He ſtudied in Clarehall, Cambridge; and in 1656 left this college, in order to become tutor to the ſon of Edmund Prideaux, Eſq; of Ford-abbey in Devonſhire. He was afterwards curate to Dr Hacket, vicar of Cheſhunt, in Hertfordſhire. In 1663, he was preſented by Sir Thomas Barnardiſton to the rectory of Ketton or Keddington in the county of Suffolk; but was the next year choſen preacher to Lincoln's-Inn, when he procured Ketton to be beſtowed on his curate. He was greatly admired in London for his ſermons; and in the ſame year was choſen Tueſday lecturer at St Lawrence's church, London, where his lectures were frequented by all the divines of the city, and by many perſons of quality and diſtinction. In 1666, he took the degree of Doctor of Divinity at Cambridge; in 1669, was made prebendary of Canterbury; in 1672, was admitted dean of that cathedral; and three years after, was made a prebendary of St Paul's cathedral, London. In 1679, he became acquainted with Charles earl of Shrewſbury, whom he converted from Popery; and the next year refuſed to ſign the clergy of London's addreſs of thanks to king Charles II. for not agreeing to the bill of excluſion of the duke of York. In 1683, he viſited the unhappy Lord Ruſſel when under condemnation; and attended him in his laſt moments on the ſcaffold. In 1689, he was inſtalled dean of St Paul's; made clerk of the cloſet to King William and Queen Mary; and appointed one of the commiſſioners to prepare matters to be laid before the convocation, in order to a comprehenſion of all Proteſtants, as well diſſenters as churchmen; but this attempt was fruſtrated by the zeal of thoſe members of that body, who refuſed to admit of any alteration in things confeſſedly indifferent. In 1691, Dr Tillotſon was, notwithſtanding the warmeſt remonſtrances and intreaties on his part, conſecrated archbiſhop of Canterbury, and four days after was ſworn one of the privy council; their majeſties always repoſing an entire confidence in his prudence, moderation, and integrity. In 1694, he was ſeized with a dead palſy, of which he died in the 65th year of his age. He was interred in the church of St Lawrence Jury, London, where a handſome monument is erected to his memory. This learned and pious divine, while living, was greatly inveighed againſt by the enemies of the revolution. After his death there was found a bundle of bitter libels which had been publiſhed againſt him, on which he had written with his own hand, "I forgive the authors of theſe books, and pray God that he may alſo forgive them." It is remarkable, that while this truly great man was in a private ſtation, he always laid aſide two-tenths of his income for charitable uſes. One volume in folio of Dr Tillotſon's ſermons was publiſhed in his life-time, and corrected by his own hand; theſe Barbeyrac tranſlated into French. Thoſe which came abroad after his death, from his chaplain Dr Barker, made two volumes in folio, the copy of which was ſold for 2500l. and this was the only legacy he left to his family, his extenſive charity having conſumed his yearly revenues as conſtantly as they came to his hands. However, King William gave two grants to his widow; the firſt of which was an annuity of 400l. during the term of her natural life, and the ſecond of 200l. as an addition to the former annuity. Dr Tillotſon wrote ſome other works beſides his Sermons; and alſo publiſhed Dr Barrow's works, and Dr Wilkins's Treatiſe of the Principles and Duties of Natural Religion, and a volume of that divine's Sermons. Timber. ‖ Timon.

TIMBER, wood fit for building, &c. See TREE, and *STRENGTH of Materials*.

TIMBERS, the ribs of a ſhip, or the incurvated pieces of wood, branching outward from the keel in a vertical direction, ſo as to give ſtrength, figure, and ſolidity, to the whole fabric. See SHIP BUILDING, book i. ch. ii.

TIME, a ſucceſſion of phenomena in the univerſe, or a mode of duration marked by certain periods or meaſures, chiefly by the motion and revolution of the ſun.

The general idea which time gives in every thing to which it is applied, is that of limited duration. Thus we cannot ſay of the Deity, that he exiſts in time; becauſe eternity, which he inhabits, is abſolutely uniform, neither admitting limitation nor ſucceſſion. See METAPHYSICS, n° 209.

TIME, in muſic, is an affection of ſound, by which it is ſaid to be long or ſhort, with regard to its continuance in the ſame tone or degree of tune.

Muſical time is diſtinguiſhed into *common* or *duple* time, and *triple* time.

Double, *duple*, or *common* time, is when the notes are in a duple duration of each other, *viz.* a ſemibreve equal to two minims, a minim to two crotchets, a crotchet to two quavers, &c.

Common or double time is of two kinds. The firſt when every bar or meaſure is equal to a ſemibreve, or its value in any combination of notes of a leſs quantity. The ſecond is where every bar is equal to a minim, or its value in leſs notes. The movements of this kind of meaſure are various, but there are three common diſtinctions; the firſt *ſlow*, denoted at the beginning of the line by the mark C; the ſecond *briſk*, marked thus  ; and the third *very briſk*, thus marked 

Triple time is when the durations of the notes are triple of each other, that is, when the ſemibreve is equal to three minims, the minim to three crotchets, &c. and it is marked T.

TIME-Keepers, or *Inſtruments for meaſuring Time*. See CLOCK, DIAL, WATCH, &c.

Harriſon's TIME-Keeper. See HARRISON and LONGITUDE.

TIMOLEON, a celebrated Corinthian general, who reſtored the Syracuſians to their liberty, and drove the Carthaginians out of Sicily. See SYRACUSE, n° 50—54.

TIMON the *Sceptic*, who is not to be confounded with Timon the *Miſanthrope*, was a Phliaſian, a diſciple of Pyrrho, and lived in the time of Ptolemy Philadelphus. He took ſo little pains to invite diſciples to his ſchool, that it has been ſaid of him, that as the Scythians ſhot flying, Timon gained pupils by running from them. He was fond of rural retirement; and was ſo much addicted to wine, that he held a ſucceſsful conteſt with ſeveral celebrated champions in drinking. Like Lucian, he wrote with ſarcaſtic humour againſt the whole body of philoſophers. The fragments of his ſatirical poem *Silli*, often quoted by the ancients, have been carefully collected by Henry Stephens, in his *Poeſis Philoſophica*. Timon lived to the age of 90 years.

TIMON, ſurnamed *Miſanthropos*, or the *Man-hater*, a famous Athenian, who lived about 420 B. C. He was one day aſked, why he loved the young Alcibiades while he deteſted all the reſt of the human race? on which he replied, "It is becauſe I foreſee that he will be the ruin of the Athenians."

Timor, Timotheus

nians." He carefully avoided all ſorts of company; yet went one day to an aſſembly of the people, and cried with a loud voice, "That he had a fig-tree on which ſeveral perſons had hanged themſelves; but as he intended to cut it down, in order to build a houſe in the place where it ſtood, he gave them notice of it, that if any of them had a mind to hang themſelves, they muſt make haſte and do it ſpeedily." He had an epitaph engraved on his tomb, filled with imprecations againſt thoſe who read it. Shakeſpeare has formed a tragedy on his ſtory.

TIMOR, an iſland of Aſia, in the Eaſt Indian ſea, to the ſouth of the Moluccas, and to the eaſt of the iſland of Java, being 150 miles in length, and 37 in breadth. It abounds in ſandal-wood, wax, and honey; and the Dutch have a fort here. The inhabitants are Pagans, and are little better than ſavages; and ſome pretend they had not the uſe of fire till a few years ago.

TIMOTHEUS, one of the moſt celebrated poet-muſicians of antiquity, was born at Miletus, an Ionian city of Caria, 446 years B. C. He was contemporary with Philip of Macedon and Euripides; and not only excelled in lyric and dithyrambic poetry, but in his performance upon the cithara. According to Pauſanias, he perfected that inſtrument by the addition of four new ſtrings to the ſeven which it had before; though Suidas ſays it had nine before, and that Timotheus only added two, the 10th and 11th, to that number. See LYRE.

With reſpect to the number of ſtrings upon the lyre of Timotheus: The account of Pauſanius and Suidas is confirmed in the famous ſenatus conſultum againſt him, ſtill extant, preſerved at full length in Boethius. Mr Stillingfleet has given an extract from it, in proof of the ſimplicity of the ancient Spartan muſic. The fact is mentioned in Athenæus; and Caſaubon, in his notes upon that author, has inſerted the whole original text from Boethius, with corrections. The following is a faithful tranſlation of this extraordinary Spartan act of parliament. "Whereas Timotheus the Mileſian, coming to our city, has diſhonoured our ancient muſic, and, deſpiſing the lyre of ſeven ſtrings, has, by the introduction of a greater variety of notes, corrupted the ears of our youth; and by the number of his ſtrings, and the novelty of his melody, has given to our muſic an effeminate and artificial dreſs, inſtead of the plain and orderly one in which it has hitherto appeared; rendering melody infamous, by compoſing in the chromatic inſtead of the enharmonic:———— The kings and the ephori have therefore reſolved to paſs cenſure upon Timotheus for theſe things; and, farther, to oblige him to cut all the ſuperfluous ſtrings of his eleven, leaving only the ſeven tones; and to baniſh him from our city; that men may be warned for the future not to introduce into Sparta any unbecoming cuſtom."————

The ſame ſtory, as related in Athenæus, has this additional circumſtance, That when the public executioner was on the point of fulfilling the ſentence, by cutting off the new ſtrings, Timotheus, perceiving a little ſtatue in the ſame place, with a lyre in his hand of as many ſtrings as that which had given the offence, and ſhowing it to the judges, was acquitted.

It appears from Suidas, that the poetical and muſical compoſitions of Timotheus were very numerous, and of various kinds. He attributes to him 19 nomes, or canticles, in hexameters; 36 proems, or preludes; 18 dithyrambics; 21 hymns; the poem in praiſe of Diana; one panegyric; three tragedies, the Perſians, Phinidas, and Laertes; to which muſt be added a fourth, mentioned by ſeveral ancient authors, called *Niobe*, without forgetting the poem on the birth of Bacchus. Stephen of Byzantium makes him author of 18 books of nomes, or airs, for the cithara, to 8000 verſes; and of 1000 Προοιμια, or preludes, for the nomes of the flutes.

Timotheus died in Macedonia, according to Suidas, at the age of 97; though the Marbles, much better authority, ſay at 90; and Stephen of Byzantium fixes his death in the fourth year of the 105th Olympiad, two years before the birth of Alexander the Great; whence it appears, that this Timotheus was not the famous player on the flute ſo much eſteemed by that prince, who was animated to ſuch a degree by his performance as to ſeize his arms; and who employed him, as Athenæus informs us, together with the other great muſicians of his time, at his nuptials. However, by an inattention to dates, and by forgetting that of theſe two muſicians of the ſame name the one was a Mileſian and the other a Theban, they have been hitherto often confounded.

TIMUR BECK. See TAMERLANE.

TIN, one of the four imperfect metals.

For an account of its metalline qualities, and the various ſtates in which it is found, ſee MINERALOGY, page 118. For its chemical qualities, ſee the places referred to in CHEMISTRY-*Index*. For the method of eſſaying and ſmelting its ore, ſee METALLURGY, Part ii. ſect. vi.; Part iii. ſect. vi. See alſo CORNWALL, and PHARMACY-*Index*.—An advantageous commerce has been lately opened between Cornwall and the Eaſt Indies and China. In 1791 about 3000 tons of tin were raiſed in Cornwall; of which 2200 tons were ſold in the European market for L. 72 each, and 800 tons carried to India and China at L. 62 *per* ton.

TINCAL, the name by which crude or impure borax is called. See BORAX and CHEMISTRY-*Index*.

TINCTURE, in pharmacy. See PHARMACY-*Index*.

TINDAL (Dr Matthew), a famous Engliſh writer, was the ſon of the reverend Mr John Tindal of Beer Ferres in Devonſhire, and was born about the year 1657. He ſtudied at Lincoln college in Oxford, whence he removed to Exeter, and was afterwards elected fellow of All Souls. In 1685 he took the degree of doctor of law, and in the reign of James II. declared himſelf a Roman Catholic; but ſoon renounced that religion. After the revolution he publiſhed ſeveral pamphlets in favour of government, the liberty of the preſs, &c. His "Rights of the Chriſtian Church aſſerted," occaſioned his having a violent conteſt with the high church clergy; and his treatiſe "Chriſtianity as old as the Creation," publiſhed in 1730, made much noiſe, and was anſwered by ſeveral writers, particularly by Dr Conybeare, Mr Forſter, and Dr Leland. Dr Tindal died at London in Auguſt 1733. He left in manuſcript a ſecond volume of his "Chriſtianity as old as the Creation;" the preface to which has been publiſhed. Mr Pope has ſatirized Dr Tindal in his Dunciad.

TINDALE (William). See TYNDALE.

TINNING, the covering or lining any thing with melted tin, or tin reduced to a very fine leaf. Looking-glaſſes are foliated or tinned with thin plates of beaten tin, the whole bigneſs of the glaſs, applied or faſtened thereto by means of quickſilver. See *FOLIATING of Looking Glaſſes*.

TINNING of Copper. See COPPER, n° 25—28.

TINNITUS AURIUM, a noiſe in the ears like the continued ſound of bells, very common in many diſorders, particularly in nervous fevers.

TIPPERARY, a county of the province of Munſter in Ireland, bounded on the weſt by that of Limerick and Clare, on the eaſt by the county of Kilkenny and Queen's county, on the ſouth by the county of Waterford, and on the north and north-eaſt by King's county and the territory of the ancient O'Carols. It extends about 42 miles in length,

Tipſtaff, Tipula.

Gough's Edition of Cambden's Britannia.

length, 27 in breadth, containing 599,500 acres, divided into 12 baronies, in which are ſeveral market towns and boroughs. It ſends eight members to parliament, *viz.* two for the county, two for the city of Caſhel, and two for each of the boroughs of Clonmell, Fetherd, and Thurles. The north part of it is mountainous and cold; but in the ſouth the air is milder, and the ſoil much more fertile, producing plenty of corn and good paſture for the numerous herds of cattle and flocks of ſheep with which it abounds. The north part is called *Ormond*, and for a long time gave the title of *earl*, and afterwards of *marquis* and *duke*, to the noble family of Butler, deſcended from a ſiſter of Thomas a Becket archbiſhop of Canterbury, till, at the acceſſion of George I. the laſt duke was attainted of high-treaſon, and died abroad. In that part of the county, the family had great prerogatives and privileges granted them by Edward III. Another diſtrict in this county was anciently called the *County of the Holy Croſs of Tipperary*, from a famous abbey in it ſtyled *Holy Croſs*, on account of a piece of Chriſt's croſs that was ſaid to be preſerved there. This abbey and diſtrict enjoined alſo ſpecial privileges in former times. The remains of the abbey, or rather the ſpot where it ſtood, are ſtill held in great veneration, and much reſorted to by the Roman Catholics.

TIPSTAFF, an officer who attends the judges with a kind of ſtaff tipped with ſilver, and takes into his charge all priſoners who are committed or turned over at a judge's chambers.

TIPULA, the CRANE-FLY; a genus of inſects belonging to the order of *diptera*. The mouth is a prolongation of the head; the upper-jaw is arched. They have two palpi, which are curved, and longer than the head. The proboſcis is ſhort, and bends inwards. Gmelin enumerates 123 ſpecies, of which 14 are Britiſh. They are divided into two families. 1. Thoſe with wings diſplayed. 2. Thoſe with wings incumbent, and which in form reſemble a gnat.

This two winged inſect is often taken for the gnat, which it reſembles, but has not its miſchievous inſtinct, nor its murderous proboſcis. The larger tipulæ go by the name of *ſempſtreſſes*, the ſmall ones by that of *culiciform*; the latter, in fine ſummer evenings, flutter about the water-ſide in legions, through which a perſon may paſs on his way unhurt. The ſhrill noiſe they make with their wings is not very diſcernible. Tipulæ, before they become inhabitants of the air, creep under the form of grubs. Thoſe which turn to larger tipulæ dwell in holes of decayed willows, in the dampeſt places, where they change into chryſalids, and in that ſtate have the faculty of breathing through two ſmall curve horns; beſides which they are endowed with progreſſive motion, but not retrogreſſive, being impeded by little ſpines placed on every ring of the abdomen. When the ſhroud is torn, the inſect, prettily apparelled, eſcapes from his gloomy habitation by means of his wings, which often are variegated, and takes his paſtime in the fields. Its long legs and its wings mutually aſſiſt each other when it either walks or flies. The larvæ and chryſalids of the little tipulæ are found in water. They are various in colour, form, and carriage; ſome being grey, others brown, and others red; ſome, like the polypus, furniſhed with a pair of arms; ſeveral with cylindrical tubes that perform the office of vent holes. Theſe ſwim with nimbleneſs; thoſe never leave the holes they have dug for themſelves in the banks of rivulets. Laſtly, others make a ſilken cod that receives part of their body; but all of them, after a period, renounce their reptile and aquatic life, and receive wings from the hands of nature. Their frame is then ſo weak, that a touch is enough to cruſh them. They are ſometimes of a beautiful green, ſometimes coal-black; and the moſt remarkable are thoſe whoſe fore-legs, extraordinarily long, do not touch the ground, and are movable like antennæ. In this ſtate of perfection, the tipulæ being provided with proper organs, apply themſelves to the propagation of the ſpecies. Thoſe ſame poor inſects, who in the ſtate of larvæ have eſcaped the voraciouſneſs of fiſhes, often become, in their progreſs through the air, a prey to equally mercileſs birds.

Tire, Tirol.

TIRE, in the ſea-language, is a row of cannon placed along a ſhip's ſide, either above upon deck, or below, diſtinguiſhed by the epithets of *upper* and *lower tires*.

TYROL, a county of Germany in the circle of Auſtria, under which may be included the territories belonging to the biſhops of Brixen, Trent and Chur, Teutonic Order, and the prince of Deitrichſtien, the Auſtrian ſeigniories before the Arlberg, and the Auſtrian diſtricts in Swabia. It is 150 miles in length, and 120 in breadth, and contains 28 large towns.

The face of the country is very mountainous. Of theſe mountains, ſome have their tops always buried in ſnow; others are covered with woods, abounding with a variety of game: and others are rich in metals, and marble of all colours. Of the lower, ſome yield plenty of corn, others wine, and woods of cheſnut trees. The valleys are exceeding fertile alſo, and pleaſant. In ſome places conſiderable quanties of flax are raiſed, in others there is a good breed of horſes and horned cattle; and, among the mountains, abundance of chamois and wild goats. In this country are alſo found precious ſtones of ſeveral ſorts; as granates, rubies, amethiſts, emeralds, and a ſpecies of diamonds, agates, cornelians, chalcedonies, malachites, &c. nor is it without hot-baths, acid waters, ſalt-pits, mines of ſilver, copper, and lead, mineral colours, alum, and vitriol. The principal river of Tirol is the Inn, which, after traverſing the country, and receiving a number of leſſer ſtreams into it, enters Bavaria, in which, at Paſſau, it falls into the Danube. The men here are very tall, robuſt, and vigorous; the women alſo are ſtout, and generally fair; and both ſexes have a mixture of the Italian and German in their tempers and characters. As there is little trade or manufacture in the country, except what is occaſioned by the mines and ſalt-works, many of the common people are obliged to ſeek a ſubſiſtence elſewhere. A particular kind of ſalutation is uſed all over Tirol. When a perſon comes into a houſe, he ſays, "Hail! Jeſus Chriſt:" the anſwer is, "May Chriſt be praiſed, and the Holy Virgin his mother." Then the maſter of the houſe takes the viſitor by the hand. This ſalutation is fixed up in print at all the doors, with an advertiſement tacked to it, importing, that pope Clement XI. granted 100 days indulgence, and a plenary abſolution, to thoſe who ſhould pronounce the ſalutation and anſwer, as often as they did it. The emperor has forts and citadels ſo advantageouſly ſituated on rocks and mountains all over the country, that they command all the valleys, avenues, and paſſes that lead into it. The inhabitants, however, to keep them in good humour, are more gently treated, and not ſo highly taxed as thoſe of the other hereditary countries. As to the ſtates, they are much the ſame in this country as in the other Auſtrian territories, except that the peaſants here ſend deputies to the diets. Tirol came to the houſe of Auſtria in the year 1363, when Margaret, counteſs thereof, bequeathed it to her uncles the dukes of Auſtria. The arms of Tirol are an eagle gules, in a field argent. The counts of Trap are hereditary ſtewards; the lords of Gloſz, chamberlains; the princes of Trautſon, marſhals; the counts of Wolkenſtein, maſters of the horſe and carvers; the houſe of Spaur, cup-bearers; the counts of Kungl, ſewers and rangers;

Titan. rangers; the counts of Brandis, keepers of the jewels; the houſe of Welſperg, purveyors and ſtaff-bearers, and the counts of Coalto, falconers. Beſides the governor, here are three ſovereign colleges, ſubordinate to the court at Vienna, which ſit at Inſpruck, and have their different departments. Towards the expences of the military eſtabliſhment of this country, the proportion is 100,000 florins yearly; but no more than one regiment of foot is generally quartered in it.

Tirol is divided into ſix quarters, as they are called; namely, thoſe of the Lower and Upper Innthal, Vintſgow, Etch, Eiſack, and Puſterthal.

TITAN, in fabulous hiſtory, the ſon of Cœlus and Terra, and the eldeſt brother of Saturn, ſuffered the latter to enjoy the crown, on condition that he ſhould bring up none of his male iſſue, by which means the crown would at length revert to him; but Jupiter being ſpared by the addreſs of Rhea, Saturn's wife, Titan and his children were ſo enraged at ſeeing their hopes fruſtrated, that they took up arms to revenge the injury; and not only defeated Saturn, but kept him and his wife priſoners till he was delivered by Jupiter, who defeated the Titans; when from the blood of theſe Titans ſlain in the battle, proceeded ſerpents, ſcorpions, and all venomous reptiles. See SATURN.

Such is the account given by the poets of this family of Grecian and Roman gods. From the fragments of Sanchoniatho, however, and other ancient writers, many learned men have inferred that the Titans were an early race of ambitious heroes, who laid the foundation of that idolatry which quickly overſpread the world, and that by aſſuming the names of the luminaries of heaven they contrived to get themſelves every where adored as the *Dii majorum gentium*. That the word *Titan* ſignifies the ſun, there can indeed be very little doubt. Every one knows that ſuch was its ſignification in the Æolic dialect; and as it is evidently compounded of *Ti*, which, in ſome oriental tongues, ſignifies *bright* or *clear*, and *Tan*, which ſignifies a *country* or the *earth*, it may be ſafely concluded that *Titan* was the name of the ſun before the word was imported into Greece. But the great queſtion among antiquarians is, of what country was that race which, aſſuming to themſelves the names of the heavenly bodies, introduced into the world that ſpecies of idolatry which is known by the appellation of *Hero-worſhip*.

M. Pezron, in a work publiſhed many years ago, and entitled *The Antiquities of Nations*, maintains that the Titans were a family of Sacæ or Scythians, who made their firſt appearance beyond Media and Mount Imaus, in the upper regions of Aſia; that they were the deſcendants of Gomer the ſon of Japheth and grandſon of Noah; and that after conquering a great part of the world, upon entering Upper Phrygia, they quitted their ancient name of Gomerians or Cimmerians, and aſſumed that of Titans. All this, he ſays, happened before the birth of Abraham and the foundation of the Aſſyrian monarchy; and he makes Uranus, their ſecond prince in the order of ſucceſſion, to have conquered Thrace, Greece, the Iſland of Crete, and a great part of Europe. Uranus was ſucceeded by Saturn, and Saturn by Jupiter, who flouriſhed, he ſays, 300 years before Moſes, and divided his vaſt empire between himſelf, his brother Pluto, and his couſin-german Atlas, who was called *Telamon*. For the truth of this genealogy of the Titans M. Pezron appeals to the moſt approved Greek hiſtorians; but unluckily for his hypotheſis theſe writers have not a ſingle ſentence by which it can be fairly ſupported. It ſuppoſes not only the great antiquity of the Scythians, but likewiſe their early progreſs in arts and ſciences, contrary to what we have proved in other articles of this work. See SCULPTURE, n° 4 and 5. and SCYTHIA.

Titan. Tithes.

Others, taking the fragment of Sanchoniatho's Phenician hiſtory for their guide, have ſuppoſed the Titans to have been the deſcendants of Ham. Of this opinion was biſhop Cumberland; and our learned friend Dr Doig, to whom we have been indebted for great favours, indulged us with the peruſal of a manuſcript, in which, with erudition and ingenuity ſtruggling for the pre-eminence, he traces that impious family from the profane ſon of Noah, and ſhows by what means they ſpread the idolatrous worſhip of themſelves over the greater part of the ancient world. Cronus, of whoſe exploits ſome account has been given elſewhere (ſee SANCHONIATHO), he holds to be Ham; and tracing the progreſs of the family from Phœnicia to Cyprus, from Cyprus to Rhodes, thence to Crete, and from Crete to Samathrace, he finds reaſon to conclude that the branch called *Titans* or *Titanides* flouriſhed about the era of Abraham, with whom, or with his ſon Iſaac, he thinks the Cretan Jupiter muſt have been contemporary. As they proceeded from countries which were the original ſeat of civilization to others in which mankind had ſunk into the groſſeſt barbariſm, it was eaſy for them to perſuade the ignorant inhabitants that they derived the arts of civil life from their parent the ſun, and in conſequence of their relation to him to aſſume to themſelves divine honours. To aſk how they came to think of ſuch groſs impiety, is a queſtion as fooliſh as it would be to aſk how Ham their anceſtor became ſo wicked as to entail the curſe of God upon himſelf and his poſterity. The origin of evil is involved in difficulties; but leaving all inquiries into it to be proſecuted by the metaphyſician and moraliſt, it is ſurely more probable that the worſhip of dead men originated among the deſcendants of Ham than among thoſe of Shem and Japheth; and that the fragment of Sanchoniatho, when giving an account of the origin of the Titans, the undoubted authors of that worſhip, is more deſerving of credit than the fabulous and comparatively late writers of Greece and Rome.

TITHES, in eccleſiaſtical law, are defined to be the tenth-part of the increaſe, yearly ariſing and renewing from the profits of lands, the ſtock upon lands, and the perſonal induſtry of the inhabitants: the firſt ſpecies being uſually called *predial*, as of corn, graſs, hops, and wood; the ſecond *mixed*, as of wool, milk, pigs, &c. conſiſting of natural products, but nurtured and preſerved in part by the care of man; and of theſe the tenth muſt be paid in groſs; the third *perſonal*, as of manual occupations, trades, fiſheries, and the like; and of theſe only the tenth-part of the clear gains and profits is due.

We ſhall, in this article, conſider, 1. The original of the right of tithes. 2. In whom that right at preſent ſubſiſts. 3. Who may be diſcharged, either totally or in part, from paying them.

1. As to their original, we will not put the title of the clergy to tithes upon any divine right; though ſuch a right certainly commenced, and we believe as certainly ceaſed, with the Jewiſh theocracy. Yet an honourable and competent maintenance for the miniſters of the goſpel is undoubtedly *jure divino*, whatever the particular mode of that maintenance may be. For, beſides the poſitive precepts of the New Teſtament, natural reaſon will tell us, that an order of men who are ſeparated from the world, and excluded from other lucrative profeſſions for the ſake of the reſt of mankind, have a right to be furniſhed with the neceſſaries, conveniences, and moderate enjoyments of life, at their expence; for whoſe benefit they forego the uſual means of providing them. Accordingly all municipal laws have provided a liberal and decent maintenance for their national prieſts or clergy; ours, in particular, have eſtabliſhed this of tithes, probably in imitation of the Jewiſh law: and perhaps

Blackſt. Comment.

Tithes. haps, conſidering the degenerate ſtate of the world in general, it may be more beneficial to the Engliſh clergy to found their title on the law of the land, than upon any divine right whatſoever, unacknowledged and unſupported by temporal ſanctions.

We cannot preciſely aſcertain the time when tithes were firſt introduced into this country. Poſſibly they were contemporary with the planting of Chriſtianity among the Saxons by Auguſtin the monk, about the end of the ſixth century. But the firſt mention of them which we have met with in any written Engliſh law, is a conſtitutional decree, made in a ſynod held A. D. 786, wherein the payment of tithes in general is ſtrongly enjoined. This cannon or decree, which at firſt bound not the laity, was effectually confirmed by two kingdoms of the heptarchy, in their parliamentary conventions of eſtates, reſpectively conſiſting of the kings of Mercia and Northumberland, the biſhops, dukes, ſenators, and people. Which was a few years later than the time that Charlemagne eſtabliſhed the payment of them in France, and made that famous diviſion of them into four parts; one to maintain the edifice of the church, the ſecond to ſupport the poor, the third the biſhop, and the fourth the parochial clergy.

The next authentic mention of them is in the *fœdus Edwardi et Guthruni*; or the laws agreed upon between king Guthrun the Dane, and Alfred and his ſon Edward the Elder, ſucceſſive kings of England, about the year 900. This was a kind of treaty between thoſe monarchs, which may be found at large in the Anglo-Saxon laws: wherein it was neceſſary, as Guthrun was a pagan, to provide for the ſubſiſtence of the Chriſtian clergy under his dominion; and accordingly, we find the payment of tithes not only enjoined, but a penalty added upon non-obſervance: which law is ſeconded by the laws of Athelſtan, about the year 930. And this is as much as can certainly be traced out with regard to their legal original.

2. We are next to conſider the perſons to whom tithes are due. Upon their firſt introduction, though every man was obliged to pay tithes in general, yet he might give them to what prieſts he pleaſed; which were called *arbitrary conſecrations of tithes*; or he might pay them into the hands of the biſhop, who diſtributed among his dioceſian clergy the revenues of the church, which were then in common. But when dioceſes were divided into pariſhes, the tithes of each pariſh were allotted to its own particular miniſter; firſt by common conſent or the appointments of lords of manors, and afterwards by the written law of the land.

Arbitrary conſecrations of tithes took place again afterwards, and were in general uſe till the time of king John. This was probably owing to the intrigues of the regular clergy, or monks of the Benedictine and other orders, under archbiſhop Dunſtan and his ſucceſſors; who endeavoured to wean the people from paying their dues to the ſecular or parochial clergy (a much more valuable ſet of men than themſelves), and were then in hopes to have drawn, by ſanctimonious pretences to extraordinary purity of life, all eccleſiaſtical profits to the coffers of their own ſocieties. And this will naturally enough account for the number and riches of the monaſteries and religious houſes which were founded in thoſe days, and which were frequently endowed with tithes. For a layman, who was obliged to pay his tithes ſomewhere, might think it good policy to erect an abbey, and there pay them to his own monks, or grant them to ſome abbey already erected: ſince for this donation, which really coſt the patron little or nothing, he might, according to the ſuperſtition of the times, have maſſes for ever ſung for his ſoul. But in proceſs of years, the income of the poor laborious pariſh-prieſts being ſcandalouſly reduced by theſe arbitrary conſecrations of tithes, it was remedied by pope Innocent III. about the year 1200, in a decretal epiſtle ſent to the archbiſhip of Canterbury, and dated from the palace of Lateran: which has occaſioned Sir Henry Hobart and others to miſtake it for a decree of the council of Lateran, held A. D. 1179, which only prohibited what was called the *infeodation of tithes*, or their being granted to mere laymen; whereas this letter of pope Innocent to the archbiſhop enjoined the payment of tithes to the parſons of the reſpective pariſhes where every man inhabited, agreeable to what was afterwards directed by the ſame pope in other countries. This epiſtle, ſays Sir Edward Coke, bound not the lay ſubjects of this realm; but being reaſonable and juſt, it was allowed of, and ſo became *lex terræ*. This put an effectual ſtop to all the arbitrary conſecrations of tithes; except ſome footſteps which ſtill continue in thoſe portions of tithes which the parſon of one pariſh hath, though rarely, a right to claim in another: for it is now univerſally held, that tithes are due, of common right, to the parſon of the pariſh, unleſs there be a ſpecial exemption. This parſon of the pariſh may be either the actual incumbent, or elſe the appropriator of the benefice; appropriations being a method of endowing monaſteries, which ſeems to have been deviſed by the regular clergy, by way of ſubſtitution to arbitrary conſecrations of tithes. Tithes.

3. We obſerved that tithes are due of common right to the parſon, unleſs by ſpecial exemption; let us therefore ſee, *thirdly*, who may be exempted from the payment of tithes, and how lands and their occupiers may be exempted or diſcharged from the payment of tithes, either in part or totally; firſt, by a real compoſition: or, ſecondly, by cuſtom or preſcription.

Firſt, a real compoſition is when an agreement is made between the owner of the lands and the parſon or vicar, with the conſent of the ordinary and the patron, that ſuch lands ſhall for the future be diſcharged from payment of tithes, by reaſon of ſome land or other real recompenſe given to the parſon in lieu and ſatisfaction thereof. This was permitted by law, becauſe it was ſuppoſed that the clergy would be no loſers by ſuch compoſition; ſince the conſent of the ordinary, whoſe duty it is to take care of the church in general, and of the patron, whoſe intereſt it is to protect that particular church, were both made neceſſary to render the compoſition effectual: and hence have ariſen all ſuch compoſitions as exiſt at this day by force of the common law. But experience ſhowing that even this caution was ineffectual, and the poſſeſſions of the church being by this and other means every day diminiſhed, the diſabling ſtatute 13 Eliz. c. 10. was made; which prevents, among other ſpiritual perſons, all parſons and vicars from making any conveyances of the eſtates of their churches, other than for three lives or 21 years. So that now, by virtue of this ſtatute, no real compoſition made ſince the 13 Eliz. is good for any longer term than three lives or 21 years, though made by conſent of the patron and ordinary: which has indeed effectually demoliſhed this kind of traffic; ſuch compoſitions being now rarely heard of, unleſs by authority of parliament.

Secondly, a diſcharge by cuſtom or preſcription, is where time out of mind ſuch perſons or ſuch lands have been either partially or totally diſcharged from the payment of tithes. And this immemorial uſage is binding upon all parties; as it is in its nature an evidence of univerſal conſent and acquieſcence, and with reaſon ſuppoſes a real compoſition to have been formerly made. This cuſtom or preſcription is either *de modo decimandi*, or *de non decimando*.

A *modus decimandi*, commonly called by the ſimple name

Tithes. of a *modus* only, is where there is by cuſtom a particular manner of tithing allowed, different from the general law of taking tithes in kind, which are the actual tenth-part of the annual increaſe. This is ſometimes a pecuniary compenſation, as twopence an acre for the tithe of land: ſometimes it is a compenſation in work and labour, as that the parſon ſhall have only the twelfth cock of hay, and not the tenth, in conſideration of the owner's making it for him: ſometimes, in lieu of a large quantity of crude or imperfect tithe, the parſon ſhall have a leſs quantity when arrived at greater maturity, as a couple of fowls in lieu of tithe-eggs, and the like. Any means, in ſhort, whereby the general law of tithing is altered, and a new method of taking them is introduced, is called a *modus decimandi*, or ſpecial manner of tithing.

A preſcription *de non decimando* is a claim to be entirely diſcharged of tithes, and to pay no compenſation in lieu of them. Thus the king by his prerogative is diſcharged from all tithes. So a vicar ſhall pay no tithes to the rector, nor the rector to the vicar, for *eccleſia decimas non ſolvit eccleſiæ*. But theſe perſonal privileges (not ariſing from or being annexed to the land) are perſonally confined to both the king and the clergy; for their tenant or leſſee ſhall pay tithes, though in their own occupation their lands are not generally tithable. And, generally ſpeaking, it is an eſtabliſhed rule, that in lay hands, *modus de non decimando non valet*. But ſpiritual perſons or corporations, as monaſteries, abbots, biſhops, and the like, were always capable of having their lands totally diſcharged of tithes by various ways: as, 1. By real compoſition. 2. By the pope's bull of exemption. 3. By unity of poſſeſſion; as when the rectory of a pariſh, and lands in the ſame pariſh, both belonged to a religious houſe, thoſe lands were diſcharged of tithes by this unity of poſſeſſion. 4. By preſcription; having never been liable to tithes, by being always in ſpiritual hands. 5. By virtue of their order; as the Knights Templars, Ciſtercians, and others, whoſe lands were privileged by the pope with a diſcharge of tithes. Though, upon the diſſolution of abbeys by Henry VIII. moſt of theſe exemptions from tithes would have fallen with them, and the lands become tithable again, had they not been ſupported and upheld by the ſtatute 31 Henry VIII. c. 13. which enacts, that all perſons who ſhould come to the poſſeſſion of the lands of any abbey then diſſolved, ſhould hold them free and diſcharged of tithes, in as large and ample a manner as the abbeys themſelves formerly held them. And from this original have ſprung all the lands which being in lay hands, do at preſent claim to be tithe-free: for if a man can ſhow his lands to have been ſuch abbey-lands, and alſo immemorially diſcharged of tithes by any of the means before-mentioned, this is now a good preſcription *de non decimando*. But he muſt ſhow both theſe requiſites: for abbey-lands, without a ſpecial ground of diſcharge, are not diſcharged of courſe; neither will any preſcription *de non decimando* avail in total diſcharge of tithes, unleſs it relates to ſuch abbey-lands.

It is univerſally acknowledged that the payment of tithes in kind is a great diſcouragement to agriculture. They are inconvenient and vexatious to the huſbandman, and operate as an impolitic tax upon induſtry. The clergyman, too, frequently finds them troubleſome and precarious; his expences in collecting are a conſiderable drawback from their value, and his juſt rights are with difficulty ſecured: he is too often obliged to ſubmit to impoſition, or is embroiled with his pariſhioners in diſputes and litigations, no leſs irkſome to his feelings than prejudicial to his intereſt, and tending to prevent thoſe good effects which his precepts ſhould produce. It is therefore of the utmoſt importance to parochial tranquillity, and even to religion, that ſome juſt and reaſonable ſtandard of compoſition could be fixed. Land has been propoſed, but in the preſent ſtate of the diviſion of property this is impoſſible: and as money is continually changing in its value, it would alſo be a very improper ſtandard, unleſs ſome plan could be formed by which the compoſition could be increaſed as the value of money diminiſhes. A plan of this kind has been publiſhed in the Tranſactions of the Society inſtituted at Bath, Vol. IV. which thoſe who are intereſted in this ſubject may conſult for farther information. Tithing, Titiano.

TITHING, (*Tithinga*, from the Sax. *Theothunge*, *i. e. Decuria*), a number or company of ten men, with their families, knit together in a kind of ſociety, and all bound to the king, for the peaceable behaviour of each other. Anciently no man was ſuffered to abide in England above forty days, unleſs he were enrolled in ſome tithing.—One of the principal inhabitants of the tithing was annually appointed to preſide over the reſt, being called the *tithing-man*, the head-borough, and in ſome countries the borſeholder, or borough's ealder, being ſuppoſed the diſcreeteſt man in the borough, town, or tithing. The diſtribution of England into tithings and hundreds is owing to king Alfred. See Borseholder.

TITIANO Vecelli, or Titian, the moſt univerſal genius for painting of all the Lombard ſchool, the beſt colouriſt of all the moderns, and the moſt eminent for hiſtories, portraits, and landſcapes, was borne at Cadore, in the province of Friuli, in the ſtate of Venice, in 1477, or in 1480 according to Vaſari and Sandrart. His parents ſent him at ten years of age to one of his uncles at Venice, who finding that he had an inclination to painting, put him to the ſchool of Giovanni Bellino. Pilkington's Dictionary of Painters.

But as ſoon as Titian had ſeen the works of Giorgione, whoſe manner appeared to him abundantly more elegant, and leſs conſtrained than that of Bellino, he determined to quit the ſtyle to which he had ſo long been accuſtomed, and to purſue the other that recommended itſelf to him, by having more force, more relief, more nature, and more truth. Some authors affirm, that he placed himſelf as a diſciple with Giorgione; yet others only ſay, that he cultivated an intimacy with him; but it is undoubtedly certain that he ſtudied with that great maſter: that he learned his method of blending and uniting the colours; and practiſed his manner ſo effectually, that ſeveral of the paintings of Titian were taken for the performances of Giorgione; and then his ſucceſs inſpired that artiſt with an invincible jealouſy of Titian, which broke off their connection for ever after.

The reputation of Titian roſe continually; every new work contributed to extend his fame through all Europe; and he was conſidered as the principal ornament of the age in which he flouriſhed. And yet, Sandrart obſerves, that amidſt all his applauſe, and conſtant employment at Venice, his income and fortune were inconſiderable; and he was more remarkable for the extenſiveneſs of his talents, than for the affluence of his circumſtances. But when his merit was made known to the emperor Charles V. that monarch knew how to ſet a juſt value on his ſuperior abilities; he enriched him by repeated bounties, allowed him a conſiderable penſion, conferred on him the honour of knighthood, and what was ſtill more, honoured him with his friendſhip. He painted the portrait of that benefactor ſeveral times; and it is recorded by Sandrart, that one day, while the emperor was ſitting for his picture, a pencil happening to drop from the painter, he ſtooped, took it up, and returned it; obligingly anſwering to the modeſt apology of the artiſt

(who

Titiano. (who bluſhed at the condeſcenſion of ſo great a monarch), that the merit of a Titian was worthy of the attendance of an emperor.

The excellence of Titian was not ſo remarkably apparent in the hiſtorical compoſitions which he painted as in his portraits and landſcapes, which ſeem to be ſuperior to all competition; and even to this day, many of them preſerve their original beauty, being as much the admiration of the preſent age as they have deſervedly been of the ages paſt.—It is obſerved of Titian by moſt writers, that in the different periods of his life he had four different manners; one reſembling his firſt inſtructor Bellino, which was ſomewhat ſtiff; another, in imitation of Giorgione, more bold, and full of force; his third manner was the reſult of experience, knowledge, and judgment, beautifully natural, and finiſhed with exquiſite care, which manner was peculiarly his own; and in thoſe pictures which he painted between the years of approaching old age and his death may be noticed his fourth manner. His portraits were very differently finiſhed in his early, and in his latter time, according to the teſtimony of Sandrart. At firſt he laboured his pictures highly, and gave them a poliſhed beauty and luſtre, ſo as to produce their effect full as well when they were examined cloſely as when viewed at a diſtance; but afterwards, he ſo managed his penciling, that their greateſt force and beauty appeared at a more remote view, and they pleaſed leſs when they were beheld more nearly. So that many of thoſe artiſts who ſtudied to imitate him, being miſled by appearances which they did not ſufficiently conſider, have imagined that Titian executed his work with readineſs and a maſterly rapidity; and concluded that they ſhould imitate his manner moſt effectually by a freedom of hand and a bold pencil: Whereas in reality, Titian took abundance of pains to work up his pictures to ſo high a degree of perfection; and the freedom that appears in the handling was entirely effected by a ſkilful combination of labour and judgment.

It cannot be truly affirmed, that Titian equalled the great maſters of the Roman ſchool in deſign; but he always took care to diſpoſe his figures in ſuch attitudes as ſhowed the moſt beautiful parts of the body. His taſte in deſigning men was not generally ſo correct or elegant as it appeared in his boys and female figures; but his colouring had all the look of real fleſh, his figures breathe. He was not ſo bold as Giorgione, but in tenderneſs and delicacy he proved himſelf much ſuperior to him and all other artiſts. The expreſſion of the paſſions was not his excellence, though even in that reſpect many of his figures merited the juſteſt commendation; but he always gave his figures an air of eaſe and dignity. His landſcapes are univerſally allowed to be unequalled, whether we conſider the forms of his trees, the grand ideas of nature which appear in his ſcenery, or his diſtances which agreeably delude and delight the eye of every obſerver; and they are executed with a light, tender, and mellow pencil. He learned from nature the harmony of colours, and his tints ſeem aſtoniſhing, not only for their force, but their ſweetneſs; and in that reſpect his colouring is accounted the ſtandard of excellence to all profeſſors of the art.

It would prove almoſt an endleſs taſk to enumerate the variety of works executed by this illuſtrious artiſt, at Rome, Venice, Bologna, and Florence, as well as thoſe which are to be ſeen in other cities of Italy, in England, Spain, Germany, and France; but there are two, which are mentioned as being truly admirable. One is, a Laſt Supper, preſerved in the Refectory at the Eſcurial in Spain, which is inimitably fine; the other is at Milan, repreſenting Chriſt crowned with Thorns. The principal figure in the latter has an attitude full of grace and dignity more than mortal, and the countenance ſhows a benevolence and humility, combined with dignity and pain, which no pencil but that of Titian could ſo feelingly have deſcribed. It is admirably coloured, and tenderly and delicately penciled; the heads are wonderfully beautiful, the compoſition excellent, and the whole has a charming effect by the chiaro-ſcuro. Titlark Titus.

He was of ſo happy a conſtitution, that he was never ill till the year 1576, when he died of the plague, at 99 years of age. His diſciples were Paulo Veroneſe, Giacomo Tintoret, Giacomo de Porte Baſſano, and his ſons.

TITLARK, in ornithology. See ALAUDA.

TITLE, an appellation of dignity or rank given to princes and perſons of diſtinction.

Titles were not ſo common among the ancient Greeks or Romans as they are in modern times. Till the reign of Conſtantine the title of *Illuſtrious* was never given except to thoſe who were diſtinguiſhed in arms or letters: But at length it became hereditary in the families of princes, and every ſon of a prince was illuſtrious. The title of *Highneſs* was formerly given only to kings. The kings of England before the reign of Henry VIII. were addreſſed by the title of *your Grace*. That monarch firſt aſſumed the title of *Highneſs*, and afterwards that of *Majeſty*. The title of majeſty was firſt given him by Francis I. in their interview in 1520. Charles V. was the firſt king of Spain who aſſumed the ſame title.

Princes, nobles, and clergy generally have one title derived from their territories and eſtates, and another derived from their rank or from ſome other remarkable circumſtance. The Pope is called the *Biſhop of Rome*, and has the title of *Holineſs*. A cardinal has his name generally from ſome church, and is ſaluted by the name of *Eminent* or *moſt Eminent*. An archbiſhop, beſides being named from his dioceſe, is called *his Grace* and *moſt Reverend*: a biſhop is alſo diſtinguiſhed by the name of his dioceſe, and has the title of *his Lordſhip* and *right Reverend*. Inferior clergymen are denominated *Reverend*.

The titles of crowned heads derived from their dominions it is unneceſſary to mention. It will be ſufficient to mention thoſe by which they are addreſſed. To an emperor is given the title of *Imperial Majeſty*; to kings, that of *Majeſty*; to the princes of Great Britain, *Royal Highneſs*; to thoſe of Spain, *Infant*; to electors, *Electoral Highneſs*; to the grand duke of Tuſcany, *Moſt Serene Highneſs*; to the other princes of Italy and Germany, *Highneſs*; to the Doge of Venice, *Moſt Serene Prince*; to the grand-maſter of Malta, *Eminence*; to nuncios and ambaſſadors of crowned heads, *Excellency*; to dukes, *Grace*; to marquiſſes, earls, and barons, *Lordſhip*.

The emperor of China, among his titles, takes that of *Tian Su*, "Son of Heaven." The Orientals, it is obſerved, are exceedingly fond of titles: the ſimple governor of Schiras, for inſtance, after a pompous enumeration of qualities, lordſhips, &c. adds the titles of *Flower of Courteſy*, *Nutmeg of Conſolation*, and *Roſe of Delight*.

TITLE, in law, denotes any right which a perſon has to the poſſeſſion of a thing, or an authentic inſtrument whereby he can prove his right. See the articles RIGHT, PROPERTY, &c.

TITLE to the Crown in the Britiſh Conſtitution. See SUCCESSION.

TITMOUSE, in ornithology. See PARUS.

TITULAR, denotes a perſon inveſted with a title, in virtue of which he holds an office or benefice, whether he perform the functions thereof or not.

TITUS VESPASIANUS, the Roman Emperor, the ſon of Veſpaſian; of whom it is related, that not being able to re-

Tivlet. ‖ Tobacco.

collect any remarkable good action he had done on a certain day, he exclaimed, "I have loſt a day!" He might truly be called the *father of his people;* and though Rome laboured under various public calamities during his reign, ſuch was his equitable and mild adminiſtration, that he conſtantly preſerved his popularity. He was a great lover of learning, and compoſed ſeveral poems. He reigned but two years; and it is thought Domitian his brother poiſoned him, A. D. 81, aged 41. See *(Hiſtory of)* ROME.

TIVIOT HILLS. See CHEVIOT.

TIVOLI, the modern name of TIBUR.

TOAD, in zoology. See RANA.

TOAD-Fiſh. See LOPHIUS.

TOAD-Flax, in botany. See ANTIRRHINUM.

TOAD-Stone, a genus of argillaceous earths examined by Dr Withering. He deſcribes it as of a dark-browniſh grey colour; its texture granular; neither effervеſcing with acids nor ſtriking fire with ſteel. The cavities of it are filled with cryſtallized ſpar, and in a ſtrong heat it is fuſible *per ſe*. An hundred parts of toad-ſtone contain from 56 to 63.5 of ſiliceous earth, near 15 of argillaceous earth, 7.5 of calcareous earth, and 16 of oxydated iron. Dr Kirwan obſerves, that the toad-ſtone is not much different from baſaltes, only that it is ſofter: it contains alſo a ſmaller proportion of iron, and a larger one of ſiliceous earth.

Philoſophical Tranſactions for 1782.

TOBACCO, in botany. See NICOTIANA and SNUFF.

The Indians (ſay Dr Leake) poiſon their arrows with the oil of tobacco, which, infuſed into a freſh wound, occaſions ſickneſs and vomiting, or convulſions and death; with what ſafety therefore, ſetting aſide propriety, the ſubtile powder of this plant, called *ſnuff*, may be applied to the tender, internal ſurface of the noſe, it may be proper to inquire; for, if the oil of tobacco is a mortal poiſon when applied to the open veſſels of a wound, ſurely this plant, when taken in ſubſtance as ſnuff, muſt in a certain degree be injurious. From the infinite number of nerves diffuſed over the mucous membrane of the noſe, it is endowed with exquiſite feeling; and, the better to preſerve the ſenſe of ſmelling, thoſe nerves are continually lubricated with moiſture.

Leake's Practical Eſſay on the Diſeaſes of the Viſcera.

By the almoſt cauſtic acrimony of ſnuff, this moiſture is dried up, and thoſe fine, delicate nerves, the organs of ſmelling, are rendered callous and inſenſible. To this ſelf-evident bad effect may be added the *narcotic* or ſtupifying power of tobacco, by which not only the brain and nerves are injured, but alſo the eyes depending upon their influence, together with the ſenſe of ſmelling; and, from the force with which ſnuff is uſually drawn up the noſe, its paſſage will be obſtructed, and the voice loſe its clearneſs and diſtinct articulation.

Beſides thoſe pernicious qualities, ſnuff often involuntarily deſcends into the ſtomach, creating nauſea, loſs of appetite, and vomiting; and by its narcotic power will diminiſh nervous influence and impair digeſtion; it diſcolours the ſkin contiguous to the noſe, and will taint the ſweeteſt breath with the rank odour of a tobacco-caſk. For this reaſon the ladies of faſhion in France ſeldom take ſnuff till they are married; a very high compliment, no doubt, to their huſbands. The only advantage of taking ſnuff is that of ſneezing, which, in ſluggiſh, phlegmatic habits, will give univerſal concuſſion to the body, and promote a more free circulation of the blood; but of this benefit, ſnuff-takers are deprived, from being familiar with its uſe.

We have been told, that tobacco, when chewed, is a preſervative againſt hunger: but this is a vulgar error; for, in reality, it may more properly be ſaid to deſtroy appetite by the profuſe diſcharge of ſaliva, which has already been conſidered as a powerful, diſſolving fluid, eſſential both to appetite and digeſtion. In ſmoking, the fumes of tobacco induce a kind of pleaſing inſenſibility not eaſily deſcribed. Its narcotic odour, thus adminiſtered, equally infatuates the ignorant ſavage and the intelligent philoſopher; but, by the large expence of ſaliva thereby occaſioned, it is productive of many diſorders of the head and ſtomach, particularly the laſt. Tobacco. Tobago.

TOBACCO-Pipe-Fiſh. See FISTULARIA.

TOBACCO-wine. See PHARMACY-*Index*.

TOBAGO, one of the Caribbee iſlands, ceded to Great Britain by the treaty of Paris in 1763, taken by the French in 1781, and retaken by the Britiſh in 1793. It lies in the latitude of 11 degrees 10 minutes north, and 59 degrees 40 minutes longitude weſt from London, about 40 leagues ſouth-by-weſt from Barbadoes, 35 ſouth-eaſt from St Vincents, 20 ſouth-eaſt from Grenada, 12 north-eaſt from the Spaniſh iſland of Trinidada, and between 30 and 40 north-eaſt from the Spaniſh main. According to the lateſt accounts, it is ſomewhat more than 30 miles in length from north-eaſt to ſouth-weſt, between 8 and 9 in breadth, and from 23 to 25 leagues in circumference. The Engliſh viſited this iſland very early, Sir Robert Dudly being there in the reign of queen Elizabeth. In that of Charles I. William earl of Pembroke procured a grant of this, with two other ſmall iſlands; but died before he was able to carry into execution his deſign of ſettling them. In A. D. 1632 ſome merchants of Zealand ſent over a ſmall colony thither, and gave it the name of *New Walcheren;* but before they were able thoroughly to eſtabliſh themſelves, they were deſtroyed by the Indians aſſiſted by the Spaniards. Ten years after, James Duke of Courland ſent a colony thither, who ſettled themſelves upon Great Courland bay, and made a conſiderable progreſs in planting. A. D. 1654, Meſſieurs Adrian and Cornelius Lampſius, two opulent merchants of Fluſhing, ſent a conſiderable number of people thither, who ſettled on the other ſide of the iſland, and lived in amity with the Courlanders, until they learned that the king of Sweden had ſeized the perſon of their duke and diſpoſſeſſed him of his dominions, when they attacked and forced his ſubjects to ſubmit. The duke being afterwards reſtored, he obtained from Charles II. a grant of this iſland, dated the 17th of November 1664. In the ſecond Dutch war the count d'Eſtrees, by order of his maſter, totally ruined it at the cloſe of the year 1677; and from that time it continued waſte till Britain took poſſeſſion of it after the treaty of Paris. The climate, notwithſtanding its vicinity to the line, is ſo tempered by the breezes from the ſea, as to be very ſupportable even to Europeans; and hath the ſame advantages with that of Grenada, in having regular ſeaſons, and alſo in being exempt from the hurricanes. There are throughout the iſland many riſing grounds, though, except at the north-eaſt extremity, there is no part of it that can be ſtiled mountainous; and even there the country is far from being rugged or impaſſable. The ſoil, if we may credit either Dutch or French writers, is as fertile and luxuriant as any of the iſlands, and very finely diverſified. Ground proviſions of all ſorts have been raiſed in great plenty, a vaſt variety of vegetables, excellent in their kind, ſome for food, ſome for phyſic. Almoſt every ſpecies of uſeful timber is to be found here, and ſome of an enormous ſize; amongſt others, the true cinnamon and nutmeg tree, as the Dutch confeſs, and of which none could be better judges; whole groves of ſaſſafras, and of trees that bear the true gum copal, with other odoriferous plants that render the air wholeſome and pleaſant. It is as well watered as can be wiſhed, by rivers that fall into the ſea on both ſides, many ſmaller ſtreams, and fine freſh ſprings in almoſt every part of the iſland. The ſea-coaſt is indented by 10 or 12 fair and ſpacious bays, and there are amongſt theſe

one

Tobolſki ‖ Todus.

one or two ports capable of receiving as large ſhips as ever viſited thoſe ſeas. There are wild hogs in great plenty, abundance of fowls of different kinds, a vaſt variety of ſea and river fiſh. At the north eaſt extremity lies Little Tobago, which is two miles long, and about half a mile broad, very capable of improvement.

TOBOLSKI, the capital of Siberia, is ſituated at the confluence of the rivers Tobol and Irtiſh, in N. Lat. 58° 12′ E. Long. 68° 18′. The city ſtands upon the aſcent of a high hill, the lower part of which is inhabited by Mahometan Tartars, who carry on a conſiderable traffic upon the river Irtiſh, and convey their merchandiſe quite acroſs Great Tartary as far as China. The river Irtiſh is reckoned as rapid as the Danube; runs from the ſouth, and empties itſelf into the Oby: the Tobol waſhes the other ſide of the town, and a little below it falls into the Irtiſh. By means of theſe two rivers, there is a conſtant flow of merchandiſe into the city during the ſummer ſeaſon. Tobolſki is therefore a great mart for the commodities of Muſcovy, Tartary and other countries: and here is a great concourſe of merchants. All ſorts of proviſions are plentiful and cheap. An hundred weight of rice is ſold for 16 copecs, equal to about eight pence Sterling; a ſturgeon weighing 40 pounds, for half that money; an ox for two rix-dollars, and every other article in proportion: the adjacent country abounds with game in great variety. The ſupreme court of judicature for all Siberia is held in this city, which is alſo the ſeat of a metropolitan, ſent hither from Moſcow to exerciſe ſpiritual juriſdiction over the whole kingdom. Tobolſki is well fortified, and defended by a ſtrong garriſon, under the command of the waiwode, who reſides in the place, and takes charge of the fur tribute, which is here depoſited in proper magazines. This governor enjoys a very extenſive command, and can occaſionally bring into the field 9000 men, beſides a ſtrong body of Tartars on horſeback, to make head againſt the Kalmucks and Coſſacks, in their repeated incurſions. A ſufficient number of Ruſſians, called *Jemſkoiks*, are kept in continual pay by the government, on the banks of the Irtiſh, to ſupply travellers on the czar's account with men, boats, or carriages, to convey them as far as Surgut on the Oby, a voyage of 200 leagues by water. This is the common method of travelling in the ſummer; but in winter the journey by land is not half ſo long, being performed in ſleds over the ice and ſnow, with which the country is covered. Theſe ſleds are moved by a pair of dogs, which will draw a load of 300 pounds with ſurpriſing expedition. They are hired at eaſy rates, and during one half of the year may be ſeen flying over the ſnow in great numbers. The city is ſuppoſed to contain 15,000 inhabitants. It is 800 miles eaſt from Moſcow, and 1000 from Peterſburgh.

TODDA PANNA. See CYCAS.

TODDY, a name given to the juice of the cocoa nut tree. See ARAK.—Toddy is alſo a name given to a mixture of ſpirits, water, and ſugar.

TODDY-Bird. See LOXIA, ſpecies 11.

TODUS, the TODY, in ornithology; a genus belonging to the order of *picæ*. The beak is ſlender, depreſſed, broad, and the baſe beſet with briſtles. The noſtrils are ſmall and oval. The toes are placed three before and one behind; the middle are greatly connected to the outer. There are 15 ſpecies according to Dr Latham.

"Birds of this genus (ſays that eminent ornithologiſt) inhabit the warmer parts of America. They vary conſiderably in their bills as to breadth, but all of them have a certain flatneſs, or depreſſion, which is peculiar. They have great affinity to the flycatchers; and indeed, to ſpeak the truth, the two genera run much into one another: however, in one thing they differ materially; for in the tody the outer and middle toes are much connected, whereas in the flycatcher genus they are divided to their origin."

Toga ‖ Toland.

TOGA, in Roman antiquity, a wide woollen gown or mantle, which ſeems to have been of a ſemicircular form, without ſleeves; differing both in richneſs and largeneſs, according to the circumſtances of the wearer, and uſed only upon occaſion of appearing in public.

Every body knows that the toga was the diſtinguiſhed mark of a Roman: hence, the *jus togæ*, or privilege of a Roman citizen; *i. e.* the right of wearing a Roman habit, and of taking, as they explain it, fire and water through the Roman empire.

TOKAY-Wine, derives its name from a town of Hungary, where it is produced. There are four ſorts of wine made from the ſame grapes, diſtinguiſhed at Tokay by the names of *eſſence*, *auſpruch*, *maſslach*, and the *common wine*. The eſſence is made by picking out the half-dried and ſhrivelled grapes, and putting them into a perforated veſſel, where they remain as long as any juice runs off by the mere preſſure of their own weight. This is put into ſmall caſks. The auſpruch is made by pouring the expreſſed juice of the grapes from which the former had been picked on thoſe that yielded the eſſence, and treading them with the feet. The liquor thus obtained ſtands for a day or two to ferment, and then is poured into ſmall caſks, which are kept in the air for about a month, and afterwards put into caſks. The ſame proceſs is again repeated by the addition of more juice to the grapes which have already undergone the two former preſſures, and they are now wrung with the hands; and thus is had the maſslach. The fourth kind is made by taking all the grapes together at firſt, and ſubmitting them to the greateſt preſſure: this is chiefly prepared by the peaſants. The eſſence is thick, and very ſweet and luſcious: it is chiefly uſed to mix with the other kinds. The auſpruch is the wine commonly exported, and which is known in foreign countries by the name of *Tokay*.

The goodneſs of it is determined by the following rules. The colour ſhould neither be reddiſh nor very pale, but a light ſilver: in trying it, the palate and tip of the tongue ſhould be wetted without ſwallowing it, and if it manifeſt any acrimony to the tongue, it is not good; but the taſte ought to be ſoft and mild: when poured out, it ſhould form globules in the glaſs, and have an oily appearance: when genuine, the ſtrongeſt is always of the beſt quality: when ſwallowed, it ſhould have an earthy aſtringent taſte in the mouth, which is called the taſte of the root. All tokay wine has an aromatic taſte, which diſtinguiſhes it from every other ſpecies of wine. It keeps to any age, and improves by time: but is never good till about three years old. It is the beſt way to tranſport it in caſks; for when it is on the ſeas, it ferments three times every ſeaſon, and thus refines itſelf. When in bottles, there muſt be an empty ſpace left between the wine and the cork, otherwiſe it would burſt the bottle. A little oil is put upon the ſurface, and a piece of bladder tied over the cork. The bottles are always laid on their ſides in ſand. *Philoſophical tranſactions*. vol. lxiii. part ii. p. 292, &c.

TOKENS. See *TRADESMENS-Tokens*.

TOISE, a French meaſure containing ſix of their feet, or a fathom.

TOLAND (John), a very famous writer, was born near Londonderry in Ireland, 1670, and educated in the Popiſh religion; but at 16 years of age embraced the principles of the Proteſtants. He ſtudied three years at the univerſity of Glaſgow; was created maſter of arts in the univerſity of Edinburgh; and afterwards completed his ſtudies at Leyden, where he reſided two years. He then went to Oxford, where,

Toledo.

where, having the advantage of the public library, he collected materials upon various ſubjects, and compoſed ſome pieces; among which was, A Diſſertation to prove the received hiſtory of the tragical death of Atilius Regulus, the Roman conſul, to be a fable. He began likewiſe a work of greater conſequence, in which he undertook to ſhow that there are no myſteries in the Chriſtian religion. He publiſhed it in 1696 at London, under the title of *Chriſtianity not myſterious*. This book gave great offence, and was attacked by ſeveral writers. He afterward wrote in favour of the Hanoverian ſucceſſion, and many other pieces. In 1707 he went into Germany, where he viſited ſeveral courts; and in 1710 he was introduced to Prince Eugene, who gave him ſeveral marks of his generoſity. Upon his return to England he was for ſome time ſupported by the liberality of the earl of Oxford lord-treaſurer, and kept a country-houſe at Epſom; but ſoon loſing his lordſhip's favour, he publiſhed ſeveral pamphlets againſt that miniſter's meaſures. In the four laſt years of his life he lived at Putney, but uſed to ſpend moſt part of the winter in London. Mr. Toland died at London in 1722. He was a man of uncommon abilities, publiſhed a number of curious tracts, and was perhaps the moſt learned of all the infidel writers; but his private character was far from being an amiable one; for he was extremely vain, and wanted thoſe ſocial virtues which are the chief ornaments as well as duties of life. His poſthumous works, two volumes octavo, were publiſhed in 1726, with an account of his life and writings, by Mr Des Maizeaux.

TOLEDO, an ancient and trading city of Spain in New Caſtile, of which it was formerly the capital. About two centuries ago it is ſaid to have contained more than 200,000 inhabitants; but they are now diminiſhed to 20,000. or at moſt to 30,000. It is advantageouſly ſeated on the river Tajo, which ſurrounded it on two ſides; and on the land-ſide it has an ancient wall built by a Gothic king, and flanked with 100 towers. It is ſeated on a mountain, which renders the ſtreets uneven, and which are narrow; but the houſes are fine, and there are a great number of ſuperb ſtructures, beſides 17 public ſquares, where the markets are kept. The fineſt buildings are the royal caſtle and the cathedral church; which laſt is the richeſt and moſt conſiderable in Spain. It is ſeated in the middle of the city, joining to a handſome ſtreet, with a fine ſquare before it. Several of the gates are very large, and of bronze. There is alſo a ſuperb ſteeple extremely high, from whence there is a very diſtant proſpect. The Sagrariro, or principal chapel, is a real treaſury, in which are 15 large cabinets let into the wall, full of prodigious quantities of gold and ſilver veſſels, and other works. There are two mitres of ſilver gilt, ſet all over with pearls and precious ſtones, with three collars of maſſy gold, enriched in like manner. There are two bracelets and an imperial crown of the Virgin Mary, conſiſting of large diamonds and other jewels. The weight of the gold in the crown is 15 pounds. The veſſel which contains the conſecrated wafer is of ſilver gilt, as high as a man, and ſo heavy, that it requires 30 men to carry it; within it is another of pure gold enriched with jewels. Here are 38 religious houſes, moſt of which are worthy a traveller's notice, with many other ſacred buildings, a great number of churches belonging to 27 pariſhes, and ſome hoſpitals. Without the town are the remains of an amphitheatre, and other antiquities.

Bourgoanne's Travels Spain, vol. ii.

Toledo is an archbiſhop's ſee, and the ſeat of the primate of Spain. His revenue is ſaid to be worth 400,000 ducats, but there are large deductions to be made from it. It pays 15,000 ducats to the monks of the Eſcurial, beſides ſeveral other penſions. Toledo has alſo a univerſity. It was formerly celebrated for the exquiſite temper of the ſword blades made there. It is ſituated in eaſt longitude 3. 15. in north latitude 39. 50. and is 37 miles ſouth from Madrid.

Swinburn's Travels in Spain.

Toleration.

TOLERATION, in matters of religion, is either civil or eccleſiaſtical. Civil toleration is an impunity and ſafety granted by the ſtate to every ſect that does not maintain doctrines inconſiſtent with the public peace: and eccleſiaſtical toleration is the allowance which the church grants to its members to differ in certain opinions, not reputed fundamental.

As the gods of Paganiſm were almoſt all local and tutelary, and as it was a maxim univerſally received that it was the duty of every man to worſhip, together with his own deities, the tutelary gods of the country in which he might chance to reſide, there was no room for perſecution in the Heathen world, on account of different ſentiments in religion, or of the different rites with which the various deities were worſhipped. Had the primitive Chriſtians joined their fellow-citizens in the worſhip of Jupiter, Juno, and the reſt of the rabble of Roman divinities, they would have been ſuffered to worſhip, without moleſtation, the Creator of the world and the Redeemer of mankind; for in that caſe the God of the Chriſtians would have been looked upon as a Being of the ſame kind with the gods of the empire; and the great principle of intercommunity would have remained unviolated. But the true God had expreſsly prohibited both Jews and Chriſtians from worſhipping any other God beſides Himſelf; and it was their refuſal to break that precept of their religion which made their Heathen maſters look upon them as Atheiſts, and perſecute them as a people inimical to the ſtate. Utility, and not truth, was the object for which the Heathen legiſlatures ſupported the national religion. They well knew that the ſtories told by their poets of their different divinities, of the rewards of Elyſium, and of the puniſhments of Tartarus, were a collection of ſenſeleſs fables; but they had nothing better to propoſe to the vulgar, and they were not ſuch ſtrangers to the human heart, as to ſuppoſe that mankind could live together in ſociety without being influenced in their conduct by ſome religion.

Widely different from the genius of Paganiſm was the ſpirit of the Jewiſh diſpenſation. Truth, which is in fact always coincident with general utility, was the great object of the Moſaic law. The children of Iſrael were ſeparated from the reſt of the world, to preſerve the knowledge, and worſhip of the true God, at a time when all the other nations on earth, forgetting the Lord that made them, were falling proſtrate to ſtocks and ſtones, and worſhipping devils and impure ſpirits. Such was the contagion of idolatry, and ſo ſtrong the propenſity of the Iſraelites to the cuſtoms and manners of the Egyptians, and other polytheiſtic nations around them, that the purpoſe of their ſeparation could not have been ſerved, had not Jehovah condeſcended to become not only their tutelary God, but even their ſupreme civil Magiſtrate (ſee THEOLOGY, n° 151.); ſo that under the Moſaic economy, idolatry was the crime of high treaſon, and as ſuch juſtly puniſhed by the laws of the ſtate. Among the Jews, the church and ſtate were not indeed different ſocieties. They were ſo thoroughly incorporated, that what was a ſin in the one was a crime in the other; and the forfeiture of eccleſiaſtical privileges was the forfeiture of the rights of citizens.

In many reſpects the Chriſtian religion is directly oppoſite to the ritual law of Moſes. It is calculated for all nations, and intended to be propagated among all. Inſtead of ſeparating one people from another, one of its principal objects is to diſſeminate univerſal benevolence, and to inculcate

Toleration. cate upon the whole human race, that mutual love which naturally ſprings from the knowledge that all men are brethren. Its ultimate end being to train its votaries for heaven, it concerns itſelf no farther with the affairs of earth than to enforce by eternal ſanctions the laws of morality; and the kingdom of its Founder not being of this world, it leaves every nation at liberty to fabricate its own municipal laws, ſo as beſt to ſerve its own intereſt in the various circumſtances in which it may be placed; and denounces a curſe upon all who pay not to thoſe laws the fulleſt obedience, when they were not obviouſly inconſiſtent with the laws of piety and virtue, which are of prior obligation. The Chriſtian church therefore muſt always remain a diſtinct ſociety from the ſtate; and tho', till the preſent age of hazardous innovations, it has been deemed expedient in every country, where the truth of the goſpel is admitted, to give to the religion of Chriſt a legal eſtabliſhment, and to confer immunities on its miniſters, this meaſure has been adopted, not to ſecure the purity of the faith which appeals to the private judgment of each individual, but merely to preſerve the peace of ſociety, and to put a reſtraint upon thoſe actions of which human laws cannot take cognizance. With religion, Chriſtian governments have no farther concern than as it tends to promote the practice of virtue. The early Chriſtians, however, not underſtanding the principle upon which penal laws were employed to preſerve the purity of the Jewiſh religion; and, as our bleſſed Lord obſerved to two of his apoſtles, not knowing what ſpirit they were of—haſtily concluded that they had a right to enforce the doctrines and worſhip of the New Teſtament, by the ſame means which had been uſed to preſerve the Iſraelites ſteady to the doctrines and worſhip of the Old. Hence, though they had ſuffered the cruelleſt perſecutions themſelves (ſee PERSECUTION), they no ſooner got the power of the ſtate in their hands, than they perſecuted the Pagans for their idolatry; and afterwards, when hereſies aroſe in the church, perſecuted one another for expreſſing in different phraſes metaphyſical propoſitions, of ſuch a nature as no human mind can fully comprehend. The apoſtle had forewarned them that there muſt be hereſies in the church, that they who are approved may be made manifeſt; but it did not occur to them that perſecution for opinion is the worſt of all hereſies, as it violates at once truth and charity.

Hitherto theſe unhallowed means of bringing Chriſtians to uniformity of faith and practice, had been only occaſionally employed from their not accurately diſtinguiſhing between the ſpirit of the goſpel and that of the law; but as ſoon as the biſhops of Rome had brought the inhabitants of Europe to recognize their infallibility in explaining articles of faith, and deciding points of controverſy, perſecution became a regular and permanent inſtrument of eccleſiaſtical diſcipline. To doubt or to deny any doctrine to which theſe unerring inſtructors had given the ſanction of their approbation, was held to be not only a reſiſting of the truth, but an act of rebellion againſt their ſacred authority; and the ſecular power, of which, by various arts, they had acquired the abſolute direction, was inſtantly employed to avenge both.

"Thus Europe had been accuſtomed, during many centuries, to ſee ſpeculative opinions propagated or defended by force, the charity and mutual forbearance which Chriſtianity recommends with ſo much warmth, were forgotten, the ſacred rights of conſcience and of private judgment were unheard of; and not only the idea of toleration, but even the word itſelf, in the ſenſe now affixed to it, was unknown. A right to extirpate error by force, was univerſally allowed to be the prerogative of thoſe who poſſeſſed the knowledge of truth;" and though the firſt reformers did not arrogate to themſelves in direct terms that infallibility which they had refuſed to the church of Rome, they were not leſs confident of the truth of their own doctrines, and required with equal ardour the princes of their party to check ſuch as preſumed to impugn or to oppoſe them. To this requeſt too many of theſe princes lent a willing ear. It flattered at once their piety and their pride to be conſidered as poſſeſſing all the rights of Jewiſh princes; and Henry the VIII. of England, after labouring to make his divines declare that all authority eccleſiaſtical as well as civil flows from the crown, perſecuted alternately the Papiſts and Proteſtants. Many of his ſucceſſors, whoſe characters were much better than his, thought themſelves duly authorized, in virtue of their acknowledged ſupremacy over all ſtates and conditions of men, to enforce by means of penal laws a uniformity of faith and worſhip among their ſubjects; and it was not till the revolution that any ſect in England ſeems to have fully underſtood, that all men have an unalienable right to worſhip God in the manner which to them may ſeem moſt ſuitable to his nature, and the relation in which they ſtand to him; or that it is impoſſible to produce uniformity of opinion by any other means than candid diſquiſition and ſound reaſoning. That the civil magiſtrate has a right to check the propagation of opinions which tend only to ſap the foundations of virtue, and to diſturb the peace of ſociety, cannot, we think, be queſtioned; but that he has no right to reſtrain mankind from publicly profeſſing any ſyſtem of faith, which comprehends the being and providence of God, the great laws of morality, and a future ſtate of rewards and puniſhments, is as evident as that it is the object of religion to fit mankind for heaven, and the whole duty of the magiſtrates to maintain peace, liberty, and property, upon earth. We have elſewhere obſerved (ſee TEST), that among a number of different ſects of Chriſtians, it is not the ſuperior purity of the ſyſtem of faith profeſſed by one of them, that gives it a right to the immunities of an eſtabliſhment in preference to all its rivals; but tho' the legiſlature is authorized, in certain circumſtances, to make a leſs pure ſyſtem the religion of the ſtate, it would be the height of abſurdity to ſuppoſe that any man, or body of men, can have authority to prevent a purer ſyſtem from being acknowledged as the religion of individuals. For propagating opinions and purſuing practices which neceſſarily create civil diſturbance, every man is anſwerable to the laws of his country; but for the ſoundneſs of his faith, and the purity of his worſhip, he is anſwerable to no tribunal but that which can ſearch the heart.

When churches are eſtabliſhed, and creeds drawn up as guides to the preaching of the national clergy, it is obvious that every clergyman who teaches any thing directly contrary to the doctrine of ſuch creeds, violates the condition on which he holds his living, and may be juſtly deprived of that living, whether his obnoxious opinion be in itſelf true or falſe, important or unimportant; but his puniſhment ſhould be extended no farther. To expel a Chriſtian from private communion for teaching any doctrine which is neither injurious to the ſtate, nor contrary to the few ſimple articles which compriſe the ſum of the Chriſtian faith, is the groſſeſt tyranny; and the governors of that church which is guilty of it, uſurp the prerogative of their bleſſed Lord, who commanded the apoſtles themſelves not to be called maſters in this ſenſe; for one (ſays he) is your maſter (ὑμῶν ὁ καθηγητης), even Chriſt. It is indeed a hardſhip to deprive a man of his living for conſcientiouſly illuſtrating what he believes to be a truth of the goſpel, only becauſe his illuſtration may be different from that which had formerly been given by men fallible like himſelf; but if the eſtabliſhment of human compilations of faith be neceſſary, this hardſhip

Robertſon's Hiſtory of Charles V.

cannot

Toll
||
Toluifera.

cannot be removed, but by making ſuch compilations as ſimple as poſſible, and drawing them up in Scripture language. Such a reformation, could it be effected peaceably, would ſerve other good purpoſes; for while it would ſufficiently guard the purity of the faith, it would withdraw that temptation which too many eſtabliſhments throw in the way of men, to ſubſcribe to the truth of what they do not really believe; and it would effectually baniſh from the Chriſtian church every thing which can be called by the name of *perſecution*. See NONCONFORMISTS.

TOLL, a tax or cuſtom paid for liberty to vend goods in a market or fair, or for keeping roads in proper repair. The firſt appointment of a toll on highways of which we read, took place in 1346. See ROAD.

TOLOUSE. See TOULOUSE.

TOLU, a town of South America in Terra Firma, and in the government of Carthagena; famous for the fine balſam of Tolu, brought into Europe from thence, and produced from a tree like a pine. It is ſeated on a bay of the North Sea, 60 miles ſouth of Carthagena. W. Long. 72. 55. N. Lat. 9. 40.

TOLUIFERA, the BALSAM OR TOLU-TREE; a genus of plants belonging to the claſs of *decandria*, and order of *monogynia*. There is only one ſpecies; the *balſamum*.

This tree grows to a conſiderable height; it ſends off numerous large branches, and is covered with rough, thick, greyiſh bark: the leaves are elliptical or ovate, entire, pointed, alternate, of a light green colour, and ſtand upon ſhort ſtrong footſtalks: the flowers are numerous, and produced in lateral racemi: the calyx is bell-ſhaped, divided at the brim into five teeth, which are nearly equal, but one is projected to a greater diſtance than the others: the petals are inſerted into the receptacle, and are five in number, of which four are equal, linear, and a little longer than the calyx; the fifth is much the largeſt, inverſely heart-ſhaped, and its unguis is of the length of the calyx: the 10 filaments are very ſhort, and furniſhed with long antheræ: the germen is oblong: there is no ſtyle: the ſtigma is pointed: the fruit is a round berry.

Woodville's Medical Botany.

It grows in Spaniſh America, in the province of Tolu, behind Carthagena, whence we are ſupplied with the balſam, which is brought to us in little gourd-ſhells. This balſam is obtained by making inciſions in the bark of the tree, and is collected into ſpoons, which are made of black wax, from which it is poured into proper veſſels.

This balſam is of a reddiſh yellow colour, tranſparent, in conſiſtence thick and tenacious: by age it grows ſo hard and brittle, that it may be rubbed into a powder between the finger and thumb. Its ſmell is extremely fragrant, ſomewhat reſembling that of lemons; its taſte is warm and ſweetiſh, and on being chewed it adheres to the teeth. Thrown into the fire it immediately liquifies, takes flame, and diſperſes its agreeable odour. Though it does not diſſolve in water, yet if boiled in it for two or three hours in a covered veſſel, the water receives its odoriferous ſmell: water alſo ſuffers a ſimilar impregnation from the balſam by diſtillation. With the aſſiſtance of mucilage it unites with water, ſo as to form a milky ſolution. It diſſolves entirely in ſpirit of wine, and eaſily mixes with diſtilled oils, but leſs eaſily with thoſe of the expreſſed kind. Diſtilled without addition, it produces not only an empyreumatic oil, of a pale dark colour, but ſometimes a ſmall portion of a ſaline matter, ſimilar to that of the flowers of benzoin.

This balſam poſſeſſes the ſame general virtues with the balſam of Gilead, and that of Peru; it is, however, leſs heating and ſtimulating, and may therefore be employed with more ſafety. It has been chiefly uſed as a pectoral, and is ſaid to be an efficacious corroborant in gleets and ſeminal weakneſſes. It is directed by the Pharmacopœias in the ſyrupus tolutanus, tinctura tolutana, and ſyrupus balſamicus. See *PHARMACY-Index*.

Tomatoes.
Tomb.

TOMATOES. See SOLANUM.

TOMB, includes both the grave or ſepulchre wherein a defunct is interred, and the monument erected to preſerve his memory. The word is formed from the Greek τυμβος, *tumulus*, "ſepulchre;" or, according to Menage, from the Latin *tumba*, which ſignifies the ſame.

In many nations it has been cuſtomary to burn the bodies of the dead; and to collect the aſhes with pious care into an urn, which was depoſited in a tomb or ſepulchre. See BURNING. Among many nations it has alſo been the practice to lay the dead body in a tomb, without conſuming it, after having wrapped it up decently, and ſometimes placing it in a coffin. See COFFIN.

The tombs of the Jews were generally hollow places hewn out of a rock. Abraham buried Sarah in a cave. Such was the place too in which the kings of Judah and Iſrael were interred; and ſuch was the place in which the body of our Saviour was depoſited by Joſeph of Arimathea. But it is probable that the common people buried their dead in graves; for our Saviour compares the Phariſees to "graves which appear not, and the men that walk over are not aware of them." Over the tombs, perhaps only of people of diſtinction, a ſtone or monument was erected, to intimate to paſſengers that they were burying places, that they might not pollute themſelves by touching them. With the ſame intention, as Lightfoot informs us, they whitened them every year on the 15th of February.

The Egyptians alſo buried their dead in caves, called *catacombs*. See CATACOMB. The pyramids, as ſome think, were alſo employed for the ſame purpoſe. Sometimes alſo, after embalming their dead, they placed them in niches in ſome magnificent apartment in their houſes.

The Greeks and Romans burned their dead, and depoſited their aſhes in a tomb. The Greeks interred the aſhes without the cities, by the ſides of their highways. Sometimes indeed, by way of particular honour, they were buried in an elevated part of the town; and the Lacedemonians were allowed by Lycurgus to bury in the city and round their temples: But this was forbidden among the Romans by the law of the twelve tables, *In urbe ne ſepelito, neve urito*; yet Valerius Publicola, Poſthumus Tubertius, and the family of the Claudii, were buried in the Capitol. To bury by the ſides of public roads was common among the Romans alſo; hence their epitaphs frequently began with *ſiſte viator*. Highways were made choice of probably for two reaſons; 1. That the dead might not be offenſive or injure the health of the living, which they certainly would if buried in towns or populous places; and, 2dly, That they might hold out to travellers a leſſon of mortality, and teach the ruſtic moraliſt to die.

As it would ſwell this article to too great a ſize to deſcribe all the different kinds of tombs which have been uſed by different nations and ages, we muſt content ourſelves with ſhortly deſcribing the tombs of a few nations, and adding a few concomitant circumſtances.

The tombs of the Parſees are ſingular. The defunct, after lying a proper time in his own houſe, for the purpoſes of mourning, is carried, followed by his relations and friends, the females chanting a requiem, and depoſited in a tomb of the following conſtruction. It is a circular building, open at top, about 55 feet diameter, and 25 feet in height, filled to within 5 feet of the top, excepting a well of 15 feet diameter in the centre. The part ſo filled is terraced, with a ſlight declivity toward the well. Two circular grooves three inches deep are raiſed round the well; the firſt at the

diſtance

Tomb. distance of four, the second at ten, feet from the well. Grooves of the like depth or height, and four feet distant from each other at the outer part of the outer circle, are carried straight from the wall to the well, communicating with the circular ones, for the purpose of carrying off the water, &c. The tomb, by this means, is divided into three circles of partitions: the outer, about seven feet by four; the middle, six by three; the inner, four by two: the outer for the men, the middle for the women, the inner for the children; in which the bodies are respectively placed, wrapped loosely in a piece of cloth, and left to be devoured by the vultures; which is very soon done, as numbers of those animals are always seen hovering and watching about these charnel houses, in expectation of their prey. The friends of the deceased, or the persons who have charge of the tomb, come at the proper time, and throw the bones into their receptacle, the well in the centre; for which purpose, iron rakes and tongs are deposited in the tomb. The entrance is closed by an iron door, four feet square, on the eastern side, as high up as the terrace, to which a road is raised. Upon the wall, above the door, an additional wall is raised, to prevent people from looking into the tomb, which the Parsees are particularly careful to prevent. A Persian inscription is on a stone inserted over the door, which we once copied, but have forgotten its tenor. From the bottom of the wall subterraneous passages lead to receive the bones, &c. and prevent the well from filling.

Of the ancient sepulchres found in Russia and Siberia, some are perfect tumuli, raised to an enormous height, while others are almost level with the ground. Some of them are encompassed with a square wall of large quarry stones placed in an erect position; others are covered only with a small heap of stones, or they are tumuli adorned with stones at top. Some are mured with brick within, and vaulted over; others are no more than pits or common graves. In some the earth is excavated several fathoms deep; others, and especially those which are topped by a lofty tumulus, are only dug of a sufficient depth for covering the carcase. In many of these sepulchres the bones of men, and frequently of horses, are found, and in a condition that renders it probable the bodies were not burnt before they were inhumed. Other bones show clearly that they have been previously burnt; because a part of them is unconsumed, and because they lie in a disordered manner, and some of them are wanting. Urns, in which other nations of antiquity have deposited the ashes of their dead, are never met with here. But sometimes what remained of the bodies after the combustion, and even whole carcases, are found wrapped up in thin plates of gold. Many dead bodies are frequently seen deposited together in one tomb; a certain indication that either a battle had been fought in the neighbourhood of the place, or that some families buried their relations in an hereditary tomb.

Archæologia, vol. vii.

The Moors, like all other Mahometans, hold it a thing irreverent, and contrary to the spirit of religion, to bury their dead in mosques, and to profane the temple of the Most High by the putrefaction of dead bodies. In the infancy of the church the Christians had the like piety, and gave example of the respect in which they held temples dedicated to religious worship; but ill-guided devotion, mingled with superstitious vanities, and that contagious spirit of self-interest which pervades all human affairs, without respecting the altar of God, have, together, insensibly perverted men's ideas. The burial grounds of the Mahometans are most of them without the city; the emperors have their sepulchres distinct and distant from the mosque, in sanctuaries, built by themselves, or in places which they have indicated: their tombs are exceedingly simple; the Moors do not imitate the ostentation of Europeans, where superb monuments are raised rather to gratify the pride of the living than the merit of the dead.

Chenier's Morocco, vol. i.

All Mahometans inter the dead at the hour set apart for prayer. The defunct is not kept in the house, except he expires after sun-set; but the body is transported to the mosque, whither it is carried by those who are going to prayer. Each, from a spirit of devotion, is desirous to carry in his turn. The Moors sing at their burial service; which usage perhaps they have imitated after the Christians of Spain, for the oriental Mahometans do not sing. They have no particular colour appropriated to mourning; their grief for the loss of relations is a sensation of the heart they do not attempt to express by outward symbols. Women regularly go on the Friday to weep over and pray at the sepulchres of the dead, whose memory they hold dear.

Among the northern nations it was customary to bury their dead under heaps of stones called *cairns*, or under barrows: (See the articles CAIRNS and BARROW). The inhabitants of Tibet, it is said, neither bury nor burn their dead, but expose them on the tops of the mountains. See TIBET.

Tompion || Tonnage.

TOMPION, a sort of bung or cork used to stop the mouth of a cannon. At sea this is carefully encircled with tallow or putty, to prevent the penetration of the water into the bore, whereby the powder contained in the chamber might be damaged or rendered incapable of service.

TON, a measure or weight. See TUN.

TONE, or TUNE, in music, a property of sound, whereby it comes under the relation of *grave* and *acute*; or the degree of elevation any sound has, from the degree of swiftness of the vibrations of the parts of the sonorous body.

The variety of tones in human voices arises partly from the dimensions of the windpipe, which, like a flute, the longer and narrower it is, the sharper the tone it gives; but principally from the head of the larynx or knot of the throat: the tone of the voice being more or less grave as the rima or cleft thereof is more or less open.

The word *tone* is taken in four different senses among the ancients: 1. For any sound; 2. For a certain interval, as when it is said the difference between the diapente and diatessaron is a tone; 3. For a certain locus or compass of the voice, in which sense they used the Dorian, Phrygian, Lydian tones; 4. For tension, as when they speak of an acute, grave, or a middle tone.

TONE is more particularly used, in music, for a certain degree or interval of tune, whereby a sound may be either raised or lowered from one extreme of a concord to the other, so as still to produce true melody.

TONGUE. See ANATOMY, n° 102.

TONIC, in music, signifies a certain degree of tension, or the sound produced by a vocal string in a given degree of tension, or by any sonorous body when put in vibration.

Tonic, says Rousseau, is likewise the name given by Aristoxenus to one of the three kinds of chromatic music, whose divisions he explains, and which was the ordinary chromatic of the Greeks, proceeding by two semitones in succession, and afterwards a third minor.

Tonic Dominant. See DOMINANT.

TONNAGE *and* POUNDAGE, an ancient duty on wine and other goods, the origin of which seems to have been this: About the 21st of Edward III. complaint was made that merchants were robbed and murdered on the seas. The king thereupon, with the consent of the peers, levied a duty of 2 s. on every ton of wine, and 12 d. in the pound on all goods imported; which was treated as illegal by the commons. About 25 years after, the king, when the knights of shires were returned home, obtained a like grant from the

Tonnage, Tonquin.

citizens and burgeſſes, and the year after it was regularly granted in parliament. Theſe duties were diminiſhed ſometimes, and ſometimes increaſed; at length they ſeem to have been fixed at 3s. tonnage and 1s. poundage. They were at firſt uſually granted only for a ſtated term of years, as, for two years in 5 Ric. II.; but in Henry VI.'s time they were granted him for life by a ſtatute in the 31ſt year of his reign; and again to Edward IV. for the term of his life alſo: ſince which time they were regularly granted to all his ſucceſſors for life, ſometimes at the firſt, ſometimes at other ſubſequent parliaments, till the reign of Charles I.; when, as the noble hiſtorian expreſſes it, his miniſters were not ſufficiently ſolicitous for a renewal of this legal grant. And yet theſe impoſts were imprudently and unconſtitutionally levied and taken, without conſent of parliament, for 15 years together; which was one of the cauſes of thoſe unhappy diſcontents, juſtifiable at firſt in too many inſtances, but which degenerated at laſt into cauſeleſs rebellion and murder. For, as in every other, ſo in this particular caſe, the king (previous to the commencement of hoſtilities) gave the nation ample ſatisfaction for the errors of his former conduct, by paſſing an act, whereby he renounced all power in the crown of levying the duty of tonnage and poundage, without the expreſs conſent of parliament; and alſo all power of impoſition upon any merchandiſes whatever. Upon the reſtoration this duty was granted to King Charles II. for life, and ſo it was to his two immediate ſucceſſors; but now, by three ſeveral ſtatutes. 9 Ann. c. 6. 1 Geo. I. c. 12. and 3 Geo. I. c. 7. it is made perpetual, and mortgaged for the debt of the public.

Blackſt. Comment. vol. i.

TONQUIN, a kingdom of Aſia, in the Eaſt Indies, beyond the Ganges; bounded on the north by the province of Yunnan in China, on the eaſt by the province of Canton and the bay of Tonquin, on the ſouth by Cochin China, and on the weſt by the kingdom of Laos. It is about 1200 miles in length and 500 in breadth; and is one of the fineſt and moſt conſiderable kingdoms of the Eaſt, as well on account of the number of inhabitants as the riches it contains and the trade it carries on. The country is thick ſet with villages; and the natives in general are of a middle ſtature and clean limbed, with a tawny complexion. Their faces are oval and flattiſh, and their noſes and lips well proportioned. Their hair is black, long, lank, and coarſe; and they let it hang down their ſhoulders. They are generally dexterous, nimble, active, and ingenious in mechanic arts. They weave a multitude of fine ſilks, and make curious lacker-works, which are tranſported to other countries. There is ſuch a number of people, that many want employment; for they ſeldom go to work but when foreign ſhips arrive. The money and goods brought hither by the Engliſh and Dutch put them in action; for they have not money of their own ſufficient to employ themſelves; and therefore one-third at leaſt muſt be advanced beforehand by the merchants: and the ſhips muſt ſtay here till the goods are finiſhed, which is generally five or ſix months. They are ſo addicted to gaming, that when every thing elſe is loſt, they will ſtake their wives and children. The garments of the Tonquineſe are made either of ſilk or cotton; but the poor people and ſoldiers wear only cotton of a dark tawny colour. Their houſes are ſmall and low; and the walls either of mud, or hurdles daubed over with clay. They have only a ground-floor, with two or three partitions; and each room has a ſquare hole to let in the light. The villages conſiſt of 30 or 40 houſes, ſurrounded with trees; and in ſome places there are banks to keep the water from overflowing their gardens, where they have oranges, betels, melons, and ſalad-herbs. In the rainy ſeaſon they cannot paſs from one houſe to another without wading through the water; they ſometimes have boats. In the capital city called *Cacho* there are about 20,000 houſes with mud-walls, and covered with thatch; a few are built with brick, and roofed with pan-tiles. In each yard is a ſmall arched building like an oven, about ſix feet high, made of brick, which ſerves to ſecure their goods in caſe of fire. The principal ſtreets are very wide, and paved with ſmall ſtones. The king of Tonquin has three palaces in it, ſuch as they are; and near them are ſtables for his horſes and elephants. The houſe of the Engliſh factory is ſeated at the north end of the city, fronting the river, and is the beſt in the city. The people in general are courteous, and civil to ſtrangers; but the great men are proud, haughty, and ambitious; the ſoldiers inſolent, and the poor thieviſh. They buy all their wives, of which the great men have ſeveral; but the poor are ſtinted for want of money. In hard times the men will ſell both their wives and children to buy rice to maintain themſelves. The women offer themſelves to ſtrangers as wives while they ſtay, and agree with them for a certain price. Even the great men will offer their daughters to the merchants and officers who are likely to ſtay ſix months in the country. They are not afraid of being with child; for if they are girls they can ſell them well when they are young, becauſe they are fairer than the other inhabitants. Theſe women are ſaid to be very faithful; and are truſted with money and goods by the Europeans during their abſence, and will make great advantage with them. The firſt new moon in the year that happens after the middle of January, is a great feſtival; when they rejoice for 10 or 12 days together, and ſpend their time in all manner of ſports. Their common drink is tea, but they make themſelves merry with arrack. The language is ſpoken very much in the throat; and ſome of the words are pronounced through the teeth, and has a great reſemblance to the Chineſe. They have ſeveral mechanic arts or trades; ſuch as ſmiths, carpenters, joiners, turners, weavers, taylors, potters, painters, money-changers, paper-makers, workers in lacker, and bell-founders. Their commodities are gold, muſk, ſilks, callicoes, drugs of many ſorts, woods for dyeing, lacquered wares, earthen wares, ſalt, anniſeeds, and worm-ſeeds. The lacquered ware is not inferior to that of Japan, which is accounted the beſt in the world. With all theſe merchandiſes, one would expect the people to be very rich, but they are in general very poor; the chief trade being carried on by the Chineſe, Engliſh, and Dutch. The goods imported, beſides ſilver, are ſaltpetre, ſulphur, Engliſh broad cloth, pepper, ſpices, and great guns.

Tonquin || Tontine.

TONSILS. See ANATOMY. n° 102.

TONSURE, in eccleſiaſtical hiſtory, a particular manner of ſhaving or clipping the hair of eccleſiaſtics or monks. The ancient tonſure of the clergy was nothing more than polling the head, and cutting the hair to a moderate degree, for the ſake of decency and gravity: and the ſame obſervation is true with reſpect to the tonſure of the ancient monks. But the Romans have carried the affair of tonſure much farther; the candidate for it kneeling before the biſhop, who cuts the hair in five different parts of the head, *viz.* before, behind, on each ſide, and on the crown.

TONTINE, a loan given for life annuities with benefit of ſurvivorſhip; ſo called from the inventor Laurence Tonti, a Neapolitan. He propoſed his ſcheme in 1653 to reconcile the people to cardinal Mazarine's government, by amuſing them with the hope of becoming ſuddenly rich. He obtained the conſent of the court, but the parliament would not regiſter the edict. He made attempts afterwards, but without ſucceſs.

It was not till Louis XIV. was diſtreſſed by the league of Augſburg, and by his own immenſe expences, that he had

Tool || Topaz.

had recourſe to the plans of Tonti, which, though long laid aſide, were not forgotten. By an edict in 1689 he created a Tontine royale of 1,400,000 livres annual rent, divided into 14 claſſes. The actions were 300 livres apiece, and the proprietors were to receive 10l. *per cent.* with benefit of ſurvivorſhip in every claſs. This ſcheme was executed but very imperfectly; for none of the claſſes roſe to above 25,000 livres, inſtead of 100,000, according to the original inſtitution; though the annuities were very regularly paid. A few years after, the people ſeeming in better humour for projects of this kind, another tontine was erected upon nearly the ſame terms, but this was never above half full. They both ſubſiſted in the year 1726, when the French king united the 13th claſs of the firſt tontine with the 14th of the ſecond; all the actions of which were poſſeſſed by Charlotte Bonnemay, widow of Lewis Barbier, a ſurgeon of Paris, who died at the age of 96. This gentlewoman had ventured 300 livres in each tontine; and in the laſt year of her life ſhe had for her annuity 73,500 livres, or about 3600l. a-year, for about 30l.

The nature of the tontine is this; there is an annuity, after a certain rate of intereſt, granted to a number of people; divided into claſſes, according to their reſpective ages; ſo that annually the whole fund of each claſs is divided among the ſurvivors of that claſs; till at laſt it falls to one, and upon the extinction of that life, reverts to the power by which the tontine was erected, and which becomes thereby ſecurity for the due payment of the annuities.

TOOL, among mechanics, denotes in general any ſmall inſtrument uſed as well for making other complex inſtruments and machines, as in moſt other operations in the mechanic arts.

TOOTH, for a deſcription of, ſee ANATOMY, n° 27.

TOOTHACH. See MEDICINE, n° 210, SURGERY, n° 236, TEETH, and ELECTRICITY, p. 535.

Toothach-Tree. See ZANTHOXYLUM.

TOOTHWORT. See PLUMBAGO.

TOP, a ſort of platform ſurrounding the lower maſt head, from which it projects on all ſides like a ſcaffold.

The principal intention of the top is to extend the topmaſt ſhrouds, ſo as to form a greater angle with the maſt, and thereby give additional ſupport to the latter. It is ſuſtained by certain timbers fixed acroſs the hounds or ſhoulders of the maſt, and called the *treſtle trees*, and *croſs-trees*.

Beſides the uſe above-mentioned, the top is otherwiſe extremely convenient to contain the materials neceſſary for extending the ſmall ſails, and for fixing or repairing the rigging and machinery with more facility and expedition. In ſhips of war it is uſed as a kind of redoubt, and is accordingly fortified for attack or defence; being furniſhed with ſwivels, muſketry, and other fire-arms, and guarded by a thick fence of corded hammocs. Finally, it is employed as a place for looking out, either in the day or night.

Top-Maſt, the ſecond diviſion of a maſt, or that part which ſtands between the upper and lower pieces. See the article MAST.

Top-Sails, certain large ſails extended acroſs the topmaſts, by the topſail-yard above, and by the yard attached to the lower maſt beneath; being faſtened to the former by robands, and to the latter by means of two great blocks fixed on its extremities, through which the topſail-ſheets are inſerted, paſſing from thence to two other blocks fixed on the inner part of the yard cloſe by the maſt; and from theſe latter the ſheets lead downwards to the deck, where they may be ſlackened or extended at pleaſure. See the article SAIL.

TOPAZ, in natural hiſtory, a gem called by the ancients *chryſolite*, as being of a gold colour; its texture foliaceous; its form cubic, parallelopipedal, or priſmatic; its ſpecific gravity from 3,46 to 4,56; it loſes its colour only in a very ſtrong heat, and of the uſual fluxes it yields only to borax and microcoſmic ſalt. According to Bergman, 100 parts of it contain 46 of argill, 39 of ſiliceous earth, 8 of mild calcareous, and 6 of iron. Its great ſpecific gravity ſhews theſe earths to be very perfectly united.

Topaz || Tories. Kirkwan's Mineralogy.

The fineſt topazes in the world are found in the Eaſt Indies; but they are very rare there of any great ſize: the Great Mogul, however, at this time, poſſeſſes one which is ſaid to weigh 157 carets, and to be worth more than 20,000 pounds. The topazes of Peru come next after theſe in beauty and in value. The European are principally found in Sileſia and Bohemia, and are generally full of cracks and flaws, and of a browniſh yellow.

TOPE, in ichthyology, a ſpecies of SQUALUS.

TOPHET. See HINNOM and MOLOCH.

TOPHUS, in medicine, denotes a chalky or ſtony concretion in any part of the body; as the bladder, kidney, &c. but eſpecially in the joints.

TOPIC, a general head or ſubject of diſcourſe.

TOPICS, in oratory. See ORATORY, n° 10—13.

TOPICS, or *Topical Medicines*, are the ſame with external ones, or thoſe applied outwardly to ſome diſeaſed and painful part; ſuch are plaſters, cataplaſms, unguents, &c.

TOPOGRAPHY, a deſcription or draught of ſome particular place, or ſmall tract of land, as that of a city or town, manor or tenement, field, garden, houſe, caſtle, or the like; ſuch as ſurveyors ſet out in their plots, or make draughts of, for the information and ſatisfaction of the proprietors.

TOPSHAM, a town in Devonſhire, in England, ſeated on the river Exmouth, five miles ſouth-eaſt of Exeter, to which place the river was formerly navigable; but in time of war was choaked up deſignedly, ſo that ſhips are now obliged to load and unload at Topſham. W. Long. 3. 26. N. Lat. 50. 39.

TORBAY, a fine bay of the Engliſh channel, on the coaſt of Devonſhire, a little to the eaſt of Dartmouth, formed by two capes, called *Bury Points*, and *Bob's Noſe*.

TORDA, or RASOR-BILL. See ALCA, n° 4.

TORDYLIUM, HART-WORT, in botany: A genus of plants belonging to the claſs of *pentandria*, and order of *digynia*; and in the natural ſyſtem arranged under the 45th order, *Umbellatæ*. The corollets are radiated, and all hermaphrodite; the fruit is roundiſh, and crenated on the margin; the involucra long and undivided. There are ſeven ſpecies: of which two are Britiſh, the *nodoſum* and *officinale*.

1. The *nodoſum*, or knotted parſley, has ſimple ſeſſile umbels, the exterior ſeeds being rough. It grows in the borders of corn-fields, and in dry ſtony places. 2. The *officinale*, officinal hart-wort, has partial involucra, as long as the flowers; leafets oval and jagged: the ſeeds are large and flat, and their edges notched.

TORIES, a political faction in Britain, oppoſed to the Whigs.

The name of *Tories* was given to a ſort of banditti in Ireland, and was thence transferred to the adherents of Charles I. by his enemies, under the pretence that he favoured the rebels in Ireland. His partiſans, to be even with the republicans, gave them the name of *Whigs*, from a word which ſignifies *whey*, in deriſion of their poor fare. The Tories, or *cavaliers*, as they were alſo called, had then principally in view the political intereſts of the king, the crown, and the church of England; and the round heads, or Whigs, propoſed chiefly the maintaining of the rights and intereſts of the people, and of Proteſtantiſm. This is the moſt popular account; and yet it is certain the names *Whig* and

Tormentilla. || Torpor.

Tory were but little known till about the middle of the reign of king Charles II. M. de Cize relates, that it was in the year 1678 that the whole nation was firſt obſerved to be divided into Whigs and Tories; and that on occaſion of the famous depoſition of Titus Oates, who accuſed the Catholics of having conſpired againſt the king and the ſtate, the appellation of *Whig* was given to ſuch as believed the plot real; and *Tory* to thoſe who held it fictitious.

Theſe parties may be conſidered either with regard to the ſtate or to religion. The ſtate Tories are either violent or moderate: the firſt would have the king to be abſolute, and therefore plead for paſſive obedience, non-reſiſtance, and the hereditary right of the houſe of Stuart. The moderate Tories would not ſuffer the king to loſe any of his prerogative; but then they would not ſacrifice thoſe of the people. The ſtate Whigs are either ſtrong republicans or moderate ones. "The firſt (ſays Rapin) are the remains of the party of the long parliament, who attempted to change monarchy to a commonwealth: but theſe make ſo ſlender a figure, that they only ſerve to ſtrengthen the party of other Whigs. The Tories would perſuade the world, that all the Whigs are of this kind; as the Whigs would make us believe that all the Tories are violent. The moderate ſtate Whigs are much in the ſame ſentiments with the moderate Tories, and deſire that the government may be maintained on the ancient foundation; all the difference is, that the firſt bear a little more to the parliament and people, and the latter to that of the king. In ſhort, the old Whigs were always jealous of the encroachments of the royal prerogative, and watchful over the preſervation of the liberties and properties of the people."

TORMENTILLA, Tormentil, in botany: A genus of plants belonging to the claſs of *icoſandria*, and order of *polygynia*; and in the natural ſyſtem ranging under the 35th order, *Senticoſæ*. The calyx is octofid; the petals are four; the ſeeds round, naked, and affixed to a juiceleſs receptacle. There are two ſpecies; the *erecta* and *repens*, both indigenous.

1. The *erecta*, common tormentil, or ſeptfoil, has a ſtalk ſomewhat erect, and ſeſſile leaves. The roots conſiſt of thick tubercles, an inch or more in diameter, replete with red juice of an aſtringent quality. They are uſed in moſt of the Weſtern-Iſles, and in the Orkneys, for tanning of leather; in which intention they are proved by ſome late experiments to be ſuperior even to the oak-bark. They are firſt of all boiled in water, and the leather is afterwards ſteeped in the liquor. In the iſland of Tirey and Col the inhabitants have deſtroyed ſo much ground by digging them up, that they have lately been prohibited the uſe of them. A decoction of theſe roots in milk is alſo frequently adminiſtered by the inhabitants of the ſame iſlands in diarrhœas and dyſenteries, with good ſucceſs; but perhaps it would be moſt proper not to give it in dyſenteries till the morbid matter be firſt evacuated. A ſpirituous extract of the plant ſtands recommended in the ſea-ſcurvy, to ſtrengthen the gums and faſten the teeth. Linnæus informs us, that the Laplanders paint their leather of a red colour with the juice of the roots.

2. The *reptans*, or creeping tormentil, has reddiſh ſtalks, ſlender and creeping. The leaves are ſharply ſerrated, grow on ſhort footſtalks, and are five-lobed. The flowers are numerous and yellow, bloſſom in July, and are frequent in woods and barren paſtures.

TORNADO, a ſudden and vehement guſt of wind from all points of the compaſs, frequent on the coaſt of Guinea.

TORPEDO, the Cramp-fish. See Raja, and Electricity, n° 258—261.

TORPOR, a numbneſs, or defect of feeling and motion. Galen ſays it is a ſort of intermediate diſorder between palſy and health.

Torrefaction || Tortoiſe.

TORREFACTION, in chemiſtry, is the roaſting or ſcorching of a body by the fire, in order to diſcharge a part either unneceſſary or hurtful in another operation. Sulphur is thus diſcharged from an ore before it can be wrought to advantage.

TORRENT, denotes a temporary ſtream of water falling ſuddenly from mountains, whereon there have been great rains, or an extraordinary thaw of ſnow.

TORRICELLI (Evangeliſte), an illuſtrious Italian mathematician and philoſopher, born at Faenza in 1608. He was trained in Latin literature by his uncle a monk; and after cultivating mathematical knowledge for ſome time without a maſter, he ſtudied it under father Benedict Caſtelli, profeſſor of mathematics at Rome. Having read Galileo's dialogues, he compoſed a treatiſe on motion, on his principles, which brought him acquainted with Galileo, who took him home as an aſſiſtant: but Galileo died in three months after. He became profeſſor of mathematics at Florence, and greatly improved the art of making teleſcopes and microſcopes: but he is beſt known for finding out a method of aſcertaining the weight of the atmoſphere by quickſilver: the barometer being called, from him, the *Torricellian tube*. He publiſhed *Opera Geometrica*, 4to, 1644; and died in 1647.

TORRICELLIAN Experiment, a famous experiment made by Torricelli, by which he demonſtrated the preſſure of the atmoſphere in oppoſition to the doctrines of ſuction, &c. finding that preſſure able to ſupport only a certain length of mercury, or any other fluid, in an inverted glaſs tube. See Barometer.

TORSK, or Tusk, in ichthyology. See Gadus.

TORTOISE, in zoology. See Testudo.

Tortoise-ſhell, the ſhell, or rather ſcales, of the teſtaceous animal called a *tortoiſe*; uſed in inlaying, and in various other works, as for ſnuff-boxes, combs, &c. Mr Cateſby obſerves, that the hard ſtrong covering which incloſes all ſorts of tortoiſes, is very improperly called a *ſhell*; being of a perfect bony contexture; but covered on the outſide with ſcales, or rather plates, of a horny ſubſtance; which are what the workmen call *tortoiſe-ſhell*. Phil. Tranſ. n° 438, p. 117.

There are two general kinds of tortoiſes, *viz.* the *land* and *ſea tortoiſe*, *teſtudo terreſtris*, and *marina*. The ſea-tortoiſe, again, is of ſeveral kinds; but it is the caret, or teſtudo imbricata of Linnæus, alone, which furniſhes that beautiful ſhell ſo much admired in Europe.

The ſhell of the caretta, or hawkſbill tortoiſe, is thick; and conſiſts of two parts, the upper, which covers the back, and the lower the belly: the two are joined together at the ſides by ſtrong ligaments, which yet allow of a little motion. In the fore-part is an aperture for the head and fore-legs, and behind for the hind-legs and tail. It is the under ſhell alone that is uſed: to ſeparate it, they make a little fire beneath it, and as ſoon as ever it is warm, the under ſhell becomes eaſily ſeparable with the point of a knife, and is taken off in laminæ or leaves.

The whole ſpoils of the caret conſiſt in 13 leaves or ſcales, eight of them flat, and five a little bent. Of the flat ones, there are four large ones, ſometimes a foot long, and ſeven inches broad. The beſt tortoiſe-ſhell is thick, clear, tranſparent, of the colour of antimony, ſprinkled with brown and white. When uſed in marquetry, &c. the workmen give it what colour they pleaſe by means of coloured leaves, which they put underneath it.

Working and joining of Tortoise-ſhell.—Tortoiſe-ſhell and horn become ſoft in a moderate heat, as that of boiling water, ſo as to be preſſed, in a mould, into any form, the ſhell or horn

Torture ‖ Touch.

horn being previouſly cut into plates of a proper ſize. Plumier informs us, in his *Art de Tourner*, that two plates are likewiſe united into one by heating and preſſing them; the edges being thoroughly cleaned, and made to fit cloſe to one another. The tortoiſe-ſhell is conveniently heated for this purpoſe by applying a hot iron above and beneath the juncture, with the interpoſition of a wet cloth to prevent the ſhell from being ſcorched by the irons: theſe irons ſhould be pretty thick, that they may not loſe their heat before the union is effected. Both tortoiſe-ſhell and horns may be ſtained of a variety of colours, by means of the colouring drugs commonly uſed in dyeing, and by certain metallic ſolutions.

TORTURE, a violent pain inflicted on perſons to force them to confeſs the crimes laid to their charge, or as a puniſhment for crimes committed.

Torture was never permitted among the Romans except in the examination of ſlaves: it would therefore appear, that it was a general opinion among them, that a ſlave had ſuch a tendency to falſehood, that the truth could only be extorted from him. To the diſgrace of the profeſſors of Chriſtianity, torture was long practiſed by thoſe who called themſelves Catholics, againſt thoſe whom they termed *heretics*; that is, thoſe who differed in opinion from themſelves. Finding that they could not bring over others to adopt their ſentiments by the force of argument, they judge it proper to compel them by the force of puniſhment. This practice was very general among orthodox Chriſtians, but eſpecially among Roman Catholics. See INQUISITION.

By the law of England, torture was at one period employed to compel thoſe criminals who ſtood obſtinately mute when brought to trial, and refuſed either to plead guilty or not guilty; but it is now aboliſhed (ſee ARRAIGNMENT, RACK). A hiſtory of the machines which have been invented to torture men, and an account of the inſtances in which theſe have been employed, would exhibit a diſmal picture of the human character.

TORUS, in architecture, a large round moulding uſed in the baſes of columns. See Plate XXXVIII. fig. 3.

TOUCAN, in ichthyology. See RHAMPHASTOS.

TOUCH-NEEDLE, among aſſayers, refiners, &c. little bars of gold, ſilver, and copper, combined together, in all the different proportions and degrees of mixture; the uſe of which is to diſcover the degree of purity of any piece of gold or ſilver, by comparing the mark it leaves on the touch-ſtone with thoſe of the bars.

The metals uſually tried by the touch-ſtone are gold, ſilver, and copper, either pure, or mixed with one another in different degrees and proportions, by fuſion. In order to find out the purity or quantity of baſer metal in theſe various admixtures, when they are to be examined they are compared with theſe needles, which are mixed in a known proportion, and prepared for this uſe. The metals of theſe needles, both pure and mixed, are all made into laminæ or plates, one-twelfth of an inch broad, and of a fourth part of their breadth in thickneſs, and an inch and half long; theſe being thus prepared, you are to engrave on each a mark indicating its purity, or the nature and quantity of the admixture in it. The black rough marbles, the baſaltes, or the ſofter kinds of black pebbles, are the moſt proper for touch-ſtones.

The method of uſing the needles and ſtone is this: The piece of metal to be tried ought firſt to be wiped well with a clean towel or piece of ſoft leather, that you may the better ſee its true colour; for from this alone an experienced perſon will, in ſome degree, judge beforehand what the principal metal is, and how and with what debaſed.

Then chooſe a convenient, not over large, part of the ſurface of the metal, and rub it ſeveral times very hardly and ſtrongly againſt the touch-ſtone, that in caſe a deceitful coat or cruſt ſhould have been laid upon it, it may be worn off by that friction: this, however, is more readily done by a grindſtone or ſmall file. Then wipe a flat and very clean part of the touch-ſtone, and rub againſt it, over and over, the juſt mentioned part of the ſurface of the piece of metal, till you have, on the flat ſurface of the ſtone, a thin metallic cruſt, an inch long, and about an eighth of an inch broad: this done, look out the needle that ſeems moſt like to the metal under trial, wipe the lower part of this needle very clean, and then rub it againſt the touchſtone, as you did the metal, by the ſide of the other line, and in a direction parallel to it.

Touch ‖ Toulon.

When this is done, if you find no difference between the colours of the two marks made by your needle and the metal under trial, you may with great probability pronounce that metal and your needle to be of the ſame alloy, which is immediately known by the mark engraved on your needle. But if you find a difference between the colour of the mark given by the metal, and that by the needle you have tried, chooſe out another needle, either of a darker or lighter colour than the former, as the difference of the tinge on the touchſtone directs; and by one or more trials of this kind you will be able to determine which of your needles the metal anſwers, and thence what alloy it is of, by the mark of the needle; or elſe you will find that the alloy is extraordinary, and not to be determined by the compariſon of your needles.

Touch-Stone, a black, ſmooth, gloſſy ſtone, uſed to examine the purity of metals. The ancients called it *lapis Lydius*, the Lydian ſtone, from the name of the country whence it was originally brought.

Any piece of pebble or black flint will anſwer the purpoſes of the beſt lapis lydius of Aſia. Even a piece of glaſs made rough with emery is uſed with ſucceſs, to diſtinguiſh true gold from ſuch as is counterfeit; both by the metallic colour and the teſt of aquafortis. The true touch-ſtone is of a black colour, and is met with in ſeveral parts of Sweden. See TRAPP.

TOUCHWOOD. See BOLETUS.

TOULON, a celebrated city and ſeaport of France, in that part of the late province of Provence which is now denominated the department of the *Var*. It is a very ancient place, having been founded, according to the common opinion, by a Roman general. It is the chief town of the department, and before the great revolution in 1789 was an epiſcopal ſee. The inhabitants are computed at 80,000. It is divided into the Old Quarter and the New Quarter. The firſt, which is very ill built, has nothing remarkable in it but the *Rue aux Arbres*, the Tree Street, which is a kind of courſe or mall, and the town-houſe; the gate of this is ſurrounded by a balcony, which is ſupported by two termini, the maſterpieces of the famous Pujet. The New Quarter, which forms as it were a ſecond city, contains, beſide the magnificent works conſtructed in the reign of Louis XIV. many fine houſes (among which that of the late ſeminary merits beyond compariſon the preference) and a grand oblong ſquare, lined with trees, and ſerving as a parade.

The Merchants Haven, along which extends a noble quay, on which ſtands the townhouſe, is protected by two moles, begun by Henry IV. The New Haven was conſtructed by Louis XIV. as were the fortifications of the city. In the front of this haven is an arſenal, containing all the places neceſſary for the conſtruction and fitting out of veſſels: the firſt object that appears is a rope-walk, entirely arched, extending as far as the eye can reach, and built after

Toulon, Toulouſe.

ter the deſigns of Vauban; here cables are made, and above is a place for the preparation of hemp. Here likewiſe is the armoury for muſkets, piſtols, halberds, &c. In the park of artillery are cannons placed in piles, bombs, grenades, mortars, and balls of various kinds, ranged in wonderful order. The long ſail room, the foundery for cannon, the dockyards, the baſons, &c. are all worthy of obſervation.

Both the old and New Port have an outlet into the ſpacious outer road or harbour, which is ſurrounded by hills, and formed by nature almoſt circular. Its circuit is of very great extent, and the entrance is defended on both ſides by a fort with ſtrong batteries. In a word, the baſons, docks, and arſenal, at Toulon, warranted the remark of a foreigner that viſited them in the late reign, that "the king of France was greater there than at Verſailles." Toulon is the only mart in the Mediterranean for the re-exportation of the products of the Eaſt Indies.

This place was deſtroyed toward the end of the tenth century, and pillaged by the African pirates almoſt as ſoon as rebuilt. The conſtable of Bourbon, at the head of the Imperial troops, obtained poſſeſſion of it in 1524, as did Charles V. in 1536; but in the next century Charles Emanuel duke of Savoy could not enter it, and Prince Eugene in 1707 ineffectually laid ſiege to it. This city was ſurrendered by the inhabitants in September 1793 to the Britiſh admiral Lord Hood, as a condition and means of enabling them to effect the re-eſtabliſhment of monarchy in France, according to the conſtitution of 1789. Lord Hood accordingly, in conjunction with the Spaniſh land and naval forces, took poſſeſſion of the harbour and forts in truſt for Louis XVII. It was garriſoned for ſome time by the Britiſh troops, and their allies the Spaniards, Neapolitans, and Sardinians; but the French having laid ſiege to it, the garriſon was obliged to evacuate the place in the month of December following, after having deſtroyed the grand arſenal, two ſhips of 84 guns, eight of 74, and two frigates; and carried off the Commerce de Marſeilles, a ſhip of 120 guns, with an 80 and 74 gun ſhip. This exploit was moſt gallantly performed, after it was found impoſſible to defend the town, or to carry off the ſhips. Lord Hood entruſted the management of the affair to Sir Sydney Smith, ſo diſtinguiſhed for his intrepidity. Captain Hare commanded the fireſhip which was towed into the grand arſenal; and ſo eager was he to execute his orders, that inſtead of ſetting fire to the train in the uſual cautious manner, he fired a piſtol loaded with powder into the bowl of the train, compoſed of 36 pounds of powder, and other combuſtibles. The conſequence was, he was blown into the water with ſuch violence, as to knock a lieutenant of the Victory's boat overboard, and narrowly eſcaped with his life. A Spaniſh captain was appointed to ſet fire to the ſmall arſenal, but cowardice prevented him from executing his orders; and this is the reaſon why the whole French ſhips were not deſtroyed. We have been favoured with this account by an officer of the Britiſh fleet.

Toulon is ſeated on a bay of the Mediterranean, 17 leagues ſouth-eaſt of Aix, 15 ſouth-eaſt of Marſeilles, and 127 ſouth-eaſt of Paris. E. Long. 5. 37. N. Lat. 43. 7.

TOULOUSE, a very ancient City of France, in the department of Upper Garonne, and late province of Languedoc, with an archbiſhop's ſee. It is the moſt conſiderable city in France next to Paris and Lyons, although its population bears no proportion to its extent. According to Mr Neckar's calculation, it contains 56,000 inhabitants. The ſtreets are very handſome, and the walls of the city, as well as the houſes, are built with bricks. The townhouſe, a modern ſtructure, forms a perfect ſquare, 324 feet long and 66 high. The principal front occupies an entire ſide of the grand ſquare, lately called the *Place Royale*. In the great hall, called the *Hall of Illuſtrious Men*, is the ſtatue of the Chevalier Iſaure, and the buſts of all the great men to whom Toulouſe has given birth. Communicating with the ocean on one ſide by the river Garonne, and with the Mediterranean on the other by the canal of Languedoc, Toulouſe might have been a very commercial city; but the taſte of the inhabitants has been principally for the ſciences and belles-lettres. Of courſe, there are two colleges, two public libraries, and three academies. The little commerce of Toulouſe conſiſts in leather, drapery, blankets, mignionets, oil, iron, mercery, hardware, and books. The bridge over the Garonne is at leaſt equal to thoſe of Tours and Orleans: it forms the communication between the ſuburb of St Cyprian and the city. The quays extend along the banks of the Garonne; and it has been in contemplation to line them with new and uniform houſes. Toulouſe is 37 miles eaſt of Auch, 125 ſouth-eaſt of Bourdeaux, and 310 ſouth-by-weſt of Paris. E. Long. 1. 27. N. Lat. 43. 36.

Toup.

TOUP (the Reverend Jonathan), was deſcended from a family formerly ſettled in Dorſetſhire. His grandfather, Oneſiphorus Toup, had been a man of good property, and patron as well as incumbent of Bridport, in that county; but he appears to have been embarraſſed in his circumſtances before his death, as he parted with the advowſon, and left a numerous family very ſlenderly provided for. His ſecond ſon Jonathan was bred to the church, and was curate and lecturer of St Ives in Cornwall. He married Prudence, daughter of John Buſvargus, Eſq; of Buſvargus in Cornwall, and by her had iſſue Jonathan, the ſubject of this article, and one daughter.

Mr Toup loſt his father while he was a child; and his mother ſome time after marrying Mr Keigwyn, vicar of Landrake in Cornwall, his uncle Buſvargus (the laſt male of that family) took him under his care, and conſidered him as his own child. He bore the whole charge of his education both at ſchool and at college, and procured for him the rectory of St Martin's near Looe.

Mr Toup was born at St Ives in Cornwall in the year 1713. He received the firſt rudiments of his education in a grammar ſchool in that town; and was afterwards placed under the care of Mr Gurney, maſter of a private ſchool in the pariſh of St Merryn. Thence he was removed to Exeter College in Oxford, where he took his degree of Bachelor of Arts. His maſter's degree he took at Cambridge in the year 1756. He obtained the rectory of St Martin's in 1750; was inſtalled prebendary of Exeter in 1774; and inſtituted to the vicarage of St Merryn in 1776: the two laſt preferments he owed to the patronage of Biſhop Keppel of Exeter. By the death of his uncle Buſvargus without iſſue in 1751, Mrs Keigwyn (ſiſter to Mr Buſvargus, and mother to Mr Toup) ſucceeded as heir at law to his eſtate and effects. She died in 1773, and left a will bequeathing the whole of her eſtates to her ſon Mr Jonathan Toup.

In the year 1760 Mr Toup publiſhed the firſt part of his *Emendationes in Suidam*, and in 1764 the ſecond part of the ſame work. Theſe books procured him the notice of Biſhop Warburton, who from the time of their publication honoured him with his correſpondence and patronage. The Biſhop in one of his letters, laments his having a ſee without any preferment on it; "had it been otherwiſe, he ſhould have been too ſelfiſh to invite any of his brethren to ſhare with him in the honour of properly diſtinguiſhing ſuch merit as Mr Toup's. All, however, that the Biſhop could do, he did with the warmth and earneſtneſs of ſincere friendſhip. He repeatedly recommended Mr Toup to Archbiſhop Secker,

Toup. Secker, to the Truſtees for diſpoſing of his Options, to Lord Shelburne, and to Biſhop Keppel; and the favours this prelate beſtowed on Mr Toup were owing to the ſolicitations of Biſhop Warburton. The third part of the *Emendationes in Suidam* was publiſhed in 1766. In the following year Archbiſhop Secker expreſſed a deſire that Mr Toup would lend his aſſiſtance towards a new edition of Polybius, which was then in contemplation. Biſhop Warburton ſtrongly preſſed his compliance with this wiſh, and that he would lay by for a while the Notes he was preparing for Mr Warton's edition of Theocritus. In the year 1767 Mr Toup's *Epiſtola Critica ad virum celeberrimum Gul. Epiſcop. Gloc.* made its appearance. In the year 1770, Mr. Warton's edition of Theocritus was printed at the univerſity preſs in Oxford. Mr Toup was a large contributor towards the corrections and annotations of this edition. A note of his on Idyll. xiv. 37. gave ſuch offence to ſome perſons, that the vice-chancellor of Oxford prevailed on the editor to cancel the leaf on which it was printed, and ſubſtitute another in its room. In 1772 Mr Toup publiſhed his *Appendiculum Notarum in Theocritum*, in which the ſubſtance (A) of the cancelled note was inſerted. He concludes his preface to this work with theſe words: "*Quod vero ſcripſimus ad* xiv. 37. *verum eſt et honeſtum. Sed rem pro ſingulari ſua ſagacitate minus ceperunt nonnulli Oxonienſes; qui et me ſugillare haud erubuerunt; homunculi eruditione mediocri, ingenio nulli; qui in Hebraicis per omnem fere vitam turpiter volutati, in literis elegantioribus plane hoſpites ſunt.*" Mr Toup's next work was the *Appendiculum Notarum in Suidam*, publiſhed in 1775. In 1778 his Longinus was publiſhed from the Oxford preſs in Quarto. A ſecond edition has ſince been printed in Octavo.

As a writer of great learning, and of ſingular critical ſagacity, Mr Toup needs no encomiaſt. The teſtimonies of Mr T. Warton, of Biſhop Warburton, and of every perſon in any way diſtinguiſhed for claſſical learning at home; of Erneſtus, Hemſterhuſius, Runkhenius, Valckenaer, Brunck, Kluit, D'Anſe de Villoiſon, L'Archer, &c. &c. in all parts of Europe, ſufficiently eſtabliſh his reputation as an author. To moſt or all of theſe he was aſſiſting in the ſeveral works they publiſhed.

As his whole life was paſt in literary retirement, his character as a man was known but to few. It will appear from his works that he was not wholly untinctured with that ſelf complacency which is the almoſt inſeparable companion of too much ſolitude; and by thoſe who beſt knew him, he is ſaid to have been unhappy in his diſpoſition. His virtues, however, were reſpectable, and his learning was confeſſedly great. His theological ſtudies were well directed: he ſought for the truths of religion where only they can be found, in the Scriptures; not in the gloſſes and comments of men: it will be needleſs to add, that he was a liberal and a tolerant divine. He was punctual and ſerious in the diſcharge of the duties of his profeſſion; and in his preaching ſingularly plain and forcible. He died on the 19th of January 1785, juſt entering into the 72d year of his age, and was buried under the communion-table in his church of St Martin's.

Mr Toup was a Chriſtian from conviction; not merely from the accident of having been born in a country where Chriſtianity was profeſſed. He fulfilled the duties of life conſcientiouſly, and from principle, without parade or oſtentation. In his purſuit of learning he was actuated by the moſt honourable motives; by the deſire of improving his own mind, and of amuſing himſelf and others. If in Biſhop Warburton he found a patron, capable of diſtinguiſhing merit, and zealous to reward it, let it be remembered, to the honour of both parties, that the Biſhop's patronage was offered, not ſolicited. In the year 1764 he was repeatedly preſſed by another prelate to quit his retirement at St Martin's, and to ſettle either in London or in Oxford, where he might have acceſs to books, and might place himſelf in the way of notice and preferment. He was aſſured, at the ſame time, that the biſhop of his dioceſe would himſelf make a tender of his connivance at his non-reſidence, without any application from Mr Toup on the ſubject. But every propoſal of this nature he conſtantly rejected; for he conſidered the non-reſidence of the parochial clergy as a neglect of duty, for which no apology can be made. He was never married, and rather capriciouſly left his fortune, amounting, it has been ſaid, to L.12,000, to a niece whoſe mother was his half-ſiſter, taking not the leaſt notice in his will of his other nieces and nephews, whoſe mother was his full ſiſter. Tour.

TOUR (Henry de la), viſcount Turenne, a celebrated French general, was the ſecond ſon of Henry de la Tour duke of Bouillon, and was born at Sedan in 1611. He made his firſt campaigns in Holland, under Maurice and Frederic Henry princes of Orange; who were his uncles by the mother's ſide; and even then diſtinguiſhed himſelf by his bravery. In 1634 he marched with his regiment into Lorraine; and having contributed to the taking of La Mothe, was, though very young, made mareſchal de camp. In 1636 he took Saverne, and the year following the caſtles of Hirſon and Sole; on which occaſion he performed an action like that of Scipio's, with reſpect to a very beautiful woman whom he ſent back to her huſband. The viſcount Turenne continued to diſtinguiſh himſelf in ſeveral ſieges and battles, and in 1644 was made marſhal of France; but had the misfortune to be defeated at the battle of Mariendal in 1645. However, he gained the battle of Nortlingen three months after; reſtored the elector of Treves to his dominions; and the following year made the famous junction of the French army with that of Sweden commanded by general Wrangel, which obliged the duke of Bavaria to demand a peace. Afterwards that duke breaking the treaty he had concluded with France, he was defeated by the viſcount Turenne at the battle of Zumarſhauſen, and in 1648 driven entirely out of his dominions. During the civil wars in France he ſided with the princes, and was defeated at the battle of Rhetel in 1650; but ſoon after was reſtored to the favour of the king, who in 1652 gave him the command of his army. He acquired great honour at the battles of Jergeau, Gren, and the ſuburbs of St Anthony, and by the retreat he made before the army commanded by the princes at Ville Neuve St George. In 1654 he made the Spaniards raiſe the ſiege of Arras: the next year he took Conde, St Guilian, and ſeveral other places; gained the famous battle of Dunes; and made himſelf maſter of Dunkirk, Oudenarde, and almoſt all Flanders: this obliged the Spaniards to conclude the peace of the Pyrenees in 1660. Theſe important ſervices occaſioned his being made marſhal-general of the king's camps and armies. The war being renewed with Spain in 1667, Turenne commanded in Flanders; and took ſo many places, that in 1668 the Spaniards were obliged to ſue for peace. He commanded the French army in the war againſt the Dutch in 1672; took 40 towns in 22 days; purſued the elector of Brandenburgh even to Berlin; gained the battles of Slintſheim, Ladenburg, Enſheim, Mulhauſen, and Turkeim; and obliged the imperial army, which

(A) Not improbably all of that note which was omitted in the ſubſtituted leaf.

Touraine ‖ Tournament.

which consisted of 70,000 men, to repass the Rhine. By this campaign the viscount Turenne acquired immortal honour. He passed the Rhine to give battle to general Montecuculi, whom he followed as far as Saspach; but mounting upon an eminence to discover the enemy's camp, he was killed by a cannon-ball in 1675. All France regretted the loss of this great man, who by his military exploits had raised the admiration of Europe.

TOURAINE, a province of France, bounded on the north by Maine, on the east by Orleanois, on the south by Berri, and on the west by Anjou and Poitou. It is about 58 miles in length, and 55 in breadth where it is broadest. This country is watered by 17 rivers, besides many brooks, which not only render it delightful, but keep up a communication with the neighbouring provinces. The air is temperate, and the soil is so fruitful that it is called the *garden of France*. It now forms the department of Indre and Loire, of which Tours is the capital.

TOURMALINE, in mineralogy, a species of siliceous earth.

It has been found only in Ceylon, Brazil, and Tyrol. That of Ceylon is of a dark brown or yellowish colour; its specific gravity 3,065, or 3,295; that of Brazil is green, blue, red, or yellow, and its specific gravity 3,075 or 3,180; that of Tyrol by reflected light is of a blackish brown, but by refracted light yellowish, or in thin pieces green; its specific gravity 3,050; mostly crystallized in polygon prisms, but sometimes amorphous. The thickest parts are opake: the thin more or less transparent.

The proportion of their constituent parts has been found by Bergman,

	Tourmaline of Tyrol.	*Tourmaline of Ceylon.*	*Tourmaline of Brazil.*

For the electrical qualities of tourmaline, see ELECTRICITY, n° 54.

TOURNAMENT, a martial sport or exercise which the ancient cavaliers used to perform, to show their bravery and address. It is derived from the French word *tourner*, i. e. "to turn round," because to be expert in these exercises, much agility both of horse and man was requisite, they riding round a ring in imitation of the ancient Circi.

The first tournaments were only courses on horseback, wherein the cavaliers tilted at each other with canes in manner of lances; and were distinguished from justs, which were courses or careers, accompanied with attacks and combats, with blunted lances and swords. See JUST.

The prince who published the tournament, used to send a king at arms, with a safe conduct, and a sword, to all the princes, knights, &c. signifying that he intended a tournament and a clashing of swords, in the presence of ladies and damsels; which was the usual formula of invitation.

The first engaged man against man, then troop against troop; and after the combat, the judges allotted the prize to the best cavalier, and the best striker of swords; who was accordingly conducted in pomp to the lady of the tournament; where, after thanking her very reverently, he saluted her and likewise her two attendants.

These tournaments made the principal diversion of the 13th and 14th centuries. Munster says, it was Henry the Fowler, duke of Saxony, and afterwards emperor, who died in 936, that first introduced them; but it appears from the chronicle of Tours, that the true inventor of this famous sport, at least in France, was one Geoffry, lord of Preuilli, about the year 1066.

Tournay ‖ Tournefort.

Instances of them occur among the English in the reign of king Stephen, about the year 1140; but they were not much in use till Richard's time, towards the year 1149. After which period these diversions were performed with extraordinary magnificence in the Tilt-yard near St James's, Smithfield, and other places.

The following account of a tournament, from Maitland, is curious. King Richard II. designing to hold a tournament at London on the Sunday after Michaelmas, sent divers heralds to make proclamations of it in all the principal courts of Europe; and accordingly not a few princes, and great numbers of the prime nobility, resorted hither from France, Germany, the Netherlands, &c. This solemnity began on Sunday afternoon, from the Tower of London, with a pompous cavalcade of 60 ladies, each leading an armed knight by a silver chain, being attended by their 'squires of honour, and, passing through Cheapside, rode to Smithfield, where the justs and tournaments continued several days with magnificent variety of entertainments; on which occasion the king kept open house at the bishop of London's palace for all persons of distinction, and every night concluded with a ball.

At last, however, they were found to be productive of bad effects, and the occasions of several fatal misfortunes—as in the instance of Henry II. of France, and of the tilt exhibited at Chalons, which, from the numbers killed on both sides, was called the *little war of Chalons*. These and other inconveniences, resulting from those dangerous pastimes, gave the popes occasion to forbid them, and the princes of Europe gradually concurred in discouraging and suppressing them.

TOURNAY, a town of the Austrian Netherlands in Flanders, and capital of a district called *Tournaysis*, with a bishop's see. It is divided into two parts by the river Scheld; and is large, populous, well built, and carries on a great trade in woollen stuffs and stockings. The cathedral is a very handsome structure, and contains a great many chapels, with rich ornaments, and several magnificent tombs of marble and brass. The town was taken by the allies in 1709; but was ceded to the house of Austria by the treaty of Utrecht, though the Dutch had a right to put in a garrison. It was taken by the French in June 1745, who demolished the fortifications. In 1781 the emperor Joseph II. obliged the Dutch to withdraw their garrison. It was taken by the French in 1791, abandoned by them in 1793, and again conquered by them in 1794. It is 14 miles south-east of Lisle, 30 south-west of Ghent, and 135 north by east from Paris. E. Long. 3. 28. N. Lat. 50. 33.

TOURNEFORT (Joseph Pitton de), a famous French botanist, born at Aix in Provence in 1656. He had a passion for plants from his childhood, which overcame his father's views in putting him to study philosophy and divinity; therefore on his death he quitted theology, and gave himself up entirely to physic, natural history, and botany. He wandered over the mountains of Dauphiny, Savoy, Catalonia, the Pyrenees, and the Alps, in search of new species of plants, which he acquired with much fatigue and danger. His fame in 1683 procured him the employment of botanic professor, in the king's garden; and by the king's order, he travelled into Spain, Portugal, Holland, and England, where he made prodigious collections of plants. In 1700, Mr Tournefort, in obedience to another order, simpled over all the isles of the Archipelago, upon the coasts of the Black Sea, in Bithynia, Pontus, Cappadocia, Armenia;

Tourniquet ‖ Trachinus.

nia, and Georgia; making obſervations on natural hiſtory at large, ancient and modern geography, religion, manners, and commerce. He ſpent three years in this learned voyage; and then reſuming his profeſſion, was made profeſſor of phyſic in the college-royal. He died in conſequence of an accidental cruſh of his breaſt by a cart-wheel, which brought on a ſpitting of blood and hydrothorax, that carried him off in 1708. He wrote Elements of Botany, both in French and Latin; A Relation of his Voyage into the Levant; with other pieces of leſs conſideration.

TOURNIQUET, in ſurgery, an inſtrument formed with ſcrews, for compreſſing any part with rollers, &c. for the ſtopping of hæmorrhagies. See SURGERY, n° 160.

TOWER, a tall building conſiſting of ſeveral ſtories, uſually of a round form, though ſome are ſquare or polygonal. Towers are built for fortreſſes, &c. as the Tower of London. See LONDON, n° 46.

TOWN, a place inhabited by a conſiderable number of people, being of a middle ſize between a city and a village.

TOXICODENDRON, in botany. See RHUS.

TRAAS. See TERRAS.

TRACHEA. See ANATOMY, n° 116.

TRACHINUS, the WEEVER, a genius fiſhes belonging to the order of jugulares. There is but one ſpecies, viz. the *draco*, or common weever. The qualities of this fiſh were well known to the ancients, who take notice of them without any exaggeration: the wounds inflicted by its ſpines are exceedingly painful, attended with a violent burning and moſt pungent ſhooting, and ſometimes with an inflammation that will extend from the arm to the ſhoulder.

It is a common notion, that theſe ſymptoms proceed from ſomething more than the ſmall wound this fiſh is capable of inflicting; and that there is a venom infuſed at leaſt into the wounds made by the ſpines that form the firſt dorſal fin, which is dyed with black, and has a moſt ſuſpicious aſpect; though it is poſſible, that the malignity of the ſymptoms ariſes from the habit of body the perſon is in, or the part in which the wound is given. The remedy uſed by ſome fiſhermen is the ſea-ſand, with which they rub the place affected for a conſiderable time. At Scarborough, ſtale urine warmed is uſed with ſucceſs. In the Univerſal Muſeum for November 1765, is an inſtance of a perſon who was reduced to great danger by a wound from this fiſh, and who was cured by the application of ſweet oil, and taking opium and Venice treacle.

This fiſh buries itſelf in the ſands, leaving only its noſe out, and if trod on immediately ſtrikes with great force; and they have been ſeen directing their blows with as much judgment as fighting cocks. Notwithſtanding this noxious property of the ſpines, it is exceeding good meat.

The Engliſh name ſeems to have no meaning, being corrupted from the French *la vive*, ſo called as being capable of living long out of the water, according to the interpretation of Belon. It grows to the length of 12 inches, but is commonly found much leſs: the irides are yellow: the under jaw is longer than the upper, and ſlopes very much towards the belly; the teeth are ſmall: the back is ſtraight, the ſides are flat, the belly is prominent, the lateral line ſtraight: the covers of the gills are armed with a very ſtrong ſpine: the firſt dorſal fin conſiſts of five very ſtrong ſpines, which, as well as the intervening membranes, are tinged with black; this fin, when quieſcent, is lodged in a ſmall hollow: the ſecond conſiſts of ſeveral ſoft rays, commences juſt at the end of the firſt, and continues almoſt to the tail: the pectoral fins are broad and angular; the ventral fins ſmall: the vent is placed remarkably forward, very near the throat: the anal fin extends to a ſmall diſtance from the tail, is a little hollowed in the middle, but not ſo much as to be called forked: the ſides are marked lengthwiſe with two or three dirty yellow lines, and tranſverſely by numbers of ſmall ones; the belly ſilvery.

Tract ‖ Tragopogon.

TRACT, in geography, an extent of ground, or a portion of the earth's ſurface.

TRACT, in matters of literature, denotes a ſmall treatiſe or written diſcourſe upon any ſubject.

TRADE, in general, denotes the ſame with commerce, conſiſting in buying, ſelling, and exchanging of commodities, bills, money, &c. See COMMERCE, COIN, MONEY, COMPANY, &c.

TRADE-Winds, denote certain regular winds at ſea, blowing either conſtantly the ſame way, or alternately this way and that; thus called from their uſe in navigation, and the Indian commerce. See WIND.

TRADESMEN's TOKENS, a term ſynonymous among medalliſts with provincial coins.

This is a ſubject curious enough to deſerve attention, though we will not go ſo far as Mr Pinkerton does, who ſays that it is a ſubject in which the perpetual glory of the nation is intereſted. Since the year 1789 provincial halfpence have been made and circulated in conſiderable quantity. As ancient medals and coins have been frequently of uſe to hiſtorians, it is to be regretted that many of theſe provincial halfpence are rendered uſeleſs in this reſpect by unmeaning figures and puerile devices. Utility and elegance ought to be ſtudied: for this view it has been propoſed by a gentleman of taſte on this ſubject, that all coins ſhould be diſtinguiſhed by one of the following five characteriſtics. 1. Fac ſimiles of magnificent beautiful buildings. 2. Repreſentations of great and uſeful undertakings. 3. Emblems of the induſtry and commerce of the age. 4. The illuſtrious men, &c. to which the nation has given birth. 5. Important hiſtorical events.

For theſe hints we acknowledge ourſelves indebted to the papers of an ingenious gentleman publiſhed in the periodical works of the time. Thoſe who wiſh to ſee more upon the ſubject, may conſult the Univerſal Magazine for Auguſt 1796.

TRADITION, ſomething handed down from one generation to another without being written. Thus the Jews pretended, that beſides their written law contained in the Old Teſtament, Moſes had delivered an oral law which had been conveyed down from father to ſon; and thus the Roman Catholics are ſaid to value particular doctrines ſuppoſed to have deſcended from the apoſtolic times by tradition.

TRAGACANTH. See ASTRAGALUS, PHARMACY-*Index*.

TRAGEDY, a dramatic poem, repreſenting ſome ſignal action performed by illuſtrious perſons, and which has frequently a fatal iſſue or end. See POETRY, Part II. ſect. 1.

TRAGI-COMEDY, a dramatic piece, partaking both of the nature of tragedy and comedy; in which a mixture of merry and ſerious events is admitted.

TRAGOPOGON, GOAT'S BEARD, in botany: A genus of plants belonging to the claſs of *ſyngeneſia*, and to the order of *polygamia æqualis*; and in the natural ſyſtem ranging under the 49th order, *Compoſitæ*. The receptacle is naked, the calyx ſimple, and the pappus plumoſe. There are 14 ſpecies; of which two are Britiſh, the *pratenſe* and *porrifolium*.

1. The *pratenſe*, or yellow goat's beard, has its calyxes equal with the florets, and its leaves entire, long, narrow, ſeſſile, and graſſy. In fair weather this plant opens at ſunriſing, and ſhuts between nine and ten in the morning. The

Trajan | Tranſactions.

roots are conical and eſculent, and are ſometimes boiled and ſerved up at table like aſparagus. It grows on meadows. 2. The *porrifolium*, or purple goat's beard, has the calyx longer than the radius of the floret; the flowers are large, purple, ſingle, and terminal; and the leaves long, pointed, and bluiſh. The root is long, thick, and eſculent. It grows in meadows, and is cultivated in gardens under the name of *ſalſafy*.

TRAJAN (Marcus Ulpius), a celebrated Roman emperor, who gained many victories over the Parthians and Germans, puſhing the empire to its utmoſt extent on the eaſt and north ſides. He died at Silinunte, a city of Cilicia, which from him was called *Trajanopolis*, in the year 117.

Trajan's Column, a famous hiſtorical column erected in Rome, in honour of the emperor Trajan. It is of the Tuſcan order, though ſomewhat irregular: its height is eight diameters, and its pedeſtal Corinthian: it was built in a large ſquare called *Forum Romanum*. Its baſe conſiſts of 12 ſtones of an enormous ſize, and is raiſed on a ſocle, or foot, of eight ſteps: withinſide is a ſtaircaſe illuminated with 44 windows. It is 140 feet high, which is 35 feet ſhort of the Antonine column, but the workmanſhip of the former is much more valued. It is adorned from top to bottom with baſſo relievos, repreſenting the great actions of the emperor againſt the Dacians.

TRAIN, a line of gunpowder laid to give fire to a quantity thereof, in order to do execution by blowing up earth, works, buildings, &c.

Train of Artillery, includes the great guns and other pieces of ordnance belonging to an army in the field.

Train-Oil, the oil procured from the blubber of a whale by boiling.

TRALLIAN (Alexander), a Greek writer on phyſic, a native of Tralles in Lydia, who lived about the middle of the ſixth century. His works are divided into 12 books; in which he treats of diſtempers as they occur, from head to foot. He was the firſt who opened the jugular vein, and that uſed cantharides as a bliſter for the gout. Dr Freind, in his Hiſtory of Phyſic, ſtyles him one of the moſt valuable authors ſince the time of Hippocrates. Though he appears on the whole to have been a rational phyſician, yet there are things in his writings that ſavour of enthuſiaſm and ſuperſtition.

TRA-LOS-MONTES, a province of Portugal, called in Latin *Tranſmontana*, becauſe ſituated on the eaſt ſide of a chain of hills that ſeparate it from Entre Duero-e-Mintio. It is bounded on the north by Galicia; on the ſouth by the provinces of Beira and Leon; by the laſt of which it is bounded alſo to the eaſt. Its length from north to ſouth is upwards of 120 miles, and its breadth about 80. It is full of mountains, and produces little corn, but plenty of wine, fruits of ſeveral ſorts, and abundance of game.

TRANSACTIONS, a name generally given to a collection of the papers read before literary or philoſophical ſocieties. The name of *Philoſophical Tranſactions* was firſt adopted by the Royal Society of London. See an account of the Royal Society, Vol. XVII. p. 582.

The Philoſophical Tranſactions to the end of the year 1700 were abridged in three volumes by Mr John Lowthorp: thoſe from the year 1700 to 1720 were abridged in two volumes by Mr Henry Jones: thoſe from 1719 to 1733 were abridged in two volumes by Mr John Eames and Mr John Martyn; Mr Martyn continued the abridgement of thoſe from 1732 to 1744 in two volumes, and of thoſe from 1743 to 1750 in two volumes.

They were for many years publiſhed in numbers, and the printing of them was always, from time to time, the ſingle act of the reſpective ſecretaries, till the year 1752, when the ſociety thought fit that a committee ſhould be appointed to reconſider the papers read before them, and to ſelect out of them ſuch as they ſhould judge moſt proper for publication in the future Tranſactions. They are publiſhed annually in two parts at the expence of the ſociety, and each fellow is entitled to receive one copy *gratis* of every volume publiſhed after his admiſſion into the ſociety.

Tranſcendental || Tranſfuſion.

They were firſt ſet on foot in 1665, by Mr Oldenburg, ſecretary of the ſociety, and were continued by him till the year 1677. Upon his death, they were diſcontinued till January 1678, when Dr Grew reſumed the publication of them, and continued it for the months of December 1678, and January and February 1679, after which they were intermitted till January 1683. During this laſt interval they were ſupplied in ſome meaſure by Dr Hooke's Philoſophical Collections. They were alſo interrupted for three years, from December 1687 to January 1691, beſide other ſmaller interruptions amounting to near one year and a half more, before October 1695, ſince which time the Tranſactions have been regularly carried on.

TRANSCENDENTAL, or TRANSCENDENT, ſomething elevated, or raiſed above other things; which paſſes and tranſcends the nature of other inferior things.

TRANSCRIPT, a copy of any original writing, particularly that of an act or inſtrument inſerted in the body of another.

TRANSFER, in commerce, an act whereby a perſon ſurrenders his right, intereſt, or property, in any thing moveable or immoveable to another.

TRANSFORMATION, in general, denotes a change of form, or the aſſuming a new form different from a former one.

TRANSFUSION, the act of pouring a liquor out of one veſſel into another.

Tranſfuſion of Blood, an operation by which it was ſome time ago imagined that the age of animals would be renewed, and immortality, or the next thing to it conferred on thoſe who had undergone it.

The method of tranſfuſing Dr Lower gives us to the following effect: take up the carotid artery of the dog, or other animal, whoſe blood is to be tranſfuſed into another of the ſame, or a different kind; ſeparate it from the nerve of the eighth pair, and lay it bare above an inch. Make a ſtrong ligature on the upper part of the artery; and an inch nearer the heart another ligature with a running knot, to be looſened and faſtened as occaſion requires. Draw two threads between the two ligatures, open the artery, put in a quill, and tie up the artery again upon the quill by the two threads, and ſtop the quill by a ſtick.

Then make bare the jugular vein of the other animal for about an inch and half in length, and at each end make a ligature with a running knot; and in the ſpace between the two knots draw under the veins two threads, as in the other. Open the vein, and put into it two quills, one into the deſcending part of the vein, to receive the blood from the other dog, and carry it to the heart; the other quill put into the other part of the jugular, towards the head, through which the ſecond animal's own blood is to run into diſhes. The quills thus tied faſt, ſtop them up with ſticks till there be occaſion to open them.

Things thus diſpoſed, faſten the dogs on their ſides towards one another, in ſuch manner as that the quills may go into each other; then unſtop the quill that goes down into the ſecond dog's jugular vein, as alſo that coming out of the other dog's artery; and by the help of two or three other

Transfusion ‖ Transmarine.

other quills put into each other, as there ſhall be occaſion, inſert them into one another. Then ſlip the running knots, and immediately the blood runs through the quills as through an artery, very impetuouſly. As the blood runs into the dog, unſtop the quill in the upper part of his jugular, for his own blood to run out at, though not conſtantly, but as you perceive him able to bear it, till the other dog begins to cry and faint, and at laſt die. *Laſtly*, take both quills out of the jugular, tie the running knot faſt, and cut the vein aſunder, and ſew up the ſkin: the dog, thus diſmiſſed, will run away as if nothing ailed him.

In the Philoſophical Tranſactions we have accounts of the ſucceſs of various transfuſions practiſed at London, Paris, in Italy, &c. Sir Edmund King transfuſed forty-nine ounces of blood out of a calf into a ſheep; the ſheep, after the operation, appearing as well and as ſtrong as before.

M. Denis transfuſed the blood of three calves into three dogs, which all continued briſk, and eat as well as before. The ſame perſon transfuſed the blood of four wethers into a horſe twenty-ſix years old, which thence received much ſtrength, and a more than ordinary appetite.

Soon after this operation was introduced at Paris, *viz.* in 1667 and 1668, M. Denis performed it on five human ſubjects, two of whom recovered of diſorders under which they laboured, one being in perfect health ſuffered no inconvenience from it; and two perſons who were ill, and ſubmitted to the operation, died: in conſequence of which the magiſtrates iſſued a ſentence, prohibiting the transfuſion on human bodies under pain of impriſonment.

Mr John Hunter, we are told, made many ingenious experiments to determine the effects of transfuſing blood, ſome of which are ſufficient to attract attention. But whether ſuch experiments can ever be made with ſafety on the human body, is a point not eaſily determined. They might be allowed in deſperate caſes proceeding from a corruption of the blood, from poiſon, &c. as in hydrophobia.

TRANSIT, from *tranſit*, "it paſſes over," ſignifies the paſſage of any planet over the ſun, moon, or ſtars.

TRANSITION, the paſſage of any thing from one place to another.

Transition, in oratory. See Oratory, n° 39.

TRANSITIVE, in grammar, an epithet applied to ſuch verbs as ſignify an action which paſſes from the ſubject that does it, to or upon another ſubject which receives it. Under the head of verbs tranſitive come what we uſually call *verbs active* and *paſſive*; other verbs, whoſe action does not paſs out of themſelves, are called *neuters*.

TRANSLATION, the act of transferring or removing a thing from one place to another; as we ſay, the tranſlation of a biſhop's ſee, a council, a ſeat of juſtice, &c.

Translation is alſo uſed for the verſion of a book or writing out of one language into another.

The principles of tranſlation have been clearly and accurately laid down by Dr Campbell of Aberdeen in his invaluable Preliminary Diſſertations to his excellent tranſlations of the goſpels. The fundamental rules which he eſtabliſhes are three: 1. That the tranſlation ſhould give a complete tranſcript of the ideas of the original. 2. That the ſtyle and manner of the original ſhould be preſerved in the tranſlation. 3. That the tranſlation ſhould have all the eaſe of original compoſition. The rules deducible from theſe general laws are explained and illuſtrated with much judgment and taſte, in a late Eſſay on the principles of Tranſlation, by Mr Tytler, judge-advocate of Scotland.

TRANSMARINE, ſomething that comes from or belongs to the parts beyond ſea.

TRANSMIGRATION, the removal or tranſlation of a whole people into another country, by the power of a conqueror. Transmigration ‖ Tranſpoſition.

Transmigration is particularly uſed for the paſſage of the ſoul out of one body into another. See Metempsychosis.

TRANSMUTATION, the act of changing one ſubſtance into another.

Nature, ſays Sir Iſaac Newton, is delighted with tranſmutation: water, which is a fluid, volatile, taſteleſs, ſalt, is, by heat, tranſmuted into vapour, which is a kind of air; and by cold into ice, which is a cold, tranſparent, brittle ſtone, eaſily diſſolvable; and this ſtone is convertible again into water by heat, as vapour is by cold.—Earth, by heat, becomes fire, and, by cold, is turned into earth again: denſe bodies, by fermentation, are rarefied into various kinds of air; and that air, by fermentation alſo, and ſometimes without it, reverts into groſs bodies. All bodies, beaſts, fiſhes, inſects, plants, &c. with all their various parts, grow and increaſe out of water and aqueous and ſaline tinctures? and, by putrefaction, all of them revert into water, or an aqueous liquor again.

Transmutation, in alchemy, denotes the act of changing imperfect metals into gold or ſilver. This is alſo called the *grand operation*; and, they ſay, it is to be effected with the philoſopher's ſtone.

The trick of tranſmuting cinnabar into ſilver is thus: the cinnabar, being bruiſed groſsly, is ſtratified in a crucible with granulated ſilver, and the crucible placed in a great fire; and, after due time for calcination, taken off; then the matter, being poured out, is found to be cinnabar turned into real ſilver, though the ſilver grains appear in the ſame number and form as when they were put into the crucible; but the miſchief is, coming to handle the grains of ſilver, you find them nothing but light friable bladders, which will crumble to pieces between the fingers.

The tranſmutability of water into earth ſeems to have been believed by Mr Boyle; and Biſhop Watſon thinks that it has not yet been diſproved. See his *Chemical Eſſays*.

Transmutation of Acids. See Chemistry-*Index*.

Transmutation of Metals. See Chemistry-*Index*.

TRANSOM, among builders, denotes the piece that is framed acroſs a double-light window.

TRANSOMS, in a ſhip, certain beams or timbers extended acroſs the ſternpoſt of a ſhip, to fortify her afterpart, and give it the figure moſt ſuitable to the ſervice for which ſhe is calculated.

TRANSPARENCY, in phyſics, a quality in certain bodies, whereby they give paſſage to the rays of light; in contradiſtinction to opacity, or that quality of bodies which renders them impervious to the rays of light.

It has been generally ſuppoſed by philoſophers, that tranſparent bodies have their pores diſpoſed in ſtraight lines, by which means the rays of light have an opportunity of penetrating them in all directions; but ſome experiments in electricity have made it apparent, that by the action of this fluid the moſt opaque bodies, ſuch a ſulphur, pitch, and ſealing-wax, may be rendered tranſparent as glaſs, while yet we cannot ſuppoſe the direction of their pores to be anyway altered from what it originally was (ſee Electricity, n° 4.) A curious inſtance of an increaſe of tranſparency we have in rubbing a piece of white paper over one that has been written upon or printed: while the white paper is at reſt, the writing or print will perhaps ſcarce appear through it; but when in motion, will be very, eaſily legible, and continue ſo till the motion is diſcontinued.

TRANSPOSITION, in grammar, a diſturbing or diſlocating

Tranſubſtantiation. ‖ Trapp.

cating the words of a diſcourſe, or a changing their natural order of conſtruction, to pleaſe the ear by rendering the contexture more ſmooth, eaſy and harmonious.

TRANSUBSTANTIATION, in theology, the converſion or change of the ſubſtance of the bread and wine in the euchariſt, into the body and blood of Jeſus Chriſt; which the Romiſh church ſuppoſe to be wrought by the conſecration of the prieſt. See *Supper of the Lord*, n° 5.

TRANSVERSALIS, in anatomy, a name given to ſeveral muſcles. See Anatomy, Part II.

TRANSVERSE, ſomething that goes acroſs another from corner to corner: thus bends and bars in heraldry are tranſverſe pieces or bearings; the diagonals of a parallelogram or a ſquare are tranſverſe lines.

TRANSYLVANIA, a province of Europe, annexed to Hungary, and bounded on the north by Upper Hungary and Poland, on the eaſt by Moldavia and Walachia, on the ſouth by Walachia, and on the weſt by Upper and Lower Hungary. It is ſurrounded on all parts by high mountains, which, however, are not barren. The inhabitants have as much corn and wine as they want themſelves; and there are rich mines of gold, ſilver, lead, copper, quickſilver, and alum. It has undergone various revolutions; but it now belongs to the houſe of Auſtria. The inhabitants are of ſeveral ſorts of religions; as Papiſts, Lutherans, Calviniſts, Socinians, Photinians, Arians, Greeks, and Mahometans. It is about 162 miles in length, and 150 in breadth. The adminiſtration of affairs is conducted by 12 perſons; namely, three Roman Catholics, three Lutherans, three Calviniſts, and three Socinians. The militia is commanded by the governor, whoſe commiſſion is the more important, as Tranſylvania is the bulwark of Chriſtendom. It is divided into ſeveral ſmall diſtricts, called *palatinates* and *counties*; and is inhabited by three different nations, Saxons, Sicilians, and Hungarians. Hermanſtadt is the capital town.

TRAPEZIUM, in geometry, a plane figure contained under four unequal right lines.

TRAPEZIUS, a muſcle. See Anatomy, Part II.

TRAPP (Dr Joſeph), an Engliſh divine of excellent parts and learning, was born at Cherington in Glouceſterſhire, of which place his father was rector in 1579. He was the firſt perſon choſen to the profeſſorſhip of poetry founded at Oxford by Dr Birkhead; and publiſhed his lectures under the title of *Prælectiones Poeticæ*, in which he laid down excellent rules for every ſpecies of poetry in very elegant Latin. He ſhowed afterwards, however, by his tranſlation of Virgil, that a man may be able to direct who cannot execute, and may have the critic's judgment without the poet's fire. In the early part of his life Dr Trapp is ſaid to have been chaplain to the father of the famous Lord Bolingbroke: he obtained the living of Chriſt-church in Newgate Street, and St Leonard's, Foſter-lane, London; and his very high-church principles probably obſtructed his farther preferment. He publiſhed ſeveral occaſional poems, a tragedy called *Abramule*, tranſlated Milton's Paradiſe Loſt into Latin verſe, and died in 1747.

Trapp, in mineralogy, a ſpecies of ſiliceous earth. It is deſcribed by Dr Kirwan as nearly the ſame with baſaltes: a dark grey or black ſtone, generally inveſted with a ferruginous cruſt, and cryſtallized in opake, triangular, or polyangular columns, is called *baſaltes*; that which is amorphous, or breaks in large, thick, ſquare pieces, is called *trapp*. Their conſtituent principles, and relation to acids and fluxes, are exactly the ſame. The texture of this ſtone is either coarſe, rough, and diſtinct, or fine and indiſcernible. It is often reddiſh; it is always opake, and moulders by expoſure to the air; ſome ſpecimens give fire with ſteel very difficultly, though it is always very compact; ſometimes it is ſprinkled over with a few minute ſhining particles; its ſpecific gravity is 3000. Travellers ‖ Treaſon.

When heated red-hot, and quenched in water, it becomes by degrees of a reddiſh brown colour: it melts *per ſe* in a ſtrong heat into a compact ſlag. Borax alſo diſſolves it in fuſion, but mineral alkali not entirely.

According to Mr Bergman, 100 parts of the baſaltes contain 52 of ſiliceous earth, 15 of argil, 8 of calcareous, 2 of magneſia, and 25 of iron; and with this Mr Meyer very nearly agrees.

For a more complete account of this ſpecies of ſtone, ſee M. Faujas de St Fond on the *Nat. Hiſt. of Trapp*.

TRAVELLERS JOY. See Clematis.

TRAVERSE, or TRANSVERSE, in general, denotes ſomething that goes athwart another; that is, croſſes and cuts it obliquely.

Traverse, in navigation, implies a compound courſe, or an aſſemblage of various courſes, lying at different angles with the meridian. See Navigation, p. 688.

Traverse Board, a thin circular piece of board, marked with all the points of the compaſs, and having eight holes bored in each, and eight ſmall pegs hanging from the centre of the board. It is uſed to determine the different courſes run by a ſhip during the period of the watch, and to aſcertain the diſtance of each courſe.

TRAVESTY, a name given to an humorous tranſlation of any author. The word is derived from the French *traveſter* "to diſguiſe."

TRAUMATIC BALSAM. See Pharmacy, n° 428.

TREACLE. See Theriaca.—Some alſo give the name *treacle* to molaſſes. See Pharmacy, n° 605.

Treacle Beer. See Spruce.

Treacle Muſtard. See Clypeola.

TREASON, a general appellation made uſe of by the law, to denote not only offences againſt the king and government, but alſo that accumulation of guilt which ariſes whenever a ſuperior repoſes a confidence in a ſubject or inferior, between whom and himſelf there ſubſiſts a natural, a civil, or even a ſpiritual relation; and the inferior ſo abuſes that confidence, ſo forgets the obligations of duty, ſubjection, and allegiance, as to deſtroy the life of any ſuch ſuperior or lord. Hence treaſon is of two kinds, *high* and *petty*.

High Treaſon, or *Treaſon Paramount* (which is equivalent to the *crimen læſæ majeſtatis* of the Romans, as Glanvil denominates it alſo in the Engliſh law), is an offence committed againſt the ſecurity of the king or kingdom, whether by imagination, word, or deed. In order to prevent the inconveniences which aroſe in England from a multitude of conſtructive treaſons, the ſtatute 25 Edw. III. c. 2. was made; which defines what offences only for the future ſhould be held to be treaſon; and this ſtatute comprehends all kinds of high-treaſon under ſeven diſtinct branches.

"1. When a man doth compaſs or imagine the death of our lord the king, of our lady his queen, or of their eldeſt ſon and heir." Under this deſcription it is held that a queen-regnant (ſuch as Queen Elizabeth and Queen Anne) is within the words of the act, being inveſted with royal power, and intitled to the allegiance of her ſubject: but the huſband of ſuch a queen is not compriſed within theſe words; and therefore no treaſon can be committed againſt him.

Let us next ſee what is a *compaſſing* or *imagining* the death of the king, &c. Theſe are ſynonymous terms: the word *compaſs* ſignifying the purpoſe or deſign of the mind or will; and not, as in common ſpeech, the carrying ſuch deſign to effect. And therefore an accidental ſtroke, which may

Treaſon. may mortally wound the ſovereign, *per infortuniam*, without any traitorous intent, is no treaſon: as was the caſe of Sir Walter Tyrrel, who, by the command of King William Rufus, ſhooting at a hart, the arrow glanced againſt a tree, and killed the king upon the ſpot. But as this compaſſing or imagination is an act of the mind, it cannot poſſibly fall under any judicial cognizance, unleſs it be demonſtrated by ſome open or overt act. The ſtatute expreſsly requires, that the accuſed "be thereof upon ſufficient proof attainted of ſome open act by men of his own condition." Thus, to provide weapons or ammunition for the purpoſe of killing the king, is held to be a palpable overt act of treaſon in imagining his death. To conſpire to impriſon the king by force, and move towards it by aſſembling company, is an overt act of compaſſing the king's death; for all force, uſed to the perſon of the king, in its conſequences may tend to his death, and is a ſtrong preſumption of ſomething worſe intended than the preſent force, by ſuch as have ſo far thrown off their bounden duty to their ſovereign: it being an old obſervation, that there is generally but a ſhort interval between the priſons and the graves of princes. It ſeems clearly to be agreed, that by the common law and the ſtatute of Edw. III. words ſpoken amount only to a high miſdemeanor, and no treaſon. For they may be ſpoken in heat, without any intention; or be miſtaken, perverted, or miſremembered by the hearers; their meaning depends always on their connection with other words and things; they may ſignify differently even according to the tone of voice with which they are delivered; and ſometimes ſilence itſelf is more expreſſive than any diſcourſe. As therefore there can be nothing more equivocal and ambiguous than words, it would indeed be unreaſonable to make them amount to high treaſon. And accordingly, in 4 Car. I. on a reference to all the judges, concerning ſome very atrocious words ſpoken by one Pyne, they certified to the king, "that though the words were as wicked as might be, yet they were no treaſon; for unleſs it be by ſome particular ſtatute, no words will be treaſon." If the words be ſet down in writing, it argues more deliberate intention; and it has been held, that writing is an overt act of treaſon; for *ſcribere eſt agere*. But even in this caſe the bare words are not the treaſon, but the deliberate act of writing them.

2. The ſecond ſpecies of treaſon is, "if a man do violate the king's companion, or the king's eldeſt daughter unmarried, or the wife of the king's eldeſt ſon and heir." By the king's companion is meant his wife; and by violation is underſtood carnal knowledge, as well without force as with it: and this is high treaſon in both parties if both be conſenting; as ſome of the wives of Henry VIII. by fatal experience evinced.

3. The third ſpecies of treaſon is, "if a man do levy war againſt our lord the king in his realm." And this may be done by taking arms, not only to dethrone the king, but under pretence to reform religion, or the laws, or to remove evil counſellors, or other grievances whether real or pretended. For the law does not, neither can it, permit any private man, or ſet of men, to interfere forcibly in matters of ſuch high importance; eſpecially as it has eſtabliſhed a ſufficient power for theſe purpoſes in the high court of parliament: neither does the conſtitution juſtify any private or particular reſiſtance for private or particular grievances; though, in caſes of national oppreſſion, the nation has very juſtifiably riſen as one man, to vindicate the original contract ſubſiſting between the king and his people.

4. "If a man be adherent to the king's enemies in his realm, giving to them aid and comfort in the realm or elſewhere," he is alſo declared guilty of high-treaſon. This muſt likewiſe be proved by ſome overt act; as by giving them intelligence, by ſending them proviſions, by ſelling them arms, by treacherouſly ſurrendering a fortreſs, or the like. Treaſon.

5. "If a man counterfeit the king's great or privy ſeal," this is alſo high-treaſon. But if a man takes wax bearing the impreſſion of the great ſeal off from one patent and fixes it to another, this is held to be only an abuſe of the ſeal, and not a counterfeiting of it: as was the caſe of a certain chaplain, who in ſuch a manner framed a diſpenſation for non-reſidence. But the knaviſh artifice of a lawyer much exceeded this of the divine. One of the clerks in chancery glued together two pieces of parchment; on the uppermoſt of which he wrote a patent, to which he regularly obtained the great ſeal, the label going through both the ſkins. He then diſſolved the cement, and taking off the written patent, on the blank ſkin, wrote a freſh patent of a different import from the former, and publiſhed it as true. This was held no counterfeiting of the great ſeal, but only a great miſpriſion; and Sir Edward Coke mentions it with ſome indignation that the party was living at that day.

6. The ſixth ſpecies of treaſon under this ſtatute is, "if a man counterfeit the king's money; and if a man bring falſe money into the realm counterfeit to the money of England, knowing the money to be falſe, to merchandiſe and make payment withal." As to the firſt branch, counterfeiting the king's money; this is treaſon, whether the falſe money be uttered in payment or not. Alſo if the king's own minters alter the ſtandard or alloy eſtabliſhed by law, it is treaſon. But gold and ſilver money only are held to be within this ſtatute. With regard likewiſe to the ſecond branch, importing foreign counterfeit money in order to utter it here; it is held that uttering it, without importing it, is not within the ſtatute.

7. The laſt ſpecies of treaſon aſcertained by this ſtatute is, "if a man ſlay the chancellor, treaſurer, or the king's juſtices of the one bench or the other, juſtices in eyre, or juſtices of aſſize, and all other juſtices aſſigned to hear and determine, being in their places doing their offices." Theſe high magiſtrates, as they repreſent the king's majeſty during the execution of their offices, are therefore for the time equally regarded by the law. But this ſtatute extends only to the actual killing of them; and not to wounding, or a bare attempt to kill them. It extends alſo only to the officers therein ſpecified; and therefore the barons of the exchequer, as ſuch, are not within the protection of this act; but the lord keeper or commiſſioners of the great ſeal now ſeem to be within it, by virtue of the ſtatutes 5 Eliz. c. 18. and 1 W. and M. c. 21.

The new treaſons, created ſince the ſtatute 1 M. c. 1. and not comprehended under the deſcription of ſtatute 25 Edw. III. may be compriſed under three heads. The firſt ſpecies relates to Papiſts; the ſecond to falſifying the coin or other royal ſignatures, as falſely forging the ſign manual, privy ſignet, or privy ſeal, which ſhall be deemed high treaſon (1 M. ſtat. ii. c. 6.) The third new ſpecies of high treaſon is ſuch as was created for the ſecurity of the Proteſtant ſucceſſion in the houſe of Hanover. For this purpoſe, after the act of ſettlement was made, it was enacted by ſtatute 13 and 14 W. III. c. 3. that the pretended prince of Wales, aſſuming the title of King James III. ſhould be attainted of high treaſon; and it was made high-treaſon for any of the king's ſubjects to hold correſpondence with him or any perſon employed by him, or to remit money for his uſe. And by 17 Geo. II. c. 39. it is enacted, that if any of the ſons of the pretender ſhall land or attempt to land in this kingdom, or be found in the kingdom or any of its dominions, he ſhall be adjudged attainted of high-treaſon; and

cor-

Treaſon. correſponding with them or remitting money to their uſe is made high-treaſon. By 1 Ann. ſtat. 2. c. 17. the offence of hindering the next in ſucceſſion from ſucceeding to the crown is high-treaſon: and by 6 Ann. c. 7. if any perſon ſhall maliciouſly, adviſedly, and directly, by writing or printing, maintain, that any other perſon hath any right to the crown of this realm, otherwiſe than according to the act of ſettlement, or that the kings of this realm with the authority of parliament are not able to make laws to bind the crown and its deſcent; ſuch perſon ſhall be guilty of high-treaſon.

The puniſhment of high treaſon in general is very ſolemn and terrible. 1. That the offender be drawn to the gallows, and not be carried or walk; though uſually (by connivance, at length ripened by humanity into law) a ſledge or hurdle is allowed, to preſerve the offender from the extreme torment of being dragged on the ground or pavement. 2. That he be hanged by the neck, and then cut down alive. 3. That his entrails be taken out, and burned while he is yet alive. 4. That his head be cut off. 5. That his body be divided into four parts. 6. That his head and quarters be at the king's diſpoſal.

The king may, and often doth, diſcharge all the puniſhment except beheading, eſpecially where any of noble blood are attainted. For beheading being part of the judgment, that may be executed, though all the reſt be omitted by the king's command. But where beheading is no part of the judgment, as in murder or other felonies, it hath been ſaid that the king cannot change the judgment, although at the requeſt of the party, from one ſpecies of death to another.

In the caſe of coining, which is a treaſon of a different complexion from the reſt, the puniſhment is milder for male offenders; being only to be drawn and hanged by the neck till dead. But in treaſons of every kind the puniſhment of women is the ſame, and different from that of men. For as the natural modeſty of the ſex forbids the expoſing and publicly mangling their bodies, their ſentence (which is to the full as terrible to ſenſe as the other) is to be drawn to the gallows, and there to be burned alive.

For the conſequences of this judgment, ſee ATTAINDER, FORFEITURE, and *CORRUPTION of Blood*.

Petty or *Petit Treaſon* according to the ſtatute 25 Edward III. c. 2. may happen three ways: by a ſervant killing his maſter, a wife her huſband, or an eccleſiaſtical perſon (either ſecular or regular) his ſuperior, to whom he owes faith and obedience. A ſervant who kills his maſter whom he has left, upon a grudge conceived againſt him during his ſervice, is guilty of petty treaſon: for the traiterous intention was hatched while the relation ſubſiſted between them, and this is only an execution of that intention. So if a wife be divorced *a menſe et thoro*, ſtill the *vinculum matrimonii* ſubſiſts; and if ſhe kills ſuch divorced huſband, ſhe is a traitreſs. And a clergyman is underſtood to owe canonical obedience to the biſhop who ordained him, to him in whoſe dioceſe he is beneficed, and alſo to the metropolitan of ſuch ſuffragan or dioceſan biſhop; and therefore to kill any of theſe is petit treaſon. As to the reſt, whatever has been ſaid with reſpect to wilful MURDER, is alſo applicable to the crime of petit treaſon, which is no other than murder in its moſt odious degree; except that the trial ſhall be as in caſes of high treaſon, before the improvements therein made by the ſtatutes of William III. But a perſon indicted of petit treaſon may be acquitted thereof, and found guilty of manſlaughter or murder: and in ſuch caſe it ſhould ſeem that two witneſſes are not neceſſary, as in caſes of petit treaſon they are. Which crime is alſo diſtinguiſhed from murder in its puniſhment.

The puniſhment of petit treaſon in a man, is to be drawn and hanged, and in a women to be drawn and burned: the idea of which latter puniſhment ſeems to have been handed down to us from the laws of the ancient Druids, which condemned a woman to be burned for murdering her huſband; and it is now the uſual puniſhment for all ſorts of treaſons committed by thoſe of the female ſex. Perſons guilty of petit treaſon were firſt debarred the benefit of clergy by ſtatute 12 Henry VII. c. 7. which has ſince been extended to their aiders, abettors, and counſellors, by ſtatutes 23 Henry VIII. c. 1. and 4 & 5 P. and M. c. 4. Treaſure, ‖ Treaſury.

TREASURE, in general, denotes a ſtore or ſtock of money in reſerve.

TREASURE-Trove, in law, derived from the French word *trover*, "to find," called in Latin *theſaurus inventus*, is where any money or coin, gold, ſilver, plate, or bullion, is found hidden in the earth or other private place, the owner thereof being unknown; in which caſe the treaſure belongs to the king: but if he that hid it be known, or afterwards found out, the owner and not the king is intitled to it.

TREASURER, an officer to whom the treaſure of a prince or corporation is committed to be kept and duly diſpoſed of, in payment of officers and other expences. See TREASURY.

Of theſe there is a great variety. His majeſty of Great Britain, in quality of elector of Brunſwick, is arch-treaſurer of the Roman empire. In England, the principal officers under this denomination are, the lord high-treaſurer, the treaſurer of the houſehold, treaſurer of the navy, of the king's chamber, &c.

The lord high-treaſurer of Great Britain, or firſt commiſſioner of the treaſury, when in commiſſion, has under his charge and government all the king's revenue which is kept in the exchequer. He holds his place during the king's pleaſure; being inſtituted by the delivery of a white ſtaff to him. He has the check of all the officers employed in collecting the cuſtoms and royal revenues: and in his gift and diſpoſition are all the offices of the cuſtoms in the ſeveral ports of the kingdom; eſcheators in every county are nominated by him; he alſo makes leaſes of the lands belonging to the crown.

The office of lord-treaſurer is now in commiſſion. The number of lords commiſſioners is five; one of whom is the firſt lord, whoſe annual ſalary was formerly L. 383, but is now L. 4000; and who, unleſs he be a peer, is alſo chancellor of the exchequer, and prime miniſter in the government of this country; the other lords commiſſioners have an annual ſalary of L. 1600 each.

TREASURER of the Houſehold, is an officer, who, in the abſence of the lord-ſteward, has power, with the comptroller and other officers of the green-cloth and the ſteward of the Marſhalſea, to hear and determine treaſons, felonies, and other crimes committed within the king's palace. See HOUSEHOLD.

There is alſo a treaſurer belonging to the eſtabliſhment of her majeſty's houſehold, &c.

TREASURER of the Navy, is an officer who receives money out of the exchequer, by warrant from the lord high-treaſurer, or the lords commiſſioners executing that place: and pays all charges of the navy, by warrant from the principal officers of the navy.

TREASURER of the County, he that keeps the county ſtock. There are two of them in each county, choſen by the major part of the juſtices of the peace, &c. at their general quarter ſeſſion; under previous ſecurity given for the money entruſted with them, and the faithful execution of the truſts repoſed in them.

TREASURY, the place wherein the revenues of a prince are

Treatise ‖ Tree.

are received, preserved, and disbursed. In England the treasury is a part of the exchequer; by some called the *lower exchequer*. The officers of his majesty's treasury, or the lower exchequer, are the lords commissioners, one of whom is chancellor, two joint secretaries, private secretary to the first lord, two chamberlains, an auditor, four tellers, a clerk of the pells, ushers of the receipt, a tally-cutter, &c. See each officer under his proper article, CHANCELLOR, TELLER, TALLY, &c.

Lords of the TREASURY. In lieu of one single director and administrator of his majesty's revenues under the title of *lord high treasurer*, it is at present thought proper to put that office in commission, *i. e.* to appoint several persons to discharge it with equal authority, under the title of *lords commissioners of the treasury*.

TREATISE, a set discourse in writing on any subject.

TREATY, a covenant between two or more nations; or the several articles or conditions stipulated and agreed upon between sovereign powers.

TREBLE, in music, the highest or most acute of the four parts in symphony, or that which is heard the clearest and shrillest in a concert.

TREBUCHET, TREBUCKET, *Tribuch (Terbichetum)*, a tumbrel or cucking stool. Also a great engine to cast stones to batter walls.

TREE, a large vegetable rising with one woody stem to a considerable height.

Trees may be divided into two classes, *timber* and *fruit-trees*: the first including all those trees which are used in machinery, ship building, &c. or, in general, for purposes of utility; and the second comprehending those trees valued only, or chiefly, for their fruit. It is not necessary to form a third class to include trees used for fuel, as timber is used for this purpose where it is abundant; and where it is not abundant the branches of the timber trees, or such of them as are dwarfish, unhealthy, or too small for mechanical purposes, are used as fuel.

The anatomy and physiology of trees have already been given under the generic name PLANT and SAP. For an account of their natural history, see NATURAL HISTORY, sect. iii.

Certain trees, it is well known, are natives of particular districts; but many of them have been transplanted from their native soil, and now flourish luxuriantly in distant countries, so that it becomes a matter of very considerable difficulty to ascertain their original soil. The following rules are given for this purpose by the Honourable Daines Barrington.

1. They must grow in large masses, and cover considerable tracts of ground, the woods not ending abruptly by a change to other trees, except the situation and strata become totally different. 2. They must grow kindly in copses, and shoot from the stool, so as to continue for ever, if not very carefully grubbed up. 3. The seed must ripen kindly; nature never plants, but where a succession in the greatest profusion will continue. Lastly, trees that give names to many places are probably indigenous.

The growth of trees is a curious and interesting subject; yet few experiments have been made to determine what the additions are which a tree receives annually in different periods of its age. The only observations which we have seen on this subject worth repeating were made by the ingenious Mr Barker, to whom the Philosophical Transactions are much indebted for papers containing an accurate register of the weather, which he has kept for many years. He has drawn up a table to point out the growth of three kinds of trees, oaks, ashes, and elms; which may be seen in the Philosophical Transactions for 1788. We shall give his conclusions. Tree.

"I find (says he) the growth of oak and ash to be nearly the same. I have some of both sorts planted at the same time, and in the same hedges, of which the oaks are the largest; but there is no certain rule as to that. The common growth of an oak or an ash is about an inch in girth in a year; some thriving ones will grow an inch and a half; the unthriving ones not so much. Great trees grow more timber in a year than small ones; for if the annual growth be an inch, a coat of one-sixth of an inch is laid on all round, and the timber added to the body every year is its length multiplied into the thickness of the coat and into the girth, and therefore the thicker the tree is, the more timber is added."

We will present our readers with a table, showing the growth of 17 kinds of trees for two years. The trees grew at Cavenham in Suffolk.

No.		July 1785. F. In.	July 1786. F. In.		July 1787. F. In.	
1	Oak	0 10½	0 11½	—	1 0½

17	Lime	1 8½	1 10¾	—	2 0	

See HUSBANDRY, n° 165, where the growth of 11 kinds of trees in 21 years is given.

Trees sometimes attain a very great size: this must depend in a great measure on the richness of soil, but no less on the degree of heat. Indeed heat is so essential to the growth of trees, that as we go from the place within the polar circles where vegetation begins, and advance to the equator, we find the trees increase in size. Greenland, Iceland, and other places in the same latitude yield no trees at all; and the shrubs which they produce are dwarfish; whereas in warm climates, they often grow to an immense size. Mr Marsham saw spruce and silver-firs in the dock-yard in Venice above 40 yards long, and one of 39 yards was 18 inches diameter at the small end. He was informed that they came from Switzerland.

The largest tree in Europe, mentioned by travellers, is the chesnut tree on mount Etna, already described under the article, ETNA, n° 18. It is a certain fact that trees acquire a very great size in volcanic countries. Beside the multitude of fine groves in the neighbourhood of Albano in Italy, there are many detached oaks 20 feet in circumference, and many elms of the same size, especially in the romantic way to Eastello, called the *Galleria*. In travelling by the side of the lake of Bolsena, the road leads us through an immense number of oaks, spread upon beautiful hills. Where the lava has been sufficiently softened, they are clean and straight, and of a considerable size; but where the lava has not been converted into a soil proper for strong vegetation, they are round-headed, and of less bigness; however, taken all together, they make a magnificent appearance;

Tree. ance; and the ſpot itſelf ought to be ranked among the fine parts of Italy. The ſame may be obſerved of the ſmall lake of Vico, encompaſſed with gentle riſings, that are all clothed with foreſt-trees.

Some yews have been found in Britain 60 feet round. Palms in Jamaica attain the height of 200 feet; and ſome of the pines in Norfolk Iſland are 280 feet high.

Of all the different kinds known in Europe, oak is beſt for building; and even when it lies expoſed to air and water, there is none equal to it. Fir-timber is the next in degree of goodneſs for building, eſpecially in England, where they build upon leaſes. It differs from oak in this, that it requires not much ſeaſoning, and therefore no great ſtock is required before hand. Fir is uſed for flooring, wainſcotting, and the ornamental parts of building within doors. Elm is the next in uſe, eſpecially in England and France: it is very tough and pliable, and therefore eaſily worked: it does not readily ſplit; and it bears driving of bolts and nails better than any other wood; for which reaſon it is chiefly uſed by wheel-wrights and coach-makers, for ſhafts, naves, &c. Beech is alſo uſed for many purpoſes: it is very tough and white when young, and of great ſtrength; but liable to warp very much when expoſed to the weather, and to be worm-eaten when uſed within doors; its greateſt uſe is for planks, bedſteads, chairs, and other houſehold goods. Aſh is likewiſe a very uſeful wood, but very ſcarce in moſt parts of Europe; it ſerves in buildings, and for any other uſe, when ſcreened from the weather; handſpikes and oars are chiefly made of it. Wild cheſnut timber is by many eſteemed to be as good as oak, and ſeems to have been much uſed in old buildings; but whether theſe trees are more ſcarce at preſent than formerly, or have been found not to anſwer ſo well as was imagined, it is certain that this timber is now but little uſed. Walnut tree is excellent for the joiner's uſe, it being of a more curious brown colour than beech, and not ſo ſubject to the worms. The poplar, abele, and aſpen trees, which are very little different from each other, are much uſed inſtead of fir; they look well, and are tougher and harder. See Quercus, Oak, Pinus, Ulmus, Platanus, Populus, &c.

The goodneſs of timber not only depends on the ſoil and ſituation in which it ſtands, but likewiſe on the ſeaſon wherein it is felled. In this people diſagree very much; ſome are for having it felled as ſoon as its fruit is ripe, others in the ſpring, and many in the autumn. But as the ſap and moiſture of the timber is certainly the cauſe that it periſhes much ſooner than it otherwiſe would do, it ſeems evident, that timber ſhould be felled when there is the leaſt ſap in it, *viz.* from the time that the leaves begin to fall till the trees begin to bud. This work uſually commences about the end of April in England, becauſe the bark then riſes moſt freely; for where a quantity of timber is to be felled, the ſtatute requires it to be done then, for the advantage of tanning. The ancients chiefly regarded the age of the moon in felling their timber; their rule was to fell it in the wane, or four days after the new moon, or ſometimes in the laſt quarter. Pliny adviſes it to be in the very inſtant of the change; which happening to be in the laſt day of the winter ſolſtice, the timber, ſays he, will be incorruptible

Timber ſhould likewiſe be cut when of a proper age; for when it is either too young or too old, it will not be ſo durable as when cut at a proper age. It is ſaid that oak ſhould not be cut under 60 years old, nor above 200. Timber, however, ſhould be cut in its prime, when almoſt fully grown, and before it begins to decay; and this will be ſooner or later, according to the dryneſs and moiſtneſs of the ſoil where the timber grows, as alſo according to the bigneſs of the trees; for there are no fixed rules in felling of timber, experience and judgment muſt direct here as in moſt other caſes. Tree.

Great attention is neceſſary in the ſeaſoning of timber. Some adviſe the planks of timber to be laid for a few days in ſome pool or running ſtream, in order to extract the ſap, and afterwards to dry them in the ſun or air. By this means, it is ſaid, they will be prevented from either chopping, caſting, or cleaving; but againſt ſhrinking there is no remedy. Some again are for burying them in the earth, others in a heat; and ſome for ſcorching and ſeaſoning them in fire, eſpecially piles, poſts, &c. which are to ſtand in water or earth. The Venetians firſt found out the method of ſeaſoning by fire; which is done after this manner: They put the piece to be ſeaſoned into a ſtrong and violent flame; in this they continually turn it round by means of an engine, and take it out when it is every where covered with a black coaly cruſt; the internal part of the wood is thereby ſo hardened, that neither earth nor water can damage it for a long time afterwards.

Dr Plott ſays, it is found by long experience, that the trunk or body of the trees, when barked in the ſpring, and left ſtanding naked all the ſummer expoſed to the ſun and wind, are ſo dried and hardened, that the ſappy part in a manner becomes as firm and durable as the heart itſelf. This is confirmed by M. Buffon, who, in 1738, preſented to the royal academy of ſciences at Paris, a memoir, intitled, "An eaſy method of increaſing the ſolidity, ſtrength, and duration of timber;" for which purpoſe he obſerves, "nothing more is neceſſary than to ſtrip the tree entirely of its bark, during the ſeaſon of the riſing of the ſap, and to leave it to dry completely before it be cut down."

By many experiments, particularly deſcribed in that eſſay, it appears, that the tree ſhould not be felled till the third year after it has been ſtripped of the bark; that it is then perfectly dry, and the ſap become almoſt as ſtrong as the reſt of the timber, and ſtronger than the heart of any other oak tree which has not been ſo ſtripped; and the whole of the timber ſtronger, heavier, and harder; from which he thinks it fair to conclude, that it is alſo more durable. "It would no longer (he adds) be neceſſary, if this method were practiſed, to cut off the ſap; the whole of the tree might be uſed as timber; one of 40 years growth would ſerve all the purpoſes for which one of 60 years is now required; and this practice would have the double advantage of increaſing the quantity, as well as the ſtrength and ſolidity, of the timber."

The navy board, in anſwer to the inquiries of the commiſſioners of the land revenue, in May 1789, informed them, that they had then ſtanding ſome trees ſtripped of their bark two years before, in order to try the experiment of building one half of a ſloop of war with that timber, and the other half with timber felled and ſtripped in the common way. This very judicious mode of making the experiment, if it be properly executed, will undoubtedly go far to aſcertain the effects of this practice. We are ſorry that we are not able to inform our readers what was the reſult of the experiment.

After the planks of timber have been well ſeaſoned and fixed in their places, care is to be taken to defend or preſerve them; to which the ſmearing them with linſeed oil, tar, or the like oleaginous matter, contributes much. The ancients, particularly Heſiod and Virgil, adviſe the ſmoke-drying of all inſtruments made of wood, by hanging them up in the chimneys where wood fires are uſed. The Dutch preſerve their gates, portcullices, drawbridges, ſluices, &c. by coating them over with a mixture of pitch and tar, whereon they ſtrew ſmall pieces of cockle and other ſhells, beaten

Tree. beaten almoſt to powder, and mixed with ſea-ſand, which incruſts and arms them wonderfully againſt all aſſaults of wind and weather. When timber is felled before the ſap is perfectly at reſt, it is very ſubject to worms; but to prevent and cure this, Mr Evelyn recommends the following remedy as the moſt approved: Put common ſulphur into a cucurbit, with as much aquafortis as will cover it three fingers deep; diſtil it to dryneſs, which is performed by two or three rectifications. Lay the ſulphur that remains at bottom, being of a blackiſh or ſand-red colour, on a marble, or put it in a glaſs, and it will diſſolve into an oil; with this oil anoint the timber which is infected with worms. This, he ſays, will not only prevent worms, but preſerve all kinds of woods, and many other things, as ropes, nets, and maſts, from putreſaction, either in water, air, or ſnow.

An experiment to determine the comparative durability of different kinds of timber, when expoſed to the weather, was made by a nobleman in Norfolk; of which an account is given by Sir Thomas Beevor. This nobleman, in the year 1774, ordered three poſts, forming two ſides of a quadrangle, to be fixed in the earth on a riſing ground in his park. Into theſe poſts were mortiſed planks, an inch and an half thick, cut out of trees from 30 to 45 years growth. Theſe, after ſtanding 10 years, were examined, and found in the following ſtate and condition:

Annals of Agriculture, vol. vi. p. 256.

The cedar was perfectly ſound; larch, the heart ſound, but the ſap quite decayed; ſpruce fir, ſound; ſilver fir, in decay; Scotch fir, much decayed; pinaſter, quite rotten; cheſnut, perfectly ſound; abele, ſound; beech, ſound; walnut, in decay; ſycamore, much decayed; birch, quite rotten. Sir Thomas Beevor juſtly remarks, that the trees ought to have been of the ſame age; and Mr Arthur Young adds, they ought to have been cut out of the ſame plantation.

The immenſe quantity of timber conſumed of late years in ſhip-building and other purpoſes has diminiſhed in a very great degree the quantity produced in this country. On this account, many gentlemen who wiſh well to their country, alarmed with the fear of a ſcarcity, have ſtrongly recommended it to government to pay ſome attention to the cultivation and preſervation of timber.

We find, on the beſt authority, that of Mr Irving inſpector general of imports and exports, that the ſhipping of England in 1760 amounted to 6,107 in number, the tonnage being 433,922; and the ſhipping in Scotland amounted to 976 in number, the tonnage being 52,818. In 1788 the whole ſhipping of Britain and Ireland and their colonies amounted to 13,800, being 1,359,752 tons burden, and employing 107,925 men. The tonnage of the royal navy in the ſame year was 413,667. We are informed alſo, on what we conſider as the beſt authority (the report of the commiſſioners of the land revenue), that the quantity of oak timber, of Engliſh growth, delivered into the dockyards from 1760 to 1788 was no leſs than 768,676 loads, and that the quantity uſed in the merchants yards in the ſame time was 516,630 loads; in all 1,285,306 loads. The foreign oak uſed in the ſame period was only 137,766 loads. So that, after deducting the quantity remaining in the dockyards in 1760 and 1788, and the foreign oak, there will remain about 1,054,284 loads of Engliſh oak, conſumed in 28 years, which is at an average 37,653 loads *per annum*, beſides from 8,300 to 10,000 loads expended annually by the Eaſt India company within the ſame period (A).

Eleventh Report.

Tree.

The price of wood has riſen in proportion to the demand and to its diminution. At the conqueſt, woods were valued, not by the quantity of timber which they contained, but the number of ſwine which the acorns could ſupport. In 1608, oak in the foreſts was ſold at 10s. *per* load, and fire-wood for 2 s. *per* load. In 1663 or 1665, in navy contracts from L.2 to 2l. 15s. 6d. *per* load was given. In 1756 it roſe to 4l. 5s. *per* load, and 3s. in addition, becauſe no tops are received. Plank four inch ſold in 1769 for L.7 a load, three inch L.6; which prices were the ſame in 1792.

So great an expenditure of valuable timber within ſo ſhort a period, gives reaſon to fear that the foreſts of this country will ſoon be entirely diſmantled, unleſs ſomething is done to raiſe freſh ſupplies. The building of a 70 gun ſhip, it is ſaid, would take 40 acres of timber. This calculation is indeed ſo exceſſive, that it is ſcarcely credible. This, however, is no exaggeration. According to the prevailing opinion of experienced ſurveyors, it will require a good ſoil and good management to produce 40 trees on an acre, which, in a hundred years, may, at an average, be computed at two loads each. Reckoning, therefore, two loads at 8l. 16s. one acre will be worth L.350, and conſequently 40 acres will only be worth L.14,200. Now a 70 gun ſhip is generally ſuppoſed to coſt L.70,000; and as ſhips do not laſt a great many years, the navy continually requires new ſhips, ſo that the foreſts muſt be ſtripped in a century or two, unleſs young trees are planted to ſupply their place.

Many plans have been propoſed for recruiting the foreſts. Premiums have been held forth to individuals; and it has been propoſed that the crown-lands ſhould be ſet apart for the ſpecial purpoſe of raiſing timber. With reſpect to individuals, as they muſt generally be diſpoſed to ſow or plant their lands with thoſe vegetables which will beſt reward their labours, it is not to be expected that they will ſet apart their fields for planting trees unleſs they have a greater return from them than other crops. But bad muſt that land be which will not yield much more than L.350 produce in 100 years. But though it be evident that good land will produce crops much more lucrative to the proprietor than timber, yet ſtill there are lands or pieces of land which might be applied with very great advantage to the production of wood. Uneven ground, or the ſides of fields where corn cannot be cultivated, might very properly be ſet apart for this purpoſe; barren lands, or ſuch as cannot be cultivated without great labour and expence, might alſo be planted. Hedge-rows and clumps of trees, and little woods ſcattered up and down, would ſhelter and defend the fields from deſtructive winds, would beautify the face of the country, render the climate warmer, improve barren lands, and furniſh wood for the arts and manufactures.

But to cultivate foreſt timber has alſo been thought of ſuch national importance, that it has been deemed worthy of the attention of government. It has been propoſed to appropriate ſuch part of the crown-lands as are fit for the purpoſe ſolely for producing timber for the navy. This appears a very proper ſcheme in ſpeculation; but it has been objected, that for government to attempt the farming of foreſts would be really to eſtabliſh groups of officers to pocket ſalaries for doing what, it is well known, will never

(A) A writer in the Bath Tranſactions ſays, that the aggregate of oaks felled in England and Wales for 30 years paſt hath amounted to 320,000 loads a year; and affirms that he has documents in his poſſeſſion founded on indiſputable facts. The difference between this account, and that which we have given in the text from the report of the commiſſioners, we leave to be reconciled by thoſe who have proper opportunities. We give the facts merely on the authority of others.

Tree. be done at all. But to this objection we reply, that ſuch an agreement might be made with the inſpectors of foreſts, as to make it their own intereſt to cultivate trees with as much care as poſſible. Their ſalary might be fixed very low, and raiſed in proportion to the number of trees which they could furniſh of ſuch a ſize in a certain number of years. After all, we muſt acknowledge, that we muſt depend greatly on Ruſſia, Sweden, Norway, and America, for ſupplying us with timber; and while theſe countries take our manufactures in exchange, we have no reaſon to complain. Still, however, we ought ſurely not to neglect the cultivation of what is of ſo much importance to our exiſtence as a nation, for it may often be impoſſible in time of war to obtain timber from foreign countries.

In the beginning of this article we mentioned the general diviſion of trees into timber or foreſt-trees and fruit trees. We have already ſaid all that our limits will permit reſpecting the former: we will now, therefore, ſay ſomething of the latter. Our obſervations ſhall be confined to the methods of preſerving fruit trees in bloſſom from the effects of froſt, and from other diſeaſes to which they are liable.

European Magazine, March 1791. The chevalier de Bienenberg of Prague, we are told, has diſcovered a method of effectually preſerving trees in bloſſom from the fatal effects of thoſe froſts which ſometimes in the ſpring deſtroy the moſt promiſing hopes of a plentiful crop of fruit. His method is extremely ſimple. He ſurrounds the trunk of the tree in bloſſom with a wiſp of ſtraw or hemp. The end of this he ſinks, by means of a ſtone tied to it, in a veſſel of ſpring water, at a little diſtance from the tree. One veſſel will conveniently ſerve two trees; or the cord may be lengthened ſo as to ſurround ſeveral, before its end is plunged into the water. It is neceſſary that the veſſel be placed in an open ſituation, and by no means ſhaded by the branches of the neighbouring trees, that the froſt may produce all its effect on the water, by means of the cord communicating with it.—This precaution is particularly neceſſary for thoſe trees the flowers of which appear nearly at the ſame time as the leaves; which trees are peculiarly expoſed to the ravages of the froſt. The proofs of its efficacy, which he had an opportunity of obſerving in the ſpring of 1787, were remarkably ſtriking. Seven apricot eſpaliers in his garden began to bloſſom in the month of March. Fearing that they would ſuffer from the late froſts, he ſurrounded them with cords as above directed. In effect, pretty ſharp froſts took place ſix or eight nights: the apricot-trees in the neighbouring gardens were all frozen, and none of them produced any fruit, whilſt each of the chevalier's produced fruit in abundance, which came to the greateſt perfection.

The following is the method propoſed by Mr William Forſyth for curing injuries and defects in trees; for which a reward was given to him by his majeſty, on condition that he ſhould make it public. It is equally applicable to foreſt as to fruit trees (B).

Take one buſhel of freſh cow-dung, half a buſhel of lime rubbiſh of old buildings (that from the ceilings of rooms is preferable); half a buſhel of wood-aſhes; and a ſixteenth part of a buſhel of pit or river ſand. The three laſt articles are to be ſifted fine before they are mixed; then work them well together with a ſpade, and afterwards with a wooden beater, until the ſtuff is very ſmooth, like fine plaſter uſed for the ceilings of rooms. The compoſition being thus made, care muſt be taken to prepare the tree properly for its application by cutting away all the dead, decayed, and injured parts, till you come to the freſh ſound wood, leaving the ſurface of the wood very ſmooth, and rounding off the edges of the bark with a draw-knife, or other inſtrument, perfectly ſmooth, which muſt be particularly attended to. Then lay on the plaſter about one eighth of an inch thick all over the part where the wood or bark has been ſo cut away, finiſhing off the edges as thin as poſſible. Then take a quantity of dry powder of wood-aſhes, mixed with a ſixth part of the ſame quantity of the aſhes of burnt bones; put it into a tin box, with holes in the top, and ſhake the powder on the ſurface of the plaſter, till the whole is covered over with it, letting it remain for half an hour to abſorb the moiſture; then apply more powder, rubbing it on gently with the hand, and repeating the application of the powder, till the whole plaſter becomes a dry ſmooth ſurface.

Tree. || Tremella.

All trees cut down near the ground ſhould have the ſurface made quite ſmooth, rounding it off in a ſmall degree, as before mentioned; and the dry powder directed to be uſed afterwards ſhould have an equal quantity of powder of alabaſter mixed with it, in order the better to reſiſt the dripping of trees and heavy rains. If any of the compoſition be left for a future occaſion, it ſhould be kept in a tub or other veſſel, and urine of any kind poured on it, ſo as to cover the ſurface; otherwiſe the atmoſphere will greatly hurt the efficacy of the application. Where lime-rubbiſh of old buildings cannot be eaſily got, take powdered chalk, or common lime, after having been ſlaked a month at leaſt. As the growth of the tree will gradually affect the plaſter, by raiſing up its edges next the bark, care ſhould be taken, where that happens, to rub it over with the finger when occaſion may require (which is beſt done when moiſtened by rain), that the plaſter may be kept whole, to prevent the air and wet from penetrating into the wound.

Forſyth's Obſervations on the Diſeaſes of Trees. By this proceſs, ſome old worn-out pear trees, that bore only a few ſmall, hard fruit, of a kernelly texture, were made to produce pears of the beſt quality and fineſt flavour the ſecond ſummer after the operation; and in four or five years they bore ſuch plenteous crops, as a young healthy tree would not have produced in four times that period.

By this proceſs, too, ſome large ancient elms, in a moſt decayed ſtate, having all their upper parts broken, and a ſmall portion only of the bark remaining, ſhot out ſtems from their tops, above thirty feet in height, in ſix or ſeven years from the firſt application of the compoſition.

Thus may valuable fruits be renovated; and foreſt trees, which are uſeful or ornamental from their particular ſituation, be preſerved in a flouriſhing ſtate. But what is far more intereſting, a perfect cure has been made, and ſound timber produced, in oak trees, which had received very conſiderable damage from blows, bruiſes, cutting of deep letters, the rubbing off the bark by the ends of rollers, or wheels of carts, or from the breaking of branches by ſtorms.

TREFOIL, in botany. See TRIFOLIUM.

TREMELLA, in botany; a genus of plants belonging to the claſs of *cryptogamia*, and natural order of *algæ*. It is

(B) A paſte for covering the wounds of trees, and the place where grafts are inſerted, was diſcovered long ago. It is recommended in a Treatiſe on Fruit Trees, publiſhed by Thomas Hitt in 1755; a third edition of which, with additions, was publiſhed in 1768. It conſiſts of a mixture of clay and cows-dung diluted with water. This paſte he directs to be laid on the wound with a bruſh; it adheres firmly, he ſays, without cracking till the wound heals. We are informed by a gentleman, to whoſe opinion and experience we pay great reſpect, that this paſte anſwers every purpoſe which Mr Forſyth's can ſerve.

Tremellius ‖ Trent.

is a gelatinous membranous ſubſtance; the parts of the fructification ſcarcely viſible. There are 11 ſpecies; of which five are indigenous; the noſtoc, lichenoides, verrucoſa, hemiſpherica, and purpurea.

1. The *noſtoc*, or jelly rain tremella, is found in paſtures and by the ſides of gravel-walks in gardens after rains; not uncommon in ſpring, ſummer, and autumn. It is a membranaceous, pellucid, and gelatinous ſubſtance, without any viſible root; of a yellowiſh dull green colour; aſſuming various forms, either round, angular, plated, or folded together irregularly, like the inteſtines, or a pocket-handkerchief, an inch or two or more in diameter: ſoft to the touch when moiſt; but thin, membranaceous, and brittle, when dry; and of a black fuſcous colour.—The ancient alchemiſts called this vegetable *the flowers of heaven*, and imagined that from it they would procure the univerſal menſtruum: but all their reſearches ended in diſcovering that by diſtillation it yielded ſome phlegm, volatile ſalt, and empyreumatic oil. It has been extolled in wounds, ulcers, &c. but no regard is ever paid to it by judicious practitioners. Dr Darwin ſays, he has been well informed that this tremella is a mucilage voided by herons after they have eaten frogs!! 2. The *lichenoides*, or tranſparent tremella, is erect, plane, margin curled, lacinulated, and brown. It grows on heaths and in woods, &c. 3. *Verrucoſa*, or warty tremella, is tubercular, ſolid, wrinkled, roundiſh, and reſembling a bladder; it is of a blackiſh yellow. It grows on ſtones in rivulets. 4. *Hemiſpherica*, or ſea tremella, is ſcattered among confervæ, fuci, &c. 5. *Purpurea*, or purple tremella, is globular, ſeſſile, ſolitary, and ſmooth. It grows on ditch-banks about London.

TREMELLIUS (Emanuel), a Jew by birth, was born at Ferrara in the year 1510. He was ſo carefully educated as to become a great maſter of the Hebrew tongue: he was converted to Chriſtianity by the celebrated Peter Martyr. After travelling to Germany and England, he was made profeſſor of Hebrew, firſt at Heidelberg, and then at Sedan, where he died in 1580. He tranſlated the Hebrew Bible and Syriac Teſtament into Latin; in the former he was aſſiſted by Junius, who afterwards corrected the ſecond edition in 1587. This work was received by the Proteſtant churches with great approbation.

TREMOR, an involuntary ſhaking, chiefly of the hands and head, ſometimes of the feet, and ſometimes of the tongue and heart.—Tremors ariſing from a too free uſe of ſpirituous liquors require the ſame treatment as palſies.

TRENCHES, in fortification, are ditches cut by the beſiegers, that they may approach the more ſecurely to the place attacked; whence they are alſo called *lines of approach*.

TRENT (biſhopric of), a province of Germany, in the circle of Auſtria, near the frontiers of Italy, is bounded on the north by Tirol; on the eaſt, by the Feltrino and Bulluneſe; on the ſouth, by Vicentino, the Veroneſe, Breſciano, and the lake de Garda; and on the weſt, by the Breſciano and the lake de Garda. The ſoil is ſaid to be pretty fruitful, and to abound in wine and oil.

TRENT, a city of Germany, and capital of the biſhopric of that name, is a very ancient place, and ſtands in a fertile and pleaſant plain, in the midſt of the high mountains of the Alps. The river Adige waſhes its walls, and creeping for ſome time among the hills, runs ſwiftly into Italy. Trent has three conſiderable churches, the principal of which is the cathedral: this is a very regular piece of architecture. The church of St Maria Major is all of red and white marble; and is remarkable for being the place where the famous council of Trent was held, whoſe deciſions are now the ſtanding rule of the Romiſh church. E. Long. 11. 5. N. Lat. 46. 10.

Trent. ‖ Trevis.

TRENT, one of the largeſt rivers in England, which riſes in the Moorland of Staffordſhire, and runs ſouth-weſt by Newcaſtle-under-Line; and afterwards dividing the county in two parts, runs to Burton, then to Nottingham and Newark; and ſo continuing its courſe due north to Gainſborough on the confines of Lincolnſhire, it joins ſeveral rivers, and falls into the Humber.

TRENT (council of), in eccleſiaſtical hiſtory, denotes the council aſſembled by Paul III. in 1545, and continued by 25 ſeſſions till the year 1563, under Julius III. and Pius IV. in order to correct, illuſtrate, and fix with perſpicuity, the doctrine of the church, to reſtore the vigour of its diſcipline, and to reform the lives of its miniſters. The decrees of this council, together with the creed of pope Pius IV. contain a ſummary of the doctrines of the Roman Catholics. Theſe decrees were ſubſcribed by 255 clergy, conſiſting of 4 legates, 2 other cardinals, 3 patriarchs, 25 archbiſhops, 168 biſhops, beſides inferior clergy. Of theſe 150 came from Italy; of courſe the council was entirely under the influence of the pope. For a more particular account of the council of Trent, ſee *Moſheim's Church Hiſtory*, the *Modern Univerſal Hiſtory*, Vol. XXIII. and *Father Paul's Hiſtory of the Council of Trent*.

TRENTON. See *New Jerſey*.

TREPANNING. See SURGERY, n° 186.

TRES TABERNÆ (anc. geog.), a place in Latium, lying on the Via Appia, on the left or ſouth ſide of the river Aſtura, to the north of the Paludes Pomptinæ. Its ruins are now ſeen near Ciſterna, a village in the Campagna di Roma, 21 miles from Rome, whence the Chriſtians went out to meet St Paul.

TRESPASS, in law, ſignifies any tranſgreſſion of the law, under treaſon, felony, or miſpriſion of either: but it is commonly uſed for any wrong or damage that is done by one private perſon to another, or to the king in his foreſt.

TRESSLE-TREES, in ſhip-building, two ſtrong bars of timber fixed horizontally on the oppoſite ſides of the lower maſt-head, to ſupport the frame of the top and the weight of the top-maſt.

TRESSURE, in heraldry, a diminutive of an orle, uſually held to be half the breadth thereof.

TRET, in commerce, an allowance made for the waſte or the dirt that may be mixed with any commodity; which is commonly four pounds in every 104 pounds weight.

TREVERI, or TREVIRI (anc. geog.), an ancient and a powerful people both in horſe and foot, according to Cæſar; extending far and wide between the Meuſe and the Rhine. Their chief town was called *Treveris*. Now *Triers* or *Treves*.

TREVES, or TRIERS (in Latin *Trevere*, *Trevers*, *Treviris*, or *Auguſta Trevirorum*), the capital of a German archbiſhopric of the ſame name, ſtands 60 miles weſt of Mentz, 52 ſouth of Cologne, and 82 north of Straſburg. This city vies with moſt in Europe for antiquity, having been a large and noted town before Auguſtus ſettled a colony in it. It was free and imperial till the year 1560, when it was ſurpriſed and ſubjected by its archbiſhop James III. It ſtands on the Moſelle, over which it has a fair ſtone bridge. The cathedral is a large building; and near it ſtands the elector's palace, which not long ago was rebuilt. Here are three collegiate and five pariſh churches, three colleges of Jeſuits, thirteen monaſteries and nunneries, an univerſity founded in 1472, a houſe of the Teutonic order, and another of that of Malta, with ſome remains of the ancient Roman theatre. Roman coins and medals are often found in

Trial. the ruins of the old city. In the cathedral they pretend to have our Saviour's coat and St Peter's ſtaff, to which they aſcribe miracles. The private houſes here are mean; and the city is neither well fortified nor inhabited. E. Long. 6. 41. N. Lat. 49. 45.

TRIAL, in law, the examination of a cauſe according to the laws of the land before a proper judge; or it is the manner and order obſerved in the hearing and determining of cauſes.

Trials are either civil or criminal.

I. *Civil* TRIALS. The ſpecies of trials in civil caſes are ſeven: By *record*; by *inſpection*, or examination; by *certificate*; by *witneſſes*; by wager of *battel*; by wager of *law*; and by *jury*. The firſt ſix are only had in certain ſpecial or eccentrical caſes, where the trial by jury would not be ſo proper or effectual: (See them explained under their reſpective titles). The nature of the laſt, that principal criterion of truth in the law of England, ſhall be explained in this article.

As trial by jury is eſteemed one of the moſt important privileges which members of ſociety can enjoy, and the bulwark of the Britiſh conſtitution, every man of reflection muſt be ſtimulated by the deſire of inquiring into its origin and hiſtory, as well as to be acquainted with the forms and advantages by which it is accompanied. We will therefore begin with tracing it to its origin. Its inſtitution has been aſcribed to our Saxon anceſtors by Sir William Blackſtone.

Black-ſtone's Commentaries, vol. iii. p. 349.

"Some authors (ſays that illuſtrious lawyer) have endeavoured to trace the original of juries up as high as the Britons themſelves, the firſt inhabitants of our iſland; but certain it is, that they were in uſe among the earlieſt Saxon colonies, their inſtitution being aſcribed by biſhop Nicholſon to Woden himſelf, their great legiſlator and captain. Hence it is, that we may find traces of juries in the laws of all thoſe nations which adopted the feodal ſyſtem, as in Germany, France, and Italy; who had all of them a tribunal compoſed of twelve good men and true, *boni homines*, uſually the vaſſals or tenants of the lord, being the equals or peers of the parties litigant; and, as the lord's vaſſals judged each other in the lord's courts, ſo the king's vaſſals, or the lords themſelves, judged each other in the king's court. In England we find actual mention of them ſo early as the laws of king Ethelred, and that not as a new invention. Stiernhook aſcribes the invention of the jury, which in the Teutonic language is denominated *nembda*, to Regner king of Sweden and Denmark, who was contemporary with our king Egbert. Juſt as we are apt to impute the invention of this, and ſome other pieces of juridical polity, to the ſuperior genius of Alfred the Great; to whom, on account of his having done much, it is uſual to attribute every thing: and as the tradition of ancient Greece placed to the account of their own Hercules whatever atchievement was performed ſuperior to the ordinary proweſs of mankind. Whereas the truth ſeems to be, that this tribunal was univerſally eſtabliſhed among all the northern nations, and ſo interwoven in their very conſtitution, that the earlieſt accounts of the one give us alſo ſome traces of the other."

This opinion has been controverted with much learning and ingenuity by Dr Pettingal in his Enquiry into the Uſe and Practice of Juries among the Greeks and Romans, who deduces the origin of juries from theſe ancient nations.

He begins with determining the meaning of the word δικασαι in the Greek, and *judices* in the Roman, writers. "The common acceptation of theſe words (ſays he), and the idea generally annexed to them, is that of *preſidents of courts*, or, as we call them, *judges*; as ſuch they are underſtood by commentators, and rendered by critics. Dr Middleton, in his life of Cicero, expreſsly calls the judices, *judges of the bench*: and Archbiſhop Potter, and in ſhort all modern writers upon the Greek or Roman orators, or authors in general, expreſs δικασαι and *judices* by ſuch terms as convey the idea of *preſidents in courts of juſtice*. The propriety of this is doubted of, and hath given occaſion for this inquiry; in which is ſhown, from the beſt Greek and Roman authorities, that neither the δικασαι of the Greeks, or the *judices* of the Romans, ever ſignified *preſidents in courts of judicature*, or *judges of the bench*; but, on the contrary, they were diſtinguiſhed from each other, and the difference of their duty and function was carefully and clearly pointed out by the orators in their pleadings, who were the beſt authorities in thoſe caſes, where the queſtion related to forms of law, and methods of proceeding in judicial affairs and criminal proceſs. Trial.

The preſidents of the courts in criminal trials at Athens were the nine archons, or chief magiſtrates, of which whoever preſided was called αγεμων δικαστηριυ, or preſident of the court. Theſe nine preſided in different cauſes peculiar to each juriſdiction. The archon, properly ſo called, had belonging to his department all pupillary and heritable caſes; the βασιλευς or *rex ſacrorum*, the chief prieſt, all caſes where religion was concerned; the polemarchus, or general, the affairs of the army and all military matters; and the ſix, the ſmothetæ, the other ordinary ſuits.

Wherever then the ανδρες δικασαι, or judicial men, are addreſſed by the Greek orators in their ſpeeches, they are not to be underſtood to be the preſiding magiſtrates, but another claſs of men, who were to inquire into the ſtate of the cauſe before them, by witneſſes and other methods of coming at truth; and after inquiry made and witneſſes heard, to report their opinion and verdict to the preſident, who was to declare it.

The ſeveral ſteps and circumſtances attending this judicial proceeding are ſo ſimilar to the forms obſerved by our jury, that the learned reader, for ſuch I muſt ſuppoſe him, cannot doubt but that the nature, intent, and proceedings of the δικαστηριον among the Greeks were the ſame with the Engliſh jury; namely, for the protection of the lower people from the power and oppreſſion of the great, by adminiſtering equal law and juſtice to all ranks; and therefore when the Greek orators directed their ſpeeches to the ανδρες δικασαι, as we ſee in Demoſthenes, Æſchines, and Lyſias, we are to underſtand it in the ſame ſenſe as when our lawyers at the bar ſay, *Gentlemen of the jury*.

So likewiſe among the Romans, the *judices*, in their pleadings at the bar, never ſignified judges of the bench, or preſidents of the court, but a body or order of men, whoſe office in the courts of judicature was diſtinct from that of the prætor or *judex queſtionis*, which anſwered to our judge of the bench, and was the ſame with the archon, or αγεμων δικαστηριυ, of the Greek: whereas the duty of the judices conſiſted in being impannelled, as we call it, challenged, and ſworn to try uprightly the caſe before them; and when they had agreed upon their opinion or verdict, to deliver it to the preſident who was to pronounce it. This kind of judicial proceſs was firſt introduced into the Athenian polity by Solon, and thence copied into the Roman republic, as probable means of procuring juſt judgment, and protecting the lower people from the oppreſſion or arbitrary deciſions of their ſuperiors.

When the Romans were ſettled in Britain as a province, they carried with them their *jura* and *inſtituta*, their laws and cuſtoms, which was a practice eſſential to all colonies; hence the Britons, and other countries of Germany and Gaul, learned from them the Roman laws and cuſtoms; and upon the irruption of the northern nations into the ſouthern kingdoms of Europe, the laws and inſtitutions of the Romans remained, when the power that introduced them was with-

Trial. withdrawn: and Monteſquieu tells us, that under the firſt race of kings in France, about the fifth century, the Romans that remained, and the Burgundians their new maſters, lived together under the ſame Roman laws and police, and particularly the ſame forms of judicature. How reaſonable then is it to conclude, that in the Roman courts of judicature continued among the Burgundians, the form of a jury remained in the ſame ſtate it was uſed at Rome. It is certain, Monteſquieu, ſpeaking of thoſe times, mentions the *paires* or *hommes de fief*, homagers or peers, which in the ſame chapter he calls *juges*, *judges* or *jurymen*: ſo that we hence ſee how at that time the *hommes de fief*, or "men of the fief," were called *peers*, and thoſe peers were *juges* or jurymen. Theſe were the ſame as are called in the laws of the confeſſor *pers de la tenure*, the "peers of the tenure, or homagers," out of whom the jury of peers were choſen, to try a matter in diſpute between the lord and his tenant, or any other point of controverſy in the manor. So likewiſe in all other parts of Europe, where the Roman colonies had been, the Goths ſucceeding them, continued to make uſe of the ſame laws and inſtitutions, which they found to be eſtabliſhed there by the firſt conquerors. This is a much more natural way of accounting for the origin of a jury in Europe, than having recourſe to the fabulous ſtory of Woden and his ſavage Scythian companions, as the firſt introducers of ſo humane and beneficent an inſtitution."

Trials by jury in civil cauſes are of two kinds; *extraordinary* and *ordinary*.

1. The firſt ſpecies of *extraordinary* trial by jury is that of the grand aſſize, which was inſtituted by king Henry II. in parliament, by way of alternative offered to the choice of the tenant or defendant in a writ of right, inſtead of the barbarous and unchriſtian cuſtom of duelling. For this purpoſe a writ *de magna aſſiſa elegenda* is directed to the ſheriff, to return four knights, who are to elect and chooſe 12 others to be joined with them; and theſe all together form the grand aſſize, or great jury, which is to try the matter of right, and muſt now conſiſt of 16 jurors. Another ſpecies of extraordinary juries is the jury to try an attaint; which is a proceſs commenced againſt a former jury for bringing a falſe verdict. See the article ATTAINT.

2. With regard to the *ordinary* trial by jury in civil caſes, the moſt clear and perſpicuous way of treating it will be by following the order and courſe of the proceedings themſelves.

Black-ſtone's Commentaries.

When therefore an iſſue is joined by theſe words, "And this the ſaid A prays may be inquired of by the country;" or, "And of this he puts himſelf upon the country, and the ſaid B does the like;" the court awards a writ of *venire facias* upon the roll or record, commanding the ſheriff "that he cauſe to come here, on ſuch a day, twelve free and lawful men, *liberes et legales homines*, of the body of his county, by whom the truth of the matter may be better known, and who are neither of kin to the aforeſaid A nor the aforeſaid B, to recognize the truth of the iſſue between the ſaid parties." And ſuch writ is accordingly iſſued to the ſheriff. It is made returnable on the laſt return of the ſame term wherein iſſue is joined, *viz.* hilary or trinity terms; which, from the making up of the iſſues therein, are uſually called *iſſuable terms*. And he returns the names of the jurors in a panel (a little pane or oblong piece of parchment) annexed to the writ. This jury is not ſummoned, and therefore not appearing at the day muſt unavoidably make default. For which reaſon a compulſive proceſs is now awarded againſt the jurors, called in the common pleas a writ of *habeas corpora juratorum*, and in the King's Bench *diſtringas*, commanding the ſheriff to have their bodies, or to diſtrain them by their lands and goods, that they may appear upon the day appointed. The entry therefore on the roll of record is, "That the jury is reſpited, through defect of the jurors, till the firſt day of the next term, then to appear at Weſtminſter; unleſs before that time, *viz.* on Wedneſday the fourth of March, the juſtices of our lord the king appointed to take aſſizes in that county ſhall have come to Oxford, that is, to the place aſſigned for holding the aſſizes. Therefore the ſheriff is commanded to have their bodies at Weſtminſter on the ſaid firſt day of next term, or before the ſaid juſtices of aſſize, if before that time they come to Oxford, *viz.* on the fourth of March aforeſaid." And as the judges are ſure to come and open the circuit-commiſſions on the day mentioned in the writ, the ſheriff returns and ſummons this jury to appear at the aſſizes; and there the trial is had before the juſtices of aſſize and *niſi prius*: among whom (as hath been ſaid*) are uſually two of the judges of the courts at Weſtminſter, the whole kingdom being divided into ſix circuits for this purpoſe. And thus we may obſerve, that the trial of common iſſues, at *niſi prius*, was in its original only a collateral incident to the original buſineſs of the juſtices of aſſize; though now, by the various revolutions of practice, it is become their principal civil employment; hardly any thing remaining in uſe of the real aſſizes but the name.

Trial.

* See the article Aſſize.

If the ſheriff be not an indifferent perſon, as if he be a party in the ſuit, or be related by either blood or affinity to either of the parties, he is not then truſted to return the jury; but the *venire* ſhall be directed to the coroners, who in this, as in many other inſtances, are the ſubſtitutes of the ſheriff to execute proceſs when he is deemed an improper perſon. If any exception lies to the coroners, the *venire* ſhall be directed to two clerks of the court, or two perſons of the county named by the court, and ſworn. And theſe two, who are called *eliſors*, or electors, ſhall indifferently name the jury, and their return is final; no challenge being allowed to their array.

Let us now pauſe a while, and obſerve (with Sir Matthew Hale*), in theſe firſt preparatory ſtages of the trial, how admirably this conſtitution is adapted and framed for the inveſtigation of truth beyond any other method of trial in the world. For, firſt, the perſon returning the jurors is a man of ſome fortune and conſequence; that ſo he may be not only the leſs tempted to commit wilful errors, but likewiſe be reſponſible for the faults of either himſelf or his officers; and he is alſo bound by the obligation of an oath faithfully to execute his duty. Next, as to the time of their return: the panel is returned to the court upon the original *venire*, and the jurors are to be ſummoned and brought in many weeks afterwards to the trial, whereby the parties may have notice of the jurors, and of their ſufficiency or inſufficiency, characters, connections, and relations, that ſo they may be challenged upon juſt cauſe; while, at the ſame time, by means of the compulſory proceſs (of *diſtringas*, or *habeas corpora*) the cauſe is not like to be retarded through defect of jurors. Thirdly, as to the place of their appearance: which in cauſes of weight and conſequence is at the bar of the court; but in ordinary caſes at the aſſizes, held in the county where the cauſe of action ariſes, and the witneſſes and jurors live: a proviſion moſt excellently calculated for the ſaving of expence to the parties. For though the preparation of the cauſes in point of pleading is tranſacted at Weſtminſter, whereby the order and uniformity of proceeding is preſerved throughout the kingdom, and multiplicity of forms is prevented; yet this is no great charge or trouble, one attorney being able to tranſact the buſineſs of 40 clients. But the troubleſome and moſt expenſive attendance is that of jurors and witneſſes at the trial; which therefore is brought home to them, in the

* Hiſt. C. L. c. 12.

county

Trial. county where moſt of them inhabit. Fourthly, the perſons before whom they are to appear, and before whom the trial is to be held, are the judges of the ſuperior court, if it be a trial at bar; or the judges of aſſize, delegated from the courts at Weſtminſter by the king, if the trial be held in the country: perſons whoſe learning and dignity ſecure their juriſdiction from contempt, and the novelty and very parade of whoſe appearance have no ſmall influence upon the multitude. The very point of their being ſtrangers in the county is of infinite ſervice, in preventing thoſe factions and parties which would intrude in every cauſe of moment, were it tried only before perſons reſident on the ſpot, as juſtices of the peace, and the like. And the better to remove all ſuſpicion of partiality, it was wiſely provided by the ſtatutes 4 Edw. III. c. 2. 8 Ric. II. c. 2. and 33 Hen. VIII. c. 24. that no judge of aſſize ſhould hold pleas in any county wherein he was born or inhabits. And as this conſtitution prevents party and faction from intermingling in the trial of right, ſo it keeps both the rule and the adminiſtration of the laws uniform. Theſe juſtices, though thus varied and ſhifted at every aſſizes, are all ſworn to the ſame laws, have had the ſame education, have purſued the ſame ſtudies, converſe and conſult together, communicate their deciſions and reſolutions, and preſide in thoſe courts which are mutually connected, and their judgments blended together, as they are interchangeably courts of appeal or advice to each other. And hence their adminiſtration of juſtice, and conduct of trials, are conſonant and uniform; whereby that confuſion and contrariety are avoided, which would naturally ariſe from a variety of uncommunicating judges, or from any provincial eſtabliſhment. But let us now return to the aſſizes.

When the general day of trial is fixed, the plaintiff or his attorney muſt bring down the record to the aſſizes, and enter it with the proper officer, in order to its being called on in courſe.

Theſe ſteps being taken, and the cauſe called on in court, the record is then handed to the judge, to peruſe and obſerve the pleadings, and what iſſues the parties are to maintain and prove, while the jury is called and ſworn. To this end the ſheriff returns his compulſive proceſs, the writ of *habeas corpora*, or *diſtringas*, with the panel of jurors annexed, to the judge's officer in court.

The jurors contained in the panel are either ſpecial or common jurors. Special juries were originally introduced in trials at bar, when the cauſes were of too great nicety for the diſcuſſion of ordinary freeholders; or where the ſheriff was ſuſpected of partiality, though not upon ſuch apparent cauſe as to warrant an exception to him. He is in ſuch caſes, upon motion in court, and a rule granted thereupon, to attend the prothonotary or other proper officer with his freeholder's book; and the officer is to take indifferently 48 of the principal freeholders, in the preſence of the attorneys on both ſides: who are each of them to ſtrike off 12, and the remaining 24 are returned upon the panel. By the ſtatute 3 Geo. II. c. 25. either party is entitled upon motion to have a ſpecial jury ſtruck upon the trial of any iſſue, as well at the aſſizes as at bar, he paying the extraordinary expence, unleſs the judge will certify (in purſuance of the ſtatute 24 Geo. II. c. 18.) that the cauſe required ſuch ſpecial jury.

A common jury is one returned by the ſheriff according to the directions of the ſtatute 3 Geo. II. c. 25. which appoints, that the ſheriff or officer ſhall not return a ſeparate panel for every ſeparate cauſe, as formerly; but one and the ſame panel for every cauſe to be tried at the ſame aſſizes, containing not leſs than 48, nor more than 72, jurors: and that their names being written on tickets, ſhall be put into a box of glaſs; and when each cauſe is called 12 of theſe perſons, whoſe names ſhall firſt be drawn out of the box, ſhall be ſworn upon the jury, unleſs abſent, challenged, or excuſed; or unleſs a previous view of the meſſuages, lands, or place in queſtion, ſhall have been thought neceſſary by the court; in which caſe, ſix or more of the jurors returned, to be agreed on by the parties, or named by a judge or other proper officer of the court, ſhall be appointed by ſpecial writ of *habeas corpora* or *diſtringas*, to have the matters in queſtion ſhown to them by two perſons named in the writ; and then ſuch of the jury as have had the view, or ſo many of them as appear, ſhall be ſworn on the inqueſt previous to any other jurors. Theſe acts are well calculated to reſtrain any ſuſpicion of partiality in the ſheriff, or any tampering with the jurors when returned. Trial.

As the jurors appear when called, they ſhall be ſworn, unleſs challenged by either party. See the article CHALLENGE.

If by means of challenges or other cauſe, a ſufficient number of unexceptionable jurors doth not appear at the trial, either party may pray a *tales*.

A *tales* is a ſupply of ſuch men as are ſummoned upon the firſt panel, in order to make up the deficiency. For this purpoſe a writ of *decem tales*, *octo tales*, and the like, was wont to be iſſued to the ſheriff at common law, and muſt be ſtill ſo done at a trial at bar, if the jurors make default. But at the aſſizes, or *niſi prius*, by virtue of the ſtatute 35 Hen. VIII. c. 6. and other ſubſequent ſtatutes, the judge is empowered at the prayer of either party to award a *tales de circumſtantibus* of perſons preſent in court, to be joined to the other jurors to try the cauſe; who are liable, however, to the ſame challenges as the principal jurors. This is uſually done till the legal number of 12 be completed; in which patriarchal and apoſtolical number Sir Edward Coke hath diſcovered abundance of myſtery.

When a ſufficient number of perſons impanelled, or talesmen appear, they are then ſeparately ſworn, well and truly to try the iſſue between the parties, and a true verdict to give according to the evidence; and hence they are denominated "the jury," *jurata*, and "jurors," *ſc. juratores*.

The jury are now ready to hear the merits; and to fix their attention the cloſer to the facts which they are impanelled and ſworn to try, the pleadings are opened to them by counſel on that ſide which holds the affirmative of the queſtion in iſſue. For the iſſue is ſaid to lie, and proof is always firſt required upon that ſide which affirms the matter in queſtion: in which our law agrees with the civil, *ei incumbit probatio qui dicit, non qui negat; cum per rerum naturam factum negantis probatio nulla ſit.* The opening counſel briefly informs them what has been tranſacted in the court above; the parties, the nature of the action, the declaration, the plea, replication, and other proceedings; and laſtly, upon what point the iſſue is joined, which is there ſent down to be determined. Inſtead of which, formerly the whole record and proceſs of the pleadings were read to them in Engliſh by the court, and the matter of iſſue clearly explained to their capacities. The nature of the caſe, and the evidence intended to be produced, are next laid before them by counſel alſo on the ſame ſide; and when their evidence is gone through, the advocate on the other ſide opens the adverſe caſe, and ſupports it by evidence; and then the party which began is heard by way of reply. See PLEADINGS.

Evidence in the trial by jury is of two kinds; either that which is given in proof, or that which the jury may receive by their own private knowledge. The former, or *proofs*, (to which in common ſpeech the name of evidence is uſually confined) are either written or parol; that is, by word of mouth.

Trial. mouth. Written proofs, or evidence, are, 1. Records; and 2. Ancient deeds of 30 years ſtanding, which prove themſelves; but, 3. Modern deeds; and, 4. Other writings, muſt be atteſted and verified by parol evidence of witneſſes. With regard to parol evidence or witneſſes; it muſt firſt be remembered, that there is a proceſs to bring them in by writ of *ſubpœna ad teſtificandum*; which commands them, laying aſide all pretences and excuſes, to appear at the trial on pain of 100 l. to be forfeited to the king; to which the ſtatute 5 Eliz. c. 9. has added a penalty of 10 l. to the party aggrieved, and damages equivalent to the loſs ſuſtained by want of his evidence. But no witneſs, unleſs his reaſonable expences be tendered him, is bound to appear at all; nor, if he appears, is he bound to give evidence till ſuch charges are actually paid him; except he reſides within the bills of mortality, and is ſummoned to give evidence within the ſame. This compulſory proceſs, to bring in unwilling witneſſes, and the additional terrors of an attachment in caſe of diſobedience, are of excellent uſe in the thorough inveſtigation of truth; and, upon the ſame principle, in the Athenian courts, the witneſſes who were ſummoned to attend the trial had their choice of three things: either to ſwear to the truth of the fact in queſtion, to deny or abjure it, or elſe to pay a fine of 1000 drachmas.

All witneſſes, of whatever religion or country, that have the uſe of their reaſon, are to be received and examined, except ſuch as are infamous, or ſuch as are intereſted in the event of the cauſe. All others are competent witneſſes; though the jury from other circumſtances will judge of their credibility. Infamous perſons are ſuch as may be challenged as jurors, *propter delictum:* and therefore never ſhall be admitted to give evidence to inform that jury, with whom they were too ſcandalous to aſſociate. Intereſted witneſſes may be examined upon a *voir dire*, if ſuſpected to be ſecretly concerned in the event; or their intereſt may be proved in court. Which laſt is the only method of ſupporting an objection to the former claſs; for no man is to be examined to prove his own infamy. And no counſel, attorney, or other perſon, intruſted with the ſecrets of the cauſe by the party himſelf, ſhall be compelled, or perhaps allowed, to give evidence of ſuch converſation or matters of privacy as came to his knowledge by virtue of ſuch truſt and confidence: but he may be examined as to mere matters of fact, as the execution of a deed or the like, which might have come to his knowledge without being intruſted in the cauſe.

One witneſs (if credible) is ſufficient evidence to a jury of any ſingle fact: though undoubtedly the concurrence of two or more corroborates the proof. Yet our law conſiders that there are many tranſactions to which only one perſon is privy; and therefore does not always demand the teſtimony of two. Poſitive proof is always required, where, from the nature of the caſe, it appears it might poſſibly have been had. But, next to poſitive proof, circumſtantial evidence, or the doctrine of preſumptions, muſt take place: for when the fact itſelf cannot be demonſtratively evinced, that which comes neareſt to the proof of the fact is the proof of ſuch circumſtances which either neceſſarily or uſually attend ſuch facts; and theſe are called *preſumptions*, which are only to be relied upon till the contrary be actually proved.

The oath adminiſtered to the witneſs is not only that what he depoſes ſhall be true, but that he ſhall alſo depoſe the whole truth; ſo that he is not to conceal any part of what he knows, whether interrogated particularly to that point or not. And all this evidence is to be given in open court, in the preſence of the parties, their attorneys, the counſel, and all byſtanders; and before the judge and jury; each party having liberty to except to its competency, which exceptions are publicly ſtated, and by the judge are openly and publicly allowed or diſallowed, in the face of the country: which muſt curb any ſecret bias or partiality that might ariſe in his own breaſt. Trial.

When the evidence is gone through on both ſides, the judge, in the preſence of the parties, the counſel, and all others, ſums up the whole to the jury; omitting all ſuperfluous circumſtances, obſerving wherein the main queſtion and principal iſſue lies, ſtating what evidence has been given to ſupport it, with ſuch remarks as he thinks neceſſary for their direction, and giving them his opinion in matters of law ariſing upon that evidence.

The jury, after the proofs are ſummed up, unleſs the caſe be very clear, withdraw from the bar to conſider of their verdict; and in order to avoid intemperance and cauſeleſs delay, are to be kept without meat, drink, fire, or candle, unleſs by permiſſion of the judge, till they are unanimouſly agreed. A method of accelerating unanimity not wholly unknown in other conſtitutions of Europe, and in matters of greater concern. For by the golden bull of the empire, if after the congreſs is opened, the electors delay the election of a king of the Romans for 30 days, they ſhall be fed only with bread and water till the ſame is accompliſhed. But if our juries eat or drink at all, or have any eatables about them, without conſent of the court and before verdict, it is fineable; and if they do ſo at his charge for whom they afterwards find, it will ſet aſide the verdict. Alſo, if they ſpeak with either of the parties or their agents after they are gone from the bar, or if they receive any freſh evidence in private, or if, to prevent diſputes, they caſt lots for whom they ſhall find, any of theſe circumſtances will entirely vitiate the verdict. And it has been held, that if the jurors do not agree in their verdict before the judges are about to leave the town, though they are not to be threatened or impriſoned, the judges are not bound to wait for them, but may carry them round the circuit from town to town in a cart. This neceſſity of a total unanimity ſeems to be peculiar to our own conſtitution; or at leaſt, in the *nembda* or jury of the ancient Goths, there was required (even in criminal caſes) only the conſent of the major part; and in caſe of an equality, the defendant was held to be acquitted.

When they are all unanimouſly agreed, the jury return back to the bar; and before they deliver their verdict, the plaintiff is bound to appear in court, by himſelf, attorney, or counſel, in order to anſwer the amercement to which by the old law he is liable, in caſe he fails in his ſuit, as a puniſhment for his falſe claim. To be amerced, or *a mercie*, is to be at the king's mercy with regard to the fine to be impoſed; *in miſericordia domini regis pro falſo clamore ſuo.* The amercement is diſuſed, but the form ſtill continues; and if the plaintiff does not appear, no verdict can be given; but the plaintiff is ſaid to be nonſuit, *non ſequitur clamorem ſuum.* Therefore it is uſual for a plaintiff, when he or his counſel perceives that he has not given evidence ſufficient to maintain his iſſue, to be voluntarily nonſuited, or withdraw himſelf: whereupon the crier is ordered to call the plaintiff, and if neither he, nor any body for him, appears, he is nonſuited, the jurors are diſcharged, the action is at an end, and the defendant ſhall recover his coſts. The reaſon of this practice is that a nonſuit is more eligible for the plaintiff than a verdict againſt him: for after a nonſuit, which is only a default, he may commence the ſame ſuit again for the ſame cauſe of action; but after a verdict had, and judgment conſequent thereupon, he is for ever barred from attacking the defendant upon the ſame ground of complaint. But in caſe the plaintiff appears, the jury by their foreman deliver in their verdict.

Trial.

A verdict, *vere dictum*, is either privy or public. A privy verdict is when the judge hath left or adjourned the court: and the jury, being agreed, in order to be delivered from their confinement, obtain leave to give their verdict privily to the judge out of court: which privy verdict is of no force, unleſs afterwards affirmed by a public verdict given openly in court; wherein the jury may, if they pleaſe, vary from their privy verdict. So that the privy verdict is indeed a mere nullity; and yet it is a dangerous practice, allowing time for the parties to tamper with the jury, and therefore very ſeldom indulged. But the only effectual and legal verdict is the public verdict: in which they openly declare to have found the iſſue for the plaintiff, or for the defendant; and if for the plaintiff, they aſſeſs the damages alſo ſuſtained by the plaintiff, in conſequence of the injury upon which the action is brought.

When the jury have delivered in their verdict, and it is recorded in court, they are then diſcharged; and ſo ends the trial by jury: a trial which ever has been, and it is hoped ever will be, looked upon as the glory of the Engliſh law. It is certainly the moſt tranſcendant privilege which any ſubject can enjoy or wiſh for, that he cannot be affected either in his property, his liberty, or his perſon, but by the unanimous conſent of 12 of his neighbours and equals. A conſtitution that we may venture to affirm has, under providence, ſecured the juſt liberties of this nation for a long ſucceſſion of ages. And therefore a celebrated French writer‡, who concludes, that becauſe Rome, Sparta, and Carthage, have loſt their liberties, therefore thoſe of England in time muſt periſh, ſhould have recollected, that Rome, Sparta, and Carthage at the time when their liberties were loſt, were ſtrangers to the trial by jury.

‡ Monteſquieu, Spir. L. xi. 6.

Great as this eulogium may ſeem, it is no more than this admirable conſtitution, when traced to its principles, will be found in ſober reaſon to deſerve.

The impartial adminiſtration of juſtice, which ſecures both our perſons and our properties, is the great end of civil ſociety. But if that be entirely entruſted to the magiſtracy, a ſelect body of men, and thoſe generally ſelected by the prince or ſuch as enjoy the higheſt offices in the ſtate, their deciſions, in ſpite of their own natural integrity, will have frequently an involuntary bias towards thoſe of their own rank and dignity: it is not to be expected from human nature, that the few ſhould be always attentive to the intereſts and good of the many. On the other hand, if the power of judicature were placed at random in the hands of the multitude, their deciſion would be wild and capricious, and a new rule of action would be every day eſtabliſhed in our courts. It is wiſely therefore ordered, that the principles and axioms of law, which are general propoſitions flowing from abſtracted reaſon, and not accommodated to times or to men, ſhould be depoſited in the breaſts of the judges, to be occaſionally applied to ſuch facts as come properly aſcertained before them. For here partiality can have little ſcope; the law is well known, and is the ſame for all ranks and degrees: it follows as a regular concluſion from the premiſſes of fact pre-eſtabliſhed. But in ſettling and adjuſting a queſtion of fact, when intruſted to any ſingle magiſtrate, partiality and injuſtice have an ample field to range in, either by boldly aſſerting that to be proved which is not ſo, or more artfully by ſuppreſſing ſome circumſtances, ſtretching and warping others, and diſtinguiſhing away the remainder. Here therefore a competent number of ſenſible and upright jurymen, choſen by lot from among thoſe of the middle rank, will be found the beſt inveſtigators of truth, and the ſureſt guardians of public juſtice. For the moſt powerful individual in the ſtate will be cautious of committing any flagrant invaſion of another's right, when he knows that the fact of his oppreſſion muſt be examined and decided by 12 indifferent men not appointed till the hour of trial; and that when once the fact is aſcertained, the law muſt of courſe redreſs it. This therefore preſerves in the hands of the people that ſhare which they ought to have in the adminiſtration of public juſtice, and prevents the encroachments of the more powerful and wealthy citizens.

Trial.

Criminal TRIALS. The regular and ordinary method of proceeding in the courts of criminal juriſdiction may be diſtributed under 12 general heads, following each other in a progreſſive order: viz. 1. Arreſt; 2. Commitment and bail; 3. Proſecution; 4. Proceſs; 5. Arraignment, and its incidents; 6. Plea, and iſſue; 7. Trial, and conviction; 8. Clergy; 9. Judgment, and its conſequences; 10. Reverſal of judgment; 11. Reprieve, or pardon; 12. Execution. See ARREST, COMMITMENT, PRESENTMENT, INDICTMENT, INFORMATION, APPEAL, *Process upon an Indictment*, ARRAIGNMENT, and PLEA; in which articles all the forms which precede the trial are deſcribed, and are here enumerated in the proper order.

The ſeveral methods of trial and conviction of offenders, eſtabliſhed by the laws of England, were formerly more numerous than at preſent, through the ſuperſtition of our Saxon anceſtors; who, like other northern nations, were extremely addicted to divination; a character which Tacitus obſerves of the ancient Germans. They therefore invented a conſiderable number of methods of purgation or trial, to preſerve innocence from the danger of falſe witneſſes, and in conſequence of a notion that God would always interpoſe miraculouſly to vindicate the guiltleſs; as, 1. By ORDEAL; 2. By CORSNED; 3. By BATTEL. See theſe articles.

4. A fourth method is that by the *peers of Great Britain*, in the *Court of* PARLIAMENT; or the *Court of the Lord High* STEWARD, when a peer is capitally indicted; for in caſe of an appeal, a peer ſhall be tried by jury. This differs little from the trial *per patriam*, or by jury; except that the peers need not all agree in their verdict; and except alſo, that no ſpecial verdict can be given in the trial of a peer; becauſe the lords of parliament, or the lord high ſteward (if the trial be had in his court), are judges ſufficiently competent of the law that may ariſe from the fact; but the greater number, conſiſting of 12 at the leaſt, will conclude, and bind the minority.

The trial by jury, or the country, *per patriam*, is alſo that trial by the peers of every Briton, which, as the great bulwark of his liberties, is ſecured to him by the great charter: *nullus liber homo capitatur, vel impriſonetur, aut exulet, aut aliquo alio modo deſtruatur, niſi per legale judicium parium ſuorum, vel per legem terræ.*

When therefore a priſoner on his ARRAIGNMENT has pleaded not guilty, and for his trial hath put himſelf upon the country, which country the jury are, the ſheriff of the county muſt return a panel of jurors, *liberos et legales homines, de viceneto*; that is, freeholders without juſt exception, and of the *viſne* or neighbourhood; which is interpreted to be of the county where the fact is committed. If the proceedings are before the court of king's bench, there is time allowed between the arraignment and the trial, for a jury to be impanelled by writ of *venire facias* to the ſheriff, as in civil cauſes; and the trial in caſe of a miſdemeanor is had at *niſi prius*, unleſs it be of ſuch conſequence as to merit a trial at bar; which is always invariably had when the priſoner is tried for any capital offence. But, before commiſſioners of oyer and terminer and gaol delivery, the ſheriff, by virtue of a general precept directed to him beforehand, returns to the court a panel of 48 jurors to try all felons that may be called upon their trial at that ſeſſion; and therefore it is there uſual to try all felons immediately or ſoon after their ar-

Trial. arraignment. But it is not cuſtomary, nor agreeable to the general courſe of proceedings, unleſs by conſent of parties, to try perſons indicted of ſmaller miſdemeanors at the ſame court in which they have pleaded not guilty, or traverſed the indictment. But they uſually give ſecurity to the court to appear at the next aſſizes or ſeſſion, and then and there to try the traverſe, giving notice to the proſecutor of the ſame.

In caſes of high-treaſon, whereby corruption of blood may enſue (except treaſon in counterfeiting the king's coin or ſeals), or miſpriſion of ſuch treaſon, it is enacted by ſtatute 7 W. III. c. 3. firſt that no perſon ſhall be tried for any ſuch treaſon, except an attempt to aſſaſſinate the king, unleſs the indictment be found within three years after the offence committed: next, that the priſoner ſhall have a copy of the indictment (which includes the caption), but not the names of the witneſſes, five days at leaſt before the trial, that is, upon the true conſtruction of the act, before his arraignment; for then is his time to take any exceptions thereto, by way of plea or demurrer: thirdly, that he ſhall alſo have a copy of the panel of jurors two days before his trial: and, laſtly, that he ſhall have the ſame compulſive proceſs to bring in his witneſſes for him, as was uſual to compel their appearance againſt him. And by ſtatute 7 Ann. c. 21. (which did not take place till after the deceaſe of the late pretender) all perſons indicted for high-treaſon, or miſpriſions thereof, ſhall have not only a copy of the indictment but a liſt of all the witneſſes to be produced, and of the jurors impanelled, with their profeſſions and places of abode, delivered to him ten days before the trial, and in the preſence of two witneſſes, the better to prepare him to make his challenges and defence. And no perſon indicted for felony is, or (as the law ſtands) ever can be, entitled to ſuch copies before the time of his trial.

When the trial is called on, the jurors are to be ſworn as they appear, to the number of 12, unleſs they are challenged by the party.

Challenges may here be made, either on the part of the king, or on that of the priſoner: and either to the whole array, or to the ſeparate polls, for the very ſame reaſons that they may be made in civil cauſes. But in criminal caſes, or at leaſt in capital ones, there is, *in favorem vitæ*, allowed to the priſoner an arbitrary and capricious ſpecies of challenge, to a certain number of jurors, without ſhowing any cauſe at all; which is called a *peremptory* challenge; a proviſion full of that tenderneſs and humanity to priſoners for which our Engliſh laws are juſtly famous. This is grounded on two reaſons. 1. As every one muſt be ſenſible what ſudden impreſſions and unaccountable prejudices we are apt to conceive upon the bare looks and geſtures of another; and how neceſſary it is that a priſoner (when put to defend his life) ſhould have a good opinion of his jury, the want of which might totally diſconcert him; the law wills not that he ſhould be tried by any one man againſt whom he has conceived a prejudice, even without being able to aſſign a reaſon for ſuch his diſlike. 2. Becauſe, upon challenges for cauſe ſhown, if the reaſon aſſigned prove inſufficient to ſet aſide the juror, perhaps the bare queſtioning his indifference may ſometimes provoke a reſentment; to prevent all ill conſequences from which, the priſoner is ſtill at liberty, if he pleaſes, peremptorily to ſet him aſide.

The peremptory challenges of the priſoner muſt, however, have ſome reaſonable boundary; otherwiſe he might never be tried. This reaſonable boundary is ſettled by the common law to be the number of 35; that is, one under the number of three full juries.

If by reaſon of challenges or the default of the jurors, a ſufficient number cannot be had of the original panel, a tales may be awarded as in civil cauſes, till the number of 12 is ſworn, "well and truly to try, and true deliverance make, between our ſovereign lord the king and the priſoner whom they have in charge; and a true verdict to give, according to their evidence."

Trial ‖ Triangle.

When the jury is ſworn, if it be a cauſe of any conſequence, the INDICTMENT is uſually opened, and the evidence marſhalled, examined, and enforced by the counſel for the crown or proſecution. But it is a ſettled rule at common law, that no counſel ſhall be allowed a priſoner upon his trial upon the general iſſue, in any capital crime, unleſs ſome point of law ſhall ariſe proper to be debated. A rule which (however it may be palliated under cover of that noble declaration of the law, when rightly underſtood, that the judge ſhall be counſel for the priſoner; that is, ſhall ſee that the proceedings againſt him are legal and ſtrictly regular) ſeems to be not at all of a piece with the reſt of the humane treatment of priſoners by the Engliſh law. For upon what face of reaſon can that aſſiſtance be denied to ſave the life of a man, which yet is allowed him in proſecutions for every petty treſpaſs? Nor indeed is it, ſtrictly ſpeaking, a part of our ancient law; for the Mirrour, having obſerved the neceſſity of counſel in civil ſuits, "who know how to forward and defend the cauſe by the rules of law, and cuſtoms of the realm," immediately afterwards ſubjoins, "and more neceſſary are they for defence upon indictments and appeals of felony, than upon other venial cauſes." And, to ſay the truth, the judges themſelves are ſo ſenſible of this defect in our modern practice, that they ſeldom ſcruple to allow a priſoner counſel to ſtand by him at the bar, and to inſtruct him what queſtions to aſk, or even to aſk queſtions for him, with regard to matters of fact; for as to matters of law ariſing on the trial, they are entitled to the aſſiſtance of counſel. But ſtill this is a matter of too much importance to be left to the good pleaſure of any judge, and is worthy the interpoſition of the legiſlature; which has ſhown its inclination to indulge priſoners with this reaſonable aſſiſtance, by enacting, in ſtatute 7 W. III. c. 3. that perſons indicted for ſuch high-treaſon as works a corruption of the blood or miſpriſion thereof (except treaſon in counterfeiting the king's coins or ſeals), may make their full defence by counſel, not exceeding two, to be named by the priſoner, and aſſigned by the court or judge; and this indulgence, by ſtatute 20 Geo. II. c. 30. is extended to parliamentary impeachments for high-treaſon, which were excepted in the former act.

When the evidence on both ſides is cloſed, the jury cannot be diſcharged (unleſs in caſes of evident neceſſity) till they have given in their VERDICT. If they find the priſoner not guilty, he is then for ever quit and diſcharged of the accuſation, except he be appealed of felony within the time limited by law. And upon ſuch his acquittal, or diſcharge for want of proſecution, he ſhall be immediately ſet at large without payment of any fee to the gaoler. But if the jury find him guilty, he is then ſaid to be convicted of the crime whereof he ſtands indicted. See the article CONVICTION; and, ſubſequent thereto, the article JUDGMENT, ATTAINDER, FORFEITURE, EXECUTION, alſo *Benefit of Clergy*, REPRIEVE, PARDON.

TRIAL, in Scotland. See *Scots Law*.

TRIANDRIA (from τρεις "three," and ἀνηρ "a man or huſband)," the name of the third claſs in Linnæus's ſexual ſyſtem, conſiſting of plants with hermaphrodite flowers, which have three ſtamina or male organs.

TRIANGLE, in geometry, a figure of three ſides and three angles.

Tribe || Trichecus.

TRIBE, in antiquity, a certain quantity or number of perſons, when a diviſion was made of a city or people into quarters or diſtricts.

TRIBRACHYS, in ancient poetry, a foot conſiſting of three ſyllables, and theſe all ſhort; as, *melius*.

TRIBUNAL, in general, denotes the ſeat of a judge, called in our courts *bench*.

TRIBUNE, among the ancient Romans, a magiſtrate choſen out of the commons, to protect them againſt the oppreſſions of the great, and to defend the liberty of the people againſt the attempts of the ſenate and conſuls.

The tribunes of the people were firſt eſtabliſhed in the year of Rome 259. The firſt deſign of their creation was to ſhelter the people from the cruelty of uſurers, and to engage them to quit the Aventine mount, whither they had retired in diſpleaſure.

Their number at firſt was but two; but the next year, under the conſulate of A. Poſthumius Aruncius and Caſſius Viſcellinus, there were three more added; and this number of five was afterwards increaſed by L. Trebonius to ten.

Military TRIBUNE, an officer in the Roman army, commander in chief over a body of forces, particularly the diviſion of a legion; much the ſame with our colonel, or the French maitre de camp.

TRIBUTARY, one who pays tribute to another, in order to live in peace with him or ſhare in his protection.

TRIBUTE, a tax or impoſt which one prince or ſtate is obliged to pay to another as a token of dependence, or in virtue of a treaty, and as a purchaſe of peace.

TRICEPS, in anatomy. See there, *Table of the Muscles*.

TRICHECUS, WALRUS; a genus of aquatic animals belonging to the claſs of *mammalia*, and order of *bruta*. This genus has no fore-teeth, when full grown: has two great tuſks in the upper jaw, which point downwards: has grinders on each ſide in both jaws, which are compoſed of furrowed bones. The body is oblong; the lips are doubled; and the hind legs are ſtretched backwards, and, as it were, bound together, forming a kind of tail fitted for ſwimming. There are three ſpecies; the roſmarus, dugon, and manatus.

1. The *roſmarus*, morſe, or ſea-horſe, has a round head; ſmall mouth; very thick lips, covered above and below with pellucid briſtles as thick as a ſtraw; ſmall fiery eyes; two ſmall orifices inſtead of ears; ſhort neck; body thick in the middle, tapering towards the tail; ſkin thick, wrinkled, with ſhort browniſh hairs thinly diſperſed; legs ſhort, five toes on each, all connected by webs, and ſmall nails on each: the hind feet are very broad; each leg looſely articulated: the hind legs generally extended on a line with the body: the tail is very ſhort; penis long: length of the animal from noſe to tail ſometimes 18 feet and 10 or 12 round in the thickeſt part: the teeth have been ſometimes found of the weight of 30 lb. each. Teeth of this ſize are only found on the coaſt of the Icy Sea, where the animals are ſeldom moleſted, and have time to attain their full growth. See Plate DX. fig. 1.

They inhabit the coaſt of Spitzbergen, Nova Zembla, Hudſon's Bay, and the gulph of St Lawrence; and the Icy Sea, as far as Cape Tſchuktſchi. They are gregarious; in ſome places appearing in herds of hundreds. They are ſhy animals, and avoid places which are much haunted by mankind; but are very fierce. If wounded in the water, they attempt to ſink the boat, either by riſing under it, or by ſtriking their great teeth into the ſides; they roar very loud, and will follow the boat till it gets out of ſight. Numbers of them are often ſeen ſleeping on an iſland of ice; if awaked, they fling themſelves with great impetuoſity into the ſea; at which time it is dangerous to approach the ice, leſt they ſhould tumble into the boat and overſet it. They do not go upon the land till the coaſt is clear of ice. At particular times they land in amazing numbers: the moment the firſt gets on ſhore, ſo as to lie dry, it will not ſtir till another comes and forces it forward by beating it with its great teeth; this is ſerved in the ſame manner by the next; and ſo in ſucceſſion till the whole is landed; continuing tumbling over one another, and forcing the foremoſt, for the ſake of quiet, to remove farther up. Trichecus.

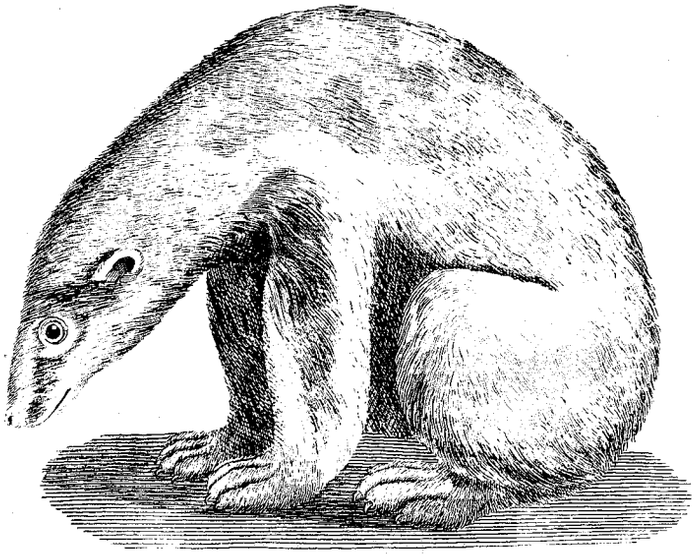
They are killed for the ſake of their oil, one walrus producing about half a tun. The knowledge of this chace is of great antiquity; Oether the Norwegian, about the year 890, made a report of it to king Alfred, having, as he ſays, made the voyage beyond Norway, for *the more commoditie of fiſhing of horſe-whales, which have in their teeth bones of great price and excellency, whereof he brought ſome at his return unto the king*. In fact, it was in the northern world, in early times, the ſubſtitute to ivory, being very white and very hard. Their ſkins, Oether ſays, were good to cut into cables. M. de Buffon ſays, he has ſeen braces for coaches made of the ſkin, which were both ſtrong and elaſtic. Hakluits's Col. Voy. i. 5.

They bring one, or at moſt two, young at a time: they feed on ſea herbs and fiſh; alſo on ſhells, which they dig out of the ſand with their teeth: they are ſaid alſo to make uſe of their teeth to aſcend rocks or pieces of ice, faſtening them to the cracks, and drawing their bodies up by that means. Beſides mankind, they ſeem to have no other enemy than the white bear, with whom they have terrible combats: but generally come off victorious, by means of their great teeth.

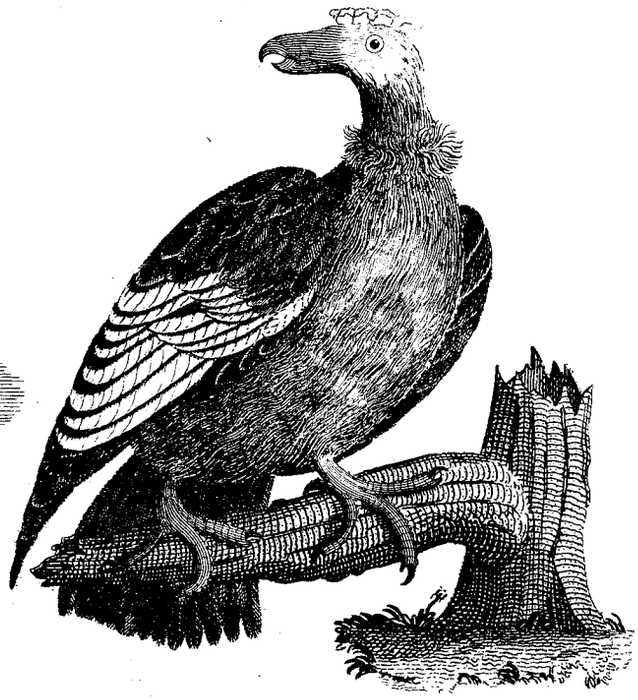
In Captain Cook's Voyages we have the following affecting account of their parental attachment to their young. "On the approach of the boats towards the ice, they took their young ones under their fins, and attempted to eſcape with them into the ſea. Some, whoſe cubs were killed or wounded, and left floating upon the ſurface of the water, roſe again, and carried them down, ſometimes juſt as our men were on the point of taking them into the boat; and could be traced bearing them to a conſiderable diſtance through the water, which was ſtained with their blood. They were afterwards obſerved bringing them, at intervals, above the ſurface, as if for air, and again plunging under it, with a horrid bellowing. The female, in particular, whoſe young one had been killed, and taken into the boat, became ſo furious, that ſhe even ſtruck her two tuſks through the bottom of the cutter."

2. The *dugon*, or Indian walrus, is diſtinguiſhed by the tuſks which extend out of the mouth from the upper jaw being placed near each other. It inhabits the ſeas lying between the Cape of Good Hope and the Philippine iſlands. This animal, ſo far as can be known, reſembles the morſe very much: the head is, however, more lengthened and narrower; the noſtrils are large, and placed higher; like the former ſpecies, there are no tuſks in the under jaw, but thoſe in the upper jaw, as has been already obſerved, are placed near each other, bent outwards, and reſemble cutting teeth, only that they are near ſix inches long; there are four grinders on each ſide in the upper jaw, and three in the lower; theſe laſt are diſtant from the tuſks, and are broader than thoſe of the morſe: the female has two teats on the breaſt: the chin has a briſtly beard; the ears are ſhort; the feet broad; and the legs ſo ſhort that the belly trails on the ground. When full grown, the animal is ſix ells in length; the male being rather larger than the female, which has breaſts like a woman: It feeds on a green ſea moſs or wood, which grows near the ſhore. The figure, manners, and

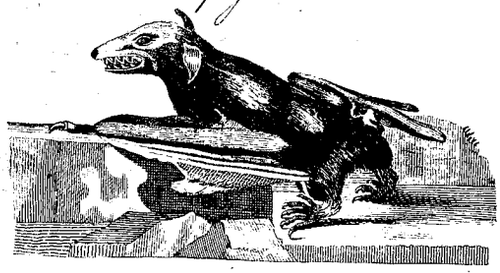
White bear



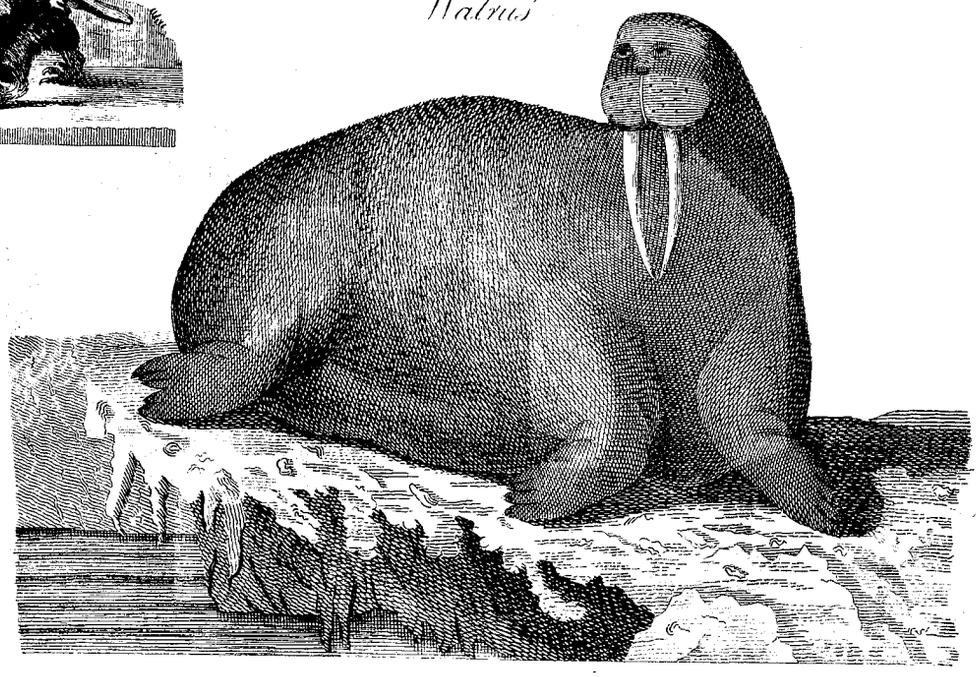
Gryphus



Vampyre



Walrus



Hardie

Trichecus. and hiſtory of this animal, are very imperfectly known; but we are informed that its fleſh eats like beef.

3. *Manatus*, fiſh-tailed walrus, or ſea-cow, has no tuſks, and no hind feet. Of this ſpecies there are two varieties; the auſtralis or lamantin, and the borealis or whale-tailed manati. The lamantin inhabits the African and American ſeas, particularly near the mouths of rivers, which they frequently enter, ſeldom going far from the ſhore. The lamantin varies in ſize from eight to ſeventeen feet long, is ſix or ſeven in circumference, and from 500 to 800 pounds weight: the ſkin of a dark or black aſh-colour; there are nine ſquare ſhaped grinders on each ſide in each jaw, which are covered with a glaſſy cruſt of enamel; the back bone has 50 joints or vertebræ: it is a thick clumſy animal, having no properly diſtinct neck, as the body continues almoſt of an equal thickneſs to the head. The female has two teats placed near the arm-pits. This animal never comes on ſhore, but frequents the mouths of large rivers, brouzing on the graſs which grows cloſe to the water. There ſeems to be two varieties, differing conſiderably in ſize. The larger frequents the ſeas near the mouths of large rivers; and the ſmaller is found higher up the ſame rivers, and in inland freſh water lakes, but never goes to the ſea.

We are told that this animal is often tamed by the native inhabitants of America, and that it delights in muſic; hence, according to ſome authors, it is probably the delphinus or dolphin of the ancients: and ſome believe, that what has been written concerning mermaids and ſirens muſt be referred to this animal. It has a voracious appetite, and is perpetually eating: it is monogamous, or lives in families of one male, one female, a half grown and a very ſmall young one; copulates in the ſpring, the female at firſt flying in various playful circles, and then throwing herſelf on her back to receive the male; when paſturing on the aquatic plants, the back is often above water; and, as the ſkin is full of a ſpecies of louſe, numbers of ſea fowls perch on them, to pick out the inſects. They bellow like bulls: their ſight is very weak, but their hearing extremely acute; the fore-feet are palmated and fin-ſhaped, almoſt like thoſe of a ſea-turtle; and inſtead of hind-feet they have a horizontal tail; they have no external ears; the noſtrils are diſtinct, and at a diſtance from each other; the females have two teats about the breaſt; the upper lip is full of ſharp, prickly, rigid briſtles. This animal has great affinity to the whale and ſeal tribes. The fleſh is very good eating.

The whale-tailed manati inhabits the north-weſt coaſt of America, the north-eaſt of Aſia, and the iſlands which lie between theſe two coaſts. This animal very often enters the mouths of the rivers; is ſometimes 23 feet long, and weighs 8000 pounds; the ſkin, while wet, is of a brown colour, but becomes black when dry. Inſtead of grinders, this ſpecies has on each ſide of each jaw, a large rugged bone. The back-bone has 60 vertebræ or joints: the body is very clumſy, and much deformed; its circumference at the ſhoulders is 12 feet, at the belly 20, and near the tail only four; the neck is near ſeven feet round, and the head only 31 inches.

They live perpetually in the water, and frequent the edges of the ſhores; and in calm weather ſwim in droves near the mouths of rivers: in the time of flood they come ſo near the land, that a perſon may ſtroke them with his hand: if hurt, they ſwim out to ſea; but preſently return again. The females oblige the young to ſwim before them, while the other old ones ſurround, and as it were guard them on all ſides. The affection between the male and female is very great: for if ſhe is attacked, he will defend her to the utmoſt: and if ſhe is killed, will follow her corpſe to the very ſhore, and ſwim for ſome days near the place it has been landed at. They copulate in the ſpring, Trichecus. in the ſame manner as the human kind, eſpecially in calm weather, towards the evening. The female ſwims gently about; the male purſues; till, tired with wantoning, ſhe flings herſelf on her back, and admits his embraces. Steller thinks they go with young about a year; it is certain that they bring but one young at a time, which they ſuckle by two teats placed between the breaſts. They are vaſtly voracious and gluttonous; and feed not only on the fuci that grow in the ſea, but ſuch as are flung on the edges of the ſhore. When they are filled, they fall aſleep on their backs. During their meals, they are ſo intent on their food, that any one may go among them and chooſe which he likes beſt. Peter Martyr gives an inſtance of one that lived in a lake of Hiſpaniola for 25 years, and was ſo tame as to come to the edge of the ſhore on being called; and would even perform the part of a ferry, and carry ſeveral people at a time on its back to the oppoſite ſhore.—Their back and their ſides are generally above water.

Trident.

They continue in the Kamtſchatkan and American ſeas the whole year; but in winter are very lean, ſo that you may count their ribs. They are taken by harpoons faſtened to a ſtrong cord; and after they are ſtruck, it requires the united force of 30 men to draw them on ſhore. Sometimes when they are transfixed, they will lay hold of the rocks with their paws, and ſtick ſo faſt as to leave the ſkin behind before they can be forced off. When a manati is ſtruck, its companions ſwim to its aſſiſtance; ſome will attempt to overturn the boat by getting under it; others will preſs down the rope, in order to break it; and others will ſtrike at the harpoons with their tails, with a view of getting it out, in which they often ſucceed. They have not any voice; but make a noiſe by hard breathing like the ſnorting of a horſe.

The ſkin is very thick, black, and full of inequalities, like the bark of oak, and ſo hard as ſcarce to be cut with an axe, and has no hair on it: beneath the ſkin is a thick blubber, which taſtes like oil of almonds. The fleſh is coarſer than beef, and will not ſoon putrefy. The young ones taſte like veal. The ſkin is uſed for ſhoes, and for covering the ſides of boats.

TRICHOMANES, in botany; a genus of plants belonging to the claſs of *cryptogamia*, and order of *filices*. The parts of fructification are ſolitary, and terminated by a ſtyle like a briſtle, on the very edge of the leaf. There are 13 ſpecies; of which two are natives of Britain, the pixidiferum and tunbrigenſe.

1. *Pixidiferum*, or cup-trichomanes, has ſub-bipinnated leaves, the pinnæ being alternate, cloſe-lobed, and linear. It is found among ſtones in wet grounds in England. 2. *Tunbrigenſe*, or Tunbridge trichomanes, has pinnated leaves, the pinnæ being oblong, dichotomous, decurrent, and dentated. It is found in the fiſſures of moiſt rocks in Wales, and in many rocky places in Scotland.

TRICOCCEÆ (τρεις "three," and κοκκος "a grain"), the name of the 38th order in Linnæus's Fragments of a Natural Method, conſiſting of plants with a ſingle three-cornered capſule, having three cells, or internal diviſions, each containing a ſingle ſeed. See BOTANY, vol. iii. page 466.

TRICOSANTHES, in botany: A genus of plants belonging to the claſs of *monœcia*, and order of *ſyngeneſia*; and in the natural ſyſtem ranging under the 34th order, *Cucurbitaceæ*. There are four ſpecies; only one of which is cultivated in the Britiſh gardens, the *anguina* or ſnake-gourd, which is a native of China, an annual, and of the cucumber tribe.

TRIDENT, an attribute of Neptune, being a kind of ſceptre which the painters and poets put into the hands of

Triennial ‖ Trifolium.

that god, in form of a ſpear or fork with three teeth; whence the word.

TRIENNIAL, an epithet applied chiefly to officers or employments which laſt for three years.

TRIENS, in antiquity, a copper money of the value of one third of an *as*, which on one ſide bore a Janus's head, and on the other a water rat.

TRIENTALIS, Chickweed winter-green, in botany: A genus of plants belonging to the claſs of *heptandria*, and order of *monogynia*; and in the natural ſyſtem ranging under the 20th order, *Rotaceæ*. The calyx is heptaphyllous; the corolla is equal and plane, and is divided into ſeven ſegments; the berry is unilocular and dry. There is only one ſpecies, the *europæa*; which is indigenous, and the only genus of heptandria that is ſo.

The ſtalk is ſingle, five or ſix inches high, terminated with five, ſix, or ſeven, oval pointed leaves; from the centre of which ariſe on long footſtalks commonly two white ſtarry flowers, each generally conſiſting of ſeven oval and equal petals, ſucceeded by a globular dry berry, covered with a thin white rind, having one cell, and containing ſeveral angular ſeeds.

TRIERS, or Treves. See Treves.

TRIFOLIUM, Trefoil, or *Clover*, in botany: A genus of plants belonging to the claſs of *diadelphia*, and order of *decandria*; and in the natural ſyſtem ranging under the 32d order, *Papilionaceæ*. The flowers are generally in round heads; the pod is ſcarcely longer than the calyx, univalve, not opening, deciduous. The leaves are three together. According to Murray's edition of Linnæus, there are 46 ſpecies; of which 17 are natives of Britain. We ſhall deſcribe ſome of the moſt remarkable of theſe:

1. *Meliloti officinalis*, or melilot, has naked racemous pods, diſpermous, wrinkly, and acute, with an erect ſtalk. It grows in corn-fields and by the way-ſides, but not common. The ſtalk is erect, firm, ſtriated, branched, and two or three feet high: the leaves ternate, ſmooth, obtuſely oval, and ſerrated: the flowers are ſmall, yellow, pendulous, and grow in long cloſe ſpikes at the tops of the branches: the pod is very ſhort, turgid, tranſverſely wrinkled, pendulous, and contains either one or two ſeeds. The plant has a very peculiar ſtrong ſcent, and diſagreeable, bitter, acrid taſte, but ſuch, however, as is not diſagreeable to cattle. The flowers are ſweet ſcented. It has generally been eſteemed emollient and digeſtive, and been uſed in fomentations and cataplaſms, particularly in the plaſter employed in dreſſing bliſters; but is now laid aſide, as its quality is found to be rather acrid and irritating than emollient or reſolvent. It communicates a moſt loathſome flavour to wheat and other grain, ſo as to render it unfit for making bread. It grows in corn-fields.

2. *Trifolium repens* white creeping trefoil, or Dutch clover, has a creeping ſtalk, its flower gathered into an umbellar head, and its pods tetraſpermous. It is very common in fields and paſtures. It is well known to be excellent fodder for cattle; and the leaves are a good ruſtic hygrometer, as they are always relaxed and flaccid in dry weather, but erect in moiſt or rainy.

3. *Trifolium pratenſe*, purple or red clover, is diſtinguiſhed by denſe ſpikes, unequal corollas, by bearded ſtipulas, aſcending ſtalks, and by the calyx having four equal teeth. This is the botanical deſcription of this ſpecies given by Mr Afzelius, who, in a paper of the firſt volume of the Linnæan Tranſactions, has been at much pains to remove three ſpecies of the trifolium from the confuſion in which they have been long involved; namely, the pratenſe, medium, and alpeſtre. The red clover is common in meadows and paſtures, and is the ſpecies which is generally cultivated for food as cattle. It abounds in every part of Europe, in North America, and even in Siberia. It delights moſt in rich, moiſt, and ſunny places; yet flouriſhes in dry, barren, and ſhady places. For an account of the mode of cultivating it, ſee Agriculture, n° 177.

Trigs. ‖ Trigonella.

4. *Alpeſtre*, long-leaved purple trefoil, or mountain clover, is thus characterized by Mr Afzelius. The ſpikes are denſe: the corollas ſomewhat equal; the ſtipulas are briſtly and divergent; the leaflets lanceolated; the ſtalks ſtiff, ſtraight, and very ſimple. It grows in dry, mountainous, woody places, in Hungary, Auſtria, and Bohemia, &c.; but is not ſaid by Mr Afzelius to be a native of Britain.

5. The *medium*, according to Mr Afzelius, has alſo been confounded with the two ſpecies laſt mentioned; but it is to be diſtinguiſhed from them by having looſe ſpikes, corollas ſomewhat equal, ſtipulas ſubulate and connivent, and ſtalks flexuous and branched. It is found in dry elevated ſituations, eſpecially among ſhrubs, or in woods where the ſoil is chalky or clay, in England, Scotland, Sweden, Denmark, &c.

For a botanical deſcription of the other ſpecies of the trifolium, ſee Lightfoot's *Flora Scotica*, Berkenhout's Synopſis of the Natural Hiſtory of Great Britain and Ireland, and Withering's Botanical Arrangements.

TRIGA, in antiquity, denotes a kind of carr or chariot drawn by three horſes; whence the name.

TRIGLA, in ichthyology, a genus of fiſhes belonging to the order of thoracici. The head is loricated with rough lines, and there are ſeven rays in the membranes of the gills. There are 11 ſpecies; of which the principal are the gurnardus, or grey gurnard; the cuculus, or red gurnard; the lyra, or piper; and the hirundo, or ſapphirine gurnard.

TRIGLOCHIN, in botany: A genus of plants belonging to the claſs of *hexandria*, and order of *trigynia*; and in the natural ſyſtem ranging under the fifth order, *Tripelatoideæ*. The calyx is triphyllous; the petals are three; there is no ſtyle; the capſule opens at the baſe. There are three ſpecies; of which the paluſtre and maritimum are Britiſh.

1. *Paluſtre*, or arrow-headed graſs, has an oblong trilocular capſule. The ſtalk is ſimple, eight or ten inches high; the leaves long and narrow; the flowers are greeniſh, and grow at the end of a long ſpike. It is frequent in moiſt ground.

2. *Maritimum*, or ſea-ſpiked graſs, has ovate ſexlocular capſules; the ſtalk is ſhort; the ſpike long, and flowers purpliſh. It is frequent on the ſea-coaſts. Linnæus ſays that cattle eat theſe two ſpecies with avidity.

TRIGLYPHS, in architecture, a ſort of ornaments repeated at equal intervals, in the Doric freeze.

Dialing Trigon. See Dialing.

TRIGONALIS. See Pila.

TRIGONELLA, Fenugreek, in botany: A genus of plants belonging to the claſs of *diadelphia*, and order of *decandria*; and in the natural ſyſtem arranged under the 32d order, *Papilionaceæ*. The vexillum and alæ are nearly equal and patent, reſembling a tripetalous corolla. There are 12 ſpecies; of which the moſt remarkable is the *fænumgræcum*, or fenugreek, a native of Montpelier in France.

Fenugreek is an annual plant, which riſes with a hollow, branching, herbaceous ſtalk, a foot and a half long, garniſhed with trifoliate leaves, placed alternately, whoſe lobes are oblong, oval, indented on their edges, and have broad furrowed footſtalks.

Fenugreek ſeeds have a ſtrong diſagreeable ſmell, and an unctuous farinaceous taſte accompanied with a ſlight bitteriſhneſs. The principal uſe of theſe ſeeds is in cataplaſms and fomentations, for ſoftening, maturing, and diſcuſſing tumours; and in emollient and carminative glyſters. They are an ingredient in the *oleum e mucilaginibus* of the ſhops, to which they communicate a conſiderable ſhare of their ſmell.

TRIGONOMETRY,

Plane. THE art of measuring the sides and angles of triangles, either plane or spherical, whence it is accordingly called either PLANE TRIGONOMETRY, or SPHERICAL TRIGONOMETRY.

Trigonometry is an art of the greatest use in the mathematical sciences, especially in astronomy, navigation, surveying, dialing, geography, &c. &c. By it we come to know the magnitude of the earth, the planets and stars, their distances, motions, eclipses, and almost all other useful arts and sciences. Accordingly we find this art has been cultivated from the earliest ages of mathematical knowledge.

Trigonometry, or the resolution of triangles, is founded on the mutual proportions which subsist between the sides and angles of triangles; which proportions are known by finding the relations between the radius of a circle and certain other lines drawn in and about the circle, called *cords*, *sines*, *tangents*, and *secants*. The ancients, Menelaus, Hipparchus, Ptolemy, &c. performed their trigonometry by means of the cords. As to the sines, and the common theorems relating to them, they were introduced into trigonometry by the Moors or Arabians, from whom this art passed into Europe, with several other branches of science. The Europeans have introduced, since the 15th century, the tangents and secants, with the theorems relating to them.

The proportion of the sines, tangents, &c. to their radius, is sometimes expressed in common or natural numbers, which constitute what we call the *tables of natural sines, tangents, and secants*. Sometimes it is expressed in logarithms, being the logarithms of the said natural sines, tangents, &c.; and these constitute the table of *artificial sines*, &c. Lastly, sometimes the proportion is not expressed in numbers; but the several sines, tangents, &c. are actually laid down upon lines of scales; whence the *line of sines, of tangents*, &c.

In trigonometry, as angles are measured by arcs of a circle described about the angular point, so the whole circumference of the circle is divided into a great number of parts: as 360 degrees, and each degree into 60 minutes, and each minute into 60 seconds, &c.; and then any angle is said to consist of so many degrees, minutes, and seconds, as are contained in the arc that measures the angle, or that is intercepted between the legs or sides of the angle.

Now the sine, tangent, and secant, &c. of every degree and minute, &c. of a quadrant, are calculated to the radius 1, and ranged in tables for use; as also the logarithms of the same; forming the triangular canon. And these numbers, so arranged in tables, from every species of right-angled triangles; so that no such triangle can be proposed, but one similar to it may be there found, by comparison with which the proposed one may be computed by analogy or proportion.

PLANE TRIGONOMETRY.

THERE are usually three methods of resolving triangles, or the cases of trigonometry; viz. geometrical construction, arithmetical computation, and instrumental operation. In the 1st method, the triangle in question is constructed by drawing and laying down the several parts of their magnitudes given, viz. the sides from a scale of equal parts, and the angles from a scale of cords or other instrument; then the unknown parts are measured by the same scales, and so they become known.

In the 2d method, having stated the terms of the proportion according to rule, which terms consist partly of the numbers of the given sides, and partly of the sines, &c. of angles taken from the tables, the proportion is then resolved like all other proportions, in which a 4th term is to be found from three given terms, by multiplying the 2d and 3d together, and dividing the product by the 1st. Or, in working with the logarithms, adding the logarithm of the 2d and 3d terms together, and from the sum subtracting the logarithm of the 1st term; then the number answering to the remainder is the 4th term sought. Plane.

To work a case instrumentally, as suppose by the logarithm lines on one side of the two foot scales: Extend the compasses from the 1st term to the 2d or 3d, which happens to be of the same kind with it; then that extent will reach from the other term to the 4th. In this operation, for the sides of triangles, is used the line of numbers (marked Num.); and for the angles, the line of sines or tangents (marked sin. and tan.) according as the proportion respects sines or tangents. See SECTOR.

In every case of plane triangles there must be three parts, one at least of which must be a side. And then the different circumstances, as to the three parts that may be given, admit of three cases or varieties only; viz.

1st, When two of the three parts given are a side and its opposite angle. 2d, When there are given two sides and their contained angle. 3d, And, thirdly, when the three sides are given.

To each of these cases there is a particular rule or proportion adapted for resolving it by.

1st, *The Rule for the 1st Case*, or that in which, of the three parts that are given, an angle and its opposite side are two of them, is this, viz. that the sides are proportional to the sines of their opposite angles; that is,

As one side given :
To the sine of its opposite angle : :
So is another side given :
To the sine of its opposite angle.

Or,

As the sine of an angle given :
To its opposite side : :
So is the sine of another angle given :
To its opposite side.

So that, to find an angle, we must begin the proportion with a given side that is opposite to a given angle; and to find a side, we must begin with an angle opposite to a given side.

Example. Suppose in the triangle BDC (fig. 1.) there be given the side BC = 106, DB = 65, and the angle BCD 31° 49′ given; to find the angle BDC obtuse and the side CD. Plate DXI.

1. *Geometrically by Construction.*

Draw the line BC equal to 106, at C make an angle of 31° 49′ by drawing CD, take 65 in your compasses, and with one foot in B lay the other upon the line CD in D; draw the line BD, and it is done; for the angle D will be 120° 43′, the angle B 27° 28′, and the side DC 56.9 as was required.

2. *Arithmetically by Logarithms.*

As the side BD 65	log.	1.81291
Is to sine angle C 31° 49′		9.72198
So is the side BC 106		2.02531
		11.74729
		1.81291
To sine angle D 120° 43′		9.93438

To

To find DC.

As fine ang. C 31°49′	9.72198	
Is to the fide BD 65	1.81291	
So is fine ang. B 27.28	9.66392	
	11.47683	
	9.72198	
To the fide DC 56.88	1.75485	

180.0	
The fupp. 59.17 of ang. D.	
120.43 angle D.	
31.49 angle C.	
152.32 their fum.	
180.0	
152.32 fum fubt.	
27.28 angle B.	

Here it may be proper to obſerve, that if the given angle be obtuſe, the angle ſought will be acute; but when the given angle is acute, and oppoſite to a leſſer given ſide, then the required angle is doubtful, whether acute or obtuſe; it ought therefore to be determined before the operation. For it is plain the above proportion produces 59° 17′ for the required angle; but as it is obtuſe, its ſupplement to 180 degrees muſt be taken, viz. 120° 43′.

By Gunter.

"The extent from 65 to 106 on the line of numbers will reach from 31° 49′ to 59° 17′ on the line of ſines."

2dly, "The extent from 31° 49′ to 27° 28′ on the line of ſines will reach from 65 to 56.88 on the line of numbers."

Case II. When there are given two ſides and their contained angle, to find the reſt, the rule is this:

As the ſum of the two given ſides :
Is to the difference of the ſides : :
So is the tangent of half the ſum of the two oppoſite angles or cotangent of half the given angle :
To tang. of half the diff. of thoſe angles.

Then the half diff. added to the half ſum, gives the greater of the two unknown angles; and ſubtracted leaves the leſs of the two angles.

Hence, the angles being now all known, the remaining 3d ſide will be found by the former caſe.

Example. The ſide BC = 109, BD = 76 (fig. 2.), and the angle CBD 101° 30′ given, to find the angle BDC or BCD, and the ſide CD.

1. *Geometrically by Conſtruction.*

Draw the line BC 109, and BD, ſo as to make an angle with BC of 101° 30′, and make BD equal to 76; join BC and BD with a right line, and it is done; for the angle D being meaſured by the cord of 60°, will be 47° 32′, angle C 30° 58′, and the ſide DC 144.8, as was required.

2. *Arithmetically by Logarithms.*

Side BC	109	- 109	-	180° 0′
BD	76	- 76	-	101 30
Their ſum	185	33 their diff.		78 30 ſum of the ang. D and C.

½ Sum 39 15 then

To find the angles D and C.

As the ſum of the ſides BC and BD = 185		2.26717
Is to their difference - -	33	1.51851
So is tang. of ½ the ſum of the angles C and D	39°15′	9.91224
		11.43075
		2.26717
To the tang of ½ the diff. of the angles C and D	8°17′	9.16358
To half the ſum of the angles D and C -	39° 15	
Add half the difference of the angles C and D	8 17	
Gives the greater angle D	47 32	
Subtracted, gives the leſſer angle C	30 58	

To find DC.

As fine angle D 47° 32′ - -		9.86786
Is to the fide BC 109 - -		2.03743
So is fine angle B 101° 30′ - -		9 99119
		12.02862
		9.86786
To the fide DC required 144. 8 -		2.16076

3. *By Gunter.*

1ſt, "The extent from 185 to 33 on the line of numbers will reach from 39° 15′ to 8° 17′ on the line of tangents. 2dly, The extent from angle D 47° 32′ to 78° 30′ (the ſupplement of angle B) on the line of ſines, will reach from the ſide BC 109 to 144.8, the ſide DC required, on the line of numbers."

Case III. Is when the three ſides are given, to find the three angles; and the method of reſolving this caſe is, to let a perpendicular fall from the greateſt angle upon the oppoſite ſide or baſe, dividing it into two ſegments, and the whole triangle into two ſmaller right-angled triangles: then it will be,

As the baſe or ſum of the two ſegments :
Is to the ſum of the other two ſides : :
So is the difference of thoſe ſides :
To the difference of the ſegments of the baſe.

Then half this difference of the two ſegments added to the half ſum, or half the baſe, gives the greater ſegment, and ſubtracted gives the leſs. Hence, in each of the two right-angled triangles, there are given the hypothenuſe, and the baſe, beſides the right angle, to find the other angles by the firſt caſe.

Example. The ſides BC (fig. 3.) = 105, BD = 85, and CD = 50, given to find the angles BDC, BCD, or CBD.

1. *Geometrically by Conſtruction.*

Draw the line BC equal to 105, take CD 50 in your compaſſes, and with one foot in C deſcribe an arch; then take BD 85 in your compaſſes, and with one foot in B cut the former arch in D, join BD and DC, and it is done; for the angle B, being meaſured, will be found 28° 4′, angle C 53° 7′, which being added together, is 81° 11′ their ſum ſubtracted from 180, leaves angle D 98° 49′ as was required.

2. *Arithmetically by Logarithms.*

The two ſhorteſt ſides are BD (=85) and CD (= 50), the ſum of which is 135, and their difference 35. The ſegments of the baſe BC are found in this manner:

As the ſide BC	= 105 log.	2.02119
Is to the ſum of the ſides BD & DC	= 135	2.13033
So is their difference	= 35	1.54407
To the difference of the ſeg. of BC	= 45	1.65321

Thus the ſum and difference of the ſegments of the baſe BC being known, we have only to add half this ſum = 52½ to half the difference = 22½, and we ſhall obtain the greater ſegment, which is = 75; which ſubtracted from 105, gives 30 = the ſmaller ſegment. Then

To find the angle BDA.

As the hypothenuſe BD	= 85 log.	1.92943
Is to radius	=	10.00000
So is the greater ſegment	= 75	1.87506
To the ſum of the angle BDA	=	9.94564

The angle BDA therefore is equal to 61° 56′

Let us now find the angle ADC, which is done thus.

As the hypothenuſe DC	= 50 log.	1.69897
Is to radius	=	10.00000
So is the ſmaller ſegment	= 30	1.47712
To the ſine of ADC	=	9.77815

The angle ADC therefore is equal to 36° 53′, and the whole angle BDC = 98° 49′.

To

Plane.

To find the angle at B, we have only to subtract the angle BDA (=61° 56′) from 90°, and the rem. 28° 4′ is the angle sought. The angle at C is equal to 53° 7′.

3. *By Gunter.*

1*st*, 'The extent from 105 to 135, will reach from 35 to 45 on the line of numbers.' 2*dly*, 'The extent from 85 to 75, on the line of numbers, will reach from radius to 61° 56′, the angle BDA on the line of sines.' 3*dly*, 'The extent from 50 to 30 on the line of numbers will reach from radius to angle ADC 36° 53′ on the line of sines.'

The foregoing three cases include all the varieties of plane triangles that can happen, both of right and oblique-angled triangles. But besides these, there are some other theorems that are useful upon many occasions, or suited to some particular forms of triangles, which are often more expeditious in use than the foregoing general ones; one of which, for right-angled triangles, as the case for which it serves so often occurs, may be here inserted, and is as follows.

Case IV. When, in a right-angled triangle, there are given the angles and one leg, to find the other leg, or the hypothenuse. Then it will,

As radius :
To given leg AB : :
So tang. adjacent the angle A :
To the opposite leg BC, and : :
So sec. of same angle A :
To hypot. AC :

Example. In the triangle ABC (fig. 4.), right-angled at B,

Given the leg AB=162
and the angle A = 53° 7′ 48″
conseq. the angle C = 36 52 12
} to find BC and AC.

1. *Geometrically.*—Draw the leg AB=162: Erect the indefinite perpendicular BC: Make the angle A = 53°$\frac{1}{8}$, and the side AC will cut BC in C, and form the triangle ABC. Then, by measuring, there will be found AC= 270, and BC=216.

2. *Arithmetically.*

As radius	= 10 - -	log. 10·0000000
To AB	= 162 - -	2·2095150
So tang. A	= 53° 7′ 48″ - -	10·1249372
To BC	= 216 - -	2·3344522
So sec. A	= 53° 7′ 48″ - -	10·2218477
To AC -	= 270 - - -	2·4313627

3. *By Gunter.*

Extend the compasses from 45° at the end of the tangents (the radius) to the tangent of 53°$\frac{1}{8}$; then that extent will reach, on the line of numbers, from 162 to 216, for BC. Again, extend the compasses from 36° 52′ to 90 on the sines; then that extent will reach, on the line of numbers, from 162 to 270 for AC.

Note, Another method, by making every side radius, is often added by the authors on trigonometry, which is thus: The given right-angled triangle being ABC, make first the hypothenuse AC radius, that is, with the extent of AC as a radius, and each of the centres A and C, describe arcs CD and AE (fig. 5.); then it is evident that each leg will represent the sine of its opposite angle, viz. the leg BC the sine of the arc CD or of the angle A, and the leg AB the sine of the arc AE or of the angle C. Again, making either leg radius, the other leg will represent the tangent of its opposite angle, and the hypothenuse the secant of the same angle; thus, with radius AB and centre A describing the arc BF, BC represents the tangent of that arc, or of the angle A, and the hypothenuse AC the secant of the same; or with the radius BC and centre C describing the arc BG, the other leg AB is the tangent of that arc BG or of the angle C, and the hypothenuse CA the secant of the same.

Spherical.

And then the general rule for all these cases is this, *viz.* that the sides bear to each other the same proportions as the parts or things which they represent. And this is called making every side radius.

SPHERICAL TRIGONOMETRY.

Spherical Trigonometry is the art whereby, from three given parts of a spherical triangle, we discover the rest; and, like plane trigonometry, is either right-angled or oblique angled. But before we give the analogies for the solution of the several cases in either, it will be proper to premise the following theorems:

Theorem I. In all right-angled spherical triangles, the sign of the hypothenuse : radius : : sine of a leg : sine of its opposite angle. And the sine of a leg : radius : : tangent of the other leg : tangent of its opposite angle.

Demonstration. Let EDAFG (*ibid.* fig. 6.) represent the eighth part of a sphere, where the quadrantal planes EDFG, EDBC. are both perpendicular to the quadrantal plane ADFB; and the quadrantal plane ADGC is perpendicular to the plane EDFG; and the spherical triangle ABC is right angled at B, where CA is the hypothenuse, and BA, BC, are the legs.

To the arches GF, CB, draw the tangents HF, OB, and the sines GM, CI, on the radii DF, DB; also draw BL the sine of the arch AB, and CK the sine of AC; and then join IK and OL. Now HF, OB, GM, CI, are all perpendicular to the plane ADFB. And HD, GK, OL, lie all in the same plane ADGC. Also FD, IK, BL, lie all in the same plane ADGC. Therefore the right-angled triangles HFD, CIK, ODL, having the equal angles HDF, CKI, OLB, are similar. And CK : DG : : CI : GM; that is, as the sine of the hypothenuse : rad. : : sine of a leg : sine of its opposite angle. For GM is the sine of the arc GF, which measures the angle CAB. Also, LB : DF : : BO : FH; that is, as the sine of a leg : radius : : tangent of the other leg : tangent of its opposite angle Q. E. D.

Hence it follows, that the sines of the angles of any oblique spherical triangle ACD (fig. 7.) are to one another, directly, as the sines of the opposite sides. Hence it also follows, that, in right-angled spherical triangles, having the same perpendicular, the sines of the bases will be to each other, inversely, as the tangents of the angles at the bases.

Theorem II. In any right-angled spherical triangle ABC (fig. 8.) it will be, As radius is to the co-sine of one leg, so is the co-sine of the other leg to the co-sine of the hypothenuse.

Hence, if two right-angled spherical triangles ABC, CBD (fig 7.) have the same perpendicular BC, the co-sines of their hypothenuses will be to each other, directly, as the co-sines of their bases.

Theorem III. In any spherical triangle it will be, As radius is to the sine of either angle, so is the co-sine of the adjacent leg to the co-sine of the opposite angle.

Hence, in right-angled spherical triangles, having the same perpendicular, the co-sines of the angles at the base will be to each other, directly, as the sines of the vertical angles.

Theorem IV. In any right-angled spherical triangle

it

Spherical. it will be, As radius is to the co-ſine of the hypothenuſe, ſo is the tangent of either angle to the co-tangent of the other angle.

As the ſum of the ſines of two unequal arches is to their difference, ſo is the tangent of half the ſum of thoſe arches to the tangent of half their difference: and as the ſum of the co-ſines is to their difference, ſo is the co-tangent of half the ſum of the arches to the tangent of half the difference of the ſame arches.

THEOREM V. In any ſpherical triangle ABC (fig. 9 and 10.) it will be, As the co-tangent of half the ſum of half their difference, ſo is the co-tangent of half the baſe to the tangent of the diſtance (DE) of the perpendicular from the middle of the baſe.

Since the laſt proportion, by permutation, becomes co-tang. $\frac{AC+BC}{2}$: co-tang. AE : : tang. $\frac{AC-BC}{2}$: tang. DE, and as the tangents of any two arches are, inverſely, as their co-tangents; it follows, therefore, that tang. AE : tang. $\frac{AC+BC}{2}$: : tang. $\frac{AC-BC}{2}$: tang. DE; or, that the tangent of half the baſe is to the tangent of half the ſum of the ſides, as the tangent of half the difference of the ſides to the tangent of the diſtance of the perpendicular from the middle of the baſe. Spherical.

THEOREM VI. In any ſpherical triangle ABC (fig. 9.) it will be, As the co-tangent of half the ſum of the angles at the baſe is to the tangent of half their difference, ſo is the tangent of half the vertical angle to the tangent of the angle which the perpendicular CD makes with the line CF biſecting the vertical angle.

The Solution of the CASES of right-angled ſpherical Triangles, (fig. 8.).

Caſe	Given	Sought	Solution
1	The hyp. AC and one angle A	The oppoſite leg BC	As radius : ſine hyp. AC : : ſine A : ſine BC (by the former part of theor. 1.)
2	The hyp. AC and one angle A	The adjacent leg AB	As radius : co-ſine of A : : tang. AC. : tang. AB (by the latter part of theor. 1.)
3	The hyp. AC and one angle A	The other angle C	As radius : co-ſine of AC : : tang. A : co-tang. C (by theorem 4.)
4	The hyp. AC and one leg AB	The other leg BC	As co-ſine AB : radius : : co-ſine AC : co-ſine BC (by theorem 2.)
5	The hyp. AC and one leg AB	The oppoſite angle C	As ſine AC : radius : : ſine AB : ſine C (by the former part of theorem 1.)
6	The hyp. AC and one leg AB	The adjacent angle A	As tang. AC : tang. AB : : radius : co-ſine A (by theorem 1.)
7	One leg AB and the adjacent angle A	The other leg BC	As radius : ſine AB : : tangent A : tangent BC (by theorem 4.)
8	One leg AB and the adjacent angle A	The oppoſite angle C	As radius : ſine A : : co-ſine of AB : co-ſine of C (by theorem 3.)
9	One leg AB and the adjacent angle A	The hyp. AC	As co-ſine of A : radius : : tang. AB : tang. AC (by theorem 1.)
10	One leg BC and the oppoſite angle A	The other leg AB	As tang. A : tang. BC : : radius : ſine AB (by theorem 4.)
11	One leg BC and the oppoſite angle A	The adjacent angle C	As co-ſine BC : radius : : co-ſine of A : ſine C (by theorem 3.)
12	One leg BC and the oppoſite angle A	The hyp. AC	As ſine A : ſine BC : : radius : ſine AC (by theorem 1.)
13	Both legs AB and BC	The hyp. AC	As radius : co-ſine AB : : co-ſine BC : co-ſine AC (by theorem 2.)
14	Both legs AB and BC	An angle, ſuppoſe A	As ſine AB : radius : : tang. BC : tang. A (by theorem 4.)
15	Both angles A and C	A leg, ſuppoſe AB	As ſine A : co-ſine C : : radius : co-ſine AB (by theorem 3.)
16	Both angles A and C	The hyp. AC	As tang. A : co-tang. C : : radius : co ſine AC (by theorem 4.)

Note, The 10th, 11th, and 12th caſes are ambiguous; ſince it cannot be determined by the data, whether A, B, C, and AC, be greater or leſs than 90 degrees each.

The Solution of the CASES of oblique ſpherical Triangles, (fig. 9 and 10.)

Caſe	Given	Sought	Solution
1	Two ſides AC, BC, and an angle A oppoſite to one of them	The angle B oppoſite to the other	As ſine BC : ſine A : : ſine AC : ſine B (by theorem 1.) Note, this caſe is ambiguous when BC is leſs than AC; ſince it cannot be determined from the data whether B be acute or obtuſe.
2	Two ſides AC, BC, and an angle A oppoſite to one of them	The included angle ACB	Upon AB produced (if need be) let fall the perpendicular CD; then (by theorem 4.) rad. : co-ſine AC : : tang. A : co-tang. ACD; but (by theorem 1.) as tang. BC : tang. AC : : co-ſine ACD : co-ſine BCD. Whence ACB=ACD $\mp$ BCD is known.
3	Two ſides AC, BC, and an angle oppoſite to one of them	The other ſide AB	As rad. : co-ſine A : : tang. AC : tang. AD (by theor. 1) and (by theor. 2.) as co-ſine AC : co-ſine BC : : co-ſine AD : co-ſine BD. Note, this and the laſt caſe are both ambiguous when the firſt is ſo.
4	Two ſides AC, AB, and the included angle A	The other ſide BC	As rad. : co-ſine A : : tang. AC : tang. AB (by theor. 1.) whence AD is alſo known; then (by theor. 2.) as co-ſine AD : co-ſine BD : : co-ſine AC : co-ſine BC.
5	Two ſides AC, AB, and the included angle A	Either of the other angles, ſuppoſe B	As rad. : co-ſine A : : tang. AC : tang. AD (by theor. 1.) whence BD is known; then (by theor. 4.) as ſine BD : ſine AD : : tang. A : tang. B.
6	Two angles A, ACB, and the ſide AC betwixt them	The other angle B	As rad. : co-ſine AB : : tang. A : co-tang. ACD (by theorem 4.) whence BCD is alſo known; then (by theor. 3.) as ſine ACD : ſine BCD : : co-ſine A : co-ſine B.
7	Two angles A, ACB, and the ſide AC betwixt them	Either of the other ſides, ſuppoſe BC	As rad. : co-ſine AC : : tang. A : co-tang. ACD (by theorem 4.) whence BCD is alſo known; then, as co-ſine BCD : co-ſine ACD : : tang. AC : tang. BC (by theor. 1.)
8	Two angles A, B, and a ſide AC oppoſite to one of them	The ſide BC oppoſite the other	As ſine B : ſine AC : : ſine A : ſine BC (by theorem 1.)
9	Two angles A, B, and a ſide AC oppoſite to one of them	The ſide AB betwixt them	As rad. : co-ſine A : : tang. AC : tang. AD (by theor. 1.) and as tang. B. : tang. A : : ſine AD : ſine BD (by theorem 4.) whence AB is alſo known.
10	Two angles A, B, and a ſide AC oppoſite to one of them	The other angle ACB	As rad. : co-ſine AC : : tang. A : co-tang. ACD (by theorem 4.) and as co-ſine A : co-ſine B : : ſine ACD : ſine BCD (by theor. 3.) whence ACB is alſo known.
11	All the three ſides AB, AC, and BC	An angle, ſuppoſe A	As tang. $\frac{1}{2}$AB : tang. $\frac{AC+BC}{2}$: : tang. $\frac{AC-BC}{2}$: tang. DE, the diſtance of the perpendicular from the middle of the baſe (by theorem 6.) whence AD is known: then, as tang. AC : tang. AD : : rad. : co-ſine A (by theor. 1.)
12	All the three angles A, B, and ACB	A ſide, ſuppoſe AC	As co-tang. $\frac{ABC+A}{2}$: tang. $\frac{ABC-A}{2}$: : tang. $\frac{ACB}{2}$: tan. of the angle included by the perpendicular and a line biſecting the vertical angles; whence ACD is alſo known: then (by theorem 5.) as tang. A : co-tang. ACD : : rad. : co-ſine AC.

Hutton's Mathematical Dictionary.

The following propoſitions and remarks, concerning ſpherical triangles (ſelected and communicated to Dr Hutton by the reverend Nevil Maſkelyne, D. D. Aſtronomer Royal, F. R. S.), will alſo render the calculation of them perſpicuous, and free from ambiguity.

1. A ſpherical triangle is equilateral, iſoſcelar, or ſcalene, according as it has its three angles all equal, or two of them equal, or all three unequal; and *vice verſa*.

2. The greateſt ſide is always oppoſite the greateſt angle, and the ſmalleſt ſide oppoſite the ſmalleſt angle.

3. Any two ſides taken together are greater than the third.

4. If the three angles are all acute, or all right, or all obtuſe; the three ſides will be, accordingly, all leſs than 90°, or equal to 90°, or greater than 90°; and *vice verſa*.

5. If from the three angles A, B, C, of a triangle ABC, as poles, there be deſcribed, upon the ſurface of the ſphere, three arches of a great circle DE, DF, FE, forming by their interſections a new ſpherical triangle DEF; each ſide of the new triangle will be the ſupplement of the angle at its pole; and each angle of the ſame triangle will be the ſupplement of the ſide oppoſite to it in the triangle ABC. Fig. 11.

6. In any triangle ABC, or A*b*C, right-angled in A, 1*ſt*, The angles at the hypothenuſe are always of the ſame kind Fig. 12.

Spherical. as their oppoſite ſides; *2dly*, The hypothenuſe is leſs or greater than a quadrant, according as the ſides including the right angle are of the ſame or different kinds; that is to ſay, according as theſe ſame ſides are either both acute or both obtuſe, or as one is acute and the other obtuſe. And *vice verſa*, *1ſt*, The ſides including the right angle are always of the ſame kind as their oppoſite angles: *2dly*, The ſides including the right angle will be of the ſame or different kinds, according as the hypothenuſe is leſs or more than 90°; but one at leaſt of them will be of 90°, if the hypothenuſe is ſo. Spherical.

Trihilatæ ‖ Tringa. TRIHILATÆ, from *tres* "three," and *hilum* "an external mark on the ſeed;" the name of the 23d claſs in Linnæus's Fragments of a Natural Method; conſiſting of plants with three ſeeds, which are marked with an external cicatrix or ſcar, where they are faſtened within the fruit. See BOTANY, Sect. 6.

TRIM, implies in general the ſtate or diſpoſition by which a ſhip is beſt calculated for the ſeveral purpoſes of navigation.

Thus the trim of the hold denotes the moſt convenient and proper arrangement of the various materials contained therein relatively to the ſhip's motion or ſtability at ſea. The trim of the maſts and ſails is alſo their moſt appoſite ſituation with regard to the conſtruction of the ſhip and the effort of the wind upon her ſails. See SEAMANSHIP.

TRINGA, SANDPIPER; a genus of birds belonging to the order of *grallæ*. The bill is ſomewhat tapering, and of the length of the head; the noſtrils are ſmall; the toes are four in number and divided, the hind toe being frequently raiſed from the ground. According to Dr Latham there are 45 ſpecies, of which 18 are Britiſh. We ſhall deſcribe ſome of the moſt remarkable.

1. *Vanellus*, lapwing, or tewit, is diſtinguiſhed by having the bill, crown of the head, creſt, and throat, of a black colour; there is alſo a black line under each eye; the back is of a purpliſh green; the wings and tail are black and white, and the legs red: the weight is 8 ounces and the length 13 inches. It lays four eggs, making a ſlight neſt with a few bents. The eggs have an olive caſt, and are ſpotted with black. The young, as ſoon as hatched, run like chickens: the parents ſhow remarkable ſolicitude for them, flying with great anxiety and clamour near them, ſtriking at either men or dogs that approach, and often fluttering along the ground like a wounded bird, to a conſiderable diſtance from their neſt, to delude their purſuers; and to aid the deceit, they become more clamorous when moſt remote from it: the eggs are held in great eſteem for their delicacy, and are ſold by the London poulterers for three ſhillings the dozen. In winter, lapwings join in vaſt flocks; but at that ſeaſon are very wild: their fleſh is very good, their food being inſects and worms. During October and November, they are taken in the fens in nets, in the ſame manner that ruffs are; but are not preſerved for fattening, being killed as ſoon as caught.

2. *Pugnax*. The male of this ſpecies is called *ruff*, and the female *reeve*. The name *ruff* is given to the males becauſe they are furniſhed with very long feathers, ſtanding out in a remarkable manner, not unlike the ruff worn by our anceſtors. The ruff is of as many different colours as there are males; but in general it is barred with black; the weight is ſix or ſeven ounces; the length, one foot. The female, or *reeve*, has no ruff; the common colour is brown; the feathers are edged with a very pale colour; the breaſt and belly white. Its weight is about four ounces.

Theſe birds appear in the fens in the earlieſt ſpring, and diſappear about Michaelmas. The reeves lay four eggs in a tuft of graſs, the firſt week in May, and ſit about a month. The eggs are white, marked with large ruſty ſpots. Fowlers avoid in general the taking of the females; not only becauſe they are ſmaller than the males, but that they may be left to breed. Tringa.

Soon after their arrival, the males begin to hill, that is, to collect on ſome dry bank near a ſplaſh of water, in expectation of the females, who reſort to them. Each male keeps poſſeſſion of a ſmall piece of ground, which it runs round till the graſs is worn quite away, and nothing but a naked circle is left. When a female lights, the ruffs immediately fall to fighting. It is a vulgar error, that ruffs muſt be fed in the dark leſt they ſhould deſtroy each other by fighting on admiſſion of light. The truth is, every bird takes its ſtand in the room as it would in the open fen. If another invades its circle, an attack is made, and a battle enſues. They make uſe of the ſame action in fighting as a cock, place their bills to the ground and ſpread their ruffs. Mr Pennant ſays, he has ſet a whole room-full a-fighting, by making them move their ſtations; and after quitting the place, by peeping through a crevice, ſeen them reſume their circles and grow pacific.

When a fowler diſcovers one of thoſe hills, he places his net over night, which is of the ſame kind as thoſe that are called *clap* or *day nets*; only it is generally ſingle, and is about 14 yards long and four broad. The fowler reſorts to his ſtand at day-break, at the diſtance of one, two, three, or four hundred yards from the nets, according to the time of the ſeaſon; for the later it is, the ſhyer the birds grow. He then makes his firſt pull, taking ſuch birds as he finds within reach; after that he places his ſtuffed birds or ſtales to entice thoſe that are continually traverſing the fen. When the ſtales are ſet, ſeldom more than two or three are taken at a time. A fowler will take 40 or 50 dozen in a ſeaſon. —Theſe birds are found in Lincolnſhire, the iſle of Ely, and in the Eaſt Riding of York. They viſit a place called *Martin-Mere* in Lancaſhire the latter end of March or beginning of April; but do not continue there above three weeks; where they are taken in nets, and fattened for the table with bread and milk, hempſeed, and ſometimes boiled wheat; but if expedition is required, ſugar is added, which will make them in a fortnight's time a lump of fat: they then ſell for two ſhillings or half a crown a-piece. They are dreſſed like the woodcock, with their inteſtines; and when killed at the critical time, ſay the Epicures, are the moſt delicious of all morſels.

3. *Canutus*, or knot, has the forehead, chin, and lower part of the neck, brown, inclining to aſh-colour; the back and ſcapulars deep brown, edged with aſh-colour; the coverts of the wings white, the edges of the lower order deeply ſo, forming a white bar; the breaſt, ſides, and belly white, the two firſt ſtreaked with brown; the coverts of the tail marked with white and duſky ſpots alternately; the tail aſh coloured, the outmoſt feather on each ſide white; the legs of a bluiſh grey; and the toes, as a ſpecial mark, divided to the very bottom; the weight four ounces and a half.—

Tringa ‖ Trinitarians.

half.—These birds, when fattened, are preferred by some to the ruffs themselves. They are taken in great numbers on the coasts of Lincolnshire, in nets such as are employed in taking ruffs; with two or three dozens of stales of wood painted like the birds, placed within; 14 dozens have been taken at once. Their season is from the beginning of August to that of November. They disappear with the first frosts. Camden says they derive their name from king Canute, Knute, or Knout, as he is sometimes called; probably because they were a favourite dish with that monarch. We know that he kept the feast of the purification of the Virgin Mary with great pomp and magnificence at Ely; and this being one of the fen-birds, it is not unlikely but he met with it there.

4. The *hypoleucos*, or common sandpiper, except in pairing time, is a solitary bird: it is never found near the sea, but frequents rivers, lakes, and other fresh waters. Its head is brown, streaked with downward black lines; the neck an obscure ash-colour; the back and coverts of the wings brown, mixed with a glossy green, elegantly marked with transverse dusky lines; the breast and belly are of a pure white; the quill-feathers and the middle feathers of the tail are brown; the legs of a dull pale green.

5. The *alpina*, or dunling sandpiper, is at once distinguished from the others by the singularity of its colours. The back, head, and upper part of the neck, are ferruginous, marked with large black spots; the lower part of the neck white, marked with short dusky streaks; the coverts of the wings ash-colour; the belly white, marked with large black spots, or with a black crescent pointing towards the thighs; the tail is ash-coloured; legs black; toes divided to their origin. In size it is superior to that of a lark. These birds are found on our sea-coasts; but may be reckoned among the more rare kinds. They lay four eggs of a dirty white colour, blotched with brown round the thicker end, and marked with a few small spots of the same colour on the smaller end. They are common on the Yorkshire coasts, and esteemed a great delicacy.

6. The *cinclus*, purre, or stint, is in length $7\frac{1}{2}$ inches; The head and hind part of the neck are ash-coloured, marked with dusky lines; a white stroke divides the bill and eyes; the back is of a browniſh ash-colour; the breast and belly white; the coverts of the wings and tail a dark brown, edged with light ash-colour or white; the upper part of the quill-feathers dusky, the lower white; the legs of a dusky green; the toes divided to their origin. The bill an inch and a half long, slender, and black; irides dusky.—These birds come in prodigious flocks on our sea-coasts during the winter: in their flight they perform their evolutions with great regularity; appearing like a white or a dusky cloud, as they turn their backs or their breasts towards you. They leave our shores in spring, and retire to some unknown place to breed. They were formerly a well known dish at our tables.

TRINIDAD, an island in the gulf of Mexico, separated from New Andalusia, in Terra Firma, by a strait, about three miles over. The soil is fruitful, producing sugar, cotton, Indian corn, fine tobacco, and fruits; but the air is unhealthy. It was taken by Sir Walter Raleigh in 1595, and by the French in 1676, who plundered the island and then left it. It is about 62 miles in length, and 45 in breadth; and was discovered by Christopher Columbus in 1498. There is a bituminous lake in this island; for an account of which, see the article PETROLEUM, p. 252. note B.

TRINITARIANS, those who believe in the Trinity; those who do not believe therein being called *Antitrinitarians*.

TRINITY, in theology, the ineffable mystery of three persons in one God; Father, Son, and Holy Spirit. See THEOLOGY, n° 61.

Trinity ‖ Tripoli.

Trinity-House. See LONDON, n° 49.

Trinity-Sunday, a festival observed on the Sunday next after Whitsunday, in honour of the holy Trinity. The observation of this festival was first enjoined in the council of Arles, anno 1260.

TRINOBANTES, (anc. geog.) a people of Britain, supposed to have occupied Middlesex and Essex.

TRIO, in music, a part of a concert wherein three persons sing; or, more properly, a musical composition consisting of three parts.

TRIPHTHONG, in grammar, an assemblage or concourse of three vowels in one syllable; as *quæ*.

TRIPLE, in music, is one of the species of measure or time. See MUSIC.

TRIPOD, in antiquity, a famed sacred seat or stool, supported by three feet, whereon the priests and sybils were placed to render oracles. It was on the tripod that the gods were said to inspire the Pythias with that divine fury and enthusiasm wherewith they were seized at the delivery of their predictions.

TRIPOLI, a country of Africa, in Barbary; bounded on the north by the Mediterranean sea; on the south, by the country of the Beriberies; on the west, by the kingdom of Tunis, Biledulgerid, and a territory of the Gadamis; and on the east, by Egypt. It is about 925 miles along the sea coast; but the breadth is various. Some parts of it are pretty fruitful; but that towards Egypt is a sandy desert. It had the title of a *kingdom*; but is now a republic, governed by a dey. He is not absolute, for a Turkish bashaw resides here, who receives his authority from the grand seignior, and has a power of controling the dey, and levying taxes on the people. The dey is elected by the soldiers, who make no scruple of deposing him when they please.

TRIPOLI, a considerable town of Africa, and capital of a republic of the same name in Barbary, and under protection of the grand seignior, with a castle and a fort. It is pretty large, and the inhabitants are noted pirates. It was taken by Charles V. who settled the knights of Malta there; but they were driven away by the Turks in 1551. It was formerly very flourishing; and has now some trade in stuffs, saffron, corn, oil, wool, dates, ostrich feathers, and skins: but they make more of the Christian slaves which they take at sea; for they either set high ransoms upon them, or make them perform all sorts of work. It is seated on the coast of the Mediterranean, in a sandy soil, and surrounded by a wall, strengthened by other fortifications. E. Long. 13. 12. N. Lat. 32. 34.

TRIPOLI, called *Tripolis* of *Syria*, to distinguish it from Tripoli in *Barbary*, received its name from its being anciently formed of three cities at a small distance from each other, one of which belonged to the Aradians, or ancient kingdom of Arad, the second to the Sidonians, and the third to the Tyrians, perhaps as a common mart to those maritime powers. The present town of Tripoli is built at the distance of a mile and a half from the other, upon the declivity of a hill facing the sea, in 34° 20′ north latitude, and in 35° 50′ east longitude from Greenwich. It is surrounded with walls, fortified with seven high strong towers, and a castle, all of Gothic architecture; but the streets are narrow, and the houses low. The city contains about 8000 houses, and near 60,000 inhabitants, consisting of Turks, Christians, and Jews. The basha, or pacha, who resides in the castle, where there is a garrison of 200 janizaries, governs the adjacent territory, in which there is plenty of fruit,

Tripoli || Triticum.

and a great number of mulberry-trees, which enable the inhabitants to carry on a ſilk manufacture, from which they draw conſiderable profit.

All the environs of Tripoli are laid out in orchards, where the mopal grows ſpontaneouſly, and the white-mulberry is cultivated for the ſilk-worm; the pomegranate, orange, and lemon trees for their fruit, which is here very fine. The country, though delightful to the eye, is unhealthy; from July to September, epidemic fevers, like thoſe of Scanderoon and Cyprus, prevail, and are principally cauſed by the artificial inundations made for the purpoſe of watering the mulberry trees, to enable them to throw out their ſecond leaves, and from a want of free circulation of air, the city being open only to the weſtward.

TRIPOLI, a genus of argillaceous earth, much uſed in the poliſhing of metals. It has its name from Tripoli in Barbary, from whence it was formerly brought to us, and has the following properties: 1. It does not effervеſce with any of the acids. 2. It hardens in the fire; and by a conſiderable heat, its ſurface becomes vitrified. 3. Every kind of it, excepting that found in England, becomes red by calcination. 4. It is fuſible by mixture with calcareous earth, as well as by means of borax and microcoſmic ſalt. 5. Generally no ſalt can be extracted by waſhing, though ſometimes the marine and vitriolic acid may be extracted by diſtillation. 6. When crude it imbibes water, but is not diffuſible in it. 7. It taſtes like common chalk, and feels ſandy between the teeth, though no ſand can by any means be extracted from it.

Tripoli is found of two different kinds: 1. Solid, and of a rough texture; brown, yellowiſh, and ſpotted like marble. 2. Friable and compact; granulated, brown, or yellowiſh; this laſt being the kind met with in England. This laſt kind has alſo been found in Scotland; but the rotten ſtone found in Derbyſhire, and likewiſe much uſed in poliſhing, is quite another ſubſtance. According to Ferber, the rotten ſtone is tripoli mixed with a calcareous earth. In the memoirs of the academy at Paris, for 1769, it is aſſerted, that tripoli is a volcanic product. In proof of this, we are there informed, that a coal-mine at St Eſtienne having accidentally taken fire, and the fire having extended to ſome beds of ſchiſtus and bitumen, tripoli was found in the burnt parts of the ſtrata, but nowhere elſe. Cronſtedt is of opinion, that 100 parts of it contain 90 of ſiliceous earth, 7 of argill, and 3 of iron; but the red ſort probably contains more iron.

TRIPTOLEMUS, laws of. See MYSTERIES, n° 74.

TRIQUETROUS, among botaniſts, expreſſes a fruit or leaf that has three ſides or faces all flat.

TRIREMIS, in antiquity, a galley with three ranks of oars on a ſide.

TRISMEGISTUS, an epithet or ſurname given to one of the two Hermeſes. See THOTH.

TRISMUS, the LOCKED JAW. See MEDICINE, n° 280.

TRISSYLLABLE, in grammar, a word conſiſting of three ſyllables.

TRITICUM, WHEAT, in botany: A genus of plants belonging to the claſs of *triandria*, and order of *digynia*; and in the natural ſyſtem ranging under the 4th order, *Gramina*. The calyx is bivalve, ſolitary, and generally containing three florets; the corolla is bivalve, one valve being bluntiſh, the other acute. There are 15 ſpecies; the *æſtivum*, ſummer or ſpring wheat; *hybernum*, winter Lammas, or common wheat; *compoſitum*, *turgidum*, or cone-wheat; *polonium*, or Poliſh wheat; *ſpelta*, or ſpelt-wheat; *monococcum*, or one-grained wheat; *proſtratum*, or trailing wheat-graſs; *pumilum*, or dwarf wheat-graſs; *junceum*, or ruſh wheat-graſs; *repens*, or couch-graſs; *tenellum*, or tender wheat-graſs; *maritimum*, or ſea wheat-graſs; *unilaterale*, or ſpiked ſea-wheat; *unioloides*, or linear ſpiked wheat-graſs.—Of what country the firſt ſix ſpecies are natives, cannot now be determined: the proſtratum is a native of Siberia; the junceum, repens, unilaterale, and maritimum, are natives of Britain; the tenellum is a native of Spain; and the unioloides is a native of Italy. It may alſo be obſerved, that the firſt nine are annuals, the reſt are perennials. See AGRICULTURE, n° 122; and HUSBANDRY. Part I.

Triticum.

Linnæus comprehends the different kinds of wheat cultivated at preſent under ſix ſpecies; but cultivation has produced a great many varieties from theſe.

1. *Triticum æſtivum*, or ſpring-wheat, hath four flowers in a calyx, three of which moſtly bear grain. The calyces ſtand pretty diſtant from each other on both ſides a flat ſmooth receptacle. The leaves of the calyx are keel ſhaped, ſmooth, and they terminate with a ſhort ariſta. The glumes of the flowers are ſmooth and bellying, and the outer leaf of three of the glumes in every calyx is terminated by a long ariſta, but the three inner ones are beardleſs. The grain is rather longer and thinner than the common wheat. It is ſuppoſed to be a native of ſome part of Tartary. The farmers call it *Spring Wheat*, becauſe it will come to the ſickle with the common wheat, though it be ſown in February or March. The varieties of it are: *Triticum æſtivum ſpica et grana rubente*. Spring wheat, with a red ſpike and grain. *Triticum æſtivum rubrum, ſpica alba*. Red ſpring wheat, with a white ſpike. *Triticum æſtivum, ſpica et grana alba*. Spring wheat, with a white ſpike and grain.—2. *Triticum hybernum*, winter or common wheat, has alſo four flowers in a calyx, three of which are moſtly productive. The calyces ſtand on each ſide a ſmooth flat receptacle, as in the former ſpecies, but they are not quite ſo far aſunder. The leaves of the calyx are bellying, and ſo ſmooth that they appear as if poliſhed, but they have no ariſta. The glumes of the flowers too are ſmooth, and the outer ones near the top of the ſpike are often tipped with ſhort ariſtæ. The grain is rather plumper than the former, and is the ſort moſt generally ſown in England; whence the name of *common wheat*. Its varieties are: *Triticum hybernum, ſpica et grana rubente*. Common wheat, with a red ſpike and grain. *Triticum hybernum rubrum, ſpica alba*. Common red wheat, with a white ſpike. *Triticum hybernum, ſpica et grana alba*. Common wheat, with a white ſpike and grain.—3. *Triticum turgidum*, thick ſpiked or cone-wheat, is eaſily diſtinguiſhed from either of the former; for though it has four flowers in a calyx after the manner of them, yet the whole calyx and the edges of the glumes are covered with ſoft hairs. The calyces too ſtand thicker on the receptacle, which make the ſpike appear more turgid. Some of the outer glumes near the top of the ſpike are terminated by ſhort ariſtæ, like thoſe of the common wheat. The grain is ſhorter, plumper, and more convex on the back than either of the former ſpecies. Its varieties are numerous, and have various appellations in different counties, owing to the great affinity of ſeveral of them. Thoſe moſt eaſily to be diſtinguiſhed are: *Triticum turgidum conicum album*. White cone wheat. *Triticum turgidum conicum rubrum*. Red cone wheat. *Triticum turgidum ariſtiferum*. Bearded cone wheat. *Triticum turgidum, ſpica multiplici*. Cone wheat, with many ears. The third variety is what the farmers call *clog wheat*, *ſquare wheat*, and *rivets*. The grain of this is remarkably convex on one ſide, and when ripe the awns generally break in pieces and fall off. This ſort is very productive, but it yields an inferior flour to what the former two ſpecies do.—4. *Triticum Polonicum*, or Poliſh wheat, has ſome reſemblance to the turgidum,

Triton. Triumph.

dum, but both grain and ſpike are longer. The calyx contains only two flowers, and the glumes are furniſhed with very long ariſtæ; the teeth of the midrib are bearded. As this ſort is ſeldom ſown in England, there is no telling what varieties it produces.—5. *Triticum Spelta*, ſpelt or German wheat. At firſt view this has a great reſemblance to barley, but it has no involucrum. The calyx is truncated; that is, it appears as if the ends were ſnipped off, and it contains four flowers, two of which are hermaphrodite and the glumes bearded, but the intermediate ones are neuter. There are two rows of grain as in barley, but they are ſhaped like wheat. It is much cultivated in France, Germany, and Italy. 6. *Triticum monococcum*, St Peter's corn, or one-grained wheat, has three flowers in each calyx alternately bearded, and the middle one neuter. The ſpike is ſhining, and has two rows of grain in the manner of barley. Where it grows naturally is not known, but it is cultivated in Germany; and in conjunction with ſpelt wheat is there made into bread, which is coarſe, and not ſo nouriſhing as that made of common wheat. Malt made of any of our wheats is often put into beer, and a ſmall quantity of it will give a large brewing a fine brown tranſparent tincture.

TRITON, a ſea demigod, held by the ancients to be an officer or trumpeter of Neptune, attending on him, and carrying his orders from ſea to ſea.

TRITURATION, the act of reducing a ſolid body into a ſubtile powder; called alſo *pulveriſation* and *levigation*.

TRIUMPH, in Roman antiquity, a public and ſolemn honour conferred by the Romans on a victorious general by allowing him a magnificent entry in the city.

The greater triumph, called alſo *curulis*, or ſimply the *triumph*, was decreed by the ſenate to a general, upon the conquering of a province or gaining a ſignal victory. The day appointed for the ceremony being arrived, ſcaffolds were erected in the forum and circus, and all the other parts of the city where they could beſt behold the pomp: the ſenate went to meet the conqueror without the gate called *Capena* or *Triumphalis*, and marched back in order to the Capitol; the ways being cleared and cleanſed by a number of officers and tipſtaffs, who drove away ſuch as thronged the paſſage or ſtraggled up and down. The general was clad in a rich purple robe, interwoven with figures of gold, ſetting forth his great exploits; his buſkins were beſet with pearl; and he wore a crown, which at firſt was only laurel, but afterwards gold; in one hand he bore a branch of laurel, and in the other a truncheon. He was carried in a magnificent chariot, adorned with ivory and plates of gold, drawn uſually by two white horſes; though ſometimes by other animals, as that of Pompey when he triumphed over Africa, by elephants; that of Marc Anthony by lions; that of Heliogabalus by tigers; that of Aurelian by deer, &c. His children were at his feet, and ſometimes on the chariot-horſes. The proceſſion was led up by the muſicians, who played triumphal pieces in praiſe of the general: theſe were followed by young men who led the victims to the ſacrifice, with their horns gilded, and their heads adorned with ribands and garlands; next came the carts and waggons, loaded with all the ſpoils taken from the enemy, with their horſes, chariots, &c.; theſe were followed by the kings, princes, and generals, who had been taken captives, loaded with chains: after theſe appeared the triumphal chariot, before which, as it paſſed, they all along ſtrewed flowers, and the people with loud acclamations called out, *Io triumphe!* The chariot was followed by the ſenate clad in white robes; and the ſenate by ſuch citizens as had been ſet at liberty or ranſomed; and the proceſſion was cloſed by the prieſts and their officers and utenſils, with a white ox led along for the chief victim. In this order they proceeded through the triumphal gate, along the via ſacra, to the Capitol, where the victims were ſlain. In the mean time all the temples were open, and all the altars loaded with offerings and incenſe; games and combats were celebrated in the public places, and rejoicings appeared every where.

Triumvir. Trochilus.

TRIUMVIR, one of the three perſons who govern abſolutely, and with equal authority, in a ſtate. It is chiefly applied to the Roman government: Cæſar, Pompey, and Craſſus, were the firſt triumvirs who divided the government among them. There were alſo other officers ſo called; as the triumviri or treſviri capitales, who were the keepers of the public goal: they had the office of puniſhing malefactors; for which purpoſe they kept eight lictors under them.

TROAS, a country of Phrygia in Aſia Minor, of which Troy was the capital. When Troas is taken for the whole kingdom of Priam, it may be ſaid to contain Myſia and Phrygia Minor; but if only applied to that part of the country where Troy was ſituated, its extent is confined within very narrow limits. Troas was anciently called Dardania. See TROJA.

TROCHÆUS, in proſody, a foot conſiſting of a long and ſhort ſyllable.

TROCHANTER, in anatomy. See there, n° 58.

TROCHE, in pharmacy, a ſort of medicine made of glutinous ſubſtances into little cakes, and afterwards exſiccated. See PHARMACY, n° 560—569.

TROCHILUS, HUMMING BIRD, a genus of birds belonging to the order of *picæ*. The roſtrum is ſubulate, filiform, and longer than the head, the apex being tubular; the upper mandible ſheaths the lower. The tongue is filiform and tubulous, the two threads coaleſcing; the feet are ſlender and fit for walking; the tail has ten feathers. There are 65 ſpecies, none of which are natives of Britain. They are all remarkable for the beauty of their colours, and moſt of them for the ſmallneſs of their ſize, though ſome are eight or nine inches in length.—They are divided into two families, viz. thoſe with crooked bills, and thoſe with ſtraight bills. Of theſe we ſhall deſcribe the four following ſpecies:

1. The *exilis*, or little humming-bird, has a crooked bill, is an inch and a half in length; frequently weighing leſs than 50 grains. The bill is black, and half an inch in length: the body greeniſh-brown, with a red, ſhining, inimitable gloſs: the head is creſted with a ſmall tuft, green at bottom, but of a ſparkling gold colour at top: quills and tail fine black. It is a native of Guiana; and the velocity of it in flying is ſo great, that the eye can ſcarce keep pace with its motion.

2. The *moſchitus*, or ruby-necked humming-bird, according to Marcgrave is the moſt beautiful of the whole genus. Its length is three inches four lines; the bill ſtraight, eight lines long, and blackiſh: the top of the head and hind part of the neck are as bright as a ruby, and of the ſame colour: the upper parts of the body are brown, with a faint mixture of green and gold: the throat and fore parts of the neck are the colour of the moſt brilliant topaz: the belly, ſides, and thighs are brown; but on the lower part of the belly, on each ſide, is a ſpot of white: the tail is rufous purple, inclining to violet at the ends; the two middle feathers are ſhorteſt: the legs and claws blackiſh. The female has only a daſh of golden or topaz on the breaſt and fore part of the neck; the reſt of the under parts are greyiſh white. This ſpecies is found in Brazil, Curaſſoa, Guiana, and Surinam.

3. The *minimus*, or leaſt humming-bird, is exceeded, both in weight and dimenſions, by ſeveral ſpecies of bees. The total length is one inch and a quarter; and when killed, weighs

Trochilus. weighs no more, according to Sir Hans Sloan, than 20 grains. The bill is ſtraight and black, three lines and a half in length: the upper parts of the head and body are of a greeniſh gilded brown, in ſome lights appearing reddiſh: the under parts are greyiſh white; the wings are violet-brown; the tail of a bluiſh black, with a gloſs of poliſhed metal; but the outer feather except one on each ſide, is grey from the middle to the tip, and the outer one wholly grey; legs and claws brown. The female is leſs than the male: the whole upper ſide of a dirty brown, with a ſlight gloſs of green; the under parts of a dirty white. Theſe birds are found in various parts of South and North America and the adjacent iſlands.—Our author received it from Jamaica.

4. *Superciliosus*, white-ſhaft, or ſupercilious humming-bird, has a bill twenty lines long; the feathers of the tail next the two long ſhafts, are alſo the longeſt, and the lateral ones continually decreaſe to the two outermoſt which are the ſhorteſt, and this gives the tail a pyramidical ſhape: its quills have a gold gloſs on a grey and blackiſh ground, with a whitiſh edge at the point, and the two ſhafts are white through the whole projecting portions; all the upper ſide of the back and head gold colour; the wing violet brown; and the under ſide of the body white-grey.

Theſe birds ſubſiſt on the nectar or ſweet juice of flowers: they frequent thoſe moſt which have a long tube; particularly the *impatiens noli me tangere*, the *monarda* with crimſon flowers, and thoſe of the convolvulus tribe. They never ſettle on the flower during the action of extracting the juice, but flutter continually like bees, moving their wings very quick, and making a humming noiſe: whence their name. They are not very ſhy, ſuffering people to come within a foot or two of the place where they are, but on approaching nearer, fly off like an arrow out of a bow. They often meet and fight for the right to a flower, and this all on the wing: in this ſtate they often come into rooms where the windows ſtand open, fight a little, and go out again. When they come to a flower which is juiceleſs, or on the point of withering, they pluck it off as it were in anger, by which means the ground is often quite covered with them. When they fly againſt each other, they have, beſides the humming, a ſort of chirping noiſe like a ſparrow or chicken. They do not feed on inſects nor fruit; nor can they be kept long in cages, though they have been preſerved alive for ſeveral weeks together by feeding them with water in which ſugar had been diſſolved.

This bird moſt frequently builds in the middle of a branch of a tree, and the neſt is ſo ſmall that it cannot be ſeen by a perſon who ſtands on the ground; any one therefore deſirous of ſeeing it, muſt get up to the branch, that he may view it from above: it is for this reaſon that the neſts are not more frequently found. The neſt is of courſe very ſmall, and quite round: the outſide, for the moſt part, is compoſed of green moſs, common on old pales and trees; the inſide of ſoft down, moſtly collected from the leaves of the great mullein, or the ſilk-graſs; but ſometimes they vary the texture, making uſe of flax, hemp, hairs, and other ſoft materials: they lay two eggs of the ſize of a pea, which are white, and not bigger at one end than the other.

The above account of the manners will in general ſuit all the birds of this genus; for as their tongues are made for ſuction, it is by this method alone that they can gain nouriſhment: no wonder, therefore, they can ſcarcely be kept alive by human artifice. Captain Davies, however, informed our author, that he kept theſe birds alive for four months by the following method:—He made an exact imitation of ſome of the tubular flowers with paper, faſtened round a tobacco-pipe, and painted them of a proper colour; theſe were placed in the order of nature, in the cage wherein theſe little creatures were confined; the bottoms of the tubes were filled with a mixture of brown ſugar and water as often as emptied; and he had the pleaſure of ſeeing them perform every action; for they ſoon grew familiar, and took the nouriſhment in the ſame manner as when ranging at large, though cloſe under his eye.

Troglodytes. ‖ Trollius.

TROGLODYTES, in ancient geography, a people of Ethiopia, ſaid to have lived in caves under ground. Pomponius Mela gives a ſtrange account of the Troglodites: he ſays, they did not ſo properly ſpeak as ſhriek; and that they lived on ſerpents.

TROGUS, (Pompeius), Latin univerſal hiſtorian to the time of Auguſtus Cæſar, of whom we have only an abridgement by Juſtin, flouriſhed about 41 B. C.

TROJA, the capital city of Troas, or, according to others, a country of which Ilium was the capital. It was built on a ſmall eminence near Mount Ida, and the promontory of Sigæum, at the diſtance of about four miles from the ſea-ſhore. Dardanus the firſt king of the country built it, and called it *Dardania*, and from Tros one of his ſucceſſors it was called *Troja*, and from Ilus *Ilion*. This city has been celebrated by the poems of Homer and Virgil; and of all the wars which have been carried on among the ancients, that of Troy is the moſt famous.

A deſcription of the plan of Troy has been lately publiſhed in French in the 3d volume of the Philoſophical Tranſactions of the Royal Society of Edinburgh, written by M. Chevalier. The city of Troy, according to him, ſtood on the preſent ſite of the modern village of Bounarbachi, diſtant four leagues from the ſea, and which is the reſidence of an Aga, ruling with abſolute ſway the inhabitants of the Trojan plain, and the inferior Agas, to whom they are immediately ſubject. Bounarbaci is ſituated on the ſide of an eminence, expoſed to every wind, at the termination of a ſpacious plain, the ſoil of which is rich and of a blackiſh colour. Cloſe to the village is to be ſeen a marſh covered with tall reeds; and the ſituation is impregnable on all ſides except at Erin (Homer's ερινεος), *the hill of wild fig trees*, which extended between the Scæan gate and the ſources of the Scamander. Theſe circumſtances, agreeing with Homer's deſcriptions, ſtrongly ſupport M. Chevalier's opinion concerning the ſituation of Troy. A very intereſting part of this work is the account of conical mounds or barrows, ſeveral of them 100 feet in diameter at the baſe; and which the author maintains to be the identical tombs raiſed over the aſhes of the heroes of the Trojan war: ſome of them he deems more ancient. He deſcribes particularly the tombs of Eſyetes, Ilus, Ajax, Hector, Achilles, Patroclus, and Antilochus.

This diſſertation, which runs to the length of 92 quarto pages, is replete with erudition and ingenious reaſoning, and is illuſtrated and embelliſhed by maps of the plan of Troy and ſeveral tables of inſcriptions. It has been tranſlated with much accuracy and care by Mr Dazel profeſſor of Greek in the Univerſity at Edinburgh, and accompanied with large notes and illuſtrations.

TSOLLIUS, Globe-flower, or *Lucken Gowan*, in botany: A genus of plants belonging to the claſs of *polyandria* and order of *polygynia*; and in the natural ſyſtem ranging under the 26th order, *Multiſiliquæ*. The calyx is wanting; there are about 14 petals; the capſules are very numerous, ovate, and monoſpermous. There are two ſpecies, the aſiaticus and europæus; the latter of which is a Britiſh plant.

Europæus, or European globe-flower, has its corollets connivent, and from 9 to 16 nectaria, of the length of the ſtamina, linear, plane, incurvated, and perforated at the inſide of the baſe. The leaves are divided firſt into five ſegments down

Tromp ‖ Troubadours.

down to the baſe; the ſegments are again divided, each about half way, into two or three lobes, which are ſharply indented on the edges. The ſtalk is a foot high, and ſcarcely branched: the flower is yellow, globoſe, and ſpacious. It grows at the foot of mountains, and by the ſides of rivulets. The country people in Sweden ſtrew their floors and pavements on holidays with the flowers. which have a pleaſant ſmell, and are ornamental in gardens.

TROMP (Martin Happertz Van), a celebrated Dutch admiral, was born at the Baille, in Holland. He raiſed himſelf by his merit, after having diſtinguiſhed himſelf on many occaſions, eſpecially at the famous engagement near Gibraltar in 1607. He paſſed for one of the greateſt ſeamen that had till that time appeared in the world; and was declared admiral of Holland, even by the advice of the prince of Orange. He in that character defeated a large Spaniſh fleet in 1630, and gained 32 other victories at ſea; but was killed when under deck, in an engagement with the Engliſh in 1653. The ſtates-general cauſed medals to be ſtruck to his honour, and lamented him as one of the greateſt heroes of their republic. Van Tromp, in the midſt of the greateſt glory, conſtantly diſcovered a remarkable modeſty; for he never aſſumed a higher character than that of a burgher, and that of being the father of the ſailors.

TRONAGE, an ancient cuſtomary duty or toll, for weighing of wool. According to Fleta, *trona* is a beam to weigh with, mentioned in the ſtat. Weſtm. 2. cap. 25. And tronage was uſed for the weighing wool in a ſtaple or public mart, by a common trona or beam; which, for the tronage of wool in London, was fixed at Leaden-Hall. The mayor and commonalty of London are ordainedkeepers of the beams and weights for weighing merchants commodities, with power to aſſign clerks and porters, &c. of the great beam and balance; which weighing of goods and wares is called *tronage*; and no ſtranger ſhall buy any goods in London before they are weighed at the king's beam, on pain of forfeiture.

TRONE-WEIGHT, the moſt ancient of the different weights uſed in Scotland; and, though now forbidden by ſeveral ſtatutes, is ſtill uſed by many for home-commodities, and that in a very irregular manner; for the pound varies in different places, and for different purpoſes, from 20 to 24 Dutch ounces. The common allowance is 21 ½ oz. for wool, 20 ½ for butter and cheeſe, 20 for tallow, lint, hemp, and hay. It is divided into 16 of its own ounces, and 16 pounds make a ſtone.

TROOP, a ſmall body of horſe or dragoons, about 50 or 60, ſometimes more, ſometimes leſs, commanded by a captain, lieutenant, cornet, quarter-maſter, and three corporals, who are the loweſt officers of a troop.

TROPE. See ORATORY, n° 52—66.

TROPHONIUS CAVE, or *Oracle* (anc. geog.), a cave near Lebadia in Bœotia, between Helicon and Chæronea (Strabo): ſo called from Trophonius, an enthuſiaſtic diviner; who, deſcending into this cave, pretended to give anſwers and pronounce oracles; and was hence called *Jupiter Trophonius*. Such as went down to this cave never after ſmiled; hence the proverbial ſaying of a man who has loſt his mirth, That he is come out of Trophonius's cave. Though Pauſanias, who writes from experience, contradicts this; affirming that perſons came out of the cave affected indeed with a ſtupor, but that they ſoon after recovered themſelves. See ORACLE.

TROPHY (*Tropæum*), among the ancients, a monument of victory.

TROPIC-BIRD. See PHÆTON.

TROPICS. See GEOGRAPHY, n° 40.

TROUBADOURS, poets that flouriſhed in Provence during the 12th century.

They wrote poems on love and gallantry; on the illuſtrious characters and remarkable events of the times; ſatires which were chiefly directed againſt the clergy and monks; and a few didactic pieces. The troubadours were great favourites in different courts, diffuſed a taſte for their language and for poetry over Europe, which was about that time ſunk in ignorance and rudeneſs; they diſappeared in the 14th century. A hiſtory of the troubadours in 3 volums 12mo, was begun by M. de Sainte Palaie, and finiſhed by the Abbé Millot. See MUSIC, n° 23.

Trover ‖ Trumpet.

TROVER, in law, an action that a man hath againſt one that, having found any of his goods, refuſeth to deliver them upon demand.

TROUT. See SALMO.

TROY. See TROJA,

Troy-Weight, one of the moſt ancient of the different kinds uſed in Britain. The ounce of this weight was brought from Grand Cairo in Egypt, about the time of the cruſades, into Europe, and firſt adopted in *Troyes* a city of Champagne; whence the name.

The pound *Engliſh* Troy contains 12 ounces, or 5760 grains. It was formerly uſed for every purpoſe; and is ſtill retained for weighing gold, ſilver, and jewels; for compounding medicines; for experiments in natural philoſophy; and for comparing different weights with each other.

Scots Troy-Weight was eſtabliſhed by James VI. in the year 1618, who enacted, that only one weight ſhould be uſed in Scotland, viz. the French Troy ſtone of 16 pounds, and 16 ounces in the pound. The pound contains 7600 grains, and is equal to 17 oz. 6 dr. avoirdupois. The cwt. or 112 lb. avoirdupois, contains only 103 lb. 2½ oz. of this weight, though generally reckoned equal to 104 lb. This weight is nearly, if not exactly, the ſame as that of Paris and Amſterdam; and is generally known by the name of *Dutch weight*. Though prohibited by the articles of union, it is ſtill uſed in weighing iron, hemp, flax, moſt Dutch and Baltic goods, meal, butcher-meat, unwrought pewter and lead, and ſome other articles.

TRUE-LOVE, in botany. See PARIS.

TRUFFLES. See LYCOPERDON.

TRUMPET, a muſical inſtrument, the moſt noble of all portable ones of the wind kind; uſed chiefly in war, among the cavalry to direct them in the ſervice. Each troop of cavalry has one. The cords of the trumpets are of crimſon, mixed with the colours of the facings of the regiments.

As to the invention of the trumpet, ſome Greek hiſtorians aſcribe it to the Tyrrhenians; but others, with greater probability, to the Egyptians; from whom it might have been tranſmitted to the Iſraelites. The trumpet was not in uſe among the Greeks at the time of the Trojan war; though it was in common uſe in the time of Homer. According to Potter (*Arch. Græc.* vol. ii. cap. 9.), before the invention of trumpets, the firſt ſignals of battle in primitive wars were lighted torches; to theſe ſucceeded ſhells of fiſhes, which were ſounded like trumpets. And when the trumpet became common in military uſe, it may well be imagined to have ſerved at firſt only as a rough and noiſy ſignal of battle, like that at preſent in Abyſſinia and New Zealand, and perhaps with only one ſound. But, even when more notes were produced from it, ſo noiſy an inſtrument muſt have been an unfit accompaniment for the voice and poetry; ſo that it is probable the trumpet was the firſt ſolo inſtrument in uſe among the ancients.

Trumpet, articulate, comprehends both the *ſpeaking* and the *hearing* trumpet, is by much the moſt valuable inſtrument, and has, in one of its forms, been uſed by people among whom we ſhould hardly have expected to find ſuch improvements.

That the *ſpeaking trumpet*, of which the object is to increaſe the

Trumpet. the force of articulate ſounds, ſhould have been known to the ancient Greeks, can excite no wonder; and therefore we eaſily admit the accouuts which we read of the horn or trumpet, with which Alexander addreſſed his army, as well as of the whiſpering caverns of the Syracuſan tyrant. But that the natives of Peru were acquainted with this inſtrument, will probably ſurpriſe many of our readers. The fact however ſeems incontrovertible.

In the Hiſtory of the Order of Jeſuits, publiſhed at Naples in 1601 by Beritaria, it is ſaid, that in the year 1595 a ſmall convent of that order in Peru, ſituated in a remote corner, was in danger of immediate deſtruction by famine. One evening the ſuperior Father Samaniac, implored the help of the cacique; next morning, on opening the gate of the monaſtery, he found it ſurrounded by a number of women, each of whom carried a ſmall baſket of proviſions. He returned thanks to heaven for having miraculouſly interpoſed, by inſpiring the good people with pity for the diſtreſs of his friars. But when he expreſſed to them his wonder how they came all to be moved as if by mutual agreement with theſe benevolent ſentiments, they told him it was no ſuch thing; that they looked on him and his countrymen as a pack of infernal magicians, who by their ſorceries had enſlaved the country, and had bewitched their good cacique, who hitherto had treated them with kindneſs and attention, as became a true worſhipper of the ſun; but that the preceding evening at ſunſet he had ordered the inhabitants of ſuch and ſuch villages, about ſix miles off, to come that morning with proviſions to this neſt of wizzards.

The ſuperior aſked them in what manner the governor had warned ſo many of them in ſo ſhort a time, at ſuch a diſtance from his own reſidence? They told him that it was by the trumpet; and that every perſon heard at their own door the diſtinct terms of the order. The father had heard nothing; but they told him that none heard the trumpet but the inhabitants of villages to which it was directed. This is a piece of very curious information; but, after allowing a good deal to the exaggeration of the reverend Jeſuits, it cannot, we think, be doubted, but that the Peruvians actually poſſeſſed this ſtentorophonic art. For we may obſerve that the effect deſcribed in this narration reſembles what we *now know* to be the effect of ſpeaking trumpets, while it is unlike what the inventor of ſuch a tale would naturally and ignorantly ſay. Till ſpeaking trumpets were really known, we ſhould expect the ſound to be equally diffuſed on all ſides, which is not the caſe; for it is much ſtronger in the line of the trumpet than in any direction very oblique to it.

About the middle of the laſt century, Athanaſius Kircher turned his attention to the philoſophy of ſound, and in different works threw out many uſeful and ſcientific hints on the conſtruction of ſpeaking trumpets (ſee Acoustics and Kircher); but his mathematical illuſtrations were ſo vague, and his own character of inattention and credulity ſo notorious, that for ſome time theſe works did not attract the notice to which they were well intitled.

About the year 1670 Sir Samuel Morland, a gentleman of great ingenuity, ſcience, and order, took up the ſubject, and propoſed as a queſtion to the Royal Society of London, What is the beſt form for a ſpeaking trumpet? which he called a ſtentorophonic horn. He accompanied his demand with an account of his own notions on the ſubject (which he acknowledged to be very vague and conjectural), and an exhibition of ſome inſtruments conſtructed according to his views. They were in general very large conical tubes, ſuddenly ſpreading at the very mouth to a greater width. Their Trumpet. effect was really wonderful. They were tried in St James's park; and his Majeſty K. Charles II. ſpeaking in his ordinary colloquial pitch of voice through a trumpet only 5 ½ feet long, was clearly and moſt diſtinctly heard at the diſtance of a thouſand yards. Another perſon, ſelected we ſuppoſe for the loudneſs and diſtinctneſs of his voice, was perfectly underſtood at the diſtance of four miles and a half. The fame of this ſoon ſpread; Sir Samuel Morland's principles were refined, conſidering the novelty of the thing, and differ conſiderably from father Kircher's. The aerial undulations (for he ſpeaks very accurately concerning the nature of ſound) endeavour to diffuſe themſelves in ſpheres, but are ſtopped by the tube, and therefore redundulate towards the axis like waves from a bank, and, meeting in the axis, they form a ſtrong undulation a little farther advanced along the tube, which again ſpreads, is again reflected, and ſo on, till it arrives at the mouth of the tube greatly magnified, and then it is diffuſed through the open air in the ſame manner, as if all proceeded from a *very* ſonorous point in the centre of the wide end of the trumpet. The author diſtinguiſhes with great judgment between the prodigious reinforcement of ſound in a ſpeaking trumpet and that in the muſical trumpet, bugle-horn, conch-ſhell, &c.; and ſhows that the difference conſiſts only in the violence of the firſt ſonorous agitation, which can be produced by us only on a very ſmall extent of ſurface. The mouth-piece diameter therefore of the muſical trumpet muſt be very ſmall, and the force of blaſt very conſiderable. Thus one ſtrong but ſimple undulation will be excited, which muſt be ſubjected to the modifications of harmony, and will be augmented by uſing a conical tube (A). But a ſpeaking trumpet muſt make no change on the nature of the firſt undulations; and each point of the mouth-piece muſt be equally conſidered as the centre of ſonorous undulations, all of which muſt be reinforced in the ſame degree, otherwiſe all diſtinctneſs of articulation will be loſt. The mouth-piece muſt therefore take in the whole of the mouth of the ſpeaker.

When Sir Samuel Morland's trumpet came to be generally known on the continent, it was ſoon diſcovered that the ſpeaker could be heard at a great diſtance only in the line of the trumpet; and this circumſtance was by a Mr Caſſegrain (*Journ. des Sçavans* 1672, p. 131.) attributed to a defect in the principle of its conſtruction, which he ſaid was not according to the laws of ſonorous undulations. He propoſed a conoid formed by the revolution of a hyperbola round its aſſymptote as the beſt form. A Mr Haſe of Wirtemberg, on the other hand, propoſed a parabolic conoid, having the mouth of the ſpeaker placed in the focus. In this conſtruction he plainly went on the principle of a reflection ſimilar to that of the rays of light; but this is by no means the caſe. The effect of the parabola will be to give one reflection, and in this all the circular undulations will be converted into plain waves which are at right angles to the axis of the trumpet. But nothing hinders their ſubſequent diffuſions; for it does not appear that the ſound will be enforced, becauſe the agitation of the particles on each wave is not augmented.

The ſubject is exceedingly difficult. We do not fully comprehend on what circumſtance the affection or agitation of our organ, or ſimply of the membrana tympani, depends. A more violent agitation of the ſame air, that is, a wider oſcillation of its particles, cannot fail to increaſe the impulſe on this membrane. The point therefore is to find what concourſe

(A) Accordingly the ſound of the bugle-horn, of the muſical trumpet, or the French horn, is prodigiouſly loud, when we conſider the ſmall paſſage through which a moderate blaſt is ſent by the trumpeter.

Trumpet. concourſe of feeble undulations will produce or be equivalent to a great one. The reaſonings of all theſe reſtorers of the ſpeaking trumpet are almoſt equally ſpecious, and each point out ſome phenomenon which ſhould characteriſe the principle of conſtruction, and thus enable us to ſay which is moſt agreeable to the procedure of nature.—Yet there is hardly any difference in the performance of trumpets of equal dimenſions made after theſe different methods.

The propagation of light and of elaſtic undulations ſeem to require very different methods of management. Yet the ordinary phenomena of echoes are perfectly explicable by the acknowledged laws either of optics or acouſtics; ſtill however there are ſome phenomena of ſound which are very unlike the genuine reſults of elaſtic undulations. If ſounds are propagated ſpherically, then what comes into a room by a ſmall hole ſhould diffuſe itſelf from that hole as round a centre, and it ſhould be heard equally well at twelve feet diſtance from the hole in every direction. Yet it is very ſenſibly louder when the hearer is in the ſtraight line drawn from the ſonorous body through the hole. A perſon can judge of the direction of the ſounding body with tolerable exactneſs. Cannon diſcharged from the different ſides of a ſhip are very eaſily diſtinguiſhed, which ſhould not be the caſe by the Newtonian theory; for in this the two pulſes on the ear ſhould have no ſenſible difference.

The moſt important fact for our purpoſe is this: An echo from a ſmall plane ſurface in the midſt of an open field is not heard, unleſs we ſtand in ſuch a ſituation that the angle of reflected ſound may be equal to that of incidence. But by the uſual theory of undulations, this ſmall ſurface ſhould become the centre of a new undulation, which ſhould ſpread in all directions. If we make an analogous experiment on watery undulations, by placing a ſmall flat ſurface ſo as to project a little above the water, and then drop in a ſmall pebble at a diſtance, ſo as to raiſe one circular wave, we ſhall obſerve, that when this wave arrives at the projecting plane, it is diſturbed by it, and this diſturbance ſpreads from it on all ſides. It is indeed ſenſibly ſtronger in that line which is drawn from it at equal angles with the line drawn to the place where the pebble was dropped. But in the caſe of ſound, it is a fact, that if we go to a very ſmall diſtance on either ſide of the line of reflection, we ſhall hear nothing.

Here then is a fact, that whatever may be the nature of the elaſtic undulations, ſounds are reflected from a ſmall plane in the ſame manner as light. We may avail ourſelves of this fact as a mean for enforcing ſound, though we cannot explain it in a ſatisfactory manner. We ſhould expect from it an effect ſimilar to the hearing of the original ſound, along with another original ſound coming from the place from which this reflected ſound diverges. If therefore the reflected ſound or echo arrives at the ear in the ſame inſtant with the original ſound, the effect will be doubled; or at leaſt it will be the ſame with two ſimultaneous original ſounds. Now we know that this is in ſome ſenſe equivalent to a ſtronger ſound. For it is a fact that a number of voices uttering the ſame or equal ſounds are heard at a much greater diſtance than a ſingle voice. We cannot perhaps explain how this happens by mechanical laws, nor aſſign the exact proportion in which 10 voices exceed the effect of one voice; nor the proportion of the diſtances at which they ſeem equally loud. We may therefore, for the preſent, ſuppoſe that two equal voices at the ſame diſtance are twice as loud, three voices three times as loud, &c. Therefore if, by means of a ſpeaking trumpet, we can make 10 equal echoes arrive at the ear at the ſame moment, we may ſuppoſe its effect to be to increaſe the audibility 10 times; and we may expreſs this ſhortly, by calling the ſound 10 Trumpet. times louder or more intenſe.

But we cannot do this preciſely. We cannot by any contrivance make the ſound of a momentary ſnap, and thoſe of its echoes, arrive at the ear in the ſame moment, becauſe they come from different diſtances. But if the original noiſe be a continued ſound, a man's voice, for example, uttering a continued uniform tone, the firſt echo may reach the ear at the ſame moment with the ſecond vibration of the larynx; the ſecond echo along with the third vibration, and ſo on. It is evident, that this will produce the ſame effect. The only difference will be, that the articulations of the voice will be made indiſtinct, if the echoes come from very different diſtances. Thus if a man pronounce the ſyllable *taw*, and the 10 ſucceſſive echoes are made from places which are 10 feet farther off, the 10th part of a ſecond (nearly) will intervene between hearing the firſt and the laſt. This will give it the ſound of the ſyllable *thaw*, or perhaps *raw*, becauſe *r* is the repetition of *t*. Something like this occurs when, ſtanding at one end of a long line of ſoldiers, we hear the muſkets of the whole line diſcharged in one inſtant. It ſeems to us the ſound of a runningfire.

The aim therefore in the conſtruction of a ſpeaking trumpet may be, to cauſe as many echoes as poſſible to reach a diſtant ear without any perceptible interval of time. This will give diſtinctneſs, and ſomething equivalent to loudneſs. *Pure* loudneſs ariſes from the violence of the ſingle aerial undulation. To increaſe this may be the aim in the conſtruction of a trumpet; but we are not ſufficiently acquainted with the mechaniſm of theſe undulations to bring this about with certainty and preciſion; whereas we can procure this accumulation of echoes without much trouble, ſince we know that echoes are, *in fact*, reflected like light. We can form a trumpet ſo that many of theſe lines of reflected ſound ſhall paſs through the place of the hearer. We are indebted to Mr Lambert of Berlin for this ſimple and popular view of the ſubject; and ſhall here give an abſtract of his moſt ingenious Diſſertation on Acouſtic Inſtruments, publiſhed in the Berlin Memoirs for 1763.

Sound naturally ſpreads in all directions; but we know that echoes or reflected ſounds proceed almoſt ſtrictly in certain limited directions. If therefore we contrive a trumpet in ſuch a way that the lines of echo ſhall be confined within a certain ſpace, it is reaſonable to ſuppoſe that the ſound will become more audible in proportion as this diffuſion is prevented. Therefore if we can oblige a ſound which, in the open air, would have diffuſed itſelf over a hemiſphere, to keep within a cone of 120 degrees, we ſhould expect it to be twice as audible within this cone. This will be accompliſhed, by making the reflections ſuch that the lines of reflected ſound ſhall be confined within this cone. *N. B.* We here ſuppoſe that nothing is loſt in the reflection. Let us examine the effect of a cylindrical trumpet.

Let the trumpet be a cylinder ABED (fig. 1.), and let C be a ſounding point in the axis. It is evident that all the ſound in the cone BCE will go forward without any reflection. Let CM be any other line of ſound, which we may, for brevity's ſake, call a *ſonorous* or *phonic line*. Being reflected in the points M, N, O, P, it is evident that it will at laſt eſcape from the trumpet in a direction PQ, equally diverging from the axis with the line CM. The ſame muſt be true of every other ſonorous line. Therefore the echoes will all diverge from the mouth of the trumpet in the ſame manner as they would have proceeded from C without any trumpet. Even ſuppoſing, therefore, that the echoes are as ſtrong as the original ſound, no advantage is gained by ſuch a trumpet, but that of bringing the ſound forward Plate DXII.

Trumpet. from C to *e*. This is quite trifling when the hearer is at a diſtance. Yet we ſee that ſounds may be heard at a very great diſtance, at the end of long, narrow, cylindrical, or priſmatical galleries. It is known that a voice may be diſtinctly heard at the diſtance of ſeveral hundred feet in the Roman aqueducts, whoſe ſides are perfectly ſtraight and ſmooth, being plaſtered with ſtucco. The ſmooth ſurface of the ſtill water greatly contributes to this effect. Cylindrical or priſmatical trumpets muſt therefore be rejected.

Let the trumpet be a cone BCA (fig. 2.), of which CN is the axis, DK a line perpendicular to the axis, and DFHI the path of a reflected ſound in the plane of the axis. The laſt angle of reflection IHA is equal to the laſt angle of incidence FHC. The angle BFH, or its equal CFD, is equal to the angles FHD, and FCH; that is, the angle of incidence CFD exceeds the next angle of incidence FHC by the angle FCD; that is, by the angle of the cone. In like manner FDH exceeds CFD by the ſame angle FCD. Thus every ſucceeding angle, either of incidence or reflection, exceeds the next by the angle of the cone. Call the angle of the cone a, and let b be the firſt angle of incidence PDC. The ſecond, or DFC, is $b-a$. The third, or FHC, is $b-2a$, &c.; and the nth angle of incidence or reflection is $b-na$, after n reflections. Since the angle diminiſhes by equal quantities at each ſubſequent reflection, it is plain, that whatever be the firſt angle of incidence, it may be exhauſted by this diminution; namely, when n times a exceeds or is equal to b. Therefore to know how many reflections of a ſound, whoſe firſt incidence has the inclination b, can be made in an infinitely extended cone, whoſe angle is a, divide b by a; the quotient will give the number n of reflections, and the remainder, if any, will be the laſt angle of incidence or reflection leſs than a. It is very plain, that when an angle of reflection IHA is equal to or leſs than the angle BCA of the cone, the reflected line HI will no more meet with the other ſide CB of the cone.

We may here obſerve, that the greateſt angle of incidence is a right angle, or 90°. This ſound would be reflected back in the ſame line, and would be incident on the oppoſite ſide in an angle $= 90° - a$, &c.

Thus we ſee that a conical trumpet is well ſuited for confining the ſound: for by prolonging it ſufficiently, we can keep the lines of reflected ſound wholly within the cone. And when it is not carried to ſuch a length as to do this, when it allows the ſounding line GH, for example, to eſcape without farther reflection, the divergency from the axis is leſs than the laſt angle of reflection BGH by half the angle BCA of the cone. Let us ſee what is the connection between the length and the angle of ultimate reflection.

We have $\text{ſin. } \overline{b-a} : \text{ſin. } b = \text{CD} : \text{CF}$, and $\text{CF} = \text{CD} \times \frac{\text{ſin. } b}{\text{ſin. } \overline{b-a}}$, and $\text{ſin. } \overline{b-2a} : \text{ſin. } \overline{b-a} = \text{CF} : \text{CH}$, and

$$\text{CH} = \text{CF} \times \frac{\text{ſin. } b-a}{\text{ſin. } b-2a} = \text{CD} \times \frac{\text{ſin. } b}{\text{ſin. } b-a} \times \frac{\text{ſin. } b-a}{\text{ſin. } b-2a},$$

$$= \text{CD} \times \frac{\text{ſin. } b}{\text{ſin. } b-2a}, \text{ &c.}$$

Therefore if we ſuppoſe X to be the length which will give us n reflections, we ſhall have $\text{X} = \text{CD} \times \frac{\text{ſin. } b}{\text{ſin. } b-na}$.

Hence we ſee that the length increaſes as the angle $b-na$ diminiſhes; but is not infinite, unleſs na is equal to b. In this caſe, the immediately preceding angle of reflection muſt be a, becauſe theſe angles have the common difference a. Therefore the laſt reflected ſound was moving parallel to the oppoſite ſide of the cone, and cannot again meet it. But though we cannot aſſign the length which will give the nth reflection, we can give the length which will give the one immediately preceding, whoſe angle with the ſide of the cone is a. Let Y be this length. We have $\text{Y} = \text{CD} \times \frac{\text{ſin. } b}{\text{ſin. } a}$. This length will allow every line of ſound to be reflected as often, ſaving once, as if the tube were infinitely long. For ſuppoſe a ſonorous line to be traced backwards, as if a ſound entered the tube in the direction $i\,b$, and were reflected in the points b, f, d, δ, D, the angles will be continually augmented by the conſtant angle a. But this augmentation can never go farther than $90° + \frac{1}{2}a$. For if it reaches that value at D, for inſtance, the reflected line DK will be perpendicular to the axis CN; and the angle ADK will be equal to the angle DKB, and the ſound will come out again. This remark is of importance on another account. Trumpet.

Now ſuppoſe the cone to be cut off at D by a plane perpendicular to the axis, KD will be the diameter of its mouth piece; and if we ſuppoſe a mouth completely occupying this circle, and every point of the circle to be ſonorous, the reflected ſounds will proceed from it in the ſame manner as light would from a flame which completely occupies its area, and is reflected by the inſide of the cone. The angle FDA will have the greateſt poſſible ſine when it is a right angle, and it never can be greater than ADK, which is $= 90 + \frac{1}{2}a$. And ſince between $90° + \frac{1}{2}a$, and $90 - \frac{1}{2}a$, there muſt be ſome multiple of a; call this multiple b. Then, in order that every ſound may be reflected as often as poſſible, ſaving once, we muſt make the length of it $\text{X} = \text{CD} \times \frac{\text{S}, b}{\text{S}, a}$.

Now ſince the angle of the cone is never made very great, never exeeeding 10 or 12 degrees, b can never differ from 90 above a degree or two, and its ſine cannot differ much from unity. Therefore X will be very nearly equal to $\frac{\text{CD}}{\text{S}, a}$ which is alſo very nearly equal to $\frac{\text{CD}}{2\,\text{S}, \frac{1}{2}a}$; becauſe a is ſmall, and the ſines of ſmall arches are nearly equal and proportional to the arches themſelves. There is even a ſmall compenſation of errors in this formula. For as the ſine of 90° is ſomewhat too large, which would give X too great, $2\,\text{S}, \frac{1}{2}a$ is alſo larger than the ſine of a. Thus let a be 12°: then the neareſt multiple of a is 84 or 96°, both of which are as far removed as poſſible from 90°, and the error is as great as poſſible, and is nearly $\frac{1}{168}$th of the whole.

This approximation gives us a very ſimple conſtruction. Let CM be the required length of the trumpet, and draw ML perpendicular to the axis in O. It is evident that S, MCO : rad. = MO : CM, and CM; or $\text{X} = \frac{\text{MO}}{\text{S}, \frac{1}{2}a,} = \frac{\text{LM}}{2\,\text{S}, \frac{1}{2}a}$, but $\text{X} = \frac{\text{CD}}{2\,\text{S}, \frac{1}{2}a}$ and therefore LM is equal to CD.

If therefore the cone be of ſuch a length, that its diameter at the mouth is equal to the length of the part cut off, every line of ſound will have at leaſt as many reflections, ſave one, as if the cone were infinitely long; and the laſt reflected line will either be parallel to the oppoſite ſide of the cone, or lie nearer the axis than this parallel; conſequently ſuch a cone will confine all the reflected ſounds within a cone whoſe angle is $2\,a$, and will augment the ſound in the proportion of the ſpherical baſe of this cone to a complete hemiſpherical ſurface. Deſcribe the circle DKT round C, and making DT an arch of 90, draw the chord DT. Then ſince the circles deſcribed with the radii DK,

Trumpet. DK, DT, are equal to the ſpherical ſurfaces generated by the revolution of the arches DK and DKT round the axis CD, the ſound will be condenſed in the proportion of DK^2 to DT^2.

This appears to be the beſt general rule for conſtructing the inſtrument; for, to procure another reflection, the tube muſt be prodigiouſly lengthened, and we cannot ſuppoſe that one reflection more will add greatly to its power.

It appears, too, that the length depends chiefly on the angle of the cone; for the mouth-piece may be conſidered as nearly a fixed quantity. It muſt be of a ſize to admit the mouth when ſpeaking with force and without conſtraint. About an inch and a half may be fixed on for its diameter. When therefore we propoſe to confine the ſound to a cone of twice the angle of the trumpet, the whole is determined by that angle. For ſince in this caſe LM is equal to CD, we have DK : CD = LM (or CD) : CM and $CM = \frac{CD^2}{DK}$.

But $2\,S,\frac{1}{2}a : 1 = DK : CD$,
and $2\,S,\frac{1}{2}a : 1 = CD : CM$;
therefore $4\,S,^2\frac{1}{2}a : 1 = DK : CM$,

And $CM = \frac{DK}{4\,S,^2\frac{1}{2}a}, = \frac{DK}{S,^2a}$ very nearly. And ſince DK is an inch and a half, we get the length in inches, counted from the apex of the cone $= \frac{1\frac{1}{2}}{S,^2a}$, or $\frac{3}{2\,S,^2a}$. From this we muſt cut off the part CD, which is $= \frac{^2DK}{S,\frac{1}{2}a}$, or very nearly $\frac{DK}{S,a}$, or $\frac{3}{2\,S,a}$, meaſured in inches, and we muſt make the mouth of the ſame width $\frac{3}{2\,S,a}$.

On the other hand, if the length of the trumpet is fixed on, we can determine the angle of the cone. For let the length (reckoned from C) be L; we have $2\,S,^2a = \frac{3}{L}$, or $S,^2a = \frac{3}{2L}$, and $S,a = \sqrt{\frac{3}{2L}}$.

Thus let 6 feet or 72 inches be choſen for the length of the cone, we have $S,a = \sqrt{\frac{3}{144}} = \sqrt{\frac{1}{48}}$, = 0,14434, = ſin 8° 17′ for the angle of the cone; and the width at the mouth is $\frac{3}{2,S,a}$ = 10,4 inches. This being taken from 72, leaves 61,6 inches for the length of the trumpet.

And ſince this trumpet confines the reflected ſounds to a cone of 16° 34′, we have its magnifying power $= \frac{DT^2}{DK^2}$ $= \frac{\frac{1}{2}DT^2}{\frac{1}{2}DK^2} = \frac{S.^2 45°}{S,^2 4°8'\frac{1}{2}}$ = 96 nearly. It therefore condenſes the ſound about 96 times; and if the diſtribution were uniform, it would be heard $\sqrt{96}$, or nearly ten times farther off. For the loudneſs of ſounds is ſuppoſed to be inverſely as the ſquare of the diſtance from the centre of undulation.

But before we can pronounce with preciſion on the performance of a ſpeaking trumpet, we muſt examine into the manner in which the reflected ſounds are diſtributed over the ſpace in which they are all confined.

Let BKDA (fig. 3.) be the ſection of a conical trumpet by a plane through the axis; let C be the vertex of the cone, and CW its axis: let TKV be the ſection of a ſphere, having its centre in the vertex of the cone; and let P be a ſonorous point on the ſurface of the ſphere, and P *a f e l* the path of a line of ſound lying in the plane of the ſection. Trumpet.

In the great circle of the ſphere take KQ = KP, DR = DQ, and KS = KR. Draw Q B *b*; alſo draw Q *d n* parallel to DA; and draw PB, P *d*, PA.

1. Then it is evident that all the lines drawn from P, within the cone APB, proceed without reflection, and are diffuſed as if no trumpet had been uſed.

2. All the ſonorous lines which fall from P on KB are reflected from it as if they had come from Q.

3. All the ſonorous lines between BP and *d* P have ſuffered all but one reflection; for *d n* will no more meet DAA′ ſo as to be reflected again.

4. All the lines which have been reflected from KB, and afterwards from DA, proceed as if they had come from R. For the lines reflected from KB proceed as if they had come from Q; and lines coming from Q and reflected by DA, proceed as if they had come from R. Therefore draw RA *o*, and alſo draw R *g m* parallel to KB, and draw Q *c* A *q*, Q *b g*, P *c*, and P *b*. Then,

5. All the lines between *b* P and *c* P have been twice reflected.

Again, draw SB *p*, B *r* R, *r u* Q, S *x* A, R *y x*, Q *z y*.

6. All the lines between *u* P and *z* P have ſuffered three reflections.

Draw the tangents TA *t*, VB *v*, croſſing the axis in W.

7. The whole ſounds will be propagated within the cone *v* W *t*. For to every ſonorous point in the line KD there correſponds a point ſimilar to Q, regulating the firſt reflection from KB; and a point ſimilar to R, regulating the ſecond reflection from DA; and a point S regulating the third reflection from KB, &c. And ſimilar points will be found regulating the firſt reflection from DA, the ſecond from KB, and the third from DA, &c.; and lines drawn from all theſe through A and B muſt lie within the tangents TA and VB.

8. Thus the centres of reflection of all the ſonorous lines which lie in planes paſſing through the axis, will be found in the ſurface of this ſphere; and it may be conſidered as a ſonorous ſphere, whoſe ſounds firſt concentrate in W, and are then diffuſed in the cone *v* W *t*.

It may be demonſtrated nearly in the ſame manner, that the ſonorous lines which proceed from P, but not in the plane paſſing through the axis, alſo proceed, after various reflections, as if they had come from points in the ſurface of the ſame ſphere. The only difference in the demonſtration is, that the centres Q, R, S of the ſucceſſive reflections are not in one plane, but in a ſpiral line winding round the ſurface of the ſphere according to fixed laws. The foregoing concluſions are therefore general for all the ſounds which come in all directions from every point in the area of the mouth-piece.

Thus it appears, that a conical trumpet is well fitted for increaſing the force of ſounds by diminiſhing their final divergence. For had the ſpeaker's mouth been in the open air, the ſounds which are now confined within the cone *v* W *t* would have been diffuſed over a hemiſphere: and we ſee that prolonging the trumpet muſt confine the ſounds ſtill more, becauſe this will make the angle BWA ſtill ſmaller; a longer tube muſt alſo occaſion more reflections, and conſequently ſend more ſonorous undulations to the ear at a diſtance placed within the cone *v* W *t*.

We have now obtained a very connected view of the whole effect of a conical trumpet. It is the ſame as if the whole ſegment TKDV were ſounding, every part of it with an intenſity proportional to the denſity of the points Q, R, S, &c. correſponding to the different points P of the mouth-piece. It is eaſy to ſee that this cannot be uniform, but

Trumpet. must be much rarer towards the margin of the ſegment. It would require a good deal of diſcuſſion to ſhow the denſity of theſe fictitious ſounding points; and we ſhall content ourſelves with giving a very palpable view of the diſtribution of the ſonorous rays, or the denſity (ſo to ſpeak) of the echoes, in the different ſituations in which a hearer may be placed.

We may obſerve, in the mean time, that this ſubſtitution of a ſounding ſphere for the ſounding mouth-piece has an exact parallel in Optics, by which it will be greatly illuſtrated. Suppoſe the cone BKDA to be a tube poliſhed in the inſide, fixed in a wall B α, perforated in BA, and that the mouth-piece DK is occupied completely by a flat flame. The effect of this on a ſpectator will be the ſame if he is properly placed in the axis, as if he were looking at a flame as big as the whole ſphere. This is very evident. Fig. 3.

It is eaſy to ſee that the line *l e* S is equal to the line *l e f a* P; therefore the reflected ſounds alſo come to the ear in the ſame moments as if they had come from their reſpective points on the ſurface of the ſubſtituted ſphere. Unleſs, therefore, this ſphere be enormouſly large, the diſtinctneſs of articulation will not be ſenſibly affected, becauſe the interval between the arrival of the different echoes of the ſame ſnap will be inſenſible.

Our limits oblige us to content ourſelves with exhibiting this evident ſimilarity of the progreſs of echo from the ſurface of this phonic ſphere, to the progreſs of light from the ſame luminous ſphere ſhining through a hole of which the diameter is AB. The direct inveſtigation of the intenſity of the ſound in different directions and diſtances would take up much room, and give no clearer conception of the thing. The intenſity of the ſound in any point is preciſely ſimilar to the intenſity of the illumination of the ſame point; and this is proportional to the portion of the luminous ſurface ſeen from this point through the hole directly, and to the ſquare of the diſtance inverſely. The intelligent reader will acquire a diſtinct conception of this matter from fig. 4. which repreſents the diſtribution of the ſonorous lines, and by conſequence the degree of loudneſs which may be expected in the different ſituations of the hearer.

As we have already obſerved, the effect of the cone of the trumpet is perfectly analogous to the reflection of light from a poliſhed concave, conical mirror. Such an inſtrument would be equally fitted for illuminating a diſtant object. We imagine that theſe would be much more powerful than the ſpherical or even parabolic mirrors commonly uſed for this purpoſe. Theſe laſt, having the candle in the focus, alſo ſend forward a cylinder of light of equal width with the mirror. But it is well known, that oblique reflections are prodigiouſly more vivid than thoſe made at greater angles. Where the inclination of the reflected light to the plane of the mirror does not exceed eight or ten degrees, it reflects about three-fourths of the light which falls on it. But when the inclination is 80, it does not reflect one fourth part.

We may alſo obſerve, that the denſity of the reflected ſounds by the conical trumpet ABC (fig. 4.) is preciſely ſimilar to that of the illumination produced by a luminous ſphere TDV, ſhining through a hole AB. There will be a ſpace circumſcribed by the cone formed by the lines TB*t* and VA *v*, which is uniformly illuminated by the whole ſphere (or rather by the ſegment TDV), and on each ſide there is a ſpace illuminated by a part of it only, and the illumination gradually decreaſes towards the borders. A ſpectator placed much out of the axis, and looking through the hole AB, may not ſee the whole ſphere. In like manner, he will not hear the whole ſounding ſphere: He may be ſo far from the axis as neither to ſee nor hear any part of it. Fig. 3. Trumpet.

Aſſiſting our imagination by this compariſon, we perceive that beyond the point *w* there is no place where *all* the reflected ſounds are heard. Therefore, in order to preſerve the magnifying power of the trumpet at any diſtance, it is neceſſary to make the mouth as wide as the ſonorous ſphere. Nay, even this would be an imperfect inſtrument, becauſe its power would be confined to a very narrow ſpace; and if it be not accurately pointed to the perſon liſtening, its power will be greatly diminiſhed. And we may obſerve by the way, that we derive from this circumſtance a ſtrong confirmation of the juſtneſs of Mr Lambert's principles; for the effects of ſpeaking trumpets are really obſerved to be limited in the way here deſcribed.—Parabolic trumpets have been made, and they fortify the ſound not only in the cylindrical ſpace in the direction of the axis, but alſo on each ſide of it, which ſhould not have been the caſe had their effect depended only on the undulations formed by the parabola in planes perpendicular to the axis. But to proceed.

Let BCA (fig. 5.) be the cone, ED the mouth-piece, TEDV the equivalent ſonorous ſphere, and TBAV the circumſcribed cylinder. Then CA or CB is the length of cone that is neceſſary for maintaining the magnifying power at all diſtances. We have two conditions to be fulfilled. The diameter ED of the mouth-piece muſt be of a certain fixed magnitude, and the diameter AB of the outer end muſt be equal to that of the equivalent ſonorous ſphere. Theſe conditions determine all the dimenſions of the trumpet and its magnifying power. And, firſt, with reſpect to the dimenſions of the trumpet.

The ſimilarity of the triangles ECG and BCF gives CG : ED=CF : AB; but CG = BF, $= \frac{1}{2}$AB, and CF = CG + GF, $=$ GF $+ \frac{1}{2}$AB; therefore $\frac{1}{2}$AB : ED = GF $+ \frac{1}{2}$AB : AB, and AB : ED = 2 GF + AB : AB; therefore 2 GF × ED + AB × ED = AB², and 2 GF × ED = AB², — AB × ED, = AB × $\overline{\text{AB} - \text{ED}}$, and GF $= \frac{\text{AB} \times \overline{\text{AB} - \text{ED}}}{2\,\text{ED}}$. And, on the other hand, becauſe AB² — × EBAD = 2 GF × ED, we have AB² — AB × ED + $\frac{1}{4}$ED² = 2 GF × ED + $\frac{1}{4}$ED², or $\overline{\text{AB} - \frac{1}{2}\text{ED}}^2$ = 2 GF × ED + $\frac{1}{4}$ED², and AB = $\sqrt{2\text{GF} \times \text{ED} + \frac{1}{4}\text{ED}^2} + \frac{1}{2}$ED.

Let x repreſent the length of the trumpet, y the diameter at the great end, and m the diameter of the mouth-piece. Then $x = \frac{y \times \overline{y - m}}{2m}$, and $y = \sqrt{2xm + \frac{1}{4}m^2} + \frac{1}{2}m$. Thus the length and the great diameter may be had reciprocally. The uſeful caſe in practice is to find the diameter for a propoſed length, which is gotten by the laſt equation.

Now if we take all the dimenſions in inches, and fix m at an inch and a half, we have $2xm = 3x$, and $\frac{1}{4}m^2 = 0{,}5625$, and $\frac{1}{2}m = 0{,}75$; ſo that our equation becomes $y = \sqrt{3x + 0{,}5625} + 0{,}75$. The following table gives the dimenſions of a ſufficient variety of trumpets. The firſt column is the length of the trumpet in feet; the ſecond column is the diameter of the mouth in inches; the third column is the number of times that it magnifies the ſound; and the fourth column is the number of times that it increaſes the diſtance at which a man may be diſtinctly heard by its means; the fifth contains the angle of the cone.

GF

ED in all is = 1,5.				

The two laſt columns are conſtructed on the following conſiderations: We conceive the hearer placed within the cylindrical ſpace whoſe diameter is BA. In this ſituation he receives an echo coming apparently from the whole ſurface TGV; and we account the effect of the trumpet as equivalent to the united voices of as many mouths as would cover this ſurface. Therefore the quotient obtained by dividing the ſurface of the hemiſphere by that of the mouth-piece will expreſs the magnifying power of the trumpet. If the chords g E, g T, be drawn, we know that the ſpherical ſurfaces T g V, E g D, are reſpectively equal to the circles deſcribed with the radii T g, E g, and are therefore as T g^2 and E g^2. Therefore the audibility of the trumpet, when compared with a ſingle voice, may be expreſſed by $\frac{T\,g^2}{E\,g^2}$. Now the ratio of T g^2 to E g^2 is eaſily obtained. For if E f be drawn parallel to the axis, it is plain that B $f = \frac{BA - ED}{2}$, and that E f is to f B as radius to the tangent of BCF; which angle we may call a. Therefore tan. $a = \frac{y-m}{2x}$, and thus we obtain the angle a. But if the radius CE be accounted 1, T g is $= \sqrt{2}$, and E g is $= 2$ ſin. $\frac{a}{2}$. Therefore $\frac{T\,g}{E\,g} = \frac{\sqrt{2}}{2 \text{ ſin.} \frac{a}{2}}$, and the magnifying power of the trumpet is $= \frac{2}{4 \text{ ſin.}^2 \frac{a}{2}}, = \frac{1}{2 \text{ ſin.}^2 \frac{a}{2}}$. The numbers, therefore, in the third column of the table are each $= \frac{1}{2 \text{ ſin.}^2 \frac{a}{2}}$.

But the more uſual way of conceiving the power of the trumpet is, by conſidering how much farther it will enable us to hear a voice equally well. Now we ſuppoſe that the audibility of ſounds varies in the inverſe duplicate ratio of the diſtance. Therefore if the diſtance d, at which a man may be diſtinctly heard, be increaſed to z, in the proportion of EG to T g, the ſound will be leſs audible, in the proportion of T g^2 to EG^2. Therefore the trumpet will be as well heard at the diſtance z as the ſimple voice is heard at the diſtance d. Therefore $\frac{z}{d}$ will expreſs the *extending power* of the trumpet, which is therefore $= \frac{\sqrt{2}}{2 \text{ ſin.} \frac{a}{2}}$. Trumpet.

In this manner were the numbers computed for the fourth column of the table.

When the angle BCA is ſmall, which is always the caſe in ſpeaking trumpets, we may, without any ſenſible error, conſider EG as $= \frac{ED}{2}, = \frac{m}{2}$. And TG $=$ TC $\times \sqrt{2}, =$ $\frac{AB}{2}\sqrt{2} = \frac{AB}{\sqrt{2}} = \frac{y}{\sqrt{2}}$. This gives a very eaſy computation of the extending and magnifying powers of the trumpet.

The extending power is $= \sqrt{2}\,\frac{y}{m}$

The magnifying power is $= 2\,\frac{y}{m^2}$.

We may alſo eaſily deduce from the premiſes, that if the mouth-piece be an inch and a half in diameter, and the length x be meaſured in inches, the extending power is very nearly $= \sqrt{\frac{8}{3}\,x}$ and the magnifying power $= \frac{8}{3}\,x$.

An inconvenience ſtill attends the trumpet of this conſtruction. Its complete audibility is confined to the cylindrical ſpace in the direction of the axis, and it is more faintly heard on each ſide of it. This obliges us to direct the trumpet very exactly to the ſpot where we wiſh it to be heard. This is confirmed by all the accounts we have of the performance of great ſpeaking trumpets. It is evident, that by lengthening the trumpet, and therefore enlarging its mouth, we make the lines TB t and VA v expand (fig. 4.); and therefore it will not be ſo difficult to direct the trumpet.

But even this is confined within the limits of a few degrees. Even if the trumpet were continued without end, the ſounds cannot be reinforced in a wider ſpace than the cone of the trumpet. But it is always advantageous to increaſe its length; for this makes the extreme tangents embrace a greater portion of the ſonorous ſphere, and thus increaſes the ſound in the ſpace where it is all reflected. And the limiting tangents TB, VA, expand ſtill more, and thus the ſpace of full effect is increaſed. But either of theſe augmentations is very ſmall in compariſon of the augmentation of ſize. If the trumpet of fig. 5. were made an hundred times longer, its power would not be increaſed one half.

We need not therefore aim at much more than to produce a cylindrical ſpace of full effect; and this will always be done by the preceding rules, or table of conſtructions. We may give the trumpet a third or a fourth part more length, in order to ſpread a little the ſpace of its full effect, and thereby make it more eaſily directed to the intended object. But in doing this we muſt be careful to increaſe the diameter of the mouth as much as we increaſe the length; otherwiſe we produce the very oppoſite effect, and make the trumpet greatly inferior to a ſhorter one, at all diſtances beyond a certain point. For by increaſing the length while the part CG remains the ſame, we cauſe the tangents TB and VA to meet on ſome diſtant point, beyond which the ſound diffuſes prodigiouſly. The conſtruction of a ſpeaking trumpet is therefore a problem of ſome nicety; and as the trials are always made at ſome conſiderable diſtance, it may frequently happen that a trumpet, which is not heard at a mile's diſtance, may be made very audible two miles off by cutting off a piece at its wide end.

After this minute conſideration of the conical trumpet, we might proceed to conſider thoſe of other forms. In particular, the hyperbolic, propoſed by Caſſegrain, and the parabolic,

Trumpet. parabolic, propoſed by Haaſe, ſeem to merit conſideration. But if we examine them merely as reflectors of echoes, we ſhall find them inferior to the conical.

With reſpect to the hyperbolic trumpet, its inaptitude is evident at firſt ſight. For it muſt diſſipate the echoes more than a conical trumpet. Indeed Mr Caſſegrain proceeds on quite different principles, depending on the mechaniſm of the aerial undulations: his aim was to increaſe the agitation in each pulſe, ſo that it may make a more forcible impulſe on the ear. But we are too imperfectly acquainted with this ſubject to decide *a priori*; and experience ſhows that the hyperbola is not a good form.

With reſpect to the parabolic trumpet, it is certain that if the mouth-piece were but a point, it would produce the moſt favourable reflection of all the ſounds; for they would all proceed parallel to the axis. But every point of an open mouth muſt be conſidered as a centre of ſound, and none of it muſt be kept out of the trumpet. If this be all admitted, it will be found that a conical trumpet, made by the preceding rules, will diſſipate the reflected ſounds much leſs than the parabolic.

Thus far have we proceeded on the fair conſequences of the well known fact, that echoes are reflected in the ſame manner as light, without engaging in the intricate inveſtigation of aerial undulations. Whoever conſiders the Newtonian theory of the propagation of ſound with intelligence and attention, will ſee that it is demonſtrated ſolely in the caſe of a ſingle row of particles; and that all the general corollaries reſpecting the lateral diffuſion of the elaſtic undulations are little more than ſagacious gueſſes, every way worthy of the illuſtrious author, and beautifully confirmed by what we can moſt diſtinctly and accurately obſerve in the circular waves on the ſurface of ſtill water. But they are by no means fit for becoming the foundation of any doctrine which lays the ſmalleſt claim to the title of accurate ſcience. We really know exceedingly little of the theory of aerial undulations; and the conformity of the phenomena of ſound to theſe gueſſes of Sir Iſaac Newton has always been a matter of wonder to every eminent and candid mathematician: and no other ſhould pretend to judge of the matter. This wonder has always been acknowledged by Daniel Bernoulli; and he is the only perſon who has made any addition to the ſcience of ſounds that is worth mentioning. For ſuch we muſt always eſteem his doctrine of the ſecondary undulations of muſical cords, and the ſecondary pulſes of air in pipes. Nothing therefore is more unwarrantable, or more plainly ſhows the precipitant preſumption of modern ſciolifts, than the familiar uſe of the general theory of aerial undulations in their attempts to explain the abſtruſe phenomena of nature (ſuch as the communication of ſenſation from the organ to the ſenſorium by the vibrations of a nervous fluid, the reciprocal communication of the volitions from the ſenſorium to the muſcle, nay, the whole phenomena of mind), by vibrations and vibratiunculæ.

Such attempts equally betray ignorance, preſumption, and meanneſs of ſoul. Ignorance of the extent to which the Newtonian theory may be logically carried, is the neceſſary conſequence of ignorance of the theory itſelf. It is preſumption to apply it to the phenomena of the intellectual world; and ſurely he has an abject ſoul who hugs and cheriſhes the humble thought, that his mind is an undulating fluid, and that its all-graſping comprehenſion, and all its delightful emotions, are nothing more than an etherial tune.—"Pol. me occidiſtis amentes." This whim is older than Hartley: It may be found in Robinet's *Syſteme de la Nature*. This by the by made its firſt appearance as a diſcourſe delivered by Brother Orateur in the lodge of the grand Orient at Lyons; from which ſource have proceeded all the coſmopolitical ſocieties in Europe, and that illumination by which reaſon is to triumph over revelation, and liberty and equality over civil government. We crave pardon of our readers for this ebullition of ſpleen; and we hope for it from all thoſe who can read Newton, and who eſteem his modeſty. Trumpet.

Thoſe who have endeavoured to improve the ſpeaking trumpet on mechanical principles, have generally aimed at increaſing the violence of the elaſtic undulations, that they may make a more forcible impulſe on the ear. This is the object in view in the parabolic trumpet. All the undulations are converted into others which are in planes perpendicular to the axis of the inſtrument; ſo that the ſame little maſs of air is agitated again and again in the ſame direction. From this it is obvious to conclude, that the total agitation will be more violent. But, in the firſt place, theſe violent agitations muſt diffuſe themſelves laterally as ſoon as they get out of the trumpet, and thus be weakened, in a proportion that it is perhaps impoſſible for the moſt expert analyſt to determine. But, moreover, we are not ſufficiently acquainted with the mechaniſm of the very firſt agitations, to be able to perceive what conformation of the trumpet will cauſe the reflected undulations to increaſe the firſt undulations, or to check them. For it muſt happen during the production of a continued ſound in a trumpet, that a parcel of air, which is in a ſtate of progreſſive agitation, as it makes a pulſe of one ſound, may be in a ſtate of retrograde agitation, as it is part of a pulſe of air producing another ſound. We cannot (at leaſt no mathematician has yet done it) diſcriminate, and then combine theſe agitations, with the intelligence and preciſion that are neceſſary for enabling us to ſay what is the ultimate accumulated effect. Mr Lambert therefore did wiſely in abſtaining from this intricate inveſtigation; and we are highly obliged to him for deducing ſuch a body of demonſtrable doctrine from the acknowledged, but ill underſtood, fact of the reflection of echoes.

We know that two ſounds actually croſs each other without any mutual diſturbance; for we can hear either of them diſtinctly, provided the other is not ſo loud as to ſtun our ears, in the ſame manner as the glare of the ſun dazzles our eyes. We may therefore depend on all the conſequences which are legitimately deduced from this fact, in the ſame manner as we depend on the ſcience of catoptrics, which is all deduced from a fact perfectly ſimilar and as little underſtood.

But the preceding propoſitions by no means explain or comprehend all the reinforcement of ſound which is really obtained by means of a ſpeaking trumpet. In the firſt place, although we cannot tell in what degree the aerial undulations are increaſed, we cannot doubt that the reflections which are made in directions which do not greatly deviate from the axis, do really increaſe the agitation of the particles of air. We ſee a thing perfectly ſimilar to this in the waves on water. Take a long ſlip of lead, about two inches broad, and having bent it into the form of a parabola, ſet it into a large flat trough, in which the water is about an inch deep. Let a quick ſucceſſion of ſmall drops of water fall preciſely on the focus of the parabola. We ſhall ſee the circular waves proceeding from the focus all converted into waves perpendicular to the axis; and we ſhall frequently ſee theſe ſtraight waves conſiderably augmented in their height and force. We ſay generally, for we have ſometimes obſerved that theſe reflected waves were not ſenſibly ſtronger than the circular or original waves. We do not exactly know to what this difference muſt be aſcribed: we are diſpoſed to attribute it to the frequency of the drops. This may be ſuch, that the interval of time between each drop is preciſely equal, or at leaſt commenſurable, to the

time

Trumpet. time in which the waves run over their own breadth. This is a pretty experiment; and the ingenious mechanician may make others of the ſame kind which will greatly illuſtrate ſeveral difficult points in the ſcience of ſounds. We may conclude, in general, that the reflection of ſounds, in a trumpet of the uſual ſhapes, is accompanied by a real increaſe of the aerial agitations; and in ſome particular caſes we find the ſounds prodigiouſly increaſed. Thus, when we blow through a muſical trumpet, and allow the air to take that uniform undulation which can be beſt maintained in it, namely, that which produces its muſical tone, where the whole tube contains but one or two undulations, the agitation of a particle muſt then be very great; and it muſt deſcribe a very conſiderable line in its oſcillations. When we ſuit our blaſt in ſuch a manner as to continue this note, that is, this undulation, we are certain that the ſubſequent agitations conſpire with the preceding agitation, and augment it. And accordingly we find that the ſound is increaſed to a prodigious degree. A cor de chaſſe, or a bugle horn, when properly winded, will almoſt deafen the ear; and yet the exertion is a mere nothing in compariſon with what we make when bellowing with all our force, but with not the tenth part of the noiſe. We alſo know, that if we ſpeak through a ſpeaking trumpet in the key which correſponds with its dimenſions, it is much more audible than when we ſpeak in a different pitch. Theſe obſervations ſhow, that the loudneſs of a ſpeaking trumpet ariſes from ſomething more than the ſole reflection of echoes conſidered by Mr Lambert—the very echoes are rendered louder.

In the next place, the ſounds are increaſed by the vibrations of the trumpet itſelf. The elaſtic matter of the trumpet is thrown into tremors by the undulations which proceed from the mouth-piece. Theſe tremors produce pulſes in the contiguous air, both in the inſide of the trumpet, and on that which ſurrounds it. Theſe undulations within the trumpet produce original ſounds, which are added to the reflected ſounds: for the tremor continues for ſome little time, perhaps the time of three or four or more pulſes. This muſt increaſe the loudneſs of the ſubſequent pulſes. We cannot ſay to what degree, becauſe we do not know the force of the tremor which the part of the trumpet acquires: but we know that theſe ſounds will not be magnified by the trumpet to the ſame degree as if they had come from the mouth-piece; for they are reflected as if they had come from the ſurface of a ſphere which paſſes through the agitated point of the trumpet. In ſhort, they are magnified only by that part of the trumpet which lies without them. The whole ſounds of this kind, therefore, proceed as if they came from a number of concentric ſpherical ſurfaces, or from a ſolid ſphere, whoſe diameter is twice the length of the trumpet cone.

All theſe agitations ariſing from the tremors of the trumpet tend greatly to hurt the diſtinctneſs of articulation; becauſe, coming from different points of a large ſphere, they arrive at the ear in a ſenſible ſucceſſion; and thus change a momentary articulation to a lengthened ſound, and give the appearance of a number of voices uttering the ſame words in ſucceſſion. It is in this way that, when we clap our hands together near a long rail, we get an echo from each poſt, which produces a chirping ſound of ſome continuance. For theſe reaſons it is found advantageous to check all tremors of the trumpet by wrapping it up in woollen liſts. This is alſo neceſſary in the muſical trumpet.

With reſpect to the undulations produced by the tremors of the trumpet in the air contiguous to its outſide, they alſo hurt the articulation. At any rate, this is ſo much of the ſonorous momentum uſeleſsly employed; becauſe they are diffuſed like common ſounds, and receive Trumpet. no augmentation from the trumpet.

Hearing Trumpet. It is evident, that this inſtrument may be uſed (and accordingly was ſo) for aiding the hearing; for the ſonorous lines are reflected in either direction. We know that all tapering cavities greatly increaſe external noiſes; and we obſerve the brutes prick up their ears when they want to hear uncertain or faint ſounds. They turn them in ſuch directions as are beſt ſuited for the reflection of the ſound from the quarter whence the animal imagines that it comes.

Let us apply Mr Lambert's principle to this very intereſting caſe, and examine whether it be poſſible to aſſiſt dull hearing in like manner as the optician has aſſiſted imperfect ſight.

The ſubject is greatly ſimplified by the circumſtances of the caſe; for the ſounds to which we liſten generally come in nearly one direction, and all that we have to do is to produce a conſtipation of them. And we may conclude, that the audibility will be proportional to this conſtipation.

Therefore let ACB, fig. 6. be the cone, and CD its axis. The ſound may be conceived as coming in the direction RA, parallel to the axis, and to be reflected in the points A, *b*, *c*, *d*, *e*, till the angle of incidence increaſes to 90°; after which the ſubſequent reflections ſend the ſound out again. We muſt therefore cut off a part of the cone; and, becauſe the lines increaſe their angle of incidence at each reflection, it will be proper to make the angle of the cone an aliquot part of 90°, that the leaſt incidence may amount preciſely to that quantity. What part of the cone ſhould be cut off may be determined by the former principles. Call the angle ACD, a. We have $Ce = \frac{CA \cdot \text{ſin. } a}{\text{ſin. } (2n+1)\,a^2}$ when the ſound gets the laſt uſeful reflection. Then we have the diameter of the mouth $AB = 2\,CA \cdot \text{ſin. } a$, and that of the other end $ef = Ce \cdot 2 \text{ ſin. } a$. Therefore the ſounds will be conſtipated in the ratio of CA^2 to Ce, and the trumpet will bring the ſpeaker nearer in the ratio of CA to Ce.

When the lines of reflected ſound are thus brought together, they may be received into a ſmall pipe perfectly cylindrical, which may be inſerted into the external ear. This will not change their angles of inclination to the axis nor their denſity. It may be convenient to make the internal diameter of this pipe $\frac{1}{3}$ of an inch. Therefore $Ce \cdot \text{ſin. } a$ is $= \frac{1}{6}$ of an inch. This circumſtance, in conjunction with the magnifying power propoſed, determines the other dimenſions of the hearing trumpet. For $Ce = \frac{1}{6 \text{ ſin. } a} = \frac{CA \cdot \text{ſin. } a}{\text{ſin. } (2n+1)\,a}$, and $CA = \frac{\text{ſin. } (2n+1)\,a}{6 \text{ ſin.}^2 a}$.

Thus the relation of the angle of the cone and the length of the inſtrument is aſcertained, and the ſound is brought nearer in the ratio of CA to Ce, or of ſin. $(2n+1)\,a$ to ſin. a. And ſeeing that we found it proper to make $(2n+1)\,a = 90°$, we obtain this very ſimple analogy, $1 : \text{ſin. } a = CA : Ce$. And the ſine of $\frac{1}{2}$ the angle of the cone is to radius as 1 to the approximating power of the inſtrument.

Thus let it be required that the ſound may be as audible as if the voice were 12 times nearer. This gives $\frac{CA}{Ce} = 12$. This gives ſin. $a = \frac{1}{12}$, and $a = 4° 47'$, and the angle of the cone $= 9.34$. Then $CA = \frac{1}{6 \text{ ſin.}^2 a} = \frac{1}{6 \frac{1}{144}} = \frac{144}{6}$, $= 24$. Therefore the length of the cone is 24 inches. From this

Trumpet. this take C $e = \frac{CA}{12} = 2$, and the length of the trumpet is 22 inches. The diameter at the mouth is 2 C e, = 4 inches. With this inſtrument one voice ſhould be as loud as 144.

If it were required to approximate the ſound only four times, making it 16 times ſtronger than the natural voice at the ſame diſtance, the angle ACB muſt be 29°; A e muſt be 2 inches, AB muſt be $1\frac{1}{3}$d inches, and ef muſt be $\frac{1}{3}$d of an inch.

It is eaſy to ſee, that when the ſize of the ear-end is the ſame in all, the diameters at the outer end are proportional to the approximating powers, and the length of the cones are proportional to the magnifying powers.

We ſhall find the parabolic conoid the preferable ſhape for an acouſtic trumpet; becauſe the ſounds come into the inſtrument in a direction parallel to the axis, they are reflected ſo as to paſs through the focus. The parabolic conoid muſt therefore be cut off through the focus, that the ſounds may not go out again by the ſubſequent reflections; and they muſt be received into a cylindrical pipe of $\frac{1}{3}$d of an inch in diameter. Therefore the parameter of this parabola is $\frac{1}{6}$th of an inch, and the focus is $\frac{1}{12}$th of an inch from the vertex. This determines the whole inſtrument; for they are all portions of one parabolic conoid. Suppoſe that the inſtrument is required to approximate the ſound 12 times, as in the example of the conical inſtrument. The ordinate at the mouth muſt be 12 times the 6th of an inch, or 2 inches; and the mouth diameter is 4 inches, as in the conical inſtrument. Then, for the length, obſerve, that DC in fig. 7. is $\frac{1}{6}$th of an inch, and MP is 2 inches, and AC is $\frac{1}{12}$th of an inch, and $DC^2 : MP^2 = AC : AP$. This will give AP = 12 inches, and CP = $11\frac{1}{12}$ths; whereas in the conical tube it was 22. In like manner an inſtrument which approximates the ſounds 4 times, is only $1\frac{1}{3}$d inches long, and $1\frac{1}{3}$d inches diameter at the big end. Such ſmall inſtruments may be very exactly made in the parabolic form, and are certainly preferable to the conical. But ſince even theſe are of a very moderate ſize when intended to approximate the ſound only a few times, and as they can be accurately made by any tin-man, they may be of more general uſe. One of 12 inches long, and 5 inches wide at the big end, ſhould approximate the ſound at leaſt 9 times.

A general rule for making them.—Let m expreſs the approximating power intended for the inſtrument. The length of the inſtrument in inches is $\frac{m \times m-1}{6}$, and the diameter at the mouth is $\frac{m}{3}$. The diameter at the ſmall end is always $\frac{1}{3}$d of an inch.

In trumpets for aſſiſting the hearing all reverberation of the trumpet muſt be avoided. It muſt be made thick, of the leaſt elaſtic materials, and covered with cloth externally. For all reverberation laſts for a ſhort time, and produces new ſounds which mix with thoſe that are coming in.

We muſt alſo obſerve, that no acouſtic trumpet can ſeparate thoſe ſounds to which we liſten from others that are made in the ſame direction. All are received by it, and magnified in the ſame proportion. This is frequently a very great inconvenience.

There is alſo another imperfection, which we imagine cannot be removed, namely, an odd confuſion, which cannot be called indiſtinctneſs, but a feeling as if we were in the midſt of an echoing room. The cauſe ſeems to be this: Hearing gives us ſome perception of the direction of the ſounding object, not indeed very preciſe, but ſufficiently ſo for moſt purpoſes. In all inſtruments which we have Trumpet. deſcribed for conſtipating ſounds, the laſt reflections are made in directions very much inclined to the axis, and inclined in many different degrees. Therefore they have the appearance of coming from different quarters; and inſtead of the perception of a ſingle ſpeaker, we have that of a ſounding ſurface of great extent. We do not know any method of preventing this, and at the ſame time increaſing the ſound.

There is an obſervation which it is of importance to make on this theory of acouſtic inſtruments. Their performance does not ſeem to correſpond to the computations founded on the theory. When they are tried, we cannot think that they magnify ſo much: Indeed it is not eaſy to find a meaſure by which we can eſtimate the degrees of audibility. When a man ſpeaks to us at the diſtance of a yard, and then at the diſtance of two yards, we can hardly think that there is any difference in the loudneſs; though theory ſays, that it is four times leſs in the laſt of the two experiments: and we cannot but adhere to the theory in this very ſimple caſe, and muſt attribute the difference to the impoſſibility of meaſuring the loudneſs of ſounds with preciſion. And becauſe we are familiarly acquainted with the ſound, we can no more think it four times leſs at twice the diſtance, than we can think the viſible appearance of a man four times leſs when he is at a quadruple diſtance. Yet we can completely convince ourſelves of this, by obſerving that he covers the appearance of four men at that diſtance. We cannot eaſily make the ſame experiment with voices.

But, beſides this, we have compared two hearing trumpets, one of which ſhould have made a ſound as audible at the diſtance of 40 feet as the other did at 10 feet diſtance; but we thought them equal at the diſtance of 40 and 18. The reſult was the ſame in many trials made by different perſons, and in different circumſtances. This leads us to ſuſpect ſome miſtake in Mr Lambert's principle of calculation; and we think him miſtaken in the manner of eſtimating the intenſity of the reflected ſounds. He conceives the proportion of intenſity of the ſimple voice and of the trumpet to be the ſame with that of the ſurface of the mouth-piece to the ſurface of the ſonorous hemiſphere, which he has ſo ingeniouſly ſubſtituted for the trumpet. But this ſeems to ſuppoſe, that the whole ſurface, generated by the revolution of the quadrantal arch TEG round the axis CG (fig. 4.), is equally ſonorous. We are aſſured that it is not: For even if we ſhould ſuppoſe that each of the points Q, R, and S (fig. 3.), are equally ſonorous with the point P, theſe points of reflection do not ſtand ſo denſe on the ſurface of the ſphere as on the ſurface of the mouth-piece. Suppoſe them arranged at equal diſtances all over the mouth-piece, they will be at equal diſtances alſo on the ſphere, only in the direction of the arches of great circles which paſs through the centre of the mouth-piece. But in the direction perpendicular to this, in the circumference of ſmall circles, having the centre of the mouth-piece for their pole, they muſt be rarer in the proportion of the ſine of their diſtance from this pole. This is certainly the caſe with reſpect to all ſuch ſounds as have been reflected in the planes which paſs through the axis of the trumpet; and we do not ſee (for we have not examined this point) that any compenſation is made by the reflection which is not in planes paſſing through the axis. We therefore imagine, that the trumpet does not increaſe the ſound in the proportion of $g\,E^2$ to $g\,T^2$ (fig. 5.), but in that of $\frac{g\,E^2}{GE}$ to $\frac{g\,T^2}{CT}$.

Mr Lambert ſeems aware of ſome error in his calculation, and propoſes another, which leads nearly to this concluſion, but

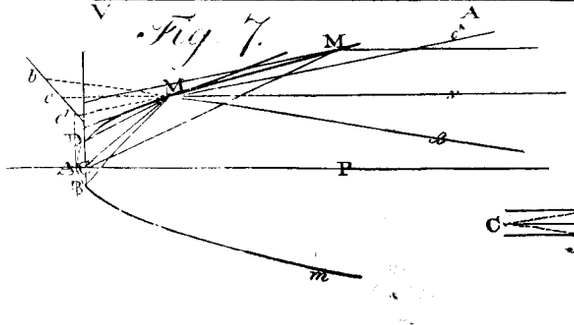

Fig. 6.

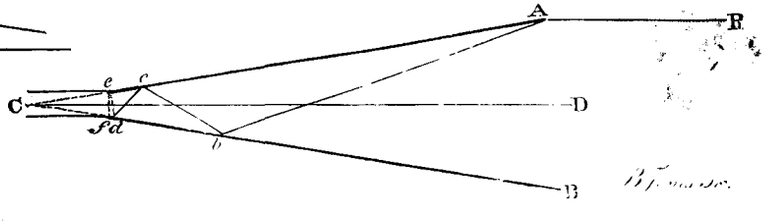

Trumpet ‖ Tuam.

but founded on a principle which we do not think in the leaſt applicable to the caſe of ſounds.

Trumpet, Marine, is a muſical inſtrument conſiſting of three tables, which form its triangular body. It has a very long neck with one ſingle ſtring, very thick, mounted on a bridge, which is firm on one ſide, but tremulous on the other. It is ſtruck by a bow with one hand, and with the other the ſtring is preſſed or ſtopped on the neck by the thumb.

It is the trembling of the bridge, when ſtruck, that makes it imitate the ſound of a trumpet, which it does to that perfection, that it is ſcarce poſſible to diſtinguiſh the one from the other. And this is what has given it the denomination of trumpet-marine, though, in propriety, it be a kind of monochord. Of the ſix diviſions marked on the neck of the inſtrument, the firſt makes a fifth with the open chord, the ſecond an octave, and ſo on for the reſt, correſponding with the intervals of the military trumpet.

Trumpet-Flower. See Bignonia.

TRUMPETER. See Psophia.

TRUNCATED, in general, is an appellation given to ſuch things as have, or ſeem to have, their points cut off: thus, we ſay, a truncated cone, pyramid, leaf, &c.

TRUNCHEON, a ſhort ſtaff or baton uſed by kings, generals, and great officers, as a mark of their command.

TRUNDLE, a ſort of carriage with low wheels, whereon heavy and cumberſome burdens are drawn.

TRUNK, among botaniſts, that part of the herb which ariſes immediately from the root, and is terminated by fructification; the leaves, buds, and auxiliary parts of the herb not entering in its deſcription.

TRUNNIONS, or Trunions, of a piece of ordnance, are thoſe knobs or bunches of metal which bear her up on the cheeks of the carriage.

TRUSS, a bundle, or certain quantity of hay, ſtraw, &c. A truſs of hay, contains 56 pounds, or half an hundred weight: 36 truſſes make a load.

Truss is alſo uſed for a ſort of bandage or ligature made of ſteel, or the like matter, therewith to keep up the parts in thoſe who have hernias or ruptures.

Truss, in a ſhip, a machine employed to pull a yard home to its reſpective maſt, and retain it firmly in that poſition.

TRUSTEE, one who has an eſtate, or money, put or truſted in his hands for the uſe of another.

TRUTH, a term uſed in oppoſition to falſehood, and applied to propoſitions which anſwer or accord to the nature and reality of the thing whereof ſomething is affirmed or denied.

TRYPHIODORUS, an ancient Greek poet, who lived ſome time between the reigns of Severus and Anaſtaſius. His writings were very numerous; yet none of them have come down to us, except an epic poem, on which Mr Addiſon has made ſome entertaining remarks in the Spectator, N° 63.

The firſt edition of this extraordinary work was publiſhed by Aldus at Venice, with Quintus Calaber's Paralipomena, and Coluthus's poem on the rape of Helen. It has been ſince reprinted at ſeveral places, particularly at Francfort in 1580 by Friſchlinus; who not only corrected many corrupt paſſages, but added two Latin verſions, one in verſe and the other in proſe. That in verſe was reprinted in 1742, with the Greek, at Oxford, in 8vo, with an Engliſh tranſlation in verſe, and Notes, by Mr Merrick.

TUAM, a town of Ireland, in the province of Connaught, and county of Galway, with an archbiſhop's ſee. It was once a famous city, though now it is reduced to a village; yet it ſtill retains the title of a city, as being an archiepiſcopal ſee. It is ſeven miles from the borders of Mayo. W. Long. 8. 46. N. Lat. 53. 33.

Tua ‖ Tulipa.

TUB, in commerce, denotes an indetermined quantity or meaſure: thus, a tub of tea contains about 60 pounds; and a tub of camphor from 56 to 86 pounds.

TUBE, in general, a pipe, conduit, or canal; a cylinder, hollow within-ſide, either of lead, iron, glaſs, wood, or other matter, for the air or ſome other matter to have a free conveyance through it.

Auricular Tube, or inſtrument to facilitate hearing. See *Articulate Trumpet*.

TUBERCLES, among phyſicians, denote little tumors which ſuppurate and diſcharge pus; and are often found in the lungs, eſpecially of conſumptive perſons.

TUCUMAN, a province of South America, in Paraguay; bounded on the north by the provinces of Los-Chicas and Chaco; on the eaſt by Chaco and Rio-de-la-Plata, on the ſouth by the country of Chicuitos and Pampes, and on the weſt by the biſhopric of St Jago. The air is hot, and the earth ſandy: however, ſome places are fruitful enough, and the original natives have a good character. The Spaniards poſſeſs a great part of this country.

TUFA, a ſtone conſiſting of volcanic aſhes concreted together with various other ſpecies of ſtone. It is of various colours, blackiſh grey, bluiſh grey, and yellow; every colour having a different mixture and ſolidity: but all of them have the bad quality of mouldering down on long expoſure to the weather; notwithſtanding which, they have been uſed in buildings both ancient and modern. The yellow kind reſiſts the air leſs than any other.

TULIPA, Tulip, in botany: A genus of plants belonging to the claſs of *hexandria*, and order of *monogynia*; and in the natural ſyſtem ranging under the 10th order *Coronariæ*. The corolla is hexapetalous and campanulated, and there is no ſtyle. The ſpecies of this genus are four; the *ſylveſtris*, or Italian yellow tulip, a native of the ſouth of Europe; the *geſneriana*, or common tulip, a native of the Levant; the *breyniana*, or cape tulip, a native of the Cape of Good Hope; and the *biflora*.

1. The *ſylveſtris*, or wild European tulip, hath an oblong bulbous root, ſending up long narrow ſpear-ſhaped leaves; and a ſlender ſtalk, ſupporting at top a ſmall yellow flower, nodding on one ſide, having acute petals.

2. The *geſneriana*, Geſner's Turky tulip of Cappadocia, or common garden-tulip, hath a large, oblong, tunicated, ſolid, bulbous root, covered with a brown ſkin, ſending up long oval ſpear-ſhaped leaves; an upright round ſtalk, from half a foot to a yard high, garniſhed with a few leaves, and its top crowned with a large bell-ſhaped erect hexapetalous flower, of almoſt all colours and variegations in the different varieties.

This tulip, and its vaſt train of varieties, is the ſort ſo generally cultivated for the ornament of our gardens, and ſo much admired by all for its great variety and beautiful appearance: It grows freely in the open ground in any common ſoil of a garden, and proves a very great decoration to the beds and borders of the pleaſure ground for ſix weeks or two months in ſpring, by different plantings of early and late ſorts; planting the principal part in autumn, and the reſt towards Chriſtmas, and in January or February. The autumn plantings will come earlieſt into bloom, and flower the ſtrongeſt: and the others will ſucceed them in flowering. In ſummer, when the flowering is paſt, and the leaves and ſtalks aſſume a ſtate of decay, the bulbs of the choiceſt varieties are generally taken up, the offsets ſeparated, and the whole cleaned from filth; then put up to dry till October or November, and then planted again for the future year's bloom.

Tulip.a

Of this ſpecies, which is the floriſt's delight, the varieties may be divided into two principal claſſes, *viz.* 1. Early or dwarf ſpring tulips *(præcocea)*. 2. Late flowering tall tulips *(ſerotina)*. 1. *Early tulips*. The early tulips are among floriſts diſtinguiſhed by the appellation of *præcoces* (early), becauſe they flower early in the ſpring, a month or more before the others: are much ſhorter ſtalked, and the flowers ſmaller; but are in greater reputation for their early bloom and their gay lively colours, both of ſelf-colours, and broken into flaked variegations; ſuch as reds, crimſon, ſcarlet, carnation, violets, purples, yellow, &c. with flowers of each, edged and flaked with red, yellow, and white, in many diverſities. 2. *Late-flowering common tulips*.—This claſs is denominated *late-flowering*, and by the floriſts called *ſerotines*, becauſe they blow later in the ſpring, a month or more, than the præcoces, *i. e.* not coming into flower before the end of April, May, and June. They are all of tall growth, ſupporting large flowers, and furniſh an almoſt endleſs variety in the vaſt diverſity of colours, after they break from whole blowers into variegations and ſtripes, exceeding all others of the tulip kind in beauty and elegance of flower.

Both theſe ſpecies of tulipa are hardy perennials, durable in root, or at leaſt, although the old bulb decays annually, it perpetuates its ſpecies by off-ſets, and is annual in leaf and ſtalk; which riſing from the bulb early in the ſpring, arrives to a flowering ſtate in April and May. All the varieties are ſucceeded by plenty of ripe ſeed in July and Auguſt, contained in an oblong capſule of three cells, having the ſeeds placed on each other in double rows. By the ſeeds many new varieties may be raiſed, which however will not attain a flowering ſtate till they are ſeven or eight years old; and after that will require two or three years or more to break into variegations, when the approved varieties may be marked, and increaſed by off-ſets of the root, as directed in their propagation.

The colours in greateſt eſtimation in variegated tulips, are the blacks, golden yellows, purple-violets, roſe, and vermilion, each of which being variegated various ways; and ſuch as are ſtriped with three different colours diſtinct and unmixed, with ſtrong regular ſtreaks, but with little or no tinge of the breeder, may be called the moſt perfect tulips. It is rare to meet with a tulip poſſeſſing all theſe properties.

As to the manner of obtaining this wonderful variety of colours in tulips, it is often accompliſhed by nature alone, but is ſometimes aſſiſted and forwarded by ſome ſimple operations of art; ſuch as that, in the firſt place, when the ſeedling bulbs of the whole blower or breeder are arrived to full ſize, and have flowered once, to tranſplant them into beds of any poor dry barren ſoil, in order that by a defect of nutriment in the earth the natural luxuriance of the plant may be checked, and cauſe a weakneſs in their general growth, whereby they generally in this weakened or infirm ſtate gradually change and break out into variegations, ſome the firſt year, others not till the ſecond or third; and according as they are thus broke, they ſhould be planted in beds of good earth.

Another method to aſſiſt nature in effecting the marvellous work of breaking the breeding tulips into diverſified colours, is to make as great a change as poſſible in the ſoil; if they were this year in a light poor ſoil, plant them the next in a rich garden mould, and another year in a compoſt of different earths and dung; or tranſplant them from one part of the garden to another, or into different gardens, &c. or from one country to another; all of which contributes in aſſiſting nature in producing this deſirable diverſity of colours and variegations.

The double tulip is alſo a variety of the common tulip, and is very beautiful, though not in ſuch eſtimation among the floriſts as the common ſingle variegated ſorts, not poſſeſſing ſuch a profuſion of variegations in the colours and regularity of ſtripes: they however exhibit an elegantly ornamental appearance, as they riſe with an upright, talliſh, firm ſtem, crowned with a very large double flower compoſed of numerous petals, multiplied in ſeveral ſeries one within another like a double peony, but far more beautiful in their diverſity of colours, variegations, and ſtripes of white and red, yellow and red, &c. ſo that they highly deſerve culture, both in beds alone near the other ſorts to increaſe their variety, alſo to plant in patches about the borders, in aſſemblage with the late variegated tulips, as they blow nearly about the ſame time, *i. e.* April and May.

Tulipa ‖ Tungſten.

Tulip-roots are ſold in full collection, conſiſting of numerous varieties, at moſt of the nurſeries and ſeeds-mens, who both propagate them themſelves by off-ſets, and ſeed, and import vaſt quantities annually from Holland; the Dutch being famous for raiſing the grandeſt collections of the fineſt tulips, and other bulbous flowers, in the greateſt perfection for the ſupply of almoſt all the other European gardens; diſtinguiſhing every variety in their vaſt collections by ſome pompous name or other, arranged in regular catalogues, charging prices in proportion to their eſtimation; which formerly was ſo great, among the Hollanders themſelves in particular, that there are accounts of a ſingle root being ſold for from 2000 to 5500 guilders; but ſome time ago they were more plentiful, and were ſold at from 5s. or 10s. to ſo many pounds *per* hundred, and even *per* root for very ſcarce capital ſorts.

Tulip-Tree. See LIRIODENDRON.

TULL (Jethro), an Oxfordſhire gentleman who farmed his own land, and introduced a new method of culture, to raiſe repeated crops of wheat from the ſame land without the neceſſity of manure: the principles of which he publiſhed about 30 years ſince, in A Treatiſe on Horſe-hoeing Huſbandry.

TUMBRELL, TUMBRELLUM, or *Turbichetum*, is an engine of puniſhment, which uſed to be in every liberty that had the view of frank-pledge, for the correction of ſcolds and unquiet women.

TUMEFACTION, the act of ſwelling or riſing into a tumor.

TUMOR, in medicine and ſurgery, a preternatural riſing or eminence in any part of the body.

TUMORS, in farriery. See there, § 26.

TUN, a large veſſel or caſk, of an oblong form, biggeſt in the middle, and diminiſhing towards its two ends, girt about with hoops, and uſed for ſtowing ſeveral kinds of merchandiſe for convenience of carriage; as brandy, oil, ſugar, ſkins, hats, &c.

TUN is alſo the name of a meaſure. A tun of wine is four hogſheads; of timber, a ſquare of 40 ſolid feet; and of coals, 20 cwt.

TUN is alſo a certain weight whereby the burden of ſhips, &c. are eſtimated.

TUNBRIDGE, a town of Kent in England, ſituated on a branch of the river Medway, over which there is a bridge. It is a large well built place, noted for the mineral waters four or five miles ſouth of the town. E. Long. 0. 20. N. Lat. 51. 14.

TUNE. See MUSIC and TONE.

TUNGSTEN, or LAPIS PONDEROSUS; a genus of calcareous earth. It contains about one half its weight of calcareous earth, and the remainder iron, and a peculiar acid of an earthy appearance, now known by the name of the *tungſten acid*. When pure, it is of a grey colour and lamellated texture; its ſpecific gravity being from 4,99 to 5,8.

TUNICA,

Tunica, Tunis.

TUNICA, a kind of waiſtcoat or under garment, in uſe among the Romans. They wore it within doors by itſelf, and abroad under the gown. The common people could not afford the toga, and ſo went in their tunics; whence Horace calls them *populus tunicatus*.

TUNICA, in anatomy, is applied to the membranes which inveſt the veſſels, and divers others of the leſs ſolid parts of the body; thus the inteſtines are formed of five tunics or coats.

TUNIS, a large and celebrated town of Africa, in Barbary, and capital of a kingdom of the ſame name. It is ſeated on the point of the Gulph of Goletta, about eight miles from the place where the city of Carthage ſtood. It is in the form of a long ſquare, and is about four miles in circumference, with 10 large ſtreets, 5 gates, and 35 moſques. The houſes are all built with ſtone, though but one ſtory high; but the walls are very lofty, and flanked with ſeveral ſtrong towers. It has neither ditches nor baſtions, but a good citadel, built on an eminence on the weſt ſide of the city. It is ſaid to contain 300,000 inhabitants, of whom 30,000 are Jews. The divan, or council of ſtate, aſſembles in an old palace; and the dey is the chief of the republic, who reſides there. The harbour of Tunis has a very narrow entrance, through a ſmall canal. In the city they have no water but what is kept in ciſterns, except one well kept for the baſhaw's uſe. It is a place of great trade, and is 10 miles from the ſea. E. Long. 10. 16. N. Lat. 36. 42.

See Obſerv. on the City of Tunis by Mr Stanley, in the Edin. Mag. vol. iv. p. 28.

TUNIS, a country of Africa, bounded on the north and eaſt by the Mediterranean Sea and the kingdom of Tripoli, on the ſouth by ſeveral tribes of the Arabs, and on the weſt by the kingdom of Algiers and the country of Eſab; being 300 miles in length from eaſt to weſt, and 250 in breadth from north to ſouth. This country was formerly a monarchy; but a difference ariſing between a king and his ſon, one of whom was for the protection of the Chriſtians, and the other for that of the Turks, in 1574 the inhabitants ſhook off the yoke of both. From this time it became a republic under the protection of the Turks, and pays a certain tribute to the baſhaw who reſides at Tunis. The air in general is healthy; but the ſoil in the eaſtern parts is indifferent for want of water. Towards the middle the mountains and valleys abound in fruits; but the weſtern part is the moſt fertile, becauſe it is watered with rivers. The environs of Tunis are very dry, upon which account corn is generally dear. The inroads of the Arabs oblige the inhabitants to ſow their barley and rye in the ſuburbs, and to incloſe their gardens with walls. However, there are plenty of citrons, lemons, oranges, dates, grapes, and other fruits. There are alſo olive-trees, roſes, and odoriferous plants. In the woods and mountains there are lions, wild beeves, oſtriches, monkeys, cameleons, roebucks, hares, pheaſants, partridges, and other ſorts of birds and beaſts. The moſt remarkable rivers are the Guadilcarbar, Magrida, Magerada, and Caps. The form of government is ariſtocratic; that is, by a council, whoſe preſident is the dey, not unlike the doge of Venice. The members of the divan or council are choſen by the dey, and he in his turn is elected by the divan; which is compoſed of ſoldiers, who have more than once taken off the dey's head. The baſhaw is a Turk, reſiding at Tunis; whoſe buſineſs is to receive the tribute, and protect the republic: the common revenues are only 400,000 crowns a-year, becauſe the people are very poor; nor can they ſend above 40,000 men into the field; nor more than 12 men of war of the line to ſea, even upon the moſt extraordinary occaſions. There are generally about 12,000 Chriſtian ſlaves in this country; and the inhabitants carry on a great trade in linen and woollen cloth. In the city of Tunis alone there are above 3000 clothiers and weavers. They alſo have a trade in horſes, olives, oil, ſoap, oſtriches eggs and feathers. The Mahometans of this city have nine colleges for ſtudents, and 86 petty ſchools. The principal religion is Mahometaniſm; but the inhabitants conſiſt of Moors, Turks, Arabs, Jews and Chriſtian ſlaves. However, the Turks, though feweſt in number, domineer over the Moors, and treat them little better than ſlaves.

Tunkers ‖ Turcæ.

TUNKERS, a religious ſect of baptiſts in Pennſylvania, ſo called from the word *tunker*, to put a morſel in ſauce. They are alſo called *tumblers*, becauſe in performing baptiſm they plunge the perſon into the water with the head firſt. As the Germans found the letters *t* and *b* like *d* and *p*, the words *tunkers* and *tumblers*, have been ſometimes written *dunkers* and *dumplers*. Their church government and diſcipline are the ſame with thoſe of the Engliſh baptiſts, except that every brother is allowed to ſpeak in the congregation, and the beſt ſpeaker is uſually ordained to be their miniſter. They are a harmleſs, well meaning people.

TUNNAGE. See TONNAGE.

TUNNY, in ichthyology. See SCOMBER.

TUNNY-FISHING. See FISHERY.

TURBAN, the head-dreſs of moſt of the eaſtern nations. It conſiſts of two parts, a cap and ſaſh of fine linen or taffety, artfully wound in divers plaits about the cap. The cap has no brim, is pretty flat, though roundiſh at top, and quilted with cotton; but does not cover the ears. There is a good deal of art in giving the turban a fine air; and the making of them is a particular trade. The ſaſh of the Turks turban is white linen; that of the Perſians red woollen. Theſe are the diſtinguiſhing marks of their different religions. Sophi king of Perſia, being of the ſect of Ali, was the firſt who aſſumed the red colour, to diſtinguiſh himſelf from the Turks, who are of the ſect of Omar, and whom the Perſians eſteem heretics.

TURBINATED, is a term applied by naturaliſts to ſhells which are ſpiral or wreathed conically, from a larger baſis to a kind of apex.

TURBITH-MINERAL. See CHEMISTRY, n° 705, and PHARMACY, n° 303.

TURBO, the WREATH, in zoology, a genus of inſects belonging to the order of *vermes teſtaceæ*. The animal is of the ſnail kind; the ſhell conſiſts of one ſpiral ſolid valve, and the aperture is orbicular. There are 116 ſpecies; of which the moſt remarkable are, 1. The *littoreus*, or periwinkle. This is abundant on moſt rocks far above low-water mark. The Swediſh peaſants believe, that when theſe ſhells creep high up the rocks, they indicate a ſtorm from the ſouth. They are eaten by the poor people in moſt parts of this kingdom. Young lobſters are ſaid to take up their lodging in the empty ſhells of theſe animals, which has given occaſion to a notion that periwinkles are changed into lobſters. 2. The *clathrus*, or barbed wreath, has a taper ſhell of eight ſpires, diſtinguiſhed by elevated diviſions running from the aperture to the apex. There is a variety pellucid, with very thin edges. It is analogous to that curious and expenſive ſhell, the *wentle-trap*.

TURBOT, in ichthyology. See PLEURONECTES.

TURCÆ, or TURCI, (Mela); ſuppoſed to be the *Tuſci* of Ptolemy; whom he places between Caucaſus and the Montes Ceraunii. The name is ſaid to denote, "to deſolate, or lay waſte." Herodotus places them among the wild or barbarous nations of the north. There is a very rapid river called *Turk*, running into the Caſpian Sea, from which ſome ſuppoſe the Turks to take their name. They made no figure in the world till towards the 7th century; about the beginning of which they ſallied forth from the

Turcoiſe ‖ Turdus.

Portæ Caſpiæ, laid waſte Perſia, and joined the Romans againſt Choſroes king of Perſia. In 1042 they ſubdued the Perſians, in whoſe pay they ſerved, and from whom they derived the Mahometan religion: and afterwards pouring forth, over-ran Syria, Cappadocia, and the other countries of the Hither Aſia, under diſtinct heads or princes, whom Ottoman ſubduing, united the whole power in himſelf, which to this day continues in his family, and who fixed his ſeat of empire at Pruſa in Bithynia. His ſucceſſors ſubdued all Greece, and at length took Conſtantinople in 1453; which put a period to the Roman empire in the Eaſt, under Conſtantine the laſt emperor. It is a ſtanding tradition or prophecy among the Turks, that their empire will at length be overturned by the Franks or Chriſtians; which ſeems now to be drawing on apace towards accompliſhment.

TURCOISE. See TURQUOISE.

TURCOMANIA, a province of Aſiatic Turkey, anſwering to the ancient kingdom of Armenia.

TURDUS, the thruſh; a genus of birds belonging to the order of *paſſeres*. The bill is ſtraightiſh, bending towards the point, and ſlightly notched near the end of the upper mandible. The noſtrils are oval, naked or half covered with a membrane; the corners of the mouth are furniſhed with a few ſlender hairs, and the tongue is ſlightly jagged at the end. There are 136 ſpecies; of which 7 are Britiſh, the viſcivorus, pilaris, iliacus, muſicus, roſeus, merula, and torquatus.

1. The *viſcivorus*, or miſſel, is the largeſt of the genus. Its length is 11 inches; its breadth 16½. The bill is ſhorter and thicker than that of other thruſhes; duſky, except the baſe of the lower mandible, which is yellow. The irides are hazel. Head, back, and leſſer coverts of the wings, are of a deep olive brown. The lower part of the back is tinged with yellow. The loweſt order of leſſer coverts, and the great coverts, are brown; the firſt tipped with white, the laſt both tipped and edged with the ſame colour. The inner coverts of the wings white. The tail is brown; the three outermoſt feathers tipped with white. The cheeks and throat are mottled with brown and white; the breaſt and belly are whitiſh yellow, marked with large ſpots of black; the legs are yellow.

Theſe birds build their neſts in buſhes, or on the ſide of ſome tree, generally an aſh, and lay four or five eggs: their note of anger or fear is very harſh, between a chatter and ſhriek; from whence ſome of its Engliſh names. Its ſong, however, is very fine; which it begins ſitting on the ſummit of a high tree, very early in the ſpring, often with the new-year, in blowing ſhowery weather, which makes the inhabitants of Hampſhire to call it the *ſtorm-cock*. It feeds on inſects, holly and miſſeltoe berries, which are the food of all the thruſh kind: in ſevere ſnowy weather, when there is a failure of their uſual diet, they are obſerved to ſcratch out of the banks of hedges the root of arum, or the cuckoo pint; this is remarkably warm and pungent, and a proviſion ſuitable to the ſeaſon.

2. The *pilaris*, or fieldfare, is in length 10 inches, in breadth 17. The head is aſh-coloured inclining to olive, and ſpotted with black; the back and greater coverts of the wings of a fine deep cheſnut; the tail is black; the lower parts of the two middlemoſt feathers, and the interior upper ſides of the outmoſt feathers excepted: the firſt being aſh coloured, the latter white. The legs are black; the talons very ſtrong.

This bird paſſes the ſummer in the northern parts of Europe; alſo in Lower Auſtria. It breeds in the largeſt trees; feeds on berries of all kinds, and is very fond of thoſe of the juniper. Fieldfares viſit Britain in great flocks about Michaelmas, and leave us the latter end of February or the beginning of March.

Theſe birds, and the redwings were the *turdi* of the Romans, which they fattened with crumbs of figs and bread mixed together. Varro informs us that they were birds of paſſage, coming in autumn, and departing in the ſpring. They muſt have been taken in great numbers; for, according to Varro (lib. 3. c. 5.) they were kept by thouſands together in their fattening aviaries. They do not arrive in France till the beginning of December. Turdus.

3. The *muſicus*, or throſtle, is in length 9 inches, in breadth 13½. In colour, it ſo nearly reſembles the miſſel-thruſh, that no other remark need to be added, but that it is leſs, and that the inner coverts of the wings are yellow.

The throſtle is the fineſt of our ſinging birds, not only for the ſweetneſs and variety of its notes, but for the long continuance of its harmony; for it obliges us with its ſong for near three parts of the year. Like the miſſel-bird, it delivers its muſic from the top of ſome high tree; but to form its neſt deſcends to ſome low buſh or thicket: the neſt is made of earth, moſs, and ſtraw, and the inſide is curiouſly plaſtered with clay. It lays five or ſix eggs, of a pale bluiſh green, marked with duſky ſpots.

4. The *iliacus*, or redwing, has a very near reſemblance to the throſtle; but is leſs: their colours are much the ſame; only the ſides under the wings and the inner coverts in this are of a reddiſh orange, in the throſtle yellow; above each eye is a line of yellowiſh white, beginning at the bill and paſſing towards the hind part of the head.

Theſe birds appear in Great Britain a few days before the fieldfare; they come in vaſt flocks, and from the ſame countries as the latter. With us they have only a diſagreeable piping note; but in Sweden, during the ſpring, they ſing very finely, perching on the top of ſome tree among the foreſts of maples. They build their neſts in hedges, and lay ſix bluiſh-green eggs ſpotted with black.

5. The *merula*, or black-bird, when it has attained its full age, is of a fine deep black, and the bill of a bright yellow; the edges of the eyelids yellow. When young, the bill is duſky, and the plumage of a ruſty black, ſo that they are not to be diſtinguiſhed from the females; but at the age of one year they attain their proper colour.

This bird is of a very retired and ſolitary nature; frequents hedges and thickets, in which it builds earlier than any other bird: the neſt is formed of moſs, dead graſs, fibres, &c. lined and plaſtered with clay, and that again covered with hay or ſmall ſtraw. It lays four or five eggs of a bluiſh-green colour, marked with irregular duſky ſpots. The note of the male is extremely fine, but too loud for any place except the woods: it begins to ſing early in the ſpring, continues its muſic part of the ſummer, deſiſts in the moulting ſeaſon, but reſumes it for ſome time in September and the firſt winter-months.

6. The *torquatus*, or ring-ouzel, is ſuperior in ſize to the black-bird: the length is 11 inches, breadth 17. The bill in ſome is wholly black, in others the upper half is yellow; on each ſide the mouth are a very few briſtles; the head and whole upper part of the body are duſky, edged with pale brown; the quill-feathers and the tail are black. The coverts of the wings, the upper part of the breaſt, and the belly, are duſky, ſlightly edged with aſh-colour. The middle of the breaſt is adorned with a white creſcent, the horns of which point to the hind part of the neck. In ſome birds this is of a pure white, in others of a dirty hue. In the females and in young birds this mark is wanting, which gave occaſion to ſome naturaliſts to form two ſpecies of them.

The ring-ouzel inhabits the Highland hills, the north of England, and the mountains of Wales. They are alſo found to breed in Dartmoor, in Devonſhire, and in banks

on

Turenne ‖ Turgot.

on the ſides of ſtreams. The places of their retreat are not known. In Scotland and Wales they breed in the hills, but deſcend to the lower parts to feed on the berries of the mountain-aſh. They migrate in France at the latter ſeaſon; and appear in ſmall flocks about Monthard in Burgundy, in the beginning of October, but ſeldom ſtay above two or three weeks.

To theſe we ſhall add the deſcription of the *polyglottus*, or mocking thruſh, which is a native of America. It is about the ſize of a thruſh, of a white and grey colour, and a reddiſh bill. It is poſſeſſed not only of its own natural notes, which are muſical and ſolemn, but it can aſſume the tone of every other animal in the wood, from the wolf to the raven. It ſeems even to ſport itſelf in leading them aſtray. It will at one time allure the leſſer birds with the call of their mates, and then terrify them when they have come near with the ſcreams of the eagle. There is no bird in the foreſt but it can mimick; and there is none that it has not at times deceived by its call. But, unlike ſuch as we uſually ſee famed for mimicking with us, and who have no particular merit of their own, the mock-bird is ever ſureſt to pleaſe when it is moſt itſelf. At thoſe times it uſually frequents the houſes of the American planters; and ſitting all night on the chimney-top, pours forth the ſweeteſt and the moſt various notes of any bird whatever. It would ſeem, if accounts be true, that the deficiency of moſt other ſong-birds in that country is made up by this bird alone. They often build their neſts in the fruit trees about houſes, feed upon berries and other fruits, and are eaſily rendered domeſtic.

TURENNE (Viſcount). See TOUR.

TURF, *peat*, a blackiſh earth uſed in ſeveral parts of England, Holland, and Flanders, as fuel. Turf, as diſtinguiſhed from peat, conſiſts of mould interwoven with the roots of vegetables; when thoſe roots are of the bulbous kind, or in a large proportion, they form the looſer and worſe kind of turf; but when mixed with a conſiderable proportion of peat, they form what is called *ſtone-turf*; it at firſt hardens, but at laſt crumbles by long expoſure to the air.

TURGESCENCE, among phyſicians, denotes a ſwelling or growing bloated.

TURGOT (Anne Robert James), the famous financier, was born at Paris May 10, 1727, of a very ancient Norman family. His father was for a long time provoſt of the corporation of merchants. During this period he was the object of general admiration; and the regularity and economy of his adminiſtration procured him the particular reſpect of the citizens. M. Turgot was the youngeſt of three brothers. The eldeſt was intended for the rank of magiſtracy, which had been the ſtation of his family for ſeveral generations; the ſecond was deſtined for the army; and Robert for the church. He had ſcarcely attained the age at which reflection commences, when he reſolved to ſacrifice all temporal advantages to liberty and conſcience, and to purſue his eccleſiaſtical ſtudies without declaring his repugnance to their propoſed object. At the age of 23 years he took his degree, and was elected prior of the Sorbonne.

The time when it was neceſſary for him to declare that he would not be an eccleſiaſtic was now arrived. He announced this reſolution to his father by letter, ſhowing the motives which induced him to decline the clerical order. His father conſented, and he was appointed maſter of requeſts. M. Turgot prepared himſelf for this office by particular application to thoſe parts of ſcience which are moſt connected with its functions and duties, viz. the ſtudy of natural philoſophy, as far as it relates to agriculture and manufactures, to the ſubjects of merchandiſe, and the execution of public works, together with ſuch parts of mathematical knowledge as lead to a practical application of natural philoſophy, and facilitate the calculations that are frequently neceſſary in politics, commerce, and law. Turgot

About this period he wrote ſome articles for the *Encyclopédie*, of which the moſt capital were, *Etymology*, *Exiſtence*, *Expanſibility*, *Fair*, and *Foundation*. He had prepared ſeveral others, but theſe five only were inſerted; the perſecution ſet on foot againſt the *Encyclopédie* hindered him from continuing to write in it, being unwilling that his opinions ſhould be publiſhed in a work which was received with diſapprobation by ſome of the moſt diſtinguiſhed people of that time.

In 1761 M. Turgot was appointed intendant of Limoges. In this office he did much good. He gave activity to the ſociety of agriculture eſtabliſhed at Limoges, by directing their efforts to important objects: he opened a mode of public inſtruction for female profeſſors of midwifery: he procured for the people the attendance of able phyſicians during the raging of epidemic diſeaſes: he eſtabliſhed houſes of induſtry, ſupported by charity (the only ſpecies of almsgiving which does not encourage idleneſs): he introduced the cultivation of potatoes into his province, &c. &c. While M. Turgot proceeded with unremitting activity and zeal, in promoting the good of the people over whom he was placed, he meditated projects of a more extenſive nature, ſuch as an equal diſtribution of the taxes, the conſtruction of the roads, the regulation of the militia, the prevention of a ſcarcity of proviſion, and the protection of commerce.

At the death of Louis XV. the public voice called M. Turgot to the firſt offices of government, as a man who united the experience reſulting from habits of buſineſs to all the improvement which ſtudy can procure. After being at the head of the marine department only a ſhort time, he was, Auguſt 24, 1774, appointed comptroller general of the finances. During his diſcharge of this important office, the operations he carried on are aſtoniſhing. He ſuppreſſed 23 kinds of duties on neceſſary occupations, uſeful contracts, or merited compenſations. He aboliſhed the corvée (A) for the highways, ſaving the nation thirty millions of livres annually.—He ſet aſide another kind of corvée, which reſpected the carriage of military ſtores and baggage.—He abated the rigour in the adminiſtration of indirect impoſitions, to the great profit of the contributors, the king, and the financiers.—He ſoftened the mode of collecting the territorial impoſts.—He ſtopped the progreſs of a plague among cattle.—He ſuppreſſed a ſedition conducted with art.—He provided for the equal diſtribution of ſubſiſtence.—He gave the utmoſt encouragement to the cultivation of the three chief productions of France, viz. wheat, cattle, and wine, and to the commerce thence reſulting.—He reformed a number of abuſes, ſome of which yielded a profit to

(A) The word *corvée* ſeems to be derived from *cura viæ*, i. e. "the care of the roads." It ſignifies the call made on individuals to furniſh labour and materials in kind for the conſtruction and repair of roads. The ſame exiſts to this day in England under the name of *ſtatute duty*. It is indeed with us under proper reſtrictions; but in France, where there are no turnpikes, all the roads, which are very good, were made and repaired by the *corvée* alone; whence it became an intolerable burden to the labourers.

Turgot, Turin.

to the place he filled. He aboliſhed as much as he could the ſale of offices.—He formed many uſeful eſtabliſhments.—He paid the penſions of the poorer ſervants of the ſtate, who were four years in arrear.—He ſupplied the expences of a coronation, the marriage of a princeſs, and the birth of a prince.—He facilitated payments as far as India.—He ſettled a part of the colony debts, and put the reſt in order.—He found the public borrowing at five and a half *per cent.* and reduced the rate to four.—He leſſened the public engagements 84 millions. He found the revenue 19 millions deficient, and left a ſurplus of three millions and a half.—All theſe he accompliſhed within the ſpace of 20 months, during ſeven of which ſevere fits of the gout totally incapacitated him for buſineſs.

At length, however, by the artifices of the courtiers, his office was taken from him; but when removed to a private ſtation, M. Turgot did not experience that frightful void which is the juſt but dreadful puniſhment of ambitious men when deſerted by fortune. The ſciences and the belles lettres, which he had cultivated in his youth, afforded him conſolation, while an active ſphere of life was denied him. Natural philoſophy and chemiſtry were his favourite purſuits; yet he frequently entertained himſelf with poetry, eſpecially with tranſlating Virgil into French verſe. "We know (ſays the Marquis de Condorcet) but of one Latin verſe compoſed by M. Turgot, and which was intended for a picture of Dr Franklin.

"*Eripuit cælo fulmen, mox ſceptra tyrannis.*"

The attacks of the gout, under which he had long laboured, becoming more frequent and exceſſive, forewarned him of the approaching moment, when, in conformity to the laws of nature, he was going to fill in a higher order of beings, the rank which theſe laws deſtined for him. He died March 20, 1781.

For a more ample account of this illuſtrious ſtateſman, we refer the reader to the Hiſtory of his Life, written by the Marquis de Condorcet.

TURIN, an ancient, populous, ſtrong, handſome, flouriſhing city of Italy, and capital of Piedmont, where the ſovereign reſides, with an archbiſhop's ſee, a ſtrong citadel, and an univerſity. It is ſeated on a vaſt plain, at the confluence of the rivers Doria and Po. It is one of the handſomeſt places in Italy; but the air is unhealthy in the autumn and winter on account of the thick fogs. One half of this place is lately built; and the ſtreets are ſtraight and clean, being waſhed by an aqueduct. The two largeſt ſtreets are the New-ſtreet and that of the Po, which are lighted in the winter time. The houſes are handſome, and all built of the ſame height. The ducal palace conſiſts of two magnificent ſtructures, joined together by a gallery, in which are ſeveral ſtatues, all ſorts of arms, the genealogy of the dukes of Savoy, a repreſentation of the celeſtial ſigns, a royal library, and many other curioſities. Beſides theſe two ſtructures, there is the palace of the prince of Carignan, the hoſpital of St John, the ſeminary of the Jeſuits, the royal hoſpital, and the metropolitan church of St John, wherein they pretend to keep the cloth in which is the print of the face of Jeſus Chriſt. Theſe are all ſuperb ſtructures. When the plague reigned at Marſeilles in 1720, a great number of artificers withdrew to Turin; inſomuch that there are now above 87,000 inhabitants, and 48 churches and convents. Turin is very well fortified, and extremely ſtrong; as the French found by experience in 1706, who then beſieged it a long while to no purpoſe. The citadel, which is flanked with five baſtions, is without doubt a maſterpiece of architecture. There are very fine walks on the ramparts, which require two hours to paſs round them. There are alſo very fine gardens on the ſide of the river Po; and the houſe commonly called *La Charité* is remarkable, as there is room for 3000 poor people. The college of the academy is very large and well built, and has a great number of ancient inſcriptions. In the royal library are 19,000 manuſcripts, beſides 30,000 printed books. It is charmingly ſeated at the foot of a mountain, 62 miles north eaſt of Genoa, 72 ſouth-weſt of Milan, and 280 north-weſt of Rome. E. Long. 7. 45. N. Lat. 44. 50.

Turkey.

TURKEY, in ornithology. See MELEAGRIS.

TURKEY, a very extenſive empire, comprehending ſome of the richeſt countries in Europe, Aſia, and Africa. See TURCÆ.

1 Conſtantinople becomes the capital of the Turkiſh dominions.

Under the article CONSTANTINOPLE, n° 111, *et ſeq.* we have given an account of the origin and progreſs of the Turks, as far as ſeemed neceſſary for underſtanding the ſubſequent and more important part of their hiſtory. In 1453 they made themſelves maſters of the city of Conſtantinople, which from that time became the capital of their empire. Mohammed II. at that time the ſultan, after having treated the inhabitants with the greateſt cruelty, began to think of adding Servia to his dominions. Accordingly, in 1454, he entered that country at the head of 20,000 men, and obliged the inhabitants to pay him an annual tribute of 40,000 ducats. On his return to Adrianople, Mohammed repeopled the towns and villages about Conſtantinople with 4000 men and women who fell to his ſhare; and going to that city, built a palace eight ſtadia in compaſs, which he lined with lead taken from the monaſteries. Next year a fleet was ſent againſt the iſlands of Rhodes and Chios; but the attempt on both proved unſucceſsful: however the iſland Cos was reduced, and ſome other places; after which the ſultan turning his arms towards Hungary, laid ſiege to Belgrade. At firſt he met with ſucceſs; beat down part of the wall, and ſtopped the navigation of the river with 60 veſſels: but the celebrated John Hunniades, happening to arrive at that critical juncture, made a furious ſally, entirely routed the Turkiſh army, wounded Mohammed himſelf in the thigh, and burnt all his ſhips. Hunniades himſelf did not long ſurvive this engagement, dying ſoon after of a wound he had received therein according to ſome, or of the plague according to others.

2 Unſucceſsful attempt on Rhodes and Chios.

3 Mohammed repulſed at Belgrade.

Mohammed being thus repulſed from Belgrade, ſet about the entire conqueſt of the Morea, the ancient Peloponneſus. The Grecian princes, among whom were two of the emperor's brothers, Thomas and Demetrius, were ſo terrified by the taking of Conſtantinople, and the great progreſs of the Turks, that they prepared to retire into Italy; upon which the Albanians ſeized on the country, chooſing one Manuel Cantacuzenus, a Greek, for their prince. Then falling on the Greeks who remained, they made an offer to the ſultan of the cities and fortreſſes, provided he would allow them to keep the open country; for the Albanians were ſhepherds, who had no fixed habitation. At this time, however, the ſultan choſe rather to ſupport the Greeks than to let the country fall into the hands of ſuch barbarians; and having defeated the Albanians, was content to accept of a tribute from the Greeks. But the danger was no ſooner over, than the Grecian princes revolted anew; upon which Mohammed entering the country with a powerful army, prince Thomas, with his family, fled to Italy; while Demetrius thought it moſt eligible to ſubmit to the ſultan, by whom he was carried away, with many of the moſt conſiderable perſons of Lacedæmon, Achaia, &c. where Turkiſh governors were appointed. Two thouſand families were alſo carried away from the Morea, in order to be ſettled at Conſtantinople, and 2000 young men to be enrolled among the ſultan's troops. Many cities at this time fell into the hands

4 Expedition againſt the Morea.

5 One of the Greek princes ſubmits.

of

Turkey.

of the Turks, among which the principal were Corinth and Athens. The Greeks, however, ſtill made ſome faint ſtruggles; but all in vain: for by the year 1459 the whole country was ſubdued, excepting ſome maritime places held by the Venetians; and prince Thomas was obliged finally to take up his abode at Rome, where he was lodged in the pope's palace, and had a penſion of 3000 livres a-year allowed him for his expences.

6 The whole country ſubdued.

Mohammed now purſued his good fortune; and having made war on the emperor of Trebizond, he ſubdued his dominions, and put him to death. His career, however, was for ſome time ſtopped by Scanderbeg the Epirote. This prince had already defeated an army of 12,000 Turkiſh horſe, of whom only 5000 eſcaped the ſlaughter; and diſperſed another, with the loſs of their general, and 4120 of his men killed on the ſpot. Encouraged by this ſucceſs, he laid ſiege to Belgrade, which it ſeems was now in the hands of the Turks: but, through the treachery of his ſcouts, his army was defeated, and 5000 of his men killed; upon which, one of his generals, by name *Moſes*, went over to the Turks.

7 War with Scanderbeg

8 His ſucceſs againſt the Turks.

Scanderbeg, not at all diſpirited by this misfortune, proſecuted the war with the utmoſt vigor. His firſt enterprize was againſt his perfidious general Moſes, who had been immediately put at the head of an army by the ſultan. This army was by Scanderbeg totally deſtroyed, excepting about 4000 men; upon which Moſes fell into ſuch diſgrace with the Turks, that he returned to his old maſter, who forgave his treachery, and reſtored him to all his former poſts.

The bad ſucceſs of Moſes did not prevent Ameſa, the nephew of Scanderbeg, from following his example. Mohammed received him kindly, and ſent him with Iſhak baſhaw of Conſtantinople; whom he intruſted with an army of 50,000 men againſt his uncle. Scanderbeg, with only 6000 men, retired towards Lyſſa, a maritime city of the Venetians. The Turks purſued, contrary to the advice of Ameſa; and being ſurpriſed by Scanderbeg, were utterly defeated, with the loſs of their camp, 20,000, or, according to others, 30,000 men killed on the ſpot, and the treacherous Ameſa taken priſoner. With the like good fortune Scanderbeg defeated three other Turkiſh armies, one of 20,000, another of 30,000, and the third of 18,000 men. On this Mohammed ſent againſt him an old experienced commander, at the head of 40,000 choſen troops; but as he likewiſe was able to atchieve nothing, the ſultan thought proper to conclude a peace with Scanderbeg in 1461.

9 Peace concluded.

Mohammed being thus freed from ſuch a troubleſome enemy, completed the conqueſt of the Greek iſlands; ſubdued Wallachia, Boſnia, and Illyria, extending his empire nearly to the confines of Italy. But as it was eaſy to ſee that no conqueſts would ſatisfy the Turkiſh ambition, the Venetians, who found themſelves ill-treated by their warlike neighbours, entered into an alliance with the Hungarians, to repreſs the overgrown power of the Turks, and prevent the weſtern parts of the world from being totally over-run by them; and into this alliance Scanderbeg was ſoon drawn, notwithſtanding his treaty with Mohammed already mentioned. The Hungarians invaded the Turkiſh dominions on the weſt ſide, defeated ſome troops, and carried off 20,000 ſlaves: the Venetians invaded the Morea, where they made ſome conqueſts, but were ſoon obliged to abandon them: however, they recovered the iſland of Lemnos; but being defeated in two engagements at land, they were obliged to ſolicit aſſiſtance from France, Germany, and Spain. Having obtained conſiderable ſupplies from thoſe parts, they again entered the Morea; but meeting with ſtill worſe ſucceſs than before, they applied for aſſiſtance to Matthias the ſon of John Hunniades king of Hungary. Matthias willingly made another incurſion into the Turkiſh dominions, ravaged Servia, and carried off a vaſt number of priſoners with a great booty.

10 Other conqueſts of Mohammed.

11 A formidable combination againſt the Turkiſh powers.

12 The war carried on with various ſucceſs.

Turkey.

In the mean time, Mohammed, fearing leſt Scanderbeg ſhould be declared generaliſſimo of the Chriſtian forces, ſent to him, deſiring a renewal of the league between them. But this being refuſed, the war was renewed with the utmoſt vigour. Many Turkiſh armies were ſent againſt this hero; but they were utterly defeated and diſperſed, till the year 1466, when by his death the ſultan was freed from the moſt formidable enemy he had ever encountered.

13 Scanderbeg dies.

The death of Scanderbeg was followed by the entire reduction of Epirus and Albania. The Venetians in 1469 defeated the Turks in a pitched battle; but were driven out of Negropont, at that time the ſtrongeſt city in Europe: after which they entered into an alliance with Ferdinand king of Naples, Lewis king of Cyprus, and the grand maſter of Rhodes, at the ſame time that they ſent ambaſſadors to Uzun Haſſan king of Perſia, in order to perſuade him to attack the Turkiſh dominions on the eaſt ſide. Mohammed did not loſe his courage at the number of his enemies; but having defeated the Perſians, reduced the Venetians to ſuch diſtreſs, that they were obliged to conclude a treaty in 1479.

14 Epirus and Albania reduced.

15 The Venetians obliged to ſue for peace.

In 1481 the war was renewed, and the city of Rhodes beſieged, but without ſucceſs; however, the city of Cephalonia was taken from the Venetians, Italy invaded, and the city of Otranto taken. This was the laſt of the exploits of Mohammed II. who died this year of the gout, and was ſucceeded by his ſon Bayezid, or Bajazet II. Under this prince a war commenced with the Mamalukes of Egypt, which, under his ſucceſſor Selim I. ended in the total ſubjection of that country. Bajazet, however, greatly facilitated Selim's conqueſt by the reduction of Circaſſia, whence the Mamalukes drew their principal reſources. Caramania and Croatia were totally reduced; the cities of Lepanto, Modon, and Durazz, taken by the Turks, though the Venetians recovered Cephalonia; Syria on the eaſt, and Moldavia on the weſt, were invaded and ravaged by the victorious armies of the ſultan; till at laſt a peace was concluded with the European powers in 1503.

16 Death of Sultan Mohammed.

17 Further conqueſts of the Turks.

18 Peace concluded.

19 Earthquakes and plague at Conſtantinople.

The year 1509 is remarkable for a dreadful earthquake at Conſtantinople, which overturned a great number of houſes, and deſtroyed 13,000 people; being alſo followed by an epidemic diſtemper, which carried off great numbers. About this time alſo the ſultan, finding the infirmities of old age drawing on, and being deſirous of paſſing the remainder of his days in quiet, reſolved to reſign the throne to his eldeſt ſon Achmed. But having engaged in this affair with too great precipitation, and before he had gained over the grandees, his ſecond ſon Selim, whom he had made governor of Trabezond, haſtily croſſing the Euxine ſea, dethroned and put to death his father, in the year 1512.

20 Sultan Bajazet deſirous of reſigning in favour of his eldeſt ſon.

21 Is depoſed, and put to death by his ſecond ſon Selim.

The new emperor, who had not ſcrupled to ſacrifice his father to his ambition, did not heſitate at eſtabliſhing himſelf on the throne by the death of his brother alſo. Accordingly, as Achmed, knowing he could be nowhere ſafe, reſolved to ſtand on his defence, Selim with a powerful army marched againſt him; and having defeated the few forces of his brother, took him priſoner, and put him to death. Having thus ſecured himſelf, he marched againſt the Perſians, whom he overthrew in a great battle: after which he took the city of Taurus; made ſome other conqueſts; and having ſecured tranquillity on the eaſtern ſide of his dominions, turned his arms againſt Sultan Gauri of Egypt. Him he reduced in the manner related under the article EGYPT, n° 101. His farther deſigns of conqueſt were fruſtrated by his death, which happened in the year 1519.

22 Selim defeats the Perſians, and reduces Egypt.

23 His death.

Selim

Turkey.

Selim was ſucceeded by his ſon Solyman I. ſurnamed *Kanuni*, or *The Lawgiver*, who proved no leſs ambitious and warlike than his father. Having defeated and killed the governor of Damaſcus, who had rebelled againſt him, he attacked the European princes with a deſign to extend his dominions as far to the weſtward as he poſſeſſed to the eaſtward of his capital. In 1520 he ſet out with a great army to conquer Hungary. The city of Belgrade was immediately inveſted, and in a ſhort time taken. Rhodes alſo being attacked by a great force by ſea and land, was obliged to ſubmit, after a moſt deſperate reſiſtance, as is related under that article, n° 33, *et ſeq.*; and Solyman entered the city in triumph on Chriſtmas day 1522. His conqueſts for ſome time were ſtopped by a rebellion in Egypt; but this being ſoon quaſhed, the war with Hungary was renewed in 1525. King Lewis having raſhly engaged the Turkiſh army of 200,000 men with only 25,000, was utterly defeated, himſelf drowned in a ditch, and his whole army, excepting a few horſe, cut in pieces.—This defeat was followed by the ſurrender of Buda, which, however, the Hungarians retook in 1528; but next year it was again taken by the Turks, and ſoon after both the Moldavias ſubmitted to their juriſdiction. The city of Vienna was then inveſted: but after being reduced to the greateſt ſtraits, the ſultan was obliged to abandon the ſiege by the coming on of the autumnal rains; which, however, he did not without barbarouſly maſſacring all his priſoners.

24 Is ſucceeded by Solyman a warlike prince.

52 The city of Rhodes reduced.

26 The king of Hungary defeated and killed.

27 Vienna beſieged without ſucceſs.

The raiſing the ſiege of Vienna was followed by an entire repulſe of the Turks from the German territories: on which Solyman, reſolving to extend his dominions on the eaſt, ſubdued the country of Georgia, and made himſelf maſter of the city of Bagdad; at the ſame time that his admiral, the celebrated Barbaroſſa, ravaged the coaſts of Italy, and took the cities of Biſerta and Tunis in Africa. But, in 1536, he was obliged to retire before Charles V. of Spain, who retook the city of Tunis. Solyman, to revenge this diſgrace, ſuſpended for a time the war in Perſia, in order to turn all his forces againſt Italy: but while this country was in danger of being totally overwhelmed, a Venetian captain having raſhly taken and ſunk ſome Turkiſh veſſels, Solyman changed his deſign of attacking Italy into that of chaſtiſing the Venetians. However, after ſome trifling encounters, a peace was concluded in 1540.

28 Georgia, Bagdad, &c. reduced.

29 Tunis reduced by Charles V.

This year the war was renewed in Hungary: the tranſactions were very unfortunate for the Chriſtians, and ended in the entire reduction of the kingdom to a Turkiſh province. The kingdom of France, being oppreſſed by its enemies, entered into an alliance with Solyman, who was now grown ſo powerful, that the whole European powers ſeemed ſcarce able to reſiſt him. However, in 1565, he was baffled by the knights of MALTA, as is related under that article; and in 1566 an end was put to his ambition and his conqueſts by death.

30 Hungary reduced to a Turkiſh province.

31 Malta beſieged unſucceſsfully.

Solyman was ſucceeded by his ſon Selim II. ſurnamed *Mey*, or "The Drunken." Under him the empire at firſt loſt nothing of its luſtre; but in 1571 the maritime power of the Turks was almoſt entirely deſtroyed at Lepanto, where one of the moſt remarkable ſea-engagements mentioned in hiſtory took place. The Chriſtian fleet was commanded by Doria the Venetian admiral; and conſiſted of 78 Spaniſh and 3 Malteſe galleys, under Don John of Auſtria, natural ſon to the emperor Charles V. Beſides theſe, under Venieri, a Venetian officer, were 108 galleys, 6 galleaſſes, 2 tall ſhips, and a great many ſmall galliots. Colonna, a kinſman of the pope, had alſo 12 of his galleys under his command. On board this fleet were 20,000 good ſoldiers, many of them perſons of great quality, who went volunteers in the expedition. Though the Turkiſh fleet conſiſted of 335 ſail, the moſt experienced officers were againſt fighting at that time, conſidering the great ſtrength of the confederates, and that there was no neceſſity for an engagement. But the opinion of Ali Paſha, the chief admiral, who was for a battle, prevailing, Parteu Paſha, the next in command, took on board 12,000 janiſaries and ſpahis, drawn out of the neighbouring garriſons; beſides 4000 other ſoldiers. Then putting out of the gulph, the fleet ſteered their courſe for the iſle of Corzalates, of old Echinates, half-way between Lepanto and Patras; and the Chriſtians moving towards them, both fleets came in ſight, October 7, afternoon. Hereupon Don John, having ordered the great enſigns of the confederates, which was the ſignal for engaging, to be hoiſted, clad in armour, went in his long boat to encourage the ſeveral ſquadrons of the centre under his command; while Doria did the like in the right wing, and Barbadico, the Venetian proveditor-general, in the left.

32 Account of the battle of Lepanto.

Turkey.

The ſignal was no ſooner given, than the Turks, with a hideous cry, fell on ſix galleaſſes which lay at anchor near a mile a-head of the confederate fleet; but thoſe ſhips fired ſo briſkly on them, firſt from their forecaſtles and then as they paſſed by, ſo galled their galleys with whole broadſides, that ſeveral of them were ſunk, which made the reſt bear farther off. The wind likewiſe chopped about to the weſt, and incommoded the Turks with the ſmoke. However, they ſoon rallied their diſordered ſquadrons, and came on with ſurpriſing reſolution. The action was continued for ſeveral hours with equal bravery on both ſides; but victory at laſt declared for the confederates.

33 The Turks defeated with great ſlaughter.

The number of Turks ſlain in this famous naval fight could not with certainty be known. An author who wrote an account of this war, makes their number 32,000 beſides priſoners, who were about 3500. The galleys taken from them amounted to 161. Forty more were ſunk or burnt; and of galliots, with other ſmall veſſels, about 60 were taken.

34 Little advantage reaped by the Chriſtians from the victory.

Notwithſtanding the prodigious loſs ſuſtained by the Turks on this occaſion, the confederates reaped but little advantage from this victory; and next year Kilij Ali Paſha, who had ſucceeded to the poſt of high admiral, fitted out a fleet of 250 galleys, with which he ravaged the coaſts of Chriſtendom wherever he came, and maintained his ground ſo well, that the confederates could never gain the leaſt advantage over him.

35 Decline of the Turkiſh power.

The Turkiſh power from this time, however, began to decline. The progreſs of civilization being much more quick among the weſtern nations, and their improvements in the art of war very conſiderable, the Turks found it not only impoſſible to extend their dominion over Germany, but even a matter of ſome difficulty to withſtand the power of the weſtern princes. During the remainder of the reign of Selim, the war was carried on in Hungary with little advantage on either ſide; but under his ſucceſſor, ſultan Morad III. the Turks met with ſeveral ſevere checks from the Germans.

In 1594, Mohammed III. having ſucceeded his father Morad, deſtroyed his 19 brethren, in order to ſecure himſelf on the throne; and for the ſame reaſon cauſed 10 of his father's wives and concubines to be thrown into the ſea, leſt any of them ſhould prove with child. The emperor Rodolph II. having entered into a confederacy againſt him with the princes of Tranſylvania, Walachia, and Moldavia, defeated the Turks and their Tartar auxiliaries in ſeveral engagements, and took many cities; while ſo grievous a famine and plague raged in Hungary, that of 85,000 Tartars who had entered the country the year before, ſcarce 8000 remained alive. This was followed by new misfortunes; ſo that

36 Confederacy againſt them.

37 Misfortunes of the Turks.

Turkey.

that in the following year the Turks were entirely driven out of Tranſylvania, Moldavia, and Walachia.

38 War with Poland.

In 1621, under Othman or Ozman II. we find the Turks firſt engaged in a war with Poland; but a peace was concluded the ſame year; the chief article of which was,

39 The Poles firſt allowed to trade to Turkey.

that the Poles ſhould have a free trade in the Turkiſh dominions, and that for this their merchants ſhould pay 10,000 ſequins. The Turkiſh affairs continued pretty much in the ſame way till the year 1673, when a dreadful war

40 War with Ruſſia, Germany, and Poland.

broke out with Germany, Ruſſia, and Poland, whoſe army was at that time commanded by the celebrated John Sobieſki. The year before, hoſtilities had commenced on account of the Poles having endeavoured to detach the Coſſacks from their allegiance to the ſultan. At this time the Turks were ſucceſsful through the diſſenſions which reigned among the Poles; and the latter were obliged to pay an annual tribute of 20,000 rix-dollars, and to deliver

41 The Poles defeated, and become tributary.

up 48 towns and villages in the territory of Kaminieck. However, the articles of this treaty were never executed; for, in 1673, the ſtates of Poland ſent a letter to Kyoprili Ahmed Paſha, the vizir at that time, informing him that they conſidered as null the conditions of the treaty, being concluded without their conſent, and that they would rather ſuffer death, than ſubmit to the infamy of paying one ſingle farthing by way of tribute. On this the ſultan, Mohammed IV. determined to take a ſevere revenge on their perfidy, ſet out with a great army; but was entirely defeated,

42 The ſtate refuſed to ratify the treaty.

with the loſs of 20,000 men killed on the ſpot, all the baggage, 25,000 waggon loads of proviſion and ammunition, and 2000 purſes of money for paying the army. Soon after this victory, John was proclaimed king of Poland: but

43 The Turks defeated, and peace concluded.

his ſubjects, jealous of his glory, refuſed to ſupport him properly in proſecuting his advantage; ſo that four years after, a treaty was concluded, by which the Poles for ever reſigned their pretenſions to Kaminieck and to the dominion of the Coſſacks in Podolia.

44 The Turks and Tartars defeated by the Ruſſians.

But though peace was thus made with Poland, the war was carried on very unſucceſsfully with Ruſſia. In 1678, an army of the Tartars was entirely cut in pieces or taken near the city of Cherin; which ſo intimidated another army of 40,000 Turks, who had waited for the arrival of theſe auxiliaries, that they threw away their arms, and fled without ſtopping till they had croſſed the river Bog. This defeat inclined the ſultan to peace; but the negotiations proving ineffectual, he, in 1679, again ſent a powerful army of

43 Another army defeated, and reduced to great diſtreſs.

80,000 Turks, 30,000 Tartars, and 4000 Coſſacks, under the command of the vizir, to retrieve his loſt honour. This army, however, ſucceeded little better than the former: for the vizir was defeated in ſeveral engagements; and at laſt, according to cuſtom, put to death on account of the bad ſucceſs of the war. In 1684 the Venetians again declared

46 War with the Venetians.

war, while the Poles and Germans continued their hoſtilities with the utmoſt violence. The Turks were forced to yield to the ſuperior fortune and valour of their adverſaries; they were defeated in a great number of engagements, and loſt many places of importance. In ſhort, their affairs ſeemed to be totally going to wreck, when, in 1688, they were re-

47 The Turkiſh affairs retrieved by Kyoprili.

trieved by the new vizir Ahmed Kyoprili, a man of great ſkill and experience in war, as well as of the moſt upright and blameleſs character. Having prevailed in the divan to have the war carried on, he applied his whole care to the raiſing of an army, and providing warlike ſtores. But finding

48 He rouſes the enthuſiaſm of the people.

the people every where intimidated and unwilling to oppoſe the enemy, the treaſury exhauſted, and an univerſal langour prevailing, he made a new kind of proclamation, in which he told the people, that "as he found it neceſſary to truſt the command of the army againſt the haughty Germans to none but himſelf, ſo he would not employ in this expedition any ſoldier forced into the ſervice; knowing that the will was of more value with God than the deed: that he would only put the Muſſulmen in mind, that, by the precepts of God and his prophet, every one is commanded neither to avoid martyrdom, nor to deſpair of ſucceſs againſt infidels, &c." Having thus once rouſed the enthuſiaſm of the common people, they flocked in great numbers to his ſtandard; after which, having reformed many abuſes both in the civil and military departments, he led them againſt the enemy. The good effects of his reformations were evident. Great numbers of the enemy were cut off, and almoſt all the important places taken which had been loſt before, when, in 1691, he was

49 Is at laſt defeated and killed.

defeated and killed by the Germans at Iſlankamen. After his death, the Turkiſh affairs again fell into diſorder; and, though the utmoſt efforts were uſed by ſucceeding vizirs, no progreſs could be made: and in 1697, a prodigious overthrow was given them by prince Eugene at Zenta. At

50 Peace concluded.

laſt, in 1698, all parties being weary of ſuch an expenſive and ruinous war, a pacification took place at Carlowitz, but on different terms with the different nations who had been

51 Terms made with the emperor.

at war with the Turks. The emperor made a truce for 25 years, upon condition that all Tranſylvania ſhould be reſigned to him: the city of Temeſwaer was to be reſtored to the Turks, and the navigation of the Teiſſe and Maros rivers be free to both nations; that the country between the Danube and the Teiſſe, called *Bachbak*, remain in the emperor's hands: that the boundary of the eaſtern part of Hungary, belonging to the emperor, ſhould be a right line drawn from the mouth of the Maros towards the banks of the river Teiſſe to the mouth of the Boſſut, where it falls into the Saave: that towards the ſouth the Saave ſhould part the Turkiſh from the Imperial limits, till it receives the Unna: and that no new caſtles beſides Belgrade and Peterwaradin ſhould be erected, or old ones fortified, any where within theſe boundaries.

52 With the Ruſſians.

The Ruſſian ambaſſador made a truce only for two years, upon the footing of each party poſſeſſing what he had taken. The Poles made a truce on the like terms with the ſultan; namely that they ſhould have Kaminieck, Podolia, and Ukrania, reſtored to them, in the ſame extent as poſſeſſed by them before ſultan Mohammed's firſt expedition into Poland; and, on the other hand, reſign Soczava, Nemos, and So-

53 With the Venetians.

raka, in Moldavia, to the Turks. The Venetians obtained theſe conditions: that all the Morea, as far as Hexamilos, ſhould belong to them; and that the firm land with Naupaktum (or Lepanto), Preveſa, and the caſtle of Romania, which had been demoliſhed, ſhould be reſtored to the Turks; that the bay of Corinth ſhould be common to both, and the Venetians poſſeſs Lenkade with the adjacent iſlands. The yearly tribute paid by the iſlands in the Archipelago to the Venetians was to be aboliſhed; and Zakinth to be declared free from the like burden by the Turks. In Dalmatia, Knin, Cing, Kiklut, Verlika, Duare, and Vergoraz, were to be left to the republic, and fixed as the boundaries of their dominions on that ſide. The Raguſians were to continue free, and the Venetians to retain the caſtles of Caſtlenuovo and Riſano, with what they poſſeſſed in the neighbourhood. Both parties were allowed to fortify their borders with new fortreſſes; or to repair thoſe which were decayed, excepting Naupaktum, Preveſa, and the caſtle of Romania before mentioned.

54 Turkiſh affairs to the year 1769.

From the concluſion of the peace of Carlowitz to the year 1769, nothing very remarkable occurs in the Turkiſh hiſtory, excepting their recovery of the Morea from the Venetians by the treaty of Paſſarowitz. (See the article VENICE). Their war with the Ruſſians under Peter the Great has been taken notice of under the article RUSSIA; thoſe afterwards with PERSIA, under that article. None of theſe, indeed,

Turkey.

indeed, were of any great conſequence; but in 1769, a war commenced with Ruſſia, which threatened the Ottoman empire with deſtruction, and which has given it ſuch a ſevere check as it can ſcarcely recover. The origin of this war is given under the article POLAND, n° 101; and during the courſe of it, an almoſt uninterrupted train of ſucceſs attended the Ruſſian arms. About the end of March 1769, a body of Ruſſian troops made themſelves maſters of the important fortreſs of Aſoph, at the mouth of the river Don. In the end of April, prince Gallitzin, commander in chief of the Ruſſian army on the frontiers of Poland, paſſed the river Nieſter, hoping to take the fortreſs of Choczim by ſurpriſe; but being diſappointed; he was obliged to return. Near the beginning of July, however, he again paſſed that river, and on the 13th attacked and defeated the van of the grand vizir's army, conſiſting of about 50,000 or 60,000 men. Thirteen thouſand of the fugitives entered Choczim; which was next day inveſted by the Ruſſians: but they were at laſt obliged to raiſe the ſiege and repaſs the Nieſter; which they could not effect without conſiderable loſs.

55 War with Ruſſia.

56 Aſoph taken by the Ruſſians.

57 The Turks defeated.

In the mean time, both the Ottoman and Ruſſian courts were diſpleaſed with the conduct of their generals. The Turkiſh grand vizir was deprived of his command, and afterwards beheaded; and was ſucceeded by Moldovani Aga Pacha, a man of a bold and enterprizing ſpirit. On his firſt taking the command of the army, finding it impoſſible to ſubſiſt where he was, he attempted to force a paſſage over the Nieſter, but being three times repulſed with great loſs, he made a precipitate retreat towards Bender, at the ſame time drawing the troops out of Choczim, which the Ruſſians immediately took poſſeſſion of.

58 The Turkiſh vizir beheaded.

59 Choczim taken by the Ruſſians.

Prince Gallitzin was now ſuperſeded by General Romanzow, who took the command of the army on the 29th of September. Soon after his arrival, he received news of the ſucceſs of general Elmpt, who, with a body of 10,000 men, had reduced the province of Yaſſy. He inveſted Bender; but finding the ſeaſon of the year too far advanced, he ſoon withdrew his troops, and put them into winter quarters.

60 They reduce the province of Yaſſy.

61 Unſucceſsful negotiations for peace.

This firſt campaign had proved ſo unpropitious to the Turkiſh affairs, that the court would gladly have concluded a peace, if they could have obtained it upon honourable terms; but the Ruſſians inſiſting upon the entire ceſſion of Moldavia and Walachia as a preliminary article, the negotiations came to nothing. A new campaign was therefore reſolved on; and this proved ſtill more unſucceſsful than before. The grand Ruſſian army under general Romanzow paſſed the Nieſter in the month of May 1770; and, having aſſembled at Choczim on the 3d of June, marched towards Pruth: at the ſame time, their ſecond army, commanded by general Panin, arrived before Bender. The plan of operation was, that the latter ſhould form the ſiege of Bender, and Romanzow ſhould cover it.

62 Bender inveſted.

63 The Turks and Tartars defeated by General Romanzow.

On the 18th of July, general Romanzow attacked an army of 80,000 Turks and Tartars, commanded by the Kahn of Crimea, and ſtrongly intrenched on an almoſt inacceſſible mountain, forced their intrenchments, and obliged them to flee in the utmoſt confuſion, leaving an immenſe quantity of ammunition and proviſions, &c. in their camp; which they totally abandoned to the victors.—After this victory, the Ruſſian general puſhed on towards the Danube; and on the 2d of Auguſt attacked another Turkiſh army, commanded by the grand vizir in perſon, and totally defeated it, making himſelf maſter of their camp, ammunition, 143 pieces of cannon, and above 7000 carriages loaded with proviſions. The loſs of the Turks on this occaſion was not reckoned leſs than 40,000 men, and ſome accounts raiſed it to 60,000.—During the courſe of this ſummer alſo, the fortreſs of Kilia Nova, at the moſt northerly mouth of the Danube, ſurrendered by capitulation; and likewiſe that of Ackerman, or Bialogorod, near the mouth of the Nieſter. Bender was taken by ſtorm on the 27th of November; and the Ruſſians, enraged at the obſtinate reſiſtance they had met with, made a terrible ſlaughter of their enemies. It was computed that 30,000 Turks periſhed on this occaſion. The fortreſs of Brailow, ſituated on the northern ſide of the Danube, was inveſted on the 26th of September; and the garriſon were ſo much intimidated by the taking of Bender, that they abandoned the place, and moſt of them were drowned in croſſing the river.—During this campaign, it was reckoned that the Ruſſians took 1000 pieces of cannon from their enemies.

64 The grand vizir defeated with prodigious ſlaughter.

Turkey.

65 Bender taken and the inhabitants maſſacred.

66 Vaſt number of cannon taken by the Ruſſians.

This year alſo a Ruſſian fleet of 16 or 18 ſhips entered the Mediterranean, and landed a body of troops on the Morea. Theſe being joined by the Greeks, committed great cruelties on the Turks and made themſelves maſters of almoſt the whole country. At laſt, however, the Porte, notwithſtanding their bad ſucceſs in other parts, found means to ſend a force into the Morea ſufficient to overpower the Ruſſians. The Greeks now ſuffered in their turn; and the Ruſſians, hearing that a Turkiſh fleet had paſſed the Dardanelles, abandoned the Morea, and failed to meet their antagoniſts. A battle enſued, in which the Turks were defeated; and having imprudently retired into a neighbouring harbour, they were next day entirely deſtroyed by the Ruſſian fireſhips, except one ſhip of 64 guns which was taken. This fleet conſiſted of 15 ſhips of the line, from 96 to 60 guns, three large frigates, and ſeven large armed veſſels, beſides galleys. After this victory the Ruſſian fleet blocked up the mouth of the Dardanelles, interrupted the Turkiſh trade, prevented the carrying of proviſions to Conſtantinople by ſea, and raiſed contributions from moſt of the iſlands in the Archipelago.

67 A Ruſſian fleet lands ſome troops on the Morea.

68 They deſtroy the Turkiſh fleet.

In 1771, matters did not at firſt go on ſo ſucceſsfully on the part of the Ruſſians. On the ſide of the Danube, they were obliged to keep on the defenſive. Another army, under prince Dolgorucki, had better ſucceſs; they reduced the whole peninſula of Crim Tartary in leſs than a month, though defended by an army of 50,000 men.—During theſe tranſactions the Turks made themſelves maſters of the fortreſs of Guirgewo; which enabled them to become ſo formidable on the ſide of Walachia, that prince Repnin durſt not attack them. Upon his refuſal to do ſo, he was deprived of his command; which was given to general Eſſen. On the 17th of Auguſt, he attacked the Turkiſh intrenchments; but, after a deſperate engagement of four hours, was defeated, with the loſs of upwards of 3000 men.

69 The Turks gain ſome advantages.

70 They take Giurgewo and defeat General Eſſen.

This was the only engagement of any conſequence in which the Turks had proved victorious ſince the beginning of the war; and, after it their uſual bad fortune attended them. In conſequence of their victory, they determined to winter on the northern ſide of the Danube, which would have been of the utmoſt ſervice to them; and with which view they conſiderably reinforced their army in Walachia. But general Romanzow, by a train of maſterly diſpoſitions, not only thwarted all their ſchemes, but ſurpriſed them on their own ſide of the river. They had divided their army into two great bodies, which were ſtationed in the neareſt and moſt important poſts on the Turkiſh ſide of the Danube. On the 20th of October, one of theſe bodies was ſurpriſed at Tuliza by general Wieſman, and another at Maczin by general Milarodowits. The event was the ſame in both places. The intrenchments were forced, the Turks totally routed, and their artillery, ſtores, and magazines taken, together with the two towns and their caſtles. Next day general Weiſman attacked the grand vizir himſelf, with the

71 Are outwitted by General Romanzow.

72 Two Turkiſh armies totally defeated.

like

Turkey.

like ſucceſs. The intrenchments were forced, a vaſt quantity of artillery taken, and likewiſe the town and caſtle of Babadagh; while the vizir, with the remains of his army, fled 30 miles to ſeek refuge at Mount Hemus. A few days afterwards general Eſſen defeated another body of Turks, and retook the fortreſs of Giurgewo, driving the enemy totally out of Walachia. The Ruſſian fleet this year ſpread ruin and deſolation through the defenceleſs iſlands of the Archipelago and the coaſts of Aſia, ſtriking terror into the city of Conſtantinople itſelf. A dreadful peſtilence raged this year in the Turkiſh army; and in the autumn broke out at Moſcow, where it deſtroyed vaſt numbers.

73 The grand vizir defeated, and driven beyond mount Hemus.

74 The Turks driven out of Walachia, &c.

The affairs of the Turks were now in ſuch a deſperate condition, that they very eagerly ſued for peace. The only conditions on which this could be obtained, however, were, that the Crimea, Budziac Tartary, and all that vaſt tract of country on the coaſt of the Black Sea, as far as the north ſhore of the Danube, ſhould continue for ever under the dominion of Ruſſia; that the Ruſſians ſhould enjoy an unlimited freedom of navigation on the Black Sea, together with the poſſeſſion of the city of Aſoph, on the mouth of the Don; and that a ſum of money ſhould be paid them by way of indemnification for the expences of the war. Theſe terms, however, were rejected; and the negotiations, which continued through the whole year 1772, at laſt came to nothing. The commiſſioners on both ſides retired from Buchareſt, the place where the congreſs was held, on the 22d of March 1773. For ſome time a deſultory kind of war was carried on between detachments from the two armies. But as this was very prejudicial to the Ruſſians, who could not be ſo eaſily recruited as the Turks, about the middle of June, Romanzow made preparations for paſſing the Danube with the grand Ruſſian army, conſiſting of 87,000 men: which, however, he did not accompliſh till the 24th; and then marched with his army, in large diviſions, towards the city of Siliſtria. He was terribly haraſſed on his march by large bodies of the Turkiſh cavalry, of whom the grand vizir had detached 27,000 for this purpoſe. At laſt, however, they arrived before the city, which was ſtrongly fortified, and defended by a body of troops conſiſting of about 24,000 men. On the 29th of June, this body was defeated by general Weiſman, who commanded the van of the Ruſſian army, and forced to retire into Siliſtria. The grand vizir then detached 50,000 men to the relief of the place: upon this the Ruſſians found it neceſſary to retreat; which was not accompliſhed without very great difficulty and loſs. In this retreat general Weiſman was killed, and the army left all their magazines behind them.

76 Negotiations broken off.

77 Romanzow paſſes the Danube.

78 A Turkiſh army defeated by General Weiſman,

79 Who is killed.

Many other ſevere conflicts happened this campaign, which proved leſs glorious to the Ruſſians than any of the former ones. In 1774, however, their arms were attended with better ſucceſs. Romanzow's army was reinforced by 40,000 men; and, on the night between the 16th and 17th of June, paſſed the Danube in ſpite of all oppoſition. A continued ſeries of engagements then happened between the Ruſſian generals and different bodies of the Turks. In theſe the latter were always defeated; and at laſt became ſo much diſpirited, that a body of 40,000, or, according to ſome accounts, of 70,000 Turks, fled at the firſt ſight of a body of their enemies greatly inferior in number, leaving behind them all their tents and baggage, with a fine train of braſs artillery. From this time, diſorder, mutiny, and diſmay, ſeized all the Turkiſh armies, and they abſolutely refuſed to face their enemies. They plundered the baggage, robbed and murdered their officers, deſerted by thouſands, taking the road to Conſtantinople, and committing every kind of outrage by the way. The miniſters of ſtate, after having tried all methods to induce this lawleſs crew to return to their duty, were obliged to furniſh them with veſſels for their tranſportation into Aſia. According to ſome accounts, no fewer than 140,000 of the turkiſh troops deſerted in this manner. Even in the grand vizir's camp at Schunla, matters went on in the ſame manner. He was abandoned by his whole cavalry; his European and Aſiatic troops quarrelled, and cut one another to pieces before his face; and, in ſhort, the vaſt army he commanded was reduced almoſt to nothing. The Ruſſian general did not fail to take advantage of theſe misfortunes. He placed the different diviſions of his army in ſuch advantageous ſituations, that he totally cut off all communication between the Turkiſh camp and every mean of ſubſiſtence. The unfortunate vizir, therefore, was obliged at laſt to ſubmit to the terms which Romanzow dictated to him. The principal articles were, the independency of the Crimea; the abſolute ceſſion of Kilburn, Kerche, and Jenickala, and all the country between the Bog and the Nieper; a free navigation in all the Turkiſh ſeas, in which was included the paſſage through the Dardanelles, with all the privileges and immunities which were granted to the moſt favoured nations. Ruſſia gave up all her conqueſts, except Aſoph and Taganrok. There were, beſides, ſeveral ſtipulations in favour of the inhabitants of Moldavia and Walachia, and the Greek iſlands which were reſtored by Ruſſia.

Turkey.

81 Almoſt the whole army deſerts.

82 Romanzow dictates terms of peace.

Soon after this period an extraordinary alarm was excited at the Porte by the ſudden appearance of a new prophet in Upper Aſia. This man, whoſe name was *Sheik Manſour*, pretended that he was predoomed by the eternal and immutable decrees of Heaven to fill up the meaſure of Divine revelation to mankind; and that as he was to be the laſt, ſo he was the greateſt of the prophets. The ſcene of his miniſtry was in the wide and deſolate regions on the borders of the Caſpian Sea; and though the firſt rumour of his proceedings repreſented him as at the head of a multitude of armed enthuſiaſts ready to overturn the eſtabliſhed government and the religion of Mahomet, it was ſoon diſcovered that all the military fury of his zeal was directed againſt the Chriſtians. He had even influence enough to form a combination of all the nations of Caucaſean Tartars againſt the Ruſſians, which was certainly of ſome ſervice to the Turks in that war, which the empreſs Catherine was now meditating againſt them.

83 Appearance of a prophet in Upper Aſia.

In the mean time, while this war was impending, the moſt formidable rebellion broke out in Egypt, the granary of the Turkiſh empire (ſee EGYPT, n° 125); but it was, after a long, bloody, and dangerous war, almoſt ſuppreſſed by the wiſe conduct and intrepid bravery of Haſſan Bey, the Captain Pacha or Grand Admiral, who, at the age of 70, fought with all the ardour of youth, and all the ſkill of the moſt conſummate general. That veteran, however, was recalled before he was able to carry all his patriotic deſigns into execution, that he might aid the divan with his counſel, in the critical ſituation into which the empire was brought by the arrogant claims of the court of Ruſſia. The reſult of the deliberations was a precipitate declaration of war againſt that court, contrary to the better judgment of the old Pacha. The war commenced in autumn 1787, and the hordes of Tartars which were firſt brought into the field, headed by the new prophet, were every where defeated by the ſuperior diſcipline of the Ruſſian troops commanded by prince Potemkin. Some enterprizes which were undertaken by the Turks againſt the iſland of Tamen and the Crimea were attended with as little ſucceſs as the attempts of the Tartars: while the emperor Joſeph declared to the Porte that he would aſſiſt his ally the empreſs of Ruſſia with an army of 80,000 men. Four Auſtrian armies were accordingly aſſembled; one at Carlſtadt in Croatia, under the command of general de Vins; another at Peterwaradin in Hungary, commanded by general Langlois; a third on the borders of Lithuania,

84 A rebellion in Egypt.

85 A new war with Ruſſia,

86 And Auſtria.

Turkey. thuania, under general Febris; and the fourth in the Buccowine, under the orders of the prince of Saxe-Cobourg. Two other generals, ten lieutenant-generals, and thirty major-generals, were all ordered to prepare for active ſervice in the frontier armies. If any thing had been yet wanting to ſhow the fixed determination of the court of Vienna, the meaſure of ſending general Alvinzi to act in and obſerve the conduct of the Ruſſian armies during the war, and the receiving a Ruſſian officer of equal rank to act the ſame part in the Auſtrian, would have been alone a ſufficient explanation.

87 The Turks at firſt ſucceſsful.

The war between the Turks and Auſtrians was carried on with various ſucceſs. At firſt the advantage was evidently on the ſide of the Ottomans, and the imperial Joſeph acquired no warlike renown. His declared purpoſe was to get poſſeſſion of Belgrade; from which however his enemies repulſed him with diſgrace. The prince of Saxe-Cobourg in his department of the war diſplayed indeed prodigies of valour; but being oppoſed to a ſuperior force, he was long obliged to act only on the defenſive. At length, being joined by a body of Ruſſian forces under general Soltikow, preparations were made for commencing in form the ſiege of Choczim, which was ſurrendered to the allied armies on Michaelmas day 1788, after a defence which would have done honour to the ableſt general in Europe. Still, however, ſucceſs ſeemed to lean to the Turks. The grand vizir made a ſudden incurſion into the Bannat, and ſpread conſternation and diſmay to the very gates of Vienna. The Auſtrian affairs ſeemed approaching to a very alarming criſis; not only the ſplendid views of conqueſt which were beheld in the imagined partition of a tottering empire had totally diſappeared, but had left in their place the ſad and gloomy reverſe of a diſcontented and impoveriſhed people, an exhauſted treaſury, and an army thinned by peſtilence and deſertion. The firſt campaign of an invaſive war had already produced an impreſſion on the territory of the invader.

88 General Laudohn takes the command of the Auſtrian army.

In this ſituation of affairs Marſhal Laudohn was with ſome difficulty drawn from his retirement to take the command of the army in Croatia; and under his auſpices fortune began to ſmile on the Auſtrian arms. He quickly reduced Dubicza and Nevi, though they were both defended with the moſt obſtinate bravery. He then ſat down before Turkiſh Gradiſca; but the autumnal rains coming on with ſuch violence that the Saave overflowed its banks, he was compelled to raiſe the ſiege. During this period the war in the Bannat raged with the utmoſt violence; torrents of blood were ſhed on both ſides; much deſperate valour diſplayed on the one ſide, and many brave actions performed on the other; while a very great part of that fine but unfortunate country ſuffered all the deſolation and ruin that fire and ſword, under the dominion of vengeance and animoſity, could inflict. The inhabitants were objects of commiſeration; but the injuſtice with which the emperor had commenced the war made his perſonal loſſes be conſidered as nothing more than the due reward of his conduct.

Hitherto the Ruſſians had hardly entered into the war; but at laſt they began to act with vigour both by ſea and land. They experienced however a very general coldneſs with reſpect to their claims, pretenſions, and deſigns, in almoſt all the courts of Europe. The court of London prohibited Britiſh ſeamen from entering into foreign ſervice, and declared its reſolution to obſerve the ſtricteſt neutrality. The united provinces of Holland purſued the ſame line of conduct; and ſome of the ambitious views of Ruſſia were thus blaſted. It the mean time a vaſt Ruſſian army, eſtimated at 150,000 men, appeared on the banks of the river Bog, adjoining to the confines of Poland, Turkey, and Tartary, and on the way to the Black Sea, under the orders of prince Potemkin and general Romanzow; theſe being aſſiſted by prince Repnin, general Soltikow, and other commanders of note. This great force was ſupported by a field train of 137 pieces of artillery, beſidesa vaſt park of heavy battering cannon and mortars, deſtined for the ſiege of Oczakow; and furniſhed with that exuberance of powder, ball, ſhells, and all manner of military machines, which are the uſual concomitants of a Ruſſian army. After the moſt obſtinate defence, Oczakow was taken on the 17th of December 1788, and the governor baſha graced the triumphant return of prince Potemkin to Peterſburgh. In the mean time Ruſſia found herſelf attacked by a new and formidable enemy in the Swediſh monarch, of whoſe exploits we have given an account elſewhere (ſee SWEDEN, n° 246.); and by his interference her conqueſts were certainly retarded. Turkey.

89 Ruſſians take Oczakow.

Marſhal Laudohn renewed his attempts upon Gradiſca as ſoon as the ſeaſon would permit, and after a brave defence it fell into his hands. This with ſome other ſucceſſes rouſed the emperor from his inactivity, and made him ſeriouſly determine upon the attack which he had long meditated upon Belgrade. The enterprize was entruſted to Laudohn, who, with that good fortune which ſeemed conſtantly to attend him, made himſelf maſter of the place in leſs than a month. The reſt of the campaign was little elſe than a ſucceſſion of the moſt important ſucceſſes; and a circumſtance that did not a little contribute to this, was the ſyſtem adopted by the Auſtrians and Ruſſians, of ſuffering the Turkiſh troops to march out of the ſeveral places they garriſoned without moleſtation. Accordingly, while one detachment of general Laudohn's forces took poſſeſſion of Czernitz in Walachia, another made itſelf maſter of Cladova in Servia. Buchareſt, the capital of the former of theſe provinces, fell without oppoſition into the hands of prince Cobourg: while Akerman on the Black Sea was reduced by the Ruſſians; and Bender ſurrendered to prince Potemkin, not without ſuſpicion of ſiniſter practices, on the 15th of November.

90 Gradiſca and Belgrade taken by Laudohn.

Soon after this, the emperor Joſeph died, and his ſucceſſor Leopold ſhowed a deſire for peace. After the reduction of Orſova, therefore, which happened on the 16th of April 1790, the war was carried on with languor on the part of Auſtria; and in the month of June a conference was agreed upon at Reichenbach, at which the miniſters of Pruſſia, Auſtria, England, and the United Provinces, aſſiſted, and at which alſo an envoy from Poland was occaſionally preſent. After a negotiation, which continued till the 17th of Auguſt, it was agreed that a peace ſhould be concluded between the king of Hungary and the Ottoman Porte; that the baſis of this treaty ſhould be a general ſurrender of all the conqueſts made by the former, retaining only Choczim as a ſecurity till the Porte ſhould accede to the terms of the agreement, when it was alſo to be reſtored. Catherine was thus deprived of an ally, but ſtill ſhe continued the war. On the 22d of December 1790, the fortreſs of Iſmail was taken by ſtorm by general Suwarrow; and it is ſaid that the ſiege and the capture did not coſt the Ruſſians leſs than 10,000 men. The moſt ſhocking part of the tranſaction is, that the garriſon (whoſe bravery merited, and would have received from a generous foe, the higheſt honours) were maſſacred in cold blood by the mercileſs Ruſſians, to the amount of, by their own account, upwards of 30,000 men; and the place was given up to the unreſtrained fury of the brutal ſoldiery. After this bloody ſcene, the Ruſſians went into winter quarters; the vizir retired towards Conſtantinople, and on his return fell a ſacrifice to the ſanguinary policy which has long diſgraced the Ottoman counſels.

91 The emperor dies, and his ſucceſſor concludes a peace.

92 Succeſs of the Ruſſians.

The campaign of 1791 opened on the part of Ruſſia with the taking of Maczin, on the 4th of April, by prince Gallitzin; and in a ſubſequent victory on the 12th by the ſame general, in the neighbourhood of Brailow, the Turks loſt not

leſs

Turkey.

less than 4000 men and upwards of 100 officers, besides many pieces of cannon. On the 14th the Russian arms experienced a check, by which they lost about 700 men, and were obliged to relinquish the intention of besieging Brailow. After reinforcing this place, the vizir proceeded to the banks of the Danube near Silistria; and, by means of a bridge which he threw across the river, his advanced posts were enabled to make incursions on the opposite side. The ability of the vizir and the valour of the Turks were however exerted in vain against the discipline and experience of European armies. In the month of June, 15,000 Turks were defeated by a party of cavalry under general Kutusow. On the 3d of July the fortress of Anape was taken by general Gudowitsch, and the garrison, to the amount of 6000 men, made prisoners. This event was followed, on the 9th of the same month, by a signal victory which prince Repnin obtained near Maczin over a body of 70,000, the flower of the Turkish army. The Ottomans left upwards of 4000 dead upon the field of battle, and lost their entire camp equipage, colours, and 30 pieces of cannon. The Russians are said to have lost only 150 men killed, and between 200 and 300 wounded. At last peace was restored between the Porte and Russia, principally through the mediation of Great Britain and the northern powers. Catherine, who talked high at first, confined her views at length to the possession of Oczakow, with the district extending from the Bog to the Niester, and even then providing for the free navigation of the latter river. These terms, considering the ill success of the war, cannot be accounted very disadvantageous to the Porte, who has lost a fortress more useful for the purpose of annoying Russia than for defending their own territories; but certainly of considerable importance to Russia, which, by this cession, has secured the peaceable enjoyment of the Crimea.

93 Peace is at last concluded.

94 Account of the Turkish dominions.

The Turkish empire comprehends several countries in Europe, Asia, and Africa. In Europe it is bounded on the south by the Mediterranean; on the north by Croatia, Sclavonia, and Transylvania; on the east by Poland, Russia, and Asia; and on the west by the Adriatic and Dalmatia. The principal countries of Turkey in Europe are Romania, Bulgaria, Servia, Walachia, Moldavia, Bessarabia, Greece, Macedonia, Albania, Thessaly, Levadia, Morea, and the Archipelago islands. Turkey in Asia is divided into Eastern and Western. The eastern comprehends Georgia, Turcomania, and Diarbekr: and the Western, Anatolia, or Asia Minor, Syria, and Palestine.—In Africa the Turkish dominions are Egypt, and some districts of Barbary. But for an account of these different countries, see the articles as they occur in the order of the alphabet.

95 Of the government, &c. in Turkey.

The grand signior, or emperor of the Turks, is restrained by no laws or compacts, the government being purely monarchical: but if he indulges not the humours of the people, and especially of the mutinous janisaries, he is in danger not only of being deposed, but also of being put to death. Those who have offices under the government he squeezes, disgraces, and puts to death, upon the least suggestion of their disaffection or misconduct, without giving them an opportunity of answering for themselves, they being looked upon as more immediately his slaves: but others seem to enjoy almost as great a degree of security, both in their persons and properties, as the subjects of other absolute monarchies. Indeed, in all such there is a gradation of governors and officers, of which the higher fleece and oppress those below them, and the lowest make reprisals upon the common people. In the succession to the empire, no regard is paid to age or birthright, the Turks thinking it sufficient if, in their elections, they keep to the family. Women are excluded from the throne. The emperor's council is either ordinary or extraordinary. The first, meeting every Sunday and Thursday, consists of the great officers of state, and is called the *galibe divani*. To the other, which is called *ajack divani*, are summoned all the great persons and officers of the empire, and even the oldest and most experienced soldiers. The sultan hears what passes from an adjoining chamber. At the head of the ministry is the grand vizir, who is as it were his lieutenant-general, with whom he divides, or rather to whom he leaves, the care of the whole empire; he being entrusted not only with the finances, with foreign affairs, and the administration of justice in civil and criminal matters, but also with the conduct of the war, and the command of the army. Great and dangerous as this charge is, there have been men who have executed it with safety and success both in peace and war, and have died quietly in their beds; but that is not the case with the most of them, it being the usual policy of the emperors to shelter themselves from the clamours of the people by throwing the whole blame of any mal-administration upon him, and giving him up to the public resentment. His income, without any breach of probity, may amount to 600,000 dollars, exclusive of presents and other perquisites. Notwithstanding his high dignity, his palace is open to every one, and he gives audience to the meanest of the poor. When the sultan names a grand vizir, he puts into his hand the seal of the empire; and when he honours him with the command of an army, he takes out one of the plumes of his own turban at the head of the troops, and delivers it to him to place it in his own. The other great officers of state are the kaimakan, or vizir's deputy, not to be confounded with the governor of Constantinople, who is also called *kaimakan;* the vizirs of the bench, or bashas of three horse-tails, because three horse-tails are carried before them when they march, and who sit in the divan or courts of justice with him; the kadinlasquiers, or chief justices of provinces; the beiglerbegs or viceroys, of which the chief are those of Romelia, Natolia, and Damascus; the ordinary bashas or governors of towns and districts under the beiglerbegs; the reis effendi, or lord chancellor and secretary of state; the testerder or high treasurer; the aga of the janisaries; the aga of the spahis; the aga of the siluds, &c. The chief officers of the seraglio are the kislaragasi, who is superintendant of the women, and has the command of all the black eunuchs; the capi aga, who has the command of all the white eunuchs, and to whom all petitions to be presented to the prince are delivered. Both these are also eunuchs, and of the same complexion as those of whom they have the command. Besides the women and eunuchs, there are in the seraglio the ichoglans and azamoglans, mutes, dwarfs, and buffoons. The ichoglans are young men bred up in the seraglio, not only to serve about the prince, but to fill in time the first posts of the empire. The azamoglans are trained up there for inferior employments.

No children are admitted into the seraglios of Constantinople, Pera, or Adrianople, till they are first reviewed and approved of by the grand signior. They are generally the most beautiful, well-made, and sprightly, that can be met with. They are first taught, after being circumcised, silence and a modest humble behaviour. Then they are instructed in the Mohammedan religion, to speak and write the Turkish language, and afterwards the Persian and Arabic. As they grow up, they are taught manly exercises, and whatever is thought requisite to qualify them for state-employments: but they are seldom preferred out of the seraglio until the age of 40.

The ladies of the haram are a collection of young beautiful virgins, either the presents of governors, purchased, or captives taken in war; most of them being the children of Christian parents. They are taught music, dancing, and other accomplishments, and furnished with the richest clothes

Turkey. and ornaments. Some of them frequently play and dance before the grand ſignior, while others divert him with their converſation. They have a great many female ſlaves to wait on them; but are ſcarce ever ſuffered to go abroad, except when the grand ſignior changes his place of reſidence; when a troop of black eunuchs convey them to the boats, which are encloſed with lattices: and when they go by land, they are put into cloſe chariots, and ſignals made at certain diſtances, to give notice that none may approach the road through which they are to paſs.

96 Dreſs, manners, &c. of the Turks.

The Turks are generally robuſt and well-ſhaped, of a good mien, and patient of hardſhips, which render them fit for war. They ſhave their heads; but wear their beards long, except the military and thoſe in the ſeraglio, who wear only whiſkers. They cover their heads with a white linen turban of an enormous ſize, and never pull it off but when they ſleep. None but Turks muſt preſume to wear a white turban. Their breeches or drawers are of a piece with their ſtockings; and they have ſlippers inſtead of ſhoes, which they pull off when they enter a temple or houſe. They wear ſhirts, with wide ſleeves, not gathered at the wriſts, and over them a veſt tied with a ſaſh; their upper garment being a looſe gown, ſomething ſhorter than the veſt.

The women's dreſs pretty much reſembles that of the men; only they have a ſtiffened cap with horns, ſomething like a mitre, on their heads inſtead of a turban, and wear their hair flowing down. When they go abroad, they are ſo wrapped up, that their faces cannot be ſeen.

The Turks ſit, eat, and ſleep, according to the cuſtom of the eaſt, on ſophas or cuſhions, mattreſſes, and carpets. Rice is their moſt general food, and coffee their common drink. Their moſt uſual ſalutation is to bow the head a little, laying the right-hand on their breaſts; but to perſons of rank they ſtoop ſo low as to touch the border of their veſt. The women are kept under a rigorous confinement. They have generally delicate ſkins, regular features, black hair and eyes, with an admirable cheſt. Many of them are complete beauties. Their cleanlineſs is extraordinary; for they bathe twice a-week, and ſuffer not the ſmalleſt hair or the leaſt ſoil to be upon their bodies. As to the qualities of their minds, they are ſaid to want neither wit, vivacity, nor tenderneſs; and to be exceeding amorous. It is no doubt for this reaſon that the men never ſuffer their wives faces to be ſeen, not even by the deareſt friend they have in the world.

There is no need of much wit to behave one's ſelf well here; for a good mien and gravity ſupply the place of merit in the eaſt, and much gaiety would ſpoil all. Not that the Turks want wit; but they ſpeak little, and pride themſelves in ſincerity and modeſty more than eloquence. The Turks uſe no unneceſſary words, whereas the Greeks talk inceſſantly. Though theſe two nations are born under one climate, their tempers are more different than if they lived in the moſt diſtant countries. The Turks make profeſſion of candour and faithfulneſs, and are a charitable good-natured people, jealouſy excepted, and very ſober. On the other-hand, they are extremely proud, inſolent, indolent, ſuperſtitious, and covetous. They are alſo much addicted to unnatural luſt; and deſpiſe all other nations in general, eſpecially thoſe which are not of their religion. The common appellation that they give the Chriſtians is that of dogs. An uniformity runs through all the actions of the Turks, and they never change their manner of living. They ſeem to have no kind of genius for the improvement of the arts and ſciences, though they live under the influence of the ſame heaven, and poſſeſs the ſame countries, as the ancient Grecians did. They generally loiter away their time, either among the women in the haram, or in ſmoking or taking opium; and though they herd together, you will obſerve as little converſation among them as amongſt ſo many horſes in a ſtable. They ſeldom travel, or uſe any exerciſe or rural ſports; and diſcover little or no curioſity to be informed of the ſtate of their own or any other country: but Turkey, after all, is not without men of parts, probity, and honour; nor without benevolent, liberal, converſible, and ingenious people. They behave very commendably to their ſlaves and ſervants, and frequently better than the Chriſtians do to theirs. There are no hereditary governments or titles of nobility in Turkey; and indeed the commonalty there enjoys the greateſt liberty. Turkey.

97 Languages and learning.

The languages ſpoken in Turkey in Europe are the Turkiſh and Tartarian, which have a great affinity to one another; the modern Greek, which differs widely from the ancient; the Sclavonian, and Walachian. The Arabic is the language of the learned. Learning is at a very low ebb among the Turks: however, they have ſome ſchools, colleges, and academies; but they are on a very different footing from thoſe among us. Not many years ſince a printing-houſe was ſet up at Conſtantinople, where books of all kinds were allowed to be printed, except on matters of religion. The moſt ingenious Muſſelmen employ themſelves in reading the Alcoran and the commentators upon it, to which almoſt all their learning is confined. Some of them amuſe themſelves with poetry, in which they are ſaid to ſucceed very well. Other Turks delight in muſic, and ſpend the whole day in playing upon an inſtrument, without being tired, though they only repeat the ſame tune. It is ſaid there are a great many manuſcripts in the Turkiſh, Arabian, and Perſian languages, among the Turks; but it is not to be ſuppoſed that they contain any very deep, ſolid, ingenious, or uſeful learning.

98 Forces.

The Turkiſh regular troops are the ſpahis and timar-ſpahis, who are light-horſe. The latter, who have eſtates in land aſſigned them inſtead of pay, are obliged to bring a certain number of ſlaves into the field with them. The tributary princes of Moldavia and Walachia, and the Crim Tartars, are alſo obliged to ſend auxiliaries. But the flower of the Turkiſh army conſiſts of the janiſaries, who amount to about 40,000, and are all infantry. They have particular privileges, being ſubject to no juriſdiction but that of their aga or commander. Their pay is three aſpers a-day, beſides victuals, and a ſuit of clothes every year. They are all lodged at Conſtantinople together in a ſort of barracks, having been educated in the ſeraglio, and trained up to the exerciſe of arms from their infancy. Beſides the janiſaries, there is another body of foot called *capis*. The whole Turkiſh army, regulars and irregulars, amounts to above 300,000 men. Beſides the true janiſaries, or janiſaries of the porte, and in actual pay, there are great numbers all over the empire, who procure themſelves to be regiſtered in this body, in order to be entitled to their privileges. The bachelors only are capable of bearing offices in the barracks or chambers at Conſtantinople. When any of the janiſaries are diſabled in the ſervice, they have an allowance for life. To diſtinguiſh them, they wear a cap of a particular make. The emperor's guards are compoſed of them, and they are feared and reſpected every where, though they carry only a cane in their hand; for arms are not delivered to them but when they take the field. The chief commanders of the army are diſtinguiſhed by two or three horſe-tails carried before them. The Turkiſh navy is not ſo conſiderable as might be expected in ſuch extenſive dominions, ſituated on ſeveral ſeas, and abounding in commodious harbours. By their neglecting navigation and foreign commerce, they can never find ſailors to man a great fleet; and thoſe they have are unſkilful, as well as their pilots and officers. If they would

Turkey. would apply themſelves to navigation, and make the moſt of their ſituation and advantages, they could not fail to become a very formidable maritime power. Their navy generally conſiſts of about 40 large ſhips, excluſive of galleys. In time of war they hire or buy merchant-ſhips, and others are ſent them from Algiers, Tunis, and Tripoli. The captain-baſha, or admiral, is the ſecond officer in the empire, the grand vizir being the only officer above him. His power is abſolute when he is out of the Dardanelles; and not only the ſea-officers, but all the governors of the maritime provinces, receive orders from him. The pilots are moſtly Greeks, and the captains renegadoes. The captain-baſha ſails round the Archipelago, in ſummer, to collect the capitation-tax, and learn the ſtate of affairs in thoſe parts.

The revenues of the empire are paid either into the public treaſury, or into the ſultan's private treaſury. The former, called by the Turks *deitalmali muſlimim*, i. e. *the public money of the Muſſulmen*, is not to be touched but on the moſt preſſing exigency of the ſtate. The other the ſultan may diſpoſe of at pleaſure. Prince Cantimir ſays, in his time, 27,000 purſes, amounting to 13,000,000 and a half of crowns, were annually returned to both treaſuries; ariſing from the produce of the cuſtoms, demeſne lands, the capitation or tax paid by every ſubject of the empire who is not of the Mahometan religion; the annual tributes paid by the cham of the Crim Tartars, the princes of Moldavia, Walachia, the little republic of Raguſa, and part of Mingrelia; together with half a million of money out of a million and a half levied annually in Egypt. Theſe are the fixed revenues: but vaſt ſums are alſo raiſed by the confiſcations of the eſtates and effects of the baſhas and other officers, and from the eſtates of Turks dying without male iſſue.

The manufactures and commodities of Turkey are, ſilks, carpets, goat's hair, wool, camel's hair, cotton-yarn, dimity, burdets, waxed linen, ſhagreen-ſkins, blue, red, and yellow Morocco leather; coffee, rhubarb, turpentine, ſtorax, gums, opium, galls, maſtic, emery, lemnian bole, pomegranate-ſhells, ſponges, dates, almonds, wine, oil, figs, raiſins, mother-of-pearl, boxwood, ſaffron, &c. Theſe are exported in large quantities by the ſeveral European trading nations, who import their own goods and purchaſe thoſe of the country. The inland trade is carried on chiefly by the Jews and Armenians; and even the Turks ſend merchandiſe, both by land and water, from one part of the empire to another, but not to foreign Chriſtian countries. No nation is more advantageouſly ſituated for traffic than the Turkiſh; having the navigation of the Black Sea, the Levant, and the Red Sea; and conſequently greater opportunities of importing the rich merchandiſes of the Eaſt, and diſtributing them all over Europe, than any maritime power: but they never attempt diſtant voyages, and have but few merchant-ſhips, both their imports and exports being chiefly made in foreign bottoms. Tyre, Sidon, and Alexandria, which once commanded the navigation and trade of the world, are in their poſſeſſion, but make no figure in commerce at this day: and well it is for the Chriſtians that the Turks are ſuch an indolent generation; for their ſituation and vaſt extent of empire would enable them to monopolize the trade of the world, if they attended to it. Several European Chriſtian nations have envoys and reſidents at Conſtantinople, and conſuls in other ports. In this empire there is a great trade in the human ſpecies: not only male ſlaves, but beautiful young girls, being publicly bought and ſold.

The empire is ſtyled the Ottoman kingdom or empire, the Ottoman Porte, the Sublime Porte, the Sublime Sultanian Porte, &c. The appellation of *Porte* is ſaid to be derived from the large gate built by Mohammed II. at the entrance of the ſeraglio at Conſtantinople; though the Orientals in general call a royal palace the *king's porte* or *gate*. Turmeric ‖ Turning.

TURMERIC, in botany. See CURCUMA.

TURNEBUS (Adrian), an eminent French critic, was born in 1512. His true name was Turnbull. He was the ſon of a Scotchman, an officer in the Scotch troop of guards, who married a Norman lady. The ſon, who is the ſubject of this article, changed his name into Tourneboeuf; but this name giving occaſion for puns, he varied it to Turnebe, in Latin Turnebus. He acquired ſo extenſive a reputation by his learning, that he had great offers made him from Italy, Germany, and England; but we are told he preferred poverty in his own country to riches in any other. He taught polite literature firſt at Toulouſe; but in 1547 went to be Greek profeſſor at Paris, whither his name drew ſcholars to him from all parts of Europe: in 1552, he took upon him the care of the royal Greek preſs for three years, when he quitted it on being admitted into the number of royal profeſſors. He died in 1565; and his works, which are all in Latin, were printed at Straſburg, in one vol. folio, 1600. His *Adverſaria*, 3 vols. folio, had been printed at Paris before.

TURNEP, in botany, a ſpecies of BRASSICA. For the culture of them, ſee AGRICULTURE, n° 151.

Turnep-Bread. See BREAD.

Turnep-Fly. See CHRYSOMALA.

TURNING, the art of forming hard bodies, as wood, ivory, iron, into a round or oval ſhape by means of a machine called a *lathe*.

This art was well known to the ancients, and ſeems to have been carried by them to a very great degree of perfection; at leaſt, if we believe the teſtimony of Pliny and ſeveral other authors, who tell us, that that thoſe precious vaſes enriched with figures in *half-relief*, which ſtill adorn our cabinets, were turned on the lathe.

The art of turning is of conſiderable importance, as it contributes eſſentially to the perfection of many other arts. The architect uſes it for many ornaments, both within and without highly finiſhed houſes. The mathematician, the aſtronomer, and the natural philoſopher, have recourſe to it, not only to embelliſh their inſtruments, but alſo to give them the neceſſary dimenſion and preciſion. In ſhort, it is an art abſolutely neceſſary to the goldſmith, the watchmaker, the joiner, the ſmith.

Turning is performed by the lathe, of which there are various kinds, and ſeveral inſtruments, as gouges, chiſels, drills, formers, ſcrew-tales, uſed for cutting what is to be turned into its proper form as the lathe turns round. One of the moſt ſimple kinds of lathe is repreſented in Plate DXI. fig. 1. in which *a* is the footſtool, *b* the cord, *c* the frame of the lathe, *d d* the puppets, *e e* the points, *f* the ſpanging-tree.

The lathe ſhould be fixed in a place very well lighted; it ſhould be immoveable, and neither too high nor too low. The puppets ſhould neither be ſo low as to oblige the workman to ſtoop in order to ſee his work properly, nor ſo high that the little chips, which he is continually driving off, ſhould come into his eyes.

The piece to be turned ſhould be rounded (if it be wood) before it be put on the lathe, either with a ſmall hatchet made for the purpoſe, or with a plane, or with a file, fixing it in a viſe, and ſhaving it down till it is everywhere almoſt of an equal thickneſs, and leaving it a little bigger than it is intended to be when finiſhed off. Before putting it on the lathe, it is alſo neceſſary to find the centres of its two end ſurfaces, and that they ſhould be exactly oppoſite to each other, that when the *points* of the puppets are applied

to

Turning. to them, and the piece is turned round, no ſide may belly out more than another. To find theſe two centres, lay the piece of wood to be turned upon a plank; open a pair of compaſſes to almoſt half the thickneſs of the piece; fix one of the legs in the plank, and let the point of the other touch one of the ends of the piece, brought into the ſame plane with the plank on which the compaſſes are fixed and very near the fixed leg. Deſcribe four arches on that end at equal diſtances from each other at the circumference of the end, but interſecting one another within; the point of interſection is the centre of the end. In the ſame manner muſt the centre of the other end be found. After finding the two centres, make a ſmall hole at each of them, into which inſert the points of the puppets, and fix the piece ſo firmly as not to be ſhaken out, and yet looſe enough to turn round without difficulty.

The piece being thus fixed, it is neceſſary in the next place to adjuſt the cord, by making it paſs twice round the piece, and in ſuch a manner that the two ends of the cord, both that which is fixed to the *ſpang* and to the *foot-board*, come off on the ſide on which the turner ſtands, that the piece may move againſt the edge of the cutting-tool and be turned. If the lathe be moved by a wheel, the manner of adjuſting the cord needs no directions.

If the workman does not chooſe to be at trouble to find the two centres of the piece in the manner deſcribed above, let him lay, as nearly as he can, the centre of one end upon the *point* of the left hand *puppet*, and then let him puſh forward the right hand puppet, ſtriking it with a mallet till its point is as near as he can in the centre of the other end of the piece; and then fixing the right hand puppet by a gentle blow of the mallet on the key, let him turn round the piece to ſee by the eye if the centres have been properly found. If any part of it bellies out, let him ſtrike that part gently with the mallet till it goes properly; then let him ſtrike one of the puppets pretty ſmartly to drive the points into the piece, and afterwards fix the puppet by ſtriking the key. If the workman cannot judge by the eye whether the piece be turning properly round its centres or not, he ſhould apply gently the point of an inſtrument called a *triangular graver*, leaning it on the *reſt*, and it will mark by a line the place where the piece is out of its centre; and by ſtriking upon this line with a mallet, the piece can eaſily be placed properly. The *reſt*, of which we have juſt ſpoken, ought to be placed upon the two arms of the lathe, and fixed with ſcrews as near the piece as the workman pleaſes.

The piece being fixed between the two points of the puppets (or, as they are called in Scotland, the *heads*), the cord adjuſted, and the *reſt* fixed as near the work as poſſible without touching it; the workman is now to take a *gouge* (fig. 2. in which *a* is the mouth and *b* the handle) of a proper ſize in his left hand, and hold it by the handle a little inclined, keeping the back of the hand lowermoſt. With his right hand, the back of which is to be turned upwards, he is to graſp it as near the end as poſſible on this ſide of the *reſt*; then leaning the gouge on the *reſt*, he is to preſent the edge of it a little higher than the horizontal diameter of the piece, ſo as to form a kind of tangent to its circumference; then putting the right foot on the foot-board, and turning round the wheel, and holding the gouge firmly on the *reſt*, the piece will be cut neatly. In the ſame manner are the chiſels, formers, and other inſtruments to be uſed, taking care that the wood be cut equally, and that the inſtrument be not puſhed improperly, ſometimes ſtronger than at others; and taking care alſo that the inſtrument uſed do not follow the work, but that it be kept firmly in the hand without yielding.

The young turner ought to endeavour to acquire the management of the gouge and the chiſel, which are the inſtruments by far the moſt frequently uſed, and the moſt neceſſary in this art: by them, almoſt entirely, are the ſoft woods *turned*; for as for hard woods and other things, as box, ebony, horn, ivory, and the metals, they are hardly ever turned except by *ſhaving off*. In that caſe gravers are to be uſed with ſquare, round, or triangular mouths (fig. 3, 4, 5.). They ſhould be held horizontally while applied to the wood, and not obliquely as directed for the gouge and the chiſel. Turning.

After the work is completely turned, it is next to be poliſhed; and this cannot be done with the inſtruments hitherto mentioned. Soft woods, as pear-tree, hazle, maple, ought to be poliſhed with ſhark-ſkin or Dutch ruſhes. There are different ſpecies of ſharks; ſome of which have a greyiſh, others a reddiſh ſkin. Shark-ſkin is always the better to be a good deal uſed; at firſt it is too rough for poliſhing. The *Dutch-ruſh* is the *equiſetum hyemale* of Linnæus, which grows in moiſt places among mountains, and is a native of Scotland; it has a naked, ſimple, round ſtem, about the thickneſs of a writing pen. The oldeſt plants are the beſt. Before uſing them they ſhould be moiſtened a little, otherwiſe they break in pieces almoſt immediately, and render it exceedingly difficult to poliſh with them. They are particularly proper for ſmoothing the hard woods, as box, lignum vitæ, ebony, &c. After having cleaned up the piece well, it ſhould be rubbed gently either with wax or olive-oil, then wiped clean and rubbed with its own raſpings or with a cloth a little worn. Ivory, horn, ſilver, and braſs, are poliſhed with pumice-ſtone finely pounded and put upon leather or a linen cloth a little moiſtened: with this the piece is rubbed as it turns round in the lathe; and to prevent any dirt from adhering to any part of it, every now and then it is rubbed gently with a ſmall bruſh dipt in water. To poliſh very finely, the workmen make uſe of tripoli, a particular kind of earth, and afterwards of putty or calx of tin. Iron and ſteel are poliſhed with very fine powder of emery; this is mixed with oil, and put between two pieces of very tender wood, and then the iron is rubbed with it. Tin and ſilver are poliſhed with a burniſher and that kind of red ſtone called in France *ſanguine dune*. They may be poliſhed alſo with putty, putting it dry into ſhammy-ſkin, or with the palm of the hand.

To ſucceed in turning iron, it is neceſſary to have a *lathe* exceedingly ſtrong in all its parts, and exceedingly well fixed. The puppets ſhould be ſhort, and the *reſt* well fixed very near the work: the back of the reſt ſhould be two or three lines lower than the iron to be turned.

The lathe and other inſtruments being prepared, it is neceſſary to determine the length and thickneſs of the iron to be turned according to the deſign which is to be executed, and to make a model of it in wood a little thicker than it ought to be: Then one exactly like this is to be forged of the beſt iron that can be procured; that is to ſay, it muſt not be new, but well prepared and well beaten with hammers; it muſt have no flaws, nor cracks, nor pimples. New iron, which has not been well beaten, often contains round drops of caſt iron, called by the workmen *grains*, which blunt the edges of the gouges, chiſels, and other inſtruments uſed for cutting; break them, or make them ſlide. The iron being forged according to the model, it ſhould be annealed, that is, heated red hot and allowed to cool ſlowly on the coals till the fire go out of itſelf. Some people, to ſoften the iron, cover it over with clay and allow it to cool. The iron cylinder being thus made, it is next to be put upon the lathe, finding the centres as formerly directed, and boring a ſmall hole in them that the iron may not eſcape from the points.

The

Turning. The points ſhould be oiled from time to time to prevent their being exceſſively heated and ſpoiled while the iron is turning. A *crotchet* is then to be applied to the iron to be turned, a little above its centre, pretty gently, and by this means the inequalities of the cylinder will be taken off. Other inſtruments are then to be applied to mould the iron according to the model; and whenever any of them grow hot, they are to be plunged into a baſon of water lying beſide the workman. If the iron, after being properly turned, is to be bored like a gun-barrel, one of the puppets is to be removed and another ſubſtituted in its place, having a ſquare hole through it, into which the collar of the iron is to be fixed firmly, ſo as not to ſhake; then borers are to be applied, like thoſe which lockſmiths uſe to bore keys; and beginning with a ſmall one, and afterwards taking larger ones, the hole is to be made as wide and deep as neceſſary; great care muſt be taken to hold the borers firm on the *reſt*, otherwiſe there is danger of not boring the hole ſtraight. The borer muſt be withdrawn from time to time to oil it and to clean the hole. Since it is difficult to make a hole quite round with borers alone, it is neceſſary to have alſo an inſtrument a good deal ſmaller than the hole, one of the ſides of which is ſharp, very well tempered, and a little hollow in the middle. This inſtrument being fixed in a pretty long handle, is to be applied with ſteadineſs to the inner ſurface of the hole, and it will entirely remove every inequality that may have been there before its application.

We ſhall now deſcribe the manner of cutting a ſcrew upon our cylinder. Some perſons make uſe of an inſtrument, conſiſting principally of a female ſcrew, for this purpoſe: but this is rather an improper inſtrument; for if one preſſes too violently, or inclines it ever ſo little to the right or left, he runs the greateſt riſk of ſpoiling the ſcrew. To avoid this danger, ſome perſons uſe it only to trace out the lines of the ſcrew, and afterwards finiſh it with a file. But there is a much better way of cutting a ſcrew; and it is this. Take a tap for making a female ſcrew, the threads of which have been cut very accurately, and exactly of the ſize of the ſcrew which you want; and having put it in the opening which you have traced in the collar of the axis on which the ſcrew is to be cut, ſolder it with tin, ſal-ammoniac, and roſin, as exactly correſponding to the axis as poſſible. Take then a puppet with a hole cut into a correſponding female ſcrew, into which the male ſcrew is to be put. The axis on which the ſcrew is to be cut muſt be placed exactly horizontally between the two puppets. The *reſt* is then to be brought as near as poſſible to the place where the ſcrew is to be cut, and a ſmall hollow ſhould be cut in that part of it which is exactly oppoſite to the place where the ſcrew is to be cut, to hold your inſtrument firmly and prevent it from ſhaking. The inſtrument with which the ſcrew is to be cut ſhould be very ſharp, and its point ſhould make an angle of 60° with the ſcrew to be cut; and if you wiſh the ſcrew to be cut very deep, it ſhould make an angle a little larger. The lathe being now put in motion, the tap fixed at the end of the axis will move gradually through the female ſcrew in the puppet; and your inſtrument in the mean time will trace a ſimilar male ſcrew on the axis fixed in the lathe. Many perſons, after having in this manner drawn the outlines of the ſcrew, finiſh it with a ſcrew-tale of three teeth correſponding exactly to the ſize of the ſcrew, or with a triangular file: but this laſt method is rather improper.

This is the exacteſt method of cutting ſcrews. There is another method deſcribed by F. Plumier, which may ſometimes be of uſe. "Cut (ſays he) a ſmall fillet of paper large enough to cover that part of the axis which you mean to cut into a ſcrew: then mark upon the two borders of it, which join when it is rolled on the axis, the largeneſs of the teeth of the ſcrew with a compaſs. Having thus Turning. marked the whole border at equal diſtances, draw a ſtraight line from the firſt point of the border to the ſecond, from the ſecond to the third, and ſo on. You will have ſeveral oblique parallel lines equally diſtant from one another. Wrap the fillet of paper thus marked upon the part of the axis on which the ſcrew is to be traced, ſo that the borders of it touch without overlapping each other: then all the extremities of theſe lines meeting mutually, will trace out a very exact ſcrew; and this you will mark upon the axis by means of a knife formed into a kind of fine ſaw by the edge of another knife. This firſt trace you are carefully to enlarge with a ſmall file till it becomes large enough to admit the edge of a three-cornered file; with which you cut a little; then, taking a proper ſcrew-tale, you introduce it into the hollows already made; and turning the lathe, you are to follow the hollow of the ſcrew with this inſtrument till the ſcrew is finiſhed."

For turning ovals, a lathe of ſomewhat a different conſtruction is uſed. The axis or ſpindle, having on it the pulley over which the band-cord paſſes for turning the lathe, is fixed between the two puppets ſo as to turn round eaſily; one end of it paſſes through one of the puppets, and to it is firmly fixed a circular plate of braſs, ſo that it turns round along with the ſpindle. Upon this plate two brazen ſegments of circles are faſtened, the circumferences of which correſpond to the circumference of the plate: their chords are parallel, and equally diſtant from the centre of the plate, ſo that they leave a diſtance between them. They have a groove in each of them: in theſe grooves another plate is placed which exactly fills up the ſpace between the two grooves, but is ſhorter than the diameter of the larger circular plate on which it is laid. This plate is made to ſlide in the grooves. To its centre is fixed a ſhort ſpindle, on which the piece of wood to be turned is fixed. When the lathe is ſet a-going, the circular plate moves round, and carries the piece along with it; the plate of braſs on which the piece is fixed being fixed looſely in the grooves already deſcribed, ſlides down a little every time that the grooves become perpendicular to the floor (and there are particular contrivances to prevent it from ſliding down too far); and by theſe two motions combined, the circular one of the large plate, and the ſtraight one of the ſmall, the circumference of the piece of wood to be turned neceſſarily deſcribes an oval; and gouges or other tools being applied in the uſual manner ſupported on the *reſt*, it is cut into an oval accordingly. The ſmall plate may be made to ſlide either more or leſs in the grooves; and by this contrivance the tranſverſe diameter of the oval, or rather ellipſe, may be made longer or ſhorter at pleaſure. Another, and ſtill ſimpler method, if poſſible, of turning ovals, is this: Take two ovals of metal, exactly of the ſize of the oval which you intend to make; fix them firmly on the ſpindle of the lathe ſo as to turn round with it: fix between them the wood to be turned; and then it is eaſy, by the help of chiſels and other tools, to cut it, as the lathe goes into exactly the figure of the external ovals. Or an oval may be formed by placing the wood, or whatever is to receive that ſhape, obliquely on the lathe. There are ſeveral other ingenious methods of turning; but our bounds do not permit us to enter upon them. We ſhall therefore conclude this article with a number of receipts which every turner ought to know.

1. *The method of moulding boxes both of ſhell and horn.*— In the firſt place, form a proper mould, which muſt conſiſt of two pieces, *viz.* of a circle about half an inch thick, which ſhould ſlope a little in order to draw out the moulded ſhell the more eaſily; and a ring fitted to the outſide

Turning. of the circle, ſo that both together make the ſhape of a box. Theſe two pieces being adjuſted, it is neceſſary to round the ſhell to be moulded of ſuch a ſize that, when moulded, it will be a little higher than the ring of the mould, that there may be no deficiency. The mould is then to be put into a preſs on a plate of iron, exactly under the ſcrew of the preſs; put then the ſhell upon the circle of the mould, ſo that its centre alſo is exactly oppoſite to the ſcrew of the preſs: then take a piece of wood formed into a truncated cone, and not ſo thick as the diameter of the circle of the mould, nor ſo deep as the ring: then put a plate of iron above the cone, and ſcrew down the preſs gently and cautiouſly till the whole is well fixed: then plunge the whole into a cauldron of boiling water placed above a fire. In 8 or 10 minutes the ſhell or horn will begin to ſoften; ſcrew the preſs a little firmer that the wooden cone may ſink into the ſoftened ſhell: repeat this from time to time till the cone is quite ſunk in the mould; then take out the preſs and plunge it into cold water. When it is cold, take the box now formed out of the mould, and put into the inſide of it a new mould of tin exactly of the form you wiſh the inſide of the box to be; do the ſame with the outſide, put it again into the preſs and plunge it into boiling water; ſcrew the preſs gradually till the box be faſhioned as you deſire.

2. *Method of preparing green wood ſo that it will not ſplit in the turning.*—Having cut your wood into pieces of a proper ſize, put it into a veſſel full of a ley made with wood aſhes. Boil it there about an hour; then, taking the cauldron off the fire, allow the ley to cool; then take out the wood and dry it in the ſhade.

3. *Method of giving an ebony-black to hard and fine woods.*—After forming the wood into the deſtined figure, rub it with aquafortis a little diluted. Small threads of wood will riſe in the drying, which you will rub off with pumice-ſtone. Repeat this proceſs again, and then rub the wood with the following compoſition: Put into a glazed earthen veſſel a pint of ſtrong vinegar, two ounces of fine iron-filings, and half a pound of pounded galls, and allow them to infuſe for three or four hours on hot cinders. At the end of this time augment the fire, and pour into the veſſel four ounces of copperas (ſulphat of iron), and a quart of water having half an ounce of borax and as much indigo diſſolved in it; and make the whole boil till a froth riſes. Rub ſeveral layers of this upon your wood; and when it is dry, poliſh it with leather, on which you have put a little tripoli.

4. *Method of giving to plum-tree the colour of brazil wood.*—Slack lime with urine, and bedaub the wood over with it while it is hot: allow it to dry; then take off the coat of lime and rub it with ſhamoy ſkin well oiled. Or, ſteep your wood in water, having a quantity of alum diſſolved in it: then, having allowed brazil wood to diſſolve in water five or ſix hours, ſteep your wood in it, kept lukewarm during a night; and when it is dry, rub it, as before directed, with ſhamoy ſkin well oiled.

5. *Method of giving a fine black colour to wood.*—Steep your wood for two or three days in lukewarm water in which a little alum has been diſſolved; then put a handful of logwood, cut ſmall into a pint of water, and boil it down to leſs than half a pint. If you then add a little indigo, the colour will be more beautiful. Spread a layer of this liquor quite hot on your wood with a pencil, which will give it a violet colour. When it is dry, ſpread on another layer; dry it again and give it a third: then boil verdegriſe at diſcretion in its own vinegar, and ſpread a layer of it on your wood: when it is dry, rub it with a bruſh, and then with oiled ſhamoy ſkin. This gives a fine black, and imitates perfectly the colour of ebony.

6. *Method of cleaning and whitening bones before uſing them.*—Having taken off with a ſaw the uſeleſs ends of the bones, make a ſtrong ley of aſhes and quick lime, and into a pailful of this ley put four ounces of alum, and boil the bones in it for an hour; then take the veſſel containing the ley off the fire and let it cool; then take out the bones and dry them in the ſhade. Turning ‖ Turquoiſe.

7. *Method of ſoldering ſhells.*—Clean the two ſides of the ſhells which you wiſh to join together; then, having joined them, wrap them up in linen folded double and well moiſtened; then heat two plates of iron pretty hot that they may keep their heat for ſome time; and putting your ſhells rolled up between them under a preſs, which you muſt ſcrew very tight, leave them there till the whole is cold, and they will be ſoldered. If you do not ſucceed the firſt time, repeat the proceſs.

8. *Method of moulding ſhells.*—Put ſix pints of water into a kettle; add to it an ounce of olive or other oil; make the water boil; then put in your ſhell, and it will grow ſoft. Take it out and put it into a mould under a preſs, and it will take the figure you want. This muſt be done quickly: for if the ſhell cool ever ſo little, the proceſs will fail. It will not require much preſſure.

9. *Method of tinging bones and ivory red.*—Boil ſhavings of ſcarlet in water. When it begins to boil, throw in a quarter of a pound of aſhes made from the dregs of wine, which will extract the colour: then throw in a little rock alum to clear it, and paſs the water through a linen cloth. Steep your ivory or bone in aquafortis, and put it into the water. If you wiſh to leave white ſpots, cover the places deſtined for them with wax.

10. *To tinge ivory black.*—Steep the ivory during five or ſix days in water of galls with aſhes made with dried dregs of wine and arſenic; then give it two or three layers of the ſame black with which plum-tree is blackened, in order to imitate ebony. Or, diſſolve ſilver in aquafortis, and put into it a little roſe water. Rub the ivory with this, and allow it to dry in the ſun.

11. *Method of hardening wood to make pulleys.*—After finiſhing the pulley, boil it ſeven or eight minutes in olive oil, and it will become as hard as copper.

12. *To make Chineſe varniſh.*—Take of gum lac in grains four ounces; put it into a ſtrong bottle with a pound of good ſpirit of wine, and add about the bulk of a hazel nut of camphor. Allow them to mix in ſummer in the ſun, or in winter on hot embers for 24 hours, ſhaking the bottle from time to time. Paſs the whole through a fine cloth, and throw away what remains upon it. Then let it ſettle for 24 hours, and you will find a clear part in the upper part of the bottle, which you muſt ſeparate gently and put into another vial, and the remains will ſerve for the firſt layers.

TURNSTONE, in ornithology. See TRINGA.

TURPENTINE, a tranſparent viſcous ſubſtance, flowing either naturally or by inciſion from ſeveral unctuous or reſinous trees; as the terebinthus, pine, larch, fir, &c. See PINUS, p. 765; CHEMISTRY *Index*; MATERIA MEDICA, *the Table*.

Oil of TURPENTINE. See CHEMISTRY-*Index*, and PHARMACY, n° 174.

TURPETH, the cortical part of the root of a ſpecies of convolvulus, brought from the Eaſt Indies. It is accounted a pretty ſtrong cathartic; but it is very uncertain in its ſtrength, for ſometimes a doſe from a ſcruple to a dram purges violently, while at other times a much greater doſe produces very little effect.

TURQUOISE, is the tooth of an animal penetrated with the blue calx of copper: it loſes its colour when heated;

it

Turretin ‖ Tuſcany.

it is opaque, and of a lamellar texture, and ſuſceptible of a fine poliſh; its ſpecific gravity is from 2,5 to 2,908; ſome are of a deep blue, ſome of a whitiſh blue, but become of a deeper when heated. This ſubſtance is found in Perſia and Languedoc. The copper may be extracted from it by diſtilled vinegar. According to Reaumur (*Mem. Par.* 1715) nitrous acid will not diſſolve that of Perſia, though it will that of France, which ſhows a difference between them.

TURRETIN (Francis), miniſter and profeſſor of divinity at Geneva, his native place, was born in 1623. Having ſtudied at Geneva, Leyden, Saumur, Montauban, and Nilmes, with great ſucceſs, he was admitted into the miniſtry in 1648, and ſerved at the ſame time the French and Italian churches at Geneva. Two years after, he was offered the profeſſorſhip of philoſophy, which he refuſed; but accepted the invitation of the church of Lyons. He was recalled to Geneva at a year's expiration, becauſe he was wanted to give lectures in divinity; which he began in 1653. He was ſent to Holland in 1661, to procure money which the city of Geneva had occaſion for. He had in that journey all the ſucceſs he could promiſe himſelf; and gained ſuch a character there, that he was ſtrongly importuned by the Walloon churches at the Hague and at Leyden to enter into their ſervice. On his return he reſumed the functions of his place, and continued there till his death with remarkable application. He died in 1687, with the character of a man of great merit; eloquent, judicious, laborious, learned, and zealous for orthodoxy. His works were publiſhed by his ſon John Alphonſus, in 3 and in 4 vols 4to.

TURRITIS, TOWER-MUSTARD, in botany: A genus of plants belonging to the claſs of *tetradynamia*, and to the order of *ſiliquoſa*; and in the natural ſyſtem ranging under the 39th order, *Siliquoſæ*. The ſiliqua is very long and angulated; the calyx connivent and erect; the corolla is alſo erect. There are three ſpecies; two of which are natives of Great Britain, the glabra and hirſuta.

TURTLE, in ichthyology. See TESTUDO.

TURTLE-DOVE, in ornithology. See COLUMBA.

TUSCAN ORDER, in architecture. See ARCHITECTURE, n° 42.

TUSCAN Earth, a yellowiſh kind of bole dug in many parts of Italy, particularly about Florence, where there is a ſtratum of it eight or ten feet thick, at the depth of five or ſix feet from the ſurface. It is ſuppoſed to have an aſtringent property.

TUSCANY, a duchy of Italy, which makes part of the ancient Hetruria, excepting ſome ſmall detached parts, is encompaſſed by a part of the Mediterranean, called here the *Tuſcan Sea*; the eccleſiaſtical ſtate; the duchy of Modena; and the republic of Lucca; its extent from north to ſouth being about 116 Engliſh miles, and from eaſt to weſt about 80.

Though ſome parts of it are mountainous, yet both the hills and dales are covered with vines, olives, citron, lemon, and orange trees, &c. The mountains yield alſo copper, iron, alum, &c. and ſome quarries of the fineſt marble and porphyry. Here is alſo plenty of corn, rice, ſaffron, honey, wax, wool, flax, hemp, with mineral waters, rich paſture, ſalt-pits, ſulphur, alabaſter, chalcedony, lapis lazuli, borax, amethyſts, cornelians, jaſpers, quickſilver, cryſtals, and black ſlate. In ſome places the elms and aſhes yield manna.

The principal river in Tuſcany is the Arno, which has its ſource in the Appennine mountains, and falls into the ſea below Piſa. There are ſome other ſmaller rivers.

This duchy fell under the dominion of the Romans about 455 years before Chriſt. The Oſtrogoths poſſeſſed themſelves of it in the fifth century, and after them the Lombards, who were expelled by Charlemagne anno 800; in conſequence of which it became ſubject to the German emperors, who appointed governors over it. At laſt the cities of Florence, Piſa, Sienna, and ſome others, during the contentions between the pope and the emperor, and their reſpective adherents, the Guelphs and Gibbelines, withdrew themſelves from the dominion of both, and erected themſelves into ſeparate commonwealths. In that of Florence, John de Medicis, a popular nobleman, ſo inſinuated himſelf into the favour of his countrymen, that they inveſted him with ſovereign power. Pope Pius V. conferred the title of *grand duke* on Coſmo de Medicis anno 1570, in whoſe family the duchy continued until the death of Gaſton de Medicis, who died anno 1737. The duchy was then transferred to the duke of Lorrain, afterwards the emperor Francis I. in lieu of the duchy of Lorrain, which, by the peace of 1736, was given to king Staniſlaus during his life, and then was to be annexed to France. Leopold, the ſecond ſon of Francis I. and afterwards emperor of Germany, ſucceeded to this duchy. It is now enjoyed by Leopold's ſecond ſon, brother to the preſent emperor of Germany, Francis II. The grand duke's annual revenues are computed at about 500,000 l. ſterling, ariſing chiefly from the tenths of all eſtates that are ſold or alienated, and the ground-rents of the houſes in Leghorn, and the duties on almoſt all manner of proviſions.

Tuſcany ‖ Tutor.

The great duke is abſolute in his dominions. His ſtanding forces conſiſt only of three regiments of foot and two of dragoons, and his marine of a few galleys and galeaſſes; but, in caſe of neceſſity, it is ſaid he can bring 30,000 men into the field, and increaſe his marine with 20 men of war; but it does not appear how he can man them.

The principal places are Florence, Piſa, Leghorn, Sienna, Orbitello, Piombino, and Arezzo.

TUSK, or TORSK, in ichthyology. See GADUS.

TUSSILAGO, COLT'S FOOT, in botany: A genus of plants belonging to the claſs of *ſyngeneſia*, and order of *polygamia ſuperflua*; and in the natural ſyſtem ranging under the 49th order, *Compoſitæ*. The receptacle is naked; the pappus ſimple; the ſcales of the calyx equal, of the ſame height as the diſk, and ſomewhat membranaceous. There are 12 ſpecies; three of which are indigenous to Britain, the farfara, hybrida, and petaſites.

The *farfara*, or common colt's foot, grows plentifully on the banks of rivulets, or in moiſt and clayey ſoils, in England and Scotland.—The leaves are ſmoked in the manner of tobacco, or a ſyrup or decoction of them and the flowers ſtand recommended in coughs and other diſorders of the breaſt and lungs. It ſeems now to be almoſt entirely rejected. The downy ſubſtance under the leaves, boiled in a lixivium with a little ſaltpetre, makes excellent tinder. The *petaſites*, or common butter-burr, is frequent in wet meadows and by the ſides of rivers. Its leaves are the largeſt of any plant in Great Britain, and in heavy rains afford a ſeaſonable ſhelter to poultry and other ſmall animals. The root dug up in the ſpring is reſinous and aromatic. A drachm of it in a doſe has been ſometimes given as a ſudorific and alexipharmic; but as it poſſeſſes thoſe virtues but in a ſmall degree, it has loſt its reputation in the ſhops.

TUTENAGO, an ore of zinc, containing commonly from 60 to 90 *per cent.* of zinc, the remainder iron, and a ſmall proportion of clay.

TUTOR, in the civil law, is one choſen to look to the perſons and eſtate of children left by their fathers and mothers in their minority. The different kinds of *tutory* eſtabliſhed among the Romans, and the powers and duties of tutors, are deſcribed in *Inſt. Leg.* 1. T. XIII. ſect. 1. and 2. to which the reader is referred. See alſo the article GUARDIAN.

Tutor ‖ Twelfth-Day.

DIAN.—For the nature and effects of tutory in the Scotch law, which is founded on that of the Romans, see *Scotch Law*, Part III. Sect. 7.

TUTOR is alſo uſed in the Engliſh univerſities for a member of ſome college or hall, who takes on him the inſtructing of young ſtudents in the arts and faculties.

TUTTY, an argillaceous ore of zinc, found in Perſia, formed on cylindrical moulds into tubulous pieces, like the bark of a tree, and baked to a moderate hardneſs; generally of a browniſh colour, and full of ſmall protuberances on the outſide, ſmooth and yellowiſh within, ſometimes whitiſh, and ſometimes with a bluiſh caſt. Like other argillaceous bodies, it becomes harder in a ſtrong fire; and after the zinc has been revived and diſſipated by inflammable additions, or extracted by acids, the remaining earthy matter affords, with oil of vitriol, an aluminous ſalt.

Tutty is celebrated as an ophthalmic, and frequently employed as ſuch in unguents and collyria. See PHARMACY, n° 654.

TWEED, a river of Scotland, which riſes on the confines of the ſhire of Clydeſdale, and running eaſtward thro' Tweedale, and dividing the ſhire of Merſe from Teviotdale and Northumberland, falls into the German Sea at Berwick. It abounds with ſalmon.

TWEEDALE, or PEEBLES, a county in the ſouth of Scotland. It has already been deſcribed under the word PEEBLES; but in that article ſeveral inaccuracies were committed, which a gentleman of that county has been kind enough to point out, and which therefore we take this opportunity of correcting.

Tweedale is chiefly a grazing county, producing excellent mutton from healthy black-faced ſheep. It is remarkable, that among this particular breed the rot or dropſical diſeaſe, and the trembling illneſs, are exceedingly rare, unleſs when they happen to be imported by ſtranger ſheep.—The account which we formerly gave of the vaſt number of eels ſwarming in Weſt-water Loch, and tumbling into the river Yarrow at particular ſeaſons, is a miſtake. At preſent no greater number of eels is ſeen there than in other rivers and lochs. This loch and Yarrow water are more than 20 miles aſunder, and running different ways, ſo that the account at any rate was impoſſible. The lake on the borders of Annandale is at preſent called *Loch Skeen*, and not *Loch Gennet*; the cataract which it forms is called the *Grey Mare's Tail*: the fall is into Moffat water. Douglas of Cavers ought not to have been reckoned among the families of Tweedale, as that branch of the Douglaſes belongs to a different county. Our miſtake proceeded from this circumſtance—In very ancient times all the country waſhed by the Tweed went by the name of *Tweedale*, and the Douglaſes were wardens of that diſtrict. Peebles lies in N. Lat. 55. 38. W. Long. 3.

TWELFTH-DAY, the feſtival of the Epiphany, or the manifeſtation of Chriſt to the Gentiles; ſo called, as being the twelfth day, excluſive, from the nativity or Chriſtmas-day.

Twilight ‖ Tyndale.

TWILIGHT, that light, whether in the morning before ſun-riſe, or in the evening after ſun-ſet, ſuppoſed to begin and end when the leaſt ſtars that can be ſeen by the naked eye ceaſe or begin to appear.

TWINKLING *of the* STARS. See OPTICS, n° 21.

TWINS, two young ones delivered at a birth, by an animal which ordinarily brings forth but one.

TWITE, in ornithology. See FRINGILLA.

TYGER, or TIGER, in zoology. See FELIS.

TYLE, or TILE, in building, a ſort of thin laminated brick uſed on the roofs of houſes: or, more properly, a kind of fat clayey earth kneaded and moulded of a juſt thickneſs, dried and burnt in a kiln like brick, and uſed in the covering and paving of houſes.

TYMPAN, among printers, a double frame belonging to the preſs, covered with parchment, on which the blank ſheets are laid in order to be printed off. See *PRINTING-Preſs*.

TYMPANUM, in mechanics, a kind of wheel placed round an axis or cylindrical beam, on the top of which are two levers or fixed ſtaves for the more eaſily turning the axis in order to raiſe a weight required. The tympanum is much the ſame with the peritrochium; but that the cylinder of the axis of the peritrochium is much ſhorter and leſs than the cylinder of the tympanum.

TYMPANUM, in anatomy. See ANATOMY, n° 141.

TYMPANY, in medicine. See MEDICINE, n° 337, and SURGERY, n° 265.

TYNDALE (William), a zealous Engliſh reformer, and memorable for having made the firſt Engliſh verſion of the Bible, was born on the borders of Wales ſome time before 1500. He was of Magdalene-hall in Oxford, where he diſtinguiſhed himſelf by ſucking in early the doctrines of Luther, and by as zealouſly propagating thoſe doctrines among others. Afterwards he removed to Cambridge, and from thence went to live with a gentleman in Glouceſterſhire in the capacity of tutor to his children.—While he continued there, he ſhowed himſelf ſo furious for Luther, and ſo inveterate to the pope, that he was forced, merely for the ſecurity of his perſon, to leave the place. He next endeavoured to get into the ſervice of Tonſtall biſhop of Durham, but did not ſucceed. His zeal for Lutheraniſm made him deſirous to tranſlate the New Teſtament into Engliſh; and as this could not ſafely be done in England, he went into Germany, where, ſetting about the work, he finiſhed it in 1527. He then began with the Old Teſtament, and finiſhed the five books of Moſes, prefixing diſcourſes to each book, as he had done to thoſe of the New Teſtament (A). At his firſt going over into Germany, he went into Saxony, and had much conference with Luther; and then returning to the Netherlands, made his abode chiefly at Antwerp.

Jortin's Life of Eraſmus,

(A) An anecdote is told of Biſhop Tonſtal, which is amuſing in itſelf, and does much honour to the Biſhop's moderation. Tonſtal being at Antwerp in 1529, he ſent for one Packington an Engliſh merchant there, and deſired him to ſee how many New Teſtaments of Tyndale's Tranſlation he might have for money. Packington, who was a ſecret favourer of Tyndale, told him what the Biſhop propoſed. Tyndale was very glad of it; for, being convinced of ſome faults in his works, he was deſigning a new and more correct edition: but he was poor, and the former impreſſion not being ſold off, he could not go about it: ſo he gave Packington all the copies that lay in his hands; for which the Biſhop paid the price, and brought them over, and burnt them publicly in Cheapſide.—Next year, when the ſecond edition was finiſhed, many more were brought over; and one Conſtantine being taken in England, the lord chancellor, in a private examination, promiſed him that no hurt ſhould be done him if he would reveal who encouraged and ſupported them at Antwerp; which he accepted of, and told them that the greateſt encouragement they had was from the Biſhop of London, who had bought up half the impreſſion. This made all that heard of it laugh heartily, though more judicious perſons diſcerned the great temper of that learned Biſhop in it.

Tyndale, Type.

werp. During his peregrinations from one country to another, he ſuffered ſhipwreck upon the coaſt of Holland, and loſt all his books and papers. His tranſlations of the Scriptures being in the mean time ſent to England, made a great noiſe there; and, in the opinion of the clergy, did ſo much miſchief, that a royal proclamation was iſſued out, prohibiting the buying or reading ſuch tranſlation or tranſlations. But the clergy were not ſatisfied with this, they knew Tyndale capable of doing infinite harm, and therefore thought of nothing leſs than removing him out of the way. For this purpoſe one Philips was ſent over to Antwerp, who inſinuated himſelf into his company, and under the pretext of friendſhip betrayed him into cuſtody. He was ſent to the caſtle of Filford, about 18 miles from Antwerp: and though the Engliſh merchants at Antwerp did what they could to procure his releaſe, and letters were alſo ſent from lord Cromwell and others out of England; yet Philips beſtirred himſelf ſo heartily, that he was tried and condemned to die. He was firſt ſtrangled by the hands of the common hangman, and then burned near Filford caſtle, in 1536. While he was tying to the ſtake, he cried with a fervent and loud voice, "Lord, open the king of England's eyes."

TYPE (τυπος), an impreſſion, image, or repreſentation of ſome model, which is termed the *antitype*. In this ſenſe the word occurs often in the writings of divines, who employ it to denote that prefiguration of the great events of man's redemption which they have found or fancied in the principal tranſactions recorded in the Old Teſtament.

That the death of Chriſt for the ſins of men, and his reſurrection from the dead for their juſtification, were prefigured in the ritual worſhip inſtituted by Moſes, is indeed incontrovertible *; but when divines conſider as a type every thing mentioned in the Hebrew Scriptures, in which an active imagination can diſcover the ſlighteſt reſemblance or analogy to any circumſtance in the life, or death, or reſurrection of Chriſt, they expoſe the whole doctrine of *types* to the ridicule of unbelievers, and do a real injury to that cauſe which it is their profeſſed intention to ſerve. To contend, as ſome of them have done, that the extraction of Eve from the ſide of Adam, while he was in a deep ſleep, was intended as a type of the Roman ſoldier's piercing our Saviour's ſide while he ſlept the ſleep of death; or that the envy of the ſons of Jacob to their brother Joſeph, was typical of the envy of the Scribes and Phariſees to Jeſus the Meſſiah, is to burleſque the Scriptures, and inſult reaſon.

* See Epiſt. to the Heb. paſſim.

The nature of types ſeems indeed to be very little underſtood even by thoſe who pretend to have ſtudied them with care. They are generally compared to prophecies having a double ſenſe, and are thought to have been ſo contrived as to give information of the future events to which they pointed; but the information which they gave of Chriſtianity muſt have been exceedingly obſcure to thoſe who lived before the coming of Chriſt, however plain it may appear to us who can now compare the type with the antitype. A different opinion has indeed been maintained, not only by myſtical cabbaliſts, who will maintain any thing from which common ſenſe revolts, but alſo by writers who, when treating of other ſubjects, have ſhown that they poſſeſſed very ſound underſtandings. One of the ableſt defenders of revelation, ſpeaking of the purpoſe for which the paſſover was inſtituted, aſks "What is the price and worth of a lamb, whoſe blood infallibly gives life to thoſe who are tinged with it, and the non-aſperſion or neglect of which is ſufficient to condemn Jew and Gentile to death without diſtinction?" Taking it for granted that this queſtion is capable of no anſwer but one favourable to the concluſion which he wiſhes to draw from it, he then proceeds in the following words: "Though the Meſſiah was not already come, who could doubt but that ſuch a myſtery *typified him*, ſince he was to be the Saviour and Deliverer of his people? and who would not be prepared to believe that he will deliver his people, and ſave them by the *effuſion of his blood*, when it is obvious that it is to the immolation of a lamb, and the aſperſion of its blood, that all Iſrael owe their lives and liberties?" Type.

That the ſacrifice of the paſchal lamb for the ſafety of the Iſraelites was typical of the ſacrifice of the Lamb of God for the ſins of the world, and that the reſemblance or analogy of the type to the antitype was in many reſpects exceedingly ſtriking, are facts known to every Chriſtian; but they could not poſſibly be known to the ancient Hebrews before it was revealed to them that Chriſt was to ſuffer. At the inſtitution of the paſſover, nothing was ſaid from which the great body of the people could infer that they were to be redeemed from death and ſin by the blood of the Meſſiah, as their fathers had in Egypt been delivered from the deſtroying angel by the blood of the immolated lamb. We readily agree with the ingenious writer, that in the blood of a lamb there is no worth to propitiate the eternal God, and from him to purchaſe life for the man who is ſprinkled with it; but the Iſraelites, at the era of their departure from Egypt, held opinions very different from his and ours. They thought groſsly of the Deity, and believed, with their ſuperſtitious maſters, that he put the higheſt value on animal ſacrifices. In the New Teſtament Chriſt is called our *Paſſover*, and is ſaid to have been ſacrificed for us. Chriſtians therefore cannot doubt but that the Jewiſh ſacrifice of the paſchal lamb was emblematical of the great ſacrifice ſlain on the croſs; but as the majority of the ancient Hebrews were ignorant of all the circumſtances of reſemblance between the type and antitype, we cannot conceive how they ſhould have dreamed of a future paſſover of which their own was but an empty figure. Lally's Principles of the Chriſtian Religion.

Some learned men indeed ſeem to imagine, that when the rites of the law were inſtituted, the people were taught to conſider them as of no value in themſelves, but merely as ſhadows of good things to come, and that by means of theſe ſhadows a diſtinct and even ſteady view was given to them of the ſubſtance; but this is a ſuppoſition which receives no ſupport from Scripture. That Abraham, who rejoiced to ſee Chriſt's day, and ſeeing it was glad; that Moſes, who was directed to make all things relating to the tabernacle according to the pattern ſhowed to him in the mount; and that ſuch other individuals as, like him, could look up to a God inviſible, and perform at once a worſhip purely ſpiritual; that theſe men were admoniſhed that the ritual law was only the ſhadow of a future and more perfect diſpenſation—cannot, we think, be queſtioned. Nay, that Abraham, Moſes, and a few others, may have had as accurate notions of Chriſtianity as we have at preſent, is a poſition which we feel not ourſelves inclined to controvert; but that the great body of the Hebrew nation was taught from the beginning to conſider their law as imperfect, or as deriving any little value which it had from its being emblematical of a purer worſhip to be revealed in the fulneſs of time, is a ſuppoſition which cannot be admitted without confounding all the divine diſpenſations.

The law was a ſchoolmaſter given to the poſterity of Jacob, to guard them from idolatry, and to train them by degrees for the coming of Chriſt. That it might anſwer this purpoſe the more effectually, prophets were raiſed up from time to time to point out its ſecret and ſpiritual meaning, as the people became able to receive it; and no reaſon can be aſſigned for the introduction of ſo burdenſome and carnal a ritual between the fall and the clear revelation of redemption, but becauſe mankind at large were not at that

period

Type ‖ Typhon.

period capable of a more ſpiritual and refined worſhip. See THEOLOGY, Part II. Sect. iv.

If this be ſo, how abſurd is it to ſuppoſe that the ancient Iſraelites ſaw through their ſacrifices the future ſacrifice of Chriſt, and the ſimple, though ſublime, worſhip of the Chriſtian church; that when their law promiſed temporal rewards to the obedient, they looked for heavenly ones through the Meſſiah; and that when they were offering a ſin-offering for their tranſgreſſions, they had their eyes fixed on the croſs of Chriſt, being aware that the blood of bulls and of goats could never take away ſin? Had the Iſraelites, at their deliverance from Egyptian bondage, been capable of all this faith, it is not to be ſuppoſed that the Father of Mercies would have laid upon them ſuch a yoke of ordinances; for that would have been in effect to ſay, though you are capable of worſhipping me in ſpirit and in truth, according to the diſpenſation which ſhall be revealed to your poſterity, yet I command you to obſerve a multifarious ritual, which you *know* to be preparatory to that diſpenſation, and of *no real value in itſelf!*

The law therefore had only the *ſhadow* of good things to come, and not ſuch an image of them, as that merely from beholding the type mankind could acquire an accurate notion of the antitype. It was indeed ſo contrived as naturally to lead the thinking part of the nation to the hopes of future redemption; but without the illuſtrations of the prophets it could not of itſelf have made them comprehend the means by which that redemption was to be effected. Between the types and the antitypes, the ſhadow and the ſubſtance, the reſemblance, or, to ſpeak more properly, the analogy, is ſo ſtriking, that no unprejudiced perſon can now entertain a doubt but that the law and the goſpel are parts of one great ſcheme of providence, which, commencing with the fall, was completed by the effuſion of the Holy Spirit on the day of pentecoſt. But it would be as equitable to condemn a Bacon or a Newton to ſpend his time in the amuſements of children, as it would have been to place the Jews under the ritual law, had they been capable of acquiring from the ſhadows of that law adequate notions of the ſubſtance of Chriſtianity.

TYPE, among letter-founders and printers, the ſame with letter. See LETTER.

TYPE is alſo uſed to denote the order obſerved in the intenſion and remiſſion of fevers, pulſes, &c.

TYPHA, CAT'S TAIL, in botany: A genus of plants belonging to the claſs of *monœcia*, and order of *triandria*; and in the natural ſyſtem ranging under the 3d order, *Calamariæ*. The amentum of the male flower is cylindrical; the calyx is tripetalous, but ſcarcely diſtinguiſhable; there is no corolla. The female has a cylindrical amentum below the male; the calyx is compoſed of villous hair; there is no corolla, and only one ſeed fixed in a capillary pappus. There are two ſpecies, both natives of Britain; the latifolia and anguſtifolia.

1. *Latifolia*, great cat's tail, or reed mace, is frequent in ponds and lakes. The ſtalk is ſix feet high; the leaves a yard long, hardly an inch wide, convex on one ſide: the amentum, or cylindrical club which terminates the ſtalk, is about ſix inches long, of a dark brown or fiſcous colour. Cattle will ſometimes eat the leaves, but Schreber thinks them noxious: the roots have ſometimes been eaten in ſalads, and the down of the amentum uſed to ſtuff cuſhions and matreſſes. Linnæus informs us, that the leaves are uſed by the coopers in Sweden to bind the hoops of their caſks.

2. *Anguſtifolia*, narrow-leaved cat's tail, is found in pools and ditches. The leaves are ſemi-cylindrical, and the male and female ſpike are remote and ſlender.

TYPHON. See WHIRLWIND.

TYPHON, the devil of the ancient Egyptians. See POLYTHEISM, n° 29. Typhon ‖ Tyrone.

TYPOGRAPHY, the art of printing. See PRINTING.

TYRANNION, a celebrated grammarian in Pompey's time, was of Amiſus in the kingdom of Pontus. He was the ſcholar of Dionyſius of Thrace at Rhodes. He fell into the hands of Lucullus, when that general of the Roman army defeated Mithridates, and ſeized his dominions. This captivity of Tyrannion was no diſadvantage to him, ſince it procured him an opportunity of being illuſtrious at Rome, and raiſing a fortune. He ſpent it, among other things, in making a library of above 30,000 volumes. He died very old, being worn out with the gout. His care in collecting books contributed very much to the preſervation of Ariſtotle's works.

TYRANT, among the ancients, denoted ſimply a king or monarch; but the ill uſe which ſeveral perſons inveſted with that ſacred character made of it, has altered the import of the word; and tyrant now carries with it the idea of an unjuſt or cruel prince, who invades the people's liberty, and rules in a more deſpotic manner than the laws of nature or of the country allow.

TYRE, formerly a celebrated city of Aſia, on the coaſt of Syria, ſituated under the 54th degree of eaſt longitude, and 32d of north latitude. It was built, according to ſome writers, 2760 years before the Chriſtian era. There were two cities of that name; the one called *Palætyrus*, ſituated on the continent; and the other the city of *Tyre*, built on an iſland about half a mile from the ſhore. It was about 19 miles in circumference, including Palætyrus; the town on the iſland was about four miles round. The buildings of Tyre were very magnificent; the walls were 150 feet high, and broad in proportion. This city was at one period the moſt famous commercial city in the world. Of its commercial tranſactions, the moſt particular account that is to be found in any ancient writer has been given by the prophet Ezekiel, which at the ſame time conveys a magnificent idea of the extenſive power of that ſtate. It reſiſted Nebuchadnezzar king of Babylon for 13 years: at the end of which, wearied with endleſs efforts, the inhabitants reſolved to place the ſea between them and their enemy, and paſſed accordingly into the iſland. The new city ſtood out againſt Alexander the Great for ſeven months; and before he could take it, he was obliged to fill up the ſtrait which ſeparated the iſland from the continent. It was repaired afterwards by Adrian, and became the metropolis of the province. It afterwards fell into the hands of the Arabs; and after being taken by Baldwin II. king of Jeruſalem, it was deſtroyed by the ſultan of Egypt in 1289, and abandoned, never more to riſe from its ruins. An excellent account of its ſituation and modern ſtate may be found in Volney's Travels, vol. ii. It now conſiſts of a ſmall village, compoſed of wretched huts, containing about 50 or 60 poor families. The words of Ezekiel are literally fulfilled, "And they ſhall make a ſpoil of thy riches." (Ezek. xxvi. 12, 13, 14). Mr Bruce ſaw this queen of the nations converted into a place for fiſhers to dry their nets in. Its harbour, formerly ſo famous for its ſhipping, is now almoſt choaked up. It is called *Sour* or *Tſour* by the Orientals.

TYRIAN DYE. See MUREX and PURPURA.

TYRONE, a county of Ireland, in the province of Ulſter, 46 miles in length, and 37 in breadth; bounded on the north by Londonderry, on the eaſt by Armagh and Lough-Neagh, on the ſouth by Fermanagh, and on the weſt by Donnegal. It is a rough and rugged country, but tolerably fruitful; contains 12,683 houſes, 30 pariſhes, 4 baronies, 4 boroughs, and ſends 10 members to parliament. The principal town is Dungannon.

U, V.

U, V.

Vaccinum. U or u, the 20th letter and 5th vowel of our alphabet, is formed in the voice by a round configuration of the lips, and a greater extruſion of the under one than in forming the letter o, and the tongue is alſo more cannulated. The ſound is ſhort in *curſt, muſt, tun, tub;* but is lengthened by a final *e*, as in *tune, tube*, &c. In ſome words it is rather acute than long; as in *brute, flute, lute*, &c. It is moſtly long in polyſyllables; as in *union, curious*, &c. but in ſome words it is obſcure, as in *nature, venture*, &c. This letter in the form of V or v, is properly a conſonant, and as ſuch is placed before all the vowels; as in *vacant, venal, vibrate*, &c. Though the letters v and u had always two ſounds, they had only the form v till the beginning of the fourth century, when the other form was introduced, the inconvenience of expreſſing two different ſounds by the ſame letter having been obſerved long before. In numerals V ſtands for five; and with a daſh added at top, thus $\overline{V}$, it ſignifies 5000.

In abbreviations amongſt the Romans, V. A. ſtood for *veterani aſſignati;* V. B. *viro bono;* V. B. A. *viri boni arbitratu;* V. B. F. *vir bonæ fidei;* V. C. *vir conſularis;* V. C. C. F. *vale, conjux chariſſime, feliciter;* V. D. D. *voto dedicatur;* V. G. *verbi gratia:* Vir. Ve. *virgo veſtalis;* V. L. *videlicet;* V. N. *quinto nonarum.*

VACCINIUM, the WHORTLE-BERRY, or *Bilberry*, in botany: A genus of plants of the claſs of *octandria*, and order of *monogyna;* and arranged in the natural ſyſtem under the 18th order, *Bicornes*. The calyx is ſuperior; the corolla monopetalous; the filaments inſerted into the receptacle; the berry quadrilocular and polyſpermous. There are 15 ſpecies; the moſt remarkable of which are,

1. The *myrtillus*, black whorts, whortle-berries, or bilberries, growing in woods and on heaths abundantly. The flowers frequently vary, with five ſegments at the rim, and with ten ſtamina. The berries when ripe are of a bluiſh black colour; but a ſingular variety, with white berries, was diſcovered by the duke of Athol, growing in the woods, about mid-way between his two ſeats of Dunkeld and Blair. The berries have an aſtringent quality. In Arran and the Weſtern Iſles they are given in diarrhœas and dyſenteries with good effect. The Highlanders frequently eat them in milk, which is a cooling agreeable food; and ſometimes they make them into tarts and jellies, which laſt they mix with whitky, to give it a reliſh to ſtrangers.—They die a violet colour; but it requires to be fixed with alum. The grous feed upon them in the autumn.

2. The *uliginoſum*, or great bilberry-buſh, is found in low moiſt grounds, and almoſt at the ſummits of the Highland mountains. The leaves are full of veins, ſmooth and glaucous, eſpecially on the under ſide; the berries are eatable, but not ſo much eſteemed as the preceding; as they are apt, if eaten in any quantity to give the headach.

3. The *vitis idæa*, or red whortle-berries, frequent in dry places, in heaths, woods, and on mountains. The berries have an acid cooling quality, uſeful to quench the thirſt in fevers. The Swedes are very fond of them made into the form of a rob or jelly, which they eat with their meat as an agreeable acid, proper to correct the animal alkali.

4. The *oxycoccus*, cran-berries, moſs-berries, or moor-berries, frequent on peat-bogs in the Lowlands, but not ſo common in the Highlands of Scotland. The ſtalks are long, ſlender, woody, weak, and trailing: the leaves are ſtiff, acutely oval, glaucous underneath, their edges turned back, and grow alternate; two or three flowers grow ſingly on long red footſtalks out of the extremity of the branches; the flowers are red, divided deeply into four acute ſegments, which are reflected quite backwards; the filaments are downy; the antheræ ferruginous and longer than the filaments: the berries red, and about the ſize of the hawthorn berries. At Longtown, on the borders of Cumberland, they are made ſo conſiderable an article of commerce, that, at the ſeaſon when they are ripe, not leſs than 20l. or 30l's worth are ſold by the poor people each market-day for five or ſix weeks together, which are afterwards diſperſed over different parts of the kingdom for making the well-known cranberry-tarts.

Vacuum ‖ Vaillant.

VACUUM, in philoſophy, denotes a ſpace empty or devoid of all matter or body.

It has been a matter of much diſpute among philoſophers whether there be in nature a perfect vacuum, or ſpace void of all matter: but if bodies conſiſt of material ſolid atoms, it is evident that there muſt be vacuities, or motion would be impoſſible (See METAPHYSICS, n° 193). We can even produce ſomething very near a vacuum in the receiver of an air pump and in the Torricellian tube (See PNEUMATICS, *paſſim*); and it is very doubtful whether the particles of the denſeſt bodies known be in perfect contact. See OPTICS, n° 63—68.

VADIUM, a pledge in law, is either *vivum* or *mortuum*.

VADIUM Vivum, or *Living Pledge*, is when a man borrows a ſum (ſuppoſe 200l.) of another; and grants him an eſtate, as of 20l. *per annum*, to hold till the rents and profits ſhall repay the ſum ſo borrowed. This is an eſtate conditioned to be void as ſoon as ſuch ſum is raiſed. And in this caſe the land or pledge is ſaid to be living: it ſubſiſts, and ſurvives the debts; and, immediately on the diſcharge of that, reſults back to the borrower.

VADIUM Mortuum, or *Dead Pledge*. See MORTGAGE.

VAGABOND, or VAGRANT, one who wanders illegally, without a ſettled habitation. Such perſons are cognizable by the laws. See IDLENESS.

VAGINA, properly ſignifies a ſheath or ſcabbard; and the term *vagina* is uſed in architecture for the part of a terminus, becauſe reſembling a ſheath out of which the ſtatue ſeems to iſſue.

VAGINA, in anatomy, a canal reaching from the external orifice, or os pudendi, of women, to the uterus.

VAILLANT (John Foy), a phyſician and great medalliſt, to whom, according to Voltair, France was indebted for the ſcience of medals, and Louis XIV. for one half of his cabinet, was born at Beauvais in 1632. Through the means of the miniſter Colbert he travelled into Italy, Greece, Egypt, and Perſia, to collect medals for the royal cabinet; and returned with ſo many as made the king's cabinet ſuperior to any in Europe. In one of his voyages the ſhip he ſailed in was fallen upon and taken by an Algerine corſair. After a captivity of near five months he was permitted to return to France, and received at the ſame time 20 gold medals which had been taken from him. He embarked in a veſſel bound for Marſeilles, and was carried on with a favourable wind for two days, when another corſair appeared, which, in ſpite of all the ſail they could make, bore down upon them within the reach of cannon-ſhot. Mr

Vai. Valencia.

Vaillant, dreading the miſeries of a freſh ſlavery, reſolved, however, to ſecure the medals which he had received at Algiers, and in order thereto ſwallowed them. But a ſudden turn of the wind freed them from this adverſary, and caſt them upon the coaſts of Catalonia; where, after expecting to run aground every moment, they at length fell among the ſands at the mouth of the Rhone. Mr Vaillant got to ſhore in a ſkiff, but felt himſelf extremely incommoded with the medals he had ſwallowed, which might weigh altogether five or ſix ounces, and therefore did not paſs like Scarborough waters. He had recourſe to a couple of phyſicians; who were a little puzzled with the ſingularity of his caſe; however, nature relieved him from time to time, and he found himſelf in poſſeſſion of the greateſt part of his treaſure when he got to Lyons. Here he explained, with much pleaſure to his friends, thoſe medals which were already come to hand, as well as thoſe which were daily expected; among which laſt was an Otho, valuable for its rarity.—He was much careſſed on his return; and when Louis XIV. gave a new form to the academy of inſcriptions in 1701, Mr Vaillant was firſt made aſſociate, and then penſionary. He wrote ſeveral works relating to ancient coins, and died in 1706.

VAIR, or VAIRE, a kind of fur, formerly uſed for lining the garments of great men and knights of renown. It is repreſented in engraving by the figures of little bells reverſed, ranged in a line. See HERALDRY, Chap. II. Sect. 2.

VAIRY, in heraldry, expreſſes a coat, or the bearings of a coat, when charged or chequered with vairs.

VALAIS, a valley in Swiſſerland, which extends from the ſource of the river Rhone to the lake of Geneva. It is near 100 miles in length, but the breadth is very unequal. It is bounded on the north by the Alps, which ſeparate it from the cantons of Bern and Uri, on the eaſt by the mountains of Forche, on the ſouth by the dutchy of Milan and the Val d'Aoſte, and on the weſt by Savoy and the republic of Geneva. The inhabitants profeſs the Roman Catholic religion. They are ſubject to the ſwelling of the throat called *bronchocele*; and idiots are ſaid to abound among them more than in any other place of the globe. They are naturally hardy, enterpriſing, and good natured. It is ſurrounded on all ſides by very high mountains, moſt of which are covered with ſnow and ice that never thaw. However, the ſoil is fertile in corn, wine, and good fruit. The muſcat-wine, which is produced here, is excellent, and well known all over Europe. There are mineral waters, plenty of game, and ſome mines. This country comprehends 55 large pariſhes, to which one biſhop only belongs, whoſe ſee is at Sion the capital. The mountains afford good paſture for their cattle in ſummer, and their harveſt continues from May to October; it being ſooner or later according to the ſituation of the place.

VALANTIA, in botany: A genus of plants in the order *monœcia*, of the claſs *polygamia*, and in the natural ſyſtem arranged under the 41ſt order, the *aſperifoliæ*. There is carcely any calyx; the corolla is monopetalous, flat, four-parted; the ſtamina four, with ſmall antheræ: the hermaphrodite flowers have a piſtillum with a large germen, a bifid ſtyle, the length of the calyx, and one ſeed; the piſtilla of the male flowers are hardly diſcernible. There are eight ſpecies, only one of which is a native of Britain, the *cruciata*; the ſtalks of which are ſquare, the whole plant hairy, the leaves oval and verticillate, four in the whirl; the flowers are yellow, and grow on ſhort peduncles out of the alæ of the leaves. The roots, like thoſe of the galiums, to which it is nearly related, will dye red. It is aſtringent, and was once uſed as a vulnerary.

VALENCIA, a province of Spain, which has the title of a kingdom; and is bounded on the eaſt and ſouth by the Mediterranean ſea, on the north by Catalonia and Arragon, and on the weſt by New Caſtile and the kingdom of Murcia. It is about 165 miles in length and 63 in breadth. It is one of the moſt populous and agreeable parts of Spain, and where they enjoy almoſt a perpetual ſpring. The great number of rivers wherewith it is watered renders it extremely fertile, particularly in fruits and wine. There are very rugged mountains in it, which contain mines of allum and other minerals.

Valencia Valentinians.

VALENCIA, a city of Spain, and capital of the kingdom of the ſame name. It contains about 12,000 houſes, beſides thoſe of the ſuburbs and the ſummer-houſes round it. It has an univerſity, and an archbiſhop's ſee; and was taken from the Moors by the Chriſtians in the 13th century. The town is handſome, and adorned with very fine ſtructures. It is not very ſtrong, though there are ſome baſtions along the ſides of the walls. They have manufactures in wool and ſilk, which bring in great ſums to the inhabitants. It is ſeated on the river Guadalaviar, over which there are five handſome bridges; and it is about three miles from the ſea, where there is a harbour, 110 miles north of Murcia, and 165 eaſt by ſouth of Madrid. This city ſurrendered to the earl of Peterborough in the year 1705; but it was loſt again in 1707. W. Long. 0. 10. N. Lat. 39. 23.

VALENCIENNES, an ancient, ſtrong, and conſiderable city of France, in the department of the North and late province of Hainault. It contains about 20,000 ſouls. The Scheld divides it into two parts. It is a very important place; the citadel and fortifications, the work of Vauban, were conſtructed by order of Louis XIV. who took this town from the Spaniards. It was confirmed to him by the treaty of Nimeguen, in 1678. In 1793, it ſurrendered to the allies after a ſevere ſiege, but was afterwards abandoned; and is now in the poſſeſſion of the French republicans. Beſides lace, this city is noted for manufactories of woollen ſtuffs and very fine linens. It is 20 miles weſt ſouth weſt of Mons, 17 north-eaſt of Cambray, and 120 north-eaſt by north of Paris. E. Long. 3. 37. N. Lat. 50. 21.

VALENS (Flavius), emperor of the Eaſt, a great patron of the Arians. Killed by the Goths in the year 379. See CONSTANTINOPLE, n° 76.

VALENTINIAN I. emperor of the Weſt, a renowned warrior, but a tyrant over his ſubjects. See ROME, n° 523.

VALENTINIAN II. emperor of the Weſt, a prince celebrated for his virtues, and above all for his moderation; yet a conſpiracy was formed againſt him by Arbogaſtes, the commander in chief of his armies; and he was ſtrangled in the year 392. See ROME, n° 536.

VALENTINIANS, in church hiſtory, a ſect of Chriſtian heretics, who ſprung up in the ſecond century, and were ſo called from their leader Valentinus.

The Valentinians were only a branch of the Gnoſtics, who realized or perſonified the Platonic ideas concerning the Deity, whom they called *Pleroma* or *Plenitude*. Their ſyſtem was this: the firſt principle is Bythos, *i. e.* Depth, which remained many ages unknown, having with it Ennoe or Thought, and Sige or Silence; from theſe ſprung the Nous or Intelligence, which is the only ſon, equal to and alone capable of comprehending the Bythos; the ſiſter of Nous they called *Aletheia* or *Truth*; and theſe conſtituted the firſt quaternity of æons, which were the ſource and original of all the reſt: for Nous and Aletheia produced the World and Life; and from theſe two proceeded Man and the Church. But beſides theſe 8 principal æons, there were 22 more; the laſt of which, called *Sophia*, being deſirous to arrive at the knowledge of Bythos, gave herſelf a great deal of uneaſineſs, which

Valerian ‖ Valerius.

which created in her Anger and Fear, of which was born Matter. But the Horos or Bounder ſtopped her, preſerved her in the Pleroma, and reſtored her to Perfection. Sophia then produced the Chriſt and the Holy Spirit, which brought the æons to their laſt perfection, and made every one of them contribute their utmoſt to form the Saviour. Her Enthymeſe, or Thought, dwelling near the Pleroma, perfected by the Chriſt, produced every thing that is in the world by its divers paſſions. The Chriſt ſent into it the Saviour, accompanied with angels, who delivered it from its paſſions, without annihilating it: from thence was formed corporeal matter. And in this manner did they romance concerning God, nature, and the myſteries of the Chriſtian religion.

VALERIAN, or VALERIANUS, (Publius Licinius), emperor of Rome, remarkable for his captivity and cruel treatment by Sapor I. king of Perſia. See ROME, n° 491.

VALERIANA, in botany: A genus of plants belonging to the claſs *triandria* and order *monogynia*, and in the natural ſyſtem arranged under the 48th order, *aggregatæ*. There is hardly any calyx; the corolla is monopetalous, gibbous at the baſe, ſituated above the germen; there is only one ſeed. There are 21 ſpecies, only four of which are natives of Britain, the *officinalis*, the *locuſta*, the *rubra*, the *dioica*; of theſe only the officinalis is uſeful. The root of this plant is perennial: the ſtalk is upright, ſmooth, channelled, round, branched, and riſes from two to four feet in height: the leaves on the ſtem are placed in pairs upon ſhort broad ſheathes; they are compoſed of ſeveral lance-ſhaped, partially dentated, veined, ſmooth pinnæ, with an odd one at the end, which is the largeſt: the floral leaves are ſpear-ſhaped and pointed; the flowers are ſmall, of a white or purpliſh colour, and terminate the ſtem and branches in large bunches. It flowers in June, and commonly grows about hedges and woods.

Woodville's Medical Botany.

It is ſuppoſed to be the φὰ of Dioſcorides and Galen, by whom it is mentioned as an aromatic and diuretic: it was firſt brought into eſtimation in convulſive affections by Fabius Columna, who relates that he cured himſelf of an epilepſy by the root of this plant: we are told, however, that Columna ſuffered a relapſe of the diſorder; and no further accounts of the efficacy of valerian in epilepſy followed till thoſe publiſhed by Dominicus Panarolus fifty years afterwards, in which three caſes of its ſucceſs are given. To theſe may be added many other inſtances of the good effects of valerian root in this diſeaſe, ſince publiſhed by Cruger, Schuchmann, Riverius, Sylvius, Marchant, Chomel, Sauvages, Tiſſot, and others.

The advantages ſaid to be derived from this root in epilepſy cauſed it to be tried in ſeveral other complaints termed *nervous*, particularly thoſe produced by increaſed mobility and irritability of the nervous ſyſtem, in which it has been found highly ſerviceable. Bergius ſtates its virtues to be antiſpaſmodic, diaphoretic, emmenagogue, diuretic, anthelmintic. The root in ſubſtance is moſt effectual, and is uſually given in powder from a ſcruple to a dram: its unpleaſant flavour may be concealed by a ſmall addition of mace. A tincture of valerian in proof ſpirit and in volatile ſpirit are ordered in the London Pharmacopœia.—Cats are very fond of the ſmell of this root, and ſeem to be intoxicated by it.

VALERIUS MAXIMUS, a Latin hiſtorian, ſprung from the families of the Valerii and Fabii, which made him take the name of *Valerius Maximus*. He ſtudied polite literature, and afterwards followed Sextus Pompey to the wars. At his return he compoſed an account of the actions and remarkable ſayings of the Romans and other great men; and dedicated that work to the emperor Tiberius. Many of the learned think that this is the ſame that is now extant, and bears the name of Valerius Maximus; but others maintain, that what we have now is only an abridgment of the work written by this celebrated hiſtorian, and that this abridgment was made by one Nepotian of Africa. However, this work is well written, and contains a great number of memorable actions performed by the Greeks and Romans that are worthy of being read.

Valet ‖ Vanbrugh.

VALET, a French term, uſed as a common name for all domeſtic men-ſervants employed in the more ſervile offices, as grooms, footmen, coachmen, &c. But with us it is only uſed in the phraſe *valet de chambre*, which is a ſervant whoſe office is to dreſs and undreſs his maſter, &c.

VALETTA, a city of Malta, and capital of the iſland (ſee MALTA, n° 26). It is ſituated in E. Long. 14. 34. N. Lat. 35. 54.

VALETUDINARY, among medical writers, denotes a perſon of a weak and ſickly conſtitution, and frequently out of order.

VALID, in law, an appellation given to acts, deeds, tranſactions, &c. which are clothed with all the formalities requiſite to their being put into execution, and to their being admitted in a court of juſtice.

VALLADOLID, an ancient, large, and handſome city of Spain, in Old Caſtile, and capital of a principality of the ſame name, with a biſhop's ſee and an univerſity. It is ſurrounded with ſtrong walls, embelliſhed with handſome buildings, large public ſquares, piazzas, and fountains. It is large and populous, containing 11,000 houſes, with fine long and broad ſtreets, and large high houſes, adorned with balconies. The market-place, called *El Campo*, is 700 paces in circumference, ſurrounded with a great number of convents, and is the place where the fairs are kept. There is another ſquare in the middle of the city, ſurrounded with handſome brick houſes, having under them piazzas, where people may walk dry in all weathers. Within theſe piazzas merchants and tradeſmen keep their ſhops. All the houſes are of the ſame height, being four ſtories; and there are balconies at every window, of iron gilt. In the whole there are 70 monaſteries and nunneries; the fineſt of which is that of the Dominicans, remarkable for its church, which is one of the moſt magnificent in the city. The kings reſided a long while at this place; and the royal palace, which ſtill remains, is of very large extent, though but two ſtories high; within are fine paintings of various kinds, and at one of the corners a curious clock, made in the ſame manner as that of Straſburg. The houſe of the inquiſition is an odd ſort of ſtructure, for there are no windows, but a few holes to let in the light. The evirons of the city are a fine plain, covered with gardens, orchards, vineyards, meadows, and fields. It is ſeated on the rivers Eſcurva and Peſuerga, in W. Long. 4. 25. N. Lat. 41. 50.

VALUE, in commerce, denotes the price or worth of any thing.

VALVE, in hydraulics, pneumatics, &c. is a kind of lid or cover of a tube or veſſel ſo contrived as to open one way, but which, the more forcibly it is preſſed the other way, the cloſer it ſhuts the aperture; ſo that it either admits the entrance of a fluid into the tube or veſſel, and prevents its return; or admits its eſcape, and prevents its re-entrance.

VALVE, in anatomy, a thin membrane applied on ſeveral cavities and veſſels of the body, to afford a paſſage to certain humours going one way, and prevent their reflux towards the place from whence they came.

VAMPYRE, a ſpecies of bat. See VESPERTILIO.

VAN, a term derived from the French *avant*, or *avaunt*, ſignifying before or foremoſt of any thing; thus we ſay, the van-guard of the army, &c.

VANBRUGH (Sir John), a celebrated Engliſh dramatic writer and architect, was deſcended of a family in Che-

Vandellia ‖ Vandyck.

shire which came from France, though by his name he appears to have been originally of Dutch extraction. He was born about the middle of the reign of Charles II. and received a liberal education. His first comedy, called the *Relapse* or *Virtue in Danger*, was acted in the year 1697 with great applause; which gave him such encouragement, that he wrote eleven more comedies. He was the friend of Mr Congreve, whose genius was naturally turned for dramatic performances; and these two gave new life to the English stage, and restored its reputation, which had been for some time sinking: but their making vicious persons their most amiable and striking characters, and their bordering too much on obscenity, could be of no service to the cause of virtue; and therefore it was not without reason that they were attacked by Mr Collier, in his piece on the Immorality and Profaneness of the Stage. However, either the reputation Sir John gained by his comedies, or his skill in architecture, procured him very considerable advantages. He was appointed Clarencieux king at arms, which he afterwards disposed of. In 1716 he was appointed surveyor of the works at Greenwich hospital; he was likewise made comptroller-general of his majesty's works, and surveyor of all the gardens and waters. He was an able architect; but his performances in that way are esteemed heavy. Under his direction were raised Blenheim-house in Oxfordshire, Claremont in Surry, and his own house at Whitehall. He died of a quinsey in 1726.

VANDELLIA, in botany; a genus of plants belonging to the class *didynamia* and order *angiospermia*. The calyx is subquadrifid; the corolla ringent; the two exterior filaments proceed from the disc of the lip of the corolla; the antheræ are connected; the capsule is unilocular and polyspermous. There is only one species known, the *diffusa*.

VAN-DIEMEN'S LAND. See DIEMEN.

VANDYCK (Sir Anthony), a celebrated painter, was born at Antwerp in the year 1599. It is said that Vandyck's mother was passionately fond of embroidery, that she excelled in it, and embroidered several historical subjects with such surprising skill, that they have been esteemed masterpieces by proficients in that art. Being desirous to have her son instructed in the first rudiments of grammar, she began by sending him to school to learn reading and writing. As he had ink, paper, and pens, at command, he amused himself more with drawing figures and other slight sketches, than with making letters. One day his master having threatened to whip one of his school-fellows, Vandyck positively assured him, that he need not fear his master's threats, as he would take care to prevent his receiving the threatened correction.—"How so?" replied his school-fellow, "I'll paint (replied Vandyck) a face on your posteriors;" which he did with such skill, that when the master drew up the curtain, he laughed so immoderately that he forgave the culprit. After giving several early proofs of his excellent genius, he became the disciple of the illustrious Rubens. In the church of the Augustines at Antwerp, at the high altar, is a celebrated picture of Rubens, representing, in one part, the Virgin Mary sitting with the child Jesus in her lap, and in another part several saints, male and female, standing. The breast of one of these, St Sebastian, is said to have been painted by Vandyck when he was only a disciple of Rubens. This great master being engaged one day abroad, his disciples went into his painting-room, where, after having been some time employed in admiring his works, they began to play or romp in such a manner, that the breast of St Sebastian, which was not yet dry, was brushed away by a hat thrown at random. This accident put an end to their play: they were very anxious to restore it, fearing that if Rubens discovered it they should all be discarded. At length it was agreed that Anthony should undertake to mend the saint's breast. In short, taking his master's pallet and brushes, he succeeded so well, that his companions imagined Rubens would overlook it. They were mistaken; for Rubens at his return knew immediately that some one had touched upon his performance: calling his disciples, he asked them why any one had dared to meddle with his painting? They were some time doubtful whether they should confess or deny the fact. Threats at length prevailed: they owned that Vandyck had thrown his hat upon it. Upon this, closeting Vandyck, instead of chiding him, he told him, that "it was proper and even necessary for him to travel into Italy, the only school that produced excellent painters; and that, if he would take his advice, he would arrive at the highest perfection." Vandyck replyed, that "he was very desirous of it; but that his purse was not equal to such a journey, and that he feared he should be obliged to sell his hat on the road." Rubens assured him that that should be his concern; and accordingly, a few days after, he made him a present of a purse full of pistoles, and added to that gift a dapple grey horse, of great beauty, to carry him thither. In return for this, Vandyck painted his master a chimney-piece; and afterwards set out for Italy, about the year 1621, being then about 21 or 22 years of age. Having staid a short time at Rome, he removed to Venice, where he attained the beautiful colouring of Titian, Paul Veronese, and the Venetian school, which appeared from the many excellent pictures he drew at Genoa. Vandyck.

After having spent a few years abroad, he returned to Flanders, with so noble, so easy, and natural a manner of painting, that Titian himself was hardly his superior; and no other master could equal him in portraits. Soon after his return, he accidentally met with D. Teniers, who accosted him with great politeness, and asked him whether he had much business since he came from Rome? "What business, think you, can I have had time to do (replied Vandyck)? I am only just arrived here. Would you believe, that I offered to draw that fat brewer's picture who just passed by us for two pistoles, and that the looby laughed in my face, saying it was too dear? I assure you, that if the cards do not turn up better, I shall make no long stay at Brussels." Soon after this, he painted those two famous pictures, the Nativity and a dying Christ; the first in the parish church, the second in that of the Capuchins, at Termond.

When he was in Holland he was very desirous to see Francis Hals the painter, who had great reputation then for portraits. On entering his room, he asked to have his picture drawn. Hals, who knew Vandyck only by fame, undertook it, and went to work. The latter seeing his head finished, rose up, saying, that it was a striking likeness. Afterwards he proposed to Hals, that if he would sit in return, he would also draw his picture; to which Hals having agreed, merely from curiosity, exclaimed, on seeing his picture so soon finished, "Thou art the devil, or else Vandyck." This picture of Hals has been engraved by Coster at the Hague.

Vandyck, finding he could not make a fortune in his own country, took a resolution of going over into England. Accordingly he borrowed some guineas of Teniers, and set out, furnished with letters of recommendation. His superior genius soon brought him into great reputation; and above all, he excelled in portraits, which he drew with an inconceivable facility, and for which he charged a very high price, according to the instructions which had been given him on that head. Is is affirmed, that for some of them he received 400 guineas apiece. He soon found himself loaded with honours and riches; and as he had a noble and generous heart, he made a figure suitable to his fortune. He married one of the fairest ladies of the English court, a daughter of the lord Ruthven,

Vane ‖ Vapours.

Ruthven, earl of Gowry; and, though ſhe had but little fortune, maintained her with a grandeur anſwerable to her birth. He himſelf was generally richly dreſſed; his coaches and equipage were magnificent, and his retinue was numerous; his table was elegant, and plentifully furniſhed; and he often entertained his gueſts after dinner with a concert performed by the beſt Engliſh muſicians of London. In ſhort, his houſe was ſo frequented by perſons of the greateſt quality of both ſexes, that his apartments rather reſembled the court of a prince than the lodgings of a painter. Notwithſtanding this expence, he amaſſed great wealth; when a chemiſt had the art to inſinuate himſelf into his eſteem, and inſpired him with a deſire of converting copper into gold: but the ſecret had no other effect, than making him convert his gold into ſmoke. Rubens being informed of it, wrote to his diſciple: he acknowledged his error, and corrected it. At length Vandyck being at an early age ſubject to the gout, it undermined him by degrees, and carried him to the grave in the year 1641, at the age of 42. He was buried in St Paul's: and left to his heirs a conſiderable eſtate, which ſome have made to amount to 40,000l. ſterling.

VANE, a thin ſlip of bunting hung to the maſt-head, or ſome other conſpicuous place in the ſhip, to ſhow the direction of the wind. It is commonly ſewed upon a wooden frame called the *ſtock*, which contains two holes whereby to ſlip over the ſpindle, upon which it turns about as the wind changes.

VANILLA, or VANILLO. See EPIDENDRUM.

VAPOUR, in philoſophy, the particles of bodies rarefied by heat, and thus rendered ſpecifically lighter than the atmoſphere, in which they riſe to a conſiderable height. See EVAPORATION, DAMP, GAS, &c.

Many kinds of vapour are unfriendly to animal life, but the moſt noxious are thoſe which ariſe from metallic ſubſtances. In the ſmelting and refining of lead, a white vapour ariſes, which, falling upon the graſs in the neighbourhood, imparts a poiſonous quality to it, ſo that the cattle which feed there will die; and in like manner ſtagnant waters impregnated with this vapour will kill fiſh. In ſome places the earth exhales vapours of a very noxious quality: ſuch as the Grotto del Cani, and other places in Italy, where a mephitic vapour conſtantly hovers over the ſurface of the ground, proving inſtantly fatal to ſuch animals as are immerſed in it. In ſome parts of the world there have been inſtances of people killed, and almoſt torn to pieces, by a vapour ſuddenly burſting out of the earth under their feet.

Of the aqueous vapour raiſed from the earth by the ſun's heat are formed the clouds; but though theſe are commonly at no great diſtance from the earth, we cannot from thence determine the height to which the vapours aſcend. Indeed, conſidering the great propenſity of water, and even quickſilver, to evaporate in the moſt perfect vacuum we can make, it is by no means probable that any limit can be fixed for this aſcent. See WEATHER.

VAPOURS, noxious, method of diſſipating. The following ingenious method of diſſipating the noxious vapours commonly found in wells and other ſubterraneous places, is related in the Tranſ. Philadel. by Mr Robinſon of Philadelphia the inventor. After various unſucceſsful trials (ſays he), I was led to conſider how I could convey a large quantity of freſh air from the top to the bottom of the well, ſuppoſing that the foul would neceſſarily give way to the pure air. With this view I procured a pair of ſmith's bellows, fixed in a wooden frame, ſo as to work in the ſame manner as at the forge. This apparatus being placed at the edge of the well, one end of a leathern tube (the hoſe of a fire-engine) was cloſely adapted to the noſe of the bellows, and the other end was thrown into the well, reaching within one foot of the bottom. At this time the well was ſo infected, that a candle would not burn at a ſhort diſtance from the top; but, after blowing with my bellows only half an hour, the candle burned bright at the bottom; then, without farther difficulty, I proceeded in the work, and finiſhed my well. Wells are often made in a very ſlight manner, owing to the difficulty of working in them, and there have been ſeveral fatal inſtances of the danger attending the workmen; but, by the above method, there is neither difficulty nor danger in completing the work with the utmoſt ſolidity. It is obvious, that in cleanſing vaults, and working in any other ſubterraneous place, ſubject to damps as they are called, the ſame method muſt be attended with the ſame beneficial effect."

Vapours ‖ Variations.

VAPOURS, in medicine, a diſeaſe properly called *hyps*, or the *hypochondriacal diſeaſe*; and in men particularly, the *ſpleen*. See MEDICINE, n° 276 and 321.

VAPOUR-Bath, in chemiſtry, a term applied to a chemiſt's bath or heat, wherein a body is placed ſo as to receive the fumes of boiling water. It conſiſts of two veſſels, diſpoſed over one another in ſuch manner as that the vapour raiſed from the water contained in the lower heats the matter incloſed in the upper. It is very commodious for the diſtilling of odoriferous waters, and the drawing of ſpirit of wine.

We alſo uſe the term *vapour-bath*, when a ſick perſon is made to receive the vapours ariſing from ſome liquid matter placed over a fire. Many contrivances have been propoſed for this purpoſe; and their expediency and utility are beſt known to thoſe who are converſant in this buſineſs. A late writer has ſuggeſted a new conſtruction of vapour baths; and the whole apparatus is reduced to a tin-boiler, tin pipes wrapped in flannel, and a deal box with a cotton cover, for the reception of the body and circulation of the vapour.

VARI, in medicine, little, hard, and ruddy tumors, which frequently infeſt the faces of young perſons of a hot temperament of body.

VARIATION *of the compaſs*, is the deviation of the magnetic or mariner's needle from the meridian or true north and ſouth line. On the continent it is called the *declination* of the magnetic needle; and this is a better term, for reaſons which will appear by and by.

Our readers know, that the needle of a mariner's compaſs is a ſmall magnet, exactly poiſed on its middle, and turning freely in a horizontal direction on a ſharp point, ſo that it always arranges itſelf in the plane of the magnetic action. We need not add any thing on this head to what has been delivered in the articles COMPASS and *Azimuth COMPASS*.

About the time that the polarity of the magnet was firſt obſerved in Europe, whether originally, or as imported from China, the magnetic direction, both in Europe and in China, was nearly in the plane of the meridian. It was therefore an ineſtimable preſent to the mariner, giving him a ſure direction in his courſe through the pathleſs ocean. But by the time that the European navigators had engaged in their adventurous voyages to far diſtant ſhores, the deviation of the compaſs needle from the meridian was very ſenſible even in Europe; and it is ſomewhat ſurpriſing that the Dutch and Portugueſe navigators did not obſerve it on their own coaſts. The ſon of Columbus poſitively ſays, that it was obſerved by his father in his firſt voyage to America, and made his companions ſo anxious leſt they ſhould not find the way back again to their own country, that they mutinied and refuſed to proceed. It is ſurpriſing that any ſhould doubt of its being known to this celebrated navigator, becauſe he even endeavours to account for it by ſuppoſing the needle always to point to a fixed point of the heavens, different from the pole of the world, which he calls

Variation. the *point attractive*. It is at any rate certain that Gonzales Oviedo and Sebaſtian Cabot obſerved it in their voyages. Indeed it could not poſſibly eſcape them; for in ſome parts of their ſeveral tracks the needle deviated above 25 degrees from the meridian; and the rudeſt dead reckoning, made on the ſuppoſition of the needle pointing due north and ſouth, muſt have thrown the navigators into the utmoſt confuſion. It would indeed be very difficult for them, unprepared for this ſource of error, to make any tolerable gueſs at its quantity, till they get to ſome place on ſhore, where they could draw a meridian line. But we know that ſpherical trigonometry was at that time abundantly familiar to the mathematicians of Europe, and that no perſon pretended to take the command of a ſhip bound to a diſtant port that was not much more informed in this ſcience than moſt maſters of ſhips are now-a-days. It could not be long, therefore, before the methods were given them for diſcovering the variation of the compaſs by obſervation of AMPLITUDES and AZIMUTHS, as is practiſed at preſent (ſee each of theſe articles). But the deviation of the compaſs from the meridian was not generally allowed by mathematicians, who had not yet become ſenſible of the neceſſity of quitting the Ariſtotelean trammels, and inveſtigating nature by experiments. They rather choſe to charge the navigators with inaccuracy in their obſervations than the ſchoolmen with error in principles. Pedro de Medina at Valladolid, in his *Arte de Naviggar*, publiſhed in 1545, poſitively denies the variation of the compaſs. But the concurring reports of the commanders of ſhips on diſtant voyages, in a few years, obliged the landſmen in their cloſets to give up the point; and Martin Cortez, in a treatiſe of navigation, printed at Seville before 1556, treats it is a thing completely eſtabliſhed, and gives rules and inſtruments for diſcovering its quantity. About the year 1580 Norman publiſhed his diſcovery of the *dip* of the needle, and ſpeaks largely of the horizontal deviation from the plane of the meridian, and attributes it to the attraction of a point, not in the heavens, but in the earth, and deſcribes methods by which he hoped to find its place. To the third, and all the ſubſequent editions of Norman's book (called the *new attractive*), was ſubjoined a diſſertation by Mr Burroughs, comptroller of the navy, on the variation of the compaſs, in which are recorded the quantity of this deviation in many places; and he laments the obſtacle which it cauſes to navigation by its total uncertainty previous to obſervation. The author indeed offers a ſort of rule for computing it *a priori*, founded on ſome conjecture as to its cauſe; but, with the modeſty and candour of a gentleman, acknowledges that this is but a gueſs, and intreats all navigators to be aſſiduous in their obſervations, and liberal in communicating them to the public; conjuring them to conſider, that an intereſted regard to their own private advantage, by concealing their knowledge, may prove the ſhipwreck of thouſands of brave men. Accordingly obſervations were liberally contributed from time to time, and were publiſhed in the ſubſequent treatiſes on navigation.

But in 1635 the mariners were thrown into a new and great perplexity, by the publication of a *Diſcourſe mathematical on the variation of the Magnetical Needle*, by Mr Henry Gillebrand, Greſham profeſſor of aſtronomy. He had compared the variations obſerved at London by Burroughs, Gunter, and himſelf, and found that the north end of the mariner's needle was gradually drawing more to the weſtward. For Norman and Burroughs had obſerved it to point about $11\frac{1}{2}$ degrees to the eaſt of the north in 1580; Gunter found its deviation only $6\frac{1}{4}$ in 1622, and he himſelf had obſerved only 4° in 1634; and it has been found to deviate more and more to the weſtward ever ſince, as may be ſeen from the following little table in Waddington's Navigation. Variation.

	London.	
1576	Norman	11°15′ Eaſt.
1580	Burroughs	11. 17
1622	Gunter	6. 12
1634	Gillebrand	4. 5
1662		0. 0
1666	Sellers	0.34 Weſt
1670		2.06
1672		2.30
1700		9.40
1720		13.—
1740		16.10
1760		19.30
1774		22.20
1778	Phil. Tranſ.	22.11

Mr Bond, teacher of mathematics in London, and employed to take care of and improve the impreſſions of the popular treatiſes of navigation, about the year 1650, declared, in a work called the "Seaman's Kalendar," that he had diſcovered the true progreſs of the deviation of the compaſs; and publiſhed in another work, called the "Longitude Found," a table of the variation for 50 years. This was, however, a very gratuitous ſort of prognoſtication, not founded on any well-grounded principles; and though it tallied very well with the obſervations made in London, which ſhowed a gradual motion to the weſtward at the rate of—.12′ annually, by no means agreed with the obſervations made in other places. See Phil. Tranſ. 1668.

But this glad news to navigators ſoon loſt its credit; for the inconſiſtency with obſervation appeared more and more every day, and all were anxious to diſcover ſome general rule, by which a near gueſs at leaſt might be made as to the direction of the needle in the moſt frequented ſeas. Mr Halley, one of the firſt geometers and moſt zealous philoſophers of the laſt century, recommended the matter in the moſt earneſt manner to the attention of government; and, after much unwearied ſolicitation, obtained a ſhip to be ſent on a voyage of diſcovery for this very purpoſe. He got the command of this ſhip, in which he repeatedly traverſed the Atlantic Ocean, and went as far as the 50th degree of ſouthern latitude. See his very curious ſpeculations on this ſubject in the Phil. Tranſ. 1683 and 1692.

After he had collected a prodigious number of obſervations made by others, and compared them with his own, he publiſhed in 1700 a ſynoptical account of them in a very ingenious form of a ſea-chart, where the ocean was croſſed by a number of lines paſſing through thoſe planes where the compaſs had the ſame deviation. Thus, in every point of one line there was no variation in 1700; in every point of another line the compaſs had 20 degrees of eaſt variation; and in every point of a third line it had 20° of weſt variation. Theſe lines have ſince been called *Halleyan lines*, or curves. This chart was received with univerſal applauſe, and was undoubtedly one of the moſt valuable preſents that ſcience has made to the arts. But though recommended with all the earneſtneſs which its importance merited, it was offered with the candour and the caution that characteriſes a real philoſopher ardently zealous for the propagation of true knowledge. Its illuſtrious author reminds the public of the inaccuracy of obſervations collected from every quarter, many of them made by perſons not ſufficiently inſtructed, nor provided with proper inſtruments; many alſo without dates, and moſt of them differing in their dates, ſo that ſome reduction was neceſſary for all, in order to bring them to a common epoch; and this muſt be made without having

Variation. having an unqueſtionable principle on which to proceed. He ſaid, that he plainly ſaw that the change of variation was very different in different places, and in the ſame place at different times; and confeſſes that he had not diſcovered any general principle by which theſe changes could be connected.

Halley's *Variation Chart*, however, was of immenſe uſe; but it became gradually leſs valuable, and in 1745 was exceedingly erroneous. This made Meſſrs Mountaim and Dodſon, fellows of the Royal Society, apply to the admiralty and to the great trading companies for permiſſion to inſpect their records, and to extract from them the obſervations of the variations made by their officers. They got all the aſſiſtance they could demand; and, after having compared above 50,000 obſervations, they compoſed new variation charts, fitted for 1745 and 1756.

The polarity of the magnetic needle, and a general tho' intricate connection between its poſitions in all parts of the world, naturally cauſes the philoſopher to ſpeculate about its cauſe. We ſee that Cortez aſcribed it to the attraction of an eccentric point, and that Bond thought that this point was placed not in the heavens, but in the earth. This notion made the baſis of the famous Theory of Magnetiſm of Dr Gilbert of Colcheſter, the firſt ſpecimen of experimental philoſophy which has been given to the public. It was publiſhed about the year 1600: he was an intimate acquaintance of the great experimental philoſopher lord Bacon, and proceeded entirely according to the plan laid down by that illuſtrious leader in his *Novum Organum Scientiarum*.

Gilbert aſſerted that the earth was a great magnet, and that all the phenomena of the mariner's compaſs were the effects of this magnetiſm. He ſhowed at leaſt that theſe phenomena were preciſely ſuch as would reſult from ſuch a conſtitution of the earth; that is, that the poſitions of the mariner's needle in different parts of the earth were preciſely the ſame with thoſe of a ſmall magnet ſimilarly ſituated with reſpect to a very large one. Although he had made more magnetic experiments than all that had gone before him put together, ſtill the magnetical phenomena were but ſcantily known till long after. But Gilbert's theory (for ſo it muſt be truly eſteemed) of the magnetical phenomena is now completely confirmed. The whole of it may be underſtood from the following general propoſition.

Plate DXIII. Let NS (fig. 1) be a magnet, of which N is the north and S the ſouth pole: Let *n s* be any oblong piece of iron, poiſed on a point *c* like a compaſs needle. It will arrange itſelf in a poſition *n c s* preciſely the ſame with that which would be aſſumed by a compaſs needle of the ſame ſize and ſhape, having *n* for its north and *s* its ſouth pole. And while the piece of iron remains in this poſition, it will be in all reſpects a magnet ſimilar to the real compaſs needle. The pole *n* will attract the ſouth pole of a ſmall magnetiſed needle, and repel its north pole. If a paper be held over *n s*, and fine iron-filings be ſtrewed on it, they will arrange themſelves into curves iſſuing from one of its ends and terminating at the other, in the ſame manner as they will do when ſtrewed on a paper held over a real compaſs needle. But this magnetiſm is quite temporary; for if the piece of iron *n s* be turned the other way, placing *n* where *s* now is, it will remain there, and will exhibit the ſame phenomena. We may here add, that if *n s* be almoſt infinitely ſmall in compariſon of NS, the line *n s* will be in ſuch a poſition that if *s a*, *s b*, be drawn parallel to N *c*, S *c*, we ſhall have *s a* to *s b* as the force of the pole N to the force of the pole S. And this is the true cauſe of that curious diſpoſition of iron-filings when ſtrewed round a magnet. Each fragment becomes a momentary magnet, and arranges itſelf in the true magnetic direction; and when ſo arranged, attracts the two adjoining fragments, and co-operates with the forces, which alſo arrange them. We throw this out to the ingenious mechanician as the foundation of a *complete* theory of the magnetical phenomena. When the filings are infinitely fine, the curves N *c* S have this property, that, drawing the tangent *n c s*, we always have *s a* : *s b* = force of N : force of S; and thus we may approximate at pleaſure to the law of magnetic attraction and repulſion. The public may expect to have ſoon a theory of magnetiſm founded on this principle, and applied with the completeſt ſucceſs to every phenomenon yet obſerved. Variation.

Now, to apply this theory to the point in hand.—Let *n s* (fig. 2.) be a ſmall compaſs needle, of which *n* is the north and *s* the ſouth pole: let this needle be poiſed horizontally on the pin *c d*; and let *n' s'* be the poſition of the *dipping needle*. Take any long bar of common iron, and hold it upright, or nearly ſo, as repreſented by AB. The lower end B will repel the pole *n* and will attract the pole *s*, thus exhibiting the properties of a north pole of the bar AB. Keeping B in its place, turn the bar round B' as a centre, till it come into the poſition A' B' nearly parallel to *n' s'*. You will obſerve the compaſs needle *n s* attract the end B' with either pole *n* or *s*, when B'A' is in the poſition B' *a* perpendicular to the direction *n' s'* of the dipping needle: and when the bar has come into the poſition B' A', the upper end B' will ſhow itſelf to be a ſouth pole by attracting *n* and repelling *s*. This beautiful experiment was exhibited to the Royal Society in 1673 by Mr Hindſhaw.

From this it appears, that the great magnet in the earth induces a momentary magnetiſm on ſoft iron preciſely as a common magnet would do. Therefore (ſays Dr Gilbert) it induces permanent magnetiſm on magnetiſable ores of iron, ſuch as loadſtones, in the ſame manner as a great loadſtone would do; and it affects the magnetiſm already imparted to a piece of tempered ſteel preciſely as any other great magnet would.

Therefore the needle of the mariner's compaſs in every part of the world arranges itſelf in the magnetic direction, ſo that, if poiſed as a dipping needle ſhould be, it will be a tangent to one of the curves N *c* S of fig. 1. The horizontal needle being ſo poiſed as to be capable of playing only in a horizontal plane, will only arrange itſelf *in the plane* of the triangle N *c* S. That end of it which has the ſame magnetiſm with the ſouth pole S of the great magnet included in the earth will be turned towards its north pole N. Therefore what we call the north pole of a needle or magnet really has the magnetiſm of the ſouth pole of the great primitive magnet. If the line NS be called the axis, and N and S the poles of this great magnet, the plane of any one of theſe curves N *c* S will cut the earth's ſurface in the circumference of a circle, great or ſmall according as the plane does or does not paſs through the centre of the earth.

Dr Halley's firſt thought was, that the north pole of the great magnet or loadſtone which was included in the bowels of the earth was not far from Baffin's Bay, and its ſouth pole in the Indian ocean ſouth-weſt from New Zealand. But he could not find any poſitions of theſe two poles which would give the needle that particular poſition which it was obſerved to aſſume in different parts of the world; and he concluded that the great terreſtrial loadſtone had four irregular poles (a thing not unfrequent in natural loadſtones, and eaſily producible at pleaſure), two of which are ſtronger and two weaker. When the compaſs is at a great diſtance from the two north poles, it is affected ſo as to be directed nearly in a plane paſſing through the ſtrongeſt. But if we approach it much more to the weakeſt, the greater vicinity will compenſate for the ſmaller abſolute force of the weak pole, and occaſion conſiderable irregularities. The appearances are favourable to this opinion. If this be the real con-

Variation. conſtitution of the great magnet, it is almoſt a deſperate taſk to aſcertain by computation what will be the poſition of the needle. Halley ſeems to have deſpaired; for he was both an elegant and a moſt expert mathematician, and it would have coſt *him* little trouble to aſcertain the places of two poles only, and the direction which theſe would have given to the needle. But to ſay what would be its poſition when acted on by four poles, it was neceſſary to know the law by which the magnetic action varied by a variation of diſtance; and even when this is known, the computation would have been exceedingly difficult.

In order to account for the change of variation, Dr Halley ſuppoſes this internal magnet not to adhere to the external ſhell which we inhabit, but to form a nucleus or kernel detached from it on all ſides, and to be ſo poiſed as to revolve freely round an axis, of which he hoped to diſcover the poſition by obſervation of the compaſs. The philoſopher will find nothing in this ingenious hypotheſis inconſiſtent with our knowledge of nature. Dr Halley imagined that the nucleus revolved from eaſt to weſt round the ſame axis with the earth. Thus the poles of the magnet would change their poſitions relatively to the earth's ſurface, and this would change the direction of the compaſs needle.

The great Euler, whoſe delight it was always to engage in the moſt difficult mathematical reſearches and computations, undertook to aſcertain the poſition of the needle in every part of the earth. His diſſertation on this ſubject is to be ſeen in the 13th volume of the Memoirs of the Royal Academy of Berlin, and is exceedingly beautiful, abounding in thoſe analytical *tours d'adreſſe* in which he ſurpaſſed all the world. He has reduced the computation to a wonderful ſimplicity.

He found, however, that four poles would engage him in an analyſis which would be exceſſively intricate, and has contented himſelf with computing for two only; obſerving that this ſuppoſition agrees ſo well with obſervation, that it is highly probable that this is the real conſtitution of the terreſtrial magnet, and that the coincidence would have been perfect if he had hit on the due poſitions of the two poles. He places one of them in lat. 76° north, and long. 96° weſt from Teneriffe. The ſouth pole is placed in lat. 58° ſouth, and long. 158° weſt from Teneriffe. Theſe are their ſituations for 1757.—Mr Euler has annexed to his diſſertation a chart of Halleyan curves ſuited to theſe aſſumptions, and fitted to the year 1757.

It muſt be acknowledged, that the *general* courſe of the variations according to this theory greatly reſembles the real ſtate of things; and we cannot but own ourſelves highly indebted to this great mathematician for having made ſo fine a firſt attempt. He has improved it very conſiderably in another diſſertation in the 22d volume of theſe memoirs. But there are ſtill ſuch great differences, that the theory is of no ſervice to the navigator, and it only ſerves as an excellent model for a farther proſecution of the ſubject. Since that time another large variation chart has been publiſhed, fitted to a late period; but the public has not ſufficient information of the authorities or obſervations on which it is founded.

The great object in all theſe charts is to facilitate the diſcovery of a ſhip's longitude at ſea. For the lines of variation being drawn on the chart, and the variation and the latitude being obſerved at ſea, we have only to look on the chart for the interſection of the parallel of obſerved latitude and the Halleyan curve of obſerved variation. This interſection muſt be the place of the ſhip. This being the purpoſe, the Halleyan lines are of great ſervice; but they do not give us a ready conception of the direction of the needle. We have always to *imagine* a line drawn through the point, cutting the meridian in the angle correſponding to the Halleyan line. We ſhould learn the general magnetic affections of the globe much better if a number of magnetic meridians were drawn. Theſe are the interſections of the earth's ſurface with planes paſſing through the magnetical axis, cutting one another in angles of 5° or 10°. This would both ſhow us the places of the magnetic poles much more clearly, and would, in every place, ſhow us at once the direction of the needle. In all thoſe places where theſe magnetical curves touch the meridians, there is no variation; and the variation in every other place is the angle contained between theſe magnetical meridians and the true ones. Variation.

The program of a work of this kind has been publiſhed by a Mr Churchman, who appears to have engaged in the inveſtigation with great zeal and conſiderable opportunities. He had been employed in ſome operations connected with ſurveys of the back ſettlements in North America. It is pretty certain that the north magnetic pole (or point, as Mr Churchman chooſes to call it) is not far removed from the ſtations given it by Halley and Euler; and there ſeems no doubt but that in the countries between Hudſon's Bay and the weſtern coaſts of North America the needle will have every poſition with reſpect to the terreſtrial meridian, ſo that the north end of a compaſs needle will even point due ſouth in ſeveral places. Mr Churchman has ſolicited aſſiſtance from all quarters, to enable him to traverſe the whole of that inhoſpitable country with the compaſs in his hand. It were greatly to be wiſhed that our gracious ſovereign, who has always ſhown ſuch a love for the promotion of nautical ſcience, and who has ſo munificently contributed to it, already enriching the world with the moſt valuable diſcoveries, and thus laying poſterity under unſpeakable obligations; it were greatly to be wiſhed that he would put this almoſt finiſhing ſtroke to the noble work, and enable Mr Churchman, or ſome fitter perſon, if ſuch can be found, to proſecute this moſt intereſting inquiry. Almoſt every thing that can be deſired would be obtained by a few *well choſen* obſervations made in thoſe regions. It would be of immenſe advantage to have the *dips* aſcertained with great preciſion. Theſe would enable us to judge at what depth under the ſurface the pole is ſituated; for the well informed mechanician, who will ſtudy ſeriouſly what we have ſaid about the magnetical curves, will ſee that a compaſs needle, when compared with the great terreſtrial magnet, is but as a particle of iron-filings compared to a very large artificial magnet. Therefore, from the poſition of the dipping needle, we may infer the place of the pole, if the law of magnetic action be given; and this law may be found by means of other experiments which we could point out.

Mr Churchman has adopted the opinion of only two poles. According to him, the north pole lies (in 1800) in Lat. 58° N. and Long. 134° weſt from Greenwich, very near Cape Fair-weather; and the ſouth pole lies in Lat. 58° S. and Lon. 165° E. from Greenwich. He alſo imagines that the north pole has moved to the eaſtward, on a parallel of latitude, about 65° ſince the beginning of laſt century (from 1600), and concludes that it makes a revolution in 1096 years. The ſouthern pole has moved leſs, and completes its revolution in 2289 years. This motion he aſcribes to ſome influences which he calls *magnetic tides*, and which he ſeems to conſider as celeſtial. This he infers from the changes of variation. He announces a phyſical theory on this ſubject, which, he ſays, enables him to compute the variation with preciſion for any time paſt or to come; and he even gives the proceſs of trigonometrical computation illuſtrated by examples. But as this publication (entitled *The Magnetic Atlas*, publiſhed for the Author, by Darton and Harvey, 1794) is only a program, he expreſſes himſelf obſcurely,

VARIATION. Plate DXIII.

Variation. obſcurely, and ſomewhat enigmatically, reſpecting his theory, waiting for encouragement to make the obſervations which are neceſſary for completing it. He has, in the mean time, accompanied his account of the theory with a chart, in the form of guſſets, for covering a globe of 15 inches diameter, objecting very juſtly to the great diſtortion which Wright's charts occaſion in every part near the poles. This diſtortion is ſuch as totally to change the appearance of the curves in thoſe very places where their appearance and magnitude are of the greateſt moment.

Mr Churchman has alſo accompanied his work with the returns which he has received from ſeveral perſons eminent for their rank or learning, to whom he had applied for encouragement and aſſiſtance. They are polite, but, we think, not ſo encouraging as ſuch zeal in ſuch a cauſe had good reaſon to expect. We acknowledge that there are circumſtances which juſtify caution in promiſes of this nature. His profers are very great, and not qualified with any doubt. Some of his proofs are not very convincing, and there are ſome conſiderable defects in the ſcientific part. He ſpeaks in ſuch terms of the magnetic influences as plainly lead us to conclude that they reſemble, in effect at leaſt, the ordinary actions of magnets. He ſpeaks of the influence of one pole being greater than that of the other; and ſays, that in this caſe the magnetic equator, where the needle will be parallel to the axis, will not be in the middle between the poles. This is true of a common magnet. He muſt therefore abide by this ſuppoſition in its other conſequences. The magnetic meridians muſt be planes paſſing through this axis, and therefore muſt be circles on the ſurface of the earth. This is incompatible with the obſervations; nay, his charts are ſo in many places, particularly in the Pacific Ocean, where the variations by his chart are three times greater than what has been obſerved.—His parallels of dip are ſtill more different from obſervation, and are incompatible with any phenomena that could be produced by a magnet having but two poles. His rules of computation are exceedingly exceptionable. He has in fact but one example, and that ſo particular, that the mode of computation will not apply to any other. This circumſtance is not taken notice of in the enunciation of his firſt problem; and the reader is made to imagine that he has got a rule for computing the variation, whereas all the rules of calculation are only running in a circle. The variation computed for the port of St Peter and Paul in Kamtſchatka, by the rule, is ten times greater than the truth. This is like the artifice of a book-maker. We do not meet with any addition to our knowledge on the ſubject. The author ſeems to know ſomething of Euler's merit; but inſtead of proſecuting the ſubject in his way, he gives us an unintereſting account of the ſurmiſes of a number of obſcure writers about the difficulty of the taſk; and we think that Mr Churchman has left us as much in the dark as ever. The obſervation of the connection of the polarity of the needle with the aurora borealis occurred to the writer of this article as early as 1759, when a midſhipman on board the Royal William in the river St Laurence. Some of the gentlemen of the quarter deck are ſtill alive, and may remember this circumſtance being pointed out to them one evening, when at anchor off the Iſle aux Coudres, during a very brilliant aurora borealis. The point of the heavens to which all the rays of light converged was preciſely that which was oppoſite to the ſouth end of the dipping-needle. The obſervation was inſerted in the St James's Chronicle, and afterwards (about 1776) in the London Chronicle, with a requeſt to navigators to take notice of it, and communicate their obſervations.

For our own part, we have little hopes of this problem ever being ſubjected to accurate calculation. We believe, Variation. indeed, that there is a coſmical change going on in the earth, which will produce a progreſſive change in the variation of the needle; and we ſee none more likely than Dr Halley's notion. There is nothing repugnant to our knowledge of the univerſe on the ſuppoſition of a magnetic nucleus revolving within this earth; and it is very eaſy to conceive a very ſimple motion of revolution, which ſhall produce the very motion of the ſenſible poles which Mr Churchman contends for. We need only ſuppoſe that the magnetical axis of this nucleus is not its axis of revolution. It may not even biſect that axis; and this circumſtance will cauſe the two poles to have different degrees of motion in relation to the ſhell which ſurrounds it.

But this regular progreſs of the magnet within the earth may produce very irregular motions of the compaſs needle, by the intervention of a third body ſuſceptible of magnetiſm. The theory of which we have juſt given a hint comes here to our aſſiſtance. Suppoſe NS (fig. 3.) to repreſent the primitive magnet in the earth, and *n s* to be a ſtratum of iron-ore ſuſceptible of magnetiſm. Alſo let *n' s'* be another ſmall maſs of a ſimilar ore; and let their ſituations and magnitudes be ſuch as is exhibited in the figure. The fact will be, that *n* will be the north pole and *s* the ſouth pole of the great ſtratum, and *n'* and *s'* will be the north and ſouth poles of the ſmall maſs or loadſtone. Any perſon may remove all doubts as to this, by making the experiment with a magnet NS, a piece of iron or ſoft tempered ſteel *n s*, and another piece *n's'*. The well informed and attentive reader will eaſily ſee, that by ſuch interventions every conceiveable anomaly may be produced. While the great magnet makes a revolution in any direction, the needle will change its poſition gradually, and with a certain regularity; but it will depend entirely on the ſize, ſhape, and ſituation, of theſe intervening maſſes of magnetiſable iron-ore, whether the change of variation of the compaſs ſhall be ſuch as the primitive magnet alone would have produced, or whether it ſhall be of a kind wholly different.

Now, that ſuch intervening diſturbances *may* exiſt, is paſt contradiction. We know that even on the film of earth which we inhabit, and with which only we are acquainted, there are extenſive ſtrata or otherwiſe diſpoſed maſſes of iron-ores in a ſtate ſuſceptible of magnetiſm; and experiments made on bars of hard tempered ſteel, and on bits of ſuch ores, aſſure us that the magnetiſm is not induced on ſuch bodies in a moment, but propagated gradually along the maſs.—That ſuch diſturbances do actually exiſt, we have many relations. There are many inſtances on record of very extenſive magnetic rocks, which affect the needle to very conſiderable diſtances. The iſland of Elbe in the Mediterranean is a very remarkable inſtance of this. The iſland of Cannay alſo, on the weſt of Scotland, has rocks which affect the needle at a great diſtance.

A ſimilar effect is obſerved near the Feroe Iſlands in the North ſea; the compaſs has no determined direction when brought on ſhore. *Journ. des Sçavans*, 1679, p. 174.

In Hudſon's Straits, in latitude 63°, the needle has hardly polarity. *Ellis's Voyage to Hudſon's Bay.*

Bouguer obſerved the ſame thing in Peru. Nay, we believe that almoſt all rocks, eſpecially of whin or trappe ſtone, contain iron in a proper ſtate.

All this refers only to the thin cruſt through which the human eye has occaſionally penetrated. Of what may be below we are ignorant; but when we ſee appearances which tally ſo remarkably with what would be the effects of great maſſes of magnetical bodies, modifying the general and regularly progreſſive action of a primitive magnet, whoſe exiſtence and motion is inconſiſtent with nothing that we know

of

Variation. of this globe, this manner of accounting for the obſerved change of variation has all the probability that we can deſire. Nay, we apprehend that very conſiderable changes may be produced in the direction of the compaſs needle even without the ſuppoſition of any internal motion. If the great magnet reſembles many loadſtones we are acquainted with, having more than two poles, we know that theſe poles will act on each other, and gradually change each other's force, and conſequently the direction of the compaſs. This proceſs, to be ſure, tends to a ſtate of things which will change no more. —But the period of human hiſtory, or of the hiſtory of the race of Adam, may make but a ſmall part of the hiſtory of this globe; and therefore this objection is of little force.

There can be no doubt of the operation of the general terreſtrial magnetiſm on every thing ſuſceptible of magnetic properties; and we cannot heſitate to explain in this way many changes of magnetic direction which have been obſerved. Thus, in Italy, Father de la Torré obſerved, that during a great eruption of Veſuvius the variation was 16° in the morning, at noon it was 14°, and in the evening it was 10°, and that it continued in that ſtate till the lava grew ſo dark as no longer to be viſible in the night; after which it ſlowly increaſed to 13½, where it remained. Daniel Bernoulli found the needle change its poſition 45′ by an earthquake. Profeſſor Muller at Manheim obſerved that the declination of the needle in that place was greatly affected by the earthquake in Calabria. Such ſtreams of lava as flowed from Hekla in the laſt dreadful eruption muſt have made a transference of magnetic matter that would conſiderably affect the needle. But no obſervations ſeem to have been made on the occaſion; for we know that common iron-ſtone, which has no effect on the needle, will, by mere cementation with any inflammable ſubſtance, become magnetic. In this way Dr Knight ſometimes made artificial loadſtones.—But theſe are partial things, and not connected with the general change of variation now under conſideration.

We have ſaid ſo much on this ſubject, chiefly with the view of cautioning our readers againſt too ſanguine expectations from any pretenſions to the ſolution of this great problem. We may certainly gather from theſe obſervations, that even although the theory of the variation ſhould be completed, we muſt expect (by what we already know of magnetiſm in general) that the diſturbances of the needle, by local cauſes intervening between it and the great influence by which it is chiefly directed, may be ſo conſiderable as to affect the poſition of the compaſs needle in a very ſenſible manner: for we know that the metallic ſubſtances in the bowels of the earth are in a ſtate of continual change, and this to an extent altogether unknown.

There is another irregularity of the mariner's needle that we have taken no notice of, namely, the daily variation. This was firſt obſerved by Mr. George Graham in 1722 (*Philoſophical Tranſactions*, n° 383), and reported to the Royal Society of London. It uſually moves (at leaſt in Europe) to the weſtward from 8 morning till 2 P. M. and then gradually returns to its former ſituation. The diurnal variations are ſeldom leſs than 0° 5′, and often much greater. Mr Graham mentions (*Philoſophical Tranſactions*, n° 428) ſome obſervations by a captain Hume, in a voyage to America, where he found the variation greateſt in the afternoon. This being a general phenomenon, has alſo attracted the attention of philoſophers. The moſt detailed accounts of it to be met with are thoſe of Mr Canton, in *Philoſophical Tranſactions*, Vol. LI. Part 1. p. 399, and thoſe of Van Swinden, in his *Treatiſe on Electricity and Magnetiſm*.

It appears from Canton's obſervations, that although there be great irregularities in this diurnal change of poſition of the mariner's needle, there is a certain average, which Variation. is kept up with conſiderable ſteadineſs. The following table ſhows the average of greateſt daily change of poſition in the different months of the year, obſerved in Mr Canton's houſe, Spital Square, in 1759.

January	7′. 8″	July	13′ .14″
February	8 .58	Auguſt	12 .19
March	11 .27	Sept.	11 .43
April	12 .26	October	10 .36

June	13 .21	Dec.	6 .58

Mr Canton attempts to account for theſe changes of poſition, by obſerving that the force of a magnet is weakened by heat. A ſmall magnet being placed near a compaſs needle, ENE from it, ſo as to make it deflect 45° from the natural poſition, the magnet was covered with a braſs veſſel, into which hot water was poured. The needle gradually receded from the magnet ¼ths of a degree, and returned gradually to its place as the water cooled. This is confirmed by uniform experience.

The parts of the earth to the eaſtward are firſt heated in the morning, and therefore the force of the earth is weakened, and the needle is made to move to the weſtward. But as the ſun warms the weſtern ſide of the earth in the afternoon, the motion of the needle muſt take the contrary direction.

But this way of explaining by a change in the force of the earth ſuppoſes that the changing cauſe is acting in oppoſition to ſome other force. We do not know of any ſuch. The force, whatever it is, ſeems ſimply to produce its own effect, in deranging the needle from the direction of terreſtrial magnetiſm. If Æpinus's theory of magnetic action be admitted, *viz.* that a bar of ſteel has magnetiſm induced on it by propelling the quieſcent and mutually repelling particles of magnetic fluid to one end, or attracting them to the other, we may ſuppoſe that the ſun acts on the earth as a magnet acts on a piece of ſoft iron, and in the morning propels the fluid in the north-weſt parts. The needle directs itſelf to this conſtipated fluid, and therefore it points to the eaſtward of the magnetic north in the afternoon. And (to abide by the ſame theory) this induced magnetiſm will be ſomewhat greater when the earth is warmer; and therefore the diurnal variation will be greateſt in ſummer. This change of poſition of the conſtipated fluid muſt be ſuppoſed to bear a very ſmall ratio to the whole fluid, which is naturally ſuppoſed to be conſtipated in one pole of the great magnet in order to give it magnetiſm. Thus we ſhall have the diurnal variation of a very ſmall quantity. This is departing, however, from the principle of Mr Canton's explanation; and indeed we cannot ſee how the weakening the general force of the terreſtrial magnet ſhould make any change in the needle in reſpect to its direction; nor does it appear probable that the change of temperature produced by the ſun will penetrate deep enough to produce any ſenſible effect on the magnetiſm. And if this be the caſe, we think that the derangements of the needle ſhould vary as the thermometer varies, which is not true. The other method of explaining is much better, if Æpinus's theory of magnetic attraction and repulſion be juſt; and we may ſuppoſe that it is only the ſecondary magnetiſm (*i. e.* that of the magnetiſable minerals) that is ſenſibly affected by the heat; this will account very well for the greater mobility of the fluid in ſummer than in winter.

A great objection to either of theſe explanations is the prodigious diverſity of the diurnal variations in different places. This is ſo very great, that we can hardly aſcribe the diurnal variation to any change in the magnetiſm of the primitive

Variation, Variety.

primitive terreſtrial magnet, and muſt rather look for its cauſe in local circumſtances. This concluſion becomes more probable, when we learn that the deviation from the meridian and the deviation from the horizontal line are not affected at the ſame time. Van Swinden aſcribes them ſolely to changes produced on the needles themſelves. If their magnetiſm be greatly deranged by the ſun's poſition, it may throw the magnetic centre away from the centre of the needle's motion, and thus may produce a very ſmall change of poſition. But if this be the cauſe, we ſhould expect differences in different needles. Van Swinden ſays, that there are ſuch, and that they are very great; but as he has not ſpecified them, we cannot draw any concluſion.

But, beſides this regular diurnal variation, there is another, which is ſubjected to no rule. The aurora borealis is obſerved (in Europe) to diſturb the needle exceedingly, ſometimes drawing it ſeveral degrees from its poſition. It is always obſerved to increaſe its deviation from the meridian, that is, an aurora borealis makes the needle point more weſterly. This diſturbance ſometimes amounts to ſix or ſeven degrees, and is generally obſerved to be greateſt when the aurora borealis is moſt remarkable.

This is a very curious phenomenon, and we have not been able to find any connection between this meteor and the poſition of a magnetic needle. It is to be obſerved, that a needle of copper or wood, or any ſubſtance beſides iron, is not affected. We long thought it an electric phenomenon, and that the needle was affected as any other body balanced in the ſame manner would be; but a copper needle would then be affected. Indeed it may ſtill be doubted whether the aurora borealis be an electric phenomenon. They are very frequent and remarkable in Sweden; and yet Bergman ſays, that he never obſerved any electric ſymptoms about them, though in the mean time the magnetic needle was greatly affected.

We ſee the needle frequently diſturbed both from its general annual poſition, and from the change made on it by the diurnal variation. This is probably the effect of auroræ boreales which are inviſible, either on account of thick weather or day light. Van Swinden ſays, he ſeldom or never failed to obſerve auroræ boreales immediately after any anomalous motion of the needle; and concluded that there had been one at the time, though he could not ſee it. Since no needle but a magnetic one is affected by the aurora borealis, we may conclude that there is ſome natural connection between this meteor and magnetiſm. This ſhould farther incite us to obſerve the circumſtance formerly mentioned, *viz.* that the ſouth end of the dipping needle points to that part of the heavens where the rays of the aurora appear to converge. We wiſh that this were diligently obſerved in places which have very different variation and dip of the mariner's needle.

For the diurnal and this irregular variation, conſult the Diſſertations of Celſius and of Hiorter, in the *Memoirs of Stockholm*; Wargentin, *Philoſophical Tranſactions*, Vol. 48. Braun (*Comment. Petropol. Novi*, T. V. VII. IX); Graham and Canton as above.

VARIETY, a change, ſucceſſion, or difference, in the appearance or nature of things; in oppoſition to *uniformity*.

Variety, in botany, is a change in ſome leſs eſſential part or quality; as colour, ſize, pubeſcence or age.—Externally; by the plaiting or interweaving of the branches—by bundling or uniting of ſeveral ſtalks into one broad flat one; by the greater breadth, or narrowneſs, or curling of leaves—by becoming awnleſs, or ſmooth, or hirſute. Internally; by becoming mutilated in the corolla; or having one larger than ordinary—by luxuriancy, multiplication, or fulneſs—by becoming proliferous, or creſted—by bearing bulbs inſtead of ſeeds—or being viviparous.

Variola ‖ Varniſh.

The uſual cauſes of variation are, climate, ſoil, expoſure, heat, cold, winds, culture.

VARIOLA, the Small-pox. See Medicine, n° 222.—224.

VARIX, in medicine, the dilatation of a vein, ariſing from the too great abundance or thickneſs of the blood.

VARNISH, a clear limpid fluid, capable of hardening without loſing its tranſparency, uſed by painters, gilders, &c. to give a luſtre to their works, to preſerve them and defend them from the air.

A coat of varniſh ought to poſſeſs the following properties: 1. It muſt exclude the action of the air; becauſe wood and metals are varniſhed to defend them from decay and ruſt. 2. It muſt reſiſt water; for otherwiſe the effect of the varniſh could not be permanent. 3. It ought not to alter ſuch colours as are intended to be preſerved by this means. It is neceſſary therefore that a varniſh ſhould be eaſily extended or ſpread over the ſurface, without leaving pores or cavities; that it ſhould not crack or ſcale; and that it ſhould reſiſt water. Now reſins are the only bodies that poſſeſs theſe properties. Reſins conſequently muſt be uſed as the baſes of varniſh. The queſtion which of courſe preſents itſelf muſt then be, how to diſpoſe them for this uſe? and for this purpoſe they muſt be diſſolved, as minutely divided as poſſible, and combined in ſuch a manner that the imperfections of thoſe which might be diſpoſed to ſcale may be corrected by others.

Reſins may be diſſolved by three agents. 1. By fixed oil. 2. By volatile oil. 3. By alcohol. And accordingly we have three kinds of varniſh: the fat or oily varniſh, eſſential varniſh, and ſpirit varniſh. Before a reſin is diſſolved in a fixed oil, it is neceſſary to render the oil drying. For this purpoſe the oil is boiled with metallic oxides; in which operation the mucilage of the oil combines with the metal, while the oil itſelf unites with the oxigene of the oxide. To accelerate the drying of this varniſh, it is neceſſary to add oil of turpentine. The eſſential varniſhes conſiſt of a ſolution of reſin in oil of turpentine. The varniſh being applied, the eſſential oil flies off, and leaves the reſin. This is uſed only for paintings. When reſins are diſſolved in alcohol, the varniſh dries very ſpeedily, and is ſubject to crack; but this fault is corrected by adding a ſmall quantity of turpentine to the mixture, which renders it brighter, and leſs brittle when dry.

We ſhall now give the method of preparing a number of varniſhes for different purpoſes.

A Varniſh for Toilet-boxes, Caſes, Fans, &c.—Diſſolve two ounces of gum maſtich and eight ounces of gum ſandarach in a quart of alcohol; then add four ounces of Venice turpentine.

A Varniſh for Wainſcots, Cane-chairs, Iron-chairs, Grates.—Diſſolve in a quart of alcohol eight ounces of gum ſandarach, two ounces of ſeed lac, four ounces of roſin; then add ſix ounces of Venice turpentine. If the varniſh is wiſhed to produce a red colour, more of the lac and leſs of ſandarach ſhould be uſed, and a little *dragon's blood* ſhould be added. This varniſh is ſo thick that two layers of it are equal to four or five of another.

A Varniſh for Fiddles, and other Muſical Inſtruments.—Put four ounces of gum ſandarach, two ounces of lac, two ounces of gum maſtich, an ounce of gum elemi, into a quart of alcohol, and hang them over a ſlow fire till they are diſſolved; then add two ounces of turpentine.

Varniſh in order to employ Vermilion for painting Equipages.—Diſſolve in a quart of alcohol ſix ounces of ſandarach, three

Varniſh. three ounces of gum lac, and four ounces of roſin: afterwards add ſix ounces of the cheapeſt kind of turpentine; mix with it a proper quantity of vermilion when it is to be uſed.

Gold-coloured Varniſh.—Pound ſeparately four ounces of ſtick lac, four ounces of gamboge, four ounces of dragon's blood, four ounces of anotta, and one ounce of ſaffron: put each of them ſeparately into a quart of alcohol, and expoſe them for five days in a narrow-mouthed bottle to the ſun, or keep them during that time in a very warm room, ſhaking them every now and then to haſten the ſolution. When they are all melted, mix them together. More or leſs of each of theſe ingredients will give the different tints of gold according as they are combined. In order to make ſilver imitate gold exactly when covered with this varniſh, the quantity of ingredients muſt be ſomewhat greater. The method of gilding ſilver-leaf, &c. with this varniſh is as follows: The ſilver-leaf being fixed on the ſubject, in the ſame manner as gold-leaf, by the interpoſition of proper glutinous matters, the varniſh is ſpread upon the piece with a bruſh or pencil. The firſt coat being dry, the piece is again and again waſhed over with the varniſh till the colour appears ſufficiently deep. What is called *gilt leather*, and many picture-frames, have no other than this counterfeit gilding. Waſhing them with a little rectified ſpirit of wine affords a proof of this; the ſpirit diſſolving the varniſh, and leaving the ſilver leaf of its own whiteneſs. For plain frames, thick tin-foil may be uſed inſtead of ſilver. The tin-leaf, fixed on the piece with glue, is to be burniſhed, then poliſhed with emery and a fine linen cloth, and afterwards with putty applied in the ſame manner: being then lacquered over with the varniſh five or ſix times, it looks very nearly like burniſhed gold. The ſame varniſh, made with a leſs proportion of the colouring materials, is applied alſo on works of braſs; both for heightening the colour of the metal to a reſemblance with that of gold, and for preſerving it from being tarniſhed or corroded by the air.

Oil Varniſhes.—Gum copal and amber are the ſubſtances principally employed in oil varniſhes; they poſſeſs the properties neceſſary for varniſhes, ſolidity and tranſparency.—The copal being whiteſt, is uſed for varniſhing light, the amber for dark colours. It is beſt to diſſolve them before mixing them with the oil, becauſe by this means they are in leſs danger of being ſcorched, and at the ſame time the varniſh is moſt beautiful. They ſhould be melted in a pot on the fire; they are in a proper ſtate for receiving the oil when they give no reſiſtance to the iron ſpatula, and when they run off from it drop by drop. The oil employed ſhould be a drying oil, and perfectly free from greaſe. It ſhould be poured into the copal or amber by little and little, conſtantly ſtirring the ingredients at the ſame time with the ſpatula. When the oil is well mixed with the copal or amber, take it off the fire; and when it is pretty cool, pour in a greater quantity of the eſſence of turpentine than the oil that was uſed. After the varniſh is made, it ſhould be paſſed through a linen cloth. Oil varniſhes become thick by keeping; but when they are to be uſed, it is only neceſſary to pour in a little eſſence of turpentine, and to put them for a little on the fire. The turpentine is neceſſary in oil varniſhes to make them dry properly; generally twice as much of it is uſed as of oil. Leſs is neceſſary in ſummer than in winter. Too much oil hinders the varniſh from drying; but when too little is uſed, it cracks and does not ſpread properly. We ſhall ſubjoin the moſt uſeful oil varniſhes:

White Copal Varniſh.—On 16 ounces of melted copal pour four, ſix, or eight ounces of linſeed oil, boiled and quite free from greaſe. When they are well mixed, take them off the fire (not forgetting to ſtir them properly); and when pretty cool, pour in ſixteen ounces of the eſſence of Venice turpentine. Paſs the varniſh through a cloth.—Amber varniſh is made in the ſame way. Varniſh.

Black Varniſh for Coaches and Iron Work.—This varniſh is compoſed of bitumen of Paleſtine, roſin, and amber, melted ſeparately, and afterwards mixed; the oil is then added, and afterwards the turpentine, as directed above. The uſual proportions are, 12 ounces of amber, two ounces of roſin, two ounces of bitumen, ſix of oil, and 12 of the eſſence of turpentine.—Golden-coloured varniſh may be made alſo by ſubſtituting linſeed oil for alcohol.

Eſſential Oil Varniſhes.—The only eſſential oil varniſhes uſed are for pictures. Picture varniſhes ſhould be white, light, and quite tranſparent, which will preſerve the colours without giving them any diſagreeable tint; and it ſhould be poſſible to take them off the picture without injuring it. They are uſually made of gum maſtich and turpentine diſſolved together in ſome eſſential oil. The varniſh is paſſed through a cloth, and allowed to clarify. It is applied cold to the picture.

Varniſh for Glaſs, in order to preſerve it from the Rays of the Sun.—Pulveriſe a quantity of gum adragant, and let it diſſolve for 24 hours in the white of eggs, well beat up; then rub it gently on the glaſs with a bruſh.

Varniſhes before they are uſed ſhould be carefully kept from duſt, which would ſpoil them; and they ſhould be kept in a veſſel quite clean and dry. When uſed, they ſhould be lifted lightly with a bruſh, and ſpread upon a ground altogether free from dirt and moiſture. The ſubſtance, after being varniſhed, ſhould be expoſed to the heat of the ſun, or placed in a warm room covered with a glaſs caſe, to keep out all filth. Oil varniſhes require more heat than alcohol varniſhes. The varniſh ſhould be put on very quickly, making great ſtrokes with the pencil or bruſh, taking care that theſe ſtrokes never croſs one another; it ſhould be ſpread equally, and never thicker than a leaf of paper; a ſecond coat ſhould not be put on till the firſt is quite dry. If the varniſh, after being put on, becomes dull and uneven, it muſt be taken off entirely, and new varniſh put on.

When wainſcot is to be varniſhed, it is firſt painted of a wooden colour. This colour is made by infuſing in water either red or yellow ochre (according to the colour wiſhed for), terra ombria (a kind of ochre) and white lead; into this as much as neceſſary is put of *parchment paſte*. Two thin coats of this are to be put on, and, after they are quite dry, the varniſh.

Varniſhes are poliſhed with pumice-ſtone and tripoli earth. The pumice-ſtone muſt be reduced to an impalpable powder, and put upon a piece of ſerge moiſtened with water; with this the varniſhed ſubſtance is to be rubbed lightly and equally. The tripoli muſt alſo be reduced to a very fine powder, and put upon a clean woollen cloth moiſtened with olive oil, with which the poliſhing is to be performed. The varniſh is then to be wiped with ſoft linen, and, when quite dry, cleaned with ſtarch or Spaniſh white, and rubbed with the palm of the hand or with a linen cloth.

To recover colours or varniſh, and to take off the dirt and filth which may adhere to them, a ley is uſed made of potaſh and the aſhes of lees of wine. Take 48 ounces of potaſh, and 16 of the above-mentioned aſhes, and put them into ſix quarts of water, and the ley is made: inſtead of the aſhes an equal quantity of potaſh would probably do as well. To clean dirty colours, dilute ſome of this ley with four times its quantity of water, and rub the picture with it; then waſh it with river water; and when dry, give it a

coat

Varniſh. coat or two of varniſh. In order to take off a varniſh, waſh it with the above mentioned ley, then with water, and then lift it off the ſubſtance on which it was with any iron inſtrument.—We ſhall finiſh this article with a deſcription of the famous Chineſe varniſh. Varniſh.

The Chineſe varniſh is not a compoſition, but a reſin which exudes from a tree called in China *tſi-chu*, "varniſh tree." This tree grows in ſeveral provinces of the ſouthern parts of China. The Chineſe take the following method of propagating this tree: In ſpring they chooſe a vigorous ſhoot about a foot in length, which proceeds immediately from the trunk; and coat over the lower part, by which it adheres to the tree, with a kind of yellow earth, at leaſt three inches in thickneſs. This coat is carefully covered with a mat, to defend it from the rain, and the injuries of the air. Towards the autumnal equinox they detach a little of the earth, to obſerve in what condition the ſmall roots are, which begin to ſpring forth from the ſhoot. If they find that the filaments which compoſe them are of a reddiſh colour, they judge it is time to make an amputation; but they defer it if the roots are white, becauſe this colour ſhows that they are yet too tender: they then cloſe up the coat again, and wait till the ſpring following. When the ſhoot is ſeparated from the trunk of the tree, it is put into the earth; but in whatever ſeaſon it is planted, whether in ſpring or autumn, great care muſt be taken to put plenty of cinders into the hole prepared for it; without this precaution the ants would deſtroy the yet tender roots, or at leaſt deprive them of all their moiſture, and cauſe them to decay.

The Chineſe do not procure varniſh from the tſi-chu until its trunk is nearly five inches in diameter, which ſize it ſeldom attains to before ſeven or eight years. Varniſh extracted from a tree ſmaller or of leſs age would not have the ſame body and ſplendor. This liquor diſtils only in the night-time, and during the ſummer ſeaſon. To cauſe the gum to flow, they make ſeveral rows of inciſions round the trunk, the number of which is proportioned to the vigour of the tree. The firſt row is ſeven inches from the earth, and the reſt are at the ſame diſtance one from the other, and continue to the top of the trunk, and even ſometimes on the boughs which are of a ſufficient ſtrength and ſize. The Chineſe uſe a crooked iron for making theſe inciſions, which muſt run a little obliquely, and be equal in depth to the thickneſs of the bark; they make them with one hand, and with the other hold a ſhell, the edges of which they inſert into the opening, where it remains without any ſupport. Theſe inciſions are made towards evening, and next morning they collect the varniſh which has fallen into the ſhells; the following evening they are again inſerted, and this operation is continued until the end of ſummer. A thouſand trees yield almoſt in one night 20 pounds of varniſh.

While the varniſh diſtils, it exhales a malignant vapour, the bad effects of which can only be prevented by preſervatives and great precaution. The merchant who employs the workmen is obliged to keep by him a large vaſe filled with rape-oil, in which a certain quantity of thoſe fleſhy filaments have been boiled that are found in hog's lard, and which do not melt. When the workmen are going to fix the ſhells to the trees, they carry ſome of this oil along with them, and rub their face and hands with it, which they do with greater care when they collect in the morning the varniſh that has diſtilled during night. After eating, they waſh their whole bodies with warm water, in which the bark of the cheſnut-tree, fir-wood, cryſtalliſed ſaltpetre, and ſome other drugs, have been boiled. When they are at work near the trees, they put upon their heads a ſmall cloth bag in which there are two holes, and cover the fore part of their bodies with a kind of apron made of doe-ſkin, which is ſuſpended from their necks with ſtrings, and tied round them with a girdle. They alſo wear boots, and have coverings on their arms, made of the ſame kind of ſkin. The labourer who ſhould attempt to collect varniſh without uſing this precaution, would ſoon be puniſhed for his raſhneſs, and the moſt dreadful effects would enſue. The diſorder ſhows itſelf by tetters, which become of a bright red colour, and ſpread in a very ſhort time; the body afterwards ſwells, and the ſkin burſts and appears covered with an univerſal leproſy. The unhappy wretch could not long endure the excruciating pains which he feels, did he not find a ſpeedy remedy in thoſe preſervatives which are uſed againſt the malignant and noxious exhalations of the varniſh.

The ſeaſon of collecting varniſh being ended, the merchant puts it into ſmall caſks cloſely ſtopped. A pound of it newly made coſts him about one ſhilling and eight pence Sterling; but he gains *cent. per cent.* upon it, and ſometimes more, according to the diſtance of the place to which he tranſports it.

Beſides the luſtre and beauty which that varniſh gives to many of the Chineſe manufactures, it has alſo the property of preſerving the wood upon which it is laid, eſpecially if no other matter be mixed with it. It prevents it from being hurt either by dampneſs or worms.

Every workman has a particular art and method of uſing the varniſh. This work requires not only much ſkill and dexterity, but alſo great attention, to obſerve the proper degree of fluidity which the gum ought to have, as it muſt be neither too thick nor too liquid when it is laid on. Patience above all is neceſſary in thoſe who wiſh to ſucceed. To be properly varniſhed, a work muſt be done at leiſure; and a whole ſummer is ſcarcely ſufficient to bring it to perfection. It is therefore rare to ſee any of thoſe cabinets which are imported to us from Canton ſo beautiful and durable as thoſe manufactured in Japan, Tong-king, and Nang-king, the capital of the province of Kiang-nan: not that the artiſts do not employ the ſame varniſh; but as they work for Europeans, who are more eaſily pleaſed, they do not take the trouble of giving the pieces which come from their hands all the poliſh they are capable of receiving.

There are two methods of laying on the varniſh; the ſimpleſt is, when it is immediately laid on the wood. The work is firſt poliſhed, and then daubed over with a kind of oil which the Chineſe call *tong-yeou*. When this oil is dry, it receives two or three coats of varniſh; which remain ſo tranſparent, that all the ſhades and veins of the wood may be ſeen through them. If the artiſt is deſirous of entirely concealing the ſubſtance on which they are laid, nothing is neceſſary but to add a few more coats; theſe give the work a ſhining ſurface, the ſmoothneſs of which equals that of the moſt beautiful ice. When the work is dry, various figures are painted upon it in gold and ſilver, ſuch as flowers, birds, trees, temples, dragons, &c. A new coat of varniſh is then ſometimes laid over theſe figures, which preſerves them, and adds much to their ſplendor. The ſecond method requires more preparation. The Chineſe workmen fix to the wood by means of glue a kind of paſteboard, compoſed of paper, hemp, lime, and other ingredients, well beaten, that the varniſh may incorporate with them. Of this they make a ground perfectly ſmooth and ſolid, over which the varniſh is laid in thin coats, that are left to dry one after the other.

It often happens, that the luſtre of varniſhed tables and other pieces of furniture is inſenſibly deſtroyed by tea and warm liquors. "The ſecret of reſtoring to varniſh its ſhin-

Varniſh, Varro.

ning black colour (ſays a Chineſe author) is to expoſe it for one night to a white hoar-froſt, or to cover it ſome time with ſnow." For a method of imitating *Chineſe varniſh*, ſee TURNING.

VARNISH alſo ſignifies a ſort of ſhining coat, wherewith potter's ware, delft-ware, china-ware, &c. are covered, which gives them a ſmoothneſs and luſtre. Melted lead is generally uſed for the firſt, and ſmalt for the ſecond. See GLAZING.

VARNISH, among medaliſts, ſignifies the colours antique medals have acquired in the earth.

The beauty which nature alone is able to give to medals, and art has never yet attained to counterfeit, enhances the value of them: that is, the colour which certain ſoils in which they have a long time lain tinges the metals withal: ſome of which are blue, almoſt as beautiful as the torquoiſe; others with an inimitable vermilion colour; others with a certain ſhining poliſhed brown, vaſtly finer than Braſil figures.

The moſt uſual varniſh is a beautiful green, which hangs to the fineſt ſtrokes without effacing them, more accurately than the fineſt enamel does on metals.

No metal but braſs is ſuſceptible of this; for the green ruſt that gathers on ſilver always ſpoils it, and it muſt be got off with vinegar or lemon juice.

Falſifiers of medals have a falſe or modern varniſh, which they uſe on their counterfeits, to give them the appearance or air of being antique. But this may be diſcovered by its ſoftneſs; it being ſofter than the natural varniſh, which is as hard as the metal itſelf.

Some depoſit their ſpurious metals in the earth for a conſiderable time, by which means they contract a ſort of varniſh, which may impoſe upon the leſs knowing; others uſe ſal ammoniac, and others burnt paper.

VARRO (Marcus Terentius), the moſt learned of all the Romans, was born 28 years B. C. He was a ſenator of the firſt diſtinction, both for birth and merit; and bore many great offices. He was an intimate friend of Cicero; and this friendſhip was confirmed and immortalized by a mutual dedication of their learned works to each other. Thus Cicero dedicated his Academic Queſtions to Varro; and Varro dedicated his treatiſe on the Latin tongue to Cicero. In the civil wars he was zealouſly attached to Pompey; but after his defeat ſoon ſubmitted to Cæſar, who was reconciled to him. Afterwards he applied his whole time to letters, and had the charge of the Greek and Latin libraries at Rome. He was above 70 when Antony proſcribed him; however, he found means to eſcape and ſave his life, though he could not ſave ſome of his works and his library from being plundered by the ſoldiers. After this ſtorm was over, he purſued his ſtudies as uſual; and Pliny relates, that he continued to ſtudy and to write when he was 88 years of age. He was 80 when he wrote his three books *De re Ruſtica*, which are ſtill extant. Five of his books *De lingua Latina*, which he addreſſed to Cicero, are alſo extant. There remain, too, divers fragments of his works, particularly of his Menippean Satires, which are medleys of proſe and verſe; and Scalliger has collected ſome of his epigrams from among the *Catalecta Virgilii*. His books *De lingua Latina*, and *De re Ruſtica*, were printed with the notes of Joſeph Scaliger, Turnebus, and Victorius, by Henry Stephens at Paris 1573, in 8vo, and have been publiſhed ſeparately ſince among the *Auctores de lingua Latina*, and the *Auctores de re Ruſtica*.

There was another Varro of antiquity, called *Atacinus*, who was born about 10 years after the firſt, at a ſmall town near Narbonne. Though infinitely below the Roman in learning, he was at leaſt as good, if not a better, poet; which perhaps has made Lilius Gyraldus and other critics confound them. He compoſed many works in verſe; ſome fragments of which were collected, and publiſhed with thoſe of other ancient poets, at Lyons in 1603. His chief works were, A poem on the war with the Sequani, a people of Gaul; and the Aſtronomics, that went under the name of Planciades the grammarian. But the *Argonautics*, in four books, was what gained him the greateſt reputation: and though indeed nothing but a tranſlation of Apollonius Rhodius, yet was ſo well done as to be commended by Quintilian.

Varronia ‖ Vaudois.

VARRONIA, in botany: A genus of plants belonging to the claſs of *pentandria*, and to the order of *monogynia*; and arranged in the natural ſyſtem under the 41ſt order, *Aſperifoliæ*. The corolla is quinquifid; the fruit a drupa, with a quadrilocular kernel. There are ſix ſpecies; none of which are natives of Britain.

VASCULAR, ſomething conſiſting of divers veſſels, as arteries, veins, &c.

VASE, a term frequently uſed for ancient veſſels dug from under ground, or otherwiſe found, and preſerved in the cabinets of the curious. In architecture, the appellation *vaſe* is alſo given to thoſe ornaments placed on corniches, fochles, or pedeſtals, repreſenting the veſſels of the ancients, particularly thoſe uſed in ſacrifice, as incenſe-pots, flower-pots, &c. See *PORTLAND-Vaſe*.

VASSAL, in our ancient cuſtoms, ſignified a tenant or feudatory; or perſon who vowed fidelity and homage to a lord, on account of ſome land, &c. held of him in fee; alſo a ſlave or ſervant, and eſpecially a domeſtic of a prince.—*Vaſſallus* is ſaid to be *quaſi inferior ſocius*; as the vaſſal is inferior to his maſter, and muſt ſerve him; and yet he is in a manner his companion, becauſe each of them is obliged to the other. See *FEODAL-Syſtem*.

VATICAN, a magnificent palace of the Pope, in Rome, which is ſaid to conſiſt of ſeveral thouſand rooms; but the parts of it moſt admired, are the grand ſtaircaſe, the pope's apartment, and eſpecially the library, which is one of the richeſt in the world, both in printed books and manuſcripts.

VAUBAN (Sebaſtian le Preſtre, ſeigneur de), marſhal of France, and the greateſt engineer that country ever produced, was born 1633. He diſplayed his knowledge of fortification in the courſe of many ſieges, and his ſervices were rewarded with the firſt military honours. He was made governor of Liſle, in 1668, commiſſary-general of the fortifications of France in 1678, governor of the maritime parts of Flanders in 1689, and a marſhal of France in 1703. He died in 1707, after having brought the arts of attacking and defending fortified places to a degree of perfection unknown before. His writings on theſe ſubjects are in the higheſt eſteem.

VAUDOIS, VALDENSES, or *Waldenſes*, in eccleſiaſtical hiſtory, a name given to a ſect of reformers, who made their firſt appearance about the year 1160.

The origin of this famous ſect, according to Moſheim, was as follows: Peter, an opulent merchant of Lyons, ſurnamed *Valdenſis*, or *Validiſius*, from Vaux or Waldum, a town in the marquiſate of Lyons, being extremely zealous for the advancement of true piety and Chriſtian knowledge, employed a certain prieſt called *Stephanus de Eviſa*, about the year 1160, in tranſlating from Latin into French the four Goſpels, with other books of Holy Scripture, and the moſt remarkable ſentences of the ancient doctors, which were ſo highly eſteemed in this century. But no ſooner had he peruſed theſe ſacred books with a proper degree of attention, than he perceived that the religion which was now taught in the Roman church, differed totally from that which was originally inculcated by Chriſt and his apoſtles.

Struck

Vaudois. Struck with this glaring contradiction between the doctrines of the pontiffs and the truths of the Gospel, and animated with zeal, he abandoned his mercantile vocation, distributed his riches among the poor (whence the Waldenses were called *poor men of Lyons*), and forming an association with other pious men, who had adopted his sentiments and his turn of devotion, he began in the year 1180 to assume the quality of a public teacher, and to instruct the multitude in the doctrines and precepts of Christianity.

Soon after Peter had assumed the exercise of his ministry, the archbishop of Lyons, and the other rulers of the church in that province, vigorously opposed him. However, their opposition was unsuccessful; for the purity and simplicity of that religion which these good men taught, the spotless innocence that shone forth in their lives and actions, and the noble contempt of riches and honours which was conspicuous in the whole of their conduct and conversation, appeared so engaging to all such as had any sense of true piety, that the number of their followers daily increased.—They accordingly formed religious assemblies, first in France, and afterwards in Lombardy, from whence they propagated their sect throughout the other provinces of Europe with incredible rapidity, and with such invincible fortitude, that neither fire, nor sword, nor the most cruel inventions of merciless persecution, could damp their zeal, or entirely ruin their cause.

The attempts of Peter Waldus and his followers were neither employed nor designed to introduce new doctrines into the church, nor to propose new articles of faith to Christians. All they aimed at was, to reduce the form of ecclesiastical government, and the manners both of the clergy and people, to that amiable simplicity and primitive sanctity that characterised the apostolic ages, and which appear so strongly recommended in the precepts and injunctions of the divine Author of our holy religion. In consequence of this design, they complained that the Roman church had degenerated, under Constantine the Great, from its primitive purity and sanctity. They denied the supremacy of the Roman pontiff, and maintained, that the rulers and ministers of the church were obliged, by their vocation, to imitate the poverty of the apostles, and procure for themselves a subsistence by the work of their hands. They considered every Christian as, in a certain measure, qualified and authorised to instruct, exhort, and confirm the brethren in their Christian course, and demanded the restoration of the ancient penitential discipline of the church *i. e.* the expiation of transgressions by prayer, fasting, and alms, which the new-invented doctrine of indulgences had almost totally abolished. They at the same time affirmed, that every pious Christian was qualified and entitled to prescribe to the penitent the kind or degree of satisfaction or expiation that their transgressions required; that confession made to priests was by no means necessary, since the humble offender might acknowledge his sins, and testify his repentance, to any true believer, and might expect from such the counsel and admonition which his case demanded. They maintained, that the power of delivering sinners from the guilt and punishment of their offences belonged to God alone; and that indulgences of consequence were the criminal inventions of lordid avarice. They looked upon the prayers and other ceremonies that were instituted in behalf of the dead, as vain, useless, and absurd, and denied the existence of departed souls in an intermediate state of purification; affirming, that they were immediately, upon their separation from the body, received into heaven, or thrust down to hell. These, and other tenets of a like nature, composed the system of doctrine propagated by the Waldenses. It is also said that several of the Waldenses denied the obligation of infant-baptism, and that others rejected water-baptism entirely; but Wall has laboured to prove that infant-baptism was generally practised among them.

Their rules of practice were extremely austere; for they adopted as the model of their moral discipline the sermon of Christ on the mount, which they interpreted and explained in the most rigorous and literal manner, and consequently prohibited and condemned in their society all wars, and suits of law, and all attempts towards the acquisition of wealth, the inflicting of capital punishments, self-defence against unjust violence, and oaths of all kinds.

During the greatest part of the 17th century, those of them who lived in the valleys of Piedmont, and who had embraced the doctrine, discipline, and worship of the church of Geneva, were oppressed and persecuted, in the most barbarous and inhuman manner, by the ministers of Rome. This persecution was carried on with peculiar marks of rage and enormity in the years 1655, 1656, and 1696, and seemed to portend nothing less than the total extinction of that unhappy nation. The most horrid scenes of violence and bloodshed were exhibited in this theatre of papal tyranny; and the few Waldenses that survived were indebted for their existence and support to the intercession made for them by the English and Dutch governments, and also by the Swiss cantons, who solicited the clemency of the duke of Savoy in their behalf.

VAULT, in architecture, an arched roof, so contrived that the stones which form it sustain each other.

Vaults are on many occasions to be preferred to soffits or flat ceilings, as they give a greater height and elevation, and are besides more firm and durable.

VAYER. See Mothe.

VAYVODE, or Vaivode. See Waywode.

UBES (St), a sea-port town of Portugal, in the province of Estremadura, seated on a bay of the Atlantic Ocean, 21 miles south of Lisbon. It stands on an eminence, with a very strong castle built on a rock. The soil about it is fertile in corn, wine, and fruits; and it is furnished with good fish from the sea, and a small lake in the neighbourhood. Here they make great quantities of fine salt, which is carried to the American plantations. E. Long. 8. 54. N. Lat. 38. 22.

UBIQUITARIANS, formed from *ubique*, "everywhere," in ecclesiastical history, a sect of Lutherans which rose and spread itself in Germany; and whose distinguishing doctrine was, that the body of Jesus Christ is every where, or in every place.

Brentius, one of the earliest reformers, is said to have first broached this error, in 1560. Luther himself, in his controversy with Zuinglius, had thrown out some unguarded expressions, that seemed to imply a belief of the omnipresence of the body of Christ; but he became sensible afterwards, that this opinion was attended with great difficulties, and particularly that it ought not to be made use of as a proof of Christ's corporal presence in the eucharist. However, after the death of Luther, this absurd hypothesis was renewed, and dressed up in a specious and plausible form by Brentius, Chemnitius, and Andræas, who maintained the communication of the properties of Christ's divinity to his human nature. It is indeed obvious, that every Lutheran who believes the doctrine of consubstantiation (see *Supper of the Lord*), whatever he may pretend, must be an Ubiquitarian.

UBIQUITY, Omnipresence; an attribute of the Deity, whereby he is always intimately present to all things; gives the *esse* to all things; knows, preserves, and does all in all things.

UDDER, in comparative anatomy, that part in brutes wherein

Vault ‖ Udder.

Vedas. || Veering.

wherein the milk is prepared, anſwering to the mammæ or breaſts in women. See COMPARATIVE ANATOMY, n° 44.

VEDAS, the ſacred books of the Hindoos, believed to be revealed by God, and called *immortal*. They are conſidered as the fountain of all knowledge human and divine, and are four in number; of which we have the following account in the firſt volume of the Aſiatic Reſearches: The *Rigveda* conſiſts of five ſections; the *Yajurveda* of eighty-ſix; the *Samaveda* of a thouſand; and the *At'harvaveda* of nine; with eleven hundred *ſac'ha's*, or branches, in various diviſions and ſubdiviſions. The *Veda's* in truth are infinite; but have been long reduced to this number and order; the principal part of them is that which explains the duties of man in a methodical arrangement; and in the fourth is a ſyſtem of divine ordinances.

From theſe are reduced the four *Upavedas*, the firſt of which was delivered to mankind by BRAHMA, INDRA, DHANWANTARI, and five other deities; and comprizes the theory of diſorders and medicines, with the practical methods of curing diſeaſes.

The ſecond conſiſts of muſic, invented for the purpoſe of raiſing the mind by devotion to the felicity of the Divine nature; the third treats of the fabrication and uſe of arms: and the fourth of *ſixty-four* mechanical arts. Of however little value we may eſteem the mechanical arts of the Hindoos, and however deſpicable their theological ſyſtem may really be, the *Upaveda*, which treats of diſeaſes and the method of curing them, ſurely deſerves to be ſtudied by every European phyſician practiſing in India. There are indeed a great number of medical books in the Shanſcrit language worthy of attention; for though the theories of their authors may be groundleſs and whimſical, they contain the names and deſcription of many Indian plants and minerals, with their uſes, diſcovered by *experience*, in the cure of diſeaſes.

VEDETTE, in war, a centinel on horſeback, with his horſe's head towards the place whence any danger is to be feared, and his carabine advanced, with the butt-end againſt his right thigh. When the enemy has encamped, there are vedettes poſted at all the avenues, and on all the riſing grounds, to watch for its ſecurity.

To VEER *and* HAUL, to pull a rope tight, by drawing it in and ſlackening it alternately, till the body to which it is applied acquires an additional motion, like the increaſed vibrations of a pendulum, ſo that the rope is ſtraitened to a greater tenſion with more facility and diſpatch. This method is particularly uſed in hauling the bowlines.

The wind is ſaid to veer and haul when it alters its direction, and becomes more or leſs fair. Thus it is ſaid to veer aft and to haul forward.

VEER, *Ter-Veer*, anciently *Camp-Veer*, a town of Zealand in the United Provinces, ſtanding at the mouth of the Eaſt Schelde, about four miles from Middleburgh, and eight from Fluſhing. Veer, in Dutch, ſignifies a paſſage or ferry over an arm of the ſea or a river; and as there was once a ferry here over the Schelde to the village of Compen, on the iſland of North Beveland, the town thereby got the name of *Veer*, *Camp-Veer*, and *Ter-Veer*. It is well fortified, and formerly enjoyed a good trade, eſpecially to Scotland; the natives enjoying particular privileges here. The harbour is very good, and the arſenal the beſt furniſhed in the world. Hence the Veres, anciently earls of Oxford, are ſaid to have derived both their origin and name.

VEERING, or WEARING, the operation by which a ſhip, in changing her courſe from one board to the other, turns her ſtern to windward. Hence it is uſed in oppoſition to TACKING, wherein the head is turned to the wind and the ſtern to leeward. See SEAMANSHIP, Vol. XVII. p. 219.

Vega.

VEGA (Lopez de), a celebrated Spaniſh poet. He was the ſon of Felix de Vega and Franciſca Fernandez, who were both deſcended from honourable families, and lived in the neighbourhood of Madrid. Our poet was born in that city on the 25th of November 1562. He was, according to his own expreſſion, a poet from his cradle; and beginning to make verſes before he had learned to write, he uſed to bribe his elder ſchool-fellows with part of his breakfaſt, to commit to paper the lines he had compoſed. Having loſt his father while he was yet ſtill a child, he engaged in a frolic very natural to a lively boy, and wandered with another lad to various parts of Spain, till, having ſpent their money, and being conducted before a magiſtrate at Segovia for offering to ſell a few trinkets, they were ſent home again to Madrid. Soon after this adventure, our young poet was taken under the protection of Geronimo Manrique, biſhop of Avila, and began to diſtinguiſh himſelf by his dramatic compoſitions, which were received with great applauſe by the public, though their author had not yet completed his education; for, after this period, he became a member of the univerſity of Alcala, where he devoted himſelf for four years to the ſtudy of philoſophy. He was then engaged as ſecretary to the duke of Alva, and wrote his Arcadia in compliment to that patron: who is frequently mentioned in his occaſional poems. He quitted that employment on his marriage with Iſabel de Urbina, a lady (ſays his friend and biographer Perez de Montalvan) beautiful without artifice, and virtuous without affectation. His domeſtic happineſs was ſoon interrupted by a painful incident:—Having written ſome lively verſes in ridicule of a perſon who had taken ſome injurious freedom with his character, he received a challenge in conſequence of his wit; and happening, in the duel which enſued, to give his adverſary a dangerous wound, he was obliged to fly from his family, and ſhelter himſelf in Valencia. He reſided there a conſiderable time; but connubial affection recalled him to Madrid. His wife died in the year of his return. His affliction on this event led him to relinquiſh his favourite ſtudies, and embark on board the Armada which was then preparing for the invaſion of England. He had a brother who ſerved in that fleet as a lieutenant; and being ſhot in an engagement with ſome Dutch veſſels, his virtues were celebrated by our afflicted poet, whoſe heart was peculiarly alive to every generous affection. After the ill ſucceſs of the Armada, the diſconſolate Lopez de Vega returned to Madrid, and became ſecretary to the Marquis of Malpica, to whom he has addreſſed a grateful ſonnet. From the ſervice of this patron he paſſed into the houſehold of the Count of Lemos, whom he celebrates as an inimitable poet. He was once more induced to quit his attendance on the great, for the more inviting comforts of a married life. His ſecond choice was Juana de Guardio, of noble birth and ſingular beauty. By this lady he had two children, a ſon who died in his infancy, and a daughter named *Feliciana*, who ſurvived her father. The death of his little boy is ſaid to have haſtened that of his wife, whom he had the misfortune to loſe in about ſeven years after his marriage. Having now experienced the precarioufneſs of all human enjoyments, he devoted himſelf to a religious life, and fulfilled all the duties of it with the moſt exemplary piety: ſtill continuing to produce an aſtoniſhing variety of poetical compoſitions. His talents and his virtues procured him many unſolicited honours. Pope Urban VIII. ſent him the croſs of Malta, with the title of Doctor in Divinity, and appointed him to a place of profit in the Apoſtolic Chamber; favours for which he

Hayley's Works, vol. ii.

expreſſed

Vegetation. expreſſed his gratitude by dedicating his *Corona Tragica* (a long poem on the fate of Mary Queen of Scots) to that liberal pontiff. In his 73d year he felt the approaches of death, and prepared himſelf for it with the utmoſt compoſure and devotion. His laſt hours were attended by many of his intimate friends, and particularly his chief patron the Duke of Seſſa, whom he had made his executor; leaving him the care of his daughter Feliciana, and of his various manuſcripts. The manner in which he took leave of thoſe he loved was moſt tender and affecting. He ſaid to his diſciple and biographer Montalvan, That true fame conſiſted in being good; and that he would willingly exchange all the applauſes he had received to add a ſingle deed of virtue to the actions of his life. Having given his dying benediction to his daughter, and performed the laſt ceremonies of his religion, he expired on the 25th of Auguſt 1635.

VEGETATION, in phyſiology, the act whereby plants receive nouriſhment and growth.

The proceſs of nature in the vegetation of plants is very accurately delivered by Malpighi: The egg or ſeed of the plant being excluded out of the ovary, called *pod* or *huſk*, and requiring further foſtering and brooding, is committed to the earth; which having received it into her fertile boſom, not only does the office of incubation by her own warm vapours and exhalation, joined with the heat of the ſun, but by degrees ſupplies what the ſeed requires for its further growth; as abounding everywhere with canals and ſinuſes, wherein the dew and rain water, impregnated with fertile ſalts, glide, like the chyle and blood in the arteries, &c. of animals. This moiſture meeting with a new depoſited ſeed, is percolated, or ſtrained through the pores or pipes of the outer rind or huſk, correſponding to the ſecundines of the fœtuſes, on the inſide whereof lies one or more, commonly two, thick ſeminal leaves, anſwering to the placenta in women, and the cotyledons in brutes.

Theſe ſeed-leaves conſiſt of a great number of little veſiculæ, or bladders, with a tube correſponding to the navel-ſtring in animals. In theſe veſiculæ is received the moiſture of the earth, ſtrained through the rind of the ſeed; which makes a ſlight fermentation with the proper juice before contained therein. This fermented liquor is conveyed by the umbilical veſſel to the trunk of the little plant; and to the germ or bud which is contiguous thereto: upon which a vegetation and increaſe of the parts ſucceed.

Such is the procedure in the vegetation of plants: which the illuſtrious author exemplifies in a grain of wheat, as follows: The firſt day the grain is ſown it grows a little turgid; and the ſecundine, or huſk, gapes a little in ſeveral places: and the body of the plant, being continued by the umbilical veſſel to a conglobated leaf (which is called the *pulp* or *fleſh* of the ſeed, and is what conſtitutes the flower) ſwells; by which means, not only the germ or ſprout (which is to be the future ſtem) opens, and waxes green, but the roots begin to bunch out; whence the placenta, or ſeed leaf, becoming looſe, gapes. The ſecond day, the ſecundine or huſk, being broke through, the ſtem, or top of the future ſtraw, appears on the outſide thereof, and grows upward by degrees; in the mean time, the ſeed-leaf guarding the roots becomes turgid with its veſiculæ, and puts forth a white down. And the leaf being pulled away, you ſee the roots of the plants bare; the future buds, leaves, and reſt of the ſtalk, lying hid. Between the roots and the aſcending ſtem the trunk of the plant is knit by the navel-knot to the flower-leaf, which is very moiſt, though it ſtill retains its white colour and its natural taſte. The third day, the pulp of the conglobated, or round leaf, becomes turgid with the juice which it received from the earth fermenting with its own.

Thus the plant increaſing in bigneſs, and its bud or ſtem becoming taller, from whitiſh turns greeniſh; the lateral roots alſo break forth greeniſh and pyramidal from the gaping ſheath, which adheres chiefly to the plant; and the lower root grows longer and hairy, with many fibres ſhooting out of the ſame. Vegetation.

Indeed there are hairy fibres hanging all along on all the roots, except on their tips; and theſe fibres are ſeen to wind about the ſaline particles of the ſoil, little lumps of earth, &c. like ivy; whence they grow curled. Above the lateral roots there now break out two other little ones.

The fourth day, the ſtem mounting upwards, makes a right angle with the ſeminal leaf: the laſt roots put forth more; and the other three growing larger, are clothed with more hairs, which ſtraitly embrace the lumps of earth; and where they meet with any vacuity, unite into a kind of network.

From this time forward the root puſhes with more regularity downward, and the ſtalk upward, than before. There is, however, this great difference in their growth, that the ſtalk and branches find no reſiſtance to their ſhooting up, while the roots find a great deal to their ſhooting downward, by means of the ſolidity of the earth; whence the branches advance much faſter and farther in their growth than the roots; and theſe laſt often finding the reſiſtance of a tough earth unſurmountable, turn their courſe, and ſhoot almoſt horizontally.

From a number of experiments made by Mr Gough, and related by him in the fourth volume of the Mancheſter Tranſactions, it appears, that ſeeds will not vegetate without air; and that during their vegetation, they abſorb oxygen, part of which they retain, and that carbonic acid is formed with the reſt. Theſe facts were aſcertained in the following manner: He put ſeveral parcels of ſteeped peas and barley, at different times, into phials, which were left to ſtand for three or four minutes in ſpring water, of the heat of 46, 5°, to reduce them to a known temperature. They were then ſecurely corked, and removed into a room, the temperature of which was never leſs than 53°. After remaining from four to ſix days in this ſituation, they were again placed in the ſame ſpring water, and opened in an inverted poſition, care being taken that the barometer ſtood at the time nearly where it did at firſt. When a cork was thus drawn, a quantity of water ruſhed in immediately, more than was ſufficient to fill the neck. The air being paſſed through lime water, contracted very ſenſibly, and precipitated the lime. The reſiduum, freed in this manner from carbonic acid, extinguiſhed a lighted taper like water; and this it did repeatedly. He made one of theſe experiments with more attention than the reſt, from which it appeared, that four ounces, one dram, forty grains, by meaſure, of atmoſpheric air, loſt one-ſixth of its original bulk, by being confined five days with one ounce of ſteeped barley. It is plain, from this experiment, that ſeeds in the act of vegetation take oxygen from the atmoſphere, part of which they retain, and reject the reſt charged with carbon. The ſubſtance of the ſeed-lobes is hereby changed, an additional quantity of oxygen being introduced into their compoſition; and a part of their carbon loſt. This change, in the proportion of their alimentary principles, generates ſugar, as is evident from the proceſs of malting. But ſugar and carbonic acid are more ſoluble in water than the farinaceous oxyd. They therefore combine with the humidity in the capillary tubes of the ſeed, and find a ready paſſage to the germ, the vegetative principle of which they call into action by a ſtimulus ſuited to its nature. A nutritious liquor being thus prepared by the decompoſition of the ſeed-lobes, and diſtributed through the infant plant, its

Vegetation || Veii.

its organs begin to exert their ſpecific actions, by decompounding the nouriſhment conveyed to them, and forming new oxyds from the elementary principles of it, for the increaſe of the veſſels and fibres; and in this manner the firſt ſtage of vegetation commences.

Mr Gough has aſcertained, that a germ in the act of vegetation requires to be continually excited by the ſtimulus of oxygen; but that as ſoon as the ſeed lobes are exhauſted, the young plant is in a ſtate to derive its nutrition from the ground; and then (and not till then) it finds itſelf in a ſituation capable of making future advances, unaſſiſted by the ſtimulus of reſpirable air.

The infant ſprout at firſt ſuffers only a ſuſpenſion of its energy from the abſence of pure air; but if this neceſſary ſupport be withheld too long, it periſhes by the putrefactive fermentation.

The lively green which the ſtems and leaves of plants receive from the action of light, cannot be imparted to them, provided the energy of the vegetative principle in them be ſuſpended: for after permitting a number of peas to produce both extremities of their ſprouts in wet ſand covered from the light by an earthen pot, Mr Gough placed five of them, on the 29th of April, in an inverted glaſs jar, containing azot confined by water; and three in another jar, in which a portion of common air was alſo incloſed by the ſame means. On the 30th the upper extremities of the ſprouts of the parcel laſt mentioned were green; but though the experiment was prolonged to the 2d of May, thoſe in the other glaſs did not exhibit any perceptible alteration in ſize or colour. Two of them were now placed in a glaſs filled with atmoſpheric air, where they were left unobſerved to the 5th, at the end of which time the germs had vegetated conſiderably; the lower parts of them ſtill remained white, but their oppoſite extremities had changed to their proper green. Hence it may be ſafely inferred, that greenneſs cannot be imparted to the ſprouts of ſeeds without the joint action of light and oxygen; in which they are very different from the ſhoots that frequently proceed from maturer plants, when ſecluded from the atmoſphere: for, as theſe grow freely in cloſe glaſs veſſels, placed in a window, and containing water and azot, the parts which are recently produced continue to vegetate, in conſequence of their connection with the parent ſtock, and acquire the colour in queſtion without the aſſiſtance of reſpirable air. See PLANT, TREE, GERMINATION, BOTANY, &c.

VEGETATIVE SOUL, among philoſophers, denotes that principle in plants by virtue of which they vegetate, or receive nouriſhment and grow. See the preceding article.

VEHICLE, in general, denotes any thing that carries or bears another along; but is more particularly uſed in pharmacy for any liquid ſerving to dilute ſome medicine, in order that it may be adminiſtered more commodiouſly to the patient.

VEII (anc. geog.), a city of Etruria, the long and powerful rival of Rome; diſtant about 100 ſtadia, or 12 miles, to the north-weſt; ſituated on a high and ſteep rock. Taken after a ſiege of 10 years by Camillus, ſix years before the taking of Rome by the Gauls: and thither the Romans, after the burning of their city, had thoughts of removing; but were diſſuaded from it by Camillus (Livy). It remained ſtanding after the Punic war; and a colony was there ſettled, and its territory aſſigned to the ſoldiers. But after that it declined ſo gradually, as not to leave a ſingle trace ſtanding. Famous for the ſlaughter of the 300 Fabii on the Cremera (Ovid). The ſpot on which it ſtood lies near Iſola, in St Peter's patrimony (Holſtenius).

VEIL, a piece of ſtuff, ſerving to cover or hide any thing. Veil || Venal.

In the Romiſh churches, in time of Lent, they have veils or curtains over the altar, crucifix, images of ſaints, &c.

A veil of crape is worn on the head by nuns, as a badge of their profeſſion: the novices wear white veils, but thoſe who have made the vows black ones. See the article NUN.

VEIN, in anatomy, is a veſſel which carries the blood from the ſeveral parts of the body to the heart. See ANATOMY, n° 123.

VEIN, among miners, is that ſpace which is bounded with woughs, and contains ore, ſpar, canck, clay, chirt, croil, brownhen, pitcher-chirt, cur, which the philoſophers call the *mother of metals*, and ſometimes *ſoil of all colours*. When it bears ore, it is called a *quick vein*; when no ore, a *dead vein*.

VELA, a remarkable cape on the coaſt of Terra Firma, in South America. W. Long. 71. 25. N. Lat. 12. 30.

VELARIUS, in antiquity, an officer in the court of the Roman emperors, being a kind of uſher, whoſe poſt was behind the curtain in the prince's apartment, as that of the chancellor's was at the entry of the balluſtrade: and that of the oſtiarii at the door. The velarii had a ſuperior of the ſame denomination, who commanded them.

VELEZ-DE-GOMARA, a town of Africa, in the kingdom of Fez, and in the province of Eriff. It is the ancient ACARTH. With a harbour and a handſome caſtle, where the governor reſides. It is ſeated between two high mountains, on the coaſt of the Mediterranean Sea. W. Long. 4. 0. N. Lat. 35. 10.

VELITES, in the Roman army, a kind of ancient ſoldiery, who were armed lightly with a javelin, a caſk, cuiraſs, and ſhield.

VELLEIUS PATERCULUS. See PATERCULUS.

VELLUM, is a kind of parchment, that is finer, evener, and more white than the common parchment. The word is formed from the French *velin*, of the Latin *vitulinus*, "belonging to a calf."

VELOCITY, in mechanics, ſwiftneſs; that affection of motion whereby a moveable is diſpoſed to run over a certain ſpace in a certain time. It is alſo called *celerity*, and is always proportional to the ſpace moved. Huyghens, Leibnitz, Bernoulli, Wolfius, and the foreign mathematicians, hold, that the momenta or forces of falling bodies, at the end of their falls, are as the ſquares of their velocities into the quantity of matter; the Engliſh mathematicians, on the contrary, maintain them to be as the velocities themſelves into the quantity of matter. See QUANTITY, n° 11 and 14, &c.

VELVET, a rich kind of ſtuff, all ſilk, covered on the outſide with a cloſe, ſhort, fine, ſoft ſhag, the other ſide being a very ſtrong cloſe tiſſue.

The nap or ſhag, called alſo the *velveting*, of this ſtuff, is formed of part of the threads of the warp, which the workman puts on a long narrow-channelled ruler or needle, which he afterwards cuts, by drawing a ſharp ſteel tool along the channel of the needle to the ends of the warp. The principal and beſt manufactories of velvet are in France and Italy, particularly in Venice, Milan, Florence, Genoa, and Lucca: there are others in Holland, ſet up by the French refugees; whereof that at Haerlem is the moſt conſiderable: but they all come ſhort of the beauty of thoſe in France, and accordingly are ſold for 10 or 15 *per cent.* leſs. There are even ſome brought from China; but they are the worſt of all.

VENAL, or VENOUS, in anatomy, ſomething that bears

a

Veneering || Venice.

a relation to the veins. This word is alſo uſed for ſomething bought with money, or procured by bribes.

VENEERING, VANEERING, or *Fineering*, a kind of marquetry, or inlaying, whereby ſeveral thin ſlices or leaves of fine wood, of different kinds, are applied and faſtened on a ground of ſome common wood.

There are two kinds of inlaying: the one, which is the more ordinary, goes no farther than the making of compartiments of different woods; the other requires much more art, and repreſents flowers, birds, and the like figures. The firſt kind is what we properly call *veneering*; the latter we have already deſcribed under MARQUETRY.

The wood intended for veneering is firſt ſawed out into ſlices or leaves, about a line thick: in order to ſaw them, the blocks or planks are placed upright in a kind of vice or ſawing-preſs: the deſcription of which may be ſeen under the article juſt referred to. Theſe ſlices are afterwards cut into ſlips, and faſhioned divers ways, according to the deſign propoſed; then the joints being carefully adjuſted, and the pieces brought down to their proper thickneſs, with ſeveral planes for the purpoſe, they are glued down on a ground or block of dry wood, with good ſtrong Engliſh glue. The pieces thus joined and glued, the work, if ſmall, is put in a preſs; if large, it is laid on the bench, covered with a board, and preſſed down with poles, or pieces of wood, one end whereof reaches to the ceiling of the room, and the other bears on the boards. When the glue is quite dry they take it out of the preſs and finiſh it; firſt with little planes, then with divers ſcrapers, ſome whereof reſemble raſps, which take off dents, &c. left by the planes. When ſufficiently ſcraped, the work is poliſhed with the ſkin of a ſea-dog, wax, and a bruſh and poliſher of ſhave-graſs: which is the laſt operation.

VENEREAL, ſomething belonging to venery; as the lues venerea, &c. See MEDICINE-*Index*.

VENERY, is uſed for the act of copulation, or coition, of the two ſexes.

VENETIAN BOLE, a fine red earth uſed in painting, and called in the colour ſhops *Venetian red*.—It is dug in Carinthia, and ſent from Venice to all parts of the world; but the uſe of it here is very much ſuperſeded by a bright colcothar of vitriol.

VENICE, a celebrated city of Italy, and capital of a republic of the ſame name, ſituated on the Lagunes or Small Iſlands, about five miles from the continent; in E. Long. 130. N. Lat. 45. 40.

1 Derivation of the name.

The name of Venice is evidently derived from *Venetia*, one of the Roman provinces of Italy; and this again from the *Henetians*, a people of Paphlagonia, who ſettled in that part of the country. The city is ſaid to have been founded about the year 451 or 452; when Attila, having deſtroyed the cities of Aquileia, Verona, Mantua, Trevigio, &c. ſuch of the inhabitants as eſcaped the ſlaughter fled to the iſlands on their coaſt, and there took up their reſidence. Hiſto-

2 Excellent character of the firſt inhabitants.

rians are profuſe in their commendations of the virtue of the Venetians during the infancy of their city; and Caſſiodorus informs us, that one would have taken the inhabitants rather for an aſſembly of philoſophers, living at their eaſe and cultivating the duties of religion, than for what they really were, a diſtreſſed and confuſed rabble who had eſcaped from the calamities of war. Nothing remarkable, however, occurs in the hiſtory of Venice for ſome time, excepting

3 When the republic began to make a figure.

the change of government from the conſular to the tribunitial form, which happened about 30 years after the building of the city. The republic firſt began to be of conſequence after the deſtruction of Padua by the Lombards. About this time they were become maſters of a fleet and a body of land-forces. They engaged in a quarrel with the Lombards, of which we know not the particulars. In a ſhort time, however, they diſtinguiſhed themſelves againſt the Iſtrian pirates, who had committed depredations on their coaſts, and the Tergeſtines, or inhabitants of Trieſte, who had ſuddenly carried off a number of the citizens of Venice. Theſe exploits procured them a conſiderable degree of reputation and eſteem among their neighbours; and by improving every opportunity of increaſing their trade, and augmenting the number of manufactures, &c. the city very ſoon arrived at a high pitch of affluence and power. In the war carried on by Juſtinian with the Goths in Italy, the Venetians gave conſiderable aſſiſtance to Narſes the Roman general, inſomuch that he expreſſed his gratitude by ſeveral rich preſents, ſome high marks of diſtinction, and particularly by building two fine churches dedicated to the ſaints Theodore and Germinian; the oldeſt public buildings, beſide St Mark's and St Peter's, in Venice.

Venice.

4 Aſſiſts the Roman general Narſes, and honoured by him on that account.

From the time of Juſtinian to the year 697, hiſtorians are ſilent with regard to the Venetian affairs. A great revolution now took place in the government: the tribunes having abuſed their power were aboliſhed; and in their ſtead was elected a *doge* or duke, in whom was veſted the ſupreme authority. He was to repreſent the honour and majeſty of the ſtate; to have reſpect and diſtinction paid him beyond what the tribunes, or even the conſuls, enjoyed: he was to aſſemble and preſide at the great council; to have a caſting vote in all diſputed points; to nominate to all offices, places, and preferments; and laſtly, to enjoy the ſame authority in the church as in the ſtate. This form of government was changed in 737, for what reaſon we know not, and a ſupreme magiſtrate choſen, with the title of *maſter of the horſe* or *general of the forces*. His power was to continue only for a year, the ſhortneſs of its duration being thought a ſufficient ſecurity againſt the abuſe of it. But in five years afterwards the doges were reſtored, and Giovanni Fabritio, the fourth and laſt maſter of the horſe, was depoſed, and his eyes put out, but for what fault we know not.

5 Firſt election of a doge or duke.

6 Changes of government.

Under the doges, the power and wealth of the Venetian republic continued to increaſe. In 764 the Heracleans and Jeſulans, ſubjects to the republic, having formed ſome deſigns againſt the ſtate, put themſelves under the protection of Charlemagne. That conqueror, not finding it convenient to give them preſent aſſiſtance, ſettled them in Malamoc until he could give them more effectual ſuccour. The Venetians, however, diſregarding the protection of that powerful monarch, attacked and inſtantly drove them out of the place where he had ſettled them. Incenſed at this, Charlemagne ordered his ſon Pepin to declare war againſt the republic. This was immediately done; but the blow was for ſome time diverted by Aſtolphus king of the Lombards, who, committing great devaſtations in the territories of the pope, obliged Pepin to come to the aſſiſtance of his holineſs. However, after having afforded the neceſſary ſuccour to the pope, Pepin proſecuted the war with Venice. The event is uncertain: all we know is, that about this time the Venetians declared themſelves a free and independent ſtate; which makes it probable that his ſucceſs had not been great. But in 804 the war was renewed with the utmoſt fury. Pepin having quarrelled with Nicephorus the Greek emperor, and finding Obelerio the Venetian doge inclined to favour his adverſary, determined to exterminate the very name of the republic. After having laid waſte the province of Venetia, he led his army directly to Venice, blocking the city up at the ſame time by his fleet. The Venetians were not diſheartened at the number of their ene-

9 The Venetians declare themſelves independent.

10 The city beſieged by Pepin.

Venice.

mies, the reputation of Pepin, or the civil diviſions among themſelves; their animoſities were laid aſide, and a ſtrict union formed againſt the common enemy: the chief command was given to Valentin, as Obelerio was ſuppoſed too nearly allied to Pepin to fight with that good-will and cheerfulneſs the ſervice of his country required. The Venetians, notwithſtanding the moſt obſtinate defence, the moſt vigorous ſallies, and their ſelling every inch of ground at an incredible expence of blood, were at length reduced to that part of the city ſouth of the Rialto; this ſtream, and their own bravery, being now their only defence. While Pepin was preparing to lay a bridge over the canal, they reſolved, as a laſt effort, to attack Pepin's fleet, and to vanquiſh or die in defence of their liberty. Embarking all the troops they could ſpare, they bore down, with the advantage of the wind and tide, upon the enemy, and began the attack with ſuch fury, as obliged the French admiral to give way. The lightneſs of their ſhips, and the knowledge of the ſoundings, gave the Venetians every advantage they could wiſh: the enemy's fleet was run aground, and the greater part of their troops periſhed in attempting to eſcape; the ſhips were all, to a few, either taken or deſtroyed. During this action at ſea, Pepin reſolved to aſſault the city by land, not doubting but the garriſon was ſo weakened by the number of forces they had ſent on board the fleet, as to be able to make but a ſlight reſiſtance. Having for this purpoſe thrown a bridge over the Rialto, he was marching his troops acroſs it, when he found himſelf attacked on every ſide by the Venetians from their boats, and others who had poſted themſelves on the bridge. The battle was long, bloody, and doubtful, until the Venetians employed all their power to break down the bridge; which at laſt yielding to their obſtinate endeavours, a prodigious ſlaughter of the French enſued: however, they fought like men in deſpair, ſeeing no hopes of ſafety but in victory; but all communication being cut off with the troops on ſhore, they were to a man either killed or drowned. The number of ſlain was ſo great, that the ſpace between the Rialto and Malamoc was covered with dead bodies, and has ever ſince gone by a name expreſſive of the prodigious ſlaughter. Pepin was ſo ſtruck with the intrepidity of the Venetians, that he raiſed the ſiege, abandoned the enterpriſe, and concluded a peace with the republic: he afterwards came to Venice to intercede for Obelerio, that he might be reſtored; which the Venetians granted, more out of reſpect to the requeſt of ſo great a prince, than love to the unhappy Obelerio. The people had a notion that Obelerio had encouraged Pepin to declare war upon the republic, and that a correſpondence between them was carried on during the ſiege; Pepin was therefore no ſooner withdrawn, than the populace ſeizing upon Obelerio, tore his body in pieces, and ſcattered his limbs and bowels about the city. His wife ſhared the ſame fate; for as ſhe was the ſiſter of Pepin, it was not doubted but her influence was the cauſe of her huſband's perfidy.

11 The citizens reduced to great ſtraits.

12 The French fleet entirely deſtroyed,

13 And great part of their army.

14 The ſiege raiſed.

15 The doge torn in pieces by the populace.

In 839 we find the Venetians engaged in an alliance offenſive and defenſive againſt the Saracens with Michael the Greek emperor. A fleet of 60 galleys was immediately equipped, who joined the Grecian fleet and engaged the enemy: but during the heat of the engagement, the Greeks having baſely deſerted their allies, the Venetians were ſo completely defeated, that ſcarce a ſingle veſſel remained to carry the news of their misfortune to Venice. This defeat threw the city into the utmoſt conſternation, as it was not doubted that the Saracens would immediately lay ſiege to the capital; but from theſe fears they were ſoon relieved, by certain intelligence that the Saracens had gone to Ancona, which they had pillaged and deſtroyed. The Narentines, however, a piratical people, no ſooner heard of the defeat of the Venetians, than they laid waſte the coaſts of Dalmatia, and ravaged the country for a conſiderable way; at the ſame time that the city was diſtracted by internal diſſenſions and tumults, in one of which the doge was murdered.

16 The Venetians defeated at ſea by the Saracens.

Venice.

It was not till the year 881 that the Venetian affairs were thoroughly re-eſtabliſhed. By the prudent and vigorous adminiſtration of Orſo Participato the power of the Saracens was checked, the Narentines utterly defeated, and peace and domeſtic tranquillity reſtored. From this time the republic continued to flouriſh; and in 903 her reputation for arms became famous all over the world by a great victory gained over the Hunns, who had invaded Italy, defeated Berengarius, and threatened the country with total deſtruction. For a long time after, we meet with no remarkable tranſactions in the Venetian hiſtory; but in general the republic increaſed in wealth and power by its indefatigable application to maritime affairs and to commerce. About the year 1040 it was ordained that no prince ſhould aſſociate a colleague with him in the ſupreme power, a ſtatute which has ever ſince continued unaltered.

17 Affairs of the republic reſtored.

18 A great victory gained over the Hunns.

19 Venetians become powerful.

Towards the cloſe of the 11th century, Venice began to make a very conſiderable figure among the Italian ſtates, and to carry on wars with ſeveral of them. In 1084 the republic was by the emperor of Conſtantinople inveſted with the ſovereignty of Dalmatia and Croatia, which, however, had been held long before by right of conqueſt. As ſoon as the Croiſade was preached up, the Venetians fitted out a fleet of 200 ſail againſt the infidels; but before this armament was in a condition to put to ſea, war broke out with Piſa. The doge Vitalis Michael took upon him the command of the fleet, when, after having defeated the Piſans in a bloody action at ſea, he ſet ſail for Smyrna, and from thence to Aſcalon, at that time beſieged by the Chriſtians. To his valour was owing the conqueſt of this city, as well as thoſe of Caipha and Tiberias; but before he had time to puſh his good fortune further, he was recalled on account of an invaſion of the Normans of Dalmatia. Here he was equally ſucceſsful: the Normans were everywhere defeated; and Michael returned home loaded with booty; but died ſoon after, to the great grief of all his ſubjects. He was ſucceeded by Ordelapho Faliero, under whom the Venetians aſſiſted Baldwin in the ſiege of Ptolemais, and are ſaid to have been the chief inſtruments of its conqueſt; and Baldwin, in recompenſe for the ſervices of the republic, inveſted her with the ſovereignty of that city, which he endowed with many extraordinary privileges, in order to render his preſent more valuable. This good fortune, however, was overbalanced by a rebellion in Dalmatia and Croatia. The former was reduced; but, in a battle with the Croatians, the doge was killed, and his army entirely defeated: by which diſaſter the Venetians were ſo much diſpirited, that they clapped up a peace on the beſt terms they could, giving up all thoughts of Croatia for the preſent.

20 Take a principal ſhare in the cruſades.

21 Exploits of the doge Vitalis Michael, &c.

22 The Venetians receive a great defeat in Croatia.

Under the government of Domenico Micheli, who ſucceeded Ordelapho, the pope's nuncio arrived at Venice, and excited ſuch a ſpirit of enthuſiaſm among all ranks and degrees of men, that they ſtrove whoſe names ſhould be firſt enrolled for the holy war. The doge, having fitted out a fleet of 60 galleys, ſailed with it to Joppa, which place the Saracens were at that time beſieging. The garriſon was reduced to the laſt extremity when the Venetian fleet arrived, ſurpriſed, and defeated that of the enemy with great ſlaughter; ſoon after which the Saracens raiſed the ſiege with precipitation. Tyre was next beſieged, and ſoon was obliged to capitulate; on which occaſion, as well as on the taking of Aſcalon, the Venetians ſhared two-thirds of the ſpoils. But in the mean time the emperor of Conſtantinople, jealous of the increaſing power and wealth of the republic,

23 Great armament againſt the Infidels.

24 Emperor of Conſtantinople reſolves to attack Venice.

Venice.

republic, reſolved to make an attack upon Venice, now weakened by the abſence of the doge and ſuch a powerful fleet. But the ſenate having timely notice of the emperor's intentions, recalled the doge, who inſtantly obeyed the ſummons. Stopping at Rhodes, in his way home to refreſh and water the fleet, the inhabitants refuſed to furniſh him with the neceſſaries he demanded. Incenſed at this denial, he levelled their city with the ground; and from thence ſailing to Chios, he laid waſte and deſtroyed the country, carrying off the body of St Iſidore, in thoſe days accounted an ineſtimable treaſure. After this he ſeized on the iſlands of Samos, Leſbos, Andros, and all thoſe in the Archipelago belonging to the emperor; and having reduced Zara, Spolatra, and Trahu, places in Dalmatia which had revolted during his abſence, he returned in triumph to Venice, where he was received with great joy.

25 Great ſucceſs of the doge againſt him.

The Venetians now became very formidable throughout all Europe. The Sicilians, Paduans, with the ſtates of Verona and Ferrara, felt the weight of their power; and in 1173 they ventured to oppoſe Frederic Barbaroſſa emperor of Germany. The occaſion of this quarrel was, that pope Alexander had taken ſhelter in Venice in order to avoid the reſentment of Barbaroſſa, who had conceived an implacable averſion againſt him. The Venetians diſpatched ambaſſadors to him; but he anſwered them in a rage, "Go tell your prince and people, that Frederic the Roman emperor demands his enemy, who is protected by them. If they ſend him not inſtantly bound hand and foot, he will overturn every law, human and divine, to accompliſh his revenge; he will bring his army before their city, and fix his victorious ſtandards in the market-place, which ſhall float in the blood of its citizens." On the return of the ambaſſadors with this terrible menace, it was agreed to equip a fleet with all expedition, and prepare for repelling the attacks of ſuch a formidable and haughty enemy. But before the armament could be prepared, Otho, the emperor's ſon, arrived before the city with a fleet of 75 galleys. The doge Sebaſtiano Ziani ſailed out with the few veſſels he had got equipped, to give the enemy battle. The fleets met off the coaſt of Iſtria, and a terrible engagement enſued, in which the imperial fleet was totally defeated, Otho himſelf taken priſoner, and 48 of his ſhips deſtroyed. On the doge's return, the pope went out to meet him, and preſented him with a ring, ſaying, "Take this Ziani, and give it to the ſea, as a teſtimony of your dominion over it. Let your ſucceſſors annually perform the ſame ceremony, that poſterity may know that your valour has purchaſed this prerogative, and ſubjected this element to you even as a huſband ſubjecteth his wife." Otho was treated with the reſpect due to his rank; and ſoon conceived a great friendſhip for Ziani. At laſt, being permitted to viſit the imperial court on his parole, he not only prevailed on his father to make peace with the Venetians, but even to viſit their city, ſo famed for its commerce and naval power. He was received with all poſſible reſpect, and on his departure attended to Ancona by the doge, the ſenate, and the whole body of the nobility. During this journey he was reconciled to the pope; and both agreed to pay the higheſt honours to the doge and republic.

26 Quarrel with the emperor Barbaroſſa.

27 Haughty meſſage of the emperor.

28 His ſon Otho defeated and taken priſoner by the Venetians.

29 Inſtitution of the cuſtom of marrying the ſea.

30 Peace concluded with the emperor.

In the beginning of the 13th century, the Venetians, now become exceedingly powerful and opulent, by reaſon of the commerce which they carried on with the richeſt countries of the world, were invited by young Alexis, ſon to the emperor of Conſtantinople, to his father's aſſiſtance, who had been depoſed by a rebellious faction. In conjunction with the French they undertook to reſtore him; and eaſily ſucceeded. But the old emperor dying ſoon after his ſon was elected in his room, and a few days after murdered by his own ſubjects; on which the empire was ſeized by Myrtillus, a man of mean birth, who had been raiſed by the favour of old Alexis. As the allied army of French and Venetians was encamped without the city, Myrtillus reſolved immediately to drive them out of his dominions, and for this purpoſe attempted to ſurpriſe their camp; but being repulſed, he ſhut himſelf up in the city, with a reſolution to ſtand a ſiege. The allies aſſaulted it with ſo much vigour, that the uſurper was obliged to fly; and though the citizens held out after his departure, they were obliged in leſs than three months to capitulate. This proved a ſource of greater acquiſition to Venice than all that had yet happened. All the chief offices in the city were filled up with Venetians, in recompenſe for their ſervices: the allies entered Thrace, and ſubdued it; Candia, and all the Greek iſlands, alſo fell under the dominion of the republic.

31 Venetians invited to the aſſiſtance of the emperor of Conſtantinople.

32 The city taken by the French and Venetians.

In the mean time the Genoeſe, by their ſucceſsful application to commerce, having raiſed themſelves in ſuch a manner as to be capable of rivalling the Venetians, a long ſeries of wars took place between the republics; in which the Venetians generally had the advantage, though ſometimes they met with terrible overthrows. Theſe expenſive and bloody quarrels undoubtedly weakened the republic in the main, notwithſtanding its ſucceſſes. In the year 1348, however, the Genoeſe were obliged to implore the protection of Viſconti duke of Milan, in order to ſupport them againſt their implacable enemies the Venetians. Soon after this, in the year 1352, the latter were utterly defeated, with ſuch loſs, that it was thought the city itſelf muſt have fallen into the hands of the Genoeſe had they known how to improve their victory. This was in a ſhort time followed by a peace; but from this time the power of the republic began to decline. Continual wars with the ſtates of Italy, with the Hungarians, and their own rebellious ſubjects, kept the Venetians employed ſo that they had no leiſure to oppoſe the Turks, whoſe rapid advances ought to have alarmed all Europe. After the deſtruction of the eaſtern empire, the Turks came more immediately to interfere with the republic. The conſequences are related under the article TURKEY. Whatever valour might be ſhown by the Venetians, or whatever ſucceſſes they might boaſt of, it is certain that the Turks ultimately prevailed; ſo that for ſome time it ſeemed ſcarce poſſible to reſiſt them. What contributed alſo greatly to the decline of the republic, was the diſcovery of a paſſage to the Eaſt Indies by the Cape of Good Hope in 1497. To this time the greateſt part of the Eaſt India goods imported into Europe paſſed thro' the hands of the Venetians; but as ſoon as the above-mentioned diſcovery took place, the carriage by the way of Alexandria almoſt entirely ceaſed. Still, however, the Venetian power was ſtrong, and in the beginning of the 16th century they maintained a war againſt almoſt the whole power of France, Germany, and Italy; but ſoon after we find them entering into an alliance with ſome Italian ſtates and the king of France againſt the emperor. Theſe wars, however, produced no conſequences of any great moment; and in 1573 tranquillity was reſtored by the concluſion of a peace with the Turks. Nothing of conſequence happened in the affairs of the Venetian republic till the year 1645, when the Turks made a ſudden and unexpected deſcent on the iſland of Candia. The ſenate of Venice did not diſplay their uſual vigilance on this occaſion. They had ſeen the immenſe warlike preparations going forward, and yet allowed themſelves to be amuſed by the grand ſeignior's declaring war againſt Malta, and pretending that the armament was intended againſt that iſland. The troops landed without oppoſition; and the town of Canéa was taken after an obſtinate defence.

33 Wars between Venice and Genoa.

34 The Genoeſe put themſelves under the protection of the duke of Milan.

35 Cauſes of the decline of the Venetian power.

36 Candia invaded by the Turks.

Venice.

This news being brought to Venice, excited an univerſal indignation againſt the Turks; and the ſenate reſolved to defend to the utmoſt this valuable part of the empire. Extraordinary ways and means of raiſing money were fallen upon: among others, it was propoſed to ſell the rank of nobility. Four citizens offered 100,000 ducats each for this honour; and, notwithſtanding ſome oppoſition, this meaſure was at laſt carried. Eighty families were admitted into the grand council, and to the honour and privileges of the nobility. What an idea does this give of the wealth of the inhabitants of Venice!

37 Extraordinary methods taken by the Venetians to carry on the war.

The ſiege of Candia, the capital of the iſland of that name, is, in ſome reſpects, more memorable than that of any town which hiſtory, or even which poetry has recorded. It laſted 24 years. The amazing efforts made by the republic of Venice aſtoniſhed all Europe; their courage intereſted the gallant ſpirits of every nation: volunteers from every country came to Candia to exerciſe their valour, to acquire knowledge in the military art, and aſſiſt a brave people whom they admired.

38 Remarkable ſiege of the capital of Candia.

During this famous ſiege the Venetians gained many important victories over the Turkiſh fleet. Sometimes they were driven from the walls of Candia, and the Turkiſh garriſon of Canéa was even beſieged by the Venetian fleets. Great ſlaughter was made of the Turkiſh armies: but new armies were ſoon found to ſupply their place, by a government which boaſts ſuch populous dominions, and which has deſpotic authority over its ſubjects.

39 Deſperate valour of the Venetians.

Mahomet the fourth, impatient at the length of this ſiege, came to Negropont, that he might have more frequent opportunities of hearing from the vizir, who carried on the ſiege. An officer, ſent with diſpatches, was directed by the vizir to explain to Mahomet the manner in which he made his approaches, and to aſſure him that he would take all poſſible care to ſave the lives of the ſoldiers. The humane emperor anſwered, That he had ſent the vizir to take the place, and not to ſpare the lives of the ſoldiers; and he was on the point of ordering the head of the officer who brought this meſſage to be cut off, merely to quicken the vizir in his operations, and to ſhow him how little he valued the lives of men.

40 Cruelty of the Turkiſh ſultan.

In ſpite of the vizir's boaſted parſimony, this war is ſaid to have coſt the lives of 200,000 Turks. Candia capitulated in the year 1668. The conditions on this occaſion were honourably fulfilled. Morſini, the Venetian general, marched out of the rubbiſh of this well-diſputed city with the honours of war.—The expence of ſuch a tedious war greatly exhauſted the reſources of Venice, which could not now repair them ſo quickly as formerly, when ſhe enjoyed the rich monopoly of the Aſiatic trade.

41 The city capitulates.

This republic remained in a ſtate of tranquillity, endeavouring, by the arts of peace and cultivation of that ſhare of commerce which ſhe ſtill retained, to fill her empty exchequer, till ſhe was drawn into a new war, in the year 1683, by the inſolence of the Ottoman court. The Venetians had for ſome time endeavoured, by negociation and many conciliatory repreſentations, to accommodate matters with the Turks; and though the haughty conduct of their enemies afforded ſmall hopes of ſucceſs, yet ſuch was their averſion to war on the preſent occaſion, that they ſtill balanced, whether to bear thoſe inſults or repel them by arms; when they were brought to deciſion by an event which gave the greateſt joy to Venice, and aſtoniſhed all Europe. This was the great victory gained over the Turkiſh army before the walls of Vienna by Sobieſki king of Poland.

42 New war with the Turks.

In this new war, their late general Morſini again had the command of the fleets and armies of the republic, and ſuſtained the great reputation he had acquired in Candia. He conquered the Morea, which was ceded formally to Venice, with ſome other acquiſitions, at the peace of Carlowitz, in the laſt year of the laſt century.

Venice.

43 The Morea conquered by the Venetians.

During the war of the ſucceſſion, the ſtate of Venice obſerved a ſtrict neutrality. They conſidered that diſpute as unconnected with their intereſts, taking care, however, to keep on foot an army on their frontiers in Italy, of ſufficient force to make them reſpected by the contending powers. But, ſoon after the peace of Utrecht, the Venetians were again attacked by their old enemies the Turks; who, beholding the great European powers exhauſted by their late efforts, and unable to aſſiſt the republic, thought this the favourable moment for recovering the Morea, which had been ſo lately raviſhed from them. The Turks obtained their object; and at the peace of Paſſarowitz, which terminated this unſucceſsful war, the Venetian ſtate yielded up the Morea; the grand ſeignior, on his part, reſtoring to them the ſmall iſlands of Cerigo and Cerigotto, with ſome places which his troops had taken during the courſe of the war in Dalmatia. Thoſe, with the iſlands of Corfou, Santa Maura, Zante, and Cephalonia, the remains of their dominions in the Levant, they have ſince fortified at a great expence, as their only barriers againſt the Turks.

44 They are obliged to relinquiſh it again.

Since this period no eſſential alteration has taken place in the Venetian government, nor has there been any eſſential increaſe or diminution in the extent of their dominions. They have little to fear at preſent from the Turks, whoſe attention is ſufficiently occupied by a more formidable enemy than the republic and the houſe of Auſtria united. Beſides, if the Turks were more diſengaged, as they have now ſtripped the republic of Cyprus, Candia, and their poſſeſſions in Greece, what remains in the Levant is hardly worth their attention.

45 State of Venice ſince that time.

The declenſion of Venice did not, like that of Rome, proceed from the increaſe of luxury, or the revolt of their own armies in the diſtant colonies, or from civil wars of any kind. Venice has dwindled in power and importance from cauſes which could not be foreſeen, or guarded againſt by human prudence although they had been foreſeen. In their preſent ſituation, there is little probability of their attempting new conqueſts; happy if they are allowed to remain in the quiet poſſeſſion of what they have.

46 Deſcription of the capital.

We have already mentioned the ſituation of Venice, the capital of this republic. Its appearance at a diſtance is very ſtriking, looking like a great town half floated by a deluge. Betwixt the city and the Terra Firma are a great many ſhallows, on which at low water you may almoſt every where touch the bottom with a pole; but all poſſible care is taken to prevent their becoming dry land. On the ſouth ſide of the city are alſo ſhallows; but on theſe there is a greater depth of water. The channels betwixt them are marked out by ſtakes or poles, which on the approach of an enemy would certainly be taken away. The city is divided by a vaſt number of canals, on which ply the gondoliers, or watermen, in their black gondolas or boats. The ſtreets are very clean and neat, but narrow and crooked. There are no carriages, not ſo much as a chair, to be ſeen in them. Though the city, by its ſituation and the great number of ſteeples towering above the water, ſtrikes one with admiration at a diſtance, yet when he is got into it, it does not anſwer his expectation; for excepting the ſquare of St Mark and a few other places, there is nothing grand or beautiful in it, at leaſt in compariſon of many other cities of Italy. Of the canals, that called *Il Canale Maggiore*, or the "great canal," is by far the largeſt and longeſt, and conſequently the moſt beautiful. Here races are ſometimes run for prizes in the gondolas. On its banks are alſo ſeveral ſtately houſes. Over theſe canals are a great number of handſome bridges

of

Venice. of one arch, but without any fence on either ſide: they are alſo built of white ſtone, with which the ſtreets are all paved, except the Rialto over the great canal which is all of marble, and coſt the republic 250,000 ducats, the arch being 90 feet wide. The canals in ſummer emit a bad ſmell, from the great quantities of filth continually running into them. The fineſt gondolas are thoſe in which the foreign miniſters make their public entries, being richly decorated with gilding, painting, and ſculpture. The number of iſlands on which the city ſtands, according to ſome, is 60; according to others, 72. The circumference is about ſix Italian miles; and it takes up about two hours to make the circuit of it in a gondola. The inhabitants are ſuppoſed to be about 150,000 including thoſe of the iſlands of Murano, La Guideca, and thoſe who live on board the barges. There are near 200 ſprings of freſh water in the city; but the water of many of them is ſo indifferent, that the principal families preſerve rain-water in ciſterns, or are ſupplied with water from the Brenta. The moſt remarkable places in the city are the ducal palace, the ſquare and church of St Mark, who is the tutelar ſaint of Venice; the mint, public library, grand arſenal, ſeveral of the palaces of the nobles, churches, convents, and hoſpitals. In theſe laſt is a prodigious collection of the fineſt paintings; Venice, in this reſpect, even ſurpaſſing Rome itſelf. The diverſions of the Venetians are chiefly maſquerading, eſpecially during the carnival and other feſtivals; ridottos, operas, plays, which are generally wretched performances, and concerts of vocal and inſtrumental muſic. During their feſtivals, debauchery, riot, and licentiouſneſs, are carried to the greateſt height. The courtezans, here, we are told, are abſolutely loſt to all ſenſe of modeſty and common decency. The grand ſcene of all the ſhows and follies of the feſtivals, is the ſquare of St Mark, in which bulls are ſometimes baited. In the doge's palace all the high colleges hold their aſſemblies; but we are told by ſeveral travellers, which ſeems very ſtrange, that the ſtairs are no better than a privy. In this palace is a ſmall arſenal, furniſhed with arms againſt any ſudden inſurrection of the people, together with a ſtate-priſon, a great many exquiſite paintings, and ſeveral curioſities, among which are ſome *clauſtra caſtitatis*. One ſide of it is towards St Mark's ſquare, and the lower gallery on that ſide, with the hall under the new procuratie facing it, are called the *Broglio*, where the nobility and none elſe, at leaſt while they are preſent, are allowed to walk. The ſquare of St Mark is the greateſt ornament of the city, and hath the form of a parallelogram. In this ſquare, beſides the church and palace of St Mark, are two towers, on one ſide of which is a curious clock; and the other has ſtairs ſo conſtructed that one may ride up on horſeback. Oppoſite to the ducal palace is the public library of the commonwealth; containing a large collection of books and manuſcripts, with ſome fine paintings, ſtatues, and curioſities. Hard by St Mark's ſquare is the zecca, or mint: from zecca the gold coin called *zecchino* takes its name. One of the ſmalleſt pieces of money at Venice is called *gazetta*; and the firſt newſpapers publiſhed there, on a ſingle leaf, having been ſold for that a-piece, all kinds of newſpapers were from thence ſtyled *gazettes*. The grand arſenal is two and a half Italian miles in circuit, and contains vaſt quantities of naval and other warlike ſtores: ſome pretend that it could furniſh arms for 10,000 horſe and 100,000 foot: here are the trophies of Scanderbeg and others, with the helmet of Attila, &c. The rope walk is 444 common paces in length, and the ropes and cables are valued at 2,000,000 of ſilver ducats. In the foundery none but braſs cannon are caſt; and 100 men are generally at work in the forges. The ſalt-petre works here deſerve a traveller's notice: there is a veſſel filled with wine and water four times a-day, where the workmen, though 1000 or more, may drink as much and as often as Venice. they pleaſe. Cloſe to the Rialto is the bank. The trade of the city at preſent is far ſhort of what it was formerly. Their chief manufactures are cloth; eſpecially ſcarlet, ſilks, gold and ſilver ſtuffs, brocades, velvets, and paper, of which, and wine, oil, fruit, ſweetmeats, anchovies, and ſeveral ſorts of drugs uſed in phyſic and painting, the exports are ſtill conſiderable. Venice has neither walls, gates, nor citadel, to defend it; its ſituation ſupplying the want of all theſe. In the treaſury of relics is the protocoll, or original manuſcript, as they pretend, of St Mark's goſpel: it is rarely ſhown; and the writing, by length of time, is ſo defaced, that the greateſt connoiſſeurs in manuſcripts cannot determine whether it was wrote in Greek or Latin. Beſides what is properly called the city, there is a multitude of little iſlands lying round, which are covered with buildings, and make each of them a kind of ſeparate town; the moſt conſiderable of which is that called *Guideca*, or the "Jews Quarter," which is large and populous; with St Eroſmo, St Helena, St Georgio, Chioſa, Il Lido de Paleſtrina, Il Lido de Malamocco, and Murano: theſe iſlands are a ſort of fence to the city, breaking the violence of the waves. To diſtinguiſh them from others, the Jews here muſt wear a bit of red cloth in their hats. The gardens in this city are few and inconſiderable. In the iſland of Murano are made thoſe beautiful looking-glaſſes, and other glaſs-works, for which Venice is ſo much noted: here the family of Cornaro hath a palace, with a gallery of paintings, little ſhort of an Italian mile in length. The ſalt-works in the iſland of Chioſa are of great benefit to the Venetians, and yield a very conſiderable revenue. There are ſeveral other ſmall iſlands about Venice beſides thoſe we have mentioned; but they are inconſiderable.

47 Government, &c. of Venice.

As to the government of this ſtate, it was, as above related, at firſt veſted in conſuls, afterwards in tribunes. About the beginning of the 8th century, a doge or duke was elected, and veſted with unlimited power, but in 1171, the power of the doge was much abridged, and a council of 240 perſons, compoſed of commons as well as nobles, was appointed. Soon after, under duke Marino Moroſini, the preſent form of electing the doge was introduced. In 1296, the government became ariſtocratical; the privilege of ſitting in the great council being then confined to the nobility, in whom alone the ſupreme authority at preſent is veſted. The number of nobles amounts to about 2000. All thoſe are members of the ſenate; but, according to their antiquity, ſome are accounted more honourable than others. One claſs, and that the loweſt, conſiſts of the poſterity of thoſe who, in the neceſſitous times of the commonwealth, purchaſed their nobility for 100,000 ducats. The nobles have the title of *Excellency*; and wear, at leaſt when in the city, a black furred gown reaching to their heels, with long caps and periwigs. Some of them are ſo poor, that they are fain to beg of the rich. At the head of the government is the doge, whoſe office was once hereditary and power abſolute; but the former is now elective, and the latter very much circumſcribed: indeed he is no more than a gaudy ſlave, loaded with fetters, which one would think could not be much the lighter for being gilt; yet ſo much is the human heart captivated with external pomp and pageantry, that the office, for the moſt part, is eagerly ſought after: but ſhould one otherwiſe inclined be choſen, he cannot decline it, without expoſing himſelf to baniſhment and confiſcation of his effects. Though the power of the doge is very ſmall, his ſtate and retinue are very ſplendid: his title is that of *Serenity*, and his office for life: he is ſaid to be a king with regard to his robes, a ſenator in the council-houſe, a priſoner in the city, and a private man out of it. The yearly revenue of his office is about

4000l.

Venice. 4000l.; and though he may be depoſed, he cannot reſign his dignity. All the nobility have a ſeat in the great council, unleſs they are under 25 years of age. In this council the ſupreme authority and legiſlative power is veſted. Next to it is the ſenate or pregradi, which conſiſts of about 250 members, who have the power of making peace or war, and foreign alliances; of appointing ambaſſadors; fixing the ſtandard of the coins; impoſing duties and taxes; and all offices by ſea and land are in their gift. The third council conſiſts of the doge and his ſix counſellors, in which all letters and inſtruments relating to the ſtate are read, ambaſſadors admitted to audience, and other important affairs tranſacted. The other colleges are the council of ten; which decides all criminal caſes without appeal, and to which even the doge himſelf is ſubject: the procurators of St Mark, whoſe office is very lucrative, and who decide with reſpect to wills, guardianſhips, and the making a proper proviſion for the poor; and the ſtate inquiſition, whoſe buſineſs it is to provide for the public tranquillity. In the wall of the ducal palace are heads of lions and leopards, with open mouths, to receive informations of any plot or treaſon againſt the ſtate. Here is alſo a particular college for the regulation of dreſs, but their juriſdiction does not extend to ſtrangers. The method of electing the doge is no leſs ſingular than complicated, and effectually calculated to prevent all kinds of bribery or corruption. All the members of the grand council who are paſt 30 years of age, being aſſembled in the hall of the palace, as many balls are put into an urn as there are members preſent; 30 of theſe balls are gilt, and the reſt white. Each counſellor draws one; and thoſe who get the gilt balls go into another room, where there is an urn containing 30 balls, nine of which are gilt. The 30 members draw again; and thoſe who by a ſecond piece of good fortune get the gilt balls are the firſt electors, and have a right to chooſe 40, among whom they comprehend themſelves.

48 Method of chooſing the doge.

Theſe 40, by balloting in the ſame manner as in the former inſtances, are reduced to 12 ſecond electors, who chooſe 25; the firſt of the 12 naming three, and the remaining 11 two a-piece. All thoſe being aſſembled in a chamber apart, each of them draws a ball from an urn containing 25 balls, among which are 9 gilt. This reduces them to 9 third electors, each of whom chooſes five, making in all 45; who, as in the preceding inſtances, are reduced by ballot to 11 fourth electors, and they have the nomination of 41, who are the direct electors of the doge. Being ſhut up by themſelves, they begin by chooſing three chiefs and two ſecretaries; each elector being then called, throws a little billet into an urn which ſtands on a table before the chiefs. On this billet is inſcribed the perſon's name whom the elector wiſhes to be doge.

The ſecretaries then, in the preſence of the chiefs and of the whole aſſembly, open the billets. Among all the 41 there are generally but a very few different names; as the election for the moſt part balances between two or three candidates. Their names, whatever is the number, are put into another urn, and drawn out one after another. As ſoon as a name is extracted the ſecretary reads it, and if the perſon to whom it belongs is preſent, he immediately retires. One of the chiefs then demands with a loud voice, whether any crime can be laid to this perſon's charge, or any objection made to his being raiſed to the ſovereign dignity? If any objection is made, the accuſed is called in and heard in his own defence; after which the electors proceed to give their deciſion, by throwing a ball into one of the two boxes, one of which is for the Ayes, the other for the Noes. The ſecretaries then count the balls; and if there are 25 in the firſt, the election is finiſhed; if not, another name is read, and the ſame inquiſition made as before, till there are 25 appearing balls.

Venice ‖ Ventilator.

The principal Venetian order of knighthood is that of St Mark; the badge of which is a large gold medal dependent on the breaſt. The order of Conſtantine knights wear a croſs hanging from a gold chain.

49 Order of knighthood.

With reſpect to religion, that of the Venetians is the Roman Catholic; but they are no bigots. The court of inquiſition is here under very great reſtrictions; and the pope is conſidered as little more than a temporal prince, his ſupremacy being rejected.

50 Religion.

The Venetians are ſtill the greateſt naval power in Italy. They pretend they could fit out, in caſe of neceſſity, 60 men of war, 100 galleys, and 10 galeaſſes; though one can hardly imagine how they could man half that number. The army is ſaid to conſiſt of between 20,000 and 30,000 men; the greateſt part of which are Dalmatians and Switzers. The commander in chief, ſtyled *Capitano*, is always a foreigner of diſtinction. General Græme, a Scotchman, lately enjoyed that honourable poſt. The ordinary revenues of the ſtate are computed at about 1,200,000l. ſterling; but in time of war they can raiſe them greatly. A conſiderable part of the revenue ariſes from the cuſtoms, and the duty on ſalt made at Corfu and Chioſa.

51 Military force and revenues.

The Venetians are in general tall and well made. They are a lively ingenious people, extravagantly fond of public amuſements, with an uncommon reliſh for humour, and yet more attached to the real enjoyments of life than to thoſe which depend on oſtentation and proceed from vanity. The women are of an eaſy addreſs, and have no averſion to cultivating an acquaintance with thoſe ſtrangers who are preſented to them by their relations, or have been properly recommended.

52 Character.

VENIRE FACIAS, in law, is a judicial writ lying where two parties plead and come to iſſue, directed to the ſheriff, to cauſe 12 men of the ſame neighbourhood to meet and try the ſame, and to ſay the truth upon the iſſue taken.

VENTER, ſignifies the belly; but it is alſo uſed for the children by a woman of one marriage: there is in law a firſt and ſecond venter, &c. where a man hath children by ſeveral wives; and how they ſhall take in deſcents of lands.

Venter Inſpiciendo, is a writ to ſearch a woman that ſaith ſhe is with child, and thereby withholdeth lands from the next heir; the trial whereof is by a jury of women.

VENTILATOR, a machine by which the noxious air of any cloſe place, as an hoſpital, gaol, ſhip, chamber, &c. may be diſcharged and changed for freſh.

The noxious qualities of bad air have been long known; and no one has taken greater pains to ſet the miſchiefs ariſing from foul air in a juſt light than Dr Hales; who has alſo propoſed an eaſy and effectual remedy by the uſe of his ventilators; his account of which was read to the Royal Society in May 1741. In the November following M. Triewald, military architect to the king of Sweden, informed Dr Mortimer, ſecretary to the Royal Society, that he had in the preceding ſpring invented a machine for the uſe of his majeſty's men of war, in order to draw out the bad air from under their decks, the leaſt of which exhauſted 36,172 cubic feet of air in an hour, or at the rate of 21,732 tons in 24 hours. In 1742 he ſent one of them, formed for a 60 gun ſhip to France; which was approved of by the Royal Academy of Sciences at Paris: and the king of France ordered all the men of war to be furniſhed with the like ventilators.

The ventilators invented by Dr Hales conſiſt of a ſquare box ABCD (fig. 1.) of any ſize; in the middle of one ſide of this box a broad partition or midriff is fixed by hinges X, and it moves up and down from A to C, by means of an

Plate DXIII.

Ventilator. an iron rod ZR, fixed at a proper diſtance from the other end of the midriff, and paſſing through a ſmall hole in the cover of the box up to R. Two boxes of this kind may be employed at once, and the two iron rods may be fixed to a lever FG (fig. 2.) moving on a fixed centre O; ſo that by the alternate raiſing and preſſing down of the lever FG, the midriffs are alſo alternately raiſed and depreſſed, whereby theſe double bellows are at the ſame time both drawing in air, and pouring it out, through apertures with valves made on the ſame ſide with, and placed both above and below, the hinges of the midriffs. In order to render the midriffs light, they are made of four bars lengthwiſe, and as many acroſs them breadthwiſe, the vacant ſpaces being filled up with thin pannels of fir-board; and that they may move to and fro with the greater eaſe, and without touching the ſides of the boxes, there is an iron regulator fixed upright to the middle of the end of the box AC (fig. 1.) from N to L, with a notch cut into the middle of the end of the midriff at Z; ſo that the midriffs, in riſing and falling, ſuffer no other friction than what is made between the regulator and the notch. Moreover, as the midriff ZX moves with its edges only one twentieth of an inch from the ſides of the box ABCDFE, very little air will eſcape by the edges; and, therefore, there will be no need of leathern ſides as in the common bellows. The end of the box at AC is made a little circular, that it may be better adapted between A and C to the riſing and falling midriff; and at the other end X of the midriff, a ſlip of leather may be nailed over the joints if needful. The eight large valves through which the air is to paſs, are placed at the hinge-end of the boxes BK (fig. 2.) as at 1, 2, 3, &c. The valve 1 opens inward to admit the air to enter, when the midriff is depreſſed at the other end by means of the lever FG. And at the ſame time the valve 3 in the lower ventilator is ſhut by the compreſſed air which paſſes out at the valve 4. But when that midriff is raiſed, the valve 1 ſhuts, and the air paſſes out at the valve 2. And it is the ſame with the valves 5, 6, &c. of the other box; ſo that the midriffs are alternately riſing and falling, and two of the ventilators drawing in air, and two blowing it out; the air entering at the valves 1, 3, 6, 8, and paſſing out at the valves 2, 4, 5, 7. Before theſe laſt valves there is fixed to the ventilators a box QQNM (fig. 3.) as a common receptacle for all the air which comes out of theſe valves; which air paſſes off by the trunk P, through the wall of a building.

For a farther account of this machine we refer to the author himſelf, who gives a full detail of it and of its manner of working. See Deſcription of Ventilators by Stephen Hales, D. D. Lond. 1743, 8vo.

The ventilators in large ſhips, ſince the order for ventilating the fleet iſſued by the lords of the admiralty in 1756, are fixed in the gunner's fore ſtore-room, and generally ahead of the ſail-room. The foul air is carried up through the decks and fore-caſtle near the fore-maſt, ſometimes afore it, and ſometimes abaft it, but more frequently on its ſtarboard ſide; the lever, by which the ventilators are worked, is under the fore-caſtle in two deck ſhips, and between the upper and middle decks in three-deckers; ſometimes the lever is hung athwart ſhips; in ſome ſhips afore and aft, and in others oblique. The iron rod, which communicates the motion from the lever, paſſes through the partners of the fore-maſt, and is connected with another lever, ſuſpended at or near the middle; in ſome ſhips over the ventilators, in others under them, when it is found neceſſary to fix them up to the deck. The beſt method to ſave room is to place the ventilators over one another with their circular ends together; the air-trunk ſhould be ſo high above deck, that the men on deck may not be incommoded by the foul air which blows out of it; and therefore the trunk comes through the upper deck, near and behind the foremaſt. For the method of freeing mines, ſhips, priſons, &c. from noxious air by means of fire-pipes, ſee PNEUMATICS, n° 371. Ventricle, Ventriloquiſm.

VENTRICLE, properly denotes any little cavity; but is more particularly uſed by phyſicians and anatomiſts for the ſtomach and certain cavities of the heart and brain.

VENTRILOQUISM, an art by which certain perſons can ſo modify their voice, as to make it appear to the audience to proceed from any diſtance, and in any direction. Some faint traces of this art are to be found in the writings of the ancients: and it is the opinion of M. de la Chapelle, who in the year 1772 publiſhed an ingenious work on the ſubject, that the reſponſes of many of the oracles were delivered by perſons thus qualified to ſerve the purpoſes of prieſt-craft and deluſion. As the ancient ventriloquiſts, when exerciſing their art, ſeemed generally to ſpeak from their own bellies, the name by which they were deſigned was abundantly ſignificant; but it is with no great propriety that modern performers are called *ventriloquiſts*, and their art *ventriloquiſm*, ſince they appear more frequently to ſpeak from the pockets of their neighbours, or from the roof or diſtant corners of the room, than from their own mouths or their own bellies.

From Brodeau, a learned critic of the 16th century, we have the following account of the feats of a capital ventriloquiſt and cheat, who was valet de chambre to Francis the Firſt. The fellow, whoſe name was *Louis Brabant*, had fallen deſperately in love with a young, handſome, and rich heireſs; but was rejected by the parents as an unſuitable match for their daughter, on account of the lowneſs of his circumſtances. The young lady's father dying, he made a viſit to the widow, who was totally ignorant of his ſingular talent. Suddenly, on his firſt appearance, in open day, in her own houſe, and in the preſence of ſeveral perſons who were with her, ſhe heard herſelf accoſted, in a voice perfectly reſembling that of her dead huſband, and which ſeemed to proceed from above, exclaiming, "Give my daughter in marriage to Louis Brabant: He is a man of great fortune, and of an excellent character. I now endure the inexpreſſible torments of purgatory, for having refuſed her to him. If you obey this admonition, I ſhall ſoon be delivered from this place of torment: You will at the ſame time provide a worthy huſband for your daughter, and procure everlaſting repoſe to the ſoul of your poor huſband."

The widow could not for a moment reſiſt this dread ſummons, which had not the moſt diſtant appearance of proceeding from Louis Brabant; whoſe countenance exhibited no viſible change, and whoſe lips were cloſe and motionleſs, during the delivery of it. Accordingly, ſhe conſented immediately to receive him for her ſon-in-law. Louis's finances, however, were in a very low ſituation; and the formalities attending the marriage contract rendered it neceſſary for him to exhibit ſome ſhow of riches, and not to give the ghoſt the lie direct. He accordingly went to work upon a freſh ſubject, one Cornu, an old and rich banker at Lyons; who had accumulated immenſe wealth by uſury and extortion, and was known to be haunted by remorſe of conſcience on account of the manner in which he had acquired it.

Having contracted an intimate acquaintance with this man, he, one day while they were ſitting together in the uſurer's little back parlour, artfully turned the converſation on religious ſubjects, on demons and ſpectres, the pains of purgatory, and the torments of hell. During an interval of ſilence between them, a voice was heard, which to the aſtoniſhed banker ſeemed to be that of his deceaſed father, com-

Ventriloquism. complaining, as in the former case, of his dreadful situation in purgatory, and calling upon him to deliver him instantly from thence, by putting into the hands of Louis Brabant, then with him, a large sum for the redemption of Christians then in slavery with the Turks; threatening him at the same time with eternal damnation if he did not take this method to expiate likewise his own sins. The reader will naturally suppose that Louis Brabant affected a due degree of astonishment on the occasion; and further promoted the deception, by acknowledging his having devoted himself to the prosecution of the charitable design imputed to him by the ghost. An old usurer is naturally suspicious. Accordingly the wary banker made a second appointment with the ghost's delegate for the next day; and, to render any design of imposing upon him utterly abortive, took him into the open fields, where not a house, or a tree, or even a bush, or a bit, were in sight, capable of screening any supposed confederate. This extraordinary caution excited the ventriloquist to exert all the powers of his art. Wherever the banker conducted him, at every step his ears were saluted on all sides with the complaints and groans not only of his father, but of all his deceased relations, imploring him for the love of God, and in the name of every saint in the kalendar, to have mercy on his own soul and theirs, by effectually seconding with his purse the intentions of his worthy companion. Cornu could no longer resist the voice of heaven, and accordingly carried his guest home with him, and paid him down 10,000 crowns; with which the honest ventriloquist returned to Paris, and married his mistress.—The catastrophe was fatal. The secret was afterwards blown, and reached the usurer's ears, who was so much affected by the loss of his money, and the mortifying railleries of his neighbours, that he took to his bed and died.

This trick of Louis Brabant is even exceeded by an innocent piece of waggery played off not 40 years ago by another French ventriloquist on a whole community. We have the story from M. de la Chapelle, who informs us, that M. St Gile the ventriloquist and his intimate friend, returning home from a place whither his business had carried him, sought for shelter from an approaching thunder storm in a neighbouring convent. Finding the whole community in mourning, he inquired the cause and was told that one of their body had died lately, who was the ornament and delight of the whole society. To pass away the time, he walked into the church, attended by some of the religious, who showed him the tomb of their deceased brother, and spoke feelingly of the scanty honours they had bestowed on his memory. Suddenly a voice was heard, apparently proceeding from the roof of the quire, lamenting the situation of the defunct in purgatory, and reproaching the brotherhood with their lukewarmness and want of zeal on his account. The friars, as soon as their astonishment gave them power to speak, consulted together, and agreed to acquaint the rest of the community with this singular event, so interesting to the whole society. M. St Gile, who wished to carry on the joke still farther, dissuaded them from taking this step; telling them that they would be treated by their absent brethren as a set of fools and visionaries. He recommended to them, however, the immediately calling of the whole community into the church, where the ghost of their departed brother might probably reiterate his complaints. Accordingly all the friars, novices, lay-brothers, and even the domestics of the convent, were immediately summoned and collected together. In a short time the voice from the roof renewed its lamentation and reproaches, and the whole convent fell on their faces, and vowed a solemn reparation. As a first step, they chanted a *De profundis* in a full choir; during the intervals of which the ghost occasionally expressed the comfort he received from their pious exercises and ejaculations on his behalf. When all was over, the prior entered into a serious conversation with M. St Gile; and on the strength of what had just passed, sagaciously inveighed against the absurd incredulity of our modern sceptics and pretended philosophers on the article of ghosts or apparitions. M. St Gile thought it now high time to disabuse the good fathers. This purpose, however, he found it extremely difficult to effect, till he had prevailed upon them to return with him into the church, and there be witnesses of the manner in which he had conducted this ludicrous deception. Ventriloquism.

A ventriloquist, who performed feats somewhat similar to these, made his appearance in Edinburgh, and many of the other towns of Scotland, a few months before the writing of this article. He imitated successfully the voice of a squeaking child, and made it appear to proceed from whatever place he chose; from the pockets of the company, from a wooden doll, with which he held many spirited conversations; from beneath a hat or a wineglass, and out of any person's foot or hand. When the voice seemed to come from beneath a glass or hat, it was dull and on a low key, as sounds confined always are; and what evinced his dexterity was, that when the glass was raised from the table during the time of his speaking, the words or syllables uttered afterwards were on a higher key, in consequence, one would have thought, of the air being readmitted to the speaker. This part of the experiment failed, however, when the management of the glass was at a distance committed to any of the company; but as the room was not well illuminated, we are inclined to attribute this failure to the ventriloquist's not being able to perceive at what precise instant of time the glass was removed from the table. The same artist imitated the tones of a scolding old woman, disturbed at unseasonable hours by a person demanding admission into her house; but this exhibition did not to us appear masterly. The tones of the old woman and the child were not accurately discriminated: the child was a young scold, and the scold spoke like an angry child. We have heard that, when in Edinburgh, the same practitioner astonished a number of persons in the Fishmarket, by making a fish appear to speak, and give the lie to its vender, who affirmed that it was fresh, and caught in the morning; and whether this fact was really performed or not, we cannot doubt, from what we saw and heard him do, but that he was fully equal to its performance.

Our ventriloquist was an illiterate man; and though sufficiently communicative, could not make intelligible to us the manner in which he produced these acoustic deceptions. Indeed if he had, we should hardly have described the practical rules of the art to the public; for though it is proper to make the existence of such an art universally known, it will readily occur to every reflecting mind, that the attainment of it should not be rendered easy to those who, like Louis Brabant, might make it subservient to the purposes of knavery and deception. The speculative principles on which it is founded must be obvious to every man who has studied the philosophy of the human mind, and has ever witnessed the feats of mimickry.

It has been shown elsewhere (see METAPHYSICS, n° 47, 48.), that, previous to experience, we could not refer sound to any external cause; that it does not therefore give immediate indication of the place or distance of the sonorous body; and that it is only by the association of place with sound that the latter becomes an indication of the former. This being admitted, nothing seems requisite to fit a man for becoming an expert ventriloquist but a delicate ear, flexibility of the organs of speech, and long practice of those rules

Ventriloquiſm, Venus.

rules which repeated trials would enable him to diſcover. A delicate ear perceives every difference which change of place produces in the ſame ſound; and if a perſon poſſeſſed of ſuch an ear have ſufficient command over his organs of ſpeech, to produce by them a ſound in all reſpects ſimilar to another proceeding from any diſtant object, it is evident that to the audience the ſound which he utters muſt appear to proceed from that object. If this be the true theory of ventriloquiſm, it does not ſeem to be poſſible for the moſt expert ventriloquiſt to ſpeak in his uſual tones of converſation, and at the ſame time make the voice appear to come from a diſtance; for theſe tones muſt be ſuppoſed familiar to his audience, and to be in their minds aſſociated with the ideas of his figure, place, and diſtance. Hence the ventriloquiſt whom we ſaw appeared to ſpeak from various places only in the tones of the ſqueaking child, while Louis Brabant and M. St Gille, in their great feats, imitated the voices of ghoſts, to which no man could be familiar, and where terror would greatly contribute to the deception. There can, however, be no doubt, but that if, by a peculiar modification of the organs of ſpeech, a ſound of any kind can be produced, which in faintneſs, tone, body, and in ſhort every other ſenſible quality, perfectly reſembles a ſound delivered from the roof of an oppoſite houſe; the ear will naturally, without examination, refer it to that ſituation and diſtance, the ſound which the perſon hears being only a ſign, which he has from his infancy been conſtantly accuſtomed, by experience, to aſſociate with the idea of a perſon ſpeaking from a houſe-top. It is evident too, that when there is no particular ground of ſuſpicion, any ſmall diſparity between the two ſounds will not be perceptible. But if our theory be juſt, that experience or habit which miſleads a perſon who has ſeldom heard the ventriloquiſt, and is a ſtranger to his powers, at length ſets another perſon right who is acquainted with them, and has been a frequent witneſs of their effects. This was actually the caſe of M. de la Chapelle, with whom the illuſion at length ceaſed, in conſequence of repeated viſits to M. St Gille: ſo that while others, ignorant of his talent, and poſſeſſed only of their old or habitual experience with regard to articulate ſounds, conſidered his voice as coming from the top of a tree, or from a deep cellar under ground; our author, well acquainted with the powers of the ventriloquiſt, and having acquired a new kind of experience, at once referred it directly to the mouth of the ſpeaker.

VENUS, in Pagan worſhip, the goddeſs of love and beauty. Cicero mentions two other deities of this name. Venus, ſtyled *Urania* and *Celeſtis*; and the *Venus Pandemos* or *Popularis*, the wife of Vulcan, and the goddeſs of wanton and effeminate love. To the firſt the Pagans aſcribed no attributes but ſuch as were agreeable to the ſtricteſt chaſtity and virtue; and of this deity they admitted no corporeal reſemblance, ſhe being only repreſented by the form of a globe, ending conically. Her ſacrifices were termed *nephalia*, on account of their ſobriety. To her honey and wine were offered, and no animal except the heifer; and on her altars the wood of figs, vines, or mulberries, were not ſuffered to be burnt. The Romans dedicated a temple to this goddeſs, to whom they gave the name of *Verticordia*; becauſe ſhe turned the hearts of lewd women, and inſpired modeſty and virtue.

But the moſt famous of theſe goddeſſes is the wife of Vulcan; who is repreſented as ſpringing from the froth raiſed by the genitals of Saturn, when cut off by Jupiter and thrown into the ſea. As ſoon as ſhe was formed, ſhe was laid in a beautiful ſhell embelliſhed with pearl, and wafted by gentle zephyrs to the iſle of Cytherea, whence ſhe ſailed to Cyprus. At her landing, flowers roſe beneath her feet; ſhe was received by the Hours, who braided her hair with golden fillets; and then wafted her to heaven, where her charms appeared ſo attractive, that moſt of the gods deſired her in marriage; but Vulcan, by the advice of Jupiter, gained poſſeſſion by putting poppies into her nectar. As Venus was the goddeſs of love and pleaſure, the poets have been laviſh in the deſcription of her beauties; and the painters and ſtatuaries have endeavoured to give her the moſt lovely form. Sometimes ſhe is repreſented clothed in purple, glittering with gems, her head crowned with roſes, and drawn in an ivory car by ſwans, doves, or ſparrows; at others ſhe ſtands attended by the Graces; but in all poſitions, her ſon Cupid is her inſeparable companion. She was honoured as the mother of Hymeneus, Cupid, Æneas, and the Graces, and was paſſionately fond of Adonis and Anchiſes.

Venus ‖ Veratrum.

This goddeſs was principally worſhiped at Paphos and Cyprus; and the ſacrifices offered to her were white goats and ſwine, with libations of wine, milk, and honey. Her victims were crowned with flowers, or wreaths of myrtle.

VENUS, in aſtronomy. See ASTRONOMY-*Index*, and PNEUMATICS, n° 237.

Venus's Fly trap. See *DIONÆA Muſcipula.*

VENUS, in zoology, a genus of inſects belonging to the order of vermes teſtaceæ. This animal is a tethys: the ſhell is bivalve; the hinge with three teeth near each other, one placed longitudinally and bent inwards. There are a great many ſpecies; of which the moſt remarkable is the *merenaria*, or commercial, with a ſtrong, thick, weighty ſhell, covered with a brown epidermis; pure white within; ſlightly ſtriated tranſverſely. Circumference above 11 inches.—Theſe are called in North America *clams*; they differ from other ſpecies only in having a purple tinge within. Wampum, or Indian money, is made of them.

VEPRECULÆ, diminutive from *vepres*, "a briar or bramble; the name of the 31ſt order in Linnæus's Fragments of a Natural Method. See BOTANY, Sect. 6.

VERA-CRUZ, a ſea-port town of North America, in New Spain, with a very ſecure and commodious harbour, defended by a fort. Here the Flotilla annually arrives from Spain to receive the produce of the gold and ſilver mines of Mexico; and at the ſame time a fair is held here for all manner of rich merchandiſe brought from China and the Eaſt Indies by way of the South Sea, and for the merchandiſe of Europe by the way of the Atlantic Ocean. This town is not two miles in circumference; and about it there is a wall of no great ſtrength on the land-ſide. The air is unwholeſome; and there are very few Spaniards here unleſs when the Flotilla arrives, and then it is crowded with people from all parts of Spaniſh America. It is 200 miles ſouth-eaſt of Mexico. W. Long. 37. 25. N. Lat. 19. 12.

VERAGUA, a province of New Spain, bounded on the eaſt of that of Coſta Rica, on the weſt by Panama, on the north by Darien and the Gulf of Mexico, and on the ſouth by the South Sea. It is about 125 miles in length from eaſt to weſt, and 60 in breadth from north to ſouth. It is a mountainous barren country; but has plenty of gold and ſilver. Conception is the capital town.

VERATRUM, in botany: A genus of plants of the claſs of *polygamia*, and order of *monœcia*; and in the natural ſyſtem arranged under the 10th order, *Coronariæ*. There is no calyx; the corolla has ſix petals; there are ſix ſtamina: the hermaphrodite flowers have three piſtils and three capſules. There are three ſpecies, none of which are natives of Britain.

The moſt important is the *album*, or hellebore, the root of which is perennial, about an inch thick, externally brown, internally white, and beſet with many ſtrong fibres; the

Veratrum ‖ Verbaſcum.

ſtalk is thick, ſtrong, round, upright, hairy, and uſually riſes four feet in height: the leaves are numerous, very large, oval, entire, ribbed, plaited, without footſtalks, of a yellowiſh green colour, and ſurround the ſtem at its baſe: the flowers are of a greeniſh colour, and appear from June to Auguſt in very long, branched, terminal ſpikes.

It appears from various inſtances, that every part of the plant is extremely acrid and poiſonous, as its leaves and even ſeeds prove deleterious to different animals.

Woodville's Medical Botany.

The ancients, though ſufficiently acquainted with the virulency of their white hellebore, were not deterred from employing it internally in ſeveral diſeaſes, eſpecially thoſe of a chronic and obſtinate kind, as mania, melancholia, hydrops, elephantiaſis, epilepſia, vitiligo, lepra, rabies canina, &c. They conſidered it the ſafer when it excited vomiting, and Hippocrates wiſhed this to be its firſt effect. To thoſe of weak conſtitutions, as women, children, old men, and thoſe labouring under pulmonary complaints, its exhibition was deemed unſafe; and even when given to the robuſt, it was thought neceſſary to moderate its violence by different combinations and preparations; for it was frequently obſerved to effect a cure, not only by its immediate action upon the primæ viæ, but when no ſenſible evacuation was promoted by its uſe.

Greding employed it in a great number of caſes of the maniacal and melancholic kind; the majority of theſe, as might be expected, derived no permanent benefit; ſeveral, however, were relieved, and five completely cured by this medicine. It was the bark of the root, collected in the ſpring, which he gave in powder, beginning with one grain: this doſe was gradually increaſed according to its effects. With ſome patients one or two grains excited nauſea and vomiting, but generally eight grains were required to produce this effect, though in a few inſtances a ſcruple and even more was given.

Veratrum has likewiſe been found uſeful in epilepſy, and other convulſive complaints; but the diſeaſes in which its efficacy ſeems leaſt equivocal, are thoſe of the ſkin; as ſcabies and different prurient eruptions, herpes, morbus pediculoſus, lepra, ſcrophula, &c. and in many of theſe it has been ſucceſsfully employed both internally and externally.

As a powerful ſtimulant, and irritating medicine, its uſe has been reſorted to only in deſperate caſes, and then it is firſt to be tried in very ſmall doſes in a diluted ſtate, and to be gradually increaſed according to the effects.

VERB, in grammar. See GRAMMAR, Chap. IV.

VERBASCUM, in botany: A genus of plants of the claſs of *pentandria*, and order of *monogynia*; and in the natural ſyſtem arranged under the 28th order, *Luridæ*. The corolla is rotated, and rather unequal: the capſule is monolocular and bivalved. There are 12 ſpecies, five of which are natives of Britain; 1. The *thapſus*, or great mullein, which has a ſtem ſingle, ſimple, erect, covered with leaves, about ſix feet high. Leaves large, broad, white, woolly on both ſides, ſeſſile, decurrent. Flowers terminal, in a long ſpike, ſeſſile, yellow.

Catarrhal coughs and diarrhœas are the complaints for which it has been internally preſcribed. Dr Home tried it in both, but it was only in the latter diſeaſe that this plant ſucceeded. He relates four caſes in which a decoction of verbaſcum was given; and from which he concludes, that it "is uſeful in diminiſhing or ſtopping diarrhœas of an old ſtanding, and often in eaſing the pains of the inteſtines. Theſe acquire a great degree of irritability; and the ordinary irritating cauſes, aliment, bile, diſtenſion from air, keep up a quicker periſtaltic motion. This is obviated by the emollient and perhaps gentle aſtringent qualities of this plant."

Verbena ‖ Verdigriſe.

2. The *nigrum*, or black mullein, having a ſtem beſet with hairs that are beautifully branched; the bloſſoms yellow, with purple tips. It is a beautiful plant, and the flowers are grateful to bees. Swine eat it; ſheep are not fond of it; cows, horſes, and goats, refuſe it. The other Britiſh ſpecies are the lychnitis, nigrum, blattaſi, and virgatum.

VERBENA, in botany: A genus of plants of the claſs of *diandria*, and order of *monogynia*; and in the natural ſyſtem arranged under the 40th order, *Perſonatæ*. There are 17 ſpecies, only one of which is a native of Britain; the *officinalis*, or common vervain, which grows on the road-ſides near towns and villages. The leaves have many jagged clefts, the bloſſoms are pale blue. It manifeſts a ſlight degree of aſtringency, and was formerly much in vogue as a deobſtruent; but is now diſregarded. Mr Millar ſays that it is never found above a quarter of a mile from a houſe; whence the common people in England call it *Simpler's joy*, becauſe, wherever it is found, it is a certain ſign of a houſe being near. Sheep eat it; cows, horſes, and goats, refuſe it.

VERD (Cape), a promontory on the weſt coaſt of Africa, 40 miles north-weſt of the mouth of the river Gambia. W. Long. 17. 38. N. Lat. 14. 45.

The iſlands of Cape de Verd are ſeated in the Atlantic Ocean, about 400 miles weſt of the Cape. They are between the 13th and 19th degree of latitude; and the principal are 10 in number, lying in a ſemicircle. Their names are, *St Anthony*, *St Vincent*, *St Lucia*, *St Nicholas*, the *Iſle of Sal*, *Bona Viſta*, *Mayo*, *St Jago*, *Fuego*, and *Brava*.

VERDICT (*Vere dictum*), is the anſwer of the jury given to the court concerning the matter of fact, in any caſe civil or criminal, committed by the court to their trial and examination. See LAW, N° clxxxvi. 51. and TRIAL.

VERDIGRISE, the acetite of copper, much uſed by painters as a green colour. It is chiefly manufactured at Montpelier; the vines of Languedoc being very convenient for this purpoſe. See CHEMISTRY, n° 872.

The following proceſs for making verdigriſe is deſcribed by Mr Monet of the Royal Society of Montpelier, and is publiſhed among the memoirs of the academy for the years 1750 and 1753.

Vine-ſtalks well dried in the ſun are ſteeped during eight days in ſtrong wine, and afterwards drained. They are then put into earthen pots, and upon them wine is poured. The pots are carefully covered. The wine undergoes the acetous fermentation, which in ſummer is finiſhed in ſeven or eight days; but requires a longer time in winter, although this operation is always performed in cellars. When the fermentation is ſufficiently advanced, which may be known by obſerving the inner ſurface of the lids of the pots, which during the progreſs of the fermentation is continually wetted by the moiſture of the riſing vapours, the ſtalks are then to be taken out of the pots. Theſe ſtalks are by this method impregnated with all the acid of the wine, and the remaining liquor is but a very weak vinegar. The ſtalks are to be drained during ſome time in baſkets, and layers of them are to be put into earthen pots with plates of Swediſh copper, ſo diſpoſed that each plate ſhall reſt upon and be covered with layers of ſtalks. The pots are to be covered with lids; and the copper is thus left expoſed to the action of the vinegar, during three or four days, or more, in which time the plates become covered with verdigriſe. The plates are then to be taken out of the pots, and left in the cellar three or four days; at the end of which time they are to be moiſtened with water, or with the weak vinegar above mentioned, and left to dry. When this moiſtening and drying

of

Verditer. Vere.

of the plates has been thrice repeated, the verdigriſe will be found to have conſiderably increaſed in quantity; and it may then be ſcraped off for ſale.

A ſolution or eroſion of copper, and conſequently of verdigriſe, may be prepared by employing ordinary vinegar inſtead of wine, as is directed in the above proceſs. But it would not have the unctuoſity of ordinary verdigriſe, which quality is neceſſary in painting. Good verdigriſe muſt be prepared by means of a vinous acid, or ſolvent half acid and half ſpirituous. Accordingly, the ſucceſs of the operation depends chiefly on the degree of fermentation to which the wine employed has been carried: for this fermentation muſt not have been ſo far advanced that no ſenſibly vinous or ſpirituous parts remained in the liquor.

Verdigriſe is employed externally for deterging foul ulcers, and as an eſcharotic. It is rarely or never given internally. Some recommend it indeed in the doſe of a grain or two as an emetic, which operates almoſt as ſoon as received into the ſtomach, and which may therefore be of uſe where poiſonous ſubſtances have been taken, to procure their immediate rejection. It appears, however, highly imprudent to have recourſe on ſuch occaſions to a remedy in itſelf ſo dangerous and ſo virulent; and more eſpecially as a ſpeedy evacuation may generally be obtained by means of ſubſtances which are not only innocent, but at the ſame time weaken the force of the poiſon by diluting and obtunding it, as warm water, milk, oils. It is accordingly excluded from the preſent pharmacopœiæ.

VERDITER, or VERDATER, a preparation of copper, ſometimes uſed by the painters, &c. for a blue; but more uſually mixed with a yellow for a green colour. See CHEMISTRY, n° 758, and *Colour-Making*, n° 28.

VERE (Sir Francis), a renowned Engliſh general, was the ſecond ſon of Geffrey de Vere, a branch of the ancient family of that name, earls of Oxford, and was born in the year 1554. Concerning his education we are uninformed. About the age of 31 he embarked with the troops ſent by Queen Elizabeth, under the command of the earl of Leiceſter, to the aſſiſtance of the ſtates of Holland; in which ſervice his courage and military genius became immediately conſpicuous: but his gallant behaviour in the defence of Bergen-op-Zoom, in the year 1588, when beſieged by the prince of Parma, eſtabliſhed his reputation. After the ſiege was raiſed, he received the honour of knighthood from lord Willoughby, who ſucceeded the earl of Leiceſter in the command. He continued in the ſervice of the ſtates till about the year 1595; during which time, namely, in 1593, he was elected member of parliament for Leominſter in Herefordſhire. The famous expedition againſt Cadiz being reſolved upon, Sir Francis Vere was called home, and appointed to a principal command under the earl of Eſſex. The ſucceſs of this enterpriſe is univerſally known. In 1597 we find him again in Holland, preſent at the battle of Turnhout, of which he has given a particular deſcription in his Commentaries. In the ſame year he embarked, with the earl of Eſſex, in the expedition to the Azores; and at his return was appointed governor of the Briel in Holland, with the command of the Engliſh troops in the ſervice of the ſtates. In 1600 he was one of the three generals at the battle of Newport, and had the honour of having the victory univerſally aſcribed to his conduct and reſolution. The ſtates of Holland, then at war with Spain, marched their army with an intention to beſiege Newport in Flanders. The commanders were, count Erneſt of Naſſau, count Somes, and Sir Francis Vere. The Spaniards marched to intercept them, and this battle enſued. Sir Francis was ſhot firſt through the leg, and then through the ſame thigh; notwithſtanding which, he rallied the flying army, and led them on to victory. The Spaniards loſt 120 enſigns, and moſt of their foot were ſlain. Queen Elizabeth on this occaſion declared him the *worthieſt captain of her time*. (See *Letters of the Sidney Family*, vol. ii. p. 104.) But the laſt and moſt glorious atchievement of his life was his gallant defence of Oſtend, with about 1600 men, againſt an army of 12,000, from July 1601 until March 1602, when he reſigned the government, and returned to Holland. An account of this memorable ſiege, which laſted above three years, to the deſtruction of the beſt troops of Holland, Spain, France, England, Scotland, and Italy, the reader may ſee in *Vere's Commentaries*, with the Continuation at the end. Queen Elizabeth died in the year 1603: the peaceful James ſucceeded to the throne; and Sir Francis Vere, with all the heroes of his time, ſheathed his ſword. He died in 1608, in the 54th year of his age; and was buried in St John's Chapel in Weſtminſter abbey, where a ſplendid monument was erected to his memory. He married the daughter of ——— Dent, a citizen of London, by whom he had three ſons and two daughters, none of whom ſurvived him. He will ever be remembered by poſterity as one of the greateſt heroes of our moſt heroic age. —The work above mentioned is intitled, "The Commentaries of Sir Francis Vere, being diverſe pieces of ſervice wherein he had command; written by himſelf by way of commentary." Cambridge, 1657, folio. It is elegantly printed, and adorned with prints of Sir Francis, Sir Horace Vere, Sir John Ogle, maps, and plans of battles, &c.

Verge. Vermin.

VERGE (*Virgata*), in law, ſignifies the compaſs of the king's court, which bounds the juriſdiction of the lord ſteward of the houſehold; and which is thought to have been 12 miles round.

The term *verge* is alſo uſed for a ſtick or rod, whereby one is admitted tenant to a copyhold eſtate, by holding it in his hand, and ſwearing fealty to the lord of the manor.

VERGERS, certain officers of the courts of king's bench and common pleas, whoſe buſineſs it is to carry white wands before the judges. There are alſo vergers of cathedrals, who carry a rod tipped with ſilver before the biſhop, dean, &c.

VERGIL (Polydore). See VIRGIL.

VERJUICE, a liquor obtained from grapes or apples, unfit for wine or cyder; or from ſweet ones, whilſt yet acid and unripe. Its chief uſe is in ſauces, ragouts, &c. though it is alſo an ingredient in ſome medicinal compoſitions, and is uſed by the wax-chandlers to purify their wax.

VERMES, the ſixth claſs of animals in the Linnæan ſyſtem, comprehending five orders. See NATURAL HISTORY, and Zoology.

VERMICELLI, or VERMICHELLY, a compoſition of flour, cheeſe, yolks of eggs, ſugar, and ſaffron, reduced to a paſte, and formed into long ſlender pieces like worms, by forcing it with a piſton through a number of little holes. It was firſt brought from Italy, where it is in great vogue: it is chiefly uſed in ſoups and pottages, to provoke venery, &c.

VERMICULAR, an epithet given to any thing that bears a relation or reſemblance to worms.

VERMIFORMIS, in anatomy, a term applied to various parts in the human body, bearing ſome reſemblance to worms.

VERMILION, a very bright and beautiful red colour, compoſed of quickſilver and ſulphur, in great eſteem among the ancients under the name of *minium*; but what goes by the name of minium amongſt us, is a preparation of lead, known alſo by the name of *red-lead*. See CHEMISTRY, n° 1404.

VERMIN, a collective name, including all kinds of little

Vernacular ‖ Vernier.

animals and insects, which are hurtful or troublesome to mankind, beasts, or fruits, &c. as worms, lice, fleas, caterpillars, ants, flies, &c.

VERNACULAR, a word applied to something that is peculiar to any one country.

VERNAL, something belonging to the spring-season.

VERNIER SCALE, a scale excellently adapted for the graduation of mathematical instruments, thus called from its inventor Peter Vernier, a person of distinction in the Franche Comté. See NONIUS.

Vernier's method is derived from the following principle. If two equal right lines, or circular arcs, A, B, are so divided, that the number of equal divisions in B is one less than the number of equal divisions of A, then will the excess of one division of B above one division of A be compounded of the ratios of one of A to A, and of one of B to B.

For let A contain 11 parts, then one of A to A is as 1 to 11, or $\frac{1}{11}$. Let B contain 10 parts, then one of B to B is as 1 to 10, or $\frac{1}{10}$. Now $\frac{1}{10}-\frac{1}{11}=\frac{11-10}{10\times 11}=\frac{1}{10\times 11}=\frac{1}{10}\times\frac{1}{11}$.

Or if B contains n parts, and A contains $n+1$ parts; then $\frac{1}{n}$ is one part of B, and $\frac{1}{n+1}$ is one part of A. And $\frac{1}{n}-\frac{1}{n+1}=\frac{n+1-n}{n\times n+1}=\frac{1}{n}\times\frac{1}{n+1}$.

The most commodious divisions, and their aliquot parts, into which the degrees on the circular limb of an instrument may be supposed to be divided, depend on the radius of that instrument.

Let R be the radius of a circle in inches; and a degree to be divided into n parts, each being $\frac{1}{p}$th part of an inch.

Now the circumference of a circle, in parts of its diameter 2 R inches, is 3,1415926 × 2 R inches.

Then $360^\circ : 3{,}1415926\times 2\text{ R} :: 1^\circ : \frac{3{,}1415926}{360}\times 2\text{ R}$ inches.

Or, 0,01745329 × R is the length of one degree in inches.

Or, 0,01745329 × R × p is the length of 1°, in pth parts of an inch.

But as every degree contains n times such parts, therefore $n = 0{,}01745329\times \text{R}\times p$.

The most commodious perceptible division is $\frac{1}{8}$ or $\frac{1}{10}$ of an inch.

Example. Suppose an instrument of 30 inches radius, into how many convenient parts may each degree be divided? how many of these parts are to go to the breadth of the vernier, and to what parts of a degree may an observation be made by that instrument?

Now 0,01745 × R = 0,5236 inches, the length of each degree: and if p be supposed about $\frac{1}{8}$ of an inch for one division; then 0,5236 × p = 4,188 shows the number of such parts in a degree. But as this number must be an integer, let it be 4, each being 15′: and let the breadth of the vernier contain 31 of those parts, or $7\frac{3}{4}^\circ$, and be divided into 30 parts.

Here $n=\frac{1}{4}$; $m=\frac{1}{30}$; then $\frac{1}{4}\times\frac{1}{30}=\frac{1}{120}$ of a degree, or 30′, which is the least part of a degree that instrument can show.

Vernier ‖ Veronica.

If $n=\frac{1}{5}$, and $m=\frac{1}{36}$; then $\frac{1}{5}\times\frac{1}{36}=\frac{60}{5\times 36}$ of a minute, or 20″.

The following table, taken as examples in the instruments commonly made from 3 inches to 8 feet radius, shows the divisions of the limb to nearest tenths of inches, so as to be an aliquot of 60's, and what parts of a degree may be estimated by the vernier, it being divided into such equal parts, and containing such degrees as their columns show.

Rad. inches.	Parts in a deg.	Parts in vernier.	Breadth of vernier.	Parts observed.
3	1	15	$15\frac{1}{4}$	4′ 0″
6	1	20	$20\frac{1}{4}$	3 0
9	2	20	$10\frac{1}{4}$	1 30
12	2	24	$12\frac{3}{4}$	1 15
15	3	20	$6\frac{3}{4}$	1 0
18	3	30	$10\frac{1}{4}$	0 40
21	4	30	$7\frac{1}{4}$	0 30
24	4	36	$9\frac{3}{4}$	0 25
30	5	30	$7\frac{1}{2}$	0 20
36	6	30	$5\frac{1}{4}$	0 20
42	8	30	$3\frac{7}{8}$	0 15
48	9	40	$4\frac{5}{9}$	0 10
60	10	36	$3\frac{7}{10}$	0 10
72	12	30	$2\frac{7}{12}$	0 10
84	15	40	$2\frac{2}{3}$	0 6
96	15	60	4	0 4

By altering the number of divisions, either in the degrees or in the vernier, or in both, an angle can be observed to a different degree of accuracy. Thus to a radius of 30 inches, if a degree be divided into 12 parts, each being five minutes, and the breadth of the vernier be 21 such parts, or $1\frac{3}{4}^\circ$, and divided into 20 parts, then $\frac{1}{12}\times\frac{1}{20}=\frac{1^\circ}{240}=15''$: or taking the breadth of the vernier $2\frac{7}{12}^\circ$, and divided into 30 parts; then $\frac{1}{12}\times\frac{1}{30}=\frac{1^\circ}{360}$, or 10″: Or $\frac{1}{12}\times\frac{1}{50}=\frac{1^\circ}{600}=6''$; where the breadth of the vernier is $4\frac{1}{4}^\circ$.

VERONA, a city of Italy, capital of the Veronese, in the territory of Venice, situated near the mountains, on the river Adige, in E. Long. 11. 24. N. Lat. 45. 26. It is seven miles in compass; and has been so fortified by the Venetians, that it is now looked upon as impregnable. It contains 57,400 inhabitants.

VERONESE, a territory of Italy, in the republic of Venice, bounded on the north by the Trentino, on the east by the Vicentino and Paduano, on the south by the Mantuano, and on the west by the Bresciano. It is about 35 miles in length, and 27 in breadth; and is one of the most fertile countries in Italy, abounding in corn, wine, fruits, and cattle.

VERONESE. See CAGLIARI.

VERONICA, in botany: A genus of plants of the class of *diandria*, and order of *monogynia*; and in the natural system arranged under the 40th order, *Personatæ*. There are 40 species;

Verſailles ‖ Vertex.

ſpecies; 15 are natives of Britain, only two of which have been applied to any uſe. 1. The *officinalis*, common male ſpeedwell, or fluellin; a native of Britain, growing on heaths and barren grounds. The bloſſoms are blue, the leaves elliptical, ſerrated, and hairy. The leaves have a ſmall degree of aſtringency, and are ſomewhat bitter. An infuſion of them is recommended by Hoffman as a ſubſtitute for tea; but is more aſtringent and leſs grateful. The herb was formerly eſteemed in medicine for various diſorders, but is now almoſt totally diſuſed. Cows, ſheep, goats, and horſes, eat it; ſwine refuſe it. 2. The *beccabunga*, or common brook-lime, the flowers of which are blue, in looſe lateral ſpikes; leaves ſeſſile, oval, oppoſite, thick, notched.

This plant was formerly conſidered as of much uſe in ſeveral diſeaſes, and was applied externally to wounds and ulcers; but if it have any peculiar efficacy, it is to be derived from its antiſcorbutic virtue. As a mild refrigerant juice it is preferred where an acrimonious ſtate of the fluids prevails, indicated by prurient eruptions upon the ſkin, or in what has been called the *hot ſcurvy*. We muſt, however, acknowledge, that we ſhould expect equal benefit from the ſame quantity of any other bland freſh vegetable matter taken into the ſyſtem. To derive much advantage from it, the juice ought to be uſed in large quantities, or the freſh plant eaten as food.

VERSAILLES, a town of France, in the late province of the Iſle of France, 10 miles weſt-ſouth-weſt of Paris. It contains 60,000 inhabitants, and ſince the Revolution has been created a biſhop's ſee. In the reign of Louis the XIII. it was only a ſmall village. This prince built here a hunting-hut in 1630, which Baſſompierre calls "the paltry chateau of Verſailles." Although the ſituation was low and very unfavourable, Louis XIV. built a magnificent palace here, which was the uſual reſidence of the kings of France till the 6th of October 1789, when the late unfortunate Louis XVI. and his family were removed from it to the Thuilleries. The buildings and the gardens are adorned with a vaſt number of ſtatues, done by the greateſt maſters, and the water-works are all worthy of admiration. The great gallery is thought to be as curious a piece of workmanſhip of that kind as any in the world: nor is the chapel leſs to be admired for its fine architecture and ornaments. The gardens with the park are five miles in circumference, and ſurrounded by walls. There are three fine avenues to Verſailles, one of which is the common road to Paris, the other comes from Seaux, and the third from St Cloud. E. Long. 2. 12. N. Lat. 48. 48.

VERSE, in poetry, a line conſiſting of a number of long and ſhort ſyllables, which run with an agreeable cadence.

VERSE is alſo uſed for a part of a chapter, ſection, &c.

VERSIFICATION, the art or manner of making verſe; alſo the tune and cadence of verſe. See POETRY, Part III.

VERSION, a tranſlation of ſome book or writing out of one language into another. See TRANSLATION.

VERT, in heraldry, the term for a green colour. It is called *vert* in the blazon of the coats of all under the degree of nobles: but in coats of nobility it is called *emerald*; and in thoſe of kings *vinas*. In engraving it is expreſſed by diagonals, or lines drawn athwart from right to left, from the dexter chief corner to the ſiniſter baſe.

VERTEBRÆ, in anatomy. See there n° 30.

VERTEX, in anatomy, denotes the crown of the head. Hence vertex is alſo uſed figuratively for the top of other things: thus we ſay, the vertex of a cone, pyramid, &c.

VERTEX, is alſo uſed in aſtronomy for the point of the heaven directly over our heads, properly called the *zenith*.

VERTICILLATÆ, the name of a claſs in Ray's and Boerhaave's Methods, conſiſting of herbaceous vegetables, having four naked ſeeds, and the flowers placed in whorls round the ſtalk. The term is ſynonymous to the *labiati*, or lip-flowers of Tournefort; and is exemplified in mint, thyme, and ſavory. Verticillatæ is alſo the name of the 42d order in Linnæus's Fragments of a Natural Method, conſiſting of plants which anſwer the above deſcription.

Verticillatæ. ‖ Verſalius.

VERTICILLUS, a mode of flowering, in which the flowers are produced in rings at each joint of the ſtem, with very ſhort foot-ſtalks. The term is exemplified in mint, hore-hound, and the other plants of the natural order deſcribed above.

VERTICITY, is that property of the loadſtone whereby it turns or directs itſelf to one particular point.

VERTIGO, in medicine, ſee there, n° 82.

VERTUMNUS, in mythology, a god who preſided over gardens and orchards, honoured among the Etruſcans, from whom the worſhip of this deity was tranſmitted to the Romans.

Ovid has deſcribed the various forms aſſumed by this deity, in order to obtain the love of Pomona. Some have ſuppoſed that Vertumnus, whoſe name they derive *a vertendo*, becauſe he had power to change his form at pleaſure, marked the year and its variations; and thus they ſay he pleaſed Pomona, by bringing the fruits to maturity. Accordingly Ovid ſays, that he aſſumed the form of a labourer, reaper, vine-dreſſer, an old woman, to repreſent the four ſeaſons, ſpring, ſummer, autumn, and winter. Vertumnus had a temple near the market place at Rome, being repreſented as one of the tutelary deities of the merchants. The commentators on Ovid ſay, that he was an ancient king of Hetruria, who, by his diligent and ſucceſsful cultivation of fruits and gardens, obtained the honour of being ranked among the gods.

VERUMONTANUM, in anatomy, a ſmall eminence near the paſſages where the ſemen is diſcharged into the urethra.

VERVAIN, in botany. See VERBENA.

VERTOT d'AUBOEF (Rene Aubert de), a celebrated hiſtorian, was deſcended from a noble and ancient family in Normandy, and born in 1655. At 16 years of age he became a Franciſcan friar; afterwards he entered into the order of the Premonſtratenſes, in which he had ſeveral benefices; and at length was a ſecular eccleſiaſtic. He became ſecretary to the dutcheſs of Orleans, member of the academy of Inſcriptions, and hiſtoriographer of Malta. He died at Paris in 1735. His principal works are, 1. The Hiſtory of the Revolutions of Sweden. 2. The Revolutions of Portugal. 3. The Revolutions of the Romans. 4. The Hiſtory of Malta. Theſe works are written in elegant French, and tranſlated into moſt of the languages of Europe.

VERULAM. See BACON.

VESALIUS (Andreas), a celebrated phyſician and anatomiſt, was born at Bruſſels about the year 1512. He ſtudied phyſic at Paris under James Sylvius; but applied himſelf chiefly to anatomy, which was then very little known, diſſections being eſteemed unlawful and impious: and it appears from his work *De humani corporis fabrica*, that he perfected himſelf in this uſeful knowledge very early. About the year 1537, the republic of Venice made him profeſſor in the univerſity of Padua, where he taught anatomy for ſeven years; Charles V. called him to be his phyſician, as he was alſo to Philip II. king of Spain. Veſalius was now at the height of his glory, when all of a ſudden he formed the deſign of taking a journey to Paleſtine; concerning which journey we are told the following ſtory. A young Spaniſh nobleman he attended, being believed to

be

Veſicatorium, Veſpa.

be dead, Veſalius obtained leave to open him to explore the true cauſe of his illneſs; but when he opened the breaſt, he perceived ſymptoms of life, and ſaw the heart beat. The parents, not ſatisfied with proſecuting him for murder, accuſed him of impiety to the inquiſition, in hopes that tribunal would puniſh him with greater rigour: but the king interpoſing, ſaved him on condition of his making a pilgrimage to the Holy Land. He was ſhipwrecked on his return, and thrown upon the iſland of Zante, where he periſhed, in 1564. He was the author of ſeveral works, the principal of which is *De humani corporis fabrica*.

VESICATORIUM, a BLISTER; an application of an acrid nature made to any part of the body, in order to draw a flux of humours to that part, and thus elevate the ſcarf-ſkin into a bliſter.

VESPA, the WASP; a genus of inſects belonging to the order of hymenoptera. The mouth conſiſts of two jaws without any proboſcis; the ſuperior wings are plaited; the eyes are lunar; and there is a ſharp ſting in the tail. There are 159 ſpecies; only three of which are natives of Britain, the *crabro*, the *vulgaris*, and the *coarctata*.

1. *Crabro*, the hornet. It has tawny antennæ; the ſegments of the abdomen are black on the anterior part and yellow on the poſterior, with two black ſpots on each. Its length is an inch; it builds in hollow trees. Its cakes or combs are compoſed of a ſubſtance like coarſe paper, or ruſty parchment. It is very voracious, devouring other inſects, and even bees.

2. *Vulgaris*, the common waſp. The male has ſeven yellow ſegments of the abdomen, with a black triangle on each: the head is yellow, and the antennæ long. The upper lip of the female is yellow, the antennæ ſhort; there are ſix ſegments of the abdomen with two lateral black ſpots on each. M. Reaumur and Dr Derham agree in diſtinguiſhing three ſorts of waſps; *viz.* the queens or females, the males, and the common labouring waſps, called *mules*, which, according to Reaumur, are neither males nor females, and conſequently barren. The queens, of which there is a great number, are much longer in the body, and larger than any other waſp: they have a large heavy belly, correſponding in ſize to the prodigious quantity of eggs with which they are charged. The males are leſs than the queens, but longer and larger than the common waſps, which are the ſmalleſt of the ſpecies: they have no ſtings with which both the queens and common waſps are furniſhed. There are in one neſt two or three hundred males, and as many females: but their number depends on the ſize of the neſt; and Dr Derham obſerved, that the males were bred, or at leaſt moſtly reſided, in the two cells or partings, between the combs, next the uppermoſt cell. The antennæ or horns of the male waſps are longer and larger than thoſe of either of the other ſorts: but the chief difference, ſays Dr Derham, conſiſts in their parts of generation, which are altogether different from thoſe of other waſps.

The mules are the labourers belonging to a neſt, and are employed in procuring materials for the neſts and in conſtructing them, and alſo in furniſhing the other waſps and the young, with proviſions.

At the beginning of winter, the waſps deſtroy all the eggs, and all the young ones without exception: all the mules and males, which have been employed in this work, being unfurniſhed with proviſions, periſh: and none ſurvive except ſome few females, which, according to Reaumur, were fecundated in October, and raiſe a new colony in the beginning of ſpring.

In ſpring a new commonwealth is founded by a ſingle female impregnated during the autumn, and that has weathered out the ſeverity of the winter. It digs a hole in a dry ſoil, contrives itſelf a ſinuous inlet, or elſe it takes up with the dwelling place of a mole, where it haſtily builds a few cells and depoſits its eggs. Within the ſpace of 20 days, they have gone through the different ſtates of larvæ, chryſalids, and turned to waſps. Nature all-wiſe provides for every thing. The mule-waſps are the only ones that labour at laying the foundation of the republic. The firſt eggs that are hatched prove to be neuter-waſps. No ſooner are they come into exiſtence, but they fall to work, enlarge the hole, and go about upon wood, lattice-work, and window ſaſhes, in ſearch of materials for building. With their teeth they cut, hack, and tear off ſmall fibres of wood, which they moiſten with a liquor they diſgorge, and then convey them to the work-ſhop. Other labourers are in waiting for them, who with thoſe materials ſet about the conſtruction of the waſp-neſt, which is commonly round, and made of materials reſembling fine paper. The common covering of it, which is formed of ſeveral leaves or layers, with intermediate ſpaces, is pierced by two holes at a diſtance from one another, one of which is uſed for the entrance of the waſps, and the other only for their exit. The ſpace within this covering is cut by a number of horizontal planes, with intervals between them of the ſize of about half an inch; they are ſuſpended from one another by ligaments, and attached to the covering by their edges: they all have hexagonal cells in their lower ſurface. Veſpa.

The eggs of the waſp are of an oblong form, and reſemble thoſe of a common fly, but they are larger; they are always faſtened to the angles of a cell, never to the ſides of it. They are uſually placed ſingle; it is very rare to find two in one cell; and, if they are laid ſo, it ſeems that only one ſucceeds; for there is never found more than one worm in a cell.

The heads of all the nymphs are turned towards the centre of the comb, and their tails go obliquely downward toward the baſe of the cell. They are continually ſeen opening their mouths, and moving their forcipes, ſeeming ever hungry, and impatiently waiting for food from their parents. The cells are left open till the nymph is at its full growth; then the waſps cover it over with a thin lid, under which the worm undergoes its transformation; and as ſoon as it is arrived at the waſp-ſtate, it eats its way through this thin cover, and comes to work with the reſt. The elder brothers, or firſt-hatched inſects, take amazing care of thoſe born after them, by proportioning their food to the delicacy of their ſtomach. Firſt, it conſiſts of the juice of fruits and meats; afterwards it is the carcaſes of inſects. The caterers provide for the labourers. Each one takes his own portion; there is no diſpute, no fighting. The republic grows daily more numerous, living in profound peace. Every individual as ſoon as he has acquired ſufficient ſtrength, flies away to the fields. They then become a gang of banditti; they pillage our wall-trees, break into our fruit before its maturity, dart with the fierceneſs of hawks upon our bees, cut their throats to poſſeſs themſelves of their honey, plunder and lay waſte their commonwealth, riot on the fruits of their labour, and oblige them to remove. During the period of plenty, the waſps bring all the booty to the neſt, and ſhare it among them. There is nothing then goes forward but feaſting, rioting, and good fellowſhip; but concord cannot be laſting among robbers. Towards the month of October proviſions begin to run ſhort: The neuters and males tear from their cradles the eggs, the larvæ, the chryſalids, and the new-born inſects, without ſhowing mercy to any. They next fight againſt one another. Froſts and rains throw the citizens into a ſtate of

langour,

Veſpaſian ‖ Veſpertilio.

languor, and they almoſt all periſh, luckily for us and our bees, ſome few females alone excepted, which in the enſuing ſpring become founders of new republics.

3. *Coarctata*, the ſmall waſp; has black antennæ, yellowiſh at the baſe; the head is black with a yellow ſpot between the antennæ, and another at the baſe of the upper lip. Each ſegment of the abdomen is bordered with yellow. It is about half an inch long. The hiſtory, as well as the manners of this ſpecies, are the ſame as thoſe of the common waſp; but their buildings are on a different conſtruction. Their neſt is faſtened to the branch of a tree with a kind of band; and is in bigneſs from the ſize of an orange down to that of an egg. Wood reduced to paper is the material part of it; which if it were of a ruddy colour, might be taken for a large opening roſe. It is covered over with a varniſh impenetrable by water. One of thoſe neſts was neither mollified nor impaired by that element.

VESPASIAN, the 10th emperor of Rome; remarkable for his clemency and other virtues. See ROME, n° 332—339.

VESPERS, in the church of Rome, denote the afternoon ſervice; anſwering in ſome meaſure to the evening prayers of the church of England.

VESPERTILIO, the BAT; a genus of quadrupeds, belonging to the order of *primates*. All the teeth are erect, pointed, near each other; and the firſt four are equal. The fore-feet have the toes connected by a membrane expanded into a kind of wings by which the creature is enabled to fly. There are 28 ſpecies, of which 4 are natives of Britain. The moſt remarkable are.

1. The *vampyrus*, vampire, or Ternate bat, with large canine teeth; four cutting teeth above, the ſame below; ſharp black noſe; large naked ears; the tongue is pointed, terminated by ſharp aculeated papillæ; talons very crooked, ſtrong, and compreſſed ſidewiſe; no tail: the membrane divided behind quite to the rump: head of a dark ferruginous colour; on the neck, ſhoulder, and under-ſide, of a much lighter and brighter red; on the back the hair ſhorter, duſky, and ſmooth: the membranes of the wings duſky. They vary in colour; ſome being entirely of a reddiſh brown, others duſky.

Theſe monſters inhabit Guinea, Madagaſcar, and all the iſlands from thence to the remoteſt in the Indian Ocean. They fly in flocks, and perfectly obſcure the air with their numbers; they begin their flight from one neighbouring iſland to another immediately on ſun-ſet, and return in clouds from the time it is light till ſun riſe. They live on fruits; and are ſo fond of the juice of the palm tree, that they will intoxicate themſelves with it till they drop on the ground. It is moſt likely, from the ſize of their teeth, they are carnivorous. Mr Edwards relates, that they will dip into the ſea for fiſh. They ſwarm like bees; hanging by one another from the trees in great cluſters. The Indians eat them, and declare the fleſh to be very good: they grow exceſſively fat at certain times of the year. The French who live in the Iſle de Bourbon boil them in their bouillon, to give it a reliſh. The negroes have them in abhorrence. Many are of an enormous ſize: Beckman meaſured one, whoſe extent from tip to tip of the wings was five feet four inches; and Dampier another, which extended farther than he could reach with out-ſtretched arms. Their bodies are from the ſize of a pullet to that of a dove: their cry is dreadful, their ſmell rank, their bite, reſiſtance, and fierceneſs great, when taken.

The ancients had ſome knowledge of theſe animals. Herodotus mentions certain winged wild beaſts like bats, that moleſted the Arabs who collected the caſſia, to ſuch a degree, that they were obliged to cover their faces, all but their eyes, with ſkins. It is very probable, as M. de Buffon remarks, it was from ſuch relations that poets formed their fictions of Harpies. Veſpertilio.

Linnæus gives this ſpecies the title of *vampyre*; conjecturing it to be the kind which draws blood from people in their ſleep. M. de Buffon denies it; aſcribing that faculty only to a ſpecies found in South America. But there is reaſon to imagine that this thirſt after blood is not confined to the bats of one continent nor to one ſpecies: for Bontius and Nieuhoff inform us, that the bats of Java ſeldom fail attacking perſons who lie with their feet uncovered, whenever they can get acceſs; and Gumilla, after mentioning a greater and leſs ſpecies found on the banks of the Oronoque, declares them to be equally greedy after human blood. Perſons thus attacked have been known to be near paſſing from a ſound ſleep into eternity. The bat is ſo dexterous a bleeder, as to inſinuate its aculeated tongue into a vein without being perceived, and then ſuck the blood till it is ſatiated; all the while fanning with its wings, and agitating the air in that hot climate in ſo pleaſing a manner, as to fling the ſufferer into a ſtill ſounder ſleep. It is therefore very unſafe to reſt either in the open air, or to leave open any entrance to theſe dangerous animals: but they do not confine themſelves to human blood; for M. Condamine ſays, that in certain parts of America they have deſtroyed all the great cattle introduced there by the miſſionaries. See Plate DX. fig. 3.

2. The *ſpectrum*, or ſpectre, with a long noſe; large teeth; long, broad, and upright ears: at the end of the noſe a long conic erect membrane, bending at the end, and flexible: hair on the body cinereous, and pretty long: wings full of ramified fibres: the membrane extends from hind leg to hind leg; no tail; but from the rump extend three tendons, terminating at the edge of the membrane. By Seba's figure the extent of the wings is two feet two inches; from the end of the noſe to the rump, ſeven inches and an half.

Inhabits South America; lives in the palm-trees; grows very fat; called *vampyre* by M. de Buffon, who ſuppoſes it to be the ſpecies that ſucks human blood: but neither Piſo, nor any other writer who mentions the fact, gives the leaſt deſcription of the kind.

3. The *Peruvian* bat hath a head like a pug-dog; large ſtraight pointed ears; two canine teeth, and two ſmall cutting teeth between each, in each jaw: the tail is incloſed in the membrane which joins to each hind-leg, and is alſo ſupported by two long cartilaginous ligaments involved in the membrane: colour of the fur, iron grey: body equal to that of a middle ſized rat: extent of the wings two feet five inches.

4. The *noctula* hath the noſe ſlightly bilobated; ears ſmall and rounded; on the chin a minute verruca; hair reddiſh aſh-colour: length of the rump two inches eight-tenths; tail one inch ſeven-tenths; extent of wings 13 inches. Inhabits Great Britain and France; flies high in ſearch of food, not ſkimming near the ground. A gentleman informed Mr Pennant of the following fact relating to thoſe animals, which he was witneſs to: That he ſaw taken, under the eaves of Queen's College, Cambridge, in one night, 185; the ſecond night, 63; the third night, 2; and that each that was meaſured had 15 inches extent of wings.

5. The *murinus*, common bat; has a tail: the lips and noſe are ſimple; and the ears are ſmaller than the head.

It inhabits Europe, and is found in Britain. This animal flies only during the night, living chiefly on moths: when it lights on the ground it is unable to riſe again till it has crawled to ſome height: it remains torpid during winter,

Veſſel ‖ Veſtry.

ter, revives in the beginning of the ſpring, and comes abroad in the duſk of the evening. This ſpecies is two inches and a half long when full grown, and about nine inches in extent; the fur is of a mouſe-colour, tinged with reddiſh; it generally ſkims near the ground, with an uneven jerking flight; and often ſeeking for gnats and other aquatic inſects, flies cloſe by the ſurface of water. It breeds in the ſummer ſeaſon, and is preyed on by owls.

Bats are very voracious, if proper food is to be had; and though moths and other inſects be their natural and common food, yet if fleſh, whether raw or roaſted, freſh or corrupted, comes in their way, they devour it with greedineſs. In this country they appear abroad early in ſpring, flying about only in the evenings; but are ſometimes rouſed from their torpidity by a warm day or two during winter, and will then venture out in queſt of food, but recommence their ſtate of hybernation whenever the cold returns: They retire at the end of ſummer into caves, ruined houſes, or the roofs and eaves of houſes, where they remain ſuſpended by the hind legs, and enveloped in their wings, generally in large numbers. Bats may be caught by means of the flower cups of bur-dock, whitened and thrown up in the way of their flight; they are attracted by the whiteneſs, and the hooks of the bur, ſticking to their membranous wings, make them fall to the ground.

VESSEL, a general name given to the different ſorts of ſhips which are navigated on the ocean, or in canals and rivers. It is, however, more particularly applied to thoſe of the ſmaller kind, furniſhed with one or two maſts. See SHIP.

VESTA, in pagan worſhip, the ſame with Cybele. See CYBELE.

VESTA the *Younger*, in pagan worſhip, the goddeſs of Fire, was the daughter of Saturn and Cybele, and the ſiſter of Ceres. She was ſo much in love with chaſtity, that on Jupiter's aſcending the throne and offering to grant whatever ſhe aſked, ſhe only deſired the preſervation of her virginity, which ſhe obtained.—Veſta was not repreſented in her temple by any image.

VESTALIA, in Roman antiquity, a feſtival celebrated in honour of the goddeſs Veſta, on the 5th of the ides of June; that is, on the ninth of the month.

VESTALS, among the ancient Romans, were prieſteſſes of the goddeſs Veſta, and had the perpetual fire committed to their charge: they were at firſt only four in number, but afterwards increaſed to ſix; and it does not appear that their number ever exceeded ſix, among whom was one ſuperior to the reſt, and called *veſtalis maxima*.

The veſtals were choſen from ſix to ten years of age, and obliged to ſtrict continency for 30 years; the firſt 10 of which were employed in learning the ceremonies of religion, the next 10 in the performance of them, and the 10 laſt in teaching them to the younger veſtals.

The habit of the veſtals conſiſted of an head-dreſs, called *infula*, which ſat cloſe to the head, and from whence hung certain laces called *vitta*; a kind of ſurplice made of white linen, and over it a purple mantle with a long train to it.

VESTIBLE, in architecture, a kind of entrance into a large building; being an open place before the hall, or at the bottom of the ſtaircaſe.

VESTRY, a place adjoining to a church, where the veſtments of the miniſter are kept; and alſo a meeting at ſuch place, conſiſting of the miniſter, church-wardens, and chief men of moſt pariſhes, who make a pariſh veſtry or meeting. By cuſtom there are ſelect veſtries, being a certain number of perſons choſen to have the government of the pariſh, make rates, and take the accounts of church-wardens, &c.

Veſuvius.

VESUVIUS, a celebrated volcano of Italy, ſix miles eaſt from the city of Naples. This mountain has two tops; one of which only goes by the name of *Veſuvius*, the other being now called *Somma*; but Sir William Hamilton is of opinion, that the latter is what the ancients called *Veſuvius*.

1 General deſcription of the mountain.

The perpendicular height of Veſuvius is only 3700 feet, though the aſcent from the foot to the top is three Italian miles. One ſide of the mountain is well cultivated and fertile, producing great plenty of vines; but the ſouth and weſt ſides are entirely covered with cinders and aſhes; while a ſulphureous ſmoke conſtantly iſſues from the top, ſometimes attended with the moſt violent exploſions of ſtones, the emiſſion of great ſtreams of lava, and all the other attendants of a moſt formidable volcano. The firſt of theſe eruptions recorded in hiſtory took place in the year 79; at which time the two cities of Pompeii and Herculaneum were entirely buried under the ſtones and aſhes thrown out. Incredible miſchief was alſo done to the neighbouring country, and numbers of people loſt their lives, among whom was Pliny the Elder.

2 Account of the firſt eruption recorded in hiſtory.

It is the opinion of the beſt judges, however, that this eruption was by no means the firſt that had ever happened. The very ſtreets of thoſe cities which were at that time overwhelmed are ſaid to be partly paved with lava. Since that time 30 different eruptions have been recorded, ſome of which have been extremely violent. In the year 1538, a mountain, three miles in circumference and a quarter of a mile in perpendicular height, was thrown up in the courſe of one night. In the year 1766, Sir William Hamilton, ambaſſador to his Sicilian Majeſty, began to obſerve the phenomena of this mountain; and ſince that time the public has been favoured with much more exact and authentic accounts of the various changes which have taken place in Veſuvius than what were to be had before.

3 Of the eruption in 1767.

The firſt great eruption taken notice of by this gentleman was that of 1767, which, though very violent, was mild in compariſon with that of 1538.

From this time (1767) Veſuvius never ceaſed for ten years to ſend forth ſmoke, nor were there many months in which it did not throw out ſtones, ſcoriæ, and cinders; which, increaſing to a certain degree, were uſually followed by lava; ſo that from the year 1767 to 1779 there were nine eruptions, ſome of them very conſiderable. In the month of Auguſt that year, however, an eruption took place, which, for its extraordinary and terrible appearance, may be reckoned among the moſt remarkable of any recorded concerning this or any other volcano.

4 Nine eruptions from 1767 to 1779.

5 Account of the great eruption in 1779.

During the whole month of July the mountain continued in a ſtate of fermentation. Subterraneous exploſions and rumbling noiſes were heard; quantities of ſmoke were thrown up with great violence, ſometimes with red-hot ſtones, ſcoriæ, and aſhes; and towards the end of the month theſe ſymptoms increaſed to ſuch a degree as to exhibit, in the night time, the moſt beautiful fire-works that can be imagined.

On Thurſday 5th Auguſt the volcano appeared moſt violently agitated; a white and ſulphureous ſmoke iſſued continually and impetuouſly from its crater, one puff ſeeming to impel another; ſo that a maſs of them was ſoon accumulated, to appearance, four times the height and ſize of the volcano itſelf. Theſe clouds of ſmoke were exceedingly white, ſo that the whole reſembled an immenſe accumulation of bales of the whiteſt cotton. In the midſt of this very white ſmoke, vaſt quantities of ſtones, ſcoriæ, and aſhes, were thrown up to the height of 2000 feet; and a quantity

of

Veſuvius. of liquid lava, ſeemingly very heavy, was lifted up juſt high enough to clear the rim of the crater, and take its way down the ſides of the mountain. This lava, having run violently for ſome hours, ſuddenly ceaſed, juſt before it had reached the cultivated parts of the mountain, near four miles from the ſpot whence it iſſued. The heat, all this day, was intolerable at the towns of Somma and Ottaiano; and was ſenſibly felt at Palma and Lauri, which are much farther off. Reddiſh aſhes fell ſo thick on the two former, that the air was darkened, ſo that objects could not be diſtinguiſhed at the diſtance of ten feet. Long filaments of a vitrified matter, like ſpun glaſs, were mixed, and fell with theſe aſhes; ſeveral birds in cages were ſuffocated, and the leaves of the trees in the neighbourhood of Somma were covered with white and very corroſive ſalt.

6 Extraordinary effuſion of fire by the approach of ſtormy clouds

About 12 at night, on the *7th*, the fermentation of the mountain ſeemed greatly to increaſe. Our author was watching the motions of the volcano from the mole at Naples, which has a full view of it. Several glorious picturesque effects had been obſerved from the reflection of the deep red fire within the crater of Veſuvius, and which mounted high amongſt thoſe huge clouds on the top of it: when a ſummer ſtorm, called in that country a *tropea*, came on ſuddenly, and blended its heavy watery clouds with the ſulphureous and mineral ones, which were already like ſo many other mountains piled up on the top of the volcano. At this moment a fountain of fire was ſhot up to an incredible height, caſting ſo bright a light, that the ſmalleſt objects were clearly diſtinguiſhable at any place within ſix miles or more of Veſuvius. The black ſtormy clouds, paſſing ſwiftly over, and at times covering the whole or a part of the bright column of fire, at other times clearing away and giving a full view of it, with the various tints produced by its reverberated light on the white clouds above in contraſt with the pale flaſhes of forked lightning that attended the tropea, formed ſuch a ſcene as no power of art can expreſs. One of his Sicilian majeſty's gamekeepers, who was out in the fields near Ottaiano whilſt this ſtorm was at its height, was ſurpriſed to find the drops of rain ſcald his face and hands; a phenomenon probably occaſioned by the clouds having acquired a great degree of heat in paſſing through the above mentioned column of fire.

On the *8th* the mountain was quiet till towards ſix o'clock in the evening, when a great ſmoke began to gather over its crater; and about an hour after a rumbling ſubterraneous noiſe was heard in the neighbourhood of the volcano; the uſual throws of red-hot ſtones and ſcoriæ began and increaſed every inſtant. The crater, viewed through a teleſcope, ſeemed much enlarged by the violence of laſt night's exploſions, and the little mountain on the top was entirely gone. About nine o'clock a moſt violent report was heard at Portici and its neighbourhood, which ſhook the houſes to ſuch a degree as made the inhabitants run out into the ſtreets. Many windows were broken, and walls cracked by the concuſſion of the air on this occaſion, though the noiſe was but faintly heard at Naples. In an inſtant a fountain of liquid tranſparent fire began to riſe, and gradually increaſing, arrived at laſt at the amazing height of ten thouſand feet and upwards. Puffs of ſmoke, as black as can poſſibly be imagined, ſucceeded one another haſtily, and accompanied the red-hot, tranſparent, and liquid lava, interrupting its ſplendid brightneſs here and there by patches of the darkeſt hue. Within theſe puffs of ſmoke at the very moment of emiſſion, a bright but pale electrical fire was obſerved playing briſkly about in zig-zag lines. The wind was ſouth-weſt, and, though gentle, was ſufficient to carry theſe puffs of ſmoke out of the column of fire; and a collection of them by degrees formed a black and extenſive curtain behind it; in other parts of the ſky it was perfectly clear, and the ſtars bright. The fiery fountain, of ſuch immenſe magnitude, on the dark ground juſt mentioned, made the fineſt contraſt imaginable; and the blaze of it reflected from the ſurface of the ſea, which was at that time perfectly ſmooth, added greatly to this ſublime view. Veſuvius.

7 Immenſe fountain of lava thrown up by Veſuvius.

The lava, mixed with ſtones and ſcoria, having riſen to the amazing height already mentioned, was partly directed by the wind towards Ottaiano, and partly falling, ſtill red-hot and liquid, upon the top of Veſuvius, covered its whole cone, part of that of the ſummit of Somma, and the valley between them. The falling matter, being nearly as inflamed and vivid as that which was continually iſſuing freſh from the crater, formed with it one complete body of fire, which could not be leſs than two miles and a half in breadth, and of the extraordinary height above mentioned, caſt a heat to the diſtance of at leaſt ſix miles round. The bruſh-wood on the mountain of Somma was ſoon in a blaze, and the flame of it being of a different colour from the deep red of the matter thrown out by the volcano, and from the ſilvery blue of the electrical fire, ſtill added to the contraſt of this moſt extraordinary ſcene.

The black cloud, increaſing greatly, once bent towards Naples, and threatened the city with ſpeedy deſtruction; for it was charged with electrical fire, which kept conſtantly darting about in bright zig-zag lines. This fire, however, rarely quitted the cloud, but uſually returned to the great column of fire whence it proceeded; though once or twice it was ſeen to fall on the top of Somma, and ſet fire to ſome dry graſs and buſhes. Fortunately the wind carried back the cloud juſt as it reached the city, and had begun to occaſion great alarm. The column of fire, however, ſtill continued, and diffuſed ſuch a ſtrong light, that the moſt minute objects could be diſcerned at the diſtance of ten miles or more from the mountain. Mr Morris informed our author, that at Sorrento, which is twelve miles diſtant from Veſuvius, he read the title-page of a book by that volcanic light.

8 Diſtreſs of the inhabitants of Ottaiano.

All this time the miſerable inhabitants of Ottaiano were involved in the utmoſt diſtreſs and danger by the ſhowers of ſtones which fell upon them, and which, had the eruption continued for a longer time, would moſt certainly have reduced their town to the ſame ſituation with Herculaneum and Pompeii. The mountain of Somma, at the foot of which the town of Ottaiano is ſituated, hides Veſuvius from the view of its inhabitants; ſo that till the eruption became conſiderable it was not viſible to them. On Sunday night, when the noiſe increaſed, and the fire began to appear above the mountain of Somma, many of the inhabitants flew to the churches, and others were preparing to quit the town, when a ſudden and violent report was heard; ſoon after which they found themſelves involved in a thick cloud of ſmoke and aſhes: a horrid claſhing noiſe was heard in the air, and preſently fell a vaſt ſhower of ſtones and large pieces of ſcoriæ, ſome of which were of the diameter of ſeven or eight feet, which muſt have weighed more than a hundred pounds before they were broken, as ſome of the fragments which Sir William Hamilton found in the ſtreets ſtill weighed upwards of 60 pounds. When theſe large vitrified maſſes either ſtruck againſt one another in the air, or fell on the ground, they broke in many pieces, and covered a large ſpace of ground with vivid ſparks of fire, which communicated their heat to every thing that was combuſtible. Theſe maſſes were formed of the liquid lava; the exterior parts of which were become black and porous by cooling in their fall through ſuch a vaſt ſpace; whilſt the interior parts, leſs expoſed, retained an extreme heat, and were perfectly red.

In an inſtant the town and country about it was on fire in many

Veſuvius.

many parts, for there were ſeveral ſtraw huts in the vineyards, which had been erected for the watchmen of the grapes; all of which were burnt. A great magazine of wood in the heart of the town was all in a blaze; and had there been much wind, the flames muſt have ſpread univerſally, and all the inhabitants would have been burnt in their houſes; for it was impoſſible for them to ſtir out. Some, who attempted it with pillows, tables, chairs, the tops of wine caſks, &c. on their heads, were either knocked down or ſoon driven back to their cloſe quarters under arches and in the cellars of their houſes. Many were wounded, but only two perſons died of their wounds.

To add to the horror of the ſcene, inceſſant volcanic lightning was whiſking about the black cloud that ſurrounded them, and the ſulphureous ſmell and heat would ſcarcely allow them to draw their breath. In this dreadful ſituation they remained about 25 minutes, when the volcanic ſtorm ceaſed all at once, and Veſuvius remained ſullen and ſilent.

9 Vaſt quantity of electric matter in the air.

Some time after the eruption had ceaſed, the air continued greatly impregnated with electrical matter. The duke of Cottofiano told our author, that having, about half an hour after the great eruption had ceaſed, held a Leyden bottle, armed with a pointed wire, out at his window at Naples, it ſoon became conſiderably charged. But whilſt the eruption was in force, its appearance was too alarming to allow one to think of ſuch experiments.—He was informed alſo by the prince of Monte Mileto, that his ſon, the duke of Popoli, who was at Monte Mileto the 8th of Auguſt, had been alarmed by the ſhower of cinders that fell there; ſome of which he had ſent to Naples weighing two ounces; and that ſtones of an ounce weight had fallen upon an eſtate of his ten miles farther off. Monte Mileto is about 30 miles from the volcano. The Abbé Cagliani alſo related, that his ſiſter, a nun in a convent at Manfredonia, had written to inquire after him, imagining that Naples muſt have been deſtroyed, when they, at ſo great a diſtance, had been alarmed by a ſhower of aſhes which fell on the city at eleven o'clock at night, ſo much as to open all the churches, and go to prayers. As the great eruption happened at nine o'clock, theſe aſhes muſt have travelled an hundred miles in the ſpace of two hours.

10 Damage done by the irruption at Ottaiano.

Nothing could be more diſmal than the appearance of Ottaiano after this eruption. The houſes were unroofed, half buried under the black ſcoriæ and aſhes; all the windows towards the mountain were broken, and ſome of the houſes themſelves burnt; the ſtreets choked up with aſhes; in ſome narrow places not leſs than four feet thick: and a few of the inhabitants who had juſt returned, were employed in clearing them away, and piling them up in hillocks, to get at their ruined houſes. The palace of the prince of Ottaiano is ſituated on an eminence above the town, and nearer the mountain. The ſteps leading up to it were deeply covered with volcanic matter: the roof was totally deſtroyed, and the windows broken, but the houſe itſelf, being ſtrongly built, had not ſuffered much.

11 Vaſt fragments of lava thrown out.

An incredible number of fragments of lava were thrown out during the eruption, ſome of which were of immenſe magnitude. The largeſt meaſured by Sir William Hamilton was 108 feet in circumference and 17 in height. This was thrown at leaſt a quarter of a mile clear of the mouth of the volcano. Another, 66 feet in circumference and 19 in height, being nearly of a ſpherical figure, was thrown out at the ſame time, and lay near the former. This laſt had the marks of being rounded, nay almoſt poliſhed, by continual rolling in torrents or on the ſea ſhore. Our author conjectures that it might be a ſpherical volcanic ſalt, ſuch as that of 45 feet in circumference mentioned by M. de St Fond, in his Treatiſe of Extinguiſhed Volcanoes. A third of 16 feet in height and 92 in circumference was thrown much farther, and lay in the valley between Veſuvius and the Hermitage. It appeared alſo, from the large fragments that ſurrounded this maſs, that it had been much larger while in the air.

Vetch ‖ Viburnum.

Veſuvius continued to emit ſmoke for a conſiderable time after this great eruption, ſo that our author was apprehenſive that another would ſoon enſue; but from that time nothing comparable to the above has taken place. From the time of this great eruption to the year 1786 our author kept an exact diary of the operations of Veſuvius, with drawings, ſhowing, by the quantity of ſmoke, the degree of fermentation within the volcano. The operations of the ſubterraneous fire, however, appear to be very capricious and uncertain. One day there will be the appearance of a violent fermentation, and the next every thing will be calmed; but whenever there has been a conſiderable ejection of ſcoriæ and cinders, it has been a conſtant obſervation, that the lava ſoon made its appearance, either by boiling over the crater, or forcing its way through the crevices in the conical part of the mountain. An eruption took place in the month of November 1784, and continued for ſome time, but without being accompanied with any extraordinary circumſtance.

12 Eruption in 1784.

13 State of Veſuvius to the preſent time.

Since that time there have been no remarkable eruptions of this volcano, at leaſt none that have been properly authenticated; though, indeed, Sir William Hamilton obſerves, that the inhabitants of Naples in general pay ſo little attention to the operations of this volcano, that many of its eruptions paſs unnoticed by at leaſt two-thirds of them.

VETCH, in botany. See VICIA.

VETERAN, among the ancient Romans, an appellation given to a *ſoldier* grown old in the ſervice, or who had made a certain number of campaigns.

VETERINARY ART. See FARRIERY.

VEXILLUM, in botany; the upper petal of a pea-bloom, or butterfly-ſhaped flower, which is generally larger than any of the others.

VIALES, in mythology, a name given among the Romans to the gods who had the care and guard of the roads and highways.

VIATICUM, in Roman antiquity, an appellation given in common to all officers of any of the magiſtrates; as *lictors*, *accenſi*, *ſcribes*, *criers*.

VIBEX, is ſometimes uſed, by phyſicians, for a black and blue ſpot in the ſkin occaſioned by an afflux or extravaſation of blood.

VIBRATION, in mechanics, a regular, reciprocal motion of a body, as a pendulum.

VIBURNUM, in botany; a genus of plants of the claſs *pentandria*, order *trigynia*, and in the natural ſyſtem arranged under the 43d order, *dumoſæ*. The calyx is quinquepartite and above; the corolla divided into five laciniæ; the fruit a monoſpermous berry. There are 19 ſpecies; two of which the *lantana* and *opulus*, are natives of Britain. 1. The *lantana*, common viburnum, wayfaring, or pliant meally tree, riſes with a woody ſtem, branching twenty feet high, having very pliant ſhoots covered with a lightiſh brown bark; large heart-ſhaped, veined, ſerrated leaves, white and hoary underneath; and the branches terminated by umbels of white flowers, ſucceeded by bunches of red berries, &c. 2. The *opulus*, or gelder roſe; conſiſting of two varieties, one with flat flowers, the other globular. The former grows eighteen or twenty feet high, branching oppoſite, of an irregular growth, and covered with a whitiſh bark; large lobated or three-lobed leaves on glanduloſe foot-ſtalks, and large flat umbels of white flowers at the ends of the branches, ſucceeded by red berries. The latter grows fifteen

or

Vicar ‖ Victim.

or eighteen feet high, branching like the other, garniſhed with large lobated or three-lobed leaves, on glandular foot-ſtalks; and large globular umbels of white flowers at the ends of the branches, in great abundance. This tree when in bloom exhibits a ſingularly fine appearance: the flowers, though ſmall, are collected numerouſly into large globular umbels round like a ball; hence it is ſometimes called *ſnow-ball-tree*. 3. The *tinus*, common lauruſtinus, or evergreen viburnum; grows eight or ten feet high or more, branching numerouſly from the bottom upwards, aſſuming a cloſe buſhy growth, with the branches ſomewhat hairy and glandulous; very cloſely garniſhed with oval, wholly entire leaves, of a ſtrong green colour, placed in pairs oppoſite; and whitiſh and red flowers, collected numerouſly in large umbellate cluſters all over the plant, at the ſides and ends of the branches, from January until March or April, exhibiting a moſt beautiful appearance. There are a great many varieties. All the different ſpecies of viburnum, both deciduous and evergreen kinds, being of the tree kind, are woody and durable in root, ſtem, and branches. They may all be propagated by layers; and are of ſuch hardy temperature, as to grow freely in the open ground all the year, in ſhrubberies, and other hardy plantations.

VICAR, a perſon appointed as deputy to another, to perform his functions in his abſence, and under his authority.

VICAR, in the canon-law, denotes a prieſt of a pariſh, the predial tithes whereof are impropriated or appropriated; that is, belong either to a chapter, religious houſe, &c. or to a layman who receives them, and only allows the vicar the ſmall tithes, or a convenient ſalary. See the article *PARSON and Vicar*.

VICE, in ethics, is ordinarily defined an elective habit, denoting either an exceſs or defect from the juſt medium wherein virtue is placed.

VICE, in ſmithery and other arts converſant in metals, a machine or inſtrument ſerving to hold faſt any thing they are at work upon, whether it is to be beat, filed, or rivetted.

VICE is alſo uſed in the compoſition of divers words to denote the relation of ſomething that comes inſtead or in the place of another; as vice-admiral, vice-chancellor, &c. are officers who take place in the abſence of admirals, &c.

VICEROY, a governor of a kingdom, who commands in the name and inſtead of a king, with full and ſovereign authority.

VICIA, in botany: A genus of plants of the claſs *diadelphia*, and order of *decandria*; and in the natural ſyſtem arranged under the 32d order, *Papilionaceæ*. The ſtigma is bearded tranſverſely on the lower ſide. There are 20 ſpecies, 7 of which are natives of Britain. The moſt important of theſe are, 1. The *ſativa*, common vetch, or tare. The ſtalks are round, weak, branched, about two feet long. Pinnæ five or ſeven pair, a little hairy, notched at the end. Stipulæ dentated. Flowers light and dark purple, on ſhort pedicles, generally two together; pods erect; ſeeds black. It is known to be an excellent fodder for horſes. 2. The *cracca*, tufted vetch. It has a ſtem branched, three or four feet long. Leaves pinnated; pinnæ generally ten or twelve pair, lance-ſhaped, downy. Stipulæ entire. Flowers purple, numerous, pendulous, in imbricated ſpikes. It is alſo reckoned an excellent fodder for cattle. 3. The *faba*, or common garden bean. It is a native of Egypt. It is too well known to require deſcription.

VICISSITUDE, the regular ſucceſſion of one thing after another; as the viciſſitude of day and night, of the ſeaſons, &c.

VICTIM, denotes a ſacrifice offered to ſome deity, of a living creature, as a man or beaſt, which is ſlain to appeaſe his wrath, or to obtain ſome favour.

Victor ‖ Vienna.

VICTOR (Sextus Aurelius), a Roman hiſtorian, who flouriſhed under the emperors Conſtantius and Julian; as we learn from many paſſages in his own writings, and alſo from Ammianus Marcellinus. This hiſtorian relates, that Conſtantius made him conſul, and honoured him with a brazen ſtatue, on account of his excellent qualifications; although, as he owns of himſelf, he was born in an obſcure village, and of poor and illiterate parents. It is commonly believed that he was an African: it is certain, that he dwells much upon the praiſes of that country, which he calls the glory of the earth; *decus terrarum*. Two books of his are extant in the hiſtorical way: one *De viris illuſtribus urbis Romæ*; the other *De Cæſaribus*; to which is prefixed *Libellus de origine gentis Romanæ*. The whole makes an abridged hiſtory of Rome, from its foundation down to the reign of Julian inclusive.

VICTORY, the overthrow or defeat of an enemy in war or combat.

VICTORY, in pagan worſhip, is repreſented by Heſiod as the daughter of Styx and Pallas; and Varro calls her the *daughter of Heaven and Earth*. The Romans erected a temple to her, where they prayed to the gods to give ſucceſs to their arms. They painted her in the form of a woman, clad in cloth of gold. In ſome medals, ſhe is repreſented with wings flying through the air, holding a laurel crown in one hand and a palm in the other; but in other medals, ſhe is ſeen ſtanding upon a globe, with the ſame crown and branch of palm.

VIDA (Marcus Hieronymus), biſhop of Alva, in Mountſerrat, and one of the moſt excellent Latin poets that have appeared ſince the Auguſtan age, was born at Cremona in 1470. Having diſtinguiſhed himſelf by his learning and taſte for literature, he was made biſhop of Alva in 1552. After continuing two years with pope Clement VII. at Rome, he went to reſide upon his ſee; where, for 30 years, he performed all the offices of a good biſhop and a good man; and though he was mild, gentle, and full of goodneſs, he was ſo far from wanting ſpirit, that when the city of Alva was beſieged by the French, he uſed all poſſible means to prevent its being given up, by ſtrenuouſly exhorting the people, and, when proviſions were ſcarce, by ſupplying them at his own expence. His poetics, and poem on the ſilk-worm, paſs for his maſterpiece; his poem on the game of cheſs is alſo greatly admired. He alſo wrote hymns, eclogues, and a poem entitled *Chriſtiados* in ſix books; all which are in Latin, and have gained him a great reputation. His works in proſe conſiſt of dialogues, ſynodical conſtitutions, letters, and other pieces. He died in 1566, ſoon after his being made biſhop of Cremona.

VIENNA, the capital of the circle of Auſtria, in Germany, and of the whole German empire, is the place where the emperor reſides. The city itſelf is not of very great extent; nor can it be enlarged, it being limited by a very ſtrong fortification; but it is very populous. The ſtreets, in general, are narrow, and the houſes built high. Some of the public buildings are magnificent; but they appear externally to no great advantage, on account of the narrowneſs of the ſtreets. The chief of them are the imperial palace, the library, and the muſeum; the palaces of the princes Lichtenſtein, Eugene, &c. Vienna was twice ineffectually beſieged by the Turks; namely, in 1589 and 1683. At the latter period, the ſiege was raiſed by John Sobieſki, king of Poland, who totally defeated the Turkiſh army before the walls of this place. There is no great danger that Vienna will ever again be ſub-

Vienna, Vigil.

jected to the inconveniences of a ſiege. Yet, in caſe this ſhould happen, a meaſure has been taken, which will prevent the neceſſity of deſtroying the ſuburbs; namely, no houſes without the walls are allowed to be built nearer to the glacis than 600 yards; ſo that there is a circular field of that breadth all round the town, which, excluſive of the advantage above-mentioned, has a very beautiful and ſalutary effect. Theſe magnificent ſuburbs, and the town together, are ſaid to contain above 300,000 inhabitants; yet the former are not near ſo populous, in proportion to their ſize, as the town; becauſe many houſes in the ſuburbs have extenſive gardens belonging to them, and many families, who live during the winter within the fortifications, ſpend the ſummer in the ſuburbs. The cathedral is built of free-ſtone, is 114 yards long, and 48 broad, and the ſteeple is 447 feet high. Inſtead of a weather-cock there was a Turkiſh creſcent, in memory of the ſiege in 1589; but, after the ſecond ſiege in 1683, they changed it for a golden croſs, which three months after was thrown down by a ſtorm. At preſent there is a black ſpread eagle, over which is a gilded croſs. Joining to this church is the archbiſhop's palace, the front of which is very fine. The univerſity had ſeveral thouſand ſtudents, who, when this city was beſieged, mounted guard, as they did alſo in 1741. Beſide this, there is the academy of Lower Auſtria; and the archducal library is much frequented by foreigners, as it contains above 100,000 printed books, and 10,000 manuſcripts. The academy of painting is remarkable for the fine pictures it produces. The archducal treaſury, and a cabinet of curioſities of the houſe of Auſtria, are great rarities. The inhabitants, in general, live in a ſplendid manner; and people of diſtinction have all ſorts of wines at their tables, which they are very free with to foreigners. There is a ſort of harbour on the Danube, where there are magazines of naval ſtores and ſhips have been fitted out to ſerve on that river againſt the Turks. Vienna is an archbiſhop's ſee. It is ſeated at the place where the river Vienna, or Wien, falls into the Danube, 30 miles weſt of Preſburgh, 350 north-north-eaſt of Rome, 520 ſouth-eaſt by ſouth of Amſterdam, 565 eaſt of Paris, and 680 eaſt-ſouth-eaſt of London. E. Long. 16. 28. N. Lat. 48. 13.

VIGIL, in church-hiſtory, is the eve or next day before any ſolemn feaſt; becauſe then Chriſtians were wont to watch, faſt, and pray, in their churches.

Vigils of Plants, a term under which botaniſts comprehend the preciſe time of the day in which the flowers of different plants open, expand, and ſhut.

As all plants do not flower in the ſame ſeaſon, or month; in like manner, thoſe which flower the ſame day, in the ſame place, do not open and ſhut preciſely at the ſame hour. Some open in the morning, as the lip flowers, and compound flowers with flat ſpreading petals; others at noon, as the mallows; and a third ſet in the evening, or after ſunſet, as ſome geraniums and opuntias: the hour of ſhutting is equally undetermined. Of thoſe which open in the morning, ſome ſhut ſoon after, while others remain expanded till night.

The hours of opening, like the time of flowering, ſeem to vary, according to the ſpecies of the plant, the temperature of the climate, and that of the ſeaſon. Flowers, whoſe extreme delicacy would be hurt by the ſtrong impreſſions of an ardent ſun, do not open till night; thoſe which require a moderate degree of heat to elevate their juices; in other words, whoſe juices do not riſe but in the morning or evening, do not expand till then; whilſt thoſe which need a more lively heat for the ſame purpoſe, expand at noon, when the ſun is in his meridian ſtrength. Hence it is, that the heat of the air being greater betwixt the tropics than elſewhere, plants which are tranſported from thoſe climates into the cold or temperate climates of Europe, expand their flowers much later than in their native ſoil. Thus, a flower which opens in ſummer at ſix o'clock in the morning at Senegal, will not open at the ſame ſeaſon in France and England till eight or nine, nor in Sweden till ten.

Linnæus diſtinguiſhes by the general name of *ſolar (flores ſolares)* all thoſe flowers which obſerve a determinate time in opening and ſhutting. Theſe flowers are again divided, from certain circumſtances, into three ſpecies, or kinds:

Equinoctial flowers *(flores æquinoctiales)* are ſuch as open and ſhut at all ſeaſons, at a certain fixed or determinate hour.

Tropical flowers *(flores tropici)* are ſuch whoſe hour of opening is not fixed at all ſeaſons, but accelerated or retarded according as the length of the day is increaſed or diminiſhed.

Meteorous flowers *(flores meteorici)* are ſuch whoſe hour of expanſion depends upon the dry or humid ſtate of the air, and the greater or leſs preſſure of the atmoſphere. Of this kind is the Siberian ſow-thiſtle, which ſhuts at night if the enſuing day is to be clear and ſerene, and opens if it is to be cloudy and rainy. In like manner the African marigold, which in dry ſerene weather opens at ſix or ſeven in the morning, and ſhuts at four o'clock in the afternoon, is a ſure indication that rain will fall during the courſe of the day, when it continues ſhut after ſeven.

VIGO, a ſea-port town of Spain, in Galicia, with an old caſtle and a fort. It is ſeated in a fertile country by the ſea-ſide. It was rendered famous by a ſea-fight between the confederate fleet commanded by Sir George Rook, and a ſquadron of French men of war, while the duke of Ormond with a body of land-forces drove the Spaniards from the caſtles which defended the harbour. Admiral Hopſon having with infinite danger broke through the boom made acroſs the mouth of the harbour, the Engliſh took four galleons and five large men of war, and the Dutch five galleons and one man of war. Four galleons, with 14 men of war, were deſtroyed, with abundance of plate and other rich effects. W. Long. 8. 21. N. Lat. 42. 3.

VILLA FRANCA, the name of ſeveral towns; one in Piedmont, three miles eaſt of Nice; another of Catalonia, 18 miles weſt of Barcelona; a third, the capital of St Michael, one of the Azores; and a fourth, a town of Eſtremadura in Spain, 57 miles ſouth-eaſt of Salamanca.

VILLAGE, an aſſemblage of houſes inhabited chiefly by peaſants and farmers, and having no market, whereby it is diſtinguiſhed from a town. The word is French, formed of *vil*, or *vilis*, "low, mean, contemptible:" or rather, from the Latin *villa*, a country-houſe or farm.

VILLAIN, or VILLEIN, in our ancient cuſtoms, denotes a man of ſervile or baſe condition, *viz.* a bond-man or ſervant.

VILLARS (Lewis Hector, duke de), marſhal of France, grandee of Spain, &c. and a very brave general, was the ſon of Peter marquis de Villars, of a noble and ancient family. He was at firſt aid de-camp to marſhal de Belleſons, his couſin; and diſtinguiſhed himſelf in ſeveral ſieges and battles till the year 1702, when having obtained the victory at Fredlinghem from the prince of Baden, he was made marſhal of France. The marſhal de Villars took the fort of Kell the year following, and gained a battle at Hochſtet in concert with the elector of Bavaria. In 1707 he forced the lines of Stolhoffen, and raiſed large contributions from the enemy: but in 1709, he, in conjunction with marſhal Bouflers, was entirely defeated by the duke of Marlborough, at the battle of Malplaquet, when marſhal Villars was wounded at the beginning of the action. In 1712 he gained much glory by forcing the intrenchments at Denain on the Scheld; which was followed by the taking of Marchiennes, Douay, Bouchain, Landau, Friburg, &c. and by the peace concluded at Raſtat between the emperor and France

Vigo ‖ Villars.

Villenage. France in 1714. The marſhal de Villars, who had been plenipotentiary at the treaty of Raſtat, was made preſident of the council of war in 1715, then counſellor of the regency, and miniſter of ſtate. In 1733, he was nominated to command in Italy under the king of Sardinia, and the French king declared him marſhal-general of his camps and armies; a title which had not been granted to any one ſince the marſhal Turenne, who appears to have been the firſt who was ever honoured with it. The marſhal de Villars made himſelf maſter of Piſighitona, Milan, Novara, and Tortona. But having opened the following campaign, he fell ſick, and died at Turin, in 1734, aged 82. The Memoirs of M. de Villars have been publiſhed in Holland, the firſt volume of which was written by himſelf.

VILLENAGE, in law. The folk-land or eſtates held in villenage, was a ſpecies of tenure neither ſtrictly feodal, Norman, nor Saxon; but mixed and compounded of them all; and which alſo, on account of the heriots that uſually attend it, may ſeem to have ſomewhat Daniſh in its compoſition. Under the Saxon Government there were, as Sir William Temple ſpeaks, a ſort of people in a condition of downright ſervitude, uſed and employed in the moſt ſervile works, and belonging, both they, their children, and effects, to the lord of the ſoil, like the reſt of the cattle or ſtock upon it. Theſe ſeem to have been thoſe who held what was called the *folkland*, from which they were removeable at the lord's pleaſure. On the arrival of the Normans here, it ſeems not improbable, that they, who were ſtrangers to any other than a feodal ſtate, might give ſome ſparks of enfranchiſement to ſuch wretched perſons as fell to their ſhare, by admitting them, as well as others, to the oath of fealty; which conferred a right of protection, and raiſed the tenant to a kind of eſtate ſuperior to downright ſlavery, but inferior to every other condition. This they called *villenage*, and the tenants *villeins*.

Theſe villeins, belonging principally to lords of manors, were either villeins *regardant*, that is, annexed to the manor or land; or elſe they were *in groſs*, or at large, that is, annexed to the perſon of the lord, and transferable by deed from one owner to another. They could not leave their lord without his permiſſion; but, if they ran away, or were purloined from him, might be claimed and recovered by action, like beaſts or other chattels. They held indeed ſmall portions of land by way of ſuſtaining themſelves and families: but it was at the mere will of the lord, who might diſpoſſeſs them whenever he pleaſed; and it was upon villein ſervices, that is, to carry out dung, to hedge and ditch the lord's demeſnes, and any other the meaneſt offices: and their ſervices were not only baſe, but uncertain both as to their time and quantity.

A villein could acquire no property either in lands or goods: if he purchaſed either, the lord might ſeize them to his own uſe; unleſs he contrived to diſpoſe of them again before the lord had ſeized them, for the lord had then loſt his opportunity.

In many places alſo a fine was payable to the lord, if the villein preſumed to marry his daughter to any one without leave from the lord: and, by the common law, the lord might alſo bring an action againſt the huſband for damages in thus purloining his property. For the children of villeins were alſo in the ſame ſtate of bondage with their parents; whence they were called in Latin *nativi*, which gave riſe to the female appellation of a villein, who was called a *neife*. In caſe of a marriage between a freeman and a neife, or a villein and a freewoman, the iſſue followed the condition of the father, being free if he was free, and villein if he was villein; contrary to the maxim of the civil law, that *partus ſequitur ventrem*. But no baſtard could be born a villein, becauſe by another maxim of our law he is *nullius filius*; and Villenage. as he can *gain* nothing by inheritance, it were hard that he ſhould *loſe* his natural freedom by it. The law, however, protected the perſons of villeins againſt atrocious injuries of the lord: for he might not kill or maim his villein; though he might beat him with impunity.

Villeins might be enfranchiſed by manumiſſion. In proceſs of time they gained conſiderable ground on their lords; and in particular ſtrengthened the tenure of their eſtates to that degree, that they came to have in them an intereſt in many places full as good, in others better than their lords. For the good-nature and benevolence of many lords of manors having, time out of mind, permitted their villeins and their children to enjoy their poſſeſſions without interruption, in a regular courſe of deſcent, the common law, of which cuſtom is the life, now gave them title to preſcribe againſt their lords; and, on performance of the ſame ſervices, to hold their lands, in ſpite of any determination of the lord's will. For though in general they are ſtill ſaid to hold their eſtates at the will of the lord, yet it is ſuch a will as is agreeable to the cuſtom of the manor: which cuſtoms are preſerved and evidenced by the rolls of the ſeveral courts-baron in which they are entered, or kept on foot by the conſtant immemorial uſage of the ſeveral manors in which the lands lie. And as ſuch tenants had nothing to ſhow for their eſtates but theſe cuſtoms, and admiſſions in purſuance of them, entered on thoſe rolls, or the copies of ſuch entries witneſſed by the ſteward, they now began to be called *tenants by copy of court-roll*, and their tenure itſelf a *copyhold*.

Privileged VILLENAGE, a ſpecies of tenure otherwiſe called *vellein-ſocage*. See TENURE.

Ancient demeſne conſiſts of thoſe lands or manors which, though now perhaps granted out to private ſubjects, were actually in the hands of the crown in the time of Edward the Confeſſor, or William the Conqueror; and ſo appear to have been by the great ſurvey in the exchequer, called *doomſday-book*. The tenants of theſe lands, under the crown, were not all of the ſame order or degree. Some of them, as Britton teſtifies, continued for a long time pure and abſolute villeins, dependent on the will of the lord, and common copyholders in only a few points. Others were in a great meaſure enfranchiſed by the royal favour; being only bound in reſpect of their lands to perform ſome of the better ſort of villein ſervices: but thoſe determinate and certain; as, to plough the king's land for ſo many days, to ſupply his court with ſuch a quantity of proviſions, and the like; all of which are now changed into pecuniary rents: and in conſideration hereof they had many immunities and privileges granted to them; as, to try the right of their property in a peculiar court of their own, called a *court of ancient demeſne*, by a peculiar proceſs denominated a writ of right cloſe: not to pay toll or taxes; not to contribute to the expences of knights of the ſhire; not to be put on juries, and the like.

Theſe tenants therefore, though their tenure be abſolutely copyhold, yet have an intereſt equivalent to a freehold: for though their ſervices were of a baſe and villenous original, yet the tenants were eſteemed in all other reſpects to be highly privileged villeins; and eſpecially for that their ſervices were fixed and determinate, and that they could not be compelled (like pure villeins) to relinquiſh thoſe tenements at the lord's will, or to hold them againſt their own: *et ideo* (ſays Bracton) *dicuntur liberi*.

Lands holding by this tenure are therefore a ſpecies of copyhold, and as ſuch preſerved and exempted from the operation of the ſtatute of Charles II. Yet they differ from common copyholds, principally in the privileges before mentioned;

Villi, Villiers.

tioned: as alſo they differ from freeholders by one eſpecial mark and tincture of villenage, noted by Bracton, and remaining to this day; *viz.* that they cannot be conveyed from man to man by the general common-law conveyances of feoffment, and the reſt; but muſt paſs by ſurrender to the lord or his ſteward, in the manner of common copyholds: yet with this difference, that, in the ſurrenders of theſe lands in ancient demeſne, it is not uſed to ſay, "to hold at the will of their lord," in their copies; but only, "to hold according to the cuſtom of the manor."

VILLI, among botaniſts, a kind of down-like ſhort hair, with which ſome trees abound.

VILLIERS (George duke of Buckingham), an ingenious and witty nobleman, whoſe mingled character rendered him at once the ornament and diſgrace, the envy and ridicule, of the court he lived in, was ſon to that famous ſtateſman and favourite of king Charles I. who loſt his life by the hands of lieutenant Felton. He was born in 1627, the year before the fatal cataſtrophe of his father's death. The early parts of his education he received from various domeſtic tutors, after which he was ſent to the univerſity of Cambridge. Having here completed a courſe of ſtudies, he, with his brother lord Francis, went abroad under the care of one Mr Ayleſbury. Upon his return, which was not till after the breaking out of the civil wars, the king being at Oxford, his grace repaired thither, was preſented to his majeſty, and entered of Chriſt-church college. Upon the decline of the king's cauſe, he attended prince Charles into Scotland, and was with him at the battle of Worceſter in 1661; after which, making his eſcape beyond ſea, he again joined him, and was ſoon after, as a reward for this attachment, made knight of the garter.

Deſirous, however, of retrieving his affairs, he came privately to England; and in 1657 married Mary, the daughter and ſole heireſs of Thomas lord Fairfax, through whoſe intereſt he recovered the greateſt part of the eſtate he had loſt, and the aſſurance of ſucceeding to an accumulation of wealth in the right of his wife.

We do not find, however, that this ſtep loſt him the royal favour; for after the reſtoration, at which time he is ſaid to have poſſeſſed an eſtate of L. 20,000 *per annum*, he was made one of the lords of the bed-chamber, called to the privy-council, and appointed lord-lieutenant of Yorkſhire and maſter of the horſe. All theſe high poſts, however, he loſt again in the year 1666. For having been refuſed the poſt of preſident of the north, he became diſaffected to the king; and it was diſcovered that he had carried on a ſecret correſpondence by letters and other tranſactions with one Dr Heydon, tending to raiſe mutinies among his majeſty's forces, particularly in the navy, to ſtir up ſedition among the people, and even to engage perſons in a conſpiracy for the ſeizing the tower of London. Matters were ripe for execution; and an inſurrection, at the head of which the duke was openly to have appeared, was on the very eve of breaking out, when it was diſcovered by means of ſome agents whom Heydon had employed to carry letters to the duke. The detection of this affair ſo exaſperated the king, who knew Buckingham to be capable of the blackeſt deſigns, that he immediately ordered him to be ſeized; but the duke finding means, after having defended his houſe for ſome time by force, to make his eſcape, his majeſty ſtruck him out of all his commiſſions, and iſſued a proclamation requiring his ſurrender by a certain day.

This ſtorm, however, did not long hang over his head; for, on his making a humble ſubmiſſion, king Charles, who was far from being of an implacable temper, took him again into favour, and the very next year reſtored him both to the privy-council and bed-chamber. But the duke's diſpoſition for intrigue and machination could not long lie idle; for having conceived a reſentment againſt the duke of Ormond for having acted with ſome ſeverity againſt him in regard to the laſt-mentioned affair, he, in 1670, was ſuppoſed to be concerned in an attempt made on that nobleman's life by the ſame Blood who afterwards endeavoured to ſteal the crown. Their deſign was to have conveyed the duke to Tyburn, and there to have hanged him; and ſo far did they proceed towards the putting it in execution, that Blood and his ſon had actually forced the duke out of his coach in St James's Street, and carried him away beyond Devonſhire houſe, Piccadilly, before he was reſcued from them.

Villiers. ‖ Vinca.

It does not appear, however, that this tranſaction hurt the duke's intereſt at court; for in 1671 he was inſtalled chancellor of the univerſity of Cambridge, and ſent ambaſſador to France. Here he was very nobly entertained by Louis XIV. and preſented by that monarch at his departure with a ſword and belt ſet with jewels, to the value of 40,000 piſtoles; and the next year he was employed in the ſecond embaſſy to that king at Utrecht. However, in June 1674, he reſigned the chancellorſhip of Cambridge, and about the ſame time became a zealous partizan and favourer of the Nonconformiſts. On the 16th of February 1676, his grace, with the earls of Saliſbury and Shafteſbury and lord Warton, were committed to the tower by order of the houſe of lords, for a contempt in refuſing to retract the purport of a ſpeech which the duke had made concerning a diſſolution of the parliament. This confinement did not laſt long; yet we find no material tranſaction of this nobleman's life recorded after it, till the time of his death, which happened in 1687. Wood tells us that he died at his houſe in Yorkſhire: but Mr Pope, who muſt certainly have had very good information, and it is to be imagined would not have dared to advance an injurious falſehood of a perſon of his rank, has, in his epiſtle to lord Bathurſt, given us a moſt affecting account of the death of this ill-ſtarred nobleman, whom, after having been maſter of near L. 50,000 *per annum*, he deſcribes as reduced to the deepeſt diſtreſs by his vice and extravagance, and breathing his laſt moments in a mean apartment at an inn.

As to his perſonal character, it is impoſſible to ſay any thing in its vindication; for though his ſevereſt enemies acknowledge him to have poſſeſſed great vivacity and a quickneſs of parts peculiarly adapted to the purpoſes of ridicule, yet his warmeſt advocates have never attributed to him a ſingle virtue. His generoſity was profuſeneſs, his wit malevolence, the gratification of his paſſions his ſole aim thro' life, his very talents caprice, and even his gallantry the mere love of pleaſure. But it is impoſſible to draw his character with equal beauty, or with more juſtice, than in that given of him by Dryden, in his Abſalom and Achitophel, under the name of *Zimri*, to which the reader is referred.

As a writer, however, he ſtands in a quite different point of view. There we ſee the wit, and forget the libertine.—His poems, which indeed are not very numerous, are capital in their kind; but what will immortalize his memory while language ſhall be underſtood, or true wit reliſhed, is his celebrated comedy of The Rehearſal.

VILLOSE, or VILLOUS, ſomething abounding with villi or fibres like ſhort hair; ſuch is one of the coats of the ſtomach.

VINCA, in botany: A genus of plants of the claſs *pentandria*, and order of *monogynia*; and in the natural ſyſtem arranged under the 30th order, *Contortæ*. The corolla is twiſted; there are two erect follicles; the ſeeds are naked. There are five ſpecies; only two of which are natives of Britain:

St Vincent. Britain: 1. The *major*, great periwinckle. It has a woody, erect ſtem; leaves broader and ſharper pointed; pedicles of the flowers ſtraight, and calyx as long as the tube: otherwiſe like the former. 2. The *minor*, ſmall periwinckle, has a woody, creeping, ſlender, crooked ſtem; leaves long, oval, entire, pointed, oppoſite, gloſſy. Flowers ſingle, on long curved pedicles from the alæ of the leaves, which are large and blue.

ST VINCENT, one of the windward Caribbee iſlands, which received its name from being diſcovered on the 22d of January, the feaſt of that Saint. It is inhabited by a race of people, of whom Dr Robertſon gives this account: "There is a great diſtinction in character between the Caribbees and the inhabitants of the larger iſlands. The former appear manifeſtly to be a ſeparate race. Their language is totally different from that of their neighbours in the large iſlands. They themſelves have a tradition that their anceſtors came originally from ſome part of the continent, and having conquered and exterminated the ancient inhabitants, took poſſeſſion of their lands and of their women. Hence they call themſelves Banaree, which ſignifies a man come from beyond ſea. Accordingly, the Caribbees ſtill uſe two diſtinct languages, one peculiar to the men, and the other to the women. The language of the men has nothing common with that ſpoken in the large iſlands. The dialect of the women conſiderably reſembles it. This ſtrongly confirms the tradition which I have mentioned. The Caribbees themſelves imagine that they were a colony from the Galibis, a powerful nation of Guiana in South America. But as their fierce manners approach nearer to thoſe of the people in the northern continent, than to thoſe of the natives of South America, and as their language has likewiſe ſome affinity to that ſpoken in Florida, their origin ſhould be deduced rather from the former than from the latter. In their wars, they ſtill preſerve their ancient practice of deſtroying all the males, and preſerving the women either for ſervitude or for breeding."

It remained a long time after it was diſcovered inhabited by theſe people, and by another race improperly ſtyled *Black Caribs*, who are in reality negroes deſcended, as is generally believed, from ſome who eſcaped out of a Guinea ſhip wrecked upon the coaſt, and gradually augmented by ſuch as from time to time fled thither from Barbadoes. Theſe nations were often at war; but when their quarrels were compoſed, they had a ſtrength ſufficient to prevent ſtrangers from ſettling by force. The French, about half a century ago, at the requeſt of the Caribs, made a deſcent from Martinico, and attacked the negroes, but were repulſed with loſs; and found it their intereſt to conciliate a friendſhip with both nations by means of preſents, and furniſhing them with arms and ammunition.

St Vincent was long a neutral iſland; but, at the peace of 1763, the French agreed that the right to it ſhould be veſted in the Engliſh; who, in the ſequel, at the inſtance of ſome rapacious planters, engaged in an unjuſt war againſt the Caribbees, who inhabited the windward ſide of the iſland, and who were obliged to conſent to a peace, by which they ceded a very large tract of valuable land to the crown. The conſequence of this was, that in the next war, in 1779, they greatly contributed to the reduction of this iſland by the French, who, however, reſtored it by the peace of 1783. Since that time it has continued in the poſſeſſion of Great Britain. During the preſent war, the Caribs revolted; and, aſſiſted by the French, ſpread deſolation over the whole iſland. By the exertions of the governor, however, and the Britiſh forces in the Weſt Indies, the revolt is in a great meaſure quelled, though it will be long before things are reſtored to their former ſtate.

St Vincent is in length about 24 miles, and about 18 in breadth; in circumference between 60 and 70. The climate is very warm; at leaſt in the judgment of the Europeans. The country is in general hilly, in ſome places mountainous; but interſperſed with a variety of pleaſant valleys, and ſome luxuriant plains, the ſoil being every where very fertile, and the high grounds are at leaſt in general eaſy of aſcent. Few iſlands of its extent are ſo well watered: for ſeveral rivers run down from the mountains, and ſmaller ſtreams from almoſt every hill; there are likewiſe ſeveral fine ſprings at a little diſtance from the ſea. The inhabitants raiſe all kinds of ground proviſions in plenty, and with little trouble. The rivers ſupply them with a variety of fiſh; and the ſame may be ſaid of the ſea that waſhes their coaſts. They have abundance of excellent fruits, and very fine timber fit for almoſt every uſe; and with which they formerly ſupplied their neighbours. Vinci.

In 1770 its exports were, cotton, 284 bags, at 10l. *per* bag, 2840l. Coffee, 4818 hundred-weight one quarter ſix pound, at 3l. 5s. *per* hundred-weight, 15,659l. 9s. 8½d. Cacao, 1000 hogſheads and one barrel, at 25l. *per* hogſhead, and 12l. *per* barrel, 25,012l. Rum, 346 hogſheads, at 10l. *per* hogſhead, 3460l. Sugar, 2866 hogſheads, at 17l. 10s. *per* hogſhead, 50,155l. In all to Great Britain, 97,126l. 9s. 1¾d. To North America, 13,375l. Total 110,501l. 9s. 8¾d. W. Long. 61°. N. Lat. 13°.

VINCI (Leonardo da), an illuſtrious Italian painter, deſcended from a noble Tuſcan family, was born in the caſtle of Vinci near Florence in 1445. He was placed under Andrea Verochia, a celebrated painter in that city; but ſoon ſurpaſſed him and all his predeceſſors ſo much, as to be reputed the maſter of the third or golden age of modern painting. But his ſtudies were far from terminating here; no man's genius was more univerſal: he applied himſelf to arts, to literature, and to the accompliſhments of the body; and he excelled in every thing which he attempted. Lewis Sforza duke of Milan prevailed on him to be director of the academy for architecture he had juſt eſtabliſhed; where Leonardo ſoon baniſhed all the Gothic faſhions, and reduced every thing to the happy ſimplicity of the Greek and Roman ſtyle. By the duke's order he conſtructed the famous aqueduct that ſupplies the city of Milan with water: this canal goes by the name of *Mortefana*, being above 200 miles in length, and conducts the water of the river Adda quite to the walls of the city. In 1479, he was deſired to conſtruct ſome new device for the entertainment of Louis XII. of France, who was then to make his entrance into Milan. Leonardo accordingly made a very curious automaton in the form of a lion, which marched out to meet the king, reared up on its hinder legs before him, and opening its breaſt, diſplayed an eſcutcheon with fleur de lys quartered on it. The diſorders of Lombardy, with the misfortunes of his patrons the Sforzi, obliging Leonardo to quit Milan, he retired to Florence, where he flouriſhed under the Medici: here he raiſed the envy of Michael Angelo, who was his contemporary; and Raphael, from the ſtudy of his works, acquired his beſt manner of deſigning. At length on the invitation of Francis I. he removed to France when about 70 years of age; where the journey and change of climate threw him into his laſt ſickneſs: he languiſhed for ſome months at Fontainbleau, where the king came frequently to ſee him; and one day riſing up in his bed to acknowledge the honour done him, he fainted, and Francis ſupporting him, Leonardo died in his arms. His death happened in 1520. Some of his paintings are to be ſeen in England and other countries, but the greateſt part of them are in Florence and France. He compoſed a great number of diſcourſes on curious ſubjects; but none of them have

Vinculum ‖ Vinegar.

have been publiſhed but his treatiſe on the Art of Painting.—For his anatomical knowledge, ſee ANATOMY (hiſtory of), p. 669.

VINCULUM, in algebra, a character in form of a line, or ſtroke drawn over a factor, diviſor, or dividend, when compounded of ſeveral letters or quantities to connect them, and ſhows that they are to be multiplied or divided, &c. together by the other term.

Thus $d \times \overline{a + b - c}$ ſhows that d is to be multiplied into $a + b - c$.

VINE, in botany. See VITIS.

VINEGAR, ACETUM, an agreeable acid and penetrating liquor, prepared from wine, cyder, beer, and other liquors; of conſiderable uſe, both as a medicine and a ſauce. The word is French, *vinaigre*: formed from *vin*, "wine;" and *aigre*, "ſour." See ACETUM, and CHEMISTRY-*Index*.

Wine and other vinous liquors are changed into vinegar by the acetous fermentation. The acetous fermentation is nothing more than the acidification or oxygenation of wine, produced in the open air by means of the abſorption of oxygen. Vinegar is compoſed of hydrogen and carbon, united together in proportions not yet aſcertained, and changed into the acid ſtate by oxygen. As vinegar is an acid, we might conclude from analogy, that it contains oxygen; but this is put beyond doubt by direct experiments. In the firſt place, we cannot change wine into vinegar without the contact of air containing oxygen: ſecondly, this proceſs is accompanied by a diminution of the air in which it is carried on from the abſorption of its oxygen; and thirdly, wine may be changed into vinegar by any other means of oxydation. Independent of the proofs which theſe facts furniſh of the acetous acid being produced by the oxygenation of wine, an experiment made by Mr. Chaptal, profeſſor of chemiſtry at Montpelier, gives a diſtinct view of what takes place in this proceſs. He impregnated ſome water with about its own bulk of carbonic acid gas, procured from beer vats in fermentation; and placed this water in a cellar, in veſſels communicating with the air, and in a ſhort time the whole was converted into acetous acid. This carbonic acid gas, procured from beer vats in fermentation, is not perfectly pure, but contains a great quantity of alcohol in ſolution; wherefore water impregnated with it contains all the materials neceſſary for forming the acetous acid. The alcohol furniſhes hydrogen and one portion of carbon; the carbonic acid furniſhes oxygen and the reſt of carbon; and the air of the atmoſphere furniſhes the reſt of the oxygen neceſſary for changing the mixture into acetous acid. From this obſervation it follows, that nothing but hydrogen is wanting to convert carbonic acid into acetous acid; or, more generally, that by means of hydrogen; and according to the degree of oxydation, carbonic acid may be changed into all the vegetable acids: and, on the contrary, that, by depriving any of the vegetable acids of their hydrogen, they may be converted into carbonic acid.

Lavoiſier's Chemiſtry.

The proceſs indicated by Boerhaave for making vinegar is ſtill the moſt frequently uſed. It conſiſts in fixing two caſks in a warm room or place. Two falſe bottoms of baſket-work are fixed at a certain diſtance from the bottom, upon which the refuſe of grapes and vine twigs are placed. One of theſe tuns is filled with wine, and the other only half filled. The fermentation begins in this laſt; and, when it is in full action, it is checked by filling the caſk up with wine out of the other. The fermentation then takes place in the laſt mentioned caſk, that remained half filled; and this is checked in the ſame manner by pouring back the ſame quantity of liquid out of the other: and in this way the proceſs is continued till the vinegar is made, which is uſually in about 15 days. When the fermentation developes itſelf, the liquor becomes heated and turbid; a great number of filaments are ſeen in it; it emits a lively ſmell; and much air is abſorbed, according to the obſervation of the Abbé Rozier. A large quantity of lees is formed, which ſubſides when the vinegar becomes clear. This lees is very analogous to the fibrous matter.

Chaptal's Chemiſtry.

Vinegar.

Vinegar is purified by diſtillation. The firſt portions which paſs over are weak; but ſoon afterwards the acetous acid riſes, and is ſtronger the later it comes over in the diſtillation. This fluid is called *diſtilled vinegar*; and is thus cleared of its colouring principle, and the lees, which are always more or leſs abundant. Vinegar may likewiſe be concentrated by expoſing it to the froſt. The ſuperabundant water freezes, and leaves the acid more condenſed.

Method of making Cyder VINEGAR.—The cyder (the meaneſt of which will ſerve the purpoſe) is firſt to be drawn off fine into another veſſel, and a quantity of the muſt of apples to be added: the whole is ſet in the ſun, if there be conveniency for it; and at a week or nine days end it may be drawn off.

Method of making Beer VINEGAR.—Take a middling ſort of beer, indifferently well hopped; into which, when it has worked well and grown fine, put ſome rape, or huſks of grapes, uſually brought home for that purpoſe; maſh them together in a tub; then letting the rape ſettle, draw off the liquid part, put it into a caſk, and ſet it in the ſun as hot as may be; the bung being only covered with a tile or ſlate-ſtone: and in about 30 or 40 days it will become a good vinegar, and may paſs in uſe as well as that made of wine, if it be refined, and kept from turning muſty.

Or thus:—To every gallon of ſpring-water add three pounds of Malaga raiſins; which put into an earthen jar, and place them where they may have the hotteſt ſun from May till Michaelmas; then preſſing all well, tun the liquor up in a very ſtrong iron-hooped veſſel, to prevent its burſting, it will appear very thick and muddy when newly preſſed; but will refine in the veſſel, and be as clear as wine. Thus let it remain untouched for three months before it is drawn off, and it will prove excellent vinegar.

To make Wine VINEGAR.—Any ſort of vinous liquor being mixed with its own fæces, flowers, or ferment, and its tartar firſt reduced to powder; or elſe with the acid and auſtere ſtalks of the vegetable from whence the wine was obtained, which hold a large proportion of tartar; and the whole being kept frequently ſtirring in a veſſel which has formerly held vinegar, or ſet in a warm place full of the ſteams of the ſame, will begin to ferment anew, conceive heat, grow ſour by degrees, and ſoon after turn into vinegar.

The remote ſubjects of acetous fermentation are the ſame with thoſe of vinous; but the immediate ſubjects of it, are all kinds of vegetable juices, after they have once undergone that fermentation which reduces them to wine: for it is abſolutely impoſſible to make vinegar of muſt, the crude juice of grapes, and other ripe fruits, without the previous aſſiſtance of vinous fermentation.

The proper ferments for this operation, whereby vinegar is prepared, are, 1. The fæces of all acid wines. 2. The lees of vinegar. 3. Pulverized tartar, eſpecially that of Rheniſh wine, or the cream or chryſtals thereof. 4. Vinegar, itſelf. 5. A wooden veſſel well drenched with vinegar, or one that has long been employed to contain it. 6. Wine that has often been mixed with its own fæces. 7. The twigs of vines, and the ſtalks of grapes, currants, cherries, or other vegetables of an acid auſtere taſte. 8. Baker's leven, after it is turned acid. 9. All manner of ferments, compounded of thoſe already mentioned.

Vinegar Concentrated. See CHEMISTRY, n° 881.

VINEYARD, a plantation of vines. The beſt ſituation of a vineyard is on the declivity of a hill facing the ſouth.

VIO (Thomas de). See CAJETAN.

VIOL, a muſical inſtrument of the ſame form with the violin, and, like that, ſtruck with a bow.

VIOLA, in botany: A genus of plants of the claſs *ſyngeneſia*, order *monogynia*; in the natural ſyſtem arranged under the 29th order, *Campanaceæ*. The calyx is pentaphyllous; the corolla five petaled, irregular, with a nectarium behind, horn-ſhaped; the capſule is above the germen, three-valved, monolocular. There are 28 ſpecies; ſix of which are natives of Britain. The moſt important of theſe are, 1. The *paluſtris*, march violet. The leaves are ſmooth, reniform, two or three on each footſtalk: flowers pale blue, ſmall, inodorous. An infuſion of the flowers is an excellent teſt of the preſence of acids and alkalis. 2. The *odorata*, purple ſweet violet, has leaves heart-ſhaped, notched: flowers deep purple, ſingle; creeping ſcions. The flowers of this plant taken in the quantity of a dram or two are ſaid to be gently purgative or laxative, and, according to Bergius and ſome others, they poſſeſs an anodyne and pectoral quality. 3. *Tricolor*, panſies, heart's eaſe, or three faces under a hood. The ſtems are diffuſe, procumbent, triangular; the leaves oblong, cut at the edges; ſtipulæ dentated: the flowers purple, yellow, and light blue; inodorous.

This elegant little plant merits culture in every garden, for the beauty and great variety of its three-coloured flowers; and it will ſucceed anywhere in the open borders, or other compartments, diſpoſed in patches towards the front; either by ſowing the ſeed at once to remain, or by putting in young plants previouſly raiſed in a ſeed-bed: they will begin flowering early in ſummer, and will continue ſhooting and flowering in ſucceſſion till winter; and even during part of that ſeaſon in mild weather.

The common violet is propagated by parting the roots, ſometimes by ſeed.

VIOLATION, the act of violating, that is, forcing a woman, committing a rape upon her.—This term is alſo uſed in a moral ſenſe, for a breach or infringement of a law, ordinance, or the like.

VIOLET, in botany. See VIOLA.

Violet-Crab, in zoology. See CANCER.

VIOLIN, or FIDDLE, a muſical inſtrument mounted with four ſtrings or guts, and ſtruck or played with a bow. The ſtyle and ſound of the violin is the gayeſt and moſt ſprightly of all other inſtruments; and hence it is of all others the fitteſt for dancing. Yet there are ways of touching it, which render it grave, ſoft, languiſhing, and fit for church or chamber muſic.—It generally makes the treble or higheſt parts in concerts. Its harmony is from fifth to fifth. Its play is compoſed of baſs, counter-tenor, tenor, and treble; to which may be added, a fifth part: each part has four fifths, which riſe to a greater ſeventeenth.

VIOLONCELLO, of the Italians, is properly our fifth violin; which is a little baſs violin half the ſize of the common baſs violin, and the ſtrings bigger and longer in proportion: conſequently its ſound is an octave lower than our baſs violin; which has a noble effect in concerts.

VIPER, in zoology. See COLUBER, POISON, and SERPENT; in which laſt article every thing concerning the poiſon of the *viper*, for which we referred from POISON, is already diſcuſſed.

VIRAGO, a woman of extraordinary ſtature and courage; and who, with the female ſex, has the mien and air of a man, and performs the actions and exerciſes of men.

VIRGIL, or PUBLIUS VIRGILIUS MARO, the moſt excellent of all the Latin poets, was the ſon of a potter of Andes, near Mantua, where he was born, 70 years B. C. He ſtudied firſt at Mantua; then at Cremona, Milan, and Naples; whence going to Rome, he acquired the eſteem of the greateſt wits and moſt illuſtrious perſons of his time; and among others of the emperor Auguſtus, Mæcenas, and Pollio. He was well ſkilled not only in polite literature and poetry, but alſo in philoſophy, the mathematics, geography, medicine, and natural hiſtory. Though one of the greateſt geniuſes of his age, and the admiration of the Romans, he always preſerved a ſingular modeſty, and lived chaſte at a time when the manners of the people were extremely corrupt. He carried Latin poetry to ſuch an high perfection, that he was juſtly eſteemed the prince of Latin poets. He firſt turned himſelf to paſtoral; and being captivated with the beauty and ſweetneſs of Theocritus, was ambitious to introduce this new ſpecies of poetry among the Romans. His firſt performance in this way is ſuppoſed to have been written U. C. 709. the year before the death of Julius Cæſar, when the poet was in his 25th year: it is intitled *Alexis*. Poſſibly *Palæmon* was his ſecond: it is a cloſe imitation of the fourth and fifth Idylls of Theocritus. Mr Wharton places *Silenus* next; which is ſaid to have been publicly recited on the ſtage by Cytheris, a celebrated comedian. Virgil's fifth eclogue is compoſed in alluſion to the death and deification of Cæſar. The battle of Philippi in 712 having put an end to the Roman liberty, the veteran ſoldiers began to murmur for their pay; and Auguſtus, to reward them, diſtributed among them the lands of Mantua and Cremona. Virgil was involved in this common calamity; and applied to Varus and Pollio, who warmly recommended him to Auguſtus, and procured for him his patrimony again. Full of gratitude to Auguſtus, he compoſed the *Tityrus*, in which he introduces two ſhepherds: one of them complaining of the diſtraction of the times, and of the havock the ſoldiers made among the Mantuan farmers; the other rejoicing for the recovery of his eſtate, and promiſing to honour as a god the perſon who reſtored it to him. But our poet's joy was not of long continuance; for we are told, that when he returned to take poſſeſſion of his farm, he was violently aſſaulted by the intruder, and would certainly have been killed by him if he had not eſcaped by ſwimming haſtily over the Mincio. Upon this unexpected diſappointment, he returned to Rome to renew his petition; and during his journey ſeems to have compoſed his ninth eclogue. The celebrated eclogue, intitled *Pollio*, was compoſed U. C. 714, upon the following occaſion: The conſul Pollio on the part of Antony, and Mæcenas on the part of Cæſar, had made up the differences between them; by agreeing, that Octavia, half-ſiſter to Cæſar, ſhould be given in marriage to Antony. This agreement cauſed an univerſal joy; and Virgil, in his eclogue, teſtified his. Octavia was with child by her late huſband Marcellus at the time of this marriage; and whereas the Sibylline oracles had foretold, that a child was to be born about this time, who ſhould rule the world, and eſtabliſh perpetual peace, the poet ingeniouſly ſuppoſes the child in Octavia's womb to be the glorious infant, under whoſe reign mankind was to be happy, the golden age to return from heaven, and fraud and violence to be no more. In this celebrated poem, the author, with great delicacy at the ſame time, pays his court to both the chiefs, to his patron Pollio, to Octavia, and to the unborn infant. In 715, Pollio was ſent againſt the Parthini, a people of Illyricum; and during this expedition, Virgil addreſſed to him a beautiful eclogue, called *Pharmaceutria*. His tenth and laſt eclogue was addreſſed to Gallus.

Virgil.

In his 34th year, he retired to Naples, and laid the plan of this Georgics; which he undertook at the intreaties of Mæcenas to whom he dedicated them. This wiſe and

Virgil. able miniſter reſolved, if poſſible, to revive the decayed ſpirit of huſbandry; to introduce a taſte for agriculture, even among the great; and could not think of a better method to effect this, than to recommend it by the inſinuating charms of poetry. Virgil fully anſwered the expectations of his patron by his Georgics. They are divided into four books. Corn and ploughing are the ſubject of the firſt, vines of the ſecond, cattle of the third, and bees of the fourth.

He is ſuppoſed to have been in his 45th year when he began to write the Æneid; the deſign of which was to reconcile the Romans to the government of Auguſtus. Auguſtus was eager to peruſe this poem before it was finiſhed; and intreated him by letters to communicate it. Macrobius has preſerved to us part of one of Virgil's anſwers to the emperor, in which the poet excuſes himſelf: who, however, at length complied, and read himſelf the ſixth book to the emperor: when Octavia, who had juſt loſt her ſon Marcellus, the darling of Rome, and adopted ſon of Auguſtus, made one of the audience. Virgil had artfully inſerted that beautiful lamentation for the death of young Marcellus, beginning with—*O nate, ingentem luctum ne quære tuorum*—but ſuppreſſed his name till he came to the line—*Tu Marcellus eris*: upon hearing which, Octavia could bear no more, but fainted away; overcome with ſurpriſe and ſorrow. When ſhe recovered, ſhe made the poet a preſent of ten ſeſterces for every line, which amounted in the whole to above 2000l.

The Æneid being brought to a concluſion, but not to the perfection our author intended to give it, he reſolved to travel into Greece, to correct and poliſh it at leiſure. It was probably on this occaſion that Horace addreſſed that affectionate ode to him, *Sic te Divæ potens Cypri, &c.* Auguſtus returning victorious from the eaſt, met with Virgil at Athens, who thought himſelf obliged to attend the emperor to Italy: but the poet was ſuddenly ſeized with a fatal diſtemper, which being increaſed by the agitation of the veſſel, put an end to his life as ſoon as he landed at Brunduſium, in his 52d year. He had ordered in his will, that the Æneid ſhould be burnt as an unfiniſhed poem; but Auguſtus forbade it, and had it delivered to Varius and Tucca, with the ſtricteſt charge to make no additions, but only to publiſh it correctly. He died with ſuch ſteadineſs and tranquillity, as to be able to dictate his own epitaph in the following words:

Mantua me genuit: Calabri rapuere, tenet nunc
Parthenope: cecini Paſcua, Rura, Duces.

His bones were carried to Naples, according to his earneſt requeſt; and a monument was erected at a ſmall diſtance from the city.

Virgil was of a ſwarthy complexion, tall, of a ſickly conſtitution, and afflicted with frequent head-achs and ſpitting of blood. He was ſo very baſhful, that he often ran into the ſhops to prevent being gazed at in the ſtreets; yet was ſo honoured by the Roman people, that once coming into the theatre, the whole audience roſe up out of reſpect to him. He was of a thoughtful and melancholy temper; he ſpoke little, and loved retirement and contemplation. His fortune was affluent; he had a fine houſe and well furniſhed library near Mæcenas's gardens, on the Eſquiline mount at Rome, and alſo a delightful villa in Sicily. He was ſo benevolent and inoffenſive, that moſt of his contemporary poets, though they envied each other, agreed in loving and eſteeming him. He reviſed his verſes with prodigious ſeverity; and uſed to compare himſelf to a ſhe bear, which licked her cubs into ſhape.

The beſt edition of Virgil's works are thoſe of Moſvicius, with the notes of Servius, printed at Lewarden in 1717, 2 vols 4to: and that of Burman, at Amſterdam, 1746, in 4 vols 4to. There are ſeveral Engliſh tranſlations, which are well known. Virgil, Virginia.

Virgil (Polydore), an Engliſh hiſtorian, born at Urbino in Italy, was ſent in the beginning of the 16th century, by pope Alexander VI. as ſub-collector of the Papal tax, called *Peter-pence*, in this kingdom. He had not been long in England before he obtained preferment in the church; for in 1503 he was preſented to the rectory of Church-Langton in the archdeaconry of Leiceſter. In 1507 he was collated to the prebend of Scamleſby in the church of Lincoln; and in the ſame year was made archdeacon of Wells, and prebendary of Hereford. In 1513, he reſigned his prebend of Lincoln, and was collated to that of Oxgate in St Paul's London. We are told, that on his preferment to the archdeaconry of Wells, he reſigned the office of ſub-collector to the pope, and determined to ſpend the remainder of his life in England, the Hiſtory of which kingdom he began in the year 1505, at the command of Henry VII. That work coſt him 12 years labour. In 1526, he finiſhed his treatiſe on Prodigies. Polydore continued in England during the whole reign of Henry VIII. and part of that of Edward VI. whence it is concluded that he was a moderate Papiſt. In 1550, being now an old man, he requeſted leave to reviſit his native country. He was accordingly diſmiſſed with a preſent of 300 crowns, together with the privilege of holding his preferments to the end of his life. He died at Urbino in the year 1555. As an hiſtorian, he is accuſed by ſome as a malignant ſlanderer of the Engliſh nation; yet Jovius remarks, that the French and Scotch accuſe him of having flattered that nation too much: (See his *Elog.* cap. 135. p. 179). Beſides the above, he wrote, 1. *De rerum inventoribus*; of which an Engliſh tranſlation was publiſhed by Langley in 1663. It was alſo tranſlated into French and Spaniſh. 2. *De prodigiis et fortibus.* 3. *Epiſcoporum Angliæ catalogus.* Manuſcript. 4. *De vita perfecta*, Baſil. 1546, 1553, 8vo. 5. *Epiſtolæ eruditæ*; and ſome other works.

VIRGINIA, one of the United States of North America, is bounded on the eaſt by the Atlantic Ocean, on the north by Pennſylvania and Maryland, on the weſt by Kentucky, on the ſouth by North Carolina.

Theſe boundaries include an area ſomewhat triangular of about 70,000 miles. The country between the great Kanhaway and the Cumberland river formerly part of this ſtate, containing about 50,000 ſquare miles has been lately erected into the new ſtate of Kentucky.

The principal rivers in Virginia are, Roanoke, James river, which receives the Rivanna, Appamattox, Chickahominy, Nanſemond, and Elizabeth rivers; York river, which is formed by the junction of Pamunky and Mattapony rivers; Rappahannok, and Patomak.

The mountains are not ſolitary and ſcattered confuſedly over the face of the country; they commence at about 150 miles from the ſea-coaſt, and are diſpoſed in ridges one behind another, running nearly parallel with the coaſt, though rather approaching it as they advance north-eaſtwardly. To the ſouth-weſt, as the tract of country between the ſea coaſt and the Miſſiſſippi becomes narrower, the mountains converge into a ſingle ridge, which, as it approaches the Gulph of Mexico, ſubſides into plain country, and gives riſe to ſome of the waters of that Gulph. Jefferſon's Virginia.

From the great extent of Virginia, it may be expected that the climate is not the ſame in all its parts. It is remarkable that, proceeding on the ſame parallel of latitude weſtwardly, the climate becomes colder in like manner as when you proceed northwardly. This continues to be the caſe till you attain the ſummit of the Allegany, which is the higheſt land between the ocean and the Miſſiſſippi.

From

Virginia. From thence, deſcending in the ſame latitude to the Miſſiſſippi, the change reverſes; and, if we may believe travellers, it becomes warmer there than it is in the ſame latitude on the ſea-ſide. Their teſtimony is ſtrengthened by the vegetables and animals which ſubſiſt and multiply there naturally, and do not on the ſea-coaſt. Thus catalpas grow ſpontaneouſly on the Miſſiſſippi as far as the latitude of 37, and reeds as far as 38, degrees. Perroquets even winter on the Sioto in the 39th degree of latitude. In the ſummer of 1779, when the thermometer was at 90 degrees at Monticello, and 96 degrees at Williamſburg, it was 110 degrees at Kaſkaſkia. Perhaps the mountain, which overhangs this village on the north ſide, may by its reflection have contributed ſomewhat to produce this heat.

The number of free inhabitants in this ſtate in 1790 was 454,983, ſlaves 292,627. The number of free inhabitants were to the number of ſlaves nearly as 54 to 29.

The college of William and Mary is the only public ſeminary of learning in Virginia. It was founded in the time of king William and queen Mary, who granted to it 20,000 acres of land, and a penny a pound duty on certain tobaccoes exported from Virginia and Maryland. The aſſembly alſo gave it by temporary law a duty on liquors imported, and ſkins and furs exported. From theſe reſources it received upwards of 3000l. *communibus annis*. The buildings are of brick, ſufficient for an indifferent accommodation of perhaps 100 ſtudents. By its charter it was to be under the government of 20 viſitors, who were to be its legiſlators; and to have a preſident and ſix profeſſorſhips, which at preſent ſtand thus:—A profeſſorſhip for Law and Police; Anatomy and Medicine; Natural Philoſophy and Mathematics; Moral Philoſophy, the Law of Nature and Nations, the Fine Arts; Modern Languages. For the Brafferton. The college edifice is a large, irregular pile, which, however, ſerves the purpoſe for the preſent. In 1787, there were about 30 young gentlemen members of this college, a large proportion of which were law ſtudents. There are a number of flouriſhing academies in Virginia; one in Prince Edward county, one at Alexandria, one at Norfolk, one at Hanover, and others in other places.

The preſent denominations of Chriſtians in Virginia are Preſbyterians, who are the moſt numerous, and inhabit the weſtern parts of the ſtate; Epiſcopalians, who are the moſt ancient ſettlers, and occupy the eaſtern and firſt ſettled parts of the ſtate. Intermingled with theſe are great numbers of Baptiſts and Methodiſts. The bulk of theſe laſt mentioned religious ſects are of the poorer ſort of people, and many of them are very ignorant (as is indeed the caſe with the other denominations), but they are generally a virtuous well-meaning ſet of people.

Virginia has produced ſome of the moſt diſtinguiſhed men that have been active in effecting the two late important revolutions in America, whoſe political and military character will rank among the firſt in the page of hiſtory. The great body of the people do not concern themſelves with politics; ſo that their government, though nominally republican, is in fact oligarchical or ariſtocratical. The Virginians who are rich, are in general ſenſible, polite, and hoſpitable and of an independent ſpirit. The poor are ignorant and abject; all are of an inquiſitive turn, and in many other reſpects very much reſemble the people in the eaſtern ſtates. There is a much greater diſparity between the rich and the poor in Virginia than in any of the northern ſtates. A ſpirit for literary inquiries, if not altogether confined to a few, is, among the body of the people, evidently ſubordinate to a ſpirit of gaming and barbarous ſports. At almoſt every tavern or ordinary on the public road there is a billiard table, a backgammon table, cards, and other implements for various games. To theſe public houſes the gambling gentry in the neighbourhood reſort to kill time which hangs heavily upon them; and at this buſineſs they are extremely expert, having been accuſtomed to it from their earlieſt youth. The paſſion for cockfighting, a diverſion not only inhumanly barbarous, but infinitely beneath the dignity of a man of ſenſe, is ſo predominant, that they even advertiſe their matches in the public newſpapers. Virginia ‖ Virtue.

The executive powers are lodged in the hands of a governor choſen annually, and incapable of acting more than three years in ſeven. He is aſſiſted by a council of eight members. The judiciary powers are divided among ſeveral courts. Legiſlation is exerciſed by two houſes of aſſembly, the one called the *Houſe of Delegates*, compoſed of two members from each county, choſen annually by the citizens poſſeſſing an eſtate for life in 100 acres of uninhabited land, or 25 acres with a houſe on it, or in a houſe or lot in ſome town. The other called the *Senate*, conſiſting of 24 members, choſen quadrennially by the ſame electors, who for this purpoſe are diſtributed into 24 diſtricts. The concurrence of both houſes is neceſſary to the paſſage of a law. They have the appointment of the governor and council, the judges of the ſuperior courts, auditors, attorney-general, treaſurer, regiſter of the land office, and delegates to Congreſs.

Before the preſent war, there was exported from this ſtate, *communibus annis*, nearly as follows:

Articles.	Quantity.
Tobacco.	55,000 hhds. of 1000lb
Wheat,	800,000 buſhels
Indian Corn,	600,000 buſhels
Shipping,	
Maſts, planks, ſkantling, ſhingles, ſtaves,	
Tar, pitch, turpentine,	30,000 barrels
Peltry, viz. ſkins of deer, beavers, otters, muſk-rats, racoons, foxes,	180 hhds. of 600 lb.
Pork,	4,000 barrels
Flax ſeed, hemp, cotton,	
Pit coal, pig iron,	
Peaſe,	5,000 buſhels
Beef,	1,000 barrels
Sturgeon, white ſhad, herring,	
Brandy from peaches and apples, whiſky,	
Horſes,	

The amount of the above articles is 850,000l. Virginia money, or 607,142 guineas.

The whole country before it was planted was one continued foreſt interſperſed with marſhes, which in the Weſt Indies they call *ſwamps*. No country now produces greater quantities of excellent tobacco; and the ſoil is generally ſo ſandy and ſhallow, that after they have cleared a freſh piece of ground out of the woods, it will not bear tobacco after two or three years unleſs cow-penned and well dunged. The foreſts yield oaks, poplars, pines, cedars, cypreſſes, ſweet myrtles, cheſnuts, hickery, live oak, walnut, dog-wood, alder, hazel, chinkapins, locuſt-trees, ſaſſafras, elm, aſh, beech, with a great variety of ſweet gums and incenſe, which diſtil from ſeveral trees; pitch, tar, roſin, turpentine, plank-timber, maſts, and yards. Virginia yields alſo rice, hemp, Indian corn, plenty of paſture, with coal, quarries of ſtone, and lead and iron ore.

VIRGO, in aſtronomy, one of the ſigns or conſtellations of the zodiac.

VIRGULA Divinitoria, divining rod. See Mine, Vol. XII. p. 41.

VIRTUAL, or Potential; ſomething that has a power or virtue of acting or doing. The term is chiefly underſtood of ſomething that acts by a ſecret inviſible cauſe, in oppoſition to actual and ſenſible.

VIRTUE, a term uſed in various ſignifications. In the

Virtuoso || Viſtula.

general it denotes power, or the perfection of any thing, whether natural or ſupernatural, animate or inanimate, eſſential or acceſſory. But, in its more proper or reſtrained ſenſe, virtue ſignifies a habit, which improves and perfects the poſſeſſor and his actions. See MORAL PHILOSOPHY, n° 84.

VIRTUOSO, an Italian term lately introduced into the Engliſh, ſignifying a man of curioſity and learning, or one who loves and promotes the arts and ſciences. But among us the term ſeems to be appropriated to thoſe who apply themſelves to ſome curious and quaint rather than immediately uſeful art or ſtudy; as antiquaries, collectors of rarities of any kind, microſcopical obſervers, &c.

VIRULENT, a term applied to any thing that yields a virus; that is, a contagious or malignant pus.

VISCERA, in anatomy, a term ſignifying the ſame with entrails; including the heart, liver, lungs, ſpleen, inteſtines, and other inward parts of the body.

VISCIDITY, or VISCOSITY, the quality of ſomething that is viſcid or viſcous; that is, glutinous and ſticky like bird-lime, which the Latins call by the name of *viſcus*.

VISCOUNT (*Vice Comes*), was anciently an officer under an earl, to whom, during his attendance at court, he acted as deputy to look after the affairs of the country. But the name was afterwards made uſe of as an arbitrary title of honour, without any ſhadow of office pertaining to it, by Henry VI; when, in the 18th year of his reign, he created John Beaumont a peer by the name of *viſcount Beaumont*; which was the firſt inſtance of the kind.

A viſcount is created by patent as an earl is; his title is *Right Honourable*; his mantle is two doublings and a half of plain fur; and his coronet has only a row of pearls cloſe to the circle.

VISCUM, in botany; a genus of plants of the claſs *dioecia*, order *tetrandria*, and in the natural ſyſtem arranged under the 48th order, *aggregatæ*. The male calyx is quadripartite; the antheræ adhere to the calyx: the female calyx conſiſts of four leaves; there is no ſtyle; the ſtigma is obtuſe. There is no corolla; the fruit is a berry with one ſeed. There are 9 ſpecies; only one of which is a native of Britain, viz, the *album*, or common miſſeltoe. It is a ſhrub growing on the bark of ſeveral trees: the leaves are conjugate and elliptical, the ſtem forked; the flowers whitiſh in the alæ of the leaves. This plant was reckoned ſacred among the druids.

VISHNOU, that perſon in the triad of the Bramins who is conſidered as the *preſerver* of the univerſe. *Brahma* is the creator and *Siva* the deſtroyer; and theſe two, with Viſhnou, united in ſome inexplicable manner, conſtitute *Brahme*, or the ſupreme numen of the Hindoos. See POLYTHEISM, n° 36.

VISIBLE, ſomething that is an object of ſight or viſion; or ſomething whereby the eye is affected ſo as to produce this ſenſation.

VISIER, an officer or dignitary in the Ottoman empire, wherof there are two kinds; one called by the Turks *Viſier-azem*, that is, "grand viſier," is the prime miniſter of ſtate in the whole empire. He commands the army in chief, and preſides in the divan or great council. Next to him are ſix other ſubordinate viſiers, called *viſiers of the bench*; who officiate as his counſellors or aſſeſſors in the divan.

VISION, in optics, the act of ſeeing or perceiving external objects by means of the organ of ſight, the eye. See ANATOMY, n° 142, and METAPHYSICS, n° 49—54.

VISTULA, or WEISEL, a large river of Poland, which taking its riſe in the mountains ſouth of Sileſia, viſits Cracow, Warſaw, &c. and continuing its courſe northward, falls into the Baltic ſea below Dantzic.

VISUAL, in general, ſomething belonging to viſion.

Viſual || Vitis.

VITAL, in phyſiology, an appellation given to whatever miniſters principally to the conſtituting or maintaining life in the bodies of animals: thus the heart, lungs, and brain, are called *vital parts*; and the operations of theſe parts by which the life of animals is maintained are called *vital functions*.

VITALIANO (Donati), an eminent naturaliſt, was born in Padua the 8th of September 1717. He ſhowed from his childhood the greateſt inclination for botany and natural hiſtory; and, at the age of twelve years, knew all the medicinal plants, and had made a collection of natural productions. When ſome years older, he profited by the friendſhip of the celebrated Pontedero, and was generouſly furniſhed with books and information by the living profeſſor Valliſneri junior. His beſt maſters were, however, his own mountain and maritime peregrinations; which he began in Dalmatia in 1743, and continued for five years. He was choſen for adjutant to the marquis Poleni, public profeſſor of experimental phyſic, and cultivated under ſo great a maſter all the parts of phyſico-mathematics. With him he made a journey to Rome, and there became an intimate friend of Leprotti the papal phyſician, to whom he afterwards dedicated his *Saggio della ſtoria naturale dell' Adriatico*; a work of great merit, which count Ginanni of Ravenna endeavoured to depreciate, though with little ſucceſs. The eſſay of Donati was publiſhed in 1750, and was afterwards tranſlated into French. The fame which our author acquired induced his Sardinian majeſty to appoint him profeſſor of botany and natural hiſtory at Turin. He went there very willingly; made many excurſions among the mountains of Savoy and Genoa, and would have been happy could he always have converſed with the mountaineers, who generally are harmleſs people. The king his maſter ſent him out of the way of his enemies, whoſe envy and hatred his merit alone had raiſed; he commanded him to ſet out on a voyage to Egypt, and from thence to viſit Syria, Paleſtine, Arabia, and the Eaſt Indies, to make obſervations and to collect the rareſt productions of nature. In 1759 he was in Alexandria, ſaw Egypt as far as the great cataract of the Nile, and a great part of Paleſtine, Arabia, and Chaldea; and in all thoſe travels was expoſed to ſuffer the cruel conſequences of a bad choice which he had made of his companions. While he ſtaid at Baſſora, waiting for orders from court, he fell ill of a putrid fever, and died in a few days. The news of his death came to Turin about the end of October 1763. He left in manuſcript two volumes in folio.

VITELLUS, the yolk of an egg. See EGG.

VITIS, in botany: A genus of the claſs *pentandria*, order *monogynia*; and in the natural ſyſtem arranged under the 46th order, *pectoraceæ*. The petals cohere at the top, and are withered; the fruit is a berry with five ſeeds. There are 11 ſpecies; the moſt important of which is the *vinifera* or common vine, which has naked, lobed, ſinuated leaves.

There are a great many varieties; but a recital of their names would be tireſome without being uſeful. All the ſorts are propagated either from layers or cuttings, the former of which is greatly practiſed in England, but the latter is much preferable.

In chooſing the cuttings, you ſhould always take ſuch ſhoots of the laſt year's growth as are ſtrong and well ripened; theſe ſhould be cut from the old vine, juſt below the place where they were produced, taking a knot, or piece of the two-years wood to each, which ſhould be pruned ſmooth; then you ſhould cut off the upper part of the ſhoots, ſo as to leave the cutting about ſixteen inches long. When the piece or knot of old wood is cut at both ends, near the

young

Vitis. young ſhoot, the cutting will reſemble a little mallet; from whence Columella gives the title of *malleolus* to the vine-cuttings. In making the cuttings after this manner, there can be but one taken from each ſhoot; whereas moſt perſons cut them into lengths of about a foot, and plant them all; which is very wrong, for various reaſons too tedious to mention.

When the cuttings are thus prepared, if they are not then planted, they ſhould be placed with their lower part in the ground in a dry ſoil, laying ſome litter upon their upper parts to prevent them from drying: in this ſituation they may remain till the beginning of April (which is the beſt time for planting them); when you ſhould take them out, and waſh them from the filth they have contracted; and if you find them very dry, you ſhould let them ſtand with their lower parts in the water ſix or eight hours, which will diſtend their veſſels, and diſpoſe them for taking root. If the ground be ſtrong and inclined to wet, you ſhould open a trench where the cuttings are to be planted, which ſhould be filled with lime rubbiſh, the better to drain off the moiſture: then raiſe the borders with freſh light earth about two feet thick, ſo that it may be at leaſt a foot above the level of the ground: then you ſhould open the holes at about ſix feet diſtance from each other, putting one good ſtrong cutting into each hole, which ſhould be laid a little ſloping, that their tops may incline to the wall; but it muſt be put in ſo deep, as that the uppermoſt eye may be level with the ſurface of the ground; for when any part of the cutting is left above ground, moſt of the buds attempt to ſhoot, ſo that the ſtrength of the cuttings is divided to nouriſh ſo many ſhoots, which muſt conſequently be weaker than if only one of them grew; whereas, by burying the whole cutting in the ground, the ſap is all employed on one ſingle ſhoot, which conſequently will be much ſtronger; beſides, the ſun and air are apt to dry that part of the cutting which remains above ground, and ſo often prevents their buds from ſhooting.

Having placed the cutting into the ground, fill up the hole gently, preſſing down the earth with your foot cloſe about it, and raiſe a little hill juſt upon the top of the cutting, to cover the upper eye quite over, which will prevent it from drying. Nothing more is neceſſary but to keep the ground clear from weeds until the cuttings begin to ſhoot: at which time you ſhould look over them carefully, to rub off any ſmall ſhoots, if ſuch are produced, faſtening the firſt main ſhoot to the wall, which ſhould be conſtantly trained up, as it is extended in length, to prevent its breaking or hanging down. You muſt continue to look over theſe once in about three weeks during the ſummer ſeaſon, conſtantly rubbing off all lateral ſhoots which are produced; and be ſure to keep the ground clear from weeds, which, if ſuffered to grow, will exhauſt the goodneſs of the ſoil and ſtarve the cuttings. The Michaelmas following, if your cuttings have produced ſtrong ſhoots, you ſhould prune them down to two eyes. In the ſpring, after the cold weather is paſt, you muſt gently dig up the borders to looſe the earth; but you muſt be very careful in doing this, not to injure the roots of your vines: you ſhould alſo raiſe the earth up to the ſtems of the plants, ſo as to cover the old wood, but not ſo deep as to cover either of the eyes of the laſt year's wood. After this they will require no farther care until they begin to ſhoot: when you ſhould rub off all weak dangling ſhoots, leaving no more than the two produced from the two eyes of the laſt year's wood, which ſhould be faſtened to the wall. From this time till the vines have done ſhooting, you ſhould look them over once in three weeks or a month, to rub off all lateral ſhoots as they are produced, and to faſten the main ſhoots to the wall as they are extended in length; about the middle or latter end of July, it will be proper to nip off the tops of theſe two ſhoots which will ſtrengthen the lower eyes. During the ſummer ſeaſon you muſt conſtantly keep the ground clear from weeds: nor ſhould you permit any ſort of plants to grow near the vines, which would not only rob them of nouriſhment, but ſhade the lower parts of the ſhoots, and thereby prevent their ripening; which will not only cauſe their wood to be ſpongy and luxuriant, but render it leſs fruitful. Vitis.

As ſoon as the leaves begin to drop in autumn, you ſhould prune theſe young vines again, leaving three buds to each of the ſhoots, provided they are ſtrong: otherwiſe it is better to ſhorten them down to two eyes if they are good; for it is a very wrong practice to leave much wood upon young vines, or to leave their ſhoots too long, which greatly weakens the roots: then you ſhould faſten them to the wall, ſpreading them out horizontal each way, that there may be room to train the new ſhoots the following ſummer, and in the ſpring the borders muſt be digged as before.

The uſes of the fruit of the vine for making wine, &c. are well known. The vine was introduced by the Romans into Britain, and appears formerly to have been very common. From the name of vineyard yet adhering to the ruinous ſites of our caſtles and monaſteries, there ſeem to have been few in the country but what had a vineyard belonging to them. The county of Glouceſter is particularly commended by Malmſbury in the twelfth century, as excelling all the reſt of the kingdom in the number and goodneſs of its vineyards. In the earlier periods of our hiſtory, the iſle of Ely was expreſsly denominated the *Iſle of Vines* by the Normans. Vineyards are frequently noticed in the deſcriptive accounts of doomſday; and thoſe of England are even mentioned by Bede as early as the commencement of the eighth century.

Doomſday exhibits to us a particular proof that wine was made in England during the period preceding the conqueſt. And after the conqueſt the biſhop of Ely appears to have received at leaſt three or four tuns of wine annually, as tythes, from the produce of the vineyards in his dioceſe; and to have made frequent reſervations in his leaſes of a certain quantity of wine for rent. A plot of land in London, which now forms Eaſt-Smithfield and ſome adjoining ſtreets, was withheld from the religious houſe within Aldgate by four ſucceſſive conſtables of the Tower, in the reigns of Rufus, Henry, and Stephen, and made by them into a vineyard to their great emolument and profit. In the old accounts of rectorial and vicarial revenues, and in the old regiſters of eccleſiaſtical ſuits concerning them, the tithe of wine is an article that frequently occurs in Kent, Surry, and other counties. And the wines of Glouceſterſhire, within a century after the conqueſt, were little inferior to the French in ſweetneſs. The beautiful region of Gaul, which had not a ſingle vine in the days of Cæſar, had numbers ſo early as the time of Strabo. The ſouth of it was particularly ſtocked with them; and they had even extended themſelves into the interior parts of the country: But the grapes of the latter did not ripen kindly. France was famous for its vineyards in the reign of Veſpaſian, and even exported its wines into Italy. The whole province of Narbonne was then covered with vines: and the wine-merchants of the country were remarkable for all the knaviſh dexterity of our modern brewers, tinging it with ſmoke, colouring it (as was ſuſpected) with herbs and noxious dyes, and even adulterating the taſte and appearance with aloes. And, as our firſt vines would be tranſplanted from Gaul, ſo were in all probability thoſe of the Allobroges in Franche Compte. Theſe were peculiarly fitted for cold countries. They ripened even in the froſts of the advancing winter. And they were of the ſame

colour,

Vitis ‖ Viverra.

colour, and ſeem to have been of the ſame ſpecies, as the black Muſcadines of the preſent day, which have lately been tried in the iſland, I think, and found to be fitteſt for the climate. Theſe were pretty certainly brought into Britain a little after vines had been carried over all the kingdoms of Gaul, and about the middle of the third century; when the numerous plantations had gradually ſpread over the face of the latter, and muſt naturally have continued their progreſs into the former.

The Romans, even nearly to the days of Lucullus, were very ſeldom able to regale themſelves with wine. Very little was then raiſed in the compaſs of Italy. And the foreign wines were ſo dear, that they were rarely produced at an entertainment; and when they were, each gueſt was indulged only with a ſingle draught. But in the ſeventh century of Rome, as their conqueſts augmented the degree of their wealth, and enlarged the ſphere of their luxury, wines became the object of particular attention. Many vaults were conſtructed, and good ſtocks of liquor depoſited in them. And this naturally gave encouragement to the wines of the country. The Falernian roſe immediately into great repute; and a variety of others, that of Florence among the reſt, ſucceeded it about the cloſe of the century. And the more weſterly parts of the European continent were at once ſubjected to the arms, and enriched with the vines, of Italy.

But the ſcarcity of the native, and dearneſs of the foreign, wines in that country, ſeveral ages before the conqueſt of Lancaſhire, had called out the ſpirit of invention, and occaſioned the making of fictitious wines. Theſe were ſtill continued by the Romans, and naturally taught to the Britons. And they were made of almoſt all the products of the orchard and garden, the pear, the apple, mulberry, ſervis, and roſe. Two of them, therefore, were thoſe agreeable liquors which we ſtill denominate *cyder* and *perry*. The latter would be called *pyrum* by the Romans, and is therefore called *perry* or *pear-water* by us. And the former aſſumed among the Romans the appellation of *ſicera*, which was colloquially pronounced by them *ſidera*, as the ſame pronunciation of it among the preſent Italians ſhows; and retains therefore the denomination of *cyder* among ourſelves.

VITREOUS HUMOUR OF THE EYE. See ANATOMY, n° 142.

VITRIFICATION, in chemiſtry, the converſion of a body into glaſs by means of fire. See GLASS.

VITRIOL, a compound ſalt, formed by the union of iron, copper, or zinc with the ſulphuric acid. It is of three colours, white, blue, and green, according to the metal. See CHEMISTRY-*Index*.

VITRIOLATED, among chemiſts, ſomething impregnated, or ſuppoſed to be ſo, with vitriol or its acid.

VITRIOLIC ACID. See *SULPHURIC Acid* and CHEMISTRY-*Index*.

VITRUVIUS POLLIO (Marcus), a very celebrated Roman architect, was, according to the common opinion, born at Verona, and lived in the reign of Auguſtus, to whom he dedicated his excellent treatiſe on architecture, divided into ten books. William Philander's edition of this celebrated work is eſteemed. Claudius Perrault has given an excellent tranſlation of it in French, with learned notes. There are alſo ſeveral Engliſh tranſlations of Vitruvius.

VITUS's DANCE. See MEDICINE, n° 284.

VIVERRA, THE WEASEL; a genus of quadrupeds belonging to the order of feræ. They have ſix fore-teeth, the intermediate ones being ſhorter, and more than three grinders, and the claws are exſerted. There are 27 ſpecies, the principal of which are,

Viverra.

1. The ichneumon, with the tail tapering to a point, and the toes diſtant from each other; inhabits Egypt, Barbary, India and its iſlands. It is there a moſt uſeful animal, being an inveterate enemy to the ſerpents and other noxious reptiles which infeſt the torrid zone: it attacks without dread that moſt fatal of ſerpents the Naja, or Cobra de Capello; and ſhould it receive a wound in the combat, inſtantly retires, and is ſaid to obtain an antidote from a certain herb (according to Sparmann the *ophiorhiza*); after which it returns to the attack, and ſeldom fails of victory: it is a great deſtroyer of the eggs of crocodiles, which it digs out of the ſand; and even kills multitudes of the young of thoſe terrible reptiles: it was not therefore without reaſon that the ancient Egyptians ranked the ichneumon among their deities. This animal is at preſent domeſticated and kept in houſes in India and in Egypt, for it is more uſeful than a cat in deſtroying rats and mice; and grows very tame. It is very active; ſprings with great agility on its prey; will glide along the ground like a ſerpent, and ſeem as if without feet. It ſits up like a ſquirrel, and eats with its fore-feet, catching any thing that is flung to it. It is a great enemy to poultry, and will feign itſelf dead till they come within reach: loves fiſh; draws its prey, after ſucking the blood, to its hole. Its excrements are very fetid; when it ſleeps, it brings its head and tail under its belly, appearing like a round ball, with two legs ſticking out. Rumphius obſerves how ſkilfully it ſeizes the ſerpents by the throat, ſo as to avoid receiving an injury; and Lucan beautifully deſcribes the ſame addreſs of this animal in conquering the Egyptian aſp.

2. The vulpecula, or ſtifling weaſel, has a ſhort ſlender noſe; ſhort ears and legs; black body, full of hair; the tail long, of a black and white colour; length from noſe to tail about 18 inches. It inhabits Mexico, and perhaps other parts of America. This and ſome other ſpecies are remarkable for the peſtiferous, ſuffocating, and moſt fetid vapour they emit from behind, when attacked, purſued, or frightened: it is their only means of defence. Some turn their tail to their enemy, and keep them at a diſtance by a frequent crepitus; and others ejaculate their urine, tainted with the horrid effluvia, to the diſtance of 18 feet. The purſuers are ſtopped with the terrible ſtench. Should any of this liquor fall into the eyes, it almoſt occaſions blindneſs: if on the clothes, the ſmell will remain for ſeveral days, in ſpite of all waſhing; they muſt even be buried in freſh ſoil, in order to be ſweetened. Dogs that are not true bred, run back as ſoon as they perceive the ſmell: thoſe that have been uſed to it, will kill the animal; but are often obliged to relieve themſelves by thruſting their noſes into the ground. There is no bearing the company of a dog that has killed one for ſeveral days. Profeſſor Kalm was one night in great danger of being ſuffocated by one that was purſued into a houſe where he ſlept; and it affected the cattle ſo, that they bellowed through pain. Another, which was killed by a maid-ſervant in a cellar, ſo affected her with its ſtench, that ſhe lay ill for ſeveral days; all the proviſions that were in the place were ſo tainted, that the owner was obliged to throw them away. Notwithſtanding this, the fleſh is reckoned good meat, and not unlike that of a pig; but it muſt be ſkinned as ſoon as killed, and the bladder taken carefully out. It breeds in hollow trees, or holes under ground, or in clefts of rocks; climbs trees with great agility; kills poultry; eats eggs, and deſtroys young birds.

3. The zibetha, or civet-cat, has ſhort rounded ears; the back and ſides cinereous, tinged with yellow, marked with large duſky ſpots diſpoſed in rows; the hair coarſe; that on the top of the body longeſt, ſtanding up like a mane;

the

Vives. ‖ Ulietea.

the tail ſometimes wholly black; ſometimes ſpotted near the baſe; length, from noſe to tail, about two feet three inches; the tail 14 inches; the body pretty thick. It inhabits India, the Philippine Iſles, Guinea, Ethiopia, and Madagaſcar. The famous drug muſk, or civet, which is produced from an aperture between the privities and the anus, in both ſexes, is ſecreted from certain glands. The perſons who keep them procure the muſk by ſcraping the inſide of this bag twice a-week with an iron ſpatula, and get about a dram each time: but it is ſeldom ſold pure, being generally mixed with ſuet or oil, to make it more weighty. The males yield the moſt, eſpecially when they are previouſly irritated. They are fed, when young, with pap made of millet, with a little fleſh or fiſh; when old, with raw fleſh. In a wild ſtate, they prey on fowl. Theſe animals ſeem not to be known to the ancients: it is probable the drug was brought without their knowing its origin; for it is certain the fine gentlemen in Rome uſed perfumes.

VIVES, in farriery. See there, § xiv.

VIVIPAROUS, in natural hiſtory, an epithet applied to ſuch animals as bring forth their young alive and perfect; in contradiſtinction to thoſe that lay eggs, which are called *oviparous* animals.

UKRAINE, a large country of Europe, lying on the borders of Turkey in Europe, Poland, Ruſſia, and Little Tartary. Its name properly ſignifies a *frontier*. By a treaty between Ruſſia and Poland in 1693, the latter remained in poſſeſſion of all that part of the Ukraine lying on the weſt ſide of the river Dnieper, which is but indifferently cultivated; while the country on the eaſt ſide, inhabited by the Coſſacs, is in much better condition. The Ruſſian part is compriſed in the government of Kiof; and the empreſs of Ruſſia having obtained the Poliſh palatinate of Kiof, by the treaty of partition in 1793, the whole of the Ukraine, on both ſides of the Dnieper, belongs now to that ambitious and formidable power. The principal town is Kiof.

ULCER, in ſurgery. See Chap. IV. Sect. 1.

Ulcer, in farriery. See Farriery, Sect. 28.

ULEX, in botany: A genus of plants of the claſs of *diadelphia*, and order of *decandria*; and in the natural ſyſtem arranged under the 32d order, *Papilionaceæ*. The calyx conſiſts of two leaves quinquedentate: pod almoſt covered by the calyx. There are two ſpecies; one of which, the *Europæus*, the furze, gorſe, or whin, is a native of Britain; it is too well known to need deſcription. Its uſes, however, are many; as a fuel where wood and coals are ſcarce; and as hedge-wood upon light barren land: its uſe as horſe provender too ſeems to be fully proved though not yet eſtabliſhed. See Agriculture, n° 47. and Fence.

ULIETEA, one of the Society Iſlands. This iſland is about 21 leagues in circuit. Its productions are plantains, cocoa nuts, yams, hogs, and fowl; the two latter of which are ſcarce. The ſoil on the top of one of the hills was found to be a kind of ſtone marle; on the ſides were found ſome ſcattered flints, and a few ſmall pieces of a cavernous or ſpongy ſtone lava, of a whitiſh colour, which ſeemed to contain ſome remains of iron, ſo that it may poſſibly be here lodged in the mountains in a great quantity. Nothing was ſeen on this iſland to diſtinguiſh either its inhabitants, or their manners, from the other neighbouring iſlands. The firſt Europeans who landed on this ſhore were Mr (now Sir Joſeph) Banks and Dr Solander; they were received by the natives in the moſt courteous manner, reports concerning them having been their harbingers from Otaheite. Every body ſeemed to fear and reſpect them, placing in them at the ſame time the utmoſt confidence: behaving, as if conſcious that their viſitors poſſeſſed the power of doing them miſchief without a diſpoſition to make uſe of it.

ULIGINOUS, in agriculture, an appellation given to a moiſt, mooriſh, and fenny ſoil. Uliginous. ‖ Ulſter.

ULLAGE, in gauging, is ſo much of a caſk or other veſſel as it wants of being full.

ULM, a free and imperial city of Germany, in the circle of Swabia, ſeated on the river Iller. It is a pretty large place, defended by fortifications; and the inhabitants are Proteſtants. Here the archives of the circle are depoſited, and it carries on a very great trade. The elector of Bavaria became maſter of it, in 1702, by a ſtratagem; but, in 1704, the French being vanquiſhed at the battle of Hochſtet, the Bavarians ſurrendered it by capitulation. The Roman Catholics have but two churches, all the reſt belonging to the Proteſtants. E. Long. 10. 12. N. Lat. 48. 25.

ULMUS, in botany: A genus of plants belonging to the claſs of *pentandria*, and order of *digynia*; and in the natural ſyſtem arranged under the 53d order, *Scabridæ*. The calyx is quinquefid; there is no corolla. The fruit is a dry, compreſſed, membranaceous berry. There are three ſpecies, one of which is a native of Britain. The *campeſtris*, common elm. The leaves are rough, oval, pointed, doubly ſerrated, unequal at the baſe. Bark of the trunk cracked and wrinkled. Fruit membranous. The *montana*, or wych elm, is generally reckoned a variety of this ſpecies.

All the ſorts of elm may be either propagated by layers or ſuckers taken from the roots of the old trees, the latter of which is generally practiſed by the nurſery-gardeners: but as theſe are often cut up with indifferent roots, they often miſcarry, and render the ſucceſs doubtful; whereas thoſe which are propagated by layers are in no hazard, and always make better roots, and come on faſter than the other, and do not ſend out ſuckers from their roots in ſuch plenty, for which reaſon this method ſhould be more univerſally practiſed.

The elm delights in a ſtiff ſtrong ſoil. It is obſervable, however, that here it grows comparatively ſlow. In light land, eſpecially if it be rich, its growth is very rapid; but its wood is light, porous, and of little value, compared with that which grows upon ſtrong land; which is of a cloſer ſtronger texture, and, at the heart, will have the colour, and almoſt the heavineſs and the hardneſs, of iron: On ſuch ſoils the elm becomes profitable, and is one of the trees which ought in preference to all others to engage the planter's attention.

ULSTER, the moſt northerly province of Ireland. In Latin it is called *Ultonia*, in Iriſh *Cui Guilly*; and gives the title of *earl* to the dukes of York of the royal family. It is bounded by the Atlantic Ocean on the weſt, St George's Channel and the Iriſh Sea on the eaſt, the Deucaledonian Ocean on the north, and on the ſouth and ſouth-weſt the provinces of Leinſter and Connaught. Its greateſt length is near 120 miles, its breadth about 100; and its circumference, including the windings and turnings, 460; containing 9 counties, 58 market-towns and boroughs, 1 archbiſhopric, 6 biſhoprics, and 214 pariſhes. Ulſter abounds in lakes and rivers, which ſupply it with variety of fine fiſh, eſpecially ſalmon, beſides what it has from the ſea, with which a great part of it is bounded. The ſouthern parts of it are rich, fertile, well cultivated, and incloſed; but the greater part of the northern is open and mountainous.—The towns of this province are in general the neateſt and beſt built of any in Ireland, as well as the farm houſes; which in moſt parts of the kingdom are conſtructed of no better materials than clay and ſtraw. The inhabitants of Ulſter are alſo more like the Engliſh in their manners and dialect than thoſe of the other three provinces: for as it includes

Ulterior ‖ Umbellatæ

includes within itſelf the whole, or by far the greater part, of the linen manufactory, the beſt branch of trade in the kingdom, they have conſequently the greateſt intercourſe with England. An Engliſhman, in ſome parts of it, indeed, will imagine himſelf, from the ſimilarity of their language and manners, in his own country. This province had anciently petty kings of its own. It was firſt ſubjected to the Engliſh in the reign of Henry II. by John Courcy, the firſt who bore the title of *earl of Ulſter*; but it afterwards threw off the yoke, and was never entirely reduced till the reign of James I. when great numbers of Scots by his encouragement went and ſettled in it. Of theſe, moſt of the preſent inhabitants are the deſcendants. This province was the firſt and principal ſcene of the bloody maſſacre in 1641.

ULTERIOR, in geography, is applied to ſome part of a country or province, which, with regard to the reſt of that country, is ſituated on the farther ſide of the river, mountain, or other boundary, which ſeparates the two countries.

ULTRAMARINE, a beautiful blue colour uſed by the painters, prepared from the lapis lazuli by calcination.

ULTRAMONTANE, ſomething beyond the mountains. The term is principally applied in relation to France and Italy, which are ſeparated by the Alps.

ULVA, in botany; a genus of plants of the claſs of *cryptogamia*, and order of *algæ*. The fructification is incloſed in a diaphanous membrane. There are 17 ſpecies; 12 of which are Britiſh plants.

They are all ſeſſile, and without roots, and grow in ditches and on ſtones along the ſea-coaſt. None of them are applied to any particular uſe different from the reſt of the algæ, except perhaps the *umbilicalis*, which in England is pickled with ſalt and preſerved in jars, and afterwards ſtewed and eaten with oil and lemon-juice. This ſpecies, called in Engliſh the *navel laver*, is flat, orbicular, ſeſſile, and coreaceous.

ULUG BEIG, a Perſian prince and learned aſtronomer, was deſcended from the famous Tamerlane, and reigned at Samarcand about 40 years; after which he was murdered by his own ſon in 1449. His catalogue of the fixed ſtars, rectified for the year 1434, was publiſhed at Oxford by Mr Hyde, in 1665, with learned notes. Mr Hudſon printed in the Engliſh Geography, Ulug Beig's Tables of the Longitude and Latitude of Places; and Mr Greaves publiſhed, in Latin, his Aſtronomical Epochas, at London, in 1650. See ASTRONOMY-*Index*.

ULYSSES, king of Ithaca, the ſon of Laertes, and father of Telemachus, and one of thoſe heroes who contributed moſt to the taking of Troy. After the deſtruction of that city, he wandered for 10 years; and at laſt returned to Ithaca, where, with the aſſiſtance of Telemachus, he killed Antinous and other princes who intended to marry his wife Penelope and ſeize his dominions. He at length reſigned the government of the kingdom to his ſon Telemachus; and was killed by Telegonus, his ſon by Circe, who did not know him. This hero is the ſubject of the Odyſſey.

UMBELLA, an UMBEL, in botany: A ſpecies of receptacle; or rather a mode of flowering, in which a number of ſlender footſtalks proceed from the ſame centre, and riſe to an equal height, ſo as to form an even and generally round ſurface at top. See BOTANY.

UMBELLATÆ, the name of a claſs in Ray's and Tournefort's methods, conſiſting of plants whoſe flowers grow in umbels, with five petals that are often unequal, and two naked ſeeds that are joined at top and ſeparated below.

The ſame plants conſtitute the 45th order of Linnæus's Fragment's of a Natural Method. See BOTANY.

UMBELLIFEROUS PLANTS, are ſuch as have their tops branched and ſpread out like an umbrella. Umbelliferous. ‖ Undecagon.

UMBER, or UMBRE, in natural hiſtory, a foſſil brown or blackiſh ſubſtance, uſed in painting; ſo called from *Ombria*, the ancient name of the duchy of Spoleto in Italy, whence it was firſt obtained; diluted with water, it ſerves to make a dark brown colour, uſually called with us an *hair colour*.

Dr Hill and Mr da Coſta conſider it as an earth of the ochre kind. It is found in Egypt, Italy, Spain, and Germany; in Cyprus alſo it is found in large quantities; but what we have brought into England is principally from different parts of the Turkiſh dominions. But it might be found in conſiderable plenty alſo in England and Ireland, if properly looked after, ſeveral large maſſes of it having been thrown up in digging on Mendip hills in Somerſetſhire, and in the county of Wexford in Ireland: it is alſo ſometimes found in the veins of lead-ore both in Derbyſhire and Flintſhire.

UMBILICAL, among anatomiſts, ſomething relating to the umbilicus or navel.

UMBRELLA, a moveable canopy, made of ſilk or other cloth ſpread out upon ribs of whale-bone, and ſupported by a ſtaff, to protect a perſon from rain, or the ſcorching beams of the ſun.

UMPIRE, a third perſon choſen to decide a controverſy left to arbitration.

UNCIA, in general, a Latin term, denoting the twelfth part of any thing; particularly the twelfth part of a pound, called in Engliſh an *ounce*; or the twelfth part of a foot, called an *inch*.

UNCTION, the act of anointing or rubbing with oil or other fatty matter.

UNCTION, in matters of religion, is uſed for the character conferred on ſacred things by anointing them with oil. Unctions were very frequent among the Hebrews. They anointed both their kings and high-prieſts at the ceremony of their inauguration. They alſo anointed the ſacred veſſels of the tabernacle and temple, to ſanctify and conſecrate them to the ſervice of God. The unction of kings is ſuppoſed to be a ceremony introduced very late among the Chriſtian princes. It is ſaid that none of the emperors were ever anointed before Juſtinian or Juſtin. The emperors of Germany took the practice from thoſe of the eaſtern empire: king Pepin of France was the firſt who received the unction. In the ancient Chriſtian church, unction always accompanied the ceremonies of baptiſm and confirmation. Extreme unction, or the anointing perſons in the article of death, was alſo practiſed by the ancient Chriſtians, in compliance with the precept of St James, chap. v. 14th and 15th verſes; and this extreme unction the Romiſh church has advanced to the dignity of a ſacrament. It is adminiſtered to none but ſuch as are affected with ſome mortal diſeaſe, or in a decrepit age. It is refuſed to impenitent perſons, as alſo to criminals. The parts to be anointed are the eyes, the ears, the noſtrils, the mouth, the hands, the feet, and the reins. The laity are anointed in the palms of the hands, but prieſts on the back of it; becauſe the palms of their hands have been already conſecrated by ordination.

The oil with which the ſick perſon is anointed repreſents the grace of God, which is poured down into the ſoul, and the prayer uſed at the time of anointing expreſſes the remiſſion of ſins thereby granted to the ſick perſon; for the prayer is this: "By this holy unction, and his own moſt pious mercy, may the Almighty God forgive thee whatever ſins thou haſt committed *by the ſight*," when the eyes are anointed; *by the hearing*, when the ears are anointed; and ſo of the other ſenſes*.

UNDECAGON, is a regular polygon of 11 ſides.

* The Sincere Chriſtian inſtructed from the Written Word.

Undecem. vir || Union.

UNDECEMVIR, a magiſtrate among the ancient Athenians, who had 10 other colleagues or aſſociates joined with him in the ſame commiſſion. The functions of the undecemviri at Athens were much the ſame as thoſe of the late *prevots de marechauſſe* in France. They took care of the apprehending of criminals; ſecured them in the hands of juſtice; and when they were condemned, took them again into cuſtody, that the ſentence might be executed on them. They were choſen by the tribes, each tribe naming its own; and as the number of the tribes after Calliſthenes was but 10, which made 10 members, a ſcribe or notary was added, which made the number 11.

UNDERSTANDING. See METAPHYSICS and LOGIC.

UNDERWALD, a canton of Swiſſerland, and the ſixth in rank. It is bounded on the north by the canton of Lucern and by the Lake of the Four Cantons, on the eaſt by the high mountains which ſeparate it from the canton of Bern, and on the weſt by the canton of Bern. The religion of this canton is the Roman Catholic.

UNDERWOOD, is coppice, or any wood that is not accounted timber.

UNDULATION, in phyſics, a kind of tremulous motion or vibration obſervable in a liquid, whereby it alternately riſes and falls like the waves of the ſea.

UNGUENT, in medicine and ſurgery, a topical remedy or compoſition, chiefly uſed in the dreſſing of wounds or bliſters. See PHARMACY, n° 635.

UNICORN, an animal famous among the ancients, and thought to be the ſame with the rhinoceros. See RHINOCEROS.

Sparmann informs us, that the figure of the unicorn deſcribed by the ancients has been found delineated by the Sneſe Hottentots on the plain ſurface of a rock in Caffraria; and therefore conjectures, that ſuch an animal either does exiſt at preſent in the internal parts of Africa, or at leaſt once did ſo. Father Lobo affirms that he has ſeen it.

UNICORN-Fiſh. See MONODON.

UNIFORM, denotes a thing to be ſimilar, or conſiſtent either with another thing, or with itſelf, in reſpect of figure, ſtructure, proportion, or the like; in which ſenſe it ſtands oppoſed to difform.

UNIFORMITY, regularity, a ſimilitude or reſemblance between the parts of a whole. Such is that we meet with in figures of many ſides, and angles reſpectively equal, and anſwerable to each other. A late ingenious author makes beauty to conſiſt in uniformity, joined or combined with variety. Where the uniformity is equal in two objects, the beauty, he contends, is as the variety; and where the variety is equal, the beauty is as the uniformity.

UNIFORMITY, is particularly uſed for one and the ſame form of public prayers, and adminiſtration of ſacraments, and other rites, &c. of the church of England, preſcribed by the famous ſtat. 1 Eliz. and 13 and 14 Car. II. cap. 4. called the *Act of Uniformity*. See LITURGY.

UNION, a junction,, coalition, or aſſemblage of two or more different things in one.

UNION, or *The Union*, by way of eminence, is more particularly uſed to expreſs the act by which the two ſeparate kingdoms of England and Scotland were incorporated into one, under the title of *The kingdom of Great Britain*. This union, in vain attempted by king James I. was at length effected in the year 1707, 6 Annæ, when 25 articles were agreed to by the parliament of both nations; the purport of the moſt conſiderable being as follows:

1. That on the firſt of May 1707, and for ever after, the kingdoms of England and Scotland ſhall be united into one kingdom, by the name of *Great Britain*.

2. The ſucceſſion to the monarchy of Great Britain ſhall be the ſame as was before ſettled with regard to that of England. Union.

3. The united kingdom ſhall be repreſented by one parliament.

4. There ſhall be a communication of all rights and privileges between the ſubjects of both kingdoms, except where it is otherwiſe agreed.

9. When England raiſes 2,000,000l. by a land tax, Scotland ſhall raiſe 48,000l.

16, 17. The ſtandards of the coin, of weights, and of meaſures, ſhall be reduced to thoſe of England throughout the united kingdoms.

18. The laws relating to trade, cuſtoms, and the exciſe, ſhall be the ſame in Scotland as in England. But all the other laws of Scotland ſhall remain in force; but alterable by the parliament of Great Britain. Yet with this caution, that laws relating to public policy are alterable at the diſcretion of the parliament; laws relating to private right are not to be altered but for the evident utility of the people of Scotland.

22. Sixteen peers are to be choſen to repreſent the peerage of Scotland in parliament, and 45 members to ſit in the houſe of commons.

23. The 16 peers of Scotland ſhall have all privileges of parliament; and all peers of Scotland ſhall be peers of Great Britain, and rank next after thoſe of the ſame degree at the time of the union, and ſhall have all privileges of peers, except ſitting in the houſe of lords, and voting on the trial of a peer.

Theſe are the principal of the 25 articles of union, which are ratified and confirmed by ſtatute 5 Ann. c. 8. in which ſtatute there are alſo two acts of parliament recited; the one of Scotland, whereby the church of Scotland, and alſo the four univerſities of that kingdom, are eſtabliſhed for ever, and all ſucceeding ſovereigns are to take an oath inviolably to maintain the ſame; the other of England, 5 Annæ, c. 6. whereby the acts of uniformity of 13 Eliz. and 13 Car. II. (except as the ſame had been altered by parliament at that time), and all other acts then in force for the preſervation of the church of England, are declared perpetual; and it is ſtipulated, that every ſubſequent king and queen ſhall take an oath inviolably to maintain the ſame within England, Ireland, Wales, and the town of Berwick upon Tweed. And it is enacted, that theſe two acts "ſhall for ever be obſerved as fundamental and eſſential conditions of the union."

Upon theſe articles and act of union, it is to be obſerved, 1. That the two kingdoms are ſo inſeparably united, that nothing can ever diſunite them; except the mutual conſent of both, or the ſucceſsful reſiſtance of either, upon apprehending an infringement of thoſe points which, when they were ſeparate and independent nations, it was mutually ſtipulated ſhould be "fundamental and eſſential conditions of the union." 2. That whatever elſe may be deemed "fundamental and eſſential conditions," the preſervation of the two churches, of England and Scotland, in the ſame ſtate that they were in at the time of the union, and the maintenance of the acts of uniformity which eſtabliſhed the liturgy, are expreſsly declared ſo to be. 3. That therefore any alteration in the conſtitution of either of theſe churches, or in the liturgy of the church of England (unleſs with the conſent of the reſpective churches, collectively or repreſentatively given), would be an infringement of theſe "fundamental and eſſential conditions," and greatly endanger the union. 4. That the municipal laws of Scotland are ordained to be ſtill obſerved in that part of the iſland, unleſs altered by parliament; and as the parliament has not yet thought

Unison || United Brethren.

proper, except in a few inſtances, to alter them, they ſtill, with regard to the particulars unaltered, continue in full force.

UNISON, in muſic. See INTERVAL.

UNIT, or UNITY, in arithmetic, the number one; or one ſingle individual part of diſcrete quantity.

UNITARIANS, in eccleſiaſtical hiſtory, a name given to thoſe who confine the glory and attribute of divinity to the One only great and ſupreme God, and Father of our Lord Jeſus Chriſt

UNITED BRETHREN, or *UNITAS Fratrum*, in eccleſiaſtical hiſtory, a church of which many of our readers will think that an account ſufficiently full has been given under the word HERRNHUT. With that account, however, ſome of the brethren have expreſſed themſelves diſſatisfied, in terms which might, without impropriety, be called ſtrong; and the preſent Editor of this work, being convinced by his own experience how difficult it is to extract pure and unſophiſticated truth from the perplexed writings of angry polemics, reſolved, when he entered upon his laborious taſk, to permit every ſect of Chriſtians to plead its own cauſe, upon the ſingle condition of not loading its opponents with opprobrious epithets. He hopes therefore that the public will forgive him for inſerting the following account of the riſe, progreſs, worſhip, and diſcipline, of the church of the *United Brethren*, extracted from a manuſcript ſent to him by one of their clergy. He has faithfully abridged the narrative of his author; but does not conſider himſelf as under any obligation either to maintain its truth, or to convict it of falſehood.

According to this writer, the church of the United Brethren took its riſe in Moravia during the 14th century; though in the ſentence immediately following this aſſertion, he ſays, that it derived its origin from the Greek church in the 9th century, when, by the inſtrumentality of Methodius and Cyrillus, two Greek monks, the kings of Bulgaria and Moravia being converted to the faith, were, together with their ſubjects, united in communion with the Greek church. Methodius was their firſt biſhop; and for their uſe Cyrillus tranſlated the Scriptures into the Sclavonian language.

The antipathy of the Greek and Roman churches is well known; and by much the greater part of the brethren were in proceſs of time compelled, after many ſtruggles, to ſubmit to the ſee of Rome. A few, however, adhering to the rites of their mother church, united themſelves in 1176 to the Waldenſes, and ſent miſſionaries into many countries. In 1457 they were called *fratres legis Chriſti*, or brethren of the law of Chriſt, becauſe about that period they had thrown off all reverence for human compilations of the faith, profeſſing ſimply to follow the doctrines and precepts contained in the word of God.

There being at this time no biſhops in the Bohemian church who had not ſubmitted to the papal juriſdiction, three prieſts of the ſociety of United Brethren were, about the year 1467, conſecrated by Stephen biſhop of the Waldenſes in Auſtria (ſee WALDENSES); and theſe prelates, on their return to their own country, conſecrated ten co-biſhops, or conſeniors, from among the reſt of the preſbyters. In 1523, the United Brethren commenced a friendly correſpondence, firſt with Luther, and afterwards with Calvin and other leaders among the Reformers. A perſecution, which was brought upon them on this account, and ſome religious diſputes which took place among themſelves, threatened for a while the ſociety with ruin; but the diſputes were in 1570 put an end to by a ſynod, which decreed that differences about non-eſſentials ſhould not deſtroy their union; and the perſecution ceaſed in 1575, when the United Brethren obtained an edict for the public exerciſe of their religion. This toleration was renewed in 1609, and liberty granted them to erect new churches. But a civil war which in 1612 broke out in Bohemia, and a violent perſecution which followed it in 1621, occaſioned the diſperſion of their miniſters, and brought great diſtreſs upon the Brethren in general. Some of them fled to England, others to Saxony and Brandenburg, whilſt many, overcome by the ſeverity of the perſecution, conformed to the rites of the church of Rome. One colony of theſe, who retained in purity their original principles and practice, was, in 1722, conducted by a brother named *Chriſtian David*, from Fulneck in Moravia to Upper Luſatia, where they put themſelves under the protection of NICHOLAS LEWIS COUNT OF ZINZENDORF, and built a village on his eſtate, at the foot of a hill called *Hutberg*, or "Watch Hill" (ſee HERRNHUT). The count, who ſoon after their arrival removed from Dreſden to his eſtate in the country, ſhowed every mark of kindneſs to the poor emigrants; but being a zealous member of the church eſtabliſhed by law, he endeavoured for ſome time to prevail upon them to unite themſelves with it, by adopting the Lutheran faith and diſcipline. This they declined; and the count, on a more minute inquiry into their ancient hiſtory and diſtinguiſhing tenets, not only deſiſted from his firſt purpoſe, but became himſelf a convert to the faith and diſcipline of the United Brethren.

United Brethren.

The ſynod, which in 1570 put an end to the diſputes which then tore the church of the Brethren into factions, had conſidered as non-eſſentials the diſtinguiſhing tenets of their own ſociety, of the Lutherans, and of the Calviniſts. In conſequence of this, many of the Reformers of both theſe ſects had followed the Brethren to Herrnhut, and been received by them into communion; but not being endued with the peaceable ſpirit of the church which they had joined, they ſtarted diſputes among themſelves, which threatened the deſtruction of the whole eſtabliſhment. By the indefatigable exertions of Count Zinzendorf theſe diſputes were allayed; and ſtatutes being in 1727 drawn up and agreed to for the regulation both of the internal and of the external concerns of the congregation, brotherly love and union was again eſtabliſhed; and no ſchiſm whatever, in points of doctrine, has ſince that period diſturbed the church of the United Brethren.

In 1735 the Count, who under God had been the inſtrument of renewing the Brethren's church, was conſecrated one of their biſhops, having the year before been examined and received into the clerical orders by the Theological Faculty of Tubingen. Dr Potter, then archbiſhop of Canterbury, congratulated him upon this event, and promiſed his aſſiſtance to a church of confeſſors, of whom he wrote in terms of the higheſt reſpect for their having maintained the pure and primitive faith and diſcipline in the midſt of the moſt tedious and cruel perſecutions. That his Grace, who had ſtudied the various controverſies about church-government with uncommon ſucceſs, admitted the Moravian epiſcopal ſucceſſion, we know from the moſt unqueſtionable authority; for he communicated his ſentiments on the ſubject to Dr Secker while biſhop of Oxford, and from his Lordſhip they came through a dignitary of the church of England to the compiler of this article. In conformity with theſe ſentiments of the archbiſhop, we are aſſured that the parliament of Great Britain, after mature inveſtigation, acknowledged the *Unitas Fratrum* to be a Proteſtant epiſcopal church; and in 1794 an act was certainly paſſed in their favour.

We have elſewhere (ſee HERRNHUT) mentioned the

ſa-

United Brethren.

favourable report that was made to the court of Dreſden by a deputation which was appointed to examine into the principles and practices of the United Brethren; of which the conſequence was, a toleration through all Saxony, as well as in Upper Luſatia. It is, however, acknowledged by the author of the manuſcript which we are abridging, that ſome of the converts to the faith and diſcipline of the *Unitas Fratrum*, having previouſly imbibed extravagant notions, propagated them with zeal among their new friends in a phraſeology extremely reprehenſible; and that Count Zinzendorf himſelf ſometimes adopted the very improper language of thoſe fanatics, whom he wiſhed to reclaim from their errors to the ſoberneſs of truth; but it is added, that much of the extravagance and abſurdity which has been attributed to the Count, is not to be charged to him, but to thoſe perſons who, writing his *extempore* ſermons in ſhort hand, printed and publiſhed them without his knowledge or conſent. This account of the matter appears indeed extremely probable; and it is but juſtice to the Count to acknowledge, that he ſeems to have been very deſirous to diſclaim the improper expreſſions, and to vindicate his church from countenancing that impurity which, whether juſtly or not, was attributed to himſelf.

This eminent benefactor to the United Brethren died in 1760; and it is with reaſon that they honour his memory, as having been the inſtrument by which God reſtored and built up their church, But they do not regard him as their head, nor take his writings, nor the writings of any other man, as the ſtandard of their doctrines, which they profeſs to derive immediately from the word of God.

It has been already obſerved, that the church of the United Brethren is epiſcopal; but though they conſider epiſcopal ordination as neceſſary to qualify the ſervants of the church for their reſpective functions, they allow to their biſhops no elevation of rank or pre-eminent authority; their church having from its firſt eſtabliſhment been governed by ſynods, conſiſting of deputies from all the congregations; and by other ſubordinate bodies, which they call *conferences*. The ſynods, which are generally held once in ſeven years, are called together by the elders who were in the former ſynod appointed to ſuperintend the whole unity. In the firſt ſitting a preſident is choſen, and theſe elders lay down their office; but they do not withdraw from the aſſembly, for they, together with all biſhops, *ſeniores civiles*, or lay-elders, and thoſe miniſters who have the general care or inſpection of ſeveral congregations in one province, have ſeats in the ſynod without any particular election. The other members are, one or more deputies ſent by each congregation, and ſuch miniſters or miſſionaries as are particularly called to attend. Women approved by the congregations are alſo admitted as hearers; and are called upon to give their advice in what relates to the miniſterial labour among their ſex; but they have no deciſive vote in the ſynod. The votes of all the other members are equal.

In queſtions of importance, or of which the conſequences cannot be foreſeen, neither the majority of votes nor the unanimous conſent of all preſent can decide; but recourſe is had to the *lot*. For adopting this unuſual mode of deciding in eccleſiaſtical affairs, the Brethren allege as reaſons the practices of the ancient Jews and the apoſtles; the inſufficiency of the human underſtanding amidſt the beſt and pureſt intentions to decide for itſelf in what concerns the adminiſtration of Chriſt's kingdom; and their own confident reliance on the comfortable promiſes that the Lord Jeſus will approve himſelf the head and ruler of his church. The *lot* is never made uſe of but after mature deliberation and fervent prayer; nor is any thing ſubmitted to its deciſion, which does not, after being thoroughly weighed, appear to the aſſembly eligible in itſelf.

United Brethren.

In every ſynod the inward and outward ſtate of the unity, and the concerns of the congregations and miſſions, are taken into conſideration. If errors in doctrine or deviations in practice have crept in, the ſynod endeavours not only to remove them, but by ſalutary regulations to prevent them for the future. It conſiders how many biſhops are to be conſecrated to fill up the vacancies occaſioned by death; and every member of the ſynod gives his vote for ſuch of the clergy as he thinks beſt qualified. Thoſe who have the majority of votes are taken into the *lot*, and they who are approved are conſecrated accordingly; but by conſecration they are veſted with no ſuperiority over their Brethren, ſince it behoves him who is the greateſt to be the ſervant of all.

Towards the concluſion of every ſynod, a kind of executive board is choſen, and called *the Elder's Conference of the Unity*. At preſent it conſiſts of 13 elders, and is divided into four committees or departments: 1. The *miſſion's* department, which ſuperintends all the concerns of the miſſions into Heathen countries. 2. The *helper's* department, which watches over the purity of doctrine and the moral conduct of the different congregations. 3. The *ſervant's* department, to which the economical concerns of the Unity are committed. 4. The *overſeer's* department, of which the buſineſs is to ſee that the conſtitution and diſcipline of the Brethren be every where maintained. No reſolution, however, of any of theſe departments has the ſmalleſt force, till it be laid before the aſſembly of the whole *Elder's Conference*, and have the approbation of that body. The powers of the *Elder's Conference* are indeed very extenſive. Beſides the general care which it is commiſſioned by the ſynods to take of all the congregations and miſſions, it appoints and removes every ſervant in the unity, as circumſtances may require; authoriſes the biſhops to ordain preſbyters or deacons, and to conſecrate other biſhops; and, in a word, tho' it cannot abrogate any of the conſtitutions of the ſynod, or enact new ones itſelf, it is poſſeſſed of the ſupreme executive power over the whole body of the United Brethren.

Beſides this general conference of elders, which ſuperintends the affairs of the whole unity, there is another conference of elders belonging to each congregation, which directs its affairs, and to which the biſhops and all other miniſters, as well as the lay-members of the congregation, are ſubject. This body, which is called the *Elder's Conference of the Congregation*, conſiſts, 1. Of the *miniſter* as preſident, to whom the ordinary care of the congregation is committed, except when it is very numerous, and then the general inſpection of it is entruſted to a ſeparate perſon, called the *Congregation Helper*; 2. Of the *warden*, whoſe office it is to ſuperintend with the aid of his council all outward concerns of the congregation and to aſſiſt every individual with his advice; 3. Of a *married pair*, who care particularly for the ſpiritual welfare of the married people; 4. Of a *ſingle clergyman*, to whoſe care the young men are more particularly committed; and, 5. Of *thoſe women*, who aſſiſt in caring for the ſpiritual and temporal welfare of their own ſex, and who in this conference have equal votes with the men. As the *Elder's Conference of each Congregation* is anſwerable for its proceedings to the *Elder's Conference of the Unity*, viſitations from the latter to the former are held from time to time, that the affairs of each congregation, and the conduct of its immediate governors, may be intimately known to the ſupreme executive government of the whole church.

We have already mentioned the epiſcopacy of the Bre-

United Brethren, United Provinces.

thren, and the very limited powers of their biſhops; and have to add, that, in their opinion, epiſcopal conſecration does not confer any power to preſide over one or more congregations; and that a biſhop can diſcharge no office but by the appointment of a ſynod, or of the Elder's conference of the Unity. Preſbyters among them can perform every function of the biſhop except ordination: for if we underſtand the manuſcript before us, he confirms by the laying on of hands young perſons when they firſt become candidates for the communion. Deacons are aſſiſtants to the preſbyters much in the ſame way as in the church of England; and in the Brethren's churches deaconeſſes are retained, for the purpoſe of privately admoniſhing their own ſex, and viſiting them in their ſickneſs: but though they are ſolemnly bleſſed to this office, they are not permitted to teach in public, and far leſs to adminiſter the ſacraments. They have likewiſe *ſeniores civiles*, or lay elders, in contradiſtinction to ſpiritual elders or biſhops, who are appointed to watch over the conſtitution and diſcipline of the Unity of the Brethren; over the obſervance of the laws of the country in which congregations or miſſions are eſtabliſhed; and over the privileges granted to the Brethren by the governments under which they live. They do not conſider a regular courſe of literary education as at all neceſſary to qualify perſons for admiſſion into orders, provided they poſſeſs a thorough knowledge of the word of God, what they call *ſolid Chriſtian experience*, and a well regulated zeal to ſerve God and their neighbours.

We have mentioned elſewhere (HERRNHUT) their daily meetings in church for worſhip and edification. On Sunday, beſides the public prayers, which are either read from a liturgy or pronounced extempore by the miniſter, one or two ſermons are preached in every church or chapel; and after the morning ſervice an exhortation is given to the children. Previous to the holy communion, which is adminiſtered on ſome Sunday once a-month, and likewiſe on *Maunday Thurſday*, each perſon who intends to communicate converſes with one of the elders on the ſtate of his ſoul, expreſſing his deſire to partake of the ſacrament. The celebration of the communion is generally preceded by a *love-feaſt*, which is alſo kept on other ſolemn occaſions. On Maunday Thurſday, before communion, the Brethren have a ſolemn *foot-waſhing*; and at this, and we ſuppoſe at other times, they greet one another with *the kiſs of charity*. Theſe ceremonies they conſider as religious rites, authoriſed thro' all ages of the church by our Saviour himſelf and his two apoſtles St Peter and St Paul*.

* John xiii. 14. 1 Peter v. 14. Rom. xvi. 16.

Our limits will not permit us to give a ſyſtematic view of the doctrinal tenets of the Brethren. Though they acknowledge no other ſtandard of truth than the ſacred Scriptures, they adhere to the Augſburg Confeſſion, and ſpeak reſpectfully of the 39 articles of the church of England. They profeſs to believe that the kingdom of Chriſt is not confined to any particular party, community, or church; and they conſider themſelves, though united in one body or viſible church, as ſpiritually joined in the bond of Chriſtian love to all who are taught of God, and belong to the univerſal church of Chriſt, however much they may differ in forms, which they deem non-eſſentials. But the reader who wiſhes to have a fuller account of this ſociety of Chriſtians, we muſt refer to *Cranz's Ancient and Modern Hiſtory of the Proteſtant Church of the United Brethren*, printed in London, 1780; and to a work entitled *An expoſition of Chriſtian Doctrine as taught in the Proteſtant Church of the United Brethren*, London, 1784.

UNITED PROVINCES, or *UNITED Netherlands*, otherwiſe called the *Republic of Holland*, conſiſt of the ſeven provinces of Holland, Zealand, Frieſland, Groningen, Overyſſel, Zutphen, and Utrecht. They are bounded on the weſt by the German Ocean; on the eaſt by the circle of Weſtphalia; and on the ſouth by Flanders, Brabant, and the duchy of Cleves. They compoſe the greateſt part of the ancient Batavia, whoſe inhabitants were formerly ſo much renowned for their valour. Under the Romans they were exempt from impoſts and taxes, in conſequence of bearing the honourable title of *Allies of the Republic*.

United Provinces.

1 Batavians in high eſteem under the Romans.

The Netherlands came into the poſſeſſion of the houſe of Auſtria by the marriage of Mary of Burgundy with the emperor Maximilian: but on that prince's reſigning the imperial crown, the 17 provinces of the Netherlands devolved of right on Don John of Spain; but he and his ſucceſſor Philip le Beau dying in a ſhort time after, they, in 1505, fell under the dominion of Charles V. at that time a minor.

2 Fall under the dominion of Spain.

At this period the ſeven provinces, which now compoſe the Republic of Holland, enjoyed a kind of independence; but the policy and warlike diſpoſition of Charles ſoon reduced them to obedience. When he reſigned the ſceptre to his ſon Philip, the Low Countries were in a moſt flouriſhing condition. In this ſmall tract of country were reckoned no fewer than 350 large cities incloſed with walls, and 6300 conſiderable towns, all become rich by their application to the arts and to commerce. At the ſame time, the love of liberty was very prevalent among the inhabitants, and they were jealous of every invaſion of their rights and privileges. The arbitrary government of Philip was therefore very diſagreeable to his ſubjects in the Low Countries, and the partiality ſhown on all occaſions to the Spaniards ſoon loſt their affections altogether.

3 Flouriſhing ſtate of the provinces at that time.

The extreme ſuperſtition, however, and cruel bigotry of Philip, proved the greateſt ſource of diſcontent. The doctrines of the reformers had been preached and received with avidity in the Low Countries. A cruel perſecution of the reformed had been commenced by Charles V. inſomuch that he is ſaid to have deſtroyed no fewer than 100,000 perſons on account of religion. This cruelty had no effect except to increaſe the number of heretics; which being obſerved by Mary queen of Hungary, ſiſter to the emperor, ſhe invited him to the Low Countries, that he might perſonally behold the bad effects of his cruelty. On this the emperor granted a toleration, but Philip was altogether inflexible. In order to proceed more effectually againſt the reformed, a court of inquiſition was inſtituted; and under pretence that the three biſhoprics, which at that time comprehended the whole country, were too large, 17 of theſe dignitaries were erected, three with the title of archbiſhops. To afford ſufficient revenues for theſe, it became neceſſary to ſuppreſs ſeveral abbeys, which of itſelf produced great diſcontent. But what gave the finiſhing ſtroke to the whole was, Philip's announcing his intention of reſiding conſtantly in Spain; his appointing the ducheſs of Parma, his natural ſiſter, to be regent of the Netherlands; and giving her for a counſellor cardinal Granvele, a bloody perſecutor of the reformed; at the ſame time that the provinces were oppreſſed by the violences of foreign troops, for the payment of whom they were alſo oppreſſed by taxes. Three councils were eſtabliſhed at Bruſſels; one to preſide over the laws and courts of juſtice; a ſecond to direct every thing reſpecting peace or war; and the third to manage the revenues: but ſtill the ducheſs of Parma was ordered to conſult Granvele in every matter, and make him at all times her chief confidant.

4 Perſecution of the Reformed.

5 Court of inquiſition eſtabliſhed.

6 Ducheſs of Parma appointed governeſs.

The ducheſs took upon her the government of the Low Countries in the year 1560; and was no ſooner arrived at Bruſſels, than complaints poured in from all quarters againſt the inquiſition, cardinal Granvele, and the new biſhoprics.

7 Univerſal diſcontent.

The

United Provinces.

The ducheſs endeavoured to allay the ferment by fair words, but in vain. At the head of the malcontents were the prince of Orange, count Egmont, and count Horn, who ſtrenuouſly inſiſted on calling an aſſembly of the States-general, and laying before them the grievances by which the country was oppreſſed. The event was, that in 1564 the cardinal was obliged to reſign his dignity; which yet did not produce any good effect, as he was ſucceeded by two of his creatures, Barlaimont and Viglius, who trod exactly in his footſteps. They puſhed on the inquiſition to freſh executions; ſtigmatized the principal nobility as heretics; and on all occaſions ſhowed ſuch violent and intolerable zeal for the Catholic religion, that one of Philip's miniſters repreſented to him the danger there was of a total revolt of the provinces, unleſs the rigours of perſecution were ſomewhat relaxed. But Philip no ſooner received this intelligence, than he replied, "that he had rather be without ſubjects, than be a king of heretics." Agreeable to this reply, all the obnoxious decrees were enforced with double rigour; upon which the ſtate of affairs became ſo alarming, that it was thought neceſſary to ſend count Egmont into Spain, in order to have a perſonal interview with the king on the ſubject. Philip, accuſtomed to deceit, gave a ſmooth anſwer, abated the rigour of his decrees, and ordered the governante ſometimes to conſult with the prince of Orange. Thus tranquillity was for a time reſtored; but in the year 1566, it being diſcovered that a ſcheme for the total extirpation of the Proteſtants had been concerted by the queen-mother of France, her ſon Charles IX. and Iſabella queen of Spain, in a conference at Bayonne, matters became worſe than ever. That the information received concerning this deteſtable combination was true, very ſoon appeared, from Philip's diſclaiming all the favourable interpretations which had been put upon his anſwer to count Egmont, and from his ordering the inquiſition to proceed with more fury than ever.—

8 Extreme bigotry of Philip.

9 A general aſſociation againſt the inquiſition.

The conſequence of this was a general aſſociation againſt this abominable tribunal, which was ſubſcribed by all orders and degrees of men, Roman Catholics as well as Proteſtants. The confederates, headed by Henry de Brodenrode, a deſcendant of the ancient earls of Holland, waited on the ducheſs of Parma, in ſuch a formidable body, that ſhe was obliged to diſmiſs them with an abſolute promiſe that their demands ſhould be granted. Theſe demands were, that the inquiſition ſhould be aboliſhed, and the edicts againſt liberty of conſcience recalled; and for this ſhe immediately interpoſed all her intereſt with Philip. Sir William Temple alleges, that Philip, in conſequence of the governante's remonſtrances, granted all that was deſired, but too late. All other hiſtorians, however, agree that he was inflexible, and that the ducheſs could procure no better conditions than that heretics ſhould from that time forward be hanged inſtead of being burned. Even this appeared a conceſſion unworthy of the king; the royal name was therefore forbid to be uſed.

Before the confederates proceeded to extremities, they ſent deputies to Madrid; but, according to ſome authors, they were refuſed admittance into the king's preſence. It appears, however, that they had found means of repreſenting the true ſtate of affairs to the king, and of informing him that the diſturbances proceeded from the deteſtation in which the inquiſition was everywhere held in the Low Countries. Their repreſentations produced no other effect than an equivocal promiſe, which was evidently never intended to be kept. The governante received orders to proceed againſt heretics with the utmoſt ſeverity; upon which the people broke out into acts of open rebellion. In ſeveral towns of Flanders the churches were deſtroyed, images pulled down, and all thoſe acts of violence committed

10 The people break out into acts of rebellion.

which are the uſual operations of a lawleſs mob. The principal inhabitants, however, ſtill remained quiet, and even did all in their power to reſtrain the violence of the commonalty; ſo that, had Philip made any kind of reaſonable conceſſion, the public tranquillity might have been reſtored. Inſtead of this, however, a new oath of allegiance was adminiſtered by the governante, and all perſons were obliged to ſwear that they would regard as traitors and enemies to their country all whom the king ſhould think proper to proſcribe. This extraordinary proceeding was followed by the moſt cruel perſecution that can be imagined; at the ſame time that the duke of Alva was ſent into the Netherlands with an army of 10,000 veteran troops, to put the laſt hand to the miſery of the people, and fully to eſtabliſh the deſpotiſm of the court. Counts Egmont and Horn took the above mentioned oath; but the prince of Orange could by no means be induced to it, and therefore retired into Germany, along with counts Brodenrode and Hoogſtrate. Their example was followed by great numbers of all ranks and conditions; and after the arrival of the army commanded by the duke of Alva, ſuch multitudes continued to emigrate, that the ducheſs of Parma informed the king, that within a few days 100,000 families had left his dominions; that in a ſhort time the country muſt be depopulated, in which caſe there would be no occaſion for a governante; ſhe therefore begged leave to reſign, before ſhe ſhould have the mortification and diſgrace of being left alone in the Netherlands.

United Provinces.

11 New oath of allegiance required.

12 Prince of Orange retires.

13 Ducheſs of Parma reſigns.

14 Is ſucceeded by the duke of Alva.

Philip immediately complied with the requeſt of the princeſs, and the duke of Alva was appointed to ſucceed her in the government. It may eaſily be imagined that the miſeries of the people would now become intolerable. The king was a proud and mercileſs tyrant, ſet at too great a diſtance from his ſubjects to be thoroughly ſenſible of their calamities, and totally deſtitute of compaſſion had he known them ever ſo well. The new governor was of the ſame diſpoſition; and the army he commanded was fierce, rapacious, and cruel, deſiring nothing more ardently than to enrich themſelves at the expence of the inhabitants. The whole country was filled with blood and horror; counts Egmont and Horn were ignominiouſly executed, and the eſtate of the prince of Orange was confiſcated. Theſe laſt proceedings drove the people into deſpair; and they invited the prince to return, in order to take upon him the defence of the country from ſuch inſufferable tyranny and oppreſſion.

15 Prince of Orange invited by the people to return.

All this time the prince of Orange, and his brother Louis of Naſſau, had been labouring to form alliances for the defence of the liberties of their country. He had repreſented matters in ſuch a light to the emperor Maximilian, that his Imperial majeſty ſent an ambaſſador to Philip, exhorting him to treat his ſubjects in the Netherlands with leſs rigour. This embaſſy was haughtily received; Philip continued his perſecutions, and the prince of Orange his preparations for entering the Low Countries. His firſt efforts, however, were very unſucceſsful. A detachment of Germans in the ſervice of the prince attempted to penetrate into Brabant and ſurpriſe Ruremond; but were defeated by a detachment from the duke of Alva's army. Another party, conſiſting chiefly of French, attempted to penetrate into Artois by the way of Picardy; but their officers were arreſted by order of Charles IX. Louis of Naſſau, however, defeated a body of Spaniards, and killed 600 of them on the ſpot; but the vigilance of his enemies prevented him from drawing any advantage of conſequence from this victory.

16 Hoſtilities commence, to the diſadvantage of the prince.

The duke of Alva was ſo much chagrined at the defeat ſuſtained by his party, that he inſtantly aſſembled his troops from all quarters. His army then appeared too formidable to be oppoſed, and the prince of Naſſau with count Hoogſtrate

United Provinces.

ſtrate retired towards the river Ens. But being hard puſhed by the duke of Alva, and mutinies ariſing among their troops for want of pay, they were ſoon brought to an action, and totally defeated. The infantry were entirely cut in pieces; the cavalry were ſaved, but all the baggage and artillery were taken by the enemy. In the mean time, the prince of Orange was haſtening to the relief of his diſtreſſed allies with an army of 28,000 men; but having the misfortune of being alſo defeated, and count Hoogſtrate killed in the action, his ſoldiers deſerted in ſuch crowds, that he was at laſt obliged to diſband his army and return to Germany.

17 Prince of Naſſau and count Hoogſtrate defeated by the duke of Alva.

18 Prince of Orange defeated, and diſbands his army.

This diſaſter happened in the year 1569. The duke of Alva reſolved to make the moſt of his time. He entered Bruſſels in triumph; and let looſe his vengeance againſt all who had in the leaſt aſſiſted, or been ſuppoſed to aſſiſt, the prince of Orange. All the priſoners taken in the laſt campaign were put to death: and, not contented with this barbarity, the cruel governor projected nothing leſs than the total extirpation of the reformed religion, by the deſtruction of every one who profeſſed it; and of rendering himſelf deſpotic, by erecting citadels in all the conſiderable towns, which were to be garriſoned by his ſoldiers. He began with Amſterdam, in which he laid the foundations of a ſtrong citadel. The people complained of it as an infringement of their rights, but the duke was deaf to their complaints. At Antwerp he cauſed his ſtatue to be erected; and here he was figured treading on the necks of two ſmaller ſtatues, which repreſented the two eſtates of the Low Countries. This piece of inſolent vanity exaſperated the people to a great degree; and they were ſtill farther provoked by a demand of the hundredth part of every man's eſtate to be paid immediately for the ſupport of the army, beſides the tenth of all the merchandiſe, and the twentieth of all immoveables, to be annually levied as a ſtanding revenue. The provinces remonſtrated, and refuſed to ſubmit to ſuch intolerable exactions: the governor was inflexible; and being incenſed at their reſiſtance, he ſent the regiment of Lombardy to live at free quarters in the province of Utrecht.

19 Cruelty of the duke of Alva.

20 His intolerant principles and exactions.

All this time the prince of Orange was employed in laying plans for the deliverance of his diſtreſſed country; but in 1571, the duke of Alva growing impatient, ordered the edict concerning the new taxes to be publiſhed at Bruſſels. The city was inſtantly filled with confuſion; the ſoldiers ſeized on the goods of the inhabitants by force; tradeſmen ſhut up their ſhops; and the peaſants refuſed to bring proviſions to the market. The ſtates offered to pay a ſubſidy of 2,000,000 of florins annually in lieu of the intended tax; but their offer was rejected. The drum beat to arms, and orders were iſſued to hang all who refuſed to comply. The ſoldiers were preparing to obey, when news arrived of the ſurrender of Briel in the iſland of Voorn, at the entrance of the Meuſe, to a ſquadron of ſhips of war that had been fitted out by the prince of Orange. Lumey, who commanded the ſquadron, made a deſcent on the iſland from 40 ſhips, deſtroyed the churches, broke the images, and executed the prieſts, but offered no violence to the other inhabitants.

21 Duke of Alva attempts in vain to eſtabliſh his new taxes at Bruſſels.

22 Briel taken by the Orange party.

However unimportant the conqueſt of ſo inconſiderable a place might appear, it alarmed the duke of Alva, and produced the moſt extravagant rejoicings in Bruſſels. The duke regarding it as the harbinger of further oppoſition, dropped his taxes and executions for the preſent, and diligently applied himſelf to ſuppreſs the growing ſpirit of rebellion. He withdrew the garriſon from Bruſſels, and detached it under the command of Maximilian Hermin Boſſu, againſt the ſhips of war which were called *Gueux*. This officer, endeavouring to force Briel, was defeated by the Orange faction, and forced to retire with loſs to the iſland of Beyerland. Trifling as this victory might ſeem, it ſerved to animate the depreſſed ſpirits of the enemies to the government. The prince of Orange, ſenſible of the advantage of poſſeſſing this iſland, exhorted the nobility of his party to fortify and garriſon it; his orders were obeyed, by which means he ſoon became maſter of Delfſhaben, a town ſituated on the oppoſite banks of the Meuſe. It appeared in Boſſu's retreat how unpopular the duke of Alva was in every part of the country. Dordrecht ſhut its gates againſt him; Rotterdam refuſed to admit his troops; but Boſſu obtaining permiſſion that they ſhould paſs through in ſeparate ſmall diviſions, ſeized the gates, and began a general maſſacre of the inhabitants. Four hundred periſhed by the ſword, the town was pillaged, the women were raviſhed, and every poſſible act of barbarity and inhumanity committed. Retribution was ſoon made by the enemy. Alva had detached Oſſorio d'Angulo with a body of forces to ſecure Fluſhing, a conſiderable port in Zealand, and to erect a citadel. The inhabitants denied Oſſorio admittance, ſhut their gates, and ſeized Pacaneo, a famous engineer, who had come to meaſure the ground where the citadel was to be erected. Apprehending that attempts would be made to force them to ſubmiſſion, they petitioned Lumey, admiral of the Gueux, for aſſiſtance; and he furniſhed them with 200 men, under the command of Captain Treſſong. On the arrival of this reinforcement, the Spaniſh engineer was hanged, and an unſucceſsful attempt made to ſurpriſe Middleburg, the capital of the iſland of Walcheren. Not diſpirited by this diſappointment, the Zealanders aſſiduouſly proſecuted their cruizes upon the Spaniards, and obtained as much wealth as purchaſed a large ſtore of arms and ammunition at Antwerp. Joined by great numbers of Engliſh and Scotch adventurers, they ventured to attack the duke of Medina Celi, ſent with a ſtrong ſquadron to ſucceed the duke of Alva in the government of the Netherlands. The duke was completely defeated, a great number of his ſhips were taken, and a booty, amounting to near 1,000,000 livres, was carried off by the Zealanders.

23 Duke of Alva deſiſts from enforcing his taxes.

United Provinces.

24 A party of his forces defeated by the Gueux.

25 The Gueux take Delfshaben.

26 Inhabitants of Rotterdam maſſacred by the Spaniards.

27 Duke de Medina Celi entirely defeated by the Zealanders at ſea.

The duke of Alva now ordered a ſquadron of ſhips to be equipped at Amſterdam, to bridle the inſolence of Lumey and the Zealanders, while he buſied himſelf in raiſing an army to oppoſe the prince of Orange and Lewis de Naſſau, who were making great preparations in Germany and France. To augment the army in the field, he had draughted moſt of the garriſons. By this means the prince's friends gained poſſeſſion of North Holland; and Louis de Naſſau was projecting a ſcheme to ſurpriſe Mons, with the inhabitants of which he held a ſecret correſpondence. The deſign ſucceeded; which emboldened moſt of the cities and towns in Holland to declare againſt the government. The count de Bergues gained over ſeveral cities in Overyſſel, Guelderland, and Frieſland. In a word, the revolt became ſo general, that the duke of Alva ſoon found he could not long reſiſt the torrent. He now, when too late, publiſhed an edict to appeaſe the people, ſetting forth, that he would conſent to remit the moſt oppreſſive taxes, if the ſtates could ſuggeſt any other means of raiſing the neceſſary ſupplies. He convoked the States-general to meet at the Hague, but his orders were now diſregarded; and the States, in contempt of his authority, aſſembled at Dordrecht, inviting deputies from the prince of Orange, the nobility, and the towns that had declared againſt the governor. Here money was raiſed to enable the prince of Orange to begin his march. His forces amounted to 15,000 foot and 7000 horſe. He had promiſed to advance three months pay; and was enabled to perform his engagements by the liberality and public ſpirit of the States-general and the cities.

28 Moſt of the towns in Holland declare againſt the Spaniards.

29 Proceedings of the States-general in favour of the prince of Orange.

He

United Provinces.

He ſhowed the addreſs with which he could manage and direct the people; and without the name of ſovereign of the provinces under his government, he poſſeſſed the authority. He preſided at all military operations by ſea and land; made and diſpoſed of offices at pleaſure; aſſembled the States; and publiſhed all ordonnances and regulations relative to the preſent ſtate of affairs, without controul. However, he conducted matters with the utmoſt delicacy, and uſed his power with great moderation, to avoid giving offence to the free ſpirit of the Hollanders. The Popiſh religion was baniſhed the churches, and perſons of that perſuaſion were, with great caution, admitted into public employments. Not only the king's revenue and church tythes were appropriated to the public ſervice, but the eſtates of thoſe who remained firm in their loyalty. In ſhort, the moſt vigorous meaſures were taken for reſiſting the tyranny of Spain; and thoſe perſons who had refuſed the tythes to the government, voluntarily ſubſcribed their all to ſupport a party formed in defence of liberty.

30 His ſucceſſes.

While the States-general were employed in ways and means to maintain an army, the prince of Orange advanced to Ruremonde, which he took by aſſault, on the refuſal of the city to ſupply him with neceſſaries. From thence he marched to Brabant, and raiſed heavy contributions. He took Mechlin, Oudenarde, and Dendermonde; and could not reſtrain the exceſſes of the ſoldiers, who pillaged the churches, maſſacred the prieſts, and committed other barbarities. Next he approached to Mons, beſieged by the duke of Alva, with deſign, if poſſible, to engage him to give battle. The duke baffled all his endeavours to force him, and carried Mons by capitulation. The whole Spaniſh dominion, however, lately ſo inſolent and exulting, was ready to expire in the Netherlands, had it not been revived by the maſſacre of the Proteſtants in Paris.

While the fate of Mons was depending, the ſtates of Holland met at Haarlem, to deliberate on the defence of the province and the proſecution of the war. Amſterdam was in the enemy's hands, which greatly obſtructed all their meaſures. It was therefore determined to beſiege it; and the enterpriſe was committed to Lumey, chief of the Gueux. After putting the States to conſiderable expence, the project miſcarried through Lumey's miſconduct. Water was his element, but his vanity led him to diſplay his abilities as a land-officer. He made regular approaches, and was foiled in every attempt.

31 Is obliged to retire.

The reduction of Mons, and the depreſſion of ſpirit conſequent on the maſſacre at Paris, obliged the prince of Orange to retire to Holland, and encouraged Alva to inveſt Dendermonde, Oudenarde, and Mechlin. The latter, being in no condition to reſiſt, opened its gates; but the Spaniſh ſoldiers choſe to ſcale the walls, to give an air of aſſault to the enterpriſe, and countenance to the horrid barbarities intended. Proteſtants and Catholics were maſſacred without diſtinction. The town was pillaged, and the booty eſtimated at 400,000 florins. All the other towns were evacuated by the garriſons, and loaded with heavy impoſitions by Alva. As to the prince, he had now removed the ſeat of war into the province of Holland. Only this province and Zealand remained firm to their engagements; the reſt, overwhelmed with conſternation, capitulated on the beſt terms they could procure from the government. However, the country being ſtrong by its nature and ſituation among the waters, and more ſo by a fierce, rough, and ſturdy people, proud of their ancient fame, and the moſt implacable enemies of Spaniſh tyranny, it was determined to make the moſt vigorous reſiſtance. Frederic de Toledo was diſpatched by Alva to begin the operations in Holland. He had already reduced Zutphen and Guelderland; and, flushed with ſucceſs, appeared before Waerden, which he ſummoned to admit a garriſon. The burghers replied, that they were intruſted by the king with the defence of the place, and could not receive a military force without violence to their privileges and engagements. They ſoon had reaſon to repent their firmneſs: the town was taken by ſurpriſe; and all the burghers, aſſembled in the great church to take the oaths of fidelity to the king, were wantonly butchered. Infants, old men, women, and the ſick, were all put to the ſword, without pity or remorſe; and of all the barbarities hitherto committed, this was the moſt horrible. It was imagined that the terror inſpired by ſuch inſtances of ſeverity, would reduce the people to obedience, and ſhake the obſtinacy of the other towns. The contrary effects were produced; rage and deſpair took poſſeſſion of every breaſt; and all determined to ſuffer the laſt extremities rather than ſubmit to ſo cruel a tyranny.

32 Succeſs and cruelty of the duke of Alva.

United Provinces.

Having finiſhed this tragedy, Frederic went to Amſterdam, to deliberate with the officers of the army about the ſiege of Haarlem. Here it was determined, before they proceeded to extremities, that the city of Amſterdam ſhould write to the magiſtrates, exhorting them, in the moſt pathetic terms, to ſubmit, rather than incur the puniſhment inflicted on Waerden. The council of Haarlem met to take this letter into conſideration. Some were for ſoliciting an immediate reinforcement from the prince of Orange; and others, who apprehended the prince was too weak to afford the neceſſary relief, were for making the beſt terms poſſible with the king. Thoſe of the latter opinion were the magiſtrates. Accordingly, without conſulting the burghers, deputies were diſpatched to Frederic to ſtipulate conditions. In their abſence, Ripperda, a gentleman of Friſeland, ſtrongly attached to the prince of Orange and the cauſe of liberty, aſſembled the chief burghers; and ſo animated them againſt the Spaniards, that they reſolved to ſtand a ſiege, and ſuffer all the horrors of war, rather than ſubmit. They ſent to the prince of Orange to acquaint him with their determination, and to implore aſſiſtance. Four companies of Germans were detached to reinforce the garriſon of Haarlem; and the deputies, on their return, were ſeized as traitors to their country, ſent to the prince of Orange, and by his order beheaded. Frederic was preparing to compel the burghers to ſubmiſſion. On the 19th of December he inveſted the town, after carrying Sparendem fort by aſſault, with great loſs and ſlaughter of his ſoldiers. A variety of errors were committed in the attack, in the defence, and manner of ſuccouring Haarlem. The aſſailants and defendants had equally ſhown themſelves ignorant of the art of war, and implacable in their reſentment. The prince of Orange uſed every expedient to relieve the town; but all his attempts were fruſtrated by untoward accidents, and the vigilance of the Spaniards. At laſt, quite ſpent with fatigue, deſpairing of relief, weakened by loſſes, and totally exhauſted of proviſions and ammunition, the burghers of Haarlem ſurrendered upon more favourable terms than they could well expect. A few only of the moſt obſtinate were executed; the reſt were pardoned on taking an oath of fidelity, and paying an acknowledgment of 15,000 florins.

33 Haarlem beſieged.

34 And taken.

During the ſiege of Haarlem, the Zealanders were performing glorious atchievements by ſea, and gaining victories over the Spaniſh naval armaments. All the efforts of the governor of Antwerp could not prevent their carrying off a great number of ſhips out of the harbour. To revenge the inſult, and relieve Middleburg and Rammekins blocked up by the Zealanders, he equipped a ſquadron, and gave battle to Wertz, the Zealand admiral, but was defeated. After repairing and augmenting his fleet, he again ſet ſail with ſixty large veſſels, encountered a ſquadron of Zealanders much

35 Succeſſes of the Zealanders by ſea.

United Provinces.

much inferior in ſtrength, and met with his former fortune. Moſt of his ſhips were ſunk or taken; but he found means to puſh into Middleburg, with the broken remains of his ſquadron, to the great joy of the garriſon, now reduced by the ſcarcity of proviſions to the laſt extremity. D'Avila's diſgrace did not end here; for, on his return to Antwerp, he was a third time attacked and defeated, with conſiderable loſs, by Wertz, who thus repaired the diſappointment of an unſucceſsful attempt made on Tolen.

Soon after the reduction of Haarlem, Alva, perceiving that his ſeverity anſwered no other purpoſe than irritating the people more againſt the Spaniſh government, publiſhed a proclamation, couched in the moſt ſoothing terms: but the people were not diſpoſed to confide in promiſes ſo often violated, nor to throw themſelves on the clemency of a prince and governor who had ſhown themſelves inflexible, implacable, perfidious, and inhuman. They now expected the worſt that could happen, and bid defiance to fortune. The Spaniards were preparing to inveſt Alcmar, and the Hollanders put every means in practice to reſiſt them. Eight months pay was due to the garriſon, who began to mutiny; but contributions were raiſed, which ſilenced their clamours. Frederic of Toledo, with 16,000 men, ſat down before a town fortified by no regular works, and defended only by 300 burghers, and 800 ſoldiers, in extreme want of proviſions, and without the proſpect of relief. Sonoi, the governor, deſpairing of being able to ſuſtain a ſiege, wrote to the prince of Orange, that a place deſtitute of troops, proviſions, ammunition, money, and every neceſſary, ought to be evacuated, and the few ſoldiers in garriſon, and the burghers, ſaved from falling into the hands of the enemy. But the prince of Orange ſo animated them by a letter, that, to a man, the townſmen, governor, and ſoldiers, determined to ſacrifice their lives, and ſpill the laſt drop of their blood in the breach. Perſeverance had made the Zealanders maſters of Rammekins, contrary to all hope and probability; the ſame virtue, the prince obſerved, might ſave Alcmar, a town of the utmoſt conſequence to the cauſe of liberty. What particularly inſpired the defendants with courage, was the prince's good fortune in ſurpriſing Gertrudenburg. Frederic puſhed the ſiege with great vigour. He ordered the inhabitants of Haarlem to work in the trenches, and ſuſtain the firſt fire of their friends and countrymen. On the 18th of September, a battery of 20 pieces of heavy cannon began to play; a breach was ſoon effected; the aſſault was given, and repulſed with vigour, though ſuſtained by the bulk of the Spaniſh army. From a Spaniſh officer taken, the garriſon were informed, that Alva had given orders to retire, in caſe he failed in the third aſſault; but if he ſucceeded, to put all to the ſword. Their courage was whetted by this account, and preparations were cheerfully made for withſtanding the utmoſt efforts. Frederic was foiled in every attempt; the aſſailants were driven from the breach with prodigious ſlaughter; the Spaniſh ſoldiers refuſed to mount the walls; in a word, the ſiege was raiſed, and the town relieved, to the exceeding joy of the prince of Orange, and great mortification of Alva.

36 The Spaniards repulſed before Alcmar.

This advantage was attended with another of leſs importance, but which equally ſerved to inſpirit the Hollanders. The duke of Alva's grand fleet, equipped with great labour and expence, was defeated by the Zealanders. Though the action did not prove deciſive, it greatly chagrined the duke, as Boſſu, one of his beſt officers, was taken priſoner, and his fleet afterwards dreaded to look the enemy in the face.

37 They are defeated at ſea.

Notwithſtanding this ſucceſs, the affairs of the States were yet in a moſt precarious ſituation; and their ability to ſupport themſelves appeared in the higheſt degree problematical. The Duke of Alva had reſigned the government, and his ſucceſſor Don Louis de Requeſnes had orders to puſh the war with vigour, while his antagoniſts prepared for the moſt obſtinate reſiſtance. The firſt advantage appeared on the ſide of the prince of Orange, by the ſurrender of Middleburg. But this was ſoon balanced by the defeat and death of prince Louis of Naſſau. The Spaniards, however, were prevented from purſuing the advantage they had gained, by a mutiny among their troops. This mutiny took place on a regular and well concerted plan. The ſoldiers depoſed all their officers, appointed new ones, and eſtabliſhed a ſort of community, veſting one of their number with the chief authority. The diſtreſſes of the Spaniards on account of this tumult were likewiſe augmented by a victory gained by the Zealanders at ſea; when almoſt 40 of the Spaniſh ſhips were taken or deſtroyed. Philip then perceiving that numberleſs difficulties would attend the reduction of the provinces by force, publiſhed an act of grace; but in ſuch a limited manner, that it was unanimouſly rejected. Requeſnes then determining to cloſe the campaign with ſome remarkable exploit, laid ſiege to Leyden. The city was reduced to the utmoſt diſtreſs for want of proviſions; the whole country was laid under water; and they could receive no relief except what was obtained by boats forcing themſelves through the enemy to the city. In ſhort, they were reduced to the brink of deſtruction, when a violent ſouth-weſt wind drove the inundation againſt the works of the beſiegers with ſuch violence, that they were obliged to relinquiſh the enterprize for fear of being entirely ſwallowed up. In their retreat they were attacked by the garriſon, and 500 of them deſtroyed. This diſappointment ſo provoked the Spaniſh ſoldiery, that they depoſed Valdes the commander, whom they had choſen for themſelves, and proclaimed their old one: a ſecond mutiny enſued, and they marched in a tumultuous manner to Utrecht. Here, however, they met with a very unfavourable reception. Barlaimont the governor declared them rebels and traitors to their king; and gave free liberty to every one to maſſacre them wherever they could be found. The mutineers attempted to ſet fire to the gates; but being repulſed, and their leader ſlain, they capitulated, were received into favour, and ſent into winter-quarters.

United Provinces.

38 Mutiny in the Spaniſh army.

The year 1575 commenced with ſome negociations for peace; but theſe proving ineffectual, though the emperor interpoſed his mediation as far as poſſible, the war was renewed with redoubled fury. Fortune now declared in favour of the Spaniards; and the States were reduced to ſuch deſpair, that they began ſeriouſly to think of making an offer of the provinces to ſome Proteſtant power who might be able to defend them againſt the tyranny of the Spaniards. This offer was made to queen Elizabeth of England; but ſhe declined it, for political reaſons. A negociation was even ſet on foot for this purpoſe with France, in favour of the duke of Anjou; but it ended in nothing beſides the advantage of eſtabliſhing a mart at Calais for the diſpoſal of the prizes made by the Gueux. Philip, however, notwithſtanding his power, had the utmoſt difficulty in ſupporting the expence of the war. He had already borrowed more than 40,000,000 crowns from the Spaniſh and Genoeſe merchants, and the intereſt ſtill unpaid now amounted to as much as the capital. The war had beſides coſt a greater ſum ſent in ſpecie from Spain and the Indies, which, with the immenſe loſſes occaſioned by the ſtagnation of trade in the Netherlands, had quite exhauſted the treaſury. Large arrears were due to the troops; they were every day mutinying, and ſome broke out into actual rebellion. To remedy theſe evils, Requeſnes demanded a ſupply of the provinces; and they anſwered him, by requiring reſtitution

39 The States offer the ſovereignty to queen Elizabeth, &c.

40 Philip diſtreſſed in his finances.

of

United Provinces.

of their privileges, and diſmiſſion of the Spaniſh troops. Flanders, in particular, paid the deſired ſubſidy, by balancing it againſt half the damages the province ſuſtained from the miſconduct of the governors, and the wars wantonly and unneceſſarily excited. While this affair was in agitation, Requeſnes died of an ardent fever: the council of ſtate aſſumed the adminiſtration, and the prince of Orange took the opportunity of the confuſion that enſued to lay the firſt foundation of the Pacification of Ghent, by which his affairs were conſiderably retrieved, and the greateſt blow given to the court of Spain ſhe had yet ſuſtained. All now was anarchy in the Low Countries. The garriſon of Ziriczee mutinied for want of pay; and to appeaſe them, the council of ſtate ſent 100,000 livres, which the Walloon regiments under Madragon ſeized upon, after expelling the Spaniſh ſoldiers, and wounding and murdering their officers. This did not unite the Spaniſh mutineers among themſelves; they turned out the few remaining officers, and made new appointments. Joining with the garriſon of Lillo, they marched, to the number of 2000 men, towards the capital; committed horrible outrages; overwhelmed the inhabitants of Bruſſels with conſternation; and, upon the 26th of July, ſeized upon Aloſt, confined the principal burghers, and hanged up a king's officer. The moſt favourable conditions were offered by the council of ſtate, in order to appeaſe the tumult, and proviſions were ſent to the mutineers. This created ſuſpicion in the inhabitants of Bruſſels, that the mutiny was excited by the connivance of the council, with a view of ruining the provinces, without incurring the reſentment and odium conſequent on any appearance of legal oppreſſion. They arreſted the council, declared the Spaniards rebels, and took meaſures in concert with the other cities and provinces for expelling foreigners out of the Netherlands. A confederacy to this purpoſe was formed between the provinces of Hainault, Artois, and Flanders, to which all the reſt except Luxemburgh acceded; and Don John of Auſtria, who had entered the Low Countries in quality of governor and ſucceſſor to Requeſnes, was obliged to live in obſcurity in Luxemburgh until the ſtorm ſhould ſubſide.

41 Confuſion in the Spaniſh affairs.

The prince of Orange was all this while profiting by theſe commotions. He had long laboured to have the States-general convoked; and he now ſaw them not only aſſembled, but preparing to make head againſt the Spaniards, by a ſtrange viciſſitude of fortune, ariſing from accidents which all his penetration and ſagacity could not foreſee. United in councils againſt the common enemy, every meaſure was taken for reducing the citadels of Ghent, Antwerp, and Maeſtricht, the chief places in the hands of the Spaniards, and what muſt principally contribute to their expulſion. Ghent citadel was taken on the 27th of November, by the aſſiſtance of a ſtrong reinforcement of troops and artillery ſent by the prince of Orange. At Antwerp, the ſtates of Brabant were leſs ſucceſsful. The citadel was vigorouſly attacked; but the mutineers at Aloſt entering the citadel to aſſiſt their countrymen, a ſally was made, the beſiegers were driven from their trenches, great part of the town was conſumed by fire, and the reſt pillaged for three days with every kind of inſolence and brutality, at a time when Antwerp was the moſt flouriſhing and populous city in the Netherlands, and indeed among the moſt wealthy in Europe. It is affirmed that the treaſure carried off amounted to four millions, beſides an infinity of rich merchandiſe. This terrible calamity united Papiſts and Proteſtants without diſtinction in a confederacy, and co-operated with the meaſures of the prince of Orange to form the Pacification of Ghent: which was a confederacy of all the provinces to expel foreign ſoldiers; to reſtore the ancient form of government; to refer matters of religion to the ſeveral

42 Antwerp taken and pillaged.

ſtates of the provinces; for ever to unite the other 15 provinces in the ſame common intereſt with Holland, Zealand, and the prince of Orange; to renew the commerce and amity between them; to aſſemble the ſtates in the manner practiſed under the houſe of Burgundy and Charles V.; to ſuſpend all the rigorous edicts of the duke of Alva on the ſubject of religion, until the States-general ſhould take the matter into conſideration; to releaſe all the natives made priſoners, mutually, without ranſom; and to reſtore all things upon the ſame footing as before the war, and the tyrannical government of the duke of Alva.

United Provinces.

43 Pacification of Ghent.

The States general began by ſoliciting aid from the queen of England. Their ambaſſador had a gracious reception; and Elizabeth advanced them 20,000l. ſterling, on condition that the French ſhould not be invited into the Netherlands, that they would accept of reaſonable terms of accommodation if offered, and that the loan ſhould be repaid the enſuing year. Next a ceſſation of hoſtilities was agreed upon with Don John, upon his aſſurances that every reaſonable requeſt of the provinces ſhould be granted. On the 27th of December, deputies were ſent with propoſals to Don John to diſband the foreign troops: but he deſired to know what ſecurity the States would give for their allegiance after the departure of the Spaniſh forces; and remonſtrated againſt the unreaſonableneſs of diſarming the king, while his rebellious ſubjects were in arms, and ready to ſeize the firſt opportunity of deſerting their obedience. He likewiſe demanded ſecurity with reſpect to religion; and inſiſted ſo warmly on this head, that it was obvious he had no inclination to part with the Spaniſh army before the provinces of Zealand and Holland embraced the Catholic religion. After much altercation, neceſſity at length obliged Don John to grant all that was required, to confirm the Pacification of Ghent, and diſmiſs the Spaniſh army. He had the king's authority for his proceedings; the treaty was proclaimed at Bruſſels and Antwerp on the 17th of February; and Don John immediately acknowledged governor, and the king's lieutenant of the Netherlands.

44 The States receive aſſiſtance from queen Elizabeth.

45 Don John accedes to the Pacification of Ghent.

It muſt be obſerved, however, that when this edict was ſigned, the provinces of Holland and Zealand, by the advice of the prince of Orange, made the following objections, *viz.* that the States-general had not eſtabliſhed the right of aſſembling this ſovereign tribunal in the perſons originally inveſted with that power by the conſtitution; that in ſome particular inſtances they had ſuffered an infraction of their privileges; that the Spaniſh troops were allowed to carry off the immenſe wealth they had acquired in the Netherlands, and by the deſtruction of the city of Antwerp in particular; that no ſtipulation was made in favour of thoſe diſpoſſeſſed of their eſtates, &c. For theſe reaſons the States and the prince refuſed to ſign the edict, though they conſented to all the articles that did not contradict thoſe ſpecified. This raiſed a contention, by which the public peace was ſoon broken. Don John was ſtrenuous in recommending violent meaſures againſt the prince and his party. To this purpoſe he wrote a letter in cypher to the king; but this letter fell into the hands of Henry IV. of France, who tranſmitted it to the prince of Orange. Eſcovedo, ſecretary to Don John, was next ſent into Spain with a meſſage to the ſame purpoſe; but the governor becoming impatient for his return, left the country himſelf, under pretence of complimenting Margaret queen of Navarre on her journey to Spaw. In this expedition he ſeized on the citadel of Namur: but attempted to juſtify his conduct to the States, by repreſenting, that he was under a neceſſity of retiring to a place of ſafety, while he ſaw the flames of war and rebellion ready to break out all around him; and concluded with deſiring the States to diſarm the burghers of Bruſſels, who were cloſely attached to the

46 Objections made to the pacification by the provinces of Holland and Zealand.

47 Hoſtilities recommenced.

United Provinces

prince of Orange. This letter was anſwered by an invitation from the States to return; promiſing at the ſame time, that they would, to the utmoſt of their power, bring to puniſhment, all thoſe who ſhould form any deſigns againſt him. This, however, was not only refuſed, but the whole tenor of his conduct afterwards ſhowed, that he was reſolved to commence hoſtilities, and that he was encouraged to do ſo by Philip. The event was, that Don John was depoſed from his dignity, the archduke Matthias was appointed governor-general, and preparations were made for a new and vigorous war. The Spaniſh troops were ordered to aſſemble in Naples and Milan; levies were made in Burgundy and Luxemburgh; and a reſolution was taken of ſupporting Don John with the whole power of the Spaniſh monarchy. To oppoſe this formidable power, the States, in 1578, entered into a new treaty with the queen of England; by which that princeſs agreed to advance them 100,000l. ſterling, and to aſſiſt the provinces with 5000 foot and 1000 horſe: on condition that the loan ſhould be repaid with intereſt in eight months: that certain towns ſhould be ceded to her in ſecurity: and that the States ſhould defray the expence of tranſporting their troops, and take them into pay while they acted in their ſervice. Elizabeth, however, afterwards departed from theſe conditions, under pretence that the French would ſuſpect her having ſome deſigns on the Netherlands, and would for that reaſon unite their forces with thoſe of Spain againſt her. Inſtead of the Engliſh troops, ſhe now propoſed to ſend John Caſimer, Count Palatine, with 3000 foot and 3000 horſe; refuſing at the ſame time to pay the money ſtipulated, until the States had conſented to this alteration.

48 Don John depoſed.

49 New treaty with queen Elizabeth.

Before this treaty was concluded, Don John was joined by an army of 16,000 foot and 2000 horſe, all choſen veterans, commanded by Alexander Farneſe, duke of Parma, the beſt officer in the Spaniſh ſervice. Being thus ſuperior to the prince of Orange, the Spaniards gained ſeveral advantages; which, however, were more than balanced by the loſs of the city of Amſterdam. This place had been cloſely blocked up for ſeveral months by ſea and land, and at laſt concluded a treaty with the friends of the prince of Orange; by which it was ſtipulated, that the Proteſtants ſhould hold their religious meetings without the walls, and have a burying-place within; that the garriſon ſhould be diſbanded, and 600 men, commanded by the burghers, levied for the defence of the city: that all perſons baniſhed on account of religion ſhould be recalled; that Amſterdam ſhould enjoy all its ancient privileges, and that all vacancies in public employments ſhould be filled without diſtinction of party or connection. This capitulation, however, was ſoon after broken; the Catholic magiſtrates were driven out of the city, attended by the prieſts and Popiſh clergy of every denomination; the images were pulled down, and only the reformed clergy ſuffered to preach publicly. Some ineffectual negociations next took place; after which the States, ſenſible that the misfortunes and loſſes in the winter aroſe from the irreſolution of the provincial ſtates, veſted the archduke, the council of ſtate, and the prince of Orange, with a power of levying what number of troops they ſhould think neceſſary, and diſpoſing of them as they thought proper, without referring to the ſtates in every particular: they only recommended that they would proportion the expences to the revenue, which at that time amounted to 600,000 livres. About this time a revolution greatly beneficial to the common cauſe, was effected in Guelderland; John of Naſſau, brother to the prince of Orange, had been appointed governor of this province. Upon entering on the adminiſtration, he perceived that the whole conduct of affairs was in the hands of perſons ſtrongly affected to king Philip and the Catholic religion; moſt of the cities profeſſed Popery; and the count, who had ſworn to the pacification of Ghent, was reſtrained from attempting any change in religion. The face of affairs, however, took a ſudden turn; John acquired great popularity, and ſoon diſcovered that foreigners were the leading perſons. By his artifice and policy he ſtimulated the people againſt them; they were deprived of their ſeats in the provincial ſtates, and turned out of their offices in the government of the cities. Thus Naſſau obtained the chief direction, and was able to co-operate with the meaſures planned by his brother. Another revolution happened in Groningen, of which the ſieur de Billy was governor. Billy was by birth a Portugueſe, by religion a Catholic, and conſequently a dependent on the court of Spain: he refuſed to accede to the union of the provinces, and the States-general found it neceſſary to ſend to him Francis Martin Stella, with propoſals for ſigning the pacification of Ghent. Billy, ſuſpecting that the deputy's real deſign was to excite a revolt in the province, put him to the torture to extort confeſſion; after having firſt wounded him with his own hand. The deputy bore the moſt excruciating tortures with firmneſs; and having a ſurgeon to dreſs his wound to enable him to undergo a ſecond trial, he communicated ſomething in the Greek language, which the ſurgeon ſoon made public: in conſequence, the mob aſſembled, reſcued Stella, declared for the pacification of Ghent, and obliged Billy to quit his government. The change of councils in theſe two provinces was of the utmoſt ſervice to the confederacy; and would have enabled the province to have encountered the whole power of Spain, had not their affairs been diſtracted by diſſenſions among themſelves.

30 Amſterdam concludes a treaty with the prince of Orange.

51 Revolution in Guelderland.

52 And in Groningen.

At laſt the prince of Orange, perceiving that little confidence was to be placed in the unanimity of provinces rent by faction, different in religion, and divided by ambition, political maxims, and private intereſt, formed the ſcheme of more cloſely uniting the provinces of which he was governor, and cementing them with thoſe more contiguous, in which the Proteſtant intereſt prevailed. Such an alliance was ſubject to fewer difficulties than attended the more general one of uniting all the provinces; it was in fact the only meaſure that could be propoſed with ſafety, and it was proſecuted with that alacrity and addreſs for which William was deſervedly celebrated.

53 Union of Utretcht.

On the 23d of January 1579, deputies from the provinces of Holland, Zealand, Utrecht, Frieſland, Groningen, Overyſſel, and Guelderland, met at Utrecht, and ſigned the alliance, ever ſince know by the name of the *Union of Utrecht*, the baſis of that commonwealth ſo renowned by the appellation of the *United Provinces*. This treaty of alliance was founded upon the infraction of the pacification of Ghent ſolemnly acceded to by Philip, and the late invaſion of certain towns in Guelderland. It was not hereby intended to divide the ſeven provinces from the other ten, or to renounce the pacification of Ghent; its object was to preſerve the liberty ſtipulated in that pacification, by more vigorous operations, and united councils. The chief articles of this union are the following.

The ſeven provinces ſhall unite themſelves in intereſt as one province, never to be ſeparated or divided by teſtament, donation, exchange, ſale, or agreement; reſerving to each particular province and city all its privileges, rights, cuſtoms, and ſtatutes. In all diſputes ariſing between either of the provinces, the reſt ſhall interpoſe only as mediators. They ſhall aſſiſt each other with life and fortune againſt every foreign attempt upon any particular province, whether to eſtabliſh ſovereignty, the Catholic religion, arbitrary meaſures, or whatever elſe may appear inconſiſtent with the liberties of the provinces and the intention of the alliance. All frontier towns belonging to the United Provinces ſhall,

United Provinces.

if old, be fortified at the expence of the provinces; if new, at the joint expence of the union. The public impoſts and duties ſhall be farmed for three months to the higheſt bidder, and employed with the king's taxes in the public ſervice. No province, city, or member of the union, ſhall contract an alliance with any foreign prince or power, without the concurrence of all the other members. Foreign powers ſhall be admitted into the alliance, only by conſent of all the contracting parties. As to religion, the provinces of Holland and Zealand ſhall act in that particular as they think adviſable: the reſt ſhall adhere to the purport of the edict publiſhed by the archduke Matthias, which preſcribed that no man ſhould be oppreſſed on the account of conſcience. All the inhabitants from the age of 18 to 60, ſhall be trained and diſciplined to war. Peace and war ſhall be declared by the unanimous voice of all the provinces, other matters that concern the internal policy ſhall be regulated by a majority. The ſtates ſhall be held in the uſual conſtitutional manner, and coinage ſhall be deferred to future determination. Finally, the parties agree, that the interpretation of theſe articles ſhall remain in the States-general; but in caſe of their failing to decide, in the ſtadtholder.

This alliance was ſo univerſally approved, that in a ſhort time the cities of Ghent, Nimeguen, Arnheim, Leewarden, Venlo, Ypres, Antwerp, Breda, Bruges, with ſeveral other towns, beſides a great number of noblemen and perſons of diſtinction, embraced and ſigned the union. Thus the foundation of a commonwealth was laid, but in a fluctuating and uncertain ſtate of affairs, when men were actuated by different paſſions, views, and intereſts; intimidated by the great ſtrength of the Spaniſh monarchy, and ſupported chiefly by a zealous adherence to liberty, and firm reſolution to periſh in defence of freedom. The firſt coin ſtruck after this alliance is expreſſive of the ſituation of the infant republic. Here was repreſented a ſhip labouring amidſt the waves, unaſſiſted by ſails or oars, with this motto, *Incertum quo fata ferant.*

54 Firſt coin ſtruck by the republic of Holland.

It was expected, that the important object of this alliance would have attracted the attention of the Walloons, and indeed of all the Catholic inhabitants of the Netherlands: it in fact did ſo, but in a different manner from what was imagined. The Walloons not only refuſed to accede to the union, but they made the ſtrongeſt remonſtrances to the States-general upon the danger, impropriety, and illegality of ſuch a confederacy. It appears from Strada and Bentivoglio, that the duke of Parma was at the bottom of their intrigues. He ſtimulated and prompted their meaſures, inſpiring them with a jealouſy of the Proteſtant deſigns on the Catholic religion. In the end, he contracted an alliance with them; and thereby confirmed by his own example the legality and neceſſity of the union of Utrecht. Immediately they began levying an army; but ſtill kept up appearances with the confederated provinces, though it was obvious that hoſtilities muſt ſoon commence. To prevent the effuſion of blood, the emperor, as mediator, ſet on foot another negociation; but Philip would allow no reaſonable terms of accommodation, and give no ſecurity for liberty of religion. Inſtead of granting equitable conditions, he laboured to detach the prince of Orange from the union; made him extraordinary propoſals; offered to reſtore him to all his eſtates, indemnify his loſſes, raiſe him to the height of power, and give him the firſt place in his eſteem and favour. But William was too wiſe to rely on the promiſes of a king who had ſhown himſelf perfidious. He determined to ſhare the fate of the United Provinces, to fulfil his engagements, and the hope conceived of his conduct.

55 Intrigues of the duke of Parma.

While the prince of Orange was buſied in conciliating factions, forming alliances, and ſtrengthening the union, the duke of Parma was taking meaſures to diſconcert his projects, and reduce the provinces to the king's obedience. He diſpatched Gonzaga and Mondragon with 8000 men to lay ſiege to Marſien. The town was taken by aſſault; the governor hanged; and 45 of the chief inhabitants were tortured to death, for having valiantly defended themſelves, and faithfully diſcharged their duty. It is ſaid the duke of Parma diſavowed this bloody proceeding, ſo inconſiſtent with the character of a hero. After ſome farther inconſiderable advantages obtained in the neighbourhood of Ruremonde, the king's army inſulted Antwerp, where the archduke and the prince of Orange then reſided. The States army was intrenched near Borgerhont, a poſt attacked without ſucceſs by the duke of Parma, after a briſk ſkirmiſhing of two hours between the armies. La Noue, however, the general of the ſtates army, not chooſing to expoſe himſelf to continual alarms from the enemy's cavalry, retired under the cannon of Antwerp.

United Provinces.

56 His ſucceſſes.

57 Maeſtricht taken, and the inhabitants maſſacred.

On La Noue's retreat, the duke of Parma inveſted Maeſtricht. The ſiege began on the 8th of March, and continued without remiſſion to the 29th of June. This defence was deemed very extraordinary, as the fortifications were in bad order, the garriſon ſlender, and the place but poorly provided with the neceſſaries of a ſiege. One Sebaſtian Tappin, an engineer by profeſſion, a Proteſtant, and a brave and alert ſoldier, by his indefatigable vigilance raiſed continual obſtructions to the duke's approaches. The garriſon had ſuſtained frequent aſſaults, and made divers bloody ſallies, by which they were ſo much fatigued, that during a parley the town was ſurpriſed and a great many ſoldiers were put to the ſword; but Tappin was ſaved by favour of the duke of Parma, who gave ſtrict orders that he ſhould have quarter. For three days Maeſtricht was a ſcene of the utmoſt deſolation and horror, the Spaniſh ſoldiers committing every exceſs and enormity, in deſpite of all the endeavours of the general to reſtrain their licentiouſneſs, and maintain diſcipline. With ſuch diligence did the duke apply himſelf to this ſiege, that, unable to ſupport the fatigue, he was ſeized with a fever, which had nearly proved fatal. His ſituation inſpired the enemy with freſh courage. They ventured to appear in the field; reduced Aloſt, and ſome other places of little conſequence; but could not prevent the loſs of Menin taken by aſſault, though it was ſoon after retaken by the prince of Orange. In Brabant the ſtates likewiſe obtained ſome advantages, though of too unimportant a nature to merit attention. The truth is, all the United Provinces were in a deplorable ſituation; and their trifling ſucceſſes were owing entirely to accident, or the duke of Parma's illneſs. Several provinces contributed nothing to the common cauſe; others furniſhed but a ſmall proportion of the taxes agreed upon at the union. The army had large arrears due, and lived at diſcretion; in a manner more oppreſſive to the people than taxes to the amount of their regular pay. The people clamoured againſt the ſtates; they threw the blame on the officers for relaxing in the point of diſcipline; and the officers recriminated, alleging, that the fault was in the ſtates, who failed in performing their engagements to the army. All was in confuſion; but as no perſon would acknowledge his error, there appeared little hopes of amendment. In a word, nothing beſides the ſame diſtreſs in the Spaniſh army could have prevented the duke of Parma from reducing the revolted provinces to accept any terms he ſhould think fit to preſcribe. He was equally in want of money; and his late treaty with the Walloons required that he ſhould diſmiſs all his foreign troops in the ſpace of ſix weeks after the publication of the treaty. His ſituation indeed was ſo deplorable, that he requeſted leave to reſign his command, and retire with the foreign ſoldiers to Italy;

58 Diſtreſſed ſituation of the republic.

United Provinces.

but the court of Spain had too much confidence in his ability to entruſt ſo important a charge to another. In this ſtate of affairs the animoſity of the parties remained, without the power of ſhowing their reſentment. The ſtates were reſolute, but unable to defend their liberties. Philip was determined, but too weak to be deſpotic; and both were obliged to content themſelves with publiſhing bitter remonſtrances againſt each other.

At laſt the prince of Orange renewed the treaty with the duke of Anjou. The queen of England was again offered the ſovereignty, but ſhe declined it for political reaſons. The duke of Anjou was, however, oppoſed by a great number of the Reformed, on account of the ſhare his mother had in the horrid maſſacre of the Proteſtants at Paris. All arguments to remove their prejudices were in vain. Anjou was a Roman Catholic, and that alone was ſufficient to render him deteſtable. The prince of Orange urged the neceſſity of receiving the prince. Theologians and civilians allowed that it was lawful to have recourſe in extremity to a Papiſt, but the people continued obſtinate. This determined the prince of Orange to have recourſe to the States-general, to whom he ſent a long remonſtrance, pointing out the cauſes why the confederacy did not produce the intended effect; and exhorting them to re-conſider the affair reſpecting the duke of Anjou. In conſequence, the States-general referred the prince's remonſtrances to the provincial ſtates and cities; and after long deliberations, and warm debates, it was at length determined, in 1580, to call in the duke of Anjou, as the only reſource in ſo great a calamity. Accordingly the year began with a ſolemn treaty, whereby the United Provinces renounced their allegiance to Philip, and acknowledged Francis Hercules de Valois, duke of Alençon and Anjou, for their ſovereign. The treaty conſiſted of 27 articles, of which this we have mentioned was the chief. Deputies were ſent to the duke of Anjou, to explain the articles, and congratulate him on his acceſſion. As to the archduke Matthias, finding himſelf unſupported by the emperor, the empire, and the numerous friends whom he expected would have joined him on his elevation, he expreſſed no reſentment at the conduct of the provinces, which with great moderation he attributed to neceſſity. He only demanded to know their intention with reſpect to his own perſon; and the ſtates made their apology, by repreſenting the ſituation of their affairs, aſſuring him of their eſteem, permitting him to reſide in the Netherlands as long as he thought convenient, and highly applauding the prudence and equity of his conduct during his adminiſtration. As to the provinces of Holland and Zealand, they were left wholly in the hands of the prince of Orange, whoſe power as ſtadtholder was in no reſpect limited by the duke's ſovereignty. After all, Grotius affirms, that the duke's authority was merely nominal, that the real power devolved on the prince of Orange, whoſe name, however, was uſed in all public acts only in a ſubaltern capacity. It was apparent indeed to the French, that William concealed ambitious views under the cloak of patriotiſm; but it was not convenient to diſcover their ſentiments.

59 Duke of Anjou choſen ſovereign.

60 Prince of Orange proſcribed.

When the king of Spain was informed of this open defection of the Provinces, he attributed the whole to the prince of Orange, and proceeded directly to proſcribe him; he confiſcated his eſtate, upbraided him with ingratitude, and attempted to ſtain his character with ignominy. He even promiſed a reward of 25,000 crowns to whoever ſhould bring him the prince of Orange dead or alive; the ſame to his heirs, in caſe the perſon periſhed in the enterpriſe; and he declared all thoſe proſcribed, their eſtates confiſcated, their honours and dignities aboliſhed, who adhered to William a month after the publication of this edict.

The prince of Orange did not ſilently paſs over this proſcription. He employed one Villiers, a Frenchman, to refute the edict: his anſwer was well received, and is recorded by hiſtorians as a proof of the ſpirit, the equity, the prudence, and the moderation of the prince. However, when it was propoſed to the ſtates for their opinion, with a requeſt they would publiſh it in their own name, they declined it; aſſigning for a reaſon, that it contained ſome facts too little known to be credited, and perhaps too much acrimony and reſentment againſt a prince whoſe power they ſtill dreaded. With theſe recriminations ended the tranſactions of the year. United Provinces.

61 The States publicly exclude Philip from the ſovereignty.

The following year the ſtates, after long deliberations at the Hague, publiſhed an edict, excluding king Philip from any ſovereignty, right, or authority over the Netherlands. This writing appeared on the 26th of July 1581, under the title of *The abdication of Philip king of Spain.* It was extremely well drawn up; ſtated in the ſtrongeſt manner the mutual privileges of the king and people; proved that the allegiance of the latter was voided by the breach of contract on the ſide of the former; enumerated the oppreſſive and tyrannical acts of his government; ſet aſide his authority for the moſt cogent reaſons; forbad money to be coined in his name; and took every other ſtep towards independence. It was in vain for Philip to remonſtrate: he knew the ſtates were to be convinced only by the ſword; to this therefore he appealed. The duke of Parma blocked up Cambray ſo cloſely, that the garriſon was reduced to the extremity of living upon horſes, dogs, and cats; though they ſtill refuſed to capitulate, in hopes of being ſuccoured. At length the duke of Anjou aſſembled a body of 10,000 foot and 4000 horſe, and approached Cambray. The viſcount de Turenne and count Voulandois undertook to force themſelves with a body of men into the town; but they were ſurrounded and taken priſoners by the Spaniards. This diſappointment did not diſcourage the duke of Anjou; he ſtill preſſed forward with intention to attack the Spaniſh lines: but the duke of Parma, not caring to hazard a battle, deſerted his works, and retired to Bouchain. As ſoon as the duke of Anjou entered the city, he took an oath to govern it agreeable to its ancient laws, and to preſerve the citizens in the full poſſeſſion of all its liberties. He was now preſſed by the ſtates and the prince of Orange to march directly into Flanders: he endeavoured to comply; but his army, compoſed chiefly of volunteers, was ſo weakened by deſertion that the deſign was laid aſide.

62 Cambray relieved by the duke of Anjou.

It was about this time that the duke of Anjou reſumed the notion of addreſſing Elizabeth queen of England. Not deterred by the ill ſucceſs of his former negociation, he determined upon a voyage to England; an excurſion which proved equally unſucceſsful to himſelf and unfortunate to the United Provinces, as during his abſence the duke of Parma made himſelf maſter of Tournay, which concluded the tranſactions of this campaign. He was magnificently entertained, led into a perſuaſion that all would ſucceed according to his wiſh, and at length tired out with tedious expectation. In his abſence, St Guilan was reduced by the prince of Eſpinoi. This general directed his march towards Dunkirk, with intention to join the French forces. The duke of Parma, who had notice of his motion, repaired to ſeize the opportunity of inveſting Tournay. He began his approaches, and was vigorouſly received by that garriſon, inſpirited by the courage of the princeſs Maria d'Eſpinoi, niece of the count Horn ſo cruelly beheaded by the duke d'Alva. The town was ſtormed in breach by the duke of Parma, who ſupported the aſſailants in perſon, received a wound, and had the mortification to ſee his Spaniards thrown headlong from the walls. The duke of Anjou

63 Succeſſes of the Spaniards.

United Provinces.

jou repeatedly promiſed ſuccours; but either forgot, or could not perform his engagements: the latter indeed is the moſt probable; as he was certainly a dupe to the ſuperior policy of Elizabeth, who had not yet declared openly in favour of the States. In the end, deſpairing of relief, haraſſed with perpetual watching, and weakened by loſſes, the garriſon capitulated on the 29th of November. The conditions were honourable; and the princeſs d'Eſpinoi was treated with particular marks of diſtinction by the duke of Parma, who highly eſteemed the heroic qualities of this amazon. This advantage was ſucceeded by another, obtained by the Spaniſh general Verdugo, over the confederate army in Frieſland, commanded by general Norris and William Lewis of Naſſau, a young prince of great expectation. It appears from the Spaniſh account, that Norris was attacked in a defile, where he could not draw out his troops in battalia; and that he was put in confuſion, and defeated with great loſs. On the other hand, the Dutch writers allege, that he attacked the enemy; but being inferior to them in cavalry, retreated in good order, with ſcarce any loſs.

64 Duke of Anjou makes his public entry.

The year 1582 began with a ſpectacle very unuſual in the Netherlands, the public entry of a ſovereign elected by the people. The duke of Anjou ſetting ſail from England on the 8th day of February, arrived on the 10th at Fluſhing, where he was received by the princes of Orange and d'Eſpinoi. Next day they ſet out for Antwerp with a magnificent retinue, and went up the Scheld attended by 50 barges. His reception at Antwerp was ſplendid beyond any thing ever ſeen in the provinces: they even exceeded the preparations made for Philip himſelf on his being appointed to the government in the Netherlands by Charles V. his father. A theatre was erected before the walls of the citadel, in which was placed a chair of ſtate, covered with cloth of gold. There the duke was ſeated, and the conditions were read to him, upon which he was received as duke of Brabant. When he had ſworn to obſerve the articles, he was clothed with the ducal robe, and his head adorned with the ducal coronet by the prince of Orange; who ſaid, "I will pin it in ſuch a manner that it will not be eaſily ſhaken:" an expreſſion which at that time was taken for a happy omen, though it ſoon proved fallacious.

While the ſtates of Brabant were employed in feſtivity and mirth, a Biſcayan merchant, named *Gaſper Anaſtra*, had contrived a project to redeem his ſhattered fortune by the death of the prince of Orange. He corrupted one of his domeſtics, by the promiſe of half the reward, to ſtrike the blow. The aſſaſſin entered the citadel; and as the prince was paſſing after dinner into another room, diſcharged a piſtol, and dangerouſly wounded him behind the ear. The prince was ſtunned with the force of the ball, and before he recovered the aſſaſſin was killed by his attendants; which prevented for a time the abſolute diſcovery of the plot, though it afterwards appeared from circumſtances. It was traced that he had confeſſed the ſecret to a Dominican named *Antonio Tunmermon*, receiving from the wicked prieſt abſolution, and a promiſe of eternal reward. Tunmermon was hanged, drawn, and quartered, his limbs being fixed upon the walls of Antwerp. But though for this time the prince eſcaped the danger, he was in 1584 aſſaſſinated at Delft, by one Balthazar Gerrard or Guion, a perſon who had before ſerved his highneſs with fidelity and zeal. He was at that very time employed by the prince to carry letters into France, and had received money to bear his expences, with which he purchaſed piſtols to murder his benefactor. At the criminal's examination, it appeared that he had long meditated this bloody action, and was confirmed in his reſolution by the Jeſuits and Catholic prieſts; he even

65 Prince of Orange aſſaſſinated.

affirmed on the rack, that the duke of Parma was privy to the deſign, who promiſed he ſhould have the reward: upon the whole, Gerrard ſeems to have been an enthuſiaſt, and his crime the reſult rather of inſanity, than of any concerted ſcheme, or malicious intention. His puniſhment, however, regarded only the action: it was cruel beyond meaſure, ſhocking to humanity, and a ſtriking inſtance of the vehement party-ſpirit of the times; not of the juſtice of the judges, or the attachment of the people to the prince of Orange.

United Provinces.

The United Provinces were now in a moſt deplorable ſituation. The duke of Anjou had been totally unable to reſiſt the duke of Parma, in conſequence of which many towns had been taken; and in other reſpects the ſtates had ſuſtained immenſe loſſes. The duke of Anjou, chagrined and diſappointed, had retired to France, where he died. But above all, the loſs of the prince of Orange ſeemed to give the finiſhing ſtroke to the affairs of the ſtates; and confuſion and anarchy now reigned in their councils. The provinces of Zealand and Holland alone endeavoured to repair the loſs, and ſhow their gratitude to William by electing his ſon Maurice their ſtadtholder and captain-general by ſea and land. Maurice was at that time only 18 years of age; but appeared in every reſpect worthy of the high dignity which had been conferred upon him. The firſt ſtep taken by the confederates was a ſolemn renewal of the treaty of Utrecht; after which the moſt vigorous preparations were made for the defence of the country. But before any thing of conſequence could be done, the duke of Parma had reduced Liſkenſhouk, Dendermonde, Vilvorde, Ghent, and Antwerp; which ſtruck the ſtates with ſuch terror, that they again offered the ſovereignty to queen Elizabeth. This was once more refuſed; though that princeſs engaged, by a new treaty, to aſſiſt the ſtates both with men and money. An army was accordingly ſent into the Netherlands under the command of the earl of Leiceſter: but it does not appear that this was of any eſſential ſervice to the cauſe; for the conduct of that general was ſo exceedingly improper that he was not only baffled in every military enterpriſe, but drew upon himſelf a general odium. It is very probable indeed that the States could not long have ſupported themſelves in ſuch circumſtances, had not Philip raſhly engaged in a war with England, with whoſe naval power he could ſcarce be enabled to cope by any ſuperiority in numbers whatever. The defeat of the Spaniſh armada in 1588* gave ſuch a blow to the power of that nation, as totally diſabled them from carrying on the war in the Netherlands. Inſtead of ſending the proper aſſiſtance to the duke of Parma, that general received orders to haſten to the aid of the duke of Mayence, who had been defeated by Henry IV. The duke was obliged to comply with this order, though he was ſenſible the loſs of the United Provinces muſt be the conſequence. Prince Maurice now carried every thing before him; and by the end of the year 1591, the Dutch ſaw their frontiers extended, the whole country ſecured by rivers and covered by fortified towns, with the greateſt probability of driving the Spaniards out of Frieſland in another campaign.

66 Prince Maurice choſen ſtadtholder.

67 Succeſs of the Spaniards.

68 Duke of Parma obliged to move towards France.

The remainder of the hiſtory of this war is only a detail of the Spaniſh loſſes and misfortunes, which now enſued. Their affairs were at laſt totally ruined by a deciſive victory gained by prince Maurice, in the year 1600, over the archduke Albert, who had been appointed the Spaniſh governor of the Netherlands. King Philip II. died in 1598, leaving the affairs of his kingdom in the moſt diſtreſſed ſituation; notwithſtanding which, his ſucceſſor Philip III. was too haughty to conſent to peace, or allow that the States were free, though he was plainly unable to keep them

United Provinces.

A truce of twelve years concluded with Spain.

them in ſubjection. At laſt, in 1606, the courts of Madrid and Bruſſels, began to think of peace in good earneſt. In 1607 a ſuſpenſion of hoſtilities took place, and in 1609 a treaty was concluded. In the firſt article of the treaty, the archduke, in his own and the king of Spain's name, acknowledged the United Provinces, and renounced all claim to ſovereignty over them, but in ſuch general terms as would admit of altercation. In the ſecond, a truce for 12 years, by ſea and land, through all the dominions of both parties, was concluded. By the third article, the parties were to remain in poſſeſſion of what they now held, without ceſſion or exchange. In the fourth, a general amneſty was ſtipulated, and full freedom of trade by ſea and land to each others dominions granted. This neceſſarily implied a ceſſation of hoſtilities in the Indies; however, great debates afterwards aroſe upon this account. Spain obſerving the rapid progreſs of the Hollanders in the India trade, apprehended they would ſoon become too powerful in that quarter; and the Dutch were willing to maintain the advantage of their ſuperiority. Both, for this reaſon, diſputed the article; yet it could not be ſet aſide without deſtroying the whole treaty, and the fruits of all their laboured conferences. The fifth article regulated the imports, and the duties to be paid by the ſubjects of the archduke and the States, trading to each others dominions, which were to be on the ſame footing with thoſe of other nations. The archduke uſed his utmoſt endeavours to have the duties at Lillo, on the Scheld, aboliſhed, and the commerce of Antwerp reſtored to its former grandeur; but this was ſo diametrically oppoſite to the intereſt of the Hollanders, that it was impoſſible it ſhould ever take place. The ſixth and ſeventh articles likewiſe regarded commercial affairs. But it would be unneceſſary to dwell on particulars. Sufficient is it, that the truce was mutually beneficial, Spain being no longer in condition to ſupport the war, and the Hollanders having obtained the end of all their deſperate reſiſtance and invincible perſeverance in the cauſe of liberty. Philip of Naſſau, by the truce, entered into poſſeſſion of all his paternal eſtates in the Spaniſh Netherlands and Burgundy; while the ſtates rewarded the faithful ſervices of Maurice with a penſion of 25,000 florins, to be paid annually out of the public treaſury, beſides an appointment of 60,000 francs as governor general. Penſions were likewiſe ſettled on the other princes of the houſe of Naſſau: all were gratified in a manner that demonſtrated the high ſenſe the republic had of their merit, though they might poſſibly be diſappointed in their great deſign of raiſing prince Maurice to the ſovereign authority.

No ſooner were the Dutch freed from this extreme danger, and felt the bleſſings of liberty, than diſſenſions among themſelves took place. The diſputes betwixt the Arminians and Calviniſts produced violent diſturbances, which frequently ended in the perſecution of the former. In 1621

70 War renewed.

war was renewed with Spain; and it may be remarked, that during the whole courſe of it, the ſubjects of the republic traded to the Spaniſh ports, as if there had been an entire friendſhip ſubſiſting between the two nations. It was no uncommon practice with them to ſupply towns with proviſion that were beſieged by their own armies; and to furniſh the enemy with ammunition and other neceſſaries, without which they could not carry on the war. Their motive and apology for this conduct was, that thus they kept in their own hands the profits by which other nations would be enriched. By ſteadily purſuing this line of conduct, making as many prizes as they could by force, and at the ſame time making as much profit of their enemies as could be obtained by a lucrative trade, it is no wonder that the republic ſhould flouriſh, and rival in wealth the greateſt nations of Europe. In 1628 the Spaniards met with a dreadful blow by the capture of their flota from Mexico. This was the greateſt prize the Hollanders had ever met with; being valued at no leſs than 15,000,000 livres. From this time the Spaniards were everywhere defeated and baffled in almoſt every enterprize they undertook; nevertheleſs, they carried on the war, with an obſtinacy hardly to be matched, for 20 years longer. At laſt, in 1648, a treaty was concluded, by which his Catholic Majeſty renounced all right and ſovereignty over the Lords the States-general of the United Provinces, who were henceforth declared a free and independent republic, and that both ſides ſhould remain in the unmoleſted poſſeſſion of what they held ſeverally at the ſigning of the treaty.

United provinces.

71 Spaniſh flota taken.

72 Peace concluded

From this time to the year 1670 we meet with nothing very remarkable in the hiſtory of the United Provinces. By invariably purſuing the maxims of prudence, induſtry, and frugality, the republic had attained the higheſt pitch of grandeur. Amſterdam was become the emporium of Europe, and the richeſt city in the univerſe. Holland alone contained 3,000,000 of ſouls, and all the other provinces were proportionably populous. The States diſpatched miniſters and conſuls to China, Siam, and Bengal, to the Great Mogul, the king of Perſia, the khan of Tartary, the Grand Signior, the czar of Muſcovy, and the princes of Africa. They were conſidered as an important weight in the ſcale of Europe, and no treaty was concluded without their ambaſſadors. The triple alliance with England and Sweden, into which they had entered, gave Louis ſuſpicion that they propoſed to ſet bounds to his ambition, and clip thoſe bold pinions which had ſo ſwiftly conveyed his conqueſts over the Low Countries. Van Beuningen's inſolence, in comparing himſelf to Joſhua ſtopping the courſe of the ſun, which was the French king's device, highly diſguſted his majeſty; who was ſhocked at the preſumption and pride of a republic juſt ſtarted out of obſcurity, and gained, in the ſpace of a century, from the ocean. But what was ſtill more alarming to Louis, was the probability that the Dutch would ruin the manufactures of France, and his new eſtabliſhed commerce of the Indies. His jealouſy diſcovered itſelf in divers inſtances; and the penſioner De Witt, who at that time had the leading of affairs, his brother, and his party, did all in their power to remove theſe prejudices; but the unhappy differences which then prevailed in the United Provinces fruſtrated all their endeavours.

73 Flouriſhing ſtate of the republic.

74 Cauſe of the war with France.

Louis now ſought every opportunity of breaking with the Dutch; leſs perhaps from any dread of their power, or ability to injure him, than with a view to enlarge his dominions by the entire conqueſt of the Low Countries. He knew that the whole ſtrength of the republic conſiſted in her marine: that her frontier was weak, her provinces divided, and the chief power in the hands of men, inveterately ſet againſt the family of Orange, the ancient captains of the republic. His firſt attempt was to diſſolve the triple alliance, and diſengage from it Charles II. king of England. In this buſineſs the ducheſs of Orleans was employed: ſhe went to England under pretence of viſiting the king her brother; and her negociation was ſucceſsful. In the mean time Louis poſſeſſed himſelf of Lorrain, under pretence that duke Charles was forming alliances in the empire againſt France.

75 Treaty between the kings of France and England.

The following year was ſpent in negociations with the emperor, Spain, and Sweden, with the electors of Cologne and Brandenburg, with the biſhop of Munſter, and other ſpiritual and German princes. The deſign of Louis was to prevent their acceding to the triple alliance; from which he had already weaned one power, the moſt conſiderable of the whole. The biſhop of Munſter beheld with uneaſineſs the

United Provinces.

the growing power of the United Provinces: he pretended that they had made ſeveral attempts upon the counties of Stirum, Culemberg, Bentheim, and Eaſt Frieſland; that they had ſeized on Ravenſtein on the Meuſe, and ſeveral other places belonging to his biſhopric. In his own defence he concluded a treaty with France, and prevailed on the elector of Cologne to follow his example. By ſigning a treaty with theſe two princes, the king opened a way to Holland by the Meuſe and the Rhine; he eſtabliſhed by this means places of arms and magazines in a country diſtant from his own dominions, and ſecured a retreat in caſe his enterpriſe proved abortive. With reſpect to the emperor, every artifice was uſed to keep him neutral; and indeed his own inclinations co-operated but little in favour of the Dutch, whom he regarded as ſubjects revolted from the princes of his family, and in poſſeſſion of ſeveral places belonging to the empire. In Sweden, Louis's negociations were equally ſucceſsful; for here he prevailed ſo far with Charles XI. as to obtain a ſtipulation, that if the emperor, or any of the princes of the empire, joined their forces to the Dutch, a Swediſh army ſhould march into the very heart of Germany and join the French, in order to force thoſe princes to obſerve the treaty of Weſtphalia.

76 Brandenburg aſſiſts the republic.

Of all the Germanic body, the elector of Brandenburg alone intereſted himſelf for the ſafety of the States-general. The peace of Weſtphalia had prevented this enterpriſing prince from extending his dominions in Germany, and retaking Pomerania from the Swedes. He had long aſpired at the ſtadtholderſhip of Holland; and though that office had been for ſix years ſuppreſſed, yet he flattered himſelf, that in caſe of a war he might obtain it, perpetuate it in his family, and in time reduce Holland by dint of force, intrigue, and ſtratagem. With this view, he rejected the propoſals of ſeveral princes of the empire, and even thoſe of France, endeavouring by every poſſible method to inſinuate himſelf into the friendſhip and confidence of the States. In the end he concluded a treaty with them, whereby it was ſtipulated that he ſhould aſſiſt the republic with 25,000 men. Beverning, the Dutch ambaſſador at Madrid, diſconcerted all the ſchemes of France at that court, and engaged the queen of Spain to furniſh money and troops for the defence of the United Provinces. Thus was the face of Europe wholly changed. France and England, who had contributed largely to the raiſing and aggrandizing the republic, were now incited to deſtroy her; while Spain, which for an age had been endeavouring to ſuppreſs her, was arming for her ſupport. Pierre de Groot, the Dutch miniſter at the Hague, was employed to penetrate into Louis's deſigns; he gave his conſtituents notice that he foreſaw a terrible ſtorm ready to fall upon them, which they might nevertheleſs break by ſeaſonable ſubmiſſions and proper acknowledgments. Upon this the States wrote to the king, endeavouring to appeaſe his wrath; but finding him inexorable, they prepared for receiving him, and provided for the ſecurity of their provinces. But the long peace the republic had enjoyed deſtroyed her ſtanding forces, and little confidence could be repoſed in her new levied ſoldiers.

77 Hoſtilities commenced.

As ſoon as matters were ripe for execution, Louis ordered an army of 100,000 men to file off towards the Rhine. Before the opening of the campaign, and previous to his declaration of war, he divided his army into four columns; commanding one in perſon, with the marſhal Turenne under him. Another was led by the prince of Conde, aſſiſted by the marſhals Humieres and Bellefonds; the third was headed by Crequi; and the fourth marched to Weſtphalia under the conduct of the duke of Luxemburgh, to join the biſhop of Munſter. As the marſhals Crequi, Bellefonds, and Humieres, refuſed to receive orders from Turenne, they were baniſhed; but after ſix months exile, were recalled, at the inſtance of the whole body of marſhals in France, upon their making proper ſubmiſſions. United Provinces.

Such an army drawing towards their frontiers could not but terrify the Dutch, now torn by civil factions. The partiſans of the Orange family were for aboliſhing the perpetual edict, and raiſing William III. to the dignity enjoyed by his predeceſſors; but the De Witt faction oppoſed him violently, though they could not prevent the young prince from being choſen captain-general and high admiral. Many perſons hoped that William's new dignity would incline his uncle Charles II. to return to the triple alliance: but that hope was fruſtrated by the conduct of his majeſty; who, in conjunction with the moſt Chriſtian king, declared war againſt the States-general on the 7th day of April. A month after, the elector of Cologne and biſhop of Munſter followed the example of the two kings. The Dutch put themſelves in the beſt poſture of defence that circumſtances would admit. Maeſtricht was ſtrongly garriſoned; the prince of Orange had aſſembled an army of 25,000 men, with which he advanced to the banks of the Iſſel, and the Dutch fleet cruiſed off the mouth of the Thames to prevent the junction of the naval forces of England and France, which amounted to 150 ſhips. All Europe watched the firſt motions of two powerful kings, ſeconded by the beſt generals of the age.

His moſt Chriſtian majeſty joined his army at Charleroy. It was compoſed of 23 companies of *gens d'armes*, life-guards, muſqueteers, and light-horſe, two regiments of the French and Swiſs guards, 14 regiments of foreign infantry, and 60 regiments of light horſe or dragoons, compriſing in all an army of 110,000 fighting men, under the command of marſhal Turenne as captain-general. Holland could only be attacked by the Rhine or the Meuſe; and the generals and miniſters differed by which of theſe inlets they were to make the firſt impreſſions. At laſt, after ſeveral deliberations, it was determined to make both attacks at the ſame time, in order the more to diſconcert their councils. It is probable that Turenne always oppoſed the ſiege of Maeſtricht; for we find him immediately after the ſurrender of Maſeik ſtrongly diſſuading the king from that enterprize, in oppoſition to the ſentiments of the prince of Conde. At laſt he prevailed; and it was reſolved in council to advance towards the Rhine, and beſiege at the ſame time the towns of Rhinberg, Veſſel, Orſoi, and Burick. Theſe places were all well fortified, and deemed the keys of Holland; however, the Dutch did not appear diſturbed at their being inveſted, as they were only under the protection, and did not immediately belong to, the United Provinces. They were beſides in hopes that any attempts upon the territory of Cleves would haſten the preparations of the elector of Brandenburg, and even rouze the emperor into a ſenſe of the danger he was in from the vaſt deſigns of Louis. Nothing could oppoſe armies ſo well appointed, led by generals ſo ſkilful and ſo experienced. The four towns ſurrendered within a few days of each other; and Rhinberg, that held out longeſt, opened its gates on the ſeventh of June. A few days after, the town and fort of Rhees, and the town of Emerick, ſurrendered; upon which the king reſolved to paſs the Rhine by a ford, over which the cavalry were to ſwim. This bold enterpriſe was projected and conducted by Conde; who, in the face of two regiments of foot, and ſeveral ſquadrons of horſe, under general Wartz, intrenched on the oppoſite ſide, effected the paſſage, in the ſame order, and with as much regularity, as if he had marched his troops on dry land. The enemy made a ſtout reſiſtance; but were driven from their poſt, after having killed the duke de Longueville on the ſpot, and wounded the

78 Succeſſes of the French.

United Provinces.

the prince of Conde, which disabled him for some time from attending the service, and obliged him to resign the command of his army to Turenne.

It is almost incredible with what rapidity towns and fortresses yielded to the fortune of his majesty's arms. The reduction of Betau, the most fruitful country of the United Provinces, and the surrender of Tolhus fort, obliged the prince of Orange to abandon the Issel, lest he should be attacked in the rear, and to retire to the very heart of the country, as far as Rhenen, in the province of Utrecht. By this means the town of Arnheim, the forts of Knotsemborough, Voorn, St André, and Shenck, this last, the strongest in the Netherlands (having cost the great Henry Frederick prince of Orange a seven months siege), with a variety of other forts and towns, surrendered as soon as summoned; and at last Nimeguen, a town strong from the nature of the works and fortifications, and garrisoned by 8000 fighting men, including the inhabitants, was invested. After the citizens had for eight days exhibited signal proofs of courage in defence of their liberties, they were forced to yield to the superior skill of Turenne.

In the mean time the Bishop of Munster and elector of Cologne, having joined that body of troops under the command of the duke of Luxemburgh, the united army entered the province of Overyssel, and by dint of cruelty, and terror which the duke spread, reduced the towns as soon as he appeared before them. Animated by that implacable rage that constantly attends religious wars, the two prelates obliged the duke to exert a severity, by no means suited to his nature, against heretics and the rebellious subjects of the house of Austria. Next the king's forces penetrated into the province of Utrecht, where their conquests went on with the same rapidity, and put the capital of the province in the utmost danger. To retard its fate, the Dutch could imagine no other expedient than opening their sluices, and overflowing the country. The other towns followed the example of Utrecht; and Holland, Brabant, and Dutch Flanders, was one vast lake, the towns rising like islands in the midst of the waters. Farther to stem the torrent of Louis's conquests, the people were persuaded the only barrier was to lodge the supreme power in the hands of the prince of Orange. They accordingly obliged the states of Holland and West Friesland to unite the dignity of stadtholder to those of captain-general and high-admiral, with which the prince was already invested. They likewise sent remonstrances so pathetic to the king of England, that Charles, moved with the situation of the republic, and jealous of the designs of Louis, dispatched the duke of Buckingham and earl of Arlington into Holland, to quiet the fears of the Dutch, and insist upon the king's penetrating no farther into Holland. In case of Louis's refusal, Charles declared he would break the alliance; as he perceived that, instead of securing Zealand to the English, agreeable to the treaty, the designs of France were to unite the whole republic to their own monarchy. His most Christian majesty had in fact no great regard to the menaces of his ally: but as persisting obstinately to advance into a country which the inundation rendered impassable, might terminate in the ruin of all his schemes, he seemed, out of compliment to the king of England, to listen to terms of accommodation; which, after all his victories, could not fail of proving advantageous. In the space of three months he had conquered the provinces of Guelderland, Overyssel, and Utrecht, taken about 50 towns and forts, and made 24,000 prisoners. Conde and Turenne advised his majesty to send the prisoners to work upon the canal of Languedoc, and to leave all the places that were not essential to the preservation of his conquests; the minister Louvois was of a different opinion, and his sentiments determined the king. The prisoners were released for a trifling ransom, and the king's army totally reduced and exhausted by the continual drains made to garrison the conquered places.

79 The Dutch obliged to overflow their country.

A negociation was set on foot at Boxtel, near Bois-le-duc, whither the king, attended by the English ambassadors and the Dutch deputies, repaired: but the terms required of the republic were so hard, that they were rejected with disdain by the Dutch; who, animated by their stadtholder, resolved to wait a change of fortune in the midst of the waters. They used every expedient to rouse the princes of Germany in their defence; and so successfully that the elector of Brandenburgh, the nearest and most interested prince, prepared to take the field. The undaunted courage, the vigilance, the public spirit of the prince of Orange, gained him the entire confidence and affection of the republic; and excited their resentment against the two brothers De Witts, his implacable enemies, whom they accused of receiving pensions from Louis. The suggestion was false; but possibly their love of liberty, and jealousy of the house of Orange, had carried those two great politicians too far in their pacific measures and complaisance to the power of the French monarch. The pensionary was attacked in the street by the populace; but by his personal bravery broke through the crowd, and saved his life, though covered with wounds. Soon after the sedition broke out afresh, and the partisans of the house of Orange again stirred up the animosity of the republic against the De Witts. Several crimes were laid to the pensioner's charge, but he cleared himself. Suborned witnesses accused his brother of an attempt to poison the prince of Orange. Cornelius was imprisoned and treated with great barbarity. While he was under the torture, he sung that ode of Horace, *Justum et tenacem propositi virum*. His brother took him out of prison after sentence of banishment was pronounced; the tumult rose high, and both the De Witts were cruelly torn in pieces in the streets. William of Orange seemed touched at this terrible sacrifice; he made the pensionary's eulogium, and ordered the murderers to be prosecuted; however, the clemency he showed them, the advantages he obtained by the massacre, and the animosity he bore the De Witts, convinced all men that he countenanced the murder.

80 Unsuccessful negociation.

81 The De Witts cruelly murdered.

William of Orange, in the mean time, daily ingratiated himself more. He gave up his whole fortune for the safety of the state; and exerted himself with such prudence and ability, that all Europe began to unite against the two kings by the month of July. Every prince in Germany was in motion to succour the Dutch. The emperor, the king of Denmark, the elector of Brandenburg, the duke of Brunswick Lunenburg, the landgrave of Hesse, immediately ordered their troops to join; several of the other princes were preparing to take the field. All were jealous, England began to waver, and there was not a power in Europe upon whom Louis XIV. could heartily rely. The army of Brandenburg, commanded by the elector in person, and the forces of the empire under the famous Montecuculi, joined near Heidelsheim, and composed a body of 40,000 men. Turenne, now appointed generalissimo of the king's army on his majesty's return to Paris, marched to oppose the enemy's passing the Rhine. For three whole months were the elector and Montecuculi employed in abortive attempts to effect a passage at Mentz, Coblentz, Strasburgh, and other places. This answered the purpose of making a powerful diversion in favour of the Dutch, though they could not accomplish their design of joining the prince of Orange. After repeated disappointments, the Imperial army directed its march to Westphalia; and Turenne followed, in order to keep the bishop of Munster steady to his engagements. For half the campaign,

82 Exploits of Turenne.

United Provinces.

paign, he, with a body of 16,000 men baffled every ſtratagem of the elector and Montecuculi, the latter the moſt renowned general of the empire, at the head of an army near triple his ſtrength. He obliged them to go into winter-quarters, in a country haraſſed and exhauſted; and confirmed the biſhop of Munſter in the alliance of France, at the very time he was on terms with the emperor. He obliged the elector of Brandenburg, who took the chief command during Montecuculi's illneſs, to abandon the ſiege of Werle; took Unna, Kamen, Altena, Berkembam, and ſeveral other towns and fortreſſes. By continuing his operations, he forced the elector out of his winter-quarters again into the field, chaſed him from poſt to poſt, until he obliged him to quit Weſtphalia, repaſs the Weſer, and retire with precipitation into the biſhopric of Hildeſheim. After taking poſſeſſion of the elector's towns in Weſtphalia, he purſued him into the biſhopric of Hildeſheim; and at length, by mere dint of ſuperior genius, forced him to ſeek ſhelter in his hereditary dominions. All this was effected after Louvois had appointed the marſhal's army quarters in Alſace and Lorrain, amidſt the rigours of a ſevere winter, oppoſed by a ſuperior enemy, by the artifices of Louvois, and ſeconded only by his own prudence, and the affections of his troops, which he maintained in defiance of all the difficulties, hardſhips, and dangers, they encountered. It was indeed ſuppoſed, that Montecuculi was prevented from giving Turenne battle by the remonſtrances of prince Lobkowitz, the emperor's ambaſſador, influenced by the gold of Louis. Certain indeed it is, that Montecuculi's illneſs aroſe from his chagrin at ſeeing all his projects fruſtrated by the unſteady dilatory conduct of the court of Vienna. Louis's negotiations diſturbed Europe no leſs than his arms. His tools and creatures ſwarmed in every court. Leopold could not be prevented from declaring in favour of Holland; but his miniſters were bought off from ſeconding the emperor's intentions. The whole Engliſh nation exclaimed againſt the alliance of their king with France; but Charles ſtood in need of French gold to ſupply his extravagance and profligacy. The elector of Bavaria had indeed been compelled by Louis to retire to his capital; but it was by dint of intrigue that he was forced from his alliance with Holland, and conſtrained to ſign a peace with France.

While Turenne was thus employed on the Rhine, Conde having recovered of his wounds, returned to the command of the army in Holland. He beſieged and took Maeſtricht in 13 days. Having repaired the fortifications, he propoſed making himſelf maſter of ſeveral other towns; but the inundations everywhere ſtopped his courſe. All his attempts to draw off the waters were in vain; and he was forced to content himſelf with preſerving, without pretending to extend, the king's conqueſts.

Whatever glory the king might have acquired by land, certain it is that the conduct of his admirals deſerved equal praiſe with that of his generals. In little more than 12 months the French were taught the art of naval war. Before, they fought ſhip to ſhip; but underſtood nothing of thoſe evolutions by which whole fleets imitate the movements of armies. The duke of York, afterwards James II. invented the method of giving all orders at ſea by means of ſignals: this and every other part of the art the French borrowed from the Engliſh; and became ſo apt ſcholars, that they ventured to give battle to the Hollanders, the great rivals of the Engliſh on that element. Their fleet, amounting to 40 ſail, beſides fire-ſhips, joined to the Engliſh, gave battle three different times to the Dutch. De Ruyter gained additional glory in theſe engagements; and D'Eſtrees the French admiral gained the eſteem of De Ruyter.

In the mean time, Spain declared in favour of the Dutch; and prevailed upon the emperor to act more heartily in the cauſe of Holland, and defence of the liberties of Europe. The prince of Orange was reinforced by 10,000 Spaniards, ſent to him by the governor of the Low Countries. Philip had concluded a treaty with the States at the Hague, whereby he declared war againſt France, engaged the emperor to make a powerful diverſion on the Rhine, ſtipulated not to accept of peace before the Dutch had retrieved all their loſſes, and obtained from them a promiſe to liſten to no terms of accommodation before his Catholic majeſty was reinſtated in all his poſſeſſions in the Low Countries, previous to the peace of the Pyrenees. Montecuculi was ordered to advance with 30,000 men to Franconia; and Turenne, joining the troops of Colonge and Munſter, paſſed the Main, and took poſt in the electorate of Mentz. The prince of Orange receiving no impediment from Conde, who was forced on account of the inundations to repaſs the Meuſe, thought this a proper time for action, as the enemy had no conſiderable forces in the heart of the United Provinces. He ordered ſome troops to file off ſecretly to Amſterdam and Muyden; lined with infantry the intrenchments which ſecured the paſſage to Holland; and to deceive the duke of Luxemburgh, who commanded in Utrecht, ſent ſome forces by ſea to attack Bommel. The duke, not penetrating the prince's deſign, came to ſuccour the place; and William, finding his ſtratagem ſucceed, marched to Naerden, and with 25,000 men inveſted and took the place before the duke could provide for its ſecurity. Upon this ſucceſs, the Dutch took courage, fortune inclined in their favour, and in a ſhort time all the horrors of war were removed from the interior parts of the United Proivnces to the Spaniſh Netherlands. Neither the experience nor conſummate addreſs of Turenne, the genius of Vauban, or the indefatigable vigilance of Louvois, could repair the error committed in ruining the army to garriſon the conquered towns. Even Conde's fire ſeemed extinguiſhed in the waters with which the Dutch had drowned their country. Inſtead of penetrating farther, he was obliged to retreat. Turenne could not prevent the junction of Montecuculi and the prince of Orange, nor the loſs of Bonne. This junction, and the declaration of Spain, obliged the armies of France to abandon the three provinces with ſtill more rapidity than they had conquered them. The triumphal arch at St Dennis was hardly erected as a monument of Louis's victories, before the fruits of thoſe victories were relinquiſhed. In a word, the parliament of England would no longer ſuffer Charles to be the mercenary tool of France; the late ill ſucceſs cooled the elector of Cologne and the biſhop of Munſter in their friendſhip; and Louis, forſaken by all his allies, found himſelf under the neceſſity of maintaining ſingly a war againſt the empire, Spain, and the United Provinces.

United Provinces.

83 Fortune declares againſt the French.

84 State of the republic to the preſent time.

From that time the United Provinces have been diſtinguiſhed among the European nations as a very conſiderable maritime and commercial power. Their connection with Britain by the Revolution in 1688, when William III. ſtadtholder of Holland became king of this iſland, brought on a much cloſer connection between the two nations than had ever taken place before. By means of this connection, William formed a plan of humbling his great adverſary Louis XIV. who had ſo lately brought his country to the verge of ruin. For this purpoſe he renewed the war in 1689, and commanded the army in perſon. However, he was overmatched by the abilities of Luxemburg the French general; who oppoſed him, and obliged him to conclude a peace in 1697. His enmity to the French king, however, was not yet extinguiſhed. The remaining part of his life he employed in forming the moſt powerful confederacy againſt

United Provinces.

against that monarch; and so much was he wrapped in this project, that even in his dying moments it seemed to prevail over every other consideration*. His measures, however, were adopted by his successor Queen Anne; and the French monarchy had nearly sunk under the united efforts of the forces of Britain, Holland, and Germany, headed by the experienced generals Marlborough and Eugene. But at last the whole plan was disconcerted by a revolution in the British ministry; the Dutch were disappointed in the moment of their expectations, and obliged to consent to the peace of Utrecht, which left them exposed to the attempts of France as much as ever. A barrier composed of a great number of fortified towns was indeed granted them; but barriers of this kind are a slender defence against the modern improvements in war. In the war of 1739, these towns were taken one after another by Marshal Saxe, who thus revenged the exploits of the duke of Marlborough; while the Dutch and British army, commanded by the late duke of Cumberland, were driven from place to place, without being able to make one successful effort from the beginning of the war to the end of it. See BRITAIN, n° 342—429.

* See Britain, n° 339, 340.

It is probable that the bad success of this war cooled the affections of the Dutch towards Britain so much, that ever since they have acted rather as concealed enemies than friends. In the war of 1755, their attachment to France was evident; and in the last, it proceeded to such an height, as to oblige the British ministry to declare war against them. The issue of this war is still fresh in our memories. A single naval engagement was the only event of consequence that took place, and showed that both were formidable antagonists to each other.

This war was undertaken in opposition to the wishes of the stadtholder, who having been maintained in his prerogatives chiefly by the powerful influence of Britain and Prussia, could have no motive for making a rupture with the court of London. The subsequent transactions of the States-general have been related under other articles (see PRUSSIA and REVOLUTION). Having deserted the grand alliance formed against the disturbers of the peace of Europe, and the office of the stadtholder being abolished, the Dutch republic, under the name of an *ally*, is now in reality little better than a province, of France. The consequence of this alliance is what might have been expected. The British government, obliged to attack its enemies wherever it might find them, commenced hostilities against the United Provinces, and in the compass of a very short period wrested from them their most valuable possessions both in the eastern and in the western world.

85 Climate, &c. of the United Provinces.

The seven United provinces being in great part surrounded by the sea, lying low, and abounding in marshes, have a damp and unwholesome air. Rains and fogs are frequent; and the gout, scurvy, rheumatism, and agues, very common and difficult of cure. The effects of human industry here are wonderful in the dykes and dams erected for defending the country against the inundations of the sea, and in ditches, canals, mills, and sluices, for draining the marshes. The quantity of grain produced is not sufficient for home consumption; but the pastures in the marshes are so rich, that they can spare a great deal of butter and cheese for exportation. They have also a good breed of sheep, whose wool is highly valued. There is turf, madder, tobacco, some fruit, and iron; but all the pit-coal and timber used in this country, and indeed most of the necessaries of life, are imported. All the provinces either lie upon, or communicate with, the North Sea, by means of that called the *Zuyder*, or *South Sea*; which was formed partly by the Rhine's right branch, then increased by the Vecht, which has now another outlet, overflowing the low swampy grounds thro' which it passed; and partly by the sea, in the 13th century breaking in, and overflowing a large tract of ground contiguous to that before laid under water by the Rhine. The principal rivers are the Rhine, the Meuse, the Scheld, and the Vecht. The first is divided into several branches, one of which joins the Old Issel, and after that falls into the Zuyder Sea; another named the *Leck*, at the village of Krimpen, mingles with the Meuse; a third, called the *Crooked Rhine*, is branched out at Leyden into canals, of which one runs into the lake of Haerlem, and another loses itself in the sand hills between Catwyk on the Rhine, and Catwyk on the sea; and a fourth, called the *Waal*, falls into the Meuse over-against Workum. The Meuse, after dividing itself into two branches, and again uniting these, falls into the North Sea below Rotterdam. The Scheld below Antwerp divides itself into two branches, called the *Western* and *Eastern Scheld*; the first separating Flanders from Zealand; and the other, running north by Bergen-op-Zoom, and afterwards east, between the islands of Beveland and Schowen, falls into the sea a little below. The Vecht runs from east to west through the province of Overyssel, and falls into the Zuyder Sea. There are many smaller rivers that join these, and a vast number of canals; yet there are few good harbours in the provinces. The best are those of Rotterdam, Helvoetsluys, and Flushing. As to the harbour of Amsterdam, it is indeed one of the largest and safest in Europe; but there is a bar at the entrance of it, over which large vessels cannot pass without being lightened or unloaded. There are no mountains in these provinces; and the only lake, properly so called, is that of Haerlem. The provinces are extremely well cultivated, and very populous; especially that of Holland, which, in this respect, perhaps has not its equal in the universe. The towns are very agreeable, being kept clean, and having canals in the middle of the streets, planted with trees. The number of inhabitants is computed at about 2,000,000. The animals here are much the same as in England; but their horses and horned cattle are of a larger size. Storks build and hatch on their chimneys; but, being birds of passage, they leave the country about the middle of August, with their young, and return the February following. It is said there are some wild boars and wolves here; and that neither oysters nor herrings are to be found upon the coast: but of other fish they have the several sorts, both in their seas and rivers, that they have in Britain.

United Provinces.

86 Religion.

The established religion here before the Revolution was the Presbyterian, or Calvinism: none but Presbyterians were admitted into any office or post in the government, excepting the army; all religions and sects, however, were tolerated, and had their respective meetings or assemblies for public worship, among which the Papists and Jews were very numerous. Since the late alliance with France, no particular religion is established; and the phlegmatic Dutch have drunk deep of the cup of infidelity, mixed by their new and volatile allies.

There are five universities in the provinces, viz. those of Utrecht, Leyden, Franeker, Groningen, and Harderwic; but the three last are inconsiderable. The dissenters in England often send their children to these universities for education. Before the Reformation there was an archbishop at Utrecht who had for his suffragans the bishops of Deventer, Groningen, Middleburg, Haerlem, and Lewarden. The language here is a dialect of the German, but French is much spoken by the better sort.

87 Commerce, &c.

With regard to the commerce of this country, their East India company had the monopoly of the fine spices for more than 100 years, and was long the most opulent and powerful of any in the world. Though the country itself produces

United Provinces.

duces very few things, yet almoſt all the products and commodities of the globe may be found here, nearly as cheap as in the countries where they are made or produced. A vaſt variety of manufactures are carried on in the provinces, and with extraordinary ſkill and diligence; and a great number of hands are employed, and much wealth acquired, by the herring, cod, and whale fiſheries. No nation has hitherto equalled them in the curing of herrings; thoſe cured at Glaſgow, in Scotland, are thought to come neareſt to them. About 150 ſail were annually employed in the whale-fiſhery, and about 200 in the herring. The profits of the latter, in a good year, after all deductions, were thought to amount to 200,000 Holland guilders. The principal manufactures here are thoſe of linen, paper, and earthen ware of all ſorts. Ship-building alſo employs vaſt numbers of hands. The trade of this country, however, upon the whole, has long been declining; owing partly to a decline of their ancient parſimony and induſtry; but chiefly to the improvement of manufactures, trade, and navigation, in other countries; and at preſent (1796) it is almoſt annihilated.

88 Conſtitution.

The late conſtitution was ſomewhat ſingular. Moſt of the towns in the ſeveral provinces are little republics, whoſe deputies, with the nobility, compoſed the ſtates thereof; and the deputies of the provinces, in like manner, compoſed the States-general. Every town or province might ſend as many deputies as they pleaſed to the aſſemblies of the provincial ſtates, or States-general; but thoſe of each town or province had but one voice, and preſided by turns. No reſolution taken by the States-general was of any force till confirmed by the ſeveral provinces. The legiſlative power in the towns was veſted in the ſenates; and the executive in the burgomaſters, ſyndics, &c. The ſtates of the provinces were ſtyled, Noble and Mighty Lords: but thoſe of Holland, Noble and Moſt Mighty Lords: and the States-general, High and Mighty Lords, or the Lords the States-general of the United Netherlands, or their High Mightineſſes. Beſides the States-general, there was alſo a council of ſtate, conſiſting of deputies from the ſeveral provinces, making twelve in all; of which Holland ſent three; Guelderland, Zealand, and Utrecht, two a-piece; and Frieſland, Groningen, and Overyſſel, one. In this council every deputy preſided a week by turns, and the ſtadtholder had a deciſive voice when the votes happened to be equal. The principal affairs that came under their deliberation, were thoſe relating to the army and finances. The ſtadtholder was alſo preſident of the ſtates in every province, but had no ſeat in the States-general. One diſſenting voice in the provincial ſtates prevented their coming to any reſolution. See STADTHOLDER.

Such was the conſtitution of the ſeven United Provinces. They are now employed in framing for themſelves a new one, upon the plan dictated to them by their maſters the French.

With reſpect to the adminiſtration of juſtice in this country, every province has its tribunal, to which, except in criminal caſes, appeals lie from the petty and country courts; and it is ſaid, that juſtice is nowhere diſtributed with more impartiality.

89 Taxes.

The taxes in theſe provinces are ſo many, and ſo heavy, eſpecially in Holland, that it is not without reaſon aſſerted, that the only thing that has eſcaped taxation there is the air they breathe. The ordinary revenues of the republic are computed at between two and three millions Sterling annually. Out of 100 guilders, the province of Holland contributes 58; and conſequently above one half of the whole public expences. For the encouragement of trade, the duties on goods and merchandiſe are ſaid to be exceeding low.

With reſpect to their land-forces in time of peace, they ſeldom exceed 40,000, and very often fall ſhort of that number. They employ a great many foreigners in their ſervice; and in time of war hire whole regiments of Germans. Their navy, were they to enter heartily into any war, could ſoon be made formidable, as they have always vaſt quantities of timber prepared for building ſhips, and great numbers of ſhip carpenters and mariners. It is under the direction of the five admiralty colleges, who, to defray the charges thereof, levy the duties on exports and imports.

United Provinces || Univerſity.

90 Forces by ſea and land.

As to the character of the Dutch, the boors or huſbandmen are induſtrious enough, but heavy, and ſlow of underſtanding. The ſeamen are a plain, blunt, but rough, ſurly, and ill-mannered ſort of people. Their tradeſmen are ſomething ſharper, and make uſe of all their ſkill to take advantage of thoſe they deal with. Every claſs of men is extremely frugal. All appetites and paſſions run lower and cooler here than in other countries, avarice excepted. Quarrels are very rare; revenge is ſeldom heard of; and jealouſy ſcarcely ever known. It is very uncommon for any of them to be really in love, or even to pretend to it; nor do the women ſeem to care whether they are or not. People converſe pretty much upon a level here; nor it is eaſy to diſtinguiſh the man from the maſter, or the maid from the miſtreſs, ſuch liberties do they allow their ſervants, or rather are obliged to allow them; for they may not be ſtruck or corrected by them, but the diſpute muſt be left to the magiſtrate. The Dutch are tall and ſtrong built; but both men and women have the groſſeſt ſhapes that are to be met with anywhere. Their garb, except among the officers of the army and ſome few others, is exceeding plain, and the faſhions change as ſeldom as in Spain. The men are addicted to drinking, which ſome think neceſſary in this foggy air, both for their health and the improvement of their underſtandings. Among their diverſions, that of ſkating in winter is one of the chief. It is amazing to ſee the crowds in a hard froſt upon the ice, and their great dexterity in ſkating; both men and women darting along with inconceivable velocity. The Dutch are remarkable for their cleanlineſs: nothing can exceed the neatneſs of their houſes, towns, and villages. Many of them have diſtinguiſhed themſelves by their learning, and ſome even by their wit and ingenuity; witneſs Eraſmus, Grotius, &c. The Dutch excel alſo in painting and engraving; and ſome of them have been no contemptible ſtatuaries.

91 Character.

UNITY, in poetry. There are three unities to be obſerved, viz. the unity of action, that of time, and that of place. In the epic poem, the great, and almoſt the only, unity, is that of the action. Some regard indeed ought to be had to that of time; for that of place there is no room. The unity of character is not reckoned among the unities. See POETRY, Part II. Sect. 3.

UNIVERSAL, ſomething that is common to many things; or it is one thing belonging to many or all things.

UNIVERSE, a collective name, ſignifying the whole world; or the aſſemblage of heaven and earth, with all things therein. See ASTRONOMY and GEOGRAPHY.

UNIVERSITY, is the name of a corporation formed for the education of youth in the liberal arts and ſciences, and authorized to admit ſuch as have ſtudied in it, to certain *degrees* in different faculties, which not only ſerved as certificates of proficiency in ſcience, but alſo confer on thoſe who obtain them conſiderable privileges within the univerſity, as well as ſome rank in the ſtate without it. Univerſities generally comprehend within them one or more colleges: but this is not always the caſe; for the univerſity of St Andrew's was in being before either of its colleges was founded, and it would continue in being with all its

Univerſity. privileges though both its colleges were levelled with the duſt.

In every univerſity with which we are acquainted, there are four faculties, viz. *Theology*, *Law*, *Phyſic*, and the *Arts and Sciences*, comprehending mathematics, natural and moral philoſophy, &c.; and in Oxford, Cambridge, and ſome other univerſities, *Muſic* is conſidered as a fifth faculty. In each of theſe there are two degrees, thoſe of *Bachelor* and *Doctor*; for though in the univerſities of Great Britain and Ireland there is no ſuch degree as *Doctor in Arts and Sciences*, the *Maſter of Arts* anſwers to the degree of *Doctor in Philoſophy*, which is conferred by many of the univerſities on the continent.

Univerſities in their preſent form, and with their preſent privileges, are inſtitutions comparatively modern. They ſprang from the convents or regular clergy, or from the chapters of cathedrals in the church of Rome, where young men were educated for holy orders, in that dark period when the clergy poſſeſſed all the little erudition which was left in Europe. Theſe convents were ſeminaries of learning probably from their firſt inſtitution; and we know with certainty, that in Old Aberdeen there was a monaſtery in which youth were inſtructed in *theology*, the *canon law*, and the *ſchool philoſophy*, at leaſt 200 years before the univerſity and King's College were founded. The ſame was doubtleſs the caſe in Oxford and Cambridge, and probably in every town in Europe where there is now a univerſity, which has any claim to be called ancient; for it was not till the more eminent of the laity began to ſee the importance of literature and ſcience, that univerſities diſtinct from convents were founded, with the privilege of admitting to degrees, which conferred ſome rank in civil ſociety. Theſe univerſities have long been conſidered as lay corporations; but as a proof that they had the eccleſiaſtical origin which we have aſſigned to them, it will be ſufficient to obſerve, that the Pope arrogated to himſelf the right of veſting them with all their privileges; and that, prior to the Reformation, every univerſity in Europe conferred its degrees in all the faculties by authority derived from a papal bull.

It is perhaps no improbable conjecture, that the church of Rome derived her idea of academical honours from the Jews, among whom literary diſtinctions extremely ſimilar ſubſiſted before the nativity of our Saviour. Among them, the young ſtudent, with reſpect to his learning, was called a *diſciple*; from his minority a *junior*; and the *choſen* or *elected*, on account of his election into the number of diſciples. When he had made ſome progreſs in knowledge, and was deemed worthy of a degree, he was by impoſition of hands made חבר, *a companion* to a *Rabbi*, the perſon who officiates uſing this form, *I aſſociate thee*, or, *Be thou aſſociated*; and as ſoon afterwards as he was thought worthy to teach others, the *aſſociate* was raiſed to the rank of *Rabbi*. Whether this proceſs ſuggeſted the idea or not, it has certainly ſome reſemblance to that by which a young man in our univerſities paſſes through the degree of *Bachelor* to that of *Maſter of Arts* or *Doctor*.

The moſt ancient univerſities in Europe are thoſe of Oxford, Cambridge, Paris, Salamanca, and Bologna; and in the two Engliſh univerſities, the firſt founded colleges are thoſe of *Univerſity*, *Baliol*, and *Merton*, in the former, and *St Peter's* in the latter. Oxford and Cambridge, however, were univerſities, or, as they were then called, *ſtudies*, ſome hundreds of years before colleges or ſchools were built in them; for the former flouriſhed as a ſeminary of learning in the reign of Alfred the Great, and the other, could we believe its partial partizans, at a period ſtill earlier. The univerſities of Scotland are four, St Andrew's, Glaſgow, Aberdeen, and Edinburgh. In Ireland there is but one univerſity, viz. that of Dublin, founded by Queen Elizabeth, and very richly endowed. Univerſity ‖ Vocal.

An idle controverſy has been agitated, whether the conſtitution of the Engliſh or of the Scotch univerſities be beſt adapted to anſwer the ends of their inſtitution: and, as might be expected, it has been differently decided, according to the partialities of thoſe who have written on the ſubject. Were we to hazard our own opinion, we ſhould ſay, that each has its advantages and diſadvantages; and that while the Engliſh univerſities, aided by their great ſchools, to which the Scotch have nothing that can be compared, are unqueſtionably fitted to carry their young members fartheſt in the knowledge of the learned languages, the mode of teaching in the Scotch univerſities is better adapted to the promotion of arts and ſciences, and the communication of that knowledge which is of moſt importance in active life.

Univerſity-Courts, in England. The two univerſities enjoy the ſole juriſdiction, in excluſion of the king's courts, over all civil actions and ſuits whatſoever, where a ſcholar or privileged perſon is one of the parties; excepting in ſuch caſes where the right of freehold is concerned. And then by the univerſity charter they are at liberty to try and determine, either according to the common law of the land, or according to their own local cuſtoms, at their diſcretion; which has generally led them to carry on their proceſs in a courſe much conformed to the civil law.

This privilege, ſo far as it relates to civil cauſes, is exerciſed at Oxford in the chancellor's court; the judge of which is the vice-chancellor, his deputy, or aſſeſſor. From his ſentence an appeal lies to delegates appointed by the congregation; from thence to other delegates of the houſe of convocation; and if they all three concur in the ſame ſentence, it is final, at leaſt by the ſtatutes of the univerſity, according to the rule of the civil law. But if there be any diſcordance or variation in any of the three ſentences, an appeal lies in the laſt reſort to judges delegates appointed by the crown, under the great ſeal in chancery.

As to the juriſdiction of the univerſity courts in criminal matters, the chancellor's court at Oxford, and probably alſo that of Cambridge, hath authority to try all offences or miſdemeanors under the degree of treaſon, felony, or mayhem; and the trial of treaſon, felony, and mayhem, by a particular charter, is committed to the univerſity juriſdiction in another court, namely, the court of the lord high ſteward of the univerſity.

The proceſs of the trial is this. The high ſteward iſſues one precept to the ſheriff of the county, who thereupon returns a panel of 18 freeholders; and another precept to the bedells of the univerſity, who thereupon return a panel of 18 matriculated laymen, *laicos privilegio univerſitatis gaudentes*: and by a jury formed *de medietate*, half of freeholders and half matriculated perſons, is the indictment to be tried; and that in the guildhall of the city of Oxford. And if execution be neceſſary to be awarded in conſequence of finding the party guilty, the ſheriff of the county muſt execute the univerſity proceſs; to which he is annually bound by an oath.

VOCABULARY, in grammar, denotes the collection of the words of a language, with their ſignifications, otherwiſe called a *dictionary*, *lexicon*, or *nomenclature*. See Dictionary.

A vocabulary is properly a ſmaller kind of dictionary, which does not enter ſo minutely into the origin and different acceptations of words.

VOCAL, ſomething that relates to the voice or ſpeech; thus vocal muſic is that ſet to words, eſpecially verſes, and

to

Vocative ‖ Volatile.

to be performed by the voice; in contradiſtinction to inſtrumental muſic, compoſed only for inſtruments, without ſinging.

VOCATIVE, in grammar, the fifth ſtate or caſe of nouns. See GRAMMAR.

VOETIUS (Giſbert), an eminent divine of the 16th century, was profeſſor of divinity and the Oriental tongues at Utrecht, where he was alſo miniſter. He aſſiſted at the ſynod of Dort; and died in 1676, aged 87. He wrote a great number of works; and was the declared enemy of Des Cartes and his philoſophy. His followers are called *Voetians*.

Voetius had two ſons, *Daniel* and *Paul*, who alſo wrote ſeveral works. *John Voetius*, the ſon of Paul, was doctor and profeſſor of law at Herborn: he wrote a commentary on the Pandects, which is eſteemed, and other works on law.

VOICE, a ſound produced in the throat and mouth of an animal, by an apparatus of inſtruments for that purpoſe.

Voices are either articulate or inarticulate. Articulate voices are thoſe whereof ſeveral conſpire together to form ſome aſſemblage or little ſyſtem of ſounds: ſuch are the voices expreſſing the letters of an alphabet, numbers of which joined together form words. Inarticulate voices are ſuch as are not organized, or aſſembled into words; ſuch is the barking of dogs, the braying of aſſes, the hiſſing of ſerpents, the ſinging of birds, &c.

The formation of the human voice, with all the varieties thereof obſerved in ſpeech, muſic, &c. makes a very curious article of inquiry: and the apparatus and organiſm of the parts adminiſtering thereto, is ſomething exceedingly ſurpriſing. Thoſe parts are the trachea or wind-pipe, through which the air paſſes and repaſſes into the lungs; the larynx, which is a ſhort cylindrical canal at the head of the trachea; and the glottis, which is a little oval cleft or chinck left between two ſemicircular membranes ſtretched horizontally withinſide the larynx; which membranes, though capable of joining cloſe together, do generally leave an interval, either greater or leſs, between them, called the *glottis*. A particular deſcription of each part may be ſeen in ANATOMY, Part IV. Sect. 5.

VOICE, in grammar, a circumſtance in verbs, whereby they come to be conſidered as either active or paſſive, *i. e.* either expreſſing an action impreſſed on another ſubject, as, *I beat*; or receiving it from another, as, *I am beaten*. See GRAMMAR.

VOICE, in matters of election, denotes a vote or ſuffrage.

VOICE, in oratory. See DECLAMATION; READING, n° 5.; and ORATORY, n° 129—131.

VOLANT, in heraldry, is when a bird, in a coat of arms, is drawn flying, or having its wings ſpread out.

VOLATILE, in phyſics, is commonly uſed to denote a mixed body, whoſe integrant parts are eaſily diſſipated by fire or heat; but is more properly uſed for bodies whoſe parts are eaſily ſeparated from each other, and diſperſed in air.

VOLATILE Alkali, in the new French nomenclature *ammoniaca*, one of the three alkaline ſalts. It conſiſts, as Mr Berthollet and ſeveral other chemiſts have proved, of 807 parts in 1000 of azot, and 193 of hydrogen. Several experiments, publiſhed by Dr Prieſtley, led the way to this analyſis, though he himſelf did not ſee their reſult. It is chiefly procurable from animal ſubſtances by diſtillation, during which proceſs the azot and hydrogen neceſſary to its formation unite in proper proportions; it is not however procured pure by this proceſs, being mixed with oil and water, and moſtly ſaturated with carbonic acid. To ſeparate theſe ſubſtances, it is firſt combined with an acid, the muriatic for inſtance, and then diſengaged from that combination by the addition of lime or pitch. In its greateſt degree of purity it can only exiſt in a gaſſeous form, at leaſt in the common temperature of the atmoſphere. It was at firſt obtained chiefly from urine, and was therefore called *ſal urinæ*; afterwards from horns, eſpecially from thoſe of the hart, hence its name, *ſal cornu cervi*, "hart's horn." See CHEMISTRY-*Index*.

Volatiliſation, Volcano.

VOLATILISATION, the art of rendering fixed bodies volatile, or of reſolving them by fire into a fine ſubtile vapour or ſpirit which eaſily diſſipates and flies away. All bodies, even the moſt fixed, as gold, may be volatiliſed, either of themſelves, or with the admixture of ſome volatile ſubſtance or ſpirit, by diſtillation or ſublimation.

VOLCANO, a name given to burning mountains, or to vents for ſubterraneous fires.

The number of volcanoes with which we are at preſent acquainted is very conſiderable, not much leſs than 100. In Europe there are Ætna, Veſuvius, Hecla, Stromboli, Vulcano; in Aſia, one in Mount Taurus, three in Kamptſchatka, five in Japan, two in the Philippines, and a great number more ſcattered through the iſlands in the South Sea; in Africa, one in Fez, one in the iſland Bourbon, one in Fuego, one of the Cape Verd iſlands; and in America, ſeveral in the Andes, Morne Garou in St Vincent, and two diſcovered by Captain Cook on the weſtern coaſt of North America. There are others, but theſe are beſt known.

It is remarkable that all the volcanoes with which we are acquainted, four or five perhaps excepted, are ſituated at a ſmall diſtance from the ſea. Moſt of them have been burning from time immemorial; ſome few however have burſt out in our time. Volcanoes all occupy the tops of mountains, we find none of them in plains; ſome of them indeed, which are ſituated in the ocean, do not riſe much above the ſurface; but even theſe volcanoes ſeem to be the apices of mountains, the greater part of which are covered by the ſea. The ſubſtances ejected by volcanoes are fixed and inflammable air, water, aſhes, pumice ſtone, ſtones that have undergone no fuſion, and lava. The phenomena which take place during the eruptions of volcanoes have been ſo fully deſcribed already in the articles ÆTNA, HECLA, ICELAND, and VESUVIUS, that any repetition here would be unneceſſary and improper. All that remains, therefore, is to explain the cauſes of volcanoes, or, to ſpeak more properly, to mention the opinions of philoſophers concerning the cauſes of volcanoes; for the real cauſe, we are afraid, after all that has been done, remains ſtill unknown. The moſt elaborate theory that has yet appeared is that of M. Houel.*

* Voyage Pittureſque.

According to him, water is neceſſary for the formation of volcanoes. All volcanoes are near the ſea: they are even extinguiſhed when the ſea retires from them, for we can ſtill perceive the craters of volcanoes in ſeveral lofty inland mountains; which diſcover what they have been formerly. He ſuppoſes that a long ſeries of ages was neceſſary for the formation of a volcano, and that they were all formed under the ſurface of the ſea. The firſt exploſion which laid open the foundation of the deep, would poſſibly be preceded by an earthquake. The waters would be parted by a vaſt globe of burning air, which would iſſue forth with a tremendous noiſe, opening at the ſame time, a large and wide vent for the immenſe flame that was to follow; and which, as it iſſued from the bottom of the ſea, would be ſpread over its ſurface by the firſt guſt of wind which followed. A fire which was to burn through thouſands of years could not be faint or feeble when it was firſt lighted up. Its firſt eruptions therefore have undoubtedly been very violent, and the ejected matter very copious. For a long ſeries of ages it would continue to diſcharge torrents of lava from the

Suppoſed method of their formation.

boſom

boſom of its native earth; and its firſt crater would be compoſed of the fragments of the ſame earth.

Thus, according to our author, the foundations of the burning mountain would be laid in the bottom of the ſea; and even then it would have an hollow cup or crater on the top ſimilar to that which is to be found on all volcanoes at preſent. But the queſtion now very naturally occurs, by what means was the internal fire preſerved from extinction by the waters of the ocean, which muſt thus have been incumbent upon it? To this he replies, that "The fire, having diſpoſed the ſubſtances in fuſion to make an eruption, next laid open the earth, and emitted as much matter as it could diſcharge, with force ſufficient to overcome the reſiſtance of the column of water which would oppoſe its aſcent; but as the ſtrength of the fire diminiſhed, the matter diſcharged was no longer expelled beyond the mouth; but, by accumulating there, ſoon cloſed up the orifice. Thus only ſmall orifices would be left ſufficient for giving vent to the vapours of the volcano, and from which only ſmall bubbles of air could aſcend to the ſurface of the water, until new circumſtances, ſuch as originally gave occaſion to the eruption of the volcano, again took place in the bowels of the earth, and produced new eruptions either through the ſame or other mouths. The appearance of the ſea over the new formed volcano, in its ſtate of tranquillity, would then be ſimilar to what it is betwixt the iſlands of Baſilizzo and Pariaria. Columns of air-bubbles are there aſcending at the depth of more than 30 feet, and burſt on their arriving at the ſurface. This air would continue to diſengage itſelf with little diſturbance as long as it iſſues forth only in ſmall quantity, until, at the very inſtant of exploſion, when prodigious quantities, generated in the burning focus, would make their way all at once, and the ſame phenomena which originally took place would again make their appearance."

2 Why the fire is not extinguiſhed by the waters of the ocean.

3 Ebullition of the ſea by the formation of a volcano.

A volcano, while under water, cannot act preciſely as it does in the open air. Its eruptions, though equally ſtrong, cannot extend to ſo great a diſtance. The lava accumulates in greater quantity round the crater; the ſands, aſhes, and pozzolano are not carried away by the winds, but are depoſited around its edges, and prevent the marine ſubſtances which are driven that way by the waters from entering. Thus they agglomerate with theſe bodies, and thus a pyramidal mount is formed of all the materials together.

4 Action of ſubmarine volcanoes.

In this manner Mr Houel ſuppoſes that the mountain was gradually raiſed out of the ſea by the accumulation of lava, &c. at every eruption, and that the cavern of the volcano was gradually enlarged, being driven down into the bottom of the cavern by the continued action of the ſtones which the volcano is conſtantly throwing up: that it was there fuſed, and at laſt thrown out at the top of the mountain to accumulate on its ſides. Mr Houel's opinion about the volcanic fire we ſhall give in his own words.

"We cannot form any idea of fire ſubſiſting alone, without any pabulum, and unconnected with any other principle. We never behold it but in conjunction with ſome other body, which nouriſhes, and is conſumed by it. The matter in fuſion, which iſſues from the focus, is but the incombuſtible part of that which nouriſhes the fire, and into the boſom of which that active principle penetrates in ſearch of pabulum. But as the fire acts only in proportion to the facility with which it can diſſolve and evaporate, I am of opinion, that it is only the bottom of the volcano on which it acts; and that its action extends no farther than to keep theſe ſubſtances which it has melted in a conſtant ſtate of ebullition. That fuſible matter being diſcharged from the mouth of the volcano, and hardening as it is gradually cooled by the action of the air, produces that ſpecies of ſtones which are diſtinguiſhed by the name of *lavas*. This lava, even when in the focus, and in a ſtate of fluidity, muſt alſo poſſeſs a certain degree of ſolidity, on account of the gravity and denſity of its particles. It therefore oppoſes the fire with a degree of reſiſtance which irritates it, and requires, to put it into a ſtate of ebullition, a power proportioned to the bulk of the maſs.

5 Formation of lavas.

"That quantity of matter, when diſſolved by the action of the fire, muſt conſtantly reſemble any other thick ſubſtance in a ſtate of ebullition. Small exploſions are produced in various parts over the ſurface of every ſuch ſubſtance while in a ſtate of ebullition; and, by the burſting of theſe bubbles, a great number of ſmall particles are ſcattered around. This is the very proceſs carried on in the focus of a volcano, though on a ſcale immenſely more large; and the vaſt exploſions there produced expel every body which lies in their way with the utmoſt violence; nor is there any piece of lava which falls down from the upper part of the arch of weight ſufficient to reſiſt this violent centrifugal force.

6 Incredible force of volcanic exploſions.

"No eſtimate can be made of the power of theſe exploſions, but by obſerving the obſtacles they overcome, and what enormous bodies are raiſed up and thrown to an immenſe height and diſtance. Such vaſt pieces of lava are to be ſeen on the top of Veſuvius and Lipari, that the projectile force by which they have been thrown out appears altogether incredible. No perſon can harbour the leaſt ſuſpicion of their having been laid there by any human power; and the appearance of them demonſtrates that they have been ejected from the bottom of the volcano, not in a ſtate of fuſion, but coherent and ſolid. A piece of lava lies on the top of Ætna of more than a cubic fathom in bulk, and whoſe weight therefore cannot be leſs than 16 tons. What an amazing force then muſt it have required, not only to raiſe this enormous maſs from the volcanic focus, but to make it deſcribe a parabola of about a league in diameter after it had come out of the crater?

"When we conſider how much the volcanic focus is ſunk below the baſe of the mountain, that the mountain itſelf is 10,000 feet high, and that conſequently there muſt have been a power ſufficient to raiſe ſuch a maſs 12,000 feet perpendicular, the boldeſt imagination muſt be loſt in amazement.—This may ſerve to give us ſome idea of the nature of that power which operates in the foci of volcanoes; a power which is unknown and inconceivable, and may juſtly be reckoned among the myſteries of nature."

The pabulum by which the internal fire is ſupported, Mr Houel thinks to be ſubſtances contained in the mountain itſelf, together with bitumen, ſulphur, and other inflammable materials which may from time to time flow into the focus of the volcano in a melted ſtate through ſubterraneous ducts, and the exploſions he aſcribes to water making its way in the ſame manner. The water is converted into ſteam, which fills the cavern and puſhes the melted lava out of the crater; this opinion is corroborated by the copious ſmoke which always precedes an eruption. But, combined with the water, there is always a quantity of other ſubſtances, whoſe effects precede, accompany, or follow the eruptions, and produce all the various phenomena which they diſplay. The eruption of water from Ætna in the year 1775 proceeded undoubtedly from this cauſe. The ſea, or ſome of the reſervoirs in Ætna or the adjacent mountains, by ſome means diſcharged a vaſt quantity of water into the focus of the volcano. That water was inſtantly reſolved into vapour, which inſtantly filled the whole cavern, and iſſued from the mouth of the crater. As ſoon as it made its way into the open atmoſphere, it was condenſed again into water, which ſtreamed down the ſides of the mountain in a dreadful and deſtructive torrent.

7 Eruption of water from Ætna in 1775 explained.

Thus

Volcano.

Thus we have given a view of Mr Houel's theory, according to which volcanoes originally began at the bottom of the ſea; and not only the mountain, but all the adjoining country, was formed by ſucceſſive eruptions. It is rather a theory of mountains raiſed by ſubterraneous heat than of volcanoes, and does not attempt to explain the origin of the fire, which is the principal difficulty; neither does his theory account for the immenſe height to which matters are ſometimes thrown during eruptions. This indeed it is impoſſible to account for, without ſuppoſing that the reſiſtance of the air is diminiſhed. The exceſſive oppoſition of the atmoſphere to bodies moving with very great degrees of velocity has been taken notice of under the article GUNNERY. If it has ſo much effect then upon ſolid and round globes of iron, what ought it to be on irregular maſſes of rock, or ſtreams of liquid lava? Nevertheleſs, in the great eruption of Veſuvius in 1779, Sir William Hamilton informs us, that a vaſt ſtream of lava was projected to the height of at leaſt 10,000 feet above the top of the mountain. Had the air reſiſted this liquid matter as it does a cannon ball, it muſt have been daſhed in pieces almoſt as ſoon as it iſſued from the crater. Either the extreme heat of the lava, therefore, or ſome other cauſe, muſt have contributed very much to diminiſh, or rather, in a manner to annihilate the reſiſtance of the atmoſphere at that time. As for the lighter materials, though they may be ſuppoſed to be carried to a vaſt diſtance by the wind, after being projected to a great height in the air, it is inconceivable how their motion was not ſuddenly ſtopped, and they ſcattered all around the top of the volcano by the violence of the blaſt. Subſtances of this kind, when quietly carried up with ſmoke, will indeed fly to a great diſtance; for we are aſſured, that the aſhes of the great fire at London in 1666 were carried by the wind to the diſtance of 16 miles. It is therefore the leſs incredible, that thoſe of the great eruption of Veſuvius in 1779 ſhould be carried to the diſtance of 100 miles, as we are informed was the caſe.

8 Central fire ſuppoſed to be the cauſe.

To account for the volcanic fire, Dr Woodward and others have had recourſe to the hypotheſis of a central fire, to which the volcanoes are only ſo many chimneys or ſpiracles. Dr Hutton, in his theory of the earth, adopts the ſame opinion; but as it did not immediately concern the ſubject of which he treated, he evades any queſtion concerning its origin, by declaring himſelf ſatisfied of its exiſtence without any inquiry into its origin.

9 Beds of pyrites, &c.

Others, as Dr Liſter, have had recourſe to the well known experiment of the fermentation of ſulphur and iron, which will take fire when mixed in conſiderable quantity, and moiſtened with water. Pyrites, therefore, which are a natural mixture of theſe two ſubſtances, it is ſuppoſed, may naturally give riſe to volcanoes. Inſtances are indeed adduced, which undeniably prove that theſe ſubſtances will ſpontaneouſly take fire when thrown together in large heaps. Of this we have a remarkable example in the following anecdote. —"A covetous copperas maker at Deptford having bought up all the pyrites he could find, in order to ruin the trade of his neighbours, collected a vaſt quantity below a ſhed in order to ſecure them from the rain. He was ſoon, however, puniſhed for his avarice; for the pyrites began to ſmoke, glowed like red-hot coals, and melted into a kind of vitrified and partly metallic ſubſtance, grievouſly annoying the neighbourhood for a long time with the ſulphureous ſteam they emitted." Beds of pyrites, therefore, taking fire in the earth, by means of a fermentation occaſioned by water, are now generally ſuppoſed to be the cauſe of volcanoes; and the obſervation, that volcanoes are generally near the ſea, is thought to confirm this hypotheſis.

10 Great quantities of pyrites will take fire ſpontaneouſly.

When the matter is properly conſidered, however, it muſt be evident, that neither of theſe hypotheſes can anſwer the purpoſe. The central fire of Dr Woodward and others is a cauſe too magnificent even for volcanoes. If any ſuch fire is ſuppoſed, we muſt imagine a burning globe in the centre of the earth, whoſe heat is ſufficient to vitrify the moſt ſolid and refractory terreſtrial ſubſtances. But of what dimenſions are we to ſuppoſe this globe? Is it one, two, three, four, or more thouſands of miles in diameter?—Very large indeed it muſt be; for we could ſcarce ſuppoſe that ſtones could be projected even from the depth of 500 miles into the air. But even this ſuppoſition is inadmiſſible; for as the fire of volcanoes is at times exceedingly augmented from ſome cauſe or other, were this cauſe general, as it muſt be in caſe of a burning central globe, the whole number of volcanoes exiſting on earth would be in a ſtate of eruption at once. Beſides, if we were to ſuppoſe a burning globe of 7000 miles in diameter to ſuffer the leaſt dilatation throughout its vaſt bulk, which muſt be the undoubted conſequence of an augmentation of heat from any unknown cauſe, all the volcanoes in the world would not be ſufficient to give vent to it, though they ſhould ſpout forth inceſſant cataracts of lava for centuries together. A diſſolution of the whole globe muſt therefore undoubtedly take place; and though we ſhould leſſen the diameter of our burning globe by 1000 miles, our difficulties will be as far from being removed as before.

Volcano.

11 Volcanoes not occaſioned by central fire.

Volcanic fire, therefore, cannot originate from any general collection of burning materials diſperſed throughout the vaſt maſs of ſolid earth which lies betwixt the ſurface and the centre. All the volcanoes at preſent in an active ſtate would not be ſuch a vent for that fire as a tobacco-pipe would be to a glaſs-houſe furnace. We muſt have recourſe then to ſome operation by which we know that nature can kindle and extinguiſh fires occaſionally; and if we can ſuppoſe ſuch an operation to take place in the bowels of the earth, we may then reaſonably conclude, that we have diſcovered a cauſe adequate to the production of volcanoes. Such a cauſe, however, cannot be pyrites, ſulphur, or nitre, in any quantity under the ſurface of the earth. It is impoſſible that beds of pyrites can remain for thouſands of years under the ſame part of the ſurface of the earth, be occaſionally inflamed and ejected, and afterwards undergo a renovation, in order to enable them to go through a ſimilar operation. Nitre is never found in a foſſil ſtate; nor can it be inflamed in ſuch a manner as to make any conſiderable exploſion without a thorough mixture with ſulphur and charcoal; neither would all the quantity which we can ſuppoſe to exiſt under the baſe of any mountain in the world be ſufficient to give force to *one* of thoſe dreadful volleys which are diſcharged by volcanoes an hundred times in a day. Beſides, neither pyrites nor ſulphur can be inflamed without acceſs of air; which cannot take place in the bowels of the earth; for it muſt be remembered, that the firſt queſtion is concerning the means by which the fire was originally kindled. Moſt writers, however, ſeem to overlook this difficulty, and to be ſolicitous only about the immediate cauſe of the exploſive force, which is generally aſcribed to ſteam of one kind or other. Mr Houel in general calls it the force of fire, or of ſteam; though he does not enter very particularly into its nature. Mr Whitehurſt ſays, that it is the force of "fire and water, which is the primary agent in all ſuch operations of nature." He alſo gives a figure, ſhowing how, by means of confined ſteam, a jet, either of hot water, or of liquid fire, may be produced. But this applies only to a particular caſe, which we cannot ſuppoſe always to happen; but volcanoes are conſtantly attended with exploſions; nay, ſo great is the tendency of volcanic matters to this violent operation, that many ſtones have been obſerved to burſt in the air like bombs,

12 They cannot be ſet on fire by pyrites, ſulphur, or nitre.

13 Hypotheſes concerning the cauſe of the exploſive force.

14 Great tendency of volcanic matters to exploſion.

Volcano ‖ Voltaire.

bombs, after they were thrown out of the volcano; and Mr Houel even informs us, that ſuch have burſt three times during their flight. Water therefore cannot be always the cauſe of volcanic exploſions. When thrown upon melted lead, ſalts, or eſpecially copper, it explodes indeed with vaſt force. With the laſt mentioned metal it is peculiarly and incredibly violent; inſomuch, that it is ſaid that furnaces have been burſt, and buildings thrown down, by the mere circumſtance of ſome of the workmen ſpitting among the melted metal; and Mr Whitehurſt calculates the force of aqueous ſteam, when thus ſuddenly and violently heated, to be no leſs than 28 times ſtronger than inflamed gunpowder.

15 Exploſive force of water peculiar to certain circumſtances.

Many philoſophers attempt to account for the origin and continuance of volcanoes by the agency of the electric fluid; but their theory is ſo ill ſupported by facts, that we think it would be improper at preſent to take up room with detailing it. It is certain that volcanoes exhibit many electrical appearances, and that great quantities of the electrical fluid are diſcharged at every eruption. But our knowledge of electricity is ſtill too limited to draw any certain concluſion from theſe appearances.

VOLERY, a great bird-cage, ſo large that the birds have room to fly up and down in it.

VOLGA, the largeſt river in Europe, riſes in the foreſt of Volkonſki, about 80 miles from Tver, a town in Ruſſia. This noble river waters ſome of the fineſt provinces in the Ruſſian empire, and at laſt falls into the Caſpian Sea by ſeveral mouths, below Aſtracan.

VOLITION, the act of willing. See METAPHYSICS.

VOLLEY, a military ſalute, made by diſcharging a great number of fire-arms at the ſame time.

VOLONES, in Roman antiquity, ſlaves who in the Punic war voluntarily offered their ſervice to the ſtate, which is the reaſon of the appellation; upon which they were admitted to citizenſhip, as none but freemen could be ſoldiers.

VOLT, in the manege, a round or circular tread; and hence, by the phraſe *to make volts*, is underſtood a gate of two treads, made by a horſe going ſidewiſe round a centre, in ſuch a manner that theſe two treads make parallel tracts; one larger, made by the fore-feet, and another ſmaller made by the hind-feet; the croup approaching towards the centre, and the ſhoulders bearing out.

VOLTAIRE (Francis Arouet de), a celebrated French author, was born at Paris, February 20, 1694. His father, Francis Arouet, was *ancien notaire au Chatelet*, and treaſurer of the chamber of accounts; his mother, Mary-Margaret Draumart. At the birth of this extraordinary man, who lived to the age of 85 years and ſome months, there was little probability of his being reared, and for a conſiderable time he continued remarkably feeble. In his earlieſt years he diſplayed a ready wit and a ſprightly imagination; and, as he ſaid of himſelf, made verſes before he was out of his cradle. He was educated, under Father Poré, in the college of Louis the Great; and ſuch was his proficiency, that many of his eſſays are now exiſting, which, though written when he was between 12 and 14, ſhow no marks of infancy. The famous Ninon de l'Enclos, to whom this ingenious boy was introduced, left him a legacy of 2000 livres to buy him a library. Having been ſent to the equity ſchools on his quitting college, he was ſo diſguſted with the dryneſs of the law, that he devoted himſelf entirely to the muſes. He was admitted into the company of the Abbé Cheaulieu, the marquis de la Fare, the duke de Sully, the grand Prior of Vendôme, marſhal Villars, and the chevalier du Bouillon; and caught from them that eaſy taſte and delicate humour which diſtinguiſhed the court of Louis XIV. Voltaire had early imbibed a turn for ſatire; and, for ſome Philippics againſt the government, was impriſoned almoſt a year in the Baſtile. He had before this period produced the tragedy of *Oedipus*, which was repreſented in 1718 with great ſucceſs; and the duke of Orleans happening to ſee it performed, was ſo delighted, that he obtained his releaſe from priſon. The poet waiting on the duke to return thanks; "Be wiſe (ſaid the duke) and I will take care of you." "I am infinitely obliged (replied the young man); but I intreat your royal highneſs not to trouble yourſelf any further about my lodging or board."

Voltaire.

He began his *Henriade* before he was 18. Having one day read ſeveral cantos of this poem when on a viſit to his intimate friend, the young preſident de Maiſons, he was ſo teaſed with objections, that he loſt patience, and threw his manuſcript into the fire. The preſident, Henaut, with difficulty reſcued it. "Remember (ſaid Mr Henaut to him, in one of his letters) it was I that ſaved the Henriade, and that it coſt me a handſome pair of ruffles." Some years after, ſeveral copies of this poem having got abroad, while it was only a ſketch, an edition of it was publiſhed, with many chaſms, under the title of *The League*. Inſtead of fame and friends, the author gained only enemies and mortification, by this firſt edition. The bigots took fire at it, and the poet was conſidered as highly criminal for praiſing admiral Coligny and queen Elizabeth. Endeavours were even uſed to get the piece ſuppreſſed; but this ſtrange deſign proved abortive. His chagrin, on this occaſion, firſt inſpired him with the thought of viſiting England, in order to finiſh the work, and republiſh it in a land of liberty. He was right; for king George I. and more particularly the princeſs of Wales, afterwards queen of England, raiſed an immenſe ſubſcription for him. Their liberality laid the foundation of his fortune; for on his return to France in 1728, he put his money into a lottery eſtabliſhed by M. Desfortes, comptroller-general of the finances. The adventurers received a rent charge on the *Hotel-de-Ville* for their tickets: and the prizes were paid in ready money; ſo that if a ſociety had taken all the tickets, it would have gained a million of livres. He joined with a numerous company of adventurers, and was fortunate.

His *Lettres Philoſophiques*, abounding in bold expreſſions and indecent witticiſms againſt religion, having been burnt by a decree of the parliament of Paris, and a warrant being iſſued for apprehending the author in 1733, Voltaire very prudently withdrew; and was ſheltered by the marchioneſs du Chatelet, in her caſtle of Cirey, on the borders of Champagne and Lorraine, who entered with him on the ſtudy of the ſyſtem of Leibnitz, and the principia of Newton. A gallery was built, in which Voltaire formed a good collection of natural hiſtory, and made an infinite number of experiments on light and electricity. He laboured in the mean time on his Elements of the Newtonian Philoſophy, then totally unknown in France, and which the numerous admirers of Des Cartes were very little deſirous ſhould be known. In the midſt of theſe philoſophic purſuits he produced the tragedy of *Alzira*. He was now in the meridian of his age and genius, as was evident from the tragedy of *Mahomet*, firſt acted in 1741; but it was repreſented to the procureur-general as a performance offenſive to religion; and the author, by order of cardinal Fleury, withdrew it from the ſtage. *Merope*, played two years after, 1743, gave an idea of a ſpecies of tragedy, of which few models had exiſted. It was at the repreſentation of this tragedy that the pit and boxes were clamorous for a ſight of the author; yet it was ſeverely criticiſed when it came

from

Voltaire. from the preſs. He now became a favourite at court, through the intereſt of madam d'Etiole, afterwards marchioneſs of Pompadour. He was appointed a gentleman of the bed-chamber in ordinary, and hiſtoriographer of France. He had frequently attempted to gain admittance into the Academy of Sciences, but could not obtain his wiſh till 1746, when he was the firſt who broke through the abſurd cuſtom of filling an inaugural ſpeech with the fulſome adulation of Richelieu; an example ſoon followed by other academicians. From the ſatires occaſioned by this innovation he felt ſo much uneaſineſs, that he was glad to retire with the marchioneſs du Chatelet to Luneville, in the neighbourhood of king Staniſlaus. The marchioneſs dying in 1749, Voltaire returned to Paris, where his ſtay was but ſhort. The king of Pruſſia now gave Voltaire an invitation to live with him, which he accepted towards the end of Auguſt 1750. On his arrival at Berlin, he was immediately preſented with the *Order of Merit*, the *key of chamberlain*, and a *penſion* of 20,000 livres. From the particular reſpect that was paid to him, his time was now ſpent in the moſt agreeable manner; his apartments were under thoſe of the king, whom he was allowed to viſit at ſtated hours, to read with him the beſt works of either ancient or modern authors, and to aſſiſt his majeſty in the literary productions by which he relieved the cares of government. But a diſpute which aroſe between him and Maupertuis ſoon brought on his diſgrace. Maupertuis was at ſome pains to have it reported at court, that one day while general Manſtein happened to be in the apartments of M. de Voltaire, who was then tranſlating into French, The Memoirs of Ruſſia, compoſed by that officer, the king, in his uſual manner, ſent a copy of verſes to be examined, when Voltaire ſaid to Manſtein, "Let us leave off for the preſent, my friend; you ſee the king has ſent me his dirty linen to waſh, I will waſh your's another time." A ſingle word is ſometimes ſufficient to ruin a man at court; Maupertuis imputed ſuch a word to Voltaire, and ſucceeded. It was about this very time that Maupertuis publiſhed his very ſtrange Philoſophical Letters; and M. de Voltaire did not fail to heighten, with his utmoſt powers of raillery, every thing which he found, or could make, ridiculous, in the projects of M. Maupertuis, who was careful to unite his own cauſe with that of the king; Voltaire was conſidered as having failed in reſpect to his majeſty; and therefore, in the moſt reſpectful manner, he returned to the king his chamberlain's key, and the croſs of his Order of Merit: accompanied with four lines of verſe; in which he, with great delicacy, compares his ſituation with that of a jealous lover, who ſends back the picture of his miſtreſs. The king returned the key and the ribbon; but they were not followed by an immediate reconciliation. Voltaire ſet out to pay a viſit to her highneſs the ducheſs of Gotha, who honoured him with her friendſhip as long as ſhe lived. While he remained at Gotha, Maupertuis employed all his batteries againſt him: Voltaire was arreſted by the king's orders, but afterwards releaſed.

He now ſettled near Geneva; but afterwards being obliged to quit that republic, he purchaſed the caſtle of Ferney in France, about a league from the lake of Geneva. It was here that he undertook the defence of the celebrated family of Calas; and it was not long before he had a ſecond opportunity of vindicating the innocence of another condemned family of the name of *Sirven*. It is ſomewhat remarkable, that in the year 1774, he had the third time a ſingular opportunity of employing that ſame zeal which he had the good fortune to diſplay in the fatal cataſtrophe of the families of Calas and Sirven.

In this retreat M. Voltaire continued long to enjoy the pleaſures of a rural life, accompanied with the admiration of a vaſt number of wits and philoſophers throughout all Europe. Wearied at length, however, with his ſituation, or yielding to the importunities of friends, he came to Paris about the beginning of the year 1778, where he wrote a new tragedy called *Irene*. By this time his underſtanding ſeems to have been impaired, either through the infirmities of age, or continued intoxication by the flattery of others; and he ridiculouſly ſuffered himſelf to be crowned in public with laurel, in teſtimony of his great poetical merit. He did not long ſurvive this farce: for having overheated himſelf with receiving viſits, and exhauſted his ſpirits by ſupplying a perpetual fund of converſation, he was firſt ſeized with a ſpitting of blood: and at laſt becoming reſtleſs in the night-time, he was obliged to uſe a ſoporific medicine. Of this he unluckily one night took ſo large a doſe, that he ſlept 36 hours, and expired a very ſhort time after awaking from it.

Volume Voluta.

VOLUME, in matters of literature, a book or writing of a juſt bulk to be bound by itſelf. The name is derived from the Latin *volvere*, "to roll up;" the ancient manner of making up books being in rolls of bark or parchment. See Book.

VOLUNTARY, in muſic, a piece played by a muſician extempore, according to his fancy. This is often uſed before he begins to ſet himſelf to play any particular compoſition, to try the inſtrument, and to lead him into the key of the piece he intends to perform.

VOLUNTEERS, perſons who, of their own accord, either for the ſervice of their prince, or out of the eſteem they have for their general, ſerve in the army without being inliſted, to gain honour and preferment, by expoſing themſelves in the ſervice.

Such are the volunteers who have been long known in the army; but the preſent age has witneſſed whole regiments of volunteers arming themſelves for a ſtill more laudable purpoſe. In conſequence of thoſe democratical principles which, in 1793, had been imported into Scotland from the Jacobins of France, a number of gentlemen in Edinburgh, eminent for their rank and reſpectability of character, aſſociated themſelves for the purpoſe of preſerving the internal peace of the city. Making their object known to government, they were, in 1794, embodied in a regiment, called The Royal Edinburgh Volunteers, with officers appointed by his majeſty; and ſo aſſiduous were they in learning the exerciſe of the army, that, without incurring the imputation of national prejudice, we may venture to affirm, that there is not in the king's ſervice a regiment better diſciplined or more alert in their evolutions than the Edinburgh Volunteers, who conſiſt of lawyers, phyſicians, and opulent tradeſmen, attached to their king and the conſtitution of their country. They amount at preſent (1796) to 850. The example of the metropolis was quickly followed by many of the other towns of Scotland; and in Glaſgow, Aberdeen, Stirling, and Perth, &c. there are now volunteer regiments, which have certainly contributed to preſerve the internal peace of the country, and are prepared to repel any foreign invaſion ſhould an enterprize ſo daring be ever attempted. Similar armaments have been formed, we believe, in many of the towns in England: and Great Britain, at preſent, can boaſt a mighty force, which, without receiving the pay of ſoldiers, is ready to fight *pro aris et focis*.

VOLVOX, in zoology; a genus of animals belonging to the order of *vermes infuſoriæ*. The body is round, ſimple, and pellucid. There are ten ſpecies, all of which live in water.

VOLUSENUS See Wilson.

VOLUTA in natural hiſtory; a genus of animals belonging

Volute ‖ Voſſius.

longing to the claſs and order of *vermes teſtacea*. There are 144 ſpecies. The animals are of the ſlug kind; the ſhell is unilocular and ſpiral; the aperture narrow and without a beak: the columella plaited.

VOLUTE, in architecture, a kind of ſpiral ſcroll uſed in the Ionic and Compoſite capitals, whereof it makes the principal characteriſtic and ornament.

VOMICA, in medicine, an abſceſs of the lungs. See MEDICINE, n° 186.

Nux Vomica, in pharmacy, a flat compreſſed round fruit, of the breadth of a ſhilling, or ſomewhat more, and of about the thickneſs of a crown-piece.

It is the nucleus of a fruit of an Eaſt-Indian tree, the wood of which is the *lignum columbrinum* of the ſhops.

Some have preſcribed ſmall doſes of the nux vomica as a ſpecific againſt a gonorrhœa, and others againſt quartan agues. But we have ſo many good and ſafe medicines for all theſe purpoſes, that there ſeems no occaſion for our having recourſe to ſuch as theſe, which ſhow ſo many ſigns of miſchief.

VOMIT. See EMETIC.

VOMITING, a retrograde ſpaſmodic motion of the muſcular fibres of the œſophagus, ſtomach, and inteſtines, attended with ſtrong convulſions of the muſcles of the abdomen and diaphragm; which, when gentle, create a nauſea; when violent, a vomiting.

VOORN, one of the iſlands of Holland, bounded by the river Maes, which divides it from the continent and the iſland of Iſlemunde, on the north; by the ſea called the *Bies-boſch*, on the eaſt; by another branch of the Maes, which divides it from the iſlands of Goree and Overflackee, on the ſouth; and by the German ſea on the weſt; being about 24 miles long, and 5 broad.

VORTEX, in meteorology, a whirlwind, or ſudden, rapid, and violent motion of the air in gyres, or circles.

Vortex is alſo uſed for an eddy or whirlpool; or a body of water, in certain ſeas or rivers, which run rapidly around, forming a ſort of cavity in the middle.

VORTEX, in the Carteſian philoſophy, is a ſyſtem or collection of particles of matter moving the ſame way, and round the ſame axis.

VORTICELLO. See MICROSCOPE, Vol. XI. page 745.

VOSSIUS (John Gerard), one of the moſt learned and laborious writers of the 17th century, was of a conſiderable family in the Netherlands; and was born in 1577, in the Palatinate, near Heidelberg, at a place where his father, John Voſſius was miniſter. He became well ſkilled in polite literature, hiſtory, and ſacred and profane antiquities, and was made director of the college of Dort. He was at length made profeſſor of eloquence and chronology at Leyden, from whence he was called in 1633 to Amſterdam, to fill the chair of a profeſſor of hiſtory. He died in 1649. He wrote many learned works, of which a complete edition has been printed at Amſterdam, in 9 vols folio.

Vossius (Iſaac), a man of great parts and learning, the ſon of John Gerard Voſſius, was born at Leyden in 1618. He had no other tutor but his father, and employed his whole life in ſtudying: his merit recommended him to a correſpondence with queen Chriſtina of Sweden; he made ſeveral journeys into Sweden by her order, and had the honour to teach her the Greek language. In 1670 he came over to England, where king Charles made him canon of Windſor; though he knew his character well enough to ſay, That there was nothing that Voſſius refuſed to believe, excepting the Bible. He appears indeed by his publications, which are neither ſo uſeful nor ſo numerous as his father's, to have been a moſt credulous man, while he afforded many circumſtances to bring his religious faith in queſtion, He died at Windſor caſtle in 1688.

Vote ‖ Upupa.

VOTE, the ſuffrage or reſolve of each of the members of an aſſembly, where any affair is to be carried by a majority; but more particularly uſed for the reſolves of the members of either houſe of parliament.

VOTIVE MEDALS, thoſe on which are expreſſed the vows of the people for the emperors or empreſſes. See MEDAL.

VOW, a ſolemn and religious promiſe or oath. See OATH.

The uſe of vows is found in moſt religions. They make up a conſiderable part of the Pagan worſhip, being made either in conſequence of ſome deliverance, under ſome preſſing neceſſity, or for the ſucceſs of ſome enterprize. Among the Jews, all vows were to be voluntary, and made by perſons wholly in their own power; and if ſuch perſon made a vow in any thing lawful and poſſible, he was obliged to fulfil it. If he appointed no particular time for accompliſhing his vow, he was bound to do it inſtantly, leſt by delay he ſhould prove leſs able, or be unwilling, to execute his promiſe. Among the Romaniſts, a perſon is conſtituted a religious by taking three vows; thoſe of poverty, chaſtity, and obedience.

Vows, among the Romans, ſignified ſacrifices, offerings, preſents, and prayers made for the Cæſars, and emperors, particularly for their proſperity and the continuance of their empire. Theſe were at firſt made every 5 years, then every 15, and afterwards every 20, and were called *quinquennalia*, *decennalia*, and *vincennalia*.

VOWEL, in grammar, a letter which affords a complete ſound of itſelf, or a letter ſo ſimple as only to need a bare opening of the mouth to make it heard, and to form a diſtinct voice. The vowels are ſix in number, *viz*, A, E, I, O, U, Y.

Vowel (John). See HOOKER.

UPHOLSTER, UPHOLSTERER, or *Upholder*, a tradeſman that makes beds, and all ſorts of furniture thereunto belonging, &c.

UPLAND, denotes high ground, or, as ſome call it, *terra firma*, by which it ſtands oppoſed to ſuch as is mooriſh, marſhy, or low.

UPLAND, a province of Sweden, bounded on the north-eaſt by the Baltic Sea, on the ſouth by the ſea of Sudermania, and on the weſt by Weſtmania and Geſtricia, from which it is ſeparated by the river Dela. It is about 70 miles in length and 45 in breadth, and contains mines of iron and lead. Stockholm is the capital.

UPSAL, a rich and conſiderable city of Sweden, in Upland, with a famous univerſity, and an archbiſhop's ſee. The town is pretty large, and as ſtraight as a line; but moſt of the houſes are of wood, covered with birch-bark, with turf on the top. On an eminence, to the ſouth of the town, is a ruined caſtle. Thoſe that view the town from hence would take it to be a garden, whoſe ſtreets repreſent the alleys; and the houſes, which are covered with turf, the graſs-plats. It was formerly the reſidence of the kings, and is now the uſual place where they are crowned. It is ſeated on the river Sala, over which there are two bridges. It is 27 miles north-weſt of Stockholm. E. Long. 17. 48. N. Lat. 59. 52.

UPUPA, in ornithology; a genus belonging to the order of *picæ*. The beak is arcuated, convex, and ſomething blunt; the tongue is obtuſe, triangular, entire, and very ſhort; and the feet are fitted for walking. There are ten ſpecies; one of which, the *epops*, hoopoe, or dung-bird, is frequently ſeen in Britain. It may be readily diſtinguiſhed from all others that viſit this iſland by its beautiful creſt, which it can erect

Ur ‖ Uranium.

or depreſs at pleaſure. It is in length 15 inches; the bill is black, two inches and a half long, ſlender, and incurvated; the irides are hazel: the creſt conſiſts of a double row of feathers; the higheſt about two inches long; the tips are black, their lower part of a pale orange colour: the neck is of a pale reddiſh brown; the breaſt and belly white; the leſſer coverts of the wings are of a light brown; the back, ſcapulars, and wings, croſſed with broad bars of white and black; the rump is white; the tail conſiſts of only 10 feathers, white marked with black, in form of a creſcent, the horns pointing towards the end of the feathers. The legs are ſhort and black; the exterior toe is cloſely united at the bottom to the middle toe.

According to Linnæus, it takes its name from its note, which has a ſound ſimilar to the word; or it may be derived from the French *huppe*, or "creſted:" it breeds in hollow trees, and lays two aſh-coloured eggs: it feeds on inſects, which it picks out of ordure of all kinds. Dr Pallas affirms, that it breeds in preference in putrid carcaſes; and that he had ſeen the neſt of one in the privy of an uninhabited houſe, in the ſuburbs of Tzaritſyn.

Ovid ſays that Tereus was changed into this bird:

Vertitur in volucrem, cui ſtant in vertice criſtæ,
Prominet immodicum pro longa cuſpidæ roſtrum:
Nomen epops volucri. Metam. lib. vi. l. 672.

Tereus, through grief and haſte to be reveng'd,
Shares the like fate, and to a bird is chang'd.
Fix'd on his head the creſted plumes appear.
Long is his beak, and ſharpen'd as a ſpear. *Croxall.*

UR (anc. geog.), a citadel of Meſopotamia, ſituated between the Tigris and Niſibis; taken by ſome for Ur of the Chaldees, the reſidence of Abraham. What ſeems to confirm this is, that from Ur to Haran, the other reſidence of the patriarch, the road lies directly for Paleſtine. And it is no objection that Ur is ſaid to be in Meſopotamia; becauſe the parts next the Tigris were occupied by the Chaldeans, as ſeems to be confirmed from Acts vii. 2, 4. It is called *Orche*, in Strabo; *Orchoe*, in Ptolemy.

URALLIAN Chain, a range of mountains which form part of the boundaries of Aſia, and anciently known by the name of *Riphæi Montes*. See *Riphæi Montes*, &c.

URANIA, in fabulous hiſtory, one of the nine Muſes, was ſuppoſed to preſide over aſtronomy. She is commonly repreſented in an azure robe, crowned with ſtars, and ſupporting a large globe with both hands.

URANIUM, a foſſil found at Johangeorgenſtad in Saxony, and at Joachimſtal in Bohemia, and is, by the miners, called *Pechblend*. M. Werner, a German mineralogiſt, being convinced that it was not a blend, gave it the name of *Ferrum Ochraceum Piceum*, and thought it contained the tungſtic acid combined with iron: but M. Klaproth is of a contrary opinion, and maintains that it is very different from wolfram. There are (he ſays) two varieties of pechblend: the one is of a dark grey colour, with very little brilliancy, the particles of which have the form of a flattened conchoid; it is not very hard, and, when triturated, becomes a black powder: its mean ſpecific gravity is 7, 5. The other is diſtinguiſhed by its black colour, though it ſometimes aſſumes a reddiſh tint: its ſurface is more brilliant than that of the former, and reſembles pit-coal; it is alſo leſs hard; and the black powder, to which it is reduced by trituration, has a greeniſh hue. This kind is generally diſcovered in compact maſſes, lying between ſtrata of a-micaceous ſchiſt, which is found to be decompounded. In the internal parts of this ſtone, it is not uncommon to meet with veins of a peculiar yellow metallic earth. The pechblend is ſoluble in the nitric and in the nitro-muriatic acids, partially ſo in the muriatic, but not at all in the ſulphuric. From theſe ſolutions, the unſaturated ferruginous pruſſiat of potaſh, or phlogiſticated alkali, precipitates the metallic ſubſtance, which then reſembles kermes mineral in colour. This, when it does not unite in flakes, but is uniformly diffuſed in the ſolution, may be conſidered as one of the moſt diſtinguiſhing characters of the pechblend; another is, that the precipitates, affected by the volatile and fixed alkalis, are yellow; the fixed cauſtic alkalis giving it a lemon colour, the aerated a like yellow. This yellow oxyd, or calx, cannot be fuſed with alkalis. As this foſſil cannot be claſſed either among the zinc or iron ores, and is very different from tungſtein, M. Klaproth propoſes to give to it the appellation of *Uranium*; and he diſtributes it into the following ſpecies:

Uranoſcopus ‖ Urinal

1. *Uranium ſulphuratum.* (*a*) Dark gray, often exhibiting traces of Galena. (*b*) Black, reſembling pit-coal.
2. *Uranium Ochraceum.* Brimſtone colour, lemon colour, deep yellow, reddiſh brown.
3. *Uranium Spathoſum.* (*a*) Tinged with green by copper. (*b*) Yellow. This is the green mica or chalcolithe.

URANOSCOPUS, in ichthyology, a genus of fiſhes belonging to the order of *jugulares*. The head is large, rough, and depreſſed, the upper jaw being ſhorter than the under one; there are ſix dentated rays in the membrane of the gills; and the anus is in the middle of the body. There are two ſpecies, one of which is found in the Mediterranean Sea.

Raphael d'URBINO. See Raphael.

URCHIN, in zoology. See Echinus.

URETERS, in anatomy. See Anatomy, n° 101.

URETHRA, in anatomy. See Anatomy, n° 107.

URIM *and* Thummim, among the ancient Hebrews, a certain oracular manner of conſulting God, which was done by the high prieſt dreſſed in his robes, and having on his pectoral or breaſt-plate.

Various have been the ſentiments of commentators concerning the urim and thummim. Joſephus, and ſeveral others, maintain, that it meant the precious ſtones ſet in the high-prieſt's breaſt-plate, which by extraordinary luſtre made known the will of God to thoſe who conſulted him. Spencer believes that the urim and thummim were two little golden figures ſhut up in the pectoral as in a purſe, which gave reſponſes with an articulate voice. In ſhort, there are as many opinions concerning the urim and thummim as there are particular authors that wrote about them. The ſafeſt opinion, according to Broughton, ſeems to be, that the words *urim* and *thummim* ſignify ſome divine virtue and power annexed to the breaſt-plate of the high-prieſt, by which an oraculous anſwer was obtained from God when he was conſulted by the high-prieſt; and that this was called *urim* and *thummim*, to expreſs the clearneſs and perfection which theſe oracular anſwers always carried with them; for urim ſignifies "light," and thummim "perfection:" theſe anſwers not being imperfect and ambiguous, like the heathen oracles, but clear and evident. The uſe made of the urim and thummim was to conſult God in difficult caſes relating to the whole ſtate of Iſrael; and ſometimes in caſes relating to the king, the ſanhedrim, the general of the army or ſome other great perſonage.

URINAL, in medicine, a veſſel fit to receive and hold urine, and uſed accordingly for the convenience of ſick perſons. It is uſually of glaſs, and crooked; and ſometimes it is filled with milk, to aſſuage the pain of the gravel.

Urinal, in chemiſtry, is an oblong glaſs veſſel, cloſed for making ſolutions, and ſo called from its reſemblance to the glaſſes in which urine is ſet to ſettle for the inſpection of the phyſicians.

Urine ‖ Urſus.

URINE, a ſerous and ſaline fluid, ſeparated from the blood, and carried by the emulgent arteries to the kidneys, from whence it deſcends to the bladder by the ureters, and is from time to time emitted thence by the canal of the urethra. See ANATOMY, n° 107. For the analyſis of urine, ſee CHEMISTRY.

URN, a kind of vaſe, of a roundiſh form, but biggeſt in the middle, like the common pitchers, now ſeldom uſed but in the way of ornament over chimney-pieces, in buffets, &c. The great uſe of urns among the ancients, was to preſerve the aſhes of the dead after they were burnt; for which reaſon they were called *cineraria*, and *urnæ cinerariæ*, and were placed ſometimes under the tomb-ſtone whereon the epitaph was cut; and ſometimes in vaults in their own houſes. Urns were alſo uſed at their ſacrifices to put liquid things in.

UROGALLUS, in ornithology. See TETRAO.

URSA, in aſtronomy, the name of two conſtellations in the northern hemiſphere.

URSULINES, in church hiſtory, an order of nuns, founded originally by St Angela of Breſcia, in the year 1537; and ſo called from St Urſula, to whom they were dedicated.

URSUS, the BEAR; a genus of quadrupeds belonging to the order of *feræ*. There are ſix fore-teeth in the upper jaw, alternately hollow in the inſide, and ſix in the under jaw, the two lateral ones being lobated. The dog-teeth are ſolitary and conical; the eyes are furniſhed with a nictitating membrane; the noſe is prominent; and there is a crooked bone in the penis. There are eight ſpecies; the principal of which are,

1. *Arctos*, the black bear, has ſtrong, thick, and clumſy limbs; very ſhort tail; large feet; body covered with very long and ſhaggy hair, various in its colour: the largeſt are of a ruſty brown; the ſmalleſt of a deep black: ſome from the confines of Ruſſia black, mixed with white hairs, called by the Germans, *ſilver bear*; and ſome (but rarely) are found in Tartary of a pure white. It inhabits the north parts of Europe and Aſia; the Alps of Switzerland, and Dauphine; Japan and Ceylon; North America and Peru. The brown bears are ſometimes carnivorous, and will deſtroy cattle, and eat carrion; but their general food is roots, fruits, and vegetables: they will rob the fields of peaſe; and when they are ripe, pluck great quantities up, beat the peaſe out of the huſks on ſome hard place, eat them, and carry off the ſtraw: they will alſo, during winter, break into the farmer's yard, and make great havock among his ſtock of oats; they are alſo particularly fond of honey. The fleſh of a bear in autumn, when they are exceſſively fat, by feeding on acorns, and other maſt, is delicate food; and that of the cubs ſtill finer; but the paws of the old bears are reckoned the moſt exquiſite morſel; the fat white, and very ſweet; the oil excellent for ſtrains and old pains. The latter end of autumn, after they have fattened themſelves to the greateſt degree, the bears withdraw to their dens, where they continue for a great number of days in total inactivity and abſtinence from food, having no other nouriſhment than what they get by ſucking their feet, where the fat lodges in great abundance; their retreats are either in cliffs of rocks, in the deepeſt receſſes of the thickeſt woods, or in the hollows of ancient trees, which they aſcend and deſcend with ſurpriſing agility: as they lay in no winter-proviſions, they are in a certain ſpace of time forced from their retreats by hunger, and come out extremely lean: multitudes are killed annually in America, for the ſake of their fleſh or ſkin; which laſt makes a conſiderable article of commerce.

2. *Maritimus*, the polar or white bear, has a long head and neck; ſhort round ears; great teeth; the hair long, ſoft, and white, tinged in ſome parts with yellow: growing to a vaſt ſize; the ſkins of ſome being 13 feet long. See Plate DX. fig. 3. Urſus.

This animal is confined to the coldeſt part of the globe; it has been found as far as navigators have penetrated northwards, above lat. 80. The frigid climes only ſeem adapted to its nature; for we do not learn from any authority that it is met with farther ſouth than Newfoundland. Its bounds in reſpect to longitude are alſo very limited; being an animal unknown except on the ſhores of Hudſon's Bay, Greenland, and Spitzbergen, on one ſide, and thoſe of Nova Zembla on the other; for ſuch as have appeared in other parts have been brought there involuntarily on floating iſlands of ice; ſo that the intermediate countries of Norway and Iceland are acquainted with them but by accident. We cannot trace them farther eaſt than Nova Zembla; though the frozen ſea, that is continued from thence as far as the land of Tſchukſchi, that lies above Kamtſchatka, is equally ſuited to their nature. The late hiſtories of thoſe countries are ſilent in reſpect to them.

During ſummer, the white bears are either reſident on iſlands of ice, or paſſing from one to another: they ſwim admirably, and can continue that exerciſe ſix or ſeven leagues, and dive with great agility. They bring two young at a time: the affection between the parents and them is ſo ſtrong, that they would die rather than deſert one another. Their winter retreats are under the ſnow, in which they form deep dens, ſupported by pillars of the ſame. They feed on fiſh, ſeals, and the carcaſes of whales, and on human bodies, which they will greedily tear up: they ſeem very fond of human blood; and are ſo fearleſs as to attack companies of armed men, and even to board ſmall veſſels. When on land, they live on birds and their eggs; and allured by the ſcent of ſeals fleſh, often break into and plunder the houſes of the Greenlanders: their greateſt enemy in the brute creation is the morſe, with whom they have terrible conflicts, but are generally worſted, the vaſt teeth of the former giving it a ſuperiority. The fleſh is white, and ſaid to taſte like mutton: the fat is melted for train-oil, and that of the feet uſed in medicine: but the liver is very unwholeſome, as three of Barentz's ſailors experienced, who fell dangerouſly ill on eating ſome of it boiled. One of this ſpecies was brought over to England a few years ago; it was very furious, almoſt always in motion, roared loud, and ſeemed very uneaſy, except when cooled by having pailfulls of water poured on it.

3. The *luſcus*, or wolverene, has a black ſharp pointed viſage; ſhort rounded ears, almoſt hid in the hairs; the ſides of a yellowiſh brown, which paſſes in form of a band quite over the hind-part of the back, above the tail; the legs are very ſtrong, thick and ſhort, of a deep black: the whole body is covered with very long and thick hair, which varies in colour according to the ſeaſon. It inhabits Hudſon's Bay and Canada, as far as the ſtraits of Michilimackinac; is found under the name of the *glutton* in the north parts of Europe and Aſia, being a native of the moſt rigorous climates.

It is a moſt voracious animal, and ſlow of foot; ſo is obliged to take its prey by ſurpriſe. In America it is called the *beaver-eater*, watching thoſe animals as they come out of their houſes, and ſometimes breaking into their habitations, and devouring them. It often lurks on trees, and falls on the quadrupeds that paſs under; will faſten on the horſe, elk, or ſtag, and continue eating a hole in its body, till the animal falls down with the pain; or elſe will tear out its eyes: no force can diſengage it; yet ſometimes the deer in their agony have been known to deſtroy it, by running their

Urſus. Urtica.

their head violently againſt a tree. It devours the iſatis, or white fox; ſearches for the traps laid for the ſables and other animals; and is often beforehand with the huntſmen, who ſuſtain great loſſes by the glutton: authors have pretended that it feeds ſo voraciouſly, that at length it is in danger of burſting; and that it is obliged to eaſe itſelf of its load, by ſqueezing it out between two trees.

In a wild ſtate, it is vaſtly fierce; a terror to both wolf and bear, which will not prey on it when they find it dead, perhaps on account of its being ſo very fetid, ſmelling like a pole-cat: it makes a ſtrong reſiſtance when attacked; will tear the ſtock from the gun, and pull the traps it is caught in to pieces. Notwithſtanding this, it is capable of being tamed, and of learning ſeveral tricks. It burrows, and has its den under ground. The ſkin is ſold in Siberia for 4s. or 6s.; at Jakutſk for 12s.: and ſtill dearer at Kamtſchatka, where the women dreſs their hair with its white paws, which they eſteem a great ornament. The fur is greatly eſteemed in Europe: that of the north of Europe and Aſia, whoſe ſkins are ſometimes to be ſeen in the furrier's ſhops, is much finer, blacker, and more gloſſy than that of the wolverene, or American kind. The glutton has by ſome authors been confounded with the hyæna.

4. The *lotor*, or raccoon, has the upper part of the body covered with hair, aſh-coloured at the root, whitiſh in the middle, and tipped with black; tail very buſhy, annulated with black; toes black, and quite divided.—It inhabits the warm and temperate parts of America; is found alſo in the mountains of Jamaica, and in the iſles of Maria, between the ſouth point of California and Cape Corientes, in the South Sea: is eaſily made tame, very good-natured, and ſportive; but as unlucky as a monkey. It is almoſt always in motion; and very inquiſitive, examining every thing with its paws. It makes uſe of them as hands; ſits up to eat; is extremely fond of ſweet things, and ſtrong liquors, and will get exceſſively drunk. It has all the cunning of a fox; and is very deſtructive to poultry; but will eat all ſorts of fruits, green corn, &c. At low water it feeds much on oyſters, and will watch their opening, and with its paw ſnatch out the fiſh; it ſometimes is caught in the ſhell, and kept there till drowned by the coming in of the tide: it is alſo fond of crabs. It climbs very nimbly up trees. It is hunted for its ſkin; the fur is next to that of the beaver for making hats.

5. The *meles*, or common badger, is an animal of a very clumſy make, with ſhort thick legs, long claws on the fore feet, and a fetid white matter exuding from the orifice below the tail. It inhabits moſt parts of Europe, as far north as Norway and Ruſſia, and the ſtep or deſert beyond Orenburgh, in the Ruſſian Aſiatic dominions, north of the Caſpian Sea: inhabits alſo China, and is often found in the butchers ſhops in Pekin, the Chineſe being fond of them; but a ſcarce animal in moſt countries. It ſeldom appears in the day; confines itſelf much to its hole; is indolent and ſleepy; generally very fat; feeds by night; eats roots, fruits, graſs, inſects, and frogs; but is not carnivorous: it runs ſlowly; when overtaken, it comes to bay, and defends itſelf vigorouſly; its bite is dangerous. It burrows under ground; makes ſeveral apartments, but forms only one entrance from the ſurface. It is hunted during night for the ſkin, which ſerves for piſtol furniture; the hairs for making bruſhes to ſoften the ſhades in painting. Its fleſh makes good bacon.

URTICA, in botany: A genus of plants of the claſs of *monœcia*, and order of *tetrandria*; and in the natural ſyſtem claſſed under the 53d order, *Scabridæ*. The ſmall flower has a calyx of four leaves; no corolla; a nectarium minute, central, urn faſhioned. The female a bivalve calyx; and a ſingle, oval, gloſſy ſeed. There are 28 ſpecies; three of which are Britiſh plants. Urtica ‖ Uſher.

1. The *pilulifera*, Roman nettle, has a ſtalk branched, two or three feet high. Leaves oppoſite, oval, ſerrated, ſtinging. Fruit globoſe.

2. The *urens*, leſs ſtinging nettle, has a ſtem a foot high. Leaves roundiſh, deeply ſerrated, oppoſite, burning. The ſtings are very curious microſcopic objects: they conſiſt of an exceedingly fine pointed, tapering, hollow ſubſtance, with a perforation at the point, and a bag at the baſe. When the ſpring is preſſed upon, it readily perforates the ſkin, and at the ſame time forces up ſome of the acrimonious liquor contained in the bag into the wound.

3. The *dioica*, common nettle, has a ſquare firm ſtem, three or four feet high. Leaves heart-ſhaped, long-pointed, ſerrated, beſet with ſtings. Flowers in long catkins. The aculei, or ſtings of the nettle, have a ſmall bladder at their baſe full of a burning corroſive liquor: when touched, they excite a bliſter, attended with a violent itching pain, though the ſting does not appear to be tubular, or perforated at the top, nor any viſible liquor to be infuſed into the puncture made by it in the fleſh. It ſeems certain, however, that ſome of this liquor is inſinuated into the wound, though inviſibly, ſince the ſtings of the dried plant excite no pain.

Nettle-tops in the ſpring are often boiled and eaten by the common people inſtead of cabbage-greens.

In Arran, and other iſlands, a rennet is made of a ſtrong decoction of nettles: a quart of ſalt is put to three pints of the decoction, and bottled up for uſe. A common ſpoonful of this liquor will coagulate a large bowl of milk very readily and agreeably. The ſtalks of nettles are ſo like in quality to hemp, that in ſome parts of Europe and Siberia they have been manufactured into cloth, and paper has been made of them. The whole plant, particularly the root, is eſteemed to be diuretic, and has been recommended in the jaundice and nephritic complaints. It is alſo reckoned aſtringent; and of ſervice in all kinds of hæmorrhagies, but is at preſent but little in practice. The roots boiled will dye yarn of a yellow colour. The larvæ, or caterpillars of many ſpecies of butterflies, feed on the green plant; and ſheep and oxen will readily eat the dried.

Urtica Marina. See *Animal-Flower*.

USANCE, in commerce, is a determined time fixed for the payment of bills of exchange, reckoned either from the day of the bills being accepted, or from the day of their date; and thus called becauſe regulated by the uſage and cuſtom of the places whereon they are drawn.

USE, in law, the profit or benefit of lands and tenements; or a truſt and confidence repoſed in a perſon for the holding of lands, &c. that he to whoſe uſe the truſt is made ſhall receive the profits.

USHANT, an iſland of France, 15 miles weſt of the coaſt of Britanny, at the entrance of the Britiſh Channel.

USHER (James), archbiſhop of Armagh, one of the moſt illuſtrious prelates in the 17th century, as well with reſpect to his piety and other virtues, as his uncommon erudition, was born in Dublin in 1580, and it is ſaid that two of his aunts taught him to read, though they were both born blind. Dublin college being finiſhed in 1593, he was one of the three firſt ſtudents admitted into it. He made ſo ſwift a progreſs in his ſtudies, that at 18 years of age he was able to diſpute with Henry Fitz-Simon, a famous Jeſuit, who challenged all the Proteſtant clergy; and defended his cauſe ſo well in the caſtle of Dublin, that he made him repent his challenge. He was ordained prieſt in 1601, and ſoon after was appointed to preach conſtantly before the court at Chriſt-church in Dublin, on Sundays in the afternoon. In 1603, he was ſent over to England with Dr Luke

Challoner,

Uſher, Uſk.

Challoner, in order to purchaſe books for the library of Dublin. In 1607, he took the degree of bachelor of divinity; ſoon after, he was made chancellor of St Patrick's cathedral, and the ſame year was choſen profeſſor of divinity, when he made choice of Bellarmine's controverſies for the ſubject of his lectures. Some years after, he made it a conſtant cuſtom to come over to England once in three years, ſpending one month of the ſummer at Oxford, another at Cambridge, and the reſt of the time at London. In 1612, he took the degree of doctor of divinity; at the latter end of the year 1620, he was promoted to the biſhopric of Meath, and in 1625 was made archbiſhop of Armagh. In the adminiſtration of his archbiſhopric he acted in a very exemplary manner, and endeavoured to reform the clergy and officers in the eccleſiaſtical courts. In 1640, he came over to England with his family, with an intention ſoon to return to Ireland; but was prevented by the rebellion which broke out there in 1641; and in that rebellion he was plundered of every thing, except his library, which was in England, and ſome furniture in his houſe at Drogheda. His majeſty, therefore, conferred on him the biſhopric of Carliſle, to be held *in commendam*; the revenues of which were greatly leſſened by the Scots and Iriſh armies quartering upon it; but when all the lands belonging to the biſhoprics in England were ſeized by the parliament, they voted him a penſion of 400l. *per annum*, though he never received it above once or twice. He afterwards removed to Oxford; and, in 1643, was nominated one of the aſſembly of divines at Weſtminſter, but refuſed to ſit amongſt them; which, together with ſome of his ſermons at Oxford giving offence to the parliament, they ordered his ſtudy of books, of conſiderable value, to be ſeized; but by the care of Dr Featly, one of the aſſembly, they were ſecured for the primate's uſe. The king's affairs declined; and Oxford being threatened with a ſiege, he left that city, and retired to Cardiff in Wales, to the houſe of Sir Timothy Tyrrel, who had married his only daughter, and was then governor and general of the ordnance. He was afterwards invited to London by the counteſs of Peterborough. In 1647, he was choſen preacher in Lincoln's-Inn; and during the treaty in the Iſle of Wight, he was ſent for by the king, who conſulted him about the government of the church. The death of his majeſty ſtruck him with great horror. The counteſs of Peterborough's houſe, where the primate then lived, being juſt over againſt Charing Croſs, ſeveral of her gentlemen and ſervants went up to the leads of the houſe, whence they could plainly ſee what was acting before Whitehall. As ſoon as his majeſty came upon the ſcaffold, ſome of the houſehold told the primate of it; and aſked him, whether he would ſee the king once more before he was put to death. He was at firſt unwilling, but at laſt went up: where, as the ceremonial advanced, the primate grew more and more affected; and, when the executioners in vizards began to put up the king's hair, he ſwooned away. He died of a pleuriſy in 1655; and was ſolemnly buried at Weſtminſter, in St Eraſmus's chapel. He publiſhed 1. *Britannicarum Eccleſiarum Antiquitates*. 2. *Polycarpi et Ignatii Epiſtolæ, Græce Latine*, &c. 3. Annals of the Old and New Teſtament, in Latin. 4. *De Græce Septuaginta interpretum Verſione Syntagma;* and many other books which are eſteemed. A conſiderable number of his works ſtill remain in manuſcript.

USHER, an officer or ſervant who has the care and direction of the door of a court, hall, chamber, or the like.

Usher of the Black Rod, the eldeſt of the gentlemen uſhers, daily waiters at court, whoſe duty is to bear the rod before the king at the feaſt of St George, and other ſolemnities,

USK, a river of Wales, which riſes on the weſt of Brecknockſhire, and runs ſouth-eaſt through that county and Monmouthſhire, falling into the mouth of the Severn.

Uſquebaugh. ‖ Utrecht.

USQUEBAUGH, a ſtrong compound liquor, chiefly taken by way of dram.

There are ſeveral different methods of making this liquor; but the following is eſteemed one of the beſt: To two gallons of brandy, or other ſpirits, put a pound of Spaniſh liquorice, half a pound of raiſins of the ſun, four ounces of currants, and three of ſliced dates; the tops of baum, mint, ſavory, thyme, and the tops of the flowers of roſemary, of each two ounces; cinnamon and mace, well bruiſed, nutmegs, aniſeeds, and coriander ſeeds, bruiſed likewiſe, of each four ounces; of citron or lemon, and orange peel, ſcraped, of each an ounce: let all theſe infuſe 48 hours in a warm place, often ſhaking them together: then let them ſtand in a cool place for a week: after which the clear liquor is to be decanted off, and to it is to be put an equal quantity of neat white port, and a gallon of canary; after which it is to be ſweetened with a ſufficient quantity of double-refined ſugar.

USTION, in pharmacy, the preparing of certain ſubſtances by burning them.

USUFRUIT, in the civil law, the uſe or enjoyment of any lands or tenements; or the right of receiving the fruits and profits of an inheritance, or other thing, without a power of alienating or changing the property thereof.

USURER, a perſon charged with a habit or act of uſury.

USURIOUS CONTRACT, is any bargain or contract whereby a man is obliged to pay more intereſt for money than the ſtatute allows.

USURPATION, in law, is an injurious uſing or enjoyment of a thing for continuance of time, that belongs of right to another.

USURY, an unlawful contract upon the loan of money, to receive the ſame again with exorbitant increaſe. Under the article INTEREST, it was obſerved, that by ſtatute 37 Hen. VIII. c. 9. the rate of intereſt was fixed at 10l. *per cent. per annum*: which the ſtatute 13 Eliz. c. 8. confirms, and ordains, that all brokers ſhall be guilty of a *præmunire* that tranſact any contracts for more, and the ſecurities themſelves ſhall be void. The ſtatute 21 Jac. I. c. 17. reduced intereſt to 8l. *per cent.*; and it having been lowered in 1650, during the uſurpation, to 6 *per cent.* the ſame reduction was re-enacted after the Reſtoration by ſtatute 12 Car. II. c. 13. and, laſtly, the ſtatute 12 Annæ, ſt. 2. c. 16. has reduced it to 5 *per cent.* Wherefore not only all contracts for taking more are in themſelves totally void, but alſo the lender ſhall forfeit treble the money borrowed. Alſo if any ſcrivener or broker takes more than 5 s. *per cent.* procuration-money, or more than 12 d. for making a bond, he ſhall forfeit 20l. with coſts, and ſhall ſuffer impriſonment for half a year.

UTERUS, in anatomy. See there, n° 108.

UTICA (anc. geog.), a town of Africa Propria, on the Mediterranean: a Tyrian colony, and older than Carthage, (Sil. Italicus); its name, according to Bochart, denoting *old*: reckoned ſecond to it; but after the deſtruction of Carthage, became the capital and centre of all the Roman tranſactions in Africa, according to Strabo; who adds, that it ſtood on the ſame bay with Carthage, at one of the promontories called *Apollonium*, bounding the bay on the weſt ſide, the other to the eaſt called *Hermeia*, being at Carthage. It became famous by the death of Cato, who thence was called *Uticenſis*.

UTRECHT, one of the ſeven United Provinces, or States of Holland, wholly ſurrounded by Holland and Guelderland, excepting a ſmall part of it that borders on the Zuyder-

Utrecht. Zuyder-Zee. Its greateſt length is about 32 miles, and breadth about 22. It enjoys a good air; and in moſt places the ſoil is fruitful, but in ſome ſandy, or what is called *turf-ground*, and in others over-run with wood. It is watered by the Leck, Rhine, Vecht, and other ſmall rivers, beſides ſeveral canals; of which that extending from the village of Vreeſwyk to Utrecht is one of the chief.

Vultur.

UTRECHT, or, Latin, *Ultrajectum*, *Trajectum vetus* or *inferius*, or, *Trajectum Rheni*, capital of a province of the ſame name, ſo called from its ancient ferry or paſſage here over the Rhine; the word being compounded of *trecht*, which in Dutch ſignifies "a ferry," and *oud* or *olt*, i. e. "old." It is a fair, large, and populous city, ſituated 19 miles from Amſterdam, 25 from Rotterdam, and 27 from Leyden. Here is a ſtately town-houſe, with a commandery of the Teutonic order, and a celebrated univerſity, which was founded in 1630, ſince which it hath flouriſhed greatly, though it has not all the privileges of moſt other univerſities; being wholly ſubject to the magiſtrates of the city. The mall without the town, having five rows of lofty limes on each ſide, is very pleaſant, and the phyſic-garden belonging to the univerſity is extremely curious. There are five churches here that have chapters; but the members of theſe purchaſe the places, of which ſome coſt 6000 or 7000 guilders. The ſtreams which run through ſeveral of the ſtreets, contribute much to the beauty and cleanlineſs of the town; and the canal that is cut from the Leck, and paſſes through it to Amſterdam, will carry ſhips of any burden. Pope Adrian VI. was a native of this city. Here in 1579, the memorable union was formed between the ſeven provinces; and, in 1713, the celebrated peace concluded between France on the one part, and the allies on the other. The Papiſts have a nominal archbiſhop of this city; and there is a ſilk manufactory carried on in it, which employs a number of hands. The inhabitants are ſuppoſed to amount to 30,000. E. Long. 5. 8. N. Lat. 52. 7.

UTRICULARIA, in botany: A genus of plants of the claſs of *diandria*, and order of *monogynia*; and in the natural ſyſtem arranged under the 24th order, *Corydales*. The calyx is ringent, with a nectarium reſembling a ſpur; the corolla diphyllous and equal; the capſule unilocular. There are nine ſpecies; two of which are natives of Britain. They have been applied to no particular uſe.

UVA URSI. See ARBUTUS.

VULCAN, in Pagan worſhip, the god of ſubterraneous fire and metals, was the ſon of Jupiter and Juno; and was ſaid to be ſo remarkably deformed, that his father threw him down from heaven to the iſle of Lemnos, in which fall he broke his leg, and there he ſet up his forge, and taught men how to ſoften and poliſh braſs and iron. Thence he removed to the Liparian iſles near Sicily, where, by the aſſiſtance of the Cyclops, he made Jupiter's thunderbolts, and armour for the other gods. Notwithſtanding the deformity of his perſon, he had a paſſion for Minerva, and by Jupiter's conſent made his addreſſes to her, but without ſucceſs. He was, however, more fortunate in his ſuit to Venus; who, after her marriage, choſe Mars for her gallant; when Vulcan expoſed them to the ridicule of the other gods, by taking them in a net.

VULGATE, a very ancient Latin tranſlation of the Bible, and the only one acknowledged by the Church of Rome to be authentic. See BIBLE.

VULNERARY, in medicine, an epithet formerly given to remedies ſuppoſed to poſſeſs virtues for the cure of wounds and ulcers.

VULTUR, a genus of birds belonging to the order of *Accipitres*. The beak is ſtraight and crooked at the point; the head has no feathers; on the forepart being only naked ſkin; and the tongue is generally bifid. There are 21 ſpecies.

1. *Gryphus*, the condor, which is not only the largeſt of this genus, but perhaps of all others which are able to fly. The accounts of authors in regard to its extent of wing are various, viz. from 9 to 18 feet from the tip of one wing to that of the other. One gives it ſtrength enough to carry off ſheep and boys of ten years old; while another ventures to affirm, that it can lift an elephant from the ground high enough to kill it by the fall! M. de Salerne ſays, that one of this kind was ſhot in France in the year 1719, which weighed 18 lib. and whoſe extent of wing was 18 feet. But to come nearer the truth, perhaps it is better to abide by deſcriptions which bear a moderate proportion. In Hawkeſworth's Voyages, mention is made of one of theſe birds ſhot at Port Deſire, off Penguin Iſlands, of which he gives the following deſcription: "The head of this bird reſembled that of an eagle, except that it had a large comb upon it. Round the neck it had a white ruff, exactly reſembling a lady's tippet; the feathers on the back were as black as jet, and as bright as the fineſt poliſh could render that mineral; the legs were remarkably ſtrong and large, and the talons like thoſe of an eagle, except that they were not ſo ſharp; and the wings when they were extended, meaſured from point to point, no leſs than 12 feet." This laſt account ſeems by no means to exceed the natural ſize, ſince we have an account in the Philoſophical Tranſactions of one of the quill-feathers of this bird, brought from Chili, which meaſured 12 feet 4 inches; the diameter of the quill half an inch; and the extent of wing 16 feet. This bird was met in latitude 33 ſouth, not far from the iſland Mocha, in the South Sea, in the year 1691. The ſeamen ſhot it on a cliff by the ſea-ſide; and taking it for a kind of turkey, made a meal of it. In this account we are told that the colour was black and white, like a magpie, and the creſt or comb ſharp like a razor.

It ſeems now certain, that the account given by the editor of Cook's Voyage is very nearly, if not preciſely the truth, as two birds of this kind are now in the muſeum of Mr Parkinſon, and are probably male and female. The firſt of theſe has an extent of wing ſomewhat under 11 feet. The bill is ſtrong, moderately hooked, and blunt at the tip, which is white, the reſt of it being of a duſky colour. On the top of the head runs a kind of carunculated ſubſtance, ſtanding up like the comb of a cock. The head and neck are ſlightly covered with brown down, in ſome parts nearly bare, and here and there a carunculated part, as in the neck of a turkey. The lower part of the neck is ſurrounded with a ruff of a pure white and hairy kind of feathers. The upper parts of the body, wing, and garl, are black, except that the middle wing coverts have whitiſh ends, and the greater coverts half black half white. The nine or ten firſt quills are black, the reſt white with the tips only black: and when the wings are cloſed, producing the appearance of the bird having the back white; giving occaſion to Molruc in his Hiſtory of Chili to ſay, that the back was white. The under parts of the body are rather ſlightly covered with feathers; but thoſe of the thighs are pretty long. The legs are ſtout and brown; claws black and blunt.

The ſecond bird in Mr Parkinſon's collection, chiefly differs from the firſt, in having not the leaſt appearance of a comb or creſt, but ſmooth for the moſt part, except where the head and neck are covered with down. The ruff on the lower part of the neck is not ſo full and conſpicuous; but as to the colour of the plumage, the difference is not worth noticing. It is not impoſſible but this laſt may prove to be

Vultur. a young male, for Molruc expreſsly ſays, that the female is ſmaller than the male, of a brown colour, and has no ruff about the neck, only a ſmall tuft at the back part.

Theſe birds are ſaid to make the neſt among the inacceſſible rocks, and to lay two white eggs, larger than thoſe of a turkey; are very deſtructive to ſheep, and will in troops often attempt calves; in which caſe, ſome of them firſt pick out the eyes, whilſt others attack the poor animal on all ſides, and ſoon tear him to pieces. This gives riſe to the following ſtratagem, uſed by the peaſants of Chili: One of them wraps himſelf up in the hide of a freſh killed ſheep or ox, and lies ſtill on the ground; the condor ſuppoſing it to be lawful prey, flies down to ſecure it, when the perſon concealed, lays hold of the legs of the bird, his hands being well covered with gloves; and immediately his comrades, who are concealed at a diſtance, run in, and aſſiſt to ſecure the depredator, by falling on him with ſticks till they have killed him. See Plate DX. fig. 4.

2. The *Percnopterus*, or Egyptian vultur. The appearance of this bird is as horrid as can well be imagined, viz. the face is naked and wrinkled; the eyes are large and black; the beak black and hooked; the talons large, and extending ready for prey; and the whole body polluted with filth: theſe are qualities enough to make the beholder ſhudder with horror. Notwithſtanding this, the inhabitants of Egypt cannot be enough thankful to Providence for this bird. All the places round Cairo are filled with the dead bodies of aſſes and camels; and thouſands of theſe birds fly about, and devour the carcaſes before they putrify and fill the air with noxious exhalations. The inhabitants of Egypt, and after them Maillet in his deſcription of Egypt, ſay, that they yearly follow the caravan to Mecca, and devour the filth of the ſlaughtered beaſts, and the carcaſes of the camels which die on the journey. They do not fly high, nor are they afraid of men. If one is killed, all the reſt ſurround him in the ſame manner as do the royſton crows; they do not quit the places they frequent, though frightened by the exploſion of a gun, but immediately return thither. Maillet imagines this bird to be the ibis of the ancients: but it is ſcarcely to be imagined, that a wiſe nation ſhould pay ſuch honours to an unclean, impure, and rapacious bird, which was not perhaps ſo common before the Egyptians filled the ſtreets with carcaſes. If the ibis is to be found, it muſt certainly be looked for in the ordo of grallæ of Linnæus; and we imagine it to be the white ſtork (*Ardea cicona*), which is ſo common in Egypt. The Arabians call it *rochæme*; the French living in Egypt, give it the name of *chapon de Pharaon*, or *de Mahometh*.

3. The *aura*, or carrion vultur, according to Mr Latham, is about the ſize of a turkey, though it varies in ſize in different parts. The bill is white; the end black; irides bluiſh ſaffron colour. The head, and part of the neck, are bare of feathers: and of a red, or rather rufous colour. The ſides of the head warted, not unlike that of a turkey. The whole plumage is brown black, with a purple and green gloſs in different reflections; but in ſome birds, eſpecially young ones, greatly verging to dirty brown. The feathers of the quills and tail are blacker than the reſt of the body. The legs are fleſh-colour; the claws black.

This bird is very common in the Weſt Indies, and both in North and South America. It feeds on dead carcaſes, ſnakes, &c. like moſt of this genus; which makes the ſmell of it very offenſive. In general, it is very tame in its wild ſtate, but particularly ſo when trained up from being young. This our author experienced in two birds ſent home from Jamaica. They were ſuffered to run wild about the garden, and were alert and briſk during the ſummer months; but impatient of the leaſt cold; for a rainy day, with the ſlighteſt degree of cold obliged them to creep for ſhelter. In the Weſt Indies, they rooſt together of nights, in vaſt numbers, like rooks in Great Britain. They are reckoned a moſt uſeful animal in the places where they reſort; which ſecures their ſafety, added to a penalty for killing one, which is in force in Jamaica, and other iſlands of the Weſt Indies. Vultur ‖ Uz.

4. The *ſagittarius*, or ſecretary, is a moſt ſingular ſpecies, being particularly remarkable for the great length of its legs; which at firſt ſight would induce one to think it belonged to waders: but the characters of the vultur are ſo ſtrongly marked throughout, as to leave no doubt to which claſs it belongs.

The bird, when ſtanding erect, is full three feet from the top of the head to the ground. The bill is black, ſharp, and crooked, like that of an eagle: the head, neck, breaſt, and upper parts of the body, are of a bluiſh aſh colour: the legs are very long, ſtouter than thoſe of a heron, and of a brown colour; claws ſhortiſh, but crooked, not very ſharp, and of a black colour; from the hind-head ſprings a number of long feathers, which hang looſe behind like a pendent creſt; theſe feathers ariſe by pairs, and are longer as they are lower down on the neck; this creſt the bird can erect or depreſs at pleaſure: it is of a dark colour, almoſt black; the webs are equal on both ſides, and rather curled; and the feathers, when erected, ſomewhat incline towards the neck: the two middle feathers of the tail twice as long as any of the reſt.

This ſingular ſpecies inhabits the internal parts of Africa, and is frequently ſeen at the Cape of Good Hope. It is alſo met with in the Philippine iſlands.

The deſcription was taken by Mr Latham from three that were alike, which he ſaw in England alive ſome years ſince; two of which are now in the Leverian muſeum. From confinement they had loſt their two long tail feathers; but this want was ſupplied by ſome accurate drawings by Sir Joſeph Banks, taken from the life at the Cape.

As to the manners of this bird, it is on all hands allowed that it principally feeds on rats, lizards, ſnakes, and the like; and that it will become familiar: whence Sonnerat is of opinion, that it might be made uſeful in ſome of our colonies, if encouraged, towards the deſtruction of theſe peſts. They call it at the Cape of Good Hope *ſlangeater*, i. e. ſnake-eater. A great peculiarity belongs to it, perhaps obſerved in no other; which is, the faculty of ſtriking forwards with its legs, never backwards. Dr Solander has ſeen one of theſe birds take up a ſnake, ſmall tortoiſe, or ſuch like, in its claws; when daſhing it from thence againſt the ground with great violence, if the victim was not killed at firſt, it repeated the operation till that end was anſwered; after which it ate it up quietly. Dr J. R. Forſter mentioned a further circumſtance, which he ſays was ſuppoſed to be peculiar to this bird; that ſhould it by any accident break the leg, the bone would never unite again.

VULVA, in anatomy. See there, n° 132.

UVULA, in anatomy. See there, n° 102.

UZ, or UTZ, the country and place of reſidence of Job. In the genealogy of the patriarchs there are three perſons called *Uz*, either of which might give this diſtrict its name. The firſt was the grandſon of Sem, by his ſon Aram (Gen. xxii. 23.), who, according to Joſephus, occupied the Trachonitis, and Damaſcus, to the north of Paleſtine: but Job was among the ſons of the Eaſt. Another *Uz* was the ſon of Nahor, Abraham's brother (Gen. x. 21.), who appears to have removed, after paſſing the Euphrates, from Haran of Meſopotamia to Arabia Deſerta. The third *Uz* was a Horite, from mount Seir (Gen. xxxvi. 28.), and thus not of Eber's poſterity. Now the queſtion is, from which of theſe

Job's

Uz. Job's country, Uz took its name? Not from the firſt, as is already ſhown; nor from the ſecond, becauſe his country is always called *Seir*, or *Edom*, never *Uz*; and then called a *ſouth* or an *eaſt*, country, in Scripture. It therefore remains, that we look for the country and place of reſidence of Job in Arabia Deſerta; for which there were very probable reaſons. The plunderers of Job are called *Chaldeans* and *Sabeans*, next neighbours to him. Theſe Sabeans came not from Arabia Felix, but from a nearer Sabe in Arabia Deſerta (Ptolemy); and his friends, except Eliphaz the Themanite were of Arabia Deſerta. Uz. Uzbeck.

UZBECK TARTARY. See TARTARY.

W.

Waag ‖ Waggon.

W or w, is the 21ſt letter of our alphabet; and is compoſed, as its name implies, of two v's. It was not in uſe among the Hebrews, Greeks, or Romans; but chiefly peculiar to the northern nations, the Teutones, Saxons, Britons, &c. But ſtill it is not uſed by the French, Italians, Spaniards, or Portugueſe, except in proper names, and other terms borrowed from languages in which it is originally uſed, and even then it is ſounded like the ſingle v. This letter is of an ambiguous nature; being a conſonant at the beginning of words, and a vowel at the end. It may ſtand before all the vowels except *u*; as *water*, *wedge*, *winter*, *wonder*: it may alſo follow the vowels *a*, *e*, *o*, and unites with them into a kind of double vowel, or diphthong; as in *ſaw*, *few*, *cow*, &c. It alſo goes before *r*, and follows *ſ* and *th*; as in *wrath*, *ſwear*, *thwart*: it goes before *h* alſo, though in reality it is ſounded after it; as in *when*, *what*, &c. In ſome words it is obſcure, as in *ſhadow*, *widow*, &c.

WAAG, a river of Hungary, which riſes in the Carpathian mountains, and falls into the Danube oppoſite to the iſland of Schut.

WAAL, a river of the United Netherlands, being one of the branches of the Rhine, which runs from eaſt to weſt, thro' Guelderland, paſſing by Nimeguen, Tiel, Bommel and Gorcum: and, uniting with the Maes, falls into the German Sea below the Briel.

WACHENDORFIA, in botany: A genus of plants of the claſs of *triandria*, and order of *monogynia*; and arranged in Linnæus's Natural Method of Claſſification under the 6th order, *Inſatæ*. The corolla is hexapetalous, unequal, and ſituated below the germen; the capſule trilocular and ſuperior. There are four ſpecies; none of which are natives of Britain.

WADD, or WADDING, is a ſtopple of paper, hay, ſtraw, or the like, forced into a gun upon the powder, to keep it cloſe in the chamber; or to put up cloſe to the ſhot, to keep it from rolling out.

WADSET, in Scots law. See LAW, n° clxix. 1.

WAFERS, or *Sealing Wafers*, are made thus: Take very fine flour, mix it with glair of eggs, iſinglaſs, and a little yeaſt; mingle the materials; beat them well together; ſpread the batter, being made thin with gum-water, on even tin plates, and dry them in a ſtove; then cut them out for uſe.

You may make them of what colour you pleaſe, by tinging the paſte with braſil or vermilion for red; indigo or verditer, &c. for blue; ſaffron, turmerics, or gamboge, &c. for yellow.

WAGER *of Law*. See *(Wager of)* LAW.

Wager of Battel. See *(Wager of)* BATTEL.

WAGGON, a wheel carriage, of which there are various forms, accommodated to the different uſes they are intended for. The common waggon conſiſts of the ſhafts or rods, being the two pieces which the hind horſe bears up; the welds; the ſlotes, or croſs pieces, which hold the ſhafts together; the bolſter, being that part on which the fore-wheels and the axle-tree turn in wheeling the waggon acroſs the road; the cheſt or body of the waggon having the ſtaves or rails fixed thereon; the bales, or hoops which compoſe the top; the tilt, the place covered with cloth, at the end of the waggon. See MECHANICS, Sect. iv. Wagtail ‖ Wake.

WAGTAIL, in ornithology. See MOTACILLA.

WAIFS, *bona waviata*, are goods ſtolen, and waived or thrown away by the thief in his flight, for fear of being apprehended. Theſe are given to the king by the law, as a puniſhment upon the owner for not himſelf purſuing the felon, and taking away his goods from him. And therefore if the party robbed do his diligence immediately to follow and apprehend the thief (which is called *making freſh ſuit*), or do convict him afterwards, or procure evidence to convict him, he ſhall have his goods again. Waived goods do alſo not belong to the king till ſeized by ſomebody for his uſe; for if the party robbed can ſeize them firſt, though at the diſtance of 20 years, the king ſhall never have them. If the goods are hid by the thief, or left any where by him, ſo that he had them not about him when he fled, and therefore did not throw them away in his flight; theſe alſo are not *bona waviata*, but the owner may have them again when he pleaſes. The goods of a foreign merchant, though ſtolen and thrown away in flight, ſhall never be waifs: the reaſon whereof may be, not only for the encouragement of trade, but alſo becauſe there is no wilful default in the foreign merchant's not purſuing the thief, he being generally a ſtranger to our laws, our uſages, and our language.

WAIGATS STRAITS, ſituated between Nova Zembla and Ruſſia, through which the Dutch ſailed to the north, as high as 75°, in order to diſcover a north-eaſt paſſage to China and the Eaſt Indies.

WAINSCOT, in building, the timber-work that ſerves to line the walls of a room, being uſually made in pannels, and painted, to ſerve inſtead of hangings.

WAIVE, in law, a woman that is put out of the protection of the law. She is called *waive*, as being forſaken of the law; and not *outlaw* as a man is; by reaſon women cannot be of the decenna, and are not ſworn in leets to the king, nor to the law, as men are; who are therefore within the law; whereas women are not, and ſo cannot be outlawed, ſince they never were within it.

WAKE, the print or track impreſſed by the courſe of a ſhip on the ſurface of the water. It is formed by the reunion of the body of water which was ſeparated by the ſhip's bottom whilſt moving through it; and may be ſeen to a conſiderable diſtance behind the ſtern, as ſmoother than the reſt of the ſea. Hence it is uſually obſerved by the compaſs, to diſcover the angle of lee-way.

Wake. A ſhip is ſaid to be in the wake of another when ſhe follows her on the ſame track, or a line ſuppoſed to be formed on the continuation of her keel.

Two diſtant objects obſerved at ſea are called in the wake of each other, when the view of the fartheſt is intercepted by the neareſt; ſo that the obſerver's eye and the two objects are all placed upon the ſame right line.

WAKE is the eve-feaſt of the dedication of churches, which is kept with feaſting and rural diverſions.

The learned Mr Whitaker, in his Hiſtory of Mancheſter, hath given a particular account of the origin of wakes and fairs. He obſerves, that every church at its conſecration received the name of ſome particular ſaint: this cuſtom was practiſed among the Roman Britons, and continued among the Saxons; and in the council of Cealchythe, in 816, the name of the denominating ſaint was expreſsly required to be inſcribed on the altars, and alſo on the walls of the church, or a tablet within it. The feaſt of this ſaint became of courſe the feſtival of the church. Thus Chriſtian feſtivals were ſubſtituted in the room of the idolatrous anniverſaries of heatheniſm: accordingly, at the firſt introduction of Chriſtianity among the Jutes of Kent, pope Gregory the Great adviſed what had been previouſly done among the Britons, viz. Chriſtian feſtivals to be inſtituted in the room of the idolatrous, and the ſuffering day of the martyr whoſe relics were repoſited in the church, or the day on which the building was actually dedicated, to be the eſtabliſhed feaſt of the pariſh. Both were appointed and obſerved; and they were clearly diſtinguiſhed at firſt among the Saxons, as appears from the laws of the Confeſſor, where the *dies dedicationis*, or *dedicatio*, is repeatedly diſcriminated from the *propria feſtivitas ſancti*, or *celebratio ſancti*. They remained equally diſtinct to the Reformation; the dedication-day in 1536 being ordered for the future to be kept on the firſt Sunday in October, and the feſtival of the patron ſaint to be celebrated no longer. The latter was, by way of pre-eminence, denominated the *church's holiday*, or its peculiar feſtival; and while this remains in many pariſhes at preſent, the other is ſo utterly annihilated in all, that biſhop Kennet (ſays Mr Whitaker) knew nothing of its diſtinct exiſtence, and has attributed to the day of dedication what is true only concerning the ſaint's day. Thus inſtituted at firſt, the day of the tutelar ſaint was obſerved, moſt probably by the Britons, and certainly by the Saxons, with great devotion. And the evening before every ſaint's day, in the Saxon Jewiſh method of reckoning the hours, being an actual hour of the day, and therefore like that appropriated to the duties of public religion, as they reckoned Sunday from the firſt to commence at the ſun-ſet of Saturday; the evening preceding the church's holiday would be obſerved with all the devotion of the feſtival. The people actually repaired to the church, and joined in the ſervices of it; and they thus ſpent the evening of their greater feſtivities in the monaſteries of the North, as early as the concluſion of the ſeventh century.

Theſe ſervices were naturally denominated from their late hours *wæccan* or *wakes*, and *vigils* or *eves*. That of the anniverſary at Rippon, as early as the commencement of the eighth century, is expreſsly denominated the *vigil*. But that of the church's holiday was named *cyric wæccan*, or church-wake, the church vigil, or church eve. And it was this commencement of both with a wake, which has now cauſed the days to be generally preceded with vigils, and the church-holiday particularly to be denominated the *church-wake*. So religiouſly was the eve and feſtival of the patron ſaint obſerved for many ages by the Saxons, even as late as the reign of Edgar, the former being ſpent in the church, and employed in prayer. And the wakes, and all the other holidays in the year, were put upon the ſame footing with the octaves of Chriſtmas, Eaſter, and of Pentecoſt. When Gregory recommended the feſtival of the patron ſaint, he adviſed the people to erect booths of branches about the church on the day of the feſtival, and to feaſt and be merry in them with innocence. Accordingly, in every pariſh, on the returning anniverſary of the ſaint, little pavilions were conſtructed of boughs, and the people indulged in them to hoſpitality and mirth. The feaſting of the ſaint's day, however, was ſoon abuſed; and even in the body of the church, when the people were aſſembled for devotion, they began to mind diverſions, and to introduce drinking. The growing intemperance gradually ſtained the ſervice of the vigil, till the feſtivity of it was converted, as it now is, into the rigour of a faſt. At length they too juſtly ſcandalized the Puritans of the laſt century, and numbers of the wakes were diſuſed entirely, eſpecially in the eaſt and ſome weſtern parts of England; but they are commonly obſerved in the north, and in the midland counties. Wake ‖ Walcheren.

This cuſtom of celebrity in the neighbourhood of the church, on the days of particular ſaints, was introduced into England from the continent, and muſt have been familiar equally to the Britons and Saxons; being obſerved among the churches of Aſia in the ſixth century, and by thoſe of the weſt of Europe in the ſeventh. And equally in Aſia and Europe on the continent, and in the iſlands, theſe celebrities were the cauſes of thoſe commercial marts which we denominate *fairs*. The people reſorted in crowds to the feſtival, and a conſiderable proviſion would be wanted for their entertainment. The proſpect of intereſt invited the little traders of the country to come and offer their wares; and thus, among the many pavilions for hoſpitality in the neighbourhood of the church, various booths were erected for the ſale of different commodities. In larger towns, ſurrounded with populous diſtricts, the reſort of the people to the wakes would be great, and the attendance of traders numerous; and this reſort and attendance conſtitute a fair.—Baſil expreſsly mentions the numerous appearance of traders at theſe feſtivals in Aſia, and Gregory notes the ſame cuſtom to be common in Europe. And as the feſtival was obſerved on a feria or holiday, it naturally aſſumed to itſelf, and as naturally communicated to the mart, the appellation of *feria* or fair. Indeed ſeveral of our moſt ancient fairs appear to have been uſually held, and have been continued to our time, on the original church-holidays of the places: beſides, it is obſervable, that fairs were generally kept in church-yards, and even in the churches, and alſo on Sundays, till the indecency and ſcandal were ſo great as to need reformation.

Wake-Robin. See ARUM.

WALACHIA, a province of Turkey in Europe, bounded on the north by Moldavia and Tranſylvania, on the eaſt and ſouth by the river Danube, and on the weſt by Tranſylvania. It is 225 miles in length, and 125 in breadth; and was ceded to the Turks by the treaty of Belgrade, in 1739. It abounds in good horſes and cattle; and there are mines of ſeveral kinds. The ſoil is ſo fertile, that it is capable of producing any thing; and there are good paſtures, with wine, oil, and all manner of European fruits. The inhabitants are chiefly of the Greek church.

WALCHEREN, an iſland of the Low Countries, and one of the principal of thoſe of Zealand; ſeparated from Dutch Flanders by the mouth of the Scheld. It is about nine miles in length, and eight in breadth; and though it lies low, has good arable and paſture land. The chief town of this iſland and the whole province is Middleburg.

WALDEN,

Walden || Wales.

WALDEN, a town of Eſſex, commonly called *Saffron Walden*, with a market on Saturdays, and two fairs on Midlent Saturday for horſes, and November 1ſt for cows. It is remarkable for the plenty of ſaffron that grows about it. This town was incorporated by Edward VI. and is governed by a mayor and 24 aldermen. It is 27 miles north-weſt-by-north of Chelmsford, and 43 north-eaſt of London. E. Long. 0. 20. N. Lat. 52. 4.

WALDENSES. See WALDO.

WALDO, a merchant of Lyons in the latter part of the 12th century, who applying himſelf to the ſtudy of the Scriptures, and finding no warrant there for ſeveral of the Romiſh doctrines, particularly that of tranſubſtantiation, publicly oppoſed them. His followers, who from him were called *Waldenſes*, being chaſed from Lyons, ſpread over Dauphine and Provence; upon which Philip II. is ſaid to have razed 300 gentlemens ſeats, and deſtroyed ſeveral walled towns to ſtop their growth: but this, inſtead of ſuppreſſing, ſpread them over a great part of Europe. The articles of their faith, which they drew up and dedicated to the king of France, agreed in moſt points with thoſe of the preſent Proteſtants. In the year 1200, thoſe of them who dwelt in the province of Albigeois in Languedoc, from whence they were called *Albigenſes*, ſtood upon their defence; upon which Philip drove them into Bohemia, Savoy, and England. The cruſade againſt them is ſaid to have conſiſted of 500,000 men, who wore their croſſes on their breaſts, to diſtinguiſh themſelves from thoſe who went to the Holy Land, and wore them on their ſhoulders.

WALES, a country ſituated in the ſouth-weſt part of Britain, into which the ancient Britons retired from the perſecution of the Saxons. Anciently it was of greater extent than it is at preſent, and comprehended all the country beyond the Severn, that is, beſides the 12 counties included in it at preſent, thoſe of Herefordſhire and Monmouthſhire, which now are reckoned a part of England, were then inhabited by three different tribes of the Britons, namely, the Silures, the Dimetæ, and the Ordovices. The Romans were never able to ſubdue them, till the reign of Veſpaſian, when they were reduced by Julius Frontinus, who placed garriſons in their country to keep them in awe. Though the Saxons made themſelves maſters of all England, they never could get poſſeſſion of Wales, except the counties of Monmouthſhire and Herefordſhire, formerly a part of Wales. About the year 870, Roderic king of Wales divided it among his three ſons; and the names of theſe diviſions were, *Demetia*, or *South-Wales*; *Poveſia*, or *Powis-Land*; and *Venedotio*, or *North-Wales*. Another diviſion is mentioned afterwards in the records, viz. North Wales, South Wales, and Weſt Wales; the laſt comprehending the counties of Monmouth and Hereford. The country derived the name of *Wales*, and the inhabitants that of *Welſh*, from the Saxons, who by thoſe terms denote a country and people to which they are ſtrangers; for the Welſh, in their own language, call their country *Cymry*, and their language *Cymraeg*. They continued under their own princes and laws from the above-mentioned period, and were never entirely ſubjected to the crown of England till the reign of Edward I. when Llewellin ap Gryffith, prince of Wales, loſt both his life and dominions. Edward, the better to ſecure his conqueſt, and to reconcile the Welſh to a foreign yoke, ſent his queen to lie in at Caernarvon, where ſhe was delivered of a prince; to whom the Welſh, on that account, the more readily ſubmitted. Ever ſince that time, the eldeſt ſons of the kings of England have commonly been created princes of Wales, and as ſuch enjoy certain revenues from that country.

As to the character of the Welſh, they are ſaid to be a brave, hoſpitable people; and though very jealous of affronts, paſſionate, and haſty, yet are eaſily reconciled. The common people look with a ſuſpicious eye on ſtrangers, and bear an hereditary grudge to the Engliſh nation, by whom their anceſtors were expelled from the fineſt parts of the iſland. The gentlemen are apt to value themſelves upon the antiquity of their families; and with ſome reaſon, as they can generally trace them much higher than the inhabitants of moſt other countries. Wales.

All the better ſort, both in town and country, can ſpeak Engliſh, eſpecially in the counties bordering upon England. The common people, in general, only ſpeak their own language, which is the ancient Britiſh; and not only differs entirely from the Engliſh, but has very little affinity with any of the weſtern tongues, unleſs we ſhould except the Gaelic, Erſe, or Iriſh. It is ſaid to be a dialect of the ancient Celtic, and in many reſpects to reſemble the Hebrew. Moſt of the clergy are natives of the country, and underſtand Engliſh ſo well, that they could exerciſe their functions in any part of Britain. The public worſhip however, is as often performed in Welſh as in Engliſh, excepting in the towns, where the latter is the prevailing language. The inhabitants are computed at about 300,000.

The country, though mountainous, eſpecially in North Wales, is far from being barren or unfruitful; the hills, beſides the metals and minerals they contain, feeding vaſt herds of ſmall black cattle, deer, ſheep, and goats, and their valleys abounding in corn, as their ſeas and rivers do in fiſh. Here are alſo wood, coal, and turf for fuel, in abundance.

Wales is bounded on all ſides by the ſea and the Severn: except on the eaſt, where it joins to the counties of Cheſter, Salop, Hereford, and Monmouth. Its length, from the ſouthernmoſt part of Glamorganſhire to the extremity of Flintſhire north, is computed at about 113 miles; and its greateſt breadth, from the river Way eaſt to St David's in Pembrokeſhire weſt, is nearly of the ſame dimenſions, being about 90 miles.

After the conqueſt of Wales by Edward I. very material alterations were made in their laws, ſo as to reduce them nearer to the Engliſh ſtandard, eſpecially in the forms of their judicial proceedings: but they ſtill retained very much of their original polity, particularly their rule of inheritance, viz. that their lands were divided equally among all the iſſue male, and did not deſcend to the eldeſt ſon alone. By other ſubſequent ſtatutes their provincial immunities were ſtill farther abridged: but the finiſhing ſtroke to their independency was given by the ſtatute 27 Hen. VIII. c. 26. which at the ſame time gave the utmoſt advancement to their civil proſperity, by admitting them to a thorough communication of laws with the ſubjects of England.—Thus were this brave people gradually conquered into the enjoyment of true liberty; being inſenſibly put upon the ſame footing, and made fellow-citizens, with their conquerors.

It is enacted by the 27 Hen. VIII. 1. That the dominion of Wales ſhall be for ever united to the kingdom of England. 2. That all Welſhmen born ſhall have the ſame liberties as other king's ſubjects. 3. That lands in Wales ſhall be inheritable according to the Engliſh tenures and rules of deſcent. 4. That the laws of England, and no other, ſhall be uſed in Wales: beſides many other regulations of the police of this principality. And the 34 and 35 Hen. VIII. c. 26. confirms the ſame, adds farther regulations, divides it into twelve ſhires, and, in ſhort, reduces it into the ſame order in which it ſtands at this day; differing from the kingdom of England in only a few particulars, and thoſe too of the nature of privileges (ſuch as having courts within itſelf, independent of the proceſs of Weſt-

Wales || Waller.

minſter-hall), and ſome other immaterial peculiarities hardly more than are to be found in many counties of England itſelf.

WALL, in architecture, the principal part of a building, as ſerving both to incloſe it, and to ſupport the roof, floors, &c.—Walls are diſtinguiſhed into various kinds, from the matter whereof they conſiſt; as plaſtered or mud-walls, brick-walls, ſtone-walls, flint or boulder-walls, and boarded-walls. See ARCHITECTURE.

Cob or *Mud-*WALL. In thoſe parts of England where ſtone is ſcarce, it is uſual to make walls and houſes of mud, or, as it is called in Devonſhire, *cob*; which is a compoſition of earth and ſtraw, wet up ſomewhat like mortar, but well beat and trod together. When a wall is making, after being raiſed to a certain height, it is allowed time to pitch or ſettle before the work is reſumed. Some value themſelves on their ſkill in building with this compoſition; the price, when materials are found, is generally in Devonſhire 3s. per perch of 16½ feet; but a ſtone foundation coſts more. Houſes built with this, being covered with thatch, are very dry and warm; a cob wall, if in a good ſituation, will laſt 50 or 60 years or more. When pulled down, they are uſed as manure, and new earth employed to rebuild with.

WALLACE (Sir William), a gallant general of the Scots, who endeavoured to reſcue his country from the Engliſh yoke; but being taken priſoner, he was unjuſtly tried by the Engliſh laws, condemned, and executed as a traitor to Edward I. in 1304. See SCOTLAND, n° 103, *et ſeq*.

WALLACHIA. See WALACHIA.

WALLER (Edmund) a celebrated Engliſh poet, was the ſon of Robert Waller, Eſq; of Agmondeſham in Buckinghamſhire, by Anne, the ſiſter of the great Hamden who diſtinguiſhed himſelf ſo much in the beginning of the civil wars. He was born in 1605; and his father dying when he was very young, the care of his education fell to his mother, who ſent him to Eton ſchool. He was afterwards ſent to King's college in Cambridge, where he muſt have been very aſſiduous in his ſtudies, ſince, at ſixteen or ſeventeen years of age, he was choſen into the laſt parliament of King James I. and ſerved as burgeſs for Agmondeſham. He began to exerciſe his poetical talent ſo early as the year 1623; as appears from his verſes "upon the danger his majeſty (being prince) eſcaped in the road of St Andero;" for there Prince Charles, returning from Spain that year, had like to have been caſt away. It was not, however, Mr Waller's wit, his fine parts, or his poetry, that ſo much occaſioned him to be firſt publicly known, as his carrying off the daughter and ſole heireſs of a rich citizen, againſt a rival whoſe intereſt was eſpouſed by the court. It is not known at what time he married his firſt lady; but he was a widower before he was 25, when he began to have a paſſion for Sachariſſa, which was a fictitious name for the lady Dorothy Sidney, daughter to the earl of Leiceſter, and afterwards wife to the earl of Sunderland. He was now known at court, careſſed by all who had any reliſh for wit and polite literature; and was one of the famous club of which Lord Falkland, Mr Chillingworth, and other eminent men, were members. He was returned burgeſs for Agmondeſham in the parliament which met in April 1640. An intermiſſion of parliaments having diſguſted the nation, and raiſed jealouſies againſt the deſigns of the court, which would be ſure to diſcover themſelves whenever the king came to aſk for a ſupply, Mr Waller was one of the firſt who condemned the preceding meaſures. He ſhowed himſelf in oppoſition to the court, and made a ſpeech in the houſe on this occaſion; from which we may gather ſome notion of his general principles in government; wherein, however, he afterwards proved very variable and inconſtant. He oppoſed the court alſo in the long parliament which met in November following, and was choſen to impeach Judge Crawley, which he did in a warm and eloquent ſpeech, July 16th 1641. This ſpeech was ſo highly applauded, that 20,000 copies of it were ſold in one day. In 1642, he was one of the commiſſioners appointed by the parliament to preſent their propoſitions of peace to the king at Oxford. In 1643, he was deeply engaged in a deſign to reduce the city of London and the tower to the ſervice of the king; for which he was tried and condemned, together with Mr Tomkins his brother-in-law, and Mr Challoner. The two latter ſuffered death; but Mr Waller obtained a reprieve: he was, however, ſentenced to ſuffer a year's impriſonment, and to pay a fine of 10,000l. After this, he became particularly attached to Oliver Cromwell, upon whom he wrote a very handſome panegyric. He alſo wrote a noble poem on the death of that great man.

Waller, Wallis.

At the Reſtoration, he was treated with great civility by Charles II. who always made him one of the party in his diverſions at the duke of Buckingham's and other places. He wrote a panegyric upon his majeſty's return; which being thought to fall much ſhort of that he had before written on Oliver Cromwell, the king one day aſked him in raillery, "How is it, Waller, that you wrote a better encomium on Cromwell than on me?" "May it pleaſe your majeſty," anſwered he, "we poets generally ſucceed beſt in fiction." He ſat in ſeveral parliaments after the Reſtoration, and continued in the full vigour of his genius to the end of his life, his natural vivacity bearing him up, and making his company agreeable to the laſt. He died of a dropſy in 1687, and was interred in the church-yard of Beaconsfield, where a monument is erected to his memory. Mr Waller has been honoured as the moſt elegant and harmonious verſifier of his time, and a great refiner of the Engliſh language. The beſt edition of his works, containing poems, ſpeeches, letters, &c. is that publiſhed in quarto by Mr Fenton, in 1730.

WALLIS (Dr John), a celebrated mathematician, was educated at Cambridge; where he became fellow of Queen's college, and continued ſo till, by his marriage, he vacated his fellowſhip. In 1640, he received holy orders, and became chaplain to the lady Vere. While he lived in this family, he cultivated the art of deciphering, and it is ſaid, that the elector of Brandenburg, for whom he explained ſeveral letters written in ciphers, ſent him a gold chain and medal. In 1643 he publiſhed, "Truth tried; or, Animadverſions on the lord Brooke's treatiſe, called *The Nature of Truth*, &c." The next year he was choſen one of the ſcribes or ſecretaries to the aſſembly of divines at Weſtminſter. Dr Peter Turner, Savilian profeſſor of geometry in Oxford, being ejected by the parliament-viſitors in 1649, Mr Wallis was appointed to ſucceed him in that place. In 1653 he publiſhed at Oxford a Grammar of the Engliſh Tongue in Latin. In 1655 he entered the liſts with Mr Hobbes; and their controverſy laſted a conſiderable time. In 1657 the Doctor publiſhed his Mathematical Works. Upon the death of Dr Langbaine, he was choſen cuſtos archivorum of the univerſity. After the Reſtoration he met with great reſpect, the king himſelf entertaining a favourable opinion of him on account of ſome ſervices he had done both to his royal father and himſelf. He was therefore confirmed in his places, admitted one of the king's chaplains in ordinary, and appointed one of the divines empowered to review the

book

Walloons || Walpole.

book of common prayer. He complied with the terms of the act of uniformity, and continued a ſteady conformiſt till his death. He was one of the firſt members of the Royal Society, and correſponded with many learned men. In 1697, the curators of the univerſity preſs at Oxford thought it for the honour of the univerſity to collect the mathematical works of the Doctor, which had been printed ſeparately, ſome in Latin, ſome in Engliſh, and publiſhed them all together in the Latin tongue, in 3 vols folio. He died in 1703. He ſpeaks of himſelf thus: "It hath been my endeavour all along to act by moderate principles, being willing, whatever ſide was uppermoſt, to promote any good deſign for the true intereſt of religion, of learning, and of the public good." Beſides the works above-mentioned, he publiſhed many others.

WALLOONS, a name for the inhabitants of a conſiderable part of the Netherlands, viz. Artois, Hainault, Namur, Luxemburgh, and part of Flanders and Brabant.

WALNUT-TREE, in botany. See JUGLANS.

WALPOLE (Sir Robert), earl of Orford, was born at Houghton in Norfolk, September 6th, 1674, and educated on the foundation at Eton ſchool. Thence he was elected to King's College in Cambridge; but, ſucceeding to the family eſtate by the death of his elder brother, he reſigned his fellowſhip. In 1700, he was choſen member of parliament for King's Lynn, and repreſented that borough in ſeveral ſucceeding parliaments. In 1705, he was nominated one of the council to prince George of Denmark, lord high admiral of England; in 1707, appointed ſecretary at war; and, in 1709, treaſurer of the navy. In 1710, upon the change of the miniſtry, he was removed from all his poſts, and held no place afterwards during the queen's reign. In 1711 he was expelled from the houſe of commons for what they called notorious corruption in his office as ſecretary at war. The borough of Lynn, however, re-elected him; and, though the houſe declared the election void, yet they perſiſted in the choice. In the well-known debate relating to Steele for publiſhing the Criſis, he greatly diſtinguiſhed himſelf in behalf of liberty, and added to the popularity he had before acquired.

On the death of the queen, a revolution of politics took place, and the Whig party prevailed both at court and in the ſenate. Walpole had before recommended himſelf to the houſe of Hanover by his zeal for its cauſe, when the commons conſidered the ſtate of the nation with regard to the Proteſtant ſucceſſion: and he had now the honour to procure the aſſurance of the houſe to the new king (which attended the addreſs of condolence and congratulation), "That the commons would make good all parliamentary funds." It is therefore not to be wondered at, that his promotion ſoon took place after the king's arrival; and that in a few days he was appointed receiver and paymaſter general of all the guards and garriſons, and of all other the land forces in Great Britain, paymaſter of the royal hoſpital at Chelſea, and likewiſe a privy counſellor. On the opening of a new parliament, a committee of ſecrecy was choſen to enquire into the conduct of the late miniſtry, of which Walpole was appointed chairman; and, by his management, articles of impeachment were read againſt the earl of Oxford, lord Bolingbroke, the duke of Ormond, and the earl of Strafford. The eminent ſervice he was thought to have done the crown, by the vigorous proſecution of thoſe miniſters who were deemed the chief inſtruments of the peace, was ſoon rewarded by the extraordinary promotions to the offices of firſt commiſſioner of the treaſury, and chancellor and under treaſurer of the exchequer.

Walpole.

In two years time he reſigned all his offices on account of a miſunderſtanding which took place between him and the reſt of the miniſtry about certain ſupplies demanded for the ſupport of his majeſty's German dominions. On the day of his reſignation he brought in the famous ſinking fund-bill, which he preſented as a country-gentleman, ſaying, that he hoped it would not fare the worſe for having two fathers; and that his ſucceſſor Mr Stanhope would bring it to perfection. His calling himſelf the father of a project, which hath ſince been ſo often employed to other purpoſes than were at firſt declared, gave his enemies frequent opportunity for ſatire and ridicule; and it hath been ſarcaſtically obſerved, that the father of this fund appeared in very bad light when viewed in the capacity of a nurſe. In the next ſeſſion of parliament, Walpole oppoſed the miniſtry in every thing: and even Wyndham or Shippen did not exceed him in patriotiſm. Upon a motion in the houſe for continuing the army, he made a ſpeech of above an hour long, and diſplayed the danger of a ſtanding army in a free country, with all the powers of eloquence. Early in 1720 the rigour of the patriot began to ſoften, and the complaiſance of the courtier to appear; and he was again appointed paymaſter of the forces, and ſeveral of his friends were found ſoon after in the liſt of promotions. No doubt now remained of his entire converſion to court meaſures; for, before the end of the year, we find him pleading as ſtrongly for the forces required by the war-office as he had before declaimed againſt them, even though at this time the ſame pretences for keeping them on foot did not exiſt.

It was not long before he acquired full miniſterial power, being appointed firſt lord commiſſioner of the treaſury, and chancellor of the exchequer; and, when the king went abroad in 1723, he was nominated one of the lords juſtices for the adminiſtration of government, and was ſworn ſole ſecretary of ſtate. About this time he received another diſtinguiſhed mark of the royal favour; his eldeſt ſon then on his travels being created a peer, by the title of baron Walpole of Walpole. In 1725 he was made knight of the Bath, and the year after knight of the Garter. The meaſures of his adminiſtration, during the long time he remained prime or rather ſole miniſter, have been often canvaſſed with all the ſeverity of critical inquiry. It is difficult to diſcern the truth through the exaggerations and miſrepreſentations of party. He has indeed been accuſed of employing the ſinking fund for the purpoſes of corruption, of which it was long the faſhion to call him the father; but the man who reflects on the tranſactions of Charles II. and his infamous cabal, will acquit him of the latter part of this charge. He was an enemy to war, and the friend of commerce; and becauſe he did not reſent ſome petty inſults of the court of Spain ſo ſuddenly as the fiery part of the nation thought he ſhould have done, a formidable oppoſition was formed againſt him in the houſe, which had influence enough to employ in its cauſe almoſt all the wit of the nation. Pulteney and Pitt were the great leaders of the party in the houſe of commons; while Bolingbroke and Pope and Johnſon, and almoſt every man of genius, exerted themſelves without doors to enlighten, by pamphlets in proſe and verſe, the minds of the people, and ſhow the neceſſity of a Spaniſh war. This he ſtrenuouſly oppoſed, becauſe he knew that the foreign ſettlements of that power are very remote, and in a climate deſtructive to Engliſhmen; and that ſuch of them as we might be able to take, we could not poſſibly retain. The oppoſition however prevailed. The nation was indulged in a war, of which it ſurely had no cauſe to boaſt of the ſucceſs; and it is now univerſally known, that the greater part of thoſe who with honeſt intentions had, either in parliament or out of it, been

engaged

Walpole.

engaged to run down the minister, lived to repent of their conduct, and do justice to the man whom they had so pertinaciously vilified.

In order to encourage commerce and improve the revenue, Sir Robert projected a scheme for an extension of the excise, as the only means of putting a stop to the frauds of merchants and illicit traders. This was another ground of clamour to the orators within, and the wits without, doors; and while the opposition represented it as a measure big with public mischief, Swift and Pope occasionally alluded to it as an oppression calculated to deprive private life of all its comforts. The minister was therefore obliged to abandon the scheme; but in a succeeding administration it was partly carried into execution, at the express solicitation of the principal persons concerned in that article of trade which it was suggested would be most affected by it; and afterwards the most popular minister that ever directed the councils of this country declared in full senate, that if a time should ever arrive which was likely to render the project feasible, he would himself recommend an extension of the excise laws as a measure of the greatest advantage to commerce, to the revenue, and to the general interests of the kingdom.

In 1742 the opposition prevailed; and Sir Robert being no longer able to carry a majority in the house of commons, resigned all his places, and fled for shelter behind the throne. He was soon afterwards created earl of Orford; and the king, in consideration of his long and faithful services, granted him a pension of 4000 l. *per annum*. The remainder of his life he spent in tranquillity and retirement, and died, 1745, in the 71st year of his age.

He has been severely, and not unjustly, censured for that system of corruption by which he almost avowed that he governed the nation; but the objects which he had in view are now acknowledged to have been in a high degree praiseworthy. Johnson, who in the earlier part of his life had joined the other wits in writing against his measures, afterwards honoured his memory for the placability of his temper, and for keeping this country in peace for so many years; and Mr Burke has lately * declared, that his only defect as a minister was the want of sufficient firmness to treat with contempt that popular clamour, which, by his yielding to it, hurried the nation into an expensive and unjust war. But his rancorous prosecution of Atterbury bishop of Rochester (see ATTERBURY), by a bill of pains and penalties, may be considered as something worse than a defect: it was a fault for which no apology can be made; because, whether that prelate was innocent or guilty, of his guilt no legal proof ever appeared. In that instance the conduct of the minister was the more extraordinary, that on other occasions he chose to gain over the disaffected by mildness and beneficence, even when he had sufficient proofs of their guilt. Of this the following anecdote, communicated by lord North to Dr Johnson, is a sufficient proof. Sir Robert having got into his hands some treasonable papers of his inveterate enemy Shippen, sent for him, and burnt them before his eyes. Some time afterwards, while Shippen was taking the oaths to the government in the house of commons, Sir Robert, who stood next to him, and knew his principles to be the same as ever, smiled; upon which Shippen, who had observed him, said "Egad, Robin, that's hardly fair."

* Letters on a Regicide Peace.

To whatever objections his ministerial conduct may be liable, in his private character he is universally allowed to have had amiable and benevolent qualities. That he was a tender parent, a kind master, a beneficent patron, a firm friend, an agreeable companion, are points that have been seldom disputed; and so calm and equal was his temper, that Pulteney, his great rival and opponent, said, he was sure that Sir Robert Walpole never felt the bitterest invectives against him for half an hour.

Walrus ‖ Walsingham.

About the end of queen Anne's reign, and the beginning of George I.'s, he wrote the following pamphlets. 1. The Sovereign's Answer to the Gloucestershire Address. The Sovereign meant Charles duke of Somerset, so nicknamed by the Whigs. 2. Answer to the Representation of the House of Lords on the State of the Navy, 1709. 3. The Debts of the Nation stated and considered, in four Papers, 1710. 4. The Thirty-five Millions accounted for, 1710. 5. A Letter from a foreign Minister in England to Monsieur Pettecum, 1710. 6. Four Letters to a Friend in Scotland upon Sacheverell's Trial; falsely attributed in the General Dictionary to Mr Maynwaring. 7. A short History of the Parliament. It is an account of the last Session of the queen. 8. The South-Sea Scheme considered. 9. A Pamphlet against the Peerage Bill, 1719. 10. The Report of the Secret Committee, June 9th, 1715.

WALRUS, in zoology. See TRICHECUS.

WALSH (William), an English critic and poet, the son of Joseph Walsh, Esq; of Abberley in Worcestershire, was born about the year 1660. He became a gentleman-commoner of Wadham college, Oxford, but left the university without taking a degree. His writings are printed among the works of the Minor Poets, printed in 1749. He was made gentleman of the horse in queen Anne's reign; and died in 1708. He was the friend of Mr Dryden and of Mr Pope; the former of whom esteemed him the best critic then living; and Mr Pope has celebrated his character in the Essay on Criticism.

WALSINGHAM, a town of Norfolk, with a market on Fridays, and a fair on Whit-Monday, for horses and pedlar's ware. It is seated not far from the sea; and in former times was famous for its college of canons, and was greatly frequented by pilgrims who went to pay their devotions to the image of the Virgin Mary at the chapel, where there are two fine springs, called the *Virgin Mary's wells*. Not many years ago there were found here 100 urns full of ashes by a husbandman, which were supposed to be those which the Romans filled with the ashes of the dead. It is 22 miles north-west of Norwich, and 117 north-north-east of London. E. Long. 0. 53. N. Lat. 52. 56.

WALSINGHAM (Thomas), an English Benedictine monk of the monastery of St Alban's, about the year 1440. He applied himself to the history and antiquity of his country, in quality of historiographer to the king; and composed the History of King Henry VI. with other works.

WALSINGHAM (Sir Francis), minister and secretary of state during the reign of queen Elizabeth, and one of the greatest politicians of his time, was descended from a noble and ancient family at Chiselhurst. After having made great progress in his studies at Cambridge, he was twice sent ambassador to France, and at his return to England was employed in the most important affairs; became secretary of state, and was one of the commissioners for the trial of Mary queen of Scotland. Sir Francis was undoubtedly one of the most refined politicians and most penetrating statesman that any age ever produced. He had an admirable talent, both in discovering and managing the secret recesses of the heart. He had his spies in most courts in Christendom, and allowed them a liberal maintenance; for it was his maxim, That knowledge cannot be bought too dear. In 1587 the king of Spain having made vast preparations, which surprised, and kept all Europe in suspence, Walsingham employed his utmost endeavours for the discovery of that important secret; and accordingly procured intelligence from Madrid, that the

king

Walſingham, Waltheria.

king had informed his council of his having diſpatched an expreſs to Rome, with a letter written with his own hand to the pope, acquainting him with the true deſign of his preparations, and begging his bleſſings upon him; which for ſome reaſons he could not diſcloſe till the return of the courier. The ſecret being thus lodged with the pope, Walſingham, by means of a Venetian prieſt, whom he retained at Rome as a ſpy, got a copy of the original letter, which was ſtolen out of the pope's cabinet by a gentleman of the bed-chamber, who took the key out of the pope's pocket while he ſlept. After this, by his dexterous management, he cauſed the Spaniards bills to be proteſted at Genoa, which ſhould have ſupplied them with money for their extraordinary preparations; and by this means he happily retarded this formidable invaſion for a whole year. In ſhort, he ſpent his whole time and faculties in the ſervice of queen Elizabeth; on which account her majeſty was heard to ſay, "That in diligence and ſagacity he exceeded her expectations." However, after all his eminent ſervices to his country, this great man gave a remarkable proof at his death, which happened on the 6th of April, 1590, how far he preferred the public intereſt to his own, he being ſo poor, that excepting his library, which was a very fine one, he had ſcarcely effects enough to defray the expence of his funeral. His principal works are, 1. Memoirs and Inſtructions for the uſe of Ambaſſadors, with his Letters and Negociations. 2. Political Memoirs.

WALTHERIA, in botany; a genus of plants in the claſs *monodelphia*, and order *triandria*; and in the natural ſyſtem arranged under the 37th order, *Columniferæ*. There is only one piſtillum, and the capſule is unilocular, bivalved, and monoſpermous. There are three ſpecies, none of which are natives of Britain.

Walton ‖ Wapentake.

WALTON (Bryan), biſhop of Cheſter, a learned Engliſh divine, who gained great reputation by his edition of the Polyglot bible, with his Prolegomena in the beginning; which is more exact, ſays Father Simon, than any other which had been publiſhed on that ſubject. He died in 1661.

WAMPUM, the money uſed by the North-American Indians. It is much uſed in all their treaties as a ſymbol of friendſhip. It is made of a ſhell of a particular ſpecies of VENUS.

WAPENTAKE, in England what is called a *hundred*; eſpecially uſed in the north countries beyond the river Trent. The word ſeems to be of Daniſh original, and to be ſo called for this reaſon: When firſt this kingdom, or part thereof, was divided into wapentakes, he who was the chief of the wapentake or hundred, and who is now called a *high conſtable*, as ſoon as he entered upon his office, appeared in a field on a certain day on horſeback with a pike in his hand, and all the chief men of the hundred met him there with their lances, and touched his pike; which was a ſign that they were firmly united to each other by the touching their weapons. But Sir Thomas Smith ſays, that anciently muſters were made of the armour and weapons of the ſeveral inhabitants of every wapentake; and from thoſe that could not find ſufficient pledges for their good abearing, their weapons were taken away and given to others; from whence he derives the word.

W A R.

WAR is a great evil; but it is inevitable, and oftentimes neceſſary. If he who firſt reduced to rules the art of deſtroying his fellow-creatures, had no end in view but to gratify the paſſions of princes, he was a monſter, whom it would have been a duty to ſmother at his birth: but if his intention was the defence of perſecuted virtue, or the puniſhment of ſucceſsful wickedneſs, to curb ambition, or to oppoſe the unjuſt claims of ſuperior power, mankind ought to erect altars to his memory.

War, in the laſt caſe, is the moſt neceſſary and uſeful of all the ſciences: the various kinds of knowledge which ought to furniſh the mind of a ſoldier are not without great difficulty to be attained. Of moſt other ſciences the principles are fixed, or at leaſt they may be aſcertained by the aſſiſtance of experience; there needs nothing but diligence to learn them, or a particular turn of mind to practiſe them. Philoſophy, mathematics, architecture, and many others, are all founded upon invariable combinations. Every man, even of a narrow underſtanding, may remember rules, apply them properly, and ſometimes draw juſt conſequences from them: but the ſcience of war branches out into ſo many particulars; it takes in ſo many different parts; there are ſo many reflections neceſſary to be made, ſo many circumſtances and caſes to be brought together; that it is only by a continual application, grounded upon the love of his duty, and an inclination to his profeſſion, that any man can attain it.

To march an army in every ſort of country, whether open, woody, or mountainous; to know how to form a camp in all thoſe countries, with which the general muſt be thoroughly acquainted in order to do it with ſecurity; to make a proper diſpoſition for a battle, whether with a view to the poſture of the enemy, or to the ſituation of the country; to foreſee events which depend in a manner upon chance; to be capable of making a good retreat on proper occaſions; to direct the forages without fatiguing or expoſing the troops; to ſend out detachments with precaution; to conduct the convoys in ſafety; to know how to canton an army; to eſtabliſh magazines in places, both ſafe and within reach of the army, ſo that it ſhall never be in want of ſubſiſtence—theſe are the great ends of the military ſcience.

It is commonly thought ſufficient for a military man to know how to obey; and it is alſo ſuppoſed that the ſucceſs of a day cannot be dubious, if a general joins the confidence of the ſoldiers to perſonal courage, a cool head, and a knowledge of the country.

It is true that, in caſes of perplexity, many generals have in a great meaſure owed to their own capacity, and the confidence their ſoldiers have repoſed in them, the advantages they have gained over the enemy; and confidence will always be repoſed by the ſoldiers in that general in whom they perceive coolneſs united with courage. At the battle of Cannæ, when Giſco ſeemed to be much aſtoniſhed at the ſuperiority of the enemy's number, Hannibal anſwered him coolly, "There is, Giſco, a thing ſtill more ſurpriſing, of which you take no notice." Giſco aſking him what it was, "It is (replied Hannibal) that in all that great crowd there is not one man whoſe name is *Giſco*." Plutarch obſerves, that this coolneſs of Hannibal greatly animated the Carthaginians, who could not imagine that their general would joke at ſo important a time, without being certain of overcoming his enemies.

Although bravery and courage are the moſt eſſential qualifications of a ſubordinate officer, yet he ſhould not be deficient in thoſe which are required in a general, and which have been already mentioned; obedience to the orders delivered

livered to him is no longer a virtue than whilſt he comprehends and knows the intention of them. War, ſays a celebrated author, is a buſineſs which, like all others, muſt be learned; it ſuppoſes ſome qualities to be born with us, and demands others which are to be acquired: but ſince all theſe qualities muſt have the original ſource in genius, a man who propoſes war for his profeſſion, ſhould never engage in it without having conſulted his natural bent, or without knowing the particular turn and power of his mind. Ability, whether in a general or an officer, is the effect of his genius, quickened by a natural liking to his buſineſs.

A quick eye, which is of great importance to a ſoldier, is natural to ſome, and in them it is the effect of genius; others acquire it by ſtudy or experience; he who knows how to command himſelf, and has courage enough to keep himſelf cool on the moſt urgent occaſions, has the readieſt and quickeſt eye. A quick, hot-headed man, however brave, ſees nothing; or if he does, it is confuſedly, and generally too late.

It is this quick eye which enables a general to judge of an advantageous poſt, of a manœuvre to be made, and of a good diſpoſition for the troops, whether with reſpect to that of the enemy, or to the ſituation and nature of the country.

The quick eye is no other than that penetrating genius which lets nothing eſcape it. A general who knows how to unite this quality with perpetual coolneſs, never is in want of expedients; he will ſee how thoſe events, which to any other would be the preſage of his own defeat, may end in the overthrow of his enemies.

The choice of the general officers depends upon this genius, which diſcovers every thing; they ought to be the right-hand of the general, and as capable of commanding the army as himſelf. Whatever good diſpoſitions a general may make, they muſt prove ineffectual if not ſeconded by the general officers under his command; he cannot be everywhere, neither can he foreſee all exigencies that may ariſe. He is obliged to give only general orders; it is therefore the buſineſs of thoſe who command under him to know how to take the advantage of a wrong movement of the enemy; to take upon them to attack, or ſuſtain the troops which are engaged; and, as circumſtances vary, to make them advance towards the enemy, either to keep him back or to attack him.

But the qualities already mentioned would be uſeleſs, if order and diſcipline were not ſeverely obſerved: the moſt numerous and beſt compoſed army would ſoon become little elſe than a body of rangers, who being only united by the hope of booty, would ſeparate as ſoon as that motive ceaſed; and truſting each to his own head, or indulging his own humour, would be cut in pieces party by party: ſo that if the general does not keep up ſubordination (the ſoul and ſtrength of diſcipline), his army will be nothing more than a troop of Tartars acting more from the hope of plunder than the deſire of glory. What art and what genius is there not requiſite to maintain this ſubordination? Too much ſeverity diſguſts the ſoldier, and renders him mutinous; too much indulgence ſinks him into indolence, and makes him neglect his duty; licentiouſneſs cauſes that ſubordination to ſeem burdenſome, which ſhould never in any degree be given up: he loſes that reſpect, and often that confidence, which he ſhould have with regard to his officer; and indulgence often makes a well-diſciplined body become a ſet of ſluggards, who march againſt their will, and who, on the moſt preſſing emergencies, think only on their own ſafety.

Beſides theſe qualities, which are eſſential to a general, and which all who would attain that rank ought of courſe to have, there are ſtill many others neceſſary to make a great man. A general who would merit the title of a hero, ought to unite in himſelf all civil, military, and political excellence. It is by this that he will eaſily attain to make war with ſucceſs: nothing will eſcape him; he will know without difficulty the genius of every country, and of the nations which compoſe the enemy's army, the abilities of the generals who command, and the nature of the troops under them; he knows that he may venture a motion with ſome troops that he would not dare to attempt with others that are equally brave. One nation is vehement, fiery, and formidable in the firſt onſet; another is not ſo haſty, but of more perſeverance: with the former, a ſingle inſtant determines ſucceſs; with the latter, the action is not ſo rapid, but the event is leſs doubtful.

No man is born a general, although he brings into the world with him the ſeeds of thoſe virtues which make a great man: Cæſar, Spinola, Turenne, the great Conde, and ſome others, ſhowed, even in their earlieſt years, ſuch qualities as ranked them above other men; they carried within them the principles of thoſe great virtues which they drew forth to action by profound ſtudy, and which they brought to perfection by the help of practice: thoſe who came after them, with perhaps fewer natural talents, have by ſtudy rendered themſelves worthy of being compared to them. Cæſar and all conquerors had this advantage, that they were able to make their own opportunities, and always acted by their own choice. A man may be a good general without being a Marlborough or a Turenne: ſuch geniuſes are ſcarcely ſeen once in an age; but the more they are raiſed above the reſt of mankind, the more they ought to excite emulation. It is by endeavouring to ſurpaſs the intellects of the ſecond rate; it is by ſtriving to equal the moſt ſublime, that the imitation of them is to be attained. This paſſion in a ſoldier is neither pride nor preſumption; it is virtue: and it is by this only that he can hope to be ſerviceable to the ſtate, and add to the glory of his king and country.

How much ſoever the honour of commanding armies may be ſought after, it degrades him who is not worthy of it; this rank, ſo much deſired, borders on the two extremes of glory and ignominy. A military man who labours to make himſelf capable of commanding, is not to be blamed; his ambition is noble: by ſtudying the art of commanding, he learns that of obeying and of executing. But it is aſtoniſhing in the higheſt degree to ſee ſoldiers thinking only on preferment, and neglecting the ſtudy of their buſineſs. It is perhaps leſs ſurpriſing if we ſee others, without having been tried, propoſing to themſelves to command in chief; becauſe ſuch attempts ſuppoſe in the projector an abſurd temerity, founded on a profound ignorance of the talents he ought to have, and the virtues which he has not. Such boldneſs is the character of a man whoſe mind is too narrow to perceive his danger: We ſhould rather approve the timidity that ſuffers itſelf to be dejected by terror, ſince it ſhows at leaſt that he knows to what hazards he is expoſed; both one and the other are blameable: modeſty is the only proper quality of a ſoldier; it gives ſplendour to virtue, it argues diffidence of himſelf, and deſire of arriving at perfection.

The title of general would be leſs tempting, if proper attention was paid to the qualities it requires, and the duties it impoſes; it would then appear a very honourable, but painful burden. The moſt firm and intrepid genius might be diſcouraged, merely by thinking that on the conduct of a general depends the fate of the ſtate, the glory of his prince's arms, and his own reputation.

Defenſive Operations.

But yet the reward that follows ſuch irkſome labours ought to animate men to undertake them. Obſtacles, however numerous they may be, are not inſurmountable, ſince ſo many great men have got the better of them: difficulties ſhould ſtir up a ſoldier's emulation, but ſhould never terrify him: he ſhould endeavour to copy ſuch great originals, though he ſhould not be able to equal them.

This treatiſe is divided into four parts.

In the firſt are mentioned all the greater operations of a campaign; and the means of executing thoſe operations, in any kind of country, are endeavoured to be laid down. Defenſive Operations.

In the ſecond, the precautions that are to be taken to attack the enemy in all the forementioned operations, are conſidered.

The third treats of the *Petite Guerre*, or the operations of detached parties, and the war of poſts.

The fourth, of ſieges, both with regard to attack and defence.

Part I. Of the GREATER OPERATIONS in DEFENSIVE WAR.

Sect. I. *Of the Knowledge of a Country.*

A Campaign of which the plan is well formed, and the diſpoſitions well concerted, may nevertheleſs prove unſucceſsful, if the general, to whoſe direction the operations are intruſted, hath not a thorough knowledge of the country in which they are to be carried into execution.

There is one knowledge of a country, which for an officer to be without ſhould be conſidered as a reproach; that of the ſituation of cities, towns, villages, foreſts, ſtreams, rivers, which is to be acquired by ſtudying of geographical maps. There is another branch of knowledge yet more particular, ſuch as, of the paſſes, or the boundaries of the country, the ſituation, the nature of the ground, whether it is plain, or divided by hollows, rivulets, hills, &c. which is to be acquired by the aſſiſtance of topographical maps. In the ſtudy of theſe laſt, care muſt be taken, not blindly to follow the marks they lay down. It very ſeldom happens, that topographical maps are perfectly exact: for, beſides the many circumſtances which may ſometimes in a year alter a large extent of country, they ſeldom take notice of fords, bridges over the ſmall rivulets, ſmall hills, and hollows of little importance; neither can they mark whatever may be occaſioned by recent inundations and diſruptions of the earth: whereas any of theſe unforeſeen circumſtances may prove an obſtruction to a great deſign, either by retarding the march of an army, preventing a column of troops from advancing, or leaving the enemy in poſſeſſion of ſome paſſes from which he might have been driven.

In order to avoid the errors into which a general may be drawn by the maps, the ſafeſt method is to apply to the inhabitants of the country, go over it with the moſt intelligent of them, and remark every obſtacle, however trifling it may appear.

For marching with greater ſecurity, a general ought to form a company of guides of the peaſants, be aſſured of their fidelity, and attach them to him by all poſſible methods, particularly by unbounded liberality. It is by money only that truſty ſpies and faithful guides can be ſecured; the latter are leſs expenſive, but full as neceſſary as the former. Parſimony ſhould be avoided in war; for, as Vigetius obſerves, money ſhould never be ſpared when expence is neceſſary to ſecure poſſeſſion. In proportion as an army advances into a country, great care muſt be taken to change the guides.

The general ſhould ſend out detachments along with ſome of theſe guides to examine the ſtreams which croſs the country, whether or no their mouths are at a diſtance, into what river they empty themſelves, from whence they take their ſource, whether they may be eaſily forded, if their banks are ſteep or ſloping, marſhy or covered with buſhes; other detachments ſhould be employed in examining the woods, in order to find out whether troops can paſs through them or not.

A general ought himſelf to examine into the truth of the reports made to him by theſe ſmall detachments, or ſend out others more conſiderable under the command of general officers: however certain a general may be of the fidelity of his ſpies and guides, yet he ſhould not always rely upon their reports: miſtruſt, which in general is accounted a vice, may almoſt be eſteemed a virtue in the buſineſs of war.

Furniſhed with theſe lights, a general can allot the eaſieſt road to the artillery and baggage, the ſhorteſt to the infantry, and longeſt to the cavalry: he can at once judge, from the nature of the ground, into how many columns the army can be divided in order to expedite the march, and what diſpoſitions will be neceſſary for the columns with regard to the enemy's poſition.

By the knowledge of the country, a general is informed of what camps the enemy doth or can occupy, and of thoſe neceſſary to be taken to oppoſe his deſigns; whether the enemy's detachments can eaſily approach, or how he can himſelf advance towards him, without being diſcovered; if there is forage in the neighbourhood of the enemy's camp, or whether he is obliged to draw it from a diſtance; where he hath fixed his magazines, and whether an attempt to carry them off is practicable or not; in what manner his quarters are diſpoſed, and which of them is moſt expoſed; what diſtance there is between himſelf and the enemy; where the enemy hath eſtabliſhed poſts, and which thoſe are that himſelf ought to occupy with regard to the ſituation of his own camp and quarters, and thoſe belonging to the enemy; which is the propereſt road for the detachments and the patrols to keep, in order to gain intelligence; and laſtly, with what degree of eaſe the enemy can attack the army on its march, and whether in front or flank. This knowledge is eſſential to a general in every kind of country; but in a woody or mountainous country it would become more particularly dangerous, and even impoſſible for him to march an army, if unacquainted with it.

In 1702, the duke of Burgundy, being deſirous to attack the enemy who were behind Cleves, but not being perfectly acquainted with the foreſt in his front, he detached the marquis d'Alegre with 500 grenadiers, and 800 horſe, to ſee if it was not poſſible to find ſome paſſage thro' it. M. d'Alegre met with a defile which was occupied by the enemy: he attacked and forced it; but being advanced beyond it, found it was not poſſible to proceed farther, by reaſon of the great number of defiles that ſucceeded to each other: he thereupon turned back, ſent, and had another paſſage ſurveyed, where there were found ſtill greater obſtacles. He gave an account of this to the duke of Burgundy, who, not chooſing to miſs the opportunity of attacking the enemy, ſent him out again with a larger detachment, that he might examine whether, by keeping along the ſide of the foreſt, it would not be practicable for him to march up to them by way of the heaths of Mook, on

Defenſive Operations.

the ſide of Grave and Nimeguen. The marquis d'Alegre diſcovered a defile which led to theſe heaths; he took poſſeſſion of it, and ſent notice thereof to the duke of Burgundy; who ordered the army to advance, obliged the enemy to ſend their infantry into Nimeguen, and cannonaded their cavalry which had taken poſt on the glacis, but were unable to maintain it; and the conſequence was, that the enemy ſuſtained a great loſs in men, artillery, waggons, and baggage.

This example tends to prove that maps are not always to be relied on. There can be no reaſon to doubt that the duke of Burgundy was furniſhed with the moſt exact: but yet it is probable that he might not have ſucceeded in this enterpriſe, if he had neglected ſending M. d'Alegre to ſurvey the paſſes, and examine two before he proceeeded to that through which he marched.

The following is a general rule: That it is upon the ground, and not upon maps, that the roads through which an army is to march muſt be examined, as well as the ſituation of places where camps are to be fixed, and fields of battle choſen. An army ſhould never move before ways are opened for every column: with regard to a detachment it is different, as there may ariſe circumſtances which will prevent the general from foreſeeing what road it may take. The command of a detachment ſhould always be given to an intelligent officer, and one who has made his buſineſs his only ſtudy; who hath been particularly careful to acquire a knowledge of the country, and of whoſe genius the general ſhould entertain no doubt. A particular choice ſtirs up emulation in young men, and induces them to exert their utmoſt endeavours to deſerve ſo diſtinguiſhing a mark of approbation.

Into how many miſtakes have even the greateſt generals fallen, by not being thoroughly acquainted with a country, and by ſuffering themſelves to be guided by general notions? M. de Feuquieres cites many examples of great enterpriſes which have miſcarried by it.

Toward the end of the year 1673, when a conſiderable body of infantry, with only few cavalry, was on its return from Holland, under the conduct of M. de Luxemburg, the prince of Orange having aſſembled the whole force of the Dutch and the Spaniards (under his command), came upon the Maeſe, with an intention to fight M. de Luxemburg between Maeſtricht and Charleroy. This march made it neceſſary for the court to ſend an order to M. de Schomberg to aſſemble all the cavalry that were in Hainault and Flanders, and immediately join M. de Luxemburg, who was greatly inferior to the prince of Orange in cavalry. The prince's aim then ſhould have been to prevent the two generals from joining, and to have fought one or other of them before their junction. The prince's being unacquinted with the country, made him miſtake for real the feints made by M. de Luxemburg, whilſt he was upon the river Ourte; as if his intention was to march by way of the Condros and the Ardennes, in order to gain Sedan and the Mezuris. The prince of Orange drew near Huy and Namur; and by that means was at ſuch a diſtance from the high-road, that M. de Schomberg had an opportunity of advancing with his cavalry to Tongres; at the ſame time that M. de Luxemburg, by a forced march, paſſed the Maeſe at Maeſtricht, and arrived at Tongres, where the junction of the two armies was effected without any accident.

If the prince of Orange had made only two reflections upon the nature of the country, he would have avoided the miſtake he fell into; the firſt of which is, that ſcarcely any body can be ignorant that the Condros and the Ardennes are ſterile and mountainous countries; from whence it is evident, that M. de Luxemburg could not have ſubſiſted his army, eſpecially in the month of December: the roads in thoſe parts, very bad in the ſummer, are almoſt impaſſable during the winter; conſequently the carriages could not have paſſed but with the utmoſt difficulty.

Defenſive Operations.

The ſecond reflection is, that if M. de Luxemburg had actually deſigned to paſs through the Ardennes, why did M. de Schomberg advance towards Tongres, and ſo expoſe himſelf to the danger of being beaten, without a poſſibility of receiving help from M. de Luxemburg, who was on the other ſide of the Maeſe? If the prince of Orange had had a thorough knowledge of the country through which M. de Luxemburg pretended he would paſs, he would ſoon have perceived that it was only to throw him into a perplexing uncertainty with regard to the road which the enemy's general ſhould naturally take: in a word, he would not have remained a moment in doubt on the part he had to act.

By this, then, it appears, that the prince ought to have continued on the ſide of Liege; by which poſition he would have ſtopped M. de Schomberg, who would have ſcarcely dared to advance to Tongres, nor would M. de Luxemburg have attempted the paſſage of the Maeſe at Maeſtricht: by this means, the junction would have been prevented; or, if either of the two armies had advanced, the prince could have attacked and beaten it; neither would it have been in the power of the other to have aſſiſted it.

It hath frequently happened, and will continue to do ſo, that a general who knows how to take advantage of the knowledge of the country, although inferior in point of force, may change a defenſive into an offenſive war. In 1671, M. de Créqui, who began the campaign on the defenſive, ended it with obliging the duke of Lorrain to paſs the Rhine: that prince diſperſed his army, and then M. de Créqui formed the ſiege of Fribourg.

The knowledge of a country is ſtill more eſſential in retreats: there is more art and more precaution required in a retreat than in any other action; that operation is the concluſion of all preceding ones. If a general, obliged to retreat precipitately, hath but a ſuperficial knowledge of the country, how will he be able to re-aſſemble his troops, re-eſtabliſh order, or march with any degree of ſecurity?

Xenophon's retreat with the ten thouſand Greeks is one of the moſt uſeful leſſons a commander can ſtudy: in that undertaking were united the virtues of a conſummate general, and the moſt intrepid courage of a ſoldier; and in particular it exhibits the moſt profound knowledge of the country.

The knowledge of a country is as neceſſary for a private officer as for the commander chief, becauſe he is to execute with part what the general performs with all the troops. When an officer, to whoſe conduct an expedition is intruſted, joins this knowledge, one of the chief branches of military ſcience, to practice and experience, he will with ſo much the greater eaſe comprehend and execute the general's intention and plan; and he will be alſo enabled to take the propereſt meaſures for ſucceſs: if, on the contrary, he begins a march, without being acquainted with the country, his mind miſgiving him, will increaſe the danger, by the very means he takes to avoid it: he will ſuppoſe it in places where there is nothing to be feared, and often fall into it where he was leaſt apprehenſive of it.

The general who commands in the cantonments and winter-quarters, and each officer who commands a particular quarter, will never be able to take proper meaſures if they are unacquainted with the country: they will be unable to preſerve a proper ſtrength when ſeparated, or to aſſemble without difficulty on the firſt order; and for want of know-

ing

Defenſive Operations.

ing the poſts which it is proper to guard, they will occupy ſuch as are unneceſſary, and leave thoſe defenceleſs that are moſt liable to be attacked; the troops will be greatly fatigued by increaſing the number of poſts without occaſion, by ſuperfluous or too numerous detachments or patroles. In a word, whatever precautions are taken within, the quarters will never be in ſecurity, if the country round about them is not perfectly known, and every important paſs between them and the enemy occupied.

SECT. II. *Of the Preparations before taking the Field, and the March of an Army on leaving its Quarters to go into Cantonments.*

THE time for an army to come out of winter-quarters, is always regulated by the plan which the general has formed for the enſuing campaign. But whether by the ſituation of the quarters the army is enabled to enter immediately on the campaign, or whether it muſt be firſt of all cantoned, the magazines ſhould be ſo ſituated as to be always within reach, eſpecially in that early ſeaſon of the year, when there can be no forage upon the ground, and conſequently the cavalry muſt be ſubſiſted out of the magazines. The magazines ought to be diſtributed about in different parts, that the troops may have leſs way to go for their forage. And this diſtribution ſhould be regulated by the movements which the general foreſees the army will make on leaving its quarters, ſuppoſing it leaves them when there is only dry forage; but if the army is in an enemy's country, and there is forage upon the ground, it is certainly better to reſerve the magazines entire, by which not only great trouble will be avoided in tranſporting the forage, but alſo a great expence ſaved to the government.

Of what nature ſoever the country may be (an enemy's country is ſuppoſed), it ſhould be foraged in front as much as poſſible, in order to reſerve that which is in the rear, that, when the campaign is over, it may be found laid up in the barns: if this precaution is not attended to, the army will be deſtitute of forage at its return, and will of courſe be obliged to draw it from home, and conſume thoſe magazines which were before ſpared; conſequently there will be nothing ſaved, the expence will only have been deferred, but it will be increaſed by tranſporting the forage from the magazines to the army.

The forming of the magazines ſhould never be delayed till the time for opening the campaign approaches. The intendant, purſuant to the general's order, ſhould lay in the proviſions during the winter, and diſtribute them in the frontier towns, by which means they can eaſily be tranſported to whatever place the general ſhall order. By theſe precautions, the general will not only avoid the inconvenience of being obliged to wait till there is forage upon the ground, but he will alſo be enabled to be firſt in the field. The ſame precautions ſhould alſo be taken with reſpect to the artillery. It ſhould be aſſembled upon the glacis of the frontier towns, or rather upon that of the conquered places: the more it is within reach of readily joining, the ſooner the operations will be commenced.

From prudence in the execution of theſe diſpoſitions, as well for the magazines and for the artillery, as for every thing that is neceſſary to an army, it follows, that a general hath often formed a ſiege, or at leaſt inveſted a place, and completed his lines of circumvallation, before the enemy could be in a condition of coming out of his quarters: he may likewiſe have made many marches, and will poſſeſs himſelf of advantageous poſts, without the enemy having it in his power to oppoſe him.

A general ſhould obſerve, that, in order to cauſe his army to be cantoned within a march of the country where he deſigns to commence the operations he muſt make all the troops leave their quarters together; aſſemble them in many bodies in different frontier towns; proportion the marching days to the diſtance of the quarters and the rendezvous that ſhall have been appointed for them, that they may arrive on the day appointed, and that from thence they may march in a body to the place where they are to canton.

Defenſive Operations.

All the bodies march, either in the number of columns that the ſituation of the country will allow, and arrive at the cantonment together; or elſe they march ſeparately, and arrive on different days: but, in either of theſe caſes, the cantonments for each regiment ought to have been marked out; and, if poſſible, forage for at leaſt three or four days diſtributed to each quarter.

In the marching orders which are ſent to each commander, the ſituation and name of the place where each regiment is to canton, ſhould be carefully expreſſed; whether on the right, the left, or in the centre: the diſcipline to be there obſerved, the place where to go and receive orders, and that where to receive forage, ſhould alſo be particularly ſpecified.

Troops, when upon a march, ſhould always obſerve the moſt exact diſcipline; and never be ſuffered to advance, but in the ſame order, and with the ſame precaution, as if they were in danger of being moleſted or attacked.

Whenever an army is cantoned, it is generally in an enemy's country; therefore, for the greater ſecurity of the cantonments, there ſhould at leaſt be one place that may ſerve for a ſupport. If no place of this ſort can be found, the army muſt then march out together and encamp, inſtead of going into cantonments.

As the cantonments are properly nothing more than a halting place where the troops are to remain till the ſeaſon permits them to take the field, till the proper quantity of forage is collected, or till the neceſſary preparations for the intended operations are completed, they ſhould be more connected than the winter-quarters. But as ſoon as the weather permits, and all the neceſſary preparations which ſhould have been forwarded during the winter are finiſhed, there is then no time to be loſt; for an army will always find its advantage in encamping early, getting the ſtart of the enemy as much as it poſſibly can, and beginning the campaign, no matter by what operations, before the enemy can have time to aſſemble.

If any particular column, upon the march, preſents its flank to any of the enemy's towns, although it is indiſpenſably neceſſary for every column to obſerve all poſſible order and diſcipline on the march, yet this column is more particularly obliged to it; neceſſity makes it become a duty. But that it ſhould not be too much expoſed, ſome huſſars ought to be appointed to march upon its flank, who ſhould alſo be ordered to advance till they come within ſight of thoſe towns. This column, whether conſiſting of infantry or cavalry, muſt detach ſome troops to ſuſtain the huſſars, in caſe they ſhould be attacked and repulſed. By poſting theſe detachments upon the flank, the enemy will be kept at a diſtance from the column, and the huſſars will be alſo ſuſtained.

SECT. III. *The March of an Army in an open Country.*

To direct the march of armies is not the leaſt difficult part of a general's duty, and it is only by a thorough knowledge of the country that he can perform this duty; that he can concert the meaſures for conducting them in

Defenſive Operations.

ſafety; and that he will be enabled to foreſee the enemy's motions.

There are but three ſorts of countries which may become the theatre of war; an open country divided by rivers, a woody, or a mountainous one.

When an army is in an open country, the general may take whatever road he thinks moſt convenient, without being under a neceſſity of keeping the beaten road. If he chooſes to march acroſs the country, it may be done by cutting down the hedges, filling up the ditches, levelling the ridges, filling up the hollow ways, thereby rendering their aſcent or deſcent eaſy, and by building bridges over the ſtreams and rivulets which divide the country. But nevertheleſs it is very imprudent for a general to ſuppoſe himſelf entirely free from danger upon a march; for the conſequences of ſelf-ſecurity are generally fatal. The effects of negligence in any military operation are pernicious, but more particularly ſo upon a march; and although a general ſhould never fear his enemy when in preſence of him, he ſhould nevertheleſs always apprehend the worſt from him when he is out of his ſight.

The number of columns in which an army can march in an open country is arbitrary, whilſt it is advancing, and the enemy at too great a diſtance to attack or annoy it upon its march. But if, on the contrary, the enemy is near at hand, and there is a poſſibility of his attacking the army, it ſhould then be diſpoſed after ſuch a manner as to form in order of battle in a very ſhort time, and to be able to take a favourable poſition for action upon the firſt ſignal.

If the army preſents its flank to the enemy, the diſpoſitions, without conſidering the probability of its being attacked, ſhould be changed; for an army upon a march ought to be always prepared againſt any accident that may happen.

A general ſhould never cauſe an army to move without having previouſly conſidered and examined the intended march of it, nor without a thorough knowledge of the enemy's poſition, and where he is, or without knowing particularly the ground intended to encamp on. An army ought never to move but with ſome deſign, either to ſeize on ſome advantageous poſt, to prevent an intended march of the enemy's, to draw him into a diſadvantageous ſituation, to deprive him of ſubſiſtence, or to procure ſome for itſelf.

This maxim being eſtabliſhed, let it be ſuppoſed, that a general would cauſe his army to march, and the enemy's diſtance to be alſo ſuch as to ſecure him from any danger of attacks; he hath it in his power to open four, ſix, or eight roads, in proportion to the number of the troops under his command: for the greater the number of columns, the leſs is the body of troops contained in each; conſequently there will be leſs confuſion, and the ſooner will the army arrive at its deſtined camp.

Before the march is planned, and the number of columns determined upon in which the army is to march, notwithſtanding the general is acquainted with the country, he ſhould ſend out a detachment ſome days before, to reconnoitre the intended route of the army, as well as the camp it is to occupy. This detachment is to be commanded by the officers of the day appointed for its ſetting out: they muſt have ſtaff-officers and guides with them, to conduct and to inform them of the nature of whatever may prove an obſtacle, of the places where the roads begin, and thoſe where they terminate: they ſhould alſo have labourers with them, to mend the ways, enlarge the roads, and make new ones, if neceſſary; to cut down the hedges, fill up the ditches, level the ridges of the hollows, and build or repair bridges.

When the general commanding this detachment is ready to enter the different ways through which the army is to follow, he will divide his detachment into as many ſeparate bodies as the army is to be divided into upon its march; and diſtribute ſtaff-officers, guides, and labourers, to each detachment, with orders to meet again at the ſame place from whence they ſeparated. Defenſive Operations.

Each of theſe detachments ſhould advance to the extremities of the woods, if they meet with any, and of the roads leading to the camp, intended to be occupied: the commanding and ſtaff-officers will then advance with an eſcort to reconnoitre its ſituation, and will leave part of their men in ambuſcade in the woods, or concealed behind ſome heights, or in ſome hollows. The knowledge of the ſituation of the camp being attained, each detachment will return by the road it came; but firſt, the commanding officer of each detachment will make a report to the general of the roads they have paſſed, what diſcoveries they have made, and, in ſhort, will give him a particular detail of every thing they have met with on their way, whether woods, villages, hollows, bridges, and of every thing they have done to render the road eaſy for the column that is to paſs through it. This detachment being aſſembled at the place appointed for meeting, will take the road to the camp, where being arrived, the lieutenant-general will make his report to the commander in chief of the army.

With theſe precautions the army may not only advance in ſafety, but the roads alſo for every column having been reconnoitred and repaired, no accident can happen to retard the march of the army.

The general muſt take care to have detachments of huſſars or dragoons always in the front and upon the flanks, to obſerve and clear the march of the army; neither ſhould a general ſuppoſe himſelf to be in abſolute ſecurity from the diſtance of the enemy: but whilſt he ſees all clear before him, it would ſhow great weakneſs for him to be apprehenſive of a ſurpriſe, eſpecially when every neceſſary precaution for avoiding it hath been taken. It is certainly a mark of prudence to take precautions: but multiplying them without cauſe is an undoubted ſign of fear and anxiety.

It is proper to make the army march as near as poſſible, in the ſame order in which it is to encamp; by which means the troops may enter the camp without confuſion. The army being ſuppoſed to march in ſix columns, the infantry will form three, the artillery and baggage the fourth; the cavalry, with the remainder of the corps of huſſars that are not detached, and the dragoons, the two laſt upon the flanks; ſo that the army, on its march, will be in the following diſpoſition: The column upon the right will conſiſt of cavalry, the one adjoining to it of infantry, and that which comes next will be formed by the artillery and baggage; then two columns of infantry, and the ſixth cloſing the left, will be compoſed of cavalry. It is to be obſerved, that, if the baggage-waggons belonging to the army form too long a row, ſome of them may be ſent into the rear of the columns of infantry, with expreſs orders to the officers to make them march in the column.

There ſhould be an advanced and a rear guard to each column, formed from the troops of which the column is compoſed; there ſhould be alſo detachments of light horſe upon the flanks of the cavalry, in order to keep off any of the enemy's parties that might advance to annoy the army upon its march. The rear guard to the column of baggage ſhould conſiſt of infantry, cavalry, or dragoons, beſides the eſcort always appointed for it. The general officers who are at the head of the two columns of cavalry ſhould not march too faſt, leſt they ſhould get too far advanced before the infantry; a matter always to be avoided. The march

of

Defenſive Operations.

of an army being diſpoſed after this manner, every column will enter the camp at the ſame time, and find itſelf oppoſite to its ground. See Plate DXIV, where *a* is the army formed in order of battle, ready to march. *b*, The park of artillery, where the baggage belonging to the army, and their eſcorts, alſo are aſſembled. *c*, March of the cavalry, to form the column on the right. *d*, March of the cavalry to form the column on the left. *e*, March of the infantry, to form in three columns. *f*, March of the artillery and baggage, to form in a column. *g*, Parties of huſſars, covering the flanks of the army, and forming the rear-guards of the column, when the army hath paſſed. *h*, Bridges and fords, diſcovered by the advanced detachments, who have marked the route of the army. *i*, Bridges built by the ſame detachments. *k* Front and rear-guards of the columns drawn from the troops of which the columns are formed. *l*, Parties of huſſars, marching upon the flanks of the army. *m*, Parties of huſſars marching at the head of the army, to ſcour the country through which the army is to paſs, and alſo to examine the routes marked by the advanced detachments.

If, by the enemy's poſition, although at a diſtance, the army ſhould, on its march, preſent a flank to the enemy, without fearing its being attacked; yet as the enemy may have ſtolen one or two marches, as hath happened on many occaſions, there muſt be only two columns of infantry placed in the centre. The third muſt be placed upon that flank which the army preſents to the enemy; ſo that the army will find itſelf diſpoſed upon its march after the following manner: Suppoſing it is the right which preſents the flank to the enemy, the firſt column will conſiſt of infantry, the ſecond of cavalry, the third of artillery, the fourth and fifth of infantry, and the ſixth of cavalry. The baggage will then be diſtributed to the three columns upon the left; ſo that neither the two columns upon the right, or the artillery, will have the leaſt embarraſſment, in caſe an action enſues. The ſame diſpoſition muſt be made upon the left, if it is that which preſents the flank. Particular care muſt be taken that the artillery have orders, ſuppoſing the enemy advancing in full force to attack, to tranſport itſelf to the column of infantry, and to divide itſelf along the front, when it ſhall be in order of battle, and to keep up a conſtant fire, in order to give the general time to make ſuch diſpoſitions as he ſhall find neceſſary.

The column of cavalry ſhould be divided into two, and be poſted upon the flanks of the infantry that is drawn up in the face of the enemy; the other columns muſt follow the orders which have been delivered to them, and execute them with the utmoſt diſpatch.

If it appears, either from the proximity or poſition of the enemy, that the army is liable to be attacked in front, the diſpoſition for the march ſhould be in the ſame order as the army is to form in for action: the artillery muſt then be diſtributed among the columns of infantry; ſo that, following the diviſions where it is placed, the brigades will find themſelves ſpread over the front of the firſt line. In this caſe, the infantry will form four columns, which will march in the centre of the two columns of cavalry upon their flanks; ſo that the head of each column, as far as the centre, when placing itſelf in order of battle, ſhall make the firſt line, and the remainder, from the centre downward, the ſecond; and the reſerve which follows ſhall form itſelf behind the other two lines. Defenſive Operations.

It is neceſſary that an army diſpoſed after this manner ſhould have orders to draw itſelf into order of battle on the very firſt ſignal, which ſhould be a diſcharge of two or three pieces of cannon. The ſignal being given, the firſt and ſecond lines, and the reſerve, will find themſelves formed in a very ſhort time. If, from the proximity and poſition of the enemy, and the facility with which he can attack, the general hath reaſon to imagine he will do it, the heavy baggage, with a good guard and eſcort, ought to be removed into the rear.

On this occaſion the *campement* (A) ſhould not be far before the army, the eſcort ſhould be increaſed, and ſome detachments of light horſe ſhould march in front to cover it, and alſo to make obſervation at a diſtance. The remainder of the body of light horſe ſhall continue upon the flanks of the army ſuſtained by dragoons, who, on the ſignal being given, ſhall immediately go and form themſelves in the place aſſigned to them during the action.

On the firſt ſight of the enemy the campement ſhould retire; for when fighting becomes neceſſary, all thought of encamping muſt be laid aſide; but the eſcort ſhall put itſelf in order of battle, and the light horſe ſhall approach the enemy as near as poſſible, in order to reconnoitre his diſpoſition and ſtrength. The officer commanding them will immediately ſend a report of the diſcoveries he hath made to the commander in chief, who on every occaſion ſhould be in the front, and even a little advanced, to ſurvey the nature of the ground; it being very certain, that in theſe caſes a man can much better rely upon his own than upon the judgment of others. This was marſhal Saxe's method; particularly when he was apprehenſive of being attacked upon a march, or had himſelf an intention of attacking. In proportion as the enemy ſhall advance, the eſcort of the campement muſt retire in good order, at the ſame time not neglecting the opportunity, if it offers, of haraſſing the enemy's advanced guard, ſo as to retard his march, and give more time for the army to form in order of battle, and to the general to make ſuch diſpoſitions as he ſhall judge neceſſary: after which, the eſcort having amuſed the enemy, or cauſed him to ſlacken the briſkneſs of his march, muſt retire in good order; and when it ſhall be near the body of the army, each body ſhall return to its own brigade.

If, from his knowledge of the country, although an open one, the general knows there are any thickets, hollows, or heights, either on the right or the left, and that this ſpot may prove favourable to the enemy, he ſhould try to poſſeſs himſelf of it. If that attempt is not practicable, as the enemy will undoubtedly take advantage of it, and poſt infantry either at theſe thickets or heights, the general muſt place a brigade of infantry at the head of each column of cavalry, which ſhall mix by platoons with that line of cavalry when formed in order of battle. This diſpoſition was made by M. de Turenne at the action of Sinzheim, and at the battle of Enzheim.

If, by the ſituation of the country, the flanks cannot be ſheltered

(A) This is a French term, for which we have not a ſynonyme equally expreſſive in the Engliſh language. It is uſed to denote a certain number of troops, who proportion their time of ſetting out before the army, by the diſtance or proximity of the enemy, in order to trace or mark out the camp. For this purpoſe, a quarter-maſter and a trooper is draughted from every troop of every regiment of horſe; and a ſerjeant and a corporal, in like manner, from every regiment of infantry, furniſhed with ropes and pickets, to lay out the ground for the tents and the intervals; ſo that every regiment will, on its arrival find its ground properly marked out. A field-officer of every regiment alſo marches with the campement, beſides the officers of each corps, who command the detachment.

Defenſive Operations.

ſheltered either by an hollow, a moraſs, a river, a town, or a village, the huſſars and dragoons muſt be poſted upon the wings, but ſidewiſe, ſo as to be able to take the enemy in flank when he ſhall come down to charge the firſt line, or at leaſt to keep back his ſecond: theſe huſſars and dragoons ſhould be ſuſtained by the infantry of the light troops belonging to the army. If the right can be formed next a village, and the left next an hollow, ſome infantry and artillery muſt be poſted there: if there is only the right or the left that can be ſheltered, that which cannot muſt be properly ſuſtained; and the ſame diſpoſition muſt be obſerved that hath been juſt now mentioned, with regard to an army whoſe flanks cannot be covered.

If, on leaving the camp, the army preſents a flank to the enemy, who may have it in his power to attack it on the march, it muſt then march but in two or three columns at moſt. Each column ſhould be diſpoſed after ſuch a manner, that by a motion to the right or to the left, according to the wing that is liable to be attacked, each battalion and ſquadron may find itſelf formed in order of battle before the enemy.

The advanced guard ſhould be compoſed of light horſe, ſuſtained by dragoons: the rear-guard of cavalry ſuſtained by infantry: there ſhould be alſo ſome light horſe upon the flanks of the cavalry, and ſome pieces of cannon with the infantry. The artillery ſhould be diſtributed by brigades in the column of infantry neareſt to the enemy; ſo that, performing the ſame movement as the troops, it may find itſelf placed in the front of the firſt line, ready to fire on the firſt order. The number of three columns is given to the army, in order that the firſt and ſecond lines and the reſerve ſhall be formed at the ſame time, which cannot be done if the army marches only in two columns: for troops muſt then be taken from theſe two lines in order to form the reſerve, which would require a conſiderable time, and conſequently retard the diſpoſitions; whereas this reſerve, forming the third column, is ſeparated from the main body, and in a condition to act with readineſs, according to the orders it ſhall have received. As the baggage, in this manner of marching, muſt neceſſarily be an embarraſſment, it muſt be ſent into the rear under a good eſcort, with orders to join the next day at the new camp.

Sect. IV. *The March of an Army in a mountainous and woody Country.*

If the ſituation of the places in a mountainous country furniſhes a general with a greater variety of expedients to conceal his diſpoſitions, it alſo renders more precautions, and a greater degree of knowledge, neceſſary to avoid being ſurpriſed. If theſe kinds of countries, on the one hand, preſent greater advantages for the concealment of marches, they alſo, on the other, offer many difficulties in the tranſporting of the proviſions and the artillery, and require a greater degree of vigilance for the ſafety of the magazines and the preſervation of the communications with the frontier towns.

It is to be feared, that in mountainous countries, in roads that cannot be enlarged, the troops preſſed too cloſe together will not be able to move but with great difficulty; and as they will embarraſs each other, the front, the rear-guard, and the flanks, muſt be equally ſecured; the columns muſt be unbroken and cloſe, that there be no diſtance left between them; and halting ſhould be particularly avoided, as that is a circumſtance by which an army is moſt fatigued.

It is again dangerous, as the commentator upon Onoſander obſerves, when troops find themſelves ſtraitened of room in a narrow road, for the general, in order to enable them to move with greater eaſe, to lengthen the columns too much: from whence would ariſe two inconveniences; the firſt of which is, that the columns would be weakened, and that in caſe of a ſurpriſe it would not be difficult for the enemy to ſeparate them entirely, and it would alſo be impoſſible for them to rally; in the ſecond place, theſe columns thus lengthened, in going round a mountain and deſcending into a valley, would take up a prodigious extent; from whence it hath often happened, that the windings of the road hiding the middle of the column, thoſe who march in the front rank can ſee only thoſe who are in the laſt, and retard their march, becauſe that, being deceived by diſtance, they will be ſcarcely able to diſtinguiſh whether they advance or whether they are halted.

Defenſive Operations.

In order to avoid theſe inconveniences, it is not barely ſufficient for a general to have a thorough knowledge of the country: he ought immediately to inform himſelf of every particular, however minute, relating to it; he ſhould take the ſame precautions which have been pointed out as neceſſary for a march in an open country, and ſend out a detachment, ſuch as hath been ſuppoſed in the foregoing ſection. This detachment will examine the narrow paſſes, ſurvey and ſound the fords, run round the windings of the mountains; and if there are many roads, it will find out which is the moſt practicable, and that through which the army, the artillery, and baggage, can paſs with the greateſt eaſe; what ſtreams croſs it, and whether there are bridges over them: it will examine whether they are ſufficiently ſtrong, and repair them, or build new ones. It often happens in a mountainous country, that the road which would be very ſhort and commodious proves to be divided, either by the ſeparation of two rocks or by hollows. As theſe breaches, however deep they may be, cannot be all of a certain breadth, therefore, in order to avoid marching over the unneceſſary ground that going round them would take up, bridges ſhould be thrown over, if poſſible, from one rock to another.

But as in a march, whether in an open or in a mountainous country, occaſions for throwing bridges very often preſent themſelves it is very neceſſary to ſay a word or two relative to the manner of their conſtruction.

Six or eight thick pieces of timber are laid acroſs a rivulet, or any other bad place neceſſary to be paſſed, at ſix feet diſtance from each other; theſe muſt be croſſed again by other pieces of timber not ſo thick, at the diſtance of three feet from each other; which muſt be fixed to one another by large pegs, and faggots well faſtened together muſt be laid over them. When the bridge ſhall be thus covered, ſome earth muſt be thrown over it, which ought to be well trampled, in order to fill up the vacancies of the faggots; and then, for the greater firmneſs, new earth ſhould be thrown over it, which ought to be well beaten down. The bridge thus made, the troops, the artillery, and the baggage, will paſs over it with great eaſe.

It muſt be obſerved, that the bridges ſhould be of the ſame breadth with the roads; they ſhould be broader rather than narrower, becauſe, excluſive of the danger the artillery and baggage would run if they were narrower, the ranks being obliged to be ſtraitened and the column to be lengthened, the march would of courſe be retarded, and it would be difficult to avoid confuſion. The labourers that accompany the detachment ought to be furniſhed with every ſort of tool neceſſary for the removing of earth, the felling of trees, and working and fitting them for uſe.

On the report of the commanding officer of this detachment to the general, he will order as many detachments as there

WAR

50 200 400 600 1200 T.

Allardice

Defenſive Operations.

there are columns intended, to ſet out two or three hours before the time appointed for the march of the army. Theſe detachments will march carefully over the ways already examined and prepared: they will ſcour every thing, hedges, narrow paſſes, entrances of paſſes, woods, heights, villages, in ſhort all that may ſerve as ſhelter for troops in ambuſcade; and for greater ſecurity, they will poſt guards in the villages, which guards are not to retire till the rear-guard of the army comes up.

The commanding officer of each detachment ſhould poſſeſs himſelf of the heights on the right and left, and ſhould diſtribute platoons of infantry at proper diſtances from the rocks and narrow paſſes: he ſhould be careful of what may be done to oppoſe him, and be attentive even to the ſmalleſt paths. When the commanding officer of the detachment ſhall be advanced to the end of the paſſes, or to the ground intended for the camp, he will eſtabliſh his infantry in the moſt advantageous poſts; he will place his light horſe or dragoons in the front, but within reach of aſſiſtance; he will ſend out patroles of light horſe advanced before the infantry. If he receives any intelligence of the enemy, he will ſend immediate notice of it to the general; but if, from the report made to him, the enemy does not appear to be ſufficiently ſtrong to annoy the army on its march, or only ſome parties were willing to try if they could enter the paſſes, his detachment will be ſufficient to keep them at a diſtance, particularly as he is in poſſeſſion of the heights and the paſſes.

With ſuch precautions as theſe, if the enemy is at too great a diſtance to attack the army, the march will be performed without any trouble: there will be no obſtacle in the roads, or reaſon to fear that the waggons will be mired; and if the wheels or axle-trees of any of them ſhould break, they will be repaired from thoſe which have ſpare ones: if, on the contrary, the enemy ſhould be ſo near as to give cauſe to apprehend an attack, the neceſſary precautions are taken for forming the troops in order of battle, and for the neceſſary diſpoſitions during the action.

It has been already obſerved, that an army on a march ſhould be divided into as many columns as the detachments have found openings or roads leading to the camp the general intends to occupy; ſuppoſe two, the army will conſequently march in two columns. The diſpoſition of the troops in their march differs entirely from what it would be in an open country; the advanced-guard of each column muſt conſiſt of infantry, ſome muſt be diſtributed either in the narrow paſſes or on the heights, and there ſhould be ſome advanced detachments of light horſe to ſcour the narrow paſſes: the rear-guard ſhould conſiſt of infantry only. The remainder of the troops may be diſpoſed after the following manner:

Four or five brigades of infantry, according to the number which compoſes the army, ſhould be placed at the head of each column; the ſame partition ſhould be made with regard to the artillery, which muſt follow the infantry; the cavalry muſt march next, and the baggage of each column, well eſcorted by infantry, muſt follow the cavalry; then the remainder of the corps of light horſe which are not detached; and the dragoons are placed the laſt, in order to diſmount and ſuſtain the rear-guard in caſe it ſhall be attacked.

Each column ſhould conſiſt of the ſame number of troops as well infantry as cavalry. Platoons of infantry ſhould be detached to march on the heights, at proper diſtances, in order to cover the flanks on the right and left. Care muſt be taken to march very leiſurely in the front, otherwiſe the rear will not be able to keep up; then, in order to give the rear time to come up, the front will be forced to halt, by which the march will be much retarded and the troops fatigued.

Defenſive Operations.

Plate DXV. repreſents the march of an army through a mountainous country. A is the poſition of the army before it begins its march. P is the artillery and baggage, with their eſcorts in the front of the camp. B, Parties of huſſars forming the advanced-guard of the army on its march. C, Parties of infantry of the advanced-guards of the columns. D, The infantry of the army forming the head of the columns. E, The artillery, and waggons belonging to the artillery. F, Battalions of artillery. G, The cavalry. H, The baggage of the army. I, The eſcort of the baggage. K, Parties of huſſars. L, Parties of dragoons. M, the infantry of the reſerve, forming the rear-guard of the army. N, Platoons of infantry marching upon the heights, to cover the flanks of the columns. O, Villages in front of the camp the army is to occupy, and of which the light infantry have taken poſſeſſion.

Theſe diſpoſitions are neceſſary, becauſe, as the enemy in a mountainous country will be able to attack with infantry only, he muſt be oppoſed with troops of the ſame nature: the reaſon why the artillery is poſted behind the infantry is, that in caſe the enemy ſhould attack briſkly in front, and the road through which the columns paſs be broad enough ſome pieces of cannon may be ſent into the front, which firing with grape-ſhot will ſoon thin the enemy's ranks, and abate ſomething of his ardour: if the road be too narrow to permit the bringing forward of the artillery, reſolution muſt ſupply the want of that aſſiſtance which the cannon would give, and the enemy muſt be charged with bayonets. The cavalry does not follow immediately, becauſe, not being able to act in this ſort of country, it muſt be covered by infantry. The baggage which follows is ſufficiently defended by the columns that cover it, and the infantry that eſcorts it: this infantry ſhould nevertheleſs join as often as circumſtances will permit, without being fearful of expoſing itſelf, that upon the heights being to reinforce it in caſe the head of the army ſhould be attacked.

There are ſome mountainous countries ſo difficult of acceſs, that it is impoſſible for the cavalry to follow, becauſe ſome poſt muſt either be immediately ſeized, or the enemy, being in poſſeſſion of the hills, muſt be driven from them before it can advance; or becauſe it would be difficult for it to be ſubſiſted.

If the army can march in four columns, the diſpoſitions ſhould ſtill be the ſame; but as the head of the columns will be weaker in infantry, the heights ſhould be guarded accordingly, and the rear-guard ſufficiently ſtrong to reſiſt the enemy: the ſame diſpoſition ſhould be made for one column only.

If the march is to be made through a woody country, the precautions which have been already mentioned in regard to examining the ways through which the army is to paſs, and for the detachments which ſet out in order to be before the army, ſhould ſtill be obſerved: but the diſpoſition and order of the troops muſt be different. If by the ſituation of the country, the army is obliged to march continually through woods till it arrive at the camp, the cavalry and the baggage ſhould be in three columns in the centre; but ſome infantry ſhould be placed at their head and their rear-guard: the infantry ſhould march in two columns, one on the right the other on the left of the cavalry and baggage; ſome brigades of artillery ſhould be diſtributed to each column of infantry the remainder muſt march at the head of the columns of baggage; the flanks of the columns muſt be covered by platoons of infantry, placed about at proper

Defenſive Operations.

proper diſtances, which are to follow the columns at 40 or 50 paces diſtance, without ever loſing ſight of them.

Plate DXVI. repreſents the march of an army through a woody country. A, Is the army formed in order of battle previous to the commencement of the march. B, The cavalry, which have marched ſome paces in advance, in order to make room for the infantry. C, The infantry, which, by facing to the right, forms the column upon the right. D, The infantry, which, by facing to the left, forms the column upon the left. E, Bodies of infantry, which are to march at the head of the columns of cavalry. F, The park of artillery, where the baggage belonging to the army, and the eſcorts, alſo are aſſembled. G, The march of the infantry, forming in columns. H, The march of the cavalry, forming in columns. I, The march of the artillery and baggage with their eſcorts, forming in column. K, The army in march. L, Huſſars of the advanced guard keeping the roads, marked out by the detachments ſent on before. M, Infantry, forming the advanced guard of the columns. N, Small parties of infantry, marching upon the flanks of the columns. O, Parties of huſſars, marching upon the flanks of the army. P, Infantry of the reſerve forming the rear-guard of the army.

If by the knowledge which the general has of the country, or rather from the report of the officers who commanded the detachment ſent out to view, open, and repair the roads, he knows that the country is interrupted by woods and little plains, the diſpoſition ought to be wholly changed; it will then be ſufficient that the ſecond detachment, which in other caſes ought to ſet out the evening before, ſets out only two hours before the campement. This detachment ſhould be compoſed of infantry, light horſe, and dragoons; the infantry to ſcour the villages and the woods, the light horſe to penetrate into the woods wherever they can enter, and clear the march of the Infantry, and the dragoons to ſuſtain the whole.

When the diſpoſition for the march of the army is ſuppoſed to be in five columns, the infantry ſhould form two, the cavalry two more, and the artillery and baggage the fifth. If it is thought there will be any occaſion for artillery, a brigade or two may be diſtributed to the columns of infantry; and the remainder may march at the head of the eſcort of the baggage, which is to be defended by the regiment of artillery; to which muſt be added a detachment of infantry, which will form the advanced guard. The cavalry and dragoons are to keep the open country as much as poſſible, and the infantry the incloſed; and the beſt and moſt acceſſible road ſhould always be given to the artillery and baggage. In order that the columns may preſerve the ſame length in marching, a brigade of infantry ſhould be placed at the heads of the columns of cavalry; if this precaution, which fixes the head of the columns of cavalry, is neglected, the cavalry will extend a great way before the columns of infantry, which ſhould be always avoided. The rear-guard ſhould conſiſt of infantry, cavalry, or dragoons: the light horſe ſhould always march on the flanks on the right and left, and before the army.

It is after this manner that the march of an army may be diſpoſed through a woody and a mountainous country; but an army muſt always ſuit its motions to circumſtances, and to the ſituation of the country where the war is carried on. If the general is inferior in point of number, he ſhould make choice of defiles; becauſe in them he can always preſent a front equal to the enemy's. Who can be ignorant that Leonidas with 8000 Greeks, at the ſtraits of Thermopylæ, ſtopped the almoſt innumerable army of Xerxes, who was unable to force him?

A mountainous and woody country, when thoroughly known, becomes a more favourable theatre for practiſing the wiles and ſtratagems of war than an open country; it is true that the knowledge of it is more difficult to attain, and that it requires more vigilance and readineſs in the general. Hannibal was even drawn into the ambuſcades by his own guides; an example worthy the notice of a general who takes guides that have either but little regard for him, or are unacquainted with the country: it is impoſſible to try them too much; and their ignorance is often more fatal than treachery itſelf.

Defenſive Operations.

The marches that require moſt precaution are thoſe made in the night, thoſe made in ſight of the enemy, and thoſe that ſhould be kept ſecret.

The firſt ſhould be avoided as much as poſſible; but if circumſtances require and force an army to march over a mountainous country in the night, care ſhould at leaſt have been taken to ſurvey the roads during the day; to make the guides march at the head of the army; to keep the ranks very cloſe together, that the men may not loſe ſight of each other; and that part of the troops do not miſtake one defile for another, which may eaſily happen in the dark, if the advanced guard has marched a little too faſt, and the officers haſtened too much. The Greeks, according to Xenophon, on like occaſions, gave the heavieſt arms to the troops that marched at the head, thereby to oblige them to proceed leiſurely.

In thoſe marches that are made in ſight of the enemy, beſide the precautions neceſſary to be taken for the ſafety of the troops, and which have already been mentioned, the general ſhould endeavour to deceive them by falſe appearances, and by an oſtentation, often in ſuch circumſtances, neceſſary: as extenſive a front as poſſible ſhould be given to the army; the intervals of the ranks and columns ſhould be widened, but not ſo as to weaken them; the general ſhould take advantage of an height, poſſeſs himſelf of it, and poſt ſome troops on it, in order to make the enemy ſuſpect there may be ſtill more behind; advantage ſhould be taken of a wood, and, by marches and countermarches, the ſame troops ſhould be made to paſs and repaſs, in order to make the enemy believe the army ſtronger than it really is. There have been inſtances of generals, who, on like occaſions, have made ſuch good uſe of their ground, that, by the arrangement of troops, they have ſeemed to multiply them in the enemy's eyes; and who, although inferior in ſtrength, appearing to have the advantage of numbers, have kept the enemy in awe.

But ſtill, unleſs it is to deceive the enemy, a general ſhould conceal his force and management: his force, becauſe, if ſuperior, he will not fail to profit by that advantage; and if inferior, he ſhould avoid a battle: he will conceal his management, becauſe he will prevent the deſigns of the enemy's general, who will receive as much information from his ſucceſſes as from his miſcarriages. Pyrrhus, who taught the art of war to the Romans, was in the end conquered by them. The Mexicans often turned the arts and wiles of Cortez and the Spaniards againſt them; and the Czar Peter I. never regretted a defeat when it became the means of inſtructing him how to conquer in his turn.

It is impoſſible to lay down fixed rules for ſecret marches: it is by his addreſs that a general will improve circumſtances: it is by art and contrivance that he will evade the enemy's vigilance, and deceive his ſpies.

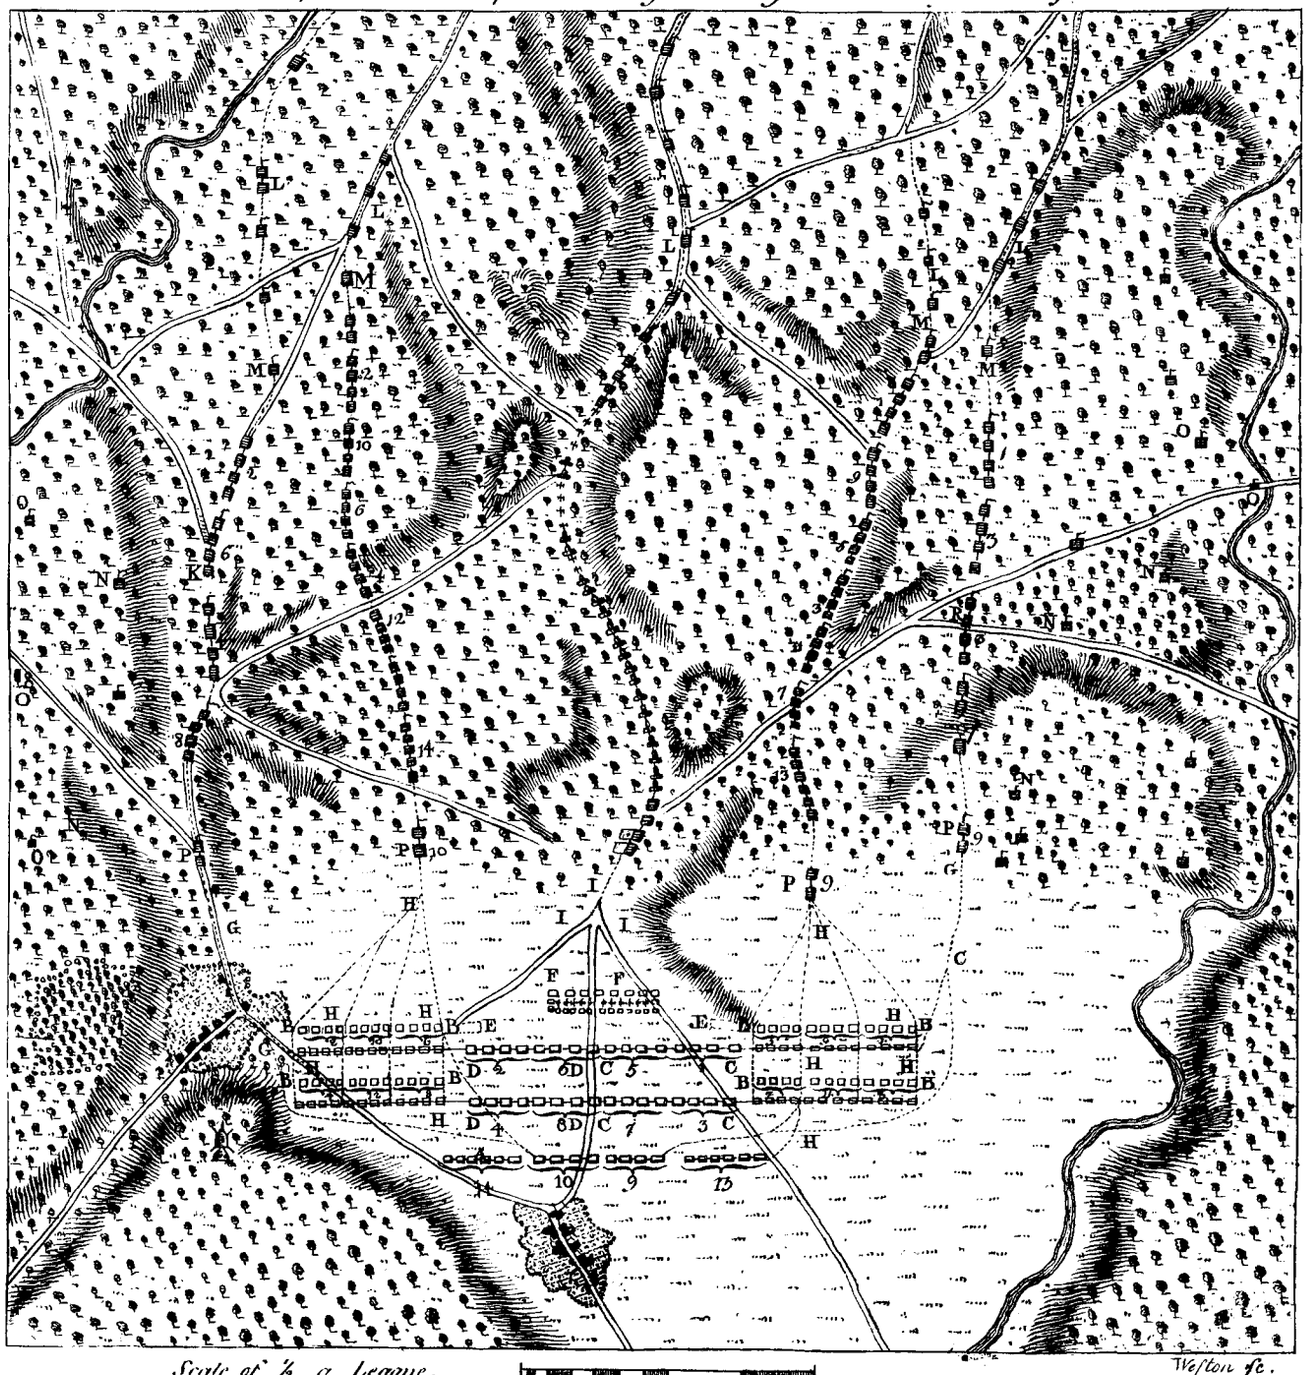
General rules only can be given for the diſpoſitions to be made of troops upon a march; particular ones would be merely conjectural, becauſe the general of an army muſt always depend upon circumſtances: it is the ſituation and nature of the country, the number of troops, the nearneſs of the enemy, the facility of foraging, and the paſſes

of

Plate DXV.

WAR. *The March of an Army through a Mountainous Country.*

WAR. *Plan of the March of an Army through a Woody Country.*



Defenſive Operations.

of which the enemy is poſſeſſed, that ought to determine him.

In a word, whatever is the order and diſpoſition of the troops, it muſt be ſuch, that they ſhall always be able to ſuſtain each other; that the flanks ſhall be well guarded, and the fronts ſecured; the roads muſt have been ſurveyed and opened; and whatever the nature of the country is, all the columns ſhould arrive at and enter the camp at the ſame time.

Sect. VI. *Of Camps in defenſive War.*

It is in general more difficult to carry on a defenſive than an offenſive war, but more particularly ſo in an open than in a mountainous country. In the former, there is nothing to conceal the movements and diſpoſitions of the army from the enemy; whereas, in the latter, the nature of the places prevents the enemy from diſcovering them: but whatever may be the nature of the country, the choice of a camp, when on the defenſive, and the art of pitching upon an advantageous ſituation, is what proves the genius and talents of a great officer. Excluſive of a thorough knowledge of the country, this operation requires a quick and penetrating eye in a general, to enable him to ſeize the poſts which from their ſituation may prevent the enemy either from attacking him or penetrating into the country.

A general who acts on the offenſive, takes what ſtate or circumſtances he pleaſes; he may act as he chooſes, and is not under a neceſſity of regulating himſelf entirely by the enemy's motions: whereas a general that is not ſufficiently ſtrong to attack, is commonly obliged to continue quiet till the enemy hath acted, and then to regulate his motions according to thoſe made by the oppoſite army, unleſs his ſuperior abilities give him a particular advantage over the enemy's general.

Although it is always neceſſary for a general to have a thorough knowledge of the country, this knowledge will yet become more neceſſary to him when acting on the defenſive. He ought to prevent the enemy's entering his country, and forming any ſiege there (a plan which he cannot execute, unleſs he is poſſeſſed of the moſt advantageous poſts, and alſo of thoſe which cover the towns liable to be threatened), by proper diſpoſitions that ſecure his camp: by covering his fronts and rears, and keeping the communication between the camp and the places where the magazines are; by endeavouring to annoy the enemy in his convoys and foragings; by haraſſing him in his camp, and perplexing him with ſmall detachments, to which he will be obliged to oppoſe more conſiderable ones: theſe diſpoſitions, properly managed, may deſtroy any enterpriſes the enemy may have formed againſt the army.

Plate DXVII. repreſents an army properly encamped to ſerve theſe purpoſes. A, Is the camp of the main body of the army. B, An advanced camp, compoſed of dragoons and huſſars, in order to cover the right of the army, to guard the paſſes by which the enemy might make incurſions upon the flanks and rear of the army, moleſt the convoys, and cut off the communications. C, Villages and bridges, guarded by the light infantry. D, Poſts of diſmounted dragoons in the front of their camp. E, Poſts of dragoons on horſeback, to ſecure the communication between their camp and that of the main body of the army. F, Bridges built, to keep up the communication between the grand and the advanced camp. G, Bridges and villages guarded by detachments of infantry. H, Grand guards of horſe. I, Guards of infantry. K, Bridge, village, and mill, guarded by the infantry belonging to the army. L, Camp of dragoons and huſſars covering the left of the army, and ſupporting the light infantry. M, Villages and bridges guarded by the light infantry. N, Poſts of diſmounted dragoons in the front and on the flanks of their camp. O, Poſts of dragoons on horſeback. P, Poſts and detachments of huſſars, to patrole in the front and upon the flanks of the army, and their camp.

Defenſive Operations.

By the enemy's ſuperiority, the nature of the country, and the ſucceſs of campaigns, the general ſhould determine whether or not his camp ſhould be entrenched: the entrenching of camps requires much obſervation. It is eaſy (ſays Vigetius) to entrench a camp while at a diſtance from the enemy; but it becomes a very difficult operation when the enemy is near at hand. The Romans, according to him, uſed to keep all their cavalry and half their infantry drawn up in order of battle, in order to cover thoſe troops that were employed in working at the entrenchments. Cæſar, when in Spain, fortified himſelf after this manner under the eyes of Afranius and Petreius, without their having the leaſt knowledge of it.

Before a general fortifies a camp in a plain, he muſt obſerve the poſition in which the ground will permit him to form his camp; whether or no it will be liable to be ſurrounded; if it will entirely cover the country it is to protect, and the towns for which there is moſt reaſon to be apprehenſive; if the parts in the rear are open; if forage is in plenty; if proviſion can eaſily be brought; if there is wood and water; if it is impoſſible for the enemy to enter the country without forcing the camp; if all theſe circumſtances concur, it is certainly moſt advantageous to entrench the camp.

A general ſhould never be too ſecure by having a ſuperiority of numbers; he ought not on that account to neglect fortifying his camp: even when he acts on the offenſive, theſe entrenchments will not hinder him from marching out to the enemy whenever he judges it proper, and his army will by that means be ſheltered from the enemy's attempts.

There are many methods of entrenching a camp by lines beginning on the right, and covering the whole front of the camp to the left; theſe lines, in their extent, have redoubts and angles at proper diſtances; and the line being continued from one to the other, forms the curtains. In the front of them there is a large and alſo deep ditch; ſometimes a covered way is added, which is palliſadoed and ſtoccaded throughout the whole front of the lines. To render them yet ſtronger and more difficult to be forced, there are pits ſunk before the covered way. Theſe pits are ranged chequered-wiſe, about ſix feet deep and five broad, and are in form like a reverſed cone. Such were the pits which the duke of Berwick cauſed to be made in 1734 to the lines of circumvallation before Philipſburg; only with this difference, there was no covered way. Without doubt theſe lines are formidable, and even very difficult to attack; but a great deal of time is required for conſtructing them; and if there is not a ſufficient number of peaſants in the army to work at them, troops muſt be employed to expedite them; which will not only greatly fatigue them, but may alſo coſt the lives of many; becauſe the removing of earth often cauſes great diſorders, particularly where the ground is ſwampy or clayey.

The method practiſed by marſhal Saxe ſeems much ſuperior to theſe lines. It contained as large an extent of ground, without diminiſhing the labour; becauſe, inſtead of lines, it conſiſted of redoubts, which require as much work to form the four faces and the covered way as lines always continued. At the ſiege of Maeſtricht, in 1748, he uſed theſe redoubts inſtead of lines; their diſtance from each other was 48 yards; they were ſtoccaded, and the covered

Defenſive Operations.

way palliſadoed. Theſe redoubts preſented an angle to the field, and conſequently were a mutual protection to each other; they were each of them capable of containing a battalion.

His deſign, ſuppoſing the enemy come to attack the army, was to cauſe all the redoubts to be occupied; to plant ten pieces of cannon between each, and to draw the army up in order of battle behind them: by this means the enemy would be obliged to force the redoubts before they could attack the army, which could not be done without great loſs. But ſuppoſing the redoubts to be forced, how would the enemy be able to enter the intervals without dividing? The army behind, in order of battle, would charge him, without giving him time to recover himſelf, and it is highly probable would beat him.

By following this method of entrenching a camp, if ſome of the enemy's battalions ſhould, for example, force three or four redoubts, they certainly would not dare to advance as long as the remainder ſhould hold out; ſo that a general might, by detaching ſome brigades, and cauſing them to march to the aſſiſtance of the battalions that have been forced, retake the redoubts; or, without diſordering the order of battle, drive away the troops which are in poſſeſſion of them with his cannon. In ſhort, this method ſeems to be excellent, becauſe it proves that all the redoubts may be forced, and yet the army not be beaten, becauſe it has not ſuffered in the action, but remained the whole time in order of battle with all its cannon; ſo that the enemy will be reduced to the neceſſity of beginning a ſecond battle.—Lines, on the contrary, have not the ſame advantage; all the troops, or the greateſt part of them, muſt line them; the cannon is planted at proper diſtances either on the angles of the redans, or thoſe of the redoubts. If one part only is forced, the army is beat, and the cannon taken, becauſe the enemy makes the attack with his whole front.

Lines are indeed never good, unleſs when there is a large extent of country to be guarded, and ſome frontier to be covered from the incurſions of the enemy; the front of an entrenched camp ſeldom exceeds ſix miles, more or leſs, whereas lines to cover a country have ſometimes extended 30 miles in front. By ſome it is thought, that, in order to cover a country, it is ſufficient to have certain holds, which ſhall be ſtrong and well entrenched, with patroles continually going from one end of the poſts to the other, and each poſt to be provided with ſignals both for day and night. It is unneceſſary that theſe patroles ſhould be ſtrong, provided they follow, and are continually croſſing each other; this will be ſufficient to prevent the enemy paſſing undiſcovered. It is certain that the enemy will not dare to paſs between theſe poſts, whether he be ſtrong or weak; if he paſs in a body, he will be cut off behind, and his convoys intercepted; if he paſs only in parties, they will be cut off with the greater eaſe. However, lines of this nature would require much labour, and alſo take up years to complete them.

Marſhal Saxe's method for entrenching a camp in a woody country interſperſed with ſmall plains, ſeems alſo to be a very good one. The redoubts are to be erected in the plain; and lines thrown up in the woods according to the uſual method, with redans placed on the ſide of each other, at 24 toiſes diſtance; there ſhould be a palliſadoed ditch in the front, and the lines as well as the half-moon ſhould be fraiſed with pointed ſtakes; behind theſe lines, which cannot be very extenſive, becauſe they only cover part of the front of the camp, muſt be placed the troops neceſſary for defending them; a conſiderable entrenchment of felled trees muſt be made behind, with the branches of the trees entangled with each other, and ſome openings muſt be left wide enough to permit the troops who guard the lines to paſs through, in caſe they ſhould be overpowered and obliged to retire; the cannon muſt be planted in the front of theſe openings; and the remainder of the army muſt be drawn up in order of battle, 100 paces at moſt behind the retrenchments of trees and the half moons. The retrenchments of trees are placed about 60 or 80 paces behind the lines, and not before them, becauſe it will be a new and unexpected obſtacle to the enemy. Theſe retrenchments, carefully made, and with large trees, can be deſtroyed by cannon only, which would take up a conſiderable time; if they were in the front of the lines there would certainly be a rampart more; but that might be uſeleſs, and perhaps hurtful, becauſe the fire of the enemy to make a paſſage would drive the ſplinters of the trees into the lines, which would do more harm than even the ſhot itſelf.

Defenſive Operations.

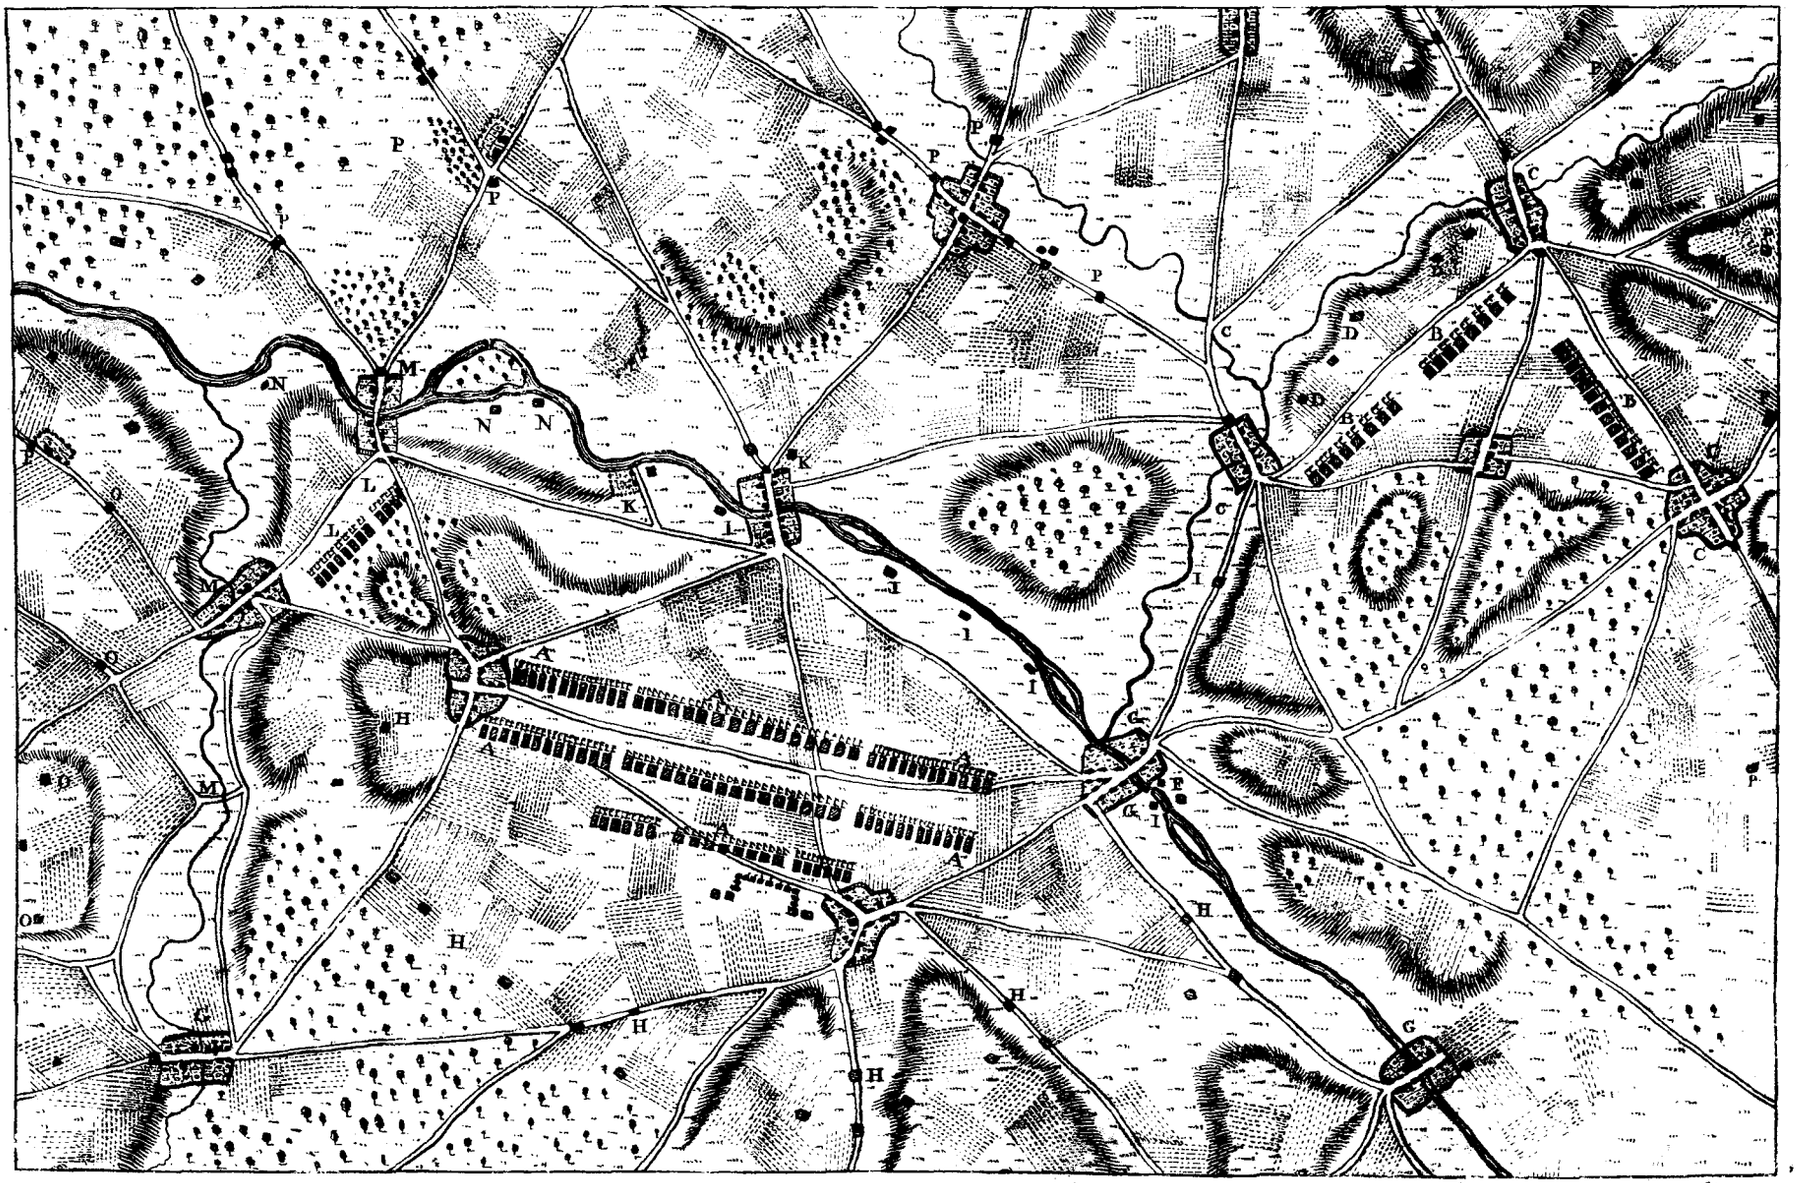
Plate DXVIII. repreſents an entrenched camp; in which A is the main body of the army encamped behind its entrenchments. B, The camp of the troops of the reſerve. C, Camp of the dragoons, to ſecure the rear of the army. D, Camp of huſſars, to cover the ground upon the right of the army. E, Villages and redoubts guarded by the light infantry, to ſecure the camp of the huſſars. F, Bridges built to ſecure the communication of the army with the ground upon the right, and to favour the retreat of the troops poſted on the oppoſite ſide. G, Brigades of artillery diſtributed upon the flanks, and along the whole front of the army. H, The park of artillery. I, A bridge entrenched, to ſecure the communication between the army and the ground upon the left. K, Villages and farm-houſes, guarded by detachments of huſſars and light infantry, to patrole in the front of the army.

In a mountainous country the diſpoſitions for entrenchments are different: it is impoſſible there to find plains ſufficiently large to draw up an army in order of battle, and place it beyond redoubts, as in an open country; the avenues and the paſſes only can be entrenched; the redoubts would not be ſufficient, becauſe not only the avenues muſt be guarded, but the heights alſo occupied. Now, as it will often happen among mountains that there is not a foot of earth, how can redoubts be erected there? A general muſt then make uſe of ſuch aſſiſtance as the country can furniſh him with, whether by heaping ſtones upon each other, or by retrenchments of trees well joined; and thus conſtruct lines ſufficiently ſtrong to ſhelter the ſoldiers from fire and all injury. In an open country, a general in a manner ſuits the ground to his diſpoſitions; in a mountainous country, he muſt apply his diſpoſitions to the ground; but in any country whatever, he muſt uſe all the aſſiſtance of art for entrenching of camps. In mountainous countries there are more inequalities of ground, which render the enemy's approach to the lines difficult; and altho' it is almoſt impoſſible for a camp in a mountainous country to be attacked in front, nothing ſhould be neglected for its ſafety: but all the avenues by which it may be ſurrounded muſt be entrenched with care, and all the heights which overlook it ſecured; becauſe the enemy, without intending to attack in front, will amuſe him during the time neceſſary for troops to take a long round, in order to penetrate to the camp on another ſide. If Leonidas, with his 8000 Greeks, had been poſſeſſed of all the avenues, ways, and heights, by which he could be cut off, in the ſame manner as he was of the paſs of Thermopylæ, Xerxes with his innumerable army could never have forced him in the defiles which he guarded.

The entrenchment ſhould never be more than 250 or 300 toiſes, which make from 500 to 600 paces, diſtant from the camp, and which ought to be divided into three parts. This diſtance ſhould be made, that the troops may be able

to

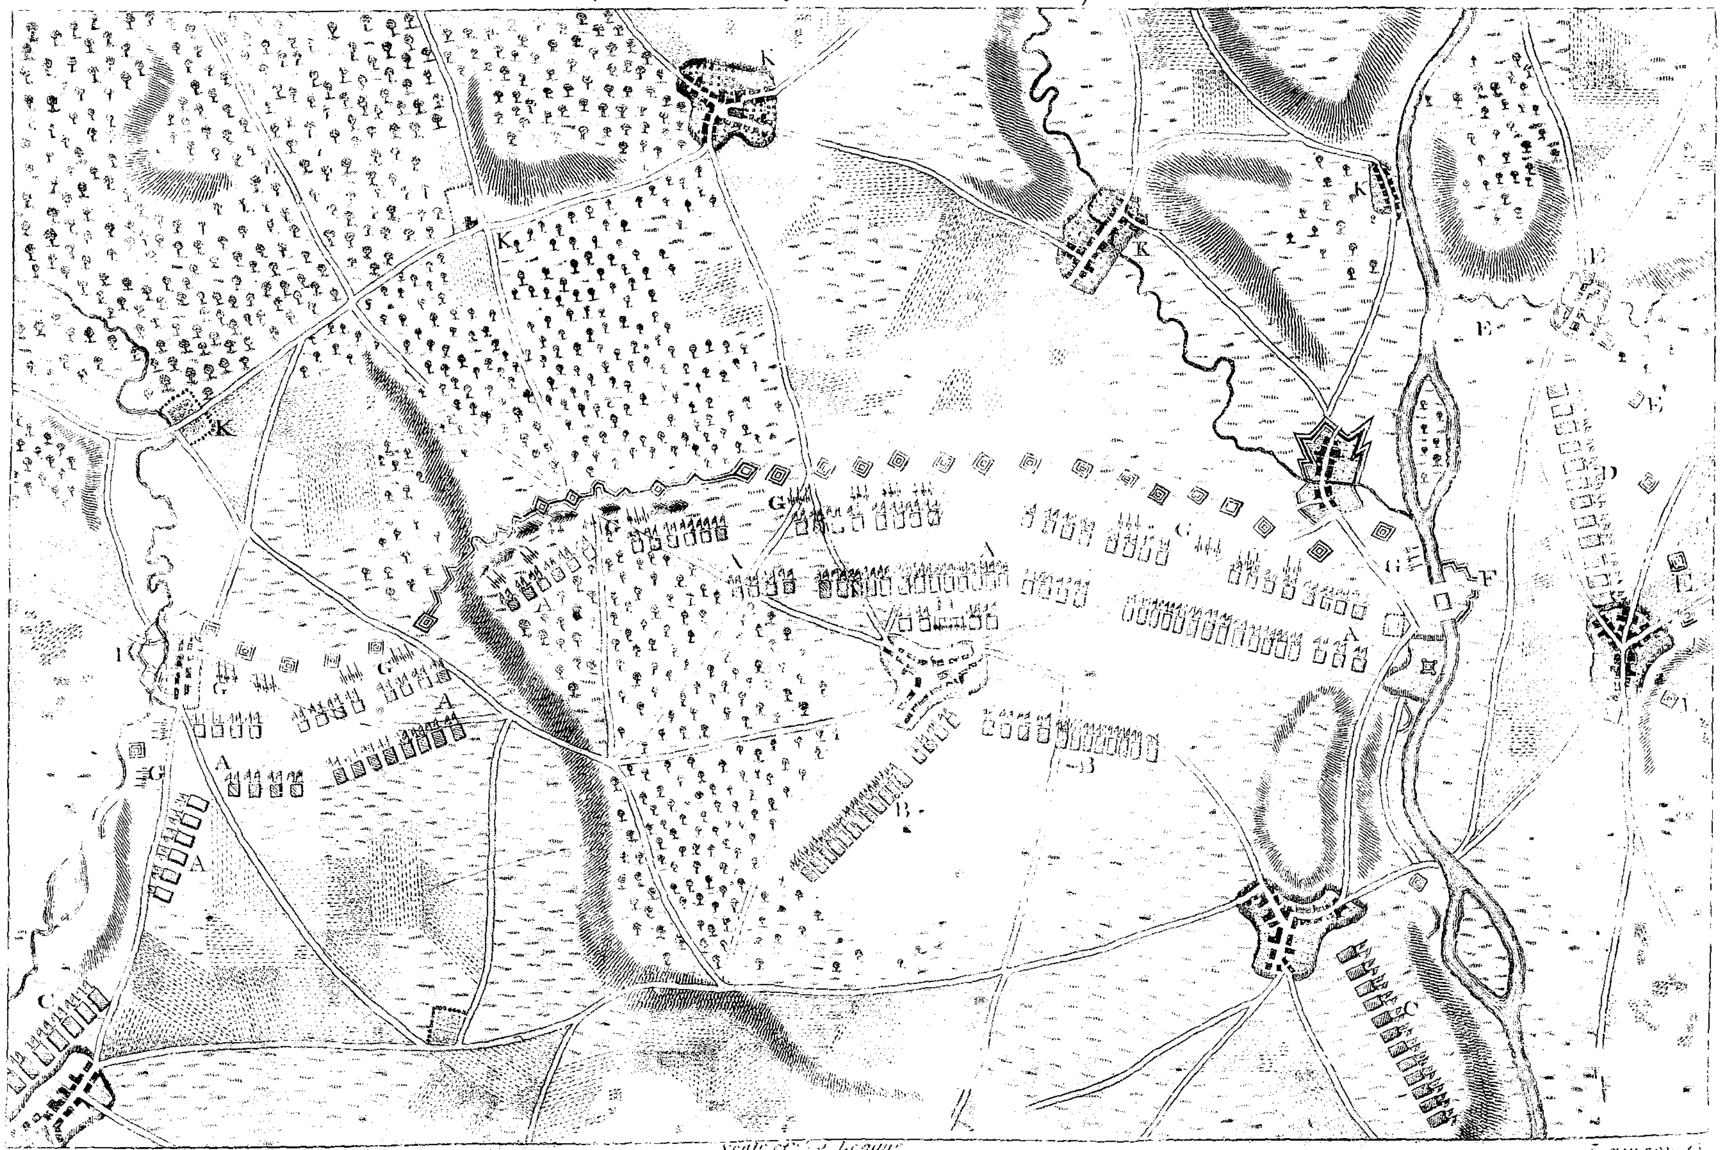
Plan of the Position of an Army in its Camp.



WAR.

Plan of an Intrenched Camp

Plate DXVIII.



Lawson sc.

Defenſive Operations.

to judge of the parts that can be carried with greateſt eaſe, and of thoſe which are moſt in need of aſſiſtance, that they may march there with greater order, diſpatch, and facility: whereas, if this diſtance is not obſerved, it will happen, as hath been ſometimes ſeen, that the troops not having ground ſufficient to range themſelves in order of battle, the diſpoſitions will be impeded by confuſion and diſorder, and the enemy will have forced the lines before the troops can be in a condition of oppoſing him.

But in a mountainous country, it is not ſufficient for a general that he cannot be turned; that he hath profited ſo well by the advantages of ground, as to render the enemy's approach to the camp difficult; that the aſſiſtance of art hath been joined to nature; and that the country to be guarded is entirely covered: he muſt alſo be careful that the communication with the neighbouring towns where the magazines of war and proviſion are eſtabliſhed, is ſafe and eaſy. If any one of theſe particulars is neglected, the camp is expoſed, neither can the general continue in it the time that would be neceſſary to retard the march and deſigns of the enemy. As it hath been already obſerved, that there is ſcarcely any poſt that is not liable to be turned or overlooked, the camp ſhould be entrenched only ſo far as the entrenchments may become an obſtacle to the enemy, and as they may be a means of giving the general time to retire to occupy another poſt.

When the enemy undertakes the ſiege of ſome town, and the general, although with an inferior army, is willing to ſuccour it, or cauſe the ſiege of it to be raiſed, he ſhould ſeek out a ſpot naturally ſtrong, and entrench it according to its ſituation: if an open country, according to the method above mentioned; if among mountains, according to the aſſiſtance that the nature of the country may give; and make uſe of theſe entrenchments as a ſure aſylum from whence to make ſallies upon the enemy, to attack his forages and his convoys, and to oblige him to raiſe the ſiege as well by the fatigues of it, when it hath been drawn out to a greater length of time than was deſigned by the enemy, as by the want to which he is reduced by the continual inquietudes that the entrenched army hath given him.

When an army is in an open country, it generally continues in the ſame camp for ſome ſpace of time; becauſe it is certain the enemy cannot conceal his deſigns ſo effectually from the general, but he may be able to circumvent them; but in a mountainous country, it is uncertain whether an army will continue in the ſame poſt till morning that it occupied over-night. A general muſt then encamp in ſuch a poſition, and after ſuch a manner, that in caſe the enemy comes to attack him in force and with advantage, he may be able, without danger, to proceed to another poſt, and evade the enemy's deſigns.

It requires great ſkill in a general to judge when it is proper or improper to make choice of places which have a great many avenues on one ſide; becauſe if he ſhould be attacked in a camp incloſed by rocks, or deep in a valley which hath but one or two paſſes open, it will be very difficult for him to diſengage himſelf from the enemy: on the contrary, if there are many ſmall paſſes or avenues to the ground of which he is poſſeſſed, and by which the enemy may eaſily inveſt his camp, it will require a great number of men to guard them. But on theſe occaſions a general ſhould be ever careful to make a good diſpoſition of his troops, to maintain ſtrict order and diſcipline in his camp, and to ſend out his patroles with the greateſt regularity; by which means he will free himſelf from all apprehenſions of being ſurpriſed.

There ought to be no difference between a well-governed town and a well-ordered camp; the exacteſt order ſhould be obſerved, and the ſtricteſt diſcipline kept up: if a ſoldier is at liberty to quit or enter it at pleaſure, the enemy's ſpies will not fail to make their advantages of it. If the camp is unhealthy, or diſtreſſed for proviſion, water, wood, or forage, and the ſoldier hath real cauſe of complaint, every method ſhould be tried to avoid the danger that will attend his being diſcouraged. It is often owing to the little order exiſting in the camp, that the ſoldiers are ſeized with a panic, occaſioned by the abſurd and groundleſs reports that are diffuſed throughout it; troops thus terrified, are in a manner vanquiſhed before they come to action.

Defenſive Operations.

In a mountainous country, ſuch places ſhould be avoided as are ſubject to be overflowed, either by the melting of the ſnow, or by torrents, which at ſome ſeaſons appear no more than trifling rivulets, but which, at others, ſwell and carry off every thing they meet with in their way: of this nature were thoſe mentioned by M. de Feuquieres, which he found near the rock that he attacked and took in 1690 from the Baduais. Situations in the neighbourhood of woods are generally to be feared, becauſe the enemy may ſet them on fire, and the flames be communicated to the camp. The general ought alſo to ſatisfy himſelf with regard to the nature of the ſprings, which may agree very well with the inhabitants, but prove very unwholeſome to ſtrangers: ſuch, according to the reports of the French, is the nature of the ſprings in many parts of Italy. The water belonging to certain ſtreams or rivers will be pernicious, while that belonging to the fountains and wells in the ſame country will be very wholeſome and ſalutary.

Sect. VII. *Of eſcorting Convoys.*

The conducting of convoys is one of the moſt important and moſt difficult of all military operations. In the eſcort aſſigned them, and the number of horſe and foot of which this eſcort is compoſed, the general ought to be guided by the diſtance of the town from whence they ſet out; the dangers to which they are expoſed from the different parties they may meet; the diſtance and ſtrength of the enemy, and the extent and nature of the country they have to travel over, whether an open or a mountainous one; the number of waggons, and the quality of the convoys, whether they conſiſt of money, or ammunition for war or proviſion; and whether they are extraordinary or daily. When eſcorts are too numerous, the troops are fatigued, and no end anſwered; and when they are too weak, they are liable to be beaten. M. de Puyſégur obſerves, that it is as dangerous to give an eſcort of 2000 men to a convoy where only 1000 are requiſite, as to give but 500 to one where 1000 are abſolutely neceſſary; in the firſt, the troops are unneceſſarily fatigued, and in the ſecond, the convoy is expoſed to the danger of being carried off.

All theſe conſiderations ſuppoſe the general to be a man whoſe natural parts are matured by experience, and who is ſenſible that, without a thorough knowledge of the country, the foundation of all conduct, it will be impoſſible to make a proper diſpoſition of troops. If a general is ignorant of the places moſt proper to form ambuſcades; of thoſe where there are bridges and fords; of the paſſes which are moſt dangerous, and thoſe which will favour the enemy's approach in order to attack, and whether in head, flank, or rear—he acts but as chance directs, and his diſpoſitions will have no meaning, either with reſpect to the ſituation of places, or the nature of the ground; the orders will be ill executed, the evolutions performed without exactneſs, and the diſpoſition of the troops will be faulty; the ſeparate bodies being, conſequently, unable to ſuſtain and aſſiſt each other,

Defenſive Operations.

will ſoon be beaten and diſperſed, and the convoy carried off.

The general officer commanding the convoy ought, for its ſecurity, to diſtribute his troops after ſuch a manner that they may be a mutual aſſiſtance to it. The choice of the troops to form the eſcort is undetermined, as it is by the nature of the country their quality ſhould be decided. In mountainous and woody countries, only infantry, huſſars, or dragoons, can be made uſe of; the huſſars or dragoons are to march in the front and on the flanks, to ſcour the woods, examine the avenues, and make ſure of the defiles; in an open country, the eſcort ſhould be compoſed of infantry, cavalry, huſſars, or dragoons. But whatever may be the nature of the country, the convoy ought never to advance without firſt ſending out detachments to reconnoitre at a diſtance.

If the convoy marches through a mountainous country, a large body of cavalry would not only be uſeleſs, but alſo an embarraſſment, as it would be unable to act, except with great difficulty; whereas, in an open country, cavalry is very ſerviceable. In any kind of country a convoy can be eſcorted with infantry, eſpecially when the enemy can only act with his; but as in an open country it is neceſſary for the infantry to be ſupported, the cavalry muſt be uſed for that purpoſe. In a mountainous country, infantry can carry on war alone.

In this laſt caſe the officer commanding the eſcort ought to place a body of infantry at the head, another in the centre, and a third at the rear-guard; to diſtribute ſmall bodies at proper diſtances on the right and left; and he ſhould be particularly careful to poſſeſs himſelf of the heights. The huſſars muſt be diſtributed to the advanced and rear-guards, and, in order to be more certain that every part hath been ſtrictly examined, as the convoy advances, notwithſtanding the huſſars of the advanced guard have already ſcoured the avenues, woods, valleys, villages, and hollows, the huſſars belonging to the rear-guard ſhould again look into thoſe places, to ſee whether any thing hath eſcaped the notice of the advanced guard. Theſe precautions are never without their uſe, and do not in the leaſt retard the march of the convoy.

The ſmall detachments ſhould advance as far as poſſible into the country, without expoſing themſelves to the danger of being cut off, the huſſars with piſtol or muſquetoon, and the dragoons with their carbine in hand, in order that, if they ſhould meet the enemy, they may, by firing, give the officer commanding the eſcort notice of it, ſo that he may have time to make his diſpoſitions for defending and preſerving the convoy. The convoy may continue marching on till the enemy is diſcovered: but on the firſt notice of him, it muſt ſtop, and the officers belonging to the convoy ſhould park their waggons; or, if the ground will not admit of that, they ſhould cauſe them to keep very cloſe together, and double them up with the diſtance of four paces, which ſhould be filled with infantry, between each waggon. By this movement the length of ground taken up by the waggons will be contracted, the troops will be brought cloſer together, and will form a ſtronger and heavier body, capable of aſſiſting each other with more eaſe.

In a mountainous country it is almoſt impoſſible for the enemy to attack the advanced and rear guards and the centre at the ſame time. Nevertheleſs, if he ſhould find an opportunity of forming theſe three attacks at once, by following the diſpoſitions above mentioned, he will find troops at every part to receive him: neither will he be able to make himſelf maſter of the heights without attacking them, and the troops already in poſſeſſion of the ground will eaſily repulſe him; and by the aſſiſtance which the officer commanding the eſcort ſhould endeavour to ſend them, they will be enabled to maintain themſelves in them, to protect the convoy, and the enemy will be unable to attack by more than one or two paſſes. Defenſive Operations.

If the enemy forms but one attack, only a part of the troops muſt be oppoſed to him, becauſe it is to be ſuppoſed this attack may be made only with a deſign to draw the whole ſtrength of the detachment to that part, and which, by being altogether in that one place, will give the enemy concealed in ambuſh an opportunity of falling with eaſe upon that part of the convoy that is unprovided with troops, and which will of courſe be incapable of making any defence. The troops of the centre ſhould never march to the aſſiſtance of the advanced guard, if it is that which is attacked, nor thoſe of the rear-guard to the aſſiſtance of the centre; but a party from thoſe troops which cover the flanks of the convoy ſhould be collected in a body, and ſent to aſſiſt the part that is attacked. However narrow and confined the country may be, a convoy may be eaſily conducted by infantry, when it would be impoſſible to do it with cavalry.

When any paſs or avenue croſſes the road on which the convoy marches, it ſhould be covered by a body of infantry, which will remain there till the rear-guard is come up; then it will fall into the poſt aſſigned it for conducting the convoy. It is always to be ſuppoſed, that this paſs hath been examined by the advanced detachments. If the eſcort is compoſed of infantry and dragoons, the latter ſhould be diſmounted, in order to give an additional ſtrength to the guards, and their horſes may be tied to the waggons. The huſſars, if the nature of the country renders them unſerviceable on horſeback, may alſo be diſmounted; by which means, inſtead of being an embarraſſment to the infantry, they will become uſeful to it. The nature of huſſars is ſuch as will admit of their being employed on every occaſion; and although the difference of their arms will not permit them to be as ſerviceable as dragoons, they may nevertheleſs amuſe a party of troops belonging to the enemy in ſuch a manner as to enable the infantry to beat them, or at leaſt to oblige them to retire.

Huſſars are more particularly neceſſary in the eſcorting of convoys, becauſe they ſcamper about on all ſides, and are very active and ready in ſcouring a country thoroughly; they leave no place till they have perfectly examined it, unleſs the thickneſs of the woods, or any other unavoidable obſtacle, ſhould prevent their penetrating as far as they would otherwiſe do; and even then they protect the infantry, who can with greater eaſe paſs into thoſe places where the huſſars cannot. Whatever country the convoy paſſes through, there ſhould always be huſſars with it; otherwiſe the officer commanding the eſcort cannot be certain that the country is thoroughly ſurveyed, becauſe for want of huſſars he muſt employ cavalry on that ſervice. Not that there can be any doubt of the cavalry's expoſing itſelf to danger with as much cheerfulneſs and courage as the huſſars; but as the horſes belonging to the cavalry are naturally heavier than thoſe of the huſſars, and often encumbered with forage, they cannot venture to a proper diſtance without running the danger of being taken, becauſe they cannot retire with that expedition which is requiſite: On the other hand, the huſſar being more active, and more accuſtomed to reconnoitre, knows how to go over a country with proper caution and care to himſelf: beſides, the trooper who is uſed always to march in a body, and to be under command, will have a very imperfect idea of the method of ſcouring a country. Although the diſpoſition of the troops ſhould always be regulated by the nature of the country through which the convoy marches, and by the nature and

number

Defenſive Operations.

number of the enemy by which it is liable to be attacked, yet the general ſhould never neglect, whatever his ſituation may be, to ſecure the head, centre, and rear. Before the convoy begins its march, the diſpoſition in caſe of an attack ſhould be ſettled; by which means the commanding officers of different corps will know where to poſt themſelves, and after what manner to act at the time the attack is made. By the knowledge which the commanding officer ought to have of the country, he will form a judgment of thoſe places where it is moſt probable he may be attacked, and of courſe make his diſpoſitions accordingly. In any diſpoſition that may happen, a general ſhould always foreſee in what manner the attack, defence, and retreat, will be conducted.

When a convoy marches through an open country, the advanced and rear guards ſhould conſiſt of cavalry ſuſtained by infantry; the infantry in the centre ſhould be continued on the right and left of the waggons, and the cavalry divided into troops ſhould be diſtributed on the flanks, at 100 or 150 paces from the infantry; ſquadrons of horſe, intermixed with platoons of infantry, ſhould be placed at proper diſtances on the flanks of the remaining part of the convoy. By this poſition, if the convoy ſhould be attacked in head, centre, or rear, theſe ſquadrons and platoons ſhould have orders to march immediately to the aſſiſtance of the party that is attacked.

The advanced detachments of huſſars, and thoſe upon the flanks, by giving notice that the enemy is at hand and coming to attack, will furniſh time for parking the waggons, and uniting the troops; in which caſe the infantry muſt form in the park, and the cavalry poſt itſelf on the flank of that front which expects to be attacked, and the huſſars place themſelves upon the flanks of the cavalry.

The attack of a convoy is always ſudden and rapid, and the ſucceſs of it is generally decided in the firſt onſet; and as the enemy, whether he ſucceeds in his attempt or not, muſt retire with great expedition, for fear of any ſuccour that may arrive, it is evident that it can be attacked only by cavalry, huſſars, or dragoons; there have indeed been ſome inſtances where the cavalry have brought infantry behind them. If the convoy has had time to park itſelf, the effort of the infantry can only be turned againſt that which it intrenched behind the waggons. The enemy's cavalry and that belonging to the eſcort attacking each other, will fight upon equal terms: but with regard to the infantry, it will be different; that which is ſheltered by the carriages having a great advantage over that which attacks it. On the contrary, if the enemy's infantry is ſuſtained by huſſars only, they will be briſkly attacked by the cavalry and huſſars belonging to the eſcort, who will take them in flank and rear. The enemy's huſſars being hemmed in, his infantry, for want of being ſuſtained, will be eaſily beaten: part of the cavalry and huſſars belonging to the eſcort ſhould be left in purſuit of the enemy's huſſars, and the remainder ought to take his infantry in flank. If the enemy is beaten, as it is probable he will, his retreat ſeems impracticable, or at beſt very difficult; becauſe, being deprived of his cavalry, he will be forced to make head againſt the infantry that attacks him in front, and to repulſe the cavalry that haraſſes him in flank.

If the enemy gives ground, the general ſhould be cautious of purſuing him too far, leſt, if he ſhould receive a reinforcement, the troops in purſuit of him, finding themſelves at too great a diſtance, will not only be beat, but alſo be deprived of every method of retreating.

There are ſome occaſions on which the enemy muſt not be purſued at all; ſuch as when the armies are very cloſe to each other, or the convoy draws near to ſome of the enemy's poſts; becauſe then, by the nearneſs of the army, the enemy's infantry can come to the attack without being under the neceſſity of mounting behind the cavalry. A general, to whoſe care a convoy is intruſted, ſhould never ſeek any other advantage than the conducting it in ſafety, even though he ſhould be ſure of beating and taking a detachment belonging to the enemy; a real advantage is often given up by endeavouring to follow an uncertain victory. There is leſs ſhame in being beat, when an officer hath done his utmoſt, and acted with propriety, than there is glory acquired in conquering when he hath exceeded the limits of his duty. An officer is no longer praiſe-worthy, than whilſt he acts up to the orders he hath received with exactneſs and diſcretion; whereas he who, depending too much on his own courage, raſhly ſuffers himſelf to be drawn on by the appearance of ſucceſs, is not only charged with, but ought to be anſwerable for, the conſequences.

Defenſive Operations.

There ſtill remains another diſpoſition to be made in an open country, whether the convoy marches on a cauſeway or in the high road, which is to divide the eſcort into many equal parts, with troops of every ſort belonging to each; the firſt body ſhould ſet out an hour before the convoy is to begin its march, the ſecond half an hour after, with orders to the commanding officers to ſcour the adjacent country with great exactneſs, and to be careful not to be cut off by any detachments the enemy may have in the country; for which reaſon theſe two bodies ſhould never be more than three quarters of a league diſtant from each other, by which means they will be within reach of aſſiſting each other. The body which ſets out laſt ſhould never be more than half a league before the advanced guard of the eſcort.

As the convoy is ſuppoſed to march through an open country, the above-mentioned diſtances are allotted between the firſt and ſecond bodies, and between the ſecond body and the advanced guard of the convoy; but if the country ſhould grow rough and unequal, theſe bodies ſhould draw cloſer together, and always keep ſight of each other, ſo as to be able to aſſiſt one another in caſe of an attack.

When theſe bodies are ſet out, the general muſt put the convoy in motion, and form the advanced guard of one of the divided detachments belonging to the eſcort; the infantry of which detachment will remain at the head of the waggons, the cavalry ſhall march by troops 300 paces in advance, and the rear-guard muſt be formed equal to the advanced; but beſides this rear-guard, there ſhould be a body of huſſars and dragoons reſerved, to march a quarter of a league or more, according to the nature of the country, in the rear of the convoy; the remainder of the infantry ſhall be diſtributed at proper diſtances on the ſides of the convoy, and the remainder of the cavalry ſhall be placed on the flanks of the convoy, about 300 paces diſtance.

When a convoy happens to be of ſuch importance that its being taken may influence the operations during the remainder of the campaign, the general ſhould not only aſſign a ſtronger or more numerous eſcort to it, but ſhould alſo ſend off detachments, which, without having orders to attack the enemy, ſhould keep between him and the road that the convoy keeps, in order to oppoſe and baffle any deſigns the enemy may have formed to carry it off. The following examples will ſhow both the ſecurity and neceſſity of this method.

During the campaign of 1746, marſhal Saxe, being encamped in the Orne, was in expectation of a conſiderable convoy from Judoigne. As its ſafe arrival in the camp was of great conſequence, he cauſed the marquis of d'Armentieres, then major-general, to ſet out with a large detachment in the night preceding the day on which the convoy

was

Defenſive Operations.

was to begin its march, with orders to march on the ſide of Rimillies. At the ſame time he cauſed another detachment to ſet out from the camp of his ſerene highneſs the prince of Clermont, with orders to march on the ſide of the abbey of Rame: theſe two detachments, by amuſing the enemy on one ſide, and by entirely concealing the march of the convoy on the other, enabled it to proceed in ſecurity, and it arrived in the camp without having been at all moleſted.

In the beginning of the campaign in 1748, the ſame general having a deſign to lay ſiege to Maeſtricht, and conſequently having occaſion for all his troops, was willing to throw a ſupply of proviſions into Bergen-op-Zoom, as he was going to a diſtance from that place, and could no longer be in a ſituation of aſſiſting it. For that purpoſe he ordered a conſiderable convoy, which ſet out from Antwerp for that town under a good eſcort; but in order to prevent an attack, which circumſtance had often happened during the winter, and that with loſs, the allies at that time occupying a chain of quarters from Breda as far as Voude, he detached the count d'Eſtrees with a conſiderable body of cavalry to march on the ſide of Breda, with orders to puſh on detachments almoſt to Voude. This detachment had two objects in view; one of which was to keep the allies in ſuſpenſe with regard to the ſiege that was to be formed, and the other to cauſe them to remain near Breda. This large body of cavalry kept the allies, who were in the neighbourhood of that town, in ſuſpence; during which interval marſhal Saxe marched to Maeſtricht, the allies not daring to attack the convoy, becauſe they would have put themſelves between the eſcort and the troops under count d'Eſtrees. From theſe two examples may be concluded the neceſſity of covering convoys of importance by detachments, independent of the eſcort aſſigned them. In ſhort, a general ſhould do every thing that will contribute to the ſecurity of his diſpoſitions; and precautions ought never to be thought ſuperfluous when they are managed with prudence, and have for their end the ſucceſs of a well-concerted plan.

Sect. VIII. *Of Detachments for forming a chain of green Forage.*

It is very difficult to provide a large army with forage; and a general often expoſes it to inevitable danger, if he is not thoroughly experienced in this operation, or if he is deſtitute of that knowledge which at once preſents all the wants of an army, and the means of ſupplying them, to his view.

Foraging parties, like convoys, are attended with a greater or leſſer degree of danger, according as the country is more or leſs acceſſible, and the forage at a diſtance or near at hand. The diſpoſition for the chain in an open country is different from what it muſt be in a mountainous one. When forage is within reach of the camp, and the enemy at a diſtance, fewer troops and attendants are required; becauſe, in caſe of an attack, there is aſſiſtance near at hand: but in proportion as the forage is farther from the camp and nearer to the enemy, the precautions ſhould be increaſed, and more troops ſhould be allotted to the chain, which ſhould alſo ſometimes be furniſhed with cannon.

A general ſhould never forget that maxim which ſays, The enemy muſt always be oppoſed by troops of the ſame nature as thoſe with which he makes the attack; if the forage, therefore, is in an open country, the chain, as it is certain the enemy will be more numerous in cavalry than infantry, ſhould conſiſt chiefly of cavalry, and only have infantry ſufficient to occupy ſuch poſts as are neceſſary to be guarded: in a mountainous country the diſpoſitions will be quite different; becauſe as it is impoſſible for cavalry to move eaſily, the chain ſhould be ſtrongeſt in infantry. In ſhort, the number and quality of the troops for the chain ſhould be regulated in the ſame manner as in regard to the convoys; in proportion to the nearneſs or diſtance of the enemy; by the extent of ground to be foraged; and by the nature of the country: and as marſhal Puyſégur obſerves, before the ground to be foraged is examined, there ſhould be a calculation made of the number of horſes to be fed, and of the fertility of the ground that is to be foraged; for if it is a plentiful ſpot, a leſs extent will be ſufficient; if it is not plentiful, a larger muſt be taken; but in either caſe the chain muſt be always proportionable. Defenſive Operations.

Before a forage is undertaken, the ground on which it is to be performed ſhould be always thoroughly known; in order for which the general ſhould ſend out in the evening, or the day before, the officer who is to command it, with a detachment, to ſurvey the ſituation of the country; the places where he muſt poſt his troops of cavalry and dragoons; the poſts which the infantry muſt occupy; the ground neceſſary for the forages; that where the corps of reſerve muſt be poſted; and what part in front of the chain it will be neceſſary for the huſſars to ſcour. After having examined all theſe particulars, the officer makes his report to the general, who, from the account given him, will order the troops neceſſary to ſecure the forage, and render the execution of it eaſy. The chain of forage ſhould be in proportion to the number of troops that are to forage, as well as to the quantity of ſown fields and the thickneſs of the grain. Beſides the horſe, dragoons, and infantry, there ſhould be huſſars to ſcour the country in the front of the chain: the number of them is undetermined, as it will be ſufficient for them to cover and protect the front, and give the commanding officer immediate notice of every thing that makes its appearance.

If the forage is to be made at a diſtance from the camp, the troops deſtined for the chain ſhould ſet out at day-break, or the evening of the foregoing night. The commanding officer muſt take care to eſtabliſh the chain before the foragers arrive, and alſo that the huſſars have ſcoured the country; firſt, becauſe the foragers ſhould not, by waiting, fatigue the horſes; and ſecondly, that no trooper or ſervant ſhall paſs; which will undoubtedly be the caſe if there is any vacancy where troops are not placed.

The whole of the troops ſhould be diſpoſed after ſuch a manner as to be able to ſee one another; and the vedets alſo, that are placed between the troops to prevent the foragers from paſſing, ſhould be within hearing. The infantry ſhould be poſted in hollows and villages and behind hedges, with horſe or dragoons to ſuſtain it and ſupport the flanks; and the diſpoſition of the chain will be ſtill better, if theſe troops can be mixed with it, provided the infantry can be ſheltered by any hollows, hedges, or buſhes.

Grenadiers, ſuſtained by horſe and cannon, if there are any, ſhould be poſted on thoſe ſides which, either from the ſituation of the country or the nearneſs of the enemy, are moſt liable to be attacked: but in reinforcing theſe poſts, the commanding officer muſt be careful not to weaken the chain too much in any particular part. When an enemy attacks a foraging party, he generally attempts to penetrate at different parts; but if he forms only one attack, the diſpoſition of the chain becomes uſeleſs, as all the troops muſt be brought to that part where the attack is made. But as it is naturally to be ſuppoſed the enemy will form many attacks, particularly if his general acts like a man underſtanding

Defenſive Operations.

underſtanding his buſineſs, he muſt be ſtrong in every part; the reſerve, which is in the centre, will, with expedition and ſpeed, ſend aſſiſtance to the parts which are attacked.

Before the commanding officer fixes the chain, he ſhould detach ſome huſſars to ſurvey and ſcour with great exactneſs the woods, villages, hollows, and all ſuch places, for at leaſt three quarters of a league or a league, in front, as may be capable of containing ambuſcades: and during the time of this ſurveying, the troops deſtined for the chain will remain in order of battle, in the front of the ground that is to be foraged, in order to cover it and protect the huſſars, in caſe they ſhould be attacked.

When this examination is finiſhed, the commanding officer may begin to eſtabliſh his chain, and the huſſars will remain in the front till the foraging is finiſhed; and will detach ſmall bodies to march round about the chain, croſſing each other, halting at times, and ſending ſome huſſars before them to patrole.

If the huſſars gain intelligence of the enemy's being either in march, or placed in ambuſcade, they will ſend immediate notice of it to the commanding officer of the chain, who ſhould always fix himſelf in a particular ſpot, that there may be no time ſpent in ſeeking him; his poſt ſhould be in the rear of that part of the chain that is neareſt to and moſt in front of the enemy, and he will regulate the diſpoſitions for his defence according to the report made to him. When an ambuſcade is diſcovered, and troops marching to attack, a general ſhould always ſuſpect there may be more ambuſcades, and more troops in march, to form different attacks; he muſt therefore, inſtead of weakening the chain in any part, ſtrengthen it as much as he can, by cauſing either the whole reſerve, or part of it, to march where circumſtances ſhall require.

The avenues and the heights in a mountainous country ſhould be occupied by infantry; the avenues, in order to prevent the enemy from penetrating into the valley or plain where the forage is made; the heights, in order to obſerve the enemy at a diſtance, and to prevent his getting poſſeſſion of them, and flanking the troops which guard the avenues. In this caſe there ſhould be a greater number of infantry than cavalry; no more of the latter being requiſite than what is neceſſary to ſuſtain and ſupport the infantry, in caſe it ſhould be attacked, repulſed, and obliged to retire through a valley or plain. Then, if it hath no cavalry to ſupport it, the wings will be entirely expoſed, and the enemy being ſuperior, can at the ſame time attack the front and the flanks; whereas, by the means of horſe, which can act with eaſe in a plain or a valley, this inconvenience will be prevented, and the infantry greatly aſſiſted.

If the forage is made at a diſtance from the camp, and in the neighbourhood of the enemy, the infantry guarding the avenues ſhould throw up ſome entrenchments in its front, which will be ſoon done; and it is then cannon becomes neceſſary, as there ſhould be two or three pieces planted at each avenue. The heights alſo muſt, on every occaſion, be occupied, which ſhould be conſtantly obſerved as a general rule, whether the enemy is at a diſtance or near at hand, in every diſpoſition that is to be executed in a mountainous country.

If the enemy forms one or more attacks, the ſmall eſcorts belonging to each regiment muſt join on the firſt order, and cover the foragers as much as poſſible, who ſhould at the ſame time aſſemble in the centre by regiments. The foragers ſhould always be provided with their carbine or ſword; and although they may not be very formidable againſt troops completely armed, yet there have been inſtances where they have charged with ſucceſs.

If it is in a plain, and the enemy, having formed but one attack, charges the chain in one particular part, the troops of horſe and dragoons which are oppoſite to him ſhould march up reſolutely and ſuſtain his efforts: if they are repulſed, they will be ſupported by the infantry that hath remained in its poſt; the huſſars which were in front will unite, and place themſelves upon the flanks of the troops which are attacked, in order to cover them, and endeavour to defeat the enemy by charging him in flank and rear. If the general is certain that the whole of the enemy's troops are engaged in this one attack, he may then bring up all the troops belonging to the chain, both cavalry and infantry, in order to oblige him to retire the ſooner: which if he does, ſome huſſars, ſuſtained by horſe and dragoons, ſhould be ſent in purſuit of him, till his retreat becomes certain; but with caution not to purſue too far, leſt he ſhould rally upon thoſe troops, who, being too far from the chain, cannot receive aſſiſtance ſo ſoon as would be neceſſary; and beſides, the making and accompliſhing the forage being the grand object, the commanding officer ſhould be contented with ſucceeding in that, without ſeeking for any other advantage unconnected with the original deſtination of the troops.

Defenſive Operations.

If the enemy forms more attacks than one, the foragers, who, as hath been already obſerved, muſt be aſſembled in the centre, ſhould have orders to take the road to the camp, and will re-enter it covered by the ſmall eſcorts from the rear-guard: but as a forage ſhould never be abandoned till the laſt extremity, they ſhould be ordered to draw up in order of battle, when they are within a quarter of a league of the camp, in order to return and complete the forage on the firſt order. But if the enemy is in force, and by his ſuperiority all hope of obtaining the forage is deſtroyed; or if it is made at ſo great a diſtance from the camp that the troops belonging to the chain cannot expect to be readily aſſiſted; the commanding officer ought to make a retreat, with every diſpoſition a good officer is capable of, and to join courage and vigilance with knowledge and experience.

If, on the contrary, the enemy is weaker, or of equal force with the chain, he ſhould be charged without heſitation; becauſe the enemy, regulating his attack by his defence, will be obliged to contract himſelf, in order to make his attack heavier and more conſiderable; ſo that the troops being united, will charge the enemy: and if, by the aſſiſtance of the huſſars who are advanced, and act after the manner already mentioned, the enemy is forced to retire, he muſt be purſued in the manner above directed; after which the troops muſt return and complete the forage.

As a commanding officer is, in caſe of a forced retreat after being beat, obliged to ſubmit to circumſtances, and regulate his diſpoſitions by the enemy's, he muſt retire with the greateſt order poſſible, cauſing the infantry to march in the centre, either in columns or in order of battle, as the ſituation of the ground will beſt allow; the horſe and dragoons upon the wings, the huſſars upon the flanks, that they may not confuſe the diſpoſitions, but ſerve as a ſupport for the chain, and prevent its being taken in flank; and the diſpoſition of the troops ſhould be ſo managed, that the enemy ſhall not be able to preſent a larger front than that which is oppoſed to him; and although it is impoſſible for a general to foreſee, for certain, what will be the diſpoſitions for an attack and retreat, becauſe they muſt be changed according as thoſe of the enemy alter, or as the nature of the ground varies; they ſhould nevertheleſs be ſo ordered, that each body ſhall be ſupported, and capable of acting without confuſion. It is only on occaſions thus preſſing, that the commanding officer ſhould ſuffer the forage to be abandoned; and even then it will be ſome ſatisfaction that he hath been able to place the foragers and their horſes in a ſtate of ſecurity.

If,

Defenſive Operations.

If, during the retreat of the chain, it ſhould receive aſſiſtance from the army, it ſhould charge the enemy, notwithſtanding its being too late to go on with the foraging; and if this charge ſhould prove ſucceſsful in either beating or cauſing the enemy to retire, he ſhould be purſued without intermiſſion, in order to deprive him of all deſire for repeating the attack. In order to improve this advantage to the utmoſt, the commanding officer ſhould leave a large detachment, conſiſting of infantry, cavalry, dragoons, and huſſars, to continue all night upon the ſpot, and the next morning betimes, the foragers, properly eſcorted, will come to take away the forage; and as ſoon as the eſcort is arrived in the front of the chain, the detachment which hath remained there all night muſt return to the camp.

There ſtill remain many other precautions to be taken for the ſecurity of foraging parties, but the limits preſcribed to us will not admit of our ſtating them. We ſhall only add, that the foragers, in entering the ground they are to encompaſs, do not occupy more than is abſolutely requiſite, and that they do not ſpoil more grain than they carry away with them; firſt, becauſe by extending the chain it would be weakened, and become eaſier to be forced; and in the ſecond place, every prudent officer ſhould be an economiſt in the article of forage; the officers commanding the ſmall eſcorts which march at the head of each regiment ſhould be charged with the care of this. Theſe officers will cauſe their troops to march as much as poſſible through roads and over grounds which are untilled, till they arrive at the place intended to be foraged. If all the grounds are ſown, the commanding officer muſt cauſe the cavalry to diſmount at the place where the chain halts, and part of the troopers furniſhed with ſcythes muſt go and cut the grain, while the remainder hold the horſes; and when there ſhall be no farther room to fear damaging the forage, the cavalry will remount and take it up. Each place ſhould be marked out for a brigade or a regiment; which diſtribution ſhould be made by the ſtaff-officers before the troops arrive.

Sect. IX. *Of the Detachments for forming a Chain of dry Forage.*

If there is great exactneſs and knowledge required in the conducting of parties for green forage, thoſe for dry forage perhaps require more; and, in general, every thing that reguards foraging parties, whether green or dry, excites a particular attention in the commander in chief; and according to the chevalier Folard, all ſucceſs in war depends upon ſecrecy, diligence, activity, and the thorough knowledge of the country.

The diſpoſitions for forming a chain of dry forage, which differ from thoſe for forming one of green, will direct the means for extending the chain in proportion to its ſtrength, and at the ſame time place the foragers in ſecurity; although, in parties of dry forage, the foragers generally take up leſs ground, according to the diſtance of the villages that are to be foraged from each other.

The diſpoſitions for a chain of dry forage are alſo varied according to the nature of the country; but whether it be open or mountainous, each different body ſhould be placed in that part where it can act with the greateſt facility; the infantry therefore ſhould occupy the villages, and the cavalry the plain in front, and ſhould be diſpoſed after ſuch a manner as to be able to retire eaſily to the protection of the infantry. Before the foraging is put in execution, the commander in chief ſhould mark out the villages to the general officer who is to command the foraging party, and regulate their number by the quantity of troops that are to forage. The firſt diſpoſitions will be the ſame with thoſe mentioned in the foregoing ſection in relation to green forage: therefore the general who is to command the forage ought to ſet out with a detachment in order to examine the ground, the poſts neceſſary to be occupied, the villages which are to be foraged, their ſituation, the rivers which cover or run through them, the bridges to be guarded, the diſtance from one village to another, and with what degree of eaſe the communication with them may be ſecured. After having thoroughly examined into theſe particulars, he can with eaſe form a judgment of the number of troops that will be neceſſary to form the chain and ſecure the foragers; after having done this, he will order the bailiff or burgomaſter of every village to come to him, and inquire of them the number of huſbandmen, and how many ploughs each huſbandman hath belonging to him; by which he will be able to calculate the number of ſheafs reaped by each huſbandman.

Defenſive Operations.

The general may, for every plough, reckon about 30 acres of ground; and, in proportion to the fertility of the ground, every acre will produce from 120 to 160 ſheafs: by this method may be computed the number of ſheafs reaped by a huſbandman who had three or four ploughs; and from this calculation the general will judge whether the number of ſheafs, ſuppoſed to be in each village, will be ſufficient for the troops coming to them.

Let every acre of ground be ſuppoſed to yield 144 ſheafs; then a huſbandman who hath three ploughs will have reaped 12,960 ſheafs; ſo by reckoning 12 ſheafs to a truſs, and every truſs to weigh 600 pounds weight, this huſbandman will ſupply ſufficient for 124 truſſes. It is true, that ſome deduction ſhould be made from the number of truſſes that every acre may yield, as the huſbandman or farmer may have preſerved or conſumed ſome either for daily uſe or for ſeed.

It is very neceſſary that the general ſhould take care to leave ſufficient grain, not only to enable the huſbandman to live, but alſo to ſow his grounds; particularly if he foreſees a probability of the next campaign being carried on in the ſame country.

Nevertheleſs, as this manner of reckoning may be attended with inconveniences, becauſe there are ſome villages which keep up a particular trade of forage and grain, and therefore the granaries and barns may ſometimes be found empty, yet the quantity of ſheafs and grain remaining in the village may be calculated by the number of inhabitants to be ſubſiſted. Marſhal de Puyſégur's method, which conſiſts in informing himſelf of the number of horned cattle and horſes, and by deducting the time they graze, is a very good one; but ſtill there muſt be ſome deficiency in this calculation, as it will be impoſſible to fix with certainty the time of their grazing.

When the general ſhall have arrived at a tolerable certainty of the quantity of forage; the ground where to eſtabliſh his chain; the poſts which the infantry are to occupy; and taken a note of the quantity of forage; he will carry away one or two of the bailiffs or burgomaſters, as hoſtages for the ſecurity of the forage: he will alſo direct them to inform the inhabitants, that if they conceal or purloin but even a ſingle ſheaf from the whole, he will cauſe their village to be firſt pillaged, and afterwards ſet on fire; ſo that the peaſants, on whom theſe threats have often great effect, will ſcarcely give the enemy information of the intended forage. The general muſt leave ſome companies of infantry, ſuſtained by a detachment of huſſars in every village, who, by conſtantly patroling on the outſkirts, will ſtop all comers and goers; while the infantry will keep a ſtrict guard on the inſide of the village, and permit no perſon to go out of it; nor ſuffer the bells to be rung,

colours

Defenſive Operations.

colours to be hoiſted upon the ſteeple, or fires to be lighted; and will put a ſtop to every thing that may be ſuppoſed to be a ſignal agreed on with the enemy. When the general hath completed all theſe diſpoſitions, he will return and give an account of them to the commander in chief.

The ſame general ſhall, upon the day appointed for the forage, ſet out at day-break, with the troops deſtined for the chain, and the ſtaff-officers. As ſoon as he ſhall be got within ſight of the villages, he will not fail to have them examined, notwithſtanding he left troops in them the foregoing evening. When they are all examined, he will leave them in the rear, march on into the front, and draw up in order of battle; after that, he will form the chain, regulating the diſpoſitions of it by the ſituation of the ground, and of the villages examined over-night. The huſſars will advance three quarters of a league or a league, in order to ſcour the country; during which time the ſtaff-officers, inſtructed by the general of the quantity of ſheafs contained in each village, will, attended by the bailiffs or burgomaſters, make a diſtribution of the forage by regiment or brigade, and aſſign a barn to each, or one to two. When this diſtribution is made, the ſtaff-officers will make a report of it to the general commanding the party.

As all the villages marked out to be foraged are not in the ſame line, thoſe which are in the rear, and covered by others in which there is infantry, and by the chain of horſe and dragoons in the front, require but a ſmall number of troops; and if a detachment of infantry is poſted in them, it is more with a view of preventing the troopers and ſervants from marauding than any thing elſe. Defenſive Operations.

The eſcort belonging to each regiment, commanded by a captain, ſhould remain upon the ſpot where the regiment forages, and, with the aſſiſtance of the infantry, prevent diſorder among the foragers, and ſend off thoſe who are loaded. As ſoon as a regiment is ſet off, the captain commanding the ſmall eſcort muſt report it to the general officer commanding the forage; after which he will follow, and form the rear-guard of it.

As ſoon as the general ſhall be appriſed by the ſtaff-officers, and the captains commanding the ſmall eſcorts, that a village is evacuated, he may contract his chain, and draw it nearer together, till the foragers are gone; which when they are, he will aſſemble his troops, and detach as many platoons of infantry as there are villages: or rather the body of infantry poſted in each village during the forage, ſhould leave a party to make a ſtrict ſearch after all ſtragglers and marauders; the firſt they ſhould keep with them, and make the others priſoners, and puniſh them ſeverely on their return to the camp. When all the different bodies ſhall be re-aſſembled, and the officers commanding them have made the report, the general will order the huſſars to be called in, and form a rear-guard according to the manner directed in the foregoing ſection, and return to the camp in the ſame order, and with the ſame diſpoſitions, as if he expected to be attacked.

Part II. Of the OPERATIONS of OFFENSIVE WAR.

JUSTICE and humanity having been conſidered, in this article, as the firſt principles of war, the chief intention of the firſt part hath therefore been, rather to convey maxims for a juſt defence, than to lay down rules for attacking. But though defenſive war be that alone to which religion and philoſophy give their ſanction, it does not follow that a nation is bound to wait patiently for the attack of its enemies. When the conduct of other nations is ſuch as evidently to ſhow that they meditate a war, the nation threatened may arm itſelf, and ſtrike the firſt blow when it can be ſtruck with advantage. There is only one precaution for avoiding the danger with which it is beſet. By obſerving the various operations of an offenſive war, it may indeed be often ſeen that the whole is nothing more than a ſeries of defence, and that the fear of being attacked is the real ſource whence theſe precautions for attacking ſpring.

Sect. I. *Of Spies.*

IT is impoſſible for a general, or even for an officer charged with the command of a detachment, to act with certainty if he have not ſpies or ſecret intelligence diſperſed about the enemy's army; for, without the information which they alone can give, he will have the mortification to ſee all his deſigns miſcarry, and all his precautions become uſeleſs, becauſe improperly taken.

No expence therefore ſhould be ſpared to procure intelligent ſpies; but care ſhould be taken that they are unacquainted with each other, and particularly that they are not known to any inferior officer: they ſhould be always ſpoken to alone, and never be ſuffered to meet each other. The general ſhould ſtudy their character, and prove them by repeated trials; he ſhould ſound them by degrees, beginning with things not difficult to be explained, and which if diſcovered, will not be of great conſequence; he ſhould engage them in long converſations, thereby to form a judgement of their parts and comprehenſion; and he ſhould alſo employ them often in bringing him intelligence.

Although a general ſhould always be upon his guard with a ſpy whom he hath cauſe to ſuſpect of treachery, he may nevertheleſs draw great advantage from him, provided he knows how to deceive him properly; becauſe he may be very certain he will inform the enemy of all the reſolutions which have been taken.

The emperor Leo, in his Tactic, adviſes a general, who hath reaſon to imagine his counſels are betrayed to the enemy, to conceal his real deſigns, by ſpeaking in a manner quite oppoſite to them: For, ſays he, in the maxims at the end of his book, an enemy muſt be deceived who receives intelligence from ſpies or deſerters directly contrary to what is actually reſolved upon. But, adds he, ſhould theſe ſpies be entruſted with the general's real intention, he ſhould, by ſome alteration in his operations, endeavour to perſuade the enemy that they have deceived him; upon which he will grow miſtruſtful of them, and be obliged to look out for others, no longer daring to confide in the former.

If a ſpy employed by the enemy is diſcovered, and brought to the general, he ought to take him in private, queſtion with mildneſs, ſpeak to him with a ſort of confidence, and, inſtead of threatening, ſhould promiſe him a reward if he will diſcover to him what he knows of the enemy's intentions. If the general finds him intelligent, he ſhould endeavour to engage him in his ſervice; and, provided he can gain him over by force of money, a thing not difficult, he may derive great advantage from him; but he ſhould be careful how he employs him, till he hath very good reaſon to be aſſured of his fidelity.

There are many different methods of trying the veracity of a ſpy: if, for example, the general receives information, that, on ſuch a day, a detachment of the enemy is to ſet out on ſome expedition, he ſhould then ſend out troops to double the number of thoſe detached by the enemy; by

Offenſive Operations.

which means, if the ſpy's intelligence is true, the enemy will not only be baulked in his deſign, but may alſo be beat by the ſuperior detachment. If the enemy's detachment has but a trifling object in view, it will be ſufficient to ſend juſt troops ſufficient to examine into the truth of the ſpy's report. The general may alſo pretend to appoint a foraging within two days, and order but few troops for the chain; in which interval, if the ſpy is falſe, he will find an opportunity of giving the enemy notice of it: but inſtead of the few troops publicly ordered, the general will privately add another body to them, which will be placed in ambuſcade behind the place where the pretended forage is to be made. If the enemy, in conſequence of this information, ſhould come and attack the chain, it ſhould immediately retire, as if too inferior in number to continue the forage, toward the troops in ambuſcade; when, being joined, they will fall upon the enemy on all ſides. If this attack is made with vivacity and reſolution, there may be great reaſon to expect it will terminate in a complete victory.

If, on the contrary, the ſpy does not appear intelligent, or affects ſtupidity, the general ſhould puniſh him with death, and cauſe him to be hanged in the ſight of the whole army, in order to deter others, which may be diſperſed in the camp, by his fate. It would be needleſs to queſtion him concerning the enemy, becauſe it would appear inhuman to execute a man who had given intelligence of importance, whether extorted from him by fear, force, or perhaps a promiſe of pardon.

Spies are as neceſſary to a general as arms are to an army: but it is money only that can ſecure their fidelity; and if a general finds himſelf ill ſerved, it is becauſe he has been too ſparing of the funds intended by his ſovereign for that purpoſe. Notwithſtanding it is the duty of a good ſubject to manage his maſter's finances as much as it is in his power, yet there are intelligences of ſo great importance, that it is ſcarcely poſſible to pay ſufficiently for them. A man is ſufficiently indemnified when, by means of the intelligence he has received, he has concerted his meaſures in ſuch a manner as to beat the enemy, gain ſome marches over him, or to be beforehand with him in ſome enterpriſe.

Spies, when diſcovered, ſhould not always be puniſhed with death; great advantage may be made of them by pretending ignorance of their real quality, eſpecially if they are not ſufficiently diſguiſed. Tacitus, in his Annals, ſays, that Vitellius's party got information of Otho's deſigns by means of his ſpies, who, by endeavouring to dive too minutely into their enemy's ſecrets, did not ſufficiently conceal their own. Vigetius's method for diſcovering ſpies who are ſuſpected to be ranging about in a camp, is to order all the ſoldiers and ſervants into their tents during the day, and the ſpies will be taken immediately.

When a general is ignorant of the enemy's deſigns he ſhould always affect a knowledge of them; but whenever he is informed of them, he ſhould, on the contrary, pretend to be ignorant of them; by which means the enemy, being eaſy with regard to his ſpies, will not alter his deſigns, or ſuſpect the general of having any knowledge of them.

If the general can procure ſuch ſpies as, by their employment, are near the perſon of the enemy's general; as, for example, a ſecretary, or any others who are near him, and who conſequently can give intelligence more to be relied upon than thoſe who are conſtantly paſſing from one army to another; their ſervice may be turned to a very great account.

If a general diſcovers an enemy's ſpy to be one of thoſe who, by their employment, are near his perſon, he can receive great advantage, by forcing him to write a letter of falſe intelligence, thereby to divert the enemy's attention from the plan he would execute; but he ſhould cauſe him to be hanged immediately after, for it would be very imprudent to uſe him above once. The prince of Orange, when he came to attack M. Luxemburg at Steinkirk, having diſcovered one of his muſicians who gave the enemy intelligence of every thing he intended, made uſe of this ſtratagem; and although it was rendered abortive by the vigilance of M. de Luxemburg, and the courage of his troops, there are nevertheleſs but very few inſtances where it hath failed: and even M. de Luxemburg would have been beaten, if he had not had early notice given him by his advanced detachments; by which means he had time ſufficient to make his diſpoſitions, and to avoid being ſurpriſed.

Offenſive Operations.

There is a ſtratagem which may be made uſe of when ſpies are wanting, and which is leſs expenſive; that is, to ſend ſuppoſititious letters by the firſt peaſant that comes in the way, who will have nothing to fear; and ſo far from concealing himſelf, he muſt take a road where he will be ſure of falling into the enemy's hands: theſe letters ſhould be directed to the general officers commanding a body of troops; or even to the general of the army, ſuppoſing they come from an advanced body. They ſhould contain ſchemes that are good, and practicable in their execution, but quite oppoſite to what is intended and will really be undertaken: it often happens that the enemy, too credulous, abandons his original deſigns to purſue chimerical ones, which to him appear very good, and do not preſent any obſtacle to thoſe which the general deſigns to execute. Prince Eugene ſucceeded, by this ſtratagem, in raiſing the ſiege of Coni, formed by the French in 1691.

But nevertheleſs a general ſhould take care that, through a fear of being deceived by ſuppoſititious letters, he does not himſelf too much neglect the intimations which are given him: a general ought, ſays Onozander, to liſten to every body at all times, and upon all occaſions. Alexander, when at a great diſtance from his own country, not being able to receive his couriers till very late, refuſed to give attention to a peaſant, who came to inform him of a ſhorter route; but ſoon repenting of what he had done, he ſent to ſeek after him, but in vain.

The ſame reaſon that ſhould make a general always have ſpies in the enemy's army, ſhould alſo make him ſuſpect that the enemy has ſome in his; therefore he ſhould endeavour to deceive them, he ſhould keep his intentions ſecret, mention them to very few, and always talk openly, contrary to what is really deſigned. Onozander obſerves, that it ſhows great folly in a general to mention his deſigns publicly, eſpecially when they are on the eve of execution; for deſerters generally go over to the enemy at the time an action is unavoidable.

But if it is diſcovered that the enemy has received information, Vigetius ſays, that the diſpoſitions muſt be immediately changed. Polybius, on like occaſions, particularly recommends ſilence and diſſimulation; he even ſtretches this rule as far as the thoughts themſelves, which he ſays muſt ſometimes be repreſſed, for fear our actions ſhould ſometimes betray and diſcover them. Metellus anſwered one of his friends, who, on an important occaſion, aſked him the reaſon of certain diſpoſitions, "that if his ſhirt knew what he thought, he would burn it."

To avoid the danger of treachery, ſealed orders have been uſed with great ſucceſs, which have been ſent to officers, with expreſs orders not to open them till at ſuch a time and at ſuch a place: this is an eſtabliſhed rule at ſea, and can alſo be practiſed on ſhore when employed in an expedition which it is eſſential to conceal from the enemy.

SECT.

Offenſive Operations.

SECT. II. *Of Ambuſcades from the Army.*

A GENERAL who loſes a battle, ſays Vigetius, may attribute his ill luck to fortune, although theſe kinds of events are generally the effects of art and ſkill; but he who ſuffers himſelf to be ſurpriſed, and who falls into the ſnares laid for him by the enemy, has no excuſe to make, becauſe, by his vigilance, and the goodneſs of his ſpies, he might have avoided them.

A deſign ſhould never be formed for an attack upon marches, detachments, convoys, forages, or upon one or many quarters, without knowing the ways which are to be paſſed, and the places where ambuſcades may be formed; whether to avoid, or whether to conceal troops in them, in order to facilitate a retreat, or to draw the enemy into it. A general who receives information from his ſpies that ſome enterpriſes are intended upon ſome bodies detached from the army, upon one of his convoys, on a forage, or upon his quarters, ought alſo, on his ſide, to form ambuſcades in the ways leading to it. The number of troops in ambuſcade ought to be regulated by that of the detachment intended to be ſurpriſed; it ſhould be ſufficiently ſtrong to attack the enemy on all ſides, that is, in head, flank, and rear. The troops who ſet out to form an ambuſcade ſhould always march by night, unleſs it be in a country ſo covered that the enemy cannot perceive them.

A general, according to Santa Cruz, ſhould endeavour to form as many ambuſcades as poſſible; ſo that if the enemy ſhould not fall into one, he may not eſcape the others: they ought to be diſpoſed after ſuch a manner, that one can neither attack nor be attacked without being heard, ſuſtained, and aſſiſted by the others: this junction is a ſtratagem which the enemy could not expect, and which will aſſure the victory. If, from the fewneſs of the troops, or the fatigues of the campaign, it is impoſſible to form many, there ſhould at leaſt be one ſufficiently ſtrong to reſiſt the enemy it would attack: but ſtill it is not requiſite that it ſhould be as numerous as the enemy, becauſe troops in ambuſcade, who charge a detachment that is unprovided on all ſides, ought, by this ſurpriſe, to have a particular advantage, and conſequently ſupply the place of number; which will certainly be the caſe, particularly if the enemy falls into the ambuſcade during the night, and that care hath been alſo taken to place a great number of drums and trumpets, that when the troops of ambuſh charge, they may ſerve to increaſe the numbers in appearance, by the terror which noiſe always raiſes in the night time.

In order to deceive the enemy who is in detachment, ſmall bodies ſhould be ſent out towards him, with orders to retire to the troops in ambuſcade as ſoon as they meet him.

Ambuſcades ſhould always have ſome object. Before they are undertaken, it ſhould be known whether the enemy is in the field; if he intends either to attack or moleſt the quarters; whether it is proper to wait for him or to ſeek him: without theſe precautions the troops will be fatigued, and no end anſwered.

Ambuſcades may be compoſed of infantry, huſſars, or dragoons; but it is the ſituation of the country that muſt determine which. Theſe troops may be mixed together or ſent ſeparately; but that muſt be according to the deſign intended to be executed, or according to the nature of the troops employed by the enemy in his detachments.

If the deſign is to attack a convoy, all theſe troops are neceſſary, becauſe the eſcort of it will undoubtedly conſiſt of infantry, cavalry, or dragoons, and alſo ſome huſſars to clear the march; if a green forage, infantry is very neceſſary, but it ſhould always be left in the rear to ſecure the retreat: cavalry, with huſſars or dragoons, is ſufficient to attack a forage, to beat the eſcort of it, or at leaſt to prevent the foraging being executed. If a dry forage is to be attacked, it muſt be done with infantry, becauſe, as it can only be performed in the villages, it is certain they will be occupied by infantry, and that there will be a chain of cavalry in the front, which will be protected by it: if a detachment, it is according to the nature of the country through which it marches; if an open country, horſe, huſſars, or dragoons, muſt be employed: but in a woody or mountainous country, infantry muſt be made uſe of. After all that can be ſaid, it is impoſſible to lay down fixed rules for the kind of troops which ſhould be employed: there are ſome woody countries where huſſars and dragoons can act with eaſe, and be of great ſervice: there are mountains where they can act ſecurely, becauſe very fine plains, divided by woods, are to be found in the bodies of them, where they can place themſelves in ambuſcade; but care muſt be taken to ſecure their retreat. There are, on the other hand, plains ſo divided by hollows and canals, that infantry only are capable of acting; therefore it is the general's buſineſs to diſcover from which kind of troops, in either country, he may expect the greateſt advantage.

Offenſive Operations.

There is no country but preſents ſome place proper for forming ambuſcades; hollows from which it is eaſy to ſally, the leaſt height, woods, hedges, ruins, vineyards, ſometimes corn-fields, marſhes covered with reeds, all preſent expedients to a general who knows how to take advantage of them: he muſt only be careful to place the ambuſcades after ſuch a manner that they ſhall not be diſcovered by the enemy's parties; and that they are not themſelves diſcovered by the inattention of any of the ſoldiers, by noiſe, or by other accidents.

If the ambuſcade conſiſts of huſſars or dragoons, the horſes muſt not be together; their neighings may prove very prejudicial. Even a peaſant, attracted by the barking of a dog or the neighing of a horſe, may go into a wood, diſcover an ambuſcade, and, often induced by the hope of a reward, will go and give the enemy information of the whole. Every perſon paſſing near an ambuſcade ſhould be ſtopped, and that without noiſe; the peaſants ſhould be tied to trees, and guarded by ſentries. If the ambuſcade is formed in an hollow-way, behind an high ground, or in any places whatever, the general muſt cauſe every body that is taken to be tied together, and well guarded.

The troops in ambuſcade muſt fall on all parties of the enemy that paſs near them, unleſs when the deſign is to carry off a convoy or to attack a large detachment. It ſhould in that caſe continue ſilent, and let them paſs: but if theſe parties, by making a ſtrict examination, diſcover the ambuſcade, as there can no longer remain any hope of attacking the convoy or detachment, it ſhould fall upon and endeavour to ſurround them, and, if poſſible, take them priſoners; and if the troops in ambuſcade are ſo lucky as not to let any of the enemy eſcape, the ambuſcade may remain in its firſt ſituation, but always purſue its firſt object, becauſe here will be no reaſon to apprehend the enemy's having received intelligence of it.

The troops in ambuſcade ſhould attack theſe parties ſword in hand, and not with their fire arms, and, if poſſible, prevent them from uſing theirs. From this manner of attacking, there will reſult two conſiderable advantages. The firſt is, that a briſk and unexpected attack aſtoniſhes, and ſcarcely gives them time to think of their defence. The ſecond is, that, by firing, it is to be feared, that if there are any other parties farther off they will hear it, and ſend and give notice. In that caſe, the ambuſcade muſt change ſitu-

Offenſive Operations.

ation, and place itſelf in ſome other part, but not abandon its original project till the laſt extremity, and till there is no longer any hope of ſucceeding otherwiſe.

The leaſt thing, as has already been ſaid, may be the occaſion of an ambuſcade's being diſcovered. The fire of a pipe may be ſeen at a great diſtance in the night-time: beſides, however ſmall the number of ſoldiers who ſmoke may be, the wind may carry the ſmoke and the ſmell of the tobacco toward that part where the enemy patroles. The ambuſcade ſhould not be cumbered with ſervants, or any thing elſe that is unneceſſary; orders ſhould be given that the horſes are tied with care, and that a profound ſilence is obſerved by every body. As it is very difficult for huſſars or dragoons to march without leaving marks behind them, by which means the road leading to the ambuſcade may be diſcovered, they ſhould try to enter it by ſome bye-way, or at leaſt by as dry a one as poſſible. In order to efface the marks of the horſes feet, eight or ten huſſars or dragoons may tie branches of trees to their horſes tails, and, by marching behind the detachment, in as large a front as the whole body, will deſtroy any marks that are made: as ſoon as they ſhall have entered the wood, they will cloſe up the entrance with the ſame branches, of which they will make a ſort of hedge.

If the detachment intended to form an ambuſcade, whether infantry or cavalry, is obliged to march upon a high-way, as ſoon as it comes near the place appointed, the commanding officer ſhould detach a body on before, with orders to take up the ſame front as the whole detachment. As ſoon as it ſhall have proceeded a quarter or half a league, it will return by another way; and it ſhould alſo make a large circuit, ſo that the enemy's parties, coming the ſame way, will not perceive that they ſhall be ſtopped by any troops in that place. This body will rejoin the troops which are in ambuſcade, by a road the moſt out of the enemy's view, never in a body, but ſcattered, ſo that they may leave fewer marks behind them. Sentries ſhould be concealed behind buſhes, in the front of the ambuſcade, ſo that they may be able to ſee the country and ways about them, without being ſeen themſelves: two or three ſoldiers ſhould alſo be made to climb into trees, in order to ſee at a great diſtance, and give notice if they perceive any troops; the ſame method muſt be obſerved with regard to huſſars or dragoons.

Before the commanding officer enters the wood where he would form his ambuſcade, he ſhould detach two or three patroles to ſcour it, for fear the enemy ſhould happen to be there in ambuſcade himſelf; after every part has been ſearched, the troops muſt enter the wood, and range themſelves according to the order that ſhall have been given them. The commanding officer will form three bodies of his detachment, and place them at a diſtance one from another; one will be deſtined to attack the advanced guard, the other the centre, and the laſt the rear-guard. If the detachment conſiſts of cavalry, the half of each corps ſhould be on horſeback; no perſons ſhould ſlip or paſs the ſentries or vedettes under pain of being declared deſerters. During the night, the cavalry ſhould be mounted, and the infantry under arms: in the day-time, half thoſe on foot will relieve thoſe on horſeback every three hours; and the ſame ſhould be done with the vedettes, as well as the infantry and ſentries.

If the ambuſcade is behind an height or ſmall mountain, ſentries muſt be placed on the top, lying on their bellies, and without hats; in other reſpects the ſame diſpoſitions ought to be obſerved, whether on the march or for the conducting of ambuſcades, always paying a proper regard to circumſtances and the ſituation of the country.

There are divers methods of drawing the enemy into ambuſcades. The general commanding the army or quarters ſends out a detachment under the command of an intelligent officer, to form an ambuſcade, at the diſtance of one or two leagues, more or leſs, according as the country is fitting for thoſe ſorts of diſpoſitions, or according to the diſtance of the enemy. The general muſt acquaint this officer, that two hours after he is ſet out, he will ſend out another detachment, of leſs force, with orders to go on the ſide where the enemy is, to endeavour to meet him, and at firſt ſight to make a feint of charging him; but, as if finding him too ſtrong, he will begin his retreat, directing it toward the place where the troops are in ambuſcade: furniſhed with theſe inſtructions he will ſet out.

Offenſive Operations.

Then the general will ſend for the officer intended to command the detachment that is to go in ſearch of the enemy, and inform him of that which is ſet out to form the ambuſcade, and of the place where it is; he will order him to advance as near to the enemy as he can, and to draw him by a feigned retreat upon the troops in ambuſcade.

Theſe two officers ſhould be the only perſons informed of the deſign: but nevertheleſs the commandant of the detachment which is to go towards the enemy, may communicate it to the principal officers under his command; ſo that in caſe he ſhould be taken or killed in the retreat, he that ſucceeds in the command may be able to act according to the general's intentions. He muſt be particularly careful, that no ſoldier, trooper, huſſar, or dragoon, penetrate into the deſign of the detachment, as it would then be in the power of a ſingle deſerter to make the ambuſcade miſcarry. The detachment which is to go and ſeek the enemy, in order to draw him into the ambuſcade, ought to be compoſed of huſſars, unleſs the country be of ſuch a nature that infantry only is capable of acting.

During the time that the huſſars are gone before, endeavouring to draw on the enemy, the troops in ambuſh will be on horſeback, and waiting in ſilence for their commander's order to go out and charge. As ſoon as they ſhall have charged and beaten the enemy, for fear leſt another detachment, at a little diſtance from that which has been beaten, ſhould come to its aſſiſtance, they will take the ſhorteſt way, and march leiſurely, but with order, towards the camp or the quarters. The detachment which drew the enemy into the ambuſcade, muſt form the rear-guard of it, and will march ſlowly on, while the reſt of the troops will retreat, conducting the priſoners with them. If the enemy ſends any ſuccours, as ſoon as the rear-guard perceives them, it will double its pace, but with order; there will be no reaſon to apprehend the enemy's coming too briſkly upon it, becauſe he will be fearful of falling into another ambuſcade: thus the rear-guard will retreat with eaſe, and the troops who conduct the priſoners have time enough to reach the camp, without any moleſtation.

It is on theſe occaſions that a man ſhould know how to keep his courage within proper bounds, and be ſenſible that flight is glorious: the deſpair of an enemy that is ſurpriſed, and even beaten, is always to be feared, when he is not entirely defeated. A man ſhould always be content with one victory, without attempting a ſecond: he may, by purſuing the enemy too eagerly, fall himſelf into ambuſcades more dangerous than that he has juſt drawn the enemy into.

If there is reaſon to apprehend that the enemy, having notice from ſome deſerters, are coming in full ſtrength, the ambuſcade muſt then change its ſituation and draw nearer to the place from whence it ſet out. This will ſerve two purpoſes; for ſhould the enemy appear in force, the ambuſcade will have the ſhorter way to retreat; or it may again happen

that

Offenſive Operations.

that the enemy, not finding the ambuſcade in the places pointed out by the deſerters, will imagine it to be retired, and, in that belief, will neglect the precautions neceſſary in ſuch a ſituation.

An ambuſcade that is ſucceſsful may cauſe the deſtruction of a whole army. The example cited by M. de Feuquieres, in his Memoirs, on that head, is ſtriking. M. de Luxemburg, ſtill attached to the prince, took all the baggage belonging to M. Turenne's army, becauſe the lieutenant-general who commanded the eſcort did not foreſee that the enemy, ſhut up in his lines of circumvallation before Arras, having two armies near his camp with a deſign of attacking him in his lines, could think of ſending out a large detachment of cavalry on an enterpriſe of ſuch a ſort. In the mean time M. Luxemburg, who was in ambuſcade, within reach of the column of baggage, ſeeing that the lieutenant-general was gone on before with the head of the eſcort, imagining the baggage in ſecurity, marched ſpeedily to the head of that column, whoſe march he ſtopped, and turned toward St Pol, where he conducted the whole baggage belonging to M. Turenne's army, without his knowing any thing of the matter. It is thus that, by the negligence of an officer, and by an ambuſcade ſeaſonably placed, an army finds itſelf ſtripped of all its baggage, and, as may be ſaid, not in a condition of continuing the campaign.

If this lieutenant-general had been provided with ſpies, detachments in front and on the flanks, theſe detachments would have diſcovered the ambuſcades, and, by the precautions uſual on ſuch occaſions, he would have placed the baggage of the army in ſafety. Again, his ſpies would have given him notice, that a large body of cavalry was detached from the camp before Arras, conſequently he would have been upon his guard; inſtead of which, being full of a falſe confidence, he marched as if in a champaign country, and, by this unpardonable remiſſneſs, occaſioned the loſs of the whole baggage. An officer who commands a detachment for any expedition whatever, cannot poſſibly take too much care to foreſee the checks that may happen to him; if he is beaten, it ſhould be wholly owing to a ſuperiority of force. He who, after having taken all the precautions poſſible, is beaten by an enemy who has the advantage of number, has nothing to reproach himſelf with: but he who, with ability, has nevertheleſs neglected certain precautions, and is beat becauſe they were not taken, is certainly culpable in the eyes of intelligent men.

Sect. III. *Of Camps in offenſive War.*

To take an advantageous poſition for an army; to make choice of a ſpot that by its ſituation is ſtrongly ſecured; to eſtabliſh a camp there, and to be alſo able to have the army within diſtance of marching eaſily to the enemy, without fear of being moleſted; in ſhort, to throw ſuch difficulties in the enemy's way as may prevent his haraſſing the army, is one of the moſt eſſential branches of knowledge for a general. He who is endowed with this talent can, with an inferior army, not only make head againſt the enemy, but alſo cauſe his deſigns to miſcarry; fatigue him the whole campaign by marches and counter-marches, which lead to nothing; oblige him to remain inactive, and at length draw him into a favourable poſition, where he will be morally ſure of beating him. All this was done by M. Turenne in 1675, who, after having exhauſted every expedient wherewith his military knowledge could furniſh him to draw M. de Montecuculi into a diſadvantageous poſt, at length ſucceeded, found an opportunity of attacking him, and glorioufly fell at the inſtant victory declared itſelf in his favour.

Before a general takes the field, he ought to be very certain what number of troops he ſhall have, that his magazines both of war and proviſions are ready, as well as the waggons, pontoons, and all other implements whatever that are neceſſary for an army; for events may happen that it is almoſt impoſſible to foreſee, and which often alter the beſt concerted deſigns. But when every thing is in order, a general poſſeſſed of the neceſſary talents can foreſee the event even before taking the field: he will know beforehand the marches he is to make, the camps he is to occupy, and thoſe which the enemy will endeavour to ſeize in order to oppoſe his deſigns.

Offenſive Operations.

An offenſive war is undoubtedly carried on with greater eaſe in an open than in a mountainous country. But whether in the one or in the other, no ſuperiority of number ſhould make a general neglectful of the ſafety of his troops in their camp; he ſhould always be aſſiduous in preſerving the ſtricteſt order and diſcipline among them; one or two checks are generally ſufficient to diſcourage the ſoldier, and take away that confidence which he ought to have in his general: the advanced poſts ſhould be well guarded, the flanks ſecured, and detachments frequently ſent out towards the enemy; for as ſucceſs is inſured by vigilance and care, ſo negligence and ſlack diſcipline are ruin to the moſt formidable army, and entertaining a contemptible opinion of an enemy renders him more daring.

It is to be obſerved, that a camp ought never to be fixed on the banks of rivers; but a ſufficient ſpace ſhould always be left between them and the camp, to draw out the army in order of battle. If this precaution is not taken, it may happen that the enemy, encamped either near to, or at a diſtance from the other ſide of the river, being informed of the poſition of the army, will come in the night to alarm the camp, and by a diſcharge of artillery and ſmall arms throw the whole camp into confuſion, without riſking the loſs of a ſingle man. For this reaſon a camp ſhould always be placed at leaſt eight or ten hundred yards from a river; ſo that the guards may be advanced without being expoſed, and within the circumference of the camp and compaſs of the guards the army may be ſupplied with forage for at leaſt four days, and more if poſſible.

There are ſome ſituations for a camp which are in appearance ſtrong, but may notwithſtanding prove very dangerous, if care be not taken to examine whether or not the army can with eaſe come out of it, to form itſelf in order of battle; or whether the enemy can prevent it, by blocking up the avenues and outlets. If this precaution be not taken; an army may be the means of ſhutting itſelf up; as was done at Seneff in 1674, and by the allies at Aſchaffenbourg in 1743.

The choice and ſtrength of a camp depend on the poſition of the enemy and ſituation of the country: a general ſhould always avoid encamping the cavalry in a wood, and ſhould be particularly careful that the wings are ſheltered; the woods ſhould be occupied by the infantry, and entrenchments thrown up in front, according to the deſigns intended to be put in execution. If the wings are ſheltered by a village, it ſhould be entrenched, and infantry poſted in it; and the camp ſhould be covered by a river as much as poſſible, unleſs the intention is to march towards the enemy; then all the obſtacles that can prevent the army coming up with him ſhould be avoided: but if, from ſome ſucceſſes of the enemy, or from his ſuperiority of troops, the general cannot determine upon opening the campaign offenſively, he muſt uſe other means to bring it about; and in the mean time ſhould ſtrengthen himſelf in his camp, eſtabliſh poſts on the banks of the river, and cover them by continual detachments of light horſe; who, by extending themſelves, will

Offenſive Operations.

will prevent parties of the enemy from paſſing to ſeize on the hind parts of the camp, moleſt the convoys, and attack the foragers.

Whatever may be the nature of the country, it is often neceſſary to have corps detached from the body of the army, to cover or keep open a communication with ſome place, in order to prevent the enemy from foraging too near the camp; to preſerve the forage; to raiſe contributions at a diſtance; to occupy ſome advantageous poſt; to oblige the enemy to divide his forces in order to oppoſe that body; to cover the camp either in the front or on the flanks, according to that ſide which is left moſt unguarded and expoſed: in a word, there ſhould always be continual detachments toward the enemy, as hath been the practice of many generals, and particularly of marſhal Saxe. The ſtrength of this body is to be proportioned to the uſe deſigned for it by the general; but it is uſually compoſed of light horſe, ſome regiments of light infantry, and a brigade or two of dragoons. In the end will be ſeen what uſe ſhould be made of this body; but in whatever ſituation it is to be placed, the communication between it and the army muſt always be kept open, that it may at any time be able to join it on the firſt order; and its camp muſt be ſo choſen, that the general may always receive intelligence from it of the leaſt movements made by the enemy. See Plate DXVII.

In every country, and on every occaſion, a camp is always defective if the wings are not ſheltered, or can be eaſily diſtreſſed by the enemy; if the front is not guarded and the rear well covered; if the communications with the frontier towns are not ſecure and eaſy; if there is any want of forage, wood, and water; and if there are not detachments in front, to prevent the enemy from approaching the camp.

A general who joins experience and ſtudy together, ought to ſee into the intention of the enemy's general, and judge of his deſigns by any of his proceedings, however trifling. All thoſe who are deſtined to the command of armies cannot indeed be endowed with this quick and exact eye, that ready power of judging of a good motion or a good poſition upon the ſpot. Some generals have excelled in marches, others in the poſition of camps; theſe in the arrangement of troops in order of battle, thoſe in their conduct in time of action; others in providing ſubſiſtence, others in projecting a campaign. There have nevertheleſs been ſome of theſe great men, whoſe genius and temper have united and carried all theſe qualifications to the greateſt degree of perfection; but the rarer theſe examples are, the more a man ought, by continual ſtudy, to endeavour to augment their number, and ſtrive to merit the honour of being enrolled among thoſe heroes, the ornament of mankind, their country's ſupport, and their maſter's glory.

Sect. IV. *Of the Attack of an Army on its March.*

However difficult certain operations in war may appear, they are nevertheleſs not impracticable when a general knows how to take the neceſſary precautions for leſſening thoſe difficulties. The attack of an army on its march ſeems to be above all reach of attempting; whereas the ſucceſs of ſuch an attempt depends only upon knowing how to take proper meaſures, on chooſing the ground, and on ſeizing a favourable opportunity.

When an army would attack another upon its march, it ſhould endeavour to be beforehand with it, and by the means of ſtolen marches, come up with it before it can know any thing of the matter: ſome parties ſhould be detached, who muſt place themſelves in ambuſcade, in order to ſtop all the comers and goers, ſo that the march and deſigns of the army may be kept ſecret from the enemy. Whenever a general hath determined to attack his enemy, he ſhould ſend off all the baggage, both great and ſmall, belonging to the army; and it ſhould be left in the rear under a good eſcort, near enough to join after victory, without the army's being obliged to wait three or four days for it.

Offenſive Operations.

The general ſhould be well aſſured of the day on which the enemy's army ſets out; or the country through which it is to march; whether it is an open, mountainous, or woody country; if it is divided by rivers; whether there are many bridges to paſs; and in how many columns it marches: he ſhould alſo get all poſſible information of the diſpoſition of it. In the third ſection of the firſt part, relative to the march of an army in an open country, the diſpoſition which it ought to make, in caſe it preſents its front or flank to the enemy, hath been laid down. The general deſigning to attack ought to regulate his diſpoſitions by thoſe which the enemy hath taken, and which he can only know from his ſpies; but if he cannot receive any information concerning them, the beſt rule for him is to ſuppoſe them good, and to form his own accordingly.

As in the caſe of a ſurpriſe there cannot be ſignals given, without running the riſk of the enemy's diſcovering that he is going to be attacked; it is therefore neceſſary, that every general officer leading columns ſhould have a watch, regulated by the general's, ſo as to march all at the ſame time, at the hour agreed on and ordered. The ancients, deſtitute of watches, regulated their motions by the courſe of the ſtars; and it is, without doubt, on that account that Polybius, Onozander, Ælian, and many others, exhorted military men to the ſtudy of aſtronomy: but as it is not often that an army marches by night, this knowledge would be very uſeleſs for an attack in the day time; beſides, the ſun, by which they were alſo regulated, could be no way ſerviceable to them, ſhould the ſky be overcaſt.

If the general's intention is to attack the enemy's army in front, he muſt detach all his light troops, ſuſtained by a large body of cavalry and ſome battalions, with orders to haraſs the flanks, in order to perplex the enemy with regard to the real attack. It is impoſſible to give the enemy too many falſe alarms with regard to what is really deſigned: the huſſars, from their readineſs in retreating and their quickneſs in paſſing from one ſpot to another, are the fitteſt troops for theſe ſorts of expeditions. The ſame rule ought to be obſerved if the real attack is deſigned to be upon the flank; then the falſe attacks ſhould be upon the front. In Santa Cruz may be ſeen the diſpoſitions which he has made to attack an army on its march.

Stratagem, and the means of ſurpriſing an army, are allowable in war, provided treachery is avoided. Whilſt the law of nations is not infringed, ſucceſsful ſtratagems add luſtre to the genius of the general; but there is no profeſſion in which rectitude of mind is more neceſſary than in that of war.

In order to carry on a ſurpriſe by ſtratagem, one of the moſt certain methods is, to calculate what time is neceſſary for the army to arrive at day-break near the road by which the enemy is to paſs, ſo as to be able to examine the country, and make the neceſſary diſpoſitions for the attack. In an open country the army may be concealed behind corn, or behind a riſing ground. Prince Eugene, in 1702, after the battle of Croſtolo, having gained ſome days march of the king of Spain, poſted himſelf between the Zero and the Po. He ſo well concealed his army behind the bank of the Zero, that the combined army of France and Spain, which was on its march, and ready to enter into its camp, was obliged to range itſelf in order of battle, and to fight, without having ſcarcely time to make any diſpoſition.

Offenſive Operations.

A woody country offers more expedients for the conceal-ing of troops: but as it is to be ſuppoſed the enemy's advanced guard will be advanced at leaſt a half or three quarters of a league, to ſcour the country; therefore, if the general's deſign is to attack the enemy's flank, he muſt preſent ſome cavalry and huſſars in the front of the enemy's army, ſo as to engage his attention. Some infantry ſhould be placed in the woods, in the rear of theſe troops, in order to ſuſtain them: this calvary and the huſſars ſhould retire in proportion as the advanced guard advances, in order to induce the enemy to believe they are not ſufficiently ſtrong, and that the reaſon of their advancing was only to examine the march of the army. As ſoon as the enemy ſhall have reached the place agreed on by the generals leading columns that are to attack, the body of infantry that is in ambuſcade in the wood, the number of whoſe columns ſhould be regulated according to the ſituation of the country, will march ſilently, and near enough to the enemy, and will charge him with bayonets, without giving him time to recover himſelf: during this attack the cavalry, dragoons, and huſſars, who keep the enemy's front in awe, will charge the troops who have paſſed the wood and ſpread themſelves over the plain. Theſe troops of cavalry muſt be ſuſtained by the infantry which was in their rear in the wood, and which ſhould be furniſhed with cannon. Theſe two attacks, made one after the other, but at ſome ſmall diſtance of time, will render the enemy doubtful with regard to the diſpoſitions he is to make; he will be undetermined where to ſend aſſiſtance, as the cannon which he will hear at the head will induce him to believe that attack the real one: he will fly to that part, and will conſequently weaken the flank, which is deſigned to be attacked by all the infantry. By this diverſion the flank will with greater eaſe be broken through, and the enemy taken in rear: the enemy thus ſurrounded, and finding himſelf between two fires, cannot avoid being beaten.

It is more difficult to form ambuſcades in an open country, particularly for a whole army, unleſs it ſhould find a bank like that at Zero; then the general ſhould conſider whether or not the attack of the army on its march is practicable. If the general by his ſuperiority can, without weakening himſelf, divide his army, and find means to conceal it, he will attempt the attack, provided that each detached body is poſted before the enemy has begun his march, and that they can all join on the firſt order, without a poſſibility of being cut off or finding any obſtacle to prevent their marching up to the enemy: but, in order to a greater certainty of ſucceſs, theſe firſt diſpoſitions being made, great exactneſs in giving, and diligence in the execution of the orders, is neceſſary; each ſeparate body ſhould charge at the ſame time, and at different parts. But as the attack may prove unſucceſsful, whether owing to the good diſpoſition of the enemy, or whether becauſe the attacks were not made together or executed with equal vivacity, it is neceſſary that the general ſhould have provided for a retreat, and that the officers commanding different bodies ſhould know after what manner and from what part it is to begin. For the greater ſecurity, the general officers ought to communicate their inſtructions to the commanding officer of each body compoſing that which they command, ſo that at the time of the attack or of the retreat, they may inſtantly comprehend the meaning of whatever they are ordered to perform.

If the army intending to attack the enemy on his march is weaker, or equal, either in number or in the nature of the troops, it is then only the ſituation of the country, and the facility with which the enemy may be ſurpriſed, that ſhould determine the attempt of this grand enterpriſe: the prudence of the general, his experience; that of the generals who are under his command; the quality of his troops; whether they are well diſciplined or not; whether they are compoſed of one or of many nations; the quality of the troops to be attacked; and, in ſhort, the genius of their general, are circumſtances by which the attacking or not attacking ſhould be decided. It is impoſſible to be deciſive upon theſe circumſtances, which depend entirely upon the ground, upon the vigilance of the enemy's general, upon the order which he cauſes his troops to obſerve in their march, and in ſhort upon the troops under his command. A general, at the head of a well-diſciplined army, compoſed of veterans and good general officers, will undertake and execute deſigns which he would not even dare think of with a new-raiſed army, however numerous: it is alſo very difficult to ſurpriſe a vigilant general, who is beſides a good ſoldier, and who is alſo aſſiſted by the counſels of able and intelligent officers.

Offenſive Operations.

A general ſhould alſo be guided, in attacking the enemy on a march, by the country and the nature of the troops of which his army is compoſed. If the enemy marches through an open country, and the general is equal to him in infantry but ſuperior in cavalry, he ſhould make no heſitation in attacking him; but if the country is woody or mountainous, and the enemy's army is more numerous in cavalry than infantry, the general has ſtill the ſame advantage with a ſuperiority of infantry; becauſe the enemy's cavalry in thoſe kinds of countries is unable to act againſt infantry; and the infantry alſo which the enemy may have will never be ſufficiently ſtrong to maintain itſelf upon the heights againſt forces ſo ſuperior: and if the heights are forced, there can be no doubt of the enemy's being beaten, of his cavalry being ruined and cruſhed to pieces, or that his retreat will be attended with great difficulty, and that he will loſe the greater part, if not the whole, of his army.

Sect. V. *Of the Attack of entrenched Camps.*

The principles of war among all nations and in all times have been ſtill the ſame; but the little experience of the early ages of the world would not permit thoſe principles to unfold themſelves, as they have ſince done, and to which it is owing that new expedients both for attack and defence have been diſcovered.

What a ſenſible difference is there in the military art, ſuch as it at preſent is, compared with that of which the rules are handed down to us by Onozander, Vigetius, the emperor Leo, Frontinus, Ælian, and many others? The towns, in their times, had no other defence than walls, raiſed at a great charge, flanked at little diſtances with towers, and a large ditch in front: it is true that the little force of their weapons contributed much to the advantages of their fortifications. Their entrenched camps had only a large ditch with ſome waggons placed behind it; and whenever the ancients were willing to practiſe all the art at that time known in war, they ſurrounded the camp with walls, in the ſame manner as they did their towns, with towers at little diſtances. Of this kind was Pompey's camp at Dyrachium in Epirus, the plan of which is given in the marſhal de Puyſegur's Art of War: the wall by which it was ſurrounded was 15,000 paces in extent.

The emperor Leo was unacquainted with any other method of entrenching a camp, than by heaping faſcines together, putting trees upon one another, and poſting advanced guards.

The experience which hath been ſince acquired, hath, without increaſing the labour, rendered the works of places ſtronger, and eaſier to be defended: the labour of the en-

Offenſive Operations.

trenchments for camps hath been ſhortened; they have taken a new form; and being conſtructed upon the ſame principles as the fortifications of towns, they are become more difficult to be forced (ſee Part I. ſect. vi.). By this ſame experience the means of attacking them hath been diſcovered; and in proportion as offenſive weapons have changed, and are become more powerful, the ſyſtem of fortification has been new-modelled.

Let an army be ſuppoſed entrenched behind lines where art and nature are both joined; whoſe flanks are ſuſtained and ſecured, furniſhed with troops and artillery along the whole front, with more troops behind to ſuſtain thoſe which line the lines. The general who would attack, ought firſt to ſurvey the ſituation of the lines himſelf, and as much as poſſible the enemy's diſpoſition; he ſhould examine the conſtruction of the lines, how they are ſupported, their extent, and whether the ſoil is firm or light. As ſoon as he ſhall be perfectly acquainted with theſe circumſtances, he may form his plan of attack, and cauſe his army to march in as many columns as there are attacks to be made; but he ſhould endeavour as much as poſſible to occupy the whole front of the enemy, in order to prevent him from ſending aſſiſtance to thoſe places where the attack will be briſkeſt. The head of each column ſhould be well furniſhed with artillery; and as ſoon as it ſhall be within diſtance of cannonading the lines with effect, it ſhould keep up a briſk and continual fire for the ſpace of an hour at leaſt, ſo as to beat down the earth of the parapet, and tumble it into the ditch, which will in ſome meaſure render the paſſage of it leſs difficult for the troops. The time of the attack ſhould be an hour before day, ſo that the cannon may have fired before the enemy ſhall know where to direct his artillery: after every diſcharge, the ſituation of the cannon ſhould be changed either to the right or the left, in order to deceive the enemy's gunners, and prevent their knowing where to direct their pieces. If there ſhould be any height within proper diſtance, the cannon ſhould be planted upon it: if the cannon can be brought to croſs each other upon the lines, the artillery will then have a very great effect.

The infantry ſhould follow the artillery, furniſhed with hurdles, planks, faſcines, pick-axes, and ſhovels; the faſcines will ſerve to fill up the wells, if there are any, before the ditch; or if there are no wells, they will fill up the ditch, and the hurdles will be thrown over them. The cavalry ſhould be formed in two lines in the rear of the infantry, in order to ſuſtain it. The general ſhould endeavour to find ſome ridges, to conceal the cavalry from the enemy; but ſhould there be none, it muſt be placed at ſuch a diſtance, as not to be expoſed to the cannon of the lines; for ſhould it be placed too near, it will very ſoon be deſtroyed, without having it in its power to be of any ſervice. In the beginning of an attack of lines, the cavalry cannot be of any aſſiſtance, and cannot even act till the infantry hath penetrated in ſome part. It would therefore be uſeleſs to cauſe it to advance too near, provided it is within reach of marching readily when the infantry has paſſed, and hath made a paſſage large enough for it, by beating down the lines and filling up the ditch: the cavalry then will have no more to fear from the cannon of the lines, becauſe the enemy's attention will be more engaged with endeavouring to repulſe the infantry, than with firing upon the cavalry. As ſoon as the lines have been beaten down, and the enemy thrown into confuſion, the infantry ſhould march reſolutely and together; and ſhould take care to leave room for the artillery, ſo that it may advance at the ſame time, and continue its fire. The attack ſhould be made by the grenadiers, ſuſtained by the piquets: they will protect the ſoldiers who fill up the wells and the ditch: and as ſoon as they find an opportunity of paſſing, they will endeavour to get over the entrenchments, ſuſtained by the whole infantry of the column, which will then be diſencumbered of the faſcines, hurdles, &c. in order to drive the enemy from his lines. As ſoon as there are ſoldiers enough upon the lines to bear the reſiſtance of the enemy, the ſoldiers who have the ſhovels and pick-axes, and who ought to be laſt, will finiſh the filling up of the ditch by beating down the parapet of the lines, and making an opening ſufficient for the paſſage of a ſquadron in order of battle. Then the whole infantry of the column that has broke through, will paſs and divide into two parts, to let the cavalry paſs, which will form under the cover of the fire of the infantry, and will not attack the enemy's cavalry till it ſhall have collected its whole force together.

Offenſive Operations.

If one of the attacks ſucceeds, on the firſt news, which will ſoon be ſpread throughout the army, all the troops at that time ought briſkly to attack the whole front of the line, in order to employ the enemy, and prevent his ſending aſſiſtance to that part that is forced. The reſerve, which is compoſed of infantry and cavalry, ought to join the troops that have broke through the lines, to ſuſtain the cavalry which is charging that of the enemy, and cannot be ſuſtained by the infantry who paſſed firſt, becauſe it is employed in taking the enemy in flank to the right and left. In this ſituation, when the reſerve and all the cavalry which followed the column that hath paſſed, and to which others may yet be joined ſhall have paſſed, it ſhould attack the enemy; if it is repulſed, it can never be to any great diſtance, becauſe it has infantry behind it, to ſuſtain it, and by its fire to ſtop the enemy. If the lines are forced by many columns, the ſucceſs and alſo the defeat of the enemy will be thereby rendered more certain.

When the duke of Savoy and prince Eugene, ſtill encamped between the town of Pianeza and la Venerie, in 1706, marched to attack the lines of the French army that beſieged Turin, they cauſed their armies to march in eight columns; the infantry formed the advanced guard, the artillery, diſtributed by brigades, marched at the head between the columns, the cavalry was behind in ſix, and out of reach of cannon-ſhot.

The diſpoſition of marſhal de Coigney in 1744, in order to attack the lines of Wiſſembourgh, of which the enemy were in poſſeſſion, was ſimilar to this, except that the whole of his army had not time to get up; but as the moments were precious, he did not wait for it. The army which came from Landau divided itſelf into four which formed the four attacks; one of which was at Wiſſembourg, the other at the mill between that town and the village of Picards, the third at the village of Picards, and the laſt was made above that village, which was entruſted to the Heſſian troops. His cavalry, which was behind, paſſed after the infantry had broke through the lines; but the enemy were then almoſt all either killed or taken, and thoſe who could ſave themſelves, retired to Lautrebourg, where their army had aſſembled after having paſſed the Rhine. It is difficult to determine which is moſt to be admired, whether the general's diſpoſition, the quickneſs and exactneſs of his eye, and his coolneſs in a circumſtance ſo delicate, or the courage of the French troops, who forced theſe lines in leſs than two hours.

As ſoon as the enemy is beat and abandons his lines, he muſt be purſued, but with precaution. The vivacity with which he ſhould be purſued depends upon the order with which he retires: if it is an open country, the general may follow him ſo long as he ſees all clear before him; but if the country is divided with defiles and woods, it would by no means be prudent for him to engage himſelf in them,

for

Offenſive Operations.

for fear of any ambuſcades being placed there by the enemy, in order to ſecure his retreat: nevertheleſs, the general ſhould endeavour to make the moſt of his victory, and ſhould never be content to win a battle by halves; at leaſt it ſhould be carried ſo far as to make the enemy ſenſible of his loſs, and of rendering him incapable of continuing openly in the field.

But if the army that attacks the lines ſhould be unable to force them, after many repeated attacks, and if the general perceives that his troops are diſcouraged, he ſhould immediately retire. If the retreat is made over an open country, he ſhould begin it by marching off the cannon, the infantry next, and the cavalry will form the rear-guard in two or three lines; the huſſars and dragoons will be upon the flanks of the cavalry: if there are any defiles or woods to paſs through, the general ſhould leave ſome infantry at the entrance of them, to ſuſtain and protect the cavalry, which will retreat by files. If the enemy is in full ſtrength, the general ſhould leave ſome field-pieces with the infantry that is poſted at the entrance of the woods and defiles, which will certainly ſtop the enemy's impetuoſity: if, on the contrary, the enemy purſues the army with only a few troops, it will be proper to charge him if he approaches too near. In this diſpoſition an army may retreat eaſily, provided that order is obſerved, and the movements not made with too much precipitation.

Sect. VI. *Of the Attack of a Convoy.*

The ſame motive that ought to oblige a general to practiſe every reſource of art, in order to conduct the eſcort of a convoy in ſafety, ſhould alſo induce him to uſe the ſame expedients to carry off the enemy's ſubſiſtence; for to deprive him of the means of ſubſiſting, is, in reality, to overcome him without fighting.

An advantageous method for attacking a convoy is, by forming three attacks, one real and two falſe. Thoſe attacks are called *real* which the troops make with vigour and in full ſtrength, and when their charging is provided for and determined; the *falſe* ones are when the general's intention is only to keep back the enemy, and prevent his ſending aſſiſtance to the troops that are really attacked.

Theſe attacks, true or falſe, are determined by the ſituation of the country, and in proportion to the degree of eaſe with which the convoy may be turned from the road it is in; that is, if the general ſhould meet with an avenue near the advanced guard, which will draw the enemy ſome diſtance from his main body, and which alſo leads to that of the troops which attack, it is at that part the real attack ſhould be made: if this avenue is found at the rear-guard, the two falſe attacks ſhould be made at the advanced guard and at the centre, ſuppoſing there is an opportunity of attacking the centre. Theſe falſe attacks ought to be ſufficiently numerous in troops, to be able to employ the enemy, without running a hazard of being beaten, and to prevent his ſending aſſiſtance to other parts.

If the troops deſigned to attack the convoy are ſufficiently numerous, although divided into three bodies, to attack every part at the ſame time with equal vigour, the ſucceſs will thereby become more certain. The eſcort of a convoy is often more numerous than the troops which attack it; but it being certainly weakened by the diviſion it is obliged to make in order to guard the whole length of the convoy, the troops which attack have greatly the advantage, although inferior in number, becauſe thoſe which they attack cannot ſend aſſiſtance to the parts attacked, eſpecially if attacked on all ſides.

If the road is wide enough, and there is room for a waggon to turn, the general ſhould rather chooſe to attack the advanced and rear guards than the centre, to prevent the enemy's ſaving any of the waggons belonging to the rear-guard, which will undoubtedly be the caſe, if only the advanced guard and centre are attacked. If the road is ſo narrow that the waggons cannot turn about in order to go back, the general ſhould attack the advanced guard, and employ the centre and rear-guard as much as poſſible.

Offenſive Operations.

A convoy may alſo be attacked at the opening of a defile into a ſmall plain; then it is again the advanced guard that the general ſhould attack, though he ſhould alſo contrive to have the rear-guard attacked at the ſame time. The troops in the centre will be confuſed, and not know where to ſend aſſiſtance, becauſe they will hear firing both in front and rear; nevertheleſs, the general ſhould defer charging till part of the waggons are paſſed, and the troops of the centre are ſtill on this ſide of the defile. An attack, when unforeſeen, briſk, and ſuſtained, can never fail of ſucceeding, particularly when the troops attacked are ſo divided as not to have it in their power to aſſiſt each other; and if the whole convoy is not taken, there is almoſt a certainty of taking a great part of it, or at leaſt of ſetting it on fire, and hamſtringing the horſes, if there is not time to carry them off.

The ſucceſs of theſe attacks partly depends upon the choice of thoſe places where the troops which are to fall upon the convoy are placed in ambuſcade; the moſt ſecure are thoſe which are leaſt liable to the inſpection of the enemy's parties. It is ſufficient to have ſentries upon the tops of the hills, ſo that they may ſee into the roads, and give notice when the convoy is near the place appointed for the attack: then the troops charged with the attack of the rear-guard, having nothing more to apprehend from being diſcovered by the enemy's parties, may draw near the entrances of the avenues.

If the ambuſcade is diſcovered, the conduct which ought to be obſerved by the troops compoſing it depends entirely upon their force and that of the eſcort; nevertheleſs, even when they are weakeſt, the attack ſhould be attempted, which, if unſucceſsful, will at leaſt have retarded the march of a convoy, for want of which the enemy may be greatly diſtreſſed. A general never riſks much in attacking a convoy; the object of the officer commanding the eſcort being to conduct it in ſafety, and to avoid fighting: it is the ſame with the eſcort of a convoy as with a chain of forage, the end of which is only to complete it; and conſequently the troops charged with them will rather be attentive to execute the orders which have been given them, than to purſue the enemy, although beaten and driven back.

When a convoy marches through an open country, there ſhould be many ambuſcades formed: an enemy is leſs apprehenſive in an open country, becauſe, ſeeing all before him, his ſearches become the leſs exact, in proportion as the country is unfavourable for troops to form ambuſcades; nevertheleſs, a general may always find ſome hollows, heights, or places of the ſame nature, where troops may be concealed. As ſoon as the convoy ſhall be arrived at the place fixed on for the attack, the general ſhould fall upon the advanced and rear-guards, in order to take in the whole, and to induce, if poſſible, the troops in the centre to divide themſelves, to run to their aſſiſtance; then the third ambuſcade muſt ſhow itſelf, and attack the centre; and endeavour to divide the convoy, before the commandant of the eſcort has had time either to park it or double it up. If the general ſucceeds in dividing the convoy, and if the troops in the centre of the eſcort are beaten and broke, he ſhould detach ſome infantry, cavalry, and huſſars in purſuit of them: the remainder muſt be divided into two parts, in or-

Offenſive Operations.

der to attack the troops lining the convoy; after which they muſt join thoſe who attack the advanced and rear-guards. The troops, when re-united, ought to make this attack with vigour, and entirely determine the defeat of the eſcort, and conſequently the taking of the convoy.

A convoy that is divided is half taken, as ſoon as the detachment of the centre is beaten; becauſe the victorious troops can be divided, and part ſent in purſuit of the body that is beaten, and the other part employed to reinforce thoſe who ſtill meet with reſiſtance; whereas, if only one part is attacked, that which is not attacked can readily ſend aſſiſtance, eſpecially in an open country, where there is nothing to prevent either cavalry or infantry from acting, and being a mutual aſſiſtance to each other.

A general who would attack a convoy never runs any hazard by dividing his troops, in order to divide thoſe of the enemy: the more the troops of an eſcort are divided, with the greater eaſe will they be beaten. An officer who would attack, ſhould know the ſtrength of the eſcort, in order to regulate the number of his troops by the enemy's, and to be proportionably ſtronger. He who is attacked, being ignorant of his enemy's force, and being charged on all ſides, is at a loſs where to ſend aſſiſtance, and how to take care of every part: he who attacks by the knowledge he ſhould have of the country, is enabled to poſt his troops after ſuch a manner as to employ all thoſe belonging to the enemy, without weakening himſelf. The troops which attack have certainly great advantages, becauſe, in dividing them, they are ſtill ſtronger than the body attacked; and then they can chooſe the place moſt favourable for the attack: whatever may be the precautions taken by the officer commanding the eſcort, whatever may be his vigilance, it will be very difficult for him, conſidering theſe different attacks and the number of the enemy's troops, to diſpoſe his own with ſufficient quickneſs to place the convoy in ſecurity, eſpecially if the attack is made with great quickneſs and vigour.

When a convoy is to be attacked as it paſſes a bridge, the commanding officer ſhould divide his troops into three bodies, placing two of them in ambuſcade on that ſide of the bridge to which the convoy is advancing, and the third on the ſide from which it is marching. All the three bodies ſhould remain concealed, if poſſible, till the advanced guard of the convoy, the body at the centre, and ſome of the waggons, have paſſed the bridge; when they ſhould inſtantly advance and attack, each that diviſion of the convoy properly oppoſed to it. Three ſuch attacks, made at the ſame time by ſuperior force, will have the whole advantage of the action; and the more ſo as the troops of the eſcort being everywhere employed, cannot ſend aſſiſtance to any particular part. If the two bodies which attacked the advanced guard and the centre ſhould break them and put them to flight, there ſhould be troops enough left in purſuit of them to finiſh their entire defeat, without any fear of being repulſed; the remainder ought to march to the bridge, and cauſe the waggons that are upon it to be ranged in order, and march to the rear-guard, in order to finiſh its defeat, if it ſtill continues to make reſiſtance.

It is neceſſary to obſerve, that ſome troops ought to be left at the head and along the convoy, in order to take care that the horſes are not taken off from the waggons, and that none of the ſoldiers or drivers make uſe of that method to eſcape.

If the general has not troops ſufficient to be divided into three bodies, he can place ambuſcades to attack only the advanced guard and the centre. This muſt be done with vigour, but not till the troops of the centre ſhall have paſſed; and the attack ſhould always be executed by the infantry with the bayonets fixed, and without firing, and by the cavalry, huſſars, and dragoons, ſword in hand. The general ſhould not then ſtay to make priſoners; but ſhould put to death all thoſe whom he finds armed. If the two firſt detachments are beaten, he ſhould march with the remainder to the rear-guard, which, not being ſtrong enough to reſiſt a body of troops much more numerous, will undoubtedly betake itſelf to a retreat. As it is the convoy, and not the troops of the eſcort, that is the principal object, the general ſhould leave only ſome troops of huſſars to purſue the rear-guard; he ſhould make the waggons file off as faſt as poſſible, and conduct them the neareſt way to the camp or the neighbouring town; or if this cannot be done, he muſt burn them and carry away the horſes.

Offenſive Operations.

Sect. VI. *Of the Attack of green and dry Forages.*

Next to the convoys, the forages become moſt neceſſary for the ſubſiſtence of an army, as it is by them that the cavalry is ſupported; and if a general can contrive to deprive the enemy of them, or to moleſt him in the making of them, his cavalry will ſoon be without reſource, his infantry without baggage, and his artillery without the means of being conveyed.

The detachment deſtined to attack a party on a green forage, made in an open country, ſhould be compoſed of infantry, cavalry, and huſſars: the infantry ſhould not appear, but ought to remain in ambuſcade in ſome hollows, behind ſome hedges, or other favourable places: and it ſhould be careful not to ſhow its arms; becauſe, by the glittering of the ſteel, they may be diſcovered: the cavalry ſhould be divided into two bodies, three quarters of a league one from the other, taking care to be able to join in caſe of neceſſity. As for the huſſars, they ſhould be diſtributed about in many ſmall detachments to the right and left, and in the centre of the two bodies of cavalry; upon one of the flanks there ſhould be a more numerous body of huſſars placed in ambuſh, at a greater diſtance than the ſmall detachments. Every one of thoſe ſmall troops ſhould have a number of trumpets with them; and when the chain is formed, and the foragers ſpread over the plain, a part of theſe detachments ſhould leave the ambuſcades, making a great noiſe, and attack thoſe belonging to the enemy which are advanced; and theſe detachments will charge them with ſo much the more vigour, as they will be ſuſtained by the large body of huſſars in ambuſcade behind them, and which ſhould march to ſuſtain them, and attract the attention of the officer commanding the eſcort. It may happen that this firſt attack, made on one ſide only, may induce the enemy to unfurniſh the chain in ſome place, by which it will conſequently be weakened; and if ſo the other detachment of huſſars ſhall inſtantly advance, followed by one of the bodies of cavalry, in order to attack that part that has been unfurniſhed. If the enemy, more prudent, does not weaken the chain in any particular part, but contents himſelf with making the reſerve march to the aſſiſtance of the troops which have been attacked, the ſecond attack ought always to take place; but in order to employ the enemy everywhere, the ſecond body of cavalry ſhould march and attack the centre. This attack ought to be made with great briſkneſs ſword in hand, whether the enterpriſe ſucceed or not; if it ſucceed, a great advantage may be drawn from the rout of the chain. Whilſt the cavalry and part of the huſſars are purſuing the troops of the chain, the other part ſhould fall upon the foragers, where they will without doubt find but little reſiſtance. If the attack do not ſucceed, and that, by the good diſpoſition of the troops of the chain, the detachment has not been able to force it, it ſhould retire to the infantry that has remained

Offenſive Operations.

mained behind in ambuſcade; this infantry will facilitate the retreat of the cavalry and huſſars. But ſuppoſe that the enemy, too eager, is carried away by this firſt ſucceſs, a great advantage may be derived from his imprudence, by attacking him reſolutely. The whole ſtrength, and each body being united, it is to be imagined, and even hoped, that the advantage will turn on the ſide of thoſe troops which were repulſed but a moment before; and the more ſo, as the general commanding the chain can have purſued only with his cavalry, his huſſars, and dragoons; becauſe his infantry will have remained in the poſts which it occupied, either to guard them, or to ſuſtain the horſe, ſuppoſing they ſhould be repulſed.

If the forage is made in a mountainous country, the infantry muſt act alone, the cavalry being only neceſſary when it can have ground on which to act, and ſuſtain the infantry in caſe it is repulſed: the infantry ſhould attack the avenues and the heights, and poſſeſs itſelf, as much as poſſible, of thoſe which have the greateſt command, and make the attack in many places as in an open country. Theſe different attacks render the enemy undetermined with regard to his diſpoſitions; he does not know where to ſend aſſiſtance: the uncertainty of the general becomes viſible to every officer, and communicates itſelf to all the troops; and thence proceeds their confuſion, and conſequently their defeat.

The priſoners and horſes that have been taken ſhould be ſent off firſt with an eſcort; the reſt of the troops will retire immediately after by the ſhorteſt road. It is cruelty to abandon the wounded, whether friends or enemies; and as the detachment has undoubtedly found, within the circumference of the chain, ſome waggons with horſes to them, they ſhould be made uſe of to carry off the wounded, who ſhould alſo be ſent on before: if there are no waggons, the detachment muſt take them from the neighbouring towns.

The attack of a dry forage is conducted nearly in the ſame manner as that of a green one; but it is often neceſſary to employ a greater number of troops; becauſe, as the forage is made in the villages, it is almoſt a certainty they will all be guarded by infantry ſuſtained by cavalry; whereas the chain of green forage is formed with a much greater number of cavalry than infantry, unleſs it ſhould be in a country where cavalry cannot act. It is difficult to force the villages where infantry is ſuſtained by cavalry; whereas it is eaſy for cavalry to attack each other in a plain, where the affair is immediately determined; but it is not ſo ſoon decided when entrenched infantry is attacked by infantry: but whatever reſiſtance a commander may find, he ſhould always attempt to force it. As the principal object is to prevent the forage, it is obtained by attacking the chain briſkly and in all parts; becauſe it is certain that the general commanding the forage will cauſe the foragers to aſſemble; or elſe, ſeeing the chain attacked, without waiting for an order, they will of their own accord diſmiſs, and fly toward the camp: but whether they aſſemble, retire in order, or ſhift for themſelves, the end is anſwered, and the forage is left unperformed. If by their flight the commander cannot hope to make any priſoners, he muſt keep the troops of the chain at bay ſuch a length of time as to make it impoſſible to continue the forage for that day: he ſhould even if poſſible endeavour to force them to retire; which if they do, he ſhould purſue them long enough to be certain of their retreat, and then collect all the waggons from the neighbouring villages, cauſe them to be loaded with the forage intended for the enemy's army, and conduct it to the camp: if they do not retire, the commander muſt remain in ſight of them during the night, and ſend to the camp to demand a reinforcement of troops, in order to oblige the enemy to retire. For the ſame reaſon that a forage ſhould not be abandoned till the laſt extremity, the troops that would prevent the enemy from attacking it, ſhould be abſolutely bent upon it, at the ſame time without expoſing themſelves to the danger of being beat by any aſſiſtance that may come from the camp to the troops belonging to the chain.

Offenſive Operations.

Sect. XI. *Of the Paſſage of Rivers.*

There is hardly an operation of war more difficult than the paſſage of rivers, whilſt war cannot be carried on in countries where there are not rivers to be paſſed.

Rivers may be paſſed by ſwimming, by fording, or upon bridges; but ſmall bodies alone can paſs with ſafety by ſwimming, and, unleſs the ſtream be very ſhallow, none but the cavalry ſhould paſs at a ford; for it is ſurely much better to throw over a bridge or two, than to expoſe the infantry to the fatigue of wading through a deep current, or the artillery and baggage to the danger of being damaged by water. When a ford is diſcovered and intended to be made uſe of, it ſhould be ſecured in every part, and the ſoldiers employed for that purpoſe ſhould be furniſhed with proper inſtruments to clear the bottom of every thing which may retard the paſſage. Its banks ſhould likewiſe be examined, that it may be known whether they are of difficult or eaſy acceſs, and whether the ground on the other ſide be marſhy, or ſuch as will permit the troops to form immediately on their landing. When bridges are to be built for the paſſage of the army, they muſt be laid upon boats, pontons, piles, or wooden horses (ſee theſe articles); or in ſome caſes rafts may be employed inſtead of them; and when a general is furniſhed with theſe neceſſaries, he will paſs the largeſt river, in the abſence of the enemy, without difficulty or the loſs of a man.

It is not, however, to be ſuppoſed that the enemy will be abſent. When a country is invaded, the army that is defending it will endeavour to meet the invaders with the greateſt advantage; and as in the paſſage of rivers the advantage is wholly on the ſide of the defenſive army, the general commanding it ſhould there, if poſſible, oppoſe the enemies of his country. We ſhall therefore, in this ſection, treat *1ſt*, Of the defence neceſſary to be made for oppoſing the enemy, and preventing his paſſage; *2dly*, Of the means which a general ſhould employ in order to facilitate the paſſage, notwithſtanding the enemy's oppoſition; and *3dly*, We ſhall demonſtrate by facts the ſecureſt method of retreating.

I. It would be impoſſible to run through every precaution that can be taken to diſpute the paſſage of a river; we ſhall therefore confine ourſelves to the principal ones, by a ſuccinct relation of the different ſyſtems of the authors who have treated on that ſubject.

The firſt precaution to be taken, according to the chevalier de Folard, is, to draw off all the boats which are upon the river; to obſerve whether any other river has a communication with it: to examine the courſe, the windings, and the moſt acceſſible parts of it; to raiſe good redoubts near the banks; to render the bottom uneven by means of ſacks and baſkets filled with ſtones, large trees with their branches, and by ſtopping them with ſtakes.

To this precaution may be alſo added another, which, executed with exactneſs, may produce great effects; that is, to throw whole trees with their branches into the river, not ſo heavy as to ſink to the bottom, but whoſe ſize and quantity ſhall be ſo conſiderable as not to be eaſily ſtopped; their branches ſhould alſo be interwoven, and formed like a chain from one bank to the other; they ſhould be held faſt till the enemy's army is engaged in the fords or upon the

Offenſive Operations.

bridges, at which time they ſhould be let into the current, the quickneſs of which will increaſe the force of this kind of moving bank, which will overturn every thing it meets with, ſoldiers, baggage, horſes, bridges, and boats: in ſhort, nothing will be capable of withſtanding it, if there is any degree of rapidity in the torrent. This method is pointed out in M. de Puyſegur as levelled againſt bridges only. To avoid alſo giving any ſuſpicion to the enemy, this chain of trees can be placed upon the bank of the river, of which ſome engineer muſt have been careful to take the dimenſions before-hand; and when it ſhall be nearly the ſame ſize of the river, and the enemy is paſſing, it muſt be held at one end whilſt it is ſhoved off by the other; the whole of it will be taken by the current, which, without any other aſſiſtance, will direct it againſt the enemy.

In regard to the troops deſigned for the defence, the beſt method, according to M. Folard, is to form ſmall camps of 2000 or 3000 men, a league diſtant one from another, with patroles and ſignals from one to another; to have canoes, in order that the river may be croſſed ſilently in the night by ſoldiers, who will endeavour to make ſome priſoners, and who will alſo liſten in order to diſcover whether the enemy is preparing to march. A general ſhould particularly endeavour to poſſeſs himſelf of the iſlands, if any, under cover of which the enemy may attempt the paſſage; and if the general can be certain that the enemy's intention is to throw over a bridge where they are, in order to ſet out from thence, to ſave ſo much of the way, the general will by this means aſſure himſelf of the place where the enemy will attempt the paſſage, which circumſtance will be almoſt ſufficient to prevent him.

But in order the better to explain the manner in which a river ſhould be defended, let two armies be ſuppoſed, one of which, conſiſting of 40,000 men, defends the paſſage againſt another of 60,000. This laſt is divided into three bodies; that of the centre conſiſts of 40,000 men, and the two others of 10,000 each: the centre-body is encamped nearly oppoſite to the place where the paſſage is intended to be effected; of the two bodies which are upon the flanks of the centre, one will ſerve to keep the enemy in ſuſpence, with relation to the true place where the paſſage is deſigned. They ought to be continually moving, ſometimes at a diſtance from the main body of the army, and pretend to throw bridges higher up, or lower down, in order to induce the enemy to divide and ſeparate the different bodies of his army in ſuch a manner, that they can no longer be of aſſiſtance to each other, or be in a condition of oppoſing a ſuperior body of troops that may attempt the paſſage.

The army defending the paſſage is divided into many bodies; three of 10,000 men each, at a league diſtance from one another, and two others of 5000 men each, compoſed of the light troops, both horſe and foot, and dragoons, encamped at half a league upon the two flanks of the army. The communication ſhould be preſerved between each ſeparate body, and conſtant patroles kept upon the ſide of the river, which ought continually to croſs each other; and detachments of huſſars upon the right and the left, both up and down the river: the general is alſo ſuppoſed to have planted batteries of cannon, in different parts upon the ſhore; and to be poſſeſſed of two iſlands which he has fortified, and in which he has alſo placed troops and cannon: in ſhort, he is ſuppoſed to have taken every advantage of ground for rendering the paſſage difficult to the enemy, and to oppoſe troops to him in every part where he may attempt it.

See Plate DXIX. fig. 1. where A repreſents the camp of the main army, divided into three parts, for the defence of the river. B, The camp of the light horſe, light infantry, and dragoons upon the wings of the army. C, Caſtle and village, guarded by light infantry. D, A town occupied by the infantry belonging to the army. E, Bridge broken down. F, Iſlands occupied by infantry. G, Poſts of infantry diſtributed along the ſide of the river. H, Batteries eſtabliſhed along the ſide of the river. I, Poſts of cavalry, to keep up the communication between the camps. K, Bridges conſtructed to preſerve the communication of the iſlands. L, Bridges conſtructed for the communication of the camps.

Offenſive Operations.

If, notwithſtanding all theſe obſtacles, the enemy attempts the paſſage, he ſhould be attacked as he debarks; and it is for this reaſon that the defending army ſhould not be divided into very ſmall bodies, which, too weak to reſiſt a ſuperior number, will be eaſily routed. In attacking the enemy, there is no danger to be feared from their cannon, which they cannot make uſe of without annoying their own troops; whereas the cannon planted upon the ſide of the river, to defend the paſſage, can always fire upon the troops which follow, in order to ſuſtain thoſe who attempt the paſſage: there ſhould alſo be infantry placed near theſe batteries, to defend them, and to flank ſuch of the enemy as have already paſſed.

There yet remain many ſtratagems to be practiſed on theſe occaſions: a general may make uſe of thoſe mentioned in the ſection which treats of ambuſcades; and they ſhould be particularly directed againſt ſuch places as are ſuppoſed to be moſt favourable for the enemy. The hiſtory of prince Eugene, whom the chevalier Folard ſtyles a great traverſer of rivers, furniſhes many examples.

The general ſhould be particularly attentive in diſturbing the enemy when conſtructing his bridges; which appears the more practicable, as the bridge is never properly eſtabliſhed, if not guarded at each end: beſides, by the aſſiſtance of artillery, the enemy may be eaſily prevented from going on with his work. M. Feuquieres indeed relates examples, where the enemy hath not been able to prevent the bridges from being built under their very noſes; but beſides the rarity of theſe examples, the precautions he uſed are a very convincing proof of the difficulty attending ſuch undertakings.

A prudent general, and one who is himſelf acquainted with the river of which the enemy would attempt the paſſage, is guided by its depth, by the difficulty of gaining its banks, and in proportion to its rapidity: he often pretends to be inactive, permits the enemy to throw his bridges over it, and waits till he is in the middle of his paſſage; at which time he makes a furious fire upon him, ſpreads diſorder amongſt his troops, and overthrows his ranks; and the enemy, beſides loſing a great number of men, alſo fails in the ſucceſs of his enterpriſe.

II. With reſpect to the means to be employed for paſſing a river in the face of the enemy, it is to be obſerved, that the general who attempts ſuch a paſſage, ought, in the firſt place, to be very certain of the ſteadineſs of his troops. He ſhould place the moſt intrepid in the front, in order to encourage thoſe who follow them: on ſuch occaſions every thing is to be apprehended from ill-diſciplined troops, who, as ſoon as they are engaged in the river or upon the bridges, having no longer any place of refuge to fly to, will be diſcouraged, and ſpread the panic throughout the whole army.

If the army paſſes upon two bridges, it is impoſſible to take too much care for their ſecurity: hiſtory is filled with fatal examples of bridges falling under the weight of troops. One of the greateſt dangers ever experienced by Charles XII, was when, having cauſed a bridge to be

Offenſive Operations.

thrown acroſs the Viſtula, the wood which had been made uſe of being too weak, and the timber-work ill ſecured, the bridge broke down whilſt the king was paſſing. Charles, the prince of Wirtemberg, and many others, fell into the water: the king, having caught hold of a piece of the timber that was floating, was carried away by the current. The troops which had already paſſed found themſelves at the enemy's mercy, who might have deſtroyed them; but they did nothing, ſays the hiſtorian Nordberg, becauſe of the heights of which the Swedes were in poſſeſſion, and from whence they kept a fire upon the Saxons. Was it not rather an inſtance of the good fortune which uſually attended that intrepid prince?

It is probable, when a river is paſſed upon bridges in preſence of the enemy, that they have been built before his arrival, and conſequently there has been time to entrench them at each end, but particularly on that ſide next the enemy. Theſe entrenchments ſhould be made in ſuch a manner as to prevent the bridges from being flanked by the enemy's cannon; therefore, inſtead of the entrenchments uſual at the heads of the bridge, ſuch as a horn-work, a crown-work, or a half-moon, the general ſhould cauſe redoubts to be thrown up, the fartheſt of which ſhould be 400 yards diſtance, and oppoſite to the bridge; and the others ſhould be thrown up nearer to the banks of the river, forming a ſemicircle: in order for their better defence, the general ſhould follow the ſame diſpoſitions which have been laid down in the preceding part. If there are many bridges, they ſhould be conſtructed as near each other as poſſible, that the ſame redoubts may equally ſerve to cover them: the reaſon of theſe redoubts being placed at a diſtance from the bridges is, that, as the troops paſs, they may have room to form, and ſuſtain thoſe occupying the redoubts. Theſe redoubts it muſt be acknowledged, require a greater degree of labour than is requiſite for the conſtruction of a half-moon, or even a crown-work; but it ſeems impoſſible to paſs a river upon bridges in preſence of an enemy, however ſtrongly they may be entrenched, if there is not ſpace enough left between the entrenchments and the bridges to contain a number of troops ſufficient to oppoſe the enemy, and to give time for the remainder of the army to paſs. Labour ſhould never be conſidered when an enterpriſe is ſucceſsful; a general, therefore, ſhould never ſpare any pains for the attainment of his ends, but ſhould take every precaution neceſſary for ſucceſs, without troubling himſelf about the time and the labour it will coſt: the glory of having forced the enemy to leave the paſſage open to him makes ſufficient amends for the trouble he has given himſelf in order to attain it.

Suppoſe an army of 60,000 men would paſs a river, guarded by an army of 40,000. Let it alſo be ſuppoſed, that the army intending to paſs has got the ſtart of the enemy, either becauſe he was not yet arrived, or becauſe he has been amuſed with marches and counter marches; that the general has alſo had time to conſtruct three bridges, and to entrench them in the manner above-mentioned: he muſt begin the paſſage by cauſing the redoubts to be occupied by a battalion, or half a battalion, according to their ſize; and he muſt plant cannon between thoſe redoubts, with infantry to guard them. Theſe diſpoſitions being made, the army muſt march in three columns; the centre column muſt be entirely infantry, and the other two compoſed of infantry and cavalry. As the infantry paſſes the bridges, it muſt divide, and form columns, conſiſting of four battalions each, which muſt paſs between the redoubts, having cannon upon their flanks: the cavalry muſt paſs to the right and left through the interval of the two redoubts neareſt the river, and form in order of battle upon the flanks of the columns; the right wing with its right towards the river, and the left with its left. When all theſe columns ſhall be formed, and ready to march towards the enemy, the right and left of the two lines of cavalry muſt ſuſtain it; and the right of thoſe of the right, as well as the left of thoſe of the left, will march to put themſelves in a line in preſence of the enemy: in this poſition the army muſt march towards the enemy, and attack him, if he is ſo raſh as to hazard an action; and if he ſhould retire before the army is entirely paſſed, the paſſage will be the more eaſily effected.

Offenſive Operations.

See Plate DXIX. fig. 2, where AAA are bridges of boats. B, Redoubts which cover the bridges. C, A battery, under cover of which the infantry work at the conſtruction of the redoubts. D, A battery to prevent the enemy from annoying the army on its march. E, The march of the army. F, The artillery diſtributed among the brigades of infantry. G, Infantry, forming in columns to open on the oppoſite ſide through the intervals of the redoubts. H, March of the columns into the front of the redoubts, where they halt in order to give time for a part of the cavalry to form upon its flanks. I, A battery erected to facilitate the forming of the cavalry. K, Cavalry, which, in gaining the oppoſite ſhore, forms in order of battle and poſts itſelf upon the flanks of the infantry. L, Eight battalions in column upon the right wing of the army, to go and examine the village, and attack the enemy in it, in caſe he ſhould be poſſeſſed of it. M, Huſſars and dragoons, who have taken poſſeſſion of the height which is on the left wing of the army. N, A brigade of infantry poſted next the height, covering the left wing of the cavalry. O, The diſpoſition of the army marching up to the enemy.

From this diſpoſition it appears, that the army which attempts the paſſage is almoſt certain of ſucceeding; it is ſheltered behind the redoubts during the paſſage of the bridges; it has ground to form itſelf upon, and to ſhow itſelf in full ſtrength. But it is ſeldom that a general has time to build the bridges and entrench them after this manner, when the enemy is on the oppoſite ſide with an intention of diſputing the paſſage: ſo circumſtanced, he muſt endeavour to find ſome fords, and, under ſhelter of one or more iſlands, conſtruct a number of rafts behind them; he muſt endeavour to keep the enemy at a diſtance from thoſe places by marches and counter marches; and when that is done, he muſt cauſe the cavalry to ford over with grenadiers and labourers behind them; theſe labourers muſt throw up entrenchments as faſt as they can, whilſt freſh infantry is cauſed to paſs over upon rafts. Provided theſe entrenchments can ſtop the enemy for ſome time, and contain infantry enough to reſiſt him, the remainder of the army will be very ſoon paſſed: the cavalry will at the ſame time paſs at the fords which have been diſcovered, in order to cover the flanks of the infantry; when it will ſpread over the plain, being itſelf protected by the infantry, as it leaves the entrenchments in columns.

The paſſage of a river cannot be ſafely attempted, if the general does not provide for a defence, and take infinite precautions to protect the army in its paſſage.

All that authors have ſaid upon this ſubject, ariſes from this principle of Vegetius, which they ſeem to have commented upon, and to which they have applied different examples. "As the enemy (ſays he) are accuſtomed to form ambuſcades, or to attack openly at the paſſage of rivers, the general ſhould poſſeſs himſelf beforehand of a good poſt on the oppoſite ſide, and entrench himſelf even on that on which he already is, to hinder the enemy from attacking his troops, ſeparated by the channel of the river; and ſtill, in order for greater ſecurity, the general ſhould cauſe the two poſts to be entrenched and well palliſadoed, that in caſe of

Offenſive Operations.

an attack, he may be able to ſuſtain the efforts of the enemy without great loſs."

It may not be improper, in this place, to relate a diſpoſition of M. de Valiere's, formed upon this principle.

He ſays, "After the cannon are planted, a parapet ſhould be raiſed upon the banks of the river, 200 yards in length or thereabouts, behind which ſome infantry ſhould be immediately launched from the centre of the parapet, and ſome ſoldiers with labourers ſent over, who muſt immediately erect a ſmall half-moon: as ſoon as that is done, more ſoldiers ſhould be ſent in order to defend it in caſe it ſhould be attacked; more labourers ſhould alſo be ſent to erect another half-moon, both upon the right and the left.

"If the labourers are not annoyed by the enemy, they ſhould at the ſame time erect an horn-work, whoſe wings ſhould be flanked by the firſt parapet, and the cannon planted in it; if the river is ſo large that the wing of the horn-work cannot be defended by muſquetry, it muſt be defended from the half-moon, made from thence to the water."

In the mean time, the general ſhould cauſe the bridge to be continually worked at; and, as ſoon as it is finiſhed, make the troops paſs over it, if the enemy is not in ſight; but if he is, the horn-work muſt be completed, to prevent the enemy from falling upon the troops as they paſs. The horn-work being made as ſtrong as is judged neceſſary, as much infantry as it will hold ſhould be lodged in it, with ſome field-pieces; and as the cannon upon the riſing will keep the enemy at a diſtance, the general may order the cavalry to paſs: but ſtill all this cannot be effected but before an army very inferior. If the enemy's army is of ſuperior force, the ſafeſt method is to try a paſſage at ſome farther diſtance, ſtill keeping the army in ſight as long as poſſible, and concealing from the enemy that any troops have been detached.

It is impoſſible to foreſee every ſtratagem that may be employed, as they depend upon many circumſtances; but it is always right to ſend, if poſſible, ſome truſty ſpy to diſcover the enemy's poſition on the other ſide of the river, what obſtacles he can place in the paſſage, what methods are to be uſed to avoid them, and what parts of the bank are moſt acceſſible or beſt guarded.

A general ſhould make many falſe attempts, particularly at thoſe parts where he leaſt intends paſſing; they ſhould be made as ſecretly as poſſible; and alſo, in order to deceive the enemy, the general may throw over two or three bridges at hazard, in ſight of the enemy, at thoſe very places where he has reſolved not to paſs: the enemy's whole attention will be directed to that ſide; and a conſtant fire ſhould be made on him from the other ſide, ſo that he may not be miſtruſtful of the ſtratagem. There is no doubt of theſe bridges being taken, which is of no conſequence, provided the enemy is amuſed, and the general has time to throw over another bridge at a diſtance from that place, by which he can paſs.

We cannot pretend to recapitulate every ſtratagem which a general may practiſe: in the hiſtories of prince Eugene and Charles XII. the reader may ſee the different methods which they made uſe of; it will be ſufficient here to relate the rules laid down by Montecuculi, with ſome modern examples, by which they ſeem to be corroborated.

1. The general muſt plant artillery upon the bank oppoſite to the poſt he intends taking; which will be attended with great advantage, if the river forms a re-entering angle, and if there is any ford near it. 2. In proportion as the conſtruction of the bridge advances, he ſhould poſt ſome infantry upon it, in order to keep a fire upon the oppoſite ſhore. 3. When the bridge is completed, he muſt cauſe a body of infantry, ſome cavalry, ſome field-pieces, and ſome pioneers, to paſs it, in order to fortify the head of the bridge on the other ſide. 4. The general muſt take great care that the enemy has not poſted armed barks, or other machines, to break down the bridge when half the army ſhall be paſſed. 5. If the general would preſerve the bridge, he muſt fortify it at both ends, and place ſufficient guards in it.

Offenſive Operations.

In 1743, prince Charles intending to paſs the Rhine, kept a continual fire upon all the French poſts from 11 o'clock at night till three in the morning, in order to conceal his real deſign with regard to the paſſage. Marſhal de Coigny aſſembled his army in three large bodies, and lay all night upon his arms, the only prudent ſtep he could take on that occaſion. By this diſpoſition he found himſelf in a condition of tranſporting himſelf oppoſite to the iſle of Raignac, of which the enemy was in poſſeſſion; and it is well known that they ended the campaign there, without being able to penetrate into Alſace.

The number of columns ought to be regulated by the breadth of the ford, or by the number of bridges that are eſtabliſhed.

The third of June 1747, at day-break, the army commanded by M. de Belleiſle paſſed the Var in five columns. This paſſage was effected without any reſiſtance on the part of the enemy, and M. Belleiſle had 15 men drowned, although there was a chain formed of peaſants, acquainted with the fords, to direct the march of the columns, and to aſſiſt the ſoldiers who were carried away by the rapidity of the current.

III. All paſſages of this nature, whether in a march, in defence, or for an attack, may be foreſeen. A general may, at a diſtance, make all the preparations neceſſary for theſe operations; he may anticipate or foreſee the diſpoſitions of the enemy: in regard to a retreat it is otherwiſe; for although it may have been provided for, a general cannot be certain whether it can be effected after the manner he hath intended; beſides, he muſt, in a retreat, unite all the different diſpoſitions already mentioned: the leaſt negligence becomes irreparable, and gives the enemy a very great advantage. A moment loſt, a movement diſcovered, may alſo be the cauſe of a rout, and render the retreat impoſſible, or at leaſt very bloody; therefore if a general, in theſe circumſtances, has not a perfect knowledge of the river he has to paſs, if he has not been careful to preſerve the bridges, or to keep the materials and inſtruments proper for the throwing over of new ones, he will be unable to paſs in ſight of the enemy. Xenophon's retreat with the 10,000 Greeks, furniſhes examples of the paſſages of rivers, which a general ſhould always have preſent to his view. What prudence, what activity in ſounding the fords himſelf whenever he met with any ſtream or river to be croſſed! What orders to prevent confuſion among his troops, and what ſtratagems to avoid being repulſed!

If a general is certain of returning by the ſame place at which he has formerly paſſed, the beſt way would be, as Vigetius ſays, to have the bridges guarded, and to erect a fort with large ditches at the head of each, for their ſecurity, and to place troops in it to guard the bridges and the paſſage, as long as ſhall be thought neceſſary.

Thus circumſtanced, a general ſhould entrench the heads of the bridges in the manner already directed: and that the troops may paſs the bridges without confuſion, according as one brigade of infantry ſhall enter the circle formed by the redoubts, another ſhall paſs the bridge, and that which enters ſhall take poſſeſſion of the poſts which that which paſſes occupied; he muſt be careful to eſtabliſh batteries of cannon to the right and the left, on the other ſide of the river, to flank the redoubts, and defend the approach to them;

Offenſive Operations.

ſo that when the whole army ſhall have paſſed, the troops who occupy the redoubts may retire with eaſe. The cavalry will paſs the bridges without ſtopping behind the redoubts.

In a retreat of this kind, the infantry ſhould march in column, and the cavalry in order of battle, upon the flanks of the infantry. Before the march is begun, ſome troops muſt be ſent to occupy the redoubts; and as ſoon as they ſhall be in poſſeſſion of them, the army will put itſelf in march, and proceed towards them. The cavalry of the right muſt paſs over the bridge neareſt to it, and that of the left will do the ſame. The columns of infantry muſt enter by the ſpaces which are between each redoubt; the grenadiers and the piquets muſt remain, in order to ſuſtain the troops occupying the redoubts: ſome pieces of cannon ſhould alſo be left to fire upon the enemy in caſe he ſhould approach too near; the columns muſt paſs over the three bridges; the grenadiers and the piquets muſt alſo draw near the head of the bridges at night-fall; the troops occupying the redoubts muſt quit them ſilently, and paſs the bridges; they muſt be followed by the cannon that has been left during the day; the grenadiers muſt paſs laſt of all; after they are paſſed, the bridges muſt be broken down. This may be eaſily executed, provided order and ſilence are preſerved; but if the enemy entertains the leaſt ſuſpicion of the redoubts being abandoned, he will come in full ſtrength to attack the troops ſtill remaining on that ſide. Theſe troops, too weak to reſiſt a ſuperior number, cannot avoid being beaten, ſlaughtered, or drowned, the cannon taken, and the bridges burnt.

For greater ſecurity, the grenadiers and the piquets may be furniſhed with chevaux-de-friſe, which will make an entrenchment, till the troops which occupied the redoubts are retired. A retreat never merits the epithet of *fine*, except it is performed with order, and with the loſs of as few brave men as poſſible, to ſave the reſt of the army.

In every enterpriſe formed by a general in difficult places he muſt, according to M. de la Valiere, provide for his retreat. In retreats of all kinds, adds the duke of Rohan, a general cannot be too attentive to render it ſafe, and to avoid diſorder: when it is the effect of his own choice, it ought to be made ſo early, and ſo expeditiouſly, that he may not be under a neceſſity of fighting.

During the paſſage of a river, or even after a general has paſſed it, if he ſhould be repulſed, the retreat becomes very difficult, and cannot be performed without great loſs; it is for that reaſon that many generals, who have been miſtruſtful of the firmneſs of their troops, have burnt their ſhips in the port, in order to animate them to victory, from conſidering the impoſſibility of retreating.

The following retreats by M. Saxe acroſs rivers, will give the reader ſome notion how ſuch enterpriſes ſhould be conducted.

In the campaign of 1742, the diſpoſition of that commander for paſſing the Danube owed its whole ſucceſs to ſecrecy, to his addreſs in profiting by circumſtances, and particularly to a very thick fog.

The two armies were encamped two leagues diſtant from each other, and the light troops ſkirmiſhed together the whole day. At ſeven o'clock at night, count Saxe ſent for the general officers, furniſhed them with inſtructions, and cauſed the guards to be doubled. At nine o'clock, the baggage filed off over two bridges; one of rafts and another of piles: after which the infantry paſſed, and the grenadiers, who formed the rear-guard, cut down and burnt the two bridges. The enemy advanced in order to charge his rear-guard; but 18 pieces of cannon that had been planted beforehand, very ſoon ſilenced the fire of their muſketry, and he loſt not a ſingle man. At day-break the army formed in order of battle, upon two lines, in order to give time for the Imperialiſts to retire from Pladling; and as ſoon as they had joined, the army put itſelf in march in four columns.

Offenſive Operations.

It is particularly neceſſary, either in paſſages or retreats, to be acquainted with the nature of places, and if they are fit to furniſh the timber neceſſary for making rafts and bridges. In Germany, and countries where wood is very plenty, in order to paſs with greater expedition, a general can make uſe of rafts or flying bridges. (See *Flying Bridge.*) Two may be placed, one upon the right, the other on the left, of a bridge built upon piles; by which means three columns can paſs at once. It ſhould be obſerved, that the flying bridges are by no means ſecure againſt torrents.

In 1742, count Saxe having beforehand poſſeſſed himſelf of Thonaſtauf, cauſed two flying bridges of rafts, and a great work of redans, to be erected, in which he poſted five battalions and ſome cannon.

On the 9th of September all the baggage paſſed the Danube: on the 10th the army put itſelf in order of battle in two lines, which retired ſucceſſively toward the river. The lines paſſed one after the other; that is, the cavalry at the ford, and the infantry upon the flying bridges.—Six thouſand of the enemy's advanced guard were witneſſes of this retreat without daring to moleſt it; ſo prudently were the orders given, and ſo exactly executed.

It is in retreats that bridges are moſt liable to break under the weight of the troops; it is at that time that precautions are neglected, becauſe the danger becomes more preſſing, and they are not ſufficiently acquainted with the rivers over which the bridges are thrown.

Sect. XI. *Of Battles.*

Of all the operations of a campaign, the moſt important, and that which is moſt deſerving of attention, is a battle, becauſe it is generally deciſive; every other operation is but preparatory to, or conſequent of it. A general engagement, ſays Vigetius, is often decided in two or three hours; after which there ſcarcely remains any reſource for the vanquiſhed. Battles, ſays M. de Montecuculi, beſtow and take away crowns; from their deciſions princes cannot appeal; by them war is put an end to, and the name of the conqueror immortalized.

A general ſhould by no means ſuffer himſelf to be forced to a battle; neither ſhould he offer it but when there is a real neceſſity for it; and even when he gives battle, it ſhould be rather with an intention of ſaving than ſhedding blood; more with a view of aſſerting the rights of his maſter, and the glory of his country, than of oppreſſing mankind. However bloody a battle may be, it is always leſs ſo than a long war; which by reiterated troubles, conſumes the treaſures of ſovereigns, that ſinew of a ſtate, and drains the blood of the ſubjects.

Nevertheleſs, there are ſome occaſions where it is not left to a general's choice, either to give or accept of battle. An army of obſervation, and an army acting on the defenſive, neither can nor ought to be deſirous of coming to action. Both the one and the other ſhould have no other object in view, than that of poſting itſelf in ſo advantageous a ſituation, that the enemy may neither entertain a thought of attacking it in its camp, or any hope of forcing it. The army of obſervation, whoſe only object is to protect, or to cover the troops forming a ſiege, ſhould never ſeek to fight the enemy, unleſs attacked by him: the other, obliged by its want of ſtrength to act upon the defenſive, ſhould only be deſirous

Offenſive Operations.

deſirous of occupying advantageous poſts, to prevent the enemy's penetrating into the country, and attacking it in any poſition it ſhall have taken.

If the choice is left to the general, he ought to be particularly careful, before he comes to a reſolution of giving battle, to examine whether he can gain greater advantage by winning it, than he will ſuſtain damage by loſing it.

It is therefore neither caprice, nor a miſtaken courage, or the deſire of diſtinguiſhing himſelf at an improper time, that ſhould determine a general to give battle; but his ſuperiority over the enemy, both in the number and quality of troops, the enemy's incapacity, his ill-choſen encampments and negligent marches, the neceſſity of ſuccouring a place, or the certainty of a reinforcement, by the junction of which the enemy will become ſuperior, or circumſtances which may change the original deſigns of the campaign. This was the reaſon which induced the viſcount Turenne, in 1674, to give the battle of Einſheim, becauſe the prince of Bournonville waited the arrival of the Elector of Brandenbourg, who was coming to join him with a conſiderable reinforcement; and if he had not given battle before that junction, the enemy's army would have had a very great ſuperiority over his. The reaſons given by Montecuculi for avoiding a battle are, "when the loſs of it will be more prejudicial than the gaining will be advantageous; when inferior to the enemy, or when ſuccour is expected; when the enemy has the advantage of the ground; when it is perceived the army is working its own ruin, either by the fault or diviſion of the commanders, or through the diſagreement of confederates." It may alſo be added, when the enemy's army labours under ſome diſeaſe; when it is in want of proviſions and forage; and that, diſheartened by theſe circumſtances, his troops deſert from him.

It is on a day of battle that it becomes particularly neceſſary for a general to be acquainted with his own ground, and alſo that which is occupied by the enemy; to know in what manner his wings are ſupported, the nature of the places where theſe ſupports are; whether he can be ſurrounded, and in what part he can be attacked with the greateſt facility.

But however eſſential theſe branches of knowledge may be, it is not always the ſuperiority of number, or quality of the troops, or advantage of ground, that will ſecure the beſt diſpoſed army from being routed: it is the foreſight of the general in the precautions he has taken before the battle; it is his genius, his activity, his coolneſs, in the time of action, and the capacity of the general officers acting under him, that determine the ſucceſs.

Ground, ſeemingly the moſt advantageous, often preſents obſtacles, which do not immediately ſtrike a general, although an experienced one, and which may prove fatal in the courſe of a battle; how, therefore, will a general be able to correct theſe miſtakes, if he conſiders them as only trivial? At the battle of Cerignoli, fought on the 28th of April 1503, the enemy's front being more extended than at firſt it was ſuppoſed to be, in order to give a greater extent to that of the French army, it was neceſſary to continue the lines acroſs vineyards and thickets; by which means, the neglecting to fill up a ditch, cauſed the defeat of the French, and the death of M. de Numours their general.

A general ſhould not always purſue his own opinion, it being impoſſible for one man to ſee every thing; he ſhould, therefore, cauſe an exact account to be given to him of whatever he cannot have an opportunity of ſeeing perſonally; to inform himſelf by ſpies of the enemy's order of battle, and act in conſequence of that knowledge; he ſhould poſſeſs himſelf of all places capable of containing ambuſcades, which he ought to have had examined ſome days before the battle. Santa Cruz hath given a particular detail of all theſe preparations.

Offenſive Operations.

It is in theſe moments, which decide the fate of nations, that the genius and prudence of a general ought to be conſpicuous; he ſhould ſee, at the ſame time, what is doing among his own and the enemy's troops. Beſides the precautions which ought to have preceded the day of battle, thoſe which ought to be taken in the courſe of the action are ſo numerous, that it is impoſſible for them all to find a place here.

Some depend upon the general's ability, others upon circumſtances which it is almoſt as difficult to deſcribe, as to mark out the neceſſary diſpoſitions for them.

It depends upon the general's genius, and foreſight to make choice of intelligent, active, and prudent aids-decamp, to aſſign to each particular body the propereſt commander; not, for example, to place, at the head of infantry, one who has been long accuſtomed to the ſervice of the cavalry; or at the head of cavalry, one who is more uſed to the infantry, &c.; to encourage the ſoldiers by the hope of rewards, and by motives which may ſpirit them up, and to threaten thoſe who are ſo unmanly as to tremble at the ſight of an enemy, or raſh enough to run forwards without order.

The general ſhould alſo be capable of forming new ſchemes, in order to render thoſe of the enemy abortive; he ſhould alſo take care, whatever may be the nature of the country, to diſpoſe his army after ſuch a manner, as to render it equally ſtrong in every part, that all the bodies of which it is compoſed may protect and aſſiſt one another without confuſion; that the intervals neceſſary for acting be well preſerved, and that the reſerve can eaſily march whereever it ſhall be ordered: in a word, the troops ſhould be diſpoſed after ſuch a manner, that even before the action they may perceive in what manner they are to act.

It is the work of genius to take advantage of circumſtances, and to ſubmit to them; it is impoſſible to foreſee the precautions dependent on them, as the very circumſtances muſt be themſelves unforeſeen: it is by a general's addreſs, in knowing how to profit by circumſtances, that he ſhows his ſuperiority in the day of battle. M. de Montecuculi reduces all the advantages that can be gained over an enemy to four principal heads, which, in reality, are of themſelves reduced to the knowledge of profiting by circumſtances; ſuch are the advantages of number, when the enemy is beaten in his poſts, his convoys, and in his forages; when an ambuſcade is ſurrounded, or when a whole army falls upon a ſmall, weak, and ſeparated body: the ſecond head conſiſts in the knowledge of the commander: the third in the manner of fighting; and the fourth in the advantage of the ground. A general, who properly conſiders theſe heads, will diſpoſe of a combined army after ſuch a manner, that it may, at the ſame time, receive orders without miſtake, and execute them without confuſion; a very neceſſary precaution, and one which Hanno, general of the Carthaginians, neglected to take with regard to the ſtrangers allied with them, which occaſioned the troubles related by Polybius. He ſhould have mixed the ſoldiers belonging to thoſe countries, where bravery is in a manner natural to them, with thoſe belonging to countries where it is more extraordinary.

Vigetius points out the precautions neceſſary to be taken by a general, to avoid having either the wind or the ſun in his front. The wind, which raiſed the duſt, and blew it into the eyes of the Romans, contributed to the loſs of the battle of Cannæ: the ſun, on the other hand, dazzles the ſoldiers, and lays open their diſpoſitions and evolutions to the enemy: in a word, the general ſhould not neglect even

Offenſive Operations.

thoſe precautions which may be in appearance uſeleſs, whether before the battle, or at the very time they may be put in execution after the action; as the rallying the troops, the refreſhing of them, the retreating from before the enemy, or the purſuit of him, ſuppoſing the battle to be gained. A general ſhould have beforehand formed the plans of the marches and the enterpriſes he would attempt, and be almoſt certain of the means of executing them; if, on the contrary, he fails, he ſhould have determined the poſitions by which the army, fixed in a camp ſtrong by ſituation, may prevent the enemy from reaping any great advantage from his victory: he ſhould alſo have provided for the ſecurity of the priſoners, the hoſpitals, the plunder of the ſoldiers; in ſhort, for all that is neceſſary for preſerving order and diſcipline, and every thing contributing to the ſecurity of the troops: the diſtreſs of the enemy, and the glory of the ſovereign, ſhould be provided for without waiting for the event; for at that time confuſion and diſorder would prove more fatal than even the battle.

In the treatiſe written by Santa Cruz, upon the diſpoſitions before and after a battle, may be ſeen a long detail of the precautions depending upon genius, and of thoſe which are regulated by circumſtances.

The general's poſt during the action ought to be, according to Vigetius, on the right wing, between the cavalry and the infantry. Onozander fixes it upon ſome height, and Santa Cruz towards the centre, in the front of the ſecond line. Titus Livius and Polybius have obſerved, that the poſts of Scipio and Hannibal were always in thoſe parts which were leaſt expoſed: becauſe, as obſerved by Onozander, a general who runs into danger is a raſh man, fuller of preſumption than courage: neither is daringneſs, adds his commentator after Plato, always a ſign of courage; beſides, a man who is really brave, is never daring but when it is abſolutely neceſſary.

A general ſhould not always ſuppoſe that what particularly ſtrikes him is right; he ſhould reaſon calmly upon the probability of it, in order to come to a greater degree of certainty with regard to the practicability: he ought alſo, ſays Vigetius, to be acquainted with the nature of the enemy, and the characters of his generals, whether they are prudent or raſh, daring or timid; whether they fight upon principles or at hazard: in effect, a general ought to be earlier or later in making an attack in proportion to the raſhneſs of the enemy. If, ſays M. de Montecuculi, any ſign of fear or confuſion is perceived among the enemy, which will be known when the ranks are diſordered, when the troops mix together in the intervals, when the colours wave about and the pikes ſhake all at the ſame time, then he ſhould charge and purſue the enemy without giving him time for recollection: ſome dragoons, light cavalry, platoons, ſome looſe troops, ſhould be ſent forward; who, whilſt the army advances in order of battle, will go before to ſeize ſome poſts into which the enemy muſt fall. A general ought alſo, ſays Vigetius, to ſound the ſpirit of his ſoldiers, and obſerve whether they have a firmer countenance than the enemy. It is dangerous to lead an army on to action that is not thoroughly determined to do its duty. "Battles," ſays Vigetius elſewhere, "are generally won by a ſmall number of men." The great myſtery conſiſts in the general's knowing how to chooſe them, to poſt them well, conformable to his plan, and the ſervices required of them.

I cannot aſſign the reaſon (ſays he) why particular bodies fight better againſt other particular ones, or why thoſe who have beat bodies ſtronger than themſelves, have in their turn been often beaten by thoſe that were weaker: It is undoubtedly owing to want of confidence; becauſe the place of action has been different; or from other circumſtances which cannot be laid hold of, but on the very inſtant. The ſituation of the mind is ſhown in the countenance of the ſoldiers; it is declared in their diſcourſe, and by the moſt trifling of their actions. The general ſhould conſult them; he ought even to go farther—the beſt countenance is not always a ſign of the firmeſt courage. Cowardice often conceals itſelf under the maſk of intrepidity; but ſoon as the action begins, the veil falls off, and the coward ſhows himſelf, notwithſtanding all his endeavours to the contrary. Neither at this time ſhould a proper degree of fear be thought blameable; nature muſt be allowed to ſhrink in that awful and uncertain ſituation: the coward gives himſelf up to his fears; the bully ſeeks in vain to diſſemble them; and the raſh man, who cannot diſtinguiſh between danger and ſafety, is ſenſible of both; the real ſoldier is always modeſt, and contented with having done his duty. A good general turns every thing, even want of ſtrength, to advantage. Hannibal, at the battle of Cannæ, poſted his beſt troops upon the wings, that the centre, which was compoſed of thoſe on whom he had the leaſt dependence, might be the ſooner broke, in order to give the wings an opportunity of ſurrounding the Romans.

Offenſive Operations.

It alſo requires a very ſtrict examination in a general, in order to be thoroughly maſter of the circumſtances on which he ſhould regulate his diſpoſitions: and he will alſo find it ſometimes neceſſary to make ſome change in his original intentions. It is always proper that the corps of reſerve ſhould be compoſed of veterans, and even of part of the flower of the army; for ſhould the army happen to be broke, this reſerve alone may probably give a new face to the action: it was this method which Hannibal purſued at the battle of Zama; where Scipio, after having defeated the troops which preſented themſelves to him, was aſtoniſhed to find he had a new army to fight with. At the battle of Fontenoy, the houſehold troops placed in reſerve, with ſome brigades of infantry, determined the ſucceſs of the day. Nevertheleſs, on ſome occaſions this diſpoſition may prove diſadvantageous; as, for inſtance, where it would be neceſſary to preſent a large front to the enemy, or where it is neceſſary to prevent his getting poſſeſſion of a paſs or a defile; where a general finds himſelf too inferior, and where there are alſo poſts to be defended.

It would be unneceſſary to repeat every thing mentioned by Vigetius, relative to the precautions neceſſary to be taken before a battle; time, and the difference of weapons, have greatly altered diſpoſitions: fire-arms, which are now made uſe of inſtead of darts and ſlings, and the bayonet inſtead of the pike, have contracted the intervals which muſt neceſſarily be left between every ſoldier.

The order and diſpoſition of troops for action depend entirely upon the general, who knows how to profit by circumſtances; the juſt execution of them depends upon the capacity of the general officers. The general cannot be everywhere, or ſee every thing; he is obliged to rely upon the underſtanding of thoſe who command under him for the juſt execution of his orders; the general officers ſhould know how to vary them, in proportion as circumſtances, and the ſituation of the enemy changes. They ſhould have an exactneſs and quickneſs of eye, both to oppoſe and profit by them; and, as M. de Puyſégur obſerves, the diſpoſition of the troops being once regulated by that of the enemy, by the ſituation of the country, and the general orders that have been delivered, the only part the general can have in the action lies in thoſe places where he is within reach of giving orders himſelf.

M. de Montecuculi, with great reaſon obſerves, that there cannot be too many officers in an army on the day of battle,

Offenſive Operations.

in order to ſupply the places of thoſe who are killed; but can a man poſſeſſed of any degree of humanity approve of what he adds, that this number ſhould be increaſed in time of war, and reduced in time of peace? What a proſpect for a ſoldier, who, after having laviſhed his blood for the ſafety of his country, and the glory of his prince, ſees himſelf expoſed to the fate of Beliſarius! Whatever were the virtues of his maſter Juſtinian, can any one, without indignation, ſee this general, after having overcome the Perſians, reunited Africa to the empire, puniſhed the Vandals, driven the Goths out of Italy, ravaged Aſſyria, ſcattered at a diſtance from both empires that throng of barbarians by which they were over-run, and preſerved the throne, and the life of the emperor; upon the bare ſuſpicion, or rather under the pretence of a conſpiracy, deprived of ſight, and reduced to beg alms of paſſengers in the ſtreets of that city which he had ſo often ſaved?

It has been already ſeen, that the diſpoſitions in a mountainous country change according to the ſituation of the ground. Vigetius repeats, ſpeaking of a field of battle, what has been ſo often eſtabliſhed in the foregoing ſections, that an open country is always moſt advantageous for an army that is ſtrongeſt in cavalry; and that an encloſed ſpot, divided by ditches and marſhes, covered with mountains and woods, is moſt convenient for infantry. In this laſt, the knowledge of the country, the art, the ability of the general, and the underſtanding of the general officers under his orders, ſooner aſcertain the ſucceſs, than a ſuperiority of troops in an open country, which preſents little or no variety of ground, and which allows the greateſt part, or indeed the whole, of the troops to act; the ſuperiority in troops is attended with great advantage, provided alſo the diſpoſition is good.

The different diſpoſitions for troops are ſo many, the circumſtances differ ſo greatly, that were it even poſſible to connect in one body only all the battles which have been fought ſince the time mankind reſolved to regulate their properties by the law of the ſtrongeſt, the number of contrivances which remained to be collected would be greater than of thoſe which have been actually executed. It is impoſſible to give a detail of every thing; for in that caſe every particular ſpot, and the diſpoſition proper for it, every country, and all the circumſtances that may oblige theſe diſpoſitions to vary, muſt be deſcribed. Thoſe now going to be mentioned, are only with the view of giving the rules, and of more clearly demonſtrating thoſe precepts which lead to the knowledge of all others.

Disp. I. Let two armies of equal force be ſuppoſed, in an open country divided by a river, conſiſting of 57 battalions and 72 ſquadrons each, cavalry, huſſars, and dragoons. The two armies are on the ſame ſide, the right of the one, and the left of the other, to the river. The left of the army whoſe right is to the river is unſupported; and that whoſe left is ſupported, has a wood on its right. By this diſpoſition may be ſeen the neceſſity of covering the wing of the army A, that is expoſed. Plate DXX.

The army I, whoſe right and left are ſupported, is formed upon two lines, and preſents the ſame front as the army A, with a reſerve in the rear. The following is therefore thought to be nearly the diſpoſition which ſhould be made by the general commanding the army whoſe left is unſupported. The firſt line ought to conſiſt of 20 battalions, with intervals of about three toiſes between each battalion; 12 ſquadrons on the right, with their proper intervals; four battalions on the right of the cavalry, 10 pieces of cannon, and a battalion in column cloſe to the river; 12 ſquadrons on the left of the firſt line, with their proper intervals; 16 battalions in the ſecond line, 300 paces diſtance from the firſt; 11 ſquadrons on its right, placed behind the intervals of thoſe in the firſt line; and on their right, ſix ſquadrons of dragoons next the river, in order to ſuſtain the infantry and cannon covering the right; 11 ſquadrons on the left, placed in the ſame manner as thoſe on the right; 10 pieces of cannon, ſupported by a battalion in column, between the infantry and the cavalry of the right; 10 others, ſupported alſo by a battalion between the infantry and the cavalry of the left; four battalions in the rear of the ſecond line on the left, with orders to tranſport itſelf obliquely, or ſidewiſe, as ſoon as the army moves to attack that which is drawn up againſt it; 12 ſquadrons of cavalry in the rear of the firſt line upon the left, to poſt themſelves obliquely upon the flank, at 100 paces diſtance from the firſt ſquadron on the left, next to the four battalions and the cannon; the reſerve, conſiſting of 10 battalions and eight ſquadrons of dragoons, in the third line upon the left flank, ſo that it may fall into the firſt line as ſoon as the ſquadrons of cavalry, which were in the rear of thoſe of the firſt line, ſhall be poſted obliquely: in this poſition, the army will move forward, the right never quitting the banks of the river.

Offenſive Operations.

If the enemy's army ſhould advance, the diſpoſition of the army A will become ſtill better, becauſe the army I will quit the ſupport it had on its right: but if, on the contrary, it remains in its poſt, in order to keep this ſupport, then the 10 battalions of the reſerve, followed by the eight ſquadrons of dragoons, will join the four which ſupport the flanks of the cavalry which is poſted obliquely. When marching, this line poſted ſidewiſe ſhould proceed obliquely; and when the cannon ſhall be near enough to cannonade with effect, it ſhould make ſeveral diſcharges, in order to break and beat down the entrenchments, or felled trees, which the enemy may have made, and alſo to deſtroy their diſpoſition. As ſoon as the army A ſhall be near enough to cannonade the army I with ſucceſs, it muſt halt, and amuſe it with a continual fire of the cannon. The principal attack ought to be made at the wood by the 14 battalions: in order to give more ſtrength and certainty to this attack, ſix other battalions, with 10 pieces of cannon, ſhould be detached to it from the ſecond line, always keeping up a fire from the front. If during this attack, it is perceived that the enemy weakens his line, in order to carry aſſiſtance to the wood that is attacked, then the centre and the right of the army ſhould march up and charge him briſkly. The troops who cannonade the wood ought not to advance, but ſhould only keep the troops poſted in it at bay; becauſe that part which the enemy has weakened will then become the principal object of attack: it is probable, that the enemy having weakened his front, will certainly be broke. If the enemy ſhould not weaken his front, and the attack of the wood ſhould ſucceed, as ſoon as the enemy is driven out of it, the troops which attacked it ſhould take the enemy in flank; then the body of the army, by advancing, ought to determine an affair already half gained. If by the intelligence the general hath received, and the number which he knows the enemy's army to conſiſt of, and which he ſees before him, he judges the wood is filled with infantry, and that conſequently the attack of it will be attended with difficulty, he muſt attack on the ſide of the river, by marching by degrees from the right, as if to ſuſtain the left. For the greater certainty of ſucceeding in this attack, he ſhould reinforce the five battalions upon the right with ſome others from the ſecond line: the left ſhould continue in the poſition already mentioned, to keep back the enemy. If it ſhould happen that the enemy, ſeeing his left attacked, cauſes the troops to leave the wood in order to replace thoſe of the centre, which he cauſed to march to the aſſiſtance of the left, the 14 battalions which

Offenſive Operations.

which are poſted ſidewiſe, ought briſkly to attack the wood ſuſtained by dragoons. Theſe laſt ſhould poſt themſelves upon the left flank of the infantry in order to cover it; and as ſoon as it ſhall be within 60 paces of the enemy, it ſhould march up to him with bayonets fixed; and the dragoons ought to attack him in flank at the time the infantry does the ſame in head. The wood is all this while ſuppoſed to be practicable for the dragoons on horſeback; but in caſe it ſhould not be ſo, they muſt diſmount, the infantry being ſufficiently ſupported by the 12 ſquadrons of cavalry, which are placed ſidewiſe.

The general may with eaſe, eſpecially in an open country, attack the enemy's whole army together; but this may be attended with great danger, and if the whole front of the firſt line is broken, there will not be much difficulty in breaking the ſecond: whereas, by attacking the enemy's army in one or two parts, if one of theſe attacks ſucceeds, the battle is won; becauſe the troops who are victorious, take the enemy in flank, at the ſame time that he is attacked in head by the reſt of the army. In caſe it ſhould not ſucceed, the troops who made the attack can retreat, protected by the whole army, which hath not at all ſuffered.

The general ſhould, as much as poſſible, conceal the motions he intends making from the enemy; conſequently the five battalions and 10 pieces of cannon which ſupport the right of the army next the river ought to march in the rear of the ſquadrons of the firſt line, the infantry with their arms ſecured, and not range themſelves in the order of battle intended, till the two armies are ready to march to charge each other. It is the ſame with regard to the ſquadrons of cavalry, which ſhould be poſted behind thoſe of the firſt line, to execute the deſign already laid down.

Disp. II. If the two armies are not ſupported either on their right or their left, the ſame poſition ſhould ſubſiſt that hath already been eſtabliſhed for the cavalry, which is in the rear of that belonging to the firſt line, except that it ſhould be diſtributed on the right and the left. If there is not cavalry ſufficient, huſſars muſt be ſubſtituted in its place; but if there ſhould be cavalry enough, it muſt be uſed on this occaſion; becauſe cavalry being a greater body, its charge is heavier, and it alſo makes a greater impreſſion upon other cavalry oppoſed to it, provided they execute their order with great quickneſs. This cavalry or huſſars, which are poſted ſidewiſe, ſhould not quit their poſt, but wait the ſucceſs of the attack. If the enemy is repulſed, they muſt then fall upon his flanks, and by a briſk and vigorous charge endeavour to involve the ſecond line in the confuſion of the firſt; they will be followed by part of the wing of cavalry that is victorious, in order to give a greater force to the attack of the ſecond line, taking as much care as poſſible not to leave any body of cavalry upon the wing of infantry that is in a condition of protecting it. After theſe two lines of cavalry have been broken and purſued, half of the victorious line ſhould remain in order of battle; and, by a motion to the right from the left, take the enemy's infantry in flank, at the ſame time that it is attacked in head by the infantry of the army. The ſecond line ſhould then move into the place of the firſt, in order to be near enough to aſſiſt it in caſe the enemy's infantry ſhould ſtand its ground firmly; but it is probable, that being deprived of its cavalry, it will neither have the ſame firmneſs, nor the ſame ſpirit, as if it was ſupported, eſpecially when it is attacked on every ſide.

The cavalry and the huſſars who purſue the beaten wing ſhould not expoſe themſelves too much, or break their order in the purſuit, for fear the enemy's huſſars which are behind ſhould fall upon and beat them by attacking them on all ſides; which may very probably happen, if they do not take care to keep in order of battle; which ſhould at leaſt be attended to by the cavalry. After the huſſars have purſued the enemy's cavalry ſo long as to entirely diſorder them, they ſhould return and take their former poſts, in order to march from thence to whatever place they may be ſerviceable. Although it may appear ſomething hard to make the huſſars return, there is nothing ſo difficult but what may be accompliſhed, when order and diſcipline are firmly eſtabliſhed, and when an officer has the art of making himſelf obeyed.

Offenſive Operations.

At the battle of Cannæ, the Carthaginian cavalry, ſuperior to that of the Romans, having broke through them, one part continued the purſuit, and the other fell upon the rear and the flanks of their infantry; at the ſame time the Carthaginian infantry charged that of the Romans in all parts, which decided the victory. Thus Hannibal owed his victory partly to his ſuperiority in cavalry, and to his attack upon the flanks. The Numidians, who were upon the right wing of the Carthaginian army, and who fought nearly in the ſame manner as the huſſars, performed on this occaſion the ſame ſervice as the huſſars would certainly do in the diſpoſition now before us; ſo true it is, that infantry, deſtitute of its cavalry, hath no longer the ſame firmneſs, nor the ſame ſpirit; and if it is alſo attacked in head by infantry, it cannot avoid being beat. The principal attention of a general, ſays M. de Montecuculi, ought to be to ſecure the flanks; experience having taught, that when the wings of cavalry are broke, the infantry is eaſily ſurrounded, and hath no longer the means, nor even the courage, of defending itſelf. The reader may ſee the principles he lays down upon that ſubject. It is ſeen by the example of the battle of Cannæ, what uſe the cavalry ought to be put to, particularly in an open country where it can eaſily act. What advantage may not be expected from it, when an army of Romans, 80,000 ſtrong in infantry, and 6000 horſe, was overcome by the Carthaginians, weaker by the half in infantry, but which derived its principal ſtrength from 10,000 cavalry, all veterans, and well diſciplined.

But if the wing of cavalry is beat, it ought to retreat with as much order as poſſible. The cavalry, or huſſars, that are poſted ſidewiſe, ſhould always continue in the ſame place; there is no reaſon to fear that the enemy will advance briſkly to the purſuit; becauſe he will be taken in flank by the body that is poſted ſidewiſe; a circumſtance which ought not only to abate the eagerneſs of the conquerors, but alſo animate the conquered. By this manner of acting they gain time to paſs through the intervals of the ſecond line, and to rally in the rear of it, which they can perform with the greater eaſe, as they are neither purſued nor moleſted, at leaſt but very ſlightly.

In order to prevent the inconveniences that may ariſe if the huſſars in charging the firſt line of the enemy in flank are charged by the ſecond, it is neceſſary to detach inſtantly from the reſerve a body of dragoons ſufficient to fill up the intervals of the huſſars, which will form a full line without taking up more ground: this can be ſo much better effected, as there would be no ground on the other ſide of the troops who are poſted ſidewiſe, and that, beſides, theſe troops would be at too great a diſtance from the main body of the army.

Again, without cauſing them to fill up the intervals of the huſſars, they may be placed in a ſecond line behind them; and when the huſſars attack the flank of the enemy's wing, the dragoons will take their place, in order to keep back the enemy's ſecond line. This method hath the ſame effect, and is performed with leſs difficulty. It is almoſt evident, that the ſecond line will not dare advance to protect the firſt for fear of being charged in flank

Offenſive Operations.

by the dragoons, but on the contrary it will be obliged to retreat.

This diſpoſition, the performance of which appears very difficult, is not in reality ſo, if the general hath taken the neceſſary meaſures, and if his troops are well diſciplined, and know how to move with order and exactneſs. Even when this motion is not performed with all the exactneſs poſſible, it can never be dangerous, becauſe the front of the two lines will not be deſtroyed, and becauſe it is alſo made upon the rear; and that if the dragoons and huſſars are attacked and beat in marching up, their defeat cannot be any way prejudicial to the main body of the army.

When the field of battle is in an open country, all the troops generally come down, eſpecially when there is no obſtacle to prevent them. On theſe occaſions, it is requiſite that the diſpoſition of the troops ſhould be ſtrong in every part: there ſhould always be a reſerve, whether of infantry or dragoons, in order to be ready to aſſiſt the troops which have ſuffered.

If it is poſſible, in an open country, to find any hollow to ſupport the right, and a village to ſupport the left, the general ſhould make choice of that ſituation, ſuppoſing his intention is to accept, and not offer battle. If he deſigns to give battle, it would be unneceſſary to take this poſition, becauſe he muſt quit it in order to attack the enemy: but if circumſtances require his accepting it, he muſt ſeize this poſt, and place infantry and cannon in the village, and ſtation other infantry in the rear to ſupport that which is in the village.

As to the diſpoſition for the order of battle, eſpecially for the front of the line, it muſt be regulated by the ground, by the diſpoſition the enemy has taken, by the troops that can moſt eaſily act, and by thoſe that the enemy can oppoſe to them.

If the enemy has pitched upon a field of battle, and the general would attack him in it, he ſhould keep his whole front employed; but ſhould make his chief efforts on one or two parts, upon the wings, or at the centre. This was the method practiſed by marſhal Saxe in all his battles: when he accepted battle, as he was obliged to do at Fontenoy in 1745, he was in expectation that the oppoſite army would attack him on one ſide ſooner than another; in this ſituation the diſpoſitions ſhould be properly regulated, the poſts intrenched and occupied, the cannon diſtributed, and troops placed in the rear of each poſt to ſuſtain thoſe which are in it; victory ſhould then be expected from the capacity of the commanders, the firmneſs of the troops, and the aſſiſtance that is properly given them. But when a general gives battle, he may attack either the right, the left, or the centre, always conforming to the ſituation of the ground, and the field of battle which the enemy has choſen, which cannot be aſcertained but by a thorough knowledge of the country.

It is dangerous to attack the whole front of the oppoſite army with equal vivacity, becauſe, if the attack does not ſucceed, the troops are diſheartened, and are witneſſes of each other's defeat. If the firſt line is repulſed, the ſecond is ſeldom of any great uſe; whereas, by only employing the whole front of the enemy, and making a ſtrong attack upon one or two parts, if it is ſucceſsful, the troops can take the enemy in flank, and thoſe which amuſed his front will then attack him briſkly, and prevent him ſending aſſiſtance to the troops that are beat. If the general does not ſucceed in the firſt attack, he can try it again with greater force, by cauſing the troops of the ſecond line to march as was done at the battle of Lafeldt fought in 1747: the French troops being repulſed four times, M. Saxe ſent them a reinforcement; theſe troops being united, carried the village at the fifth attack, which determined the fate of the battle.

Offenſive Operations.

In a plain but incloſed country, a general can attack only part of an army. Antiquity furniſhes many examples of this. Epaminondas, at the battle of Leuctra, attacked only the right of the Lacedemonian army, with a large column of infantry that formed his left; cauſing the right to be ſupported, and making the left march, the whole army, according to the opinion of the chevalier de Folard, wheeled. The battle of Mantinæa, won by the ſame general, is alſo of the ſame nature; with this exception, that it was the centre of the Lacedemonian army that was attacked. Theſe examples are only propoſed as what may poſſibly happen, but which it would be dangerous to imitate on every occaſion, and which ſhould be purſued in circumſtances only where a general expects great advantage from them.

As the cavalry can eaſily act in an open country, and be of great aſſiſtance to the infantry, all poſſible means ſhould be uſed to contribute to the ſucceſs of their attack; they ſhould always be ſupported by troops in their rear. Cavalry is of great uſe, particularly where the two armies, from the ſituation of the country, find no obſtacle to prevent their joining; and if the cavalry, as M. de Puyſégur obſerves, is beat, even when the infantry of the ſame army is victorious, the beſt thing that can afterwards happen to it is, to retire in good order.

The ground ſo often varies, that even in an open country there are unevenneſſes, thickets, moraſſes, and hollows; in each of theſe ſituations the diſpoſitions ſhould be changed. If theſe thickets happen to be in the line of cavalry, and it can act there (for if it cannot, it would be a very great fault to place it in them), it ſhould be intermixed with platoons of infantry, obſerving alſo not to take them from the main body of the army, but from the reſerve, in order not to diminiſh the ſtrength of the front; which ſhould never be done on any occaſion whatever, unleſs part of the army, either by its own or the enemy's poſition, cannot act offenſively, by reaſon of ſome moraſs, hollow, or any other obſtacle that the enemy may have placed before him; if, nevertheleſs, a general can take an advantageous poſition, by cauſing theſe thickets or theſe hedges to be occupied by infantry, he ſhould give it the preference, to enable the cavalry to act with the greater facility.

The diſpoſitions vary not only according to the ſituation of the ground, but alſo according to the general's views. Some draw up the battalions without intervals, or like a wall; others, with ſmall intervals; others leave the diſtance of half a battalion between each; and others, in purſuance of the chevalier de Folard's method, place them in columns.

The firſt diſpoſition is without doubt formidable as to infantry; but, as it has been already remarked, it is defective with regard to cavalry. In the third, the interval of half a battalion is too wide: it would require an immenſe tract of ground; beſides, the battalions would not be near enough to have it in their power to protect each other. The ſecond ſeems better, becauſe the front is not ſo large, the battalions are more within reach of aſſiſting each other, and have only the diſtance neceſſary to prevent their mixing confuſedly together. The fourth is undoubtedly very good; but can a general promiſe himſelf, that the ſoldiers can always march at an equal pace together, and without ſtopping? The fire of the column is continual, it defends itſelf on all ſides; but its oblique fire does not do much execution, and there are ſituations and ſpots where this poſition in column would be faulty. When it cannot approach the enemy, and is alſo expoſed to his cannon, this diſpoſition would be dangerous; becauſe it is certain that

cannon

Offenſive Operations.

cannon plays with much greater advantage upon depth than upon breadth: beſides, not being able to get near the enemy, there are only the heads of the columns able to fire, and the reſt remains inactive, expoſed to the cannon. The poſition of the column is therefore only very good, when it can get up to the enemy and charge him.

The marſhal de Puyſégur aſſerts, that an army in an open country, formed in two lines, the firſt of which is without intervals, ought of courſe to beat an army that is formed with intervals.

The reaſon he gives for it is plauſible: it being certain, that a full line keeps itſelf much cloſer in marching; and that, charging the firſt line of the army that has intervals, it ought to have broke through it before the ſecond line, which is 150 toiſes or 300 paces behind, can have time to come up to its aſſiſtance; which might very well happen, and examples of it may alſo be cited. But could not there be another diſpoſition oppoſed to this diſpoſition in wall, keeping the neceſſary intervals, not only capable of reſiſting it, but alſo ſtronger, whether by the poſition and arrangement of troops, or by the ready aſſiſtance they can give each other, without being confuſed in their motions?

Let two armies be ſuppoſed in a plain country, without ſupport to the wings of either ſide, or without any obſtacle that may prevent their getting up to each other. The enemy's army, as hath already been ſaid, is in two lines; the firſt of which is formed in wall, both infantry and cavalry; the ſecond is formed with large intervals, and a body of huſſars in the rear. The army to be oppoſed to it is of equal force, and conſiſts of 40 battalions and 54 ſquadrons, cavalry, huſſars, and dragoons. The following ſeems to be nearly the manner in which it ought to act againſt the enemy, who is ſuppoſed to be drawn up in wall.

The firſt line of infantry compoſed of 15 battalions, has the diſtance of three toiſes between each battalion, and the diſtance of half a battalion between each brigade, eight ſquadrons on the right, and as many on the left, with their proper intervals: 15 battalions in the ſecond line, 200 paces diſtant from the firſt, ſeven ſquadrons on the right, and the like number on the left, in the rear of the intervals of thoſe of the firſt line, ſupporting the infantry of the ſecond; 10 battalions in reſerve in two columns, one of which in the rear of the ſquadrons on the right of the ſecond line, and the other of the ſame force poſted in the ſame manner on the left; 12 ſquadrons of dragoons in the rear of the ſecond line, half on the right, half on the left; and 12 ſquadrons of cavalry, or huſſars if there is not cavalry, in the rear of thoſe of the firſt line.

By this diſpoſition, the army appears to be ranged in two lines, with a reſerve, and will leave no room for the enemy to doubt of the motions it may make in marching: this diſpoſition will undoubtedly have that effect, and does not appear very formidable; but as ſoon as the two armies begin to move forward, the ſecond line of infantry muſt advance as unperceived as poſſible, forming itſelf in columns by battalions, each of which, with its head to a battalion of the firſt line, will form as many T's. The 10 battalions in reſerve, which form two columns of five battalions each, will march and fill up the ſpace on the right and left, between the infantry and cavalry. The cavalry, or huſſars, which are in the rear of the firſt line, one by a motion to the right, the other by a motion to the left, will poſt themſelves ſidewiſe, at 100 paces from the wings of the army; the dragoons muſt poſt themſelves in the rear of them in a ſecond line. This will be performed much eaſier marching, becauſe it is not complicated; it is alſo performed in the rear, and the front of the firſt line is not put into diſorder; and conſequently, the enemy will not perceive it ſoon enough to change his poſition, and oppoſe the diſpoſition which is preſented to him. This firſt line, by this diſpoſition, forming as many columns as there are battalions, of courſe ought to break through the enemy's army, which is in wall, but not above four deep, becauſe the impreſſion of a column ought to be much ſtronger, than that of a battalion four or ſix deep. See Plate DXXI.

Offenſive Operations.

Suppoſing the wings of each T to give way, the battalions which penetrate there will find themſelves between two columns hedged in with bayonets; the 10 battalions in reſerve, which, according to this diſpoſition, ought to join the right and the left of the infantry, ſhould of courſe ſeparate the two wings of the infantry, which are on the outſide of the diſpoſition in columns. Four battalions ſhould remain in purſuit of them, and the two laſt take the line in flank, at the ſame time that it is attacked in head. The cavalry ſhould charge the line which is in wall with great vigour; and the ſecond line ſhould follow it very cloſe, but in good order: the cavalry, or huſſars, which are poſted ſidewiſe, will attack it in flank, and the dragoons muſt remain in their poſt, in order to keep back the enemy's ſecond line.

Whatever diſpoſitions are made in the drawing up of an army, they ſhould always have ſome object. A general ſhould foreſee all that may be done by the enemy, whoſe diſpoſition he ſhould always ſuppoſe to be a good one, and to which he ſhould oppoſe one at leaſt as ſtrong, and always better if poſſible; he ſhould particularly conceal from him the motions he intends making, or diſguiſe them from him in ſuch a manner, that he ſhall not have time to oppoſe them, or at leaſt not readily enough: neither ſhould a general be ſo near as to give the enemy an opportunity of diſcovering and profiting by the method he intends following.

The diſpoſition of an army in wall is good; but in general only ſo with reſpect to infantry, becauſe that body acting by itſelf requires but very little ground to retreat, or preſent itſelf to the enemy, or to make a motion to the right or to the left. But this ſame diſpoſition is defective, and even hurtful for cavalry, unleſs there is a moral certainty of its getting the better: but as, with regard to war, a moral certainty would be a real preſumption, this diſpoſition of cavalry in wall would be dangerous, becauſe it may be broke. If that which is oppoſed to it marches up to it reſolutely without confuſion, and without being afraid of that maſs of cavalry, and charges it the firſt, ſword in hand, how can it retire in order if it is broke, being as much ſtraitened in its retreat as in its diſpoſition? All the ſquadrons filling up the ground, it will neither be able to make any evolution, or to act; and if it retreats through the large intervals of the ſecond line, it will carry it away with it in its flight: were there even ſix lines behind it, they would all be carried away, the ſecond by the firſt, the third by the ſecond, and ſo on with the others.

It is true that it may give the firſt charge, and conſequently make thoſe ſquadrons which have intervals give way; but as theſe laſt have more ground to act on, they can retreat with greater eaſe than thoſe who have none, by paſſing through the intervals of the ſecond line, which is not to be done by a line that hath no interval. They can rally in the rear, while the ſecond will charge the line that is without interval, and which is already diſunited by its firſt attack; even when theſe two lines are beaten, they can retire with greater eaſe, each ſquadron having ground enough to act upon. They will never be ſo much diſordered as the line which has no interval, which cannot eſcape being cut in pieces if broke, or which can only find its ſafety in flight; whereas, thoſe that have intervals can retire one after another, and in a ſoldier-like manner, ſuſtaining each other.

Beſides, in order to prevent the impetuoſity of this caval-

Offenſive Operations.

ry in wall, it appears that nothing is to be done but to poſt huſſars, if there is not a ſufficiency of horſe, behind the ſquadrons of the firſt line, who, when the two armies begin to move forward in order to charge, will place themſelves on the right and the left ſidewiſe, 100 paces diſtant from the firſt lines of cavalry: by this poſition, they will be able to take the enemy's line in flank, whenever it comes to attack the cavalry. If a part of this line perceiving this motion divides into two, one part to attack the line that has intervals, and the other the huſſars, it is ſo much ſtrength loſt; conſequently, the line with proper intervals has fewer troops to fight, and may expect to break them by giving the firſt charge. If the huſſars ſhould be beat, it is of no great conſequence, the defeat of thoſe troops never deciding the ſucceſs of the battle: it is the body of the army the enemy muſt break, and not two regiments of huſſars, which retreat with great eaſe from before cavalry, and rally and return to the attack as readily as they retired. But if, inſtead of huſſars, cavalry can be poſted there, the enemy's line, which is divided into two, will find itſelf obliged to fight upon equal terms: the certainty of ſucceſs depends upon the quickneſs with which the enemy is attacked; and the more ſo, as he will be obliged to make a motion in the preſence of troops already poſted and ready to charge. If this line without intervals advances, without ſhowing any attention to the huſſars, in order to charge the cavalry, the huſſars, at leaſt a great part of them, ought to fall upon the flanks; and the dragoons, which are in the rear of them in reſerve, ſhould take their place, to keep back the enemy's ſecond line, and to prevent the huſſars from being taken in the rear.

Theſe two diſpoſitions are ideal. A general ſeldom chooſes to fight upon a ſpot where the wings are void of ſupport; and prevents the enemy, as much as poſſible, from getting poſſeſſion of an advantageous poſt, or at leaſt does not attack him when he cannot prevent him doing it, eſpecially if the ground which he occupies is everywhere expoſed; there are, nevertheleſs, circumſtances where a general is obliged to fight, although not in a poſt ſtrong by ſituation. By the two diſpoſitions juſt now deſcribed, the order which would be moſt proper to be preſerved for covering the wings, which may be expoſed by the ſituation of the ground, has been endeavoured to be ſhown; it has been ſeen of what conſequence it is for a general to know, and to ſecure all the heights, moraſſes, hollows, and every obſtacle he may meet with. On occaſions ſo important, a general ſhould take the ſame precautions that he would uſe under the cannon of a place, if he found heights that overlooked the works; in which caſe he would not fail of conſtructing others more advanced, to prevent the enemy from getting there, and retarding their approaches.

If the duke of Savoy, at the battle of Marſaille, gained in 1698 by the French army, commanded by M. de Catinat, had been poſſeſſed of the heights of Pioſaca, the two wings of that prince's army would have been ſupported; inſtead of which, his left wing was expoſed. M. de Catinat, profiting from this fault, extended his right to the foot of thoſe heights, of which he poſſeſſed himſelf, and outſtretched the enemy's left: it was from theſe heights that the diſorder in the duke of Savoy's army commenced; it ſoon communicated to the whole front, and got poſſeſſion of the whole army: ſo true it is, that the moſt trifling object, being neglected, changes the order of things; that the leaſt fault becomes eſſential; that confidence in the number and in the courage of the troops is often dangerous; and that having a contemptible opinion of an enemy is always fatal. The enemy, although inferior in troops, will ſoon attain a degree of ſuperiority, if he has the advantage of ground.

Armies can engage in ſo many different poſitions, that it is impoſſible to particulariſe all of them. In this ſection two armies have already been preſented in an open country, without any ſupport to their wing: two others have been poſted, one of which is upon a ſpot advantageouſly ſituated, its two wings covered; the other hath only its right wing ſupported, and its left expoſed. It has been endeavoured to give to that, whoſe left wing is unſupported, the greateſt ſtrength in its whole front that is poſſible, and by the diſpoſition of the left wing it is both ſtrong and ſecure; but there are ſuch a variety of ſpots where two armies may meet, that it will ſuffice to know in general the advantages they may derive from their ſituation.

Offenſive Operations.

Disp. III. A third diſpoſition very different from the two former is as follows. The enemy's army is ſuppoſed to be advantageouſly poſted; it hath a hollow on its right, through which run the waters of an impaſſable moraſs, forming a rivulet. Its left is ſupported by a large town, croſſed by a rivulet. In the centre is an height, capable of containing 12 battalions; in the front of it is a plain of 700 or 800 toiſes, which extends from its left to the cavalry on its right. Oppoſite to this cavalry the plain grows narrower, by reaſon of an height which reaches to the rivulet, and which the cavalry could not occupy, becauſe the enemy hath taken poſſeſſion of it during the night. The town is entrenched, and filled with infantry and artillery; 16 battalions in two lines are poſted next the town, in order to ſuſtain the troops that are in it. Behind the town there are three bridges upon the rivulet: in the front of the town, on the other ſide of the rivulet, are poſted four battalions and five pieces of cannon, in order to flank the troops intending to attack the town: theſe four battalions are ſuſtained by eight ſquadrons of dragoons. The centre of the army conſiſts of 20 battalions in the firſt line, and as many in the ſecond; eight of which are next to the moraſs, ſuſtained by ſix ſquadrons of dragoons; 12 ſquadrons in the firſt line, and 12 in the ſecond. The cavalry on the right conſiſts of 11 ſquadrons in the firſt line, and 11 in the ſecond. Thirty ſquadrons of huſſars, diſtributed half on the right, and half on the left, and the whole front of the army lined with artillery. Plate DXXII.

The army A, which was encamped a quarter of a league from the height by which it is ſeparated from the enemy, began its march at dark; it halted at the foot of the height, and ſent ſome detachments of infantry to take poſſeſſion of the ſummit of it. The army I made the above-mentioned diſpoſitions, becauſe the army A was too near to be able to avoid a battle. The army I is compoſed of 78 battalions and 90 ſquadrons: theſe two armies are nearly of equal ſtrength.

The left of the army A hath a fine plain before it, extending from the moraſs to that part where the height commences. In that place are poſted eight battalions in two columns of four battalions each, next the moraſs, with 10 pieces of cannon between the two columns: there are 14 battalions in the firſt line, and 13 in the ſecond; four battalions towards the height, and next the cavalry. Sixteen battalions occupy the height as far as the ſmall wood; four battalions occupy the other ſide of the wood, and 32 battalions upon two lines very cloſe together; 12 battalions behind the height next the rivulet; 12 ſquadrons of horſe, and 20 of huſſars, who have orders to paſs three bridges thrown over the rivulet, and attack the town with three columns of four battalions each, ſuſtained by the 12 ſquadrons of horſe, and the 20 of dragoons. In the rear of the cavalry upon the left, are poſted 16 ſquadrons of dragoons at a little diſtance, with intervals; ſo that, if the enemy ſhould attack this left and beat it, the cavalry may eaſily retire through the intervals of the dragoons, to give them the greater facility of acting, and turn their defeat into

an

Offenſive Operations.

an almoſt certain victory. Fifteen ſquadrons of horſe are poſted behind the height, with their right toward the height, and their left toward the camp, in order to take the enemy in flank, whilſt he is employed in purſuing the cavalry of the left, which he has beaten. The chief object of the attack ſhould be the town, although the moſt difficult. If it is forced, the enemy will be beat without reſource: becauſe the infantry who has driven him from that poſt, will attack him in the rear; at the ſame time that the infantry which remained on the height will come down from it, and join, either to attack, or at leaſt to employ the enemy upon the height, and by that attack prevent him from ſending aſſiſtance to the troops already driven from the town and put to flight: the cavalry upon the left will advance at the ſame time to ſupport the infantry, and, if neceſſary, to charge the enemy's cavalry.

The 32 battalions which are upon the height in two lines, will be divided into ſix columns, of which four of ſix battalions will be employed in attacking the town, the laſt battalion of every column excepted; which muſt remain at the entrance of the wood, with four columns of four battalions upon the left, in order to ſuſtain the infantry attacking the town, and to keep back the enemy's cavalry upon the left. They will deſcend from the height under the protection of the wood by which it is covered, and which ends at about 400 toiſes from the town. Theſe troops will be followed by artillery, which muſt be poſted between the columns; they muſt halt on leaving the wood, and will begin by making a continual fire of cannon upon the town and the cavalry: during this fire of the artillery, the 12 battalions on the other ſide of the rivulet ought to attack the four battalions and the eight ſquadrons of dragoons belonging to the enemy; and when they have forced them to give way, they will amuſe them by a conſtant fire of muſquetry. When the artillery ſhall have played long enough to have broken down the enemy's entrenchments, and deſtroyed the order of the troops, the four columns, formed of 20 battalions, will march up, and with their bayonets endeavour to penetrate at ſome part; the 12 battalions on the other ſide of the rivulet will charge at the ſame time; the two columns of four battalions each, as well as the four laſt battalions belonging to the columns which attack the town, will remain at the entrance of the wood with the artillery, in order to keep back the enemy's infantry and cavalry which was next the town. If any one of the columns can penetrate as far as the bridge that is in the town, it will take poſſeſſion of it, as well as of the market place; the others following it will take poſſeſſion of the hedges and gardens. One column only will be ſufficient to ſecure the banks of the rivulet, and take poſſeſſion of the bridges. As ſoon as the bridges are free from the enemy, the 12 ſquadrons of horſe and the 20 of huſſars will paſs and attack every thing they find to oppoſe them; then the left ought to advance; the battalions which have remained upon the heights ſhould come down from them, and all together attack the front of the army, whoſe left wing is already broken and taken in flank.

But if the enemy, after having examined the diſpoſition of the army A, imagining that the principal attack will be directed againſt the town, inſtead of remaining in his firſt diſpoſition, changes it entirely, and cauſes a part of his ſecond line of infantry to march to the town; and if he ſtrengthens his right by the cavalry of the left (a ſpot more favourable for cavalry than infantry), the attack of the town will then become impracticable, becauſe of the great ſuperiority of the troops defending it; therefore it would be uſeleſs to perſiſt in it; but his right ſhould be vigorouſly and briſkly attacked. It is true, that it is reinforced by the cavalry from the left; but as the ground between the height and the eight battalions which are next the moraſs can contain but 12 ſquadrons, thoſe which the enemy hath drawn from the left can only be poſted behind the height, or in the third line; if they are behind the height, nothing can prevent their being attacked: but ſuppoſing the firſt line broken, it ſhould not be too warmly purſued, for fear of ſeparating, and being taken in flank by the cavalry behind the height. The 16 ſquadrons of dragoons which are behind, ought to remain in that ſituation; the 15 ſquadrons of horſe, which are with their right to the height, and their left to the old camp, ought to take the place of thoſe who have attacked the enemy; and then the 20 battalions which are upon the height will come down into the plain and attack the enemy's infantry, at the ſame time that the 15 ſquadrons of cavalry and the 16 of dragoons attack the cavalry which is poſted behind the height. If they ſucceed in beating it, or whether they do or not, if the enemy ſends aſſiſtance, he will weaken his left, and then the 44 battalions, who till this time have remained inactive, may come down from the height and attack the town, not ſo much with a deſign of forcing it, as to oblige the enemy not to take any troops from it; if no aſſiſtance is ſent to the right wing, it will be undoubtedly beaten, being attacked by forces ſo greatly ſuperior to it: the whole of the cavalry being thus put to flight, the moſt prudent part the enemy can take is, to endeavour to paſs the rivulet by the three bridges behind the town, and by ſo doing ſecure himſelf from farther inſult: if the enemy does this, the 12 battalions, the 12 ſquadrons of horſe, and the 20 of dragoons, will retire by the ſame road they marched up, and they will be in ſecurity as ſoon as they are in the wood: beſides, a beaten army is ſeldom to be feared; therefore, they may retire unmoleſted, and in order.

Offenſive Oepration.

But if it happens that the enemy, without changing his poſition, is not to be forced in any of theſe attacks, the general had better retire to the height, where there will be no danger of the enemy's endeavouring to attack him: but if he ſhould attempt the attack of the left wing of the army A, it muſt be reinforced by all the cavalry that can be employed without cauſing confuſion, and two brigades of infantry ſhould be joined to the two which are next the moraſs.

Disp. IV. The fourth diſpoſition is ſuppoſed in a country mixed with thickets and plains. The enemy's army hath its right to ſome mountains, and its left to a river; in about a third part of the length of his front, there is a village a little behind its right. His diſpoſition is, four battalions and ſix pieces of cannon upon an height which overlooks the plain, to which is alſo added the cavalry of the right. Behind are two paſſes entrenched and guarded by four battalions; upon the heights of theſe paſſes there are four more, to prevent the enemy penetrating at the flank. There are eight ſquadrons in the firſt line, four battalions poſted at the village, and 12 in it with cannon: 16 battalions on the left of the village, 14 ſquadrons and four battalions next the river. The ſecond line conſiſts of 11 ſquadrons upon the right, eight battalions behind the village, in order to carry timely aſſiſtance to it; 12 battalions in the rear of the 16 of the firſt line; 15 ſquadrons and four battalions to the river. The reſerve conſiſts of 18 ſquadrons of dragoons next the mountains (in order to diſmount and be within reach of aſſiſting the battalions guarding the paſſes), and of 24 ſquadrons of huſſars on the left next the river. An iſland is ſuppoſed a little in the front of the firſt line: in this iſland are placed two battalions and ſix pieces of cannon. A ſtone bridge is alſo ſuppoſed between the two lines, behind which is poſted two battalions, to ſupport thoſe in the iſland, and to facilitate their retreat. It ſeems impoſſible to attack an army thus

ſituated;

Offenſive Operations.

ſituated; all the troops are a mutual ſupport to each other: the flanks are ſecured and well guarded; artillery is planted along the whole front; and the paſſes are entrenched, and troops poſted in them.

In the front of the enemy's army is a large plain, which runs from the mountains as far as the river; but the largeneſs of it is broke into by ſome thickets, where nevertheleſs cavalry may act: in order to attack this army, thus advantageouſly poſted, a diſpoſition muſt be made, entirely different from that which it is in. If the village, which is entrenched and well furniſhed with troops and artillery, is attacked, the forcing it will be doubtful: but ſuppoſing it ſhould be forced, it will not be without loſing a great number of men; which ſhould be avoided, becauſe it is the duty of a general to ſpare the blood of his ſoldiers as much as poſſible. and even, if practicable, to employ but few of his troops againſt a greater number of the enemy's. If the paſſes only are attacked in order to take the enemy in flank, it is very certain he can ſend aſſiſtance to it without weakening his front, having it in his power to cauſe the eight battalions in reſerve behind the village to march there, and to cauſe the 18 ſquadrons of dragoons to diſmount. If only the left wing next the river is attacked, it is true that attack is more practicable, there being no obſtacle or entrenchment to prevent coming up with the enemy: but ſtill there is but one wing beaten; and that, by falling back upon the troops in the village, can retreat by the mountains of which the enemy is maſter. There is great reaſon to imagine it will be beat; but the general muſt endeavour to reap as much profit from that victory as he can: it is therefore thought that, not to loſe the fruit of it, the enemy ſhould be attacked on the left wing, from the centre to within about 200 toiſes of the river, at the ſame time that the entrenched paſſes are attacked. During theſe two attacks, a briſk cannonade ſhould be kept up upon the village, the infantry and cavalry upon the right, the infantry that is poſted in the iſland, and that which is next the river: by theſe two attacks the enemy's front and right wing will be equally annoyed; he will not know where to ſend aſſiſtance, and in that ſtate of uncertainty may probably ſend it to a part where the danger is not ſo preſſing. But ſuppoſe he ſhould act in the moſt proper and prudent manner, as it ſhould always be imagined he will, the aſſiſtance which he will ſend to that part, cannot be effected without unfurniſhing or weakening ſome other: if he ſtrengthens the paſſes and the heights with the eight battalions behind the village, they perhaps will not be forced; but he will ſcarcely venture to take any troops from the village, in order to ſend them to the aſſiſtance of the front that is attacked. But if he ſhould unfurniſh the village, it muſt then be attacked, and that vigorouſly; which may be the eaſier done, as it hath been for ſome time cannonaded, and conſequently the earth hath been tumbled down, and openings made, at leaſt large enough for the infantry to enter it: this attack will not at all prevent that at the front from going on.

In order to execute the attack upon the enemy's army, it is imagined the troops ought to be diſtributed after the following manner: all the infantry ſhould be placed in the firſt line, excepting that of the reſerve, which ſhould conſiſt of 20 battalions; the ſecond line ſhould conſiſt of the cavalry; and the third ſhould be formed of the dragoons and huſſars, The 20 battalions on the left, forming five brigades, ſhould remain in order of battle at the coming out of the thickets, with artillery diſtributed between the intervals of each brigade; the 28 battalions, after making ſeven brigades as ſoon as they come out of the thickets, will form in column: then the 24 ſquadrons which are in the rear of the infantry, formed in column, will poſt themſelves, four ſquadrons in the intervals of each brigade. The brigade ſupporting the right flank will advance on the ſide of the river: and then the ſeven columns and the 24 ſquadrons will march up to the enemy and attack him with their bayonets, without loſing time in firing. As ſoon as the columns have broken or ſtaggered the enemy's firſt line, the cavalry will fall furiouſly upon them, ſword in hand; a part of the dragoons and huſſars ſhould follow, in order to be within diſtance of ſuſtaining the troops who have attacked, or to join themſelves to the cavalry who have broken in among the enemy: it ſhould be obſerved, that as ſoon as the huſſars are engaged and purſuing the enemy, the cavalry ſhould rally in order to ſuſtain them, or to flank the infantry which may ſtill make reſiſtance. The brigade of infantry which ſupported the right, followed by the ſeven ſquadrons, ſhould attack the four battalions on the left of the firſt line, and the ſeven ſquadrons will take them in flank; which they can with the greater eaſe effect, as the cavalry hath been put to flight. The ſeventh column ſhould, with four ſquadrons, attack the four battalions of the ſecond line, at the ſame time that this attack is executed from the front as far as the river; 16 battalions of the 20 in reſerve ſhould attack the paſſes, and alſo the heights; the remaining four will march under cover of the mountains, ſuſtained by a brigade of infantry and eight ſquadrons, in order to attack the cavalry on the right; thus of the whole front of the enemy's army, there will remain only the village that hath not been attacked, unleſs there hath been ſuch a number of troops drawn from it, as to render the carrying of it not difficult. It is to be ſuppoſed that one of theſe attacks will ſucceed; that made by the columns ſooner than the reſt: the diſpoſition of columns intermixed with cavalry is very formidable, becauſe each body is ſupported without confuſion: beſides, it is to be ſuppoſed that a column four battalions in depth, and from 18 to 20 men in front, ought to break through a line that is only four deep, and which being once penetrated, the cavalry will find no difficulty in breaking through it. See Plate DXXIII.

Offenſive Operations.

The movement of the infantry to form itſelf in column, and the evolutions of the cavalry to fill up the intervals of each column, ought to be performed with great quickneſs, and near enough to the enemy to ſurpriſe him, but not at ſuch a diſtance as to give him time to remedy it.

The nature of the ground, which is continually changing, cannot be followed through all its various ſhapes; the author from whoſe work we take this article hath therefore endeavoured to form his diſpoſitions in thoſe ſituations which moſt ordinarily occur, in order that theſe general diſpoſitions may be aſſiſtant to the ideas in more particular and critical ſituations. Mountainous countries have not been mentioned, becauſe it is very rare that they preſent an opportunity of coming to a general action: the affairs which happen among them are generally with regard to ſome poſt, which can never decide the fate of an army, however briſk they may be. The four diſpoſitions now mentioned are ideal; and although the propriety of them may be defended, it would be very imprudent to anſwer for their ſucceſs; becauſe with regard to the buſineſs of war, the whole depends upon circumſtances, and the leaſt accident often renders a diſpoſition, ſeemingly the beſt, the moſt prejudicial that can be taken. A motion of the enemy's troops ill conducted by their commanders, too much ſloth or too much eagerneſs in the execution of orders, an accidental word falling from the mouth either of an officer or a ſoldier, and which is always increaſed when told again, may occaſion the defeat of an army, however well diſpoſed or advantageouſly ſituated. The epithet "beſt" ſhould be given to that general who commits the feweſt faults; for

Petite Guerre.

there is no man who can flatter himſelf with having committed none: it is impoſſible for a general to ſee every thing himſelf, or to remedy any unforeſeen accident that may happen, if he is not aſſiſted by his general officers, who ſee things which it is impoſſible he can: they ought not only to be the means of putting his orders in execution: but even, in certain circumſtances, they ſhould prevent them, and make the ſame diſpoſitions which the general ought to make, and would certainly order, were he in their ſituation.

Petite Guerre.

PART III. Of the PETITE GUERRE.

THE Petite Guerre conſiſts in the manœuvres of the Partiſan in ſecret marches, occupying, defending, or attacking poſts, reconnoitring countries or the enemy, placing of ambuſcades, &c.

SECT. I. *Of the Qualifications of a Partiſan, and the Nature of his Corps.*

THEY generally call every officer a partiſan who is deſtined to go at the head of a detachment, whether draughted from the body of the army, or of a party which he belongs to, and for that reaſon has no other name than that of a partiſan.

Of all military employments, there is none which requires more extraordinary qualities than that of a partiſan. A good partiſan ought to have an imagination fertile in projects, ſchemes, and reſources; a penetrating ſpirit, capable of combining the whole circumſtances of an action; a heart intrepid againſt every appearance of danger; a ſteady countenance, always aſſured, and which no ſigns of diſquiet can alter; a happy memory, that can call every one by his name; a diſpoſition alert, to carry him through every thing, and give a ſoul to the whole; a piercing rapid eye, which inſtantly catches faults or advantages, obſtacles and dangers of ſituation, of country, and every object as it paſſes; his ſentiments ought to be ſuch, as to fix the reſpect, confidence, and attachment of the whole corps. Without theſe diſpoſitions, it is impoſſible to ſucceed.

A partiſan ought to ſpare nothing to be aſſured by his ſpies of the march, force, deſigns, and poſition of the enemy. As chief, he owes the example of an irreproachable conduct to his corps, by which he will inſpire reſpect, love, zeal, and vigilance, and gain the hearts of the whole to his ſervice. It is extremely dangerous for ſuch an officer to contract the leaſt attachment to women, wine, or riches. The firſt makes him neglect his duty, and frequently occaſions the moſt ruinous treacheries: the ſecond leads to dangerous indiſcretions, and is ſure to draw down contempt: the third leads to guilt, and deſtroys all ſentiments of honour. The partiſan muſt be content without the delicacies of the table, as he may be often expoſed to want proviſion; his bed the ſame with the mens, a cloak and ſtraw, never ſtripping but to change linen. Nothing animates ſoldiers ſo much as the preſence and vigilance of a commanding officer ſharing with them the fatigues of the ſervice: the officers follow his example; the men are aſſured, encouraged, and content.

A corps capable of carrying on the Petite Guerre to advantage ſhould be compoſed of infantry and cavalry; and as it is inconteſtable that the cavalry ought to be the moſt active in carrying on the Petite Guerre, it were to be wiſhed that they were likewiſe the ſtrongeſt, ſo as to have 600 cavalry and 400 infantry in a corps of 1000 men, making four companies of infantry and twelve troops of cavalry.

The commanding officer ſhould have the naming of the officers of this corps, or at leaſt have liberty to reject ſuch as he is convinced are not qualified for ſuch ſervice, as every officer who may be ambitious to ſerve in the corps, tho' poſſeſſed of great military merit, may not have the talents requiſite for the duties of the partiſan.

To ſupport the honour of this corps upon a ſolid and reſpectable footing, the ſtricteſt ſubordination muſt extend from the chief to all the officers, and the moſt rigid diſcipline inſpire vigilance, patience, bravery, and love of glory, to the whole corps.

It is of the utmoſt importance for the officer that commands, to have the chooſing his men and officers whom he knows to be fitteſt for his enterpriſe, and thereby preventing many difficulties, contradictions, and dangers, which jealouſy and diſtruſt always occaſion among ſtrangers.

No recruit for the corps of a partiſan, either cavalry or infantry, ſhould exceed 30 years of age; but the younger they are, if they can carry arms, ſo much the better for ſuch a ſervice, to which youth is particularly inclined. In the choice of recruits for the cavalry, it were not unworthy the attention of officers to prefer men that are lovers of horſes, and to recruit chiefly in thoſe countries where ſuch are moſtly to be expected.

As for arms, the firelock and bayonet are ſufficient for a foot ſoldier; and in the corps of the partiſan, barrels of 36 inches, with a long bayonet, but to have the caliber the ſame as that of the reſt of the army, which, for the ſake of having ammunition made up to ſuit the whole, ought to be invariably the ſame. A helmet likewiſe is preferable to a hat, as the ſword is almoſt the only thing to be dreaded from the enemy's cavalry. Four ſpades and four pick-axes ſhould be given to each company of infantry.

The preſent manner of equipping the light dragoons is ſo perfect, it is unneceſſary to ſay any thing on that head; but no white horſe, ſtone-horſe, or mare, ſhould be ſuffered in the corps of the partiſan, as the leaſt neighing or perceivable colour may make enterpriſes fail. No horſe ſhould be mounted for ſervice till ſix years old. The ſize of the light dragoons is very proper for the partiſan; and while they have firm ground to act upon, and plenty of forage, none can excel them; but when they come among moraſſes, and feel the ſeverity of want, perhaps the Hungarian huſſars may be found more equal to the duty: poſſibly, therefore, in forming the corps of the partiſan, 200 horſe, ſuch as are bred in the mountains of Wales or Scotland, mounted by the lighteſt men, might be found of good ſervice.

The principal attention of an officer of cavalry ſhould be, to ſee that the men feed and dreſs their horſes well. During the whole campaign, they ſhould have dry food only, as green weakens them. When the exigency of the ſervice requires the horſes to be kept ſaddled day and night, every horſeman ſhould ſeize ſome moment to turn the ſaddle-cloth, which greatly comforts a horſe, keeps him at eaſe, and leſs apt to gall; and care ſhould be taken to keep the cloth ſoft, and clean from ſweat and duſt.

SECT. II. *Of Poſts, &c. and the different Works with which they may be fortified.*

POSTS are generally ſuch places as bodies of troops can fix in when detached from the army, to cover and ſecure the frontiers; and upon the vigilance and reſiſtance of the parties

Petite Guerre.

parties that are detached there, depends the ſafety of the army. Whatever the abilities of a general may be, it is ſcarce poſſible that he can have an eye to every detail that contributes to their defence; it is ſufficient if he knows that the guards are properly placed, and the line that they make properly eſtabliſhed. It is then the buſineſs of the particular officers who command them, to make the beſt diſpoſition for a vigorous defence, and anſwering the views of the general.

An officer who is detached to a poſt, is either to relieve a party, or to take poſſeſſion for the firſt time. In the firſt caſe, if the guard which he relieves, happens to be entrenched, as ſoon as he arrives at the poſt, and has taken his inſtructions from the officer who commands, he ſhould prepare himſelf for his defence, as ſhall be mentioned in that article. In the ſecond, if an officer who is detached is to entrench himſelf, he muſt examine if the place is advantageous for the execution of his projects, the defence of his people, and the ſecuring a retreat.

He muſt conſult, 1ſt, Whether the ſituation be convenient for ſending parties to diſcover the enemy; whether to give intelligence of their ſituation and march, or to diſturb and ſurpriſe them. 2d, If it has ſome natural defence on its front or flanks, ſuch as a river, rivulet, moraſs, or ſmall wood that can be eaſily penetrated. 3d, If he can preſerve his communication with the army, and if there are ſome covered places to favour his retreat. 4th, If he can diſcover all the approaches; becauſe if the enemy can come within a ſmall diſtance of the poſt without being ſeen, he will place himſelf under cover there, and reſt while the beſieged are obliged to remain continually under arms, and will watch the moment for making an attack. If then he finds hollow roads, clumps of wood, or any place where the enemy can ſecure himſelf in the neighbourhood of his poſt, he muſt fill them up, or guard them with detachments of ſix or ſeven men. 5th, He muſt take care not to be commanded by any neighbouring heights, or muſt prevent the enemy from profiting by that advantage: becauſe if they can take his ſoldiers in the rear, it will be impoſſible for them to defend themſelves. 6th, The extent of the work muſt be proportioned to the number of men that are to defend it. Good ſenſe and numberleſs examples prove, that too large entrenchments can only be defended by conſiderable bodies. 7th, He ſhould take care to have all the parts of his entrenchment nearly of an equal ſtrength, ſo as to be able to make an equal reſiſtance everywhere; and, laſtly, He will take care to fulfil exactly the intention of the general in poſting a guard in that place.

There are ſome places ſo advantageouſly poſted by nature, that though they are not fortified, they may in a ſhort time, and with little charge, be made ſo ſtrong, that it will require as much art to beſiege them as many others that are perfect fortifications; ſuch as iſlands, peninſulas, and places ſeated on eminences of difficult acceſs, or in moraſſes.

If the poſt is in a level country, or upon a height that may be ſurrounded, as happens almoſt always to ſmall detachments, they ſhould conſtruct a redoubt, or ſmall ſquare fort, compoſed of a parapet with its banquette and ditch.

Plate DXXIV.

The ground being choſen, you muſt trace a ſtraight line AE (fig. 1.), and raiſe the perpendicular BC, as directed in practical geometry; obſerving to give to each of theſe lines which mark the interior ſide of the parapet but two toiſes, or two and a half for 30 men, four toiſes for 50, and eight for 100; which will leave a ſpace of two feet at leaſt againſt the parapet for each man. Having traced the two firſt lines A, B, you muſt put the cord over the picquet C of the perpendicular B, and with the ſame length trace the arch D, then put the cord over the picquet E of the line A, and trace the arch F. The point where the arches interſect each other, is the point to end the lines EH and CG. Theſe four lines mark the interior ſide of the parapet.

Petite Guerre.

Then trace four other lines at the diſtance of two or three feet parallel to the firſt, as I, L, M, N, to mark the ſize of the banquette, which ſhould be greater or leſs according to the number of ſoldiers you would place in a file. Then trace a third parallel ſquare on the outſide of the firſt, as O, P, Q, R, to mark the exterior ſide of the parapet, and to determine its thickneſs, which is uſually eight or nine feet, or 18 if it is to reſiſt cannon, which you ſhould always be prepared to do.

Then trace a fourth and laſt ſquare STVX, to determine the width of the ditch, which is the ſame or two feet more than the thickneſs of the parapet: leaving a picquet planted at all the angles, as likewiſe at the lines already traced, ſo as not to loſe the points from whence the lines were drawn.

While you are employed with two or three men in tracing, five or ſix men ſhould be ordered to cut down the trees that are in the neighbourhood of the poſt, not only to open the approaches, but to ſerve for conſtructing the intrenchments. The ſmalleſt branches ſerve to make faſcines, which are a ſort of faggots about ſix feet long, two feet thick, and of the ſame ſize all over, tied in the middle and at the two ends, to ſerve for ſupporting the earth, which would tumble down without that ſupport. The middling branches ſerve to make picquets proper for mixing with the faſcines, and fixing them in the ground, or one above another to raiſe the parapet. The trunks to which the large branches are left, ſerve to increaſe the ſtrength of a poſt, as ſhall be mentioned afterwards.

Having traced all in the manner directed, fix a row of faſcines upon the ſmall ſquare ILMN, to ſupport the earth of the banquette; then fix a ſecond row upon the ſquare ABGH, to ſupport the interior ſide of the parapet; then a third row on the third ſquare OPQR, to ſupport the exterior ſide of the parapet. You ſhould obſerve in the beginning to picquet the faſcines, to leave a paſſage of three feet PB, on the ſide leaſt expoſed to the enemy, to ſerve for an entry to the redoubt; but if this paſſage can be taken in a ſtraight line, it ſhould be made like a mortoiſe, as you ſee at Y, fig. 2.

After having picqueted the three rows of faſcines as directed, you muſt dig the ditch AB, as in the profile, fig. 3. a foot diſtant from the exterior ſide of the parapet. This diſtance or breadth is called *berme*, and ſerves to ſupport the earth, or receive what falls from the parapet by the enemy's cannon. This *berme* is more or leſs according to the ſolidity of the earth; the earth to be thrown into the intervals C, D, E, marked for the parapet and banquette, taking care to make the men tread it well down, and obſerving to leave a *talus* or ſlope on the two ſides of the ditch FG, more or leſs according to the conſiſtence of the earth, ſo that it may not tumble down. The ſlope F, which is on the ſide of the redoubt, is called the *ſcarp*; and the oppoſite ſlope, which is next the country, is called the *counterſcarp*. Care muſt be taken in picqueting the faſcines with which the parapet is raiſed, to bring them nearer one another by degrees in raiſing it as at H, ſo as to leave the ſame ſlope on each ſide. The diſtance DE marks the banquette; the diſtance DC the thickneſs of the parapet at the bottom; the diſtance IL the thickneſs of the parapet at the top; MN the width of the ditch at bottom; AB the width of the ditch at top.

If the ground is level, the banquette of this work muſt be

Petite Guerre.

be raiſed two feet; but in low places two banquettes are neceſſary, the one above the other like ſteps: but if this banquette is raiſed on account of ſome neighbouring heights from whence you may be taken in the rear, the parapet muſt be raiſed to ſuch a height, that the enemy's ſhot can no longer plunge down upon you. A ſlope muſt be left on the top of the parapet, as IL, ſo that the ſoldiers may ſee round the poſt, and fire eaſily towards the country at O.

Though the ſquare form of a redoubt, which we have given the method of conſtructing, is almoſt the only one uſed in the field, yet it has its faults, which ought to make it be rejected, at leaſt for thoſe poſts which ought to defend the environs equally. Experience ſhows us, that we ought never to depend on the oblique firing of muſquetry, as the ſoldiers almoſt always fire right forwards, as at A, fig. 4. and often even without taking aim. This being the caſe, there are large ſpaces oppoſite to the angles of the redoubt at B that are not defended, and where we may ſay that the enemy remains in ſafety. The chevalier Clairac propoſes an excellent method to prevent this inconvenience, by conſtructing the interior edge of the parapet like the edge of a ſaw, in form of ſmall redans, to hold a man or two in each ſide, fig. 6. which by the croſs fire takes the enemy on the two flanks, ſo that there are no approaches but what are defended; but the conſtruction of this redoubt is too tedious and complex to be executed by ſmall detachments.

The ſame author prefers conſtructing circular redoubts as at C, fig. 5. becauſe all the points of the circumference being equally diſpoſed, the ſoldier poſts himſelf indifferently over all; and the exterior ſpaces D which are defended, varying every moment, the enemy is nowhere in ſafety.

The circular redoubt, then, is the moſt perfect that can be conſtructed: but where a road or the edge of a river, is to be defended, the ſquare, or long, or triangular redoubt, is preferable, becauſe they ought the oppoſe the faces of the intrenchment as parallel as poſſible to the places they are to fire at, obſerving always to round the angles.

To trace a circular redoubt, after fixing the central point of the poſt, let a picquet be fixed in that point, and draw from it as centre the circle EE, with a length of cord in proportion to the number of the party, to mark the interior ſide of the parapet; then trace another within the firſt, at the diſtance already given, to mark the banquette; then trace a third FF, to mark the exterior edge of the parapet; then trace a fourth GG, to mark the width of the ditch; which being done, picquet the faſcines, and make them take the bend of the circle, finiſhing as in a ſquare redoubt.

If an officer is poſted with a detachment on a paſſage or before a bridge, in a defile, or oppoſite to a ford, he may make a parapet either bending or ſtraight, with a banquette or ditch which ſhould ſhut up the whole entry; or he may make a redan, which is a work with two faces, and in ſuch a ſituation ſhould be made with a re-entrant angle (that is, the angle pointing from the enemy); taking care when he is to guard a ford, to conſtruct it ſo near the river that the enemy cannot have room to form after they have paſſed. A deep ditch may be dug oppoſite to the ford, into which they ſhould let the water of the river paſs; they may likewiſe make the banks ſteep; throw trees acroſs, and ſcatter chauſſe-traps, which are inſtruments of iron with four ſpikes, made ſo as to have always one point erect.

The ſtrength of a redoubt or any other work may be augmented by blocking up the paſſage that leads to it, ſurrounding the poſt with felled trees, and ſinking their trunks three or four feet deep in the earth, which muſt be dug on purpoſe, leaving a number of large branches on them, which muſt be ſharpened at the ends, and the leaves taken away, and placed as near to one another as poſſible, ſo that the branches may mix, and taking care that they incline towards the enemy. Two or three rows may be made in this manner; but they ſhould be at leaſt two toiſes diſtant from each other, that the enemy may not burn them all at once to approach the entrenchments. M. Saxe in his Reverie ſays, that redoubts are proportionably advantageous as they take leſs time in conſtructing, and are proper for numberleſs circumſtances, where one often may ſerve to ſtop an army in a cloſe country, hinder them from troubling you on a critical march, or to occupy a large ſpace of country when you have but few troops.

Petite Guerre.

There is no need to mention large works which require engineers to conſtruct, and great bodies to defend them, as theſe have been deſcribed under the article FORTIFICATION; but a redoubt, ſuch as A, fig. 7. may be ſtrengthened by filling the ditch with water, by turning a rivulet, or cutting a river or pond. If the ground is uneven, ſo that the water cannot be put equally in all parts of the ditch, dams ſhould be left in digging at C; or little traverſes of earth to form banks proper for keeping the water in the upper part of the ditch D, from whence it may be let run into the lower E. Theſe banks ſhould have but half a foot in thickneſs at the height D, which ſhould be raiſed ſharp; but a good deal more muſt be left below at E, by ſloping the two ſides pretty much. Dams likewiſe are made of planks or boards, as at F; but they muſt be ſtrong, and ſupported by large ſtakes, ſo that the body of water above may not overturn them; and then they are reckoned preferable to thoſe that are of earth; but a more particular explanation of this figure may be of uſe.—A therefore is the ground within the redoubt. B, The bottom of the ditch. C, D, E, Dam of earth. F, Dam of planks, boards, or faſcines. G, Upper part of the redoubt conſtructed of faſcines, and the earth dug out of the ditch. H, The lower part of the redoubt dug in the earth. I, The berme or ſpace left at the bottom of the parapet to ſupport the earth. L, The entry of the redoubt. M, The inſide of the parapet. N, The upper part of the parapet. O, The banquette. P, The glacis. Q, Rivulet from whence water may be let into the ditch of the redoubt.

BUT it is not with the works alone which have been already mentioned that an officer may fortify a poſt; there are an infinity of ways to ſtop an enemy, to tire him, and even to repulſe him, with which it is neceſſary that every commander ſhould be acquainted.

All the ſchemes for oppoſing the enemy, of which we have given a detail, ſerve only to add to the exterior ſtrength of poſts; there are others which have ſome natural fortifications, ſuch as churches, church-yards, mills, or farm-houſes, &c. An officer who is ſent to a poſt of this kind, which is detached from other buildings, ought, before he begins to work, to make the inhabitants go out, and the magiſtrates of the neareſt place receive and lodge them. He ſhould then entrench the houſe with a turning parapet, if he have people enough to defend it; but if he have only a few, he ſhould make a breaſt-work of felled trees round the houſe, eſpecially oppoſite to the angles, to prevent the enemy from undermining it. He muſt likewiſe take off the tiles and ſlates, leſt the enemy ſhould get up by ladders, and cruſh his people that are within. If the houſe is covered with thatch, it ſhould be pulled off and burnt, as well as every thing combuſtible that can be found in the neighbourhood, leſt the enemy make uſe of it againſt the houſe.

Though the houſe is ſurrounded with a parapet of felled trees, yet the walls ſhould yet be pierced with loop-poles,

Petite Guerre.

about a foot from the ground, ſo as to diſcover the enemy's legs, that they may not get footing on the outſide. Theſe loop-holes ſhould be four inches wide, and three feet diſtant from one another; and a little ditch ſhould be made a foot and a half from the wall within the houſe, to place the ſoldiers in who are to defend it. Other loop-holes ſhould likewiſe be pierced ſeven or eight feet from the ground, oppoſite to the interſtices of the lower ones, and of the ſame width, placing the ſoldiers that are to defend them upon tables, planks, or ladders; and taking care to pierce a greater number oppoſite to the avenues, before, and at the ſides of the gate, and the angles of the houſe, becauſe theſe are the places where the enemy uſually makes his greateſt efforts. If the houſe has an inner court, the walls ſhould be pierced which incloſe it, ſo as to fire upon the enemy after he has made himſelf maſter of it. If there are ſeveral gates, they ſhould all be blocked up except one, to be left for an entrance to the poſt, which ſhould be made ſo as to admit but one man at a time.

If there is a broad ſtaircaſe for going up to the firſt floor, it ſhould be broke down, or blocked up with ſtones or caſks filled with earth. If it is a winding ſtair, the wall ſhould be pierced in different places with loop-holes, to fire upon the enemy that are already entered, keeping ladders for the troops defending the houſe to get up to the firſt floor, which ſhould have the boards pierced with a number of holes about four inches diameter, to fire down upon the enemy, obſerving to pierce them only where there are no trees below, but to have a greater number over the door and other weak places which the enemy can force. A poſt entrenched in this manner may reſiſt a great while, and even tire out the beſiegers if defended by reſolute men.

Captain d'Enferney of a French regiment, with a company of volunteers, in the campaign of 1748, took poſt in the church of Bevera, two miles from Ventimiglia. It is detached from other buildings, and he fortified it with a parapet and ditch full of water; but his entrenchment was commanded by ſome houſes in the village, ſo that the enemy could fire down upon his party. He remedied this defect by covering the commanded part with a kind of blind made with rafters, leaning with one end on the wall of the church, and the other upon poſts raiſed a foot higher than the top of the parapet, which left room to fire through. This blind, covered with faſcines and earth, prevented the enemy's fire from piercing, and did not prevent his firing upon them, ſo that they durſt not attack him.

This example is mentioned to ſhow how to ſecure a poſt that is commanded by a height. When there is no redoubt or entrenchments of earth, the interior ſide of the parapet which is commanded ſhould be raiſed, or a ſort of penthouſe ſhould be made with rafters, placed perpendicularly againſt the inner ſide of the parapet, upon which planks or faſcines are nailed, taking care to leave room between the bottom of the penthouſe and the top of the parapet for the men to fire through.

If an officer has not time to oppoſe all the ſchemes which have been mentioned to the enemy, when the general wants to make a forage, and throws infantry into the houſe to form a line, he ſhould immediately place a couple of trees acroſs before the door, pierce the boards, ſhut the windows, and prepare for his defence, which gives time to the foragers to retire, and the ſupporting parties to advance.

The fortification of villages, if they conſiſt of ſcattered houſes, differs nothing from the fortification of a few contiguous poſts, between which a communication is to be preſerved. If they conſiſt of houſes collected, the commander muſt proceed upon the principles laid down in another article. See FORTIFICATION.

Petite Guerre.

SECT. III. *Of going on Detachments and Secret Marches.*

DETACHMENTS are particular bodies of ſoldiers detached from a greater body, to guard a poſt, or to go on an expedition.

When an officer is ordered on a detachment, he ſhould provide himſelf with a cord regularly divided, in caſe he has occaſion to entrench; and be at the parade by times, to get information from the brigade-major, whether he is deſtined to relieve a detachment, or to occupy a poſt for the firſt time. If to relieve a party, he is only to know where the guide is who is to conduct him; the guide is a ſoldier, ſent by the officer who is to be relieved, as orderly-man to the major-general, who by having been at the poſt before can lead a new detachment to it.

If it is a poſt that is to be occupied for the firſt time, the officer is to aſk the brigade-major for inſtructions relating to its defence; which being got, he muſt inſpect his party, and take care that every ſoldier is properly equipped; his firelock loaded, freſh primed, and a good flint well fixed; his cartouch-box filled with cartridges: and that he carries proviſion for 24 hours, which is the time that detachments commonly continue, and are not allowed to go away to eat. Care muſt be taken to have ſpades, pick-axes, hatchets, and wood-bills, one or two of each kind; and if any thing is wanting, to apply to the brigade-major for it, that they may have every thing neceſſary for entrenching.

When an officer has inſpected his party, he ought to get information from his guide whether the way is broad or narrow, open or encloſed; if the enemy's poſts are near; if they go on patroles, or ſee their parties in the day; and, laſtly, if he is to paſs mills, farms, manors, &c. and from theſe informations take the neceſſary precautions for his march.

When the whole are ready to march, the advanced guard A (fig. 8.), which ſhould conſiſt of cavalry only, ſhould ſet out. It is ſurpriſing that all the authors who have written on this part of the art of war, having neglected to ſhow ſufficient attention to ſo eſſential a point: the greateſt part are ſilent, and the reſt paſſing ſlightly over the different duties of this corps, are content that it ſhould be compoſed of infantry; though, on the leaſt reflection, in the moſt ordinary caſes of a ſecret march, reaſon muſt determine that none but cavalry ought to be placed there, whether it be to ſtop paſſengers who may diſcover your route, or ſuddenly to attack an advanced guard of the enemy whom they meet face to face, or to haraſs their corps, in order to gain time for your own to form: it is inconteſtable, that for all theſe purpoſes, cavalry has greatly the advantage of infantry: who are by no means capable of running here and there to ſeize paſſengers, or of pouring ſuddenly on an advanced guard of the enemy; or of reſiſting their cavalry a moment in caſe of a ſudden rencounter, when they muſt expect to be thrown down and trod under the horſes feet, and the corps attacked before the commanding officer has had a moment to prepare for his defence. Plate DXXIV.

As examples ſerve beſt to illuſtrate opinions that have been ſeldom declared, the ſpirited behaviour of Cornet Nangle of the 15th regiment of light dragoons merits our particular notice, and will ſerve as a proof of the great advantage of having the advanced guard of cavalry. In the campaign of 1761, when the French army under the command of Marſhal Broglio and the prince of Soubiſe were retiring towards Hoxter, where they paſſed the Weiſſer, Prince Ferdinand followed cloſe after them for ſeveral days, and

Petite Guerre.

and on the evening before they gained the paſs over the river one of Prince Ferdinand's German aid-de-camps deſired the grenadiers and Highlanders who were in front, to puſh on and take ſome of the enemy's baggage, which was a little way before them and but weakly guarded. They were immediately formed, and marched in a hurry over a plain with a thick wood in front, which they were told was clear, and had got within 400 paces of the enemy's baggage, when ſeveral ſquadrons of French dragoons ruſhed ſuddenly out upon them from the ſkirts of the wood upon both flanks, and were hewing them down without mercy, when Cornet Nangle with an advanced guard of 20 men coming up the hill, got ſight of the attack, and inſtantly ruſhing on, charged the French cavalry, who, ſtartled at the briſkneſs of an attack which they were not expecting, immediately reined back; when the reſt of the regiment getting in view, came on; and attacking the French, drove them off, having killed and wounded a few, and taken ſome priſoners. The determined bravery of this young officer with his 20 men ſaved a great number of the grenadiers and Highlanders from being cut to pieces, and ſhows what may be effected by the ſudden attack of an advanced guard of cavalry.

An advanced guard by night ſhould be of double the force of one by day. In an open country, it is a matter of indifference at what diſtance they advance, provided they keep in view of the commanding officer, who ſhould continually obſerve them: but in covered places, and in the darkneſs of the night, they ſhould not be more than 50 paces diſtant.

This advanced guard ſhould have an advanced corporal B, with ſix horſemen divided into three pairs; one in the centre B, the two others out of the road on the right and left at CC, to examine as wide as poſſible, ſilently and attentively ſearching all hollow and covered places, taking care that there is nobody lying on the ground, or hid in dry ditches, behind trees or buſhes. At the ſame diſtance of 50 paces upon the flanks of the corps, ſhould march two wings DD, conſiſting of eight or twelve horſemen, each according to the ſtrength of the corps, led by a non-commiſſioned officer. They can haraſs an enemy who may happen to ruſh ſuddenly out of ambuſcade, and give time to the corps to form. Each wing to detach two men EE, keeping 50 paces wide from the others, and preſerving the ſame route as exactly as the face of the country will permit. At the entrance of the wood NN, the horſemen ſhould ſpread, and cloſe again at coming out, and do the ſame at meeting any little hills, to examine them on both ſides. When they perceive any traces of a party, they ſhould immediately communicate it from one to another, till it comes to the commanding officer.

The advanced guard ought to march ſlowly, and the commanding officer at the head of the corps ſhould follow at the ſame rate, ſo that the rear of the detachment may not be obliged to gallop. As the rear-guard H is only eſtabliſhed for form, there is no need of its being numerous. The officers and quarter-maſters ſhould be careful to keep the men from ſleeping, as a horſe is eaſily hurt under the irregular motions of a ſleeping rider, which retards the march. The whole corps ſhould be forbid to ſmoke or ſpeak; and if any one is obliged to cough or ſpit, let him cover his mouth ſo as to make no noiſe.

When the corps is numerous, the cavalry ſhould march by ſquadrons, the infantry by platoons, to follow alternately, ſo that each platoon of infantry FFF may march at the head of a ſquadron of cavalry GGG; which diſpoſition will preſerve the whole at an equal pace, and keep them readier to form in caſe of meeting the enemy, or being ſuddenly attacked, as we are about to mention.

Petite Guerre.

When the advanced guard perceives an enemy at a diſtance, whether it is day or night, they ſhould not purſue them, for fear of falling ſtupidly into ſome ambuſcade, if it is not in a country that has been well examined; but if they meet them ſuddenly face to face, as may happen at the entrance of a hollow way I, opening obliquely upon them, then the advanced guard, without deliberating about their ſtrength, ſhould inſtantly ruſh upon them. This manœuvre cannot fail againſt infantry, and gives a great advantage in a rencounter with the cavalry; but if the advanced guard falls back, they expoſe the whole body to be defeated with them.

When the commanding officer ſees the action of his advanced guard, he will inſtantly turn the infantry on the ſide of the road moſt proper to protect them from the enemy's cavalry, and will form them quickly at the ſide LLL, or on ſome neighbouring height MM. If it is day, they ought to face the cavalry, ſtooping down till the inſtant of the attack, while the firſt ſquadron advances to ſuſtain the advanced guard. If the enemy appears deſirous to renew the charge, and obſtinate in diſputing the paſſage, he may make uſe of a feint, and by falling back bring them oppoſite to his infantry, who will have them in the flank, and by a well placed fire put them inſtantly in diſorder. His cavalry profiting by this, muſt immediately face about, and fall upon them with all poſſible violence; which cannot fail to complete their defeat.

All villages, hamlets, and houſes, ſhould be avoided, eſpecially by night (which is the moſt common time for the partiſan), to avoid being diſcovered by the barking of dogs, or being ſeen by peaſants who can inform the enemy. You will ſee equally how dangerous it is to keep the great roads by day, or to croſs places that are too open in an enemy's country.

If you cannot avoid paſſing through a village, it ſhould be done in a hurry, marching confuſedly, very cloſe, and filling up the whole breadth, by which you will conceal your ſtrength from the peaſants; ſome officers ſhould remain at coming in, and in the rear, till the whole are paſſed, taking care that no one ſtops or withdraws. The ſame care ſhould be taken at every road that opens upon your route. At the approach of every place that is covered or hollow, ſuch as houſe, wood, gully, &c. they ſhould halt till it is well examined, and continue attentive in paſſing it.

At the paſſage of defiles, bridges, or fords, the advanced guard ſhould ſtop at 100 paces, and form till the whole corps is paſſed and in order. The ancients employed dogs to diſcover the enemy in ambuſcade; but it will be well to diſtruſt ſuch ſpies, and to ſuffer none with the corps, as there is nothing more dangerous; their diſpoſition leading them to bark at meeting the leaſt animal, they will furniſh the enemy with a thouſand opportunities of obſerving you, before you can know where they are.

You ſhould always detain the guides that were taken at ſetting out; but if neceſſity requires another, the quarter-maſter ſhould go and take one without making a noiſe, and lead him a round-about way, that none of the peaſants may diſcover either your party or route. If any of the party diſcover paſſengers in ſight of the march, they ſhould be ſtopped and brought to the corps, and care taken to prevent their eſcape.

The party ſhould never refreſh in a village, but in a wood by day, and open country by night, cauſing every neceſſary to be brought to them from places in the neighbourhood, which ought to be received from the peaſants at a diſtance,

ſo

Petite Guerre.

ſo that they can neither diſcover the number nor quality of your corps. During the whole time of ſtopping, you ſhould not be ſparing of ſentries, and have always ſix horſemen ready to ſecure any perſon by whom you imagine you are perceived; when their number becomes conſiderable, they ſhould be tied together, and great care taken that none eſcape till the ſtroke is ſtruck. The officers ſhould be equally attentive that no ſoldier gets out of ſight; and if they meet a deſerter from the enemy, he ſhould be conducted immediately to the corps, and then to the army, under the care of a non-commiſſioned officer.

When neceſſity obliges you to ſtop in the neighbourhood of ſome farm or hamlet, you muſt take poſſeſſion of it, and carry off the farmer or chief of the place at going away, threatening to kill him and ſet his houſe on fire if any one ſtir from the place before he is releaſed. Every horſeman ſhould take care to have a ſpare fore ſhoe, and a peck of oats.

If an officer of the infantry marches a detachment to relieve a poſt at a diſtance, he ſhould not mount his horſe till out of ſight of the camp, and ſhould diſmount on coming in ſight of the poſt; but if it is only about a league diſtant from the army, and near the enemy, it is better to go on foot, ſo as to be leſs encumbered in caſe of engaging with any parties of the enemy. The men ſhould not be preſſed too much for fear of lagging in the rear, but ſhould march cloſe without ſtopping, and in as many files as the roads will permit, keeping profound ſilence, that they may hear any orders that are given.

An officer who marches at the head of a party, ought to keep exact order and profound ſilence, that they may be in a ſtate to execute whatever he may order for their defence; but in giving his orders, he ſhould take care to do it with a firm and determined countenance, ſo as to make the ſoldiers think that he is ſure of what he is about, and that nothing better can be done. When the men ſee their officer heſitating, or varying in his orders, they imagine he does not know what to do; and ſeeing him diſordered, they become ſo. It is upon ſuch occaſions that an officer ſhould be ſteady to reſtrain his party, and make them inſtantly obey. The danger is greater on a march than in an attack. Here the ſoldiers have their arms in their hands; and, ſeeing the enemy before them, are ready to engage. It is otherwiſe on a march; they are leſs upon their guard, and have not their arms in readineſs: then, ſays Vigetius, an attack confounds them, an ambuſcade diſorders them. An officer ought therefore to take every precaution in examining, by his advanced guard, all places that may conceal any of the enemy.

But as the greateſt precaution cannot prevent an officer on a march from being attacked, it is neceſſary, as ſoon as he perceives the enemy, to obſerve if the party is ſuperior to his detachment; whether it conſiſts of cavalry or infantry, or both together. If it is cavalry, and ſuperior, there is no neceſſity of being diſcouraged; but, on the contrary, he ſhould profit by every advantage that offers, by gliding into land that is furrowed, uneven, cut, and difficult or inacceſſible to cavalry; or if the country is incloſed, he ſhould line the hedges, and cheer up his ſoldiers by ſome encouraging language, while he diſpatches a truſty fellow with advice of his ſituation to the general. If the enemy march up to him in this ſituation, he muſt do all that he can to ſuſtain the attack, by ordering his party not to preſs upon one another, to keep up their fire, and not to diſcharge their pieces till they are at the muzzles.

Petite Guerre.

When you have the advantage of rocks or other obſtacles to the acting of cavalry, continue the route as near as poſſible, keeping the party cloſe, and always ready to receive the enemy. If the number of the enemy's cavalry do not exceed your party, you may continue your route; and keeping your men cloſe together and prepared, they will not venture to attack you. If an officer ſees no means of poſſeſſing an advantageous poſt, or of getting to the poſt he was detached to, he can do nothing better than retreat to the camp, along ſome river or wood, to prevent being broken: but if he is ſo cloſely purſued that he cannot avoid being beat or taken, there is no better manœuvre to imitate than that of the Barbets (A); who ſcatter themſelves, and retire from tree to tree, from rock to rock, and deſtroy a party, who can neither beat them, nor take one of them.

The moment of taking poſſeſſion of a poſt is the moſt critical that a detachment can have; officers have been frequently attacked at the very time they thought they had nothing to do but quietly take the neceſſary meaſures for remaining in ſafety.

If the party which arrives at a poſt is to relieve another, the officer that is to be relieved gets under arms as ſoon as his ſentries give notice of the approach of the relief. The detachment being known, they are permitted to enter and occupy the poſt in the room of thoſe that are to depart; at the ſame time, the corporals go to relieve the ſentries, and the officers and ſerjeants give the counter-ſign, with the detail of all that is to be done at the poſt by day or night. He ought likewiſe to get information from the officer he relieves, if the enemy make incurſions in the neighbourhood; if their guards are diſtant, whether cavalry or infantry, and whereabouts placed. After theſe precautions let him guard againſt his poſt being ſurpriſed.

The ſentries being relieved, the officer that is to go out muſt form his detachment, and return to camp with the ſame precautions as in coming. The new detachment remain under arms till the other is gone 50 paces: then the officer is to make them lay down their arms againſt the parapet, putting their havre-ſacks againſt the gun-locks, to prevent duſt from ſpoiling them, or the dew of the night from wetting the powder. In an open country without fortification, the men muſt not go to any diſtance from their arms when they lay them down in the day, and keep them between their knees when they ſit round their fires in the night, with the locks inward to prevent accidents.

Sect. IV. *Of Reconnoitring.*

Parties ordered to reconnoitre, are to obſerve the country or the enemy; to remark the routes, conveniences and inconveniences of the firſt; the poſition, march, or forces of the ſecond. In either caſe, they ſhould have an expert geographer, capable of taking plans readily: he ſhould be the beſt mounted of the whole, in caſe the enemy happen to ſcatter the eſcort, that he may ſave himſelf more eaſily with his works and ideas.

All parties that go for reconnoitring only, ought to be but few in number. They ſhould never conſiſt of more than 12 or 20 men. An officer, be his rank what it will, cannot decline going with ſo few people under his orders; the honour is amply made up by the importance of the expedition,

(A) They are peaſants ſubject to the king of Sardinia, who abandon their dwellings when the enemy take poſſeſſion, and are formed into bodies to defend the Alps which are in his dominions.

Petite Guerre.

pedition, frequently of the moſt intereſting conſequence, and the propereſt to recommend the prudence, bravery, and addreſs of any officer that has the fortune to ſucceed.

It muſt be evident that the ſucceſs of ſuch a commiſſion depends upon ſecrecy, and that it is impoſſible to fulfil the intention without keeping out of ſight of the enemy. It is inconteſtable, that a numerous party cannot glide along ſo imperceptibly as a ſmall handful of men. As theſe detachments muſt finiſh their courſe quickly, it is neceſſary that they ſhould conſiſt of cavalry only; but if they are to go far, they may increaſe each with 30 foot, to remain in ambuſh about half-way in a wood or covered place, with whom the cavalry can leave their proviſion they brought with them.

An officer charged to reconnoitre in front, ſhould take his inſtructions in writing, and ſet out at ſuch time as to arrive at the place proper for beginning his obſervations at day break. Every time that he has occaſion to ſtop, the party ſhould face toward the enemy, and ſend a non-commiſſioned officer with two horſemen to run over the neighbouring heights, and cloſely examine the environs. When near the enemy, avoid ſtopping in a village.

The officer, and geographer who is ſuppoſed to be preſent, ſhould remark every intereſting particular: The heights, woods, ponds, moraſſes, rivulets, rivers, fords, bridges, roads, croſſings, difficult and dangerous paſſages, by-ways, meadows, fields, heaths, gullies, hills, and mountains; the diſtance and ſtrength of villages, hamlets, houſes, farms, and mills; what ſovereign the country belongs to, and what are its productions.

If the enemy comes in ſight, the officer ſhould quickly aſſemble his party, though his reconnoitring be not finiſhed, and let him retire to his infantry, if he placed any; but if not, let him gain ſome other place that he has choſen for a retreat. After being refreſhed, let him go back with the cavalry to finiſh the reconnoitring; but if he was obliged to return quite to the poſt, he ſhould not go back till next day. Mid-day is the time of being leaſt incommoded, as detachments are leſs frequent at that hour. The commanding officer ought always to avoid coming to blows, even though he thinks himſelf ſecure of ſucceſs, unleſs he happen to be on his return, and near to his poſt, ſo that he foreſees the grand guard, hearing the firing, cannot fail to run to his aſſiſtance. If obliged to engage with a party who are cutting off your retreat, and that no other means is left of turning them, you muſt riſk all without heſitating, by ruſhing on, and try to ſave the geographer with the fruits of his commiſſion, eſpecially if the reconnoitring was of importance to the general of the army, and merits the ſacrificing a dozen men, which they can eaſily retrieve on another occaſion.

When a party goes out to obtain news of the enemy, it ought to approach as near as poſſible, but cautiouſly: day-break is not the time proper for ſuch a purpoſe, becauſe at that time the enemy ſend their different parties and patroles to make diſcoveries; you ſhould therefore prevent them by approaching in the night. You may eaſily reconnoitre their poſition and extent by their fires, which they never extinguiſh at the head of the guards and picquets; and you may eaſily remark if they are about to change their poſition, by hearing a more than ordinary noiſe; beſides, as it is eaſy to approach by night, you may diſcover a number of things by the light of the fires.

A partiſan ought not to neglect to reconnoitre every place round his poſt for two or three leagues, or farther, if it is poſſible on the ſide of the enemy; and for that purpoſe he ſhould employ the method of Mr Jeney; who, during the campaigns that he made, often examined the enemy's poſts without approaching, in the following manner, which he recommends as infallible.

Petite Guerre. Plate DXXV.

I ſuppoſe myſelf, ſays he, with my party at Soeſt in Weſtphalia A (fig. 2.), and the enemy poſted at Bervick B, two leagues from me. To know the ſituation of this place without ſtirring from Soeſt, I take the map of the country: and from Soeſt as centre, I draw a circle whoſe circumference paſſes half a league beyond Bervick. I draw a circle of the ſame ſize upon a leaf of paper, to make my plan as in fig. 2. and then place Soeſt in the centre A; and I mark all the villages which I find in the map near the circumference, upon my plan, with the diſtances and bearings as they are repreſented in the map, making uſe of a pencil to mark the places DDD, ſo as to correct the errors more eaſily which the map may have led me to make.

Having thus formed my plan, with a ſcale of two leagues (which is the diſtance I ſuppoſe Bervick), I go to the burgomaſter of the town of Soeſt, where I cauſe ſome of the moſt intelligent inhabitants to come, ſpeaking to them freely, and openly induce them to communicate all the information I have occaſion for.

The better to conceal my deſigns, I begin my reconnoitring by Brokhuſen, a village diſtant from the enemy. I aſk the diſtance from Soeſt to Brokhuſen; if they ſay it is ſeven quarters of a league, I correct the diſtance of my plan which made it two leagues: then I inform myſelf of all that is to be found on the road from Soeſt to Brokhuſen; chapels, houſes, woods, fields, orchards, rivers, rivulets, bridges, mills, &c. If they ſay that at half a league from Soeſt they paſs the village of Hinderking, I mark that place upon my plan. I aſk if the road from Soeſt to Hinderking is croſſed by any other road; if there is any moraſs or heath; if the road is incloſed, paved, or ſtraight; if there is any bridge to paſs, and at what diſtance. I take care to mark every thing in my plan, forgetting nothing, even to mills, buſhes, gibbets, gullies, fords, and every thing that can be got from their informations; which will probably be perfect, becauſe one always knows more than another. I continue my queſtions from Hinderking to Brokhuſen; and advancing by little and little, obſerve the ſame method on the roads of the other villages round, marked DDD. In this manner I cannot fail to acquire an entire knowledge of all the places; beſides, I find myſelf imperceptibly inſtructed in the poſition of the enemy, by ſeeing the different routes by which I can approach moſt ſecretly.

It is plain that ſuch a plan muſt be very uſeful to regulate ſecret expeditions. It is chiefly uſeful, not to ſay neceſſary, for a commander of a party, who can give more ample and preciſe inſtructions to his officers, by accompanying them with a copy of the routes marked out, which they can conſult even in the night, if it happens to be clear; by which they will be guarded againſt being deceived by ignorant or treacherous guides, which occaſion the miſtakes of ſo many who go unprovided with ſuch helps.

There is ſtill another means to ſecure a reconnoitring party; which is, to compoſe them of people who ſpeak the language of the enemy, and give them ſurtouts of the colour of a regiment of the enemy, and cockades the ſame. This ſcheme may be carried ſo far as to line the ſurtouts with the colour of another regiment of the enemy, provided that by turning the ſurtouts, they appear to be a different corps, and deceive guard, ſpies, and peaſants, and confound their reports.

Sect. V. *Of the Defence of Poſts.*

When a partiſan has taken every precaution that prudence ſuggeſts in reconnoitring a place where he would fix

a

Petite Guerre.

a poſt, he is to take poſſeſſion in the following manner. The infantry remain under arms in the middle of the place, the cavalry to patrole without, while the commanding officer, eſcorted by a dozen horſemen, goes to examine the environs to make his arrangements; having ſent ſeveral ſmall detachments before, to cover him in time of reconnoitring.

Having remarked the places proper for his guard, defence, and retreat, as well as the dangerous ones by which the enemy can make approaches ſecretly to ſurpriſe him, he ſhould chooſe the moſt convenient in the front of his poſt to fix his grand guard D (fig. 1.), which muſt face the enemy. He muſt mark the heights for this guard to place their vedettes EEEE, and regulate the number according to the exigencies of the ſituation. In a covered country you muſt not be ſparing of them, and muſt reinforce every guard. At 50 paces before the front of the grand guard, a ſubaltern or non-commiſſioned officer with eight horſemen ſhould be always ready to ſet out at K, to go and reconnoitre, when the vedettes have obſerved any party.

Plate DXXV.

The grand guard being fixed, you ſhould form another in the middle of the village, called the *ordinary guard*, compoſed of cavalry and infantry, placing ſentries at the entries and vedettes all round: the laſt at ſuch diſtance as to ſee one another. A picquet ſhould likewiſe be fixed before the quarters of the commanding officer, which ſhould be near the ordinary guard and the whole corps. In the day, half the cavalry of the picquet muſt keep their horſes bridled and ready to mount; but if the enemy is near, they muſt remain on horſeback, the other half to unbridle till the hour of relief.

According to the arrangement we have given for compoſing the corps of a partiſan, the grand guard may conſiſt of a captain, a firſt and ſecond lieutenant, a quarter-maſter, two ſerjeants, four corporals, a trumpeter, farrier, and 52 private horſemen. The ordinary guard to have cavalry equal to the grand guard, with a captain, a firſt and ſecond lieutenant of infantry, two ſerjeants, and 60 men, including four corporals, two lance-corporals, and a drummer: the picquet to conſiſt of the ſame number of cavalry and infantry as the ordinary guard.

If there is any dangerous place capable of covering the approaches of the enemy in the environs of the poſt, and out of the circuit of the patroles, there ſhould be a guard placed there, more or leſs ſtrong according to the importance of the place, and care ſhould be taken to preſerve the communication. The guards and picquets being placed, the detachment that was ſent out on the roads muſt be called in, and then go to work to lodge the party in the gardens that open upon the country, and the commanding officer's quarters; beating down hedges, filling up ditches, and levelling a piece of ground large enough to draw up the whole corps. The horſes to be put under cover in barns contiguous to the gardens; but in caſe there are no barns, they may ſubſtitute ſheds open on one ſide, that the horſes may go out altogether in caſe of an alarm.

The officers ſhould occupy the houſes in the neighbourhood of the ſheds, and one of each company remain day and night with the company, to prevent any of the men from entering the village without leave, upon any pretence. The commanding officer muſt acquaint the officers of his having choſen the place M for the rendezvous in caſe of a retreat: which ought to be at ſome diſtance from the village, and on the ſide he judges moſt convenient for retiring to the army. At ſunſet the grand guard are to return to the poſt and join the picquet, the one half of each to mount alternately till day-break, and then the grand guard to return to the place they poſſeſſed the day before. The ſentries and vedettes ſhould be doubled, and all the paſſages ſhut up with waggons placed in two rows, except one for ſallying out at, in caſe of a retreat, made wide enough for the paſſage of the patroles or the whole cavalry.

Petite Guerre.

The corporals of the ordinary guard ſhould lead the relief of the vedettes every hour, ſetting off together; but when they come to the paſſage of the poſt A, they muſt ſeparate into two parties, the one to the right to relieve the vedettes BBB, the other to the left for the vedettes CCC; then each of them with the parties they have relieved ſhould go on at their head a quarter of a league, by the two routes pointed out in the plan, to examine the environs, ſuppoſing an hour to each. Beſides this reconnoitring, the captain of the grand guard ſhould ſend two patroles in the night. To fill up the intervals, they ſhould ſet one about half an hour after the corporals, and make the ſame round. At returning to the poſt, the corporals to make their report to the officer of the ordinary guard; the conductors of the patroles to the captain of the grand guard.

A little before ſunriſe or ſunſet, a grand patrole detached from the corps ſhould be ſent under the conduct of an officer to ſearch the whole environs of the poſt minutely, eſpecially the dangerous places, becauſe at theſe times the enemy are moſt likely to attempt a ſurpriſe. If the patroles diſcover them, they will be in a ſtate to repulſe them, or at leaſt to haraſs them till the commanding officer, upon the firſt notice, draws up the whole corps. The officers ſhould take great care to inſtruct the ſentries in their duty, explaining it to them every time of their mounting, and forbid them to ſmoke, as the leaſt fire can be eaſily perceived in the dark, and ſerve to direct the approaches of the enemy. No ſentry to move more than 50 paces to the right, and as many to the left of his poſt: and let the weather be ever ſo bad, he muſt not get under cover. No one to be allowed to go out of the poſt without leave of the commanding officer; and to prevent deſertion or marauding, the ſentries and vedettes muſt be charged to let no ſoldier paſs.

The vedettes muſt ſtop all paſſengers, and take them to the next ſentry, who muſt call a corporal to conduct them to the commanding officer. If there are a great number paſſing at once, the vedette at the challenge muſt haſten to ſtop them at 100 paces, till the officer has ſent to reconnoitre them; but if he finds them to be a party of the enemy, he muſt fire upon them and retire. At the firſt alarm, the grand guard and picquet ought to mount, and each of them to detach a ſubaltern officer immediately at the head of the beſt mounted horſemen, to go quickly to encounter the enemy. The reſt of the grand guard and cavalry of the picquet to follow immediately, led by their captains to ſuſtain the firſt detachments, to repulſe or keep back the enemy as long as it is poſſible, and give time to the commanding officer to form the whole corps.

If the commanding officer obſerves that the enemy are of no very extraordinary force, he muſt without heſitating put himſelf at the head of his cavalry, and inſtantly charge them, pouring upon them with his whole force, which is the beſt way to ſucceed; and in the mean time, the infantry ſhould form to ſuſtain the cavalry. One eſſential circumſtance ſhould not be forgot here, which is, that at the going of the detachments of the grand guard and picquet, all the infantry of the picquet ſhould march immediately to the place appointed for the rendezvous in caſe of a retreat, and a ſtrong detachment of cavalry ſhould follow to occupy the place. If it is at the entrance of a wood or ſome covered place which the enemy may occupy, and thereby cut off your retreat, you muſt prevent it by fixing the infantry of the picquet in the poſt, to remain day and night, with a

lieutenant

lieutenant at the head of 20 horſemen to clear round it. If the enemy is too ſuperior, and appears to form an attack on that ſide, the commanding officer ſhould get there before with all his force to oppoſe them, till all his detachments join, and then regulate his retreat, as will be ſeen in the ſection of the Retreat.

To be better ſecured in a poſt which you expect to remain in for ſome time, and where you find that the enemy will not fail to diſturb you, it will be proper immediately to employ ſome of your people with the peaſants, to form ſome intrenchments in a hurry in the moſt dangerous places, to have breaſt-works of felled trees in the woods; herſes placed in the fords (ſee HERSE); pits dug at the entries and plains without defence; ſo that the cavalry coming full ſpeed to charge you, may tumble in. If there happen to be a bridge either in the front or on the flanks of the poſt, as at N, by which the enemy can facilitate their approach or retreat, it muſt be inſtantly deſtroyed, unleſs you find it may be of uſe, and neceſſary to fix a good guard on it.

To regulate the attack and defence moſt advantageouſly, you ſhould take care to obſerve the places by which the enemy can approach, and form a plan of operations for cutting off, or taking in flank, the different routes which he can attempt. You ſhould inform your officers, and not fail to hearken to the advice of thoſe whoſe talents, genius, and experience, render them competent judges of your deſigns. Theſe arrangements will be of great uſe in ſurpriſing the enemy's parties, who will come from time to time to reconnoitre the poſt. If the enemy approaches in the night, take care how you attack him; you cannot reconnoitre his force, and you ought to ſuppoſe that he is informed of yours.

Do not ſuffer any ſuſpected women to approach the ſoldiers; their viſits are dangerous in debauching your people, and the enemy frequently employ them to diſcover your ſtrength. Let no deſerter ſtop in your poſt; and if he comes in the night, keep him till day-break is near, and then ſend him to the army. Every party that approaches your poſt will profeſs belonging to you; but if they are not provided with a proper paſſport from the general, or if you do not know any of the officers, truſt neither to their word nor uniform.

Theſe inſtructions may ſerve for the corps of a partiſan according to the propoſed arrangements; but partiſans of leſs force muſt regulate their precautions according to their ſtrength; and detachments of 30, 50, or 100 men, will ſeek to poſt themſelves in redoubts proportioned to their number, or in mills, farms, hamlets, detached houſes, churches, church-yards, &c. obſerving that the more a poſt is extended, the more care and fatigue it requires.

The principal object for an officer that is detached, ſays Monſieur Vauban, is to foreſee every troubleſome event. The want of exactneſs, and the ſmalleſt relaxation in the ſervice of out-poſts, may have the moſt fatal conſequences; and hiſtory furniſhes a thouſand examples of camps being ſurpriſed, and armies cut in pieces, by the negligence of detachments that ought to have watched for their preſervation.

The manner of relieving detached poſts has been mentioned; but if an officer is detached to a mill or houſe, let him draw up his party about 15 or 20 paces from the poſt, and ſend a ſerjeant or corporal with five or ſix men to ſearch the chambers, cellars, and barns: which being done, the ſentries muſt be placed, the poſt taken poſſeſſion of, the arms ranged ſo that every one can find his own without confuſion, and the inhabitants lodged in ſome other houſe; and then intrench himſelf according to the rules given.

If an officer is to fix in a village where it is difficult to examine every place where the enemy may lie in ambuſh, he ſhould ſend for the magiſtrates to come and ſpeak with him, while his party remain drawn up at the end of the village, that they may declare if they know whether there are any of the enemy's parties, ſuſpected perſons, or concealed arms in the place; which being done, the ſentries are to be placed, and the party to take poſſeſſion; putting ſmall detachments of five or ſix men, more or leſs according to the ſtrength of the party, at the avenues; and examining the church, or any detached houſe, to make the principal poſt in caſe the advanced poſts are forced. The men beſt acquainted with the duty ſhould be planted on the moſt expoſed and diſtant places, ſo as to ſee all the approaches; and ſometimes in trees, that they may ſee at a diſtance, and remain concealed from the enemy.

Petite Guerre.

If he finds any place near him where the enemy can lie concealed, he ſhould place a corporal with ſix or ſeven men there, with orders to fall back upon his poſt if attacked, or remain till they find themſelves diſengaged. The ſoldiers of this leſſer poſt ſhould take care to make no fires, becauſe it would ſerve for a guide to the enemy to avoid them when they want to fall upon the principal poſt; but fires may be lighted in the places where they have no guards, to make the enemy think they have them every where, at the ſame time placing ſoldiers in ambuſh where there are none lighted. This ſcheme may ſerve for all poſts in a level country, where two or three ſoldiers ſhould be kept going all night to ſtir up the fires.

The exterior arrangements being made, and ſentries placed on the avenues, bridges, and ſteeples, the works for fortifying the poſt ſhould be marked out, and executed by the workmen, and the magiſtrates ordered to ſend ſtraw to the neareſt houſes for lodging the ſoldiers, who muſt never abſent themſelves. The officer muſt always be in readineſs to go where his preſence may be wanted, and make his ſerjeants and corporals frequently go the rounds. Monſieur Vauban ſays, that if an officer is to remain but four hours in a poſt, he ought to intrench. If he is to paſs only ſome hours in a poſt, it is a good way to make a parapet of felled trees; or if it is in a village, to intrench a detached houſe.

The way to guard againſt being ſurpriſed, betrayed, or made priſoner, is to take precautions againſt all that the enemy can undertake; and whatever diſtance he may be at, we ought not to found our ſecurity on probabilities, but extend them even to poſſibilities. Neither ſtranger nor ſoldier of any other party ſhould be admitted into the poſt; and the roll ſhould be called three or four times a-day, that the men may not abſent themſelves: the commander ſhould likewiſe examine the ſentries, to ſee whether they are acquainted with the detail of their duty, and ſhould ſhow them how to defend themſelves in caſe of being attacked; obſerving to them, that if the enemy make ſuch a manœuvre, they ſhould oppoſe ſuch another; if they try this ſcheme, to reſiſt with that, and deceive them at every ſtep. He may make ſome of them try to ſcale the intrenchment, to ſhow the difficulty of mounting it; and by exerciſing them in this manner, he will prepare them to reſiſt the enemy; it will flatter their vanity, and give them a confidence in him.

An hour or two before day, the men ſhould be kept alert, ſitting on the banquette near their arms; and the patroles ſent at that time, rather than in the night, to march ſlowly, to liſten attentively, and examine every place round the poſt where a man can conceal himſelf.

It frequently happens that two armies are encamped oppoſite to one another, and have ſeveral poſts on the ſame line, and two patroles meet in the night. As it is impoſſi-

Petite Guerre.

ble to diſtinguiſh whether they are friends or enemies, they who firſt diſcover the others, ſhould conceal themſelves on the ſides of the road, behind buſhes, or in a ditch, to examine if they are ſtronger; and in that caſe to let them paſs in ſilence, and return another way to the poſt to tell what they have ſeen: but if they find them weaker, he who commands the patrole ſhould make the ſignal which is ordered for the patroles of the night, which is commonly a ſtroke or two on the cartouch-box or butt-end of the fire-lock, which is anſwered by an appointed number; but a word is the ſafeſt. If the patrole does not anſwer, they ſhould advance upon them with fixed bayonets, fire upon them if they ſee them retiring, and make them ſurrender.

If detached oppoſite to the enemy, it is to be preſumed that you may be attacked: therefore ſmall detachments ſhould be advanced between the ſentries in the night, about 30 or 40 paces from the poſt, with their bellies on the ground, in thoſe places where they imagine the enemy may come; with orders to thoſe who command them, to make a ſoldier reconnoitre any parties that are ſeen, ſo as not to confound their own patroles with the enemy's parties, and to retire to the poſt on the firſt firing.

In villages there ſhould be great care taken of ſuſpected perſons, or of the peaſants revolting; and for this purpoſe, you ſhould make the magiſtrates order two peaſants, the beſt known in the place, to be put on duty with the ſentries of the party, at the paſſages left in intrenching. Theſe peaſants, whom the magiſtrates muſt cauſe to be relieved every two hours, ſhould be charged to recollect all who paſs in or out of the village; and both one and the other muſt be told, that they ſhall be anſwerable for all the accidents that may happen from the treachery or negligence of thoſe ſentries who have let enemies in diſguiſe enter the village.

They muſt likewiſe order the ſoldiers who guard the intrenchments, to let no peaſant approach, and to ſhut up the paſſage, with two trees acroſs in the night, and not to open them till day, except for the paſſing of the patroles. They muſt examine with iron ſpits, or their ſwords, all carts that paſs loaded with hay, ſtraw, or caſks, or any thing that can conceal men, arms, or ammunition.

An officer cannot watch too carefully to prevent ſchemes that may be contrived againſt him; and the attempt on Briſac, in the month of November 1704, is ſo much to the purpoſe, that it ought not to be paſſed in ſilence. The governor of Fribourg having formed the deſign of ſurpriſing Briſac, ſet out in the night of the 9th or 10th of November, with 2000 men, and a great number of waggons loaded with arms, grenades, pitch, &c. and ſome choſen ſoldiers: all theſe waggons were driven by officers diſguiſed like waggoners, and were covered with perches, which had hay placed over them, ſo that they appeared like waggons loaded with hay coming in contribution. They arrived at the new gate by eight o'clock in the morning, under the favour of a thick fog: three waggons entered the town, two full of men, and one with arms, when an Iriſhman, an overſeer of workmen, obſerving 30 men near the gate, who, though they had the dreſs, had not the manner of peaſants; aſked them what they were, and why they did not go to work like other people? Upon their not anſwering, and appearing confounded, he ſtruck ſome of them with his cane; upon which the diſguiſed officers run to the arms which were in the waggon next them, and fired 15 or 20 ſhot at him within half a dozen paces, without wounding him. The Iriſhman leaped into the ditch, where they likewiſe fired ſeveral uſeleſs ſhot at him, while he called *To arms, to arms,* with all his might.

At this noiſe, the guards of the half-moon and the gate run to arms, and would have pulled up the draw-bridge, but were prevented by the waggons which the enemy had placed upon it. The officers and ſoldiers who were in the waggons, ruſhed out with their arms, and having joined the reſt, attacked the guard commanded by a captain of grenadiers; but being repulſed, and five of them killed, the reſt were diſmayed, and fled either into the town, or out into the country. The captain of the guard made the firſt gate, which was a grate, to be ſhut, acroſs which the enemy, who were upon the bridge, fired at all who appeared; and having left the half of his guard, he mounted the rampart with the other half, and continued firing upon the enemy. A lieutenant who commanded 12 men of the advanced guard, was attacked at the ſame time by an officer who preſented a piſtol to his breaſt; but ſnatching it from him, he fired it at him, and killed him: this lieutenant defended himſelf to the end of the action; but having received ſeveral wounds, he died that day.

Petite Guerre.

Upon hearing the noiſe of the ſurpriſe, the commanding officer of the place diſtributed his garriſon to their proper poſts: and having made every diſpoſition neceſſary for his defence, the enemy ſaw that their deſign had failed, and retired in diſorder, leaving a number of waggons behind them, and more than 40 ſoldiers who were killed or wounded. Such was the enterpriſe on Briſac, which failed by a trifling accident.

This example, and many others which might be cited, ſhow that an officer who commands in a poſt cannot be too much on his guard to prevent his falling into the ſnares which the enemy prepare for him, as the ſeizing of a poſt, of however little importance it may ſeem, may be attended with the moſt troubleſome conſequences.

In an enemy's country, the inhabitants are always ready to revolt and betray; therefore the commanding officer ought to take one or two of the magiſtrates children, or three or four of the moſt conſiderable families of the village, and keep them in the principal poſt as a pledge of the fidelity of the inhabitants. The children (to whom they ſhould take care to do no manner of hurt) ſhould only be kept half a day each, and changed for ſome others. The commanding officer ſhould forbid the inhabitants to aſſemble in taverns or public walks, or any place whatever, and cauſe theſe orders to be fixed up at the door of the church. If they are ſeen to ſtop and converſe at coming out of church, or in the market-place, let the patroles oblige them to retire. The tavern-keepers and all the inhabitants muſt be forbid to receive any ſtranger without acquainting the commanding officer. None to be permitted to ſtir abroad after retreat beating, on pain of being killed by the ſentries who ſee them, or ſtopped and conducted to dungeons by the patroles; who ought to march ſlowly, ſtop from time to time to hearken if they hear any noiſe, go over all the quarters that are marked out to them, and give an account of every thing that they have diſcovered that can cauſe any alarm in the poſt.

If fire breaks out anywhere, or the inhabitants quarrel among themſelves, an officer ſhould take care how he ſends a party to their aſſiſtance, becauſe theſe are frequently ſnares of the enemy to divide the ſtrength of a detachment on purpoſe to attack them; he ſhould therefore ring the alarm bell, make all the different poſts get under arms, and order thoſe who command them, to make the ſoldiers remain armed againſt the parapet, ſo as to obſerve what paſſes without the village. The ſoldiers of the principal poſt ſhould likewiſe get under arms, and the officer detach four or five men with a ſerjeant or corporal to part the fray, or ſet the inhabitants to work in extinguiſhing the fire.

As all the neceſſary precautions for the ſafety of a poſt are

Petite Guerre.

are too many to have them executed by giving them verbally, the commanding officer ſhould give his orders in writing, and have them fixed up in all the leſſer poſts. One thing to which officers who are detached to a village ſhould give particular attention, is, not to vex the inhabitants by making them furniſh too much: whatever they are allowed by the general to exact, ſuch as firing, forage, candle, &c. for the guards, ſhould be demanded in proportion to the abilities of the inhabitants; and an officer cannot be too delicate in preſerving the character of a gentleman in ordering contributions, and preſerving the inhabitants from being robbed or treated ill by the ſoldiers.

It is not ſufficient for the preſervation of a poſt, to raiſe intrenchments, nor to take every precaution againſt being ſurpriſed. As the enemy muſt attack with a ſuperior force, your diſpoſitions muſt be made in ſuch a manner as not to confuſe one another, and every one being properly placed, contributes to the common ſafety. If it is a redoubt, or other entrenchment of earth that is to be defended, ſeven or eight trees with their branches ſhould be kept in reſerve, to throw into the breaches the enemy may make, and the parapet kept well lined with men, who ought not to fire till the enemy are on the glacis. They ſhould be provided with grenades to throw in the midſt of the enemy who have jumped into the ditch, nay even aſhes or quicklime, whoſe burning duſt cannot fail to blind the enemy, ſhould be had if poſſible. If the ſtrength of your detachment will admit of it, eight or ten ſoldiers ſhould be placed in the ditch (on the oppoſite ſide from the enemy), ſo divided as to take the enemy on the flanks, who have jumped into the ditch. This kind of ſally, by running round upon the right and left at the ſame time, muſt aſtoniſh an enemy who could not dream of being attacked.

If there are heights from whence the enemy can cruſh your people with ſtones, they muſt be occupied with eight or ten men covered with a breaſt work, to prevent the enemy from poſſeſſing them, or guard againſt them, as has been formerly directed.

In the defence of houſes, mills, &c. as well as regular fortifications, the men ſhould be made acquainted with the different manœuvres they may employ for their defence; without which they do not foreſee the intentions of their officer, and may counteract one another by their being in diſorder.

The obſtinate defence of a poſt is the action where an officer detached ſingly can acquire the greateſt glory; the reſiſtance not proceeding from the number of ſoldiers deſtined to defend it, but from the talents of the officer who commands. It is in him that the ſtrength in the intrenchment lies; and if he joins to determined bravery the abilities neceſſary on theſe occaſions, and can perſuade his ſoldiers that the lot the enemy prepares for them is a thouſand times worſe than death, he may be ſaid in ſome ſort to have rendered his poſt impregnable.

In the defence of detached buildings, there are ſo many different retreats, that it becomes an arduous taſk to ſucceed in an attack, when brave people are to defend them They have the loop-holes on the ground-floor to defend, when beat from the entrenchments without, and may reſiſt great numbers, by retiring gradually to the different floors of the houſe, where they ſhould have large buckets of water provided to throw upon the enemy, which, though it may appear trifling, is one of the moſt diſagreeable that can be oppoſed to the aſſailants; for at the ſame time that it wets their powder, arms, and clothes, it hinders them from ſeeing what is doing above, prevents every ſcheme for ſetting fire to the houſe, and may oblige them to deſiſt from the attack.

Having obſerved that the defence of a poſt does not depend upon the ſoldiers who are deſtined for that ſervice, but upon the officer who commands, the following example may ſerve to confirm the obſervation, and will at the ſame time ſhow the utility of having ſtones collected to throw over upon the enemy, as formerly recommended.

In the month of September 1761, captain-lieutenant Alexander Campbell of the 88th regiment, with 100 men under his command, was pitched on to defend the remarkable poſt near Caſſel in Heſſe, called the *Hercules*. Monſieur Roziere, the celebrated partiſan and engineer of marſhal Broglio's army, with 600 infantry and four ſquadrons of cavalry, arrived in the neighbourhood of the poſt the morning of the 22d; and having beat a parley, ſurrounded and carried off the two men who were ſent out to receive the meſſage. After having examined them ſeparately, he cauſed a detachment, under cover of his muſquetry from a hill that was oppoſite to the principal paſſage, to advance and mount the ſtair, three men abreaſt; which they did ſo ſlowly and without any interruption, that the whole ſtair of about 100 ſteps was full of men, when Captain Campbell (who had made an excellent diſpoſition for the defence of all the parts of his poſt), having ſome choſen men at each ſide of him, waited to receive thoſe who advanced firſt upon their bayonets, and firing at the ſame time, gave the ſignal for the reſt to throw over large ſtones which he had collected and diſpoſed for that purpoſe; which made ſuch havock, that Monſieur Roziere, ſtartled at the unexpected reception, and deſpairing of ſucceſs, wiſhed to get his party off. Captain Campbell ſeeing the deſtruction of the enemy without a man of his being hurt, and that he could renew the reception as often as they choſe to repeat the attempt, was elated with his ſucceſs, and encouraging his men, when he happened to move from the wall that covered him, and received a muſket ſhot from the oppoſite hill, which entered a little below the left temple and came out at the ſame diſtance below the right; upon which he fell, and the party beat the chamade and ſurrendered. After two hours poſſeſſion the French retired, carrying off the priſoners, and leaving Captain Campbell, whom they thought dead, to be ſaved by our troops, who ſoon took poſſeſſion again, and ſent him to be recovered, and to diſplay new merits in his profeſſion.

If the enemy take cannon to force the poſt, it does not appear how it can be reſiſted, unleſs the houſe is low, and they cannot range round the intrenchments, as every ſhot can make a large opening in bad built houſes, and may cruſh the beſieged. The only means then to ſhun being maſſacred is to capitulate, or to ruſh out briſkly upon the enemy when they leaſt expect it. The firſt is not reſolved upon but when the honours of war can be obtained, which is to march out with drums beating to return to the army with a proper eſcort. But if this capitulation cannot be obtained, the beſieged have nothing left conſiſtent with true bravery, but to ruſh out ſword in hand, and cut their way through the enemy. The neceſſity of conquering changes the brave man into the determined ſoldier, which gives him the means of retiring to the army or ſome neighbouring poſt.

If a poſt is to be abandoned when it can be no longer held, and you are going to make the ſally, you ſhould continue to fire with ſpirit, taking away barricadoes from the door through which you are to paſs with as little noiſe as poſſible. When they are aſſembled, the whole party ſhould go out cloſe together, ruſhing with their bayonets to the place the officer thinks the leaſt guarded. You ought never (ſays Mr Folard) to wait for day to execute theſe ſallies, which cannot ſucceed but in a dark night, by which you

Petite Guerre.

eaſily conceal from the enemy the road you have taken; for which reaſon you ſhould not fire, but open to yourſelves a paſſage ſword in hand, leſt the enemy come where they hear the noiſe.

Officers ſhould be attentive to diſtinguiſh between the true and falſe attacks, and not deſpair when beat from their firſt entrenchments. The defence of poſts is ſo eaſy, that it is ſurpriſing they do not hold out longer than they commonly do. There wants only reſolution and vigilance, taking every advantage of the ground, and perſuading the ſoldiers that nothing but the moſt manifeſt baſeneſs can let the enemy penetrate. The example of Cremona, ſurpriſed by prince Eugene in 1702, will remain a proof to poſterity of what determined bravery can do; and ſhow, that though an enemy is maſter of half the ramparts, and part of the town, he is not maſter of the whole.

Prince Eugene having formed the deſign of ſurpriſing this town, which was defended by a garriſon of French and Iriſh, got ſome thouſand Auſtrian ſoldiers admitted at a ſecret paſſage by a prieſt. Theſe troops ſeized the two gates, and a great part of the town; the garriſon buried in ſleep, were awaked by the aſſault, and obliged to fight in their ſhirts; but by the excellent manœuvres of the officers, and reſolute bravery of the men, they repulſed the Imperialiſts from ſquare to ſquare, from ſtreet to ſtreet, and obliged Prince Eugene to abandon the part of the town and ramparts of which he had been in poſſeſſion.

Poſts have often reſiſted the firſt and greateſt efforts of the aſſailants, and have yielded or been abandoned to ſubſequent attacks, though much leſs ſpirited. How comes this? It is owing to an officer's not daring to abandon his poſt at the firſt attack: he repulſes the enemy, becauſe if forced they will be put to the ſword with their whole party; but when the enemy comes back, he thinks he has nothing to reproach himſelf with, having defended it for ſome time, ſo retires, or ſurrenders. Since he could repulſe the enemy when in good order and quite freſh, how much more eaſy and leſs to be dreaded when they return haraſſed with fatigue?

Is not the great cauſe of miſconduct among military men the want of encouragement to excite emulation? An officer who is not protected, who is never ſure of the leaſt favour, neglects himſelf, and takes leſs trouble to acquire glory, rarely heard of, though merited by the braveſt actions, than to enjoy the tranquillity of an ordinary reputation.

It is not expected that an officer who is placed in a poſt ſhould ſeek to engage; but that he ſhould ſteadily reſiſt when he is preſſed, and die rather than abandon his intrenchment.

Hiſtorians have been very ſilent about poſts being well defended; though the leſſons to be drawn from them may be more generally inſtructive, and as agreeable to read, as thoſe left us of the beſt fortified places of a ſtate. We are aſtoniſhed at the account of 100,000 men periſhing before Oſtend in 1604, and their general, the archduke Albert, with the ruins of his army, not making himſelf maſter of it, till after three years ſiege: nor is our wonder leſs, to ſee Charles the XII. of Sweden, in the year 1713, with ſeven or eight officers and ſome domeſtics, defend himſelf in a houſe of wood near Bender againſt 20,000 Turks and Tartars.

Several hiſtorians mention the defence of this houſe becauſe it was done by a crowned head; but brave actions, whoever are the authors, ſhould never be buried in oblivion, as they excite emulation, and are full of inſtruction.

Sect. VI. *Of the Attack of Poſts.*

Although the taking of a poſt is alway difficult when you have to do with people who know how to defend it, nevertheleſs you may ſucceed in attacking them by ſurpriſe and ſtratagem. We ought never to form a ſcheme for an attack upon ſimple ſpeculation, becauſe from reaſoning we often think that things are feaſible, which we find impoſſible in the execution. When you intend to undertake an action of this kind, you ought to form a juſt idea of it, by examining all the branches ſeparately, and the different means you can uſe, ſo that, by comparing them together, you may ſee if they concur, and anſwer to the general purpoſe; and laſtly, you are to take ſuch meaſures as may in a manner render you certain of ſucceſs before you begin.

Petite Guerre.

As it is not the practice of the army to chooſe a particular officer for the attack of an intrenched poſt if he does not offer himſelf, ſo an officer ſhould not embark in ſuch an enterpriſe, without having examined the means of ſucceeding, and being capable of ſhowing the general a plan of what he has projected, to ſee if he will conſent to the execution of it. If the general approves the plan, he muſt beg leave to go to reconnoitre the poſt with a man or two, that he may take his meaſures more juſtly.

When he has been to reconnoitre, as is directed in a former ſection, and has got every neceſſary information, he ſhould go to give the general an account of his diſcoveries, and receive his laſt orders for the attack, for the ſoldiers of his party, and for thoſe who are to march to ſuſtain him.

The choice of men that are to go upon the attack of a poſt, is ſo much the more eſſential, as the ſucceſs of the enterpriſe depends on it. None but volunteers of determined bravery ought to be taken, men, who are not ſtupid, and have no colds upon them; becauſe he who does not attend to the orders of his officers, runs on with blind zeal; and he who coughs or ſpits, may diſcover the party to the enemy's ſentries, and cauſe the beſt concerted ſcheme to fail. As to thoſe who are to ſupport them, they may be taken according to their rank in the guard or detachment, as the general judges proper.

The diſpoſition for an attack muſt depend on the diſcoveries that are made, ſo as not to be obliged to return in the midſt of the execution. The men being choſen, they muſt be inſpected, to ſee that nothing is wanted which can contribute to their ſucceſs; becauſe, if the poſt is fortified with an entrenchment of earth or faſcines, the two firſt ranks ſhould be provided with ſpades and pickaxes beſide their arms; if fraiſed or palliſadoed, they muſt likewiſe have hatchets; and if covered with maſonry, they muſt have ladders.

The men ſhould be in their waiſtcoats, to be leſs conſtrained. If they propoſe to make one or two true, and as many falſe attacks, ſo many platoons muſt be formed of the choſen party, as they are to make true ones, and the ſuſtaining party to make the falſe attacks, ſo as to divide the enemy and ſhare their fire. A man muſt be placed at the head of each platoon, who is capable of commanding them, and, if poſſible, the ſame who had been employed before to make diſcoveries, as he may more eaſily guide the diviſion. The orders which ſhould be given to thoſe leaders, are to march together to the place where they are to ſeparate, and then each to go to the ſpot which is appointed for him in the neighbourhood of the poſt, and wait there, with their bellies on the ground, for the ſignal to jump into the ditch and ſcale the poſt.

If you are to be conducted by ſpies or guides, they ſhould be examined about every thing that can be of uſe, before they are employed, eſpecially about the road by which they propoſe to conduct you. The reaſon of this is,

Petite Guerre.

is, becauſe we often ſee ſimple people, animated with the hope of gain, imagine they can eaſily lead a party, when they have only a great deal of good-will; but if you find in thoſe who offer all the neceſſary qualities, you muſt immediately ſecure them to you as much as poſſible, by making them dread the deſtruction of their houſes, and pillaging their goods, if they lead the party into a ſnare; you may likewiſe aſk their wives and children as pledges of their fidelity, and, the moment of ſetting out, place them between the corporals of the firſt rank, tied with a ſmall chain; which precaution is the more eſſential, as traitors have often been known, on pretence of conducting a party to ſeize a poſt, to have led them where they have had their throats cut in the middle of the night, and have diſappeared at the very moment of its execution. If you make your guides hope for a recompenſe proportioned to their ſervices on one ſide, on the other you muſt make them fear the cruelleſt puniſhment if they betray you.

The night being the moſt proper time to march to the attack of a poſt, you ſhould ſet out ſoon enough to be ready to make the attack an hour or two before day. Care muſt be taken that it is not moon-light when you propoſe making the attack; the ſoldiers ought to march two and two, with the leaſt noiſe poſſible, eſpecially when paſſing between the enemy's ſentries: you muſt likewiſe recommend to them, neither to ſpeak, ſpit, nor ſmoke. The detachments muſt get as oppoſite as poſſible to the ſalient angles of the intrenchment, as it is probable that they will be the leaſt defended by the enemy's muſketry. If a patrole of the enemy comes while you are on your march, or ambuſhed in the environs, you need not be alarmed, nor make the leaſt motion which may make the enterpriſe fail, but remain concealed in the profoundeſt ſilence, that the patroles may paſs without perceiving any thing, and afterwards purſue your deſign.

If the poſt which you want to carry is a redoubt with a dry ditch and parapet of earth, your two firſt ranks muſt have ſpades and pick-axes, with their arms ſlung, and, on the ſignal being given, jump into the ditch together; becauſe it ought to be a general maxim in attacking a poſt, to ſtrike all at once. When the firſt rank have jumped down, the ſecond muſt ſtop a moment, that they may not fall upon the ſhoulders or bayonets of the firſt. The two firſt ranks having got into the ditch, they ſhould immediately run to ſap the angles of the ſcarp and the parapet of the redoubt, to facilitate the mounting of the reſt of the party; the leaders of each diviſion ſhould obſerve at the ſame time, that the ſoldiers who remain armed with their firelocks, and who have likewiſe leaped into the ditch, do not interrupt thoſe who are demoliſhing the ſcarp of the redoubt, but protect them by preſenting their bayonets to the right and left, and be ready to repulſe any of the enemy that happen to be placed in the ditch.

If the parapet is fraiſed, they ſhould break as many of the fraiſes with hatchets as is neceſſary to let the men paſs. When the breach is made, the workers ſhould drop their working tools; and taking their arms from the ſlings, mount up with fixed bayonets, and ruſh upon the enemy huzzaing.

When you march to attack a redoubt or ſuch poſt, where the enemy have a connection with more conſiderable poſts, the commanding officer ſhould charge on that ſide, ſo as to cut off the communication. People who ſee themſelves briſkly attacked without hope of ſuccour or retreat, will very ſoon beg for quarter.

When the ſcarps and parapets are of ſtone, they can only be carried by ſcaling; but you may ſucceed by being briſk in ſurrounding and ſuſtaining the attack. An officer who is to attack a poſt of this kind, ſhould take care that his ladders are rather too long than too ſhort, and to give them in charge only to the ſtouteſt of the detachment. The ſoldiers ſhould carry theſe ladders with the left arm paſſed through the ſecond ſtep, taking care to hold them upright at their ſides, and very ſhort below, that they may not diſlocate their ſhoulders in leaping into the ditch.

The firſt ranks of each diviſion provided with ladders, ſhould ſet out with the reſt of the ſignal, marching reſolutely with their firelocks ſlung at their backs to jump into the ditch. When they are arrived, they ſhould apply their ladders againſt the parapet, obſerving to place them towards the ſalient angles rather than the middle of the curtain, becauſe the enemy have leſs force there. They muſt take care to place their ladders within a foot of each other, and not to give them too much nor too little ſlope, that they may not be overturned or broken by the weight of ſoldiers mounting upon them.

The ladders being applied, they who have carried them, and they who come after, ſhould mount up and ruſh upon the enemy ſword in hand. If he who goes firſt happens to be overturned, the next ſhould take care not to be drawn down by his comrade; but on the contrary, help him to paſs between two ladders, and immediately mount himſelf, ſo as not to give the enemy time to load his piece.

As the ſoldiers who mount the firſt may be eaſily tumbled over, and their fall may cauſe the attack to fail, it would perhaps be right to protect their breaſts with the foreparts of light cuiraſſes; becauſe if they can penetrate, the reſt may eaſily follow.

The ſucceſs of an attack by ſcaling is infallible, if they mount the four ſides at once, and take care to ſhower a number of grenades among the enemy, eſpecially when ſupported by ſome grenadiers and picquets, who ſhare the attention and fire of the enemy.

During the ſiege of Caſſel, under the Count de la Lippe, in the campaign of 1762, a young engineer undertook to carry one of the outworks with a much ſmaller detachment than one which had been repulſed; and ſucceeded with eaſe, from the uſe of grenades; which is a proof that grenades ought not to be neglected, either in the attack or defence of poſts.

If the ditch of a poſt is filled with water, and but middle-deep, that ſhould not hinder you from jumping into the ditch to attack, in the manner that has been mentioned; but if there is a greater quantity, and you cannot paſs, the ſoldiers of each platoon ſhould carry faſcines, or faggots of ſmall branches well bound, and made as large as poſſible, to fill up the ditch, and make a kind of ford, ſo as to get at the parapet, either to demoliſh or ſcale it.

Many ways of filling up the ditch, recommended by different authors, might be mentioned; but the faſcines are preferable to them all, as the ſoldiers can eaſily carry them before them, and march quicker, and make uſe of them as a defence againſt muſketry, and reaching them from hand to hand, ſoon make a ford.

If the approaches of the poſt are defended by chevaux de friſe, the firſt and ſecond rank of each platoon muſt break them down with hatchets; or with iron graplings tied to ropes, they may pull them to them, and ſeparate them. If it is a breaſt-work of felled trees, you muſt have faſcines thrown againſt the points, or upon the branches, upon which the ſoldiers can eaſily paſs. If there are two or three rows, you may burn them with dry faſcines lighted at one end and thrown in the middle row. In caſe of trying this laſt ſcheme, the ſoldiers muſt retire to a little diſtance after throwing the faſcines, that the enemy may not ſee to fire at them by the light of the fire, but place themſelves

Petite Guerre.

ſelves ſo that they can fire upon any who may attempt to extinguiſh it. If there are chauſſe-traps, they muſt be ſwept away, by dragging a tree or two over the ground where they are ſcattered.

In the attack of detached buildings, you muſt ſeize the approaches, and ſtrive to ſcale them; to get on the top, and cruſh the people who are below, with the tiles or ſlates; but if the enemy has uncovered the houſe, you muſt throw as many grenades as you can in at the windows and doors; or dry faſcines, with lighted faggots dipped in roſin; or fire-balls, to endeavour to ſet fire to them, and ſmoke them out. If the weather is windy, you ſhould profit by it to ſet fire to the houſe, and try to ſhut up the loop-holes which the enemy have pierced near the ground, with bags of earth ſo as to ſap the corners. If you have ſome cannon, you may ſhorten the ceremony, by planting them againſt the angles of the poſt. If you have none, you may ſucceſsfully ſuſpend a large beam by a rope, to three bars placed in a triangle in imitation of the Roman battering ram: this beam puſhed violently againſt the walls, will ſoon make a breach; but you muſt obſerve, in ſuſpending it, to do it in a dark night, ſo that the enemy cannot prevent it by firing at the ſoldiers who are employed in the work. If it is glorious to get out with honour on ſuch an attack, it is no leſs ſo to make it ſo as to coſt but few people. The blood of the ſoldiers is precious, and cannot be too much prized, and an able chief will neglect no means that can contribute to their preſervation. The comparing of two examples will ſhow the importance of what is advanced.

During the two ſieges of Barcelona, by Monſieur de Vendome in 1697, and Monſieur de Berwick in 1713, the firſt of theſe generals cauſed the convent of Capuchins, ſituated out of the place, to be attacked ſword in hand by ſeveral detachments of infantry, and carried it in three hours, with the loſs of 1700 men. Marſhal Berwick cauſed the ſame convent to be attacked in the year 1713. They were equally intrenched, and reckoning to make him pay as dear as Monſieur de Vendome had done; but this general having opened a ſort of trench before the convent, they not expecting to be attacked in form, ſurrendered at diſcretion, after having held it 24 hours. The reader is left to judge which example to follow.

You ſhould prepare for the attack of a village, or ſuch like poſt of large extent, as has been directed in the ſection for detached poſts: but as theſe ſorts of attacks are always more difficult than others, on account of the multiplicity of ſchemes they have to encounter at every ſtep, an officer ſhould not march there till he is acquainted with the ſtrength of the intrenchments; the ſituation of the ſmaller poſts; the obſtacles to be met with in every ſtreet or ſquare; and even what terms the inhabitants are on with the ſoldiers of the garriſon.

While the aſſailants have penetrated into the village, the commanders of each diviſion ought to take care to leave ſmall detachments at all the churches and ſquares they find; to ſtand firm and ſuſtain the main body in caſe they are repulſed. You muſt watch very carefully that the ſoldiers do not withdraw to pillage the houſes of the inhabitants, as whole detachments have been driven from towns and villages where they had penetrated, from having neglected this precaution.

Three days after the ſurpriſe of Cremona, in 1702, ſome Germans were found in the cellars, where they had got drunk, and were aſtoniſhed when they were told that they muſt quit theſe agreeable retreats. An officer who would ſhun a diſorder ſo fatal, ſhould forbid his ſoldiers to ſtir from their party on pain of death; and by placing a ſergeant in the rear of each diviſion, take care that no one falls behind.

Petite Guerre.

If you find cavalry drawn up in the ſquares or open places, the aſſailants ſhould remain firm at the entrance of the ſtreets that meet there, while ſome go up to the houſes that are at the corners, and fire upon them from the windows; if this cauſes any diſorder among them, they ſhould be charged with fixed bayonets to make them ſurrender. If the interior part of the village is defended with cannon, you ſhould march quickly to the place where they are, and take them, or nail them up, or turn them againſt the enemy or principal poſt of the village.

Polybius, in his ſeventh book, gives an account of an attack full of inſtruction for military men. The blockade of Sardis by Antiochus the Great, had laſted two years, when Lagoras of Crete, a man of extenſive knowledge in war, put an end to it in the following manner. He conſidered that the ſtrongeſt places are often taken with the greateſt eaſe, from the negligence of the beſieged, who, truſting to the natural or artificial fortifications of their town, are at no pains to guard it. He knew likewiſe that towns are often taken at the ſtrongeſt places, from their being perſuaded that the enemy will not attempt to attack them there. Upon theſe conſiderations, though he knew that Sardis was looked upon as a place that could not be taken by aſſault, and that hunger only could make them open their gates, yet he hoped to ſucceed. The greatneſs of the difficulties only increaſed his zeal to contrive a means of carrying the town.

Having perceived that a part of the wall which joined the citadel to the town was not guarded, he formed the deſign of ſurpriſing it at that place: he obſerved that this wall was built on the top of a rock which was extremely high and ſteep, at the foot of which, as into an abyſs, the people of the town, threw down the carcaſſes of their dead horſes, and other beaſts of burden; at which place great numbers of vultures and other carnivorous birds aſſembled daily to feed; and after having filled themſelves, they never failed to reſt upon the top of the rock or wall, which made our Cretan imagine that this place was neglected, and without any guard upon it.

On this thought, he went to the place at night, and examined with care how he could approach it, and where he ought to place his ladders. Having found a proper place for his purpoſe, he acquainted the king with his diſcovery and deſign; and the king, delighted with the project, adviſed Lagoras to purſue it, and granted him two other officers whom he aſked for, and who appeared to him to have all the neceſſary qualities for aſſiſting him in his ſcheme.

The three having conſulted together, they only waited one night, at the end of which there was no moon; which being come, they choſe 15 of the ſtouteſt and braveſt men of the army to carry the ladders, to ſcale the walls, and run the ſame riſk that they did. They likewiſe took 30 others to place in ambuſh in the ditch, and to aſſiſt thoſe who ſcaled the wall to break down a gate into which they were to enter. The king was to make 2000 men follow them, and favour the enterpriſe by marching the reſt of the army to the oppoſite ſide of the town. Every thing being prepared for the execution, Lagoras and his people approached ſoftly with their ladders; and having ſcaled the rock, they came to the gate which was near them, and having broke it, let in the 2000 men, who cut the throats of all they met, and ſet fire to the houſes, ſo that the town was pillaged and ruined in an inſtant.

Young officers who read this account, ought to reflect on this attack. The attention of Lagoras, who went himſelf

to

Petite Guerre.

to examine the places proper for fixing the ladders; his diſcernment in the choice of the officers and ſoldiers who were to ſupport him; and the harmony of the whole means that were employed on the occaſion, afford very excellent leſſons for any officer who may attempt ſuch an attack.

Sect. VII. *Of Surpriſes and Stratagems for ſeizing Poſts.*

All the environs that have any relation to the place the enemy occupies muſt be known; on what ſide lie the avenues, moraſſes, rivers, bridges, heights, woods, and all covered places that are in the neighbourhood, without which it is ſcarce poſſible to regulate approaches prudently. It is equally neceſſary to know nearly the number and kind of troops with which he poſſeſſes the poſt, that you may not attack him with inſufficient force. It is likewiſe neceſſary to know if the enemy is careful or remiſs in carrying on his duty. The knowledge of theſe circumſtances contributes infinitely to form a project of ſurpriſe well, and to conduct the whole expertly.

As to the manner of ſurpriſing a poſt, it is impoſſib leto eſtabliſh certain rules on the ſubject; becauſe, amo ng a thouſand means which chance offers, there are rarely two alike. It muſt, however, be obſerved, that there are ſtratagems with which it is impoſſible to ſucceed without a proper force to ſuſtain them. A town or village, for example, where we are introduced by a ſecret correſpondence, cannot be carried unleſs we be well ſeconded. The only means of managing the ſurpriſe of poſts well, is to divide your force inſtantly, to ſeize the caſtle, church, church-yard, or public ſquares. It has been ſaid, that troops ſo divided can act but weakly, and run a riſk of being defeated ſeparately. But by making as many detachments as the enemy has poſts, in the diſmay cauſed by ſurpriſe, it is eaſy to carry theſe poſts before they who defend them have time to diſpute them or even look round them. The enemy being likewiſe obliged to divide, and not knowing what ſide to prefer, there is almoſt a moral certainty, that, ſtupified with the noiſe which they hear all round, they are ready to let their arms drop out of their hands: beſide, the horrors of a dark night, and the dread that cannot fail to ſeize a party who are ſurpriſed, repreſent objects much greater than what they are, ſo that they imagine they have to do with a whole army.

The bad ſucceſs of the affair at Cremona mentioned in Sect V. makes nothing againſt this opinion. If inſtead of ſtopping to make priſoners, a detachment had gone directly to the citadel, which ſhould be the way in all ſuch actions, it would have been impoſſible for theſe brave officers who drove out the Imperialiſts to have made ſo glorious a defence.

M. de Schower did otherwiſe when he ſurpriſed Benevar in Spain in 1708, and did not fail. He learnt that the Spaniards neglected the guard of an old caſtle which was at the entrance of the place; and marching in the night he took it, and detached ſeveral parties to attack the town. Surpriſed with ſuch a viſit, they ſought for ſafety in flight, and ran to take ſhelter in the citadel, but were ſcarcely entered when they were made priſoners. The enemy did not think of the attack being begun where they were ſtrongeſt; but it is the beſt way, as it is to be preſumed they have divided their forces to be able to defend every where.

M. Menard, in his hiſtory of Niſmes, gives an account of the ſurpriſe of that town, which merits our attention. Nicholas Calviere, called Captain St Coſme, having reſolved to make himſelf maſter of this place, engaged a miller whoſe mill was ſituated within the walls, at the ſide of the gate, to file the bars of a grate which ſhut up the entry of an aqueduct through which the water paſſed into the town, and to receive 100 men armed into his mill, while a conſiderable body of cavalry and infantry ſhould arrive from different places to ſuſtain the enterpriſe.

The day for the execution of his project being fixed for the 16th of November 1569, and proper orders given for the rendezvous of the troops, St Coſme came out of the mill with his party at three o'clock in the morning, and advancing to the guard at the gate, put them to the ſword, and opening the gate let in 200 horſemen, with each a foot ſoldier behind him. Theſe troops having entered the town, formed ſeveral detachments immediately: one of which went to block up the citadel; while the reſt, ſcattering over the ſquares of the place, and ſounding their trumpets, inſtantly made themſelves maſters of the town.

There are a number of circumſtances mentioned in this ſurpriſe, which convey a great deal of uſeful inſtruction. Captain St Coſme knew how to profit by the negligence of the governor, who omitted to guard the entrance of the aqueduct: to make a proper choice of cavalry for advancing ſo readily with the infantry from different quarters; the juſtneſs of the orders given the troops, which brought them 15 leagues from Niſmes at the hour and place appointed for the rendezvous; the precaution with which he inveſted the citadel, to prevent his having to do with the garriſon in the ſtreets; his attention in dividing his troops into the different quarters of the town, and making them ſound their trumpets, that the inhabitants might imagine they were very numerous.

But the active corps of the partiſan, without truſting to the ſtratagems that others have ſucceeded by, muſt find other reſources than thoſe againſt which people are ſo prepared now-a-days; and as the ſurpriſing of the enemy is the great buſineſs of the partiſan in carrying on the Petite Guerre, he muſt ſee what can be effected by his hardineſs and activity.

The expedient which appears to be the moſt proper for an officer who has 400 infantry under his command, and is certain that the garriſon is only 200 (for ſurpriſes ſhould be always attempted with a double force), is to chooſe very bad weather; the ſtrong winds, for example, and fogs in winter; or the ſtorms and tempeſts in ſummer, when, after exceſſive heats, violent winds riſe ſuddenly, and agitate the air.

When you have meditated ſuch a ſcheme, then is the time to put a part of your infantry in covered waggons, which ſhould be kept ready for the purpoſe. The whole party ought to be provided with dog-ſkin covers for their gun-locks and cartouch-boxes, to take off readily when there is occaſion; and the reſt of the infantry to be mounted behind part of the cavalry. Both parties to aſſemble at ſome place a league diſtant from that which you would ſurpriſe, and there to ſtop; when, if you ſee the bad weather diſſipating, you muſt retire till another occaſion. If you renew it ten times, you need not deſpair; a ſtrong place deſerves this trouble, and ſucceſs will overpay every fatigue.

But on the contrary, if the ſtorm forms, and the wind increaſes, direct your approaches in ſuch a manner, that you may always have the wind on your back; becauſe if you have it in your face, the enemy's ſentries can look forward and diſcover you; and likewiſe if it is in your face, your horſes cannot be made to advance without a great deal of trouble. Theſe precautions being taken, you advance more quickly as the ſtorm increaſes, the horſes and waggons going with great ſpeed before the wind. You need be in no uneaſineſs about the enemy's ſentries ſeeing you, or hearing the noiſe of your march; becauſe the ſeverity of the weather obliges them to enter their boxes, and turn their backs to

Petite Guerre.

the wind, to ſave their eyes from the duſt and ſharpneſs of the air.

At 300 paces from the place, the foot and part of the cavalry ſhould diſmount and fix their bayonets, the reſt of the cavalry to remain with the waggons near ſome trees or houſes, the waggons turned for a retreat. Divide your infantry into five detachments, and inſtantly run at a great rate, keeping your men as cloſe as poſſible, and paſſing the barrier and gates, ſeize all the centries and the guard without firing or making the leaſt noiſe, which may be executed with an extreme quickneſs, to be acquired by practice. While the firſt detachment ſeizes the gate and all the ſentries of its environs, the reſt muſt run rapidly into the town. One muſt go quickly to ſeize the main guard: another to ſeize the governor or commanding officer; the fourth, which ſhould be the ſtrongeſt, ſhould fly to the caſerns or mens barracks, to ſeize their arms; the fifth to remain in the ſtreet near the gate for a corps de reſerve.

Every detachment muſt be conducted by priſoners made at entering; and orders ſent with all ſpeed, to cauſe half the cavalry to advance and patrole the ſtreets, as the infantry get forward.

As this kind of ſurpriſe can ſucceed only under favour of a ſtorm, which rarely continues any time, it is evident that the march and execution muſt be conducted with inexpreſſible ſwiftneſs, and the orders be perfectly underſtood. It is true, that rain is inconvenient for the infantry, whoſe feet ſlip on clay-ground; but they muſt do their beſt, and frequently it is found that the roads which are moſt uſed are not therefore the moſt ſlippery.

If it happens that you are perceived in taking poſſeſſion of the gate, and they take the alarm, you muſt quickly divide your party into two wings, mounting them on the rampart, the one to the right, the other to the left; and ſeizing the loaded cannon, turn them upon the town; and at the ſame time ſummon the garriſon to ſurrender. If you happen to fail, and are obliged to retire, you do not riſk much, as they will not care to moleſt your retreat.

There may be a reluctance in attempting ſuch a ſurpriſe; it may appear to be hazardous and raſh, and a conduct too nice not to deſpair of ſucceſs: but Mr Jeney ſays that experience convinces him of the validity of the means propoſed, and relates what happened to him upon two occaſions, to prove that the cold eaſt winds or ſtorms are the moſt proper times for attempting ſurpriſes.

Being at the head of 30 huſſars, ſays he, and willing to ſhun a ſtorm which was gathering behind us, I puſhed to get to a place which was well fortified and occupied by a numerous garriſon: the wind was ſtrong, and I paſſed the barriere and all the gates with my horſes, which made a great noiſe, without any ſentry either ſeeing or hearing; and though I called to the firſt guard to declare myſelf, no one perceived me. I croſſed the whole town without ſeeing a ſoul in the ſtreet; and hurrying to an inn in the other ſuburbs, I went out at the gallop, and ſaw only the ſentry at the laſt barriere, to whom I anſwered without our comprehending one another; nevertheleſs the rain had not begun to fall, but the wind was violent. I experienced the ſame during the winter, when the eaſt wind was very proper to facilitate the ſurpriſe of a fortified town or poſt. On Chriſtmas night 1757, I paſſed through the country of Hanover with 80 horſe between two guards of the enemy without being perceived. I marched over the middle of a plain when the night was clear, with a violent eaſt wind, which prevented any ſentry from turning his head to look at me, and I went quietly to carry off horſes in the rear of their army. The following night at my return, I paſſed two different poſts of our army; the one guarded by a party of huſſars, the other by a regiment of dragoons, without being ſeen but by one ſentry in the middle of the dragoon poſt, who durſt not challenge, becauſe it was no longer time, having paſſed the firſt guards.

Petite Guerre.

You may likewiſe take the advantage of bad weather to ſcale all ſorts of poſts ſurrounded with walls, as towns, abbeys, caſtles, &c. to do which, you muſt approach in the dark, and ſeize the moment of a great ſquall, or when a cold eaſt wind obliges the garriſon to take ſhelter from the rigour of the ſeaſon: then there is no one upon the ramparts, and the ſentries turn their back to the wind, or remain in their boxes, while your people are warm with marching, and animated with the hopes of ſucceſs. You need not be apprehenſive of the enemy ſeeing you if you advance on the ſide next the wind to place your ladders, becauſe the ſentries will cover their faces, and bend down their heads to ſave them from cold.

The time of a thick fog is not leſs favourable for approaching and forcing an intrenched poſt. When the fog is low, the infantry ſhould creep on all fours, the better to conceal them from the enemy's ſentries. Theſe ſorts of ſurpriſes are the leaſt dangerous, you run ſcarcely any riſk; but if you cauſe ſome falſe attacks, the garriſon will not fail to run to arms, and ſometimes make you pay dear for failing.

When you would ſurpriſe the enemy in a village, farm, monaſtery, or ſome place detached from the army, you ſhould divide your party in two bodies, each compoſed of cavalry and infantry; the one to take the enemy in the rear, the other in front, taking care to cauſe ſome waggons to follow, which may carry off the wounded in caſe of need. You muſt calculate exactly the time it will take the firſt detachment to go round the enemy. The two commanders ſhould agree on a word for rallying, and the time of making the attack, which ſhould be in the night, eſpecially if the poſt is ſo diſtant from the army that they can receive no aſſiſtance; for in that caſe the time is favourable till day-break. They muſt regulate their departure according to the diſtance they have to go; and the detachment which goes round the enemy, ought to take no more infantry than can be carried behind the horſemen. This detachment having got round, ſhould form about a quarter of a league from the poſt, and 100 paces out of the road.

When the other detachment has arrived within a quarter of a league of the poſt, your cavalry ſhould form out of the road with the waggons and drums near them, who are not to advance till ten minutes after the departure of the infantry, who muſt advance towards the fires of the enemy, ſtooping as much as poſſible. They muſt take care to conceal themſelves from patroles, as has been directed; and when they ſee them paſſed or entered the poſt, the infantry muſt hurry on to gain the village, and clear the entry by which the cavalry muſt paſs, in caſe it has been barricadoed with waggons. You muſt run rapidly to the place where you ſee the fires lighted, and make as many detachments as you ſee fires, in order to ſurpriſe the whole at once.

The cavalry who followed ſlowly, muſt inſtantly join to the noiſe of your arms and cries their trumpets and drums, advancing with all ſpeed, and leaving only a non-commiſſioned officer with ſome horſemen near the waggons. The detachment, which is advanced on the other ſide of the village to turn the enemy, on hearing the alarm, muſt immediately advance, ſounding trumpets, beating drums, and attacking all who would ſave themſelves on that ſide. You may rely on it as certain, that the enemy, ſeeing all his guards ſurrounded by your infantry ſcattered in the village, and hearing the march of different bodies of foot and horſe who arrive on all ſides, will not delay to ſurrender, or ſeek to ſave himſelf by a diſorderly flight: it will be eaſy then

for

Petite Guerre.

for your cavalry to fall upon the flying, and ſtop them. The party ſhould be forbid to purſue the enemy more than a quarter of a league in the night; but no purſuit at all ſhould be attempted, if it is in an incloſed country. The poſt being taken, the booty and priſoners ſhould be ſent off immediately under the care of the infantry, putting the wounded in waggons, or on the horſes that are taken, the cavalry making both the front and rear-guard and taking care to have the laſt the ſtrongeſt.

There is no time more precious for a partiſan, or that merits ſo much attention, as that of a battle, when every one is attentive to the great firing which they hear on all ſides; to the manœuvres of the armies that are engaging; to the deciſion of an affair of the greateſt importance, upon which the fate of each depends. It is then that he can employ his ſkill to the greateſt advantage; ſtrike the ſevereſt blow that is poſſible; cauſe the ruin of the enemy; pillage the quarters of their generals; carry off their equipages; defeat their guards; ſet fire to their camp, and ſpread an alarm over all, which may contribute to the defeat of an army.

But meaſures muſt be taken to execute ſo great, ſo brilliant a project with ſucceſs; and it ſhould not be engaged in, till after having prudently regulated the deſign on three principal circumſtances, viz. the ſituation of the enemy's camp; the means of approaching it; and the hour of engaging. When the enemy's camp is in the middle of a great plain, or on a height with an extenſive view on all ſides, it is certain that one cannot approach without being ſeen at a diſtance: and in that caſe, prudence will put a ſtop to zeal, and prevent raſhneſs from attempting impoſſibilities; but when their poſition extends over a country covered with mountains, woods, or villages, the occaſion is more favourable, and may almoſt enſure ſucceſs.

It is then very advantageous for a partiſan to be perfectly acquainted with the ſituation of places that are in front of his army; eſpecially when he foreſees that the enemy will ſooner or later come to encamp there. What aſſiſtance would it not give for the direction of his project, if he knew how to take a plan of that part of the country which he propoſes to invade beforehand? Then, without the weak and dangerous aſſiſtance of ſpies and deſerters, he can by his own proper knowledge think of every means for executing a deſign, which ought to be regulated and conducted with impenetrable ſecrecy.

When he perceives by the motions of the armies that they are on the eve of an action, he muſt not delay to acquaint the general with his project. If he conſents, he will regulate the reſt, and the time of departure, according to the advices which he receives.

As theſe ſorts of expeditions cannot be made but by long circuits, they muſt take the time neceſſary for the march. In the campaign of 1757, the duke of Richelieu cauſed his army to advance near Zell to attack our army; and ſent a partiſan with 100 horſe to the rear of the camp the day before, who, having made a march of 22 leagues, arrived without any accident: but the prudence of the prince of Brunſwick defeated his deſign, and left him to admire his retreat; nevertheleſs, they picked up ſome ſtragglers, horſes, and waggons.

Among the meaſures that ought to be taken to ſecure the blow, and ſtrike it more effectually, it ſhould not be forgot to diſtribute cockades like the enemy's to all the cavalry; and to give a ſtick of ſix feet long to 20 of each detachment, with a bit of torch fixed on the end, and covered with a little dry ſtraw or hemp, to kindle inſtantly.

Plate DXXVI.

The whole party to ſet out from the camp A (fig. 1.), marching under the conduct of a good guide by covered ways, at a diſtance from the enemy. Being come to the place C, which ought to be in the environs, and as high as the field of battle, the infantry ſhould be concealed out of the road far from the ſight of paſſengers. This muſt be the centre of correſpondence with the army; the rendezvous of the booty; and ſupport the retreat of all the cavalry, of which there ſhould be as many detachments formed as you purpoſe to make attacks. We ſhall ſuppoſe ſix of a hundred men each, and they muſt go ſecretly by particular routes to their reſpective poſts E, D, F, G, H, I. Neither trouble nor expence ſhould be ſpared to procure good guides. Each detachment ſhould lie in ambuſh half a league, if neceſſary, from the object of the attack, BKKKK.

Petite Guerre.

The noiſe of the muſketry of the armies to be the ſignal for their irruption; and then bravery, intrepidity, and courage, will give wings to your people. The ſecond detachment D will glance imperceptibly between the villages, and fall like thunder upon the camp B; and while 80 attack all whom they meet, the other 20 ſhould light their torches at the fires that are to be found everywhere, and ſpread the flames rapidly to the ſtraw of the tents. As they cannot fail to have the picquet of the camp ſoon at their heels, they muſt ſtrike their blow with all poſſible quickneſs without ſtopping to plunder; being content with the glory of having excited a general alarm, capable of confounding the whole army, and contributing to the gaining of a battle.

At the ſame time that the detachment D attacks the camp B, the others E, F, G, H, muſt with equal violence attack the villages K, K, K, K, which they have in front, doing the ſame the firſt did in camp, except that they may plunder every thing which they can eaſily carry off of the generals equipages, with which theſe villages are commonly filled; ſeizing the beſt horſes, hamſtringing others with the ſtroke of a ſword, and ſetting fire to all the places which contain the enemy's baggage. Each detachment ſhould cauſe ſome horſemen to advance beyond the village, to obſerve the motion of the troops that will not fail to run to their aſſiſtance. As ſoon as they perceive them, they muſt make their retreat as faſt as poſſible by the routes which the commanding officer has premeditated, and which are propoſed to be repreſented by the coarſer hatched lines. The ſixth detachment I, in ambuſh on the ſide of the road leading from the camp, ſhould remain there, to ſeize all the enemy who think of ſaving themſelves by flight.

There is no danger to be apprehended in theſe expeditions, during the critical inſtant while the armies are engaged, and all the troops a great way in the front of the camp: you meet none but ſutlers, ſervants, lame people, and ſome picquet guards ſcattered here and there, whom you may eaſily defeat as they advance. The commanding officer ought to have an eye over all; and as ſoon as he perceives ſome bodies of troops advancing upon him, he ought to retreat quickly, and at leaſt gain the entrance of the wood in the neighbourhood of the enemy's camp; for without ſome ſuch ſhelter enterpriſes like this can hardly be attempted.

Each detachment having rejoined the infantry, muſt there wait the fate of the battle; ſo that if it is decided in favour of their army, they may ſpeedily regain the propereſt places for haraſſing the enemy on his retreat. Theſe moments are the more favourable, as diſorder, dread, and noiſe, render all defence impracticable. But all theſe ſorts of ſurpriſes require places proper to cover approaches and retreats.

The great importance of ſkill in the language of the enemy is apparent from the following exploit of the prince (now reigning duke) of Brunſwick in the campaign of 1760. That excellent partiſan was ſituated at ſome diſtance from

Petite Guerre.

Zerenberg, at that time in the poſſeſſion of the French; and being informed by two Hanoverian officers, who had been in the town diſguiſed like peaſants, that the garriſon were very remiſs in their duty, truſting to the vicinity of their army, and the diſtance of ours, the prince was reſolved to ſurpriſe them: and after appointing a corps to ſuſtain him, he advanced in the night with Major Maclean of the 88th regiment; and 200 Highlanders, with bayonets fixed and their arms not loaded, followed at a little diſtance. Upon the firſt ſentry's challenging, the prince anſwered in French, and the ſentry ſeeing but two perſons advancing (whom he believed to be French), he had no diſtruſt; ſo that the major getting up to him, ſtabbed him, and prevented his giving the alarm. The Highlanders immediately ruſhing in, attacked the guard with their bayonets, and carried the town, having killed or taken the whole garriſon of 800 men.

The French officer who commanded at that time in Zerenberg concerted a ſcheme for being amply revenged, which failed only by a moſt trivial accident. When almoſt every houſe in Bremen was filled with corn, being the grand magazine and grand hoſpital of our army, this officer held a ſecret correſpondence in the town, which informed him of the ſtate of the garriſon, and that there was a general order to let couriers going to the army paſs out at all hours. He diſpatched about 20 huſſars to ſcamper over the country, who were all that were heard of his party, while he marched 15,000 infantry from Duſſeldorp to Bremen (about 200 miles), concealing them in woods by day, and marching in the night. He arrived at the gate at the appointed hour; when a perſon on horſeback blowing a horn came along the ſtreet, and deſired to paſs out to the army. The officer of the guard had the keys, and happened to be out of the way; and while a meſſenger went for him, the people without growing impatient, began to break down the outer barrier, which made the ſentry fire at the place where he heard the noiſe; and the guard taking the alarm, got upon the rampart, and likewiſe fired at the ſame place: upon which the pretended courier galloped back; and the French, believing that they were diſcovered, relinquiſhed their ſcheme, and retired.

This example proves that no diſtance is a ſecurity from ſurpriſes, and that very conſiderable parties may paſs over a great extent of country without being diſcovered. The following inſtance of that preſence of mind ſo much the happineſs of all who poſſeſs it, and more particularly of a military man ſo expoſed to ſurpriſes, deſerves to be recorded.

In the month of February 1761, when Prince Ferdinand beat up the quarters of the French, they were obliged to retire a great way without being able to reſiſt: However, when they came to collect their force, and to recoil upon our army, Sir William Erſkine with the 15th regiment of light dragoons was in a village in our front. In a very foggy morning, ſoon after the patroles reported that all was well, Sir William was alarmed by his vedettes having ſeen a great body of cavalry coming to ſurpriſe him. He inſtantly mounted his horſe, and ſallied out at the head of the picquet of 50 men, leaving orders for the regiment to follow as faſt as they could mount, without beating a drum or making any noiſe. He attacked their advance-guard in the curſory manner of the light cavalry, and continued to do ſo, while his men were joining him by tens and twenties, and the French cavalry forming to reſiſt an attack, till he collected the whole, and then retired, the ſurgeon of the regiment (Mr Elliot) having in the mean time carried off the baggage.

Strokes of this kind diſplay a ſuperiority of genius, and to that alone was the preſervation of the regiment owing. Had a drum to beat to arms, the enemy muſt have known that they were unprepared, and probably would have ruſhed in and deſtroyed them; but the attack convinced them that they were diſcovered, and made them think only of their own preſervation.

Petite Guerre.

Among many inſtances in the courſe of the war, the ſucceſs of this officer on another occaſion, where he diſplayed the moſt ſingular addreſs, likewiſe merits our attention. After a repulſe, and a march of 72 miles in one day, when the men were fatigued and ſcarcely a horſe able to trot, he ſaw a regiment of French infantry drawn up with a moraſs in their rear. He left his own corps, and advancing to the French, deſired to ſpeak with the commanding officer, whom he entreated to ſurrender to prevent their being cut to pieces by a large body of cavalry that were advancing. The French officer deſired leave to conſult with his officers, which having done, they refuſed to ſubmit; but upon Sir William telling them that their blood muſt be on their own heads, and turning to move off to his own corps, they called to him, and laying down their arms ſurrendered to his haraſſed troops.

Such ſtratagems overleap the bounds of inſtruction, and no author will preſume to propoſe them for imitation. Here was the reaching out the hand to fortune which Vigetius recommends: but there are few who have the requiſite talents from nature; and we may as properly ſay of the ſoldier as of the poet, *naſcitur non fit.*

Sect. VIII. *Of Ambuſcades from the Partiſan.*

An ambuſcade may be formed in any place covered by art or nature in which a party may be concealed to ſurpriſe the enemy in paſſing; and the proper uſe of them is, of all the ſtratagems in war, the beſt calculated to diſplay the genius, ſkill, ſpirit, and addreſs of a partiſan. They are eaſily carried into execution in woods, buildings, and hollow places; but require a more fertile imagination, and greater trouble, in a level country. Both ought to be regulated by the knowledge of the enemy's march, and the extraordinary means that may be employed to ſurpriſe them.

When a partiſan has information that can be depended on of the march of ſome part of the enemy; whether a convoy of artillery, baggage, or proviſions; a body of recruits, or horſes to remount the cavalry; an eſcort of a general officer going to rejoin, or reconnoitre ſome country; he ought to apply directly to procure a ſufficient knowledge of the route that the enemy is to take, the ſituation of the places he is to paſs, and of the poſt he goes to. The better to cover his deſign, he muſt get information of the roads that lead to oppoſite places, which he muſt pretend to be attentive about, as has been mentioned in the ſection of Reconnoitring.

Having perfectly concerted his plan, he ſhould ſet out at the head of his detachment if poſſible, and leaving his poſt on the ſide oppoſite to his true route, the better to conceal his deſign. If the place where he intends to plant his ambuſcade is not diſtant, he ſhould come into his true route about half way, and there place half his infantry in ambuſh to favour his retreat. But when the country where he propoſes going is diſtant, and the march requires at leaſt two nights, he muſt conduct his party by meandring from wood to wood, if there are any. He muſt not forget to provide neceſſary refreſhments for the day, which muſt be paſſed in ſome concealed place where he may not be perceived, and muſt cauſe three rations of oats to be carried for each horſe.

The firſt night you muſt make to ſome wood or other place proper for paſſing the day near ſome rivulet, and, if poſſible, on the road of your retreat to leave a part of your infantry

Petite Guerre.

infantry in ambuſh, in caſe there is no other water to paſs till you come to the place of your principal ambuſcade; for when there is ſtill a river or canal to paſs, you muſt conduct the infantry to the paſſage, and chooſe the moſt convenient place to fix them in ambuſcade.

If there is no bridge or ford, the cavalry muſt ſwim over, in which we ſuppoſe the horſes are practiſed. When there is a ford, half the infantry ſhould paſs behind the cavalry, to go along with them. In caſe there is a bridge to paſs near the village, the officer who is left in this poſt with ſome infantry, ſhould be enjoined to allow no one peaſant or ſoldier to leave the place; and for greater ſecurity, a ſmall detachment of cavalry ſhould remain with him, to ſtop any who may attempt to run away before the return of the whole corps, who ought not to delay long. If the enemy come in the interval to attack the bridge, it muſt be defended till the return of the party, that their retreat may not be cut off.

Every precaution being thus taken to guard the bridge, the commanding officer ſhould be diligent to arrive at the place of ambuſcade two hours before the enemy is to paſs, and place the ambuſcade on the ſide he would retire to; never on the other ſide, if poſſible, leſt the advanced guard happen to diſcover you, and oblige you to repaſs in ſight of the corps, who, ſeeing your ſtrength, may ruſh upon you and drive you back.

Plate DXXVI.

The infantry A (fig. 2.) ought to be ambuſhed at leaſt 600 paces behind the cavalry B, ſo that if they are purſued, they can fall back to A, and both afterwards to the guard at the bridge, or to the infantry that are in ambuſh at half way.

If the ambuſcade is placed in a wood, an intelligent non-commiſſioned officer ſhould be choſen to get upon a high tree C, from whence he can ſee the march of the enemy, and give notice of the moſt eſſential circumſtances. There are three: the firſt is, the ſeeing the advanced guard; the ſecond is, the approach of the corps; and the third is, the time when their front is advanced as far as the ambuſcade B: for which the commanding officer ſhould inſtruct the obſerver what ſignals he is to make from the top of the tree, to communicate the neceſſary information without ſpeaking, which may be done by the means of a ſmall cord D, of a brown or green colour, ſo as to be leaſt perceivable. Let this cord be placed as in the plan, ſo that no branch interrupt it, with one end in the hand of the obſerver, and the other in the commanding officer's in the ambuſcade B.

As ſoon as the advanced guard appears, the obſerver muſt pull the cord, and the commanding officer cauſe the party to mount and remain in deep ſilence. If by a ſtratagem, which is frequently practiſed for particular reaſons, the advanced guard is immediately followed by the corps, which may eaſily be known by their being more numerous than ordinary, and not followed by any other corps, that you may not be deceived by the enemy, the cord ſhould be drawn a ſecond time, and a third time when their front is advanced as high as the ambuſcade; upon which you muſt ruſh out, and pour furiouſly upon the flank of their centre in the following manner.

If the advanced guard E is formed only of an ordinary number, they ſhould be let paſs; and at the approach of the principal party or convoy F, the chief to be informed by the ſecond pulling of the cord. At the moment the head of the convoy ſhall be advanced as high as B, the cord muſt be pulled the third and laſt time; at which ſignal the whole party muſt ruſh out without being perceived, and ſuddenly attack the centre upon the flank, engaging only with their ſwords, and making ſuch a noiſe as to prevent the enemy from hearing the orders of their officers. They muſt diſarm all whom their bravery or chance throws in their way, taking care not to ſcatter or purſue too far, unleſs you are ſure that they are ſo far from their army or other parties that they cannot be aſſiſted; for in either of theſe caſes, they will not fail to run at the noiſe, and diſturb your retreat. Petite Guerre.

In all ſecret expeditions you ought to be extremely circumſpect that you may not be ſeen or betrayed. If the advanced guard diſcovers you before the blow is ſtruck, abandon the enterpriſe immediately, and retire. When your guide, or ſome one of your party deſerts, and you cannot catch him, think immediately of retreating, or placing your ambuſcade ſomewhere elſe; therefore, to prevent ſuch a misfortune, the officers ſhould be charged to examine frequently if they have all their people.

You ſhould never form an ambuſcade for cutting off the enemy's retreat, as this manœuvre will give him an idea of rallying, and attacking you in deſpair; but the caſe is different when you are well informed that you run no riſk in ſtopping his whole force, either from the nature of the defile where they cannot form, or from the ſmallneſs of the number which cannot reſiſt.

It is equally difficult and dangerous to form ſeveral ambuſcades at once; the greater number that are formed, the more they are expoſed to be diſcovered, and leſs in a ſtate to unite for a retreat. To this rule, however, there is one exception. When ambuſcades are formed to ſeize foragers, it is very proper to have ſeveral, and to diſpoſe them in ſuch a manner that the ſentries can ſee from one to another. Theſe diſpoſitions being made, they who chance to be next the foragers muſt ſtrike the blow, while the others march to ſecure the retreat of their companions, as ſoon as they perceive it.

In all ambuſcades, no ſentries ſhould be placed but officers, or non-commiſſioned officers. On downs, behind mountains, or in gullies, the ſentries ſhould lie with their bellies on the ground, and their feet towards the ambuſcade, the body covered with a grey or green cloak, according to the colour of the ground, with their heads a little raiſed, and wrapped in a handkerchief of a ſtraw-green colour, or white in time of ſnow, ſo as not to be perceived. The number of ſentries cannot be determined; but ſhould be diſpoſed ſo as to watch on all ſides of the ambuſcade, and ſtop every one who from ignorance approaches too near. The ſentries ſhould give notice of what they diſcover by geſtures, to which all the officers ſhould be very attentive.

In countries where there are no woods, vineyards, or hedges, you may place an ambuſcade in a field of hemp or corn, or ſome ſort of grain, provided it be high enough to cover you, at leaſt with the help of art. When the ſtalk of the corn, &c. is not high enough, you muſt get ſome of the infantry to work with ſpades and pick-axes, which they muſt have brought along with them.

The commanding officer muſt mark out the ground A (fig. 1.) which they are to prepare for an ambuſcade, entering at the ſide B, and raiſing in the front and at the two flanks a kind of parapet C, made with an inſenſible ſlope outwards, covered with corn raiſed from the ſurface of the ambuſcade in form of ſquare turfs of a foot thick D. They ſhould be ranged and placed one againſt the other till they have gained ſix feet and a half. If the grain is not more than three feet high, it is plain, that forming the ſlope imperceptibly to a foot and a half high, with the earth dug of the ſame depth, the grain which borders the ambuſcade will be ſix feet and a half from the bottom, reckoning the thickneſs of the turf, which ſerves to ſhow that ſuch a work ought not to be declined in arable ground Plate DXXVII.

Petite Guerre.

ſo eaſily worked. When the ſoldiers have finiſhed the work, a ſubaltern officer muſt lead them back to the place deſtined for the infantry.

The ambuſcade being thus made at 100 paces from the road where the enemy are to paſs, they ſhould lead the horſes into it one after another by the bridle, ſo as not to enlarge the entry: the horſemen to range themſelves ſtanding, and holding the bridles in their hands, with the reins ſlackened on the horſes necks. The officers ſhould be continually employed in viſiting the party, and waking thoſe who ſleep; and be equally careful to deface all traces of the entry, that none may appear near the ambuſcade.

Ambuſcades may be placed advantageouſly in hollow roads when they open obliquely behind that of the enemy, as the road K (fig. 2.) which enters by an acute angle upon the route F of the enemy; nor is there greater difficulty in concealing themſelves in the gullies of ſome rivulet G, when the borders are of a ſufficient height, or have ſhrubs that run parallel with the road of the enemy. It is extremely dangerous to fix there when the road of the enemy approaches towards, or croſſes too near, the ambuſcade, as they cannot fail to diſcover it.

Plate DXXVI.

As theſe gullies are not very large, it is neceſſary to have a number of ways to ruſh out quickly on the enemy: We ſuppoſe four, H, H, H, H, by which the cavalry can dart out ſuddenly upon the enemy at F.

It will be proper, before the placing the party, to cauſe the rivulet to be cut ſomewhat higher, to give it a new courſe I, ſo that the horſes feet may be dry in the gullies, and make leſs noiſe; and the ſhorter way they have to go, they will more certainly ſucceed. The commanding officer will not fail to diſpoſe them in ſuch manner, that the whole can ruſh out at once by the four paſſages, and pour in great numbers upon the flank of the enemy.

In ſuch ſort of ambuſcades, the commanding officer ſhould himſelf be the ſentry, leaning upon the edge, and covering himſelf, ſo that he may ſee every thing without being perceived.

Plate DXXVII.

In deſerted villages they may fix an ambuſcade in the gardens G (fig. 1.), or in the barns H. The doors fronting the enemy muſt be ſhut up, and the paſſages which are marked by ſmall dots made uſe of; for it is a general rule in all ambuſcades, to ſally forth in ſuch manner as to take the enemy obliquely behind their front.

You ought never to employ infantry in the ambuſcades we have been deſcribing, where the cavalry act, unleſs to favour their retreat: but when you go at hazard, ſeeking to draw the enemy into an ambuſcade, then the infantry ſhould have their turn. Neither woods, villages, nor any places which are much covered, are proper for them; however unſkilled an enemy may be, he will not follow a party on the ſkirts of a foreſt, or in the neighbourhood of ſome covered place: for which reaſon, there are no places fitter for ſucceeding with ambuſcades of infantry, than heaths, hilly countries, hollow roads, corn-fields, ditches at the ſide of great cauſeways; provided always that you do not plant them on roads that lead to your army, for then the enemy will take care how he purſues you too far.

When you would place an ambuſcade on a heath, or in a country full of little hills, your infantry muſt lie down with their bellies on the ground. If there is ſome water near them, it may ſuggeſt to them to wet their clothes and cover them with duſt, to give them the colour of the ground: but that this party ſo laid on the ground may not be cruſhed or trod upon by the enemy's horſe when hurried along with violence, they muſt preſerve the flank of the ambuſcade I, next the enemy, with a bar K, which may be made in a hurry with ſome ſtakes drove in the ground, at ten feet from one another, and above five or ſix feet high, held together by croſs pieces tied above five feet from the ground, which can be eaſily done in the neighbourhood of a wood. The time for the infantry to fire is, when the enemy's cavalry L, paſſing before the front, ſtretch their flank the whole length of the ambuſcade; then your cavalry M muſt quickly face about and attack the enemy. Their defeat will be ſo much the more certain, as the fire of your infantry happens to have driven their ſquadrons into confuſion.

Petite Guerre.

To ambuſh in the ditch of a great cauſeway, you muſt chooſe the deepeſt place, and at the edge of a corn-field which is pretty high, and there place your people ſitting or kneeling. You ſhould collect as many ſmall round buſhes as poſſible, which are to be found in plenty in the country, which ſhould be planted, as if naturally, along the ſide of the road in front of your party, and beyond the ambuſcade on the ſide you expect the enemy, and here and there ſo open, that the enemy being accuſtomed to them may paſs without diſtruſt. You ſhould then make the corn lean over to cover the ambuſcade; but if there is none near enough the ditch, you muſt have as many ſquares cut in the manner directed above as will cover the edge of the ditch. Some of the corn ſo tranſplanted ſhould be beat down, but to appear as if done by hail or wind.

Mr Jeney ambuſhed in this manner with 50 men, when under the command of Captain Palaſti, who advanced with his cavalry upon the cauſeway leading to Straſbourg; and as ſoon as he was perceived, 400 Bavarian dragoons advanced to attack him: he wheeled about, and the dragoons believing themſelves maſters of the booty, did not fail to purſue, and arrived before the ambuſcade without ſuſpecting. Mr Jeney let their front paſs, and fired ſuch a deadly fire upon their centre, that he brought to the ground 17 killed or wounded: at the ſame time, the cavalry who pretended to fly, faced about and attacked the enemy, and would have completed their defeat, if it had not been for the great ſupport of cavalry and infantry hurrying out of Straſbourg to ſuſtain the dragoons; nevertheleſs, he carried off more than 50 horſes.

An officer having placed his infantry in ambuſcade, ought to ſend on the cavalry at day-break, a non-commiſſioned officer with ſix of the beſt mounted horſemen making the advanced guard: they ſhould advance as far before the party as the commanding officer can ſee. At ſight of the enemy, they ſhould begin to retire ſlowly without flying, at leaſt till the enemy comes to purſue with keenneſs: in that caſe, the advanced guard makes the rear-guard, and may drop a few ſhot at the enemy, to haraſs them and draw them on, or make pretended delays to excite them to purſue, till they fall by degrees into the ambuſcade.

When you cannot place your infantry in ambuſh without having a village between them and the enemy, the cavalry ſhould not be ſent beyond the village, becauſe the enemy will never expoſe themſelves to croſs it in following your party, for fear of falling into ſome ſnare: but inſtead of going beyond it, your cavalry ſhould enter the village, and demand refreſhment for 50 men, if the party are 100; then make three or four peaſants carry orders to the magiſtrates of the villages that are towards the enemy, to come to you, and regulate the delivery of waggons and forage, or ſome other pretence. As the peaſants will not fail to acquaint the enemy, and to deſcribe your ſtrength and ſituation according to what they have heard, the enemy will certainly come with ſuperior force; and that they may come more ſpeedily, they will bring no infantry.

As ſoon as the peaſants are gone, you muſt be careful to

let

Petite Guerre.

let none of the inhabitants leave the place, and ſend continually ſome ſtrong patroles to the rear on the road of your retreat, and eſpecially to the paſſages by which they can cut off your communication with the ambuſcade. Every horſeman holding his horſe by the bridle muſt be ready to mount, ſo that upon the enemy's appearing you may retire quickly from the village, and fall back one after another upon your ambuſcade.

When a partiſan has no infantry, he may form an ambuſcade with cavalry, which ſhould be as near as poſſible to the enemy. In the night, he ſhould ſend out two or three waggons covered with white linen, that they may be ſeen at a diſtance: care muſt be taken that the harneſs be in good order, ſo that no troubleſome accident happen by the want of attention to it. Each carriage to have four horſes mounted by two dragoons diſguiſed like waggoners, with their arms in the hands of two or four comrades concealed in each waggon, ſo that they may repulſe any patrole they chance to fall in with.

The waggons ſhould go ſlowly on ſome road parallel to the front of the enemy, and paſſing at ſome diſtance from their poſt (for it is not neceſſary that they paſs through them), and regulate their march ſo, that they may be within half a league of the ambuſcade at day-break, and readily perceived by the enemy; then let them ſtop while one mounts a tree or ſome height to ſee round them. When they perceive the patrole of the enemy, they muſt move off, for the others will not fail to follow; but if the enemy appears not to be inclined to follow, which the non-commiſſioned officer muſt attend to, and make one of the drivers' ſtop, as if ſomething were the matter with his waggon, which will draw them on till they fall into the ambuſcade.

Among the thouſand opportunities that the different marches of the enemy offer for ambuſcades, there is none more proper than the retreat of an army which decamps to fall back. When a partiſan happens to get information of it on the eve by good ſpies, he ought to ſet out immediately with his whole party, making ſuch a round as has been drawn in fig. 1. leaving his infantry in ambuſcade at half-way.

Plate DXXVII.

The cavalry muſt be diligent to arrive at the place of ambuſcade by day-break, which ought to be placed on the route that the enemy is to take, and two or three leagues in the rear of his camp.

To be more ſecure of his retreat, he ſhould leave two or three detachments of cavalry between him and his infantry, at a good diſtance from one another; the remainder to line the road in ſeveral ranks parallel to it, and 300 or 400 paces behind one another, concealed from the view of paſſengers by the favour of hollows, woods, or hills.

The firſt line being near the road, muſt take care of ſutlers, equipages, &c. which are the forerunners of an army, and the firſt to decamp when they are retiring. When they ſecure ſome waggons or mules, the firſt detachment ſhould paſs them to the ſecond, and ſo on till they come to the infantry.

You muſt haſten to carry off what you can for a full quarter of an hour; after which you muſt preſs your retreat, expecting that the alarm will ſoon paſs to the army, and the light troops be inſtantly at your heels.

Sect. X. *Of the Retreat.*

Every march in withdrawing from the enemy is called a *retreat*. That which is done in ſight of the enemy, who purſues with a ſuperior force, makes the preſent ſubject; and is, with reaſon, looked upon as the glory of the profeſſion. It is a manœuvre the moſt delicate, and the propereſt to diſplay the prudence, genius, courage, and addreſs of an officer who commands.

Petite Guerre.

The ſucceſs of the retreat depends upon the knowledge of the country that is to be paſſed over, and the goodneſs of the diſpoſition that is made for the troops to defend themſelves. The firſt offers advantages, and contributes greatly to the ſeizing them; the ſecond reſtrains the ardour of the enemy, and keeps up the force of a party to its higheſt pitch. Both deſerve to be ſtudied.

1ſt, Every officer who commands a detachment ought to apply himſelf carefully to reconnoitre every ſtep he takes, and examine perfectly every route that can conduct him from one place to another; he ſhould obſerve attentively all the ſtratagems that can be employed for ambuſhing infantry, or poſting cavalry; the courſe of rivers, their bridges and fords; the roads moſt covered with woods, hills, gullies, and villages; and, in a word, he ſhould know all the advantages, as well as the dangers, that lie in his way. It will be eaſy for him to acquire a knowledge of all this, if he will uſe the method recommended in a former ſection. With the aſſiſtance of ſuch a plan as is there deſcribed, he may regulate his retreat with eaſe, and put it in practice to advantage, profiting by every means proper for his defence, or ſurpriſing the enemy.

2dly, The diſpoſitions that ought to be made for a party, to ſuſtain their retreat in the face of the enemy, depend upon the number and kind of troops in both corps; for they muſt be varied according as they happen to be of cavalry or infantry united, or of either ſingly.

Every forced retreat in conſequence of an unfortunate action, would be almoſt impracticable, if it were not premeditated before you come in preſence of the enemy, or when you are obliged to fly by unknown routes. That which can be made in a fog, or in the night, is eaſieſt, when your rear is ſecured, as you can ſlip out of ſight of the enemy without any difficulty, and they will be afraid of following you for fear of being ſurpriſed in the dark: we ſhall only therefore ſpeak of that which is to be made in open day, and under the fire of the enemy.

To conduct it properly, you muſt abſolutely know the ſtrength of the enemy; for it is ſhameful to be the dupe of a falſe alarm, and to retreat precipitately from an ill founded fear at the approach of an inferior enemy. You muſt therefore be convinced of his great ſuperiority, and know what his party conſiſts of.

If they come with a ſtrong cavalry, united to a more numerous infantry than yours, you muſt immediately render their acting uſeleſs, by hurrying your infantry as quick as poſſible to retreat to the firſt place where they can lie in ambuſh, and ſerve the cavalry advantageouſly, if they can draw on thoſe of the enemy, as has been ſaid in ſpeaking of ambuſcades.

To conceal from the enemy, and favour the departure of your infantry, you ſhould cauſe your cavalry to advance, and pretend as if they were going to attack the enemy A (fig. 2.), your party forming into two diviſions B and C, each drawn up in two lines, the ſecond double the firſt, and diſpoſed as in the plan.

The diviſion C is to retire firſt 100 or 200 paces, and then fronting the enemy divide into two wings, leaving an interval for the paſſage of the diviſion, B, who, in retiring, muſt leave a rear-guard at 50 paces, which muſt be divided into ſeveral parties D, to ſcamper about the enemy's front; and in caſe they appear deſirous to attack you, your ſmall parties muſt keep a conſtant fire, particularly on the ſides that advance the moſt; and continue this manœuvre till they have joined the diviſion C, which ſhould immediately detach ſome ſmall parties of the beſt mounted to ſerve for a rear-

guard,

Petite Guerre.

guard, and to haraſs the enemy, till the diviſion B is drawn up 100 paces in the rear, and divided into wings, leaving an interval for the diviſion Ç to paſs through in its turn; and continue to manœuvre it in this manner, till you draw the enemy's cavalry under the fire of your infantry.

When the force of the enemy conſiſts of cavalry alone, your infantry (marked in the plan by dotted right angles) ſhould retire jointly with the cavalry, at leaſt if the country does not expoſe you to be ſurrounded by ſome covered place; becauſe in that caſe your infantry ſhould go and occupy that place, and form an ambuſcade.

The reſt of the infantry ſhould place themſelves in the ſecond line of each diviſion. If the enemy approaches the firſt line too near, they ſhould fall lightly back upon the two wings of the ſecond, opening the centre quickly for the infantry to fire upon the enemy in platoons, at the ſame time that your cavalry detach ſeveral ſmall parties to advance briſkly to prevent the enemy's forming, who were thrown into confuſion by the fire of the infantry. The diviſion which retires will force its march, and go to a greater or leſs diſtance according to the purſuit of the enemy. The ſuſtaining diviſion muſt fall back afterwards till it has paſſed between the wings of the ſecond diviſion, who muſt then make the manœuvre of the firſt, continuing it alternately till the enemy deſiſts from the purſuit.

To facilitate the retreat of the infantry, and gain ſome way on the enemy, many have been of opinion that they ought to tranſport them in waggons. But when the enemy is at our heels, the time is very ill employed in collecting carriages and harnaſſing them: thoſe moments are too precious; and ſhould be employed in cauſing the infantry to move off quickly, by which they will not be expoſed to a train of waggons taken in haſte, which may ſoon break, or be put out of order, and may ſtop the whole line; which not only retards the infantry, but likewiſe the cavalry, when they find the route they were to have taken blocked up with broken carriages.

When there happens to be a wood in your rear, you need not enter it if the enemy follows you cloſe, and is prevented by your ſtrength: it is better to coaſt along it by the route marked G, for fear of his coming round you; but if you cannot avoid croſſing it, the diviſion C ſhould paſs quickly, and at getting out face to the two flanks of the wood. The diviſion B is to remain at the entrance of it, till they judge that the diviſion C is ſufficiently advanced, and then fall back, leaving the infantry for a rear-guard during the whole paſſage through the wood: at which time the whole ſhould reſume their firſt diſpoſition.

In all defiles, and paſſages of bridges, the ſame manœuvre ſhould be uſed as for woods: but the firſt diviſion having paſſed, they ſhould form facing the enemy; and the infantry likewiſe draw up on the other ſide, upon the edge of the river.

Petite Guerre.

When the country through which you are to retire happens to be mountainous, the diviſion which falls back ſhould guard the heights by ſmall detached parties, or, if poſſible, guard them themſelves.

A body of cavalry retreating without infantry, ought to form in three lines at 200 paces behind one another; the two laſt extending their front, that they may appear more numerous, and draw up on the two ſides out of the road. The firſt line being attacked, the ſecond is to ſuſtain it, the third to wait the retreat of the firſt, and to ſuſtain the ſecond, and continue to do ſo alternately.

If the enemy ſeem to quit the purſuit, the whole corps muſt reſume the order of an ordinary march; with this precaution, that the rear-guard be reinforced, and the advanced guard weakened.

As to the retreat of a ſmall detachment of cavalry, ſuch as go to reconnoitre the enemy, to diſcover their march, to carry off ſome officer, or for ſome other commiſſion, as they are not numerous enough to ſkirmiſh and retreat by rule, they have but two ways to chooſe; either to fly, or break through the enemy. They ought to determine for the laſt, when their retreat is cut off on all ſides, ſo that they have no other way to eſcape but by cutting their way through the enemy ſword in hand: but flight is always leſs hazardous when it is practicable.

If the officer is certain of the fidelity of his men, and their attachment to him; and ſees that they cannot get out of ſight of the enemy, but are ready to fall into their hands; he ought to try one means ſtill, which has been known frequently to ſucceed. He ſhould diſperſe his party by two and two, by the favour of the firſt covered place, where they may be at liberty to take ſo many different routes. It is evident that two men may wind from right to left, and eſcape more eaſily than a party of 12 or 20, who cannot move ſo freely.

Mr Jeney made uſe of ſuch an expedient ſucceſsfully in Italy, when the Spaniards having advice of his detachment having ſlipped to the rear of their army, they cut off his retreat on all ſides. The whole party being diſperſed, he took two huſſars with him, and was followed ſo cloſe, that every inſtant he thought he muſt be taken; however, he ſaved himſelf by croſſing a marſhy pond. The enemy ran to turn him but he got ſo far before them, that they could not take him. He got ſafe to his poſt, and in three days the whole detachment met without the loſs of a man; which will prove that in ſuch a ſituation we need not deſpair, and that in extreme neceſſity the paſſage of a river or moraſs ought not to be declined.

PART IV. Of SIEGES.

SECT. I. *Of Attack.*

§ 1. *Maxims or Principles to be obſerved in the Attack of Places.*

1. THE approaches ought to be made, without being ſeen from the town, either directly, obliquely, or in flank.

2. No more works ſhould be made than are neceſſary for approaching the place without being ſeen; that is, the beſiegers ought to carry on their approaches the ſhorteſt way poſſible, conſiſtent with being covered againſt the enemy's fire.

3. All the parts of the trenches ſhould mutually ſupport each other, and thoſe which are fartheſt advanced ought not to be diſtant from thoſe which are to defend them above 120 or 130 fathoms, that is, above muſket-ſhot.

4. The parallels or places of arms the moſt diſtant from the town, ought to have a greater extent than thoſe which are neareſt, that the beſiegers may be able to take the enemy in flank, ſhould they reſolve to attack the neareſt parallels.

5. The trench ſhould be opened or begun as near as poſſible to the place, without expoſing the troops too much, in order to accelerate and diminiſh the operations of the ſiege.

There

Of Sieges. There is no ſuch thing as giving any exact rule in regard to the diſtance which ought to be obſerved upon opening the trenches. On level ground this diſtance may be 800 or 900 fathoms; but if there ſhould be a hollow way in the neighbourhood of the place, the beſiegers are to take advantage of it, and open the trenches nearer. In general, they are to regulate themſelves upon this head according to the nature of the ground, more or leſs favourable to the opening of the trenches.—We ſhall ſuppoſe, in the preſent work, that the opening ought to be made within 800 fathoms of the covert way; the firſt parallel within 300 fathoms, the ſecond within 150, and the third at the foot of the glacis.

6. Care ſhould be taken to join the attacks; that is, they ought to have communications, to the end that they may be able to ſupport each other.

7. Never to advance a work, unleſs it be well ſupported; and for this reaſon, in the interval between the ſecond and third place of arms, the beſiegers ſhould make, on both ſides of the trenches, ſmaller places of arms, extending 40 or 50 fathoms in length, parallel to the others, and conſtructed in the ſame manner, which will ſerve to lodge the ſoldiers in who are to protect the works deſigned to reach the third place of arms.

8. Obſerve to place the batteries of cannon in the continuations of the faces of the pieces attacked, in order to ſilence their fire; and to the end that the approaches being protected, may advance with greater ſafety and expedition.

9. For this reaſon the beſiegers ſhould always embrace the whole front attacked, in order to have as much ſpace as is requiſite to plant the batteries on the produced faces of the works attacked.

10. Do not begin the attack with works that lie cloſe to one another, or with rentrant angles, which would expoſe the attack to the croſs-fire of the enemy.

§ 2. *Of Inveſting.*

The firſt operation of a ſiege is inveſting. The body of troops inveſting a town ought at leaſt to be as ſtrong again as the garriſon; they are to divide themſelves into ſeveral parties, in order to take poſſeſſion of all the avenues leading to the place. By day they ſhould keep themſelves out of the reach of cannon-ſhot; but as ſoon as it is duſk they muſt approach much nearer, the better to be able to ſupport each other.

The inveſting is generally made by cavalry; but when the country is cut with ravins or hollow ways, or when there are woods in the neighbourhood of the place, then there muſt be likewiſe a body of infantry to guard all the avenues, and even to ſtop up, by a kind of retrenchments, ſuch as might be the eaſieſt to penetrate.

A few days after the inveſting, the army arrives, and is diſpoſed round the town, according to the ground taken up by the line of circumvallation, and aſſigned by the engineer who has the direction of the ſiege. As ſoon as the place is inveſted, they begin to trace the line of circumvallation, and afterwards they ſet about its conſtruction.

§ 3. *To trace out the line of Circumvallation.*

Before a general begins the attack of a place, he muſt endeavour to have as exact a plan of it as poſſible, by which he forms a deſign of the circumvallation and the attacks. The plan is rectified after the inveſting as much as the vicinity of the enemy will permit; and thereby he may correct the deſign traced at firſt, as far as there may be occaſion for correction. It is upon ſuch a plan, ſo rectified, that we ſuppoſe a general to proceed. We ſhall therefore begin with explaining or tracing the operations of the ſiege. We ſhall exhibit the progreſs of theſe operations from the inveſting to the taking of the place, in the order they are really executed. The line of circumvallation being a fortification intended againſt the enemy from without, who ſhould attempt to ſuccour the town, its defences ought to be directed againſt that enemy; that is, they ought to be oppoſite to the town; and the beſieging army ſhould, as we have already obſerved, be encamped behind that line, that is, between it and the town. The camp ſhould be, as much as poſſible, without the reach of cannon-ſhot: therefore, as the line of circumvallation ſhould be at a greater diſtance from the place than the camp, the reaſon is ſtill ſtronger for its being alſo out of the reach of the cannon-ſhot; which, whether fired horizontally, or at an angle of 10 or 12 degrees, may be reckoned about 1200 fathoms. As the rear of the camp ſhould not be incommoded by the cannon, this part ought to be above 1200 fathoms diſtant from the place; and we ſhall ſuppoſe that the diſtance ought to be fixed at 1400 fathoms from the covert way. The depth of the camp may be eſtimated at about 30 fathoms. From the front of the line of circumvallation there ſhould be a ſpace of 120 fathoms, to draw up the army in battalia behind the circumvallation; which ſpace added to 30 fathoms, ſuppoſed for the depth of the camp, gives 150 fathoms; and this added to the diſtance from the covert-way to the rear of the camp, gives 1550 fathoms for the diſtance from the circumvallation to the covert-way.

This being laid down, if the place be a regular octagon, fortified according to M. Vauban's firſt method*, the radius thereof will be 234 fathoms. This diſtance being added to the 1550 fathoms, then we ſhall have 1784. Or we may make it a round number by adding 16 fathoms, which are here of no manner of conſequence, and we ſhall have 1800 fathoms for the diſtance from the centre of the place to the line of circumvallation.

* See Fortification.

The radius of the circumvallation being thus ſettled, from the centre of the place, with the diſtance of 1800 fathoms, you are to deſcribe the circumference of a circle round the place. The diameter being 3600 fathoms, the circumference will then take 11,314; then take the diſtance of 120 fathoms, which you are to carry to the circumference above deſcribed. This diſtance will be in this example 93 times, and ſomething over, which differs very little from 120 fathoms; ſo that you may look upon the polygon of this circumvallation as a polygon of 94 ſides, of 120 fathoms each.

The polygon of the circumvallation being traced, take on each of the extremities of its ſides the lines BD and BE, each of 15 fathoms; and from the points D and E, taken for the centre and diſtance of 25 fathoms, deſcribe two arcs which cut one another at the point F; from whence draw the lines FD, FE, for the faces of the redans of the line of circumvallation: thus it is we form the ſaliant parts EFD of this line, which ſerve to flank it. Perform the ſame operation on every ſide of the circumvallation, and then you will have its principal line traced. Plate DXXVIII. fig. 1.

The parapet within muſt be ſix or eight feet deep; and without make a ditch parallel to all its parts, three or four fathoms in breadth. The parapet of the circumvallation will be ſeven feet and a half high, and the depth of the ditch equal to the height of the parapet.

To make the profile of the circumvallation, let AB fig. 2. be the line level with the country, and CD the ſcale of the profile. Let A be the ſide of the town, and B that of the country; take AE, of ſix feet; from the point E, raiſe the perpendicular EF, of three feet, and draw the line AF, which will be the talus of the banquette.

Draw

Of Sieges.

Draw FG parallel to A B, three feet from F to G, and the line FG will be the breadth of the banquette. On the point G raiſe the perpendicular GH, upon the line FG, four feet and a half. Draw from the point H, HK, parallel to AB. Make HK ſeven feet and a half, HI a foot and a half, draw GI, which will be the inſide of the parapet of circumvallation.

From the point K, let fall on the line AB the perpendicular KM; take KL a foot and a half, and draw IL, which will be the upper part of the parapet of the line of circumvallation. Take MN five feet, and from the point N draw the perpendicular NO, and ſet off ſeven feet and a half from N to O. Draw OR parallel to AB, making the diſtance three fathoms or 18 feet from O to R; draw the line LN and produce it to P, and LP will be the ſcarp, or the outſide of the parapet of the line of circumvallation. From the point R raiſe RS, perpendicular to OR, or parallel to ON. Make QR equal to OP, and draw QS, which produce beyond S three feet to V; then take SX ſix feet, and draw VX, and the profile of the circumvallation will be completed.

This kind of glacis, VX, will ſerve to raiſe the enemy, and to expoſe them more to the fire of the line, ſhould they attempt to make themſelves maſters of it, and to cover the parapet of the circumvallation, in the ſame manner almoſt as the glacis of a place covers the top of the rampart.

The dimenſions above given may vary a little without inconvenience; but it would be to no manner of uſe to make the lines ſtronger; only you may reduce the ditch to ten or twelve feet in breadth at the top, and five or ſix feet in depth. A ditch of leſs breadth and depth, beſides its not allowing ground enough to form a good parapet, would have the inconvenience of being too eaſy to paſs over by the enemy. The lines may be fraiſed (ſee FRAISE); which is done when they are to laſt for ſome time, and the neighbouring country furniſhes wood enough for the purpoſe.

Sometimes a fore-ditch is dug before the lines, 12 or 15 feet in breadth at the top, and ſix or ſeven feet deep; it is made about 12 or 15 fathoms from the ditch of the line.

The deſign of it is to ſtop the enemy when they attempt to attack the lines, and to make them loſe both time and men in paſſing over it. As it is expoſed to the fire of the lines, the time the enemy muſt neceſſarily ſpend in croſſing will of courſe occaſion their loſing a great many men; and beſides, the paſſage itſelf may throw them into ſuch diſorder, as ſhall prevent their attacking ſo advantageouſly as they would otherwiſe do, were it not for this obſtruction. Between this fore ditch and the ditch of circumvallation, at the ſiege of Philipſburg, in order to ſtrengthen the defence of the circumvallation, there were likewiſe dug wells, which were ranged chequerwiſe, of about nine feet diameter at the mouth, and ſix or ſeven feet deep. They were ſituated near to each other, to prevent the enemy from paſſing eaſily through the intervening ſpaces. The Spaniards practiſed ſomething of this kind at the ſiege of Arras in 1654. Before the circumvallation, they dug a number of holes two feet diameter, and a foot and a half deep; in which they faſtened ſtakes that were capable of greatly obſtructing the paſſage of the cavalry. See Plate DXXIX.

A line of circumvallation requires a ſtrong army to defend it. We have found the circumference of the line which we have been now tracing, namely, of 94 ſides, each of 120 fathoms, to be 11,280 fathoms; out of this number the gorges of the redans are to be deducted, but then their faces are to be added. The gorges have 30 fathoms; and the two faces which have 50, give an overplus of 20 fathoms on each redan; that is, to the number above mentioned of 11,280 fathoms, add as many times 20 as there are redans, in order to have the entire circumference of the circumvallation. This circumference has 95 redans; therefore we muſt add 94 times 20, or 1880, which will make 13,160 fathoms for the whole circumference. This number being divided by 2282 (which is the number of fathoms contained in a French league) gives about five leagues and a half. Now it is clear, that ſo great an extent of ground requires a very numerous army to guard it. We may make a calculation pretty near, by ſuppoſing that every ſoldier drawn up in a line occupies a ſpace of three feet, that is, half a fathom; that the ſoldiers are four deep; and that the army is drawn up in two lines, which will give eight ranks of ſoldiers. Each rank containing 26,320 ſoldiers, the circumference of the circumvallation being 13,160 fathoms, the eight ranks will therefore make 210,560 men.

Of Sieges.

To theſe we ſhould likewiſe add about 12,000 or 15,000 men for the works of the attack, which would form an army of about 225,000 men. And as it is not cuſtomary, at leaſt in Europe, to ſend ſuch ſtrong armies into the field, from thence it follows, that the circumvallations, and the lines in general, when they are of a very great extent, are extremely difficult to guard. And indeed the moſt celebrated generals have been divided in their opinions upon this ſubject. They all agree that there are certain caſes in which they may be of ſome advantage, eſpecially when they are of a narrower compaſs, and the deſign of them is to ſtop up the entrance of a country of a ſmall extent; but if they are very large, it is extremely difficult to defend them when attacked by a ſkilful enemy.

It was heretofore the cuſtom to add great outworks to the lines, ſuch as horn and crown works, tenailles, &c. All the circumvallations of the towns that were beſieged during the wars between Spain and Holland, under the princes of Orange, were remarkable for this ſort of works. Theſe have been ſince laid aſide, becauſe we find that even a line, with its ſimple redans, is very difficult to guard; and ſuch a number of outworks does but increaſe its circumference. The modern lines have only a few ſmall half-moons A, before the gates of the circumvallation, placed, like thoſe of the towns, againſt the middle of the curtains; the entrance is ſhut up by wooden barriers, and ſometimes by chevaux-de-frize, and other contrivances, which will hinder the paſſage from being eaſily forced. Plate DXXVIII. fig. 1.

The lines having very little elevation, ſtand in no need of baſtions to be flanked in all their parts, like thoſe in the circuit of a town. Redans, which are of more ſimple and expeditious conſtruction, are ſufficient. The angle they make with the curtain is always very obtuſe, to the end that the ſoldier being placed on the face of the redan, may be the better able to defend its approach. It is cuſtomary indeed to make baſtions in thoſe parts where the lines form ſuch angles as could not be ſufficiently defended by redans. Yet, whenever it may be judged neceſſary, the line of circumval lation may be fortified with baſtions. The greateſt part of the lines at the ſiege of Philipſburg was flanked in this manner, as may be ſeen in Plate DXXIX. The baſtions increaſe the circumference of the circumvallation; and probably the reaſon why they were uſed at the ſiege of Philipſburg, was becauſe the circumvallation was of a very ſmall extent.

At the point of the redans, batteries are erected to fire the cannon a barbette over the parapet; and the ſame is practiſed wherever the cannon are placed on the line of circumvallation.

Hitherto we have ſuppoſed that the circumvallation was regular: but even were it irregular, the conſtruction of it would differ very little from that which we have juſt now given.

Of Sieges. which the lines may be commanded, when it is poſſible to do it without carrying the circumvallation to too great a diſtance. He ſhould likewiſe take all advantages ariſing from the nature of the ground, as precipices, eminences, rivers, brooks, moraſſes, and, generally ſpeaking, whatever is capable of rendering the camp of difficult acceſs. If there are any woods or buſhes within its incloſure, it will be right to cover it in thoſe parts by felling the trees, and therewith making a proper fence.

The tracing of the lines is a matter of no difficulty, if you have a good map of the adjacent country; ſince you have only to bring the ſeveral parts of the line nearly within 1800 fathoms of the centre of the place, and to take care that there ſhall be about 120 fathoms from the point of one redan to another.

Nor is there any difficulty in transferring this line to the ground; the operation is too eaſy to thoſe who know a little of practical geometry, to loſe any time in explaining it here.

When the garriſon is numerous enough to diſturb the beſieging army, another line is traced in the rear of the camp, called the *line of countervallation*. As it is intended to oppoſe a far leſs conſiderable body of troops, it is never made ſo ſtrong as the line of circumvallation; but it is conſtructed on the very ſame principles, as the figure will ſufficiently ſhow.

Plate DXXX. fig. 1.

§ 4. *Of the Park of Artillery.*

The park of artillery is the place which contains the cannon, bombs, powder, and in general all military implements and machines that have any relation to the artillery. This park ſhould be placed where there is leaſt danger of being inſulted by the enemy. It ought to be without the reach of cannon-ſhot, and incloſed within a particular ſpot, which ſhould be fortified alſo by a line, conſiſting of a ditch and a parapet, flanked with redans in the ſame manner as the circumvallation. Nothing ſhould be neglected that is capable of ſecuring it either from the attacks of the enemy, or from any other poſſible damage.

§ 5. *Of the Trenches and Parallels.*

While the line of circumvallation is finiſhing, all the materials neceſſary for the conſtruction of the trenches are got ready, and the engineer who has the direction of the ſiege, examines on the ſpot the moſt proper place for the attacks, and the figure they ought to have; and of theſe he makes a particular plan.

We have ſuppoſed that the place is regularly fortified, and on level ground; ſo that here it is indifferent on which ſide the attack is begun. It is ſufficient to explain the rules that are to be there obſerved; and afterwards to apply them to irregular towns, and to uneven grounds. Let C (fig. 2.) be the place beſieged, and A and B the baſtions attacked. Begin with indefinitely producing towards the field the capitals of theſe two baſtions; in like manner produce the capital of the half-moon oppoſite the curtain between theſe two baſtions; ſet off 800 fathoms from the faliant angles D and E of the covert-way to F and G. This done, take DH, and EI of 300 fathoms; and from the centre C, with the radius CH or CI, deſcribe an arc, which produce beyond the points H and I; and on this arc H I conſtruct the firſt parallel. Then on the ſame lines, DF, EG, take the points M and N 140 fathoms diſtant from the points H and I; and through theſe points deſcribe from the centre C another arc, on which the ſecond parallel is conſtructed. This ſecond arc will cut the produced capital of the half-moon in the point L, which is to be obſerved, in order to begin from hence a trench, which ſhall extend to the ſaliant angle of the covert-way before this half-moon. Laſtly, through the points O and P, the diſtance of 20 or 25 fathoms from the angles D and E, deſcribe from the centre C a third arc, on which the third parallel is conſtructed.

Plate DXXX.

Of Sieges.

Terminate the firſt parallel by producing the faces *a b*, *a b* of the half-moons 1 and 2, collateral to the baſtions A and B; but extend the parallel 15 or 20 fathoms beyond the interſection of this prolongation. The ſecond parallel will be leſs extended than the firſt, by about 30 fathoms on each ſide; and the third alſo leſs extended than the ſecond, by about 30 fathoms on each ſide.

This being done, you have a ſketch of the trenches and the places of arms. The buſineſs now is to trace the trenches, or approaches, without being ſeen or enfiladed.

Take a long ruler, and lay it on the point G, ſo that it ſhall make, with the produced capital EG of the baſtion B, an angle EGS, whoſe ſide GS being produced, ſhall meet no part of the covert-way, and ſhall be diſtant about 10 or 12 fathoms from the angles to which it approaches neareſt. Take GS of an arbitrary extent, as of 200 or 220 fathoms, and put the ruler on the point S, ſo that it ſhall make with GS ſuch an angle GST, as that the ſide ST produced ſhall not fall on any part of the covert-way, but be 10 or 12 fathoms diſtant from the moſt ſaliant parts. Terminate this ſide in T, and there make alſo a new angle STI, whoſe ſide TI ſhould terminate at the point I, where it meets the firſt parallel. Perform the like operation on FH, and it will give you the outline of the trenches as far as the firſt parallel.

At this part of the trenches you may make a greater number of turnings; you may likewiſe carry it in a direct line to the firſt parallel. The moſt important article is, to take care not to let it be enfiladed from any part of the covert-way; and the fewer angles and turnings it makes, the quicker it is conſtructed, which in transferring it to the ground is worthy of great attention. Take care alſo, that its extremity I, do not fall far from the point where the produced capital of the baſtion meets the firſt parallel.

By the ſame method trace the trenches between the firſt and ſecond parallel, as may be ſeen in the figure; but as this part is nearer the place than the former, in order to avoid being raked, it muſt have a greater number of angles. All its ſides ought to cut the prolongment of the capital of the baſtion B, as appears by the figure. In like manner trace the trenches betwixt the ſecond and third place of arms, by making as frequent turnings on the produced capital of the baſtion B, as ſhall be neceſſary, in order to its defiling from the covert-way. By the ſame method trace the trenches on the capital of the baſtion A; trace alſo a trench on the produced capital of the half-moon, between the ſecond and third parallel, to reach the flanked angle of its covert-way.

When the garriſon happens to be ſtrong and enterpriſing, it will be proper, between the ſecond and third parallel, to make parts of trenches V, V, &c. parallel to the places of arms; they are to be 30 or 40 fathoms long, and to communicate with the trench, as may be ſeen in the figure. Theſe parts of the parallels are what we have diſtinguiſhed by the name of *half parallels* or *places of arms*. At every angle of the trenches obſerve to produce the part of the trenches in thoſe places, ſo that this prolongation ſhall cover that part of the trenches which it terminates.

This will be illuſtrated by an example.

Let ABCDFGMQ be a part of the trenches, and let AB be one of the ſides oppoſite to the enemy; produce AB, ſo that BE ſhall be five or ſix fathoms; and in FG take alſo five or ſix fathoms from I to L, which will give

Plate DXXXI. fig. 1.

Of Sieges. the end of the trench BELI, the uſe of which is to cover the *boyau* or branch IOMG, whereby the enemy will not know the place where it falls into the trench AB, and to make room for withdrawing thoſe who are in this part of the trenches, and that the paſſage may be free at all the angles. In like manner produce the ſide GM from M to N, and the ſide IC from O to P, and you will have the end of the trench MNOP, which will cover the branch DCOQ. Do the ſame at all the angles of the trench.

The parapet of the trench being made to cover it, ought to change ſides alternately. If, for inſtance, AE, in the preceding figure, is towards the place, it is evident that the ſide GN will be towards it alſo, and likewiſe the ſide CD; and therefore the parapet of the trench is ſucceſſively conſtructed from the right ſide to the left, and from the left to the right. In the plans of attacks, the ſide of the parapet of the trench, as alſo that of the parallels, are diſtinguiſhed by a ſtronger line than any of the reſt; but the latter admits of no difficulty, becauſe we may eaſily conceive that, being parallel to the place, its parapet muſt neceſſarily be on the ſide that faces it. Care has been likewiſe taken to expreſs, as we have already mentioned in the figure, the parapet of the branches, by a ſtronger line than the other lines of the attacks. The ſide of the trench oppoſite to the parapet is called the *reverſe of the trench*.

The trenches are generally no more than three feet deep; and their parapet, beginning from the bottom of the trench, is ſix feet and a half high, or thereabouts. The parallels have a parapet like the trench, and of the ſame height; but as they are intended for firing over, they are made with a kind of banquette, as may be ſeen Plate DXXXI. fig. 3. to raiſe the ſoldier, to the end that he may fire over the parapet. On the parapet of the places of arms are put baſkets, faſcines, or ſand-bags, ranged in ſuch a manner that the troops may be able to fire without being too much ſeen by the enemy. The third parallel, or place of arms, is generally wider than the reſt. Sometimes the inſide of its parapet is likewiſe made with ſteps or banquettes, to the end that the ſoldiers may conveniently paſs over it in caſe of an attack. See fig. 4.

There will never be any great difficulty in tracing the attacks, from an exact plan, by obſerving the method we have made uſe of to make its parts defile properly. But the difficulty is to transfer the works from the plan to the field; for doing which the following plan has been recommended.

In the firſt place, the engineer muſt from all the angles of the branches of the trench, upon the plan, draw perpendiculars to the produced capitals; obſerving the diſtance of each of theſe perpendiculars and their length. He is then to walk about the place in the day-time, at a ſufficient diſtance to be without the reach of muſket-ſhot. It is not uſual to fire cannon againſt a ſingle man, becauſe the ſhot is very uncertain, eſpecially againſt a perſon who does not ſtand ſtill for any time; therefore, without any great danger, he may only keep himſelf out of muſket-ſhot. It is eaſy to diſcover the flanked angle of the baſtions againſt which he wants to direct the attacks, and the ſaliant angle of the covert-way oppoſite to them; which gives two points, and theſe the direction or the prolongation of the capitals of thoſe baſtions. Conſequently he has only to plant ſome picquets on the direction of theſe points, in order to have the prolongation of the capitals of the baſtions. Theſe picquets can only be put out of the reach of muſket-ſhot; but by day-light he may obſerve ſomething of the ground lying in the direction of theſe picquets, and he may afterwards reconnoitre it in the evening, in order to place picquets there alſo. In this manner he may have the prolongation of the capitals pretty exact. Of Sieges.

In order to conduct the trench by theſe capitals, the following method has been pointed out by marſhal Vauban.

Examine upon the plan of the attacks what diſtance there is from the beginning of the trench to the firſt perpendicular; meaſure this perpendicular and the ſide or part of the branch correſponding to it; take cords of equal length with theſe lines, and faſten the extremities of the two cords, one repreſenting the length of the line of direction, and the other that of the branch which makes an angle with it, to a picquet at the point of the produced capital where the trench begins, and make two men walk, each of them holding one end of theſe cords, viz. one in a direct line towards the place, the other alſo advancing towards the place and walking alongſide of the former. When the firſt comes to the fartheſt diſtance betwixt the opening of the trench and the firſt perpendicular, he muſt plant a picquet on this point, to which he is to faſten the cord which expreſſes the perpendicular. He muſt take the other end of this perpendicular, and afterwards turn off to the right or to the left, according to the ſide where the perpendicular ought to be, till the part of the cord expreſſing the perpendicular is well ſtretched, and joined to that end of the cord of the trench carried by the other man: at their meeting they are to plant a picquet, by means of which the triangle, thus tranſferred to the ground, will be like that which was taken upon the plan; and this part will be traced on the ground in the ſame manner as on the plan. In like manner may every part be traced in the beginning, when the trench is yet at a diſtance from the place.

Let the trenches be traced upon the plan (fig. 2.), and let C be the place againſt which you are to direct the attacks, transferring the plan to the ground: let BG be likewiſe equal to the line of direction of the plan; you are to plant along this line a ſufficient number of picquets, with burning matches tied to them, in order to diſcover them the more eaſily. Plate DXXX.

To begin the tracing of the trenches, tie to the picquet G a cord of the length GS, and to the ſame picquet another cord of the length GX: let there be two men, and each take an end of theſe two cords, and let them walk, the one at a venture towards S, and the other directly to X towards the place along the line of direction BG; and having reached the end of his cord, let him faſten it with a picquet, after having drawn it very ſtraight; and to this picquet let him tie one of the ends of the cord, which is to mark the perpendicular XS. Let him take the other end, and walk towards S till his cord XS is ſtretched very tight, and then let him join the man who holds the end of the cord GS, and let them faſten a picquet in S, where both the cords join. Let them afterwards take away the cord XS, the perpendicular which is of no uſe, and the cord GS which remains will mark the real tracing of the trenches. In order to have the line ST, you come to the picquet X; to which you tie a cord of the length of XY, and another to the picquet S of the length of ST. Let two men, as before, take each an end of theſe two cords, and let them walk, the firſt who holds the end of the cord XY directly towards B, and the other who holds the end of the cord ST obliquely towards T: he who holds the cord XY, having reached Y at the end of his cord, ſhall place a picquet there; to which let him tie the end of the cord of the perpendicular YT, and let him walk towards T, holding the end of this cord, till he meets or joins the man who holds the end of the cord ST; and at the point T of their meeting let them place a picquet, to which let them tie the end T of the cord ST.

After

Of Sieges. After this take away the cord of the perpendicular, and thus continue the ſame operation as long as you pleaſe, or are able, in order to trace all the other turnings or windings of the trenches.

This whole operation ſuppoſeth that you know exactly the diſtance of the point G, the extremity of the line of direction to the top E of the ſaliant angle of the covert-way. This diſtance may be found by the common rules of trigonometry, or by the following ſimple method pointed out by marſhal Vauban: Let A (fig. 5.) be the vertex of the ſaliant angle of the covert-way, and AB the line of direction of the trench whoſe length you want to take. At the point B, draw BC perpendicular to AB, to which give what meaſure you pleaſe, as 80 or 100 fathoms, and at the point C draw CD perpendicular to BC: In CD take any point E, and in the line of direction between it and the angle A, place a picquet G, in the line BC. Meaſure GC and CE, and ſay, as GC: BG:: CE: AB.

Plate DXXXI.

When once you have found out by this, or ſuch other methods as you may make uſe of, the length of the line of direction EG (Plate DXXX. fig. 2.), you will be always able to know the diſtance that remains to the ſaliant angle of the covert-way, and to the points I, N, P, through which the parallels or places of arms are to paſs. Theſe points being determined, it would be an eaſy matter from geometry to find out a method of deſcribing the parallels that are to paſs through them, if their ſituation admitted the engineers to perform the operation quietly by day-light; but they are to be traced in the dark, and under the fire of the place: ſo that there is no other way to trace them than by approximation, that is, to move as nearly parallel to the circuit of the place as you can by your judgment; and to plant picquets, with cords tied to them at proper intervals, the whole length of the line. But you can trace with cords only the firſt parallel; for the others are too near the place to permit you to perform this operation: you are therefore to proceed in tracing them almoſt in the ſame manner, as we ſhall obſerve when ſpeaking of the ſap, to which they belong, and which is carried on by that method.

§ 6. *Obſervations on the propereſt Part for making the Attacks.*

While the lines are perfecting, the neceſſary materials are to be got ready for the conſtruction and operations of the attacks. The materials conſiſt of faſcines, picquets three feet long, and about an inch or two in diameter, gabions, and picquets for gabions. There muſt likewiſe be a proviſion of the ſeveral inſtruments or tools neceſſary for theſe operations.

The engineer, who has the direction of the ſiege, will likewiſe make uſe of this time to examine into the parts moſt convenient for carrying on the attacks, and where they will be moſt ſimple and expeditious. There are few fortreſſes in Europe, of which plans are not to be had; but as it is preſumed that the enemy hath increaſed the fortifications of a town which is threatened with a ſiege, care ſhould be taken to get intelligence thereof from ſome ſkilful perſon that has been in the place, and made all the obſervations poſſible in regard to the works lately raiſed, without giving any ſuſpicion of his intentions. The danger of ſuch an undertaking is very well known, ſo that the perſon employed cannot be too cautious in keeping himſelf concealed.

While the circumvallation is making, the engineers may at a diſtance, or, as we have already obſerved, out of muſket-ſhot, examine ſome part of the out-works; and afterwards, from the report of the perſon ſent into the place, and from what they know themſelves, they may ſettle with the general the propereſt and fitteſt place for carrying on the attacks. On this occaſion there are many things to be obſerved, as well with regard to the ground as to the fortifications; but in a work of this nature, it is ſufficient to conſider the points of moſt importance. Of Sieges.

Firſt of all, the nature of the ground about the place muſt be well obſerved, Whether there are any ditches or hollow ways, that may ſerve as a cover to guards of horſe and foot againſt the cannon of the place; whether there are any parts that command the town, and may ſerve for the erecting of batteries; and whether the ground is fit for the works. The moſt favourable circumſtance is to find a ſoil eaſy to dig; then the works advance with eaſe and leſs loſs, becauſe the ſoldier is ſoon under cover, and the cannon does not do half the miſchief as in ſtony places. If the ground about the place is a pure rock, or a moraſs, the operations are extremely difficult; and there will be occaſion for a vaſt quantity of faſcines, ſand-bags, wool-packs, &c. becauſe the workmen are in much greater danger.

The rivers which run through the town, or in the neighbourhood, likewiſe deſerve conſideration; for they ſeparate the attacks, and it may happen by ſome ſtoppage of the water, or other accident, that the bridges of communication being broke down, the ſeparation of the attacks will expoſe the army of the beſiegers to be defeated, by which means the place may be relieved. It is proper alſo to inquire, whether thoſe rivers are not ſubject to inundations, which, if they were to happen during the ſiege, and to break in upon the attacks, would oblige the beſiegers to abandon the trenches, and to raiſe the ſiege. In a word, whether the town can command any quantity of water ſo as to make an inundation round the place, and to lay the ground appointed for the attacks under water. All theſe points, and a great many others which we do not mention, deſerve the moſt ſerious attention.

After chooſing the propereſt ground for the attacks, a general is to conſider the front which is leaſt fortified and leaſt covered with outworks. All other things being the ſame, it is evident, that the fewer outworks there are, the eaſier will be the attack. But if the place be ſituated in a moraſs, or upon an eminence, then he muſt neceſſarily make his attack on the acceſſible ſide, be its outworks what they will. In a word, the whole choice of the attacks conſiſts in finding out the propereſt ground, and the weakeſt ſide; but as it is to be preſumed that the enemy are acquainted with the nature of the ground about the place, and therefore have taken care to fortify more exactly thoſe parts which are moſt favourable to an attack, the beſiegers ſhould not heſitate to make their approaches on that ſide; where, by the ſituation of the ground, they may gain, what the increaſe of the fortifications might otherwiſe make them loſe.

§ 7. *Of opening the Trenches.*

Every thing being ready for opening the trenches, the ground pitched upon, the attacks ſettled and drawn upon a plan, and ſtores or magazines of all the materials neceſſary on the occaſion being within reach of the place where the pioneers propoſe to work; the general having alſo ſettled the round of duty for the guard of the trenches, both of horſe and foot, as likewiſe the number of horſe for bringing the faſcines, with the number of pioneers and troops to ſupport them: and the chief director of the engineers having acquainted the reſt of the corps with his plan of attack, and the manner they are to act; in a word, every thing being ready for execution, the troops deſigned for the ſervice of the firſt night being prepared and drawn up in battalia at the place of rendezvous, and the pioneers provided with faſcines, picquets, ſhovels, and pick-axes;—in the duſk of the

Of Sieges. evening they all begin to advance, every ſoldier being obliged to carry a faſcine, together with his arms, in order to reach the place deſigned for opening the trenches. The guard of horſe march at the ſame time to their aſſigned poſts, to the right and left of the attacks, ready to ſupport the troops for the guard of the trenches in caſe of any ſally from the enemy. All this is to be done with the greateſt ſilence poſſible, and nothing ſhould be neglected to conceal the deſign from the enemy.

The pioneers are, according to marſhal Vauban, divided into brigades of 50 men each, commanded by a captain, a lieutenant, and two ſergeants. They advance four or ſix abreaſt, near the place where the trenches are to be opened; after which the reſt of the troops that are to ſupport them, being come up, the engineers charged with the tracing of the trenches, and who are to place the pioneers, make them come forward where the opening is to commence, while the battalions that ſupport them are drawn up to the right and left in the places aſſigned them, where they unload the faſcines, and ſilently wait for further orders. In the meanwhile the engineers trace the branches of the trenches, and the firſt parallel in the manner already deſcribed, and the work is advanced as faſt as poſſible.

As much work is undertaken as the pioneers can be expected to perform this firſt night: and in proportion as the tracing goes on, the engineers place the pioneers, making them file off one by one, each carrying his faſcine under the right arm if the place is on the right, or under the left if it is on the left, to the end that by the poſition of their faſcines, which they lay on the ground along the tracing, and on the ſame ſide as they carry them, they may be enabled to diſtinguiſh the ſide of the place, that is, the ſide towards which they ought to throw up the ground in order to cover the trench from the fire of the town. As faſt as they are placed, they are ordered ſilence, and made to lie down with their faces on the faſcines, and not to begin to work till commanded. The whole operation begins at the ſame time, that they may advance equally. When every thing is ready, and the pioneers are all placed along the tracing which is purpoſed to be made this firſt night, orders are again given for them to work; and then they all ſet about it with all the diligence poſſible till day-light, that they may be covered againſt the fire of the place, which is ſtill very dangerous in the morning, conſidering that the trench has not had time as yet to be rendered ſo perfect as it ought. The troops that are to ſupport the pioneers are put under cover on the back of that part of the trench which is finiſhed; that is, on the border of the trench oppoſite to that on which its parapet is raiſed; they are made to lie on their faces; after which the pioneers, who have been upon duty in the night, begin to file off, and others fill up their places. It is very difficult this firſt day to render the trench as complete as it ſhould be; but no pains are ſpared to make it as complete as poſſible.

As the deſign cannot be now concealed from the enemy, the guard mounts the next day with drums beating about noon; and care is taken to continue the work of the trenches the ſecond night, in the ſame manner as the firſt, that is, by placing the pioneers uncovered, becauſe they are at ſuch a diſtance from the town, that the fire is not yet dangerous enough to require their being placed otherwiſe: the work goes on quicker in this manner; but it muſt neceſſarily be altered as ſoon as the workmen come within muſket-ſhot of the place.

The firſt night is the beſt adapted for advancing the works of the trenches, becauſe of the diſtance from the place, which is too great to apprehend any danger from the enemy's fire. Sometimes it happens ſo, that the enemy is not appriſed of theſe works; eſpecially when all the Of Sieges. neceſſary precautions have been taken to conceal them, and in that caſe the buſineſs is done in a manner without loſs or danger. It is of importance to advance them with ſuch expedition, that they may be fit to receive the troops who are to ſupport the pioneers, in order to cover them againſt the fire of the place; and as the firſt parallel is deſigned for this purpoſe, therefore it cannot be perfected too ſoon.

According to marſhal Vauban, the firſt place of arms, though begun the firſt night, has need of a ſecond and a third, before it can be completely finiſhed and in condition to hold the troops that are to guard the trenches; but the work for perfecting this line will not hinder the beſiegers from advancing to the ſecond parallel, which ought not to be begun till the fourth night. It is to be obſerved, that the guard who mount the trenches are changed every day; they mount about noon, and they are to be as ſtrong as ſhall be requiſite for oppoſing the ſallies which the garriſon of the place may make againſt the workmen. They are generally equal to two-thirds of the garriſon, becauſe the enemy may fall upon the trenches with that number, reſerving the other third to guard the town. But as it is poſſible that the beſieged may think proper to ſally forth with their whole force and fall upon the workmen, together with the troops that ſupport them; therefore, in order to guard againſt every accident of that ſort, the troops in the trenches ought to be nearly equal to thoſe of the place, eſpecially in ſmall towns, where a few are ſufficient to guard the poſts, or where the burghers are ſo well attached to the prince, that the commandant may depend upon their fidelity in guarding the town; becauſe in that caſe he may make a general effort with his whole garriſon againſt the troops in the trenches.

We have obſerved, that the ſecond night the pioneers may ſtill be placed uncovered; but the third it would be very dangerous to do it, becauſe of the enemy's fire being too near. When the engineers are of this opinion, they take care not to expoſe the men any longer uncovered, and then the works are carried on by ſap.

§ 8. *Of the Sap.*

Let ABC be the part of the trenches advanced to A, ſo near the town as to render it impoſſible, without evident danger, to work any longer at the approaches, unleſs the men have ſome cover againſt the fire of the place: and let the branch AD be traced by the engineer, not with a cord, as at the opening of the trenches, but with ſome picquets, which he has taken care to place in the direction this branch ought to have, to ſerve as a guide to the workmen. A cut is made in the parapet BA of the trenches; and then the men deſigned to work by ſap, who are therefore called ſappers, will move forward through the opening A, ſucceſſively eight in number. The firſt is to roll before him a mantlet to cover him againſt muſket-ſhot. He advances as far as is neceſſary to place a gabion on the line AD; and this gabion being ſet on its baſe, in the proper ſituation, with the picquets uppermoſt, the ſapper makes a little trench behind, about ſix inches diſtant from the gabion, of a foot and a half in depth, and as many in breadth, and he empties the earth of this ditch into the gabion. This done, he places a ſecond gabion near the firſt, in the ſame manner, and always under the cover of his mantlet; in like manner he makes a ditch behind, the earth of which ſerves to fill his gabion. Thus he places a certain number, till he grows tired of the operation.

The ſecond ſapper, who immediately follows him, widens the ditch made by the former by ſix inches; on the oppoſite ſide to where the gabions are placed, and makes it half a foot deeper. The earth he digs up ſerves to fill the gabions

of

Of Sieges.

of the firſt ſapper. The third ſapper widens the ditch of the two firſt likewiſe half a foot, and he deepens it in the ſame proportion.

At length the fourth enlarges it alſo in the ſame proportion, in breadth and depth; and then the trench is three feet wide, and the ſame in depth, which is as much as it ought to be. The earth dug up on this occaſion is ſufficient, not only to fill the gabions placed by the ſappers, but likewiſe to make a parapet of the reſt, which is thrown up, and is ſtrong enough to reſiſt muſket-ſhot. The third and fourth ſapper lay the faſcines over the gabions, with their hooks, or otherwiſe; then they preſs them down, ſo that the ſtakes of the gabions ſhall keep them firm. As the ſappers are ranged by brigades of eight each, while the firſt four are working at the ſap, in the manner above deſcribed, the other four furniſh them with gabions, faſcines, and whatever other things they want. But when the firſt four are tired, the four laſt take their places, and work in the ſame manner; after which they are relieved by the firſt, and ſo alternately, till each has performed his part at the head of the ſap.

When the firſt gabions are placed, and the ſap is not as yet perfected, the part in which the gabions touch one another being leſs ſolid than the reſt, their joints are filled up by ſand-bags, which are taken away when the work is completed, or thoſe interſtices are filled up with ſmall faſcines called *ſap-faggots*.

This is the nature of the ſap; a work ſo much the more conſiderable, as it is performed by day as well as night. Several ſaps are carried on at the ſame time; and there is one to both ſides of each of the attacks for the ſecond and third parallel. There are likewiſe ſaps to each of the advanced parts, and to the half places of arms or parallels.

We have ſuppoſed that the firſt ſapper covered himſelf with a mantlet; this was the cuſtom formerly, and an excellent cuſtom; but now it is more uſual to have a ſtuffed gabion. He rolls this gabion before him, and uſes it in the ſame manner as he would the mantlet. Though care be taken to give a ſtuffed gabion to the directors of the ſaps, yet it happens ſometimes that the ſappers will not make uſe of them: for as the weight of this gabion renders it ſometimes troubleſome to roll, they chooſe to do without it; and are ſatisfied with rolling ſeveral gabions before them, near one another, and with working behind them. Theſe gabions are indeed of little defence, but are ſufficient to conceal them from the enemy, who cannot tell the gabion behind which the firſt ſapper is. But as the preſervation of theſe men is of great importance, they ought to be obliged to work behind the ſtuffed gabion: for the ſame reaſon, the firſt ſappers ſhould have a cuiraſs, and even a head-piece, muſket-proof.

There are three ſorts of ſap; the ſimple, viz. that which we have been deſcribing, the double, and the flying ſap.

1. The ſimple ſap, or the ſap without any other appellation, is made on one ſide, or, which is the ſame thing, has only one parapet. 2. The double ſap has a parapet on each ſide, and is carried on wherever its two ſides are ſeen from the place. 3. The flying ſap is that in which they do not give themſelves the trouble of filling the gabions with earth; it is made where the workmen are not much expoſed, and in order to accelerate the approaches.

As ſoon as the men have brought the ſap to its proper perfection, the pioneers are ordered forward, and theſe make it of the ſame width as the other parts of the trenches; upon which it changes its name of ſap to that of trench. It is called a *trench*, if it ſerves as a way to the town; and a place of arms, if it be parallel to it, and deſigned to lodge troops. See Plate DXXXI. fig. 7, 8. DXXXII. fig. 1. 2. See alſo the upper compartment of Plate DXXVIII. for figures of the different inſtruments uſed in this and other operations of a ſiege.

Of Sieges.

§ 9. *Of Batteries.*

CANNON is made uſe of at a ſiege for two different purpoſes; the firſt to drive away the enemy from their defences, and the ſecond to diſmount their guns.

To produce theſe two effects, the batteries ſhould not be above the mean reach of cannon ſhot from the place; that is, above 300 fathoms. Therefore there is no poſſibility of conſtructing them till the firſt parallel is formed; and as the diſtance of this firſt parallel from the place is generally 300 fathoms, the batteries muſt be on this line, or beyond it, nearer the town. They muſt always be placed, when the ground will permit, on the produced faces of the works attacked, as we have mentioned in the maxims of attack.

Let Z be the centre of the place attacked, and the trenches, as well as the parallels, completed. To find a proper poſition for erecting batteries, produce the faces AD, AC, BE, BF of the two baſtions attacked, till their prolongation cuts the firſt parallel. Produce alſo the two faces OM and OL of the half-moon MQL of the front attacked, and the faces HG and IK of the two collateral half-moons 1 and 2, to the firſt parallel, and erect batteries on theſe produced faces, as you ſee in P, Q, R, S, T, U, X, and Y. Plate DXXXII. fig. 3.

They are advanced beyond the firſt parallel 40 or 50 fathoms; and are parted from the trenches, to the end that they may be uſed with greater eaſe and convenience, and leſs trouble to the workmen.

§ 10. *Of Sallies.*

THAT we might not interrupt the making of the trenches, we conducted them to the foot of the glacis, without taking notice of ſallies; that is, attacks which the garriſon may make againſt the trenches, with a view of ruining or retarding the works. As it is not to be preſumed that the enemy will ſuffer themſelves to be ſtraitened in the town without uſing ſome endeavours to prolong the ſiege, and as ſallies ſeem to be one of the principal means they can employ, it is proper to point out the conduct to be obſerved, not only for preventing their effects, but likewiſe for rendering them diſadvantageous to the enemy.

Sallies can be attended with no ſucceſs, unleſs they are made at a time when unexpected. When the workmen are ſuddenly fallen upon, they are ſcattered, and obliged to fly; which muſt occaſion confuſion and diſorder among the troops that are to ſupport them; and it requires ſome time before they can be brought again to order, and made to charge the enemy. In the mean while the latter avail themſelves of the opportunity to fill up the trenches, and to do all the miſchief poſſible, but when the troops are upon their guard againſt every deſign of the enemy, if the latter ſtir out of the place, they are ſuffered to advance; and care is taken to cut off their retreat, by means of the cavalry and the picquet, in caſe they ſhould advance too far into the field: otherwiſe they are fired at from the places of arms, and other works within reach; and then they are briſkly attacked by the grenadiers and the troops upon duty in the trenches. Care, however, muſt be taken not to purſue them too far, for fear of the fire of the place, which never fails to be extremely ſharp when the enemy have got back to the covert-way.

In proportion as the works advance towards the town, ſallies become more dangerous to the beſiegers, becauſe the enemy may fall upon the trenches more readily; for which reaſon,

Of Sieges. reaſon, double care ſhould be taken to ſtraiten them more cloſely, and to prevent their ſallying out with impunity. As the works carried on beyond the ſecond parallel are more expoſed than the reſt, becauſe of their proximity to the covert-way, no part ſhould be advanced without being well ſupported. Hence, as we have already taken notice, half-places of arms are formed, in order to ſupport the head of the trenches, till they reach the third place of arms; which muſt be ſet about with the greateſt care and expedition poſſible. When this is done in the manner it ought, there will hardly be any farther danger from the ſallies.

Sallies are ſeldom made in the day-time but by a preſumptuous enemy, who imagine they may ſafely attack and defy the troops on duty in the trenches: but they are eaſily repulſed, unleſs the beſiegers are ſo weak as not to be able to furniſh a ſufficient guard for the trenches; in which caſe they ought not to continue the ſiege, leſt they run a riſk of being at length entirely defeated.

At the opening of the trenches, and when the beſiegers are at a good diſtance from the place, there is little occaſion to be afraid of any ſallies in the day; for there would be full time enough to prepare to receive them before they reached the works. If the enemy are diſpoſed then to iſſue forth, they will do it by night; but it will be an eaſy matter to get intelligence of any attempt they may make, by ordering parties of 10 or 12 men, headed by a ſerjeant, to range in the night between the trenches and the town.

Theſe men may lie on their faces as near the place as poſſible; remaining in profound ſilence till they hear or perceive ſome motion in the covert-way; then they ſhould ſend one of their own body immediately to acquaint the lieutenant-general who that day commands the trenches, and the reſt ſhould continue there as long as they can be concealed, to ſee which way the enemy direct their courſe. This caution is not only ſimple and eaſy, but ſufficient to guard the beſiegers againſt ſurpriſe, and to enable them to give a warm reception to the enemy.

When the works are advanced pretty near to the place, for inſtance, to the third parallel, if the enemy ſhould then ſally out and fall upon the workmen, the latter muſt be ordered to retire quickly to the back of the third place of arms, and let the guard fire briſkly upon them, without minding the overturning of a dozen or two of gabions; for the galling fire of the ſmall arms, to which the enemy are expoſed during this expedition, will make them pay dearly for what little diſorder they occaſion.

§ 11. *Of the Lodgments on the Glacis, and the taking of the Covert-way.*

We left the works at the foot of the glacis, and at the third parallel; our buſineſs is now to make a lodgment there, and to go on with them till we have driven the enemy from the covert-way.

Our being then ſo near the covert-way, renders it impoſſible to defile from it; but in order to prevent the effect of enfilading, it is neceſſary to make the trenches much deeper in the glacis; the fire of the covert-way being very near, cannot plunge into thoſe deep trenches, which renders it leſs dangerous to abide there than it would otherwiſe be were it not for this precaution: or they are made with traverſe, much in the ſame manner as in the covert-way, by which means the enfilading will be prevented in part, though not entirely.

In regard to the figure of the lodgment on the glacis, it varies according to the different circumſtances or poſition of the works by which it is defended. The common way is to make ſeveral ſhort turnings or zig-zags upon the ridge of the glacis, in the direction of the ſaliant angle of the covert-way, and continued to this angle; or you begin with making two or three ſhort turnings towards the foot of the glacis, from whence you aſcend afterwards by a direct trench, or ſap, in the following manner. Of Sieges.

Two ſappers roll each a mantlet, or ſtuffed gabion, before them on the ridge of the glacis; each making a ſap, one on one ſide of the ridge, and the other on the other. The ditch is dug deeper than uſual, in order to cover them the better againſt the fire of the place. This work, which advances on both ſides at the ſame time, and both ſides covered, each with a parapet, is what we called a *double ſap*. In the middle they make traverſes three fathoms thick, and of the ſame breadth as the trench. On each ſide ſmall paſſages are made like thoſe over againſt the traverſe of the covert-way, to the end that the communication thereof be not interrupted.

Theſe traverſes are conſtructed ſo near to each other, as to be a ſufficient cover, by their elevation and diſtance, againſt the fire of the place. In order to guard againſt the effect of the grenades, upon coming within their reach, that is, within 14 or 15 fathoms of the covert-way, care is then taken to cover this trench with blinds, or, which is the ſame thing, to cover the upper part of it. The firſt and ſecond figures of Plate DXXXIII. will ſhow this direct trench. The firſt exhibits the plan, and the ſecond the profile, which paſſes over one of the traverſes.

All this being done, and the third parallel finiſhed in the manner we ſuppoſed, they advance from this parallel upon the glacis to each of the ſaliant angles of the covert-way of the front attacked, and they begin with making two or three ſhort turnings, as marked on Plate DXXXIII. fig. 6. along the ridge of the glacis, ſo as to occupy about one-third thereof. Theſe are to be made as deep as neceſſary, to be a ſhelter againſt the fire of the covert-way; afterwards they may proceed directly along the ridge of the glacis, by a deep ditch, to the ſaliant angle of the covert-way. M. Vauban obſerves, that if we follow directly the ridge of the glacis, this trench is made without much danger: for the paliſade which is placed at the ſaliant angle of the covert-way, and the other two next it, do not preſent directly to the ridge, but only oppoſite to the faces; where at the moſt there is only room for one or two fuſileers to ſee the head of the trenches, and who are eaſily ſilenced by the fire of the third parallel, which ought to be well ſerved, and likewiſe by that of the ricochet.

Upon coming to the middle, or two-thirds of the glacis, two new ſaps are made, *b b*, *ibid.* which embrace both ſides of the covert-way, to which they are almoſt parallel. Their length is 18 or 20 fathoms, and about five in breadth. They are covered at the end with crochets and winding traverſes, which prevent the fire of the covert-way from enfilading them eaſily.

The parapet of theſe ſaps is raiſed about eight or nine feet above the glacis; and by means of gabions, three banquettes are made, as may be ſeen Plate DXXXIV. fig. 5. The ſoldier placed on the upper banquette is thereby raiſed high enough to plunge into the covert-way, as appears from the ſame figure. When this work, which Marſhal Vauban calls the *cavalier of the trench*, is once finiſhed, it is very difficult for the enemy to remain anywhere in the covert-way; for they would be too much expoſed to the fire of the ſoldiers placed on theſe cavaliers. But theſe places of arms or cavaliers cannot be made without being protected by the ricochet batteries, which enfilade the covert-way.

Theſe cavaliers being once finiſhed, it is eaſy to carry on the direct trench, as far as the ſaliant angle of the covert-way,

Of Sieges.

way, and to eſtabliſh at the point of this angle and on the head of the glacis a ſmall lodgment bounded by a circular arc; whence the enemy may be entirely driven from the ſaliant place of arms of the covert-way. Afterwards this lodgment may be widened on branches of the covert-way, by digging into the upper part of the glacis, at the diſtance of three fathoms from the inner ſide of the covert-way; to the end that this thickneſs may ſerve as a parapet to the lodgment, and ſcreen it from the cannon.

The operation we have been deſcribing, to reach from the third parallel to the ſaliant angle of the covert-way, is formed at the ſame time againſt all the ſaliant angles of the front attacked: hence the enemy is obliged to abandon them almoſt at the ſame time; and the lodgment on the glacis is afterwards advanced on both ſides of theſe angles, towards the re-entering places of arms of the covert-way.

As it is impoſſible to make this lodgment defile from the works of the place, there is no other way to guard againſt the enemy's fire than by many traverſes. The 5th figure of Plate DXXXIII. ſhows the plan of part of this lodgment with its traverſes; which are made with chandeliers and gabions. If the enemy, notwithſtanding the cannon and bomb-batteries *à ricochet*, and the fire of the cavaliers of the trenches, ſhould obſtinately continue in the re-entering places of arms of the covert-way; in order to compel them to remove, batteries for throwing of ſtones are raiſed overagainſt thoſe places of arms: and with this view, as ſoon as the lodgment of the glacis is brought within one-half or two-thirds of the branches of the covert-way, on both ſides of the re-entering angle, a ſap is carried on oppoſite to the place of arms; and on this ſap batteries for throwing ſtones are erected, as may be ſeen in *c c*, Plate DXXXIII. fig. 6. Theſe batteries being finiſhed and ready to play, they diſcharge a ſhower of ſtones into the place of arms (fig. 6.), which will not ſuffer the enemy to maintain themſelves there any longer. The lodgment continues to advance; and as ſoon as the enemy is driven from the place of arms, it is continued all round the faces thereof. This lodgment being properly finiſhed, will hinder the enemy from venturing to return to the covert-way; and of courſe will ſecure the poſſeſſion of it to the beſiegers. Theſe lodgments are made with gabions and faſcines; the gabions are filled with earth, faſcines are put over them, and the whole is covered with earth; they ſink into the glacis as deep as is requiſite to be covered againſt the fire of the place.

In the whole of this account we have not made uſe of mines; becauſe we were willing that the deſcription of the works, which are carried on from the third parallel, in order to become maſters of the covert-way, ſhould be as plain as poſſible. This omiſſion we ſhall now ſupply, by making mention of the principal difficulties occaſioned by mines, in endeavouring to drive the enemy from the covert-way.

Without mines the enemy would find it very difficult to retard the works we have been deſcribing; becauſe the ricochet batteries muſt gall them exceſſively, and break up their defences, ſo as to deprive them of all ſhelter: but they may have ſome reſource left in works under ground, where their miners can proceed with more ſafety; while thoſe of the beſiegers, not having the ſame knowledge of the ground, can only grope in the dark; ſo that it is altogether a mere chance if they find out the enemy's galleries, and ſucceed ſo as to deſtroy them. If information is received that the glacis is countermined, there can be no manner of doubt but the enemy will avail themſelves of their countermines, to carry branches forward into the field; and then to avoid, as much as poſſible, the miſchief that may be done by thoſe ſubterraneous fires, in the third parallel ſhafts or pits are ſunk 18 or 20 feet deep, if the ground will permit, in order to get below the galleries of the beſieged: and from thence galleries are carried on towards the covert-way, to meet with thoſe of the enemy, by boring the earth with a long iron needle or augre, to find them out. If they are found underneath, an opening is made down into them, and ſhells are thrown in, to drive away the enemy and to ruin their gallery. If, on the contrary, they are found above them, a ſmall mine muſt be ſprung to break them: but if none of the enemy's galleries can be found, in that caſe branches muſt be carried to the right and left; at the end of which are made ſmall chambers, to ſhake the neighbouring ground, which can hardly miſs deſtroying the galleries and chambers of the beſieged.

Notwithſtanding all the care that can be taken in this caſe, it is not to be preſumed that the mines of the beſieged under the glacis ſhould be rendered abſolutely ineffectual; but as ſoon as any of them are ſprung, workmen are immediately ſent to make a lodgment in the pits. In ſome grounds, the mines of the beſieged may be ſpoiled, by letting in a brook or rivulet into the galleries; for which purpoſe you have only to dig pits in the neighbourhood, and let the water run in. The expedient was made uſe of at the ſiege of Turin in 1706, whereby a great many mines of the beſieged were rendered uſeleſs.

The enemy ſhould have mines placed to hinder the lodgment on the head of the glacis, within four or five fathoms of the paliſades of the covert-way; to the end that in ſpringing them the paliſades may not be hurt, but that they may be under the lodgment which the beſiegers make there. When they have ſprung the mines, they make lodgments in them; and the beſiegers likewiſe on their part ſpring mines, with a view to deſtroy the paliſades; but nothing that is not very general can be ſaid on this ſort of conteſts. They depend on the ſituation of the ground, and upon the capacity and underſtanding of thoſe who attack, and thoſe who defend the place.

Before we made mention of mines, we ſuppoſed, when treating of the lodgment on the top of the glacis, that the fire of the cavaliers of the trenches, together with the cannon and ricochet bomb-batteries, had obliged the enemy to quit the covert-way; but if, notwithſtanding theſe fires, they ſhould obſtinately continue in the places of arms and behind the traverſes, the way to drive them entirely from thence, and to make the lodgment we have been ſpeaking of upon the glacis, is as follows.

Whether the enemy has ſprung a mine near the ſaliant angle of the covert-way, or the beſieged have blown up ſome of the paliſades near it, as ſoon as the mine is ſprung, workmen muſt be ſent to the excavation; where they are to cover themſelves with all poſſible expedition, and afterwards to extend their lodgment in the covert-way on both ſides of its ſaliant angle.

The double trench, or the double ſap on the ridge of the glacis, muſt be made to communicate with this lodgment, in order to be able to ſuſtain it if there ſhould be occaſion, and to communicate with it more ſafely. Particular care muſt be taken to cover the extremities of it, that is, to make traverſes everywhere, in order to be ſheltered from the fire of the other parts of the covert-way, where the enemy ſtill maintain themſelves.

When this lodgment is extended to the firſt traverſes of the covert-way, if the enemy keep their ground behind it, as there can be but few under cover there, conſidering the ſpace they have to occupy, a company of grenadiers muſt make a briſk attack to drive them away: this done, ſome of thoſe grenadiers ſhould endeavour to find out in the part

abandoned

abandoned by the enemy the entrance into the mine, and the SAUCISSON; and upon finding it, as there is great probability that they will, they are to cut it off, and thereby render the mine uſeleſs. Workmen may be likewiſe ſent into the paſſage round the traverſe, and there make a ſmall lodgment, which will be the ſafeſt that can be contrived when the enemy is ſo very near. After this an entrance is to be dug in the covert-way oppoſite thoſe traverſes, and continued towards the bank of the ditch, under cover of the traverſe; then a ſap is to be made from each of the extremities of this paſſage, that is, near the border of the counterſcarp; which are to be carried along the rounding of the counterſcarp towards the middle, where they are to meet. This lodgment muſt be made very deep, that it may be no hindrance to that on the head of the glacis; and it is to be managed ſo as to leave between it and the border of the ditch a breadth of earth ſufficient to reſiſt the cannon of the flanks and the curtain. This lodgment muſt be alſo covered with blinds, to prevent the effect of the grenades; and it is of great uſe towards an opening into the ditch.

During the whole time that the beſiegers are working upon this lodgment in the interior part of the covert-way, they are to continue the lodgment on the top of the glacis, as far as the re-entering places of arms; from whence the enemy may be driven by ordering a few companies of grenadiers to attack them, ſuppoſing they ſhould be ſo obſtinate as to continue there, notwithſtanding the fire of the ricochet batteries, and of the ſhells and ſtones. As ſoon as the enemy have entirely withdrawn themſelves, a lodgment muſt be made there, as we have already mentioned.

§ 12. *Attack of the Covert-way ſword in hand.*

THERE is another method of driving the enemy out of the covert-way, more expeditious indeed, but at the ſame time more bloody, more precarious, and infinitely leſs ſkilful. This conſiſts in making a ſudden attack on the whole front of the covert-way, in driving the enemy from thence by main force, and afterwards making good a lodgment.

There may be circumſtances that ſhall abſolutely require this method of attacking the covert-way; as when there is no poſſibility of erecting ricochet batteries to fire at its branches, nor at the faces of the works in the front of the attack; or when it is preſumed that the enemy are not in a condition to withſtand an attack of this ſort; or, in fine, when it is thought expedient to run any hazard in order to be maſters of the covert-way a few days ſooner: on ſuch occaſions it is uſual to take this method of attacking it, which is conducted thus:

When the reſolution is taken to attack the covert-way ſword in hand, the third parallel ſhould be made to advance as near as poſſible to the glacis; and the more forward it is brought, the ſafer the attack. All along this parallel banquettes are to be made, ſtep-faſhion, to the top of its parapet, that the troops deſigned for the attack may paſs over it with eaſe. At the back of this line, and in the very line itſelf, a great quantity of materials, as tools, gabions, faſcines, ſand-bags, &c. muſt be got ready, that nothing may be wanting to make the lodgment with all expedition, after driving the enemy out of the covert-way. A ſtrong party of grenadiers is ordered, and placed along the third parallel, four or ſix deep, and the workmen behind them on the back of this parallel with their tools, gabions, faſcines, &c. Care, moreover, is taken, that all the other parts of the trenches be well furniſhed with troops to ſupport the grenadiers, if there ſhould be occaſion; and to fire at the enemy's defences wherever they appear: the grenadiers muſt alſo be provided with hatchets, to cut down the paliſades of the covert-way.

Plate DXXXI. fig. 4.

The guns and mortars muſt be ordered to be ready to ſupport the attack with their whole fire.

A ſignal is to be agreed on for all the troops that are to commence the attack, to move at the ſame time, and to fall upon the enemy. This ſignal is to conſiſt in firing a certain number of cannon, or a certain number of bombs, and at the laſt cannon-ſhot, or at the laſt bomb, the troops are to move.

The ſignal being given, all the troops of the third parallel are to move at the ſame time, and to paſs quickly over the parapet of the parallel, and to march directly to the covert-way; which they enter either through the ſally-ports or paſſages made by the guns, or elſe the grenadiers cut down the paliſades with their hatchets. As ſoon as they have entered, they charge the enemy vigorouſly; and when they have obliged them to abandon ſome of the angles, the engineers ſet the workmen about making a lodgment on the ridge of the glacis, oppoſite to that part of the covert-way which the enemy have abandoned, and within three fathoms of the inſide of it. This lodgment, as we have obſerved, is made with gabions, which workmen lay on the glacis on the ſide of one another. The joints are covered with ſand-bags, or with ſap-faggots. Theſe gabions are filled with earth and covered with faſcines; and a-top of all you are to throw earth taken out of the glacis, by digging and widening the lodgment; and of this a parapet is raiſed to ſcreen the troops as quick as poſſible from the direct fire of the place, and traverſes are to be made everywhere to prevent the enfilades, as may be ſeen in Plate DXXXIII. fig. 5. While this is doing, the batteries of the trenches are to fire inceſſantly upon the defences of the place, in order to diſturb the enemy, and to abate as much as poſſible the briſkneſs of their fire upon the workmen and the lodgment.

When the troops employed in the attack have driven the enemy from the covert-way, or from their places of arms, they retire behind the lodgment, where they kneel down till it is in a condition to cover them. Sometimes it ſhall happen that the enemy, who was ſuppoſed to have been driven from the covert-way, will return to the charge, and oblige the beſiegers to renew the attack, by overthrowing the lodgment and falling upon the troops unawares. This attack may be renewed ſeveral times, and vigorouſly diſputed, when there happens to be a ſtrong garriſon. In this caſe the beſiegers muſt exert their bravery, and reſolutely encounter every obſtacle raiſed by the enemy.

It muſt be allowed that this manner of attacking is very bloody: for the beſiegers muſt move almoſt the whole breadth of the glacis, uncovered and expoſed to the whole fire of the place. It is indeed in every reſpect ſo inferior to the former, that, according to M. Vauban, it never ſhould be attempted but for the moſt eſſential reaſons. Night is the beſt time for it, becauſe the beſiegers are leſs ſeen from the place, and of courſe the fire of the beſieged is leſs dangerous: yet there are generals who undertake it by day. There is nothing ſettled in regard to this article; they are at liberty to act as they judge moſt proper, according to the circumſtances of time and place.

§ 13. *Of the Batteries on the Covert-way.*

WHEN the enemy are entirely driven out of the covert-way, the next thing to be done is the erecting of batteries, in order to ruin the defences of the place, and to make a breach.

As it is neceſſary for the beſiegers to make themſelves maſters of the half-moon C (Plate DXXXIII. fig. 6.) before they can come to the body of the place, which is flanked or defended by part of the faces of the baſtions A and B oppoſite to its ditch; they muſt begin with erecting batteries on

on the covert-way oppoſite thoſe parts. They are marked on the plan *e*, *e*. Batteries muſt be alſo erected to make a breach in the half-moon. But before they are erected, it will be proper to conſider what part of the face of the half-moon is to be attacked; or, which is the ſame thing, at what part the half-moon is to be entered. It muſt not be at its flanked angle, becauſe an opening towards the point would not afford a ſufficient ſpace to make a lodgment able to withſtand the enemy, and moreover the troops would be ſeen in their paſſage by the two faces of the baſtions by which its flanked angle is defended. The moſt favourable paſſage is towards the third part of its face, reckoning from its flanked angle; becauſe by battering at the ſame time the two faces near this part, the whole point of the half-moon may be deſtroyed, and a large opening made there eaſier than anywhere elſe. Thus the batteries for making a breach in the half-moon C will be placed in *d* and *d*, and will occupy almoſt the third part of each of the faces of the half-moon from its flanked angle. Theſe batteries are each to conſiſt of four or five pieces of cannon.

When the faces of the baſtions A and B are well enfiladed by the ricochet batteries, there will be no occaſion for the batteries *e* and *e*; for thoſe which are to batter the half-moon in breach will be ſufficient; and after it is taken, if there is any neceſſity for ruining the faces of the baſtions A and B, you may make uſe of the batteries *d* and *d*, by placing them in *e*, *e*. Batteries muſt alſo be erected to ruin the flanks of the demi-baſtions in the front of the attack. It is evident that they cannot be placed but in *i*, *i*, on the covert-way oppoſite to them. They ought alſo to contain as great a number of guns as the ſpace of ground will permit.

For the ſame reaſon that batteries have been erected to make a breach in the half-moon, oppoſite the third part of the face joining to its flanked angle, thoſe alſo are to be erected which are to make a breach in the baſtions; they are marked *h*, *h*, and are each of ſeven or eight pieces of cannon. Batteries are likewiſe erected to ruin the flanks of the demi-baſtions bordering upon thoſe of the front attacked, in order to favour the paſſage over the ditch which is made on the ſide, upon a ſuppoſition that the baſtion is entered at both faces, as we ſuppoſe in this example. The attacking both faces of the baſtion renders the taking of it more certain and eaſy; but, generally ſpeaking, it is looked upon as ſufficient to make only a breach in the face of the earth of the demi-baſtions towards the front attacked.

Beſides all theſe batteries, others are erected in the re-entering places of arms of the covert-way, as in *k*, and in *k*; they ſerve to batter the tenaille when there is one, the curtain, and the faces of the baſtions, &c. Sometimes they are of mortars for throwing of ſtones.

All theſe batteries ſhould have 24 pounders; ſometimes larger pieces are uſed, eſpecially when there is any work of extraordinary ſtrength and ſolidity to be demoliſhed.

They are all to be placed on the parapet of the covert-way; and the outſide of their epaulement is to graze the inſide of the covert-way. It is in order to have room enough for this epaulement, that the lodgment is made on the ridge of the glacis at the diſtance of three fathoms from the inſide of the covert-way.

The only eſſential thing to be obſerved in theſe batteries, is to open their embraſures, ſo that they ſhall perfectly diſcover every part of the place they are to batter, and have a ſufficient ſloping from the back to the fore-part, to fire as low as the bottom of the revetements (c), which they are intended to deſtroy. It is alſo proper to prevent the enemy's blowing them up with mines: for this end it will be requiſite to dig wells deep enough round the batteries, ſo as to be ſure of being lower than the enemy, and to make ſmall galleries round the batteries, in order to diſcover the branches the enemy have underneath to blow them up.

Of Sieges.

As the conſtruction of this ſort of batteries is very dangerous, being abſolutely to be made under the fire of the rampart of the place, they are ſometimes maſked; that is, before the part where they are erected, ſand-bags or ſome other materials are placed, with a view to ſhelter the workmen from the enemy.

In order to batter in breach, all the guns ſhould fire together, and towards the ſame part. They ſhould fire as low as they can, and continue to batter the ſame part, till the earth of the rampart behind the revetement begins to fall, which is a ſign that the revetement is entirely deſtroyed. This united firing, repeated in this manner againſt the ſame place, is productive of a much better effect than if the guns were to be fired one after the other; for not only a greater quantity of the wall is ſhaken at the ſame time, but, moreover, the ſhaking is far more conſiderable.

§ 14. *Of the deſcent, and paſſage over the Ditch of the Half-moon.*

While the batteries on the covert-way are erecting, preparations are made for the deſcent and paſſage over the ditch of the half-moon.

The ditches are either dry, or filled with water, which may be either ſtagnated, or running; and even into dry ditches the enemy may let in water, only opening the ſluices by which it is withheld. Each of theſe ſorts of ditches requires a different manner of paſſing.

Firſt of all, if the ditch be dry, and very deep, as from 25 to 30 feet, the deſcent may be made by one or ſeveral ſubterraneous galleries, paſſing under the covert-way, and terminating at the bottom of the ditch: the entrance is to begin about the middle of the glacis. Theſe galleries are made like thoſe of miners, and the earth is ſupported by boards and timber frames. They are directed in ſuch a manner, that the opening in the ditch ſhall be oppoſite to that part of the breach where the paſſage is intended.

As this gallery is made ſloping, the buſineſs is to have ſome rule for directing the ſlope, ſo as to prevent its being too ſmall or too great: too ſmall, if it terminated above the bottom of the ditch; and too great, if it terminated below it.

The following is a moſt ſimple way to find it out: Firſt of all, it is requiſite to take the depth of the ditch; which is done by letting fall a plummet, with a ſtring tied to it, from the border of the covert-way to the bottom of the ditch. It is requiſite alſo to know the diſtance from the entrance of the gallery to the border of the covert-way, which may be eaſily meaſured thus: Suppoſe the depth of the ditch is 30 feet, and that the diſtance from the entrance of the gallery to the border of the ditch is 90 feet, then by advancing ſix feet towards the counterſcarp, the ſlope muſt ſink two; that is, there muſt be always the ſame proportion between the length of the paſſage made to approach the counterſcarp and the depth of the ſlope, as between the diſtance from the entrance of the gallery to the border of

(c) The revetement is a ſtrong wall built on the outſide of the rampart and parapet, to ſupport the earth, and prevent it from rolling into the ditch.

Of Sieges. the counterſcarp and the depth of the ditch: ſo that if the diſtance from the entrance of the gallery to the border of the counterſcarp is four times as much as the depth of the ditch; then for every four feet advanced horizontally towards the ditch, there muſt be one ſunk perpendicularly, &c. When the ditch is not deep, as of 12 or 15 feet deep, inſtead of a gallery under ground, the deſcent is made by a ſap only, which cuts the parapet of the covert-way, and ſinks therein as deep as is neceſſary for the deſcent to terminate at the bottom of the ditch. This ſap muſt begin at the lodgment on the ridge of the glacis; it is ſecured on both ſides with blinds, to ſupport the earth, and it muſt have a good epaulement on the ſide expoſed to the place. Above it is covered with faſcines and with earth, to avoid the ſhell-ſtones and grenades that may be thrown in by the enemy. Upon advancing to the foot of the counterſcarp, an entrance is made into the ditch. There are generally two or three deſcents made for the ſame paſſage of the ditch, near enough to ſupport each other for greater ſafety.

It is in the paſſage of the dry ditch that the enemy has the advantage in making uſe of various artifices to retard it. In theſe they are chiefly aſſiſted by their miners, who blow up the ſaps by means of ſmall mines, and ſally out at the ſame time, neglecting nothing that can delay the progreſs of the work. They may likewiſe order 12 ſoldiers to fall at once upon the head of the ſap: this number is ſufficient to drive away the ſappers, and to do ſome damage to that work. A few companies of grenadiers ſhould be placed near at hand, to attack theſe men as ſoon as they appear; and the cannon muſt be kept continually firing againſt every part, from whence the enemy may poſſibly ſally out. As the batteries of the covert-way command all their communications, they may deſtroy them, or at leaſt render them very dangerous.

In order to protect the ſap at the bottom of the ditch, the beſiegers may likewiſe make uſe of a kind of ſmall galleries behind the counterſcarp, near the place where the entrance is effected; and they may pierce ſome loop-holes, from whence the enemy may be fired at, and a check put to their ſallies, at leaſt by day: and in regard to night, the beſieged ought to be more circumſpect than by day, ſince they can neither ſee the diſpoſitions nor the troops that are ordered into the ditch to ſupport the ſappers; ſo that they can only raiſe a falſe alarm, without doing any great miſchief. Yet we muſt obſerve, that this paſſage can be made only ſo far as it is protected by the battery placed on the ridge of the parapet of the covert-way oppoſite the ditch: for as the cannon of this battery keeps continually playing againſt the defences of this ditch, they muſt ruin them of courſe, and deſtroy their parapet, ſo that the enemy ſhall no longer be able to keep any cannon there; the conſequence of which will be, that the beſiegers have only to ſcreen themſelves from muſket-ſhot, which is an eaſy matter.

The paſſage of the ditch is made on each ſide of the faces of the half-moon, as may be ſeen in *m*, *m*, fig. 6. Plate DXXXIII.

If the ditch is full of ſtanding water, and the ſurface of it be raiſed to three, four, or five feet, below the upper border of the counterſcarp, the deſcent will be eaſier; becauſe as the ſteps are to have but a very ſmall ſlope, they may begin nearer the border of the ditch, as in the lodgment on the ridge of the glacis, and be directed in ſuch a manner as to terminate at the ſurface of the water. They are to be covered on the ſide expoſed to the place, and ſtrongly ſecured with blinds, placed within five or ſix feet of each other. Blinds are likewiſe to be laid over the deſcent, which is to be covered with faſcines, and theſe with earth, to prevent the enemy from ſetting them on fire.

In order to paſs this ditch, a bridge muſt be made with faſcines; for which end, after breaking the counterſcarp, a number of men, ſufficient to occupy the whole length of the deſcent, are ranged at the diſtance of two feet from each other: theſe men muſt be covered by the parapet, and to forward the faſcines from hand to hand, from the head of the paſſage to the opening into the ditch. The ſapper in this part (for all theſe works relate to the ſappers) will throw them into the ditch, in order to make an epaulement or covering on that ſide of the town which looks towards the paſſage. Of Sieges.

As ſoon as he has flung in a ſufficient number of faſcines to ſhelter himſelf, and to advance a few paces into the ditch, he muſt throw a great number of them into the paſſage, in order to fill the ditch up entirely in that part.—They are laid different ways, and ranged in different beds; which are covered with earth, in order to make them ſink to the bottom. All theſe different beds of faſcines muſt be fixed with long ſtakes, that they may keep cloſer together: and as the work advances, the parapet muſt be puſhed forward, otherwiſe it would be impoſſible to effect the paſſage without the utmoſt danger.

When the paſſage is commanded, or fired into from the oppoſite parapet of the place, or from any other part, the foremoſt men muſt be covered with a great heap of faſcines, or by ſome other contrivance: but whatever cover it be, in that caſe the paſſage of the ditch is extremely difficult and dangerous.

After what has been ſaid concerning the paſſage of dry ditches, and thoſe which are full of ſtanding water, it remains to take notice of thoſe which are full of running water, and thoſe that are dry but may be filled at any time with water. Theſe ſorts of ditches are extremely difficult to paſs, unleſs the current can be turned and made to take a different courſe from that which carries it to the town ditches, or unleſs the beſiegers can contrive to break down the ſluices which keep up the water reſerved by the enemy for filling the ditch.

A great deal might be ſaid, were we to enter into the whole detail of the works neceſſary for paſſing theſe ſorts of ditches; we ſhall only touch upon the ſubject.

Suppoſing the ditches to be filled with running water, or with a river, the channel of which can be diverted no other way, which is called *draining the ditch*, it will be requiſite then, generally ſpeaking, to throw into the ditch a large quantity of faſcines, loaded with earth and ſtones, faſtened together with long ſtakes: thus the paſſage is to be puſhed on, till the ditch is contracted to the breadth of 20 or 30 feet; and then ſmall beams may be laid acroſs, to join the bridge of faſcines to the rubbiſh of the breach. The filling up, and conſequently the paſſage of the ditch, may be alſo forwarded, by ordering the miners to advance to the rubbiſh, and to ſpring a mine, in order to blow up part of the revetement of the work into the ditch.

Should the enemy happen to have reſervoirs of water which they may open, and thereby deſtroy the lodgments in the ditch when they are no longer to make a ſtand there, the beſiegers muſt endeavour during the ſiege to deſtroy the ſluices, that is, the ſtone-work or timber that ſerves to keep up the water. This may be done by throwing a great number of bombs towards that part where the ſluices are known to be ſituated; if they ſhould be broke down by that means, then the water will have a free current; and after it has run off, the paſſage of the ditch muſt be attempted in the ſame manner as if it was ſtanding water; if there remains only a very ſmall current, a paſſage muſt be left to drain it, as was mentioned before.

This whole operation is very tedious, difficult, and dangerous;

gerous; nay, it is impoſſible to be done at all without being protected by a very briſk firing, not only from all the cannon of the covert-way and the ricochet batteries, but moreover from the lodgments on the glacis and thoſe on the covert-way.

Plates DXXXIV. and DXXXV. will illuſtrate all that we have been ſaying upon this head, concerning the deſcent and paſſage over the ditch.

Plate DXXXIV. fig. 1. exhibits the plan of the deſcent under ground, and that of its opening into the dry ditch. Fig. 2. repreſents the profile of that deſcent; the opening of which is made at the lower part of the ditch. Fig. 3. is a perſpective view of the opening of this deſcent, ſeen from the bottom of the glacis: and fig. 4. ſhows in perſpective the opening of the ſame deſcent, ſeen from the top of the breach.

Plate DXXXV. fig. 1. is the plan of the paſſage over a wet ditch in the open air; that is to ſay, the gallery of which is an open ſap. A is the opening of it. You ſee in B, towards its opening, the blinds that are laid on its upper part, to ſupport the faſcines with which it is covered. On theſe blinds, at firſt, is laid a bed of faſcines, ranged according to the length of the gallery: over this firſt bed is laid a ſecond, wherein the faſcines are ranged according to the breadth of the gallery, as you ſee in B and C. D is the epaulement of faſcines, which covers the paſſage againſt the fire of the place, by which it is flanked. E is part of the bridge of faſcines; and F is an elevation alſo of faſcines, intended to cover the head of the work, and to ſecure it from the immediate fire of the place. Fig. 2. repreſents the profile of this deſcent into the ditch. Fig. 3. gives its opening ſeen in perſpective from the country; and fig. 4. its opening into the ditch, alſo in perſpective, as it appears from the top of the breach.

§ 15. *Of the attack of the Ravelin, or Half-moon.*

The paſſage over the ditch before the half-moon being effected on both ſides, and a breach made 14 or 15 fathoms wide, preparations are made for the aſſault. For this purpoſe a large quantity of materials is collected from all the neighbouring lodgments. Endeavours are uſed to render the breach practicable by making the ſlope eaſy. The cannon continue playing, in order to throw down the parts of the revetement that may yet be ſtanding. Very good uſe may alſo be made of ſhells fired point blank; for they are eaſily buried in the breach, the earth of which has been already broken up and ſhaken by the cannon; and as they burſt upon that earth, they produce the effect, as it were of ſmall mines. Howitzers may likewiſe be uſed with ſucceſs on theſe occaſions.

In order to render the breach more practicable, ſome miners, or a ſergeant with a few grenadiers, are ſent to level it with hooks. The fire from the lodgments and batteries will hinder the enemy from appearing on their defences; or if they ſhould, they muſt do it with great circumſpection, which renders their fire leſs dangerous.

If the enemy have made any galleries along the face of the half-moon, and oppoſite the breaches, the miners may go and diſcover them, in order to ſtop them up, or to cut off the match, or to drive away the enemy: if they cannot find them, they ſpring ſeveral mines; which being often repeated, muſt needs occaſion ſome diſorders in the galleries and mines belonging to the beſieged. Every thing being ready for making a lodgment in the half-moon, that is, for taking poſſeſſion of the breach: the materials being at hand, in order to be removed hither with eaſe and expedition: the batteries and lodgments of the covert-way being in a condition to fire away briſkly;—a ſignal is agreed upon with the officers that command thoſe batteries and lodgments, to give them notice to fire, and to leave off whenever it is thought proper. This ſignal is generally a flag raiſed in the former caſe, and lowered in the latter. All this being ſettled, and the breach as we obſerved, made practicable, two or three ſappers are ſent to the extremity of the breach next to the place, there being generally a kind of ſmall cover or cavity in this part; there they begin a lodgment for themſelves, and for ſome more, who are ſent after them; when there is room to receive them, they make them mount, and inſenſibly extend the lodgment upon the top of the breach; and thus they proceed till they make a lodgment towards the point, which is generally called a *magpy's neſt*. While theſe ſappers are at work, the fire of the batteries and the lodgments ceaſes; but when the enemy attempts to attack the workmen in order to deſtroy their lodgments, they muſt retire as quick as poſſible; and then the colours being raiſed, the batteries fire upon them with the utmoſt vivacity, to oblige them to quit the upper part of the breach.—Upon this the colours are lowered, the fire ceaſes, the ſappers return to repair the miſchief that was done to their lodgment, and try to enlarge and ſtrengthen it.

This way of proceeding muſt be continued till the lodgment is in a ſtate of defence; that is, till it can hold a number of troops ſufficient to awe the enemy, and to withſtand any attack that may happen to be made againſt it. The beſieged, before they entirely quit the half-moon, will ſpring what mines they have ready there. As ſoon as this is done, the beſiegers ſhould directly lodge themſelves in the excavations made by thoſe mines, or at leaſt ſome defence ſhould be made there, to hold a few ſappers, and to forward the lodgments of the inſide of the work.

The lodgment of the point is made in the form of a ſmall arc, the concavity of which is turned towards the place. From each of its extremities a lodgment is carried along the faces of the half-moon, on the platform of its rampart, at the foot of its parapet. This lodgment is ſunk deep in the earth of the rampart, to the end that the ſoldiers may be the better covered againſt the fire of the place; there muſt be alſo traverſes to ſecure it from the enfilades, as was done in regard to the lodgment on the glacis. Withinſide the half-moon, lodgments are alſo made, which traverſe the whole breadth thereof, as may be ſeen in the half-moon *C*, Plate DXXXIII. fig. 6. They ſerve to command the communication between the tenaille and the place; of courſe to render that communication more difficult, and to hold a ſufficient number of troops to reſiſt the enemy, ſhould they have any deſign to return and repoſſeſs themſelves of the half-moon.

What we have been obſerving, in regard to the attack of the half-moon, is only when the beſiegers intend to take it by the ſap, or with pick-axe and ſpade: but ſometimes they go about it in a more expeditious manner: for when the breach is made ſo as the troops may mount to enter the half-moon, they advance boldly to the aſſault, juſt as in the attack of the covert-way, ſword in hand, and endeavour to come up with the enemy, and to drive them entirely out of the work. This attack is very dangerous, and may coſt a great many men, when there happens to be a brave garriſon, who will not eaſily yield their ground. But there are frequent caſes in which it may be thought prudent to adopt this meaſure, in order to accelerate a few days the taking the half-moon. As ſoon as the beſiegers are maſters of the upper part of the breach, they make a lodgment there in a hurry with gabions and faſcines; and while it is making, as alſo while they charge the enemy, and oblige them to abandon the upper part of the breach, ſome ſoldiers are ſent to diſcover the mines, which the beſieged are ſuppoſed to have made

Of Sieges.

within the rampart of the half-moon, and to cut off the fauciſſon. If they cannot find them, they muſt advance with great circumſpection, and take care not to keep all together, that the mine may have leſs effect. Oftentimes the enemy will ſuffer the beſiegers to carry on their lodgment without making any great oppoſition, becauſe it cannot be effected without a conſiderable loſs of men; but when the lodgement is advanced, the enemy ſpring their mines, and return afterwards to the half-moon, in order to take it amidſt the confuſion which thoſe ſubterraneous fires muſt unavoidably occaſion among the troops in the lodgment; in that caſe, it will be requiſite to renew the charge moſt vigorouſly with freſh troops, which ſhould be at hand to ſupport thoſe of the half-moon, to place themſelves in the excavations made by the mines, to render the lodgment ſufficiently ſtrong, and to ſecure it with a proper number of ſoldiers, ſo as to be able to withſtand any further attempt of the enemy.

This work can hardly be diſputed in this manner, except when the half-moon has a reduit (D), as it affords a ſhelter or retreat to the garriſon, and enables them more eaſily to fall upon the half-moon. For if there ſhould be no reduit, and the enemy are driven out of the half-moon, they can ſcarce attempt to return, eſpecially if the communication between the place and the half-moon is diſcovered by the batteries and lodgments of the covert-way: becauſe, if the ditch is filled with water, this communication can hardly be made but with boats, which may be eaſily ſeen from the lodgments of the covert-way, and may be overſet by the cannon of the batteries; and if the ditch be dry, and there happens to be a caponnier, the communication, though more ſafe, is not without danger, by reaſon of the fire that may plunge into it from the lodgments of the covert-way; ſo that it will be extremely difficult for the enemy to advance quick enough to repoſſeſs themſelves of the half-moon; beſides, they want room to aſſemble in a large body, and fall all at once upon the lodgments of that work.

There is only one caſe in which they may do it; that is, when in the angle of the gorge of the half-moon they have made a ſpace, nearly as large as the places of arms in the covert-way. This ſpace cannot be ſeen from the covert-way, nor from its lodgments; and as there are generally ſteps to aſcend from the bottom of the ditch to the half-moon, the enemy might take advantage thereof to try to enter it; but if the beſiegers are upon their guard, they will find it eaſy to repulſe them, even with loſs.

The beſt time for attacking the half-moon ſword in hand, is by night, for the enemy's fire is not ſo ſure then as by day.

§ 16. *The Attack of the Baſtions.*

Whilst the beſiegers endeavour to poſſeſs themſelves of the half-moon, they work the ſame time at the deſcents into the ditch, which are made nearly towards the third part of the faces, reckoning from the flanked angle of the baſtion. A deſcent may be effected at each face of the two baſtions in the front of the attack, as in *n*, *n*, Plate DXXXIII. fig. 6. or, according to the more general cuſtom, only oppoſite the faces in the front attacked. The manner of proceeding is much the ſame as in the deſcent and paſſage over the ditch of the half-moon, whether it be dry or wet; that is, if it be dry, a ſap is carried into the ditch, from the opening of the deſcent to the foot of the breach, and ſtrongly covered towards the oppoſite flank. If the ditch be full of water, it is paſſed over on a bridge of faſcines, conſtructed in the ſame manner as in the paſſage over the ditch of the half-moon.

Of Sieges.

The batteries erected on the ridge of the glacis for making a breach in the face of the baſtions, muſt fire againſt that part of the faces where the breach is to be effected, and fire all together, as was mentioned in the article of the attack of the half-moon; and when they have made a breach ſufficient to attempt the attack in front, ſome of the guns muſt be kept to batter the upper part of the breach, and ſome muſt be removed to the back of the platform, and diſpoſed in ſuch a manner, as to be able to annoy the enemy, whenever they preſent themſelves towards the upper part of the breach. All this is done during the deſcent and paſſage over the ditch. Mines are alſo made uſe of to widen, and ſometimes even to make the breach.

To fix the miner to the wall when the ditch is dry, a lodgment is made near the opening of the deſcent, to protect him from thence againſt the ſallies of the beſieged. Then the wall is broke with cannon, as near as poſſible to the bottom of the ditch, in order to get under the galleries which the beſieged may have built withinſide the baſtion. An opening of five or ſix feet may be made with the cannon, to lodge the miner that moves the rubbiſh, and makes room for one or two of his comrades, who are to aſſiſt him to get rid of the earth in the gallery. When the ditch is dry, and the ground will admit of it, the miner ſometimes gets under it by a ſubterraneous gallery, which leads him to the foot of the wall; but if the ditch be filled with water, it is not always the cuſtom to wait for the completing of the paſſage over the ditch, before the miner is fixed to the face of the baſtion. The wall is pierced with cannon, in the manner before mentioned, but a little above the ſurface of the water, to the end that the miner may not be incommoded in this gallery; and he is ſent over in a little boat to place himſelf in the hole. The miners relieve one another every two hours to carry on their work with more ſpeed; that is, to complete and finiſh their mine. At the ſame time, the enemy will uſe various artifices to obſtruct them.

When the miner has pierced the wall, he makes behind it, on both ſides of him, two ſmall galleries, from 12 to 14 feet, at the end of which he places, on both ſides the galleries, two mines, namely, one within the breadth of the wall, and the other ſunk 15 feet under the rampart. A common train is given to theſe four chambers, which taking fire at one and the ſame time, will produce a very large and ſpacious breach.

When there are countermines under the rampart, and along its revetement, care muſt be taken to ſeize them, and to drive the miners from thence. For this purpoſe M. Goulon propoſes to ſpring four fougaſſes* near them, in order to burſt them; when this is done, he is for entering it with 10 or 12 grenadiers, and as many ſoldiers, commanded by two ſerjeants; part of theſe grenadiers ſhould have each four grenades, and the reſt ſhould carry four or five bombs, of which three only ſhould be charged, the other two with fuſees only. The two ſerjeants ſhould begin with attacking the countermine ſword and piſtol in hand, and the grenadiers ſhould follow them. If the beſieged do not appear to defend their countermine, a lodgment is quickly made with ſand-bags. This lodgment conſiſts of no more than a good traverſe,

* See Fougade.

(D) The reduit is a ſmall half-moon conſtructed within the other. It uſually conſiſts of a ſingle wall with loop holes; but in Landau, Neufbriſac, and ſome other places, the reduit is conſtructed with a rampart and parapet like the external half-moon.

Of Sieges.

traverſe, which entirely ſtops up the gallery of the countermine, towards the ſide from whence the enemy may come. If they attempt to oppoſe this operation, the grenadiers ſhould throw their three loaded ſhells, and retire quickly with their comrades, to prevent being hurt by the effect of thoſe ſhells: for the ſmoke they make in burſting, together with the ſplinters, muſt unavoidably oblige the enemy to quit the gallery for ſome time: but as ſoon as they have produced their effect, the ſerjeants and the grenadiers, with their comrades, muſt immediately return, and work as hard as poſſible upon the traverſe, in order to ſtop up the gallery. If the beſieged ſtill perſiſt in interrupting this work, the grenadiers muſt throw the two ſhells with fuſees only, which will oblige the enemy to retire quickly; and as no harm is to be apprehended from them, which is more than the beſieged can tell, the beſiegers continue to finiſh the traverſe. Even openings or loop-holes are made, in order to fire upon the enemy, in caſe they ſhould appear again in the part of the gallery oppoſite the traverſe.

When there is no gallery or countermine behind the walls, or when there is one which cannot eaſily be come at, the miner ſhould leave no means untried to diſcover it; and at the ſame time he ought to uſe the utmoſt precaution to prevent being ſurpriſed himſelf by the enemy's miners, who will attempt to ſmother him in the gallery, and to deſtroy his works: therefore the buſineſs of a miner requires great art and cunning to avoid the ſnares of the enemy. "A miner (ſays M. de Vauban in his Memoirs) ought to liſten frequently to diſcover whether there are any at work under him. He ought to ſound with his augre towards the place he hears the noiſe come from; but the enemy often make a noiſe on one ſide, while they are at work on the other." If their miner draws too near, a ſmall mine muſt be made to ſtifle him in the gallery; which may be effected thus: A hole of five or ſix inches diameter, and ſix or ſeven deep, is made on that ſide of the gallery where the enemy is heard; a cartridge of the ſame ſize, and containing about 10 or 12 pounds of powder, is put into it: the hole or opening towards the gallery is ſtopped cloſe with a ſtrong tampion, which is immediately applied to the cartridge, and ſupported by ſtrong planks well buttreſſed: this powder is ſet on fire by a fuſee, which paſſes through a hole made in the tampion, and communicates with the powder in the cartridge. If the gallery of the enemy's miner is within four or five feet of this powder, it will undoubtedly burſt, and the miner will be either killed, or obliged by the ſmoke to retire.

Another way of burſting the gallery of the beſieged, when it is at no great diſtance, is to put ſeveral ſhells on the ſide where the enemy's miner is at work, and to range them in ſuch a manner that they ſhall have their effect.—When the miners are at work in ſearch of one another, they have great iron borers, with which they pierce the interval betwixt them, to find, as near as they can, their diſtance from one another. The miner muſt be very vigilant, and as ſoon as the borer is withdrawn, he ſhould clap a piſtol into the hole, which, when well directed, and fired by a man of reſolution, ſeldom fails, as M. Vauban affirms, to kill the miner. The firſt ſhot ought to be followed by three or four more; then the hole ſhould be cleaned with the borer, to prevent the enemy from ſtopping it up on their ſide: and this is a matter of importance, for it will hinder the miner from continuing his work in that ſpot, and oblige him entirely to abandon it. Theſe and many other ſtratagems, which may be ſeen in the Memoirs of M. Vauban, plainly ſhow that the buſineſs of a miner requires not only addreſs and cunning, but likewiſe great courage and reſolution, to guard againſt and remove the ſeveral obſtacles that may be thrown in his way, with a view to prevent the progreſs of the works committed to his direction: he may eaſily guard againſt them when he is undermoſt; but if it be otherwiſe, his ſituation is extremely bad. In order to know for certain whether they are at work under the gallery, the miner generally makes uſe of a drum with ſomething upon it, and then the ſhaking of the earth muſt occaſion a kind of trembling, which will diſcover that they are at work underneath. Sometimes he liſtens with his ear to the ground; but the fluttering of the drum is the ſureſt way.

Of Sieges.

While the miner is working upon the conſtruction of his gallery, the beſiegers muſt be employed in demoliſhing all the works of the enemy, and diſabling them from defending or repairing the breach. With this view a continual fire is made againſt the breaches, which will hinder the beſieged from ſhowing themſelves in that part, and from advancing to ſee the works which may be made in the ditch or at the foot of the breaches. If there is a tenaille before the curtain, batteries are placed in the re-entering places of arms of the covert way of the half-moon, which plunge into the tenaille, and hinder the enemy from making uſe of it to diſturb the paſſage over the ditch. And in order to ſilence them farther, another battery of mortars may be erected, in the moſt advanced lodgment of the gorge of the half-moon; which battery being well ſerved, will render it too dangerous and inconvenient for the beſieged to abide there, ſo as to have the attention requiſite for obſtructing the paſſage over the ditch.

But ſometimes the enemy will make oblique embraſures in the curtain; and from thence they fire on the lodgments of the covert-way, ſo as greatly to incommode both thoſe lodgments and the opening of the deſcent into the ditch. The way to prevent the effect of thoſe batteries, is to endeavour to deſtroy them with ſhells: and, when the ground will permit, to enfilade the curtain with ricochet firing. Four or five pieces may be alſo placed on the upper part of the flanked angle of the half-moon; in which poſition they can fire directly upon the curtain, and plunge into the tenaille and the poſtern, by which the enemy keep a communication with the ditch when it is dry.

Let us ſuppoſe that the paſſages over the ditch are finiſhed, ſo as to be fit to walk over; that the cannon or the mines have made the breaches ſufficiently wide for the aſſault; that the aſcent is made ſmooth, and that the beſiegers can eaſily mount to the top of the breach; then they may lodge themſelves there, by following either of the two methods mentioned in the article of the half-moon.

If the enemy have made no retrenchments in the inſide of the baſtion, they will hardly venture to ſtand an aſſault, as this would only expoſe the place to be carried ſword in hand, themſelves to be taken priſoners of war, and the town to be plundered. Therefore every thing being ready for the aſſault, they will beat the chamade, that is, they will deſire to ſurrender on certain terms.

When a reſolution is taken to attack the baſtions while the mines are making and charging, a conſiderable heap of materials is laid up in the lodgments neareſt the breaches, that they may be handed readily for the conſtruction of the lodgment, as ſoon as the enemy is driven away. Every thing being prepared to ſet fire to the mines, all the grenadiers of the army are ordered to march to the aſſault; and they are to be ſupported by a ſufficient number of detachments, that the enemy may not be able to make a ſtand. Theſe troops being ready, the mines are ſprung; and as ſoon as the duſt is a little laid, the grenadiers, commanded to march and to mount foremoſt, move on to the foot of the breach; and when they get there, they mount immediately with their bayonets fixed, and are followed by the

Of Sieges

the reſt of the troops that are to ſupport them. The enemy will not fail to make uſe of their mines, if they have any left; and will likewiſe throw all kinds of combuſtibles, to make the beſiegers pay as dear as poſſible for the ground which the beſieged will be obliged to yield in the upper part of the breach; for yield at length they muſt, and the ſuperior numbers of the beſiegers muſt ſurmount every obſtacle.

As ſoon as they are beaten away, and have abandoned the upper part of the breach, the beſiegers muſt ſet about making a lodgment; which will conſiſt at firſt of a kind of arc of a circle, the convexity whereof is turned towards the enemy, if there is a breach in the faces of the two baſtions, otherwiſe it will only be made on the upper part of the breach. The breaches are to be all ſtormed at the ſame time, by which means the reſiſtance of the enemy will be divided. This whole time the batteries and lodgments are to fire with all the vivacity poſſible againſt the ſeveral defences of the enemy, and againſt every place they are in and that can be fired againſt, without annoying the troops that are ſtorming the breaches.

The lodgment on the breach being made, the ſaps are carried on to the right and left towards the centre of the baſtion, and diſpoſed in the manner as in Plate DXXXV. fig. 5. baſtion A. Cannon are brought upon the breach to batter the inner retrenchment, the ditch is paſſed over here alſo, and a lodgment is made upon the breach in the manner mentioned in regard to the baſtions.

If behind this firſt retrenchment there be a ſecond, the enemy, after being forced to quit the former, retires to the latter to capitulate. There they are to be attacked as in the former retrenchment, and at length they will be forced to ſurrender. It is very rare to ſee a defence carried ſo far as we have here ſuppoſed; but it was incumbent upon us to make this ſuppoſition, in order to give an idea of what is proper to be done, ſhould the enemy reſolve to defend the place to the laſt extremity.

§ 17. *Attack of a place covered with Fore-ditches, Lunettes, and other Outworks*, &c.

In order to give a more ſimple idea of the operations of a ſiege, we have explained and applied them to a place that had no other outworks than half-moons and a covert-way: but a greater number of works will make no alteration in the principles here eſtabliſhed: to take and keep poſſeſſion of thoſe works, the beſiegers have only to follow the ſame rules; which we ſhall ſhow in a few words.

Let us ſuppoſe a place ſurrounded by a fore-ditch, and a ſecond covert way, ſtrengthened with lunettes, and ſuppoſe the front by which it may be attacked is covered with a horn or crown work, &c.

Firſt of all the trenches are to be opened as uſual, in order to come to the foot of the glacis of the ſecond covert way; the ricochet batteries are to be placed on the produced faces of the works attacked, and of their defences; the faces of the lunettes of the front attacked ought to be enfiladed by the ricochet batteries.

The ſecond covert way is taken in the ſame manner as the common covert way; and then, if the fore-ditch is full of water, a good lodgment is to be ſecured along this ditch, and batteries are to be erected to make a breach in the lunettes, if the enemy do not think proper to quit them. It is very difficult for them to maintain themſelves in thoſe works, when their communication is ſeen; and they can hardly avoid being ſeen, when a lodgment is made all along the fore-ditch. Be that as it may, ſuppoſing that they are lined with ſtone-work, or only with turf, that they are fraiſed and palliſaded, and that the enemy are obſtinate in their defence, a breach may be made in them, by placing ſome cannon oppoſite the middle of the faces, and the ditch may be paſſed over by filling it with faſcines or ſome other materials. As it is a great deal ſmaller than that before the body of the place, it is much eaſier to paſs.

Of Sieges.

When the beſiegers have made themſelves maſters of the lunettes which cover the front attacked, they begin to think of paſſing the fore-ditch. This is a very difficult taſk, becauſe it is performed under the grazing fire of the covert way; but this fire ought to be checked by the ricochet batteries, which ſhould plunge into the covert way on every ſide. This ditch is croſſed near the ſaliant angles of the glacis. It is always to be underſtood, however, that there is no poſſibility of croſſing any ditch without a good epaulement of faſcines, to cover the paſſage on the ſide which is ſeen by the place, or by the works that defend it.

When the lodgment is entirely finiſhed on the covert-way, then the other attacks are carried on in the manner before explained.

There are places which, without any fore-ditch, have lunettes oppoſite to the ſaliant and re-entering angles of the glacis, which are alſo enveloped by a ſecond covert way: ſometimes they are vaulted and bomb-proof, as at Luxemburg; and ſometimes they have only a ditch, a parapet, and a covert way.

Thoſe which are vaulted and bomb-proof are very difficult to take; becauſe the ricochet firing and the bombs can do them no miſchief. In that caſe they muſt either be turned or be taken by mines.

A work is ſaid to be turned, when the beſiegers get between that work and the place, and ſo cut off their communication. Sometimes the lunettes have communications under ground, and then there is hardly any other way of driving out the enemy but by mines. This is tedious work; but there is no remedy for it.

The lunettes and the ditch are always defended by branches of the covert way, with which they have alſo a communication, like thoſe of the lunettes, A, A, Plate DXXXVI. fig. 1.

This plate, which repreſents part of Landau and its attacks in 1713, may ſerve to give an idea of the manner in which a work is turned. The advanced lunette B, as well as the work C, called a *tenaille*, are turned; that is, the trenches cut off the communication betwixt them and the place.

When this communication cannot be cut off, there will be often a neceſſity for attacking the lunette and covert way at the ſame time; and the reaſon is, becauſe though the enemy ſhould be obliged to abandon the lunette, yet ſo long as they are maſters of the covert way, they have it in their power to return and retake it. Therefore, the ſure way of keeping poſſeſſion of it is to drive the beſieged out of the covert way, at the ſame time that they are forced to quit the lunette.

The garriſon may avail themſelves greatly of mines for the defence of theſe ſmall outworks, ſo as to oblige the beſiegers to pay very dear for their acquiſition, and be a long while in making it. But they muſt purſue the ſame methods as the beſieged; they muſt dig deep into the earth, they muſt endeavour to deſtroy the enemy's mines, to blow up their galleries, and to make themſelves maſters of the lower ground. This is an eſſential point, without which the enemy may blow up and deſtroy the lodgments ſeveral times. The celebrated M. de Valiere, in a Diſſertation on Mines, at the end of the third volume of M. Folard's Commentary on Polybius, ſhows, that in a ground 25 or 30 feet deep, the enemy may be blown up twenty times. Therefore it is impoſſible to be too cautious in endeavouring to get

 get under the gallery of the beſieged, in order to prevent the miſchief they may do by their great number of mines.

In the neighbourhood of ſome places there are a ſort of ſmall half-moons, called *redoubts*. When they are diſtant from the place, the enemy cannot maintain themſelves there without expoſing their troops to be taken priſoners of war; but when they are covered and defended as they ought to be, and judiciouſly ſituated, they are an object worth attention. Endeavours ought to be uſed to cut off the communication between them and the place, and to oblige the enemy to abandon them by throwing in ſhells; it may even be proper to aſſault them and drive them out ſword in hand, provided they are not ſo near the place as to receive powerful ſuccours, and be able to withſtand the attack. It is a matter of conſequence to get rid of theſe ſmall outworks as ſoon as poſſible, becauſe they may be of great hindrance to the progreſs of the attacks, by having a view of the trenches from the flanks, and enfilading them, &c.

In ſome ſieges, when the garriſon are obſtinate in their defence, ſmall outworks are made at the foot of the ſaliant and re-entering angles of the glacis; theſe conſiſt only of a parapet raiſed at the foot of the glacis upon theſe angles, each ſide of which has about 10 or 12 fathoms. Theſe ſmall works are called *arrows*. They may be ſeen in A, A, A, Plate DXXXVI. fig. 2. They communicate with the covert-way by a paſſage pierced on the ridge of the glacis, and palliſaded on both ſides. At the entrance of this paſſage is conſtructed a traverſe B, generally called the *tambour*, which hinders the beſiegers from being maſters of the arrow, or diſcovering the inſide of the place of arms belonging to the covert way.

To prevent the effect of theſe arrows, the beſt method is to ply them well with ricochet batteries, and with ſhells thrown in alſo *à ricochet*. Stone mortars may likewiſe be made uſe of, to annoy the enemy in their arrows; for as theſe works are but ſmall, the ſtone mortars produce a very good effect. We have already taken notice of almoſt all the works the beſiegers may meet with beyond the covert-way; there remains, therefore, only to ſee the manner of conducting the attacks of the other outworks moſt commonly uſed in fortified towns.

§ 18. *Attack of a Horn-work.*

A Horn-work is nothing more than the front of a fortification, which projects into the field, and is joined to the place by two long ſides. It is placed oppoſite to the curtains, and ſometimes alſo to the baſtions. The beſiegers ſhould endeavour, as much as poſſible, to avoid attacking the ſide covered by theſe works, becauſe they are very difficult to take, and of courſe will greatly lengthen out the ſiege. But ſuppoſing there is an abſolute neceſſity for attacking the place on the ſide covered by a horn-work oppoſite the baſtion, and that this horn-work has an half-moon oppoſite to its curtain: The trenches and parallels are to be made in the uſual manner; the ſame method is to be uſed in regard to the ricochet batteries, which will alſo enfilade the branches of the horn-work. The taking of the covert-way of the half-moon, and of the half baſtions of the horn-work, is carried on in the ſame manner as the attack of the half-moon, and the two baſtions of the body of the place. There remains, therefore only to ſhow how the lodgments are to be made in this work. We will ſuppoſe that there are two retrenchments withinſide, as in Plate DXXXV. fig. 5.

When the lodgments towards the point of the half baſtions are finiſhed, ſome guns are to be planted there, in order to batter the face of the oppoſite baſtion; and they are to be placed over-againſt the lodgments of the flanked angles of the half baſtions. Theſe lodgments are to be extended on both ſides towards the curtain, along which ſaps are carried on; as alſo towards the orillon of the half baſtions, if they are made with orillons: this will form a kind of ſmall parallel, the fire of which will help to cover the lodgments in front, in caſe the enemy ſhould make any ſallies to deſtroy them. In large fortifications, ſuch as horn and crown works, the lodgments ought to be carried on with the greateſt circumſpection, in order to be able to ſupport them againſt every attack of the enemy.

As all theſe lodgments are commanded by the baſtion, it will be requiſite to dig the ſaps ſufficiently deep, ſo as to be ſecure againſt their fire; and likewiſe to make traverſes near enough to each other for the ſame effect.

If the baſtion can be battered in breach from the rampart of the half baſtions of the horn-work, the beſiegers will for this purpoſe make uſe of batteries erected on theſe half-baſtions; and for the ſame end they will alſo plant a battery of ſix or eight guns towards the middle of the curtain.—Should it be impoſſible to ſink ſufficiently into theſe, ſo as to batter the lower part of the revetement of the baſtion, ſtill they might be uſefully employed in playing againſt the enemy's defences, and driving them out of their retrenchments. When the lodgments are well ſecured withinſide, it will be extremely difficult for the enemy to continue in the retrenchments, without running the riſk of being made priſoners of war; becauſe the communication between them and the place will become too difficult. They might indeed, by means of a bridge level with the water, retire into the collateral half-moons: but at the ſame time that the beſiegers endeavour to make themſelves maſters of the horn-work, they will alſo ſtrive to get poſſeſſion of theſe half-moons; the taking of which muſt inevitably follow that of this work.

As ſoon as the enemy are entirely driven out of the horn work, the beſiegers muſt poſſeſs themſelves of it by carrying on lodgments which ſhall occupy its whole extent; and if there be any occaſion to erect batteries within, in order to batter the baſtion in breach, they are to be erected along its counterſcarp, as may be ſeen in *z (ibid)*.

Sometimes it ſhall happen, that the ground of the inſide of the horn-work will not permit lodgments to be extended there, as they are ranged in this figure, becauſe it may be too wet and marſhy, or elſe of too narrow a circumference. In that caſe there is no carrying on the lodgments but along the parapet of the front of this work, and along its branches, if the breadth of the platform of the rampart of theſe branches will permit. It muſt be made to defile by frequent zig-zags or turnings; but if it be too narrow, the only way for the beſiegers is to ſink very deep, in order to defile from the fire of the place, and to cover themſelves by traverſes made very near one another.

Plate DXXXVII. repreſents the plan of the lodgments made in the horn and crown work of Philipſburg in 1734.

A great deal more might be ſaid in regard to all theſe articles; but for the particulars, we refer the reader to the Memoirs of M. de Vauban, which diſplay the whole extent of genius of that great man, and ſhow how capable he was of finding out expedients for ſurmounting all obſtacles ariſing either from ſoil, ſituation, or different manners of fortifying.

§ 19. *To prevent ſuccours from being thrown into a town beſieged.*

NOT to interrupt the thread of the uſual operations of a ſiege, we have ſuppoſed that the general had taken every neceſſary meaſure to guard againſt all the attempts of the enemy, and to ſecure ſucceſs by the great ſuperiority of his forces. Sometimes, however, it may happen that an enemy who was looked upon as too weak to relieve the place, ſhall prepare to attack the army of the beſiegers, either in conſequence of drawing out moſt of the troops from the neighbouring garriſons, which are leaſt expoſed, or of having been reinforced from ſome other part. In ſuch caſe, there are two ways to follow. The firſt is, to wait for the enemy in the lines, and to hinder them from breaking through: the ſecond, to leave part of the army in the lines, in order to carry on the ſiege, and to oppoſe any ſallies of the garriſon; with the other to go and meet the enemy, and fight them out of the lines.

Both theſe ways are ſupported by the opinion of different generals; but the latter ſeems to have the moſt general approbation.

The inconvenience of waiting for the enemy in the lines, is the uncertainty on which ſide he intends to direct the attack; for which reaſon the beſiegers are obliged to be equally ſtrong in all their poſts; and when the line is very extenſive, the troops are at too great a diſtance from one another, to make any conſiderable reſiſtance on the ſide where the enemy forms his attack. Moſt lines of circumvallation, that were ever attacked, have been forced; ſo that both reaſon and experience ſeem to eſtabliſh it as a maxim, that it is preferable to go and meet the enemy, and not to let him come within reach of the lines.

Without pretending, however, to determine ſo important a matter, it ſeems, that when a line is not very extenſive, it may be defended to an advantage. And, firſt, it is beyond all doubt, that if the troops behind the line know how to avail themſelves of the ſeveral circumſtances in their favour, their ſituation is in many reſpects preferable to that of the aſſailants. The latter are expoſed to the fire of the line for a very conſiderable time before they can come up to the border of the ditch. This ditch muſt be filled up: and all the while they are expoſed to the ſame fire, which muſt kill a great many of their men, and throw their troops into ſome confuſion. And when they break into the line, they can make but a very narrow front; for which reaſon, they may be charged both in front and flank by the troops within; who, if they do their duty, muſt drive them into the ditch. For, ſuppoſe the firſt line of the defendant's infantry next the ditch ſhould be obliged to give way, the horſe that are behind them may and ought to fall upon the enemy's foot that have pierced through the line; and as the latter cannot force their way but in ſome confuſion, the former may eaſily drive them out again. We may therefore conclude, that if the troops are ſenſible of the many advantages of a good line, and are determined to defend it; if the ſeveral parts are likewiſe well ſupported, and all the neceſſary precautions have been taken to prevent being ſurpriſed; it will be extremely difficult for the enemy to force it. Of Sieges.

Thus, at the ſiege of Philipſburg, in 1734, prince Eugene reconnoitred the lines of circumvallation, and found them ſo well diſpoſed, that he never once attacked them. They formed a kind of irregular ſemicircle round the place, of which the Rhine might be conſidered as the diameter. They were defended by a kind of fore-ditch, and by wells between this fore-ditch and the lines, as may be ſeen in Plate DXXIX. If the prince had attempted to paſs over this ditch and theſe wells, he would have loſt a great number of men by the fire of the lines. The wells were ſo near to one another, that there was no poſſibility of paſſing between them: they muſt have been filled up, as well as the fore-ditch, with faſcines; which would have been too tedious and dangerous an enterpriſe.

In ſuch a ſituation, therefore, the beſiegers may wait quietly in their lines; but if they ſhould be of ſo great an extent, as not to admit of being equally guarded, then it ſeems to be the ſafeſt way to draw out the troops, and meet the enemy, as marſhal Tallard did at Landau, in 1703. After he had defeated the army which was marching to the relief of the place, he returned and finiſhed the ſiege. The duke of Vendome acted juſt in the ſame manner at the ſiege of Barcelona, in 1697. Having had intelligence that the marquis of Valeſco, viceroy of Catalonia, was preparing to attack him, he went out to meet that general, gained a complete victory, and returned afterwards before the place, which was obliged to capitulate.

At the ſame time, we muſt allow that the ſafeſt way to conduct a ſiege, is to have a good army of obſervation advantageouſly poſted ſo as to cover the ſiege, and be near enough to receive ſuccours from the troops employed before the town, ſhould the enemy come to a reſolution of giving battle.

If the enemy do not think proper to attack the beſieging army, they may probably try to throw in ſome ſmall ſuccours of troops and ammunition into the town. The way to prevent them is to make the circumvallation very exact, and not to leave an opening in it, under any pretext whatſoever.

The enemy may likewiſe attempt the raiſing of the ſiege, by making themſelves maſters of the ſpot, or place, from whence the beſiegers draw their proviſions and ammunition. But before a general lays ſiege to a town, he ſhould take all the neceſſary precautions for ſecuring his magazines, covering his convoys, and guarding the ſeveral poſts through which the enemy might march to attack him.

Another expedient the enemy may think of for raiſing the ſiege, is to attack ſome place of importance, which the beſiegers have an intereſt in preſerving; in order to engage them to march to its aſſiſtance, and to abandon the ſiege they have in hand. But this expedient ought to have been foreſeen, and every precaution taken to prevent it. However, ſhould the enemy find means to engage in an enterpriſe of importance, and which requires an immediate relief, if a general thinks there is not time ſufficient to take the place he has laid ſiege to, and at the ſame time to oppoſe the enemy's deſigns, in that caſe he may raiſe the ſiege; but for ſo doing, there ſhould be very cogent reaſons. When king William laid ſiege to Namur, in 1695, marſhal Villeroy, in order

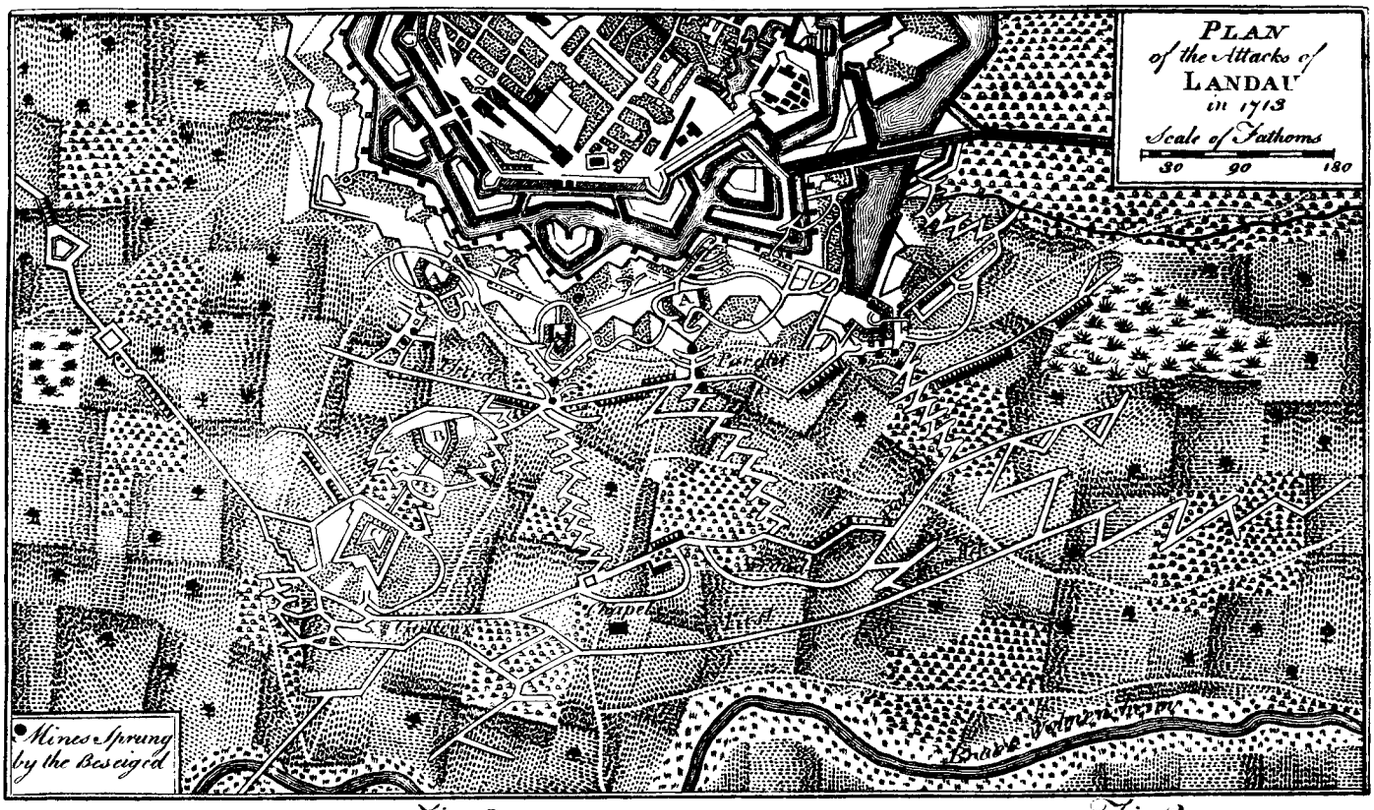

Fig. 2.

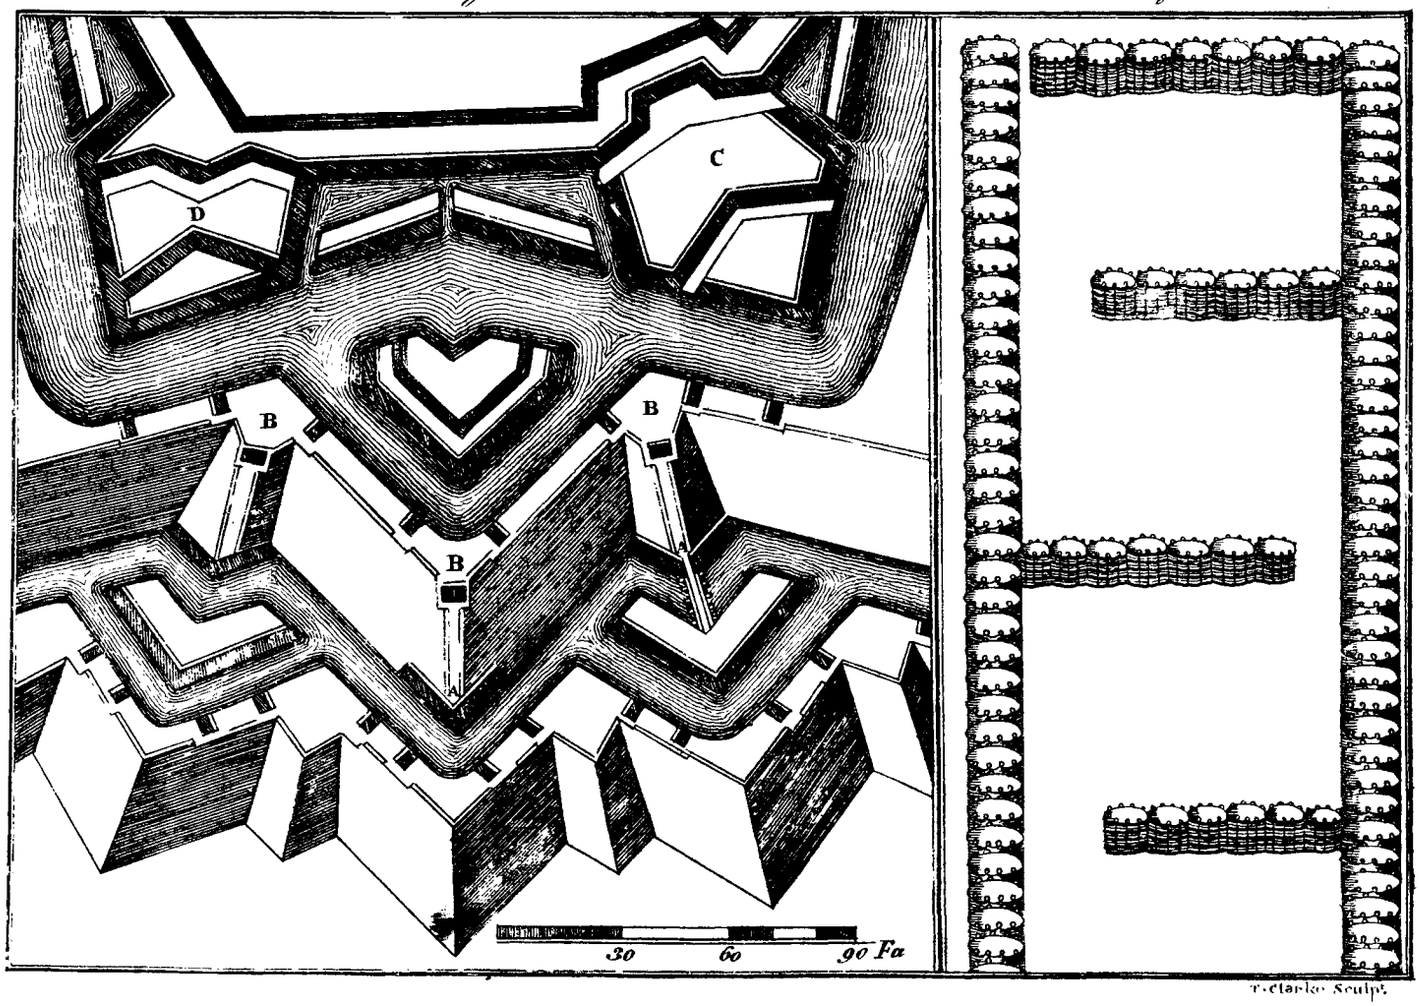
Fig. 3.



T. Clarke Sculpt.

Of Sieges.

order to divert him from his purpoſe, ſat down before Bruſſels, thinking he ſhould oblige that prince to march to its relief, and abandon his enterpriſe againſt Namur; but king William choſe rather to ſuffer that city to be bombarded, than to relinquiſh a very important conqueſt, in which he was in a manner ſure of ſucceeding.

SECT. II. *Of Defence.*

§ 1. *Of the Troops and Ammunition with which a fortified Town ought to be provided.*

As the goodneſs of the works, when a place is well provided with troops, ammunition, and proviſions, is what enables it to hold out againſt the attack of an enemy; ſo the want of any one of theſe three articles will not permit all the advantage to be reaped that was propoſed in fortifying a town. Men are properly the ſoul of a defence; and without them the beſt fortifications in the world are not able to make any great reſiſtance againſt the enemy.

Therefore we muſt firſt of all lay down as a maxim, that a governor cannot make a good defence, unleſs he hath the number of troops neceſſary for defending the ſeveral poſts, and obliging the enemy to pay dear for them. Immenſe ſums are expended in fortifying a place, in order to ſtop a ſtrong army with a ſmall force: but what reſiſtance can the place make without exerting a briſk fire; and what will thoſe heaps of walls avail, if they are not defended? The garriſon of a town beſieged ought to have a reaſonable ſtock of proviſions, in order to ſupport themſelves under the fatigue of military duty; they ought alſo to have powder, arms, and generally every thing that is requiſite to annoy the enemy, and to ſtop the progreſs of their operations.
